

Workspace Environment Management 4.1

Dec 07, 2016

Citrix Workspace Environment Management uses intelligent resource management and user profile management technologies to deliver the best possible performance, desktop logon and application response times for XenApp and XenDesktop deployments. It is a software-only, driver-free solution.

What's new

- **Transformer module re-enabled.** The Transformer module is available in the Administration Console. Transformer allows you to configure your physical machines to operate a locked-down thin client version of Windows.
- **Agent Host enhancements.** Improvements to the Agent Host remove the communication between the WEM Broker Service and Agent Host executable. All communication now occurs between the WEM Broker Service and Agent Host Service, which then passes its instructions down to the Agent Host executable. This includes local cache access.
- **Documentation on docs.citrix.com.** Workspace Environment Management 4.1 documentation is now available from docs.citrix.com. These PDFs are no longer included in the download. Filter conditions are now documented in the Administration Guide.
