Introduction

Use Provisioning Services’ programming interfaces to manage your implementation from a command line or from scripts. Only users with correct administrative privileges can use programming commands. Non-administrators, that do not have elevated privileges and attempt to use these commands, will receive the ‘Invalid access’ message.

Four different programming interfaces exist:

- Management Command Line Interface (MCLI)
- Simple Object Access Protocol (SOAP) Server Programmer Interface
- PowerShell Programmer Interface with Objects
- PowerShell Programmer Interface (Deprecated)

This document provides the information needed to use this interface.

Using the PowerShell Programmer Interface with Objects

Use the information that follows to manage a Provisioning Service’s implementation from the PowerShell Interface with Objects.

Installation of PowerShell Snap-In

The PowerShell snap-in (Citrix.PVS.SnapIn.dll) can be installed using the Provisioning Server Console install.

Registration of McliPSSnapIn.dll using Import-Module

If the snap-in later needs to be registered in PowerShell, this can be manually done by running one of the following command in PowerShell. The path where the Citrix.PVS.SnapIn.dll is installed needs to be used.

Import-Module “path\Citrix.PVS.SnapIn.dll”

Registration of Citrix.PVS.SnapIn.dll using Add-PSSnapin

If the snap-in later needs to be registered in PowerShell, this can be manually done by running one of the following commands at the DOS command prompt. After the command is run and PowerShell is started, the snap-in needs to be added using the command “Add-PSSnapin -Name Citrix.PVS.SnapIn”.

64-bit Registration

%systemroot%\Microsoft.NET\Framework64\v4.0.30319\installutil.exe Citrix.PVS.SnapIn.dll
32-bit Registration
%systemroot%\Microsoft.NET\Framework\v4.0.30319\installutil.exe
Citrix.PVS.SnapIn.dll

Alternative Registration of Citrix.PVS.SnapIn.dll in PowerShell
Another way to register is by running one of the following commands at the PowerShell command prompt:

64-bit Registration in PowerShell
$installutil = $env:systemroot + '\Microsoft.NET\Framework64\v4.0.30319\installutil.exe'
&$installutil Citrix.PVS.SnapIn.dll
Add-PSSnapin -Name Citrix.PVS.SnapIn

32-bit Registration in PowerShell
$installutil = $env:systemroot + '\Microsoft.NET\Framework32\v4.0.30319\installutil.exe'
&$installutil Citrix.PVS.SnapIn.dll
Add-PSSnapin -Name Citrix.PVS.SnapIn

Uninstall of PowerShell Snap-In
The PowerShell snap-in (Citrix.PVS.SnapIn.dll) can be uninstalled using the Provisioning Server Console install.

Unregister of Citrix.PVS.SnapIn.dll
The snap-in needs to be unregistered from PowerShell, this can be manually done by running one of the following commands at the DOS command prompt:

64-bit Unregister
%systemroot%\Microsoft.NET\Framework64\v4.0.30319\installutil.exe -u
Citrix.PVS.SnapIn.dll

32-bit Unregister
%systemroot%\Microsoft.NET\Framework\v4.0.30319\installutil.exe -u
Citrix.PVS.SnapIn.dll

Alternative Unregister of Citrix.PVS.SnapIn.dll in PowerShell
Another way to unregister is by running one of the following commands at the PowerShell command prompt:
**64-bit Unregister in PowerShell**

```powershell
$installutil = $env:systemroot + '
\Microsoft.NET\Framework64\v4.0.30319\installutil.exe'
&$installutil -u Citrix.PVS.SnapIn.dll
```

**32-bit Unregister in PowerShell**

```powershell
$installutil = $env:systemroot + '
\Microsoft.NET\Framework32\v4.0.30319\installutil.exe'
&$installutil -u Citrix.PVS.SnapIn.dll
```

**Setup of the SOAP Server Communication**

Unless the defaults are fine, use this command to set the values for the SOAP Server connection:

**Set-PvsConnection**

Set the SoapServer connection, and if -Persist is specified the connection settings are saved in the registry. A PvsConnection object can be used as the parameter.

**Required**

- **PvsConnection**
  - Connection: PvsConnection object with changed property value(s) to be set. The object can come from a pipeline.
  - These values are in the PvsConnection object, and only will be set if the value has changed.
  - **string Name or Server**: Name or IP of the Server to connect to. Default=localhost
  - **string Port**: The Port to use to connect. Default=54321
  - **string User**: User name to use for Authentication. If it has a value, it will be *****. Default=""
  - **string Domain**: Domain name to use for Authentication. If it has a value, it will be *****. Default=""
  - **string Password**: Password to use for Authentication. If it has a value, it will be *****. Default=""
  - **string Persist**: True when the connection settings should be, for Set, or have been, for Get, saved to the registry.

**PvsConnection** can be created or modified using methods below:

- **New-Object**
  - **Citrix.PVS.SnapIn.PvsConnection**: Creates default Server=localhost, Port=54321, and no authentication.
  - **New-Object**
    - **Citrix.PVS.SnapIn.PvsConnection(Citrix.PVS.SnapIn copyFrom)**: Creates with settings of the copyFrom Citrix.PVS.SnapIn.
  - **SetServerToLocalHostDefaultSettings**: Server=localhost, Port=54321, and no authentication.
Copy(Citrix.PVS.SnapIn copyFrom): Modifies the settings to match the copyFrom Citrix.PVS.SnapIn.

Equals(Citrix.PVS.SnapIn compareTo): Returns true when the settings match what is in the compareTo.

When Connection is not passed, the parameters below are used:

Optional field values to set:

string Name or Server: Name or IP of the Server to connect to.
    Default=localhost
string Port: The Port to use to connect. Default=54321
string User: User name to use for Authentication. If it has a value, it will be ****. Default=""
string Domain: Domain name to use for Authentication. If it has a value, it will be ****. Default=""
string Password: Password to use for Authentication. If it has a value, it will be ****. Default=""
string Persist: True when the connection settings should be, for Set, or have been, for Get, saved to the registry.

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsConnection object is returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsConnection for Individual Fields

Get the PvsConnection into a $o variable. Change the $o field values and then Set the PvsConnection with the result.

$o = Get-PvsConnection -Fields Port
$o.Port = 54322
Set-PvsConnection $o

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 2: Set PvsConnection for a Field Using Pipe

Get the PvsConnection into a $o variable for the field that has the wrong value. Change the $o field to the correct value and then Set the PvsConnection with the result.
Get-PvsConnection -Fields Port | Where-Object {$_ .Port -ne 54322} | foreach { $o = $_; $o.Port = 54322; $o } | Set-PvsConnection

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**EXAMPLE 3: Set PvsConnection Port with Parameter**

Set the PvsConnection Port using the Port parameter instead of a PvsConnection object.

```powershell
Set-PvsConnection -Port 54322
```

This is the only Set command that has field parameters.

**Command Specific Help**

All of the documentation for specific commands is included in the command-line help by calling Get-Help and the name of the command, for example “Get-Help Get-PvsDevice”. The documentation for the specific command includes information about the object that is may get or set. The documentation of all of the objects is included in the "Objects, in the Citrix.PVS.SnapIn Namespace" section.

**Error Handling**

For the Citrix.PVS.SnapIn, if an error occurs, a PvsException will be in the Exception member of the $error. The “Error codes” information is included in this document.

The members of a PvsException are:

- **InnerException**: The exception that occurred. This exception maybe an EAException or other standard Exception.
- **ToString()**: Has the formatted full Message of the InnerException.

If the InnerException GetType().Name equals "EAException", then the members of it are:

- **returnCode**: The number, as shown below in the Error codes. The name of the error, for example "NotImplemented", is not included in the EAException.
- **Message**: The message, as shown below in the Error codes. The [v1], [v2], [v3], [v4], and [v5] will be replaced with values as required.
- **Details**: Has the Details for the EAException if there are any. OtherException, ManagementInterfaceError and PvsStatusException will have Details.
ToString(): Has the Message as shown below in the Error codes. If there is Details, it will be returned or included, and if partialReturn, they will be included.

partialReturn: Might have a list of EAException objects if any of the items processed during the command had any issues.

Severity: Can have the values Critical, Error, Warning or Duplicate.
Source: Has the value that is displayed in the Console as a Title or Type for the error.

Error codes
For the Citrix.PVS.SnapIn, if an error occurs, a PvsException will be in the Exception member of the $error.
The members of a PvsException are:
InnerException: The exception that occurred. This exception maybe an EAException or other standard Exception.
ToString(): Has the formatted full Message of the InnerException.
If the InnerException GetType().Name equals "EAException", then The members of it are:
returnCode: The number, as shown below in the Error codes. The name of the error, for example "NotImplemented", is not included in the EAException.
Message: The message, as shown below in the Error codes. The \[v1\], \[v2\], \[v3\], \[v4\], and \[v5\] will be replaced with values as required.
Details: Has the Details for the EAException if there are any. OtherException, ManagementInterfaceError and PvsStatusException will have Details.
ToString(): Has the Message as shown below in the Error codes. If there is Details, it will be returned or included, and if partialReturn, they will be included.
partialReturn: Might have a list of EAException objects if any of the items processed during the command had any issues.
Severity: Can have the values Critical, Error, Warning or Duplicate.
Source: Has the value that is displayed in the Console as a Title or Type for the error.
0 Success: The command succeeded.
1 NotImplemented: The [v1] feature has not been implemented.
2 InvalidCommand: The [v1] command does not exist.
3 InvalidField: The [v1] field does not exist.
4 InvalidFieldFormat: The [v1] field is not formatted properly, the correct format is [v2].
5 InvalidParameter: The [v1] parameter is not valid.
6 InvalidParameterFormat: The [v1] parameter is not formatted properly, the correct format is [v2].
7 ReadOnlyField: Unable to change the [v1] field because it is read-only.
8 RequiredFieldMissing: The required [v1] field is missing.
9 RequiredFieldsMissing: The required [v1] or [v2] field is missing.
10 RequiredParameterMissing: The required [v1] parameter is missing.
11 RequiredParametersMissing: The required [v1] or [v2] parameter is missing.
12 InternalIdAndNameFieldsMustBeDefined: An internal error occurred. The [v1] field is not the next FieldSettings object after the ID.
13 NoFarmAccess: The domain/user does not have access to the Farm.
14 InvalidForeignKeyValue: The [v1] field with value [v2] is an invalid foreign key.
15 SetupError: The system was not configured correctly.
16 Executing: The [v1] command can only be called one at a time. Wait for the command to finish before running again.
17 NoDiskMapped: A vDisk has not yet been mapped.
18 DatabaseError: A database error occurred.
19 DuplicateKey: To avoid creating a duplicate key, the Add or Set command was cancelled.
20 DatabaseErrorMissed: An internal error occurred. An uncaught database error occurred.
21 AddCommandFailed: No objects were added during the last 'Add' command.
22 InsufficientPrivileges: Access denied. The appropriate privileges are not assigned to perform this task.
23 ZeroObjectsAffected: No object was added, updated, or deleted in the last operation.
24 OtherException: An unexpected MAPI error occurred.
25 InvalidFieldLength: The [v1] field value is too long, maximum length is [v2].
26 InvalidFieldValueMinMax: The [v1] field value is invalid, the minimum is [v2] and the maximum is [v3].
27 InvalidFieldValue: The [v1] field can only have values [v2] or [v3].
28 TooManyParameters: More parameters were specified than permitted.
29 TooFewParameters: Not enough identifying parameters specified.
30 FollowingParametersMissing: To use the [v1] parameter, [v2] or [v3] must also be used.
31 InconsistentData: The action is canceled because the Store directory date/times does not match. Update the Store directories to match.
32 DatabaseOpenFailed: Unable to contact the database server. Ensure Provisioning Services is configured correctly.
33 DatabaseVersionWrong: The wrong database version is being used. Found version number: [v1] Expected version number: [v2]
34 DatabaseVersionNotFound: The database version number does not exist or was not found. Ensure Provisioning Services is configured correctly.
35 SomeRequiredParametersMissing: Required parameters are missing.
36 PartialError: The following items failed:
   item1 Error message...
   item2 Error message...
37 NoItemsToProcess: There are no items to process.
38 NoDefaultCollectionDefined: Unable to add a Device until a default Collection is set.
39 NoDefaultSiteDefined: A default Site is not set, no Devices can be added.
40 InvalidCollection: The specified Collection does not exist.
41 InvalidAuthGroup: The specified AuthGroup does not exist.
42 InvalidGroup: The specified Group does not exist.
43 InvalidDevice: The specified Device does not exist.
44 InvalidDiskLocator: The specified vDisk does not exist.
45 InvalidServer: The specified Server does not exist.
46 InvalidServerSite: Server specified is not in the Site specified.
47 InvalidStoreSite: Store specified is not for the Site specified.
48 InvalidSiteView: The specified Site View does not exist.
49 InvalidSite: The specified Site does not exist.
50 InvalidDeviceDiskLocator: The specified Device or vDisk does not exist.
51 InvalidDeviceImport: Import failed because the file must have Device Name, Mac Address, Site Name, and Collection Name, and they must be tab or comma-delimited.
52 InvalidServerFrom: The Server to copy [v1]=[v2] was not found.
53 InvalidServerTo: No Server to copy to ([v1]=[v2]) was found.
54 InvalidDeviceFrom: The Device to copy [v1]=[v2] was not found.
InvalidDeviceTo: No Devices to copy to are found.
InvalidDiskFrom: The vDisk to copy [v1]=[v2] was not found.
InvalidDiskTo: No vDisk to copy to ([v1]=[v2]) was found.
InvalidDiskPath: The path '[v1]' to the vDisk file is not found.
V DiskFileNotFound: [v1]: vDisk file was not found.
InvalidDiskServer: There is no Server that can serve the vDisk [v1] or the Store to which this vDisk belongs. Verify that one or more Servers belonging to the Store are online and that there is sufficient free space for the operation you are attempting.
InvalidDiskForServer: Server [v1] cannot access all versions of vDisk [v2], the vDisk was updated on at least one other Server.
SameSiteRequired: Objects within the same Site must be selected.
TooFewFields: Not enough fields for a record.
ADerrorDC: Unable to connect to the Domain Controller (if any) or the default rootDSE. Error code: [v1], message: [v2], provider: [v3].
ADerrorOU: Unable to get the Organizational Unit setting (if any). Error code: [v1], message: [v2], provider: [v3].
ADerrorDefaultContainer: Unable to get the default computer accounts container (default location is Active Directory root> Computers). Error code: [v1], message: [v2], provider: [v3].
ADerrorCreate: Unable to create the computer account in Active Directory. Ensure the account does not already exist and that the appropriate permissions are available to perform this task. Error code: [v1], message: [v2], provider: [v3].
ADerrorNewAccount: Unable to get the newly created Active Directory computer account. Error code: [v1], message: [v2], provider: [v3].
ADerrorSam: Unable to set the Active Directory samAccountName property. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].
ADerrorUserAccount: Unable to set the Active Directory userAccountControl property. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].
ADerrorSave: Unable to save Active Directory change. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].
ADerrorSetPassword: Unable to set a new password for this user account. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].
ADerrorAddTrustee: Unable to add trustee (if any). Error code: [v1], message: [v2], provider: [v3].
ADerrorEnableAccount: Unable to enable the Active Directory account. Error code: [v1], message: [v2], provider: [v3].
ADerrorAlreadyExists: The computer name is already in use. Error code: [v1], message: [v3], provider: [v2]. Select a unique name for this machine.

ADerrorGeneral: A general Active Directory error occurred. Error code: [v1], message: [v2], provider: [v3].

ADerrorDirectorySearch: Unable to find Active Directory items meeting the search criteria entered. Error code: [v1], message: [v2], provider: [v3].

ADerrorSearchComputerAccount: Unable to perform the computer accounts search. Error code: [v1], message: [v2], provider: [v3].

ADerrorComputerAccountNotFound: Specified computer account not found. Error code: [v1], message: [v2], provider: [v3].

ADerrorComputerAccountHold: This computer account is currently unavailable. Ensure that Active Directory is running properly. Error code: [v1], message: [v2], provider: [v3].

ADerrorComputerAccountMove: Failed to move the computer account to the target organizational unit set (also returned if caller lacks permission). Error code: [v1], message: [v2], provider: [v3].

ADerrorDelete: Unable to delete this computer account. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].

ADerrorPasswordGeneration: Unable to generate this password. Ensure the appropriate permissions exist to perform this task.

MapDiskNoDriver: Unable to map vDisk because a driver was not found.

MapDiskDeniedByServer: Unable to map the vDisk. Mapping was denied by the Server.

MapDiskLocalAccessDenied: Unable to map the vDisk. Denied local access.

MapDiskMiniportError: Unable to map vDisk because of a Miniport error.

UnmapDiskFailed: Failed to unmap a vDisk.

DuplicateDisk: The vDisk [v1] already exists on [v2] at [v3].

DuplicateDiskLocator: A DiskLocator: [v1] already exists on Site: [v2].

DiskCreationInProgress: The vDisk [v1] is being created on [v2] at [v3].

InvalidServerStore: A database integrity error occurred. The Server is not set to deliver vDisks from the Store, but should be.

InvalidStore: The specified Store does not exist.

InvalidFarmView: Farm View specified does not exist.

InvalidStorePath: Store path is empty.

ManagementInterfaceError:
  Management Interface: Undefined error.
  Management Interface: Database interface is inaccessible.
  Management Interface: Database interface library is inaccessible.
Management Interface: The database access library is a version incompatible with the Management Server.
Management Interface: Database interface library is invalid.
Management Interface: Database interface could not be created.
Management Interface: Database could not be opened.
Management Interface: Database is in use.
Management Interface: Database error occurred.
Management Interface: Not implemented.
Management Interface: Registry entry was not found.
Management Interface: Request was not created.
Management Interface: Operating System error occurred.
Management Interface: vDisk error.
Management Interface: vDisk header is incomplete.
Management Interface: vDisk footer is incomplete.
Management Interface: vDisk boot record is incomplete.
Management Interface: vDisk boot sector is incomplete.
Management Interface: vDisk size is below the minimum.
Management Interface: vDisk size is above the maximum.
Management Interface: vDisk boot record template is inaccessible.
Management Interface: vDisk boot sector template is inaccessible.
Management Interface: vDisk lock was not found.
Management Interface: vDisk has exclusive lock.
Management Interface: vDisk has shared lock.
Management Interface: vDisk lock error.
Management Interface: vDisk format is incompatible.
Management Interface: vDisk prefooter is incomplete.
Management Interface: vDisk creation is in progress.
Management Interface: vDisk creation information was not found.
Management Interface: vDisk creation cancellation was requested.
Management Interface: vDisk file was not found.
Management Interface: vDisk file path was not found.
Management Interface: vDisk file access was denied.
Management Interface: Cancelled.
Management Interface: Registry key for the product is inaccessible.
Management Interface: Registry key for the installation folder is inaccessible.
Management Interface: Registry key for the management interface is inaccessible.
Management Interface: Registry key for the database path is inaccessible.
Management Interface: Registry key for the management interface IP address is inaccessible.
Management Interface: Buffer size is too small.
Management Interface: Buffer size is too large.
Management Interface: Unknown error.
Management Interface: Remote Server failed to relay a request.
Management Interface: Remote Server is not servicing the Device.
Management Interface: Remote Server or Device refused the request.
Management Interface: Local Server failed to complete a request to a Server or Device.
Management Interface: Local Server failed to complete a request to a Server.
Management Interface: Remote requests were disabled because of an initialization error.
Management Interface: Remote request failed.
Management Interface: Remote request timed out.
Management Interface: Remote request result was not found.
Management Interface: Remote request receiver failed to initialize.
Management Interface: Management command failed for all objects.
Management Interface: Failed to get the preshared key in secure version.
Management Interface: VHD Error.
Management Interface: vDisk properties were lost.
Management Interface: Insufficient Memory.
Management Interface: The network path was not found.
Management Interface: The network name cannot be found.
Management Interface: File already exists.
Management Interface: The geometry of the vDisk is not accessible.
Management Interface: Unable to create the vDisk because the store media is read-only.
Management Interface: vDisk file is being used by another process.

97 ServerTimeout: Server did not respond to a request in time.
98 NotFound: [v1] not found.
99 AccountRetrieve: Account information for user [v1] was not found.
100 ActiveDevice: The task cannot be performed on active Devices. Shut down the Devices before attempting to perform the task.

101 ActiveDiskLocator: The task cannot be performed on active vDisks. Shut down the Devices that are using the vDisks before attempting to perform the task.

102 AssignedDiskLocator: Unable to delete a vDisk that is currently assigned to a Device. Unassign all Devices, then delete the vDisk.

103 ActiveServer: The task cannot be performed on active Servers. Shut down the Servers before attempting to perform the task.

104 NotEnoughFreeDiskSpace: There is not enough free disk space to create the vDisk.

105 InvalidDiskName: The vDisk name has one or more invalid characters. The invalid characters are < > | " \ / : * ?.

106 CannotDeleteLastAuthGroup: Deleting the last Authorization Group causes the system to be inoperable.

107 CannotDeleteUsedAuthGroup: An Authorization Group that is currently in use cannot be deleted.

108 ServerStartFailed: The Server did not start successfully. Ensure the appropriate permissions exist for the service account.

109 ServerStopFailed: The Server did not stop successfully.

110 LockOwnerNotFound: The Device that owns the lock was not found, the vDisk was not unlocked.

111 PossiblySharedVDisk: Unable to delete File [v1]. It is possible that the file is being referenced in other Sites or Stores.

112 StorePathInaccessible: The Store path [v1] is inaccessible.

113 InvalidAction: The [v1] action does not exist.

114 InvalidObjectType: The [v1] objectType does not exist.

115 TooManyRecords: The amount of data returned using Get is too large. Use GetFirst and GetNext instead of Get.

117 InvalidAuditAction: The specified AuditAction does not exist.

118 LoginFailed: The database login failed. Ensure the appropriate permissions exist to access the database.

119 DatabaseConnectionError: Unable to connect to the database. Restore the connection in order to manage the farm.

120 CreateTriggersParsing: Unable to parse the database script 'CreateTriggers' at: [v1]

121 CreateStoredProcParsing: Unable to parse the database script 'CreatestoredProcedures' at: [v1]

122 MediaIsReadOnly: Management Interface: Unable to create the vDisk because the store media is read-only.
ConnectedDeviceForVirtualHostingPool: Unable to delete this VM from a machine catalog because it is connected to a Delivery Group.

ADerrorDN: Unable to get the distinguishedName property. Ensure the appropriate Active Directory permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].

ADerrorGetSecDes: Unable to get the Active Directory Security Descriptor property. Error code: [v1], message: [v2], provider: [v3].

ADerrorSetSecDes: Unable to set the Active Directory Security Descriptor property. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].

ADerrorDNHostName: Unable to set the DNS Host Name property (dNSHostName). Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].

ADerrorDisplayName: Unable to set the displayName property. Error code: [v1], message: [v2], provider: [v3].

ADerrorBind: This device was unable to bind to the Domain Controller. Ensure the Domain Controller is running. Error code: [v1], message: [v2], provider: [v3].

ADerrorGetSPN: Unable to get an Active Directory Service Principal Name. Error code: [v1], message: [v2], provider: [v3].

ADerrorWriteSPN: Unable to write the Active Directory Service Principal Name. Error code: [v1], message: [v2], provider: [v3].

ADerrorSearch: Unable to perform the requested Search. Error code: [v1], message: [v2], provider: [v3].

ADerrorMoveToOU: Unable to move the Active Directory account to the requested Organizational Unit. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].

ADerrorDeleteAccount: Unable to delete this computer account. Ensure the appropriate permissions exist to delete accounts. Error code: [v1], message: [v2], provider: [v3].

ADerrorBadParameters: Incorrect parameters sent to Provisioning Services from Studio. Error code: [v1], message: [v2], provider: [v3].

VolumeInUse: The volume is being used.

VolumeAccessDenied: Volume access is denied.

VolumeUnknownVolume: An unknown volume was specified.

VolumeGeneralError: An error occurred when executing a volume command.

MaintenanceServerError: Action cannot be performed, [v1] is a maintenance server for [v2].

NotManagedStore: The action cannot be performed because the store is not managed.

PathNotExist: The path does not exist on the given Server.

PathNoCreatePermission: The path does not have the appropriate create permissions.

35
144 PathNoReadPermission: The path does not have the appropriate read permissions.
145 PathNoWritePermission: The path does not have the appropriate write permissions.
146 PathNoDeletePermission: The path does not have the appropriate delete permissions.
147 IPCProtocolError: An internal error occurred. A field is missing from the process communication protocol data.
148 InvalidStoreServer: No active Server can serve the Store [v1].
149 ConstraintCheck: A database constraint caused an Add or Update to be stopped.
150 VamtNotFound: The Volume Activation Management Tool cannot be found.
151 ADErrorCannotGetObjectSID: Cannot return objectSID. Error code: [v1], message: [v2], provider: [v3].
152 ADErrorCannotDisableAccount: Cannot disable the Active Directory account at this time. Ensure that all account users are logged off before attempting to disable the account. Error code: [v1], message: [v2], provider: [v3].
153 ADErrorFailedToChangePassword: Unable to reset the machine account password. Ensure the appropriate permissions exist to perform this Active Directory task. Error code: [v1], message: [v2], provider: [v3].
154 ADErrorFailedToCopyDCName: Unable to copy the Domain Controller name. Error code: [v1], message: [v2], provider: [v3].
155 ADErrorDCNameIsTooLong: The Domain Controller name entered exceeds the maximum character length of [v4]. Error code: [v1], message: [v2], provider: [v3].
156 SiteMakUserPassword: The Site's makUser and makPassword fields must have values.
157 VamtError: See the log for additional error details.
158 InactiveDevice: Device specified is not active.
159 DiskIsInPrivateMode: This task cannot be performed because the vDisk is in private image mode.
160 AlreadyInChangeMode: Unable to complete this operation, vDisk is already in Maintenance, Merge, or Test mode.
161 CannotCreateMaintenanceDisk: Cannot create maintenance vDisk.
162 CannotEnterMaintenanceMode: To place a vDisk in Maintenance Mode requires using a Server. No Server is available at this time.
163 NotInMaintenanceMode: Unable to perform this action because the vDisk is not in Maintenance Mode.
164 NoVersionForMaintenanceMode: Unable to place this vDisk in Maintenance Mode because the highest version is not found.
NoVersionFound: Unable to perform this action because a version record was not found in the database.

Obsolete: The [v1] feature is obsolete.

DatabaseWarning: A database warning occurred.

DatabaseSQL: A database SQL error occurred.

DatabaseResource: A database resource error occurred.

InvalidUpdateTask: The specified UpdateTask does not exist.

InvalidVirtualHostingPool: The specified VirtualHostingPool does not exist.

RemoteCommand: An exception occurred executing a command on a remote Server.

IpcNotConfigured: An internal error occurred. The process communication interface must be configured before executing remote commands.

DiskAlreadySetForUpdate: The vDisk is already set for Update with Device [v1] in Site [v2].

InvalidDiskVersion: The vDisk Version specified is not valid.

HostResolution: Could not resolve the host name for [v1].

InProcess: The remote task is taking longer than expected. TaskId: [v1]

DateMustBeInFuture: The [v1] must be in the future.

InvalidRemoteReturn: The remote command did not return valid data.

InvalidParameterValueMinMax: The [v1] parameter value is invalid, the minimum is [v2] and the maximum is [v3].

InvalidParameterNotNumeric: The [v1] parameter value is invalid, it is not numeric.

InvalidParameterNotGuid: The [v1] parameter value is invalid, it is not a GUID.

PassThroughMessage: [v1]

DiskUpdateNotEnabled: The Automatic vDisk Update option must be enabled and the vDisk Update Server must be defined. Set these in the Site properties.

PvsStatusException:
  Windows API error occurred, number 0xE000FFFF.
  SQL error occurred, number 0xE001FFFF.
  Manager error occurred. Error number 0xE002FFFF.
  StreamProcess error occurred. Error number 0xE003FFFF.

VHD Library: Size of a parameter was too small. Error number 0xE0060007.

VHD Library: The media is write protected. Error number 0xE0060008.

VHD Library: Type is invalid. Error number 0xE0060009.

VHD Library: Footer is incomplete. Error number 0xE006000A.

VHD Library: Failed to read or write the entire VHD Header. Error number 0xE006000B.

VHD Library: Failed to read or write the entire VHD Block Allocation Table. Error number 0xE006000C.

VHD Library: Failed to read or write all of the VHD properties. Error number 0xE006000D.
VHD Library: VHD footer is corrupt. Error number 0xE006000E.
VHD Library: VHD header is corrupt. Error number 0xE006000F.
VHD Library: Failed to read or write the VHD objects. Error number 0xE0060010.
VHD Library: Destination string is too small. Error number 0xE0060011.
VHD Library: Destination string pointer is NULL. Error number 0xE0060012.
VHD Library: Source string pointer is NULL. Error number 0xE0060013.
VHD Library: Offset is before the beginning of the VHD data area. Error number 0xE0060014.
VHD Library: Offset is after the end of the VHD data area. Error number 0xE0060015.
VHD Library: Failed to allocate memory because it was unavailable. Error number 0xE0060016.
VHD Library: Caller cancelled the last create request. Error number 0xE0060017.
VHD Library: Failed to read or write all of the data as requested. Error number 0xE0060018.
VHD Library: Failed to create a Universal Unique Identification for a VHD. Error number 0xE0060019.
VHD Library: Failed to find the VHD properties. Error number 0xE006001A.
VHD Library: Failed to read or write the entire sector bitmap within a block. Error number 0xE006001B.
VHD Library: Failed to read or write the entire block. Error number 0xE006001C.
VHD Library: Failed to open the file that represents the VHD. Error number 0xE006001D.
VHD Library: Requested number of bytes exceeds the remainder of bytes in a block. Error number 0xE006001E.
VHD Library: Accessed past end of the VHD file. Error number 0xE006001F.
VHD Library: Differencing VHD Unique ID (UUID) differs to parent VHD Unique ID. Error number 0xE0060020.
VHD Library: Differencing VHD timestamp differs to parent VHD last modified time. Error number 0xE0060021.
VHD Library: Failed to read or write the entire VHD Block Allocation Table Map. Error number 0xE0060022.
IPC error occurred. Error number 0xE007FFFF.
There was an unknown transmission error. Error number 0xE0070001.
No response received for successful send. Error number 0xA0070002.
Message processor timed out. Error number 0xE0070003.
Retry limit exhausted. Error number 0xE0070004.
Message recipient task is not active. Error number 0xE0070005.
Socket send/recv cannot be retried. Error number 0xE0070006.
Port shutdown due to connection opens exhausted. Error number 0xE0070007.
Port shutdown due to flood of junk packets. Error number 0xE0070008.
Port shutdown due to receive retries exhausted. Error number 0xE0070009.
Transport does not support fragmentation. Error number 0xE007000A.
One or more packet fragments are missing. Error number 0xE007000B.
Error sending message. Error number 0xE0070100.
Message acknowledgement timeout. Error number 0xA0070101.
Command timeout. Error number 0xE0070102.
Not implemented. Error number 0xE0070103.
Error verifying message port number, must be >= 0 and <= 65535. Error number 0xE0070104.
Command initialization failed. Error number 0xE0070105.
Start of IPC failed. Error number 0xE0070106.
Stop of IPC failed. Error number 0xE0070107.
Memory allocation failure. Error number 0xE0070108.
Internal error, failure to wait long enough for a communication response to be received. Error number 0xE0070109.
Disk Update error occurred. Error number 0xE008FFFF.
Inventory error occurred. Error number 0xE009FFFF.
Inventory Table: Failed to start thread. Error number 0xE0090001.
Inventory Table: Invalid Entry. Error number 0xE0090002.
Inventory Table: Failed to initialize inventory. Error number 0xE0090003.
Shutdown in progress; request ignored. Error number 0xE0090004.
Get Disk Inventory: Parameters bad. Error number 0xE0090003.
Populate database: Failed offline. Error number 0xE0090065.
Populate database: Server get by name failed. Error number 0xE0090066.
Populate database: Uninitialized. Error number 0xE0090067.
Populate database: Get host name failed. Error number 0xE0090068.
Populate database: Char conversion failed. Error number 0xE0090069.
Populate database: Initialization failed. Error number 0xE009006A.
Populate database: Database open failed. Error number 0xE009006B.
Populate database: Get all disk locators failed. Error number 0xE009006C.
Inventory Table: Not yet implemented. Error number 0xE009006D.
Notifier error occurred. Error number 0xE00AFFFF.
MAPI error occurred. Error number 0xE00BFFFF.

186 TaskCancelled: Task [v1] is cancelled and is not running.
187 TaskCompleted: Task [v1] has been completed and is not running.
188 TaskInProgress: Task [v1] is running and cannot be processed.
189 InvalidTask: The specified Task does not exist.
190 InventoryServerCannotContactDatabase: The Inventory Service cannot contact the database.
191 ServerOffline: The Server is offline.
192 ServerStateUnknown: The Server state is unknown.
193 HighestVersionIsPending: Could not complete this action because the highest vDisk version is still pending. The scheduled date for the version has not occurred yet.
194 MergeInvalidWithCurrentVersions: Merge is not valid with the current versions that exist.
195 DiskInventoryError: vDisk versions are not up to date on all Servers that access this vDisk. Update all Servers with the latest versions of the vDisk files.
196 VDiskFileNotFoundWarning: [v1]: vDisk file was not found because it was deleted.
197 CannotAssignActiveServer: Stop the Server before attempting to assign the Server to a different site.
198 CannotAssignServerWithActiveDevice: Before attempting to assign the Server to a different site, shut down Devices connecting to the Server, then shut down the Server.
199 MappedDiskLocator: The vDisk is mapped and cannot be changed.
200 InvalidTemplateDevice: The Template Device must be a Production Device that does not have a Personal vDisk.
201 DeviceWithPersonalVDiskInvalid: Unable to process a Device that uses a personal vDisk.
202 CreatingDisk: Server is creating a vDisk so change cannot be done.
203 AssignedDiskLocatorToDeviceWithPersonalvDisk: Unable to delete a vDisk if the vDisk is currently assigned to a Device that uses a Personal vDisk. Unassign the Device, then delete the vDisk.
204 InvalidMacAddress: The MAC address for this VM is invalid. Configure the VM with a valid MAC address.
205 CannotGetMacFromHypervisor: The hypervisor did not return the MAC address for this VM: [v1]
206 Win32SystemException: A system error occurred.
207 RemoteManagementIpCannotBeResolved: Unable to resolve the management IP for Server [v1].
208 LocalManagementIpNotSet: The management IP for local server [v1] is not set in registry IPC\IPv4Address.
209 PerformVolumeMaintenanceTaskPermissions: Ensure the Service Account user has the appropriate 'Perform volume maintenance task' permissions.
210 CannotLoginToVirtualHostingPool: Unable to log on to the virtual hosting pool [v1]. Ensure that the hypervisor server is running properly.
211 VirtualHostingPoolNotSetForDevice: The virtualHostingPoolId for device [v1] with bdmBoot must be set.
212 ActiveBdmBootDeviceCannotProcess: The Boot Device Manager [v1] did not process successfully.
213 CannotMovePvdDeviceToAnotherSite: Personal vDisk Devices cannot be moved to another site.
214 XenDesktopSiteInvalid: XenDesktop Site for Devices is not valid, the XenDesktop Site is: [v1]
215 XenDesktopServiceListOutOfRange: XenDesktop Site [v1] is not reachable, check that the Citrix PVS Soap Server service user has XenDesktop permissions and network connectivity.
216 NoXenDesktopServiceForPersonalVDiskCapability: No XenDesktop service found for Personal vDisk capability.
217 InsufficientPermissionsToPreparePersonalVDisks: The user account for the Citrix PVS Soap Server has insufficient permissions to prepare Personal vDisks.
218 NotEnoughFreeDiskSpaceForManifest: There is not enough free disk space to create the manifest.
219 OperationCannotBeDoneOnlyPvdDevicesAssigned: Operation cannot be done, only Personal vDisk Devices are assigned.
220 DiskFormatCannotBeSetToVHD: The format cannot be set to VHD since no VHD vDisk file is found in the path, [v1], for Server, [v2].
221 DiskFormatCannotBeSetToVHDX: The format cannot be set to VHDX since no VHDX vDisk file is found in the path, [v1], for Server, [v2].
4100 ADerrorUnexpectedError: An unexpected Active Directory related error occurred. Ensure the appropriate permissions exist to perform this task. Error code: [v1], message: [v2], provider: [v3].

Objects, in the Citrix.PVS.SnapIn Namespace

PvsADAccount
Read-Only Fields
string Domain: Domain the account is a member of.

string DomainController: The name of the DC used to create the host's computer account.

string Name: Name of the Device for the account.

string Sid: The value of the objectSID AD attribute of the same name for the Device's computer account.

**PvsAuditAction**

Read-Only Fields

Guid Guid or AuditActionId: GUID of the action.

Guid ObjectId: GUID of the object of the action.

string ObjectName: Name of the object of the action. Max Length=1000

string Path: Path of the object of the action. An example is Site\Collection for a Device. Default="" Max Length=101

Guid SiteId: GUID of the Site for the object of the action. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

Guid SubId: GUID of the Collection or Store of the action. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

uint Type: Type of object that action was performed on. Values are: 1 (AuthGroup), 2 (Collection), 3 (Device), 4 (Disk), 5 (DiskLocator), 6 (Farm), 7 (FarmView), 8 (Server), 9 (Site), 10 (SiteView), 11 (Store), 12 (System), and 13 (UserGroup)

**PvsAuditActionParameter**

Read-Only Fields

Guid AuditActionId: GUID of the Audit Action used for Get and Set.

string Name or AuditParameterName: Name of the parameter. Max Length=50

string Value: Value of the parameter. Max Length=1000

**PvsAuditActionProperty**

Read-Only Fields

Guid AuditActionId: GUID of the Audit Action used for Get and Set.

string Name or AuditPropertyName: Name of the property. Max Length=50

string NewValue: New value of the Property. Default="" Max Length=1000

string OldValue: Previous value of the Property. Default="" Max Length=1000

**PvsAuditTrail**

Read-Only Fields
uint Action: Name of the action taken. This is a number that is converted to a string for display. Values are: 1 (AddAuthGroup), 2 (AddCollection), 3 (AddDevice), 4 (AddDiskLocator), 5 (AddFarmView), 6 (AddServer), 7 (AddSite), 8 (AddSiteView), 9 (AddStore), 10 (AddUserGroup), 11 (AddVirtualHostingPool), 12 (AddUpdateTask), 13 (AddDiskUpdateDevice), 1001 (DeleteAuthGroup), 1002 (DeleteCollection), 1003 (DeleteDevice), 1004 (DeleteDeviceDiskCacheFile), 1005 (DeleteDiskLocator), 1006 (DeleteFarmView), 1007 (DeleteServer), 1008 (DeleteServerStore), 1009 (DeleteSite), 1010 (DeleteSiteView), 1011 (DeleteStore), 1012 (DeleteUserGroup), 1013 (DeleteVirtualHostingPool), 1014 (DeleteUpdateTask), 1015 (DeleteDiskUpdateDevice), 1016 (DeleteDiskVersion), 2001 (RunAddDeviceToDomain), 2002 (RunApplyAutoUpdate), 2003 (RunApplyIncrementalUpdate), 2004 (RunArchiveAuditTrail), 2005 (RunAssignAuthGroup), 2006 (RunAssignDevice), 2007 (RunAssignDiskLocator), 2008 (RunAssignServer), 2009 (RunWithReturnBoot), 2010 (RunCopyPasteDevice), 2011 (RunCopyPasteDisk), 2012 (RunCopyPasteServer), 2013 (RunCreateDirectory), 2014 (RunCreateDiskCancel), 2015 (RunDisableCollection), 2016 (RunDisableDevice), 2017 (RunDisableDeviceDiskLocator), 2018 (RunDisableDiskLocator), 2019 (RunDisableUserGroup), 2020 (RunDisableUserGroupDiskLocator), 2021 (RunWithReturnDisplayMessage), 2022 (RunEnableCollection), 2023 (RunEnableDevice), 2024 (RunEnableDeviceDiskLocator), 2025 (RunEnableDiskLocator), 2026 (RunEnableUserGroup), 2027 (RunEnableUserGroupDiskLocator), 2028 (RunExportOemLicenses), 2029 (RunImportDatabase), 2030 (RunImportDevices), 2031 (RunImportOemLicenses), 2032 (RunMarkDown), 2033 (RunWithReturnReboot), 2034 (RunRemoveAuthGroup), 2035 (RunRemoveDevice), 2036 (RunRemoveDeviceFromDomain), 2037 (RunRemoveDirectory), 2038 (RunRemoveDiskLocator), 2039 (RunResetDeviceFromDomain), 2040 (RunResetDatabaseConnection), 2041 (RunRestartStreamingService), 2042 (RunWithReturnShutdown), 2043 (RunStartStreamingService), 2044 (RunStopStreamingService), 2045 (RunUnlockAllDisk), 2046 (RunUnlockDisk), 2047 (RunServerStoreVolumeAccess), 2048 (RunServerStoreVolumeMode), 2049 (RunMergeDisk), 2050 (RunRevertDiskVersion), 2051 (RunPromoteDiskVersion), 2052 (RunCancelDiskMaintenance), 2053 (RunActivateDevice), 2054 (RunAddDiskVersion), 2055 (RunExportDisk), 2056 (RunAssignDisk), 2057 (RunRemoveDisk), 2057 (RunDiskUpdateStart), 2057 (RunDiskUpdateCancel), 2058 (RunSetOverrideVersion), 2059 (RunCancelTask), 2060 (RunClearTask), 2001 (RunWithReturnCreateDisk), 2002 (RunWithReturnCreateDiskStatus), 2003 (RunWithReturnMapDisk), 2004 (RunWithReturnRebalanceDevices), 2005 (RunWithReturnCreateMaintenanceVersion), 2006 (RunWithReturnImportDisk), 2007 (RunByteArrayInputExportOemLicenses), 2008 (RunByteArrayInputImportOemLicenses), 2009 (RunByteArrayOutputArchiveAuditTrail), 2010 (RunByteArrayOutputExportOemLicenses), 2011 (SetAuthGroup), 2012 (SetCollection), 2013 (SetDevice), 2014 (SetDisk), 2015 (SetDiskLocator), 2016 (SetFarm), 2017 (SetFarmView), 2018 (SetServer), 2019 (SetServerBiosBootstrap), 2020 (SetServerStore), 2021 (SetSite), 2022 (SetSiteView), 2023 (SetStore), 2024 (SetUserGroup), 2025 (SetVirtualHostingPool), 2026 (SetUpdateTask), 2027 (SetDiskUpdateDevice), 2028 (SetListDeviceBootstraps), 2029 (SetListDeviceBootstrapsDelete), 2030 (SetListDeviceBootstrapsAdd), 2031 (SetListDeviceCustomProperty), 2032 (SetListDeviceCustomPropertyDelete),
7006 (SetListDeviceCustomPropertyAdd), 7007 (SetListDeviceDiskPrinters),
7008 (SetListDeviceDiskPrintersDelete), 7009 (SetListDeviceDiskPrintersAdd),
7010 (SetListDevicePersonality), 7011 (SetListDevicePersonalityDelete), 7012 (SetListDevicePersonalityAdd),
7013 (SetListDiskLocatorCustomProperty), 7014 (SetListDiskLocatorCustomPropertyDelete), 7015 (SetListDiskLocatorCustomPropertyAdd),
7016 (SetListServerCustomProperty), 7017 (SetListServerCustomPropertyDelete), 7018 (SetListServerCustomPropertyAdd), 7019 (SetListUserGroupCustomProperty), 7020 (SetListUserGroupCustomPropertyDelete), and 7021 (SetListUserGroupCustomPropertyAdd)

uint Attachments: An or'ed value that indicates if there are any details for this action. A value of 15 indicates that there are Children, Sibling, Parameters and Properties for the action. Values are: 0 (None), 1 (Children), 2 (Sibling), 4 (Parameters), and 8 (Properties) Default=0

Guid Guid or AuditActionId: GUID of the action.

string Domain: Domain of the user that performed the action. Max Length=255

Guid ObjectId: GUID of the object of the action. Default=00000000-0000-0000-0000-000000000000

string ObjectName: Name of the object of the action. Default="" Max Length=1000

Guid ParentId: GUID of the parent action (one that triggered this action) if one exists. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

string Path: Path of the object of the action. An example is Site\Collection for a Device. Default="" Max Length=101

Guid RootId: GUID of the root action (one that triggered this group of actions) if one exists. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

Guid SiteId: GUID of the Site for the object of the action. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

Guid SubId: GUID of the Collection or Store of the action. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

DateTime Time: Date/Time the action occurred down to the millisecond. Has the date and time including milliseconds. Default=Empty

uint Type: Type of object that action was performed on. Values are: 0 (Many), 1 (AuthGroup), 2 (Collection), 3 (Device), 4 (Disk), 5 (DiskLocator), 6 (Farm), 7 (FarmView), 8 (Server), 9 (Site), 10 (SiteView), 11 (Store), 12 (System), and 13 (UserGroup)

string UserName: User that performed the action. Max Length=255

**PvsAuthGroup**

Read/Write Fields
string Name or AuthGroupName: Name of the Active Directory or Windows Group. Max Length=450

string Description: User description. Default="" Max Length=250

Read-Only Fields

Guid Guid or AuthGroupId: Read-only GUID that uniquely identifies this AuthGroup.

uint Role: Role of the AuthGroup for a Collection. role can only be used with CollectionId or CollectionName. 300 is Collection Administrator, and 400 is Collection Operator. Default=999

**PvsAuthGroupUsage**

Read-Only Fields

Guid Guid or Id: GUID of the item. The item can be a Farm, Site or Collection. It will be 00000000-0000-0000-0000-000000000000 for Farm.

string Name: Name of the item. The item can be a Farm, Site or Collection.

uint Role: Role of the AuthGroup for the item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999

**PvsCollection**

Read/Write Fields

uint AutoAddNumberLength: The maximum length of the Device Number for Auto Add. This length plus the AutoAddPrefix length plus the AutoAddSuffix length must be less than 16. Required that ((lenAutoAddPrefix+lenAutoAddSuffix)+AutoAddNumberLength)<=15. Min=3, Max=9, Default=4

string AutoAddPrefix: The string put before the Device Number for Auto Add. Default="" ASCII computer name characters no end digit Max Length=12

string AutoAddSuffix: The string put after the Device Number for Auto Add. Default="" ASCII computer name characters no begin digit Max Length=12

bool AutoAddZeroFill: True when zeros be placed before the Device Number up to the AutoAddNumberLength for Auto Add, false otherwise. Default=true

string Name or CollectionName: Name of the Collection. It is unique within the Site. Max Length=50

string Description: User description. Default="" Max Length=250

bool Enabled: True when Devices in the Collection can be booted, false otherwise. Default=true

uint LastAutoAddDeviceNumber: The Device Number of the last Auto Added Device. Default=0

Guid TemplateDeviceId: GUID of a Device in the Collection whose settings are used for initial values of new Devices. Not used with templateDeviceName. Default=00000000-0000-0000-0000-000000000000
string TemplateDeviceName: Name of a Device in the Collection whose settings are used for initial values of new Devices. Not used with TemplateDeviceId. Default=""

Read-Only Fields

uint ActiveDeviceCount: Read-only count of active Devices in this Collection. Default=0

Guid Guid or CollectionId: Read-only GUID that uniquely identifies this Collection.

uint DeviceCount: Read-only count of Devices in this Collection. Default=0

uint DeviceWithPVDCount: Read-only count of Devices with Personal vDisk in this Collection. Default=0

uint MakActivateNeededCount: Read-only count of active Devices that need MAK activation in this Collection. Default=0

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999

Guid SiteId: GUID of the Site that this Collection is a member of. It is not used with SiteName.

string SiteName: Name of the Site that this Collection is a member of. It is not used with SiteId.

PvsConnection

Read/Write Fields

string Domain: Domain name to use for Authentication. If it has a value, it will be *****. Default=""

string Password: Password to use for Authentication. If it has a value, it will be *****. Default=""

string Persist: True when the connection settings should be, for Set, or have been, for Get, saved to the registry.

string Port: The Port to use to connect. Default=54321

string Name or Server: Name or IP of the Server to connect to.

    Default=localhost

string User: User name to use for Authentication. If it has a value, it will be *****. Default=""

Read-Only Field

string Connected: True when the Citrix.PVS.SnapIn is currently connected to the SoapServer with the settings in this PvsConnection.

PvsConnection can be created or modified using methods below:

New-Object Citrix.PVS.SnapIn.PvsConnection: Creates default Server=localhost, Port=54321, and no authentication.

New-Object Citrix.PVS.SnapIn.PvsConnection(Citrix.PVS.SnapIn copyFrom): Creates with settings of the copyFrom Citrix.PVS.SnapIn.
SetServerToLocalHostDefaultSettings: Server=localhost, Port=54321, and no authentication.

Copy(Citrix.PVS.SnapIn copyFrom): Modifies the settings to match the copyFrom Citrix.PVS.SnapIn.

Equals(Citrix.PVS.SnapIn compareTo): Returns true when the settings match what is in the compareTo.

**PvsDevice**

Read/Write Fields

- **uint AdSignature**: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

- **uint AdTimestamp**: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

- **uint Authentication**: Device log in authentication. Choices are 0 for none, 1 for User Name/Password, and 2 for Extern. This cannot be Set for a Device with Personal vDisk. Min=0, Max=2, Default=0

- **bool BdmBoot**: Use BDM instead of PXE boot when set to true. Default=false

- **uint BootFrom**: Device to boot from. Choices are 1 for vDisk, 2 for Hard Disk, and 3 for Floppy. This cannot be Set for a Device with Personal vDisk. Min=1, Max=3, Default=1

- **string ClassName**: Used by Automatic Update feature to match new versions of Disks to a Device. This cannot be Set for a Device with Personal vDisk. Default=\"\" Max Length=41

- **string Description**: User description. Default=\"\" Max Length=250

- **PvsPhysicalAddress DeviceMac**: Ethernet address can have the form XX-XX-XX-XX-XX-XX. Uniquely identifies the Device.

- **string Name or DeviceName**: Computer name with no spaces. ASCII computer name characters Max Length=15

- **string DomainControllerName**: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default=\"\" Max Length=4000

- **string DomainName**: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default=\"\" Max Length=255

- **string DomainObjectSID**: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default=\"\" Max Length=186

- **DateTime DomainTimeCreated**: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

- **bool Enabled**: True when it can be booted, false otherwise. This cannot be Set for a Device with Personal vDisk. Default=true
bool LocalDiskEnabled: If there is a local disk menu choice for the Device, this is true. This cannot be Set for a Device with Personal vDisk. Default=false

uint LocalWriteCacheDiskSize: The size in GB to format the Device cache file disk. If the value is 0, then the disk is not formatted. Min=0, Max=2048, Default=0

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

string Password: Password of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=100

uint Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

uint Type: 1 when it performs test of Disks, 2 when it performs maintenance on Disks, 3 when it has a Personal vDisk, 4 when it has a Personal vDisk and performs tests, 0 otherwise. A Device with type 0–3 can only be Set to 0–3, and a Device with type 3–4 can only be Set to 3–4. Min=0, Max=4, Default=0

string User: Name of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=20

Read-Only Fields

bool Active: True if the Device is currently active, false otherwise. Default=false

Guid CollectionId: GUID of the Collection this Device is to be a member of. It is not used with CollectionName.

string CollectionName: Name of the Collection this Device is to be a member of. SiteName or SiteId must also be used.

Guid Guid or DeviceId: Read-only GUID that uniquely identifies this Device.

string PvdDriveLetter: Read-only Personal vDisk Drive letter. Range is E to U and W to Z. Default="" Max Length=1

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999

Guid SiteId: GUID of the Site the CollectionName is to be a member of. This or SiteName is used with CollectionName.

string SiteName: Name of the Site the CollectionName is to be a member of. This or SiteId is used with CollectionName.

bool Template: True if the Device is the template in its Collection, false otherwise. Default=false

Guid VirtualHostingPoolId: GUID that uniquely identifies the Virtual Hosting Pool for a VM. This is needed when Adding a VM device. Default=00000000-0000-0000-0000-000000000000
**PvsDeviceBootstrap**

Read-Only Fields

- **Guid Guid or DeviceId**: GUID of the Device.
- **PvsDeviceBootstrapList**: Each one of these has these 2 fields:
  - **string Name or Bootstrap**: Name of the bootstrap file. Max Length=259
  - **string MenuText**: Text that is displayed in the Boot Menu. If this field has no value, the bootstrap value is used. Default="" ASCII Max Length=64

**PvsDeviceBootstrapList[] DeviceBootstrap**: List of objects that can be changed with the methods below.

**Methods**

- **Add(string bootstrap, string menuText)**: Used to add a PvsDeviceBootstrapList to the end of the array.
- **Insert(int position, string bootstrap, string menuText)**: Used to insert a PvsDeviceBootstrapList array item at position. The position is 0 based.
- **Remove(int position)**: Used to remove a PvsDeviceBootstrapList array item at position. The position is 0 based.
- **Set(int position, string menuText)**: Used to set a PvsDeviceBootstrapList array item MenuText at position. The position is 0 based.
- **Reorder(int oldPosition, int newPosition)**: Used to move a PvsDeviceBootstrapList array item from the oldPosition to the newPosition. The oldPosition and newPosition are 0 based.

**PvsDeviceBootstrapList**

Read/Write Fields

- **string Name or Bootstrap**: Name of the bootstrap file. Max Length=259
- **string MenuText**: Text that is displayed in the Boot Menu. If this field has no value, the bootstrap value is used. Default="" ASCII Max Length=64

**PvsDeviceInfo**

Read-Only Fields

- **bool Active**: True if the Device is currently active, false otherwise. Default=false
- **uint AdSignature**: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0
- **uint AdTimestamp**: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0
- **uint Authentication**: Device log in authentication. Choices are 0 for none, 1 for User Name/Password, and 2 for Extern. This cannot be Set for a Device with Personal vDisk. Min=0, Max=2, Default=0
bool BdmBoot: Use BDM instead of PXE boot when set to true. Default=false

uint BootFrom: Device to boot from. Choices are 1 for vDisk, 2 for Hard Disk, and 3 for Floppy. This cannot be Set for a Device with Personal vDisk. Min=1, Max=3, Default=1

string ClassName: Used by Automatic Update feature to match new versions of Disks to a Device. This cannot be Set for a Device with Personal vDisk. Default="" Max Length=41

Guid CollectionId: GUID of the Collection this Device is to be a member of. It is not used with CollectionName.

string CollectionName: Name of the Collection this Device is to be a member of. SiteName or SiteId must also be used.

string Description: User description. Default="" Max Length=250

Guid Guid or DeviceId: Read-only GUID that uniquely identifies this Device.

PvsPhysicalAddress DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX. Uniquely identifies the Device.

string Name or DeviceName: Computer name with no spaces. ASCII computer name characters Max Length=15

string DiskFileName: Name of the Disk File including the extension. It is equal to "" if the Device is not active.

Guid DiskLocatorId: Read-only GUID of the Disk Locator that the Device is using. It is equal to 00000000-0000-0000-0000-000000000000 if the Device is not active.

string DiskLocatorName: Read-only name of the Disk Locator File that the Device is using. It is equal to the list of Disk Locator names for the Device if the Device is not active.

uint DiskVersion: Read-only version of the Disk Locator File that the Device is using. It is equal to 0 if the Device is not active. Default=0

uint DiskVersionAccess: State of the Disk Version. Values are: 0 (Production), 1 (Maintenance), 2 (MaintenanceHighestVersion), 3 (Override), 4 (Merge), 5 (MergeMaintenance), 6 (MergeTest), and 7 (Test). It is equal to 0 if the Device is not active. Default=0

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

string DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

bool Enabled: True when it can be booted, false otherwise. This cannot be Set for a Device with Personal vDisk. Default=true
System.Net.IPAddress Ip: Read-only IP of the Device. It is equal to 0.0.0.0 if the Device is not active.

uint License: Oem Only: Read-only type of the license. Values are 0 when None, 1 or 2 when Desktop. It is equal to 0 if the Device is not active. Default=0

uint LicenseType: 0 when None, 1 for Desktop, 2 for Server, 5 for OEM SmartClient, 6 for XenApp, 7 for XenDesktop. It is equal to 0 if the Device is not active. Default=0

bool LocalDiskEnabled: If there is a local disk menu choice for the Device, this is true. This cannot be Set for a Device with Personal vDisk. Default=false

uint LocalWriteCacheDiskSize: The size in GB to format the Device cache file disk. If the value is 0, then the disk is not formatted. Min=0, Max=2048, Default=0

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

uint MakLicenseActivated: Read-only indicator if MAK licensing is being used and is activated. Values are: 0 (MAK not used), 1 (Not Activated), 2 (Activated). It is equal to 0 if the Device is not active. Default=0

string Model: Oem Only: Read-only model of the computer. Values are OptiPlex 745, 755, 320, 760, FX160, or Default. It is equal to "" if the Device is not active.

string Password: Password of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=100

uint Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

string PvdDriveLetter: Read-only Personal vDisk Drive letter. Range is E to U and W to Z. Default="" Max Length=1

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999

Guid ServerId: Read-only GUID of the Server that the Device is using. It is equal to 00000000-0000-0000-0000-000000000000 if the Device is not active.

System.Net.IPAddress ServerIpConnection: Read-only IP of the Server that the Device is using. It is equal to 0.0.0.0 if the Device is not active.

string ServerName: Read-only Name of the Server that the Device is using. It is equal to "" if the Device is not active.

uint ServerPortConnection: Read-only Port of the Server that the Device is using. It is equal to 0 if the Device is not active. Default=0

Guid SiteId: GUID of the Site the CollectionName is to be a member of. This or SiteName is used with CollectionName.
string SiteName: Name of the Site the CollectionName is to be a member of. This or SiteId is used with CollectionName.

string Status: 1 or 2 numbers in the format n,n. They are the number of retries and if ram cache is being used, ram cache percent used. It is equal to "" if the Device is not active.

bool Template: True if the Device is the template in its Collection, false otherwise. Default=false

uint Type: 1 when it performs test of Disks, 2 when it performs maintenance on Disks, 3 when it has a Personal vDisk, 4 when it has a Personal vDisk and performs tests, 0 otherwise. Min=0, Max=4, Default=0

string User: Name of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default=""

Guid VirtualHostingPoolId: GUID that uniquely identifies the Virtual Hosting Pool for a VM. This is needed when Adding a VM device. Default=00000000-0000-0000-0000-000000000000

PvsDevicePersonality

Read-Only Fields

Guid Guid or DeviceId: GUID of the Device.

PvsDevicePersonalityList[]: Each one of these has these 2 fields:

  string Name: Name of the Device personality item. Max Length=250
  string Value: Value for the Device personality item. Max Length=1000

PvsDevicePersonalityList[] DevicePersonality: List of objects that can be changed with the methods below.

Methods

Add(string name, string value): Used to add a PvsDevicePersonalityList to the end of the array.

Insert(int position, string name, string value): Used to insert a PvsDevicePersonalityList array item at position. The position is 0 based.

Remove(int position): Used to remove a PvsDevicePersonalityList array item at position. The position is 0 based.

Set(int position, string value): Used to set a PvsDevicePersonalityList array item Value at position. The position is 0 based.

Reorder(int oldPosition, int newPosition): Used to move a PvsDevicePersonalityList array item from the oldPosition to the newPosition. The oldPosition and newPosition are 0 based.

PvsDevicePersonalityList

Read/Write Fields

string Name: Name of the Device personality item. Max Length=250

string Value: Value for the Device personality item. Max Length=1000
PvsDeviceStatus

Read-Only Fields

Guid Guid or DeviceId: Read-only GUID of the Device. Can be used with Get Device.

string Name or DeviceName: Read-only Name of the Device. Can be used with Get Device.

string DiskFileName: Name of the Disk File including the extension.
Guid DiskLocatorId: Read-only GUID of the Disk Locator that the Device is using.

string DiskLocatorName: Read-only name of the Disk Locator File that the Device is using.
uint DiskVersion: Read-only version of the Disk Locator File that the Device is using. Default=0
uint DiskVersionAccess: State of the Disk Version. Values are: 0 (Production), 1 (Maintenance), 2 (MaintenanceHighestVersion), 3 (Override), 4 (Merge), 5 (MergeMaintenance), 6 (MergeTest), and 7 (Test) Default=0
System.Net.IPAddress Ip: Read-only IP of the Device.
uint LicenseType: 0 when None, 1 for Desktop, 2 for Server, 5 for OEM SmartClient, 6 for XenApp, 7 for XenDesktop. Default=0
bool AdPasswordEnabled: Enable AD password management when set to true. Default false
System.Net.IPAddress ServerIpConnection: Read-only IP of the Server that the Device is using.
string ServerName: Read-only Name of the Server that the Device is using.
uint ServerPortConnection: Read-only Port of the Server that the Device is using. Default=0
string Status: 1 or 2 numbers in the format n,n. They are the number of retries and if ram cache is being used, ram cache percent used.

PvsDisk

Read/Write Fields

bool ActivationDateEnabled: Use activation date to activate image when set to true. Default false
DateTime ActiveDate: Date to activate the disk if AutoUpdateEnabled and activationDateEnabled are true. Has the date. Empty when the AutoUpdateEnabled or activationDateEnabled are false.
bool AdPasswordEnabled: Enable AD password management when set to true.
string Author: User defined author. Max Length=40
bool AutoUpdateEnabled: Automatically update this image for matching Devices when set to true. Default false

UInt64 Build: User defined build number. Min=0, Max=4294967295, Default=0
string Class: Class of the Disk. Max Length=40
string Company: User defined company. Max Length=40
string Date: User defined date. Max Length=40
bool VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false

bool HaEnabled: Enable HA when set to true.
stringHardwareTarget: User defined hardware target. Max Length=127
string ImageType: Type of this image (software type). Max Length=40
string InternalName: User defined name. Max Length=63
uint LicenseMode: 0 (None), 1 (Multiple Activation Key), or 2 (Key Management Service). Min=0, Max=2, Default=0
string LongDescription: Description of the Disk. Max Length=399
UInt64 MajorRelease: User defined major release number. Min=0, Max=4294967295, Default=0
UInt64 MinorRelease: User defined minor release number. Min=0, Max=4294967295, Default=0
string OriginalFile: User defined original file. Max Length=127
bool PrinterManagementEnabled: Invalid printers will be deleted from the Device when set to true.
string SerialNumber: User defined serial number. Max Length=36
string Title: User defined title. Max Length=40
UInt64 WriteCacheSize: RAM cache size (MB). Not 0 when used with Cache in Device RAM, and Cache in Device RAM with Overflow on Hard Disk. A value of 0 will disable the RAM use for Cache in Device RAM with Overflow on Hard Disk. Min=0, Max=131072, Default=0
uint WriteCacheType: 0 (Private), (other values are standard image) 1 (Cache on Server), 3 (Cache in Device RAM), 4 (Cache on Device Hard Disk), 6 (Device RAM Disk), 7 (Cache on Server, Persistent), or 9 (Cache in Device RAM with Overflow on Hard Disk). Min=0, Max=9, Default=0

Read-Only Fields
Guid Guid or DiskLocatorId: GUID of the DiskLocator used for Get and Set.
UInt64 DiskSize: Read-only size of the image. The value is 0 when it is not available. Default=0
string LogicalSectorSize: Logical Sector Size. Values are: 512, 4096, Default=512
uint VhdBlockSize: Block size in KB. For VHD it is only used with Dynamic type. Tested sizes for VHD are 512, 2048, and 16384. VHD Min=512,
Max=16384, Default=2048. For VHDX it is used for all types. Tested size for VHDX is 32768. VHDX Min=1024, Max=262144, Default=32768. Default=0

PvsDiskInfo

Read-Only Fields

bool ActivationDateEnabled: Use activation date to activate image when set to true. Default false

bool Active: True if the DiskLocator is currently active, false otherwise. Default=false

DateTime ActiveDate: Date to activate the disk if AutoUpdateEnabled and activationDateEnabled are true. Has the date. Empty when the AutoUpdateEnabled or activationDateEnabled are false.

bool AdPasswordEnabled: Enable AD password management when set to true.

string Author: User defined author. Max Length=40

bool AutoUpdateEnabled: Automatically update this image for matching Devices when set to true. Default false

UInt64 Build: User defined build number. Min=0, Max=4294967295, Default=0

string Class: Class of the Disk. Max Length=40

string Company: User defined company. Max Length=40

string Date: User defined date. Max Length=40

string Description: User description. Default="" Max Length=250

uint DeviceCount: Read-only count of Devices. Default=0

Guid Guid or DiskLocatorId: Read-only GUID that uniquely identifies this Disk Locator.

string Name or DiskLocatorName: Name of the Disk Locator File. It is unique within the Store. ASCII Max Length=52

UInt64 DiskSize: Read-only size of the image. The value is 0 when it is not available. Default=0

Guid DiskUpdateDeviceId: GUID of the DiskUpdateDevice that is used when updates are performed. Default=00000000-0000-0000-0000-000000000000

string DiskUpdateDeviceName: Name of the DiskUpdateDevice that is used when updates are performed. Default=""

bool Enabled: True when this disk can be booted, false otherwise. Default=true

bool EnabledForDevice: True when this disk is enabled for the Device specified, false otherwise. This is only returned when a Device is specified. Default=true

bool VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false

bool HaEnabled: Enable HA when set to true.

string HardwareTarget: User defined hardware target. Max Length=127
string ImageType: Type of this image (software type). Max Length=40
string InternalName: User defined name. Max Length=63
uint LicenseMode: 0 (None), 1 (Multiple Activation Key), or 2 (Key
Management Service). Min=0, Max=2, Default=0
bool Locked: True if the Disk is currently locked, false otherwise.
    Default=false
string LogicalSectorSize: Logical Sector Size. Values are: 512, 4096,
    Default=512
string LongDescription: Description of the Disk. Max Length=399
UInt64 MajorRelease: User defined major release number. Min=0,
    Max=4294967295, Default=0
bool Mapped: True if the Disk is currently mapped, false otherwise.
    Default=false
string MenuText: Text that is displayed in the Boot Menu. If this field has
    no value, the name value is used. Default="" ASCII Max Length=64
UInt64 MinorRelease: User defined minor release number. Min=0,
    Max=4294967295, Default=0
string OriginalFile: User defined original file. Max Length=127
bool PrinterManagementEnabled: Invalid printers will be deleted from the
    Device when set to true.
bool RebalanceEnabled: True when this Server can automatically rebalance
    Devices, false otherwise. Default=false
uint RebalanceTriggerPercent: Percent over fair load that triggers a
    dynamic Device rebalance. Min=5, Max=5000, Default=25
uint Role: Read-only Role of the user for this item. 100 is Farm
    Administrator, 200 is Site Administrator, 300 is Collection
    Administrator, and 999 is read-only. Default=999
string SerialNumber: User defined serial number. Max Length=36
Guid ServerId: GUID of the single Server that this Disk Locator is assigned
to. It is not used with ServerName. Default=00000000-0000-0000-0000-
000000000000
string ServerName: Name of the single Server that this Disk Locator is
    assigned to. It is not used with ServerId. Default=""
Guid SiteId: GUID of the Site this DiskLocator is to be a member of. It is
    not used with SiteName.
string SiteName: Name of the Site this DiskLocator is to be a member of. It
    is not used with SiteId.
Guid StoreId: GUID of the Store that this Disk Locator is a member of.
    SiteName or SiteId must also be used. It is not used with StoreName.
string StoreName: Name of the Store that this Disk Locator is a member of.
    SiteName or SiteId must also be used. It is not used with StoreId.
uint SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=None, 1=Best Effort, 2=Fixed. Min=0, Max=2, Default=0

string Title: User defined title. Max Length=40

uint VhdBlockSize: Block size in KB. For VHD it is only used with Dynamic type. Tested sizes for VHD are 512, 2048, and 16384. VHD Min=512, Max=16384, Default=2048. For VHDX it is used for all types. Tested size for VHDX is 32768. VHDX Min=1024, Max=262144, Default=32768. Default=0

UInt64 WriteCacheSize: RAM cache size (MB). Not 0 when used with Cache in Device RAM, and Cache in Device RAM with Overflow on Hard Disk. A value of 0 will disable the RAM use for Cache in Device RAM with Overflow on Hard Disk. Min=0, Max=131072, Default=0

uint WriteCacheType: 0 (Private), (other values are standard image) 1 (Cache on Server), 3 (Cache in Device RAM), 4 (Cache on Device Hard Disk), 6 (Device RAM Disk), 7 (Cache on Server, Persistent), or 9 (Cache in Device RAM with Overflow on Hard Disk). Min=0, Max=9, Default=0

**PvsDiskInventory**

Read-Only Fields

string Active: 1 if the Server is currently active, 2 if unknown, and 0 otherwise.

Guid Guid or DiskLocatorId: GUID of the DiskLocator used for Get and Set.

string FilePath: Path used to access the disk version from the Server. Empty if the information is not available.

DateTime FileTime: Date/Time of the date version file. Has the date and time without milliseconds. Empty if the information is not available.

DateTime PropertiesTime: Date/Time of the disk properties. Has the date and time without milliseconds. Empty if the information is not available.

Guid ServerId: GUID of the Server that the Disk Version Inventory is being reported about.

string ServerName: Name of the Server that the Disk Version Inventory is being reported about.

string State: The number code of the inventory state. Values are: 0 (Up to date), 1 (version file is missing), 2 (version file is out of date), 3 (properties are missing), 4 (properties are out of date), 5 (server is not reachable).

string Version: Version number. The base disk is version 0, the other version numbers are in part of the file name.

**PvsDiskLocator**

Read/Write Fields

string Description: User description. Default="" Max Length=250

bool Enabled: True when this disk can be booted, false otherwise. Default=true
string MenuText: Text that is displayed in the Boot Menu. If this field has no value, the name value is used. Default="" ASCII Max Length=64

bool RebalanceEnabled: True when this Server can automatically rebalance Devices, false otherwise. Default=false

uint RebalanceTriggerPercent: Percent over fair load that triggers a dynamic Device rebalance. Min=5, Max=5000, Default=25

Guid ServerId: GUID of the single Server that this Disk Locator is assigned to. It is not used with ServerName. Default=00000000-0000-0000-0000-000000000000

string ServerName: Name of the single Server that this Disk Locator is assigned to. It is not used with ServerId. Default=""

uint SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=None, 1=Best Effort, 2=Fixed. Min=0, Max=2, Default=0

Read-Only Fields

bool Active: True if the DiskLocator is currently active, false otherwise. Default=false

Guid Guid or DiskLocatorId: Read-only GUID that uniquely identifies this Disk Locator.

string Name or DiskLocatorName: Name of the Disk Locator File. It is unique within the Store. ASCII Max Length=52

Guid DiskUpdateDeviceId: GUID of the DiskUpdateDevice that is used when updates are performed. Default=00000000-0000-0000-0000-000000000000

string DiskUpdateDeviceName: Name of the DiskUpdateDevice that is used when updates are performed. Default=""

bool EnabledForDevice: True when this disk is enabled for the Device specified, false otherwise. This is only returned when a Device is specified. Default=true

bool Mapped: True if the Disk is currently mapped, false otherwise. Default=false

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 999 is read-only. Default=999

Guid SiteId: GUID of the Site this DiskLocator is to be a member of. It is not used with SiteName.

string SiteName: Name of the Site this DiskLocator is to be a member of. It is not used with SiteId.

Guid StoreId: GUID of the Store that this Disk Locator is a member of. SiteName or SiteId must also be used. It is not used with StoreName.

string StoreName: Name of the Store that this Disk Locator is a member of. SiteName or SiteId must also be used. It is not used with StoreId.

PvsDiskLocatorLock

Read-Only Fields
Guid DeviceId: GUID of the Device that has the lock, will be 00000000-0000-0000-0000-000000000000 if a Server has the lock.

string DeviceName: Name of the Device that has the lock, will not be included if a Server has the lock.

bool Exclusive: True when the lock is exclusive, false when it is shared. Default=false

bool ReadOnly: True when lock is because file system is read only, false when file system is read write Default=false

Guid ServerId: GUID of the Server that has the lock, will be 00000000-0000-0000-0000-000000000000 if a Device has the lock.

string ServerName: Name of the Server that has the lock, will not be included if a Device has the lock.

PvsDiskUpdateDevice

Read/Write Fields

uint AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

uint AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

string Description: User description. Default="" Max Length=250

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

string DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

uint Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

Read-Only Fields

bool Active: True if the Device is currently active, false otherwise. Default=false

Guid Guid or DeviceId: Read-only GUID that uniquely identifies this Device.
PvsPhysicalAddress DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX-XX. Uniquely identifies the Device.

string Name or DeviceName: Computer name with no spaces. ASCII computer name characters Max Length=15

Guid DiskLocatorId: GUID of the Disk Locator to update with this Device.

string DiskLocatorName: Name of the Disk Locator File to update with this Device.

uint DiskVersion: Read-only version of the Disk Locator File that the Device is using. It is equal to 0 if the Device is not active. Default=0

System.Net.IPAddress Ip: Read-only IP of the Device. It is equal to 0.0.0.0 if the Device is not active.

uint License: Oem Only: Read-only type of the license. Values are 0 when None, 1 or 2 when Desktop. It is equal to 0 if the Device is not active. Default=0

uint LicenseType: 0 when None, 1 for Desktop, 2 for Server, 5 for OEM SmartClient, 6 for XenApp, 7 for XenDesktop. It is equal to 0 if the Device is not active. Default=0

uint MakLicenseActivated: Read-only indicator if MAK licensing is being used and is activated. Values are: 0 (MAK not used), 1 (Not Activated), 2 (Activated). It is equal to 0 if the Device is not active. Default=0

string Model: Oem Only: Read-only model of the computer. Values are OptiPlex 745, 755, 320, 760, FX160, or Default. It is equal to "" if the Device is not active.

Guid ServerId: Read-only GUID of the Server that the Device is using. It is equal to 00000000-0000-0000-0000-000000000000 if the Device is not active.

System.Net.IPAddress ServerIpConnection: Read-only IP of the Server that the Device is using. It is equal to 0.0.0.0 if the Device is not active.

string ServerName: Read-only Name of the Server that the Device is using. It is equal to "" if the Device is not active.

uint ServerPortConnection: Read-only Port of the Server that the Device is using. It is equal to 0 if the Device is not active. Default=0

Guid SiteId: GUID of the Site this Disk Update Device is to be a member of.

string SiteName: Name of the Site this Disk Update Device is to be a member of.

string Status: 1 or 2 numbers in the format n,n. They are the number of retries and if ram cache is being used, ram cache percent used. It is equal to "" if the Device is not active.

Guid StoreId: GUID of the Store that the Disk Locator is a member of.

string StoreName: Name of the Store that the Disk Locator is a member of.

Guid VirtualHostingPoolId: GUID of the Virtual Hosting Pool. It is not used with VirtualHostingPoolName. Default=00000000-0000-0000-0000-000000000000

string VirtualHostingPoolName: Name of the Virtual Hosting Pool.
**PvsDiskUpdateStatus**

Read-Only Fields

uint CurrentStatus: Current status of the update. Values are: 0 (Ready), 1 (Update Pending), 2 (Preparing Image), 3 (Starting VM), 4 (Update In Progress), 5 (Stopping VM), 6 (Submitting Image), 7 (Reverting Image), 8 (Invalid), 9 (Aborted), 10 (Completed Successfully), 11 (No Updates) Min=0, Max=11, Default=0

string CurrentStatusMessage: Message string that includes the results of the run. Default="" Max Length=255

string Description: User description of the Update Task.

Guid DeviceId: GUID that Device being used to do the update.

string DeviceName: Name of the Device being used to do the update.

Guid DiskLocatorId: GUID of the Disk Locator to update.

string Name or DiskLocatorName: Name of the Disk Locator File to update.

Guid Guid or DiskUpdateTaskId: GUID that uniquely identifies this Update Task and Device relationship.

uint PreviousResult: Status of the last run. Values are: 0 (Ready), 1 (Update Pending), 2 (Preparing Image), 3 (Starting VM), 4 (Update In Progress), 5 (Stopping VM), 6 (Submitting Image), 7 (Reverting Image), 8 (Invalid), 9 (Aborted), 10 (Completed Successfully), 11 (No Updates) Min=0, Max=11, Default=0

string PreviousResultMessage: Message string that includes the results of the last run. Default="" Max Length=255

Guid SiteId: GUID of the Site that this Update Task Name is a member of.

string SiteName: Name of the Site that this Update Task Name is a member of.

Guid StoreId: GUID of the Store that the Disk Locator is a member of.

string StoreName: Name of the Store that the Disk Locator is a member of.

Guid UpdateTaskId: GUID that uniquely identifies the Update Task.

string UpdateTaskName: Name of the Update Task.

Guid VirtualHostingPoolId: GUID of the Virtual Hosting Pool being used for the update.

string VirtualHostingPoolName: Name of the Virtual Hosting Pool being used for the update.

**PvsDiskVersion**

Read/Write Fields

string Description: User description. Default="" Max Length=250

DateTime ScheduledDate: Date/Time that the Disk Version is scheduled to become available. Has the date, hour and minute. Empty when the disk version is made available immediately. Default=Empty
Read-Only Fields

uint Access: Read-only access of the Disk Version. Values are: 0 (Production), 1 (Maintenance), 2 (MaintenanceHighestVersion), 3 (Override), 4 (Merge), 5 (MergeMaintenance), 6 (MergeTest), and 7 (Test) Min=0, Max=7, Default=0

bool CanDelete: Read-only true when the version can be deleted. Default=false

bool CanMerge: Read-only true when the version can be update merged. Will be set for the highest version number. Default=false

bool CanMergeBase: Read-only true when the version can be base merged. Will be set for the highest version number. Default=false

bool CanOverride: Read-only true when the version can be set as the Override. Default=false

bool CanPromote: Read-only true when the version can be promoted. Default=false

bool CanRevertMaintenance: Read-only true when the version can be reverted to Maintenance Access. Default=false

bool CanRevertTest: Read-only true when the version can be reverted to Test Access. Default=false

bool CanSetScheduledDate: Read-only true when the version can have the scheduled date modified. Default=false

string CreateDate: Read-only Date/Time that the Disk Version was created. Default=getdate

bool DeleteWhenFree: Read-only true if the Disk Version is no longer needed because of a merge. If not current booted by a Device, it can be deleted. Default=false

uint DeviceCount: Read-only count of Devices. Default=0

string Name or DiskFileName: Name of the Disk File including the extension. Default=""

Guid Guid or DiskLocatorId: GUID of the DiskLocator used for Get and Set.

bool GoodInventoryStatus: True when the up to date file is accessible by all Servers, false otherwise. Default=false

bool IsPending: Read-only true when the version ScheduledDate has not occurred. Default=false

uint TaskId: When a Merge is occurring, this will be set with the task number of the process that is occurring. Default=""

uint Type: Read-only type of the Disk Version. Values are: 0 (Base), 1 (Manual), 2 (Automatic), 3 (Merge), and 4 (MergeBase) Min=0, Max=4, Default=0

uint Version: Read-only version number. The base disk is version 0, the other version numbers are in part of the file name. Default=0
PvsFarm

Read/Write Fields

bool AuditingEnabled: True when Auditing is enabled, false otherwise.
   Default=false

bool AutoAddEnabled: True when Auto Add is enabled, false otherwise.
   Default=false

bool AutomaticMergeEnabled: True when Automatic Merge is enabled, false otherwise. If the number of versions becomes more than the MaxVersions value, a merge will occur at the end of PromoteDiskVersion. Default=true

Guid DefaultSiteId: GUID of the Site to place new Devices into automatically. Not used with defaultSiteName. Default=00000000-0000-0000-0000-000000000000

string DefaultSiteName: Name of the Site to place new Devices into automatically. Not used with DefaultSiteId. Default=""

string Description: User description. Default="" Max Length=250

string Name or FarmName: Name of the Farm. Default="" Max Length=50

DateTime LastAuditArchiveDate: Last date of Audit Trail data that was Archived. Has the date. Default=Empty

string LicenseServer: License server name. Default="" Max Length=255

uint LicenseServerPort: License server port. Min=1025, Max=65534, Default=27000

uint MaxVersions: Maximum number a versions of a Disk that can exist before a merge will automatically occur. Min=3, Max=50, Default=5

uint MergeMode: Mode to place the version in after a merge has occurred. Values are: 0 (Production), 1 (Test) and 2 (Maintenance). Min=0, Max=2, Default=2

bool OfflineDatabaseSupportEnabled: True when Offline Database Support is enabled, false otherwise. Default=false

Read-Only Fields

bool AdGroupsEnabled: Active Directory groups are used for authorization, when set to true. Windows groups are used when set to false. Default=false

string DatabaseInstanceName: Read-only name of the database instance.

string DatabaseName: Read-only name of the database.

string DatabaseServerName: Read-only name of the database server.

string FailoverPartnerInstanceName: Read-only name of the database server instance.

string FailoverPartnerServerName: Read-only name of the database server.

Guid Guid or FarmId: Read-only GUID that uniquely identifies this Farm.

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 999 is read-only. Default=999
**PvsFarmView**

Read/Write Fields

- string Description: User description. Default="" Max Length=250
- string Name or FarmViewName: name of the Farm View. Max Length=50

Read-Only Fields

- uint ActiveDeviceCount: Read-only count of active Devices in this Farm View. Default=0
- uint DeviceCount: Read-only count of Devices in this Farm View. Default=0
- Guid Guid or FarmViewId: Read-only GUID that uniquely identifies this Farm View.
- uint MakActivateNeededCount: Read-only count of active Devices that need MAK activation in this Farm View. Default=0

**PvsGroup**

Read-Only Fields

- Guid Guid: GUID of the Active Directory group. 00000000-0000-0000-0000-000000000000 for Windows groups.
- string Name: Name of the Group.

**PvsLocalServer**

Read-Only Field

- string Name or LocalServer: NetBios name of local server.

**PvsNewDiskVersion**

Read-Only Fields

- string Name: Name of the disk file without the extension.
- uint Status: Status of the disk file. Values are: 0 (Valid), 1 (Missing Properties File), 2 (Access Denied), 3 (Access Denied and Missing Properties File), 4 (Invalid Disk File), 5 (Manifest Invalid)

**PvsPhysicalAddress**

**PvsServer**

Read/Write Fields

- uint AdMaxPasswordAge: Number of days before a password expires. Min=1, Max=30, Default=7
- bool AdMaxPasswordAgeEnabled: Age the password, when set to true. Default=false
uint BootPauseSeconds: Number of seconds that a Device will pause during login if its server busy. Min=1, Max=60, Default=10

uint BuffersPerThread: Number of buffers per worker thread. Min=1, Max=128, Default=24

uint BusyDbConnectionRetryCount: Number of times a failed database connection will be retried. Min=0, Max=32767, Default=2

uint BusyDbConnectionRetryInterval: Interval, in number of milliseconds, the server should wait before retrying to connect to a database. Min=0, Max=10000, Default=25

string Description: User description. Default="" Max Length=250

bool EventLoggingEnabled: Enable event logging, when set to true. Default=false

uint FirstPort: Number of the first UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6910

uint InitialQueryConnectionPoolSize: Initial size of database connection pool for non-transactional queries. Min=1, Max=1000, Default=50

uint InitialTransactionConnectionPoolSize: Initial size of database connection pool for transactional queries. Min=1, Max=1000, Default=50

uint IoBurstSize: Number of bytes read/writes can send in a burst of packets. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=4096, Max=61440, Default=32768

System.Net.IPAddress[] Ip: One or more streaming ip addresses.

uint LastPort: Number of the last UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6930

uint LicenseTimeout: Amount of seconds before a license times out. Min=15, Max=300, Default=30

uint LocalConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are local. A value of 0 disables the feature. Min=0, Max=128, Default=4

uint LogFileBackupCopiesMax: Maximum number of log file backups. Min=1, Max=50, Default=4

uint LogFileSizeMax: Maximum size log files can reach in Megabytes. Min=1, Max=50, Default=5

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=4

uint MaxBootDevicesAllowed: Maximum number of Devices allowed to boot simultaneously. Min=1, Max=1000, Default=500

uint MaxBootSeconds: Maximum number of seconds for a Device to boot. Min=10, Max=900, Default=60

uint MaxQueryConnectionPoolSize: Maximum size of database connection pool for non-transactional queries. Min=1, Max=32767, Default=1000
uint MaxTransactionConnectionPoolSize: Maximum size of database connection pool for transactional queries. Min=1, Max=32767, Default=1000

uint MaxTransmissionUnits: Ethernet maximum transmission unit size for the protocol for use for Server and Device. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=502, Max=16426, Default=1506

bool NonBlockingIoEnabled: Use non-Blocking IO, when set to true. Default=true

float PowerRating: A strictly relative rating of this Server's capabilities when compared to other Servers in the Store(s) it belongs too; can be used to help tune load balancing. Min=0.1, Max=1000, Default=1

uint RamDiskInvitationPeriod: The amount of time in seconds that invitations are sent to Devices. Min=1, Max=300, Default=10

bool RamDiskInvitationType: Either false for Fixed, or true for Variable. Default=false

System.Net.IPAddress RamDiskIpAddress: IP address to use for transferring the RAM Disk. When equal to 0.0.0.0 the server IP is used with the first part replaced with 233. Default=0.0.0.0

uint RamDiskTimeToLive: Time to live for the invitation packet sent to Devices. Min=1, Max=128, Default=4

uint RefreshInterval: Interval, in number of seconds, the server should wait before refreshing settings. If set to 0, unused database connections are never released. Min=0, Max=32767, Default=300

uint RemoteConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are remote. A value of 0 disables the feature. Min=0, Max=128, Default=4

uint ServerCacheTimeout: Number of seconds to wait before considering another Server is down. Min=5, Max=60, Default=8

string Name or ServerName: Computer name with no spaces. ASCII computer name characters Max Length=21

uint ThreadsPerPort: Number of worker threads per IO port. Required that (threadPerPort * numberPorts * numberIPs) <= 1000. Min=1, Max=60, Default=8

uint UnusedDbConnectionTimeout: Interval, in number of seconds, a connection should go unused before it is to be released. Min=0, Max=32767, Default=300

uint VDiskCreatePacing: VDisk create time pacing in miliseconds. Min=0, Max=5, Default=0

Read-Only Fields

uint Active: 1 if the Server is currently active, 2 if unknown, and 0 otherwise. Min=0, Max=2, Default=0

System.Net.IPAddress ManagementIp: IP address used for management communications between Servers. Default=0.0.0.0

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 200 is Site Administrator. Default=999
string ServerFqdn: Read-only fully qualified domain name. Default="" Max Length=1024

Guid Guid or ServerId: Read-only GUID that uniquely identifies this Server.
Guid SiteId: GUID of the Site this Server is to be a member of. It is not used with SiteName.
string SiteName: Name of the Site this Server is to be a member of. It is not used with SiteId.

**PvsServerBiosBootstrap**

Read/Write Fields

bool BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false

System.Net.IPAddress Bootserver1_Ip: 1st boot server IP. Only used when Lookup is false.
uint Bootserver1_Port: 1st boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

System.Net.IPAddress Bootserver2_Ip: 2nd boot server IP. Only used when Lookup is false. Default=0.0.0.0
uint Bootserver2_Port: 2nd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

System.Net.IPAddress Bootserver3_Ip: 3rd boot server IP. Only used when Lookup is false. Default=0.0.0.0
uint Bootserver3_Port: 3rd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

System.Net.IPAddress Bootserver4_Ip: 4th boot server IP. Only used when Lookup is false. Default=0.0.0.0
uint Bootserver4_Port: 4th boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

bool DhcpEnabled: Use DHCP to retrieve target device IP when set to true, otherwise use the static domain, dnsIpAddress1=true and dnsIpAddress2 settings. Default=true

System.Net.IPAddress DnsIpAddress1: Primary DNS server IP. Only used when DhcpEnabled is false.
System.Net.IPAddress DnsIpAddress2: Secondary DNS server IP. Only used when DhcpEnabled is false.

string Domain: Domain of the primary and secondary DNS servers. Only used when DhcpEnabled is false.

bool Enabled: Automatically update the BIOS on the target device with these setting when set to true, otherwise do not use these settings. Default=false

uint GeneralTimeout: Login general timeout in milliseconds. Min=1000, Max=60000, Default=5000
bool InterruptSafeMode: Interrupt safe mode (use if target device hangs during boot) when set to true. Default=false

bool Lookup: Use DNS to find the Server when set to true with the ServerName host value, otherwise use the bootservertrue_Ip, bootservertrue_Port, bootserver2_Ip, bootserver2_Port, bootserver3_Ip, bootserver3_Port, bootserver4_Ip, and bootserver4_Port settings. Default=true

bool PaeMode: PAE mode (use if PAE enabled in boot.ini of target device) when set to true. Default=false

uint PollingTimeout: Login polling timeout in milliseconds. Min=1000, Max=60000, Default=5000

uint RecoveryTime: When bootFromHdOnFail is 1, this is the number of seconds to wait before reboot to hard drive. Min=10, Max=60000, Default=50

string Name or ServerName: Host to use for DNS lookup. Only used when Lookup is true. Default=IMAGESERVER1

bool VerboseMode: Display verbose diagnostic information when set to true. Default=false

Read-Only Field

Guid Guid or ServerId: GUID of the Server used for Get and Set.

PvsServerBootstrap

Read/Write Fields

bool BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false

  Default=0.0.0.0

System.Net.IPAddress Bootserver1_Ip: 1st boot server IP.

  Default=0.0.0.0

uint Bootserver1_Port: 1st boot server port. Min=1025, Max=65536, Default=6910

  Default=0.0.0.0

System.Net.IPAddress Bootserver2_Ip: 2nd boot server IP. Default=0.0.0.0

System.Net.IPAddress Bootserver2_Netmask: 2nd boot server netmask.
  Default=0.0.0.0

uint Bootserver2_Port: 2nd boot server port. Min=1025, Max=65536, Default=6910

System.Net.IPAddress Bootserver3_Gateway: 3rd boot server gateway.
  Default=0.0.0.0

System.Net.IPAddress Bootserver3_Ip: 3rd boot server IP. Default=0.0.0.0
System.Net.IPAddress Bootserver3_Netmask: 3rd boot server netmask.

    seconds to wait before reboot to hard drive. Min=10, Max=60000,
    Default=50

bool VerboseMode: Display verbose diagnostic information when set to true.
    Default=false

Read-Only Fields

    string Name: Name of the bootstrap file used to Get and Set.
    Guid Guid or ServerId: GUID of the Server used for Get and Set.

**PvsServerBootstrapName**

Read-Only Field

    string Name: Bootstrap file name.

**PvsServerInfo**

Read-Only Fields

    uint Active: 1 if the Server is currently active, 2 if unknown, and 0
        otherwise. Min=0, Max=2, Default=0

    uint AdMaxPasswordAge: Number of days before a password expires. Min=1,
        Max=30, Default=7

    bool AdMaxPasswordAgeEnabled: Age the password, when set to true.
        Default=false

    uint BootPauseSeconds: Number of seconds that a Device will pause during
        login if its server busy. Min=1, Max=60, Default=10
uint BuffersPerThread: Number of buffers per worker thread. Min=1, Max=128, Default=24

uint BusyDbConnectionRetryCount: Number of times a failed database connection will be retried. Min=0, Max=32767, Default=2

uint BusyDbConnectionRetryInterval: Interval, in number of milliseconds, the server should wait before retrying to connect to a database. Min=0, Max=10000, Default=25

System.Net.IPAddress ContactIp: Read-only contact IP for the Server.

string ContactPort: Read-only contact port for the Server.

string Description: User description. Default="" Max Length=250

uint DeviceCount: Read-only count of Devices. Default=0

bool EventLoggingEnabled: Enable event logging, when set to true. Default=false

uint FirstPort: Number of the first UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6910

uint InitialQueryConnectionPoolSize: Initial size of database connection pool for non-transactional queries. Min=1, Max=1000, Default=50

uint InitialTransactionConnectionPoolSize: Initial size of database connection pool for transactional queries. Min=1, Max=1000, Default=50

uint IoBurstSize: Number of bytes read/writes can send in a burst of packets. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=4096, Max=61440, Default=32768

System.Net.IPAddress[] Ip: One or more streaming ip addresses.

uint LastPort: Number of the last UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6930

uint LicenseTimeout: Amount of seconds before a license times out. Min=15, Max=300, Default=30

uint LocalConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are local. A value of 0 disables the feature. Min=0, Max=128, Default=4

uint LogFileBackupCopiesMax: Maximum number of log file backups. Min=1, Max=50, Default=4

uint LogFileSizeMax: Maximum size log files can reach in Megabytes. Min=1, Max=50, Default=5

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=4

System.Net.IPAddress ManagementIp: IP address used for management communications between Servers. Default=0.0.0.0

uint MaxBootDevicesAllowed: Maximum number of Devices allowed to boot simultaneously. Min=1, Max=1000, Default=500
uint MaxBootSeconds: Maximum number of seconds for a Device to boot. 
Min=10, Max=900, Default=60

uint MaxQueryConnectionPoolSize: Maximum size of database connection pool for non-transactional queries. Min=1, Max=32767, Default=1000

bool RamDiskInvitationType: Either false for Fixed, or true for Variable. 
Default=false

System.Net.IPAddress RamDiskIpAddress: IP address to use for transferring the RAM Disk. When equal to 0.0.0.0 the server IP is used with the first part replaced with 233. Default=0.0.0.0

uint RamDiskTimeToLive: Time to live for the invitation packet sent to Devices. Min=1, Max=255, Default=1

uint RefreshInterval: Interval, in number of seconds, the server should wait before refreshing settings. If set to 0, unused database connections are never released. Min=0, Max=32767, Default=300

uint RemoteConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are remote. A value of 0 disables the feature. Min=0, Max=128, Default=4

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 200 is Site Administrator. Default=999

uint ServerCacheTimeout: Number of seconds to wait before considering another Server is down. Min=5, Max=60, Default=8

string ServerFqdn: Read-only fully qualified domain name. Default="" Max Length=1024

Guid Guid or ServerId: Read-only GUID that uniquely identifies this Server.

string Name or ServerName: Computer name with no spaces. ASCII computer name characters Max Length=21

Guid SiteId: GUID of the Site this Server is to be a member of. It is not used with SiteName.

string SiteName: Name of the Site this Server is to be a member of. It is not used with SiteId.
uint ThreadsPerPort: Number of worker threads per IO port. Required that (threadPerPort * numberPorts * numberIPs) <= 1000. Min=1, Max=60, Default=8

uint UnusedDbConnectionTimeout: Interval, in number of seconds, a connection should go unused before it is to be released. Min=0, Max=32767, Default=300

uint VDiskCreatePacing: VDisk create time pacing in miliseconds. Min=0, Max=5, Default=0

**PvsServerStatus**

Read-Only Fields

uint DeviceCount: Read-only count of Devices. Default=0
System.Net.IPAddress Ip: Read-only contact IP for the Server.
uint Port: Read-only contact port for the Server.
Guid Guid or ServerId: Read-only GUID of the Server. Can be used with Get Server.
string Name or ServerName: Read-only Name of the Server. Can be used with Get Server.
uint Status: Status of the server, 0 if down, 1 if up and 2 if unknown. Default=0

**PvsServerStore**

Read/Write Fields

string[] CachePath: Cache path(s) that the Server uses with the Store. If none are specified the caches will be placed in the Store cachePath. Default=None

string Path: Directory path that the Server uses to access the Store. Default="" Max Length=255

Read-Only Fields

Guid ServerId: GUID of the server that uses the Store. ServerName can be used instead.
string ServerName: Name of the server that uses the Store. ServerId can be used instead.
Guid StoreId: GUID of the Store. StoreName can be used instead.
string StoreName: Name of the Store. StoreId can be used instead.

**PvsSite**

Read/Write Fields

Guid DefaultCollectionId: GUID of the Collection to place new Devices into automatically. Not used with defaultCollectionName. Default=00000000-0000-0000-0000-000000000000
string DefaultCollectionName: Name of the Collection to place new Devices into automatically. Not used with DefaultCollectionId. Default=""

string Description: User description. Default="" Max Length=250

Guid DiskUpdateServerId: GUID of the Disk Update Server for the Site. Not used with DiskUpdateServerName. Default=00000000-0000-0000-0000-000000000000

string DiskUpdateServerName: Name of the Disk Update Server for the Site. Not used with DiskUpdateServerId. Default=""

bool EnableDiskUpdate: True when Disk Updated is enabled for the Site, false otherwise. Default=false

uint InventoryFilePollingInterval: The number of seconds between polls for Disk changes in the Stores. Min=1, Max=600, Default=60

string MakPassword: User password used for MAK activation. Default="" Max Length=64

string MakUser: User name used for MAK activation. Default="" Max Length=64

string Name or SiteName: Name of the Site. Max Length=50

Read-Only Fields

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, and 999 is read-only. Default=999

Guid Guid or SiteId: Read-only GUID that uniquely identifies this Site.

PvsSiteView

Read/Write Fields

string Description: User description. Default="" Max Length=250

string Name or SiteViewName: Name of the Site View. Max Length=50

Read-Only Fields

uint ActiveDeviceCount: Read-only count of active Devices in this Site View. Default=0

uint DeviceCount: Read-only count of Devices in this Site View. Default=0

uint DeviceWithPVDCount: Read-only count of Devices with Persona vDisk in this Site View. Default=0

uint MakActivateNeededCount: Read-only count of active Devices that need MAK activation in this Site View. Default=0

uint Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 200 is Site Administrator. Default=999

Guid SiteId: GUID of the Site this View is to be a member of. It is not used with SiteName.

string SiteName: Name of the Site this View is to be a member of. It is not used with SiteId.
Guid Guid or SiteViewId: Read-only GUID that uniquely identifies this Site View.

**PvsStore**

Read/Write Fields

- **string[] CachePath:** Default Cache path(s) that the Servers use with this Store. If none are specified the caches will be placed in the WriteCache subdirectory of the Store path. Default=None
- **string Description:** User description. Default="" Max Length=250
- **string Path:** Default directory path that the Servers use to access this Store. Max Length=255
- **Guid SiteId:** GUID of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteName can be used instead. Default=00000000-0000-0000-0000-000000000000
- **string SiteName:** Name of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteId can be used instead. Default=""
- **string Name or StoreName:** Name of the Store. Max Length=50

Read-Only Fields

- **uint Role:** Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, and 999 is read-only. Default=999
- **Guid Guid or StoreId:** Read-only GUID that uniquely identifies this Store.

**PvsStoreSharedOrServerPath**

Read-Only Fields

- **string Path:** Directory path that the Servers use to access this Store.
- **Guid StoreId:** GUID of the Store.
- **string StoreName:** Name of the Store.

**PvsTask**

Read-Only Fields

- **string Command:** Command being processed. Default="" Max Length=50
- **string CommandType:** Type of the command. Values are: Add, Delete, Get, Info, Run, RunWithReturn, Set and SetList. Default="" Max Length=13
- **DateTime ExpirationTime:** Time the task record may be removed from the database if the task does not complete. Has the date and time without milliseconds.
- **uint Handle:** Handle to a running function.
- **System.Net.IPAddress Ip:** IP Address of the remote host.
- **string MapiException:** Exception result in XML format. Default=""
uint Port: Port number of the remote service.

string Results: Result in XML format. Default=""

string ServerFqdn: Qualified name of the server. Default="" Max Length=1024

Guid SiteId: GUID of the Site that this Task is being processed in.
    Default=00000000-0000-0000-0000-000000000000

string SiteName: Name of the Site that this Task is being processed in.

DateTime StartTime: Time the task was started. Has the date and time without milliseconds.

uint State: State of the Task. Values are: 0 (Processing), 1 (Cancelled), and 2 (Complete). Min=0, Max=2

uint TaskId: Unique ID of the task.

**PvsUndefinedDisk**

Read-Only Fields

bool VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false

string Name: Name of the disk file without the extension.

uint Status: Status of the disk file. Values are: 0 (Valid), 1 (Missing Properties File), 2 (Access Denied), 3 (Access Denied and Missing Properties File), 4 (Invalid Disk File), 5 (Manifest Missing or Invalid), 6 (Both VHD and VHDX)

**PvsUpdateTask**

Read/Write Fields

uint[] Date: Days of the month. Numbers from 1-31 are the only valid values. This is used with Monthly Date recurrence. Default="" Max Length=83

uint DayMask: Days selected values. 1 = Monday, 2 = Tuesday, 4 = Wednesday, 8 = Thursday, 16 = Friday, 32 = Saturday, 64 = Sunday, 128 = Day.
    Default=0. This is used with Weekly and Monthly Type recurrence. Min=1, Max=255, Default=4

string Description: User description. Default="" Max Length=250

string Domain: Domain to add the Disk Update Device(s) to. If not included, the first Domain Controller found on the Server is used. Default="" Max Length=255

bool Enabled: True when it will be processed, false otherwise. Default=true

string EsdType: Esd to use. Valid values are SCCM or WSUS. If no value, a custom script is run on the client. Default="" Max Length=50

uint Hour: The hour of the day to perform the task. Min=0, Max=23, Default=0

uint Minute: The minute of the hour to perform the task. Min=0, Max=59, Default=0
uint MonthlyOffset: When to happen monthly. 0 = None, 1 = First, 2 = Second, 3 = Third, 4 = Forth, 5 = Last. This is used with Monthly Type recurrence. Min=0, Max=5, Default=3

string OrganizationUnit: Organizational Unit to add the Disk Update Device(s) to. This parameter is optional. If it is not specified, the device is added to the built in Computers container. Child OU's should be delimited with forward slashes, e.g. "ParentOU/ChildOU". Special characters in an OU name, such as '"', '#', '+', ',', ';', '>', '=' , must be escaped with a backslash. For example, an OU called "commaIn,TheMiddle" must be specified as "commaIn\\,TheMiddle". The old syntax of delimiting child OU's with a comma is still supported, but deprecated. Note that in this case, the child OU comes first, e.g. "ChildOU,ParentOU". Default="" Max Length=255

uint PostUpdateApprove: Access to place the version in after the update has occurred. 0 = Production, 1 = Test, 2 = Maintenance. Min=0, Max=2, Default=0

string PostUpdateScript: Script file to run after the update finishes. Default="" Max Length=255

string PostVmScript: Script file to run after the VM is unloaded. Default="" Max Length=255

string PreUpdateScript: Script file to run before the update starts. Default="" Max Length=255

string PreVmScript: Script file to run before the VM is loaded. Default="" Max Length=255

uint Recurrence: The update will reoccur on this schedule. 0 = None, 1 = Daily, 2 = Every Weekday, 3 = Weekly, 4 = Monthly Date, 5 = Monthly Type. Min=0, Max=5, Default=0

string Name or UpdateTaskName: Name of the Update Task. It is unique within the Site. Max Length=50

Read-Only Fields

Guid SiteId: GUID of the Site that this Update Task is a member of. It is not used with SiteName.

string SiteName: Name of the Site that this Update Task is a member of. It is not used with SiteId.

Guid Guid or UpdateTaskId: Read-only GUID that uniquely identifies this Update Task.

PvsVersion

Read-Only Fields

uint DbSize: Size of the database in MB. Monitor this value if the edition is 'Express Edition' and this value is close to reaching the 4000 MB maximum. Default=0

uint DbVersion: Version of the database schema as a number. Default=0
string MapiVersion: Version of the system in major.minor.build format.
string SdkVersion: Version of the SDK in major.minor.build format.
uint Type: Type of system. Values are 0 (Normal), 1 (OROM), and 2 (Secure). Default=0

PvsVirtualHostingPool

Read/Write Fields

string Datacenter: Datacenter of the Virtual Hosting Pool. Default="" Max Length=250
string Description: User description. Default="" Max Length=250
string Password: Password to use when logging into the Server.
uint Port: Port of the Host Server. Min=80, Max=65534, Default=80
string Server: Name or IP of the Host Server. Max Length=255
uint ShutdownTimeout: Timeout for shutdown. Min=2, Max=30, Default=10
uint Type: Type of the Virtual Hosting Pool. 0 = Citrix XenServer, 1 = Microsoft SCVMM/Hyper-V, 2 = VMWare vSphere/ESX. Min=0, Max=2, Default=0
uint UpdateLimit: Number of updates at the same time. Min=2, Max=1000, Default=1000
uint UpdateTimeout: Timeout for updates. Min=2, Max=240, Default=60
string UserName: Name to use when logging into the Server.
string Name or VirtualHostingPoolName: Name of the Virtual Hosting Pool. It is unique within the Site. Max Length=50

Read-Only Fields

Guid SiteId: GUID of the Site that this Virtual Hosting Pool is a member of. It is not used with SiteName.
string SiteName: Name of the Site that this Virtual Hosting Pool is a member of. It is not used with SiteId.

Guid Guid or VirtualHostingPoolId: Read-only GUID that uniquely identifies this Virtual Hosting Pool.

PvsXDSite

Read/Write Field

string[] ConfigServices: XenDesktop Server addresses. Max Length=2000

Read-Only Field

Guid Guid or XdSiteId: GUID of the XenDesktop Site.

Cmdlets

Add-PvsDeviceToDomain

Add a Device, all Devices in a Collection or View to a Domain.
One of these required

Guid[] Guid or DeviceId: GUID of the Device to Add to the Domain.
string[] Name or DeviceName: Name of the Device to Add to the Domain.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Add to the Domain.

Guid[] CollectionId: GUID of the Collection to Add all Devices to the Domain.
Guid[] SiteViewId: GUID of the Site View to Add all Devices to the Domain.
Guid[] FarmViewId: GUID of the Farm View to Add all Devices to the Domain.

string[] FarmViewName: Name of the Farm View to Add all Devices to the Domain.
or one of these required & resolutions

string[] CollectionName: Name of the Collection to Add all Devices to the Domain.

string[] SiteViewName: Name of the Site View to Add all Devices to the Domain.

Optional

string[] Domain: Domain to add the Device(s) to. If not included, the first Domain Controller found on the Server is used.

string[] OrganizationUnit: Organizational Unit to add the Device(s) to. This parameter is optional. If it is not specified, the device is added to the built in Computers container. Child OU's should be delimited with forward slashes, e.g. "ParentOU/ChildOU". Special characters in an OU name, such as '"', '#', '+', ',', ';', '>', '=' must be escaped with a backslash. For example, an OU called "commaIn,TheMiddle" must be specified as "commaIn\,TheMiddle". The old syntax of delimiting child OU's with a comma is still supported, but deprecated. Note that in this case, the child OU comes first, e.g. "ChildOU,ParentOU".

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId, CollectionId, SiteViewId or FarmViewId

Optional
SwitchParameter Confirm: The impact of this operation is "low". If Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Add-PvsDeviceToDomain for Name with Domain and OrganizationUnit**

Add-PvsDeviceToDomain -Name theDevice -Domain theDomain -OrganizationUnit theOrganizationUnit

**EXAMPLE 2: Add-PvsDeviceToDomain for PvsDevice Using Pipe**

The Get-PvsDevice output is piped to the Add-PvsDeviceToDomain.

Get-PvsDevice -Name theDevice -Fields Guid | Add-PvsDeviceToDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Add-PvsDeviceToDomain for FarmViewName with Domain and OrganizationUnit**

Add-PvsDeviceToDomain -FarmViewName theFarmView -Domain theDomain -OrganizationUnit theOrganizationUnit

**EXAMPLE 4: Add-PvsDeviceToDomain for PvsFarmView Using Pipe**

The Get-PvsFarmView output is piped to the Add-PvsDeviceToDomain.

Get-PvsFarmView -Name theFarmView -Fields Guid | Add-PvsDeviceToDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 5: Add-PvsDeviceToDomain for CollectionName with Domain and OrganizationUnit**

Add-PvsDeviceToDomain -CollectionName theCollection -SiteName theSite -Domain theDomain -OrganizationUnit theOrganizationUnit

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 6: Add-PvsDeviceToDomain for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Add-PvsDeviceToDomain.

Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Add-PvsDeviceToDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.
**EXAMPLE 7: Add-PvsDeviceToDomain for SiteViewName with Domain and OrganizationUnit**

Add-PvsDeviceToDomain -SiteViewName theSiteView -SiteName theSite -Domain theDomain -OrganizationUnit theOrganizationUnit

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 8: Add-PvsDeviceToDomain for PvsSiteView Using Pipe**

The Get-PvsSiteView output is piped to the Add-PvsDeviceToDomain.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Add-PvsDeviceToDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Add-PvsDeviceToView**

Move a Device to a Collection. Personal vDisk Devices cannot be moved to a Collection in another Site.

One of these required

- Guid[] Guid or DeviceId: GUID of the Device to Add.
- string[] Name or DeviceName: Name of the Device to Add.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device to Add.

One of these required

- Guid[] SiteViewId: GUID of the Site View to Add the Device to.
- Guid[] FarmViewId: GUID of the Farm View to Add the Device to.
- string[] FarmViewName: Name of the Farm View to Add the Device to.

or this required & resolution

- string[] SiteViewName: Name of the Site View to Add the Device to.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:
  - DeviceId, SiteViewId or FarmViewId

Optional
SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1:** Add-PvsDeviceToView for PvsDevice to PvsFarmView
Add-PvsDeviceToView -Name theDevice -PvsFarmViewName thePvsFarmView

**EXAMPLE 2:** Add-PvsDeviceToView for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Add-PvsDeviceToView.
Get-PvsDevice -Name theDevice -Fields Guid | Add-PvsDeviceToView -PvsFarmViewName thePvsFarmView
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3:** Add-PvsDeviceToView for PvsFarmView Using Pipe
The Get-PvsFarmView output is piped to the Add-PvsDeviceToView.
Get-PvsFarmView -Name theFarmView -Fields Guid | Add-PvsDeviceToView -Name theDevice
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 4:** Add-PvsDeviceToView for PvsDevice to PvsSiteView
Add-PvsDeviceToView -Name theDevice -SiteViewName theSiteView -SiteName theSite
SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 5:** Add-PvsDeviceToView for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Add-PvsDeviceToView.
Get-PvsDevice -Name theDevice -Fields Guid | Add-PvsDeviceToView -SiteViewName theSiteView -SiteName theSite
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 6:** Add-PvsDeviceToView for PvsSiteView Using Pipe
The Get-PvsSiteView output is piped to the Add-PvsDeviceToView.
Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Add-PvsDeviceToView -Name theDevice
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Add-PvsDiskLocatorToDevice**

Assign a Disk Locator to a Device, a Collection or View.

This required

- Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Assign.
- or this required & resolution
  - string[] Name or DiskLocatorName: Name of the Disk Locator File to Assign.

One of these required

- Guid[] DeviceId: GUID of the Device to Assign a Disk Locator.
- string[] DeviceName: Name of the Device to Assign a Disk Locator.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device to Assign a Disk Locator.
- Guid[] CollectionId: GUID of the Collection to Assign a Disk Locator or Locators to all Devices.
- Guid[] SiteViewId: GUID of the Site View to Assign a Disk Locator to all Devices.
- Guid[] FarmViewId: GUID of the Farm View to Assign a Disk Locator to all Devices.
- string[] FarmViewName: Name of the Farm View to Assign a Disk Locator to all Devices.
- or one of these required & resolutions
  - string[] CollectionName: Name of the Collection to Assign a Disk Locator or Locators to all Devices.
  - string[] SiteViewName: Name of the Site View to Assign a Disk Locator to all Devices.

Optional

- SwitchParameter RemoveExisting: If -RemoveExisting is specified, remove the existing Disk Locators before assigning the new one.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

One of these resolutions when needed

- Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
- string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
DiskLocatorId, DeviceId, CollectionId, SiteViewId or FarmViewId
Optional
SwitchParameter Confirm: The impact of this operation is "low". If -
Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "low" to
have confirmation without the Confirm parameter.

EXAMPLE 1: Add-PvsDiskLocatorToDevice for PvsDiskLocator to PvsDevice
Add-PvsDiskLocatorToDevice -Name theDiskLocator -DeviceName theDevice
-DeviceId theDeviceId -SiteName theSite -SiteId theSiteId -StoreName theStore
-StoreName theStoreName
Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

EXAMPLE 2: Add-PvsDiskLocatorToDevice for PvsDiskLocator Using Pipe
The Get-PvsDiskLocator output is piped to the Add-
PvsDiskLocatorToDevice.
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore
theStore -Fields Guid | Add-PvsDiskLocatorToDevice -
DeviceName theDevice
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.
Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

EXAMPLE 3: Add-PvsDiskLocatorToDevice for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Add-PvsDiskLocatorToDevice.
Get-PvsDevice -Name theDevice -Fields Guid | Add-
PvsDiskLocatorToDevice -Name theDiskLocator -SiteName theSite
-theSite -StoreName theStore
theStoreName
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.
Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

EXAMPLE 4: Add-PvsDiskLocatorToDevice for PvsDiskLocator to PvsCollection
Add-PvsDiskLocatorToDevice -Name theDiskLocator -CollectionName
theCollection -SiteName theSite -SiteId theSiteId -StoreName theStore

EXAMPLE 5: Add-PvsDiskLocatorToDevice for PvsDiskLocator Using Pipe
The Get-PvsDiskLocator output is piped to the Add-
PvsDiskLocatorToDevice.
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Add-PvsDiskLocatorToDevice -CollectionName theCollection -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 6: Add-PvsDiskLocatorToDevice for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Add-PvsDiskLocatorToDevice.

Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Add-PvsDiskLocatorToDevice -Name theDiskLocator -SiteName theSite -StoreName theStore

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 7: Add-PvsDiskLocatorToDevice for PvsDiskLocator to PvsFarmView**

Add-PvsDiskLocatorToDevice -Name theDiskLocator -FarmViewName theFarmView -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 8: Add-PvsDiskLocatorToDevice for PvsDiskLocator Using Pipe**

The Get-PvsDiskLocator output is piped to the Add-PvsDiskLocatorToDevice.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Add-PvsDiskLocatorToDevice -FarmViewName theFarmView

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 9: Add-PvsDiskLocatorToDevice for PvsFarmView Using Pipe**

The Get-PvsFarmView output is piped to the Add-PvsDiskLocatorToDevice.

Get-PvsFarmView -Name theFarmView -Fields Guid | Add-PvsDiskLocatorToDevice -Name theDiskLocator -SiteName theSite -StoreName theStore

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.
EXAMPLE 10: Add-PvsDiskLocatorToDevice for PvsDiskLocator to PvsSiteView

Add-PvsDiskLocatorToDevice -Name theDiskLocator -SiteViewName theSiteView -SiteName theSite -StoreName theStore

EXAMPLE 11: Add-PvsDiskLocatorToDevice for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Add-PvsDiskLocatorToDevice.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Add-PvsDiskLocatorToDevice -SiteViewName theSiteView -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 12: Add-PvsDiskLocatorToDevice for PvsSiteView Using Pipe

The Get-PvsSiteView output is piped to the Add-PvsDiskLocatorToDevice.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Add-PvsDiskLocatorToDevice -Name theDiskLocator -SiteName theSite -StoreName theStoreName

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Add-PvsDiskToUpdateTask

Add a Disk to an Update Task.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Assign.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator File to Assign.

One of these required

Guid[] UpdateTaskId: GUID of the Update Task to Assign a Disk.

string[] UpdateTaskName: Name of the Update Task to Assign a Disk.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DiskLocatorId or UpdateTaskId
Optional

SwitchParameter Confirm: The impact of this operation is "low". If - Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Add-PvsDiskToUpdateTask for PvsDiskLocator to PvsUpdateTask**

```
Add-PvsDiskToUpdateTask -Name theDiskLocator -UpdateTaskName theUpdateTask -SiteName theSite -StoreName theStore
```

UpdateTaskId can be used instead of UpdateTaskName so that the SiteName or SiteId is not also needed.

**EXAMPLE 2: Add-PvsDiskToUpdateTask for PvsDiskLocator Using Pipe**

The Get-PvsDiskLocator output is piped to the Add-PvsDiskToUpdateTask.

```
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Add-PvsDiskToUpdateTask -UpdateTaskName theUpdateTask -SiteName theSite
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Add-PvsDiskToUpdateTask for PvsUpdateTask Using Pipe**

The Get-PvsUpdateTask output is piped to the Add-PvsDiskToUpdateTask.

```
Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Fields Guid | Add-PvsDiskToUpdateTask -Name theDiskLocator -SiteName theSite -StoreName theStore
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**Add-PvsDiskVersion**

Add one or more new Versions to a Disk. A manifest file for the new Disk Version(s) must exist in the Store.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator File to Add the new Disk Version(s) to.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator File to Add the new Disk Version(s) to.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a
  DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a
  DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
  the Object parameter or from a pileline:
  DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -
  Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to
  have confirmation without the Confirm parameter.

EXAMPLE 1: Add-PvsDiskVersion for Name

Add-PvsDiskVersion -Name theDiskLocator -SiteName theSite -StoreName
  theStore

Guid can be used instead of Name so that the SiteName or SiteId and
  StoreName or StoreId are not also needed.

EXAMPLE 2: Add-PvsDiskVersion for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Add-PvsDiskVersion.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName
  theStore -Fields Guid | Add-PvsDiskVersion

The -Fields parameter with only the needed fields specified makes the
  Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and
  StoreName or StoreId are not also needed.

Clear-PvsConnection

Closes the existing SoapServer connection, and if -Persist is specified the
  connection settings in the registry are removed.

Optional

SwitchParameter Persist: If -Persist is specified, clear the
  connection settings in the registry.

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -
  Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to
  have confirmation without the Confirm parameter.
**EXAMPLE 1: Clear-PvsConnection**

Clear-PvsConnection

**EXAMPLE 2: Clear-PvsConnection with Persist**

Clear-PvsConnection -Persist

---

**Clear-PvsTask**

Clear a single or all completed or cancelled Tasks in a Site or the whole Farm.

One of these optional

uint TaskId: Id of the Task to Clear.

Guid[] SiteId: Site Id of the Tasks to Clear.

string[] SiteName: Site Name of the Tasks to Clear.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

TaskId or SiteId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

---

**EXAMPLE 1: Clear-PvsTask for TaskId**

Clear-PvsTask -TaskId 101

**EXAMPLE 2: Clear-PvsTask for PvsTask Using Pipe**

The Get-PvsTask output is piped to the Clear-PvsTask.

Get-PvsTask -TaskId 101 -Fields -TaskId | Clear-PvsTask

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

---

**EXAMPLE 3: Clear-PvsTask for SiteName**

Clear-PvsTask -SiteName theSite

**EXAMPLE 4: Clear-PvsTask for PvsTask Using Pipe**

The Get-PvsTask output is piped to the Clear-PvsTask.

Get-PvsTask -SiteName theSite -Fields -SiteId | Clear-PvsTask

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
Copy-PvsDeviceProperties

Copy properties of one Device to a Device, all the Devices in a Collection, Site View or Farm View.

One of these required

Guid DeviceIdFrom: GUID of the Device to Copy from.
string DeviceNameFrom: Name of the Device to Copy from.
PvsPhysicalAddress DeviceMacFrom: Mac of the Device to Copy from.

One of these required

Guid Guid or DeviceId: GUID of the Device to Copy to.
string Name or DeviceName: Name of the Device to Copy to.
PvsPhysicalAddress DeviceMac: MAC of the Device to Copy to.
Guid CollectionId: GUID of the Collection to Copy to.
Guid SiteViewId: GUID of the Site View to Copy to.
Guid FarmViewId: GUID of the Farm View to Copy to.
string FarmViewName: Name of the Farm View to Copy to.

or one of these required & resolutions

string CollectionName: Name of the Collection to Copy to.
string SiteViewName: Name of the Site View to Copy to.

Optional

uint[] Properties: If not specified, all are copied. Properties to copy. Values are: 1 (Description), 2 (Class), 3 (Port), 4 (Disabled), 5 (Boot Behavior), 6 (Disk Assignment), 7 (Personality), 8 (Printer), 9 (Type), 10 (Authentication) and 11 (Logging).

One of these resolutions when needed

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId, CollectionId, SiteViewId or FarmViewId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Copy-PvsDeviceProperties for Name**

Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -Name theDeviceTo
EXAMPLE 2: Copy-PvsDeviceProperties for Name with Properties
Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -Name theDeviceTo -Properties 2, 3

EXAMPLE 3: Copy-PvsDeviceProperties for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Copy-PvsDeviceProperties.
Get-PvsDevice -Name theDeviceTo -Fields Guid | Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -Properties 2, 3
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 4: Copy-PvsDeviceProperties for Name
Copy-PvsDeviceProperties -DeviceMacFrom "00-11-22-33-44-55" -Name theDeviceTo

EXAMPLE 5: Copy-PvsDeviceProperties for Name with Properties
Copy-PvsDeviceProperties -DeviceMacFrom "00-11-22-33-44-55" -Name theDeviceTo -Properties 2, 3

EXAMPLE 6: Copy-PvsDeviceProperties for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Copy-PvsDeviceProperties.
Get-PvsDevice -Name theDeviceTo -Fields Guid | Copy-PvsDeviceProperties -DeviceMacFrom "00-11-22-33-44-55" -Properties 2, 3
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 7: Copy-PvsDeviceProperties for FarmViewName
Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -FarmViewName theFarmViewNameTo

EXAMPLE 8: Copy-PvsDeviceProperties for FarmViewName with Properties
Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -FarmViewName theFarmViewNameTo -Properties 2, 3

EXAMPLE 9: Copy-PvsDeviceProperties for PvsFarmView Using Pipe
The Get-PvsFarmView output is piped to the Copy-PvsDeviceProperties.
Get-PvsFarmView -Name theFarmViewTo -Fields Guid | Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -Properties 2, 3
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
**EXAMPLE 10: Copy-PvsDeviceProperties for CollectionName**

Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -CollectionName theCollectionNameTo -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 11: Copy-PvsDeviceProperties for CollectionName with Properties**

Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -CollectionName theCollectionNameTo -SiteName theSite -Properties 2, 3

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 12: Copy-PvsDeviceProperties for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Copy-PvsDeviceProperties.

Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -Properties 2, 3

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 13: Copy-PvsDeviceProperties for SiteViewName**

Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -SiteViewName theSiteViewNameTo -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 14: Copy-PvsDeviceProperties for SiteViewName with Properties**

Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -SiteViewName theSiteViewNameTo -SiteName theSite -Properties 2, 3

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 15: Copy-PvsDeviceProperties for PvsSiteView Using Pipe**

The Get-PvsSiteView output is piped to the Copy-PvsDeviceProperties.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Copy-PvsDeviceProperties -DeviceNameFrom theDeviceFrom -Properties 2, 3

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.
Copy-PvsDiskProperties

Copy properties of one Disk to a Disk.

This required

 Guid DiskLocatorIdFrom: GUID of the Disk Locator to Copy from.

This required

 Guid or DiskLocatorId: GUID of the Disk Locator to Copy to.

Optional

 uint[] Properties: If not specified, all are copied. Properties to copy. Values are: 1 (Description), 2 (Class), 3 (Type), 4 (Disk Mode), 5 (Auto Update), 6 (HA), 7 (Active Directory), 8 (Printer), 10 (Version), 11 (Date), 12 (Author), 13 (Title), 14 (Company), 15 (Internal Filename), 16 (Original Filename), 17 (Hardware Target), 18 (Menu Text), 19 (Enabled), 20 (Server), and 21 (Store).

Instead of a parameter that matches one of the members listed

 PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

 DisklocatorId

Optional

 SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Copy-PvsDiskProperties for Guid

Copy-PvsDiskProperties -DiskLocatorIdFrom "66302103-2991-4e42-ba58-a1614ce070c" -Guid "f5eb3de9-bcf4-416f-a289-6a9472c13f8b"

EXAMPLE 2: Copy-PvsDiskProperties for Guid with Properties

Copy-PvsDiskProperties -DiskLocatorIdFrom "66302103-2991-4e42-ba58-a1614ce070c" -Guid "f5eb3de9-bcf4-416f-a289-6a9472c13f8b" -Properties 2, 3

EXAMPLE 3: Copy-PvsDiskProperties for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Copy-PvsDiskProperties.

Get-PvsDiskLocator -Guid "f5eb3de9-bcf4-416f-a289-6a9472c13f8b" -Fields Guid | Copy-PvsDiskProperties -DiskLocatorIdFrom "66302103-2991-4e42-ba58-a1614ce070c" -Properties 2, 3

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
Copy-PvsServerProperties

Copy properties of one Server to a Server.

One of these required

Guid ServerIdFrom: GUID of the Server to Copy from.
string ServerNameFrom: Name of the Server to Copy from.

One of these required

Guid Guid or ServerId: GUID of the Server to Copy to.
string Name or ServerName: Name of the Server to Copy to.

Optional

uint[] Properties: If not specified, all are copied. Properties to copy. Values are: 1 (Configuration), 2 (Port), 4 (Active Directory), 5 (Advanced Server), 6 (Advanced Network), 7 (Advanced Pacing), 8 (Advanced Device) and 9 (Logging).

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Copy-PvsDiskProperties for Name**

Copy-PvsDiskProperties -ServerNameFrom theServerFrom -Name theServerTo

**EXAMPLE 2: Copy-PvsDiskProperties for Name with Properties**

Copy-PvsDiskProperties -ServerNameFrom theServerFrom -Name theServerTo -Properties 2, 3

**EXAMPLE 3: Copy-PvsDiskProperties for PvsServer Using Pipe**

The Get-PvsServer output is piped to the Copy-PvsDiskProperties.

Get-PvsServer -Name theServerTo -Fields Guid | Copy-PvsDiskProperties -ServerNameFrom theServerFrom -Properties 2, 3

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Disable-PvsDeviceDiskLocator

Disable a Device's DiskLocator.

One of these required
Guid[] Guid or DeviceId: GUID of the Device to Disable the DiskLocator for.

string[] Name or DeviceName: Name of the Device to Disable the DiskLocator for.

PvsPhysicalAddress[] DeviceMac: MAC of the Device to Disable the DiskLocator for.

This required

Guid[] DiskLocatorId: GUID of the DiskLocator to Disable for the Device.

or this required & resolution

string[] DiskLocatorName: Name of the DiskLocator File to Disable for the Device.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId or DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Disable a PvsDevice PvsDiskLocator**

This example disables the PvsDiskLocator named theDiskLocator for the PvsDevice named theDevice.

Disable-PvsDeviceDiskLocator -Name theDevice -DiskLocatorName theDiskLocator -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the StoreName or StoreId are not also needed.

**Dismount-PvsDisk**

No longer Map the Disk.

**EXAMPLE 1: Dismount-PvsDisk**

Dismount-PvsDisk
Enable-PvsDeviceDiskLocator

Enable a Device's DiskLocator. If the DiskLocator is Disabled, that overrides the Device DiskLocator setting.

One of these required

- Guid[] Guid or DeviceId: GUID of the Device to Enable the DiskLocator for.
- string[] Name or DeviceName: Name of the Device to Enable the DiskLocator for.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device to Enable the DiskLocator for.

This required

- Guid[] DiskLocatorId: GUID of the DiskLocator to Enable for the Device.

or this required & resolution

- string[] DiskLocatorName: Name of the DiskLocator to Enable for the Device.

One of these resolutions when needed

- Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
- string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  - DeviceId or DiskLocatorId

Optional

- SwitchParameter Confirm: The impact of this operation is "low". If Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Enable a PvsDevice PvsDiskLocator**

This example enables the PvsDiskLocator named theDiskLocator for the PvsDevice named theDevice.

Enable-PvsDeviceDiskLocator -Name theDevice -DiskLocatorName theDiskLocator -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the StoreName or StoreId are not also needed.
Export-PvsAuditTrail

Archive the information in the Audit Trail up to a certain date to a file. When finished, the information archived will be removed from the Audit Trail.

This required

string[] FileName: Name of the file to archive the Audit Trail to. This must be a full file path name.

Optional

DateTime EndDate: Last date of information to Archive. If not entered, all information is Archived. Uses only the date.

SwitchParameter NoPurgeData: If -NoPurgeData is specified, the information archived will not be removed from the Audit Trail.

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Export-AuditTrail for PvsFarm

Export-AuditTrail -Name "C:\export\theFileName"

EXAMPLE 2: Export-AuditTrail for PvsFarm with EndDate

Export-AuditTrail -EndDate "01/01/2015" -Name "C:\export\theFileName"

EXAMPLE 3: Export-AuditTrail for PvsFarm with EndDate and NoPurgeData

Export-AuditTrail -EndDate "01/01/2015" -NoPurgeData -Name "C:\export\theFileName"

Export-PvsDisk

Export the disk stack to a manifest file.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator that identifies the disk to export.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator that identifies the disk to export.

Optional

uint Version: Version to use as the start of the export. The export will include all versions starting with this to the highest one.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.
One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a
DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a
DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

DiskLocatorId

EXAMPLE 1: Export-PvsDisk for Name

Export-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName
theStore

Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

EXAMPLE 2: Export-PvsDisk for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Export-PvsDisk.
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName
theStore -Fields Guid | Export-PvsDisk

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

EXAMPLE 3: Export-PvsDisk for Name with Version

Export-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName
theStore -Version 4

Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

EXAMPLE 4: Export-PvsDisk for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Export-PvsDisk.
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName
theStore -Fields Guid | Export-PvsDisk -Version 4

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.
Export-PvsOemLicenses

Oem Only: Export the Oem Licenses for the Devices to the fileName specified.

This required

string FileName: Name of the file to export the Oem Licenses to. This must be a full file path name.

One of these required

Guid Guid or DeviceId: GUID of the Device to Export Oem Licenses to the fileName specified.
string Name or DeviceName: Name of the Device to Export Oem Licenses to the fileName specified.
PvsPhysicalAddress DeviceMac: MAC of the Device to Export Oem Licenses to the fileName specified.
Guid CollectionId: GUID of the Collection to Export all Device Oem Licenses to the fileName specified.
Guid SiteViewId: GUID of the Site View to Export all Device Oem Licenses to the fileName specified.
Guid FarmViewId: GUID of the Farm View to Export all Device Oem Licenses to the fileName specified.
string FarmViewName: Name of the Farm View to Export all Device Oem Licenses to the fileName specified.

or one of these required & resolutions

string CollectionName: Name of the Collection to Export all Device Oem Licenses to the fileName specified.
string SiteViewName: Name of the Site View to Export all Device Oem Licenses to the fileName specified.

One of these resolutions when needed

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId, CollectionId, SiteViewId or FarmViewId

EXAMPLE 1: Export-PvsOemLicenses for Name

Export-PvsOemLicenses -Name theDevice -FileName "C:\export\theFileName"

EXAMPLE 2: Export-PvsOemLicenses for PvsDevice Using Pipe

The Get-PvsDevice output is piped to the Export-PvsOemLicenses.

Get-PvsDevice -Name theDevice -Fields Guid | Export-PvsOemLicenses -FileName "C:\export\theFileName"
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Export-PvsOemLicenses for DeviceMac**

```
Export-PvsOemLicenses -DeviceMac "00-11-22-33-44-55" -FileName "C:\export\theFileName"
```

**EXAMPLE 4: Export-PvsOemLicenses for PvsDevice Using Pipe**

The Get-PvsDevice output is piped to the Export-PvsOemLicenses.

```
Get-PvsDevice -DeviceMac "00-11-22-33-44-55" -Fields Guid | Export-PvsOemLicenses -FileName "C:\export\theFileName"
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 5: Export-PvsOemLicenses for FarmViewName**

```
Export-PvsOemLicenses -FarmViewName theFarmView -FileName "C:\export\theFileName"
```

**EXAMPLE 6: Export-PvsOemLicenses for PvsFarmView Using Pipe**

The Get-PvsFarmView output is piped to the Export-PvsOemLicenses.

```
Get-PvsFarmView -Name theFarmView -Fields Guid | Export-PvsOemLicenses -FileName "C:\export\theFileName"
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 7: Export-PvsOemLicenses for CollectionName**

```
Export-PvsOemLicenses -CollectionName theCollection -SiteName theSite -FileName "C:\export\theFileName"
```

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 8: Export-PvsOemLicenses for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Export-PvsOemLicenses.

```
Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Export-PvsOemLicenses -FileName "C:\export\theFileName"
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.
EXAMPLE 9: Export-PvsOemLicenses for SiteViewName

Export-PvsOemLicenses -SiteViewName theSiteView -SiteName theSite -FileName "C:\export\theFileName"

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

EXAMPLE 10: Export-PvsOemLicenses for PvsSiteView Using Pipe

The Get-PvsSiteView output is piped to the Export-PvsOemLicenses.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Export-PvsOemLicenses -FileName "C:\export\theFileName"

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

Get-PvsADAccount

Return a PvsAdAccount object if the named Device Account in the domain is found.

This required

  string Domain: Domain the account is a member of.

This required

  string Name: Name of the Device for the account.

PvsADAccount: If successful, the PvsADAccount object is returned.

EXAMPLE 1: Get PvsADAccount

Get the PvsADAccount in the Domain named theDomain for the Device named theDevice.

Get-PvsADAccount -Domain theDomain -Name theDevice

Get-PvsAuditActionParameter

Get the Parameters of an Audit Action.

This required

  Guid[] AuditActionId: GUID of the Audit Action to Get Parameters for.

Instead of a parameter that matches one of the members listed

  PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  AuditActionId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Name or AuditParameterName: Name of the parameter. Max Length=50
Value: Value of the parameter. Max Length=1000

PvsAuditActionParameter[]: If successful, the PvsAuditActionParameter object(s) are returned.

**EXAMPLE 1: Get PvsAuditActionParameter**

Get all PvsAuditActionParameter for the AuditActionId e8baa554-7c2d-49e5-9f6b-e0bc46179fc7.

Get-PvsAuditActionParameter -AuditActionId "e8baa554-7c2d-49e5-9f6b-e0bc46179fc7"

**EXAMPLE 2: Get PvsAuditActionParameter for Multiple AuditActionId**

Get all PvsAuditActionParameter for the AuditActionId e8baa554-7c2d-49e5-9f6b-e0bc46179fc7 and 54ee6180-7fbc-42a2-9499-2e4936f039dc.

Get-PvsAuditActionParameter -AuditActionId "e8baa554-7c2d-49e5-9f6b-e0bc46179fc7", "54ee6180-7fbc-42a2-9499-2e4936f039dc"

**EXAMPLE 3: Get PvsAuditActionParameter for Get-PvsAuditTrail Results with Parameters**

Get-PvsAuditTrail is called and only the PvsAuditTrail.Attachment with bit 4 (Parameters) set are used to call Get-PvsAuditActionParameter.

Get-PvsAuditTrail | Where-Object {($_.Attachments.band 4) -eq 4} | Get-PvsAuditActionParameter

**Get-PvsAuditActionProperty**

Get the Properties of an Audit Action.

This required

Guid[] AuditActionId: GUID of the Audit Action to Get Properties for.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

AuditActionId

If only selected fields are needed, pass them in the Fields parameter as a string array.
Name or AuditPropertyName: Name of the property. Max Length=50
OldValue: Previous value of the Property. Default="" Max Length=1000
NewValue: New value of the Property. Default="" Max Length=1000
PvsAuditActionProperty[]: If successful, the PvsAuditActionProperty object(s) are returned.

**EXAMPLE 1: Get PvsAuditActionProperty**

Get all PvsAuditActionProperty for the AuditActionId e8baa554-7c2d-49e5-9f6b-e0bc46179fc7.
Get-PvsAuditActionProperty -AuditActionId "e8baa554-7c2d-49e5-9f6b-e0bc46179fc7"

EXAMPLE 2: Get PvsAuditActionProperty for Multiple AuditActionId
Get all PvsAuditActionProperty for the AuditActionId e8baa554-7c2d-49e5-9f6b-e0bc46179fc7 and 54ee6180-7fbc-42a2-9499-2e4936f039dc.
Get-PvsAuditActionProperty -AuditActionId "e8baa554-7c2d-49e5-9f6b-e0bc46179fc7", "54ee6180-7fbc-42a2-9499-2e4936f039dc"

EXAMPLE 3: Get PvsAuditActionProperty for Get-PvsAuditTrail Results with Properties
Get-PvsAuditTrail is called and only the PvsAuditTrail.Attachment with bit 8 (Properties) set are used to call Get-PvsAuditActionProperty.
Get-PvsAuditTrail | Where-Object {($_.Attachments -band 8) -eq 8} | Get-PvsAuditActionProperty

Get-PvsAuditActionSibling
Get the Sibling of an Audit Action. It is the 2nd object involved with the action.
This required
Guid[] Guid or AuditActionId: GUID of the Audit Action to Get Sibling for.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  AuditActionId
If only selected fields are needed, pass them in the Fields parameter as a string array.
Guid or AuditActionId: GUID of the action.
Type: Type of object that action was performed on. Values are: 1 (AuthGroup), 2 (Collection), 3 (Device), 4 (Disk), 5 (DiskLocator), 6 (Farm), 7 (FarmView), 8 (Server), 9 (Site), 10 (SiteView), 11 (Store), 12 (System), and 13 (UserGroup)
ObjectId: GUID of the object of the action.
ObjectName: Name of the object of the action. Max Length=1000
Path: Path of the object of the action. An example is Site\Collection for a Device. Default="" Max Length=101
SiteId: GUID of the Site for the object of the action. 00000000-0000-0000-0000-000000000000 when not valid.
  Default=00000000-0000-0000-0000-000000000000

103
SubId: GUID of the Collection or Store of the action. 00000000-0000-0000-0000-000000000000 when not valid.
Default=00000000-0000-0000-0000-000000000000

PvsAuditAction[]): If successful, the PvsAuditAction object(s) are returned.

**EXAMPLE 1: Get PvsAuditActionSibling**

Get all PvsAuditActionSibling for the AuditActionId e8baa554-7c2d-49e5-9f6b-e0bc46179fc7.

Get-PvsAuditActionSibling -Guid "e8baa554-7c2d-49e5-9f6b-e0bc46179fc7"

**EXAMPLE 2: Get PvsAuditActionSibling for Multiple AuditActionId**

Get all PvsAuditActionSibling for the AuditActionId e8baa554-7c2d-49e5-9f6b-e0bc46179fc7 and 54ee6180-7fbc-42a2-9499-2e4936f039dc.

Get-PvsAuditActionSibling -Guid "e8baa554-7c2d-49e5-9f6b-e0bc46179fc7", "54ee6180-7fbc-42a2-9499-2e4936f039dc"

**EXAMPLE 3: Get PvsAuditActionSibling for Get-PvsAuditTrail Results with Siblings**

Get-PvsAuditTrail is called and only the PvsAuditTrail.Attachment with bit 2 (Siblings) set are used to call Get-PvsAuditActionSibling.

Get-PvsAuditTrail | Where-Object {($_.Attachments -band 2) -eq 2} | Get-PvsAuditActionSibling

**Get-PvsAuditTrail**

Get the Audit Trail actions for a Farm, Site, Server, DiskLocator, Collection, Device, User Group, Site View, Farm View or Store. All Audit Trail actions are returned if no parameters are passed. The result can be filtered by parent, user\domain and date range.

One of these optional

Guid[] Guid or AuditActionId: GUID of the Audit Action to Get.

Guid[] ParentId: Parent AuditActionId of the records to retrieve. If no parameters are included, only records with no parent are returned.

Guid[] RootId: Root AuditActionId of the records to retrieve. All of the actions caused by the root action are returned. If no parameters are included, only records with no root are returned.

Guid[] SiteId: GUID of the Site to get the Audit Trail for.

string[] SiteName: Name of the Site to get the Audit Trail for.

Guid[] CollectionId: GUID of the Collection to get the Audit Trail for.

Guid[] SiteViewId: GUID of the Site View to get the Audit Trail for.

Guid[] FarmViewId: GUID of the Farm View to get the Audit Trail for.
string[] FarmViewName: Name of the Farm View to get the Audit Trail for.

Guid[] ServerId: GUID of the Server to get the Audit Trail for.

string[] ServerName: Name of the Server to get the Audit Trail for.

Guid[] DeviceId: GUID of the Device to get the Audit Trail for.

string[] DeviceName: Name of the Device to get the Audit Trail for.

PvsPhysicalAddress[] DeviceMac: MAC of the Device to get the Audit Trail for.

Guid[] StoreId: GUID of the Store to get the Audit Trail for.

string[] StoreName: Name of the Store to get the Audit Trail for.

Guid[] DiskLocatorId: GUID of the DiskLocator to get the Audit Trail for.

or one of these optional & resolutions

string[] CollectionName: Name of the Collection to get the Audit Trail for.

string[] SiteViewName: Name of the Site View to get the Audit Trail for.

string[] DiskLocatorName: Name of the DiskLocator to get the Audit Trail for.

Optional

string[] UserName: User that performed the action.

string[] Domain: Domain of the user that performed the action.

DateTime BeginDate: Date/Time of the first actions to get. If not included, all actions until the endDate are returned. If neither this or the endDate are included, then only actions that occurred in the last week are returned. Uses only the date, hour and minute. If connected to a Server version previous to 7.7, only the date is used.

DateTime EndDate: Date/Time of the last actions to get. If not included, all actions from the beginDate until now are returned. If neither this or the beginDate are included, then only actions that occurred in the last week are returned. Uses only the date, hour and minute. If connected to a Server version previous to 7.7, only the date is used.

uint[] Type: Types to get. Values are: 0 (Many), 1 (AuthGroup), 2 (Collection), 3 (Device), 4 (Disk), 5 (DiskLocator), 6 (Farm), 7 (FarmView), 8 (Server), 9 (Site), 10 (SiteView), 11 (Store), 12 (System), and 13 (UserGroup)

uint[] Action: Actions to get. Values are: 1 (AddAuthGroup), 2 (AddCollection), 3 (AddDevice), 4 (AddDiskLocator), 5 (AddFarmView), 6 (AddServer), 7 (AddSite), 8
(RunWithReturnRebalanceDevices), 3005
(RunWithReturnCreateMaintenanceVersion), 3006
(RunWithReturnImportDisk), 4001

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to get the Audit Trail for.

string[] SiteName: Name of the Site to get the Audit Trail for.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store to get the Audit Trail for.

string[] StoreName: Name of the Store to get the Audit Trail for.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

AuditActionId, ParentId, RootId, SiteId, CollectionId, SiteViewId,
FarmViewId, ServerId, DeviceId, StoreId or
DiskLocatorId
If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or AuditActionId: GUID of the action.

Time: Date/Time the action occurred down to the millisecond. Has the date and time including milliseconds. Default=Empty

UserName: User that performed the action. Max Length=255

Domain: Domain of the user that performed the action. Max Length=255

Type: Type of object that action was performed on. Values are: 0 (Many), 1 (AuthGroup), 2 (Collection), 3 (Device), 4 (Disk), 5 (DiskLocator), 6 (Farm), 7 (FarmView), 8 (Server), 9 (Site), 10 (SiteView), 11 (Store), 12 (System), and 13 (UserGroup)

Action: Name of the action taken. This is a number that is converted to a string for display. Values are: 1 (AddAuthGroup), 2 (AddCollection), 3 (AddDevice), 4 (AddDiskLocator), 5 (AddFarmView), 6 (AddServer), 7 (AddSite), 8 (AddSiteView), 9 (AddStore), 10 (AddUserGroup), 11 (AddVirtualHostingPool), 12 (AddUpdateTask), 13 (AddDiskUpdateDevice), 1001 (DeleteAuthGroup), 1002 (DeleteCollection), 1003 (DeleteDevice), 1004 (DeleteDeviceDiskCacheFile), 1005 (DeleteDiskLocator), 1006 (DeleteFarmView), 1007 (DeleteServer), 1008 (DeleteServerStore), 1009 (DeleteSite), 1010 (DeleteSiteView), 1011 (DeleteStore), 1012 (DeleteUserGroup), 1013 (DeleteVirtualHostingPool), 1014 (DeleteUpdateTask), 1015 (DeleteDiskUpdateDevice), 1016 (DeleteDiskVersion), 2001 (RunAddDeviceToDomain), 2002 (RunApplyAutoUpdate), 2003 (RunApplyIncrementalUpdate), 2004 (RunArchiveAuditTrail), 2005 (RunAssignAuthGroup), 2006 (RunAssignDevice), 2007 (RunAssignDiskLocator), 2008 (RunAssignServer), 2009 (RunWithReturnBoot), 2010 (RunCopyPasteDevice), 2011 (RunCopyPasteDisk), 2012 (RunCopyPasteServer), 2013 (RunCreateDirectory), 2014 (RunCreateDiskCancel), 2015 (RunDisableCollection), 2016 (RunDisableDevice), 2017 (RunDisableDeviceDiskLocator), 2018 (RunDisableDiskLocator), 2019 (RunDisableUserGroup), 2020 (RunDisableUserGroupDiskLocator), 2021 (RunWithReturnDisplayMessage), 2022 (RunEnableCollection), 2023 (RunEnableDevice), 2024 (RunEnableDeviceDiskLocator), 2025 (RunEnableDiskLocator), 2026 (RunEnableUserGroup), 2027 (RunEnableUserGroupDiskLocator), 2028 (RunExportOemLicenses), 2029 (RunImportDatabase), 2030 (RunImportDevices), 2031 (RunImportOemLicenses), 2032 (RunMarkDown), 2033 (RunWithReturnReboot), 2034 (RunRemoveAuthGroup), 2035 (RunRemoveDevice), 2036 (RunRemoveDeviceFromDomain), 2037 (RunRemoveDirectory), 2038 (RunRemoveDiskLocator),
2039 (RunResetDeviceForDomain), 2040 (RunResetDatabaseConnection), 2041 (RunRestartStreamingService), 2042 (RunWithReturnStreamingShutdown), 2043 (RunStartStreamingService), 2044 (RunStopStreamingService), 2045 (RunUnlockAllDisk), 2046 (RunUnlockDisk), 2047 (RunServerStoreVolumeAccess), 2048 (RunServerStoreVolumeMode), 2049 (RunMergeDisk), 2050 (RunRevertDiskVersion), 2051 (RunPromoteDiskVersion), 2052 (RunCancelDiskMaintenance), 2053 (RunActivateDevice), 2054 (RunAddDiskVersion), 2055 (RunRemoveDisk), 2056 (RunAssignDisk), 2057 (RunDiskUpdateStart), 2058 (RunDiskUpdateCancel), 2059 (RunCancelTask), 2060 (RunClearTask), 3001 (RunWithReturnCreateDisk), 3002 (RunWithReturnCreateDiskStatus), 3003 (RunWithReturnMapDisk), 3004 (RunWithReturnRebalanceDevices), 3005 (RunWithReturnCreateMaintenanceVersion), 3006 (RunWithReturnImportDisk), 4001 (RunByteArrayInputImportDevices), 4002 (RunByteArrayInputImportOemLicenses), 5001 (RunByteArrayOutputArchiveAuditTrail), 5002 (RunByteArrayOutputExportOemLicenses), 6001 (SetAuthGroup), 6002 (SetCollection), 6003 (SetDevice), 6004 (SetDisk), 6005 (SetDiskLocator), 6006 (SetFarm), 6007 (SetFarmView), 6008 (SetServer), 6009 (SetServerBiosBootstrap), 6010 (SetServerBootstrap), 6011 (SetServerStore), 6012 (SetSite), 6013 (SetSiteView), 6014 (SetStore), 6015 (SetUserGroup), 6016 (SetVirtualHostingPool), 6017 SetUpdateTask, 6018 SetDiskUpdateDevice, 7001 (SetListDeviceBootstraps), 7002 (SetListDeviceBootstrapsDelete), 7003 (SetListDeviceBootstrapsAdd), 7004 (SetListDeviceCustomProperty), 7005 (SetListDeviceCustomPropertyDelete), 7006 (SetListDeviceCustomPropertyAdd), 7007 (SetListDeviceDiskPrinters), 7008 (SetListDeviceDiskPrintersDelete), 7009 (SetListDeviceDiskPrintersAdd), 7010 (SetListDevicePersonality), 7011 (SetListDevicePersonalityDelete), 7012 (SetListDevicePersonalityAdd), 7013 (SetListDiskLocatorCustomProperty), 7014 (SetListDiskLocatorCustomPropertyDelete), 7015 (SetListDiskLocatorCustomPropertyAdd), 7016 (SetListServerCustomProperty), 7017 (SetListServerCustomPropertyDelete), 7018 (SetListServerCustomPropertyAdd), 7019 (SetListUserGroupCustomProperty), 7020
(SetListUserGroupCustomPropertyDelete), and 7021
(SetListUserGroupCustomPropertyAdd)

ObjectId: GUID of the object of the action. Default=00000000-0000-0000-0000-000000000000

ObjectName: Name of the object of the action. Default="" Max Length=1000

Path: Path of the object of the action. An example is Site\Collection for a Device. Default="" Max Length=101

SiteId: GUID of the Site for the object of the action. 00000000-0000-0000-0000-000000000000 when not valid.
Default=00000000-0000-0000-0000-000000000000

SubId: GUID of the Collection or Store of the action. 00000000-0000-0000-0000-000000000000 when not valid.
Default=00000000-0000-0000-0000-000000000000

ParentId: GUID of the parent action (one that triggered this action) if one exists. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

RootId: GUID of the root action (one that triggered this group of actions) if one exists. 00000000-0000-0000-0000-000000000000 when not valid. Default=00000000-0000-0000-0000-000000000000

Attachments: An or'ed value that indicates if there are any details for this action. A value of 15 indicates that there are Children, Sibling, Parameters and Properties for the action. Values are: 0 (None), 1 (Children), 2 (Sibling), 4 (Parameters), and 8 (Properties) Default=0

PvsAuditTrail[]: If successful, the PvsAuditTrail object(s) are returned.

EXAMPLE 1: Get PvsAuditTrail for Farm

Get all PvsAuditTrail for the Farm.
Get-PvsAuditTrail

EXAMPLE 2: Get PvsAuditTrail for FarmView

Get all PvsAuditTrail for the FarmView named theFarmView.
Get-PvsAuditTrail -FarmViewName theFarmView

EXAMPLE 3: Get PvsAuditTrail for Site

Get all PvsAuditTrail for the Site named theSite.
Get-PvsAuditTrail -SiteName theSite

EXAMPLE 4: Get PvsAuditTrail for SiteView

Get all PvsAuditTrail for the SiteView named theSiteView in the Site named theSite.
Get-PvsAuditTrail -SiteViewName theSiteView -SiteName theSite
SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 5: Get PvsAuditTrail for Collection**

Get all PvsAuditTrail for the Collection named theCollection in the Site named theSite.
Get-PvsAuditTrail -CollectionName theCollection -SiteName theSite
CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 6: Get PvsAuditTrail for Device**

Get all PvsAuditTrail for the Device named theDevice.
Get-PvsAuditTrail -DeviceName theDevice

**EXAMPLE 7: Get PvsAuditTrail for Device MAC**

Get all PvsAuditTrail for the Device with MAC 02-50-F2-00-00-01.
Get-PvsAuditTrail -DeviceMac "02-50-F2-00-00-01"

**EXAMPLE 8: Get PvsAuditTrail for Server**

Get all PvsAuditTrail for the Server named theServer.
Get-PvsAuditTrail -ServerName theServer

**EXAMPLE 9: Get PvsAuditTrail for Store**

Get all PvsAuditTrail for the Store named theStore.
Get-PvsAuditTrail -StoreName theStore

**EXAMPLE 10: Get PvsAuditTrail for DiskLocator**

Get all PvsAuditTrail for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.
Get-PvsAuditTrail -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore
DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 11: Get PvsAuditTrail for User**

Get all PvsAuditTrail for the User named theUser in Domain theDomain.
Get-PvsAuditTrail -UserName theUser -DomainName theDomain

**EXAMPLE 12: Get PvsAuditTrail for January**

Get all PvsAuditTrail for January.
Get-PvsAuditTrail -BeginDate "01/01/2015 00:00" -EndDate "01/31/2015 23:59"
**EXAMPLE 13: Get PvsAuditTrail for DiskLocator and Server Type Actions**

Get all PvsAuditTrail for 5 (DiskLocator) and 8 (Server) type actions.

Get-PvsAuditTrail -Type 5 8

**EXAMPLE 14: Get PvsAuditTrail for DiskLocator and Server Type Actions**

Get all PvsAuditTrail for the 1003 (DeleteDevice) and 1007 (DeleteServer) actions.

Get-PvsAuditTrail -Action 1003 1007

**EXAMPLE 15: Get PvsAuditTrail with Children**

Get the 4fd16fc1-8dcd-4097-be5a-d0485bd7433b PvsAuditTrail and if it has children, the child PvsAuditTrail are retrieved.

```
$x = Get-PvsAuditTrail -AuditActionId "4fd16fc1-8dcd-4097-be5a-d0485bd7433b"
if (($x.Attachments -band 1) -eq 1) { Get-PvsAuditTrail -ParentId $x.AuditActionId }
```

**Get-PvsAuthGroup**

Get the fields for an AuthGroup, all AuthGroups in the system, AuthGroups with Farm, Site or Collection Authorization. All AuthGroups in the system are returned if no parameters are passed.

One of these optional

- Guid[] Guid or AuthGroupId: GUID of the AuthGroup to Get.
- string[] Name or AuthGroupName: Name of the AuthGroup to Get.
- Guid[] SiteId: GUID of the Site to Get all AuthGroups with Authorization for.
- string[] SiteName: Name of the Site to Get all AuthGroups with Authorization for.
- Guid[] CollectionId: GUID of the Collection to Get all AuthGroups with Authorization for.
- or this optional & resolution
- string[] CollectionName: Name of the Collection to Get all AuthGroups with Authorization for.

Optional

- SwitchParameter Farm: If -Farm is specified, AuthGroups with Farm Authorization should be returned.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site to Get all AuthGroups with Authorization for.
- string[] SiteName: Name of the Site to Get all AuthGroups with Authorization for.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

- AuthGroupId, SiteId or CollectionId

If only selected fields are needed, pass them in the Fields parameter as a string array.

- Guid or AuthGroupId: Read-only GUID that uniquely identifies this AuthGroup.
- Name or AuthGroupName: Name of the Active Directory or Windows Group. Max Length=450
- Description: User description. Default="" Max Length=250
- Role: Role of the AuthGroup for a Collection. role can only be used with CollectionId or CollectionName. 300 is Collection Administrator, and 400 is Collection Operator. Default=999

PvsAuthGroup[]: If successful, the PvsAuthGroup object(s) are returned.

**EXAMPLE 1: Get PvsAuthGroup for System**

Get all PvsAuthGroup for the System.

Get-PvsAuthGroup

**EXAMPLE 2: Get PvsAuthGroup for Farm**

Get all PvsAuthGroup for the Farm.

Get-PvsAuthGroup

**EXAMPLE 3: Get PvsAuthGroup for Site**

Get all PvsAuthGroup for the Site named theSite.

Get-PvsAuthGroup -SiteName theSite

**EXAMPLE 4: Get PvsAuthGroup for Collection**

Get all PvsAuthGroup for the Collection named theCollection in the Site named theSite.

Get-PvsAuthGroup -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**Get-PvsAuthGroupUsage**

Get the items that are authorized for an AuthGroup.

One of these required:

- Guid[] AuthGroupId: GUID of the AuthGroup to Get all items that are authorized for it.
- string[] Name or AuthGroupName: Name of the AuthGroup to Get all items that are authorized for it.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

AuthGroupId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or Id: GUID of the item. The item can be a Farm, Site or Collection. It will be 00000000-0000-0000-0000-000000000000 for Farm.

Name: Name of the item. The item can be a Farm, Site or Collection.

Role: Role of the AuthGroup for the item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999

PvsAuthGroupUsage[]: If successful, the PvsAuthGroupUsage object(s) are returned.

**EXAMPLE 1: Get PvsAuthGroupUsage**

Get all PvsAuthGroupUsage for the AuthGroup named theAuthGroup.

Get-PvsAuthGroupUsage -Name theAuthGroup

**Get-PvsCollection**

Get the fields for a Collection or all Collections in a Site or Farm. All Collections are returned if no parameters are passed.

One of these optional

Guid[] Guid or CollectionId: GUID of the Collection to Get.

Guid[] SiteId: GUID of the Site to Get all Collections for.

string[] SiteName: Name of the Site to Get all Collections for.

or this optional & resolution

string[] Name or CollectionName: Name of the Collection to Get.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to Get all Collections for.

string[] SiteName: Name of the Site to Get all Collections for.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

CollectionId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or CollectionId: Read-only GUID that uniquely identifies this Collection.
Name or CollectionName: Name of the Collection. It is unique within the Site. Max Length=50

SiteId: GUID of the Site that this Collection is a member of. It is not used with SiteName.

SiteName: Name of the Site that this Collection is a member of. It is not used with SiteId.

Description: User description. Default="" Max Length=250

TemplateDeviceId: GUID of a Device in the Collection whose settings are used for initial values of new Devices. Not used with templateDeviceName. Default=00000000-0000-0000-0000-000000000000

TemplateDeviceName: Name of a Device in the Collection whose settings are used for initial values of new Devices. Not used with TemplateDeviceId. Default=""

LastAutoAddDeviceNumber: The Device Number of the last Auto Added Device. Default=0

Enabled: True when Devices in the Collection can be booted, false otherwise. Default=true

DeviceCount: Read-only count of Devices in this Collection. Default=0

DeviceWithPVDCount: Read-only count of Devices with Personal vDisk in this Collection. Default=0

ActiveDeviceCount: Read-only count of active Devices in this Collection. Default=0

MakActivateNeededCount: Read-only count of active Devices that need MAK activation in this Collection. Default=0

AutoAddPrefix: The string put before the Device Number for Auto Add. Default="" ASCII computer name characters no end digit Max Length=12

AutoAddSuffix: The string put after the Device Number for Auto Add. Default="" ASCII computer name characters no begin digit Max Length=12

AutoAddZeroFill: True when zeros be placed before the Device Number up to the AutoAddNumberLength for Auto Add, false otherwise. Default=true

AutoAddNumberLength: The maximum length of the Device Number for Auto Add. This length plus the AutoAddPrefix length plus the AutoAddSuffix length must be less than 16. Required that \(((\text{len} \text{AutoAddPrefix} + \text{len} \text{AutoAddSuffix}) + \text{AutoAddNumberLength}) \leq 16\). Min=3, Max=9, Default=4

Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999
PvsCollection[]: If successful, the PvsCollection object(s) are returned.

**EXAMPLE 1: Get PvsCollection for Farm**

Get all PvsCollection for the Farm.

Get-PvsCollection

**EXAMPLE 2: Get PvsCollection for Site**

Get all PvsCollection for the Site named theSite.

Get-PvsCollection -SiteName theSite

**EXAMPLE 3: Get PvsCollection**

Get the PvsCollection for the Collection named theCollection in the Site named theSite.

Get-PvsCollection -Name theCollection -SiteName theSite

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 4: Get PvsCollection and Enable**

Get all PvsCollection that are not Enabled and then Enables them.

Get-PvsCollection -Fields Enabled | Where-Object {$_._Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsCollection

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Get-PvsConnection**

Return the PvsConnection object with the information about the SoapServer connection.

PvsConnection: If successful, the PvsConnection object is returned.

**EXAMPLE 1: Get PvsConnection**

Get the PvsConnection for the SoapServer.

Get-PvsConnection

**Get-PvsCreateDiskStatus**

Get the Percent Finished for an active CreateDisk. When finished, the PvsDiskLocator created is returned.

This required

string Name: Name of the Disk file that is being created.
One of these required

Guid StoreId: GUID of the Store that the Disk will be a member of.

string StoreName: Name of the Store that the Disk will be a member of.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

- StoreId
- UInt32 or PvsDiskLocator: If not finished, the percent complete is
  returned in an UInt32. If finished and successful, the PvsDiskLocator
  is returned.

**EXAMPLE 1: Start-PvsCreateDiskStatus**

This example shows how to use Get-PvsCreateDiskStatus during Start-
PvsCreateDisk processing.

```
$thePvsDiskLocator = Start-PvsCreateDiskStatus -Name $theDiskName -Size 20480 -StoreName $theStore -SiteName $theSite -VHDX -Dynamic
while ($thePvsDiskLocator -eq $null) # while the create is processing
{
    %percentFinished = Get-PvsCreateDiskStatus -Name $theDiskName -StoreName $theStore # get percent finished or
    DiskLocator when done
    if (%percentFinished.GetType().Name == "PvsDiskLocator")
    {
        $thePvsDiskLocator = %percentFinished
    }
    else
    {
        %percentFinished.ToString() + "% finished" # display percent finished
        Start-Sleep -seconds 10 # wait 10 seconds more
    }
}
"Successful"
```

**Get-PvsDevice**

Get the fields for a Device, all Devices in a Collection, Site, Farm View,
or Farm. All Devices are returned if no parameters are passed.

One of these optional
Guid[] Guid or DeviceId: GUID of the Device to Get.
string[] Name or DeviceName: Name of Device to Get.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Get.
Guid[] CollectionId: GUID of the Collection to Get all Devices for.
Guid[] ServerId: GUID of the Server to Get all Devices for.
string[] ServerName: Name of the Server to Get all Devices for.
Guid[] DiskLocatorId: GUID of the DiskLocator to Get all Devices for.
Guid[] SiteViewId: GUID of the Site View to Get all Devices for.
Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.
Guid[] FarmViewId: GUID of the Farm View to Get all Devices for.
string[] FarmViewName: Name of the Farm View to Get all Devices for.
or one of these optional & resolutions
string[] CollectionName: Name of the Collection to Get all Devices for.
string[] DiskLocatorName: Name of the DiskLocator to Get all Devices for.
string[] SiteViewName: Name of the Site View to Get all Devices for.

One of these resolutions when needed
Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

One of these resolutions when needed
Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  DeviceName, CollectionId, ServerId, DiskLocatorId, SiteViewId, SiteId or FarmViewId

If only selected fields are needed, pass them in the Fields parameter as a string array.
Guid or DeviceId: Read-only GUID that uniquely identifies this Device.
Name or DeviceName: Computer name with no spaces. ASCII computer name characters Max Length=15
CollectionId: GUID of the Collection this Device is to be a member of.
  It is not used with CollectionName.
CollectionName: Name of the Collection this Device is to be a member of. SiteName or SiteId must also be used.

SiteId: GUID of the Site the CollectionName is to be a member of. This or SiteName is used with CollectionName.

SiteName: Name of the Site the CollectionName is to be a member of. This or SiteId is used with CollectionName.

Description: User description. Default="" Max Length=250

DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX-XX. Uniquely identifies the Device.

BootFrom: Device to boot from. Choices are 1 for vDisk, 2 for Hard Disk, and 3 for Floppy. This cannot be Set for a Device with Personal vDisk. Min=1, Max=3, Default=1

ClassName: Used by Automatic Update feature to match new versions of Disks to a Device. This cannot be Set for a Device with Personal vDisk. Default="" Max Length=41

Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

Enabled: True when it can be booted, false otherwise. This cannot be Set for a Device with Personal vDisk. Default=true

LocalDiskEnabled: If there is a local disk menu choice for the Device, this is true. This cannot be Set for a Device with Personal vDisk. Default=false

Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999

Authentication: Device log in authentication. Choices are 0 for none, 1 for User Name/Password, and 2 for Extern. This cannot be Set for a Device with Personal vDisk. Min=0, Max=2, Default=0

User: Name of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=20

Password: Password of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=100

Active: True if the Device is currently active, false otherwise. Default=false

Template: True if the Device is the template in its Collection, false otherwise. Default=false

AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0
AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

Type: 1 when it performs test of Disks, 2 when it performs maintenance on Disks, 3 when it has a Personal vDisk, 4 when it has a Personal vDisk and performs tests, 0 otherwise. Min=0, Max=4, Default=0

PvdDriveLetter: Read-only Personal vDisk Drive letter. Range is E to U and W to Z. Default="" Max Length=1

LocalWriteCacheDiskSize: The size in GB to format the Device cache file disk. If the value is 0, then the disk is not formatted. Min=0, Max=2048, Default=0

BdmBoot: Use BDM instead of PXE boot when set to true. Default=false

VirtualHostingPoolId: GUID that uniquely identifies the Virtual Hosting Pool for a VM. This is needed when Adding a VM device. Default=00000000-0000-0000-0000-000000000000

PvsDevice[]: If successful, the PvsDevice object(s) are returned.

**EXAMPLE 1: Get PvsDevice for Farm**

Get all PvsDevice for the Farm.

Get-PvsDevice

**EXAMPLE 2: Get PvsDevice for FarmView**

Get all PvsDevice for the FarmView named theFarmView.

Get-PvsDevice -FarmViewName theFarmView

**EXAMPLE 3: Get PvsDevice for Site**

Get all PvsDevice for the Site named theSite.
Get-PvsDevice -SiteName theSite

**EXAMPLE 4: Get PvsDevice for SiteView**

Get all PvsDevice for the SiteView named theSiteView in the Site named theSite.

Get-PvsDevice -SiteViewName theSiteView -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 5: Get PvsDevice for Collection**

Get all PvsDevice for the Collection named theCollection in the Site named theSite.

Get-PvsDevice -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 6: Get PvsDevice for DiskLocator**

Get all PvsDevice for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Get-PvsDevice -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 7: Get PvsDevice for Device**

Get the PvsDevice for the Device named theDevice.

Get-PvsDevice -Name theDevice

**EXAMPLE 8: Get PvsDevice and Enable**

Get all PvsDevice that are not Enabled and then Enables them.

Get-PvsDevice -Fields Enabled | Where-Object {$_ .Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsDevice

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Get-PvsDeviceBootstrap**

Get all Bootstrap files for a Device, and the MenuText for each.

One of these required

Guid[] Guid or DeviceId: GUID of the Device.
string[] Name or DeviceName: Name of the Device.
PvsPhysicalAddress[] DeviceMac: MAC of the Device.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
  DeviceId
If only selected fields are needed, pass them in the Fields parameter
as a string array.
These fields exist in the DeviceBootstrap array within each
PvsDeviceBootstrap returned.
Each array item is a PvsDeviceBootstrapList object.
  Name or Bootstrap: Name of the bootstrap file. Max Length=259
  MenuText: Text that is displayed in the Boot Menu. If this field has
  no value, the bootstrap value is used. Default=""
  ASCII Max Length=64
PvsDeviceBootstrap[]: If successful, the PvsDeviceBootstrap object(s)
are returned.

**EXAMPLE 1: Get PvsDeviceBootstrap for Device**
  Get all PvsDeviceBootstrap for the Device named theDevice.
  Get-PvsDeviceBootstrap -Name theDevice

**EXAMPLE 2: Get PvsDeviceBootstrap for Device MAC**
  Get all PvsDeviceBootstrap for the Device with MAC 02-50-F2-00-00-01.
  Get-PvsDeviceBootstrap -DeviceMac "02-50-F2-00-00-01"

Get-PvsDeviceCount
Get count of Devices in a Collection or View.
One of these required
  Guid CollectionId: GUID of the Collection to get the Device Count of.
  Guid SiteViewId: GUID of the Site View to get the Device Count of.
  Guid FarmViewId: GUID of the Farm View to get the Device Count of.
  string FarmViewName: Name of the Farm View to get the Device Count of.
or one of these required & resolutions
  string CollectionName: Name of the Collection to get the Device Count of.
  string SiteViewName: Name of the Site View to get the Device Count of.
One of these resolutions when needed
  Guid SiteId: GUID of the Site.
  string SiteName: Name of the Site.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

- CollectionId, SiteViewId or FarmViewId
- UInt32: If successful, the numeric value is returned

**EXAMPLE 1: Get-PvsDeviceCount** Returns the Number (or Count) of PvsDevice in PvsCollection

Get-PvsDeviceCount -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the
SiteName or SiteId is not also needed.

**EXAMPLE 2: Get-PvsDeviceCount** Returns the Number (or Count) of PvsDevice in PvsFarmView

Get-PvsDeviceCount -FarmViewName theFarmView

**EXAMPLE 3: Get-PvsDeviceCount** Returns the Number (or Count) of PvsDevice in PvsSiteView

Get-PvsDeviceCount -SiteViewName theSiteView -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or
SiteId is not also needed.

**Get-PvsDeviceDiskLocatorEnabled**

Return true if a Device/DiskLocator is enabled.

One of these required

- Guid Guid or DeviceId: Device GUID, to see if the DiskLocator for it
  is enabled.
- string Name or DeviceName: Device name, to see if the DiskLocator for
  it is enabled.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device, to see if the
  DiskLocator for it is enabled.

This required

- Guid DiskLocatorId: DiskLocator GUID, to see if it is enabled for the
  Device.

or this required & resolution

- string DiskLocatorName: DiskLocator name, to see if it is enabled for
  the Device.

One of these resolutions when needed

- Guid StoreId: GUID of the Store that is needed when a DiskLocatorName
  is used.
- string StoreName: Name of the Store that is needed when a
  DiskLocatorName is used.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
DeviceId or DiskLocatorId
String: If successful, the String value is returned.

**EXAMPLE 1: Get-PvsDeviceDiskLocatorEnabled Determine if PvsDevice/PvsDiskLocator is Enabled**

Get-PvsDeviceDiskLocatorEnabled -Name theDevice -DiskLocatorName theDiskLocator -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the StoreName or StoreId are not also needed.

**Get-PvsDeviceInfo**

Get the fields and status for a Device, all Devices in a Collection, Site, Farm View, or Farm. All Devices are returned if no parameters are passed.

One of these optional

  Guid[] Guid or DeviceId: GUID of the Device to Get.
  string[] Name or DeviceName: Name of Device to Get.
  PvsPhysicalAddress[] DeviceMac: MAC of the Device to Get.
  Guid[] CollectionId: GUID of the Collection to Get all Devices for.
  Guid[] ServerId: GUID of the Server to Get all Devices for.
  string[] ServerName: Name of the Server to Get all Devices for.
  Guid[] DiskLocatorId: GUID of the DiskLocator to Get all Devices for.
  Guid[] SiteViewId: GUID of the Site View to Get all Devices for.
  Guid[] SiteId: GUID of the Site.
  string[] SiteName: Name of the Site.
  Guid[] FarmViewId: GUID of the Farm View to Get all Devices for.
  string[] FarmViewName: Name of the Farm View to Get all Devices for.

or one of these optional & resolutions

  string[] CollectionName: Name of the Collection to Get all Devices for.
  string[] DiskLocatorName: Name of the DiskLocator to Get all Devices for.
  string[] SiteViewName: Name of the Site View to Get all Devices for.

Optional

  SwitchParameter OnlyActive: If -OnlyActive is specified, include only the active Devices, otherwise all Devices are returned. Only active Devices are always returned for ServerId, ServerName, or version.
  uint MakLicenseActivated: Optional MAK licensing indicator value to only return active Devices for. Values are: 0 (MAK not used), 1 (Not Activated), 2 (Activated).
  uint Version: Version of the Disk to Get all active Devices for. This is used with DiskLocatorId or DiskLocatorName.
One of these resolutions when needed
Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

One of these resolutions when needed
Guid[] StoreId: GUID of the Store that is needed when a
DiskLocatorName is used.
string[] StoreName: Name of the Store that is needed when a
DiskLocatorName is used.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
DeviceName, CollectionId, ServerId, DiskLocatorId, SiteViewId, SiteId
or FarmViewId

If only selected fields are needed, pass them in the Fields parameter
as a string array.
Guid or DeviceId: Read-only GUID that uniquely identifies this Device.
Name or DeviceName: Computer name with no spaces. ASCII computer name
characters Max Length=15
CollectionId: GUID of the Collection this Device is to be a member of.
It is not used with CollectionName.
CollectionName: Name of the Collection this Device is to be a member of.
SiteName or SiteId must also be used.
SiteId: GUID of the Site the CollectionName is to be a member of. This
or SiteId is used with CollectionName.
SiteName: Name of the Site the CollectionName is to be a member of.
This or SiteId is used with CollectionName.
Description: User description. Default="" Max Length=250
DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX.
Uniquely identifies the Device.
BootFrom: Device to boot from. Choices are 1 for vDisk, 2 for Hard
Disk, and 3 for Floppy. This cannot be Set for a Device with Personal vDisk. Min=1, Max=3, Default=1
ClassName: Used by Automatic Update feature to match new versions of
Disks to a Device. This cannot be Set for a Device with Personal vDisk. Default="" Max Length=41
Port: UDP port to use with Stream Service. Min=1025, Max=65534,
Default=6901
Enabled: True when it can be booted, false otherwise. This cannot be
Set for a Device with Personal vDisk. Default=true
LocalDiskEnabled: If there is a local disk menu choice for the Device,
this is true. This cannot be Set for a Device with Personal vDisk. Default=false
Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 400 is Collection Operator. Default=999

Authentication: Device log in authentication. Choices are 0 for none, 1 for User Name/Password, and 2 for Extern. This cannot be set for a Device with Personal vDisk. Min=0, Max=2, Default=0

User: Name of user to authenticate before the boot process continues. This cannot be set for a Device with Personal vDisk. Default="" ASCII Max Length=20

Password: Password of user to authenticate before the boot process continues. This cannot be set for a Device with Personal vDisk. Default="" ASCII Max Length=100

Active: True if the Device is currently active, false otherwise. Default=false

Template: True if the Device is the template in its Collection, false otherwise. Default=false

AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

Type: 1 when it performs test of Disks, 2 when it performs maintenance on Disks, 3 when it has a Personal vDisk, 4 when it has a Personal vDisk and performs tests, 0 otherwise. Min=0, Max=4, Default=0

PvdDriveLetter: Read-only Personal vDisk Drive letter. Range is E to U and W to Z. Default="" Max Length=1
LocalWriteCacheDiskSize: The size in GB to format the Device cache file disk. If the value is 0, then the disk is not formatted. Min=0, Max=2048, Default=0

BdmBoot: Use BDM instead of PXE boot when set to true. Default=false

VirtualHostingPoolId: GUID that uniquely identifies the Virtual Hosting Pool for a VM. This is needed when Adding a VM device. Default=00000000-0000-0000-0000-000000000000

Ip: Read-only IP of the Device. It is equal to 0.0.0.0 if the Device is not active.

ServerPortConnection: Read-only Port of the Server that the Device is using. It is equal to 0 if the Device is not active. Default=0

ServerIpConnection: Read-only IP of the Server that the Device is using. It is equal to 0.0.0.0 if the Device is not active.

ServerId: Read-only GUID of the Server that the Device is using. It is equal to 00000000-0000-0000-0000-000000000000 if the Device is not active.

ServerName: Read-only Name of the Server that the Device is using. It is equal to "" if the Device is not active.

DiskLocatorId: Read-only GUID of the Disk Locator that the Device is using. It is equal to 00000000-0000-0000-0000-000000000000 if the Device is not active.

DiskLocatorName: Read-only name of the Disk Locator File that the Device is using. It is equal to the list of Disk Locator names for the Device if the Device is not active.

DiskVersion: Read-only version of the Disk Locator File that the Device is using. It is equal to 0 if the Device is not active. Default=0

DiskVersionAccess: State of the Disk Version. Values are: 0 (Production), 1 (Maintenance), 2 (MaintenanceHighestVersion), 3 (Override), 4 (Merge), 5 (MergeMaintenance), 6 (MergeTest), and 7 (Test). It is equal to 0 if the Device is not active. Default=0

DiskFileName: Name of the Disk File including the extension. It is equal to "" if the Device is not active.

Status: 1 or 2 numbers in the format n,n. They are the number of retries and if ram cache is being used, ram cache percent used. It is equal to "" if the Device is not active.

LicenseType: 0 when None, 1 for Desktop, 2 for Server, 5 for OEM SmartClient, 6 for XenApp, 7 for XenDesktop. It is equal to 0 if the Device is not active. Default=0
MakLicenseActivated: Read-only indicator if MAK licensing is being used and is activated. Values are: 0 (MAK not used), 1 (Not Activated), 2 (Activated). It is equal to 0 if the Device is not active. Default=0

Model: Oem Only: Read-only model of the computer. Values are OptiPlex 745, 755, 320, 760, FX160, or Default. It is equal to "" if the Device is not active.

License: Oem Only: Read-only type of the license. Values are 0 when None, 1 or 2 when Desktop. It is equal to 0 if the Device is not active. Default=0

PvsDeviceInfo[]: If successful, the PvsDeviceInfo object(s) are returned.

**EXAMPLE 1: Get PvsDeviceInfo for Farm**
Get all PvsDeviceInfo for the Farm.
Get-PvsDeviceInfo

**EXAMPLE 2: Get PvsDeviceInfo for FarmView**
Get all PvsDeviceInfo for the FarmView named theFarmView.
Get-PvsDeviceInfo -FarmViewName theFarmView

**EXAMPLE 3: Get PvsDeviceInfo for Site**
Get all PvsDeviceInfo for the Site named theSite.
Get-PvsDeviceInfo -SiteName theSite

**EXAMPLE 4: Get PvsDeviceInfo for SiteView**
Get all PvsDeviceInfo for the SiteView named theSiteView in the Site named theSite.
Get-PvsDeviceInfo -SiteViewName theSiteView -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 5: Get PvsDeviceInfo for Collection**
Get all PvsDeviceInfo for the Collection named theCollection in the Site named theSite.
Get-PvsDeviceInfo -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 6: Get PvsDeviceInfo for DiskLocator**
Get all PvsDeviceInfo for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.
Get-PvsDeviceInfo -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore
DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 7: Get PvsDeviceInfo for Device**

Get the PvsDeviceInfo for the Device named theDevice.

```
Get-PvsDeviceInfo -Name theDevice
```

**EXAMPLE 8: Get PvsDeviceInfo and Enable**

Get all PvsDeviceInfo that are not Enabled and then Enables them.

```
Get-PvsDeviceInfo -Fields Enabled | Where-Object {$_ Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsDevice
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Get-PvsDevicePersonality**

Get the Device Personality names and values.

One of these required

- Guid[] Guid or DeviceId: GUID of the Device.
- string[] Name or DeviceName: Name of the Device.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  - DeviceId

If only selected fields are needed, pass them in the Fields parameter as a string array.

These fields exist in the DevicePersonality array within each PvsDevicePersonality returned.

Each array item is a PvsDevicePersonalityList object.

- Name: Name of the Device personality item. Max Length=250
- Value: Value for the Device personality item. Max Length=1000

PvsDevicePersonality[]: If successful, the PvsDevicePersonality object(s) are returned.

**EXAMPLE 1: Get PvsDevicePersonality for Device**

Get all PvsDevicePersonality for the Device named theDevice.

```
Get-PvsDevicePersonality -Name theDevice
```
EXAMPLE 2: Get PvsDevicePersonality for Device MAC

Get all PvsDevicePersonality for the Device with MAC 02-50-F2-00-00-01.

Get-PvsDevicePersonality -DeviceMac "02-50-F2-00-00-01"

Get-PvsDeviceStatus

Get the DeviceStatus fields for a Device or all Devices for a Server, Disk Locator, or Farm. All Devices are returned if no parameters are passed.

One of these optional

Guid[] Guid or DeviceId: GUID of the Device to Get status for.
string[] Name or DeviceName: Name of Device to Get status for.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Get status for.
Guid[] ServerId: GUID of the Server to Get all Device Status for.
string[] ServerName: Name of the Server to Get all Device Status for.
Guid[] DiskLocatorId: GUID of the Disk Locator to Get all DeviceStatus for.
Guid[] CollectionId: GUID of the Collection to Get all DeviceStatus for.

or one of these optional & resolutions

string[] DiskLocatorName: Name of the Disk Locator File to Get all DeviceStatus for.
string[] CollectionName: Name of the Collection to Get all DeviceStatus for.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId, ServerId, DiskLocatorId or CollectionId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or DeviceId: Read-only GUID of the Device. Can be used with Get Device.
Name or DeviceName: Read-only Name of the Device. Can be used with Get Device.

Ip: Read-only IP of the Device.

ServerPortConnection: Read-only Port of the Server that the Device is using. Default=0

ServerIpConnection: Read-only IP of the Server that the Device is using.

ServerId: Read-only GUID of the Server that the Device is using.

ServerName: Read-only Name of the Server that the Device is using.

DiskLocatorId: Read-only GUID of the Disk Locator that the Device is using.

DiskLocatorName: Read-only name of the Disk Locator File that the Device is using.

DiskVersion: Read-only version of the Disk Locator File that the Device is using. Default=0

DiskVersionAccess: State of the Disk Version. Values are: 0 (Production), 1 (Maintenance), 2 (MaintenanceHighestVersion), 3 (Override), 4 (Merge), 5 (MergeMaintenance), 6 (MergeTest), and 7 (Test) Default=0

DiskFileName: Name of the Disk File including the extension.

Status: 1 or 2 numbers in the format n,n. They are the number of retries and if ram cache is being used, ram cache percent used.

LicenseType: 0 when None, 1 for Desktop, 2 for Server, 5 for OEM SmartClient, 6 for XenApp, 7 for XenDesktop. Default=0

MakLicenseActivated: Read-only indicator if MAK licensing is being used and is activated. Values are: 0 (MAK not used), 1 (Not Activated), 2 (Activated). Default=0

PvsDeviceStatus[]: If successful, the PvsDeviceStatus object(s) are returned.

EXAMPLE 1: Get PvsDeviceStatus for Farm
   Get all PvsDeviceStatus for the Farm.
   Get-PvsDeviceStatus

EXAMPLE 2: Get PvsDeviceStatus for FarmView
   Get all PvsDeviceStatus for the FarmView named theFarmView.
   Get-PvsDeviceStatus -FarmViewName theFarmView

EXAMPLE 3: Get PvsDeviceStatus for Site
   Get all PvsDeviceStatus for the Site named theSite.
   Get-PvsDeviceStatus -SiteName theSite
EXAMPLE 4: Get PvsDeviceStatus for SiteView

Get all PvsDeviceStatus for the SiteView named theSiteView in the Site named theSite.

Get-PvsDeviceStatus -SiteViewName theSiteView -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

EXAMPLE 5: Get PvsDeviceStatus for Collection

Get all PvsDeviceStatus for the Collection named theCollection in the Site named theSite.

Get-PvsDeviceStatus -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 6: Get PvsDeviceStatus for DiskLocator

Get all PvsDeviceStatus for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Get-PvsDeviceStatus -DiskLocatorName theDiskLocator -SiteName theSite
  -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 7: Get PvsDeviceStatus for Device

Get the PvsDeviceStatus for the Device named theDevice.

Get-PvsDeviceStatus -Name theDevice

Get-PvsDirectory

Look for Directories or Drives on the Server specified. Return a String array of the Directories or Drives found.

One of these required

Guid Guid or ServerId: GUID of the Server to get a list of Directories or Drives.

string Name or ServerName: Name of the Server to get a list of Directories or Drives.

Optional

string Path: Path to get list of Directories for. If not specified, the Drives are returned.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

  ServerId

string[]: If successful, the array of directory names is returned.
**EXAMPLE 1: Get-PvsDirectory for Name**
Get-PvsDirectory -Name theServer -Path "C:\directory"

**EXAMPLE 2: Get-PvsDirectory for PvsServer Using Pipe**
The Get-PvsServer output is piped to the Get-PvsDirectory.
Get-PvsServer -Name theServer -Fields Guid | Get-PvsDirectory -Path "C:\directory"

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**Get-PvsDisk**
Get the fields for a single disk.
This required
Guid[] Guid or DiskLocatorId: GUID of the Disk Locator.
or this required & resolution
string[] Name or DiskLocatorName: Name of the Disk Locator.
One of these resolutions when needed
Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.
One of these resolutions when needed
Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DiskLocatorId
If only selected fields are needed, pass them in the Fields parameter as a string array.
Class: Class of the Disk. Max Length=40
ImageType: Type of this image (software type). Max Length=40
DiskSize: Read-only size of the image. The value is 0 when it is not available. Default=0
VhdBlockSize: Block size in KB. For VHD it is only used with Dynamic type. Tested sizes for VHD are 512, 2048, and 16384. VHD Min=512, Max=16384, Default=2048. For VHDX it is used for all types. Tested size for VHDX is 32768. VHDX Min=1024, Max=262144, Default=32768. Default=0
LogicalSectorSize: Logical Sector Size. Values are: 512, 4096, Default=512

WriteCacheSize: RAM cache size (MB). Not 0 when used with Cache in Device RAM, and Cache in Device RAM with Overflow on Hard Disk. A value of 0 will disable the RAM use for Cache in Device RAM with Overflow on Hard Disk. Min=0, Max=131072, Default=0

AutoUpdateEnabled: Automatically update this image for matching Devices when set to true. Default false

ActivationDateEnabled: Use activation date to activate image when set to true. Default false

AdPasswordEnabled: Enable AD password management when set to true.

HaEnabled: Enable HA when set to true.

PrinterManagementEnabled: Invalid printers will be deleted from the Device when set to true.

WriteCacheType: 0 (Private), (other values are standard image) 1 (Cache on Server), 3 (Cache in Device RAM), 4 (Cache on Device Hard Disk), 6 (Device RAM Disk), 7 (Cache on Server, Persistent), or 9 (Cache in Device RAM with Overflow on Hard Disk). Min=0, Max=9, Default=0

LicenseMode: 0 (None), 1 (Multiple Activation Key), or 2 (Key Management Service). Min=0, Max=2, Default=0

ActiveDate: Date to activate the disk if AutoUpdateEnabled and activationDateEnabled are true. Has the date. Empty when the AutoUpdateEnabled or activationDateEnabled are false.

LongDescription: Description of the Disk. Max Length=399

SerialNumber: User defined serial number. Max Length=36

Date: User defined date. Max Length=40

Author: User defined author. Max Length=40

Title: User defined title. Max Length=40

Company: User defined company. Max Length=40

InternalName: User defined name. Max Length=63

OriginalFile: User defined original file. Max Length=127

HardwareTarget: User defined hardware target. Max Length=127

MajorRelease: User defined major release number. Min=0, Max=4294967295, Default=0

MinorRelease: User defined minor release number. Min=0, Max=4294967295, Default=0

Build: User defined build number. Min=0, Max=4294967295, Default=0

VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false
PvsDisk[]: If successful, the PvsDisk object(s) are returned.

**EXAMPLE 1: Get PvsDisk for DiskLocator**

Get the PvsDisk for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Get-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Get-PvsDiskInfo**

Get the fields for a Disk and Disk Locator or all Disks and Disk Locators for a Device, Server, Store, Site, or Farm. All Disks and DiskLocators are returned if no parameters are passed.

One of these optional

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Get.

Guid[] DeviceId: GUID of the Device to Get all DiskLocators for.

string[] DeviceName: Name of the Device to Get all DiskLocators for.

PvsPhysicalAddress[] DeviceMac: MAC of the Device to Get all DiskLocators for.

Guid[] ServerId: GUID of the Server to Get all DiskLocators for.

string[] ServerName: Name of the Server to Get all DiskLocators for.

Guid[] UpdateTaskId: GUID of the Update Task to Get all DiskLocators for.

Guid[] SiteId: GUID of the Site to Get all DiskLocators for.

string[] SiteName: Name of the Site to Get all DiskLocators for.

or one of these optional & resolutions

string[] Name or DiskLocatorName: Name of the Disk Locator File to Get.

Guid[] StoreId: GUID of the Store to Get all DiskLocators for.

string[] StoreName: Name of the Store to Get all DiskLocators for.

string[] UpdateTaskName: Name of the Update Task to Get all DiskLocators for.

One of these optional

SwitchParameter Single: If -Single is specified, include single server connection. If this and All are not included, both connection types are included.

SwitchParameter All: If -All is specified, include all server connections for the store. If this and Single are not included, both connection types are included.

Optional
SwitchParameter OnlyActive: If -OnlyActive is specified, include only the active DiskLocators. If not included, all DiskLocators are returned.

SwitchParameter UpdateDevice: If -UpdateDevice is specified, include only DiskLocators that have an Update Device.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to Get all DiskLocators for.

string[] SiteName: Name of the Site to Get all DiskLocators for.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store to Get all DiskLocators for.

string[] StoreName: Name of the Store to Get all DiskLocators for.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

   DiskLocatorId, DeviceId, ServerId, UpdateTaskId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or DiskLocatorId: Read-only GUID that uniquely identifies this Disk Locator.

Name or DiskLocatorName: Name of the Disk Locator File. It is unique within the Store. ASCII Max Length=52

SiteId: GUID of the Site this DiskLocator is to be a member of. It is not used with SiteName.

SiteName: Name of the Site this DiskLocator is to be a member of. It is not used with SiteId.

StoreId: GUID of the Store that this Disk Locator is a member of.

   SiteName or SiteId must also be used. It is not used with StoreName.

StoreName: Name of the Store that this Disk Locator is a member of.

   SiteName or SiteId must also be used. It is not used with StoreId.

Description: User description. Default="" Max Length=250

MenuText: Text that is displayed in the Boot Menu. If this field has no value, the name value is used. Default="" ASCII Max Length=64

ServerId: GUID of the single Server that this Disk Locator is assigned to. It is not used with ServerName. Default=00000000-0000-0000-0000-000000000000

ServerName: Name of the single Server that this Disk Locator is assigned to. It is not used with ServerId. Default=""

Enabled: True when this disk can be booted, false otherwise.

Default=true
Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, 300 is Collection Administrator, and 999 is read-only. Default=999

Mapped: True if the Disk is currently mapped, false otherwise. Default=false

EnabledForDevice: True when this disk is enabled for the Device specified, false otherwise. This is only returned when a Device is specified. Default=true

Active: True if the DiskLocator is currently active, false otherwise. Default=false

RebalanceEnabled: True when this Server can automatically rebalance Devices, false otherwise. Default=false

RebalanceTriggerPercent: Percent over fair load that triggers a dynamic Device rebalance. Min=5, Max=5000, Default=25

SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=None, 1=Best Effort, 2=Fixed. Min=0, Max=2, Default=0

DiskUpdateDeviceId: GUID of the DiskUpdateDevice that is used when updates are performed. Default=00000000-0000-0000-0000-000000000000

DiskUpdateDeviceName: Name of the DiskUpdateDevice that is used when updates are performed. Default=""

Class: Class of the Disk. Max Length=40

ImageType: Type of this image (software type). Max Length=40

DiskSize: Read-only size of the image. The value is 0 when it is not available. Default=0

VhdBlockSize: Block size in KB. For VHD it is only used with Dynamic type. Tested sizes for VHD are 512, 2048, and 16384. VHD Min=512, Max=16384, Default=2048. For VHDX it is used for all types. Tested size for VHDX is 32768. VHDX Min=1024, Max=262144, Default=32768. Default=0

LogicalSectorSize: Logical Sector Size. Values are: 512, 4096, Default=512

WriteCacheSize: RAM cache size (MB). Not 0 when used with Cache in Device RAM, and Cache in Device RAM with Overflow on Hard Disk. A value of 0 will disable the RAM use for Cache in Device RAM with Overflow on Hard Disk. Min=0, Max=131072, Default=0

AutoUpdateEnabled: Automatically update this image for matching Devices when set to true. Default false

ActivationDateEnabled: Use activation date to activate image when set to true. Default false

AdPasswordEnabled: Enable AD password management when set to true.

HaEnabled: Enable HA when set to true.
PrinterManagementEnabled: Invalid printers will be deleted from the Device when set to true.

WriteCacheType: 0 (Private), (other values are standard image) 1 (Cache on Server), 3 (Cache in Device RAM), 4 (Cache on Device Hard Disk), 6 (Device RAM Disk), 7 (Cache on Server, Persistent), or 9 (Cache in Device RAM with Overflow on Hard Disk). Min=0, Max=9, Default=0

LicenseMode: 0 (None), 1 (Multiple Activation Key), or 2 (Key Management Service). Min=0, Max=2, Default=0

ActiveDate: Date to activate the disk if AutoUpdateEnabled and activationDateEnabled are true. Has the date. Empty when the AutoUpdateEnabled or activationDateEnabled are false.

LongDescription: Description of the Disk. Max Length=399

SerialNumber: User defined serial number. Max Length=36

Date: User defined date. Max Length=40

Author: User defined author. Max Length=40

Title: User defined title. Max Length=40

Company: User defined company. Max Length=40

InternalName: User defined name. Max Length=63

OriginalFile: User defined original file. Max Length=127

HardwareTarget: User defined hardware target. Max Length=127

MajorRelease: User defined major release number. Min=0, Max=4294967295, Default=0

MinorRelease: User defined minor release number. Min=0, Max=4294967295, Default=0

Build: User defined build number. Min=0, Max=4294967295, Default=0

VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false

DeviceCount: Read-only count of Devices. Default=0

Locked: True if the Disk is currently locked, false otherwise. Default=false

PvsDiskInfo[]: If successful, the PvsDiskInfo object(s) are returned.

**EXAMPLE 1: Get PvsDiskInfo for Farm**

Get all PvsDiskInfo for the Farm.

Get-PvsDiskInfo

**EXAMPLE 2: Get PvsDiskInfo for Site**

Get all PvsDiskInfo for the Site named theSite.

Get-PvsDiskInfo -SiteName theSite
EXAMPLE 3: Get PvsDiskInfo for Site and Store

Get all PvsDiskInfo for the Site named theSite and Store named theStore.

Get-PvsDiskInfo -SiteName theSite -StoreName theStore

EXAMPLE 4: Get PvsDiskInfo for DiskLocator

Get the PvsDiskInfo for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Get-PvsDiskInfo -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 5: Get PvsDiskInfo and Enable

Get all PvsDiskInfo that are not Enabled and then Enables them.

Get-PvsDiskInfo -Fields Enabled | Where-Object {$_ Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsDiskLocator

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Get-PvsDiskInventory

Get the fields for Inventory Status of a Disk Version or all Disk Versions for a Disk Locator.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Get Disk Version Inventory of.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator to Get Disk Version Inventory of.

Optional

uint Version: Specific Version to Get.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

(DiskLocatorId and Version) or DiskLocatorId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Version: Version number. The base disk is version 0, the other version numbers are in part of the file name.

ServerId: GUID of the Server that the Disk Version Inventory is being reported about.

ServerName: Name of the Server that the Disk Version Inventory is being reported about.

FilePath: Path used to access the disk version from the Server. Empty if the information is not available.

FileTime: Date/Time of the date version file. Has the date and time without milliseconds. Empty if the information is not available.

PropertiesTime: Date/Time of the disk properties. Has the date and time without milliseconds. Empty if the information is not available.

State: The number code of the inventory state. Values are: 0 (Up to date), 1 (version file is missing), 2 (version file is out of date), 3 (properties are missing), 4 (properties are out of date), 5 (server is not reachable).

Active: 1 if the Server is currently active, 2 if unknown, and 0 otherwise.

PvsDiskInventory[]: If successful, the PvsDiskInventory object(s) are returned.

**EXAMPLE 1: Get PvsDiskInventory for DiskLocator**

Get all PvsDiskInventory for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Get-PvsDiskInventory -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Get-PvsDiskLocator**

Get the fields for a Disk Locator or all Disk Locators for a Device, Server, Store, Site, or Farm. All DiskLocators are returned if no parameters are passed.
One of these optional

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Get.
Guid[] DeviceId: GUID of the Device to Get all DiskLocators for.
string[] DeviceName: Name of the Device to Get all DiskLocators for.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Get all DiskLocators for.
Guid[] ServerId: GUID of the Server to Get all DiskLocators for.
string[] ServerName: Name of the Server to Get all DiskLocators for.
Guid[] UpdateTaskId: GUID of the Update Task to Get all DiskLocators for.
Guid[] SiteId: GUID of the Site to Get all DiskLocators for.
string[] SiteName: Name of the Site to Get all DiskLocators for.
or one of these optional & resolutions

string[] Name or DiskLocatorName: Name of the Disk Locator File to Get.
Guid[] StoreId: GUID of the Store to Get all DiskLocators for.
string[] StoreName: Name of the Store to Get all DiskLocators for.
string[] UpdateTaskName: Name of the Update Task to Get all DiskLocators for.

One of these optional

SwitchParameter Single: If -Single is specified, include single server connection. If this and All are not included, both connection types are included.

SwitchParameter All: If -All is specified, include all server connections for the store. If this and Single are not included, both connection types are included.

Optional

SwitchParameter OnlyActive: If -OnlyActive is specified, include only the active DiskLocators. If not included, all DiskLocators are returned.

SwitchParameter UpdateDevice: If -UpdateDevice is specified, include only DiskLocators that have an Update Device.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to Get all DiskLocators for.
string[] SiteName: Name of the Site to Get all DiskLocators for.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store to Get all DiskLocators for.
string[] StoreName: Name of the Store to Get all DiskLocators for.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

DiskLocatorId, DeviceId, ServerId, UpdateTaskId, SiteId or StoreId

If only selected fields are needed, pass them in the Fields parameter
as a string array.

Guid or DiskLocatorId: Read-only GUID that uniquely identifies this
Disk Locator.

Name or DiskLocatorName: Name of the Disk Locator File. It is unique
within the Store. ASCII Max Length=52

SiteId: GUID of the Site this DiskLocator is to be a member of. It is
not used with SiteName.

SiteName: Name of the Site this DiskLocator is to be a member of. It
is not used with SiteId.

StoreId: GUID of the Store that this Disk Locator is a member of.
SiteName or SiteId must also be used. It is not used
with StoreName.

StoreName: Name of the Store that this Disk Locator is a member of.
SiteName or SiteId must also be used. It is not used
with StoreId.

Description: User description. Default="" Max Length=250

MenuText: Text that is displayed in the Boot Menu. If this field has
no value, the name value is used. Default="" ASCII
Max Length=64

ServerId: GUID of the single Server that this Disk Locator is assigned
to. It is not used with ServerName. Default=00000000-
0000-0000-0000-000000000000

ServerName: Name of the single Server that this Disk Locator is
assigned to. It is not used with ServerId. Default=""

Enabled: True when this disk can be booted, false otherwise.
   Default=true

Role: Read-only Role of the user for this item. 100 is Farm
   Administrator, 200 is Site Administrator, 300 is
   Collection Administrator, and 999 is read-only.
   Default=999

Mapped: True if the Disk is currently mapped, false otherwise.
   Default=false

EnabledForDevice: True when this disk is enabled for the Device
   specified, false otherwise. This is only returned
   when a Device is specified. Default=true

Active: True if the DiskLocator is currently active, false otherwise.
   Default=false

RebalanceEnabled: True when this Server can automatically rebalance
   Devices, false otherwise. Default=false
RebalanceTriggerPercent: Percent over fair load that triggers a dynamic Device rebalance. Min=5, Max=5000, Default=25

SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=None, 1=Best Effort, 2=Fixed. Min=0, Max=2, Default=0

DiskUpdateDeviceId: GUID of the DiskUpdateDevice that is used when updates are performed. Default=00000000-0000-0000-0000-000000000000

DiskUpdateDeviceName: Name of the DiskUpdateDevice that is used when updates are performed. Default=""

PvsDiskLocator[]: If successful, the PvsDiskLocator object(s) are returned.

**EXAMPLE 1: Get PvsDiskLocator for Farm**
Get all PvsDiskLocator for the Farm.
Get-PvsDiskLocator

**EXAMPLE 2: Get PvsDiskLocator for Site**
Get all PvsDiskLocator for the Site named theSite.
Get-PvsDiskLocator -SiteName theSite

**EXAMPLE 3: Get PvsDiskLocator for Site and Store**
Get all PvsDiskLocator for the Site named theSite and Store named theStore.
Get-PvsDiskLocator -SiteName theSite -StoreName theStore

**EXAMPLE 4: Get PvsDiskLocator for DiskLocator**
Get the PvsDiskLocator for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore
Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 5: Get PvsDiskLocator and Enable**
Get all PvsDiskLocator that are not Enabled and then Enables them.
Get-PvsDiskLocator -Fields Enabled | Where-Object {$_-Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsDiskLocator
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.
Get-PvsDiskLocatorCount

Get count of Disk Locators for a Site and Type.

One of these required

- Guid SiteId: GUID of the Site to get the Disk Locator Count of.
- string SiteName: Name of the Site to get the Disk Locator Count of.

One of these optional

- SwitchParameter Single: If -Single is specified, include single server connection. If this and All are not included, both connection types are included.
- SwitchParameter All: If -All is specified, include all server connections for the store. If this and Single are not included, both connection types are included.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  - SiteId
  - UInt32: If successful, the numeric value is returned

EXAMPLE 1: Get-PvsDiskLocatorCount Returns the Number (or Count) of PvsDiskLocator in PvsSite

Get-PvsDiskLocatorCount -SiteName theSite

Get-PvsDiskLocatorLock

Get the fields for all the locks of a Disk Locator.

This required

- Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Get the Locks.

or this required & resolution

- string[] Name or DiskLocatorName: Name of Disk Locator to Get the Locks.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

One of these resolutions when needed

- Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
- string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
DiskLocatorId
If only selected fields are needed, pass them in the Fields parameter as a string array.
Exclusive: True when the lock is exclusive, false when it is shared. Default=false
DeviceId: GUID of the Device that has the lock, will be 00000000-0000-0000-0000-000000000000 if a Server has the lock.
DeviceName: Name of the Device that has the lock, will not be included if a Server has the lock.
ServerId: GUID of the Server that has the lock, will be 00000000-0000-0000-0000-000000000000 if a Device has the lock.
ServerName: Name of the Server that has the lock, will not be included if a Device has the lock.
ReadOnly: True when lock is because file system is read only, false when file system is read write Default=false
PvsDiskLocatorLock[]: If successful, the PvsDiskLocatorLock object(s) are returned.

**EXAMPLE 1: Get PvsDiskLocatorLock for DiskLocator**

Get all PvsDiskLocatorLock for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.
Get-PvsDiskLocatorLock -Name theDiskLocator -SiteName theSite -StoreName theStore
Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Get-PvsDiskUpdateDevice**

Get the fields and status for a Disk Update Device, or all Disk Update Devices for a Site, Server, DiskLocator or Farm. All Disk Update Devices are returned if no parameters are passed.

One of these optional
- Guid[] Guid or DeviceId: GUID of the Disk Update Device to Get.
- string[] Name or DeviceName: Name of Disk Update Device to Get.
- PvsPhysicalAddress[] DeviceMac: MAC of the Disk Update Device to Get.
- Guid[] ServerId: GUID of the Server to Get all Disk Update Devices for.
- string[] ServerName: Name of the Server to Get all Disk Update Devices for.
- Guid[] DiskLocatorId: GUID of the DiskLocator to Get the Disk Update Device for.
- Guid[] UpdateTaskId: GUID of the Update Task to Get all Disk Update Devices for.
- Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

or one of these optional & resolutions

string[] DiskLocatorName: Name of the DiskLocator to Get the Disk Update Device for.

string[] UpdateTaskName: Name of the Update Task to Get all Disk Update Devices for.

Optional

SwitchParameter OnlyActive: If -OnlyActive is specified, include only the active Disk Update Devices. Only active Disk Update Devices are always returned for ServerId or ServerName.

class uint MakLicenseActivated: Optional MAK licensing indicator value to only return active Disk Update Devices for. Values are: 0 (MAK not used), 1 (Not Activated), 2 (Activated).

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId, ServerId, DiskLocatorId, UpdateTaskId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or DeviceId: Read-only GUID that uniquely identifies this Device.

Name or DeviceName: Computer name with no spaces. ASCII computer name characters Max Length=15

VirtualHostingPoolId: GUID of the Virtual Hosting Pool. It is not used with VirtualHostingPoolName. Default=00000000-0000-0000-0000-000000000000

VirtualHostingPoolName: Name of the Virtual Hosting Pool.

DiskLocatorId: GUID of the Disk Locator to update with this Device.

DiskLocatorName: Name of the Disk Locator File to update with this Device.

SiteId: GUID of the Site this Disk Update Device is to be a member of.
SiteName: Name of the Site this Disk Update Device is to be a member of.

StoreId: GUID of the Store that the Disk Locator is a member of.

StoreName: Name of the Store that the Disk Locator is a member of.

Description: User description. Default="" Max Length=250

DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX-XX. Uniquely identifies the Device.

Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

Active: True if the Device is currently active, false otherwise. Default=false

AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

Ip: Read-only IP of the Device. It is equal to 0.0.0.0 if the Device is not active.

ServerPortConnection: Read-only Port of the Server that the Device is using. It is equal to 0 if the Device is not active. Default=0

ServerIpConnection: Read-only IP of the Server that the Device is using. It is equal to 0.0.0.0 if the Device is not active.

ServerId: Read-only GUID of the Server that the Device is using. It is equal to 00000000-0000-0000-0000-000000000000 if the Device is not active.
ServerName: Read-only Name of the Server that the Device is using. It is equal to "" if the Device is not active.

DiskVersion: Read-only version of the Disk Locator File that the Device is using. It is equal to 0 if the Device is not active. Default=0

Status: 1 or 2 numbers in the format n,n. They are the number of retries and if ram cache is being used, ram cache percent used. It is equal to "" if the Device is not active.

LicenseType: 0 when None, 1 for Desktop, 2 for Server, 5 for OEM SmartClient, 6 for XenApp, 7 for XenDesktop. It is equal to 0 if the Device is not active. Default=0

MakLicenseActivated: Read-only indicator if MAK licensing is being used and is activated. Values are: 0 (MAK not used), 1 (Not Activated), 2 (Activated). It is equal to 0 if the Device is not active. Default=0

Model: Oem Only: Read-only model of the computer. Values are OptiPlex 745, 755, 320, 760, FX160, or Default. It is equal to "" if the Device is not active.

License: Oem Only: Read-only type of the license. Values are 0 when None, 1 or 2 when Desktop. It is equal to 0 if the Device is not active. Default=0

PvsDiskUpdateDevice[]: If successful, the PvsDiskUpdateDevice object(s) are returned.

**EXAMPLE 1: Get PvsDiskUpdateDevice for Farm**

Get all PvsDiskUpdateDevice for the Farm.

Get-PvsDiskUpdateDevice

**EXAMPLE 2: Get PvsDiskUpdateDevice for Site**

Get all PvsDiskUpdateDevice for the Site named theSite.

Get-PvsDiskUpdateDevice -SiteName theSite

**EXAMPLE 3: Get PvsDiskUpdateDevice for Server**

Get all PvsDiskUpdateDevice for the Server named theServer.

Get-PvsDiskUpdateDevice -ServerName theServer

**EXAMPLE 4: Get PvsDiskUpdateDevice for DiskLocator**

Get all PvsDiskUpdateDevice for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Get-PvsDiskUpdateDevice -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.
EXAMPLE 5: Get PvsDiskUpdateDevice for Device

Get the PvsDiskUpdateDevice for the Device named theDevice.

Get-PvsDiskUpdateDevice -Name theDevice

EXAMPLE 6: Get PvsDiskUpdateDevice for Device MAC

Get the PvsDiskUpdateDevice for the Device with MAC 02-50-F2-00-00-01.

Get-PvsDiskUpdateDevice -DeviceMac "02-50-F2-00-00-01"

EXAMPLE 7: Get PvsDiskUpdateDevice for UpdateTask

Get the PvsDiskUpdateDevice for the UpdateTask named theUpdateTask in the Site named theSite.

Get-PvsDiskUpdateDevice -UpdateTaskName theUpdateTask -SiteName theSite

UpdateTaskId can be used instead of UpdateTaskName so that the SiteName or SiteId is not also needed.

Get-PvsDiskUpdateStatus

Get the status of an Update Task, or all Update Tasks for a Site or Farm. All Disk Update Tasks are returned if no parameters are passed.

One of these optional

Guid[] UpdateTaskId: GUID of the Update Task to Get.
Guid[] DeviceId: GUID of the Disk Update Device to Get Disk Update Status for.
string[] DeviceName: Name of the Disk Update Device to Get Disk Update Status for.
PvsPhysicalAddress[] DeviceMac: MAC of the Disk Update Device to Get Disk Update Status for.
Guid[] Guid or DiskUpdateTaskId: GUID of the Disk Update Task and Device relationship to Get Disk Update Status for.
Guid[] SiteId: GUID of the Site to Get all Update Tasks for. Also used with UpdateTaskName.
string[] SiteName: Name of the Site to Get all Update Tasks for. Also used with UpdateTaskName.

or this optional & resolution

string[] UpdateTaskName: Name of the Update Task to Get.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to Get all Update Tasks for. Also used with UpdateTaskName.
string[] SiteName: Name of the Site to Get all Update Tasks for. Also used with UpdateTaskName.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

UpdateTaskId, DeviceId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or DiskUpdateTaskId: GUID that uniquely identifies this Update Task and Device relationship.

UpdateTaskId: GUID that uniquely identifies the Update Task.

UpdateTaskName: Name of the Update Task.

Description: User description of the Update Task.

DiskLocatorId: GUID of the Disk Locator to update.

Name or DiskLocatorName: Name of the Disk Locator File to update.

VirtualHostingPoolId: GUID of the Virtual Hosting Pool being used for the update.

VirtualHostingPoolName: Name of the Virtual Hosting Pool being used for the update.

DeviceId: GUID that Device being used to do the update.

DeviceName: Name of the Device being used to do the update.

SiteId: GUID of the Site that this Update Task Name is a member of.

SiteName: Name of the Site that this Update Task Name is a member of.

StoreId: GUID of the Store that the Disk Locator is a member of.

StoreName: Name of the Store that the Disk Locator is a member of.

PreviousResult: Status of the last run. Values are: 0 (Ready), 1 (Update Pending), 2 (Preparing Image), 3 (Starting VM), 4 (Update In Progress), 5 (Stopping VM), 6 (Submitting Image), 7 (Reverting Image), 8 (Invalid), 9 (Aborted), 10 (Completed Successfully), 11 (No Updates) Min=0, Max=11, Default=0

PreviousResultMessage: Message string that includes the results of the last run. Default="" Max Length=255

CurrentStatus: Current status of the update. Values are: 0 (Ready), 1 (Update Pending), 2 (Preparing Image), 3 (Starting VM), 4 (Update In Progress), 5 (Stopping VM), 6 (Submitting Image), 7 (Reverting Image), 8 (Invalid), 9 (Aborted), 10 (Completed Successfully), 11 (No Updates) Min=0, Max=11, Default=0

CurrentStatusMessage: Message string that includes the results of the run. Default="" Max Length=255

PvsDiskUpdateStatus[]: If successful, the PvsDiskUpdateStatus object(s) are returned.

**EXAMPLE 1: Get PvsDiskUpdateStatus for Farm**

Get all PvsDiskUpdateStatus for the Farm.
Get-PvsDiskUpdateStatus

**EXAMPLE 2: Get PvsDiskUpdateStatus for Site**
Get all PvsDiskUpdateStatus for the Site named theSite.
Get-PvsDiskUpdateStatus -SiteName theSite

**EXAMPLE 3: Get PvsDiskUpdateStatus for Server**
Get all PvsDiskUpdateStatus for the Server named theServer.
Get-PvsDiskUpdateStatus -ServerName theServer

**EXAMPLE 4: Get PvsDiskUpdateStatus for DiskLocator**
Get all PvsDiskUpdateStatus for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.
Get-PvsDiskUpdateStatus -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 5: Get PvsDiskUpdateStatus for Device**
Get the PvsDiskUpdateStatus for the Device named theDevice.
Get-PvsDiskUpdateStatus -Name theDevice

**EXAMPLE 6: Get PvsDiskUpdateStatus for Device MAC**
Get the PvsDiskUpdateStatus for the Device with MAC 02-50-F2-00-00-01.
Get-PvsDiskUpdateStatus -DeviceMac "02-50-F2-00-00-01"

**EXAMPLE 7: Get PvsDiskUpdateStatus for UpdateTask**
Get the PvsDiskUpdateStatus for the UpdateTask named theUpdateTask in the Site named theSite.
Get-PvsDiskUpdateStatus -UpdateTaskName theUpdateTask -SiteName theSite

UpdateTaskId can be used instead of UpdateTaskName so that the SiteName or SiteId is not also needed.

**EXAMPLE 8: Get PvsDiskUpdateStatus for DiskUpdateTaskId**
Get the PvsDiskUpdateStatus for the Device named theDevice then uses the DiskUpdateTaskId of the PvsDiskUpdateStatus to get the future Get-PvsDiskUpdateStatus.

$u = Get-PvsDiskUpdateStatus -DeviceName theDevice -Fields DiskUpdateTaskId
Get-PvsDiskUpdateStatus -Guid $u.DiskUpdateTaskId

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
Get-PvsDiskVersion

Get the fields for a Disk Version or all Disk Versions for a Disk Locator.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Get Disk Versions of.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator to Get Disk Versions of.

One of these optional

uint Version: Specific Version to Get.

uint Type: When set to 1, get the Maintenance or MaintenanceHighestVersion access version if it exists. When set to 2, get the Test access versions if any exist. When set to 3, get the Override access version if it exists.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

(DiskLocatorId and Version) or DiskLocatorId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Version: Read-only version number. The base disk is version 0, the other version numbers are in part of the file name. Default=0

Description: User description. Default="" Max Length=250

Type: Read-only type of the Disk Version. Values are: 0 (Base), 1 (Manual), 2 (Automatic), 3 (Merge), and 4 (MergeBase) Min=0, Max=4, Default=0

CreateDate: Read-only Date/Time that the Disk Version was created. Default=getdate

ScheduledDate: Date/Time that the Disk Version is scheduled to become available. Has the date, hour and minute. Empty when the disk version is made available immediately. Default=Empty
DeleteWhenFree: Read-only true if the Disk Version is no longer needed because of a merge. If not current booted by a Device, it can be deleted. Default=false

Access: Read-only access of the Disk Version. Values are: 0 (Production), 1 (Maintenance), 2 (MaintenanceHighestVersion), 3 (Override), 4 (Merge), 5 (MergeMaintenance), 6 (MergeTest), and 7 (Test) Min=0, Max=7, Default=0

Name or DiskFileName: Name of the Disk File including the extension. Default=""

DeviceCount: Read-only count of Devices. Default=0

GoodInventoryStatus: True when the up to date file is accessible by all Servers, false otherwise. Default=false

TaskId: When a Merge is occurring, this will be set with the task number of the process that is occurring. Default=""

CanDelete: Read-only true when the version can be deleted. Default=false

CanMerge: Read-only true when the version can be update merged. Will be set for the highest version number. Default=false

CanMergeBase: Read-only true when the version can be base merged. Will be set for the highest version number. Default=false

CanPromote: Read-only true when the version can be promoted. Default=false

CanRevertTest: Read-only true when the version can be reverted to Test Access. Default=false

CanRevertMaintenance: Read-only true when the version can be reverted to Maintenance Access. Default=false

CanSetScheduledDate: Read-only true when the version can have the scheduled date modified. Default=false

CanOverride: Read-only true when the version can be set as the Override. Default=false

IsPending: Read-only true when the version ScheduledDate has not occurred. Default=false

PvsDiskVersion[]: If successful, the PvsDiskVersion object(s) are returned.

EXAMPLE 1: Get PvsDiskVersion for DiskLocator

Get all PvsDiskVersion for the DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Get-PvsDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.
EXAMPLE 2: Get PvsDiskVersion for DiskLocator

Get the first base PvsDiskVersion for the DiskLocator named theDiskLocator in Site named theSite and Store named theStore.

Get-PvsDiskVersion -Name theDiskLocator -Version 0 -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 3: Get Maintenance PvsDiskVersion for DiskLocator

Get the Maintenance PvsDiskVersion for the DiskLocator named theDiskLocator in Site named theSite and Store named theStore.

Get-PvsDiskVersion -Name theDiskLocator -Type 1 -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 4: Get Test PvsDiskVersion for DiskLocator

Get all Test PvsDiskVersion for the DiskLocator named theDiskLocator in Site named theSite and Store named theStore.

Get-PvsDiskVersion -Name theDiskLocator -Type 2 -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 5: Get Override PvsDiskVersion for DiskLocator

Get the Override PvsDiskVersion for the DiskLocator named theDiskLocator in Site named theSite and Store named theStore.

Get-PvsDiskVersion -Name theDiskLocator -Type 3 -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

Get-PvsExists

Return true if a Site, Server, Collection, View, Device, Store, Update Task or Virtual Hosting Pool Name is already used. If a CollectionName, SiteViewName, UpdateTaskName or VirtualHostingPoolName is specified, SiteName or SiteId must be included.

One of these required

string SiteName: Name of the Site.

string ServerName: Server name, to see if it is already used in the Farm.
string FarmViewName: Farm View name, to see if it is already used in the Farm.

string DeviceName: Device name, to see if it is already used in the Farm.

PvsPhysicalAddress[] DeviceMac: Device MAC, to see if it is already used in the Farm.

string StoreName: Store name, to see if it is already used.
or one of these required & resolutions

string CollectionName: Collection name, to see if it is already used in a Site.

string SiteViewName: Site View name, to see if it is already used in the Site.

string VirtualHostingPoolName: Virtual Hosting Pool name, to see if it is already used in a Site.

string UpdateTaskName: Update Task name, to see if it is already used in a Site.

string DiskLocatorName: DiskLocator name, to see if it is already used in a Site.

One of these resolutions when needed

string SiteName: Name of the Site.
Guid SiteId: GUID of the Site.

One of these resolutions when needed

Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string StoreName: Store name, to see if it is already used.

Boolean: If successful, $true or $false is returned.

**EXAMPLE 1: Get-PvsExists Determine if SiteName Already Exists**

Get-PvsExists -SiteName theName

**EXAMPLE 2: Get-PvsExists Determine if ServerName Already Exists**

Get-PvsExists -ServerName theName

**EXAMPLE 3: Get-PvsExists Determine if FarmViewName Already Exists**

Get-PvsExists -FarmViewName theName

**EXAMPLE 4: Get-PvsExists Determine if DeviceName Already Exists**

Get-PvsExists -DeviceName theName

**EXAMPLE 5: Get-PvsExists Determine if DeviceMac Already Exists**

Get-PvsExists -DeviceMac "00-11-22-33-44-55"

**EXAMPLE 6: Get-PvsExists Determine if StoreName Already Exists**

Get-PvsExists -StoreName theName
EXAMPLE 7: Get-PvsExists Determine if CollectionName Already Exists
Get-PvsExists -CollectionName theName -SiteName theSite
SiteId can be used instead of SiteName.

EXAMPLE 8: Get-PvsExists Determine if SiteViewName Already Exists
Get-PvsExists -SiteViewName theName -SiteName theSite
SiteId can be used instead of SiteName.

EXAMPLE 9: Get-PvsExists Determine if VirtualHostingPoolName Already Exists
Get-PvsExists -VirtualHostingPoolName theName -SiteName theSite
SiteId can be used instead of SiteName.

EXAMPLE 10: Get-PvsExists Determine if UpdateTaskName Already Exists
Get-PvsExists -UpdateTaskName theName -SiteName theSite
SiteId can be used instead of SiteName.

EXAMPLE 11: Get-PvsExists Determine if DiskLocatorName Already Exists
Get-PvsExists -DiskLocatorName theName -SiteName theSite -StoreName theStore
SiteId can be used instead of SiteName, and StoreId can be used instead of StoreName.

Get-PvsFarm
Get the fields for the Farm.
Optional
Guid[] Guid or FarmId: GUID of the Farm to Get. This is optional since there is only one Farm.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
FarmId
If only selected fields are needed, pass them in the Fields parameter as a string array.
Guid or FarmId: Read-only GUID that uniquely identifies this Farm.
Name or FarmName: Name of the Farm. Default="" Max Length=50
Description: User description. Default="" Max Length=250
AutoAddEnabled: True when Auto Add is enabled, false otherwise.
Default=false
AuditingEnabled: True when Auditing is enabled, false otherwise.
Default=false
LastAuditArchiveDate: Last date of Audit Trail data that was Archived. Has the date. Default=Empty
DefaultSiteId: GUID of the Site to place new Devices into automatically. Not used with defaultSiteName. Default=00000000-0000-0000-0000-000000000000

DefaultSiteName: Name of the Site to place new Devices into automatically. Not used with DefaultSiteId. Default=""

OfflineDatabaseSupportEnabled: True when Offline Database Support is enabled, false otherwise. Default=false

AdGroupsEnabled: Active Directory groups are used for authorization, when set to true. Windows groups are used when set to false. Default=false

LicenseServer: License server name. Default="" Max Length=255

LicenseServerPort: License server port. Min=1025, Max=65534, Default=27000

AutomaticMergeEnabled: True when Automatic Merge is enabled, false otherwise. If the number of versions becomes more than the MaxVersions value, a merge will occur at the end of PromoteDiskVersion. Default=true

MaxVersions: Maximum number a versions of a Disk that can exist before a merge will automatically occur. Min=3, Max=50, Default=5

MergeMode: Mode to place the version in after a merge has occurred. Values are: 0 (Production), 1 (Test) and 2 (Maintenance). Min=0, Max=2, Default=2

DatabaseServerName: Read-only name of the database server.

DatabaseInstanceName: Read-only name of the database instance.

DatabaseName: Read-only name of the database.

FailoverPartnerServerName: Read-only name of the database server.

FailoverPartnerInstanceName: Read-only name of the database server instance.

Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 999 is read-only. Default=999

PvsFarm[]: If successful, the PvsFarm object(s) are returned.

EXAMPLE 1: Get PvsFarm

Get the PvsFarm.

Get-PvsFarm

Get-PvsFarmView

Get the fields for a Farm View or all Farm Views in the Farm. All Farm Views are returned if no parameters are passed.

One of these optional

Guid[] Guid or FarmViewId: GUID of the Farm View to Get.
string[] Name or FarmViewName: Name of the Farm View to Get.
Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

FarmViewId
If only selected fields are needed, pass them in the Fields parameter
as a string array.

Guid or FarmViewId: Read-only GUID that uniquely identifies this Farm
View.
Name or FarmViewName: Name of the Farm View. Max Length=50
Description: User description. Default="" Max Length=250
DeviceCount: Read-only count of Devices in this Farm View. Default=0
ActiveDeviceCount: Read-only count of active Devices in this Farm
View. Default=0
MakActivateNeededCount: Read-only count of active Devices that need
MAK activation in this Farm View. Default=0

PvsFarmView[]: If successful, the PvsFarmView object(s) are returned.

EXAMPLE 1: Get PvsFarmView for Farm
Get all PvsFarmView for the Farm.
Get-PvsFarmView

EXAMPLE 2: Get PvsFarmView
Get the PvsFarmView for the FarmView named theFarmView.
Get-PvsFarmView -Name theFarmView

Get-PvsGroup
Get the fields for the Groups for the user or the System.

Optional

string[] Domain: Domain of user (may be the name of the local
computer).

string[] User: Name of user.

SwitchParameter AdGroupsEnabled: Get Active Directory groups, when set
to true. Get Windows groups, when set to false. If
not included, the Farm AdGroupsEnabled setting is
used.

If only selected fields are needed, pass them in the Fields parameter
as a string array.

Name: Name of the Group.

Guid: GUID of the Active Directory group. 00000000-0000-0000-0000-
000000000000 for Windows groups.
PvsGroup[]: If successful, the PvsGroup object(s) are returned.

**EXAMPLE 1: Get PvsGroup for System**
Get all PvsGroup for the System.
Get-PvsGroup

**EXAMPLE 2: Get PvsGroup for User**
Get all the PvsGroup in the Domain named theDomain for the User named theUser.
Get-PvsGroup -Domain theDomain -User theUser

**EXAMPLE 3: Get Active Directory PvsGroup**
Get all the Active Directory PvsGroup in the System.
Get-PvsGroup -AdGroupsEnabled

**EXAMPLE 4: Get Windows Groups PvsGroup**
Get all the Windows Groups PvsGroup in the System.
Get-PvsGroup -AdGroupsEnabled:$false

**Get-PvsLocalServer**
Return one record with the local server's NetBios name

PvsLocalServer[]: If successful, the PvsLocalServer object(s) are returned.

**EXAMPLE 1: Get PvsLocalServer**
Get the PvsLocalServer for the PVS SoapServer connected to.
Get-PvsLocalServer

**Get-PvsMaintenanceVersionExists**
Return true if the if the DiskLocator has a maintenance version, false otherwise.
This required
Guid Guid or DiskLocatorId: DiskLocator GUID, to see if it has a maintenance version.
or this required & resolution
string Name or DiskLocatorName: DiskLocator name, to see if it has a maintenance version.
One of these resolutions when needed
Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.
One of these resolutions when needed
Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  DiskLocatorId

Boolean: If successful, $true or $false is returned.

EXAMPLE 1: Get-PvsMaintenanceVersionExists for Name

Get-PvsMaintenanceVersionExists -Name theDiskLocator -SiteName theSite
-StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

Get-PvsMinimumLastAutoAddDeviceNumber

Get the minimum that the Device Number of the last Auto Added Device can be.

This required

  Guid CollectionId: GUID of the Collection to get the Minimum LastAutoAddDeviceNumber for.

or this required & resolution

string CollectionName: Name of the Collection to get the Minimum LastAutoAddDeviceNumber for.

Optional

string AutoAddPrefix: The string put before the Device Number for Auto Add.

string AutoAddSuffix: The string put after the Device Number for Auto Add.

uint AutoAddNumberLength: The maximum length of the Device Number for Auto Add. This length plus the AutoAddPrefix length plus the AutoAddSuffix length must be less than 16.

One of these resolutions when needed

Guid SiteId: GUID of the Site.

string SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  CollectionId

UInt32: If successful, the numeric value is returned
EXAMPLE 1: Get-PvsMinimumLastAutoAddDeviceNumber

This example gets the highest auto-add number used so far for a PvsDevice that starts with the AutoAddPrefix and AutoAddSuffix of the PVsCollection.

Get-PvsMinimumLastAutoAddDeviceNumber -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 2: Get-PvsMinimumLastAutoAddDeviceNumber for AutoAddPrefix with AutoAddSuffix and AutoAddNumberLength

This example gets the highest auto-add number used so far for a PvsDevice with name length up to 10 characters and starts with the AutoAddPrefix and AutoAddSuffix specified.

Get-PvsMinimumLastAutoAddDeviceNumber -CollectionName theCollection -SiteName theSite -AutoAddPrefix "P" -AutoAddSuffix "S" -AutoAddNumberLength 10

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

Get-PvsMountedDisk

Get the mounted disk, if there is one.

One of these optional
Guid ServerId: GUID of the Server.
string ServerName: Name of the Server.

One of these optional
Guid StoreId: GUID of the Store.
string StoreName: Name of the Store.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
ServerId or StoreId
PvsDiskLocator: If successful, the mapped PvsDiskLocator is returned.

EXAMPLE 1: Get-PvsMountedDisk

This example gets the PvsMappedDisk. If no disk is mapped, null is returned.

$thePvsDiskLocator = Get-PvsMappedDisk
if ($thePvsDiskLocator -ne $null)
{

EXAMPLE 2: Get-PvsMountedDisk for ServerName

This example gets any mapped disk for the ServerName. If no disk is mapped, null is returned.

```powershell
$thePvsDiskLocator = Get-PvsMappedDisk -ServerName theServer
if ($thePvsDiskLocator -ne $null)
{
    $thePvsDiskLocator.Name  # display the name of the mapped PvsDiskLocator
}
```

EXAMPLE 3: Get-PvsMountedDisk for StoreName

This example gets any mapped disk for the StoreName. If no disk is mapped, null is returned.

```powershell
$thePvsDiskLocator = Get-PvsMappedDisk -StoreName theStore
if ($thePvsDiskLocator -ne $null)
{
    $thePvsDiskLocator.Name  # display the name of the mapped PvsDiskLocator
}
```

Get-PvsMountedDriveLetter

If there is currently a Mounted Drive, return the Letter of the Drive.
String: If successful, the String value is returned.

EXAMPLE 1: Get-PvsMountedDriveLetter

This example gets any mapped disk drive letter. If no disk is mapped, a string with length greater than 0 is returned.

```powershell
$theDriveLetter = Get-PvsMappedDisk
if ($theDriveLetter -ne $null -and $theDriveLetter.length -gt 0)
{
    $theDriveLetter  # display the drive letter
}
```

Get-PvsNewDiskVersion

Get new Disk versions for the Store on the Server specified.

One of these required
Guid[] ServerId: GUID of the Server to look for new Disk versions.
string[] ServerName: Name of the Server to look for new Disk versions.

One of these required

Guid[] StoreId: GUID of the Store that the Server services to look for new Disk versions.

string[] StoreName: Name of the Store that the Server services to look for new Disk versions.

Optional

SwitchParameter AutoAddEnabled: If -AutoAddEnabled is specified, undefined Disk versions found will be automatically added.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

    ServerId or StoreId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Name: Name of the disk file without the extension.

Status: Status of the disk file. Values are: 0 (Valid), 1 (Missing Properties File), 2 (Access Denied), 3 (Access Denied and Missing Properties File), 4 (Invalid Disk File), 5 (Manifest Invalid)

PvsNewDiskVersion[]: If successful, the PvsNewDiskVersion object(s) are returned.

**EXAMPLE 1: Get PvsNewDiskVersion**

Get all PvsNewDiskVersion in the Store named theStore using the Server named theServer.

Get-PvsNewDiskVersion -ServerName theServer -StoreName theStore

**EXAMPLE 2: Get PvsNewDiskVersion with AutoAdd**

Get all PvsNewDiskVersion and Auto Adds them in the Store named theStore using the Server named theServer.

Get-PvsNewDiskVersion -ServerName theServer -StoreName theStore -AutoAddEnabled

**Get-PvsServer**

Get the fields for a Server, all Servers in a Site that use a Store, service a DiskLocator, or for the whole Farm. All Servers are returned if no parameters are passed.

One of these optional

Guid[] Guid or ServerId: GUID of the Server to Get.

string[] Name or ServerName: Name of the Server to Get.

Guid[] SiteId: GUID of the Site to Get all Servers.
string[] SiteName: Name of the Site to Get all Servers.
Guid[] DiskLocatorId: GUID of the Disk Locator to Get all Servers.
or this optional & resolution
string[] DiskLocatorName: Name of the Disk Locator File to Get all Servers.

One of these optional & resolutions
Guid[] StoreId: GUID of the Store to Get all Servers.
string[] StoreName: Name of the Store to Get all Servers.

Optional
SwitchParameter All: If -All is specified, with StoreId or StoreName all Servers for the Store including ones with invalid paths will be returned.

One of these resolutions when needed
Guid[] SiteId: GUID of the Site to Get all Servers.
string[] SiteName: Name of the Site to Get all Servers.

One of these resolutions when needed
Guid[] StoreId: GUID of the Store to Get all Servers.
string[] StoreName: Name of the Store to Get all Servers.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
ServerId, SiteId, DiskLocatorId or StoreId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or ServerId: Read-only GUID that uniquely identifies this Server.
Name or ServerName: Computer name with no spaces. ASCII computer name characters Max Length=21
SiteId: GUID of the Site this Server is to be a member of. It is not used with SiteName.
SiteName: Name of the Site this Server is to be a member of. It is not used with SiteId.
Description: User description. Default="" Max Length=250
AdMaxPasswordAge: Number of days before a password expires. Min=1, Max=30, Default=7
LicenseTimeout: Amount of seconds before a license times out. Min=15, Max=300, Default=30
VDiskCreatePacing: VDisk create time pacing in miliseconds. Min=0, Max=5, Default=0
FirstPort: Number of the first UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6910

LastPort: Number of the last UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6930

ThreadsPerPort: Number of worker threads per IO port. Required that (threadPerPort * numberPorts * numberIPs) <= 1000. Min=1, Max=60, Default=8

BuffersPerThread: Number of buffers per worker thread. Min=1, Max=128, Default=24

ServerCacheTimeout: Number of seconds to wait before considering another Server is down. Min=5, Max=60, Default=8

IoBurstSize: Number of bytes read/writes can send in a burst of packets. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=4096, Max=61440, Default=32768

MaxTransmissionUnits: Ethernet maximum transmission unit size for the protocol for use for Server and Device. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=502, Max=16426, Default=1506

MaxBootDevicesAllowed: Maximum number of Devices allowed to boot simultaneously. Min=1, Max=1000, Default=500

MaxBootSeconds: Maximum number of seconds for a Device to boot. Min=10, Max=900, Default=60

BootPauseSeconds: Number of seconds that a Device will pause during login if its server busy. Min=1, Max=60, Default=10

AdMaxPasswordAgeEnabled: Age the password, when set to true. Default=false

EventLoggingEnabled: Enable event logging, when set to true. Default=false

NonBlockingIoEnabled: Use non-Blocking IO, when set to true. Default=true

Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 200 is Site Administrator. Default=999

Ip: One or more streaming ip addresses.

InitialQueryConnectionPoolSize: Initial size of database connection pool for non-transactional queries. Min=1, Max=1000, Default=50

InitialTransactionConnectionPoolSize: Initial size of database connection pool for transactional queries. Min=1, Max=1000, Default=50
MaxQueryConnectionPoolSize: Maximum size of database connection pool for non-transactional queries. Min=1, Max=32767, Default=1000

MaxTransactionConnectionPoolSize: Maximum size of database connection pool for transactional queries. Min=1, Max=32767, Default=1000

RefreshInterval: Interval, in number of seconds, the server should wait before refreshing settings. If set to 0, unused database connections are never released. Min=0, Max=32767, Default=300

UnusedDbConnectionTimeout: Interval, in number of seconds, a connection should go unused before it is to be released. Min=0, Max=32767, Default=300

BusyDbConnectionRetryCount: Number of times a failed database connection will be retried. Min=0, Max=32767, Default=2

BusyDbConnectionRetryInterval: Interval, in number of milliseconds, the server should wait before retrying to connect to a database. Min=0, Max=10000, Default=25

LocalConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are local. A value of 0 disables the feature. Min=0, Max=128, Default=4

RemoteConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are remote. A value of 0 disables the feature. Min=0, Max=128, Default=4

RamDiskIpAddress: IP address to use for transferring the RAM Disk. When equal to 0.0.0.0 the server IP is used with the first part replaced with 233. Default=0.0.0.0

RamDiskTimeToLive: Time to live for the invitation packet sent to Devices. Min=1, Max=255, Default=1

RamDiskInvitationType: Either false for Fixed, or true for Variable. Default=false

RamDiskInvitationPeriod: The amount of time in seconds that invitations are sent to Devices. Min=1, Max=300, Default=10

Active: 1 if the Server is currently active, 2 if unknown, and 0 otherwise. Min=0, Max=2, Default=0

LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=4

LogFileSizeMax: Maximum size log files can reach in Megabytes. Min=1, Max=50, Default=5

LogFileBackupCopiesMax: Maximum number of log file backups. Min=1, Max=50, Default=4

PowerRating: A strictly relative rating of this Server's capabilities when compared to other Servers in the Store(s) it
belongs too; can be used to help tune load balancing.
Min=0.1, Max=1000, Default=1

ServerFqdn: Read-only fully qualified domain name. Default="" Max
Length=1024

ManagementIp: IP address used for management communications between
Servers. Default=0.0.0.0

PvsServer[]: If successful, the PvsServer object(s) are returned.

EXAMPLE 1: Get PvsServer for Farm

Get all PvsServer for the Farm.
Get-PvsServer

EXAMPLE 2: Get PvsServer for Site

Get all PvsServer for the Site named theSite.
Get-PvsServer -SiteName theSite

EXAMPLE 3: Get PvsServer for Site and Store

Get all PvsServer for the Site named theSite and Store named theStore.
Get-PvsServer -SiteName theSite -StoreName theStore

EXAMPLE 4: Get PvsServer for DiskLocator

Get the PvsServer for the DiskLocator named theDiskLocator in the Site
named theSite and Store named theStore.
Get-PvsServer -DiskLocatorName theDiskLocator -SiteName theSite -
StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the
SiteName or SiteId and StoreName or StoreId are not
also needed.

EXAMPLE 5: Get PvsServer for Server

Get the PvsServer for the Server named theServer.
Get-PvsServer -Name theServer

EXAMPLE 6: Get PvsServer Not Active and Start

Get all PvsServer that are not Active and then Start them.
Get-PvsServer -Fields Active | Where-Object {$_Active -eq 0} | Start-
PvsStreamService

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

Get-PvsServerBiosBootstrap

Oem Only: Get the bootstrap fields for the Server dell_bios.bin BIOS
bootstrap file.

One of these required
Guid[] Guid or ServerId: GUID of the Server to Get the dell_bios.bin BIOS bootstrap file from.

string[] Name or ServerName: Name of the Server to Get the dell_bios.bin BIOS bootstrap file from.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

    ServerId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Enabled: Automatically update the BIOS on the target device with these setting when set to true, otherwise do not use these settings. Default=false

DhcpEnabled: Use DHCP to retrieve target device IP when set to true, otherwise use the static domain, dnsIpAddress=true and dnsIpAddress2 settings. Default=true

Lookup: Use DNS to find the Server when set to true with the ServerName host value, otherwise use the bootservertrue_Ip, bootservertrue_Port, bootserver2_Ip, bootserver2_Port, bootserver3_Ip, bootserver3_Port, bootserver4_Ip, and bootserver4_Port settings. Default=true

VerboseMode: Display verbose diagnostic information when set to true. Default=false

InterruptSafeMode: Interrupt safe mode (use if target device hangs during boot) when set to true. Default=false

PaeMode: PAE mode (use if PAE enabled in boot.ini of target device) when set to true. Default=false

BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false

RecoveryTime: When bootFromHdOnFail is 1, this is the number of seconds to wait before reboot to hard drive. Min=10, Max=60000, Default=50

PollingTimeout: Login polling timeout in milliseconds. Min=1000, Max=60000, Default=5000

GeneralTimeout: Login general timeout in milliseconds. Min=1000, Max=60000, Default=5000

Name or ServerName: Host to use for DNS lookup. Only used when Lookup is true. Default=IMAGESERVER1

Bootserver1_Ip: 1st boot server IP. Only used when Lookup is false.

Bootserver1_Port: 1st boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910
Bootserver2_Ip: 2nd boot server IP. Only used when Lookup is false. Default=0.0.0.0

Bootserver2_Port: 2nd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

Bootserver3_Ip: 3rd boot server IP. Only used when Lookup is false. Default=0.0.0.0

Bootserver3_Port: 3rd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

Bootserver4_Ip: 4th boot server IP. Only used when Lookup is false. Default=0.0.0.0

Bootserver4_Port: 4th boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

Domain: Domain of the primary and secondary DNS servers. Only used when DhcpEnabled is false.

DnsIpAddress1: Primary DNS server IP. Only used when DhcpEnabled is false.

DnsIpAddress2: Secondary DNS server IP. Only used when DhcpEnabled is false.

PvsServerBiosBootstrap[]: If successful, the PvsServerBiosBootstrap object(s) are returned.

**EXAMPLE 1: Get PvsServerBiosBootstrap for Server**

Get all PvsServerBiosBootstrap for the Server named theServer.

Get-PvsServerBiosBootstrap -Name theServer

**Get-PvsServerBootstrap**

Get the bootstrap fields for the Server and named bootstrap file specified.

One of these required

Guid[] Guid or ServerId: GUID of the Server to Get the named bootstrap file from.

string[] ServerName: Name of the Server to Get the named bootstrap file from.

This required

string[] Name: Name of the bootstrap file.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

(ServerId and Name) or ServerId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Bootserver1_Ip: 1st boot server IP.

Bootserver1_Netmask: 1st boot server netmask. Default=0.0.0.0
Bootserver1_Gateway: 1st boot server gateway. Default=0.0.0.0
Bootserver1_Port: 1st boot server port. Min=1025, Max=65536, Default=6910
Bootserver2_Ip: 2nd boot server IP. Default=0.0.0.0
Bootserver2_Netmask: 2nd boot server netmask. Default=0.0.0.0
Bootserver2_Gateway: 2nd boot server gateway. Default=0.0.0.0
Bootserver2_Port: 2nd boot server port. Min=1025, Max=65536, Default=6910
Bootserver3_Ip: 3rd boot server IP. Default=0.0.0.0
Bootserver3_Netmask: 3rd boot server netmask. Default=0.0.0.0
Bootserver3_Gateway: 3rd boot server gateway. Default=0.0.0.0
Bootserver3_Port: 3rd boot server port. Min=1025, Max=65536, Default=6910
Bootserver4_Ip: 4th boot server IP. Default=0.0.0.0
Bootserver4_Netmask: 4th boot server netmask. Default=0.0.0.0
Bootserver4_Gateway: 4th boot server gateway. Default=0.0.0.0
Bootserver4_Port: 4th boot server port. Min=1025, Max=65536, Default=6910
VerboseMode: Display verbose diagnostic information when set to true. Default=false
InterruptSafeMode: Interrupt safe mode (use if target device hangs during boot) when set to true. Default=false
PaeMode: PAE mode (use if PAE enabled in boot.ini of target device) when set to true. Default=false
BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false
RecoveryTime: When bootFromHdOnFail is 1, this is the number of seconds to wait before reboot to hard drive. Min=10, Max=60000, Default=50
PollingTimeout: Login polling timeout in milliseconds. Min=1000, Max=60000, Default=5000
GeneralTimeout: Login general timeout in milliseconds. Min=1000, Max=60000, Default=5000
PvsServerBootstrap[]: If successful, the PvsServerBootstrap object(s) are returned.

**EXAMPLE 1: Get PvsServerBootstrap**

Get the PvsServerBootstrap for the Bootstrap named theBootstrap on the Server named theServer.

Get-PvsServerBootstrap -ServerName theServer -Name theBootstrap
Get-PvsServerBootstrapName

Get the bootstrap names for a Server.

One of these required

- Guid[] Guid or ServerId: GUID of the Server to Get bootstrap names for.
- string[] Name or ServerName: Name of the Server to Get bootstrap names for.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

- ServerId
- PvsServerBootstrapName[]: If successful, the PvsServerBootstrapName object(s) are returned.

EXAMPLE 1: Get PvsServerBootstrapName for Server

Get all PvsServerBootstrapName for the Server named theServer.
Get-PvsServerBootstrapName -Name theServer

Get-PvsServerCount

Get count of Servers in a Site.

One of these required

- Guid Guid or SiteId: GUID of the Site to get the Server Count of.
- string Name or SiteName: Name of the Site to get the Server Count of.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

- SiteId
- UInt32: If successful, the numeric value is returned

EXAMPLE 1: Get-PvsServerCount Returns the Number (or Count) of PvsServer in PvsSite

Get-PvsServerCount -Name theSite

Get-PvsServerInfo

Get the fields and status for a Server, all Servers in a Site that use a Store, service a DiskLocator, or for the whole Farm. All Servers are returned if no parameters are passed.

One of these optional

- Guid[] Guid or ServerId: GUID of the Server to Get.
- string[] Name or ServerName: Name of the Server to Get.
- Guid[] SiteId: GUID of the Site to Get all Servers.
string[] SiteName: Name of the Site to Get all Servers.
Guid[] DiskLocatorId: GUID of the Disk Locator to Get all Servers.

or this optional & resolution

string[] DiskLocatorName: Name of the Disk Locator File to Get all Servers.

One of these optional & resolutions

Guid[] StoreId: GUID of the Store to Get all Servers.
string[] StoreName: Name of the Store to Get all Servers.

Optional

SwitchParameter All: If -All is specified, with StoreId or StoreName all Servers for the Store including ones with invalid paths will be returned.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to Get all Servers.
string[] SiteName: Name of the Site to Get all Servers.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store to Get all Servers.
string[] StoreName: Name of the Store to Get all Servers.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

ServerId, SiteId, DiskLocatorId or StoreId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or ServerId: Read-only GUID that uniquely identifies this Server.
Name or ServerName: Computer name with no spaces. ASCII computer name characters Max Length=21
SiteId: GUID of the Site this Server is to be a member of. It is not used with SiteName.
SiteName: Name of the Site this Server is to be a member of. It is not used with SiteId.
Description: User description. Default="" Max Length=250
AdMaxPasswordAge: Number of days before a password expires. Min=1, Max=30, Default=7
LicenseTimeout: Amount of seconds before a license times out. Min=15, Max=300, Default=30
VDiskCreatePacing: VDisk create time pacing in miliseconds. Min=0, Max=5, Default=0
FirstPort: Number of the first UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6910

LastPort: Number of the last UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6930

ThreadsPerPort: Number of worker threads per IO port. Required that (threadPerPort * numberPorts * numberIPs) <= 1000. Min=1, Max=60, Default=8

BuffersPerThread: Number of buffers per worker thread. Min=1, Max=128, Default=24

ServerCacheTimeout: Number of seconds to wait before considering another Server is down. Min=5, Max=60, Default=8

IoBurstSize: Number of bytes read/writes can send in a burst of packets. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=4096, Max=61440, Default=32768

MaxTransmissionUnits: Ethernet maximum transmission unit size for the protocol for use for Server and Device. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=502, Max=16426, Default=1506

MaxBootDevicesAllowed: Maximum number of Devices allowed to boot simultaneously. Min=1, Max=1000, Default=500

MaxBootSeconds: Maximum number of seconds for a Device to boot. Min=10, Max=900, Default=60

BootPauseSeconds: Number of seconds that a Device will pause during login if its server busy. Min=1, Max=60, Default=10

AdMaxPasswordAgeEnabled: Age the password, when set to true. Default=false

EventLoggingEnabled: Enable event logging, when set to true. Default=false

NonBlockingIoEnabled: Use non-Blocking IO, when set to true. Default=true

Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 200 is Site Administrator. Default=999

Ip: One or more streaming ip addresses.

InitialQueryConnectionPoolSize: Initial size of database connection pool for non-transactional queries. Min=1, Max=1000, Default=50

InitialTransactionConnectionPoolSize: Initial size of database connection pool for transactional queries. Min=1, Max=1000, Default=50
MaxQueryConnectionPoolSize: Maximum size of database connection pool for non-transactional queries. Min=1, Max=32767, Default=1000

MaxTransactionConnectionPoolSize: Maximum size of database connection pool for transactional queries. Min=1, Max=32767, Default=1000

RefreshInterval: Interval, in number of seconds, the server should wait before refreshing settings. If set to 0, unused database connections are never released. Min=0, Max=32767, Default=300

UnusedDbConnectionTimeout: Interval, in number of seconds, a connection should go unused before it is to be released. Min=0, Max=32767, Default=300

BusyDbConnectionRetryCount: Number of times a failed database connection will be retried. Min=0, Max=32767, Default=2

BusyDbConnectionRetryInterval: Interval, in number of milliseconds, the server should wait before retrying to connect to a database. Min=0, Max=10000, Default=25

LocalConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are local. A value of 0 disables the feature. Min=0, Max=128, Default=4

RemoteConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are remote. A value of 0 disables the feature. Min=0, Max=128, Default=4

RamDiskIpAddress: IP address to use for transferring the RAM Disk. When equal to 0.0.0.0 the server IP is used with the first part replaced with 233. Default=0.0.0.0

RamDiskTimeToLive: Time to live for the invitation packet sent to Devices. Min=1, Max=255, Default=1

RamDiskInvitationType: Either false for Fixed, or true for Variable. Default=false

RamDiskInvitationPeriod: The amount of time in seconds that invitations are sent to Devices. Min=1, Max=300, Default=10

Active: 1 if the Server is currently active, 2 if unknown, and 0 otherwise. Min=0, Max=2, Default=0

LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=4

LogFileSizeMax: Maximum size log files can reach in Megabytes. Min=1, Max=50, Default=5

LogFileBackup CopiesMax: Maximum number of log file backups. Min=1, Max=50, Default=4

PowerRating: A strictly relative rating of this Server's capabilities when compared to other Servers in the Store(s) it
belongs too; can be used to help tune load balancing.
Min=0.1, Max=1000, Default=1

ServerFqdn: Read-only fully qualified domain name. Default="" Max
Length=1024

ManagementIp: IP address used for management communications between
Servers. Default=0.0.0.0

ContactIp: Read-only contact IP for the Server.

ContactPort: Read-only contact port for the Server.

DeviceCount: Read-only count of Devices. Default=0

PvsServerInfo[]: If successful, the PvsServerInfo object(s) are
returned.

EXAMPLE 1: Get PvsServerInfo for Farm

Get all PvsServerInfo for the Farm.
Get-PvsServerInfo

EXAMPLE 2: Get PvsServerInfo for Site

Get all PvsServerInfo for the Site named theSite.
Get-PvsServerInfo -SiteName theSite

EXAMPLE 3: Get PvsServerInfo for Site and Store

Get all PvsServerInfo for the Site named theSite and Store named
theStore.
Get-PvsServerInfo -SiteName theSite -StoreName theStore

EXAMPLE 4: Get PvsServerInfo for DiskLocator

Get the PvsServerInfo for the DiskLocator named theDiskLocator in the
Site named theSite and Store named theStore.
Get-PvsServerInfo -DiskLocatorName theDiskLocator -SiteName theSite -
StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the
SiteName or SiteId and StoreName or StoreId are not
also needed.

EXAMPLE 5: Get PvsServerInfo for Server

Get the PvsServerInfo for the Server named theServer.
Get-PvsServerInfo -Name theServer

EXAMPLE 6: Get PvsServerInfo Not Active and Start

Get all PvsServerInfo that are not Active and then Start them.
Get-PvsServerInfo -Fields Active | Where-Object {$_Active -eq 0} | 
Start-PvsStreamService

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.
Get-PvsServerName

Return the name of the Server the SoapServer is running on.

String: If successful, the String value is returned.

EXAMPLE 1: Get-PvsServerName

Get-PvsServerName

Get-PvsServerStatus

Get the Server Status fields for a Server.

One of these required

Guid[] Guid or ServerId: GUID of the Server to Get status for.
string[] Name or ServerName: Name of Server to Get status for.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

ServerId

If only selected fields are needed, pass them in the Fields parameter
as a string array.

Guid or ServerId: Read-only GUID of the Server. Can be used with Get
Server.

Name or ServerName: Read-only Name of the Server. Can be used with Get
Server.

Ip: Read-only contact IP for the Server.

Port: Read-only contact port for the Server.

DeviceCount: Read-only count of Devices. Default=0

Status: Status of the server, 0 if down, 1 if up and 2 if unknown.
Default=0

PvsServerStatus[]: If successful, the PvsServerStatus object(s) are
returned.

EXAMPLE 1: Get PvsServerStatus for Server

Get the PvsServerStatus for the Server named theServer.

Get-PvsServerStatus -Name theServer

Get-PvsServerStore

Get the directory and cache paths of a Server for one or all Stores.

One of these required

Guid[] ServerId: GUID of a Server.
string[] ServerName: Name of a Server.

One of these optional
Guid[] StoreId: GUID of the Store.
string[] StoreName: Name of the Store.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
(ServerId and StoreId), ServerId or StoreId
If only selected fields are needed, pass them in the Fields parameter
as a string array.
storeId: GUID of the Store. StoreName can be used instead.
StoreName: Name of the Store. StoreId can be used instead.
ServerId: GUID of the server that uses the Store. ServerName can be
used instead.
ServerName: Name of the server that uses the Store. ServerId can be
used instead.
Path: Directory path that the Server uses to access the Store.
Default="" Max Length=255
CachePath: Cache path(s) that the Server uses with the Store. If none
are specified the caches will be placed in the Store
cachePath. Default=None
PvsServerStore[]: If successful, the PvsServerStore object(s) are
returned.

EXAMPLE 1: Get PvsServerStore for Server
Get all PvsServerStore for the Server named theServer.
Get-PvsServerStore -ServerName theServer

EXAMPLE 2: Get PvsServerStore for Server and Store
Get the PvsServerStore for the Server named theServer and Store named
theStore.
Get-PvsServerStore -ServerName theServer -StoreName theStore

Get-PvsServerStoreActiveDeviceCount
Get the count of Devices currently connected to any vdisk served from the
Store by the Server.
One of these required
Guid ServerId: GUID of the Server.
string ServerName: Name of the Server.
One of these required
Guid StoreId: GUID of the Store.
string StoreName: Name of the Store.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

- ServerId or StoreId
- UInt32: If successful, the numeric value is returned

**EXAMPLE 1: Get-PvsServerStoreActiveDeviceCount Returns the Number (or Count) of PvsDevice Served from PvsStore by PvsServer**

```
Get-PvsServerStoreActiveDeviceCount -ServerName theServer -StoreName theStore
```

## Get-PvsSite

Get the fields for a Site or all Sites. All Sites are returned if no parameters are passed.

One of these optional

- Guid[] Guid or SiteId: GUID of the Site to Get.
- string[] Name or SiteName: Name of the Site to Get.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

- SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

- Guid or SiteId: Read-only GUID that uniquely identifies this Site.
- Name or SiteName: Name of the Site. Max Length=50
- Description: User description. Default="" Max Length=250
- DefaultCollectionId: GUID of the Collection to place new Devices into automatically. Not used with defaultCollectionName. Default=00000000-0000-0000-0000-000000000000
- DefaultCollectionName: Name of the Collection to place new Devices into automatically. Not used with DefaultCollectionId. Default=""
- InventoryFilePollingInterval: The number of seconds between polls for Disk changes in the Stores. Min=1, Max=600, Default=60
- EnableDiskUpdate: True when Disk Updated is enabled for the Site, false otherwise. Default=false
- DiskUpdateServerId: GUID of the Disk Update Server for the Site. Not used with DiskUpdateServerName. Default=00000000-0000-0000-0000-000000000000
- DiskUpdateServerName: Name of the Disk Update Server for the Site. Not used with DiskUpdateServerId. Default=""
- MaksUser: User name used for MAK activation. Default="" Max Length=64
MakPassword: User password used for MAK activation. Default="" Max Length=64

Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, and 999 is read-only. Default=999

PvsSite[]: If successful, the PvsSite object(s) are returned.

**EXAMPLE 1: Get PvsSite for Farm**

Get all PvsSite for the Farm.
Get-PvsSite

**EXAMPLE 2: Get PvsSite**

Get the PvsSite for the Site named theSite.
Get-PvsSite -Name theSite

**Get-PvsSiteView**

Get the fields for a Site View or all Site Views in a Site or the whole Farm. All Site Views are returned if no parameters are passed.

One of these optional

Guid[] Guid or SiteViewId: GUID of the Site View to Get.
Guid[] SiteId: GUID of the Site to Get all Views for.
string[] SiteName: Name of the Site to Get all Views for.

or this optional & resolution

string[] Name or SiteViewName: Name of the Site View to Get.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to Get all Views for.
string[] SiteName: Name of the Site to Get all Views for.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

SiteViewId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or SiteViewId: Read-only GUID that uniquely identifies this Site View.

Name or SiteViewName: Name of the Site View. Max Length=50

SiteId: GUID of the Site this View is to be a member of. It is not used with SiteName.

SiteName: Name of the Site this View is to be a member of. It is not used with SiteId.

Description: User description. Default="" Max Length=250
DeviceCount: Read-only count of Devices in this Site View. Default=0
DeviceWithPVDCount: Read-only count of Devices with Personal vDisk in this Site View. Default=0
ActiveDeviceCount: Read-only count of active Devices in this Site View. Default=0
MakActivateNeededCount: Read-only count of active Devices that need MAK activation in this Site View. Default=0
Role: Read-only Role of the user for this item. 100 is Farm Administrator, and 200 is Site Administrator. Default=999

PvsSiteView[]: If successful, the PvsSiteView object(s) are returned.

**EXAMPLE 1: Get PvsSiteView for Farm**
Get all PvsSiteView for the Farm.
Get-PvsSiteView

**EXAMPLE 2: Get PvsSiteView for Site**
Get all PvsSiteView for the Site named theSite.
Get-PvsSiteView -SiteName theSite

**EXAMPLE 3: Get PvsSiteView**
Get the PvsSiteView for the SiteView named theSiteView in the Site named theSite.
Get-PvsSiteView -Name theSiteView -SiteName theSite
Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Get-PvsStore**
Get the fields for a Store or all Stores for a Server, Site or the Farm. All Stores are returned if no parameters are passed.

One of these optional
Guid[] Guid or StoreId: GUID of the Store to Get.
string[] Name or StoreName: Name of the Store to Get.
Guid[] ServerId: GUID of the Server to Get all Stores for.
string[] ServerName: Name of the Server to Get all Stores for.
Guid[] SiteId: GUID of the Site to Get all Stores for.
string[] SiteName: Name of the Site to Get all Stores for.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

StoreId, ServerId or SiteId
If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or StoreId: Read-only GUID that uniquely identifies this Store.

Name or StoreName: Name of the Store. Max Length=50

SiteId: GUID of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteName can be used instead. Default=00000000-0000-0000-0000-000000000000

SiteName: Name of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteId can be used instead. Default=""

Description: User description. Default="" Max Length=250

Path: Default directory path that the Servers use to access this Store. Max Length=255

CachePath: Default Cache path(s) that the Servers use with this Store. If none are specified the caches will be placed in the WriteCache subdirectory of the Store path. Default=None

Role: Read-only Role of the user for this item. 100 is Farm Administrator, 200 is Site Administrator, and 999 is read-only. Default=999

PvsStore[]: If successful, the PvsStore object(s) are returned.

**EXAMPLE 1: Get PvsStore for Farm**

Get all PvsStore for the Farm.

Get-PvsStore

**EXAMPLE 2: Get PvsStore for Site**

Get all PvsStore for the Site named theSite.

Get-PvsStore-SiteName theSite

**EXAMPLE 3: Get PvsStore for Server**

Get all PvsStore for the Server named theServer.

Get-PvsStore-ServerName theServer

**EXAMPLE 4: Get PvsStore**

Get the PvsStore for the Store named theStore.

Get-PvsStore-Name theStore-SiteName theSite

**Get-PvsStoreFreeSpace**

Get the free megabytes available in the Store.

One of these required & resolutions

Guid Guid or StoreId: GUID of the Store.
string Name or StoreName: Name of the Store.
One of these resolutions when needed
Guid ServerId: GUID of the Server to use to determine the free space
in the Store.
string ServerName: Name of the Server to use to determine the free
space in the Store.
Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.
UInt32: If successful, the numeric value is returned

EXAMPLE 1: Get-PvsStoreFreeSpace for Name with ServerName
Get-PvsStoreFreeSpace -Name theStore -ServerName theServer

EXAMPLE 2: Get-PvsStoreFreeSpace for Name with SiteName
Get-PvsStoreFreeSpace -Name theStore -SiteName theSite

Get-PvsStoreSharedOrServerPath
Get the Stores and paths for the ServerName specified or Stores with only
shared UNC paths.
One of these required
Guid[] SiteId: GUID of a Site used for authorization check.
string[] SiteName: Name of a Site used for authorization check.
Optional
string[] ServerName: Name of a Server to also get local Store paths
for.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

SiteId
If only selected fields are needed, pass them in the Fields parameter
as a string array.
StoreId: GUID of the Store.
StoreName: Name of the Store.
Path: Directory path that the Servers use to access this Store.
PvsStoreSharedOrServerPath[]: If successful, the
PvsStoreSharedOrServerPath object(s) are returned.

EXAMPLE 1: Get PvsStoreSharedOrServerPath with Sharded UNC Paths
Get PvsStoreSharedOrServerPath with shared UNC paths for the Farm.
Get-PvsStoreSharedOrServerPath -SiteName theSite

182
EXAMPLE 2: Get PvsStoreSharedOrServerPath with Sharded UNC Paths and Server Local Paths

Get PvsStoreSharedOrServerPath with shared UNC paths for the Farm with local paths for the Server named theServer.

Get-PvsStoreSharedOrServerPath -SiteName theSite -StoreName theServer

Get-PvsTask

Get the current Task fields for select, or all active and completed uncleared tasks.

One of these optional

- uint TaskId: ID of the Task to get.
- Guid[] SiteId: GUID of the Site to get Tasks for.
- string[] SiteName: Name of the Site to get Tasks for.

Optional

- uint State: The TaskState to get Tasks for. Values are: 0 (Processing), 1 (Cancelled), and 2 (Complete).

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

TaskId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

TaskId: Unique ID of the task.
SiteId: GUID of the Site that this Task is being processed in.
  Default=00000000-0000-0000-0000-000000000000
SiteName: Name of the Site that this Task is being processed in.
Handle: Handle to a running function.
ServerFqdn: Qualified name of the server. Default="" Max Length=1024
Ip: IP Address of the remote host.
Port: Port number of the remote service.
StartTime: Time the task was started. Has the date and time without milliseconds.
ExpirationTime: Time the task record may be removed from the database if the task does not complete. Has the date and time without milliseconds.
State: State of the Task. Values are: 0 (Processing), 1 (Cancelled), and 2 (Complete). Min=0, Max=2
CommandType: Type of the command. Values are: Add, Delete, Get, Info, Run, RunWithReturn, Set and SetList. Default="" Max Length=13
Command: Command being processed. Default="" Max Length=50
MapiException: Exception result in XML format. Default=""
Results: Result in XML format. Default=""
PvsTask[]: If successful, the PvsTask object(s) are returned.

**EXAMPLE 1: Get PvsTask for Farm**
Get all PvsTask for the Farm.
Get-PvsTask

**EXAMPLE 2: Get PvsTask for Site**
Get all PvsTask for the Site named theSite.
Get-PvsTask -SiteName theSite

**EXAMPLE 3: Get PvsTask Currently Processing**
Get PvsTask that are currently in Processing state for the Farm.
Get-PvsTask -State 0

**EXAMPLE 4: Get PvsTask**
Get PvsTask for TaskId 101.
Get-PvsTask -TaskId 101

**Get-PvsTaskStatus**
Get the status of a Task in percent complete.
This required
uint TaskId: Id of the Task to get the Status of.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

TaskId
UInt32: If successful, the numeric value is returned

**EXAMPLE 1: Get-PvsTaskStatus for Start-PvsBoot to PvsTask**
$thePvsTask = Start-PvsBoot -Name theDevice # start
the task
while ($thePvsTask.State -eq 0) # while
    the task is processing
{
    %percentFinished = Get-PvsTaskStatus -Object $thePvsTask # get
    percent finished
    %percentFinished.ToString() + "% finished" #
    display percent finished
    Start-Sleep -seconds 10 # wait
    10 seconds more
}
$thePvsTask = Get-PvsTask -Object $thePvsTask  # get
    the current PvsTask object

}  # check to see if completed
if ($thePvsTask.State -eq 2)
{
    "Successful"
}
else
{
    "Cancelled"
}

EXAMPLE 2: Get-PvsTaskStatus for taskId

Get-PvsTaskStatus -taskId 101

Get-PvsUndefinedDisk

Get undefined Disks for the Store on the Server specified.

One of these required
    Guid[] ServerId: GUID of the Server to look for undefined Disks.
    string[] ServerName: Name of the Server to look for undefined Disks.

One of these required
    Guid[] StoreId: GUID of the Store that the Server services to look for
        undefined Disks.
    string[] StoreName: Name of the Store that the Server services to look
        for undefined Disks.

Optional
    SwitchParameter AutoAddEnabled: If -AutoAddEnabled is specified, then
        undefined Disks found will be automatically added.

Instead of a parameter that matches one of the members listed
    PvsObject[] Object: PvsObjects with the members below can be used as
        the Object parameter or from a pipeline:
        ServerId or StoreId

If only selected fields are needed, pass them in the Fields parameter
    as a string array.
    Name: Name of the disk file without the extension.
    Status: Status of the disk file. Values are: 0 (Valid), 1 (Missing
        Properties File), 2 (Access Denied), 3 (Access Denied and
        Missing Properties File), 4 (Invalid Disk File),
        5 (Manifest Missing or Invalid), 6 (Both VHD and
        VHDX)
VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false

PvsUndefinedDisk[]: If successful, the PvsUndefinedDisk object(s) are returned.

**EXAMPLE 1: Get PvsUndefinedDisk**

Get all PvsUndefinedDisk in the Store named theStore using the Server named theServer.

Get-PvsUndefinedDisk -ServerName theServer -StoreName theStore

**EXAMPLE 2: Get PvsUndefinedDisk with AutoAdd**

Get all PvsUndefinedDisk and Auto Adds them in the Store named theStore using the Server named theServer.

Get-PvsUndefinedDisk -ServerName theServer -StoreName theStore -AutoAddEnabled

**Get-PvsUpdateTask**

Get the fields for an Update Task or all Update Tasks in a Site or the whole Farm. All Update Tasks are returned if no parameters are passed.

One of these optional

- Guid[] Guid or UpdateTaskId: GUID of the Update Task to Get.
- Guid[] SiteId: GUID of the Site to Get all Update Tasks for.
- string[] SiteName: Name of the Site to Get all Update Tasks for.
- or this optional & resolution
- string[] Name or UpdateTaskName: Name of the Update Task to Get.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site to Get all Update Tasks for.
- string[] SiteName: Name of the Site to Get all Update Tasks for.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  - UpdateTaskId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

- Guid or UpdateTaskId: Read-only GUID that uniquely identifies this Update Task.
- Name or UpdateTaskName: Name of the Update Task. It is unique within the Site. Max Length=50
- SiteId: GUID of the Site that this Update Task is a member of. It is not used with SiteName.
- SiteName: Name of the Site that this Update Task is a member of. It is not used with SiteId.
Description: User description. Default="" Max Length=250

Enabled: True when it will be processed, false otherwise. Default=true

Hour: The hour of the day to perform the task. Min=0, Max=23,
    Default=0

Minute: The minute of the hour to perform the task. Min=0, Max=59,
    Default=0

Recurrence: The update will reoccur on this schedule. 0 = None, 1 =
    Daily, 2 = Every Weekday, 3 = Weekly, 4 = Monthly
    Default, 5 = Monthly Type. Min=0, Max=5, Default=0

DayMask: Days selected values. 1 = Monday, 2 = Tuesday, 4 = Wednesday,
    8 = Thursday, 16 = Friday, 32 = Saturday, 64 =
    Sunday, 128 = Day. Default=0. This is used with
    Weekly and Monthly Type recurrence. Min=1, Max=255,
    Default=4

Date: Days of the month. Numbers from 1-31 are the only valid values.
    This is used with Monthly Date recurrence. Default=""
    Max Length=83

MonthlyOffset: When to happen monthly. 0 = None, 1 = First, 2 =
    Second, 3 = Third, 4 = Forth, 5 = Last. This is used
    with Monthly Type recurrence. Min=0, Max=5, Default=3

EsdType: Esd to use. Valid values are SCCM or WSUS. If no value, a
    custom script is run on the client. Default="" Max
    Length=50

PreUpdateScript: Script file to run before the update starts.
    Default="" Max Length=255

PreVmScript: Script file to run before the VM is loaded. Default=""
    Max Length=255

PostUpdateScript: Script file to run after the update finishes.
    Default="" Max Length=255

PostVmScript: Script file to run after the VM is unloaded. Default=""
    Max Length=255

Domain: Domain to add the Disk Update Device(s) to. If not included,
    the first Domain Controller found on the Server is
    used. Default="" Max Length=255

OrganizationUnit: Organizational Unit to add the Disk Update Device(s)
    to. This parameter is optional. If it is not
    specified, the device is added to the built in
    Computers container. Child OU's should be delimited
    with forward slashes, e.g. "ParentOU/ChildOU".
    Special characters in an OU name, such as '"', '#',
    '+', ',', ';', '>', '=' must be escaped with a
    backlash. For example, an OU called
    "commaIn,TheMiddle" must be specified as
    "commaIn\,TheMiddle". The old syntax of delimiting
    child OU's with a comma is still supported, but
    deprecated. Note that in this case, the child OU
comes first, e.g. "ChildOU,ParentOU". Default="" Max Length=255

PostUpdateApprove: Access to place the version in after the update has occurred. 0 = Production, 1 = Test, 2 = Maintenance. Min=0, Max=2, Default=0

PvsUpdateTask[]: If successful, the PvsUpdateTask object(s) are returned.

**EXAMPLE 1: Get PvsUpdateTask for Farm**

Get all PvsUpdateTask for the Farm.
Get-PvsUpdateTask

**EXAMPLE 2: Get PvsUpdateTask for Site**

Get all PvsUpdateTask for the Site named theSite.
Get-PvsUpdateTask -SiteName theSite

**EXAMPLE 3: Get PvsUpdateTask**

Get PvsUpdateTask for UpdateTask named theUpdateTask in Site named theSite.
Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Get-PvsVersion**

Get the version information.

If only selected fields are needed, pass them in the Fields parameter as a string array.

MapiVersion: Version of the system in major.minor.build format.

DbVersion: Version of the database schema as a number. Default=0

Type: Type of system. Values are 0 (Normal), 1 (OROM), and 2 (Secure). Default=0

DbSize: Size of the database in MB. Monitor this value if the edition is 'Express Edition' and this value is close to reaching the 4000 MB maximum. Default=0

PvsVersion[]: If successful, the PvsVersion object(s) are returned.

**EXAMPLE 1: Get PvsVersion**

Get the PvsVersion for the PVS SoapServer connected to.
Get-PvsVersion

**EXAMPLE 2: Get the PvsVersion MapiVersion**

Get the PvsVersion for the PVS SoapServer connected to.
Get-PvsVersion -Fields MapiVersion

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**Get-PvsVirtualHostingPool**

Get the fields for a Virtual Hosting Pool or all Virtual Hosting Pools in a Site or the whole Farm. All Virtual Hosting Pools are returned if no parameters are passed.

One of these optional

Guid[] Guid or VirtualHostingPoolId: GUID of the Virtual Hosting Pool to Get.

Guid[] SiteId: GUID of the Site to Get all Virtual Hosting Pools for.

string[] SiteName: Name of the Site to Get all Virtual Hosting Pools for.

or this optional & resolution

string[] Name or VirtualHostingPoolName: Name of the Virtual Hosting Pool to Get.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to Get all Virtual Hosting Pools for.

string[] SiteName: Name of the Site to Get all Virtual Hosting Pools for.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

VirtualHostingPoolId or SiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.

Guid or VirtualHostingPoolId: Read-only GUID that uniquely identifies this Virtual Hosting Pool.

Name or VirtualHostingPoolName: Name of the Virtual Hosting Pool. It is unique within the Site. Max Length=50

SiteId: GUID of the Site that this Virtual Hosting Pool is a member of. It is not used with SiteName.

SiteName: Name of the Site that this Virtual Hosting Pool is a member of. It is not used with SiteId.

Type: Type of the Virtual Hosting Pool. 0 = Citrix XenServer, 1 = Microsoft SCVMM/Hyper-V, 2 = VMWare vSphere/ESX. Min=0, Max=2, Default=0

Description: User description. Default="" Max Length=250

Server: Name or IP of the Host Server. Max Length=255
Port: Port of the Host Server. Min=80, Max=65534, Default=80

Datacenter: Datacenter of the Virtual Hosting Pool. Default="" Max Length=250

UpdateLimit: Number of updates at the same time. Min=2, Max=1000, Default=1000

UpdateTimeout: Timeout for updates. Min=2, Max=240, Default=60

ShutdownTimeout: Timeout for shutdown. Min=2, Max=30, Default=10

UserName: Name to use when logging into the Server.
Password: Password to use when logging into the Server.

PvsVirtualHostingPool[]: If successful, the PvsVirtualHostingPool object(s) are returned.

EXAMPLE 1: Get PvsVirtualHostingPool for Farm
Get all PvsVirtualHostingPool for the Farm.
Get-PvsVirtualHostingPool

EXAMPLE 2: Get PvsVirtualHostingPool for Site
Get all PvsVirtualHostingPool for the Site named theSite.
Get-PvsVirtualHostingPool -SiteName theSite

EXAMPLE 3: Get PvsVirtualHostingPool
Get PvsVirtualHostingPool for VirtualHostingPool named theVirtualHostingPool in Site named theSite.
Get-PvsVirtualHostingPool -Name theVirtualHostingPool -SiteName theSite

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

Get-PvsXDSite
Get the fields for a XenDesktop Site or all XenDesktop Sites. All XenDesktop Sites are returned if no parameters are passed.

This optional
Guid[] Guid or XdSiteId: GUID of the XenDesktop Site to Get.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

XdSiteId

If only selected fields are needed, pass them in the Fields parameter as a string array.
Guid or XdSiteId: GUID of the XenDesktop Site.
ConfigServices: XenDesktop Server addresses. Max Length=2000
PvsXDSite[]: If successful, the PvsXDSite object(s) are returned.

**EXAMPLE 1: Get PvsXDSite for Farm**
Get all PvsXDSite for the Farm.
Get-PvsXDSite

**EXAMPLE 2: Get PvsXDSite**
Get the PvsXDSite for the XDSite with Guid 45687f34-c9ec-4852-9d55-337a1af41405.
Get-PvsXDSite -Guid "45687f34-c9ec-4852-9d55-337a1af41405"

**Grant-PvsAuthGroup**
Assign an AuthGroup to have Farm, Site or Collection Authorization. If no Site or Collection is specified, the AuthGroup is given Farm Authorization.

One of these required
Guid[] Guid or AuthGroupGuid: GUID of the AuthGroup to assign Authorization for.
string[] Name or AuthGroupName: Name of the AuthGroup to assign Authorization for.

One of these optional
Guid[] SiteId: GUID of the Site to assign Authorization to for the AuthGroup.
string[] SiteName: Name of the Site to assign Authorization to for the AuthGroup.
Guid[] CollectionId: GUID of the Collection to assign Authorization to for the AuthGroup.

or this optional & resolution
string[] CollectionName: Name of the Collection to assign Authorization to for the AuthGroup.

Optional
uint Role: Authorization Role for the Collection. 300 or 400 can be used. Role can only be used with CollectionId or CollectionName. 300 is Collection Administrator, and 400 is Collection Operator. Default=400

One of these resolutions when needed
Guid[] SiteId: GUID of the Site to assign Authorization to for the AuthGroup.
string[] SiteName: Name of the Site to assign Authorization to for the AuthGroup.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
AuthGroupId, SiteId or CollectionId
Optional
SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Grant-PvsAuthGroup for PvsAuthGroup to PvsFarm
Grant-PvsAuthGroup -Name theAuthGroup

EXAMPLE 2: Grant-PvsAuthGroup for PvsAuthGroup Using Pipe
The Get-PvsAuthGroup output is piped to the Grant-PvsAuthGroup.
Get-PvsAuthGroup -Name theAuthGroup -Fields Guid | Grant-PvsAuthGroup
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 3: Grant-PvsAuthGroup for PvsAuthGroup to PvsSite
Grant-PvsAuthGroup -Name theAuthGroup -SiteName theSite

EXAMPLE 4: Grant-PvsAuthGroup for PvsAuthGroup Using Pipe
The Get-PvsAuthGroup output is piped to the Grant-PvsAuthGroup.
Get-PvsAuthGroup -Name theAuthGroup -Fields Guid | Grant-PvsAuthGroup -SiteName theSite
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 5: Grant-PvsAuthGroup for PvsSite Using Pipe
The Get-PvsSite output is piped to the Grant-PvsAuthGroup.
Get-PvsSite -Name theSite -Fields Guid | Grant-PvsAuthGroup -Name theAuthGroup
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 6: Grant-PvsAuthGroup for PvsAuthGroup to PvsCollection
Grant-PvsAuthGroup -Name theAuthGroup -CollectionName theCollection -SiteName theSite
CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 7: Grant-PvsAuthGroup for PvsAuthGroup Using Pipe
The Get-PvsAuthGroup output is piped to the Grant-PvsAuthGroup.
Get-PvsAuthGroup -Name theAuthGroup -Fields Guid | Grant-PvsAuthGroup -CollectionName theCollection -SiteName theSite
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 8: Grant-PvsAuthGroup for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Grant-PvsAuthGroup.

```
Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Grant-PvsAuthGroup -Name theAuthGroup
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 9: Grant-PvsAuthGroup for PvsAuthGroup to PvsCollection**

```
Grant-PvsAuthGroup -Name theAuthGroup -CollectionName theCollection -SiteName theSite -Role 300
```

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 10: Grant-PvsAuthGroup for PvsAuthGroup Using Pipe**

The Get-PvsAuthGroup output is piped to the Grant-PvsAuthGroup.

```
Get-PvsAuthGroup -Name theAuthGroup -Fields Guid | Grant-PvsAuthGroup -Name theAuthGroup -CollectionName theCollection -SiteName theSite -Role 300
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 11: Grant-PvsAuthGroup for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Grant-PvsAuthGroup.

```
Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Grant-PvsAuthGroup -Name theAuthGroup -Role 300
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Import-PvsDevices**

Import Devices from the contents of the comma or tab delimited fileName specified. Each record needs to have Device Name, Mac Address, Site Name,
Collection Name, optional Description and optional Type. Description must exist for Type to be included, but it can have 0 length. Type can be 1 when it performs test of Disks, 2 when it performs maintenance on Disks, and 0 otherwise.

This required

string[] Name or FileName: Name of the file to import the Devices from. This must be a full file path name.

One of these optional

Guid[] CollectionId: GUID of the Collection to import the Devices into.

Guid[] SiteId: GUID of the Site to import the Devices into.

string[] SiteName: Name of the Site to import the Devices into.

or this optional & resolution

string[] CollectionName: Name of the Collection to import the Devices into.

Optional

SwitchParameter CopyTemplate: If -CopyTemplate is specified, the Template Device for the collection, if it exists, will be used for the property settings of the imported Devices.

SwitchParameter DoNotCreateNewSites: If -DoNotCreateNewSites is specified, new Sites found in the file will not be created.

SwitchParameter DoNotCreateNewCollections: If -DoNotCreateNewCollections is specified, new Collections found in the file will not be created.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to import the Devices into.

string[] SiteName: Name of the Site to import the Devices into.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

CollectionId or SiteId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Import-PvsDevices

Import-PvsDevices -Name "C:\import\theFileName"
**EXAMPLE 2: Import-PvsDevices**

```
Import-PvsDevices -CopyTemplate -DoNotCreateNewSites -
DoNotCreateNewCollections -Name "C:\import\theFileName"
```

**EXAMPLE 3: Import-PvsDevices for SiteName**

```
Import-PvsDevices -SiteName theSite -Name "C:\import\theFileName"
```

**EXAMPLE 4: Import-PvsDevices for SiteName with CopyTemplate and DoNotCreateNewCollections**

```
Import-PvsDevices -SiteName theSite -CopyTemplate -
DoNotCreateNewCollections -Name "C:\import\theFileName"
```

**EXAMPLE 5: Import-PvsDevices for PvsSite Using Pipe**

The Get-PvsSite output is piped to the Import-PvsDevices.

```
Get-PvsSite -Name theSite -Fields Guid | Import-PvsDevices -Name "C:\import\theFileName"
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 6: Import-PvsDevices for CollectionName**

```
Import-PvsDevices -CollectionName theCollection -SiteName theSite -
Name "C:\import\theFileName"
```

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 7: Import-PvsDevices for CollectionName with CopyTemplate**

```
Import-PvsDevices -CollectionName theCollection -SiteName theSite -
CopyTemplate -Name "C:\import\theFileName"
```

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 8: Import-PvsDevices for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Import-PvsDevices.

```
Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Import-PvsDevices -Name "C:\import\theFileName"
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.
**Import-PvsDisk**

Import a Disk. It will add a Disk Locator for the Disk to the Site. A manifest file must exist in the Store. If successful, the new PvsDiskLocator is returned.

This required & resolution

string Name or DiskLocatorName: Name of the Disk Locator File. It is unique within the Store. ASCII Max Length=52

One of these optional

Guid ServerId: GUID of the single Server that this Disk Locator is assigned to. It is not used with ServerName. Default=00000000-0000-0000-0000-000000000000

string ServerName: Name of the single Server that this Disk Locator is assigned to. It is not used with ServerId. Default=""

Optional

string Description: User description. Default="" Max Length=250

string MenuText: Text that is displayed in the Boot Menu. If this field has no value, the name value is used. Default="" ASCII Max Length=64

SwitchParameter Enabled: True when this disk can be booted, false otherwise. Default=true

SwitchParameter RebalanceEnabled: True when this Server can automatically rebalance Devices, false otherwise. Default=false

uint RebalanceTriggerPercent: Percent over fair load that triggers a dynamic Device rebalance. Min=5, Max=5000, Default=25

uint SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=None, 1=Best Effort, 2=Fixed. Min=0, Max=2, Default=0

SwitchParameter VHDX: If -VHDX is specified, VHDX will be used for the format of the image. VHDX has a Block size of 32 MB. VHD is the default.

One of these resolutions when needed

Guid SiteId: GUID of the Site.

string SiteName: Name of the Site.

One of these resolutions when needed

Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsDiskLocator: If successful, the new PvsDiskLocator object is returned.

**EXAMPLE 1: Import-PvsDisk for VHDX to PvsDiskLocator**

This example imports a VHDX Disk and uses the default settings for all other optional parameters.

```
$thePvsDiskLocator = Import-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName theStore -VHDX
if ($thePvsDiskLocator -eq $null) # check that the PvsDiskLocator was returned
{
    $thePvsDiskLocator.Name # display the name
}
```

**EXAMPLE 2: Import-PvsDisk for VHD to PvsDiskLocator**

This example imports a VHD Disk and sets all of the other optional parameters to non-default values.

```
$thePvsDiskLocator = Import-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName theStore -ServerName theServer -Description "The VHD disk." -MenuText "The VHD disk." -Enabled -RebalanceEnabled -rebalanceTriggerPercent 50 -SubnetAffinity 2
if ($thePvsDiskLocator -eq $null) # check that the PvsDiskLocator was returned
{
    $thePvsDiskLocator.Name # display the name
}
```

**Import-PvsOemLicenses**

Oem Only: Import the Oem Licenses from the contents of the fileName specified.

This required

string[] Name or FileName: Name of the file to import the Oem Licenses from. This must be a full file path name.

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Import-PvsOemLicenses**

Import-PvsOemLicenses -Name "C:\import\theFileName"

**Invoke-PvsActivateDeviceMAK**

Proxy Activate with a Multiple Activation Key and/or apply the Confirmation ID to remote activate a Device DiskLocator pair.

One of these required
- Guid[] Guid or DeviceId: GUID of the Device to Activate.
- string[] Name or DeviceName: Name of the Device to Activate.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device to Activate.

This required
- string[] MakUsedToActivate: Multiple Activation Key to Activate the Device with.

Instead of a parameter that matches one of the members listed
- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  - DeviceId

Optional
- SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Invoke-ActivateDeviceMAK for Name**

Invoke-ActivateDeviceMAK -Name theDevice -MakUsedToActivate "2FKWD-NYFC7-VH8G3-BK3GD-7T667"

**EXAMPLE 2: Invoke-ActivateDeviceMAK for DeviceMac**

Invoke-ActivateDeviceMAK -DeviceMac "00-11-22-33-44-55" -MakUsedToActivate "2FKWD-NYFC7-VH8G3-BK3GD-7T667"

**EXAMPLE 3: Invoke-ActivateDeviceMAK for PvsDevice Using Pipe**

The Get-PvsDevice output is piped to the Invoke-ActivateDeviceMAK.

Get-PvsDevice -Name theDevice -Fields Guid | Invoke-ActivateDeviceMAK -MakUsedToActivate "2FKWD-NYFC7-VH8G3-BK3GD-7T667"

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
Invoke-PvsMarkDown

Mark Down a Device, Collection, View, Server or Site.

One of these required

Guid[] DeviceId: GUID of the Device to Mark Down.

string[] DeviceName: Name of the Device to Mark Down.

PvsPhysicalAddress[] DeviceMac: MAC of the Device to Mark Down.

Guid[] CollectionId: GUID of the Collection to Mark Down all Devices.

Guid[] SiteViewId: GUID of the Site View to Mark Down all Devices.

Guid[] SiteId: GUID of the Site. Can be used alone to Mark Down all Servers and Devices in the Site.

string[] SiteName: Name of the Site. Can be used alone to Mark Down all Servers and Devices in the Site.

Guid[] FarmViewId: GUID of the Farm View to Mark Down all Devices.

string[] FarmViewName: Name of the Farm View to Mark Down all Devices.

Guid[] DiskLocatorId: GUID of the DiskLocator to Mark Down all Devices.

Guid[] ServerId: GUID of the Server to Mark Down.

string[] ServerName: Name of the Server to Mark Down.

or one of these required & resolutions

string[] CollectionName: Name of the Collection to Mark Down all Devices.

string[] SiteViewName: Name of the Site View to Mark Down all Devices.

string[] DiskLocatorName: Name of the DiskLocator to Mark Down all Devices.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site. Can be used alone to Mark Down all Servers and Devices in the Site.

string[] SiteName: Name of the Site. Can be used alone to Mark Down all Servers and Devices in the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId, CollectionId, SiteViewId, SiteId, FarmViewId, DiskLocatorId or ServerId
Optional
SwitchParameter Confirm: The impact of this operation is "medium". If
-Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Invoke-PvsMarkDown for SiteName
Invoke-PvsMarkDown -SiteName theSite

EXAMPLE 2: Invoke-PvsMarkDown for PvsSite Using Pipe
The Get-PvsSite output is piped to the Invoke-PvsMarkDown.
Get-PvsSite -Name theSite -Fields Guid | Invoke-PvsMarkDown
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

EXAMPLE 3: Invoke-PvsMarkDown for ServerName
Invoke-PvsMarkDown -ServerName theServer

EXAMPLE 4: Invoke-PvsMarkDown for PvsServer Using Pipe
The Get-PvsServer output is piped to the Invoke-PvsMarkDown.
Get-PvsServer -Name theServer -Fields Guid | Invoke-PvsMarkDown
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

EXAMPLE 5: Invoke-PvsMarkDown for DeviceName
Invoke-PvsMarkDown -DeviceName theDevice

EXAMPLE 6: Invoke-PvsMarkDown for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Invoke-PvsMarkDown.
Get-PvsDevice -Name theDevice -Fields Guid | Invoke-PvsMarkDown
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

EXAMPLE 7: Invoke-PvsMarkDown for DeviceMac
Invoke-PvsMarkDown -DeviceMac "00-11-22-33-44-55"

EXAMPLE 8: Invoke-PvsMarkDown for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Invoke-PvsMarkDown.
Get-PvsDevice -DeviceMac "00-11-22-33-44-55" -Fields Guid | Invoke-
PvsMarkDown
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.
**EXAMPLE 9: Invoke-PvsMarkDown for FarmViewName**

Invoke-PvsMarkDown -FarmViewName theFarmView

**EXAMPLE 10: Invoke-PvsMarkDown for PvsFarmView Using Pipe**

The Get-PvsFarmView output is piped to the Invoke-PvsMarkDown.
Get-PvsFarmView -Name theFarmView -Fields Guid | Invoke-PvsMarkDown

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 11: Invoke-PvsMarkDown for CollectionName**

Invoke-PvsMarkDown -CollectionName theCollection -SiteName theSite
CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 12: Invoke-PvsMarkDown for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Invoke-PvsMarkDown.
Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Invoke-PvsMarkDown

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 13: Invoke-PvsMarkDown for SiteViewName**

Invoke-PvsMarkDown -SiteViewName theSiteView -SiteName theSite
SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 14: Invoke-PvsMarkDown for PvsSiteView Using Pipe**

The Get-PvsSiteView output is piped to the Invoke-PvsMarkDown.
Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Invoke-PvsMarkDown

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 15: Invoke-PvsMarkDown for DiskLocatorName**

Invoke-PvsMarkDown -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore
DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 16: Invoke-PvsMarkDown for PvsDiskLocator Using Pipe**

The Get-PvsDiskLocator output is piped to the Invoke-PvsMarkDown.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsMarkDown

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Invoke-PvsPromoteDiskVersion**

Commit the changes made in the current Maintenance or a Test version. Promotes the Maintenance version or a Test version to a Test or new Production version.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator File to Promote the Disk Version of.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator File to Promote the Disk Version of.

Optional

DateTime ScheduledDate: Date/Time the new disk version will become available. Uses only the date, hour and minute.

uint TestVersion: Specifies the Test version number that should be Promoted to Production.

SwitchParameter Test: If -Test is specified, set the mode of the Maintenance version to Test.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Invoke-PvsPromoteDiskVersion to Production

Invoke-PvsPromoteDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 2: Invoke-PvsPromoteDiskVersion to Production Using Pipe

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsPromoteDiskVersion

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 3: Invoke-PvsPromoteDiskVersion to Test

Invoke-PvsPromoteDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -Test

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 4: Invoke-PvsPromoteDiskVersion to Test Using Pipe

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsPromoteDiskVersion -Test

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 5: Invoke-PvsPromoteDiskVersion Test to Production

Invoke-PvsPromoteDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -TestVersion 4

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.
**EXAMPLE 6: Invoke-PvsPromoteDiskVersion Test to Production Using Pipe**

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsPromoteDiskVersion -TestVersion 4

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 7: Invoke-PvsPromoteDiskVersion to Production, for Future**

Invoke-PvsPromoteDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -ScheduledDate "2016/01/01"

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 8: Invoke-PvsPromoteDiskVersion to Production, for Future Using Pipe**

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsPromoteDiskVersion -ScheduledDate "2016/01/01"

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Invoke-PvsRebalanceDevices**

Rebalance Devices for a Server. When successful, returns the number of Devices affected.

One of these required

Guid Guid or ServerId: GUID of the Server to Rebalance Devices on, ServerName.

string Name or ServerName: Name of the Server to Rebalance Devices on, ServerId.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

UInt32: If successful, the numeric value is returned
EXAMPLE 1: Invoke-PvsRebalanceDevices for Name

Invoke-PvsRebalanceDevices -Name theServer

Invoke-PvsRevertDiskVersion

Set the existing highest version disk to Maintenance or Test mode. A specified version can be reverted to Test mode if there are no Production versions higher than it. If the mode is Test, it can be set to Maintenance.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator File to Revert.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator File to Revert.

Optional

uint Version: Specifies the version number that should be Reverted to Test mode.

SwitchParameter Test: If -Test is specified, when reverting the highest version, the access will be set to Test, otherwise set it to Maintenance.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Invoke-PvsRevertDiskVersion to Maintenance

Invoke-PvsRevertDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore

205
Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 2: Invoke-PvsRevertDiskVersion to Maintenance Using Pipe**

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsRevertDiskVersion

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 3: Invoke-PvsRevertDiskVersion to Test**

Invoke-PvsRevertDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -Test

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 4: Invoke-PvsRevertDiskVersion to Test Using Pipe**

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsRevertDiskVersion -Test

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 5: Invoke-PvsRevertDiskVersion Production to Test**

Invoke-PvsRevertDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -Version 4

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 6: Invoke-PvsRevertDiskVersion Production to Test Using Pipe**

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Invoke-PvsRevertDiskVersion -Version 4

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Merge-PvsDisk**

Merge the Disk.

This required
Guid[] Guid or DiskLocatorId: GUID of the Disk Locator File to Merge.
or this required & resolution
string[] Name or DiskLocatorName: Name of the Disk Locator File to Merge.

Optional

uint Access: Access to set the version to when merge is finished.
  Default value is found in the Farm MergeMode setting.
  Values are: 0 (Production), 1 (Test) and 2 (Maintenance), Min=0, Max=2

SwitchParameter NewBase: If -NewBase is specified, create a new base from last base plus all updates from that base. The default is to merge all updates from the last base by default.

One of these resolutions when needed
Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

One of these resolutions when needed
Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Merge-PvsDisk for Name

  Merge-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName theStore

  Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 2: Merge-PvsDisk for PvsDiskLocator Using Pipe

  The Get-PvsDiskLocator output is piped to the Merge-PvsDisk.

  Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Merge-PvsDisk
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 3: Merge-PvsDisk for Name with Access and NewBase**

```
Merge-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName theStore -Access 2 -NewBase
```

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 4: Merge-PvsDisk for PvsDiskLocator Using Pipe**

The Get-PvsDiskLocator output is piped to the Merge-PvsDisk.

```
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Merge-PvsDisk -Access 2 -NewBase
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Mount-PvsDisk**

Mount a disk. If successful, the drive letter or an empty string is returned. An empty string can be returned if a drive letter was not assigned by the operating system before the maxDiskLetterWaitSeconds is used up.

This required

- Guid Guid or DiskLocatorId: GUID of the Disk Locator to Mount the Disk.

or this required & resolution

- string Name or DiskLocatorName: Name of the Disk Locator to Mount the Disk.

One of these optional

- Guid ServerId: Specific Server GUID to use to Mount the Disk.

- string ServerName: Specific Server Name to use to Mount the Disk.

Optional

- uint MaxDiskLetterWaitSeconds: Once mapping a disk is successful, this is the maximum amount of seconds spent waiting for the operating system to return a drive letter. If the operating system does not return a drive letter before the maximum wait time, then an empty string is returned. Default=30
One of these resolutions when needed

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.

One of these resolutions when needed

Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DiskLocatorId or ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If - Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

String: If successful, the String value is returned.

**EXAMPLE 1: Mount-PvsDisk**

```
$theDriveLetter = Start-PvsMapDisk -Name theDiskLocator -SiteName theSite -StoreName theStore
if ($theDriveLetter -ne $null -and $theDriveLetter.length -gt 0)
{
    $theDriveLetter  # display the drive letter
}
```

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 2: Mount-PvsDisk for PvsServer with MaxDiskLetterWaitSeconds**

```
$theDriveLetter = Start-PvsMapDisk -Name theDiskLocator -SiteName theSite -StoreName theStore -ServerName theServer -MaxDiskLetterWaitSeconds 60
if ($theDriveLetter -ne $null -and $theDriveLetter.length -gt 0)
{
    $theDriveLetter  # display the drive letter
}
```

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.
Move-PvsDeviceToCollection

Move a Device to a Collection. Personal vDisk Devices cannot be moved to a Collection in another Site.

One of these required

Guid[] Guid or DeviceId: GUID of the Device to Move.
string[] Name or DeviceName: Name of the Device to Move.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Move.

This required

Guid[] CollectionId: GUID of the Collection to Move a Device to. The Device is moved from whatever Collection it is currently in, to the Collection specified.

or this required & resolution

string[] CollectionName: Name of the Collection to Move a Device to. The Device is moved from whatever Collection it is currently in, to the Collection specified.

Optional

SwitchParameter CopyTemplate: If -CopyTemplate is specified, the Template Device for the Collection, if it exists, will be used for the property settings of the moved Device.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId or CollectionId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Move-PvsDeviceToCollection for PvsDevice to PvsCollection

Move-PvsDeviceToCollection -Name theDevice -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 2: Move-PvsDeviceToCollection for PvsDevice Using Pipe

The Get-PvsDevice output is piped to the Move-PvsDeviceToCollection.
Get-PvsDevice -Name theDevice -Fields Guid | Move-PvsDeviceToCollection -Name theDevice -CollectionName theCollection -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 3: Move-PvsDeviceToCollection for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Move-PvsDeviceToCollection.

Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Move-PvsDeviceToCollection -Name theDevice

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

### Move-PvsServerToSite

Move a Server to a Site.

One of these required

Guid[] Guid or ServerId: GUID of the Server to Assign.

string[] Name or ServerName: Name of the Server to Assign.

One of these required

Guid[] SiteId: GUID of the Site to Assign a Server.

string[] SiteName: Name of the Site to Assign a Server.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

ServerId or SiteId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Move-PvsServerToSite for PvsServer to PvsSite**

Move-PvsServerToSite -Name theServer -SiteName theSite

**EXAMPLE 2: Move-PvsServerToSite for PvsServer Using Pipe**

The Get-PvsServer output is piped to the Move-PvsServerToSite.
Get-PvsServer -Name theServer -Fields Guid | Move-PvsServerToSite -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Move-PvsServerToSite for PvsSite Using Pipe**

The Get-PvsSite output is piped to the Move-PvsServerToSite.

Get-PvsSite -Name theSite -Fields Guid | Move-PvsServerToSite -Name theServer

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

### New-PvsAuthGroup

Create a new authorization AuthGroup for an Active Directory or Windows Group.

All parameters that do not have a Default are required, unless only a few of a group are required.

- **string Name or AuthGroupName:** Name of the Active Directory or Windows Group. Max Length=450
- **string Description:** User description. Default="" Max Length=250
- **SwitchParameter Confirm:** The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsAuthGroup: If successful, the new PvsAuthGroup object is returned.

**EXAMPLE 1: Create PvsAuthGroup with Minimum Fields**

Creates a PvsAuthGroup for the "AD\PVSFarmAdminGroup" Active Directory security group.

New-PvsAuthGroup -Name "AD\PVSFarmAdminGroup"

**EXAMPLE 2: Create PvsAuthGroup with All Fields**

Creates a PvsAuthGroup for the "AD\PVSFarmAdminGroup" Active Directory security group with "Farm AuthGroup" as the description.

New-PvsAuthGroup -Name "AD\PVSFarmAdminGroup" -Description "Farm AuthGroup"

**EXAMPLE 3: Create PvsAuthGroup and Assign to Site**

Creates a PvsAuthGroup for the "AD\PVSSiteAdminGroup" Active Directory security group and Assigns it to theSite.

New-PvsAuthGroup -Name "AD\PVSSiteAdminGroup" | Grant-PvsAuthGroup -SiteName theSite

212
New-PvsCollection

Create a new Collection for a Site.

All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or CollectionName: Name of the Collection. It is unique within the Site. Max Length=50

Guid SiteId: GUID of the Site that this Collection is a member of. It is not used with SiteName.

string SiteName: Name of the Site that this Collection is a member of. It is not used with SiteId.

string Description: User description. Default="" Max Length=250

uint LastAutoAddDeviceNumber: The Device Number of the last Auto Added Device. Default=0

SwitchParameter Disabled: If -Disabled is specified, the Devices in the Collection can not be booted. By default the Devices can be booted.

string AutoAddPrefix: The string put before the Device Number for Auto Add. Default="" ASCII computer name characters no end digit Max Length=12

string AutoAddSuffix: The string put after the Device Number for Auto Add. Default="" ASCII computer name characters no begin digit Max Length=12

SwitchParameter NoAutoAddZeroFill: If -NoAutoAddZeroFill is specified, zeros will not be placed before the Device Number up to the AutoAddNumberLength for Auto Add.

uint AutoAddNumberLength: The maximum length of the Device Number for Auto Add. This length plus the AutoAddPrefix length plus the AutoAddSuffix length must be less than 16. Required that 

((lenAutoAddPrefix+lenAutoAddSuffix)+AutoAddNumberLength)<=15. Min=3, Max=9, Default=4

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsCollection: If successful, the new PvsCollection object is returned.

EXAMPLE 1: Create PvsCollection with Minimum Fields

Creates a PvsCollection named theCollection in theSite.

New-PvsCollection -Name theCollection -SiteName theSite

EXAMPLE 2: Create PvsCollection with All Fields

Creates a PvsCollection named theCollection in theSite with "XenServer Collection" as the description that is Disabled and has all AutoAdd settings different than defaults.
New-PvsCollection -Name theCollection -SiteName theSite -Description "XenServer Collection" -Disabled - LastAutoAddDeviceNumber 100 -AutoAddPrefix A - AutoAddSuffix A -NoAutoAddZeroFill - AutoAddNumberLength 3

**EXAMPLE 3: Create PvsCollection and Assign AuthGroup to it**

Creates a PvsCollection named theCollection in theSite and Assigns AuthGroup "AD\PVSCollectionAdminGroup" to it.

New-PvsCollection -Name theCollection -SiteName theSite | Grant-PvsAuthGroup -AuthGroupName "AD\PVSCollectionAdminGroup"

**New-PvsDevice**

Add a new Device to a Collection.

All parameters that do not have a Default are required, unless only a few of a group are required.

- **string Name or DeviceName:** Computer name with no spaces. ASCII computer name characters Max Length=15
- **Guid CollectionId:** GUID of the Collection this Device is to be a member of. It is not used with CollectionName.
- **string CollectionName:** Name of the Collection this Device is to be a member of. SiteName or SiteId must also be used.
- **Guid SiteId:** GUID of the Site the CollectionName is to be a member of. This or SiteName is used with CollectionName.
- **string SiteName:** Name of the Site the CollectionName is to be a member of. This or SiteId is used with CollectionName.
- **string Description:** User description. Default="" Max Length=250
- **PvsPhysicalAddress DeviceMac:** Ethernet address can have the form XX-XX-XX-XX-XX-XX. Uniquely identifies the Device.
- **uint BootFrom:** Device to boot from. Choices are 1 for vDisk, 2 for Hard Disk, and 3 for Floppy. Min=1, Max=3, Default=1
- **string ClassName:** Used by Automatic Update feature to match new versions of Disks to a Device. Default="" Max Length=41
- **uint Port:** UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901
- **SwitchParameter Disabled:** If -Disabled is specified, the Device can not be booted. By default the Device can be booted.
- **SwitchParameter LocalDiskEnabled:** If -LocalDiskEnabled is specified, there will be a local disk menu choice for the Device.
- **uint Authentication:** Device log in authentication. Choices are 0 for none, 1 for User Name/Password, and 2 for Extern. Min=0, Max=2, Default=0
string User: Name of user to authenticate before the boot process continues. Default="" ASCII Max Length=20

string Password: Password of user to authenticate before the boot process continues. Default="" ASCII Max Length=100

SwitchParameter CopyTemplate: If -CopyTemplate is specified, the Template Device for the collection, if it exists, will be used for the property settings of the new Device.

uint AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

uint AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

string DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

uint Type: 1 when it performs test of Disks, 2 when it performs maintenance on Disks, 0 otherwise. Min=0, Max=2, Default=0

uint LocalWriteCacheDiskSize: The size in GB to format the Device cache file disk. If the value is 0, then the disk is not formatted. Min=0, Max=2048, Default=0

SwitchParameter BdmBoot: If -BdmBoot is specified, user BDM instead of PXE boot. PXE boot is used by default.

Guid VirtualHostingPoolId: GUID that uniquely identifies the Virtual Hosting Pool for a VM. This is needed when Adding a VM device. Default=00000000-0000-0000-0000-000000000000

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsDevice: If successful, the new PvsDevice object is returned.

**EXAMPLE 1: Create PvsDevice with Minimum Fields**

Creates a PvsDevice named theDevice in theCollection of theSite.

New-PvsDevice -Name theDevice -DeviceMac "00-11-22-33-44-55" -SiteName theSite -CollectionName theCollection

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 2: Create PvsDevice with All Fields**

Creates a PvsDevice named theDevice in theCollection of theSite with all fields set different than defaults.

New-PvsDevice -Name theDevice -DeviceMac "00-11-22-33-44-55" -SiteName theSite -CollectionName theCollection -Description "XenServer Device" -BootFrom 2 -ClassName C -Port 6000 -Disabled -LocalDiskEnabled -Authentication 1 -User U -Password P -CopyTemplate -LogLevel 3 -Type 2 -LocalWriteCacheDiskSize 100 -BdmBoot -VirtualHostingPoolId "15e0544e-4cf9-449e-b47f-8d836b16026f"

Do not set AdTimestamp, AdSignature, DomainName, DomainObjectSID, DomainControllerName and DomainTimeCreated. They are only set internally by PVS.

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 3: Create PvsDevice and Boot it**

Creates a PvsDevice named theDevice in theCollection of theSite and Boots it.

New-PvsDevice -Name theDevice -DeviceMac "00-11-22-33-44-55" -SiteName theSite -CollectionName theCollection -Start-PvsBoot

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**New-PvsDeviceWithPersonalvDisk**

Add a new Device with Personal vDisk to a collection.

All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or DeviceName: Computer name with no spaces. ASCII computer name characters Max Length=15

Guid CollectionId: GUID of the Collection this Device with Personal vDisk is to be a member of. It is not used with CollectionName.
string CollectionName: Name of the Collection this Device with Personal vDisk is to be a member of. SiteName or SiteId must also be used.

Guid DiskLocatorId: GUID of the Disk Locator to update with this Device.

Guid SiteId: GUID of the Site the CollectionName is to be a member of. This or SiteName is used with CollectionName.

string SiteName: Name of the Site the CollectionName is to be a member of. This or SiteId is used with CollectionName.

string Description: User description. Default="" Max Length=250

PvsPhysicalAddress DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX. Uniquely identifies the Device with Personal vDisk.

uint Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

uint AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

uint AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

string DomainName: Fully qualified name of the domain that the Device with Personal vDisk belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device with Personal vDisk's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

uint Type: 3 when it has a Personal vDisk, 4 when it has a Personal vDisk and performs tests. Min=3, Max=4, Default=3

string PvdDriveLetter: Personal vDisk Drive letter. Range is F to Z. Default="" Max Length=1
uint LocalWriteCacheDiskSize: The size in GB to format the Device
cache file disk. If the value is 0, then the disk is
not formatted. Min=0, Max=2048, Default=0

SwitchParameter BdmBoot: If -BdmBoot is specified, user BDM instead of
PXE boot. PXE boot is used by default.

Guid XdSiteId: GUID of the XenDesktop Site. Default=00000000-0000-
0000-0000-000000000000

uint XdCatalogId: Integer identifier of the XenDesktop Catalog.
Default=""

Guid VirtualHostingPoolId: GUID that uniquely identifies the Virtual
Hosting Pool for a VM. This is needed when Adding a
VM device. Default=00000000-0000-0000-0000-
000000000000

SwitchParameter Confirm: The impact of this operation is "low". If -
Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "low" to
have confirmation without the Confirm parameter.

PvsDeviceWithPersonalvDisk: If successful, the new
PvsDeviceWithPersonalvDisk object is returned.

**EXAMPLE 1: Create PvsDeviceWithPersonalvDisk with Minimum Fields**

Creates a PvsDeviceWithPersonalvDisk with Personal vDisk named
theDevice in theCollection of theSite.

New-PvsDeviceWithPersonalvDisk -Name theDevice -DeviceMac "00-11-22-
33-44-55" -SiteName theSite -CollectionName
theCollection

CollectionId can be used instead of CollectionName so that the
SiteName or SiteId is not also needed.

**EXAMPLE 2: Create PvsDeviceWithPersonalvDisk with All Fields**

Creates a PvsDeviceWithPersonalvDisk named theDevice in theCollection
of theSite with all fields set different than
defaults.

New-PvsDeviceWithPersonalvDisk -Name theDevice -DeviceMac "00-11-22-
33-44-55" -SiteName theSite -CollectionName
theCollection -Description "XenServer Device" -
ClassName C -Port 6000 -LogLevel 3 -Type 4 -
PvdDriveLetter G -LocalWriteCacheDiskSize 100 -
BdmBoot XdSiteId "bd712b52-a262-4aa2-9c36-
1602efe07f57" -XdCatalogId 5 -VirtualHostingPoolId
"15e054ae-4cf9-449e-b47f-8d836b16026f"

Do not set AdTimestamp, AdSignature, DomainName, DomainObjectSID,
DomainControllerName and DomainTimeCreated. They are
only set internally by PVS.

CollectionId can be used instead of CollectionName so that the
SiteName or SiteId is not also needed.
EXAMPLE 3: Create PvsDeviceWithPersonalvDisk and Boot it

Creates a PvsDeviceWithPersonalvDisk with Personal vDisk named theDevice in theCollection of theSite and Boots it.

New-PvsDeviceWithPersonalvDisk -Name theDevice -DeviceMac "00-11-22-33-44-55" -SiteName theSite -CollectionName theCollection | Start-PvsBoot

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

New-PvsDirectory

Create a Directory on the Server specified.

One of these required

Guid[] Guid or ServerId: GUID of the Server to create a Directory on.
string[] Name or ServerName: Name of the Server to create a Directory on.

This required

string[] Path: Path of the new Directory to create.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: New-PvsDirectory for Name

New-PvsDirectory -Name theServer -Path "C:\directory\subdirectory"

EXAMPLE 2: New-PvsDirectory for PvsServer Using Pipe

The Get-PvsServer output is piped to the New-PvsDirectory.

Get-PvsServer -Name theServer -Fields Guid | New-PvsDirectory -Path "C:\directory\subdirectory"

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

New-PvsDiskLocator

Create a new Disk Locator for a Site. The Disk file must already exist.

All parameters that do not have a Default are required, unless only a few of a group are required.
string Name or DiskLocatorName: Name of the Disk Locator File. It is unique within the Store. ASCII Max Length=52

Guid SiteId: GUID of the Site this DiskLocator is to be a member of. It is not used with SiteName.

string SiteName: Name of the Site this DiskLocator is to be a member of. It is not used with SiteId.

Guid StoreId: GUID of the Store that this DiskLocator is a member of. SiteName or SiteId must also be used. It is not used with StoreName.

string StoreName: Name of the Store that this DiskLocator is a member of. SiteName or SiteId must also be used. It is not used with StoreId.

string Description: User description. Default="" Max Length=250

string MenuText: Text that is displayed in the Boot Menu. If this field has no value, the name value is used. Default="" ASCII Max Length=64

Guid ServerId: GUID of the single Server that this Disk Locator is assigned to. It is not used with ServerName. Default=00000000-0000-0000-0000-000000000000

string ServerName: Name of the single Server that this Disk Locator is assigned to. It is not used with ServerId. Default=""

SwitchParameter Disabled: If -Disabled is specified, the disk can not be booted. By default the disk can be booted.

SwitchParameter RebalanceEnabled: If -RebalanceEnabled is specified, this Server can automatically rebalance Devices.

uint RebalanceTriggerPercent: Percent over fair load that triggers a dynamic Device rebalance. Min=5, Max=5000, Default=25

uint SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=None, 1=Best Effort, 2=Fixed. Min=0, Max=2, Default=0

string NewDiskWriteCacheType: The WriteCacheType that if a new Disk will be created, it will be set with. It is only used when a new Disk is being created. Value are: 0 (Private), (other values are standard image) 1 (Cache on Server), 3 (Cache in Device RAM), 4 (Cache on Device Hard Disk), 6 (Device RAM Disk), 7 (Cache on Server, Persistent), or 9 (Cache in Device RAM with Overflow on Hard Disk) Default=0

SwitchParameter VHDX: If -VHDX is specified, the format of the image the DiskLocator is being added for that has never been added to the Farm is VHDX. Otherwise it is assumed to be VHD.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.
PvsDiskLocator: If successful, the new PvsDiskLocator object is returned.

**EXAMPLE 1: Create PvsDiskLocator with Minimum Fields**

Creates a PvsDiskLocator named theDiskLocator in theSite and theStore.

```
New-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore
```

**EXAMPLE 2: Create PvsDiskLocator with All Fields**

Creates a PvsDiskLocator named theDiskLocator in theSite and theStore with all fields set different than defaults.

```
New-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Description "XenServer DiskLocator" -MenuText "XenServer Disk" -ServerName theServer -Disabled -RebalanceEnabled -RebalanceTriggerPercent 50 -SubnetAffinity -1 -NewDiskWriteCacheType 9 -VHDX
```

-NewDiskWriteCacheType 9 (Cache in Device RAM with Overflow on Hard Disk) is an important parameter since this is the most optimal cache type.

**New-PvsDiskMaintenanceVersion**

Create a Maintenance version for the Disk Locator. Returns a PvsDiskVersion when successful.

This required

- **Guid** Guid or DiskLocatorId: GUID of the Disk Locator File to Enable Disk Maintenance on.

or this required & resolution

- **string** Name or DiskLocatorName: Name of the Disk Locator File to Enable Disk Maintenance on.

One of these resolutions when needed

- **Guid** SiteId: GUID of the Site.
- **string** SiteName: Name of the Site.

One of these resolutions when needed

- **Guid** StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
- **string** StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

- **PvsObject[]** Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  - **DiskLocatorId**

Optional
SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsDiskVersion: If successful, the new PvsDiskVersion object is returned.

**EXAMPLE 1: New-PvsDiskMaintenanceVersion**

This example create a maintenance version for an existing DiskLocator. It returns a PvsDiskVersion when successful.

```powershell
$thePvsDiskVersion = New-PvsDiskMaintenanceVersion -Name theDiskLocator -SiteName theSite -SiteId theStore
if ($thePvsDiskVersion -ne $null)
{
    $thePvsDiskVersion.Name  # display the name of the version file
}
```

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**New-PvsDiskUpdateDevice**

Add a new Device related to a Disk that can be updated.

All parameters that do not have a Default are required, unless only a few of a group are required.

- **string Name** or **DeviceName**: Computer name with no spaces. ASCII computer name characters Max Length=15
- **Guid VirtualHostingPoolId**: GUID of the Virtual Hosting Pool. It is not used with VirtualHostingPoolName.
- **string VirtualHostingPoolName**: Name of the Virtual Hosting Pool.
- **Guid DiskLocatorId**: GUID of the Disk Locator to update with this Device.
- **string Description**: User description. Default="" Max Length=250
- **PvsPhysicalAddress** DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX-XX. Uniquely identifies the Device.
- **uint Port**: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901
- **uint AdTimestamp**: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0
- **uint AdSignature**: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0
uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

string DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

SwitchParameter Confirm: The impact of this operation is "low". If Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsDiskUpdateDevice: If successful, the new PvsDiskUpdateDevice object is returned.

**EXAMPLE 1: Create PvsDiskUpdateDevice with Minimum Fields**

Creates a PvsDiskUpdateDevice named theDevice for the DiskLocatorId 2888f183-2f48-4771-b8dd-e5a44b2e59b.

New-PvsDiskUpdateDevice -Name theDevice -DeviceMac "00-11-22-33-44-55" -VirtualHostingPoolName theVirtualHostingPool -DiskLocatorId "2888f183-2f48-4771-b8dd-e5a44b2e59b"

**EXAMPLE 2: Create PvsDiskUpdateDevice with All Fields**

Creates a PvsDiskUpdateDevice named theDevice for the DiskLocatorId 2888f183-2f48-4771-b8dd-e5a44b2e59b with all fields set different than defaults.

New-PvsDiskUpdateDevice -Name theDevice -DeviceMac "00-11-22-33-44-55" -VirtualHostingPoolName theVirtualHostingPool -DiskLocatorId "2888f183-2f48-4771-b8dd-e5a44b2e59b" -Description "DiskUpdate Device" -Port 6000 -LogLevel 3

Do not set AdTimestamp, AdSignature, DomainName, DomainObjectSID, DomainControllerName and DomainTimeCreated. They are only set internally by PVS.

**New-PvsFarmView**

Create a new View for the Farm.
All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or FarmViewName: name of the Farm View. Max Length=50
string Description: User description. Default="" Max Length=250

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsFarmView: If successful, the new PvsFarmView object is returned.

EXAMPLE 1: Create PvsFarmView with Minimum Fields

Creates a PvsFarmView named theFarmView.
New-PvsFarmView -Name theFarmView

EXAMPLE 2: Create PvsFarmView with All Fields

Creates a PvsFarmView named theFarmView with "XenServer FarmView" as the description.
New-PvsFarmView -Name theFarmView -Description "XenServer FarmView"

New-PvsServer

Add a new Server to a Site.

All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or ServerName: Computer name with no spaces. ASCII computer name characters Max Length=21
Guid SiteId: GUID of the Site this Server is to be a member of. It is not used with SiteName.
string SiteName: Name of the Site this Server is to be a member of. It is not used with SiteId.
string Description: User description. Default="" Max Length=250
uint AdMaxPasswordAge: Number of days before a password expires. Min=1, Max=30, Default=7
uint LicenseTimeout: Amount of seconds before a license times out. Min=15, Max=300, Default=30
uint VDiskCreatePacing: VDisk create time pacing in miliseconds. Min=0, Max=5, Default=0
uint FirstPort: Number of the first UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6910
uint LastPort: Number of the last UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6930
uint ThreadsPerPort: Number of worker threads per IO port. Required that (threadPerPort * numberPorts * numberIPs) <= 1000. Min=1, Max=60, Default=8

uint BuffersPerThread: Number of buffers per worker thread. Min=1, Max=128, Default=24

uint ServerCacheTimeout: Number of seconds to wait before considering another Server is down. Min=5, Max=60, Default=8

uint IoBurstSize: Number of bytes read/writes can send in a burst of packets. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=4096, Max=61440, Default=32768

uint MaxTransmissionUnits: Ethernet maximum transmission unit size for the protocol for use for Server and Device. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=502, Max=16426, Default=1506

uint MaxBootDevicesAllowed: Maximum number of Devices allowed to boot simultaneously. Min=1, Max=1000, Default=500

uint MaxBootSeconds: Maximum number of seconds for a Device to boot. Min=10, Max=900, Default=60

uint BootPauseSeconds: Number of seconds that a Device will pause during login if its server busy. Min=1, Max=60, Default=10

SwitchParameter AdMaxPasswordAgeEnabled: If -AdMaxPasswordAgeEnabled is specified, Age the password.

SwitchParameter EventLoggingEnabled: If -EventLoggingEnabled is specified, event logging is enabled.

SwitchParameter NonBlockingIoDisabled: If -NonBlockingIoDisabled is specified, do not use non-Blocking IO.

string[] Ip: One or more streaming ip addresses.

uint InitialQueryConnectionPoolSize: Initial size of database connection pool for non-transactional queries. Min=1, Max=1000, Default=50

uint InitialTransactionConnectionPoolSize: Initial size of database connection pool for transactional queries. Min=1, Max=1000, Default=50

uint MaxQueryConnectionPoolSize: Maximum size of database connection pool for non-transactional queries. Min=1, Max=32767, Default=1000

uint MaxTransactionConnectionPoolSize: Maximum size of database connection pool for transactional queries. Min=1, Max=32767, Default=1000

uint RefreshInterval: Interval, in number of seconds, the server should wait before refreshing settings. If set to 0, unused database connections are never released. Min=0, Max=32767, Default=300
uint UnusedDbConnectionTimeout: Interval, in number of seconds, a connection should go unused before it is to be released. Min=0, Max=32767, Default=300

uint BusyDbConnectionRetryCount: Number of times a failed database connection will be retried. Min=0, Max=32767, Default=2

uint BusyDbConnectionRetryInterval: Interval, in number of milliseconds, the server should wait before retrying to connect to a database. Min=0, Max=10000, Default=25

uint LocalConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are local. A value of 0 disables the feature. Min=0, Max=128, Default=4

uint RemoteConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are remote. A value of 0 disables the feature. Min=0, Max=128, Default=4

string RamDiskIpAddress: IP address to use for transferring the RAM Disk. When equal to 0.0.0.0 the server IP is used with the first part replaced with 233. Default=0.0.0.0

uint RamDiskTimeToLive: Time to live for the invitation packet sent to Devices. Min=1, Max=255, Default=1

SwitchParameter RamDiskInvitationVariable: If - RamDiskInvitationVariable is specified, the Invitation Type is Variable. By default it is Fixed.

uint RamDiskInvitationPeriod: The amount of time in seconds that invitations are sent to Devices. Min=1, Max=300, Default=10

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=4

uint LogFileSizeMax: Maximum size log files can reach in Megabytes. Min=1, Max=50, Default=5

uint LogFileBackupCopiesMax: Maximum number of log file backups. Min=1, Max=50, Default=4

float PowerRating: A strictly relative rating of this Server's capabilities when compared to other Servers in the Store(s) it belongs too; can be used to help tune load balancing. Min=0.1, Max=1000, Default=1

SwitchParameter Confirm: The impact of this operation is "low". If - Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsServer: If successful, the new PvsServer object is returned.
**EXAMPLE 1: Create PvsServer with Minimum Fields**

Creating a PvsServer named theServer in theSite.

```
New-PvsServer -Name theServer -SiteName theSite -Ip 192.168.0.33 192.168.0.34
```

**EXAMPLE 2: Create PvsServer with All Fields**

Creating a PvsServer named theServer in theSite with all fields set different than defaults.

```
New-PvsServer -Name theServer -SiteName theSite -Ip 192.168.0.33 192.168.0.34 -Description "XenServer Server" -AdMaxPasswordAge 10 -LicenseTimeout 60 -VDiskCreatePacing 5 -FirstPort 7910 -LastPort 7930 -ThreadsPerPort 16 -BuffersPerThread 48 -ServerCacheTimeout 15 -IoBurstSize 13632 -MaxTransmissionUnits 502 -MaxBootDevicesAllowed 1000 -MaxBootSeconds 20 -AdMaxPasswordAgeEnabled -EventLoggingEnabled -NonBlockingIoDisabled -InitialQueryConnectionPoolSize 100 -InitialTransactionConnectionPoolSize 100 -MaxQueryConnectionPoolSize 2000 -MaxTransactionConnectionPoolSize 2000 -RefreshInterval 500 -UnusedDbConnectionTimeout 500 -BusyDbConnectionRetryCount 5 -BusyDbConnectionRetryInterval 50 -LocalConcurrentIoLimit 5 -RemoteConcurrentIoLimit 5 -RamDiskIpAddress 192.168.5.5 -RamDiskTimeToLive 2 -RamDiskInvitationVariable -RamDiskInvitationPeriod 20 -LogLevel 3 -LogFileBackupCopiesMax 5 -PowerRating 1.5
```

**New-PvsSite**

Create a new Site for the Farm.

All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or SiteName: Name of the Site. Max Length=50

string Description: User description. Default="" Max Length=250

uint InventoryFilePollingInterval: The number of seconds between polls for Disk changes in the Stores. Min=1, Max=600, Default=60

SwitchParameter EnableDiskUpdate: If -EnableDiskUpdate is specified, the Disk Update will be enabled for the Site. By default Disk Update is disabled.

Guid DiskUpdateServerId: GUID of the Disk Update Server for the Site. Not used with DiskUpdateServerName. Default=00000000-0000-0000-0000-000000000000

string DiskUpdateServerName: Name of the Disk Update Server for the Site. Not used with DiskUpdateServerId. Default=""
string MakUser: User name used for MAK activation. Default="" Max Length=64

string MakPassword: User password used for MAK activation. Default="" Max Length=64

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsSite: If successful, the new PvsSite object is returned.

**EXAMPLE 1: Create PvsSite with Minimum Fields**

Creates a PvsSite named theSite.

New-PvsSite -Name theSite

**EXAMPLE 2: Create PvsSite with All Fields**

Creates a PvsSite named theSite with all fields set different than defaults.

New-PvsSite -Name theSite -Description "XenServer Site" -InventoryFilePollingInterval 100 -EnableDiskUpdate -DiskUpdateServerName theServer -MakUser theMakUser -MakPassword theMakPassword

**EXAMPLE 3: Create PvsSite and Assign AuthGroup to it**

Creates a PvsSite named theSite and Assigns AuthGroup "AD\PVSSiteAdminGroup" to it.

New-PvsSite -Name theSite | Grant-PvsAuthGroup -AuthGroupName "AD\PVSSiteAdminGroup"

**New-PvsSiteView**

Create a new View for a Site.

All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or SiteViewName: Name of the Site View. Max Length=50

Guid SiteId: GUID of the Site this View is to be a member of. It is not used with SiteName.

string SiteName: Name of the Site this View is to be a member of. It is not used with SiteId.

string Description: User description. Default="" Max Length=250

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsSiteView: If successful, the new PvsSiteView object is returned.
EXAMPLE 1: Create PvsSiteView with Minimum Fields

Creates a PvsSiteView named theSiteView in theSite.

New-PvsSiteView -Name theSiteView -SiteName theSite

EXAMPLE 2: Create PvsSiteView with All Fields

Creates a PvsSiteView named theSiteView in theSite with "XenServer SiteView" as the description.

New-PvsSiteView -Name theSiteView -SiteName theSite -Description "XenServer SiteView"

New-PvsStore

Create a new Store for the Farm.

All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or StoreName: Name of the Store. Max Length=50

Guid SiteId: GUID of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteName can be used instead. Default=00000000-0000-0000-0000-00000000000

string SiteName: Name of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteId can be used instead. Default=""

string Description: User description. Default="" Max Length=250

string Path: Default directory path that the Servers use to access this Store. Max Length=255

string[] CachePath: Default Cache path(s) that the Servers use with this Store. If none are specified the caches will be placed in the WriteCache subdirectory of the Store path. Default=None

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsStore: If successful, the new PvsStore object is returned.

EXAMPLE 1: Create PvsStore with Minimum Fields

Creates a PvsStore named theStore with network share path.

New-PvsStore -Name theStore -Path "\\thePath\subDirectory"

EXAMPLE 2: Create PvsStore with All Fields

Creates a PvsStore named theStore that only theSite administrators can change with all fields set different than defaults.
New-PvsStore -Name theStore -Path "c:\thePath" -SiteName theSite -Description "Local Server Path Store" -CachePath "c:\thePath\sub1" "c:\thePath\sub2"

**New-PvsUpdateTask**

Create a new Update Task for a Store.

All parameters that do not have a Default are required, unless only a few of a group are required.

- **string Name or UpdateTaskName**: Name of the Update Task. It is unique within the Site. Max Length=50
- **Guid SiteId**: GUID of the Site that this Update Task is a member of. It is not used with SiteName.
- **string SiteName**: Name of the Site that this Update Task is a member of. It is not used with SiteId.
- **string Description**: User description. Default=Max Length=250
- **SwitchParameter Disabled**: If -Disabled is specified, the updates will not be processed. By default the updates will be processed.
- **uint Hour**: The hour of the day to perform the task. Min=0, Max=23, Default=0
- **uint Minute**: The minute of the hour to perform the task. Min=0, Max=59, Default=0
- **uint Recurrence**: The update will reoccur on this schedule. 0 = None, 1 = Daily, 2 = Every Weekday, 3 = Weekly, 4 = Monthly Date, 5 = Monthly Type. Min=0, Max=5, Default=0
- **uint DayMask**: Days selected values. 1 = Monday, 2 = Tuesday, 4 = Wednesday, 8 = Thursday, 16 = Friday, 32 = Saturday, 64 = Sunday, 128 = Day. Default=0. This is used with Weekly and Monthly Type recurrence. Min=1, Max=255, Default=4
- **uint[] Date**: Days of the month. Numbers from 1-31 are the only valid values. This is used with Monthly Date recurrence. Default="" Max Length=83
- **uint MonthlyOffset**: When to happen monthly. 0 = None, 1 = First, 2 = Second, 3 = Third, 4 = Forth, 5 = Last. This is used with Monthly Type recurrence. Min=0, Max=5, Default=3
- **string EsdType**: Esd to use. Valid values are SCCM or WSUS. If no value, a custom script is run on the client. Default="" Max Length=50
- **string PreUpdateScript**: Script file to run before the update starts. Default="" Max Length=255
- **string PreVmScript**: Script file to run before the VM is loaded. Default="" Max Length=255
- **string PostUpdateScript**: Script file to run after the update finishes. Default="" Max Length=255
string PostVmScript: Script file to run after the VM is unloaded.
    Default="" Max Length=255

string Domain: Domain to add the Disk Update Device(s) to. If not included, the first Domain Controller found on the
    Server is used. Default="" Max Length=255

string OrganizationUnit: Organizational Unit to add the Disk Update Device(s) to. This parameter is optional. If it is
    not specified, the device is added to the built in Computers container. Child OU's should be delimited with forward slashes, e.g. "ParentOU/ChildOU". Special characters in an OU name, such as "", '#', '+', ',', ';', '>', '=', must be escaped with a backslash. For example, an OU called "commaIn,TheMiddle" must be specified as "commaIn\,TheMiddle". The old syntax of delimiting child OU's with a comma is still supported, but deprecated. Note that in this case, the child OU comes first, e.g. "ChildOU,ParentOU". Default="" Max Length=255

uint PostUpdateApprove: Access to place the version in after the update has occurred. 0 = Production, 1 = Test, 2 = Maintenance. Min=0, Max=2, Default=0

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsUpdateTask: If successful, the new PvsUpdateTask object is returned.

EXAMPLE 1: Create PvsUpdateTask with Minimum Fields

Creates a PvsUpdateTask named theUpdateTask in theSite. Since no EsdType is set, the update.bat in the client install directory will be executed for this task.

New-PvsUpdateTask -Name theUpdateTask -SiteName theSite

EXAMPLE 2: Create PvsUpdateTask for Daily Updates

Creates a PvsUpdateTask named theUpdateTask in theSite for SCCM that occurs every day at midnight.

New-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Description "Every day at Midnight" -Recurrence 1 -Hour 0 -Minute 0 -EsdType SCCM

EXAMPLE 3: Create PvsUpdateTask for Weekday Updates

Creates a PvsUpdateTask named theUpdateTask in theSite for WSUS that occurs every weekday at midnight.

New-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Description "Every weekday at Midnight" -Recurrence 2 -Hour 0 -Minute 0 -EsdType WSUS
EXAMPLE 4: Create PvsUpdateTask for Weekly Updates

Creates a PvsUpdateTask named theUpdateTask in theSite for SCCM that occurs every week on Monday and Friday at 3 AM.

New-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Description "Every week on Monday and Friday at 3 AM" -Recurrence 3 -Hour 3 -Minute 0 -DayMask 17 -EsdType SCCM

EXAMPLE 5: Create PvsUpdateTask for Monthly Updates

Creates a PvsUpdateTask named theUpdateTask in theSite for WSUS that occurs every month on the 1st and 15th at midnight.

New-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Description "Every month on the 1st and 15th at Midnight" -Recurrence 4 -Hour 0 -Minute 0 -Date 1 15 -EsdType WSUS

EXAMPLE 6: Create PvsUpdateTask for Monthly Type Updates

Creates a PvsUpdateTask named theUpdateTask in theSite for SCCM that is disabled and occurs every month on the 2nd Tuesday and Thursday at Midnight.

New-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Description "Every month on the 2nd Tuesday and Thursday at Midnight" -Disabled -Recurrence 5 -Hour 0 -Minute 0 -DayMask 10 -MonthlyOffset 2 -EsdType SCCM

New-PvsVirtualHostingPool

Add a new Virtual Hosting Pool to a Site.

All parameters that do not have a Default are required, unless only a few of a group are required.

string Name or VirtualHostingPoolName: Name of the Virtual Hosting Pool. It is unique within the Site. Max Length=50

Guid SiteId: GUID of the Site that this Virtual Hosting Pool is a member of. It is not used with SiteName.

string SiteName: Name of the Site that this Virtual Hosting Pool is a member of. It is not used with SiteId.

uint Type: Type of the Virtual Hosting Pool. 0 = Citrix XenServer, 1 = Microsoft SCVMM/Hyper-V, 2 = VMWare vSphere/ESX. Min=0, Max=2, Default=0

string Description: User description. Default="" Max Length=250

string Server: Name or IP of the Host Server. Max Length=255

uint Port: Port of the Host Server. Min=80, Max=65534, Default=80

string Datacenter: Datacenter of the Virtual Hosting Pool. Default="" Max Length=250

uint UpdateLimit: Number of updates at the same time. Min=2, Max=1000, Default=1000
uint UpdateTimeout: Timeout for updates. Min=2, Max=240, Default=60
uint ShutdownTimeout: Timeout for shutdown. Min=2, Max=30, Default=10
string UserName: Name to use when logging into the Server.
string Password: Password to use when logging into the Server.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsVirtualHostingPool: If successful, the new PvsVirtualHostingPool object is returned.

**EXAMPLE 1: Create PvsVirtualHostingPool with Minimum Fields**

Creates a PvsVirtualHostingPool named theVirtualHostingPool in theSite.

```powershell
New-PvsVirtualHostingPool -Name theVirtualHostingPool -SiteName theSite -Server 192.168.0.33 -UserName theUserName -Password thePassword
```

**EXAMPLE 2: Create PvsVirtualHostingPool with All Fields**

Creates a PvsVirtualHostingPool named theVirtualHostingPool in theSite with all fields set different than defaults.

```powershell
New-PvsVirtualHostingPool -Name theVirtualHostingPool -SiteName theSite -Server 192.168.0.33 -UserName theUserName -Password thePassword -Type 1 -Description "A VirtualHostingPool" -Port 180 -Datacenter Data -UpperLimit 500 -UpdateTimeout 120 -ShutdownTimeout 20
```

### Remove-PvsAuthGroup

Remove one or more AuthGroup Active Directory or Windows Group names.

One of these required

- Guid[] Guid or AuthGroupId: GUID of the AuthGroup to Delete.
- string[] Name or AuthGroupName: Name of the AuthGroup to Delete.

Optional

- SwitchParameter Force: If -Force is specified, the AuthGroup will be Deleted even if being used, otherwise an error is returned if being used.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

```powershell
AuthGroupId
```

Optional

- SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Remove the PvsAuthGroup with Name theAuthGroup**

This example removes the PvsAuthGroup named theAuthGroup.

Remove-PvsAuthGroup -Name theAuthGroup

**EXAMPLE 2: Remove the PvsAuthGroup with Name theAuthGroup using Pipe**

This example uses Get-PvsAuthGroup that returns the PvsAuthGroup named theAuthGroup that is piped to Remove-PvsAuthGroup for removal.

Get-PvsAuthGroup -Name theAuthGroup | Remove-PvsAuthGroup

**EXAMPLE 3: Remove All PvsAuthGroup in a Collection Even When Still Used**

This example removes all PvsAuthGroup in the Collection named theCollection of the Site named theSite even when the PvsAuthGroup is still being used.

Remove-PvsAuthGroup -SiteName theSite -CollectionName theCollection -Force

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 4: Remove All Operator PvsAuthGroup in a Collection using Pipe**

This example uses Get-PvsAuthGroup that returns a list of Role 400 PvsAuthGroup in the Collection named theCollection of the Site named theSite that is piped to Remove-PvsAuthGroup for removal.

Get-PvsAuthGroup -SiteName theSite -CollectionName theCollection -Fields Role | Where-Object {$_._Role -eq 400} | Remove-PvsAuthGroup

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "Where-Object {$_._Role -eq 400}" only includes PvsAuthGroup with Role equal to 400 (Collection Operator).

**Remove-PvsCollection**

Remove one or more Collections.

This required

Guid[] Guid or CollectionId: GUID of the Collection to Delete.

or this required & resolution

string[] Name or CollectionName: Name of the Collection to Delete.
One of these resolutions when needed

Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
CollectionId

Optional
SwitchParameter Confirm: The impact of this operation is "medium". If
-Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Remove the PvsCollection with Name theCollection

This example removes the PvsCollection named theCollection in the Site
named theSite.
Remove-PvsCollection -Name theCollection -SiteName theSite
Guid can be used instead of Name so that the SiteName or SiteId is not
also needed.

EXAMPLE 2: Remove the PvsCollection with Name theCollection using Pipe

This example uses Get-PvsCollection that returns the PvsCollection
named theCollection in the Site named theSite that is
piped to Remove-PvsCollection for removal.
Get-PvsCollection -Name theCollection -SiteName theSite | Remove-
PvsCollection
Guid can be used instead of Name so that the SiteName or SiteId is not
also needed.

Remove-PvsDevice

Remove one or more Devices.

One of these required
Guid[] Guid or DeviceId: GUID of the Device to Delete.
string[] Name or DeviceName: Name of the Device to Delete.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Delete.
Guid[] CollectionId: GUID of the Collection to delete all Devices.
or this required & resolution
string[] CollectionName: Name of the Collection to delete all Devices.

One of these resolutions when needed
Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
  DeviceId or CollectionId
Optional
SwitchParameter Confirm: The impact of this operation is "medium". If
  -Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Remove the PvsDevice with Name theDevice
This example removes the PvsDevice named theDevice.
Remove-PvsDevice -Name theDevice

EXAMPLE 2: Remove the PvsDevice with Name theDevice using Pipe
This example uses Get-PvsDevice that returns the PvsDevice named
theDevice that is piped to Remove-PvsDevice for
removal.
Get-PvsDevice -Name theDevice | Remove-PvsDevice

EXAMPLE 3: Remove All PvsDevice in a Collection
This example removes all PvsDevice in the Collection named
theCollection of the Site named theSite.
Remove-PvsDevice -SiteName theSite -CollectionName theCollection
CollectionId can be used instead of CollectionName so that the
SiteName or SiteId is not also needed.

EXAMPLE 4: Remove All Not Active PvsDevice in a Collection using Pipe
This example uses Get-PvsDevice that returns a list of not Active
PvsDevice in the Collection named theCollection of the Site named theSite that is piped to Remove-
PvsDevice for removal.
Get-PvsDevice -SiteName theSite -CollectionName theCollection -Fields
  Active | Where-Object {$_ .Active -eq $false} | Remove-PvsDevice
CollectionId can be used instead of CollectionName so that the
SiteName or SiteId is not also needed.
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.
The "Where-Object {$_ .Active -eq $false}" only includes PvsDevice with
Active equal to false.
**Remove-PvsDeviceDiskCacheFile**

Remove one or more Disk cache files for Devices.

One of these required

- Guid[] Guid or DeviceId: GUID of the Device to Delete Disk cache files.
- string[] Name or DeviceName: Name of the Device to Delete Disk cache files.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device to Delete Disk cache files.

This required

- Guid[] DiskLocatorId: GUID of the Disk Locator to Delete Disk cache files.

or this required & resolution

- string[] DiskLocatorName: Name of the Disk Locator File to Delete Disk cache files.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

One of these resolutions when needed

- Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
- string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  - DeviceId or DiskLocatorId

Optional

- SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Remove the PvsDeviceDiskCacheFile for Device with Name theDevice**

This example removes the PvsDeviceDiskCacheFile for the Device named theDevice.

Remove-PvsDeviceDiskCacheFile -Name theDevice
EXAMPLE 2: Remove the PvsDeviceDiskCacheFile for the Devices that use the DiskLocator with Name theDiskLocator

This example removes the PvsDeviceDiskCacheFile for the Devices that use DiskLocator named theDiskLocator in Site named theSite and Store named theStore.

Remove-PvsDeviceDiskCacheFile -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore

DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

Remove-PvsDeviceFromDomain

Remove a Device, all Devices in a Collection or View from a Domain.

One of these required

- Guid[] Guid or DeviceId: GUID of the Device to Remove from the Domain.
- string[] Name or DeviceName: Name of the Device to Remove from the Domain.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device to Remove from the Domain.
- Guid[] CollectionId: GUID of the Collection to Remove all Devices from the Domain.
- Guid[] SiteViewId: GUID of the Site View to Remove all Devices from the Domain.
- Guid[] FarmViewId: GUID of the Farm View to Remove all Devices from the Domain.
- string[] FarmViewName: Name of the Farm View to Remove all Devices from the Domain.

or one of these required & resolutions

- string[] CollectionName: Name of the Collection to Remove all Devices from the Domain.
- string[] SiteViewName: Name of the Site View to Remove all Devices from the Domain.

Optional

- string[] Domain: Domain to remove the Device(s) from. If not included, the first Domain Controller found on the Server is used.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

DeviceId, CollectionId, SiteViewId or FarmViewId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If
Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Remove-PvsDeviceFromDomain for Name

Remove-PvsDeviceFromDomain -Name theDevice

EXAMPLE 2: Remove-PvsDeviceFromDomain for Name with Domain

Remove-PvsDeviceFromDomain -Name theDevice -Domain theDomain

EXAMPLE 3: Remove-PvsDeviceFromDomain for PvsDevice Using Pipe

The Get-PvsDevice output is piped to the Remove-PvsDeviceFromDomain.

Get-PvsDevice -Name theDevice -Fields Guid | Remove-
PvsDeviceFromDomain -Domain theDomain -
OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

EXAMPLE 4: Remove-PvsDeviceFromDomain for FarmViewName

Remove-PvsDeviceFromDomain -FarmViewName theFarmView

EXAMPLE 5: Remove-PvsDeviceFromDomain for FarmViewName with Domain

Remove-PvsDeviceFromDomain -FarmViewName theFarmView -Domain theDomain

EXAMPLE 6: Remove-PvsDeviceFromDomain for PvsFarmView Using Pipe

The Get-PvsFarmView output is piped to the Remove-PvsDeviceFromDomain.

Get-PvsFarmView -Name theFarmView -Fields Guid | Remove-
PvsDeviceFromDomain -Domain theDomain -
OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

EXAMPLE 7: Remove-PvsDeviceFromDomain for CollectionName

Remove-PvsDeviceFromDomain -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the
SiteName or SiteId is not also needed.
**EXAMPLE 8: Remove-PvsDeviceFromDomain for CollectionName with Domain**

Remove-PvsDeviceFromDomain -CollectionName theCollection -SiteName theSite -Domain theDomain

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 9: Remove-PvsDeviceFromDomain for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Remove-PvsDeviceFromDomain.

Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Remove-PvsDeviceFromDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 10: Remove-PvsDeviceFromDomain for SiteViewName**

Remove-PvsDeviceFromDomain -SiteViewName theSiteView -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 11: Remove-PvsDeviceFromDomain for SiteViewName with Domain**

Remove-PvsDeviceFromDomain -SiteViewName theSiteView -SiteName theSite -Domain theDomain

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 12: Remove-PvsDeviceFromDomain for PvsSiteView Using Pipe**

The Get-PvsSiteView output is piped to the Remove-PvsDeviceFromDomain.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Remove-PvsDeviceFromDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Remove-PvsDeviceFromView**

Remove a Device from a View.

One of these required

Guid[] Guid or DeviceId: GUID of the Device to Remove.

string[] Name or DeviceName: Name of the Device to Remove.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Remove.

One of these required

Guid[] SiteViewId: GUID of the Site View to Remove the Devices from.

Guid[] FarmViewId: GUID of the Farm View to Remove the Devices from.

string[] FarmViewName: Name of the Farm View to Remove the Devices from.

or this required & resolution

string[] SiteViewName: Name of the Site View to Remove the Devices from.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

DeviceId, SiteViewId or FarmViewId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -
Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to
have confirmation without the Confirm parameter.

**EXAMPLE 1: Remove-PvsDeviceFromView for PvsDevice to PvsFarmView**

Remove-PvsDeviceFromView -Name theDevice -PvsFarmViewName
thePvsFarmView

**EXAMPLE 2: Remove-PvsDeviceFromView for PvsDevice Using Pipe**

The Get-PvsDevice output is piped to the Remove-PvsDeviceFromView.

Get-PvsDevice -Name theDevice -Fields Guid | Remove-PvsDeviceFromView
-PvsFarmViewName thePvsFarmView

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are retrieved.

**EXAMPLE 3: Remove-PvsDeviceFromView for PvsFarmView Using Pipe**

The Get-PvsFarmView output is piped to the Remove-PvsDeviceFromView.

Get-PvsFarmView -Name theFarmView -Fields Guid | Remove-
PvsDeviceFromView -Name theDevice

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are retrieved.
EXAMPLE 4: Remove-PvsDeviceFromView for PvsDevice to PvsSiteView

Remove-PvsDeviceFromView -Name theDevice -SiteViewName theSiteView -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

EXAMPLE 5: Remove-PvsDeviceFromView for PvsDevice Using Pipe

The Get-PvsDevice output is piped to the Remove-PvsDeviceFromView.

Get-PvsDevice -Name theDevice -Fields Guid | Remove-PvsDeviceFromView -SiteViewName theSiteView -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

EXAMPLE 6: Remove-PvsDeviceFromView for PvsSiteView Using Pipe

The Get-PvsSiteView output is piped to the Remove-PvsDeviceFromView.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Remove-PvsDeviceFromView -Name theDevice

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

Remove-PvsDirectory

Remove a Directory on the Server specified.

One of these required

Guid[]> Guid or ServerId: GUID of the Server to remove a Directory from. The directory must be empty to be removed.

string[]> Name or ServerName: Name of the Server to remove a Directory from. The directory must be empty to be removed.

This required

string[]> Path: Path of the Directory to remove.

Instead of a parameter that matches one of the members listed

PvsObject[]> Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

  ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Remove-PvsDirectory for Name**

Remove-PvsDirectory -Name theServer -Path "C:\directory\subdirectory"

**EXAMPLE 2: Remove-PvsDirectory for PvsServer Using Pipe**

The Get-PvsServer output is piped to the Remove-PvsDirectory.

Get-PvsServer -Name theServer -Fields Guid | Remove-PvsDirectory -Path "C:\directory\subdirectory"

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**Remove-PvsDiskFromUpdateTask**

Remove a Disk from an Update Task.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Remove.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator File to Remove.

One of these optional

Guid[] UpdateTaskId: GUID of the Update Task to Remove a Disk.

string[] UpdateTaskName: Name of the Update Task to Remove a Disk.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

- DiskLocatorId or UpdateTaskId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.
**EXAMPLE 1: Remove-DiskFromUpdateTask for PvsDiskLocator to PvsUpdateTask**

Remove-DiskFromUpdateTask -Name theDiskLocator -UpdateTaskName theUpdateTask -SiteName theSite -StoreName theStore

UpdateTaskId can be used instead of UpdateTaskName so that the SiteName or SiteId is not also needed.

**EXAMPLE 2: Remove-DiskFromUpdateTask for PvsDiskLocator Using Pipe**

The Get-PvsDiskLocator output is piped to the Remove-DiskFromUpdateTask.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Remove-DiskFromUpdateTask -UpdateTaskName theUpdateTask -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Remove-DiskFromUpdateTask for PvsUpdateTask Using Pipe**

The Get-PvsUpdateTask output is piped to the Remove-DiskFromUpdateTask.

Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Fields Guid | Remove-DiskFromUpdateTask -Name theDiskLocator -SiteName theSite -StoreName theStore

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**Remove-PvsDiskLocator**

Remove one or more Disk Locators.

This required

- Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Delete.
- or one of these required & resolutions
- string[] Name or DiskLocatorName: Name of the Disk Locator File to Delete.
- Guid[] StoreId: GUID of the Store to delete all DiskLocators.
- string[] StoreName: Name of the Store to delete all DiskLocators.

Optional

- SwitchParameter DeleteDiskFile: If -DiskFile is specified, the Disk File will be deleted.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

One of these resolutions when needed
Guid[] StoreId: GUID of the Store to delete all DiskLocators.
string[] StoreName: Name of the Store to delete all DiskLocators.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
  DiskLocatorId or StoreId
Optional
SwitchParameter Confirm: The impact of this operation is "medium". If
-Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Remove the PvsDiskLocator with Name theDiskLocator
This example removes the PvsDiskLocator named theDiskLocator in the
Site named theSite and Store named theStore and
deletes the vDisk file.
Remove-PvsDiskLocator -Name theDiskLocator -SiteName theSite -
  StoreName theStore -DeleteDiskFile
Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

EXAMPLE 2: Remove the PvsDiskLocator with Name theDiskLocator using Pipe
This example uses Get-PvsDiskLocator that returns the PvsDiskLocator
named theDiskLocator in the Site named theSite and
Store named theStore that is piped to Remove-
PvsDiskLocator for removal.
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName
  theStore | Remove-PvsDiskLocator
Guid can be used instead of Name so that the SiteName or SiteId and
StoreName or StoreId are not also needed.

Remove-PvsDiskLocatorFromDevice
Remove a Disk Locator from a Device, Collection, View, or Site.
This required
  Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Remove.
or this required & resolution
  string[] Name or DiskLocatorName: Name of the Disk Locator File to
  Remove.
One of these optional
  Guid[] DeviceId: GUID of the Device to Remove a Disk Locator.
  string[] DeviceName: Name of the Device to Remove a Disk Locator.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Remove a Disk Locator.

Guid[] CollectionId: GUID of the Collection to Remove a Disk Locator or Locators from all Devices.

Guid[] SiteViewId: GUID of the Site View to Remove a Disk Locator from all Devices.

Guid[] FarmViewId: GUID of the Farm View to Remove a Disk Locator from all Devices.

string[] FarmViewName: Name of the Farm View to Remove a Disk Locator from all Devices.

or one of these optional & resolutions

string[] CollectionName: Name of the Collection to Remove a Disk Locator or Locators from all Devices.

string[] SiteViewName: Name of the Site View to Remove a Disk Locator from all Devices.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DiskLocatorId, DeviceId, CollectionId, SiteViewId or FarmViewId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator to PvsDevice**

Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -DeviceName theDevice -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 2: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator Using Pipe**

The Get-PvsDiskLocator output is piped to the Remove-PvsDiskLocatorFromDevice.
Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Remove-PvsDiskLocatorFromDevice -DeviceName theDevice

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 3: Remove-PvsDiskLocatorFromDevice for PvsDevice Using Pipe**

The Get-PvsDevice output is piped to the Remove-PvsDiskLocatorFromDevice.

Get-PvsDevice -Name theDevice -Fields Guid | Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -SiteName theSite -StoreName theStoreName

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 4: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator to PvsCollection**

Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -CollectionName theCollection -SiteName theSite -StoreName theStore

**EXAMPLE 5: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator Using Pipe**

The Get-PvsDiskLocator output is piped to the Remove-PvsDiskLocatorFromDevice.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Remove-PvsDiskLocatorFromDevice -CollectionName theCollection -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 6: Remove-PvsDiskLocatorFromDevice for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Remove-PvsDiskLocatorFromDevice.

Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -SiteName theSite -StoreName theStoreName

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
EXAMPLE 7: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator to PvsFarmView

Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -FarmViewName theFarmView -SiteName theSite -StoreName theStore
Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 8: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Remove-PvsDiskLocatorFromDevice.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Remove-PvsDiskLocatorFromDevice -FarmViewName theFarmView
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 9: Remove-PvsDiskLocatorFromDevice for PvsFarmView Using Pipe

The Get-PvsFarmView output is piped to the Remove-PvsDiskLocatorFromDevice.

Get-PvsFarmView -Name theFarmView -Fields Guid | Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -SiteName theSite -StoreName theStoreName
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 10: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator to PvsSiteView

Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -SiteViewName theSiteView -SiteName theSite -StoreName theStore

EXAMPLE 11: Remove-PvsDiskLocatorFromDevice for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Remove-PvsDiskLocatorFromDevice.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Remove-PvsDiskLocatorFromDevice -SiteViewName theSiteView -SiteName theSite
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
EXAMPLE 12: Remove-PvsDiskLocatorFromDevice for PvsSiteView Using Pipe

The Get-PvsSiteView output is piped to the Remove-PvsDiskLocatorFromDevice.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Remove-PvsDiskLocatorFromDevice -Name theDiskLocator -SiteName theSite -StoreName theStoreName

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Remove-PvsDiskUpdateDevice

Remove one or more Disk Update Devices.

One of these required

- Guid[] Guid or DeviceId: GUID of the Disk Update Device to Delete.
- string[] Name or DeviceName: Name of the Disk Update Device to Delete.
- PvsPhysicalAddress[] DeviceMac: MAC of the Disk Update Device to Delete.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  - DeviceId

Optional

- SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Remove the PvsDiskUpdateDevice with Name theDevice

This example removes the PvsDiskUpdateDevice named theDevice.

Remove-PvsDiskUpdateDevice -Name theDevice

EXAMPLE 2: Remove the PvsDiskUpdateDevice with Name theDevice using Pipe

This example uses Get-PvsDiskUpdateDevice that returns the PvsDiskUpdateDevice named theDevice that is piped to Remove-PvsDiskUpdateDevice for removal.

Get-PvsDiskUpdateDevice -Name theDevice | Remove-PvsDiskUpdateDevice

EXAMPLE 3: Remove All Not Active PvsDiskUpdateDevice for a DiskLocator using Pipe

This example uses Get-PvsDiskUpdateDevice that returns a list of not Active PvsDiskUpdateDevice for the DiskLocator named theDiskLocator of the Site named theSite and Store named theStore that is piped to Remove-PvsDiskUpdateDevice for removal.
Get-PvsDiskUpdateDevice -DiskLocatorName theDiskLocator -SiteName theSite -StoreName theStore -Fields Active | Where-Object {$_.Active -eq $false} | Remove-PvsDiskUpdateDevice

DiskLocatorId can be used instead of DiskLocatorName so that the SiteName or SiteId and StoreName or StoreId are not also needed.

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "Where-Object {$_.Active -eq $false}" only includes PvsDiskUpdateDevice with Active equal to false.

**Remove-PvsDiskVersion**

Remove the latest Disk version or no longer needed version if no Devices are currently booted from that version.

This required

- Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to Delete the Version from.

or this required & resolution

- string[] Name or DiskLocatorName: Name of the Disk Locator File to Delete the Version from.

Optional

- uint Version: Specifies the version that should be deleted. Used when deleting versions that are no longer needed because of a Merge.

One of these resolutions when needed

- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

One of these resolutions when needed

- Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
- string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  
  (DiskLocatorId and Version) or DiskLocatorId

Optional

- SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Remove the Highest PvsDiskVersion with Name theDiskLocator**

This example removes the highest PvsDiskVersion for DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Remove-
PvsDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 2: Remove the highest PvsDiskVersion with Name theDiskLocator using Pipe**

This example uses Get-PvsDiskLocator that returns the PvsDiskLocator named theDiskLocator in the Site named theSite and Store named theStore that is piped to Remove-
PvsDiskVersion for removal of the highest version.

Get-
PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore | Remove-
PvsDiskVersion

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 3: Remove the Version PvsDiskVersion with Name theDiskLocator**

This example removes the Version PvsDiskVersion for DiskLocator named theDiskLocator in the Site named theSite and Store named theStore.

Remove-
PvsDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -Version 5

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**EXAMPLE 4: Remove the Version PvsDiskVersion with Name theDiskLocator using Pipe**

This example uses Get-PvsDiskVersion that returns the Version PvsDiskVersion for DiskLocator named theDiskLocator in the Site named theSite and Store named theStore that is piped to Remove-
PvsDiskVersion for removal of the specified version.

Get-
PvsDiskVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -Version 5 | Remove-
PvsDiskVersion

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

**Remove-PvsFarmView**

Remove one or more Views from the Farm.

One of these required

Guid[] Guid or FarmViewId: GUID of the Farm View to Delete.
string[] Name or FarmViewName: Name of the Farm View to Delete.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

FarmViewId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If
-Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Remove the PvsFarmView with Name theFarmView

This example removes the PvsFarmView named theFarmView.
Remove-PvsFarmView -Name theFarmView

EXAMPLE 2: Remove the PvsFarmView with Name theFarmView using Pipe

This example uses Get-PvsFarmView that returns the PvsFarmView named
theFarmView that is piped to Remove-PvsFarmView for
removal.
Get-PvsFarmView -Name theFarmView | Remove-PvsFarmView

Remove-PvsServer

Remove one or more Servers.
One of these required

Guid[] Guid or ServerId: GUID of the Server to Delete.
string[] Name or ServerName: Name of the Server to Delete.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If
-Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Remove the PvsServer with Name theServer

This example removes the PvsServer named theServer.
Remove-PvsServer -Name theServer
**EXAMPLE 2: Remove the PvsServer with Name theServer using Pipe**

This example uses Get-PvsServer that returns the PvsServer named theServer that is piped to Remove-PvsServer for removal.

Get-PvsServer -Name theServer | Remove-PvsServer

**Remove-PvsServerStore**

Remove the connection from Servers to Stores.

One of these required

- Guid[] Guid or ServerId: GUID of a Server that uses the path to get to the Store.
- string[] Name or ServerName: Name of a Server that uses the path to get to the Store.

One of these required

- Guid[] StoreId: GUID of the Store.
- string[] StoreName: Name of the Store.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

- ServerId or StoreId

Optional

- SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Remove the PvsServerStore with Name theServer/theStore**

This example removes the PvsServerStore for the Server named theServer and Store named theStore.

Remove-PvsServerStore -Name theServer -StoreName theStore

**EXAMPLE 2: Remove the PvsServerStore with Name theServer/theStore using Pipe**

This example uses Get-PvsServer that returns the PvsServer named theServer that is piped to Remove-PvsServerStore with StoreName theStore for removal.

Get-PvsServer -Name theServer | Remove-PvsServerStore -StoreName theStore

**Remove-PvsSite**

Remove one or more Sites.

One of these required
Guid[] Guid or SiteId: GUID of the Site to Delete.
string[] Name or SiteName: Name of the Site to Delete.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
  SiteId
  Optional
SwitchParameter Confirm: The impact of this operation is "medium". If
-Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.

EXAMPLE 1: Remove the PvsSite with Name theSite
This example removes the PvsSite named theSite.
Remove-PvsSite -Name theSite

EXAMPLE 2: Remove the PvsSite with Name theSite using Pipe
This example uses Get-PvsSite that returns the PvsSite named theSite
that is piped to Remove-PvsSite for removal.
Get-PvsSite -Name theSite | Remove-PvsSite

Remove-PvsSiteView
Remove one or more Views from Sites.
This required
  Guid[] Guid or SiteViewId: GUID of the Site View to Delete.
or this required & resolution
  string[] Name or SiteViewName: Name of the Site View to Delete.
One of these resolutions when needed
  Guid[] SiteId: GUID of the Site.
  string[] SiteName: Name of the Site.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
  SiteViewId
  Optional
SwitchParameter Confirm: The impact of this operation is "medium". If
-Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium"
or "low" to have confirmation without the Confirm
parameter.
EXAMPLE 1: Remove the PvsSiteView with Name theSiteView

This example removes the PvsSiteView named theSiteView in the Site named theSite.

Remove-PvsSiteView -Name theSiteView -SiteName theSite

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

EXAMPLE 2: Remove the PvsSiteView with Name theSiteView using Pipe

This example uses Get-PvsSiteView that returns the PvsSiteView named theSiteView in the Site named theSite that is piped to Remove-PvsSiteView for removal.

Get-PvsSiteView -Name theSiteView -SiteName theSite | Remove-PvsSiteView

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

Remove-PvsStore

Remove one or more Stores.

One of these required

Guid[] Guid or StoreId: GUID of the Store to Delete.
string[] Name or StoreName: Name of the Store to Delete.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

  StoreId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Remove the PvsStore with Name theStore

This example removes the PvsStore named theStore.

Remove-PvsStore -Name theStore

EXAMPLE 2: Remove the PvsStore with Name theStore using Pipe

This example uses Get-PvsStore that returns the PvsStore named theStore that is piped to Remove-PvsStore for removal.

Get-PvsStore -Name theStore | Remove-PvsStore
Remove-PvsUpdateTask

Remove one or more Update Tasks from Sites.

This required
- Guid[] Guid or UpdateTaskId: GUID of the Update Task to Delete.

or this required & resolution
- string[] Name or UpdateTaskName: Name of the Update Task to Delete.

One of these resolutions when needed
- Guid[] SiteId: GUID of the Site.
- string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed
- PvsObject[] Object: PvsObjects with the members below can be used as
  the Object parameter or from a pipeline:
  - UpdateTaskId

Optional
- SwitchParameter Confirm: The impact of this operation is "medium". If
  -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Remove the PvsUpdateTask with Name theUpdateTask

This example removes the PvsUpdateTask named theUpdateTask in the Site named theSite.

Remove-PvsUpdateTask -Name theUpdateTask -SiteName theSite

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

EXAMPLE 2: Remove the PvsUpdateTask with Name theUpdateTask using Pipe

This example uses Get-PvsUpdateTask that returns the PvsUpdateTask named theUpdateTask in the Site named theSite that is piped to Remove-PvsUpdateTask for removal.

Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite | Remove-PvsUpdateTask

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

Remove-PvsVirtualHostingPool

Remove one or more Virtual Hosting Pools from Sites.

This required
- Guid[] Guid or VirtualHostingPoolId: GUID of the Virtual Hosting Pool to Delete.
or this required & resolution
string[] Name or VirtualHostingPoolName: Name of the Virtual Hosting Pool to Delete.

One of these resolutions when needed
Guid[] SiteId: GUID of the Site.
string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

VirtualHostingPoolId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Remove the PvsVirtualHostingPool with Name theVirtualHostingPool

This example removes the PvsVirtualHostingPool named theVirtualHostingPool in the Site named theSite.

Remove-PvsVirtualHostingPool -Name theVirtualHostingPool -SiteName theSite

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

EXAMPLE 2: Remove the PvsVirtualHostingPool with Name theVirtualHostingPool using Pipe

This example uses Get-PvsVirtualHostingPool that returns the PvsVirtualHostingPool named theVirtualHostingPool in the Site named theSite that is piped to Remove-PvsVirtualHostingPool for removal.

Get-PvsVirtualHostingPool -Name theVirtualHostingPool -SiteName theSite | Remove-PvsVirtualHostingPool

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

Reset-PvsDatabase

Cause the database location to be reloaded.

EXAMPLE 1: Reset-PvsDatabase

Reset-PvsDatabase

Reset-PvsDeviceForDomain

Reset a Device, all Devices in a Collection or View for a Domain.

One of these required
Guid[] Guid or DeviceId: GUID of the Device to Reset for the Domain.

string[] Name or DeviceName: Name of the Device to Reset for the Domain.

PvsPhysicalAddress[] DeviceMac: MAC of the Device to Reset for the Domain.

Guid[] CollectionId: GUID of the Collection to Reset all Devices for the Domain.

Guid[] SiteViewId: GUID of the Site View to Reset all Devices for the Domain.

Guid[] FarmViewId: GUID of the Farm View to Reset all Devices for the Domain.

string[] FarmViewName: Name of the Farm View to Reset all Devices for the Domain.

or one of these required & resolutions

string[] CollectionName: Name of the Collection to Reset all Devices for the Domain.

string[] SiteViewName: Name of the Site View to Reset all Devices for the Domain.

Optional

string[] Domain: Domain to Reset the Device(s) for. If not included, the first Domain Controller found on the Server is used.

string[] OrganizationUnit: Organizational Unit to reset the Device(s) to. This parameter is optional. If it is not specified, the account remains in its existing OU. Child OU's should be delimited with forward slashes, e.g. "ParentOU/ChildOU". Special characters in an OU name, such as '"', '#', '+', '\', ';', '>', '=' must be escaped with a backslash. For example, an OU called "commaIn,TheMiddle" must be specified as "commaIn\,TheMiddle". The old syntax of delimiting child OU's with a comma is still supported, but deprecated. Note that in this case, the child OU comes first, e.g. "ChildOU,ParentOU".

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DeviceId, CollectionId, SiteViewId or FarmViewId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Reset-PvsDeviceForDomain for Name**

Reset-PvsDeviceForDomain -Name theDevice

**EXAMPLE 2: Reset-PvsDeviceForDomain for Name with Domain**

Reset-PvsDeviceForDomain -Name theDevice -Domain theDomain

**EXAMPLE 3: Reset-PvsDeviceForDomain for Name with Domain and OrganizationUnit**

Reset-PvsDeviceForDomain -Name theDevice -Domain theDomain -OrganizationUnit theOrganizationUnit

**EXAMPLE 4: Reset-PvsDeviceForDomain for PvsDevice Using Pipe**

The Get-PvsDevice output is piped to the Reset-PvsDeviceForDomain.

Get-PvsDevice -Name theDevice -Fields Guid | Reset-PvsDeviceForDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 5: Reset-PvsDeviceForDomain for FarmViewName**

Reset-PvsDeviceForDomain -FarmViewName theFarmView

**EXAMPLE 6: Reset-PvsDeviceForDomain for FarmViewName with Domain**

Reset-PvsDeviceForDomain -FarmViewName theFarmView -Domain theDomain

**EXAMPLE 7: Reset-PvsDeviceForDomain for FarmViewName with Domain and OrganizationUnit**

Reset-PvsDeviceForDomain -FarmViewName theFarmView -Domain theDomain -OrganizationUnit theOrganizationUnit

**EXAMPLE 8: Reset-PvsDeviceForDomain for PvsFarmView Using Pipe**

The Get-PvsFarmView output is piped to the Reset-PvsDeviceForDomain.

Get-PvsFarmView -Name theFarmView -Fields Guid | Reset-PvsDeviceForDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 9: Reset-PvsDeviceForDomain for CollectionName**

Reset-PvsDeviceForDomain -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.
EXAMPLE 10: Reset-PvsDeviceForDomain for CollectionName with Domain

Reset-PvsDeviceForDomain -CollectionName theCollection -SiteName theSite -Domain theDomain

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 11: Reset-PvsDeviceForDomain for CollectionName with Domain and OrganizationUnit

Reset-PvsDeviceForDomain -CollectionName theCollection -SiteName theSite -Domain theDomain -OrganizationUnit theOrganizationUnit

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 12: Reset-PvsDeviceForDomain for PvsCollection Using Pipe

The Get-PvsCollection output is piped to the Reset-PvsDeviceForDomain.

Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Reset-PvsDeviceForDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

EXAMPLE 13: Reset-PvsDeviceForDomain for SiteViewName

Reset-PvsDeviceForDomain -SiteViewName theSiteView -SiteName theSite

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

EXAMPLE 14: Reset-PvsDeviceForDomain for SiteViewName with Domain

Reset-PvsDeviceForDomain -SiteViewName theSiteView -SiteName theSite -Domain theDomain

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

EXAMPLE 15: Reset-PvsDeviceForDomain for SiteViewName with Domain and OrganizationUnit

Reset-PvsDeviceForDomain -SiteViewName theSiteView -SiteName theSite -Domain theDomain -OrganizationUnit theOrganizationUnit

SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

EXAMPLE 16: Reset-PvsDeviceForDomain for PvsSiteView Using Pipe

The Get-PvsSiteView output is piped to the Reset-PvsDeviceForDomain.
Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Reset-PvsDeviceForDomain -Domain theDomain -OrganizationUnit theOrganizationUnit

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Restart-PvsStreamService**

Restart the Stream Service on a Server or all Servers in a Site.

One of these required
- Guid[] Guid or ServerId: GUID of the Server to restart the Stream Service.
- string[] Name or ServerName: Name of the Server to restart the Stream Service.
- Guid[] SiteId: GUID of the Site to restart the Stream Service on all Servers.
- string[] SiteName: Name of the Site to restart the Stream Service on all Servers.

Instead of a parameter that matches one of the members listed
- PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  - ServerId or SiteId

Optional
- SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Restart-PvsStreamService for Name**

Restart-PvsStreamService -Name theServer

**EXAMPLE 2: Restart-PvsStreamService for PvsServer Using Pipe**

The Get-PvsServer output is piped to the Restart-PvsStreamService.

Get-PvsServer -Name theServer -Fields Guid | Restart-PvsStreamService

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Restart-PvsStreamService for SiteName**

Restart-PvsStreamService -SiteName theSite
EXAMPLE 4: Restart-PvsStreamService for PvsSite Using Pipe

The Get-PvsSite output is piped to the Restart-PvsStreamService.

Get-PvsSite -Name theSite -Fields Guid | Restart-PvsStreamService

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Revoke-PvsAuthGroup

Remove Farm, Site or Collection Authorization for an AuthGroup. If no Site or Collection is specified, Farm Authorization is removed for the AuthGroup.

One of these required

Guid[] Guid or AuthGroupId: GUID of the AuthGroup to remove Authorization for.

string[] Name or AuthGroupName: Name of the AuthGroup to remove Authorization for.

One of these optional

Guid[] SiteId: GUID of the Site to remove Authorization for the AuthGroup.

string[] SiteName: Name of the Site to remove Authorization for the AuthGroup.

Guid[] CollectionId: GUID of the Collection to remove Authorization for the AuthGroup.

or this optional & resolution

string[] CollectionName: Name of the Collection to remove Authorization for the AuthGroup.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to remove Authorization for the AuthGroup.

string[] SiteName: Name of the Site to remove Authorization for the AuthGroup.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

AuthGroupId, SiteId or CollectionId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

262
**EXAMPLE 1: Revoke-PvsAuthGroup for PvsAuthGroup to PvsFarm**

Revoke-PvsAuthGroup -Name theAuthGroup

**EXAMPLE 2: Revoke-PvsAuthGroup for PvsAuthGroup Using Pipe**

The Get-PvsAuthGroup output is piped to the Revoke-PvsAuthGroup.

Get-PvsAuthGroup -Name theAuthGroup -Fields Guid | Revoke-PvsAuthGroup

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Revoke-PvsAuthGroup for PvsAuthGroup to PvsSite**

Revoke-PvsAuthGroup -Name theAuthGroup -SiteName theSite

**EXAMPLE 4: Revoke-PvsAuthGroup for PvsAuthGroup Using Pipe**

The Get-PvsAuthGroup output is piped to the Revoke-PvsAuthGroup.

Get-PvsAuthGroup -Name theAuthGroup -Fields Guid | Revoke-PvsAuthGroup -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 5: Revoke-PvsAuthGroup for PvsSite Using Pipe**

The Get-PvsSite output is piped to the Revoke-PvsAuthGroup.

Get-PvsSite -Name theSite -Fields Guid | Revoke-PvsAuthGroup -Name theAuthGroup

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 6: Revoke-PvsAuthGroup for PvsAuthGroup to PvsCollection**

Revoke-PvsAuthGroup -Name theAuthGroup -CollectionName theCollection -SiteName theSite

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 7: Revoke-PvsAuthGroup for PvsAuthGroup Using Pipe**

The Get-PvsAuthGroup output is piped to the Revoke-PvsAuthGroup.

Get-PvsAuthGroup -Name theAuthGroup -Fields Guid | Revoke-PvsAuthGroup -CollectionName theCollection -SiteName theSite

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

263
**EXAMPLE 8: Revoke-PvsAuthGroup for PvsCollection Using Pipe**

The Get-PvsCollection output is piped to the Revoke-PvsAuthGroup.

```
Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Revoke-PvsAuthGroup -Name theAuthGroup
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Set-PvsAuthGroup**

Set AuthGroup(s) changed values from PvsAuthGroup object(s), or set one or more field values for a PvsAuthGroup.

Required

- **PvsAuthGroup AuthGroup**: PvsAuthGroup object(s) with changed property value(s) to be set. The object(s) can come from a pipeline.

These values are in the PvsAuthGroup object, and only will be set if the value has changed.

- **string Name or AuthGroupName**: Name of the Active Directory or Windows Group. Max Length=450

- **string Description**: User description. Default="" Max Length=250

When AuthGroup is not passed, the parameters below are used:

One of these required

- **Guid Guid or AuthGroupId**: GUID of the AuthGroup to Set.

- **string Name or AuthGroupName**: Name of the AuthGroup to Set.

Optional field values to set:

- **string NewName**: Name of the Active Directory or Windows Group. Max Length=450

- **string Description**: User description. Default="" Max Length=250

Optional

- **SwitchParameter PassThru**: If -PassThru is specified, the resulting PvsAuthGroup object(s) are returned.

- **SwitchParameter Confirm**: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.
**EXAMPLE 1: Set PvsAuthGroup for Individual Fields**

Get the PvsAuthGroup into a $o variable. Change the $o field values and then Set the PvsAuthGroup with the result.

```powershell
$o = Get-PvsAuthGroup -Name oldName -Fields Name
$o.Name = "newName"
Set-PvsAuthGroup $o
```

The `-Fields` parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 2: Set PvsAuthGroup for a Field Using Pipe**

Get the PvsAuthGroup into a $o variable. Change a $o field to the correct value and then Set the PvsAuthGroup with the result.

```powershell
Get-PvsAuthGroup -Name oldName -Fields Name | foreach { $o = $_; $o.Name = "newName"; $o } | Set-PvsAuthGroup
```

The `-Fields` parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Set-PvsCollection**

Set Collection(s) changed values from PvsCollection object(s), or set one or more field values for a PvsCollection.

**Required**

- **PvsCollection Collection**: PvsCollection object(s) with changed property value(s) to be set. The object(s) can come from a pipeline.

These values are in the PvsCollection object, and only will be set if the value has changed.

- **string Name or CollectionName**: Name of the Collection. It is unique within the Site. Max Length=50

- **string Description**: User description. Default="" Max Length=250

- **Guid TemplateDeviceId**: GUID of a Device in the Collection whose settings are used for initial values of new Devices. Not used with templateDeviceName. Default=00000000-0000-0000-0000-000000000000

- **string TemplateDeviceName**: Name of a Device in the Collection whose settings are used for initial values of new Devices. Not used with TemplateDeviceId. Default=""

- **uint LastAutoAddDeviceNumber**: The Device Number of the last Auto Added Device. Default=0
bool Enabled: True when Devices in the Collection can be booted, false otherwise. Default=true

string AutoAddPrefix: The string put before the Device Number for Auto Add. Default="" ASCII computer name characters no end

digit Max Length=12

string AutoAddSuffix: The string put after the Device Number for Auto Add. Default="" ASCII computer name characters no

begin digit Max Length=12

bool AutoAddZeroFill: True when zeros be placed before the Device Number up to the AutoAddNumberLength for Auto Add,
false otherwise. Default=true

uint AutoAddNumberLength: The maximum length of the Device Number for Auto Add. This length plus the AutoAddPrefix length

plus the AutoAddSuffix length must be less than 16. Required that

((lenautoAddPrefix+lenautoAddSuffix)+AutoAddNumberLength)<=15. Min=3, Max=9, Default=4

When Collection is not passed, the parameters below are used:

This required

Guid Guid or CollectionId: GUID of the Collection to Set.

or this required & resolution

string Name or CollectionName: Name of the Collection to Set.

One of these resolutions when needed

Guid SiteId: GUID of the Site.

string SiteName: Name of the Site.

Optional field values to set:

string NewName: Name of the Collection. It is unique within the Site. Max Length=50

string Description: User description. Default="" Max Length=250

Guid TemplateDeviceId: GUID of a Device in the Collection whose settings are used for initial values of new Devices. Not used

with templateDeviceName. Default=00000000-0000-0000-0000-000000000000

string TemplateDeviceName: Name of a Device in the Collection whose settings are used for initial values of new Devices. Not

used with TemplateDeviceId. Default=""

uint LastAutoAddDeviceNumber: The Device Number of the last Auto Added Device. Default=0

bool Enabled: True when Devices in the Collection can be booted, false otherwise. Default=true
**string AutoAddPrefix:** The string put before the Device Number for Auto Add. Default="" ASCII computer name characters no end digit Max Length=12

**string AutoAddSuffix:** The string put after the Device Number for Auto Add. Default="" ASCII computer name characters no begin digit Max Length=12

**bool AutoAddZeroFill:** True when zeros be placed before the Device Number up to the AutoAddNumberLength for Auto Add, false otherwise. Default=true

**uint AutoAddNumberLength:** The maximum length of the Device Number for Auto Add. This length plus the AutoAddPrefix length plus the AutoAddSuffix length must be less than 16. Required that 
\(((\text{lenautoAddPrefix}+\text{lenautoAddSuffix})+\text{AutoAddNumberLength})\leq15.\ \text{Min}=3,\ \text{Max}=9,\ \text{Default}=4

Optional

**SwitchParameter PassThru:** If -PassThru is specified, the resulting PvsCollection object(s) are returned.

**SwitchParameter Confirm:** The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsCollection for Individual Fields**

Get the PvsCollection into a $o variable. Change the $o field values and then Set the PvsCollection with the result.

```powershell
$o = Get-PvsCollection -Name theCollection -SiteName theSite -Fields AutoAddSuffix, AutoAddZeroFill

;o.AutoAddSuffix = "Ex"
;o.AutoAddZeroFill = $true

Set-PvsCollection $o
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 2: Set PvsCollection for a Field Using Pipe**

Get the PvsCollection into a $o variable. Change a $o field to the correct value and then Set the PvsCollection with the result.

```powershell
Get-PvsCollection -CollectionName theCollection -SiteName theSite -Fields AutoAddSuffix | foreach { $o = $_; $o.AutoAddSuffix = "Ex"; $o } | Set-PvsCollection
```
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**EXAMPLE 3: Get PvsCollection and Enable**

Get all PvsCollection that are not Enabled and then Enables them.

Get-PvsCollection -Fields Enabled | Where-Object {$_ Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsCollection

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Set-PvsConnection**

Set the SoapServer connection, and if -Persist is specified the connection settings are saved in the registry. A PvsConnection object can be used as the parameter.

Required

PvsConnection Connection: PvsConnection object with changed property value(s) to be set. The object can come from a pipeline.

These values are in the PvsConnection object, and only will be set if the value has changed.

string Name or Server: Name or IP of the Server to connect to. Default=localhost

string Port: The Port to use to connect. Default=54321

string User: User name to use for Authentication. If it has a value, it will be *****. Default=""

string Domain: Domain name to use for Authentication. If it has a value, it will be *****. Default=""

string Password: Password to use for Authentication. If it has a value, it will be *****. Default=""

string Persist: True when the connection settings should be, for Set, or have been, for Get, saved to the registry.

PvsConnection can be created or modified using methods below:

New-Object Citrix.PVS.SnapIn.PvsConnection: Creates default Server=localhost, Port=54321, and no authentication.
New-Object Citrix.PVS.SnapIn.PvsConnection(Citrix.PVS.SnapIn
copyFrom): Creates with settings of the copyFrom Citrix.PVS.SnapIn.

SetServerToLocalHostDefaultSettings: Server=localhost, Port=54321, and
no authentication.

Copy(Citrix.PVS.SnapIn copyFrom): Modifies the settings to match the
copyFrom Citrix.PVS.SnapIn.

Equals(Citrix.PVS.SnapIn compareTo): Returns true when the settings
match what is in the compareTo.

When Connection is not passed, the parameters below are used:

Optional field values to set:
- **string Name or Server**: Name or IP of the Server to connect to.
  Default=localhost
- **string Port**: The Port to use to connect. Default=54321
- **string User**: User name to use for Authentication. If it has a value,
  it will be *****. Default=""
- **string Domain**: Domain name to use for Authentication. If it has a
  value, it will be *****. Default=""
- **string Password**: Password to use for Authentication. If it has a
  value, it will be *****. Default=""
- **string Persist**: True when the connection settings should be, for Set,
  or have been, for Get, saved to the registry.

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting
PvsConnection object is returned.

SwitchParameter Confirm: The impact of this operation is "low". If -
Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to
have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsConnection for Individual Fields**

Get the PvsConnection into a $o variable. Change the $o field values
and then Set the PvsConnection with the result.

```
$o = Get-PvsConnection -Fields Port
$o.Port = 54322
Set-PvsConnection $o
```

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are retrieved.
EXAMPLE 2: Set PvsConnection for a Field Using Pipe

Get the PvsConnection into a $o variable for the field that has the wrong value. Change the $o field to the correct value and then Set the PvsConnection with the result.

Get-PvsConnection -Fields Port | Where-Object {$_ .Port -ne 54322} | foreach { $o = $_; $o.Port = 54322; $o } | Set-PvsConnection

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

EXAMPLE 3: Set PvsConnection Port with Parameter

Set the PvsConnection Port using the Port parameter instead of a PvsConnection object.

Set-PvsConnection -Port 54322

This is the only Set command that has field parameters.

Set-PvsDevice

Set Device(s) changed values from PvsDevice object(s), or set one or more field values for one or more PvsDevices.

Required

PvsDevice Device: PvsDevice object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsDevice object, and only will be set if the value has changed.

string Name or DeviceName: Computer name with no spaces. ASCII computer name characters Max Length=15

string Description: User description. Default="" Max Length=250

PvsPhysicalAddress DeviceMac: Ethernet address can have the form XX-XX-XX-XX-XX-XX. Uniquely identifies the Device.

uint BootFrom: Device to boot from. Choices are 1 for vDisk, 2 for Hard Disk, and 3 for Floppy. This cannot be Set for a Device with Personal vDisk. Min=1, Max=3, Default=1

string ClassName: Used by Automatic Update feature to match new versions of Disks to a Device. This cannot be Set for a Device with Personal vDisk. Default="" Max Length=41

uint Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

bool Enabled: True when it can be booted, false otherwise. This cannot be Set for a Device with Personal vDisk. Default=true
bool LocalDiskEnabled: If there is a local disk menu choice for the Device, this is true. This cannot be Set for a Device with Personal vDisk. Default=false

uint Authentication: Device log in authentication. Choices are 0 for none, 1 for User Name/Password, and 2 for Extern. This cannot be Set for a Device with Personal vDisk. Min=0, Max=2, Default=0

string User: Name of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=20

string Password: Password of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=100

uint AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

uint AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

string DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

uint Type: 1 when it performs test of Disks, 2 when it performs maintenance on Disks, 3 when it has a Personal vDisk, 4 when it has a Personal vDisk and performs tests, 0 otherwise. A Device with type 0 - 3 can only be Set to 0 - 3, and a Device with type 3 - 4 can only be Set to 3 - 4. Min=0, Max=4, Default=0

uint LocalWriteCacheDiskSize: The size in GB to format the Device cache file disk. If the value is 0, then the disk is not formatted. Min=0, Max=2048, Default=0
bool BdmBoot: Use BDM instead of PXE boot when set to true.  
    Default=false

When Device is not passed, the parameters below are used:

One of these required

Guid Guid or DeviceId: GUID of the Device to Set.
string Name or DeviceName: Name of the Device to Set.
PvsPhysicalAddress DeviceMac: MAC of the Device to Set.
Guid CollectionId: GUID of the Collection to set all Devices.  
    DeviceName and DeviceMac cannot be set.
Guid SiteViewId: GUID of the Site View to set all Devices. DeviceName  
    and DeviceMac cannot be set.
Guid FarmViewId: GUID of the Farm View to set all Devices. DeviceName  
    and DeviceMac cannot be set.
string FarmViewName: Name of the Farm View to set all Devices.  
    DeviceName and DeviceMac cannot be set.
or one of these required & resolutions

string CollectionName: Name of the Collection to set all Devices.  
    DeviceName and DeviceMac cannot be set.
string SiteViewName: Name of the Site View to set all Devices.  
    DeviceName and DeviceMac cannot be set.

One of these resolutions when needed

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.

Optional field values to set:

string NewName: Computer name with no spaces. ASCII computer name  
    characters Max Length=15
string Description: User description. Default="" Max Length=250
PvsPhysicalAddress DeviceMac: Ethernet address can have the form XX-  
    XX-XX-XX-XX-XX. Uniquely identifies the Device.
uint BootFrom: Device to boot from. Choices are 1 for vDisk, 2 for  
    Hard Disk, and 3 for Floppy. This cannot be Set for a  
    Device with Personal vDisk. Min=1, Max=3, Default=1
string ClassName: Used by Automatic Update feature to match new  
    versions of Disks to a Device. This cannot be Set for a  
    Device with Personal vDisk. Default="" Max  
    Length=41
uint Port: UDP port to use with Stream Service. Min=1025, Max=65534,  
    Default=6901
bool Enabled: True when it can be booted, false otherwise. This cannot  
    be Set for a Device with Personal vDisk. Default=true
bool LocalDiskEnabled: If there is a local disk menu choice for the Device, this is true. This cannot be Set for a Device with Personal vDisk. Default=false

uint Authentication: Device log in authentication. Choices are 0 for none, 1 for User Name/Password, and 2 for Extern. This cannot be Set for a Device with Personal vDisk. Min=0, Max=2, Default=0

string User: Name of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=20

string Password: Password of user to authenticate before the boot process continues. This cannot be Set for a Device with Personal vDisk. Default="" ASCII Max Length=100

uint AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

uint AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

string DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

uint Type: 1 when it performs test of Disks, 2 when it performs maintenance on Disks, 3 when it has a Personal vDisk, 4 when it has a Personal vDisk and performs tests, 0 otherwise. A Device with type 0 - 3 can only be Set to 0 - 3, and a Device with type 3 - 4 can only be Set to 3 - 4. Min=0, Max=4, Default=0

uint LocalWriteCacheDiskSize: The size in GB to format the Device cache file disk. If the value is 0, then the disk is not formatted. Min=0, Max=2048, Default=0
bool BdmBoot: Use BDM instead of PXE boot when set to true.
    Default=false

Optional
SwitchParameter PassThru: If -PassThru is specified, the resulting PvsDevice object(s) are returned.
SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsDevice for Individual Fields
Get the PvsDevice into a $o variable. Change the $o field values and then Set the PvsDevice with the result.
$o = Get-PvsDevice -Name theDevice -Fields LocalWriteCacheDiskSize
$o.LocalWriteCacheDiskSize = 1024
Set-PvsDevice $o
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 2: Set PvsDevice for a Field Using Pipe
Get the PvsDevice into a $o variable. Change a $o field to the correct value and then Set the PvsDevice with the result.
Get-PvsDevice -Name theDevice -Fields LocalWriteCacheDiskSize | foreach { $o = $_; $o.LocalWriteCacheDiskSize = 1024; $o } | Set-PvsDevice
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

EXAMPLE 3: Get PvsDevice and Enable
Get all PvsDevice that are not Enabled and then Enables them.
Get-PvsDevice -Fields Enabled | Where-Object {$_ Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsDevice
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.
**Set-PvsDeviceBootstrap**

Set Device Bootstrap List(s) changed values from PvsDeviceBootstrap object(s).

Required

PvsDeviceBootstrap[] DeviceBootstrap: Array of PvsDeviceBootstrap objects with changed DeviceBootstrap. The object(s) can come from a pileline.

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsDeviceBootstrap object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

These exist in the DeviceBootstrap array within each PvsDeviceBootstrap.

Each array item is a PvsDeviceBootstrapList object.

They are set using the Add, Insert, Remove, Set, and Reorder methods in the PvsDeviceBootstrap.

string Name or Bootstrap: Name of the bootstrap file. Max Length=259

string MenuText: Text that is displayed in the Boot Menu. If this field has no value, the bootstrap value is used. Default="" ASCII Max Length=64

**EXAMPLE 1: Set PvsDeviceBootstrap for Individual Fields**

The Get-PvsDeviceBootstrap returns a PvsDeviceBootstrap object with a PvsDeviceBootstrapList array in it called DeviceBootstrap.

The DeviceBootstrap is manipulated using the Add, Insert, Remove, Set, and Reorder methods.

The Set-PvsDeviceBootstrap is called with the final result.

$o = Get-PvsDeviceBootstrap -Name theDevice
$o.Add("addName", "addValue")
$o.Insert(0, "insertName", "insertValue")
$o.Remove(1)
$o.Set(2, "setValue")
$o.Reorder(0, 1)
Set-PvsDeviceBootstrap $o

**Set-PvsDevicePersonality**

Set Device Personality List(s) changed values from PvsDevicePersonality object(s).
Required

PvsDevicePersonality[] DevicePersonality: Array of PvsDevicePersonality objects with changed DevicePersonality. The object(s) can come from a pileline.

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsDevicePersonality object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

These exist in the DevicePersonality array within each PvsDevicePersonality.

Each array item is a PvsDevicePersonalityList object.

They are set using the Add, Insert, Remove, Set, and Reorder methods in the PvsDevicePersonality.

string Name: Name of the Device personality item. Max Length=250
string Value: Value for the Device personality item. Max Length=1000

**EXAMPLE 1: Set PvsDevicePersonality for Individual Fields**

The Get-PvsDevicePersonality returns a PvsDevicePersonality object with a PvsDevicePersonalityList array in it called DevicePersonality.

The DevicePersonality is manipulated using the Add, Insert, Remove, Set and Reorder Methods.

The Set-PvsDevicePersonality is called with the final result.

$o = Get-PvsDevicePersonality -Name theDevice
$o.Add("addName", "addValue")
$o.Insert(0, "insertName", "insertValue")
$o.Remove(1)
$o.Set(2, "setValue")
$o.Reorder(0, 1)
Set-PvsDevicePersonality $o

**Set-PvsDisk**

Set Disk(s) changed values from PvsDisk object(s), or set one or more field values for a PvsDisk.

Required

PvsDisk Disk: PvsDisk object(s) with changed property value(s) to be set. The object(s) can come from a pileline.
These values are in the PvsDisk object, and only will be set if the value has changed.

**string Class**: Class of the Disk. Max Length=40

**string ImageType**: Type of this image (software type). Max Length=40

**UInt64 WriteCacheSize**: RAM cache size (MB). Not 0 when used with Cache in Device RAM, and Cache in Device RAM with Overflow on Hard Disk. A value of 0 will disable the RAM use for Cache in Device RAM with Overflow on Hard Disk. Min=0, Max=131072, Default=0

**bool AutoUpdateEnabled**: Automatically update this image for matching Devices when set to true. Default false

**bool ActivationDateEnabled**: Use activation date to activate image when set to true. Default false

**bool AdPasswordEnabled**: Enable AD password management when set to true.

**bool HaEnabled**: Enable HA when set to true.

**bool PrinterManagementEnabled**: Invalid printers will be deleted from the Device when set to true.

**uint WriteCacheType**: 0 (Private), (other values are standard image) 1 (Cache on Server), 3 (Cache in Device RAM), 4 (Cache on Device Hard Disk), 6 (Device RAM Disk), 7 (Cache on Server, Persistent), or 9 (Cache in Device RAM with Overflow on Hard Disk). Min=0, Max=9, Default=0

**uint LicenseMode**: 0 (None), 1 (Multiple Activation Key), or 2 (Key Management Service). Min=0, Max=2, Default=0

**DateTime ActiveDate**: Date to activate the disk if AutoUpdateEnabled and activationDateEnabled are true. Has the date. Empty when the AutoUpdateEnabled or activationDateEnabled are false.

**string LongDescription**: Description of the Disk. Max Length=399

**string SerialNumber**: User defined serial number. Max Length=36

**string Date**: User defined date. Max Length=40

**string Author**: User defined author. Max Length=40

**string Title**: User defined title. Max Length=40

**string Company**: User defined company. Max Length=40

**string InternalName**: User defined name. Max Length=63

**string OriginalFile**: User defined original file. Max Length=127

**string HardwareTarget**: User defined hardware target. Max Length=127

**UInt64 MajorRelease**: User defined major release number. Min=0, Max=4294967295, Default=0

**UInt64 MinorRelease**: User defined minor release number. Min=0, Max=4294967295, Default=0
UINT64 Build: User defined build number. Min=0, Max=4294967295, Default=0

bool VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false

When Disk is not passed, the parameters below are used:
This required
  Guid Guid or DiskLocatorId: GUID of the Disk Locator.
or this required & resolution
  string Name or DiskLocatorName: Name of the Disk Locator.
One of these resolutions when needed
  Guid SiteId: GUID of the Site.
  string SiteName: Name of the Site.
One of these resolutions when needed
  Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
  string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Optional field values to set:
  string Class: Class of the Disk. Max Length=40
  string ImageType: Type of this image (software type). Max Length=40
  UINT64 WriteCacheSize: RAM cache size (MB). Not 0 when used with Cache in Device RAM, and Cache in Device RAM with Overflow on Hard Disk. A value of 0 will disable the RAM use for Cache in Device RAM with Overflow on Hard Disk. Min=0, Max=131072, Default=0
  bool AutoUpdateEnabled: Automatically update this image for matching Devices when set to true. Default false
  bool ActivationDateEnabled: Use activation date to activate image when set to true. Default false
  bool AdPasswordEnabled: Enable AD password management when set to true.
  bool HaEnabled: Enable HA when set to true.
  bool PrinterManagementEnabled: Invalid printers will be deleted from the Device when set to true.
  uint WriteCacheType: 0 (Private), (other values are standard image) 1 (Cache on Server), 3 (Cache in Device RAM), 4 (Cache on Device Hard Disk), 6 (Device RAM Disk), 7 (Cache on Server, Persistent), or 9 (Cache in Device RAM with Overflow on Hard Disk). Min=0, Max=9, Default=0
uint LicenseMode: 0 (None), 1 (Multiple Activation Key), or 2 (Key Management Service). Min=0, Max=2, Default=0

DateTime ActiveDate: Date to activate the disk if AutoUpdateEnabled and activationDateEnabled are true. Has the date. Empty when the AutoUpdateEnabled or activationDateEnabled are false.

string LongDescription: Description of the Disk. Max Length=399
string SerialNumber: User defined serial number. Max Length=36
string Date: User defined date. Max Length=40
string Author: User defined author. Max Length=40
string Title: User defined title. Max Length=40
string Company: User defined company. Max Length=40
string InternalName: User defined name. Max Length=63
string OriginalFile: User defined original file. Max Length=127
string HardwareTarget: User defined hardware target. Max Length=127
UInt64 MajorRelease: User defined major release number. Min=0, Max=4294967295, Default=0
UInt64 MinorRelease: User defined minor release number. Min=0, Max=4294967295, Default=0
UInt64 Build: User defined build number. Min=0, Max=4294967295, Default=0
bool VHDX: If VHDX is true, the format of the image is VHDX. Otherwise it is VHD. Default=false

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsDisk object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsDisk for Individual Fields**

Get the PvsDisk into a $o variable. Change the $o field values and then Set the PvsDisk with the result.

```
$o = Get-PvsDisk -DiskLocatorId "81ea9077-598d-459f-a443-71fabd1840bf" -Fields PrinterManagementEnabled
```

```
$o.PrinterManagementEnabled = $false
```

Set-PvsDisk $o

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
EXAMPLE 2: Set PvsDisk for a Field Using Pipe

Get the PvsDisk into a $o variable. Change a $o field to the correct value and then Set the PvsDisk with the result.

Get-PvsDisk -DiskLocatorId "81ea9077-598d-459f-a443-7ffabd1840bf" -
Fields PrinterManagementEnabled | foreach { $o = $_; $o.PrinterManagementEnabled = $false; $o } | Set-PvsDisk

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Set-PvsDiskLocator

Set Disk Locator(s) changed values from PvsDiskLocator object(s), or set one or more field values for a PvsDiskLocator.

Required

PvsDiskLocator DiskLocator: PvsDiskLocator object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsDiskLocator object, and only will be set if the value has changed.

string Description: User description. Default="" Max Length=250
string MenuText: Text that is displayed in the Boot Menu. If this field has no value, the name value is used.
   Default="" ASCII Max Length=64
Guid ServerId: GUID of the single Server that this Disk Locator is assigned to. It is not used with ServerName.
   Default=00000000-0000-0000-0000-000000000000
string ServerName: Name of the single Server that this Disk Locator is assigned to. It is not used with ServerId. Default=""
   Default=true
bool Enabled: True when this disk can be booted, false otherwise.
   Default=true
bool RebalanceEnabled: True when this Server can automatically rebalance Devices, false otherwise. Default=false
   Default=false
uint RebalanceTriggerPercent: Percent over fair load that triggers a dynamic Device rebalance. Min=5, Max=5000, Default=25
   Default=25
uint SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=none, 1=Best Effort, 2=Fixed. Min=0, Max=2,
   Default=0

When DiskLocator is not passed, the parameters below are used:
This required
Guid Guid or DiskLocatorId: GUID of the Disk Locator to Set.
or this required & resolution
string Name or DiskLocatorName: Name of the Disk Locator File to Set.
One of these resolutions when needed
Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.
One of these resolutions when needed
Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Optional field values to set:
string Description: User description. Default="" Max Length=250
string MenuText: Text that is displayed in the Boot Menu. If this field has no value, the name value is used.
   Default="" ASCII Max Length=64
Guid ServerId: GUID of the single Server that this Disk Locator is assigned to. It is not used with ServerName.
   Default=00000000-0000-0000-0000-000000000000
string ServerName: Name of the single Server that this Disk Locator is assigned to. It is not used with ServerId. Default=""
bool Enabled: True when this disk can be booted, false otherwise.
   Default=true
bool RebalanceEnabled: True when this Server can automatically rebalance Devices, false otherwise. Default=false
uint RebalanceTriggerPercent: Percent over fair load that triggers a dynamic Device rebalance. Min=5, Max=5000, Default=25
uint SubnetAffinity: Qualifier for subnet affinity when assigning a Server. 0=None, 1=Best Effort, 2=Fixed. Min=0, Max=2, Default=0

Optional
SwitchParameter PassThru: If -PassThru is specified, the resulting PvsDiskLocator object(s) are returned.
SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.
EXAMPLE 1: Set PvsDiskLocator for Individual Fields

Get the PvsDiskLocator into a $o variable. Change the $o field values and then Set the PvsDiskLocator with the result.

```
$o = Get-PvsDiskLocator -DiskLocatorId "81ea9077-598d-459f-a443-71fabd1840bf" -Fields RebalanceEnabled
```

```
$o.RebalanceEnabled = $true
Set-PvsDiskLocator $o
```

The `-Fields` parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 2: Set PvsDiskLocator for a Field Using Pipe

Get the PvsDiskLocator into a $o variable. Change a $o field to the correct value and then Set the PvsDiskLocator with the result.

```
Get-PvsDiskLocator -DiskLocatorId "81ea9077-598d-459f-a443-71fabd1840bf" -Fields RebalanceEnabled | foreach { $o = $_; $o.RebalanceEnabled = $true; $o } | Set-PvsDiskLocator
```

The `-Fields` parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

EXAMPLE 3: Get PvsDiskLocator and Enable

Get all PvsDiskLocator that are not Enabled and then Enables them.

```
Get-PvsDiskLocator -Fields Enabled | Where-Object {$_ Enabled -eq $false} | foreach { $o = $_; $o.Enabled = $true; $o } | Set-PvsDiskLocator
```

The `-Fields` parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Set-PvsDiskUpdateDevice

Set Disk Update Device(s) changed values from PvsDiskUpdateDevice object(s), or set one or more field values for one or more PvsDiskUpdateDevices.

Required
PvsDiskUpdateDevice: PvsDiskUpdateDevice object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsDiskUpdateDevice object, and only will be set if the value has changed.

String Description: User description. Default="" Max Length=250

Uint Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

Uint AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

Uint AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

Uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

String DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

String DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

String DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

When DiskUpdateDevice is not passed, the parameters below are used:

One of these required:

Guid Guid or DeviceId: GUID of the Disk Update Device to Set.

String Name or DeviceName: Name of Disk Update Device to Set.

PvsPhysicalAddress DeviceMac: MAC of Disk Update Device to Set.

Guid SiteId: GUID of the Site. Can be used alone to Set all Disk Update Devices in the Site.

String SiteName: Name of the Site. Can be used alone to Set all Disk Update Devices in the Site.

Guid DiskLocatorId: GUID of the DiskLocator to Set the Disk Update Device for.
or this required & resolution

string DiskLocatorName: Name of the DiskLocator to Set the Disk Update Device for.

One of these resolutions when needed

Guid SiteId: GUID of the Site. Can be used alone to Set all Disk Update Devices in the Site.

string SiteName: Name of the Site. Can be used alone to Set all Disk Update Devices in the Site.

One of these resolutions when needed

Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Optional field values to set:

string Description: User description. Default="" Max Length=250

uint Port: UDP port to use with Stream Service. Min=1025, Max=65534, Default=6901

uint AdTimestamp: The time the Active Directory machine account password was generated. Do not set this field, it is only set internally by PVS. Default=0

uint AdSignature: The signature of the Active Directory machine account password. Do not set this field, it is only set internally by PVS. Default=0

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=0

string DomainName: Fully qualified name of the domain that the Device belongs to. Do not set this field, it is only set internally by PVS. Default="" Max Length=255

string DomainObjectSID: The value of the objectSID AD attribute of the same name for the Device's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=186

string DomainControllerName: The name of the DC used to create the host's computer account. Do not set this field, it is only set internally by PVS. Default="" Max Length=4000

DateTime DomainTimeCreated: The time that the computer account was created. Has the date and time including milliseconds. Do not set this field, it is only set internally by PVS. Default=Empty

Optional
SwitchParameter PassThru: If -PassThru is specified, the resulting PvsDiskUpdateDevice object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsDiskUpdateDevice for Individual Fields**

Get the PvsDiskUpdateDevice into a $o variable. Change the $o field values and then Set the PvsDiskUpdateDevice with the result.

```powershell
$o = Get-PvsDiskUpdateDevice -Name theDevice -Fields Port
$o.Port = 5901
Set-PvsDiskUpdateDevice $o
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 2: Set PvsDiskUpdateDevice for a Field Using Pipe**

Get the PvsDiskUpdateDevice into a $o variable. Change a $o field to the correct value and then Set the PvsDiskUpdateDevice with the result.

```powershell
Get-PvsDiskUpdateDevice -Name theDevice -Fields Port | foreach { $o = $_; $o.Port = 5901; $o } | Set-PvsDiskUpdateDevice
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Set-PvsDiskVersion**

Set Disk Version(s) changed values from PvsDiskVersion object(s), or set one or more field values for a PvsDiskVersion.

Required

PvsDiskVersion DiskVersion: PvsDiskVersion object(s) with changed property value(s) to be set. The object(s) can come from a pipeline.

These values are in the PvsDiskVersion object, and only will be set if the value has changed.

string Description: User description. Default="" Max Length=250

DateTime ScheduledDate: Date/Time that the Disk Version is scheduled to become available. Has the date, hour and minute. Empty when the disk version is made available immediately. Default=Empty
When DiskVersion is not passed, the parameters below are used:

This required
- Guid Guid or DiskLocatorId: GUID of the Disk Locator Version to Set.
- or this required & resolution
  - string Name or DiskLocatorName: Name of the Disk Locator Version to Set.

This required
- uint Version: Version to Set.

One of these resolutions when needed
- Guid SiteId: GUID of the Site.
- string SiteName: Name of the Site.

One of these resolutions when needed
- Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
- string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Optional field values to set:
- string Description: User description. Default="" Max Length=250
- DateTime ScheduledDate: Date/Time that the Disk Version is scheduled to become available. Has the date, hour and minute. Empty when the disk version is made available immediately. Default=Empty

Optional
- SwitchParameter PassThru: If -PassThru is specified, the resulting PvsDiskVersion object(s) are returned.
- SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsDiskVersion for Individual Fields**

Get the PvsDiskVersion into a $o variable. Change the $o field values and then Set the PvsDiskVersion with the result.

```powershell
$o = Get-PvsDiskVersion -DiskLocatorId "81ea9077-598d-459f-a443-71fabd1840bf" -Version 5 -Fields ScheduledDate

$o.ScheduledDate = "2016/01/01"

Set-PvsDiskVersion $o
```
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 2: Set PvsDiskVersion for a Field Using Pipe**

Get the PvsDiskVersion into a $o variable. Change a $o field to the correct value and then Set the PvsDiskVersion with the result.

```powershell
Get-PvsDiskVersion -DiskLocatorId "81ea9077-598d-459f-a443-71fabd1840bf" -Version 5 -Fields ScheduledDate | foreach { $o = $_; $o.ScheduledDate = "2016/01/01"; $o } | Set-PvsDiskVersion
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

---

**Set-PvsFarm**

Set Farm changed values from a PvsFarm object, or set one or more field values for a PvsFarm.

Required

- **PvsFarm Farm**: PvsFarm object with changed property value(s) to be set. The object can come from a pileline.

These values are in the PvsFarm object, and only will be set if the value has changed.

- string **Name or FarmName**: Name of the Farm. Default="" Max Length=50
- string **Description**: User description. Default="" Max Length=250
- bool **AutoAddEnabled**: True when Auto Add is enabled, false otherwise. Default=false
- bool **AuditingEnabled**: True when Auditing is enabled, false otherwise. Default=false
- DateTime **LastAuditArchiveDate**: Last date of Audit Trail data that was Archived. Has the date. Default=Empty
- Guid **DefaultSiteId**: GUID of the Site to place new Devices into automatically. Not used with defaultSiteName. Default=00000000-0000-0000-0000-000000000000
- string **DefaultSiteName**: Name of the Site to place new Devices into automatically. Not used with DefaultSiteId. Default=""
- bool **OfflineDatabaseSupportEnabled**: True when Offline Database Support is enabled, false otherwise. Default=false
- string **LicenseServer**: License server name. Default="" Max Length=255
uint LicenseServerPort: License server port. Min=1025, Max=65534, Default=27000

bool AutomaticMergeEnabled: True when Automatic Merge is enabled, false otherwise. If the number of versions becomes more than the MaxVersions value, a merge will occur at the end of PromoteDiskVersion. Default=true

uint MaxVersions: Maximum number a versions of a Disk that can exist before a merge will automatically occur. Min=3, Max=50, Default=5

uint MergeMode: Mode to place the version in after a merge has occurred. Values are: 0 (Production), 1 (Test) and 2 (Maintenance). Min=0, Max=2, Default=2

When Farm is not passed, the parameters below are used:

Optional

Guid Guid or FarmId: GUID of the Farm to Set. This is optional since there is only one Farm.

Optional field values to set:

string NewName: Name of the Farm. Default="" Max Length=50

string Description: User description. Default="" Max Length=250

bool AutoAddEnabled: True when Auto Add is enabled, false otherwise. Default=false

bool AuditingEnabled: True when Auditing is enabled, false otherwise. Default=false

DateTime LastAuditArchiveDate: Last date of Audit Trail data that was Archived. Has the date. Default=Empty

Guid DefaultSiteId: GUID of the Site to place new Devices into automatically. Not used with defaultSiteName. Default=00000000-0000-0000-0000-000000000000

string DefaultSiteName: Name of the Site to place new Devices into automatically. Not used with DefaultSiteId. Default=""

bool OfflineDatabaseSupportEnabled: True when Offline Database Support is enabled, false otherwise. Default=false

string LicenseServer: License server name. Default="" Max Length=255

uint LicenseServerPort: License server port. Min=1025, Max=65534, Default=27000

bool AutomaticMergeEnabled: True when Automatic Merge is enabled, false otherwise. If the number of versions becomes more than the MaxVersions value, a merge will occur at the end of PromoteDiskVersion. Default=true
uint MaxVersions: Maximum number a versions of a Disk that can exist before a merge will automatically occur. Min=3, Max=50, Default=5

uint MergeMode: Mode to place the version in after a merge has occurred. Values are: 0 (Production), 1 (Test) and 2 (Maintenance). Min=0, Max=2, Default=2

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsFarm object is returned.

SwitchParameter Confirm: The impact of this operation is "low". If - Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsFarm for Individual Fields**

Get the PvsFarm into a $o variable. Change the $o field values and then Set the PvsFarm with the result.

```
$o = Get-PvsFarm -Fields AuditingEnabled, OfflineDatabaseSupportEnabled
```

```
{o.AuditingEnabled = $true
{o.OfflineDatabaseSupportEnabled = $true
Set-PvsFarm $o
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 2: Set PvsFarm for a Field Using Pipe**

Get the PvsFarm into a $o variable for the field that has the wrong value. Change the $o field to the correct value and then Set the PvsFarm with the result.

```
Get-PvsFarm -Fields AuditingEnabled | Where-Object {$_ .AuditingEnabled -ne $true} | foreach { $o = $_; $o.AuditingEnabled = $true; $o } | Set-PvsFarm
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Set-PvsFarmView**

Set Farm View(s) changed values from PvsFarmView object(s), or set one or more field values for a PvsFarmView.

Required
PvsFarmView FarmView: PvsFarmView object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsFarmView object, and only will be set if the value has changed.

string Name or FarmViewName: name of the Farm View. Max Length=50
string Description: User description. Default="" Max Length=250

When FarmView is not passed, the parameters below are used:
One of these required

Guid Guid or FarmViewId: GUID of the Farm View to Set.
string Name or FarmViewName: Name of the Farm View to Set.

Optional field values to set:

string NewName: name of the Farm View. Max Length=50
string Description: User description. Default="" Max Length=250

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsFarmView object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsFarmView for Individual Fields
Get the PvsFarmView into a $o variable. Change the $o field values and then Set the PvsFarmView with the result.

$o = Get-PvsFarmView -Name oldFarmView -Fields Name
$o.Name = "newFarmView"
Set-PvsFarmView $o

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 2: Set PvsFarmView for a Field Using Pipe
Get the PvsFarmView into a $o variable. Change a $o field to the correct value and then Set the PvsFarmView with the result.

Get-PvsFarmView -Name oldFarmView -Fields Name | foreach { $o = $_;
    $o.Name = "newFarmView";
    $o } | Set-PvsFarmView
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Set-PvsOverrideVersion**

Specify a Disk Version all Production Devices will boot from.

This required

Guid[] Guid or DiskLocatorId: GUID of the Disk Locator File to Override the Production Version for.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator File to Override the Production Version for.

Optional

uint Version: Version to set as the Override Production Version. If Version is not included and if there is an Override Production Version, then no longer have it as the Override Version.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Set-PvsOverrideVersion for Name with Version**

Set-PvsOverrideVersion -Name theDiskLocator -SiteName theSite -StoreName theStore -Version 4

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.
EXAMPLE 2: Set-PvsOverrideVersion for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Set-PvsOverrideVersion.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Set-PvsOverrideVersion - Version 4

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 3: Set-PvsOverrideVersion for Name

Set-PvsOverrideVersion -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 4: Set-PvsOverrideVersion for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Set-PvsOverrideVersion.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Set-PvsOverrideVersion

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

Set-PvsServer

Set Server(s) changed values from PvsServer object(s), or set one or more field values for a PvsServer. Restart the Server(s) after setting.

Required

PvsServer Server: PvsServer object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsServer object, and only will be set if the value has changed.

string Name or ServerName: Computer name with no spaces. ASCII computer name characters Max Length=21

string Description: User description. Default="" Max Length=250

uint AdMaxPasswordAge: Number of days before a password expires. Min=1, Max=30, Default=7

uint LicenseTimeout: Amount of seconds before a license times out. Min=15, Max=300, Default=30

uint VDiskCreatePacing: VDisk create time pacing in milliseconds. Min=0, Max=5, Default=0
uint FirstPort: Number of the first UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6910

uint LastPort: Number of the last UDP port for use by the Stream Service, First and Last must allow at least 5 ports. Min=1025, Max=65534, Default=6930

uint ThreadsPerPort: Number of worker threads per IO port. Required that (threadPerPort * numberPorts * numberIPs) <= 1000. Min=1, Max=60, Default=8

uint BuffersPerThread: Number of buffers per worker thread. Min=1, Max=128, Default=24

uint ServerCacheTimeout: Number of seconds to wait before considering another Server is down. Min=5, Max=60, Default=8

uint IoBurstSize: Number of bytes read/writes can send in a burst of packets. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=4096, Max=61440, Default=32768

uint MaxTransmissionUnits: Ethernet maximum transmission unit size for the protocol for use for Server and Device. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=502, Max=16426, Default=1506

uint MaxBootDevicesAllowed: Maximum number of Devices allowed to boot simultaneously. Min=1, Max=1000, Default=500

uint MaxBootSeconds: Maximum number of seconds for a Device to boot. Min=10, Max=900, Default=60

uint BootPauseSeconds: Number of seconds that a Device will pause during login if its server busy. Min=1, Max=60, Default=10

bool AdMaxPasswordAgeEnabled: Age the password, when set to true. Default=false

bool EventLoggingEnabled: Enable event logging, when set to true. Default=false

bool NonBlockingIoEnabled: Use non-Blocking IO, when set to true. Default=true

string[] Ip: One or more streaming ip addresses.

uint InitialQueryConnectionPoolSize: Initial size of database connection pool for non-transactional queries. Min=1, Max=1000, Default=50

uint InitialTransactionConnectionPoolSize: Initial size of database connection pool for transactional queries. Min=1, Max=1000, Default=50

uint MaxQueryConnectionPoolSize: Maximum size of database connection pool for non-transactional queries. Min=1, Max=32767, Default=1000
uint MaxTransactionConnectionPoolSize: Maximum size of database connection pool for transactional queries. Min=1, Max=32767, Default=1000

uint RefreshInterval: Interval, in number of seconds, the server should wait before refreshing settings. If set to 0, unused database connections are never released. Min=0, Max=32767, Default=300

uint UnusedDbConnectionTimeout: Interval, in number of seconds, a connection should go unused before it is to be released. Min=0, Max=32767, Default=300

uint BusyDbConnectionRetryCount: Number of times a failed database connection will be retried. Min=0, Max=32767, Default=2

uint BusyDbConnectionRetryInterval: Interval, in number of milliseconds, the server should wait before retrying to connect to a database. Min=0, Max=10000, Default=25

uint LocalConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are local. A value of 0 disables the feature. Min=0, Max=128, Default=4

uint RemoteConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are remote. A value of 0 disables the feature. Min=0, Max=128, Default=4

string RamDiskIpAddress: IP address to use for transferring the RAM Disk. When equal to 0.0.0.0 the server IP is used with the first part replaced with 233. Default=0.0.0.0

uint RamDiskTimeToLive: Time to live for the invitation packet sent to Devices. Min=1, Max=255, Default=1

bool RamDiskInvitationType: Either false for Fixed, or true for Variable. Default=false

uint RamDiskInvitationPeriod: The amount of time in seconds that invitations are sent to Devices. Min=1, Max=300, Default=10

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1 (Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug), and 6 (Trace). Min=0, Max=6, Default=4

uint LogFileSizeMax: Maximum size log files can reach in Megabytes. Min=1, Max=50, Default=5

uint LogFileBackupCopiesMax: Maximum number of log file backups. Min=1, Max=50, Default=4

float PowerRating: A strictly relative rating of this Server's capabilities when compared to other Servers in the Store(s) it belongs too; can be used to help tune load balancing. Min=0.1, Max=1000, Default=1
When Server is not passed, the parameters below are used:

One of these required

Guid Guid or ServerId: GUID of the Server to Set.
string Name or ServerName: Name of the Server to Set.

Optional field values to set:

string NewName: Computer name with no spaces. ASCII computer name characters Max Length=21

string Description: User description. Default="" Max Length=250

uint AdMaxPasswordAge: Number of days before a password expires.
   Min=1, Max=30, Default=7

uint LicenseTimeout: Amount of seconds before a license times out.
   Min=15, Max=300, Default=30

uint VDiskCreatePacing: VDisk create time pacing in miliseconds.
   Min=0, Max=5, Default=0

uint FirstPort: Number of the first UDP port for use by the Stream Service, First and Last must allow at least 5 ports.
   Min=1025, Max=65534, Default=6910

uint LastPort: Number of the last UDP port for use by the Stream Service, First and Last must allow at least 5 ports.
   Min=1025, Max=65534, Default=6930

uint ThreadsPerPort: Number of worker threads per IO port. Required that (threadPerPort * numberPorts * numberIPs) <= 1000. Min=1, Max=60, Default=8

uint BuffersPerThread: Number of buffers per worker thread. Min=1, Max=128, Default=24

uint ServerCacheTimeout: Number of seconds to wait before considering another Server is down. Min=5, Max=60, Default=8

uint IoBurstSize: Number of bytes read/writes can send in a burst of packets. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32. Min=4096, Max=61440, Default=32768

uint MaxTransmissionUnits: Ethernet maximum transmission unit size for the protocol for use for Server and Device. Required that IoBurstSize/(MaxTransmissionUnits-76)<=32.
   Min=502, Max=16426, Default=1506

uint MaxBootDevicesAllowed: Maximum number of Devices allowed to boot simultaneously. Min=1, Max=1000, Default=500

uint MaxBootSeconds: Maximum number of seconds for a Device to boot.
   Min=10, Max=900, Default=60

uint BootPauseSeconds: Number of seconds that a Device will pause during login if its server busy. Min=1, Max=60, Default=10

bool AdMaxPasswordAgeEnabled: Age the password, when set to true.
   Default=false
bool EventLoggingEnabled: Enable event logging, when set to true. Default=false

bool NonBlockingIoEnabled: Use non-Blocking IO, when set to true. Default=true

string[] Ip: One or more streaming ip addresses.

uint InitialQueryConnectionPoolSize: Initial size of database connection pool for non-transactional queries. Min=1, Max=1000, Default=50

uint InitialTransactionConnectionPoolSize: Initial size of database connection pool for transactional queries. Min=1, Max=1000, Default=50

uint MaxQueryConnectionPoolSize: Maximum size of database connection pool for non-transactional queries. Min=1, Max=32767, Default=1000

uint MaxTransactionConnectionPoolSize: Maximum size of database connection pool for transactional queries. Min=1, Max=32767, Default=1000

uint RefreshInterval: Interval, in number of seconds, the server should wait before refreshing settings. If set to 0, unused database connections are never released. Min=0, Max=32767, Default=300

uint UnusedDbConnectionTimeout: Interval, in number of seconds, a connection should go unused before it is to be released. Min=0, Max=32767, Default=300

uint BusyDbConnectionRetryCount: Number of times a failed database connection will be retried. Min=0, Max=32767, Default=2

uint BusyDbConnectionRetryInterval: Interval, in number of milliseconds, the server should wait before retrying to connect to a database. Min=0, Max=10000, Default=25

uint LocalConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are local. A value of 0 disables the feature. Min=0, Max=128, Default=4

uint RemoteConcurrentIoLimit: Maximum concurrent IO transactions it performs for vDisks that are remote. A value of 0 disables the feature. Min=0, Max=128, Default=4

string RamDiskIpAddress: IP address to use for transferring the RAM Disk. When equal to 0.0.0.0 the server IP is used with the first part replaced with 233. Default=0.0.0.0

uint RamDiskTimeToLive: Time to live for the invitation packet sent to Devices. Min=1, Max=255, Default=1

bool RamDiskInvitationType: Either false for Fixed, or true for Variable. Default=false
uint RamDiskInvitationPeriod: The amount of time in seconds that
invitations are sent to Devices. Min=1, Max=300,
Default=10

uint LogLevel: Level to perform logging at. Values are: 0 (None), 1
(Fatal), 2 (Error), 3 (Warning), 4 (Info), 5 (Debug),
and 6 (Trace). Min=0, Max=6, Default=4

uint LogFileSizeMax: Maximum size log files can reach in Megabytes.
Min=1, Max=50, Default=5

uint LogFileBackupCopiesMax: Maximum number of log file backups.
Min=1, Max=50, Default=4

float PowerRating: A strictly relative rating of this Server's
capabilities when compared to other Servers in the
Store(s) it belongs too; can be used to help tune
load balancing. Min=0.1, Max=1000, Default=1

Optional

 SwitchParameter PassThru: If -PassThru is specified, the resulting
PvsServer object(s) are returned.

 SwitchParameter Confirm: The impact of this operation is "low". If -
Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "low" to
have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsServer for Individual Fields
Get the PvsServer into a $o variable. Change the $o field values and
then Set the PvsServer with the result.

$_ = Get-PvsServer -Name theServer -Fields LicenseTimeout,
ThreadsPerPort
$_.LicenseTimeout = 60
$_.ThreadsPerPort = 10
Set-PvsServer $_

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

EXAMPLE 2: Set PvsServer for a Field Using Pipe
Get the PvsServer into a $o variable. Change a $o field to the correct
value and then Set the PvsServer with the result.

Get-PvsServer -Name theServer -Fields LicenseTimeout | foreach { $o =
$_; $o.LicenseTimeout = 60; $o } | Set-PvsServer

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.
The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Set-PvsServerBiosBootstrap

Oem Only: Set Server Bios Bootstrap(s) changed values from PvsServerBiosBootstrap object(s), or set one or more field values for a PvsServerBiosBootstrap.

Required

PvsServerBiosBootstrap ServerBiosBootstrap: PvsServerBiosBootstrap object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsServerBiosBootstrap object, and only will be set if the value has changed.

bool Enabled: Automatically update the BIOS on the target device with these setting when set to true, otherwise do not use these settings. Default=false

bool DhcpEnabled: Use DHCP to retrieve target device IP when set to true, otherwise use the static domain, dnsIpAddresstrue and dnsIpAddress2 settings. Default=true

bool Lookup: Use DNS to find the Server when set to true with the ServerName host value, otherwise use the bootservertrue_Ip, bootservertrue_Port, bootserver2_Ip, bootserver2_Port, bootserver3_Ip, bootserver3_Port, bootserver4_Ip, and bootserver4_Port settings. Default=true

bool VerboseMode: Display verbose diagnostic information when set to true. Default=false

bool InterruptSafeMode: Interrupt safe mode (use if target device hangs during boot) when set to true. Default=false

bool PaeMode: PAE mode (use if PAE enabled in boot.ini of target device) when set to true. Default=false

bool BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false

uint RecoveryTime: When bootFromHdOnFail is 1, this is the number of seconds to wait before reboot to hard drive. Min=10, Max=60000, Default=50

uint PollingTimeout: Login polling timeout in milliseconds. Min=1000, Max=60000, Default=5000

uint GeneralTimeout: Login general timeout in milliseconds. Min=1000, Max=60000, Default=5000

string Name or ServerName: Host to use for DNS lookup. Only used when Lookup is true. Default=IMAGESERVER1
string Bootserver1_Ip: 1st boot server IP. Only used when Lookup is false.

uint Bootserver1_Port: 1st boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Bootserver2_Ip: 2nd boot server IP. Only used when Lookup is false. Default=0.0.0.0

uint Bootserver2_Port: 2nd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Bootserver3_Ip: 3rd boot server IP. Only used when Lookup is false. Default=0.0.0.0

uint Bootserver3_Port: 3rd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Bootserver4_Ip: 4th boot server IP. Only used when Lookup is false. Default=0.0.0.0

uint Bootserver4_Port: 4th boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Domain: Domain of the primary and secondary DNS servers. Only used when DhcpEnabled is false.

string DnsIpAddress1: Primary DNS server IP. Only used when DhcpEnabled is false.

string DnsIpAddress2: Secondary DNS server IP. Only used when DhcpEnabled is false.

When ServerBiosBootstrap is not passed, the parameters below are used:
One of these required

Guid Guid or ServerId: GUID of the Server to Set the dell_bios.bin BIOS bootstrap file.

string Name or ServerName: Name of the Server to Set the dell_bios.bin BIOS bootstrap file.

Optional field values to set:

bool Enabled: Automatically update the BIOS on the target device with these setting when set to true, otherwise do not use these settings. Default=false

bool DhcpEnabled: Use DHCP to retrieve target device IP when set to true, otherwise use the static domain, dnsIpAddress1 and dnsIpAddress2 settings. Default=true

bool Lookup: Use DNS to find the Server when set to true with the ServerName host value, otherwise use the bootserver1_Ip, bootserver1_Port, bootserver2_Ip, bootserver2_Port, bootserver3_Ip, bootserver3_Port, bootserver4_Ip, and bootserver4_Port settings. Default=true
bool VerboseMode: Display verbose diagnostic information when set to true. Default=false

bool InterruptSafeMode: Interrupt safe mode (use if target device hangs during boot) when set to true. Default=false

bool PaeMode: PAE mode (use if PAE enabled in boot.ini of target device) when set to true. Default=false

bool BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false

uint RecoveryTime: When bootFromHdOnFail is 1, this is the number of seconds to wait before reboot to hard drive. Min=10, Max=60000, Default=50

uint PollingTimeout: Login polling timeout in milliseconds. Min=1000, Max=60000, Default=5000

uint GeneralTimeout: Login general timeout in milliseconds. Min=1000, Max=60000, Default=5000

string NewName: Host to use for DNS lookup. Only used when Lookup is true. Default=IMAGESERVER1

string Bootserver1_Ip: 1st boot server IP. Only used when Lookup is false.

uint Bootserver1_Port: 1st boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Bootserver2_Ip: 2nd boot server IP. Only used when Lookup is false. Default=0.0.0.0

uint Bootserver2_Port: 2nd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Bootserver3_Ip: 3rd boot server IP. Only used when Lookup is false. Default=0.0.0.0

uint Bootserver3_Port: 3rd boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Bootserver4_Ip: 4th boot server IP. Only used when Lookup is false. Default=0.0.0.0

uint Bootserver4_Port: 4th boot server port. Only used when Lookup is false. Min=1025, Max=65536, Default=6910

string Domain: Domain of the primary and secondary DNS servers. Only used when DhcpEnabled is false.

string DnsIpAddress1: Primary DNS server IP. Only used when DhcpEnabled is false.

string DnsIpAddress2: Secondary DNS server IP. Only used when DhcpEnabled is false.

Optional
SwitchParameter PassThru: If -PassThru is specified, the resulting PvsServerBiosBootstrap object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsServerBiosBootstrap for Individual Fields**

Get the PvsServerBiosBootstrap into a $o variable. Change the $o field values and then Set the PvsServerBiosBootstrap with the result.

```
$o = Get-PvsServerBiosBootstrap -Name theServer -Fields DhcpEnabled
$o.DhcpEnabled = $true
Set-PvsServerBiosBootstrap $o
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 2: Set PvsServerBiosBootstrap for a Field Using Pipe**

Get the PvsServerBiosBootstrap into a $o variable. Change a $o field to the correct value and then Set the PvsServerBiosBootstrap with the result.

```
Get-PvsServerBiosBootstrap -Name theServer -Fields DhcpEnabled |
    foreach { $o = $_; $o.DhcpEnabled = $true; $o } |
    Set-PvsServerBiosBootstrap
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Set-PvsServerBootstrap**

Set Server Bootstrap(s) changed values from PvsServerBootstrap object(s), or set one or more field values for a PvsServerBootstrap.

Required

PvsServerBootstrap ServerBootstrap: PvsServerBootstrap object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsServerBootstrap object, and only will be set if the value has changed.

string Bootserver1_Ip: 1st boot server IP.
string Bootserver1_Netmask: 1st boot server netmask. Default=0.0.0.0
string Bootserver1_Gateway: 1st boot server gateway. Default=0.0.0.0
uint Bootserver1_Port: 1st boot server port. Min=1025, Max=65536, Default=6910

string Bootserver2_Ip: 2nd boot server IP. Default=0.0.0.0
string Bootserver2_Netmask: 2nd boot server netmask. Default=0.0.0.0
string Bootserver2_Gateway: 2nd boot server gateway. Default=0.0.0.0
uint Bootserver2_Port: 2nd boot server port. Min=1025, Max=65536, Default=6910

string Bootserver3_Ip: 3rd boot server IP. Default=0.0.0.0
string Bootserver3_Netmask: 3rd boot server netmask. Default=0.0.0.0
string Bootserver3_Gateway: 3rd boot server gateway. Default=0.0.0.0
uint Bootserver3_Port: 3rd boot server port. Min=1025, Max=65536, Default=6910

string Bootserver4_Ip: 4th boot server IP. Default=0.0.0.0
string Bootserver4_Netmask: 4th boot server netmask. Default=0.0.0.0
string Bootserver4_Gateway: 4th boot server gateway. Default=0.0.0.0
uint Bootserver4_Port: 4th boot server port. Min=1025, Max=65536, Default=6910

bool VerboseMode: Display verbose diagnostic information when set to true. Default=false
bool InterruptSafeMode: Interrupt safe mode (use if target device hangs during boot) when set to true. Default=false
bool PaeMode: PAE mode (use if PAE enabled in boot.ini of target device) when set to true. Default=false
bool BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false
uint RecoveryTime: When bootFromHdOnFail is 1, this is the number of seconds to wait before reboot to hard drive. Min=10, Max=60000, Default=50
uint PollingTimeout: Login polling timeout in milliseconds. Min=1000, Max=60000, Default=5000
uint GeneralTimeout: Login general timeout in milliseconds. Min=1000, Max=60000, Default=5000

When ServerBootstrap is not passed, the parameters below are used:
One of these required
Guid Guid or ServerId: GUID of the Server to Set the named bootstrap file on.
string ServerName: Name of the Server to Set the named bootstrap file on.
This required
string Name: Name of the bootstrap file.

Optional field values to set:

string Bootserver1_Ip: 1st boot server IP.
string Bootserver1_Netmask: 1st boot server netmask. Default=0.0.0.0
string Bootserver1_Gateway: 1st boot server gateway. Default=0.0.0.0
uint Bootserver1_Port: 1st boot server port. Min=1025, Max=65536, Default=6910

string Bootserver2_Ip: 2nd boot server IP. Default=0.0.0.0
string Bootserver2_Netmask: 2nd boot server netmask. Default=0.0.0.0
string Bootserver2_Gateway: 2nd boot server gateway. Default=0.0.0.0
uint Bootserver2_Port: 2nd boot server port. Min=1025, Max=65536, Default=6910

string Bootserver3_Ip: 3rd boot server IP. Default=0.0.0.0
string Bootserver3_Netmask: 3rd boot server netmask. Default=0.0.0.0
string Bootserver3_Gateway: 3rd boot server gateway. Default=0.0.0.0
uint Bootserver3_Port: 3rd boot server port. Min=1025, Max=65536, Default=6910

string Bootserver4_Ip: 4th boot server IP. Default=0.0.0.0
string Bootserver4_Netmask: 4th boot server netmask. Default=0.0.0.0
string Bootserver4_Gateway: 4th boot server gateway. Default=0.0.0.0
uint Bootserver4_Port: 4th boot server port. Min=1025, Max=65536, Default=6910

bool VerboseMode: Display verbose diagnostic information when set to true. Default=false
bool InterruptSafeMode: Interrupt safe mode (use if target device hangs during boot) when set to true. Default=false
bool PaeMode: PAE mode (use if PAE enabled in boot.ini of target device) when set to true. Default=false
bool BootFromHdOnFail: For network recovery reboot to hard drive when set to true, restore network connection when set to false. Default=false
uint RecoveryTime: When bootFromHdOnFail is 1, this is the number of seconds to wait before reboot to hard drive. Min=10, Max=60000, Default=50
uint PollingTimeout: Login polling timeout in milliseconds. Min=1000, Max=60000, Default=5000
uint GeneralTimeout: Login general timeout in milliseconds. Min=1000, Max=60000, Default=5000

Optional
SwitchParameter PassThru: If -PassThru is specified, the resulting
PvsServerBootstrap object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -
Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "low" to
have confirmation without the Confirm parameter.

**EXAMPLE 1: Set PvsServerBootstrap for Individual Fields**

Get the PvsServerBootstrap into a $o variable. Change the $o field
values and then Set the PvsServerBootstrap with the
result.

```powershell
$o = Get-PvsServerBootstrap -Name theBootstrapFile -ServerName
theServer -Fields VerboseMode
```

```powershell
$o.VerboseMode = $true
Set-PvsServerBootstrap $o
```

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

**EXAMPLE 2: Set PvsServerBootstrap for a Field Using Pipe**

Get the PvsServerBootstrap into a $o variable. Change a $o field to
the correct value and then Set the PvsServerBootstrap
with the result.

```powershell
Get-PvsServerBootstrap -Name theBootstrapFile -ServerName theServer -
Fields VerboseMode | foreach { $o = $_; $o.VerboseMode = $true; $o } | Set-PvsServerBootstrap
```

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y
and returns the object again so it can be piped to
the Set command for update.

**Set-PvsServerStore**

Set ServerStore(s) changed values from PvsServerStore object(s), or set one
or more field values for a PvsServerStore.

**Required**

PvsServerStore ServerStore: PvsServerStore object(s) with changed
property value(s) to be set. The object(s) can come
from a pileline.

These values are in the PvsServerStore object, and only will be set if
the value has changed.

string Path: Directory path that the Server uses to access the Store.
Default="" Max Length=255
string[] CachePath: Cache path(s) that the Server uses with the Store. If none are specified the caches will be placed in the Store cachePath. Default=None

When ServerStore is not passed, the parameters below are used:

One of these required

Guid Guid or ServerId: GUID of a Server that uses the path to get to the Store.

string Name or ServerName: Name of a Server that uses the path to get to the Store.

One of these required

Guid StoreId: GUID of the Store.

string StoreName: Name of the Store.

Optional field values to set:

string Path: Directory path that the Server uses to access the Store. Default="" Max Length=255

string[] CachePath: Cache path(s) that the Server uses with the Store. If none are specified the caches will be placed in the Store cachePath. Default=None

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsServerStore object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsServerStore for Individual Fields

Get the PvsServerStore into a $o variable. Change the $o field values and then Set the PvsServerStore with the result.

$o = Get-PvsServerStore -ServerName theServer -StoreName theStore -Fields CachePath

$o.CachePath = "\Network\CachePath"

Set-PvsServerStore $o

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 2: Set PvsServerStore for a Field Using Pipe

Get the PvsServerStore into a $o variable. Change a $o field to the correct value and then Set the PvsServerStore with the result.
Get-PvsServerStore -ServerName theServer -StoreName theStore -Fields CachePath | foreach { $o = $_; $o.CachePath = "\\Network\\CachePath"; $o } | Set-PvsServerStore

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Set-PvsSite

Set Site(s) changed values from PvsSite object(s), or set one or more field values for a PvsSite.

Required

PvsSite Site: PvsSite object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsSite object, and only will be set if the value has changed.

string Name or SiteName: Name of the Site. Max Length=50
string Description: User description. Default="" Max Length=250
Guid DefaultCollectionId: GUID of the Collection to place new Devices into automatically. Not used with defaultCollectionName. Default=00000000-0000-0000-0000-000000000000

string DefaultCollectionName: Name of the Collection to place new Devices into automatically. Not used with DefaultCollectionId. Default=""

uint InventoryFilePollingInterval: The number of seconds between polls for Disk changes in the Stores. Min=1, Max=600, Default=60

bool EnableDiskUpdate: True when Disk Updated is enabled for the Site, false otherwise. Default=false

Guid DiskUpdateServerId: GUID of the Disk Update Server for the Site. Not used with DiskUpdateServerName. Default=00000000-0000-0000-0000-000000000000

string DiskUpdateServerName: Name of the Disk Update Server for the Site. Not used with DiskUpdateServerId. Default=""

string MakUser: User name used for MAK activation. Default="" Max Length=64

string MakPassword: User password used for MAK activation. Default="" Max Length=64

When Site is not passed, the parameters below are used:
One of these required

Guid Guid or SiteId: GUID of the Site to Set.
string Name or SiteName: Name of the Site to Set.

Optional field values to set:

string NewName: Name of the Site. Max Length=50
string Description: User description. Default="" Max Length=250
Guid DefaultCollectionId: GUID of the Collection to place new Devices into automatically. Not used with defaultCollectionName. Default=00000000-0000-0000-0000-000000000000

string DefaultCollectionName: Name of the Collection to place new Devices into automatically. Not used with DefaultCollectionId. Default=""

uint InventoryFilePollingInterval: The number of seconds between polls for Disk changes in the Stores. Min=1, Max=600, Default=60

bool EnableDiskUpdate: True when Disk Updated is enabled for the Site, false otherwise. Default=false

Guid DiskUpdateServerId: GUID of the Disk Update Server for the Site. Not used with DiskUpdateServerName. Default=00000000-0000-0000-0000-000000000000

string DiskUpdateServerName: Name of the Disk Update Server for the Site. Not used with DiskUpdateServerId. Default=""

string MakUser: User name used for MAK activation. Default="" Max Length=64

string MakPassword: User password used for MAK activation. Default="" Max Length=64

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsSite object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsSite for Individual Fields

Get the PvsSite into a $o variable. Change the $o field values and then Set the PvsSite with the result.

$o = Get-PvsSite -Name theSite -Fields InventoryFilePollingInterval
$o.InventoryFilePollingInterval = 120
Set-PvsSite $o
The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

**EXAMPLE 2: Set PvsSite for a Field Using Pipe**

Get the PvsSite into a $o variable. Change a $o field to the correct
value and then Set the PvsSite with the result.

```powershell
Get-PvsSite -Name theSite -Fields InventoryFilePollingInterval |
foreach { $o = $_; $o.InventoryFilePollingInterval = 120; $o } | Set-PvsSite
```

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y
and returns the object again so it can be piped to
the Set command for update.

**Set-PvsSiteView**

Set Site View(s) changed values from PvsSiteView object(s), or set one or
more field values for a PvsSiteView.

Required

PvsSiteView SiteView: PvsSiteView object(s) with changed property
value(s) to be set. The object(s) can come from a
pileline.

These values are in the PvsSiteView object, and only will be set if
the value has changed.

string Name or SiteViewName: Name of the Site View. Max Length=50
string Description: User description. Default="" Max Length=250

When SiteView is not passed, the parameters below are used:

This required

Guid Guid or SiteViewId: GUID of the Site View to Set.
or this required & resolution

string Name or SiteViewName: Name of the Site View to Set.

One of these resolutions when needed

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.

Optional field values to set:

string NewName: Name of the Site View. Max Length=50
string Description: User description. Default="" Max Length=250
Optional
SwitchParameter PassThru: If -PassThru is specified, the resulting PvsSiteView object(s) are returned.
SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsSiteView for Individual Fields
Get the PvsSiteView into a $o variable. Change the $o field values and then Set the PvsSiteView with the result.

$o = Get-PvsSiteView -Name oldSiteView -SiteName theSite -Fields Name
$o.Name = "newSiteView"
Set-PvsSiteView $o

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

EXAMPLE 2: Set PvsSiteView for a Field Using Pipe
Get the PvsSiteView into a $o variable. Change a $o field to the correct value and then Set the PvsSiteView with the result.

Get-PvsSiteView -Name oldSiteView -SiteName theSite -Fields Name | foreach { $o = $_; $o.Name = "newSiteView"; $o } | Set-PvsSiteView

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Set-PvsStore
Set Store(s) changed values from PvsStore object(s), or set one or more field values for a PvsStore.

Required
PvsStore Store: PvsStore object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsStore object, and only will be set if the value has changed.

string Name or StoreName: Name of the Store. Max Length=50
Guid SiteId: GUID of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteName can be used instead. Default=00000000-0000-0000-0000-00000000000

string SiteName: Name of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteId can be used instead. Default=

string Description: User description. Default="" Max Length=250

string Path: Default directory path that the Servers use to access this Store. Max Length=255

string[] CachePath: Default Cache path(s) that the Servers use with this Store. If none are specified the caches will be placed in the WriteCache subdirectory of the Store path. Default=None

When Store is not passed, the parameters below are used:

One of these required

Guid Guid or StoreId: GUID of the Store to Set.

string Name or StoreName: Name of the Store to Set.

Optional field values to set:

string NewName: Name of the Store. Max Length=50

Guid SiteId: GUID of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteName can be used instead. Default=00000000-0000-0000-0000-00000000000

string SiteName: Name of the Site where Administrators of that Site can change this Store. Not used for Farm Stores. SiteId can be used instead. Default=""

string Description: User description. Default="" Max Length=250

string Path: Default directory path that the Servers use to access this Store. Max Length=255

string[] CachePath: Default Cache path(s) that the Servers use with this Store. If none are specified the caches will be placed in the WriteCache subdirectory of the Store path. Default=None

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsStore object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.
**EXAMPLE 1: Set PvsStore for Individual Fields**

Get the PvsStore into a $o variable. Change the $o field values and then Set the PvsStore with the result.

```
$o = Get-PvsStore -Name theStore -Fields CachePath
$o.CachePath = "\Network\CachePath"
Set-PvsStore $o
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 2: Set PvsStore for a Field Using Pipe**

Get the PvsStore into a $o variable. Change a $o field to the correct value and then Set the PvsStore with the result.

```
Get-PvsStore -Name theStore -Fields CachePath | foreach { $o = $_; $o.CachePath = "\Network\CachePath"; $o } | Set-PvsStore
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

---

**Set-PvsUpdateTask**

Set Update Task(s) changed values from PvsUpdateTask object(s), or set one or more field values for a PvsUpdateTask.

**Required**

- `PvsUpdateTask UpdateTask`: PvsUpdateTask object(s) with changed property value(s) to be set. The object(s) can come from a pipeline.

These values are in the PvsUpdateTask object, and only will be set if the value has changed.

- `string Name or UpdateTaskName`: Name of the Update Task. It is unique within the Site. Max Length=50

- `string Description`: User description. Default="" Max Length=250

- `bool Enabled`: True when it will be processed, false otherwise. Default=true

- `uint Hour`: The hour of the day to perform the task. Min=0, Max=23, Default=0

- `uint Minute`: The minute of the hour to perform the task. Min=0, Max=59, Default=0
uint Recurrence: The update will reoccur on this schedule. 0 = None, 1 = Daily, 2 = Every Weekday, 3 = Weekly, 4 = Monthly Date, 5 = Monthly Type. Min=0, Max=5, Default=0

uint DayMask: Days selected values. 1 = Monday, 2 = Tuesday, 4 = Wednesday, 8 = Thursday, 16 = Friday, 32 = Saturday, 64 = Sunday, 128 = Day. Default=0. This is used with Weekly and Monthly Type recurrence. Min=1, Max=255, Default=4

uint[] Date: Days of the month. Numbers from 1-31 are the only valid values. This is used with Monthly Date recurrence. Default="" Max Length=83

uint MonthlyOffset: When to happen monthly. 0 = None, 1 = First, 2 = Second, 3 = Third, 4 = Forth, 5 = Last. This is used with Monthly Type recurrence. Min=0, Max=5, Default=3

string EsdType: Esd to use. Valid values are SCCM or WSUS. If no value, a custom script is run on the client. Default="" Max Length=50

string PreUpdateScript: Script file to run before the update starts. Default="" Max Length=255

string PreVmScript: Script file to run before the VM is loaded. Default="" Max Length=255

string PostUpdateScript: Script file to run after the update finishes. Default="" Max Length=255

string PostVmScript: Script file to run after the VM is unloaded. Default="" Max Length=255

string Domain: Domain to add the Disk Update Device(s) to. If not included, the first Domain Controller found on the Server is used. Default="" Max Length=255

string OrganizationUnit: Organizational Unit to add the Disk Update Device(s) to. This parameter is optional. If it is not specified, the device is added to the built in Computers container. Child OUs should be delimited with forward slashes, e.g. "ParentOU/ChildOU". Special characters in an OU name, such as '"', '#', '+', ';', '<', '>', '=', must be escaped with a backslash. For example, an OU called "commaIn,TheMiddle" must be specified as "commaIn\,TheMiddle". The old syntax of delimiting child OUs with a comma is still supported, but deprecated. Note that in this case, the child OU comes first, e.g. "ChildOU,ParentOU". Default="" Max Length=255

uint PostUpdateApprove: Access to place the version in after the update has occurred. 0 = Production, 1 = Test, 2 = Maintenance. Min=0, Max=2, Default=0

When UpdateTask is not passed, the parameters below are used:
This required
Guid Guid or UpdateTaskId: GUID of the Update Task to Set.
or this required & resolution
string Name or UpdateTaskName: Name of the Update Task to Set.
One of these resolutions when needed
Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.
Optional field values to set:
string newName: Name of the Update Task. It is unique within the Site.  
Max Length=50
string Description: User description. Default="" Max Length=250
bool Enabled: True when it will be processed, false otherwise.  
Default=true
uint Hour: The hour of the day to perform the task. Min=0, Max=23,  
Default=0
uint Minute: The minute of the hour to perform the task. Min=0,  
Max=59, Default=0
uint Recurrence: The update will reoccur on this schedule. 0 = None, 1  
= Daily, 2 = Every Weekday, 3 = Weekly, 4 = Monthly  
Date, 5 = Monthly Type. Min=0, Max=5, Default=0
uint DayMask: Days selected values. 1 = Monday, 2 = Tuesday, 4 =  
Wednesday, 8 = Thursday, 16 = Friday, 32 = Saturday,  
64 = Sunday, 128 = Day. Default=0. This is used with  
Weekly and Monthly Type recurrence. Min=1, Max=255,  
Default=4
uint[] Date: Days of the month. Numbers from 1-31 are the only valid  
values. This is used with Monthly Date recurrence.  
Default="" Max Length=83
uint MonthlyOffset: When to happen monthly. 0 = None, 1 = First, 2 =  
Second, 3 = Third, 4 = Forth, 5 = Last. This is used  
with Monthly Type recurrence. Min=0, Max=5, Default=3
string EsdType: Esd to use. Valid values are SCCM or WSUS. If no  
value, a custom script is run on the client.  
Default="" Max Length=50
string PreUpdateScript: Script file to run before the update starts.  
Default="" Max Length=255
string PreVmScript: Script file to run before the VM is loaded.  
Default="" Max Length=255
string PostUpdateScript: Script file to run after the update finishes.  
Default="" Max Length=255
string PostVmScript: Script file to run after the VM is unloaded.  
Default="" Max Length=255
string Domain: Domain to add the Disk Update Device(s) to. If not included, the first Domain Controller found on the Server is used. Default="" Max Length=255

string OrganizationUnit: Organizational Unit to add the Disk Update Device(s) to. This parameter is optional. If it is not specified, the device is added to the built in Computers container. Child OU's should be delimited with forward slashes, e.g. "ParentOU/ChildOU". Special characters in an OU name, such as '"', '#', '+', ',', ';', '>', '=", must be escaped with a backslash. For example, an OU called "commaIn,TheMiddle" must be specified as "commaIn\,TheMiddle". The old syntax of delimiting child OU's with a comma is still supported, but deprecated. Note that in this case, the child OU comes first, e.g. "ChildOU,ParentOU". Default="" Max Length=255

uint PostUpdateApprove: Access to place the version in after the update has occurred. 0 = Production, 1 = Test, 2 = Maintenance. Min=0, Max=2, Default=0

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsUpdateTask object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsUpdateTask for Individual Fields

Get the PvsUpdateTask into a $o variable. Change the $o field values and then Set the PvsUpdateTask with the result.

$o = Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Fields Date, Recurrence

$o.Date = 1, 15
$o.Recurrence = 4

Set-PvsUpdateTask $o

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

EXAMPLE 2: Set PvsUpdateTask for a Field Using Pipe

Get the PvsUpdateTask into a $o variable. Change a $o field to the correct value and then Set the PvsUpdateTask with the result.
Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Fields
Recurrence | foreach { $o = $_; $o.Recurrence = 1; $o } | Set-PvsUpdateTask

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Set-PvsVirtualHostingPool

Set Virtual Hosting Pool(s) changed values from PvsVirtualHostingPool object(s), or set one or more field values for a PvsVirtualHostingPool.

Required

PvsVirtualHostingPool VirtualHostingPool: PvsVirtualHostingPool object(s) with changed property value(s) to be set. The object(s) can come from a pileline.

These values are in the PvsVirtualHostingPool object, and only will be set if the value has changed.

string Name or VirtualHostingPoolName: Name of the Virtual Hosting Pool. It is unique within the Site. Max Length=50

uint Type: Type of the Virtual Hosting Pool. 0 = Citrix XenServer, 1 = Microsoft SCVMM/Hyper-V, 2 = VMWare vSphere/ESX. Min=0, Max=2, Default=0

string Description: User description. Default="" Max Length=250

string Server: Name or IP of the Host Server. Max Length=255

uint Port: Port of the Host Server. Min=80, Max=65534, Default=80

string Datacenter: Datacenter of the Virtual Hosting Pool. Default="" Max Length=250

uint UpdateLimit: Number of updates at the same time. Min=2, Max=1000, Default=1000

uint UpdateTimeout: Timeout for updates. Min=2, Max=240, Default=60

uint ShutdownTimeout: Timeout for shutdown. Min=2, Max=30, Default=10

string UserName: Name to use when logging into the Server.

string Password: Password to use when logging into the Server.

When VirtualHostingPool is not passed, the parameters below are used:

This required

Guid Guid or VirtualHostingPoolId: GUID of the Virtual Hosting Pool to Set.

or this required & resolution

315
string Name or VirtualHostingPoolName: Name of the Virtual Hosting Pool to Set.

One of these resolutions when needed

Guid SiteId: GUID of the Site.

string SiteName: Name of the Site.

Optional field values to set:

string NewName: Name of the Virtual Hosting Pool. It is unique within the Site. Max Length=50

uint Type: Type of the Virtual Hosting Pool. 0 = Citrix XenServer, 1 = Microsoft SCVMM/Hyper-V, 2 = VMWare vSphere/ESX. Min=0, Max=2, Default=0

string Description: User description. Default="" Max Length=250

string Server: Name or IP of the Host Server. Max Length=255

uint Port: Port of the Host Server. Min=80, Max=65534, Default=80

string Datacenter: Datacenter of the Virtual Hosting Pool. Default="" Max Length=250

uint UpdateLimit: Number of updates at the same time. Min=2, Max=1000, Default=1000

uint UpdateTimeout: Timeout for updates. Min=2, Max=240, Default=60

uint ShutdownTimeout: Timeout for shutdown. Min=2, Max=30, Default=10

string UserName: Name to use when logging into the Server.

string Password: Password to use when logging into the Server.

Optional

SwitchParameter PassThru: If -PassThru is specified, the resulting PvsVirtualHostingPool object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Set PvsVirtualHostingPool for Individual Fields

Get the PvsVirtualHostingPool into a $o variable. Change the $o field values and then Set the PvsVirtualHostingPool with the result.

$o = Get-PvsVirtualHostingPool -Name theVirtualHostingPool -SiteName theSite -Fields Port

$o.Port = 180

Set-PvsVirtualHostingPool $o
The `-Fields` parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 2: Set PvsVirtualHostingPool for a Field Using Pipe**

Get the PvsVirtualHostingPool into a `$o` variable. Change a `$o` field to the correct value and then Set the PvsVirtualHostingPool with the result.

Get-PvsVirtualHostingPool -Name theVirtualHostingPool -SiteName theSite -Fields Port | foreach { $o = $_; $o.Port = 180; $o } | Set-PvsVirtualHostingPool

The `-Fields` parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o}" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

**Set-PvsXDSite**

Set XDSite(s) changed values from PvsXDSite object(s), or set one or more field values for a PvsXDSite.

**Required**

PvsXDSite XDSite: PvsXDSite object(s) with changed property value(s) to be set. The object(s) can come from a pipeline.

These values are in the PvsXDSite object, and only will be set if the value has changed.

string[] ConfigServices: XenDesktop Server addresses. Max Length=2000

When XDSite is not passed, the parameters below are used:

This required

Guid Guid or XdSiteId: GUID of the XenDesktop Site to Set.

Optional field values to set:

string[] ConfigServices: XenDesktop Server addresses. Max Length=2000

Optional

SwitchParameter PassThru: If `-PassThru` is specified, the resulting PvsXDSite object(s) are returned.

SwitchParameter Confirm: The impact of this operation is "low". If `-Confirm` is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.
EXAMPLE 1: Set PvsXDSite for Individual Fields

Get the PvsXDSite into a $o variable. Change the $o field values and then set the PvsXDSite with the result.

```
$o = Get-PvsXDSite -Guid "27965b92-7034-408c-9910-cfff53f1feec" -Fields ConfigServices
```

```
$o.ConfigServices = "192.168.0.190", "192.168.0.191"
```

```
Set-PvsXDSite $o
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 2: Set PvsXDSite for a Field Using Pipe

Get the PvsXDSite into a $o variable. Change a $o field to the correct value and then set the PvsXDSite with the result.

```
Get-PvsXDSite -Guid "27965b92-7034-408c-9910-cfff53f1feec" -Fields ConfigServices | foreach { $o = $_; $o.ConfigServices = "192.168.0.190", "192.168.0.191"; $o } | Set-PvsXDSite
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

The "foreach { $o = $_; $o.X = Y; $o }" sets the field X to value Y and returns the object again so it can be piped to the Set command for update.

Start-PvsAutoUpdate

Apply Auto Update for a Server or all Servers in a Site.

One of these required

Guid[] Guid or ServerId: GUID of the Server to apply Auto Update.

string[] Name or ServerName: Name of the Server to apply Auto Update.

Guid[] SiteId: GUID of the Site to apply Auto Update on all Servers.

string[] SiteName: Name of the Site to apply Auto Update on all Servers.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

ServerId or SiteId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.
EXAMPLE 1: Start-PvsAutoUpdate for Name
Start-PvsAutoUpdate -Name theServer

EXAMPLE 2: Start-PvsAutoUpdate for PvsServer Using Pipe
The Get-PvsServer output is piped to the Start-PvsAutoUpdate.
Get-PvsServer -Name theServer -Fields -ServerId | Start-PvsAutoUpdate
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 3: Start-PvsAutoUpdate for SiteName
Start-PvsAutoUpdate -SiteName theSite

EXAMPLE 4: Start-PvsAutoUpdate for PvsSite Using Pipe
The Get-PvsSite output is piped to the Start-PvsAutoUpdate.
Get-PvsSite -SiteName theSite -Fields -SiteId | Start-PvsAutoUpdate
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Start-PvsCreateDisk
Create a Disk and the Disk Locator for it. Returns the PvsDiskLocator created if finished. If not returned, then call CreateDiskStatus to get the PvsDiskLocator when processing finishes.

This required

string Name: Name of the Disk file to be created.
This required

UInt64 Size: Size of the disk in Megabytes for a fixed size disk. Maximum size in Megabytes for a dynamically sized disk. Min=1, VHD Max=2088960, VHDX Max=67108864

One of these required

Guid StoreId: GUID of the Store that the Disk will be a member of.
string StoreName: Name of the Store that the Disk will be a member of.
One of these required

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.
One of these optional

Guid ServerId: GUID of the only Server for this Disk.
string ServerName: Name of the only Server for this Disk.
Optional
string Description: Description of the Disk that will be placed in the Disk Locator.

SwitchParameter CreateDiskDisabled: If -CreateDiskDisabled is specified, the Disk will be created disabled. It is created Enabled by default.

SwitchParameter VHDX: If -VHDX is specified, VHDX will be used for the format of the image. VHDX has a Block size of 32 MB. VHD is the default.

SwitchParameter Dynamic: If -Dynamic is specified, a dynamic VHD that will be created. The default is fixed.

uint VhdBlockSize: Block size in KB. For VHD it is only used with Dynamic type. Tested sizes for VHD are 512, 2048, and 16384. VHD Min=512, Max=16384, Default=2048. For VHDX it is used for all types. Tested size for VHDX is 32768. VHDX Min=1024, Max=262144, Default=32768.

uint LogicalSectorSize: Only used with VHDX format. Logical Sector Size. Values are: 512, 4096, Default=512

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

    StoreId, SiteId or ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsDiskLocator: If the create is already finished and successful, the PvsDiskLocator is returned.

**EXAMPLE 1: Start-PvsCreateDisk for VHDX to PvsDiskLocator**

This example creates a Dynamic VHDX Disk that has a size of 20 GB.

```powershell
$thePvsDiskLocator = Start-PvsCreateDisk -Name theDiskName -Size 20480 -StoreName theStore -SiteName theSite -VHDX -Dynamic
while ($thePvsDiskLocator -eq $null)      # while the create is processing
{

    %percentFinished = Get-PvsCreateDiskStatus -Name theDiskName -StoreName theStore     # get percent finished or DiskLocator when done

    if (%percentFinished.GetType().Name == "PvsDiskLocator")
    {
        $thePvsDiskLocator = %percentFinished
    }
}
```

320
else
{
    %percentFinished.ToString() + "% finished"  # display percent finished

    Start-Sleep -seconds 10  # wait 10 seconds more
}

"Successful"

**EXAMPLE 2: Start-PvsCreateDisk for VHD to PvsDiskLocator**

This example creates a Fixed VHD Disk that has a size of 20 GB.

```powershell
$thePvsDiskLocator = Start-PvsCreateDisk -Name theDiskName -Size 20480 -StoreName theStore -SiteName theSite
while ($thePvsDiskLocator -eq $null)  # while the create is processing
{
    %percentFinished = Get-PvsCreateDiskStatus -Name theDiskName -StoreName theStore  # get percent finished or DiskLocator when done
    if (%percentFinished.GetType().Name == "PvsDiskLocator")
    {
        $thePvsDiskLocator = %percentFinished
    }
    else
    {
        %percentFinished.ToString() + "% finished"  # display percent finished
        Start-Sleep -seconds 10  # wait 10 seconds more
    }
}

"Successful"
```

**Start-PvsDeviceBoot**

Boot a Device, Collection or View. Returns a PvsTask of the Task being run. With the PvsTask, call Get-PvsTaskStatus to get the percent complete, Get-PvsTask to get the results, and Stop-PvsTask to stop it early. The PvsTask Results has the DeviceName/value of the devices that succeeded in the first name/value pair of each record of the XML.

One of these required
Guid[] Guid or DeviceId: GUID of the Device to Boot.
string[] Name or DeviceName: Name of the Device to Boot.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Boot.
Guid CollectionId: GUID of the Collection to Boot all Devices.
Guid SiteViewId: GUID of the Site View to Boot all Devices.
Guid FarmViewId: GUID of the Farm View to Boot all Devices.
string FarmViewName: Name of the Farm View to Boot all Devices.

or one of these required & resolutions

string CollectionName: Name of the Collection to Boot all Devices.
string SiteViewName: Name of the Site View to Boot all Devices.

One of these resolutions when needed

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

    DeviceName, CollectionId, SiteViewId or FarmViewId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -
    Confirm is specified, the operation will be
    confirmed. $ConfirmPreference can be set to "low" to
    have confirmation without the Confirm parameter.

PvsTask: If successful, the PvsTask object for the process started is
    returned.

**EXAMPLE 1: Start-PvsDeviceBoot for DeviceName to PvsTask**

```powershell
$thePvsTask = Start-PvsDeviceBoot -DeviceName theDevice # start the task
while ($thePvsTask.State -eq 0) # while the task is processing
{
    %percentFinished = Get-PvsTaskStatus -Object $thePvsTask # get percent finished
    %percentFinished.ToString() + "% finished" # display percent finished
    Start-Sleep -seconds 10 # wait 10 seconds more
    $thePvsTask = Get-PvsTask -Object $thePvsTask # get the current PvsTask object
}
```
if ($thePvsTask.State -eq 2)  # check
to see if completed
{
    "Successful"
}
else
{
    "Cancelled"
}

**EXAMPLE 2: Start-PvsDeviceBoot for DeviceMac**

Start-PvsDeviceBoot -DeviceMac "00-11-22-33-44-55"

**EXAMPLE 3: Start-PvsDeviceBoot for FarmViewName**

Start-PvsDeviceBoot -FarmViewName theFarmView

**EXAMPLE 4: Start-PvsDeviceBoot for CollectionName**

Start-PvsDeviceBoot -CollectionName theCollection -SiteName theSite
CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 5: Start-PvsDeviceBoot for SiteViewName**

Start-PvsDeviceBoot -SiteViewName theSiteView -SiteName theSite
SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**Start-PvsDeviceReboot**

Reboot a Device, Collection or View. Returns a PvsTask of the Task being run. With the PvsTask, call Get-PvsTaskStatus to get the percent complete, Get-PvsTask to get the results, and Stop-PvsTask to stop it early. The PvsTask Results has the DeviceName/value of the devices that succeeded in the first name/value pair of each record of the XML.

One of these required

- Guid[] Guid or DeviceId: GUID of the Device to Reboot.
- string[] Name or DeviceName: Name of the Device to Reboot.
- PvsPhysicalAddress[] DeviceMac: MAC of the Device to Reboot.
- Guid CollectionId: GUID of the Collection to Reboot all Devices.
- Guid SiteViewId: GUID of the Site View to Reboot all Devices.
- Guid FarmViewId: GUID of the Farm View to Reboot all Devices.
- string FarmViewName: Name of the Farm View to Reboot all Devices.
- Guid DiskLocatorId: GUID of the DiskLocator to Reboot all Devices.

or one of these required & resolutions
string CollectionName: Name of the Collection to Reboot all Devices.
string SiteViewName: Name of the Site View to Reboot all Devices.
string DiskLocatorName: Name of the DiskLocator to Reboot all Devices.

Optional

string Message: Message to display before rebooting the Device(s).
    Default=The target device is being shutdown remotely by the Console.

uint Delay: Number of seconds to delay before rebooting the Device(s).
    Default=10

uint Version: Version of the Disk to Reboot all Devices for. This is used with DiskLocatorId or DiskLocatorName.

One of these resolutions when needed

Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.

One of these resolutions when needed

Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:
    DeviceName, CollectionId, SiteViewId, FarmViewId or DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

PvsTask: If successful, the PvsTask object for the process started is returned.

EXAMPLE 1: Start-PvsDeviceReboot for DeviceName to PvsTask

$thePvsTask = Start-PvsDeviceReboot -DeviceName theDevice # start the task
while ($thePvsTask.State -eq 0) # while the task is processing
{
    %percentFinished = Get-PvsTaskStatus -Object $thePvsTask # get percent finished
    %percentFinished.ToString() + "% finished" # display percent finished
Start-Sleep -seconds 10
10 seconds more

$thePvsTask = Get-PvsTask -Object $thePvsTask
the current PvsTask object

} if ($thePvsTask.State -eq 2) # check
to see if completed

{"Successful"
)
else
{
"Cancelled"
}

EXAMPLE 2: Start-PvsDeviceReboot for DeviceMac
Start-PvsDeviceReboot -DeviceMac "00-11-22-33-44-55"

EXAMPLE 3: Start-PvsDeviceReboot for FarmViewName
Start-PvsDeviceReboot -FarmViewName theFarmView

EXAMPLE 4: Start-PvsDeviceReboot for CollectionName
Start-PvsDeviceReboot -CollectionName theCollection -SiteName theSite
CollectionId can be used instead of CollectionName so that the
SiteName or SiteId is not also needed.

EXAMPLE 5: Start-PvsDeviceReboot for SiteViewName
Start-PvsDeviceReboot -SiteViewName theSiteView -SiteName theSite
SiteViewId can be used instead of SiteViewName so that the SiteName or
SiteId is not also needed.

Start-PvsDeviceShutdown

Shutdown a Device, Collection or View. Returns a PvsTask of the Task being
run. With the PvsTask, call Get-PvsTaskStatus to get the percent
complete, Get-PvsTask to get the results, and Stop-PvsTask to stop it
early. The PvsTask Results has the DeviceName/value of the devices that
succeeded in the first name/value pair of each record of the XML.

One of these required
Guid[] Guid or DeviceId: GUID of the Device to Shutdown.
string[] Name or DeviceName: Name of the Device to Shutdown.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to Shutdown.
Guid CollectionId: GUID of the Collection to Shutdown all Devices.
Guid SiteViewId: GUID of the Site View to Shutdown all Devices.
Guid FarmViewId: GUID of the Farm View to Shutdown all Devices.
string FarmViewName: Name of the Farm View to Shutdown all Devices.
Guid DiskLocatorId: GUID of the DiskLocator to Shutdown all Devices.
or one of these required & resolutions
string CollectionName: Name of the Collection to Shutdown all Devices.
string SiteViewName: Name of the Site View to Shutdown all Devices.
string DiskLocatorName: Name of the DiskLocator to Shutdown all Devices.
Optional
string Message: Message to display before shutting down the Device(s).
  Default=The target device is being shutdown remotely by the Console.
uint Delay: Number of seconds to delay before shutting down the Device(s). Default=10
uint Version: Version of the Disk to Shutdown all Devices for. This is used with DiskLocatorId or DiskLocatorName.
One of these resolutions when needed
Guid SiteId: GUID of the Site.
string SiteName: Name of the Site.
One of these resolutions when needed
Guid StoreId: GUID of the Store that is needed when a DiskLocatorName is used.
string StoreName: Name of the Store that is needed when a DiskLocatorName is used.
Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
  DeviceName, CollectionId, SiteViewId, FarmViewId or DiskLocatorId
Optional
SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.
PvsTask: If successful, the PvsTask object for the process started is returned.

EXAMPLE 1: Start-PvsDeviceShutdown for DeviceName to PvsTask
$thePvsTask = Start-PvsDeviceShutdown -DeviceName theDevice
  start the task
while ($thePvsTask.State -eq 0) # while the task is processing
{
    %percentFinished = Get-PvsTaskStatus -Object $thePvsTask # get percent finished
    %percentFinished.ToString() + "% finished" # display percent finished
    Start-Sleep -seconds 10 # wait 10 seconds more
    $thePvsTask = Get-PvsTask -Object $thePvsTask # get the current PvsTask object
}
if ($thePvsTask.State -eq 2) # check to see if completed
{
    "Successful"
}
else
{
    "Cancelled"
}

EXAMPLE 2: Start-PvsDeviceShutdown for DeviceMac
    Start-PvsDeviceShutdown -DeviceMac "00-11-22-33-44-55"

EXAMPLE 3: Start-PvsDeviceShutdown for FarmViewName
    Start-PvsDeviceShutdown -FarmViewName theFarmView

EXAMPLE 4: Start-PvsDeviceShutdown for CollectionName
    Start-PvsDeviceShutdown -CollectionName theCollection
        -SiteName theSite
    CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 5: Start-PvsDeviceShutdown for SiteViewName
    Start-PvsDeviceShutdown -SiteViewName theSiteView
        -SiteName theSite
    SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

Start-PvsDisplayMessage

Display a message on a Device, Collection or View. Returns a PvsTask of the Task being run. With the PvsTask, call Get-PvsTaskStatus to get the percent complete, Get-PvsTask to get the results, and Stop-PvsTask to
stop it early. The PvsTask Results has the DeviceName/value of the devices that succeeded in the first name/value pair of each record of the XML.

This required

  string Message: Message to display on the Device(s).

One of these required

  Guid[] DeviceId: GUID of the Device to Display a Message.
  string[] DeviceName: Name of the Device to Display a Message.
  PvsPhysicalAddress[] DeviceMac: MAC of the Device to Display a Message.

  Guid CollectionId: GUID of the Collection to Display a Message on all Devices.
  Guid SiteViewId: GUID of the Site View to Display a Message all Devices.
  Guid FarmViewId: GUID of the Farm View to Display a Message on all Devices.
  string FarmViewName: Name of the Farm View to Display a Message on all Devices.

or one of these required & resolutions

  string CollectionName: Name of the Collection to Display a Message on all Devices.
  string SiteViewName: Name of the Site View to Display a Message on all Devices.

One of these resolutions when needed

  Guid SiteId: GUID of the Site.
  string SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

  PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

    DeviceName, CollectionId, SiteViewId or FarmViewId

Optional

  SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

PvsTask: If successful, the PvsTask object for the process started is returned.

**EXAMPLE 1: Start-PvsDisplayMessage for DeviceName to PvsTask**

```powershell
$thePvsTask = Start-PvsDisplayMessage -DeviceName theDevice -Message "message" # start the task
```
while ($thePvsTask.State -eq 0)  # while the task is processing
{
    %percentFinished = Get-PvsTaskStatus -Object $thePvsTask  # get percent finished
    %percentFinished.ToString() + "% finished"  # display percent finished
    Start-Sleep -seconds 10  # wait
    10 seconds more
    $thePvsTask = Get-PvsTask -Object $thePvsTask  # get the current PvsTask object
}
if ($thePvsTask.State -eq 2)  # check to see if completed
{
    "Successful"
}
else
{
    "Cancelled"
}

**EXAMPLE 2: Start-PvsDisplayMessage for DeviceMac**

Start-PvsDisplayMessage -DeviceMac "00-11-22-33-44-55" -Message "message"

**EXAMPLE 3: Start-PvsDisplayMessage for FarmViewName**

Start-PvsDisplayMessage -FarmViewName theFarmView -Message "message"

**EXAMPLE 4: Start-PvsDisplayMessage for CollectionName**

Start-PvsDisplayMessage -CollectionName theCollection -SiteName theSite -Message "message"
CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

**EXAMPLE 5: Start-PvsDisplayMessage for SiteViewName**

Start-PvsDisplayMessage -SiteViewName theSiteView -SiteName theSite -Message "message"
SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**Start-PvsStreamService**

Start the Stream Service on a Server or all Servers in a Site.
One of these required
Guid[] Guid or ServerId: GUID of the Server to start the Stream Service.
string[] Name or ServerName: Name of the Server to start the Stream Service.
Guid[] SiteId: GUID of the Site to start the Stream Service on all Servers.
string[] SiteName: Name of the Site to start the Stream Service on all Servers.

Instead of a parameter that matches one of the members listed
PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

ServerId or SiteId

Optional
SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Start-PvsStreamService for Name
Start-PvsStreamService -Name theServer

EXAMPLE 2: Start-PvsStreamService for PvsServer Using Pipe
The Get-PvsServer output is piped to the Start-PvsStreamService.
Get-PvsServer -Name theServer -Fields Guid | Start-PvsStreamService
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 3: Start-PvsStreamService for SiteName
Start-PvsStreamService -SiteName theSite

EXAMPLE 4: Start-PvsStreamService for PvsSite Using Pipe
The Get-PvsSite output is piped to the Start-PvsStreamService.
Get-PvsSite -Name theSite -Fields Guid | Start-PvsStreamService
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Start-PvsUpdateTask
Starts an Update Task.

This required
Guid[] Guid or UpdateTaskId: GUID of the Update Task to Start.
or this required & resolution

string[] Name or UpdateTaskName: Name of the Update Task to Start.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:

UpdateTaskId

Optional

 SwitchParameter Confirm: The impact of this operation is "low". If -
Confirm is specified, the operation will be
confirmed. $ConfirmPreference can be set to "low" to
have confirmation without the Confirm parameter.

EXAMPLE 1: Start-PvsUpdateTask for Name

Start-PvsUpdateTask -Name theUpdateTask -SiteName theSite

Guid can be used instead of Name so that the SiteName or SiteId is not
also needed.

EXAMPLE 2: Start-PvsUpdateTask for PvsUpdateTask Using Pipe

The Get-PvsUpdateTask output is piped to the Start-PvsUpdateTask.

Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Fields Guid |
Start-PvsUpdateTask

The -Fields parameter with only the needed fields specified makes the
Get work faster because only those fields are
retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not
also needed.

Stop-PvsCreateDisk

Cancel an active CreateDisk.

This required

 string[] Name: Name of the Disk file that is being created.

One of these required

 Guid[] StoreId: GUID of the Store that the Disk will be a member of.

string[] StoreName: Name of the Store that the Disk will be a member of.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as
the Object parameter or from a pileline:
StoreId
Optional
SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Stop-PvsCreateDisk for Name
Stop-PvsCreateDisk -Name theDiskFile -StoreName theStor

EXAMPLE 2: Stop-PvsCreateDisk for PvsStore Using Pipe
    Get-PvsStore -Name theStore -Fields Guid | Stop-PvsCreateDisk -Name theDiskFile
    The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Stop-PvsStreamService
Stop the Stream Service on a Server or all Servers in a Site.
    One of these required
    Guid[] Guid or ServerId: GUID of the Server to stop the Stream Service.
    string[] Name or ServerName: Name of the Server to stop the Stream Service.
    Guid[] SiteId: GUID of the Site to stop the Stream Service on all Servers.
    string[] SiteName: Name of the Site to stop the Stream Service on all Servers.
    Instead of a parameter that matches one of the members listed
    PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:
        ServerId or SiteId
    SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Stop-PvsStreamService for Name
Stop-PvsStreamService -Name theServer
**EXAMPLE 2: Stop-PvsStreamService for PvsServer Using Pipe**

The Get-PvsServer output is piped to the Stop-PvsStreamService.

Get-PvsServer -Name theServer -Fields Guid | Stop-PvsStreamService

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Stop-PvsStreamService for SiteName**

Stop-PvsStreamService -SiteName theSite

**EXAMPLE 4: Stop-PvsStreamService for PvsSite Using Pipe**

The Get-PvsSite output is piped to the Stop-PvsStreamService.

Get-PvsSite -Name theSite -Fields Guid | Stop-PvsStreamService

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**Stop-PvsTask**

Cancel a running Task.

This required

- uint TaskId: Id of the Task to Cancel.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

  TaskId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Stop-PvsTask for TaskId**

Stop-PvsTask -TaskId 101

**Stop-PvsUpdateTask**

Cancel an active Update Task for an Update Device.

This required

- Guid[] Guid or UpdateTaskId: GUID of the Update Task to Cancel.

or this required & resolution

- string[] Name or UpdateTaskName: Name of the Update Task to Cancel.

One of these required
Guid[] DeviceId: GUID of a specific Update Device to Cancel an Update Task for.

string[] DeviceName: Name of a specific Update Device to Cancel an Update Task for.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

UpdateTaskId or DeviceId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Stop-PvsUpdateTask for Name

Stop-PvsUpdateTask -Name theUpdateTask -DeviceName theDevice

EXAMPLE 2: Stop-PvsUpdateTask for PvsUpdateTask Using Pipe

The Get-PvsUpdateTask output is piped to the Stop-PvsUpdateTask.

Get-PvsUpdateTask -Name theUpdateTask -SiteName theSite -Fields Guid | Stop-PvsUpdateTask -DeviceName theDevice

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

EXAMPLE 3: Stop-PvsUpdateTask for PvsDiskUpdateDevice Using Pipe

The Get-PvsDiskUpdateDevice output is piped to the Stop-PvsUpdateTask.

Get-PvsDiskUpdateDevice -Name theDevice -Fields Guid | Stop-PvsUpdateTask -Name theUpdateTask

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Test-PvsDirectory

Validate a Directory on the Server specified.

One of these required

Guid[] Guid or ServerId: GUID of the Server to validate a Directory on.
string[] Name or ServerName: Name of the Server to validate a Directory on.

This required

string[] Path: Path of the Directory to validate.

This optional

SwitchParameter ReadOnly: If -ReadOnly is specified, the directory should be validated for a managed read-only store.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

ServerId

Optional

SwitchParameter Confirm: The impact of this operation is "low". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1: Test-PvsDirectory for Name**

```
Test-PvsDirectory -Name theServer -Path "C:\directory\subdirectory"
```

**EXAMPLE 2: Test-PvsDirectory for PvsServer Using Pipe**

```
The Get-PvsServer output is piped to the Test-PvsDirectory.
Get-PvsServer -Name theServer -Fields Guid | Test-PvsDirectory -Path "C:\directory\subdirectory"
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 3: Test-PvsDirectory for Name with ReadOnly**

```
Test-PvsDirectory -Name theServer -Path "C:\directory\subdirectory" -ReadOnly
```

**EXAMPLE 4: Test-PvsDirectory for PvsServer Using Pipe**

```
The Get-PvsServer output is piped to the Test-PvsDirectory.
Get-PvsServer -Name theServer -Fields Guid | Test-PvsDirectory -Path "C:\directory\subdirectory" -ReadOnly
```

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**Unlock-PvsAllDisk**

Remove all locks for a Disk.

This required
Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to remove all locks for the Disk.

or this required & resolution

string[] Name or DiskLocatorName: Name of Disk Locator to remove all locks for the Disk.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

   DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Unlock-PvsAllDisk for Name

Unlock-PvsAllDisk -Name $theDiskLocator -SiteName $theSite -StoreName $theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 2: Unlock-PvsAllDisk for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Unlock-PvsAllDisk.

Get-PvsDiskLocator -Name $theDiskLocator -SiteName $theSite -StoreName $theStore -Fields Guid | Unlock-PvsAllDisk

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

Unlock-PvsDisk

Remove lock for the Disk.

This required
Guid[] Guid or DiskLocatorId: GUID of the Disk Locator to remove a lock for the Disk.

or this required & resolution

string[] Name or DiskLocatorName: Name of the Disk Locator to remove a lock for the Disk.

Optional

Guid[] OwnerId: GUID of the Owner of the Disk Lock.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site.

string[] SiteName: Name of the Site.

One of these resolutions when needed

Guid[] StoreId: GUID of the Store that is needed when a DiskLocatorName is used.

string[] StoreName: Name of the Store that is needed when a DiskLocatorName is used.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pileline:

DiskLocatorId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

EXAMPLE 1: Unlock-PvsDisk for Name

Unlock-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName theStore

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 2: Unlock-PvsDisk for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Unlock-PvsDisk.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Unlock-PvsDisk

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.
EXAMPLE 3: Unlock-PvsDisk for Name with OwnerId

Unlock-PvsDisk -Name theDiskLocator -SiteName theSite -StoreName theStore -OwnerId = "e6c9884e-067c-4924-a581-312c699b4bb6"

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

EXAMPLE 4: Unlock-PvsDisk for PvsDiskLocator Using Pipe

The Get-PvsDiskLocator output is piped to the Unlock-PvsDisk.

Get-PvsDiskLocator -Name theDiskLocator -SiteName theSite -StoreName theStore -Fields Guid | Unlock-PvsDisk -OwnerId = "e6c9884e-067c-4924-a581-312c699b4bb6"

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId and StoreName or StoreId are not also needed.

Update-PvsBootPartitionBDM

Update the bootstrap for Virtual Machine Devices. The Devices that are not active can only be updated.

One of these optional

Guid[] Guid or DeviceId: GUID of the Device to update the bootstrap.
string[] Name or DeviceName: Name of the Device to update the bootstrap.
PvsPhysicalAddress[] DeviceMac: MAC of the Device to update the bootstrap.
Guid[] CollectionId: GUID of the Collection to update the bootstrap for all Devices in it.
Guid[] ServerId: GUID of the Server to update the bootstrap for all Devices it supports.
string[] ServerName: Name of the Server to update the bootstrap for all Devices it supports.
Guid[] SiteViewId: GUID of the Site View to update the bootstrap for all Devices in it.
Guid[] FarmViewId: GUID of the Farm View to update the bootstrap for all Devices in it.
string[] FarmViewName: Name of the Farm View to update the bootstrap for all Devices in it.
Guid[] SiteId: GUID of the Site to update the bootstrap for all Devices in it.
string[] SiteName: Name of the Site to update the bootstrap for all Devices in it.
or one of these optional & resolutions

string[] CollectionName: Name of the Collection to update the bootstrap for all Devices in it.

string[] SiteViewName: Name of the Site View to update the bootstrap for all Devices in it.

One of these resolutions when needed

Guid[] SiteId: GUID of the Site to update the bootstrap for all Devices in it.

string[] SiteName: Name of the Site to update the bootstrap for all Devices in it.

Instead of a parameter that matches one of the members listed

PvsObject[] Object: PvsObjects with the members below can be used as the Object parameter or from a pipeline:

  DeviceId, CollectionId, ServerId, SiteViewId, FarmViewId or SiteId

Optional

SwitchParameter Confirm: The impact of this operation is "medium". If -Confirm is specified, the operation will be confirmed. $ConfirmPreference can be set to "medium" or "low" to have confirmation without the Confirm parameter.

**EXAMPLE 1:** Update-PvsBootPartitionBDM for PvsFarm

Update-PvsBootPartitionBDM

**EXAMPLE 2:** Update-PvsBootPartitionBDM for SiteName

Update-PvsBootPartitionBDM -SiteName theSite

**EXAMPLE 3:** Update-PvsBootPartitionBDM for PvsSite Using Pipe

The Get-PvsSite output is piped to the Update-PvsBootPartitionBDM.

Get-PvsSite -Name theSite -Fields Guid | Update-PvsBootPartitionBDM

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

**EXAMPLE 4:** Update-PvsBootPartitionBDM for ServerName

Update-PvsBootPartitionBDM -ServerName theServer

**EXAMPLE 5:** Update-PvsBootPartitionBDM for PvsServer Using Pipe

The Get-PvsServer output is piped to the Update-PvsBootPartitionBDM.

Get-PvsServer -Name theServer -Fields Guid | Update-PvsBootPartitionBDM

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.
EXAMPLE 6: Update-PvsBootPartitionBDM for Name
Update-PvsBootPartitionBDM -Name theDevice

EXAMPLE 7: Update-PvsBootPartitionBDM for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Update-PvsBootPartitionBDM.
Get-PvsDevice -Name theDevice -Fields Guid | Update-PvsBootPartitionBDM
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 8: Update-PvsBootPartitionBDM for DeviceMac
Update-PvsBootPartitionBDM -DeviceMac "00-11-22-33-44-55"

EXAMPLE 9: Update-PvsBootPartitionBDM for PvsDevice Using Pipe
The Get-PvsDevice output is piped to the Update-PvsBootPartitionBDM.
Get-PvsDevice -DeviceMac "00-11-22-33-44-55" -Fields Guid | Update-PvsBootPartitionBDM
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 10: Update-PvsBootPartitionBDM for FarmViewName
Update-PvsBootPartitionBDM -FarmViewName theFarmView

EXAMPLE 11: Update-PvsBootPartitionBDM for PvsFarmView Using Pipe
The Get-PvsFarmView output is piped to the Update-PvsBootPartitionBDM.
Get-PvsFarmView -Name theFarmView -Fields Guid | Update-PvsBootPartitionBDM
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

EXAMPLE 12: Update-PvsBootPartitionBDM for CollectionName
Update-PvsBootPartitionBDM -CollectionName theCollection -SiteName theSite
CollectionId can be used instead of CollectionName so that the SiteName or SiteId is not also needed.

EXAMPLE 13: Update-PvsBootPartitionBDM for PvsCollection Using Pipe
The Get-PvsCollection output is piped to the Update-PvsBootPartitionBDM.
Get-PvsCollection -Name theCollection -SiteName theSite -Fields Guid | Update-PvsBootPartitionBDM
The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**EXAMPLE 14: Update-PvsBootPartitionBDM for SiteViewName**

Update-PvsBootPartitionBDM -SiteViewName theSiteView -SiteName theSite
SiteViewId can be used instead of SiteViewName so that the SiteName or SiteId is not also needed.

**EXAMPLE 15: Update-PvsBootPartitionBDM for PvsSiteView Using Pipe**

The Get-PvsSiteView output is piped to the Update-PvsBootPartitionBDM.

Get-PvsSiteView -Name theSiteView -SiteName theSite -Fields Guid | Update-PvsBootPartitionBDM

The -Fields parameter with only the needed fields specified makes the Get work faster because only those fields are retrieved.

Guid can be used instead of Name so that the SiteName or SiteId is not also needed.

**Update-PvsInventory**

Force the Inventory service to refresh its Inventory Table.

**EXAMPLE 1: Update-PvsInventory**

Update-PvsInventory
