- <https-port> is the port number for HTTPS traffic.

> **Note:**
>
> After changing a port, Studio might display a message about license compatibility and upgrading. To resolve the issue, re-register service instances using the following PowerShell cmdlet sequence:

```
Get-ConfigRegisteredServiceInstance -ServiceType Broker -Binding
    XML_HTTPS |
Unregister-ConfigRegisteredServiceInstance
Get-BrokerServiceInstance | where Binding -eq "XML_HTTPS" |
Register-ConfigServiceInstance
```

Enable TLS on Web Studio and Director

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

We recommend always using TLS to secure connections to Web Studio and Director by enabling HTTPS. This article explains how to configure Web Studio and Director to use a trusted certificate and ensure secure access over HTTPS.

Default behavior

When you install Web Studio, the installer creates a self-signed certificate and binds it to port 443 on the current server. You can access Web Studio and Director from a web browser over HTTPS on the local server.

However, if you try to access Web Studio or Director from another machine over HTTPS, the browser shows a security error because it doesn't trust the certificate.

> **Note:**
>
> If you install Director without Web Studio, the installer doesn't create a self-signed certificate.

Enable secure access over HTTPS

To allow access to Web Studio or Director over HTTPS from machines other than the Web Studio server, follow these steps:

1. Create or import a trusted certificate.
2. Bind the certificate to port 443 in IIS.
3. (Optional) Enable HTTP Strict Transport Security (HSTS).
4. If Web Studio isn't configured as a proxy (client machines connect to both Web Studio and the Delivery Controllers), enable TLS on Delivery Controllers.

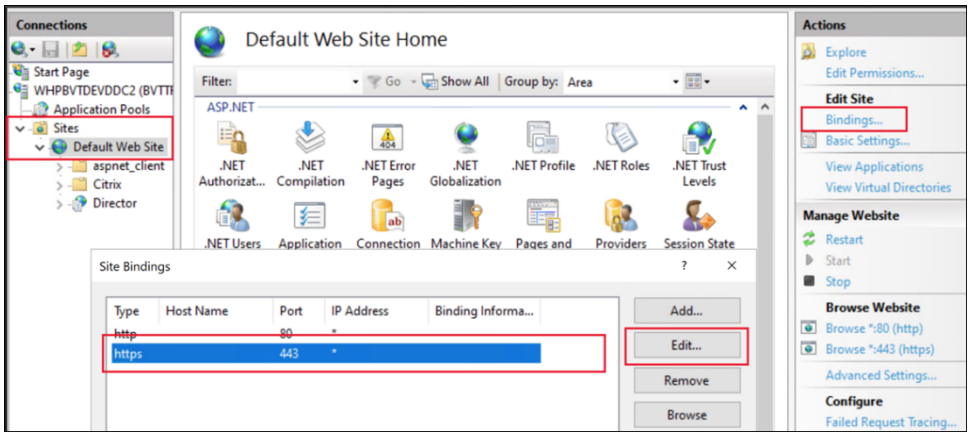
> **Note:**
>
> Using the self-signed certificate isn't recommended because it requires manual configuration on each machine. For more information, see Use the self-signed certificate.

Create or import a trusted certificate

We recommend using a certificate from an enterprise or public certificate authority that is trusted by machines connecting to the server.

For more information, see Create a new certificate and Import existing certificate. The certificate's common name or subject alternative name must match the FQDN that the users use to connect to Web Studio or Director. If a load balancer is deployed in front of the server, use the FQDN of the load balancer.

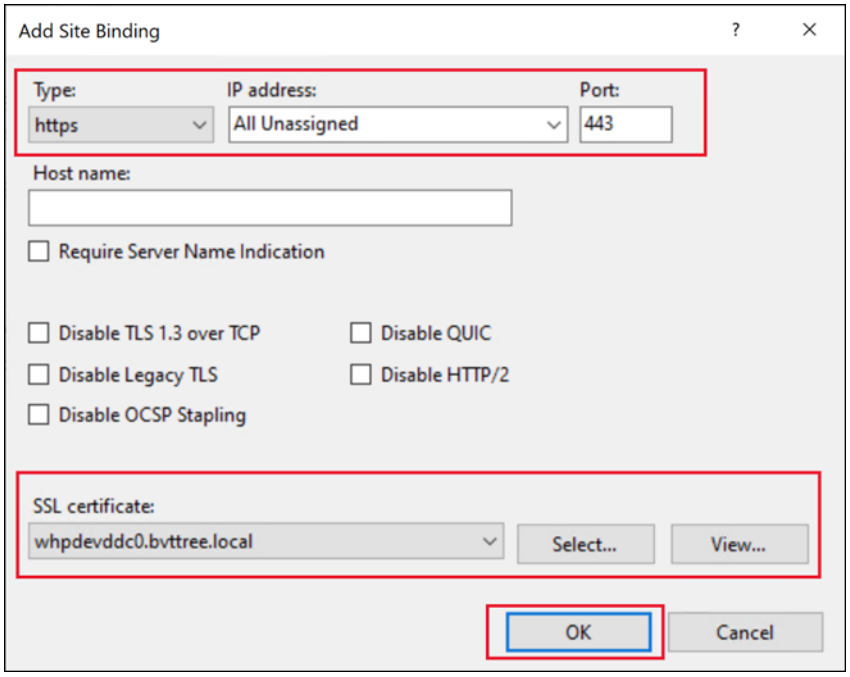
© 1997–2026 Citrix Systems, Inc. All rights reserved.



Bind the certificate to port 443

After creating or importing a trusted certificate, bind it to port 443 in IIS. You can do that either before or after installation. If certificate binding is already configured for port 443, the installer makes no changes.

> **Note:**
>
> By default, Web Studio and Director use port 443 for secure HTTPS access. You can change the port number if needed. See Change the default port number for details.



To bind the certificate to port 443, follow these steps:

1. Log on to the server as an administrator.
2. Open the IIS Manager, and browse to **Sites > Default Web Site > Bindings**.
3. If there is an existing binding of type **https** then select it and click **Edit...**. If there is no **https** binding then click **Add**.

4. Create or edit the site binding:
   a) For a new binding, set the type to **https** and the port to 443.
   b) Select the appropriate SSL certificate.
   c) On Windows Server 2022 or higher, optionally select **Disable Legacy TLS** to ensure that users can only connect using modern TLS versions.
   d) Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Alternatively, you can change the certificate using PowerShell. For example the following script looks for a certificate with a given common name and binds it to all IP addresses, port 443, and disables legacy TLS versions.

```
$certSName = 'CN=whpdevddc0.bvttree.local'  # The subject name of the
    certificate
$certificate = Get-ChildItem -Path Cert:\LocalMachine\My\ | ? {
 $_.Subject -eq $certSName }

netsh http add sslcert ipport=0.0.0.0:443 certhash=$($certificate.
    Thumbprint) certstorename=My appid="{
 91fe7386-e0c2-471b-a252-1e0a805febac }
 " disablelegacytls=enable
```

Note that `appid` is an arbitrary GUID that can be used to identify which application added the certificate.

Use the self-signed certificate

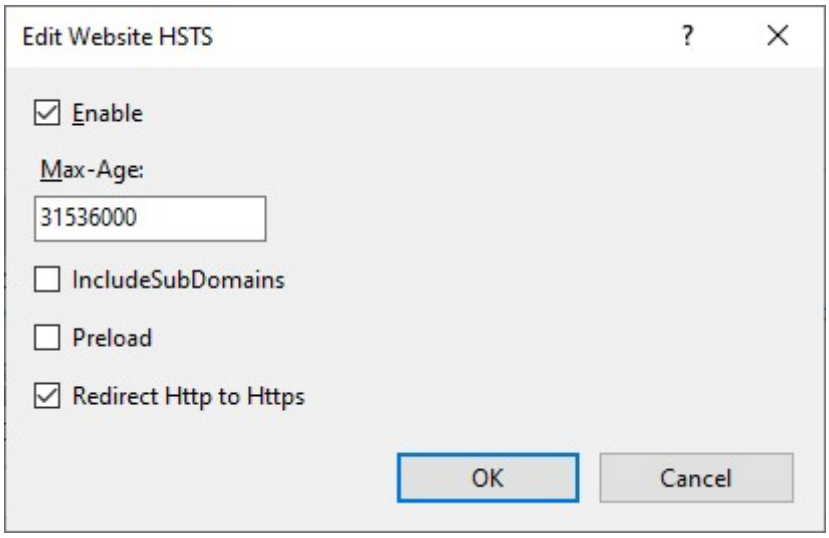
You can use the existing self-signed certificate, but it's not recommended because it requires manually configuring each machine that accesses the server.

To install the self-signed certificate on machines that need to connect to Web Studio:

1. Export the existing self-signed certificate from the Web Studio and Delivery Controller servers.
2. Import the certificate into the **Trusted Root Certificate** store of machines that must access the server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

(Optional) Enable HTTP Strict Transport Security (HSTS)



HTTP Strict Transport Security (HSTS) tells web browsers to only use HTTPS when accessing the site. If a user tries to access the URL using HTTP, the browser automatically switches to HTTPS. This setting ensures secure connection validation on both the client and server sides. The browser maintains this validation for the configured period.

On Windows Server 2019 and later, you can configure HSTS in IIS:

1. Open **Internet Information Services (IIS) Manager**.
2. Select **Default Web Site** (or the appropriate website).
3. In the **Actions** pane on the right side, select **HSTS…**.
4. Select **Enable** and enter a max age, for example 31536000 for one year.
5. Select **Redirect Http to Https**.

   > **Note:**
   >
   > Web Studio automatically configures a **URL Rewrite** rule to redirect HTTP to HTTPS when accessing the Studio website. However, this option also applies to Director and any other applications on the IIS site.

6. Click **OK**.

(Optional) Change the default port number

By default, Web Studio and Director use port 443 for secure HTTPS access. To change this port number, follow these steps to create a site binding for the desired port on `Default Web Site`.

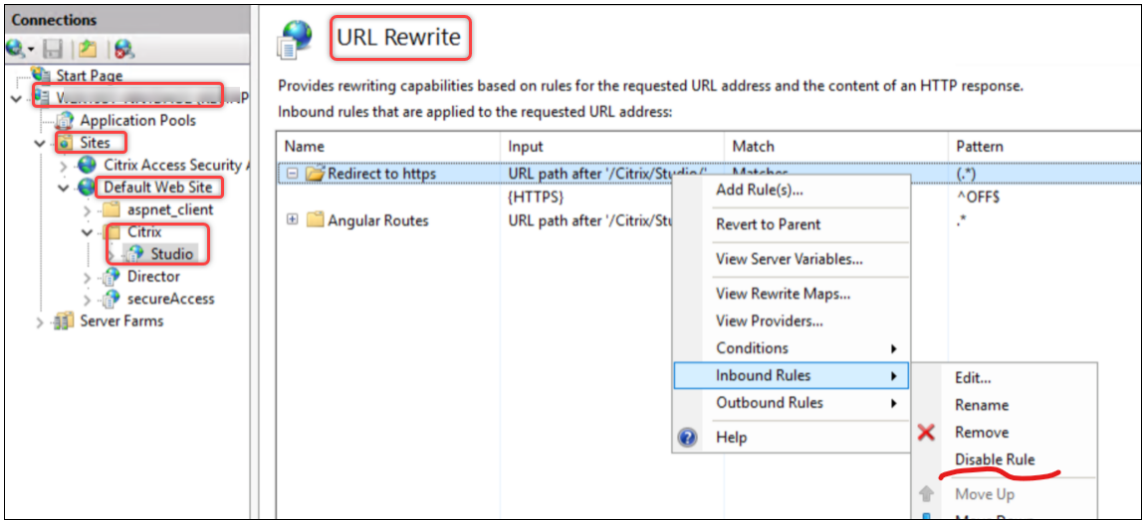
Steps:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. On the server hosting Web Studio, open **Internet Information Services (IIS) Manager**.
2. In the **Connections** pane, expand the server node and select **Default Web Site** under **Sites**.
3. In the **Actions** pane on the right, click **Bindings**.
4. In the **Site Bindings** window, click **Add**.
5. In the Add Site Binding window, set the following for the new binding:

    a) **Type**: Select **https**.
    b) **IP address**: Select the appropriate IP address, or leave as All Unassigned if applicable.
    c) **Port**: Enter the desired port number (for example, 444).
    d) **SSL certificate**: Select the appropriate SSL certificate for secure communication.

    > **Note:**
    >
    > If the Delivery Controller™ and Web Studio are installed on separate machines, and the server doesn't have other services or websites deployed, you can remove port 443. Otherwise, keep this port to avoid communication issues with the Orchestration service and other FMA services.



6. Click **OK** to save the binding, and then close the **Site Bindings** window.
7. In **IIS Manager**, click the server node, then in the **Actions** pane, click **Restart** to apply the new binding.

(Optional) Disable HTTPS redirection

When you install Web Studio, by default, any HTTP access is auto-redirected to HTTPS. It is possible to disable this redirection to allow HTTP access. This approach is recommended only if you have taken other measures to block HTTP access. In the case you have a TLS terminating load balance in front of Web Studio, it is still recommended to use HTTPS between your load balancer and Web Studio.

1. Log on to the Web Studio server.
2. Open **Internet Information Services (IIS) Manager**, and go to *Server_name* **> Sites > Default Web Site > URL Rewrite**.
3. Disable **Inbound Rules** for **Redirection to https**, as shown in the following screenshot.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you have enabled HSTS in IIS then you must also clear **Redirect Http to Https**.

Enable TLS / DTLS on VDAs

May 13, 2026

Enable TLS connections between Citrix Workspace™ app and Virtual Delivery Agents (VDAs) by completing the following tasks:

- Install certificates on the VDAs. For details, see requesting and installing a certificate
- Configure TLS on the machines where the VDAs are installed. (For convenience, further references to machines where VDAs are installed are simply called "VDAs."). It is highly recommended that you use the Citrix supplied PowerShell script to configure TLS/DTLS. For details, see Configure TLS on a VDA using the PowerShell script. However, if you want to configure TLS/DTLS manually, see Manually configure TLS on a VDA.
- Configure TLS in the Delivery Groups containing the VDAs by running a set of PowerShell cmdlets in Studio. For details, see Configure TLS on Delivery Groups.

Requirements and considerations:

- Configure TLS in the Delivery Groups and on the VDAs after you install components, create a Site, create machine catalogs, and create Delivery Groups.
- To configure TLS in the Delivery Groups, you must have permission to change Controller access rules. A Full Administrator has this permission.
- To configure TLS on the VDAs, you must be a Windows administrator on the machine where the VDA is installed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- On pooled VDAs that are provisioned by Machine Creation Services™ or Provisioning Services, the VDA machine image is reset on restart, causing previous TLS settings to be lost. Run the PowerShell script each time the VDA is restarted to reconfigure the TLS settings.

A Delivery Group cannot have a mixture of some VDAs with TLS configured and some VDAs without TLS configured. Before you configure TLS for a Delivery Group, ensure that you have already configured TLS for all the VDAs in that Delivery Group

When you configure TLS on VDAs, permissions on the installed TLS certificate are changed, giving the ICA® Service read access to the certificate's private key, and informing the ICA Service of the following:

- Which certificate in the certificate store to use for TLS.
- Which TCP port number to use for TLS connections.

  The Windows Firewall (if enabled) must be configured to allow incoming connection on this TCP port. This configuration is done for you when you use the PowerShell script.
- Which versions of the TLS protocol to allow.

  > **Important:**
  >
  > Citrix recommends using TLS 1.2 or higher. SSL and older versions of TLS are deprecated.

  The supported TLS protocol versions follow a hierarchy (lowest to highest): SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, and TLS 1.3. Specify the minimum allowed version; all protocol connections using that version or a higher version are allowed.

  For example, if you specify TLS 1.1 as the minimum version, then TLS 1.1, TLS 1.2 and TLS 1.3 protocol connections are allowed. If you specify SSL 3.0 as the minimum version, then connections for all the supported versions are allowed. If you specify TLS 1.3 as the minimum version, only TLS 1.3 connections are allowed.
- Which TLS cipher suites to allow.

  A cipher suite selects the encryption that is used for a connection. Clients and VDAs can support different sets of cipher suites. When a client (Citrix Workspace app) connects and sends a list of supported TLS cipher suites, the VDA matches one of the client's cipher suites with one of the cipher suites in its own list of configured cipher suites, and accepts the connection. If there is no matching cipher suite, the VDA rejects the connection.

  The VDA supports three sets of cipher suites (also known as compliance modes): GOV(ernment), COM(mercial), and ALL. The acceptable cipher suites also depend on the Windows FIPS mode; see http://support.microsoft.com/kb/811833 for information about Windows FIPS mode. The following table lists the cipher suites in each set:

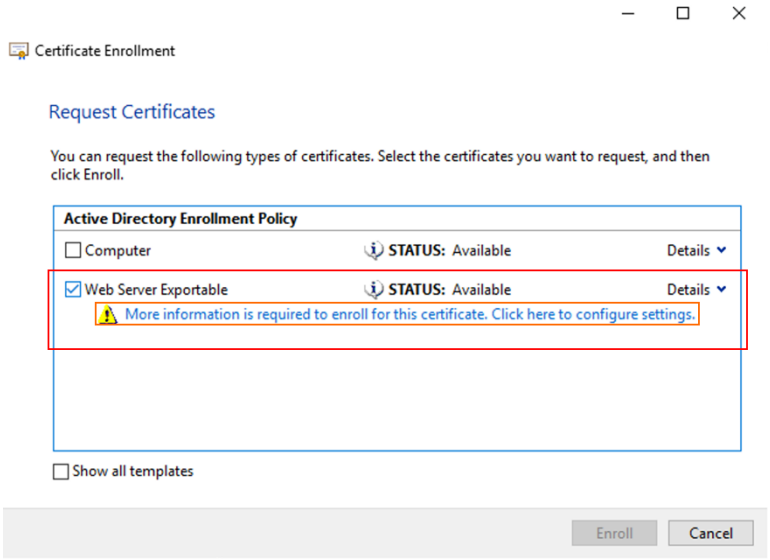
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cipher Suite	ALL	COM	GOV	ALL	COM	GOV
FIPS Mode	Off	Off	Off	On	On	On
TLS_AES_256_GCM_SHA384	X		X	X		X
TLS_AES_128_GCM_SHA256	X			X		X
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	X		X	X		X
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384	X		X	X		X
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA	X			X	X	

> **Note:**
>
> The VDA does not support DHE ciphersuites (for example, TLS_DHE_RSA_WITH_AES_256_GCM_SHA384, TLS_DHE_RSA_WITH_AES_256_CBC_SHA, TLS_DHE_RSA_WITH_AES_128_GCM_SHA256, and TLS_DHE_RSA_WITH_AES_128_CBC_SHA.) If selected by Windows, the connection will fail.
>
> If you are using a NetScaler Gateway, refer to the NetScaler documentation for information on cipher suite support for back-end communication. For information on TLS cipher suite support, see Ciphers available on the Citrix ADC appliances. For information on DTLS cipher suite support, see DTLS cipher support.

Requesting and installing a certificate

To use TLS, you must install a certificate whose Alternative Name includes the VDA's FQDN. The certificate must be trusted by any clients connecting directly to the VDA (not via a Citrix Gateway). To allow un-managed devices where you cannot easily deploy certificates to connect to the VDA, consider deploying a NetScaler® Gateway.

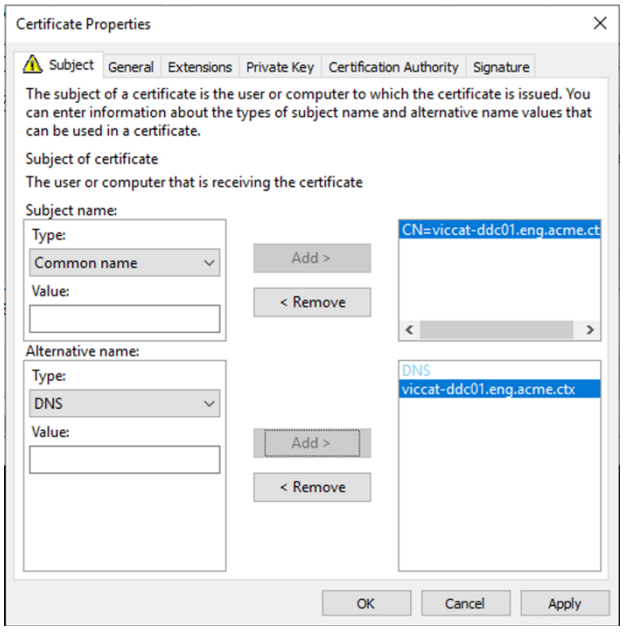


Create certificate using Microsoft Certificate Authority

If your clients and VDAs are on a trusted forest and it has a Microsoft Certificate Authority, you can acquire a certificate from the Certificates MMC snap-in Certificate Enrollment wizard.

1. On the VDA, open the MMC console and add the Certificates snap-in. When prompted select Computer account.
2. Expand **Personal > Certificates**, then use the context menu command **All Tasks > Request New Certificate**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

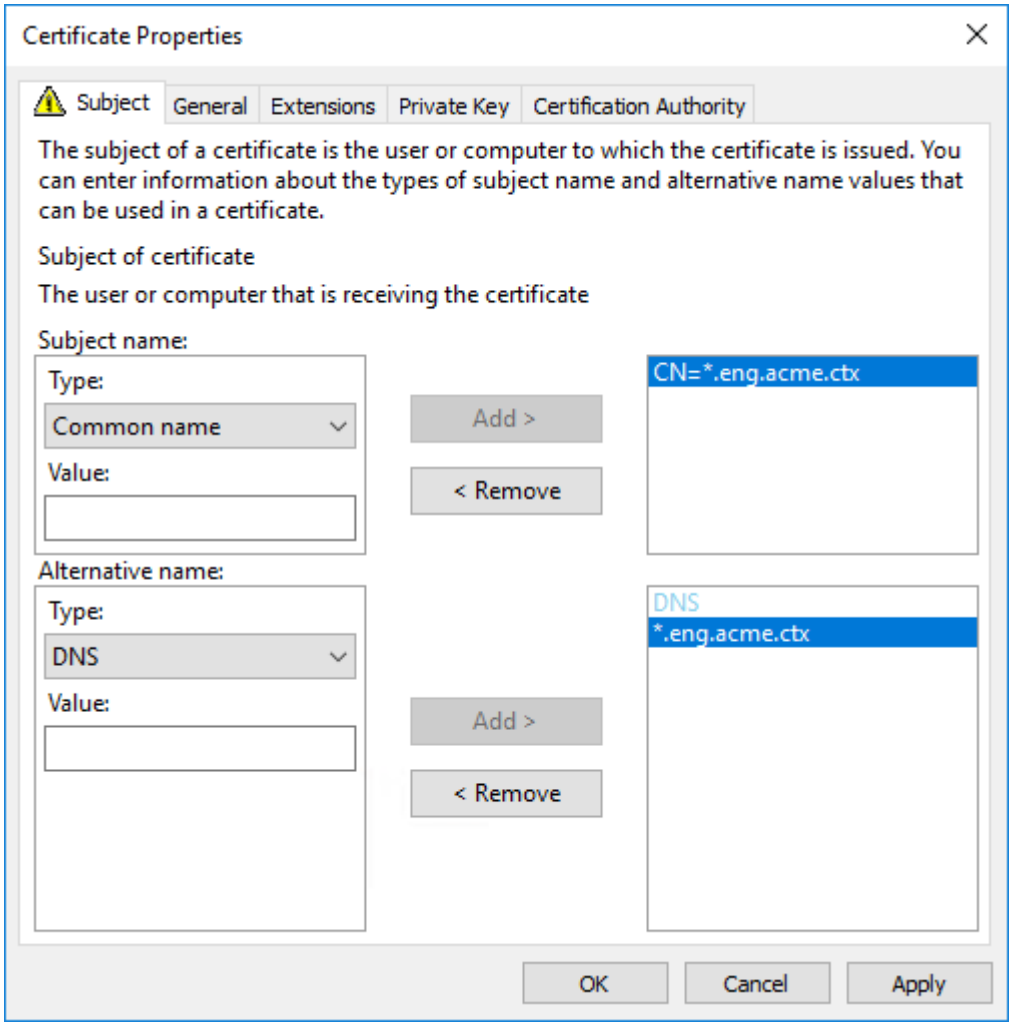


3. Click **Next** to begin, and **Next** to confirm that you are acquiring the certificate from Active Directory enrollment.
4. Select the template for Server Authentication certificate. Both the default Windows **Computer** or **Web Server Exportable** are acceptable. If the template has been set up to automatically provide the values for Subject, you can click **Enroll** without providing more details.

5. To provide more details for the certificate template, click **Details** and configure the following:

   Subject name —select type **Common name** and add the FQDN of the VDA

   Alternative name —select type **DNS** and add the FQDN of the VDA



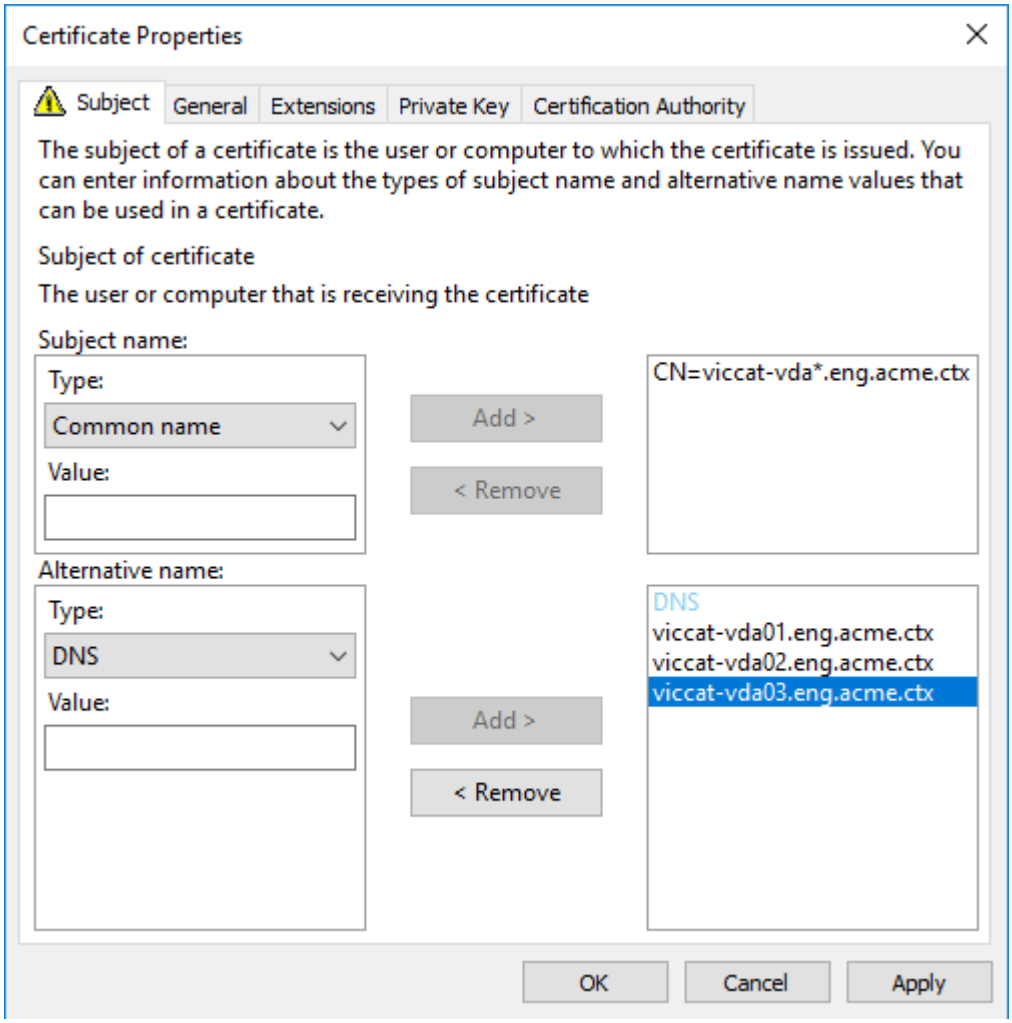
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Use Active Directory Certificate Services Certificate Auto-Enrollment to automate issuing and deploying certificates to the VDAs. This is described in Enable certificate auto-enrollment).

You can use wildcard certificates to allow a single certificate to secure multiple VDAs:

Subject name —select type **Common name** and enter the *.primary.domain of the VDAs

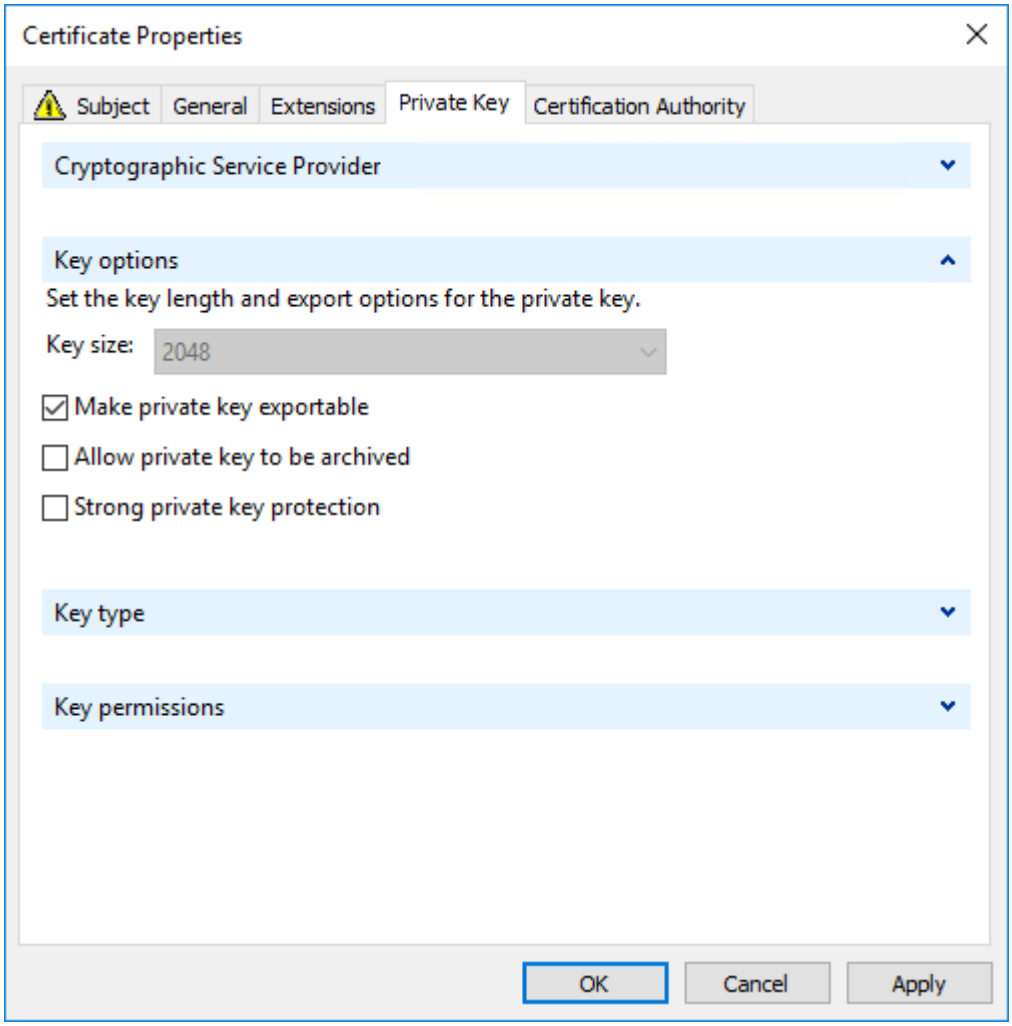
Alternative name —select type **DNS** and add the *.primary.domain of the VDAs



You can use SAN certificates to allow a single certificate to secure multiple specific VDAs:

Subject name —select type **Common name** and enter a string to help identify the certificate usage

Alternative name —select type **DNS** and add an entry for the FQDN of each VDA. Keep the number of Alternative names to a minimum to ensure optimal TLS negotiation.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

Both wildcard and SAN certificates require **Make private key exportable** on the Private Key tab to be selected:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure TLS on a VDA using the PowerShell script

Install the TLS Certificate in the Local Computer > Personal > Certificates area of the certificate store. If more than one certificate resides in that location, supply the thumbprint of the certificate to the PowerShell script.

> **Note:**
>
> Starting with XenApp and XenDesktop 7.15 LTSR, the PowerShell script finds the correct certificate based on the FQDN of the VDA. You do not need to supply the thumbprint when only a single certificate is present for the VDA FQDN.

The Enable-VdaSSL.ps1 script enables or disables the TLS listener on a VDA. This script is available in the *Support* > *Tools* > *SslSupport* folder on the installation media.

When you enable TLS, DHE cipher suites are disabled. ECDHE cipher suites are not affected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When you enable TLS, the script disables all existing Windows Firewall rules for the specified TCP port. It then adds a new rule that allows the ICA Service to accept incoming connections only on the TLS TCP and UDP ports. It also disables the Windows Firewall rules for:

- Citrix ICA (default: 1494)
- Citrix CGP (default: 2598)
- Citrix WebSocket (default: 8008)

The effect is that users can only connect using TLS or DTLS. They cannot use ICA/HDX, ICA/HDX with Session Reliability, or HDX over WebSocket, without TLS or DTLS.

> **Note:**
>
> DTLS is not supported with ICA/HDX Audio over UDP Real-time Transport, or with ICA/HDX Framehawk.

See Network ports.

The script contains the following syntax descriptions, plus extra examples; you can use a tool such as Notepad++ to review this information.

> **Important:**
>
> Specify either the Enable or Disable parameter, and the CertificateThumbPrint parameter. The other parameters are optional.

Syntax

```
Enable-VdaSSL { -Enable | -Disable } -CertificateThumbPrint "<thumbprint
>"[-SSLPort <port>] [-SSLMinVersion "<min-ssl-version>"] [-SSLCipherSuite
"\<suite>"]
```

Parameter	Description
Enable	Installs and enables the TLS listener on the VDA. Either this parameter or the Disable parameter is required.
Disable	Disables the TLS listener on the VDA. Either this parameter or the Enable parameter is required. If you specify this parameter, no other parameters are valid.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
CertificateThumbPrint “”	Thumbprint of the TLS certificate in the certificate store, enclosed in quotation marks. The script uses the specified thumbprint to select the certificate you want to use. If this parameter is omitted, an incorrect certificate is selected.
SSLPort	TLS port. Default: 443
SSLMinVersion “”	Minimum TLS protocol version, enclosed in quotation marks. Valid values: `SSL_3.0`, `TLS_1.0` (default), `TLS_1.1`, `TLS_1.2` and `TLS_1.3`. `TLS_1.3` requires Windows 11 or Windows Server 2022 or higher.
SSLCipherSuite “”	TLS cipher suite, enclosed in quotation marks. Valid values: “GOV”, “COM”, and “ALL”(default).

Examples

The following script installs and enables the TLS protocol version value. The thumbprint (represented as “12345678987654321”in this example) is used to select the certificate to use.

```
Enable-VdaSSL -Enable -CertificateThumbPrint "12345678987654321"
```

The following script installs and enables the TLS listener, and specifies TLS port 400, the GOV cipher suite, and a minimum TLS 1.2 protocol value. The thumbprint (represented as “12345678987654321” in this example) is used to select the certificate to use.

```
Enable-VdaSSL -Enable
-CertificateThumbPrint "12345678987654321"
-SSLPort 400 -SSLMinVersion "TLS_1.2"
-SSLCipherSuite "All"
```

The following script disables the TLS listener on the VDA.

```
Enable-VdaSSL -Disable
```

Manually configure TLS on a VDA

When configuring TLS on a VDA manually, you grant generic read access to the private key of the TLS certificate for the appropriate service on each VDA: NT SERVICE\PorticaService for a VDA for Windows

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Single-session OS, or NT SERVICE\TermService for a VDA for Windows Multi-session OS. On the machine where the VDA is installed:

STEP 1. Launch the Microsoft management console (MMC): Start > Run > mmc.exe.

STEP 2. Add the Certificates snap-in to the MMC:

1. Select File > Add/Remove Snap-in.
2. Select Certificates and then click Add.
3. When prompted with "This snap-in will always manage certificates for:"choose "Computer account"and then click Next.
4. When prompted with "Select the computer you want this snap-in to manage"choose "Local computer"and then click Finish.

STEP 3. Under Certificates (Local Computer) > Personal > Certificates, right–click the certificate and then select All Tasks > Manage Private Keys.

STEP 4. The Access Control List Editor displays "Permissions for (FriendlyName) private keys"where (FriendlyName) is the name of your TLS certificate. Add one of the following services and give it Read access:

- For a VDA for Windows Single-session OS, "PORTICASERVICE"
- For a VDA for Windows Multi-session OS, "TERMSERVICE"

STEP 5. Double-click the installed TLS certificate. In the certificate dialog, select the Details tab and then scroll to the bottom. Click Thumbprint.

STEP 6. Run regedit and go to HKLM\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd.

1. Edit the SSL Thumbprint key and copy the value of the TLS certificate's thumbprint into this binary value. You can safely ignore unknown items in the Edit Binary Value dialog box (such as '0000'and special characters).
2. Edit the SSLEnabled key and change the DWORD value to 1. (To disable SSL later, change the DWORD value to 0.)
3. If you want to change the default settings (optional), use the following in the same registry path:

   SSLPort DWORD –SSL port number. Default: 443.

   SSLMinVersion DWORD –1 = SSL 3.0, 2 = TLS 1.0, 3 = TLS 1.1, 4 = TLS 1.2, 5 = TLS 1.3. Default: 2 (TLS 1.0).

   SSLCipherSuite DWORD –1 = GOV, 2 = COM, 3 = ALL. Default: 3 (ALL).

STEP 7. Ensure that the TLS TCP and UDP ports are that open in the Windows Firewall if they are not the default 443. (When you create the inbound rule in Windows Firewall, ensure its properties have the "Allow the connection"and "Enabled"entries selected.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

STEP 8. Ensure that no other applications or services (such as IIS) are using the TLS TCP port.

STEP 9. For multi-session VDAs, restart the machine for the changes to take effect. (You do not need to restart single-session VDA machines.)

STEP 10. Modify the Windows cipher suite preference so that the VDA-supported cipher suites have the highest priority in order to avoid connection issues.

> **Important:**
>
> The Group Policy changes outlined below only take effect after the system is restarted.
>
> If you are using non-persistent session hosts provisioned with MCS or PVS, you must apply these settings in the master image.

Option 1:

Using the Group Policy Editor, go to Computer Configuration > Policies > Administrative Templates > Network > SSL Configuration Settings > SSL Cipher Suite Order. Ensure the following cipher suites are at the top of the list:

```
TLS_AES_256_GCM_SHA384_P384
TLS_AES_256_GCM_SHA384_P256
TLS_AES_128_GCM_SHA256_P384
TLS_AES_128_GCM_SHA256_P256
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P384
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P256
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384_P384
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384_P256
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA_P384
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA_P256
```

> **Note:**
>
> TLS_AES_256_GCM_SHA384 and TLS_AES_128_GCM_SHA256 only apply to Windows 11 and Windows Server 2022 or newer. If you are using older operating systems, please do not include these cipher suites in your list.
>
> Note that the listed cipher suites also specify the elliptic curve, P384 or P256, to ensure that "curve25519"is not selected. FIPS Mode does not prevent the use of "curve25519".
>
> It is not necessary to remove any cipher suites from the list. Note that these settings apply to the entire system, so if you decide to remove any cipher suites, you must ensure they are not required by any applications or services running on your session hosts.

Option 2:

Using the Group Policy Editor, go to Computer Configuration > Policies > Administrative Templates > Network > SSL Configuration Settings > SSL Cipher Suite Order. Ensure the following cipher suites are at the top of the list:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
TLS_AES_256_GCM_SHA384
TLS_AES_128_GCM_SHA256
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA
```

> **Note:**
>
> TLS_AES_256_GCM_SHA384 and TLS_AES_128_GCM_SHA256 only apply to Windows 11 and Windows Server 2022, or newer. If you are using older operating systems, please do not include these cipher suites in your list.
>
> It is not necessary to remove any cipher suites from the list. Note that these settings apply to the entire system, so if you decide to remove any cipher suites, you must ensure they are not required by any applications or services running on your session hosts.

Using the Group Policy Editor, go to Computer Configuration > Policies > Administrative Templates > Network > SSL Configuration Settings > ECC Curve Order. Enable the setting and include the following curves in the list:

```
NistP384
NistP256
```

> **Note:**
>
> This ensure that "curve25519"is not selected. FIPS Mode does not prevent the use of "curve25519".

The VDA selects a cipher suite only if appears in both lists: the Group Policy list and the list for the selected compliance mode (COM, GOV, or ALL). The cipher suite must also appear in the list sent by the client (Citrix Workspace app).

Configure TLS on Delivery Groups

Complete this procedure for each Delivery Group that contains VDAs you have configured for TLS connections.

1. From Studio, open the PowerShell console.
2. Run **Get-BrokerAccessPolicyRule -DesktopGroupName '*<delivery-group-name>*'| Set-BrokerAccessPolicyRule -HdxSslEnabled $true**.
3. Run **Set-BrokerSite -DnsResolutionEnabled $true**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enabling SSL for Pooled VDAs using Auto-Enrolment

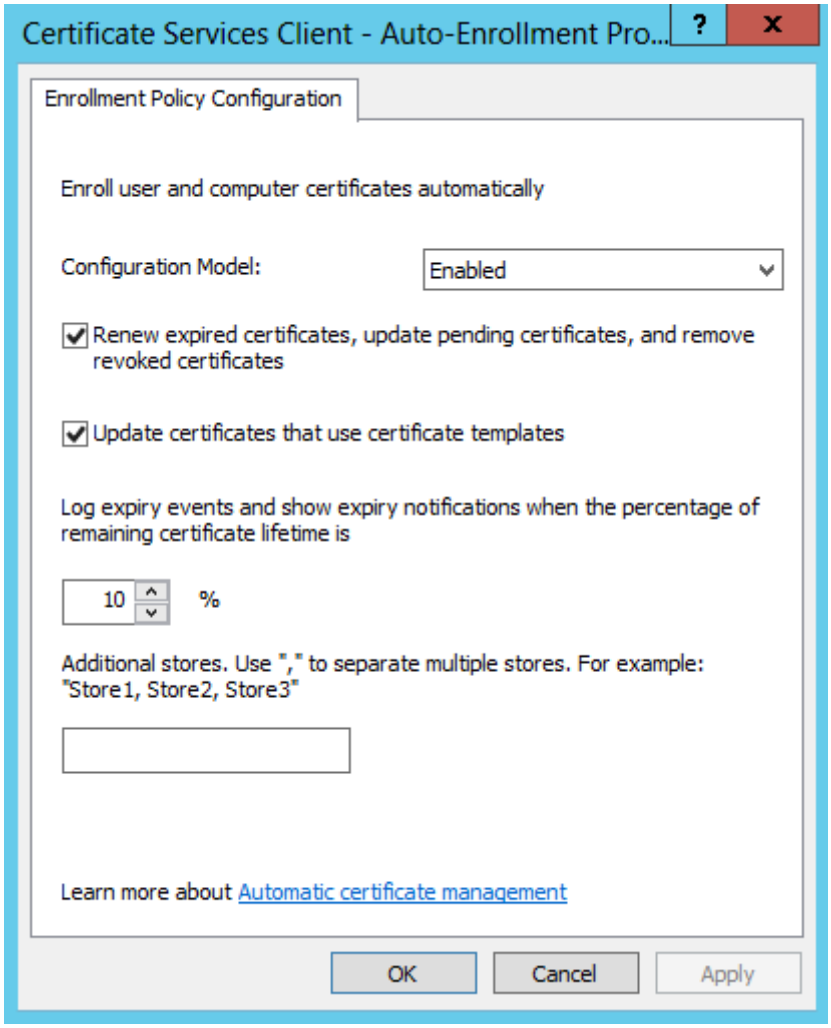
When using pooled VDAs, if you add a certificate to the master image then all VDAs share the same image. You can use a wildcard certificate but a disadvantage is that if any one of the VDAs becomes compromised, this all powerful certificate would mean HDX™ connections belonging to all VDAs would be at risk.

Instead a secure alternative is to leverage Microsoft Active Directory Certificate Services to provisioning certificates automatically using group policy. You can use a startup script on the VDA to dynamically provision a fresh certificate and enables SSL to the VDA.

Note that this approach will only work for single-session Desktop VDAs. For multi-session VDAs, the ICA listener is brought up too early during the boot process, before certificates can be automatically provisioned.

Since Active Directory Certificate Services uses an internal Enterprise Certificate Authority, it won't be automatically trusted by all Windows installations. If the clients are managed by the corporation and part of a domain forest, the trusted CA certificates can be distributed automatically using group policy. For BYOD and other non-domain joined devices you need to distribute the trusted CA certificates to your users by some other mechanism (such as offering a download link), or use a NetScaler gateway.

Enable Certificate Auto-Enrollment



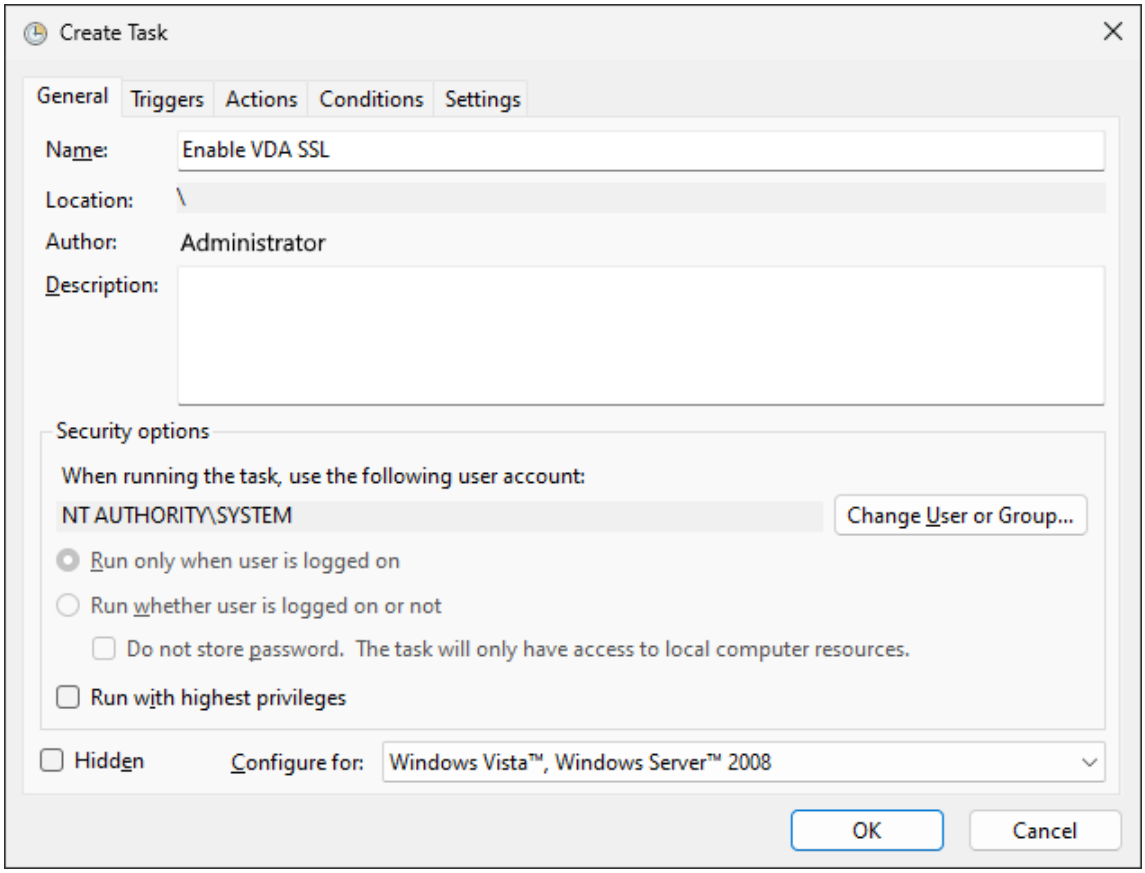
First ensure you have Active Directory Certificate Services role installed on a server in your VDA domain forest providing an Enterprise CA, otherwise auto-enrollment will not be possible.

Note that this may put considerable higher load than usual on your Enterprise CA, since VDAs will be submitting a certificate request on every boot. Make sure to allocate sufficient CPU and memory on the CA server to cope with the load, and as ever test the scalability of the deployment in a lab environment before moving into production.

In the Group Policy Management Editor, create a new policy which applies to the Organizational Unit that will contain your pooled VDAs with SSL enabled as follows:

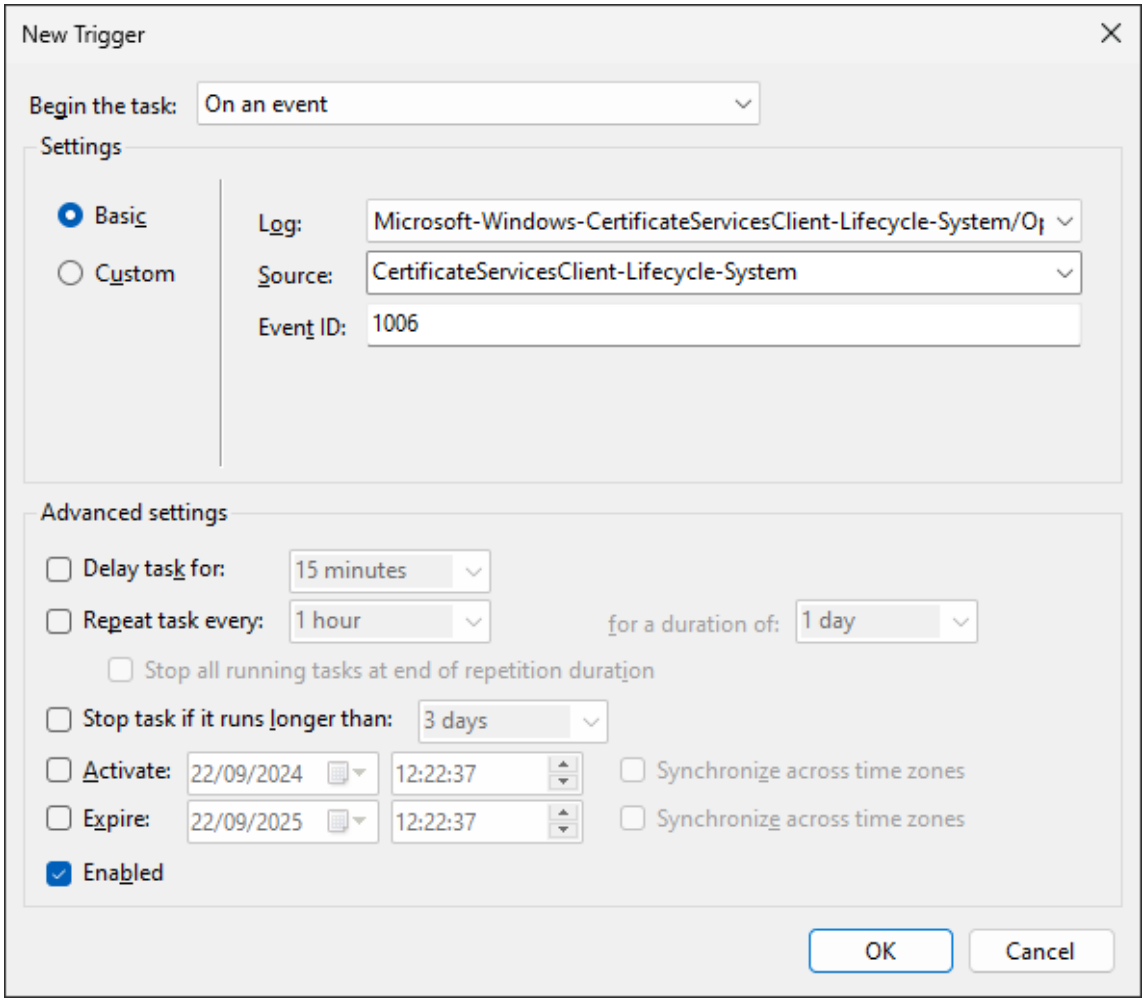
1. Expand Computer Configuration -> Policies -> Windows Settings -> Security Settings -> Public Key Policies
2. Edit the 'Certificate Services Client –Auto Enrollment Policy' object properties
3. Configure as shown in the screenshot below.
4. Right-click the Automatic Certificate Request container and select New -> Automatic Certificate Request…
5. In the Automatic Certificate Request Setup Wizard, click Next
6. Ensure the Computer certificate template is selected, click Next
7. Click Finish

© 1997–2026 Citrix Systems, Inc. All rights reserved.



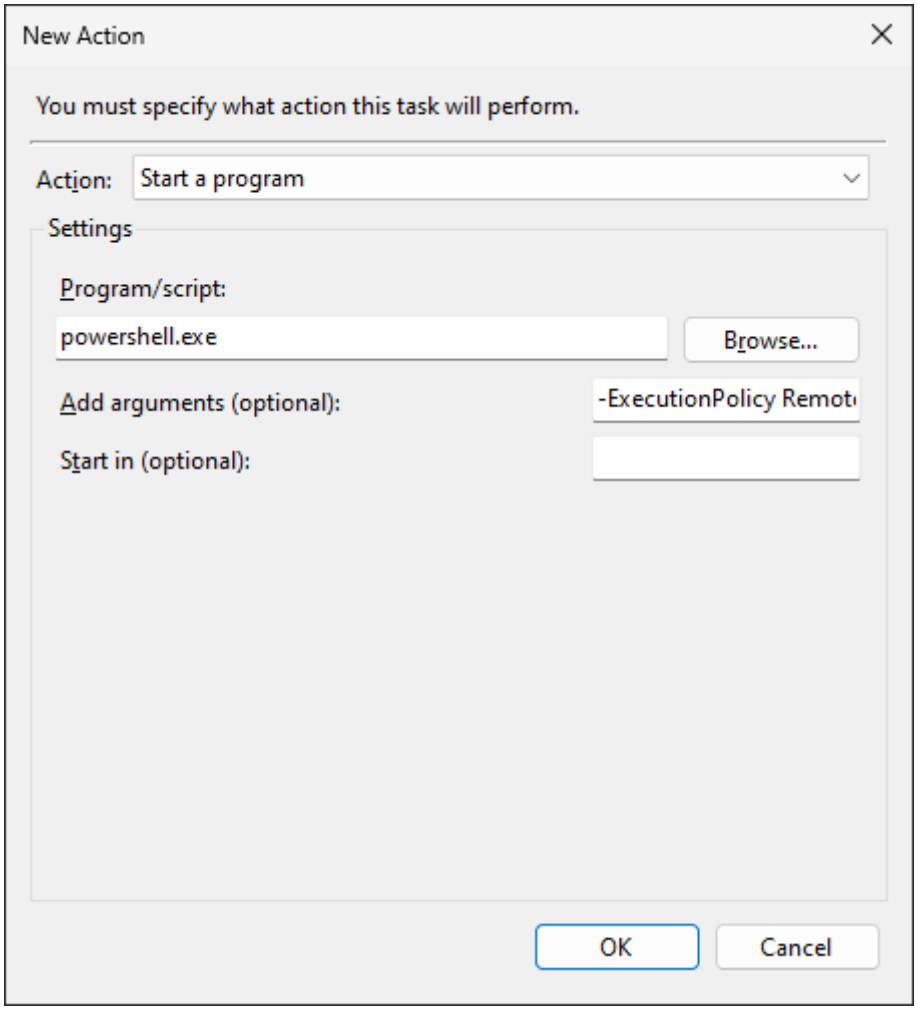
Preparing the Windows Master Image

Copy the Enable-VdaSsl.ps1 script from the product installation media in the `Support\Tools\SslSupport` folder to the VDA master image. Note the master image should not contain any certificates to be used for HDX SSL connections. The certificates will be provisioned when the MCS or PVS machine catalog is created. Now create a new scheduled task as follows (do not run the scheduled task now):



1. Open Task Scheduler.
2. In the **Actions** pane, press **Create Task...**
3. On the general tab:
    - Enter a **Name** such as `Enable VDA SSL`
    - Click **Change User or Group...** and in the Select User or Group dialog box enter `SYSTEM` and click **OK**

© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. Select the Triggers tab
5. Click **New...**. In the **New Trigger** dialog:
    a) Set **Begin the task** to **On an event**
    b) Set **Log** to **Microsoft-Windows-CertificateServicesClient-Lifecycle-System/Operational**
    c) Set **Source** to **Microsoft-Windows-CertificateServicesClient-Lifecycle-System**
    d) Set **Event ID** to `1006`
    e) Click **OK** to save the trigger

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Select the **Actions** tab
7. Click **New...**
8. In the **New Action** dialog:
    a) Set **Action** to **Start a program**
    b) In the Program/script field, enter `powershell.exe`
    c) In the Add arguments field, enter `-ExecutionPolicy RemoteSigned Enable-VdaSsl.ps1 -Enable -Confirm:$False`, including the path to the powershell script.
    d) Press **OK** to save the action

© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. Press **OK** to save the task

Troubleshooting

If a connection error occurs, check the system event log on the VDA.

When using Citrix Workspace app for Windows, if you receive a connection error that indicates a TLS error, disable Desktop Viewer and then try connecting again. Although the connection still fails an explanation of the underlying TLS issue might be provided. For example, you specified an incorrect template when requesting a certificate from the certificate authority.)

Most configurations that use HDX Adaptive Transport work successfully with DTLS, including those using the latest versions of Citrix Workspace app, Citrix Gateway, and the VDA. Some configurations which use DTLS between Citrix Workspace app and Citrix Gateway, and which use DTLS between Citrix Gateway and the VDA, require additional action.

Additional action is needed if:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- the Citrix Receiver version supports HDX Adaptive Transport and DTLS: Receiver for Windows (4.7, 4.8, 4.9), Receiver for Mac (12.5, 12.6, 12.7), Receiver for iOS (7.2, 7.3.x) or Receiver for Linux (13.7)

and either of the following also applies:

- the Citrix Gateway version supports DTLS to the VDA, but the VDA version does not support DTLS (version 7.15 or earlier),
- the VDA version supports DTLS (version 7.16 or later), but the Citrix Gateway version does not support DTLS to the VDA.

To avoid connections from Citrix Receiver™ failing, do one of the following:

- update Citrix Receiver, to Receiver for Windows version 4.10 or later, Receiver for Mac 12.8 or later, or Receiver for iOS version 7.5 or later; or,
- update the Citrix Gateway to a version that supports DTLS to the VDA; or,
- update the VDA, to version 7.16 or later; or,
- disable DTLS at the VDA; or,
- disable HDX Adaptive Transport.

> **Note:**
>
> A suitable update for Receiver for Linux is not yet available. Receiver for Android (version 3.12.3) does not support HDX Adaptive Transport and DTLS via Citrix Gateway, and is therefore not affected.
>
> To disable DTLS at the VDA, modify the VDA firewall configuration to disable UDP port 443. See Network ports.

TLS and HTML5 video redirection, and browser content redirection

You can use HTML5 video redirection and browser content redirection to redirect HTTPS websites. The JavaScript injected into those websites must establish a TLS connection to the Citrix HDX HTML5 Video Redirection Service running on the VDA. To achieve this, the HTML5 Video Redirection Service generates two custom certificates in the certificate store on the VDA. Stopping the service removes the certificates.

The HTML5 video redirection policy is disabled by default.

The browser content redirection is enabled by default.

For more information on HTML5 video redirection, see Multimedia policy settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

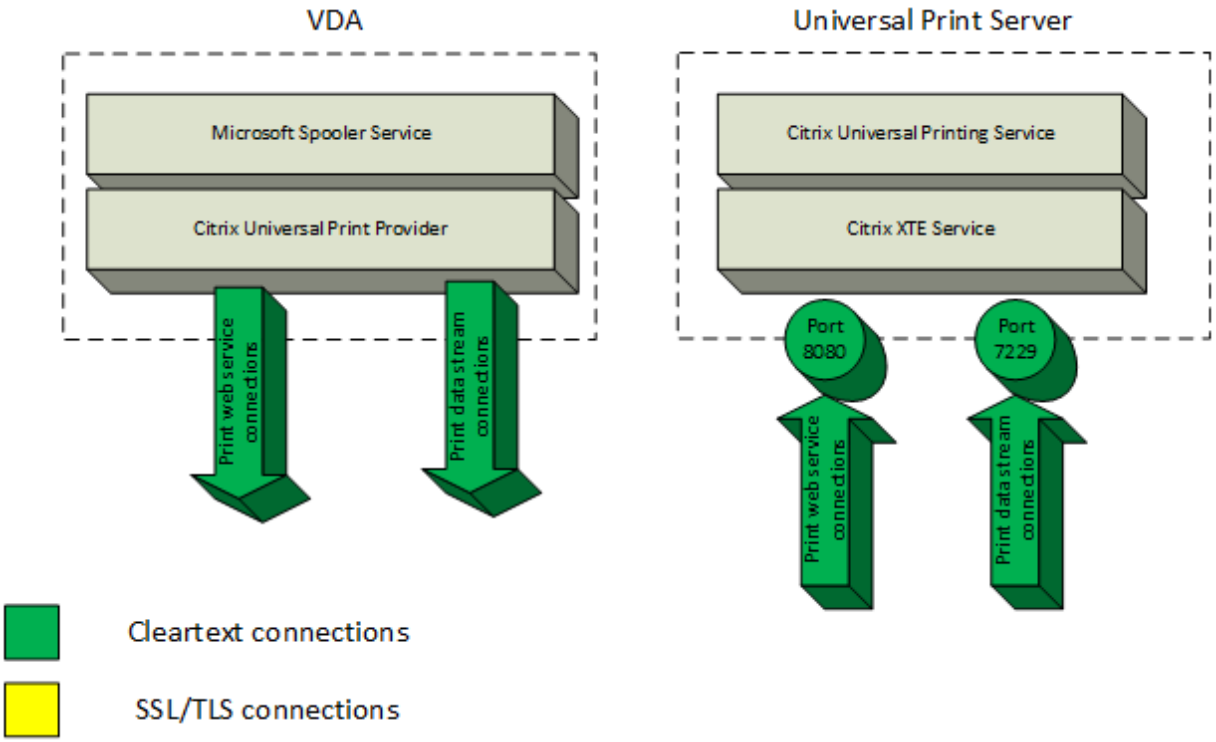
Enable TLS on Universal Print Server

May 13, 2026

The Transport Layer Security (TLS) protocol is supported for TCP-based connections between the Virtual Delivery Agent (VDA) and the Universal Print Server.

> **Warning:**
>
> For tasks that include working in the Windows registry—editing, the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Types of printing connections between the VDA and Universal Print Server



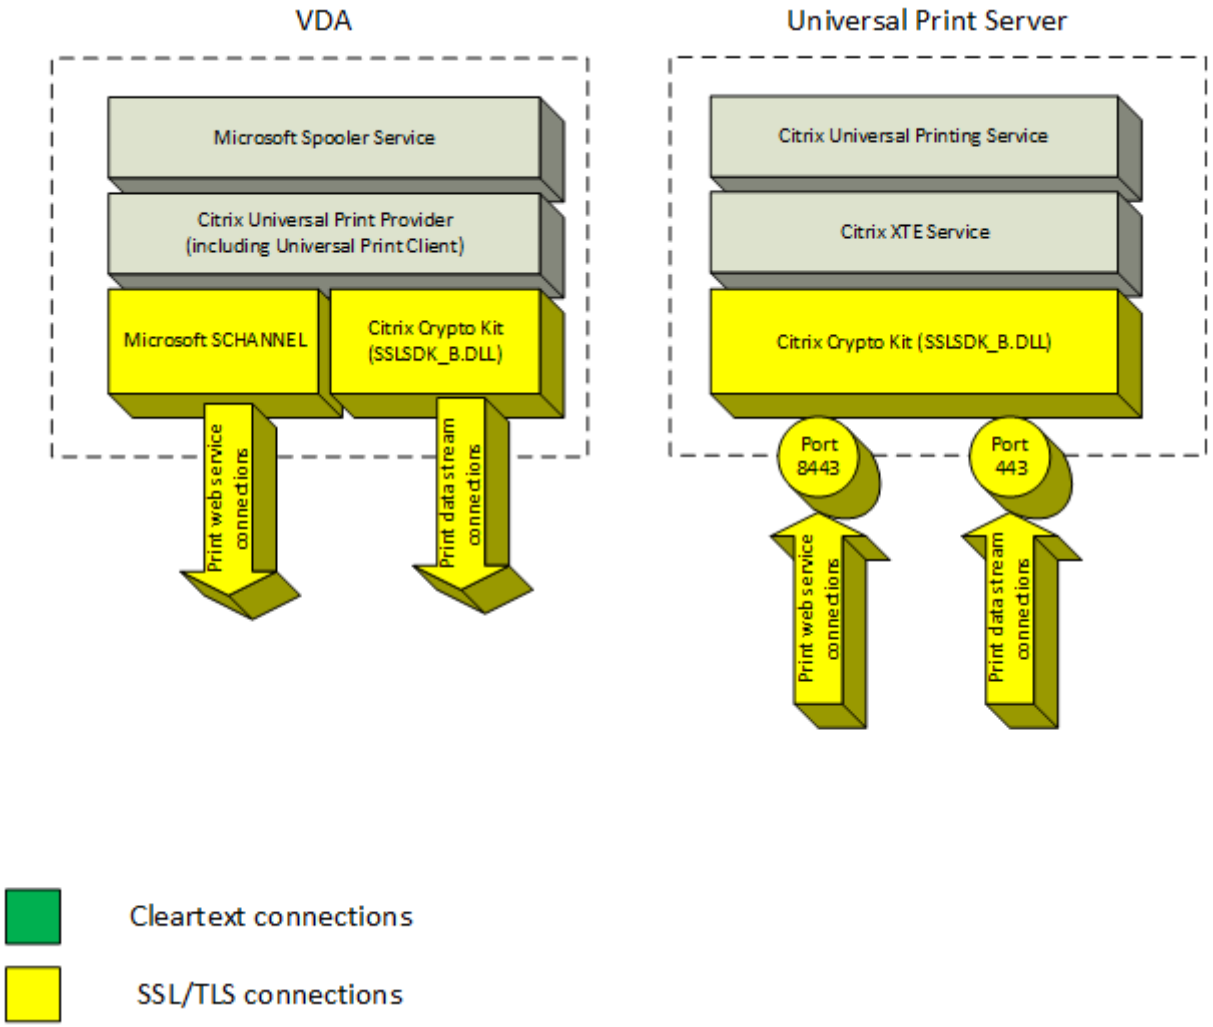
Cleartext connections

The following connections related to printing originate from the VDA and connect to ports on the Universal Print Server. These connections are made only when the **SSL enabled** policy setting is set to **Disabled** (the default).

- Cleartext print web service connections (TCP port 8080)
- Cleartext print data stream (CGP) connections (TCP port 7229)

The Microsoft support article Service overview and network port requirements for Windows describes the ports used by the Microsoft Windows Print Spooler Service. The SSL/TLS settings in this document do not apply to the NetBIOS and RPC connections made by the Windows Print Spooler service. The VDA uses the Windows Network Print Provider (win32spl.dll) as a fallback if the **Universal Print Server enable** policy setting is set to **Enabled with fallback to Windows'native remote printing**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Encrypted connections

These SSL/TLS connections related to printing originate from the VDA and connect to ports on the Universal Print Server. These connections are made only when the **SSL enabled** policy setting is set to **Enabled**.

- Encrypted print web service connections (TCP port 8443)
- Encrypted print data stream (CGP) connections (TCP port 443)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SSL/TLS client configuration

The VDA functions as the SSL/TLS client.

Use Microsoft Group Policy and the registry to configure Microsoft SCHANNEL SSP for encrypted print web service connections (TCP port 8443). The Microsoft support article TLS Registry Settings describes the registry settings for Microsoft SCHANNEL SSP.

Using the Group Policy Editor on the VDA, go to **Computer Configuration > Administrative Templates > Network > SSL Configuration Settings > SSL Cipher Suite Order**. Select the following order when TLS 1.3 is set:

TLS_AES_256_GCM_SHA384
TLS_AES_128_GCM_SHA256

Select the following order when TLS 1.2 is set:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P384
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P256
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384_P384
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384_P256
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA_P384
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA_P256

> **Note:**
>
> When this Group Policy setting is configured, the VDA selects a cipher suite for encrypted print web service connections (default port: 8443) only if the connections appear in both SSL cipher suite lists:
>
> - Group Policy SSL cipher suite order list
> - List corresponding to the selected SSL Cipher Suite policy setting (COM, GOV, or ALL)
>
> This Group Policy configuration also affects other TLS applications and services on the VDA. If your applications require specific cipher suites, you might need to add them to this Group Policy Cipher Suite Order list.
>
> **Important:**
>
> Group Policy changes for TLS configuration take effect only after an operating system restart.
>
> Use a Citrix policy to configure SSL/TLS settings for encrypted print data stream (CGP) connections (TCP port 443).

SSL/TLS server configuration

The Universal Print Server functions as the SSL/TLS server.

Use the `Enable-UpsSsl.ps1` PowerShell script to configure SSL/TLS settings.

Install a TLS certificate on the Universal Print Server

For HTTPS, you must install an SSL server certificate on the Universal Print Server that is trusted by the VDAs. Use Microsoft Active Directory Certificate Services or another certification authority to request a certificate for the Universal Print Server.

Keep in mind the following considerations when enrolling/requesting a certificate using Microsoft Active Directory Certificate Services:

1. Place the certificate in the Local Computer **Personal** certificate store.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Set the **Common Name** attribute of the Subject Distinguished Name (Subject DN) of the certificate to the fully qualified domain name (FQDN) of the Universal Print Server. Specify this in the certificate template.
3. Set the Cryptographic Service Provider (CSP) used to generate the certificate request and private key to **Microsoft Enhanced RSA and AES Cryptographic Provider (Encryption)**. Specify this in the certificate template.
4. Set the Key Size to at least 2048 bits. Specify this in the certificate template.

For more information on creating and installing certificates, see Manage certificates.

Configuring SSL on the Universal Print Server

The XTE Service on the Universal Print Server listens for incoming connections. It functions as an SSL server when SSL is enabled. The incoming connections have two types: print web service connections, which contain printing commands, and print data stream connections, which contain print jobs. SSL can be enabled on these connections. SSL protects the confidentiality and integrity of these connections. By default, SSL is disabled.

The PowerShell script used to configure SSL is on the installation media and has this file name: `\Support\Tools\SslSupport\Enable-UpsSsl.ps1`.

Configuring listening port numbers on the Universal Print Server

These are the default ports for the XTE Service:

- Cleartext print web service (HTTP) TCP port: 8080
- Cleartext print data stream (CGP) TCP port: 7229
- Encrypted print web service (HTTPS) TCP port: 8443
- Encrypted print data stream (CGP) TCP port: 443

To change the ports used by the XTE Service on the Universal Print Server, run the following commands in PowerShell as administrator (see the later section for notes on the usage of the Enable-UpsSsl.ps1 PowerShell script):

1. `Stop-Service CitrixXTEServer, UpSvc`
2. `Enable-UpsSsl.ps1 -Enable -HTTPSPort <port> -CGPSSLPort <port>` or `Enable-UpsSsl.ps1 -Disable -HTTPPort <port> -CGPPort <port>`
3. `Start-Service CitrixXTEServer`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TLS settings on Universal Print Server

If you have multiple Universal Print Servers in a load-balanced configuration, ensure that the **TLS** settings are configured consistently across all Universal Print Servers.

When you configure TLS on Universal Print Server, permissions on the installed TLS certificate are changed, giving the Universal Printing Service read access to the certificate's private key, and informing the Universal Printing Service of the following:

- Which certificate in the certificate store to use for TLS.
- Which TCP port numbers to use for TLS connections.

The Windows Firewall (if enabled) must be configured to allow incoming connections on these TCP ports. This configuration is done for you when you use the Enable-UpsSsl.ps1 PowerShell script.

- Which versions of the TLS protocol to allow.

Universal Print Server supports TLS protocol versions 1.3 and 1.2. Specify the minimum allowed version.

The default TLS protocol version is 1.2.

> **Note:**
>
> TLS 1.1 and 1.0 are no longer supported from Citrix Virtual Apps and Desktops version 2311.

- Which TLS cipher suites to allow.

A cipher suite selects the cryptographic algorithms that are used for a connection. VDAs and Universal Print Server can support different sets of cipher suites. When a VDA connects and sends a list of supported TLS cipher suites, the Universal Print Server matches one of the client's cipher suites with one of the cipher suites in its own list of configured cipher suites and accepts the connection. If there is no matching cipher suite, the Universal Print Server rejects the connection.

The Universal Print Server supports the following sets of cipher suites named GOV(ernment), COM(mercial), and ALL for the OPEN, FIPS, and SP800-52 native Crypto Kit modes. The acceptable cipher suites also depend on the **SSL FIPS Mode** policy setting and on the Windows FIPS Mode. See this Microsoft support article for information about Windows FIPS mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cipher suite (in decreasing priority order)	OPEN ALL	OPEN COM	OPEN GOV	FIPS ALL	FIPS COM	FIPS GOV	SP800-52 ALL	SP800-52 COM	SP800-52 GOV
TLS_ECDHE_RSA_AES256_GCM_SHA384	X		X	X		X	X		X
TLS_ECDHE_RSA_AES256_CBC_SHA384	X		X	X		X	X		X
TLS_ECDHE_RSA_AES256_CBC_SHA	X	X		X	X		X	X	

Configure TLS on a Universal Print Server using the PowerShell script

Install the TLS Certificate in the **Local Computer > Personal > Certificates** area of the certificate store. If more than one certificate resides in that location, supply the thumbprint of the certificate to the `Enable-UpsSsl.ps1` PowerShell script.

> **Note:**
>
> The PowerShell script finds the correct certificate based on the FQDN of the Universal Print Server. You do not need to supply the certificate thumbprint when only a single certificate is present for the Universal Print Server FQDN.

The `Enable-UpsSsl.ps1` script enables or disables TLS connections originating from the VDA to the Universal Print Server. This script is available in the **Support > Tools > SslSupport** folder on the installation media.

When you enable TLS, the script disables all existing Windows Firewall rules for the Universal Print Server's TCP ports. It then adds new rules that allow the XTE Service to accept incoming connections only on the TLS TCP and UDP ports. It also disables the Windows Firewall rules for:

- Cleartext print web service connections (default: 8080)
- Cleartext print data stream (CGP) connections (default: 7229)

The effect is that the VDA can make these connections only when using TLS.

> **Note:**
>
> Enabling TLS does not affect Windows Print Spooler RPC/SMB connections originating from the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> VDA and going to the Universal Print Server.
>
> **Important:**
>
> Specify either **Enable** or **Disable** as the first parameter. The CertificateThumbprint parameter is optional if only one certificate in the Local Computer Personal certificate store has the Universal Print Server's FQDN. The other parameters are optional.

Syntax

```
1 Enable-UpsSSL.ps1 -Enable [-HTTPPort <port>] [-CGPPort <port>] [-
      HTTPSPort <port>] [-CGPSSLPort <port>] [-SSLMinVersion <version>] [-
      SSLCipherSuite <name>] [-CertificateThumbprint <thumbprint>] [-
      FIPSMode <Boolean>] [-ComplianceMode <mode>]
2 Enable-UpsSSL.ps1 -Disable [-HTTPPort <portnum>] [-CGPPort <portnum>]
```

Parameter	Description
Enable	Enables SSL/TLS on the XTE Server. Either this parameter or the Disable parameter is required.
Disable	Disables SSL/TLS on the XTE Server. Either this parameter or the Enable parameter is required.
CertificateThumbprint "<thumbprint>"	Thumbprint of the TLS certificate in the Local Computer Personal certificate store, enclosed in quotation marks. The script uses the specified thumbprint to select the certificate you want to use.
HTTPPort <port>	Cleartext print web service (HTTP/SOAP) port. Default: 8080
CGPPort <port>	Cleartext print data stream (CGP) port. Default: 7229
HTTPSPort <port>	Encrypted print web service (HTTPS/SOAP) port. Default: 8443
CGPSSLPort <port>	Encrypted print data stream (CGP) port. Default: 443
SSLMinVersion "<version>"	Minimum TLS protocol version, enclosed in quotation marks. Valid values: "TLS_1.2"and "TLS_1.3". Default: TLS_1.2.
SSLCipherSuite "<name>"	Name of TLS cipher suite package, enclosed in quotation marks. Valid values: "GOV", "COM", and "ALL"(default).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
FIPSMode <Boolean>	Enables or disables FIPS 140 mode in the XTE Server. Valid values: $true to enable FIPS 140 mode, $false to disable FIPS 140 mode.

Examples

The following script enables TLS. The thumbprint (represented as "12345678987654321"in this example) is used to select the certificate to use.

```
Enable-UpsSsl.ps1 –Enable -CertificateThumbprint "12345678987654321"
```

The following script disables TLS.

```
Enable-UpsSsl.ps1 –Disable
```

Configuring FIPS mode

Enabling US Federal Information Processing Standards (FIPS) mode ensures that only FIPS 140 compliant cryptography is used for Universal Print Server encrypted connections.

Configure FIPS mode on the server before configuring FIPS mode on the client.

Consult Microsoft's documentation site for enabling/disabling Windows FIPS mode.

Enabling FIPS mode on the client

On the Delivery Controller™, run Web Studio and set the **UPS FIPS Mode** Citrix policy setting to **Enabled**. Enable the Citrix policy.

Do this on each VDA:

1. Enable Windows FIPS mode.
2. Restart the VDA.

Enabling FIPS mode on the server

Do this on each Universal Print Server:

1. Enable Windows FIPS mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Run this PowerShell command as Administrator: `stop-service CitrixXTEServer, UpSvc`
3. Run the `Enable-UpsSsl.ps1` script with the `-Enable -FIPSMode $true` parameters.
4. Restart the Universal Print Server.

Disabling FIPS mode on the client

On Web Studio, set the **UPS FIPS Mode** Citrix policy setting to **Disabled**. Enable the Citrix policy. You can also delete the **UPS FIPS Mode** Citrix policy setting.

Do this on each VDA:

1. Disable Windows FIPS mode.
2. Restart the VDA.

Disabling FIPS mode on the server

Do this on each Universal Print Server:

1. Disable Windows FIPS mode.
2. Run this PowerShell command as Administrator: `stop-service CitrixXTEServer, UpSvc`
3. Run the `Enable-UpsSsl.ps1` script with the `-Enable -FIPSMode $false` parameters.
4. Restart the Universal Print Server.

> **Note:**
>
> FIPS mode is not supported when the SSL protocol version is set to TLS 1.3.

Configuring SSL/TLS protocol version

The default SSL/TLS protocol version is TLS 1.2. TLS 1.2 and TLS 1.3 are the recommended SSL/TLS protocol versions for production use. For troubleshooting, it might be necessary to temporarily change the SSL/TLS protocol version in a non-production environment.

SSL 2.0 and SSL 3.0 are not supported on the Universal Print Server.

Setting SSL/TLS protocol version on the server

Do this on each Universal Print Server:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Run this PowerShell command as Administrator: `stop-service CitrixXTEServer, UpSvc`
2. Run the `Enable-UpsSsl.ps1` script with the `-Enable -SSLMinVersion` version parameters. Remember to set this back to TLS 1.2 or TLS 1.3 when you are done testing.
3. Restart the Universal Print Server.

Setting SSL/TLS protocol version on the client

In Studio, set the **SSL Protocol Version** policy setting to the desired protocol version and enable the policy.

Ensure that the VDA's operating system supports the selected TLS version. For supported TLS versions on Windows, see Microsoft Learn - TLS protocol version support. To configure the registry to override defaults, see Microsoft Learn - TLS, DTLS, and SSL protocol version settings.

Troubleshooting

If a connection error occurs, check the C:\Program Files (x86)\Citrix\XTE\logs\error.log file on the Universal Print Server.

The error message **SSL handshake from client failed** appears in this log file if the SSL/TLS handshake fails. Such failures can occur if the SSL/TLS protocol version on the VDA and the Universal Print Server do not match.

Use the Universal Print Server FQDN in the following policy settings that contain Universal Print Server host names:

- Session printers
- Printer assignments
- Universal Print Servers for load balancing

Ensure that the system clock (date, time, and time zone) are correct on the Universal Print Servers and the VDAs.

Virtual channel allow list

May 15, 2026

The virtual channel allow list is a feature that allows you to control which non-Citrix virtual channels are allowed in your environment. By default, the virtual channel allow list feature is enabled. As a result, only Citrix virtual channels are allowed to open in Citrix Virtual Apps and Desktops™ sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If there is a need to use custom virtual channels, whether homegrown or from a third party, these need to be explicitly added to the allow list.

Configuration

The virtual channel allow list is enabled by default. You can configure this feature using the following settings in the Citrix policy:

- **Virtual channel allow list**: to enable or disable the feature and to add virtual channels to the list.
- **Virtual channel allow list log throttling**: sets the throttling period for the virtual channel allow list event logging.
- **Virtual channel allow list logging**: sets the logging level for the virtual channel allow list.

Adding virtual channels to the allow list

To add a virtual channel to the allow list, you need the following information:

1. The virtual channel name as defined in the code, which can be up to seven characters long. For example, `CTXCVC1`.
2. The paths to the processes that open the virtual channel on the VDA machine. For example, `C:\Program Files\Application\run.exe`.

Once you have the required information, you must add the virtual channel to the allow list using the Virtual channel allow list policy setting. To add a virtual channel to the list, enter the virtual channel name followed by a comma, and then the path to the process that accesses the virtual channel. If there are multiple processes, you can add these processes by separating each process with commas.

For single processes

Using the previous examples, add the following entry to the list:

```
CTXCVC1,C:\Program Files\Application\run.exe
```

For multiple processes

If there are multiple processes, add the following entry to the list:

```
CTXCVC1,C:\Program Files\Application\run.exe,C:\Program Files\Application
\run2.exe
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using wildcards

The use of wildcards (*) is supported. You can use wildcards when the names of directories or executables change based on the version of the application, or if the third-party component is installed in the users' profiles.

You can use wildcards in the following scenarios:

- To replace the full directory name.
  For example: `C:\Program Files\Application\*\run1.exe`
- To replace part of the directory name.
  For example: `C:\Program Files\Application\v*\run1.exe`
- To replace the executable's name.
  For example: `C:\Program Files\Application\v1.2\*.exe`
- To replace part of the executable's name.
  For example: `C:\Program Files\Application\v1.2\run*.exe`

The following restrictions apply:

- The wildcard can only be used to replace a single directory. For example, if the executable is located in `C:\Program Files\Application\v1.2\run1.exe`
  - Allowed: `C:\Program Files\Application\*\run1.exe`
  - Not allowed: `C:\Program Files\*\run1.exe`
- Entries must contain the file name extension.
  - Allowed: `C:\Program Files\Application\v1.2\*.exe`
  - Not allowed: `C:\Program Files\Application\v1.2\*`
- All paths must be local.

> **Note:**
>
> - Network paths are not allowed.
> - Wildcard support is available from Citrix Virtual Apps and Desktops™ 2206.
> - Wildcard support is available in Citrix Virtual Apps and Desktops 2203 LTSR from CU2.

Using system environment variables

You can use system environment variables to simplify the definition of the trusted processes in your allow list. You can use any of the out-of-box variables, such as `%programfiles%`, `%programfiles(x86)%`, `%systemdrive%`, and `%systemroot%`.

You can also use custom environment variables as long as they are defined at the system level.

The following examples depict out-of-box environment variables:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `%programfiles%\Application\v1.2\run.exe`
- `%programfiles%\Application\*\run.exe`
- `%programfiles(x86)%\Application\v1.*\run.exe`

The following example depicts a custom system environment variable:

- Custom variable name: `app`
- Custom variable value: `%programfiles%\Application\`
- Allow list entry: `CTXCVC1,%app%\run.exe`

> **Note:**
>
> User environment variables are not supported.
>
> Environment variable support is available from Citrix Virtual Apps and Desktops version 2209.

Obtain virtual channel names and processes

The easiest way to obtain the name of the virtual channel and the process that opens it on the VDA machine is to get the information from the developer or a third-party vendor that provided the virtual channel.

Alternatively, you can obtain information by applying the feature's logs and following these steps:

1. Once the client and server components of the custom virtual channel are in place, launch a virtual application or virtual desktop.
2. In the VDA machine's System event log, look for the custom virtual channel's name and the process that tried to open it. For more information on available events, see Event logs.
3. Log out from the session.
4. Add an entry in the virtual channel allow list policy settings for the identified virtual channel and process.
5. Restart the machine.
6. Once the VDA is registered, run the virtual application or virtual desktop to validate that the custom virtual channels open successfully.

Considerations for Citrix virtual channels

All built-in Citrix virtual channels are trusted and allowed to open without further configuration. However, the following two features require explicit entries in the allow list because of external dependencies:

- Multimedia Redirection
- HDX RealTime Optimization Pack for Skype for Business

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Multimedia Redirection

If you use a media player other than Windows Media Player as your system media player, you need to add it to the allow list as a trusted process. The following information is required for the allow list entry:

- Virtual channel name: `CTXMM`
- Process: Path to the media player used in your VDA machine. For example, `C:\Program Files (x86)\Windows Media Player\wmplayer.exe`.
- Allow list entry: `CTXMM,C:\Program Files (x86)\Windows Media Player\wmplayer.exe`

HDX RealTime Optimization Pack for Skype for Business

The following information is required for the allow list entry:

- Virtual channel name: `CTXRMEP`
- Process: Path to the Skype for Business executable in your VDA machine, which can vary based on the version of Skype for Business or if you used a custom installation path. For example, `C:\Program Files\Microsoft Office\root\Office16\lync.exe`.
- Allow list entry: `CTXRMEP,C:\Program Files\Microsoft Office\root\Office16\lync.exe`

WebSocket communication between VDA and Delivery Controller™

May 13, 2026

This article describes how to set up a WebSocket connection for communication between VDAs and Delivery Controllers as an alternative to using WCF communication. It provides the benefit that only the TLS port 443 for communication from the VDA to the Delivery Controller.

How it works

The following sections describes the workflow for the WebSocket connection between a Delivery Controller and a VDA:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

During normal brokering operation

1. Citrix Virtual Apps and Desktops™ admins initiate the process by provisioning VDAs using the Machine Creation Service (MCS).
2. During the MCS provisioning process, MCS generates public-private key pairs for each VDAs and registers the public keys with the FMA trust service on the Delivery Controller. MCS saves the public-private key pair as a file under the identity disk on the VDAs.
3. When the VDA machine boots up, the MCS agent installed on the VDA machine reads the key pair from the identity disk and writes this information to the VDA registry location.
4. The broker agent installed on the VDA reads the key pairs from the registry and generates an SSL-enabled WebSocket request to the Delivery Controller with the service key signed by the private key.
5. The Delivery Controller verifies the signed service key authorization header with the public key from the FMA trust service.
6. Once the verification is complete, the system establishes the WebSocket connection between the VDA and the Delivery Controller.

When LHC mode becomes active

If you enable the Websocket support for LHC, then during the LHC mode, when a VDA tries to establish a Websocket connection with the High Availability Service, the High Availability Service verifies the signed service key authorization header with the public key from the local database. This authenticates the Websocket connection and the WebSocket connection between the VDA and Delivery Controller is successful even in LHC mode.

WebSocket support

Before you begin

1. Configure your site. For more information, see Create a site.
2. Install TLS certificates on the Delivery Controllers. For more information, see Install TLS server certificates on Controllers.
3. Install root CA and intermediate CA on VDA to trust the Delivery Controller.

Procedure

Follow the instructions to set up a WebSocket connection:

1. Enable WebSocket connection on the Delivery Controller. Run the following command on each Delivery Controller present on your site:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-ItemProperty "HKLM:\SOFTWARE\Citrix\DesktopServer\WorkerProxy
"-Name "WebSocket_Enabled"-PropertyType "DWord"-Value 1 -Force
```

2. Restart the Broker Service after enabling the WebSocket.
3. Enable websocket support for the LHC mode. Run the following command on each Delivery Controller present on your site:

```
1 New-ItemProperty "HKLM:\SOFTWARE\Citrix\DesktopServer\LHC" -Name "
    WebSocketEnabledLhc" -PropertyType "DWord" -Value 1 -Force
```

4. Create a machine catalog for AD-joined VDAs with MCS provisioning. For more information, see Create machine catalog.
5. Create a delivery group and add your VDA to it. For more information, see Create delivery groups.
6. Enable WebSocket connection on the VDA. Run the following PowerShell command on the VDA:

```
1 New-ItemProperty "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\
    Services\CitrixBrokerAgent\WebSocket" -Name "Enabled" -
    PropertyType "DWord" -Value 1 -Force
```

   - To check if WebSocket is enabled, check the following registry key value. The value of `Enabled` must be 1.

     Key:

     ```
     1 HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\
         CitrixBrokerAgent\WebSocket
     ```

     Name: Enabled

     Type: REG_DWORD

     Value: 1

HDX™ connectivity

May 13, 2026

Citrix HDX represents a broad set of technologies that deliver a high-definition experience to users of centralized applications and desktops, on any device and over any network.

HDX is designed around three technical principles:

- Intelligent redirection
- Adaptive compression

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Data de-duplication

Applied in different combinations, they optimize the IT and user experience, decrease bandwidth consumption, and increase user density per hosting server.

Within the HDX offering, you can connect over a unique, proprietary transport protocol, utilize the maximum transmission units when establishing sessions, and optimize connectivity with Citrix SD-WAN.

Adaptive transport

May 15, 2026

Adaptive Transport is a mechanism in Citrix Virtual Apps and Desktops™ that allows establishing connections for HDX sessions using a preferred transport protocol while providing a fallback to TCP if connectivity with the preferred protocol is unavailable.

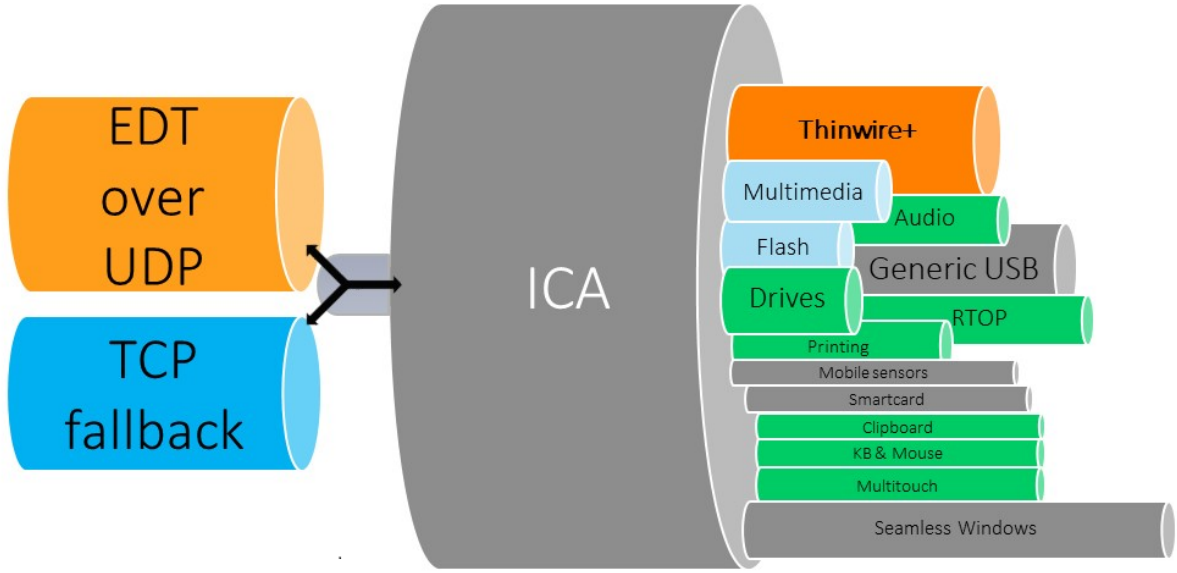
The following transport protocols are supported:

- Enlightened Data Transport (EDT)
- Transmission Control Protocol (TCP)

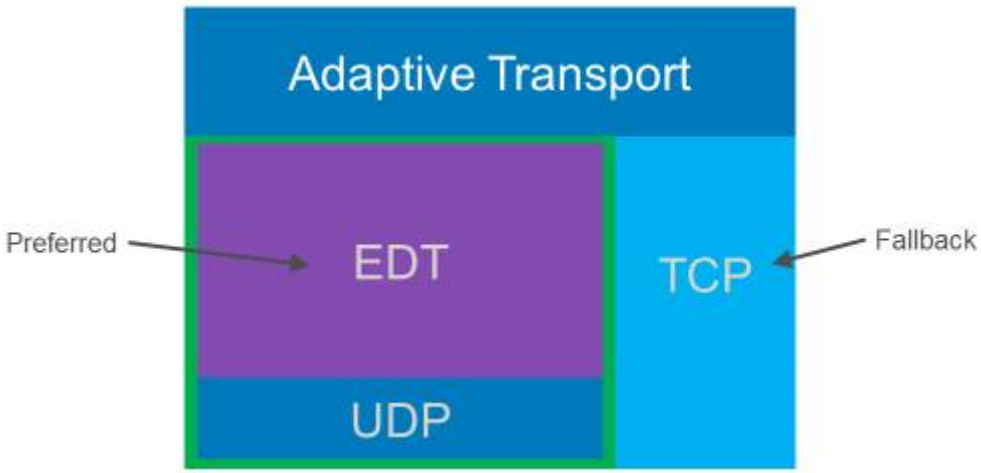
Configuration

Adaptive Transport is enabled by default. You can configure Adaptive Transport to operate in the following modes:

- **Preferred**: (Default) The client attempts to connect with the preferred protocol and falls back to TCP if connectivity with the preferred protocol is unavailable.
- **Diagnostic mode**: The client only attempts to connect using the preferred protocol. Fall back to TCP is disabled.
- **Off**: The client only attempts to connect using TCP.



How it works



When **Adaptive Transport** is set to `Preferred`, the client attempts to connect to the session with both the preferred protocol and TCP in parallel. This allows optimizing the connection time if it's not possible to connect with the preferred protocol and the client must fall back to using TCP. If the connection is established using TCP, the client attempts to connect with the preferred protocol in the background every five minutes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When **Adaptive Transport** is set to `Diagnostic mode`, the client connects to the session only with the preferred protocol. If the client is unable to establish a connection using the preferred protocol, it doesn't fall back to using TCP, and the connection fails.

When **Adaptive Transport** is set to `Off`, **Adaptive Transport** is disabled, and the client connects to the session using TCP only.

System requirements

The following are the requirements for using Adaptive Transport and EDT:

- Control plane
  - Citrix DaaS (formerly Citrix Virtual Apps and Desktops™ service)
  - Citrix Virtual Apps and Desktops: currently supported version

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Virtual Delivery Agent
  - Windows: currently supported version (2402 or later is recommended)
  - Linux: currently supported version (2402 or later is recommended)
- Citrix Workspace™ app
  - Windows: currently supported version (2402 or later is recommended)
  - Linux: currently supported version (2402 or later is recommended)
  - Mac: currently supported version (2402 or later is recommended)
  - iOS: latest version available in the Apple App Store
  - Android: latest version available in Google Play
- Citrix NetScaler® Gateway
  - 14.1.12.30 or later (recommended)
  - 13.1.17.42 or later (13.1-52.19 or later recommended)

> **Note:**
>
> For details on Linux VDA, see the Linux Virtual Delivery Agent documentation.

Network requirements

The following sections are the network requirements for using EDT with Adaptive Transport:

Session hosts

If your session hosts have a firewall such as Windows Defender Firewall, you must allow the following inbound traffic for internal connections.

Description	Source	Protocol	Port
Internal connection - Session Reliability enabled	Client	UDP	2598
Internal connection - Session Reliability disabled			1494
Internal connection - HDX™ Direct or VDA SSL			443

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The VDA installer adds the appropriate inbound rules to the Windows Defender Firewall. If you use a different firewall, you must add the rules above.

Internal network

The following table depicts the firewall rules required for using EDT in your network:

Description	Protocol	Source	Destination	Destination port
Direct internal connection - Session Reliability enabled	UDP	Client network	VDA network	2598
Direct internal connection - Session Reliability disabled				1494
Direct internal connection - HDX Direct or VDA SSL				443
NetScaler Gateway		NetScaler SNIP		2598
NetScaler Gateway - VDA SSL				443

> **Note:**
>
> If you are using Citrix Gateway Service, you must enable **Rendezvous** to use EDT as your transport protocol. See the Rendezvous documentation for system and network requirements.

Client network

The following table outlines the connectivity requirements for client devices:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Description	Protocol	Source	Destination	Destination port
Internal connection - Session Reliability enabled	UDP	Client IP	VDA network	2598
Internal connection - Session Reliability disabled				1494
Internal connection - HDX Direct or SSL VDA				443
External connection - NetScaler Gateway			NetScaler Gateway public IP address	443
External connection - Citrix Gateway Service			Citrix Gateway Service	443

> **Note:**
>
> If you are using Citrix Gateway Service, clients must be able to reach https://*.*.nssvc.net. If you can't allow all subdomains using https://*.*.nssvc.net, you can use https://*.c.nssvc.net and https://*.g.nssvc.net instead. For more information, see Knowledge Center article CTX270584.

Enlightened Data Transport

August 11, 2026

Enlightened Data Transport (EDT) is a Citrix-proprietary transport protocol built on top of User Datagram Protocol (UDP). It delivers a superior user experience on challenging long-haul connections while maintaining server scalability. EDT improves data throughput for all ICA® virtual channels on unreliable networks, providing a better and more consistent user experience.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When **Adaptive Transport** is enabled, EDT is the preferred protocol.

Things to know

- **Session Reliability** must be enabled to use **MTU Discovery** and EDT with NetScaler® Gateway and Citrix Gateway Service.
- Packet fragmentation can cause performance degradation or even failure to open sessions in some cases. To prevent this, you must adjust the EDT MTU to a value adequate for your networks. You can use EDT MTU Discovery or a manual workaround described in How to configure MSS when using EDT on networks with non-standard MTU.
- For details on enabling the use of EDT with NetScaler Gateway, see Configure NetScaler Gateway to support Enlightened Data Transport.

EDT MTU Discovery

MTU Discovery allows EDT to automatically determine the Maximum Transmission Unit (MTU) when establishing a session. Doing so prevents EDT packet fragmentation that might result in performance degradation or failure to establish a session.

MTU Discovery is enabled by default. If you need to disable it, see HDX features managed through the registry for details.

> **Note:**
>
> - **Session Reliability** must be enabled for MTU Discovery to work.
> - MTU Discovery with Multi-Stream ICA is available with VDA versions 2209 and later.

EDT MTU Rediscovery

MTU Rediscovery allows EDT to automatically adjust the MTU for an active session if a lower MTU is detected after the initial connection, ensuring optimal performance and reliability.

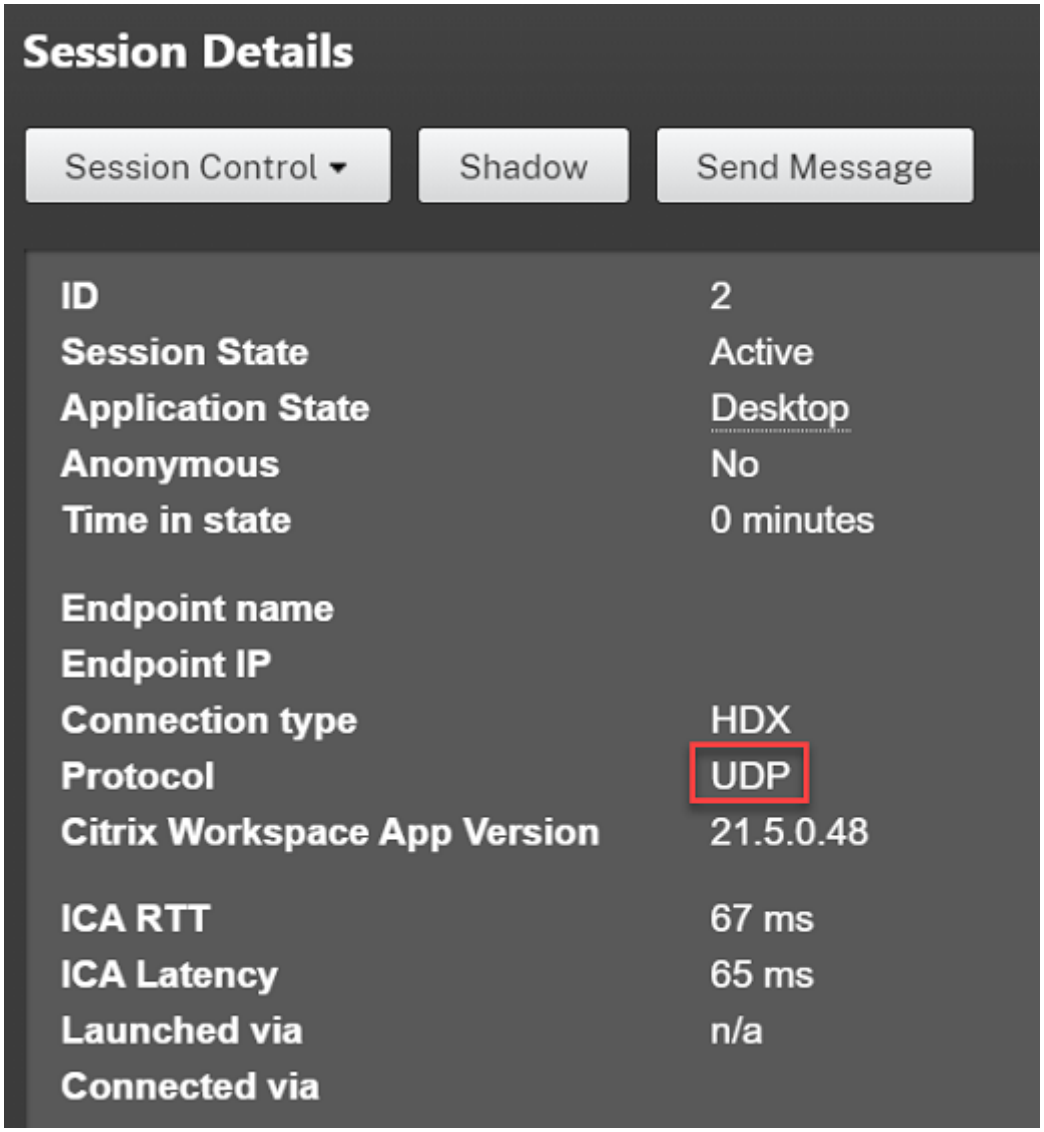
MTU Rediscovery can be configured via Citrix policy using the following setting:

- **MTU Rediscovery**:
  - Off: MTU Rediscovery is disabled.
  - Static: when a decrease in MTU is detected, the session's MTU is set to 1200 for the remainder of the session.
  - Dynamic: when a decrease in MTU is detected in an active session, MTU discovery is trigerred to determine an optimal MTU for the connection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, this setting is disabled.

> **Note:**
>
> - **Session Reliability** must be enabled for MTU Rediscovery to work.
> - MTU Rediscovery requires Workspace app for Windows 2607 or later.
> - If you had previously configured MTU Rediscovery through the registry, you must remove the registry configuration to be able to configure MTU Rediscovery with the policy setting.

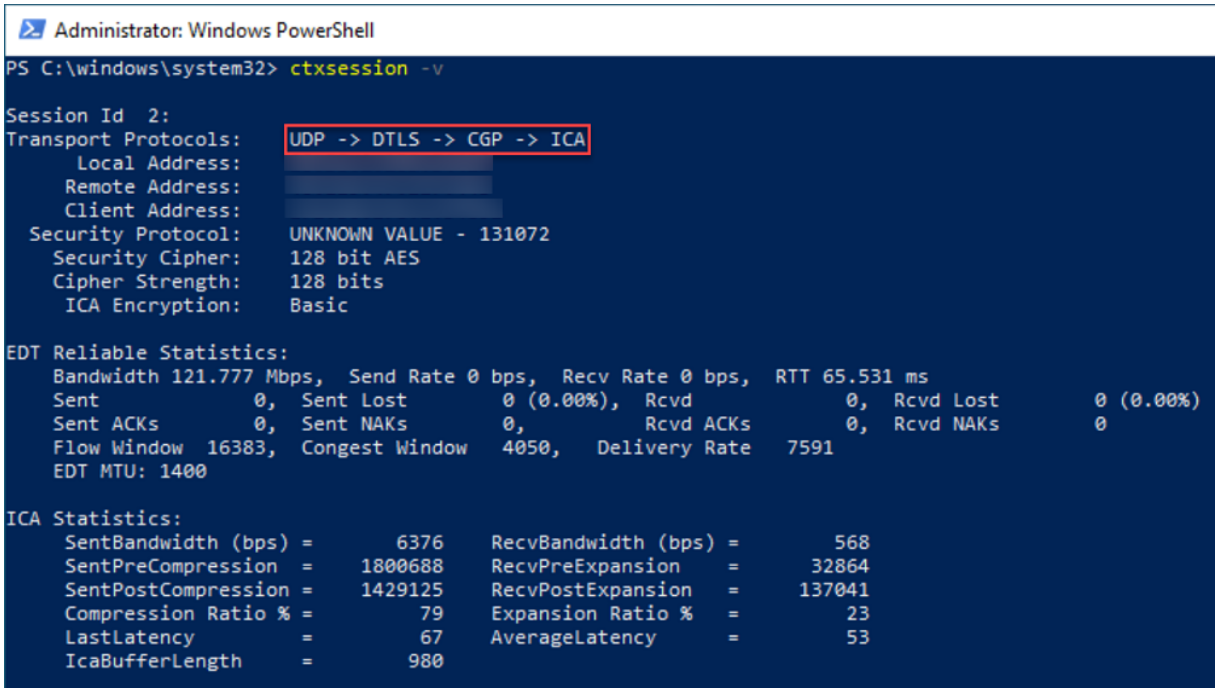


Troubleshooting

May 13, 2026

To confirm that EDT is being used as the transport protocol for the session, you can use Director or the `CtxSession.exe` command-line utility on the VDA.

In Director, look up the session and select **Details**. If the **Connection type** is HDX™ and the **Protocol** is UDP, EDT is being used as the transport protocol for the session.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

To use the CtxSession.exe utility, launch a Command Prompt or PowerShell within the session and run `ctxsession.exe`. To see verbose statistics, run `ctxsession.exe -v`. If EDT is in use, the transport protocol shows one of the following:

- **UDP > ICA®** (Session Reliability disabled)
- **UDP > CGP > ICA** (Session Reliability enabled)
- **UDP > DTLS > CGP > ICA** (ICA is DTLS-encrypted end-to-end)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When sessions fail to connect with EDT

To troubleshoot **Adaptive Transport** and **EDT**, we suggest the following:

1. Review the System requirements, Network requirements, Known issues, and Things to know, and ensure that all items have been addressed.
2. Check if there are Citrix® policies in Studio or GPO overwriting the desired **HDX Adaptive Transport** setting.
3. Check if there are settings on the client overwriting the desired HDX Adaptive Transport setting. This can be a GPO preference, a setting configured using the optional Workspace app administrative template, or a manual configuration of the **HDXoverUDP** setting in the registry or client's configuration file.
4. On multi-session VDA machines, ensure that the UDP listeners are active. Open a command prompt in the VDA machine and run `netstat -a -p udp`. For more information, see How to Confirm HDX Enlightened Data Transport Protocol.
5. Check if the appropriate firewall rules have been configured in both network firewalls and firewalls running on the VDA machines.
6. Launch a direct session internally, bypassing the NetScaler® Gateway or Citrix Gateway Service, and check the protocol in use. If the session uses EDT, the VDA is ready to use EDT for external connections through NetScaler Gateway or Citrix Gateway Service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. If EDT works for direct internal connections and not for sessions going through NetScaler Gateway or Citrix Gateway Service:

    - Ensure that **Session Reliability** is enabled.
    - If using NetScaler Gateway, ensure that your configuration adheres to the required configuration outlined in Configure NetScaler Gateway to support Enlightened Data Transport and HDX Insight.

8. If using Citrix Gateway Service, ensure that Rendezvous is enabled and working.

9. Check if your users' connections require a non-standard MTU. Connections with an effective MTU lower than 1500 bytes cause EDT packet fragmentation, which in turn can affect performance or even cause session launch failures. This issue is common when using VPNs, some Wi-Fi access points, and mobile networks, such as 4G and 5G. Ensure that you either have MTU Discovery enabled or are setting a custom MTU as outlined in How to configure MSS when using EDT on networks with non-standing MTU.

Known issues

- Asymmetrical network paths can cause MTU Discovery to fail for connections that do not go through NetScaler Gateway or Citrix Gateway Service. To address this issue, upgrade to VDA version 2103 or later. [CVADHELP-16654]
- When using NetScaler Gateway, asymmetrical network paths can cause MTU Discovery to fail. This is due to an issue on Gateway that causes the Don't Fragment (DF) bit in the EDT packets' header not to be propagated. A fix for this issue is available, starting with firmware release 13.1 build 17.42. For details on how to enable the fix, see the NetScaler Gateway documentation. [CGOP-18438]
- MTU Discovery can fail for users that connect through a DS-Lite network. Some modems fail to honor the DF bit when packet processing is enabled, preventing MTU Discovery from detecting fragmentation. In this situation, the following are the available options:

    - Disable packet processing on the user's modem.
    - Disable **MTU Discovery** and use a hardcoded MTU as described in How to configure MSS when using EDT on networks with non-standing MTU.
    - Disable **Adaptive Transport** to force sessions to use TCP. If only a subset of users are affected, consider disabling it on the client side so that other users can continue to use EDT.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HDX™ Direct

May 13, 2026

When accessing Citrix-delivered resources, HDX Direct allows both internal and external client devices to establish a secure direct connection with the session host if direct communication is possible.

System requirements

The following are the system requirements for using HDX Direct:

- Control plane
  - Citrix DaaS™
  - Citrix Virtual Apps and Desktops™ 2503 or later
- Virtual Delivery Agent (VDA)
  - Windows: version 2503 or later
- Workspace app
  - Windows: version 2503 or later
  - Linux: version 2411 or later
  - Mac: version 2411 or later
- Access tier
  - Citrix Workspace™
  - Citrix Storefront™ 2503 or later
  - Citrix Gateway Service
  - Citrix NetScaler® Gateway

Network requirements

The following are the network requirements for using HDX Direct.

Session hosts

If your session hosts have a firewall such as Windows Defender Firewall, you must allow the following inbound traffic for internal connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Description	Source	Protocol	Port
Direct internal connection	Client	TCP	443
Direct internal connection	Client	UDP	443

> Note:
>
> The VDA installer adds the appropriate inbound rules to Windows Defender Firewall. If you use a different firewall, you must add the rules above.

Client network

The following table describes the client network for internal and external users.

Internal users

Description	Protocol	Source	Source port	Destination	Destination port
Direct internal connection	TCP	Client network	1024–65535	VDA network	443
Direct internal connection	UDP	Client network	1024–65535	VDA network	443

External users

Description	Protocol	Source	Source port	Destination	Destination port
STUN (external users only)	UDP	Client network	1024–65535	Internet (see note below)	3478, 19302
External user connection	UDP	Client network	1024–65535	Data center's public IP address	1024–65535

Data center network

The following table describes the data center network for internal and external users.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Internal users

Description	Protocol	Source	Source port	Destination	Destination port
Direct internal connection	TCP	Client network	1024–65535	VDA network	443
Direct internal connection	UDP	Client network	1024–65535	VDA network	443

External users

Description	Protocol	Source	Source port	Destination	Destination port
STUN (external users only)	UDP	VDA network	1024–65535	Internet (see note below)	3478, 19302
External user connection	UDP	DMZ / Internal network	1024–65535	VDA network	55000–55250
External user connection	UDP	VDA network	55000–55250	Client's public IP	1024–65535

> **NOTE:**
>
> Both the VDA and Workspace app attempt to send STUN requests to the following servers in the same order:
>
> - stun.cloud.com:3478
> - stun.cloudflare.com:3478
> - stun.l.google.com:19302
>
> If you change the default port range for external user connections using the **HDX Direct port range** policy setting, the corresponding firewall rules must match your custom port range.

Configuration

HDX Direct is disabled by default. You can configure this feature using the **HDX Direct** setting in the Citrix policy.

- **HDX Direct**: To enable or disable a feature.
- **HDX Direct mode**: Determines if **HDX Direct** is available for internal clients only or for both internal and external clients.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **HDX Direct port range**: Defines the port range that the VDA uses for connections from external clients.

If needed, the list of STUN servers used by HDX Direct can be modified by editing the following registry value:

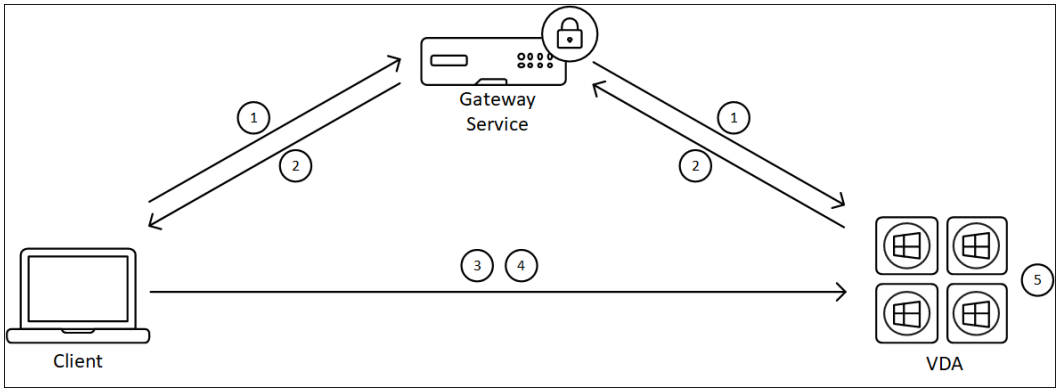
- Key: HKLM\SOFTWARE\Citrix\HDX-Direct
- Value type: REG_MULTI_SZ
- Value name: STUNServers
- Data: stun.cloud.com:3478 stun.cloudflare.com:3478 stun.l.google.com:19302

> **NOTE:**
>
> HDX Direct for external users is only available with EDT (UDP) as the transport protocol. Therefore, Adaptive Transport must be enabled.

Considerations

The following are considerations for using HDX Direct:

- HDX Direct for external users is only available with EDT (UDP) as the transport protocol. Therefore, **Adaptive Transport** must be enabled.
- If you are using **HDX Insight**, note that using **HDX Direct** prevents the HDX Insight data collection, as the session would no longer be proxied through NetScaler Gateway.
- In environments with multi-session session hosts, HDX Direct requires the user logon to complete within one minute. If logon time exceeds this threshold, HDX Direct will not be triggered and the session will remain connected through the Gateway. You can increase the HDX Direct timeout to support longer logon times. Refer to HDX features managed through the registry for details.



How it works

HDX Direct allows clients to establish a direct connection to the session host when direct communication is available. When direct connections are made using HDX Direct, self-signed certificates are used to secure the direct connection with network level-encryption (TLS/DTLS).

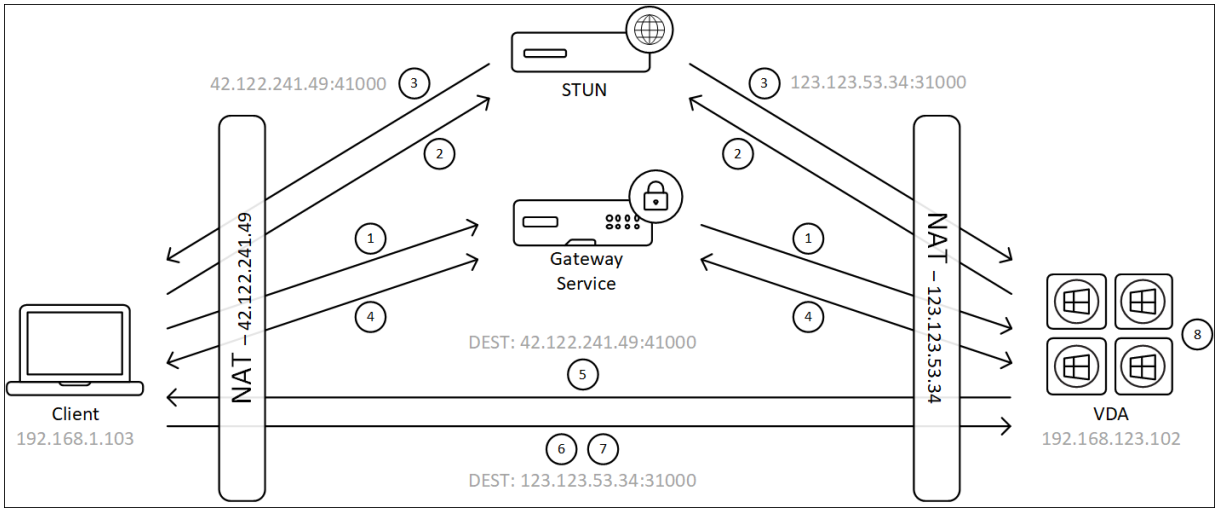
Internal users

The following diagram depicts the overview of the HDX Direct connection process of internal users.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. The client establishes an HDX session through the Gateway Service.
2. Upon a successful connection, the VDA sends to the client the VDA machine's FQDN, a list of its IP addresses, and the VDA machine's certificate via the HDX connection.
3. The client probes the IP addresses to see if it can reach the VDA directly.
4. If the client can reach the VDA directly with any of the IP addresses shared, the client establishes a direct connection with the VDA, secured with (D)TLS using a certificate that matches the one exchanged in step (2).
5. Once the direct connection is successfully established, the session is transferred to the new connection, and the connection to the Gateway Service is terminated.

> **Note:**
>
> After establishing the connection in step 2, above, the session is active. The subsequent steps do not delay or interfere with the user's ability to use the virtual application or desktop. If any of the subsequent steps fail, the connection through the Gateway is maintained without interrupting the user's session.



Traditional direct connections When using Storefront, Workspace with Direct Workload Connection, or Workspace configured for internal-only connectivity, direct connections are established between the client and the session host without the need to route through a Gateway first.

In these instances, HDX Direct is not triggered since the connections are inherently direct. However, if HDX Direct is enabled, these connections will leverage the HDX Direct certificates to secure the sessions.

External users

The following diagram depicts the overview of the HDX Direct connection process for external users:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. The client establishes an HDX session through the Gateway Service.
2. Upon a successful connection, both the client and the VDA send a STUN request to discover their public IP addresses and ports.
3. The STUN server responds to the client and VDA with their corresponding public IP addresses and ports.
4. Through the HDX connection, the client and the VDA exchange their public IP addresses and UDP ports, and the VDA sends its certificate to the client.
5. The VDA sends UDP packets to the client's public IP address and UDP port. The client sends UDP packets to the VDA's public IP address and UDP port.
6. Upon receipt of a message from the VDA, the client responds with a secure connection request.
7. During the DTLS handshake, the client verifies that the certificate matches the certificate exchanged in step (4). After validation, the client sends its authorization token. A secure direct connection is now established.
8. Once the direct connection is successfully established, the session is transferred to the new connection, and the connection to the Gateway Service is terminated.

> **Note:**
>
> After establishing the connection in step 2, above, the session is active. The subsequent steps do not delay or interfere with the user's ability to use the virtual application or desktop. If any of the subsequent steps fail, the connection through the Gateway is maintained without interrupting the user's session.

Certificate management

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Overview

HDX™ Direct connections are secured with network level encryption. To facilitate this, each session host has a unique self-signed root CA certificate and a corresponding server certificate, which is signed by the self-signed root CA certificate.

This solution provides the following advantages:

- **Streamlined Security:** HDX Direct connections are secured without the administrative overhead of managing certificates within the environment.
- **Reduced Attack Surface:** The attack surface is limited to a single host because each host has a unique set of keys and certificates.
- **Enhanced Security for Non-Persistent Environments:** In environments with non-persistent session hosts, security is further enhanced as new keys and certificates are generated upon restart.

Session host

The **Citrix ClxMtp Service** and the **Citrix Certificate Manager Service** are the two services responsible for managing certificates on each session host. The ClxMtp Service handles key generation and rotation, while the Certificate Manager Service generates and manages the certificates.

Two certificates are created: a self-signed root CA and a server certificate. Both are issued with a two-year validity period; however, they are replaced when keys are rotated. Additionally, new certificates are generated each time non-persistent machines restart.

Details for each certificate are as follows:

- **Self-signed Root CA**
  - Issued to: CA-Citrix-Certificate-Manager
  - Issued by: CA-Citrix-Certificate-Manager
  - Issuer details: The organization is Citrix Systems, Inc.
- **Server Certificate**
  - Issued to: <host FQDN> (For example, FTLW11-001.ctxlab.net)
  - Issued by: CA-Citrix-Certificate-Manager
  - Issuer details: The organization is Citrix Systems, Inc.

> **NOTE:**
>
> The Citrix Certificate Manager Service generates RSA certificates that leverage 2048-bit keys.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> If there is an existing machine certificate created by the Citrix Certificate Manager Service and the subject name does not match the machine's FQDN, a new certificate is generated.

Key rotation

The **Citrix ClxMtp Service** automatically rotates keys every six months. However, you can trigger a key rotation manually by increasing the rotation counter in the session host's registry.

To rotate the keys, update the following value:

- Key: SOFTWARE\Citrix\ClxMtpConnectorSvcRotateKeyPairs
- Value type: DWORD
- Value name: ClxMtpRotateRequestCounter
- Data: integer (Decimal)

> **NOTE:**
>
> For first-time key rotation:
>
> 1. Create the ClxMtpConnectorSvcRotateKeyPairs key.
> 2. Create and set the ClxMtpRotateRequestCounter value to 1.
>
> For subsequent key rotations, increase the ClxMtpRotateRequestCounter value by 1.

Once the value is updated, the **Citrix ClxMtp Service** will automatically rotate the keys without requiring a restart. The **Citrix Certificate Manager Service** will then generate new certificates automatically once it detects new keys.

Client device

The root CA certificate is sent to the client by Workspace or Storefront™ through the already established secure and trusted connection path. This eliminates the need to distribute CA certificates to the client devices' certificate stores, and ensures that the client trusts the certificates used to secure the HDX Direct connection.

Using custom certificates

HDX Direct supports the use of certificates issued and managed by your own PKI. The following steps outline how to install your certificate, configure the necessary permissions, bind it to the session manager service, and enable the required TLS listeners.

1. Proceed to step 2 if HDX Direct is disabled on the machine. If HDX Direct is enabled, follow the steps below:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Open the registry editor (regedit.exe) and navigate to **HKLM\SYSTEM\CurrentControlSet\Control\Ter**
Server\Wds\icawd.
b) Set the **SSLEnabled** value to **0**.
c) Navigate to **HKLM\Software\Citrix\HDX-Direct**.
d) Set the **HdxDirectCaInTls** value to **0**.

2. Install the appropriate certificate issued by your PKI on the machine's certificate store.
3. Grant the session manager service read access to the certificate's private keys.

a) Launch the Microsoft management console (**MMC**): Start > Run > mmc.exe.
b) Navigate to **File > Add/Remove Snap-in**.
c) Select **Certificates**, then click **Add**.
d) Choose **Computer account** and click **Next**.
e) Select **Local computer** and click **Finish**.
f) Navigate to **Certificates (Local Computer) > Personal > Certificates**.
g) Right click on the appropriate certificate and select **All Tasks > Manage Private Keys**.
h) Add one of the following services and give it Read access:
- For **Single Session VDA**: `NT SERVICE\PorticaService`
- For **Multi Session VDA**: `NT SERVICE\TermService`

i) Click **Apply**, then **OK**.

4. Bind the certificate to the session manager service.

a) Retrieve the certificate thumbprint (double click on the certificate > **Details** > **Thumbprint**).
b) Open the registry editor (regedit.exe) and navigate to **HKLM\SYSTEM\CurrentControlSet\Control\Ter**
Server\Wds\icawd.
c) Edit the **SSLThumbprint** value and paste the certificate's thumbprint.

5. Enable the Citrix TLS listeners.

a) In the same registry location, set the **SSLEnabled** value to **1**.

6. Enable HDX Direct (in Citrix policy).

The Citrix Virtual Apps and Desktops installation media includes a PowerShell script (Enable-VdaSSL.ps1) that automates several of these tasks:

- Setting permissions for the certificate's keys
- Binding the certificate to the session manager service
- Enabling the Citrix TLS listeners

This script is located in the Support > Tools > SslSupport directory. For more details, see Configure TLS on a VDA using the PowerShell script.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **NOTE:**
>
> The devices connecting to the session hosts need to have the correct root CA and intermediate CA certificates installed if you are using your own certificates.

NAT Compatibility

May 13, 2026

To establish a direct connection between an external user device and the session host, HDX™ Direct leverages hole punching for NAT traversal and STUN to facilitate the exchange of the public IP address and port mappings for the client device and session host. This is similar to how VoIP, unified communications, and P2P solutions work.

As long as firewalls and other network components are configured to allow the UDP traffic for the STUN requests and the HDX sessions, HDX Direct for external users is expected to work. However, there are certain scenarios where the NAT types of the user and session host networks lead to an incompatible combination, thus causing HDX Direct to fail.

Validations

You can validate the NAT type and filtering on the client and the session host by using STUNTMAN's STUN client utility:

1. Download the appropriate package for the target platform from stunprotocol.org, and extract the contents.
2. Open a terminal prompt and navigate to the directory where the contents were extracted.
3. Run the following command to perform NAT binding and behavior test:
   `stunclient.exe stunserver2025.stunprotocol.org --mode behavior`
4. If the binding and behavior tests are successful, both **binding test** and **behavior test** report the success and a NAT behavior is specified:

   If the tests fail, **binding test** and/or **behavior test** report the failure.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Run the following command to perform NAT binding and filtering test:
   `stunclient.exe stunserver2025.stunprotocol.org --mode filtering`
6. If the binding and filtering tests are successful, both **binding test** and **filtering test** report the success and a NAT filtering type is specified:

   If the tests fail, **binding test** and/or **filtering test** report the failure.

After performing the tests above, check the following table to determine if HDX Direct for external users is expected to work based on the NAT behavior and filtering combination:

Client NAT Behavior	Client NAT Filtering	Session Host NAT Behavior	Session Host NAT Filtering	Expected to work?
Endpoint Independent Mapping	Any	Endpoint Independent Mapping	Any	Yes
Endpoint Independent Mapping	Endpoint Independent Filtering	Address Dedependent Mapping	Any	Yes
Endpoint Independent Mapping	Address Dependent Filtering	Address Dedependent Mapping	Any	No
Endpoint Independent Mapping	Address and Port Dependent Filtering	Address Dedependent Mapping	Any	No
Endpoint Independent Mapping	Endpoint Independent Filtering	Address and Port Dedependent Mapping	Endpoint Independent Filtering	Yes
Endpoint Independent Mapping	Address Dependent Filtering	Address Dedependent Mapping	Any	No
Endpoint Independent Mapping	Address and Port Dependent Filtering	Address Dedependent Mapping	Any	No

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Client NAT Behavior	Client NAT Filtering	Session Host NAT Behavior	Session Host NAT Filtering	Expected to work?
Address Dependent Mapping	Any	Endpoint Independent Mapping	Endpoint Independent Filtering	Yes
Address Dependent Mapping	Any	Endpoint Independent Mapping	Address Dependent Filtering	No
Address Dependent Mapping	Any	Endpoint Independent Mapping	Address and Port Dependent Filtering	No
Address Dependent Mapping	Any	Address Dependent Mapping	Any	No
Address Dependent Mapping	Any	Address and Port Dependent Mapping	Any	No
Address and Port Dependent Mapping	Any	Endpoint Independent Mapping	Endpoint Independent Filtering	Yes
Address and Port Dependent Mapping	Any	Endpoint Independent Mapping	Address Dependent Filtering	No

Troubleshooting

May 13, 2026

To confirm that **HDX Direct** successfully established a direct connection, you can use the `CtxSession.exe` utility on the VDA machine.

To use the `CtxSession.exe` utility, launch a Command Prompt or PowerShell within the session and run `ctxsession.exe -v`. If the **HDX Direct** connection is successfully established, **HDX Direct Status** is `Connected`.

```
PS C:\Users\                > ctxsession -v

Session Id  1:
Transport Protocols:    UDP -> DTLS -> CGP -> ICA
      Local Address:                :55000
     Remote Address:                :60410
     Client Address:                :63274
  Security Protocol:    DTLS 1.2
    Security Cipher:    256 bit AES
    Cipher Strength:    256 bits
     ICA Encryption:    Transport Only
 Rendezvous Version:    None
   HDX Direct State:    Connected - External
    Reducer Version:    4.0

EDT Reliable Statistics:
    Bandwidth 301.904 Mbps,  RTT 57.690 ms,  EDT MTU: 1480

EDT Unreliable Statistics:
    Bandwidth 7.544 Kbps,  RTT 1 us,  EDT MTU: 1480

EDT Reliable Basic FEC Statistics:
    Bandwidth 92.090 Mbps,  RTT 35.164 ms,  EDT MTU: 1480

ICA Statistics:
     SentBandwidth (bps)      =          0
     HDX Latency              =         63
     IcaBufferLength          =       1436
```

You can also look at the session host's event logs for information on whether the HDX™ Direct connection was established successfully or failed. See the **Event Logs** section for details.

> Note:
>
> Depending on the environment and the number of IP addresses available to the session hosts, it can take up to 5 minutes for the HDX Direct connection to be established.

When HDX Direct fails to establish a direct connection

If HDX Direct is failing to establish a direct connection, review the following steps:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Ensure that the VDA version and Workspace app version in use support the feature per the system requirements.
2. Confirm that you have a policy applied to the VDA that enables HDX Direct and that there are no other policies with higher priority disabling the feature.
3. Confirm that you have a policy applied to the VDA that sets the desired HDX Direct mode and that there are no other policies with higher priority overwriting the configuration.
4. Ensure that the Citrix ClxMtp Service is running on the session host.
5. Ensure that the Citrix Certificate Manager Service is running on the session host. If it's not running, try to start it manually. The service automatically stops if HDX Direct is disabled.
6. Check if the session host has its self-signed Root CA certificate:
    a) Issued to: `CA-Citrix-Certificate-Manager`
    b) Issued by: `CA-Citrix-Certificate-Manager`
    c) Issuer details: The organization is Citrix Systems, Inc.
7. Check if the session host has its self-signed server certificate:
    a) Issued to: <`host FQDN`> (For example, FTLW11-001.ctxlab.net)
    b) Issued by: `CA-Citrix-Certificate-Manager`
    c) Issuer details: The organization is Citrix Systems, Inc.
8. If the certificates are missing, contact Citrix Tech Support.
9. If the certificates are present:
    a) Stop the Citrix Certificate Manager Service on the session host.
    b) Delete both the self-signed Root CA certificate and the self-signed server certificate.
    c) Start the Citrix Certificate Manager Service on the session host. The service creates new certificates once it starts.
10. For internal users:
    a) Ensure the session host's firewall is not blocking inbound traffic on UDP 443 or TCP 443, for HDX over EDT and HDX over TCP, respectively.
    b) Ensure that your network firewall is not blocking traffic on UDP 443 and TCP 443 between your clients' network and session hosts' network.
11. For external users:
    a) Check that the session host contains the list of STUN servers:
        - Key: HKLM\SOFTWARE\Citrix\HDX-Direct
        - Value type: REG_MULTI_SZ
        - Value name: STUNServers
        - Data: stun.cloud.com:3478 stun.cloudflare.com:3478 stun.l.google.com:19302
    b) Check the NAT type for the client and the session host, and ensure that the combination is expected to work. See the NAT Compatibility section for details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

c) If the NAT test fails on either the client or the session host:
   i. If there is a firewall running on the system, ensure it is not blocking outbound traffic on UDP 3478.
   ii. Ensure that your network firewalls are not blocking outbound traffic on UDP 3478.
   iii. Ensure the firewalls are not blocking the STUN server's response.

d) Ensure that your network firewalls have the appropriate rules configured to allow all necessary traffic. See the Network Requirements section for details.

e) If you change the default port range using the HDX Direct port range policy setting, ensure that your firewall rules are set for the custom port range.

Event logs

The following events are logged in the VDA machine's event log:

Log	ID	Source	Level	Description
Applications and Services Logs > Citrix-HostCore-HDX Direct/Operational	1	HDX Direct	Information	HDX Direct connection for internal user <username> established.
Applications and Services Logs > Citrix-HostCore-HDX Direct/Operational	2	HDX Direct	Information	HDX Direct connection for external user <username> established.
Applications and Services Logs > Citrix-HostCore-HDX Direct/Operational	3	HDX Direct	Information	HDX Direct connection for user <username> failed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Log	ID	Source	Level	Description
Applications and Services Logs > Citrix-HostCore-HDX Direct/Operational	4	HDX Direct	Information	STUN server <URL:PORT> provided the following session host IP and PORT mapping for user <username>: <IP>:<PORT>.
Applications and Services Logs > Citrix-HostCore-HDX Direct/Operational	5	HDX Direct	Information	No response received by session host from any of the configured STUN servers for user <username>.
Applications and Services Logs > Citrix-HostCore-HDX Direct/Operational	6	HDX Direct	Information	Client provided <IP>:<PORT> as external mapping for user <username>.
Applications and Services Logs > Citrix-HostCore-HDX Direct/Operational	7	HDX Direct	Information	No external mapping was provided by the client for user <username>.

Known issues

- HDX Direct for external users may fail in environments that use Workspace with Gateway Service if Rendezvous is disabled. To resolve this issue, ensure that Rendezvous is enabled.
- HDX Direct might stop working after performing an in-place upgrade of the VDA on a machine that already has **HDX Direct** enabled. To resolve the issue, complete the following steps:

  1. Stop the Citrix Certificate Manager Service on the session host.
  2. Delete the self-signed Root CA certificate and the self-signed server certificate.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Open the registry.
4. Delete the `HKLM\Software\Citrix\HDX-Direct` key.
5. Go to `HKLM\SYSTEM\CurrentControlSet\Control\TerminalServer\Wds\icawd`.
6. Set the **SSLEnabled** value to `0`.
7. Delete the contents of the **SSLThumbprint** value.
8. Start the **Citrix Certificate Manager Service**.

Secure HDX™

May 15, 2026

Secure HDX is an Application Level Encryption (ALE) solution that prevents any network elements in the traffic path from being able to inspect the HDX traffic. It does this by providing true End-to-End Encryption (E2EE) at the application level between the Citrix Workspace™ app (client) and the VDA (session host) using AES-256-GCM encryption.

System requirements

The following list depicts the system requirements for using Secure HDX.

- Control plane
  - Citrix DaaS™
  - Citrix Virtual Apps and Desktops™ 2503 or later
- Session host
  - Operating System
    - Windows 10 22H2
    - Windows 11 22H2 or later
    - Windows Server 2019 or later
  - Virtual Delivery Agent (VDA)
    - Windows: version 2503 or later
    - Linux: version 2407 or later
- Workspace app
  - Windows: version 2503 or later
  - Linux: version 2408 or later
  - Mac: version 2409 or later

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Chrome OS: version 2409 or later
- HTML5: version 2408 or later
- Android: version 2503 or later
- iOS: version 2503 or later

- Access tier
  - Citrix Workspace
  - Citrix StoreFront™ 2402 or later

> **NOTE:**
>
> For details on configuring Secure HDX with Linux VDA, refer to the Linux VDA documentation.

Configuration

Secure HDX is disabled by default. You can configure this feature using the Secure HDX setting in Citrix policy:

Secure HDX: Defines whether to enable or disable the feature.

> **IMPORTANT:**
>
> If you have Secure ICA® enabled on the delivery groups that you want to enable Secure HDX on, you must first disable Secure ICA (Edit delivery group > User Settings).

HDX Insight and Smart Control

The following are the requirements to use HDX Insight and SmartControl with NetScaler Gateway when Secure HDX is enabled:

- NetScaler 14.1 Build 47.46 or newer.
- **Network telemetry** must be enabled in Citrix policy.
- **Session Reliability** must be enabled. This setting is enabled by default, so ensure there are no policies disabling it.

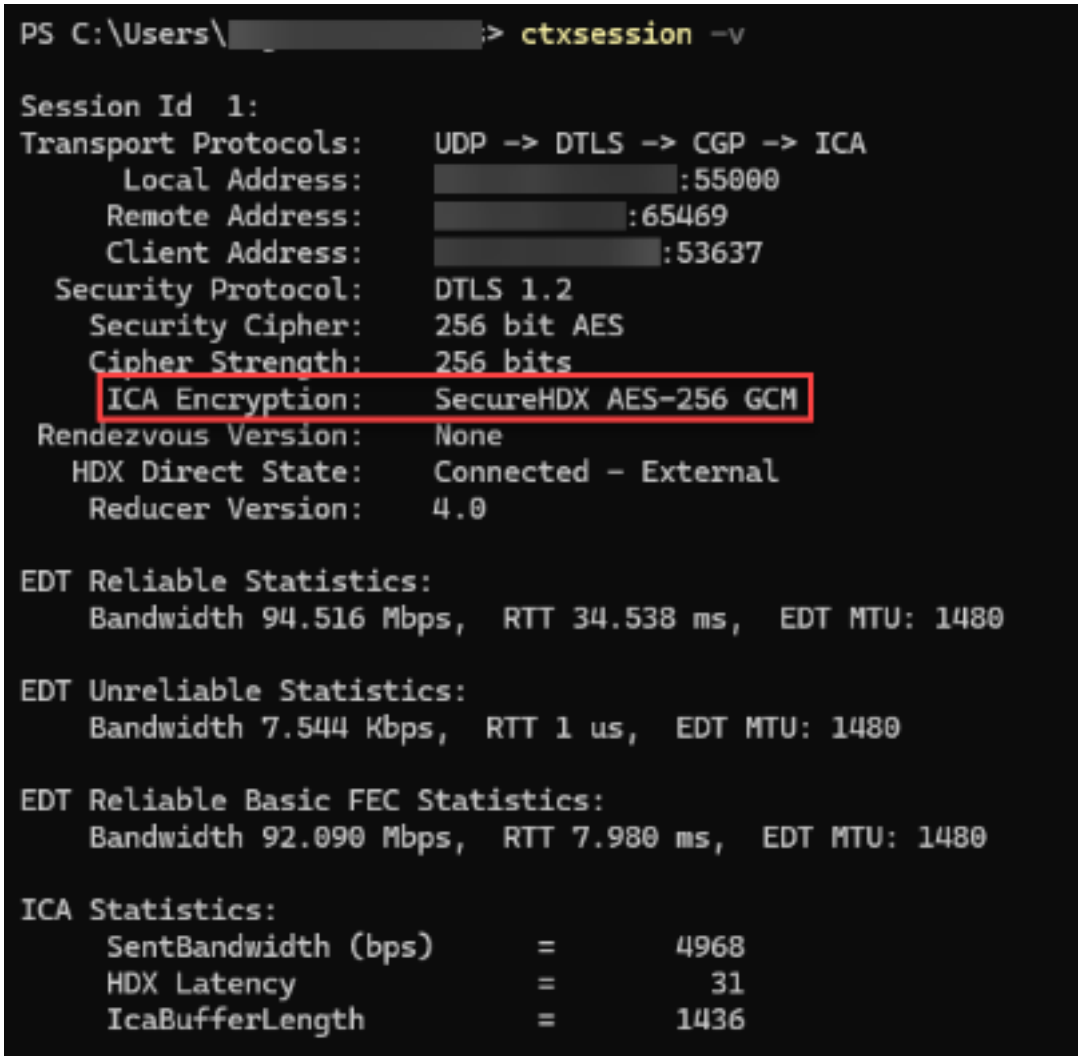
> **Note:**
>
> HDX Insight and SmartControl with Secure HDX is available only in the following scenarios:
>
> - Connections using TCP as transport protocol
> - Connections using IPv4
> - Clients using the following Workspace app versions:
>   - Windows: 2503 or newer

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - Mac: 2505 or newer
> - Linux: 2508 or newer

Considerations

The following are considerations for using Secure HDX:



- If a user tries to connect to a session host with Secure HDX enabled using a client that does not support the feature, the connection will be denied.
- Only Service Continuity for connector-less workloads is supported with Secure HDX. If you are using the standard version of Service Continuity, you will not be able to connect to any session hosts that have Secure HDX enabled if there is a Cloud service outage.
- Multi-Stream ICA is not supported when Secure HDX is enabled.
- If you use any third-party solutions that rely on inspecting HDX traffic, they would no longer work if you enable Secure HDX since HDX traffic is encrypted.

Troubleshooting

To confirm that Secure HDX is active, you can use the `ctxsession.exe` utility on the VDA machine.

To use the `CtxSession.exe` utility, open a Command Prompt or PowerShell within the session and run `ctxsession.exe -v`. If Secure HDX is in use, ICA Encryption displays `SecureHDX AES-256 GCM`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When Secure HDX does not get enabled in the session

- Ensure the VDA version in use supports the feature per the system requirements.
- Confirm that you have a policy applied to the VDA that enables Secure HDX and that there are no other policies with higher priority disabling the feature.
- If the session host was already running when you configured Secure HDX, restart the machine to ensure changes take effect.

Network telemetry

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Network metrics are critical for Citrix session troubleshooting because the performance and stability of a Citrix session are heavily dependent on the underlying network conditions. Unlike a local application, a Citrix session involves streaming an interactive desktop or application experience over a network, meaning any network instability or bottleneck will directly impact the user's perception of performance.

For details about the network metrics available in Citrix Monitor and Director, see Diagnose Session Performance issues.

System requirements

The following are the system requirements for using Network Telemetry:

- Control plane
  - Citrix DaaS
  - Citrix Virtual Apps and Desktops 2503 or later
- Virtual Delivery Agent (VDA)
  - Windows: version 2503 or later
  - Linux: version 2507 or later
  - Mac: version 2507 or later
- Workspace app
  - Windows: version 2503 or later
  - Linux: version 2508 or later
  - Mac: version 2505 or later
- Access tier
  - Citrix Workspace
  - Citrix Storefront 2402 or later
  - Citrix Gateway Service
  - Citrix NetScaler Gateway 14.1 Build 47.46 or later

Network requirements

If you are using Citrix Gateway Service, there are no additional network requirements. However, if you are using NetScaler Gateway, there are additional requirements to use Network Telemetry, which are outlined below.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session hosts

If your session hosts have a firewall such as Windows Defender Firewall, you must allow the following inbound traffic for connections from NetScaler Gateway.

Description	Source	Protocol	Port
Connection from NetScaler Gateway	NetScaler SNIP	TCP	443

> **NOTE:**
>
> The VDA installer adds the appropriate inbound rules to Windows Defender Firewall. If you use a different firewall, you must add the rules above.

Internal network

The following are the firewall requirements for your internal network:

Description	Protocol	Source	Source port	Destination	Destination port
Connection from Gateway	TCP	NetScalet SNIP	1024-65535	VDA network	443

Configuration

Network telemetry is disabled by default. You can configure this feature via Citrix policy in Studio using the following setting.

- **Network telemetry:** defines whether to enable or disable the feature.

Considerations

The following are considerations for using Network Telemetry:

- To ensure monitoring data remains secure while in transit, connections from NetScaler Gateway to the session hosts are secured with TLS/DTLS when Network Telemetry is enabled. As a result, connections are established on ports UDP 443 (HDX over EDT) and TCP 443 (HDX over TCP) by default. Refer to HDX features managed through the registry if you wish to change the port number.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Self-managed certificates are used to faciliate network-level encryption for session connections. See HDX Direct certificate management for details on certificate management. Please note that enabling Network Telemetry does not enable HDX Direct.
- Currently, EDT is not supported with NetScaler Gateway when Network Telemetry is enabled; enabling Network Telemetry forces sessions to use TCP.

Virtual channel allow list

May 15, 2026

The virtual channel allow list is a feature that allows you to control which non-Citrix virtual channels are allowed in your environment. By default, the virtual channel allow list feature is enabled. As a result, only Citrix virtual channels are allowed to open in Citrix Virtual Apps and Desktops™ sessions. If there is a need to use custom virtual channels, whether homegrown or from a third party, these need to be explicitly added to the allow list.

Configuration

The virtual channel allow list is enabled by default. You can configure this feature using the following settings in the Citrix policy:

- **Virtual channel allow list**: to enable or disable the feature and to add virtual channels to the list.
- **Virtual channel allow list log throttling**: sets the throttling period for the virtual channel allow list event logging.
- **Virtual channel allow list logging**: sets the logging level for the virtual channel allow list.

Adding virtual channels to the allow list

To add a virtual channel to the allow list, you need the following information:

1. The virtual channel name as defined in the code, which can be up to seven characters long. For example, `CTXCVC1`.
2. The paths to the processes that open the virtual channel on the VDA machine. For example, `C:\Program Files\Application\run.exe`.

Once you have the required information, you must add the virtual channel to the allow list using the Virtual channel allow list policy setting. To add a virtual channel to the list, enter the virtual channel

© 1997–2026 Citrix Systems, Inc. All rights reserved.

name followed by a comma, and then the path to the process that accesses the virtual channel. If there are multiple processes, you can add these processes by separating each process with commas.

For single processes

Using the previous examples, add the following entry to the list:

```
CTXCVC1,C:\Program Files\Application\run.exe
```

For multiple processes

If there are multiple processes, add the following entry to the list:

```
CTXCVC1,C:\Program Files\Application\run.exe,C:\Program Files\Application
\run2.exe
```

Using wildcards

The use of wildcards (*) is supported. You can use wildcards when the names of directories or executables change based on the version of the application, or if the third-party component is installed in the users' profiles.

You can use wildcards in the following scenarios:

- To replace the full directory name.
  For example: `C:\Program Files\Application\*\run1.exe`
- To replace part of the directory name.
  For example: `C:\Program Files\Application\v*\run1.exe`
- To replace the executable's name.
  For example: `C:\Program Files\Application\v1.2\*.exe`
- To replace part of the executable's name.
  For example: `C:\Program Files\Application\v1.2\run*.exe`

The following restrictions apply:

- The wildcard can only be used to replace a single directory. For example, if the executable is located in `C:\Program Files\Application\v1.2\run1.exe`
  - Allowed: `C:\Program Files\Application\*\run1.exe`
  - Not allowed: `C:\Program Files\*\run1.exe`
- Entries must contain the file name extension.
  - Allowed: `C:\Program Files\Application\v1.2\*.exe`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Not allowed: `C:\Program Files\Application\v1.2\*`
- All paths must be local.

> **Note:**
>
> - Network paths are not allowed.
> - Wildcard support is available from Citrix Virtual Apps and Desktops™ 2206.
> - Wildcard support is available in Citrix Virtual Apps and Desktops 2203 LTSR from CU2.

Using system environment variables

You can use system environment variables to simplify the definition of the trusted processes in your allow list. You can use any of the out-of-box variables, such as `%programfiles%`, `%programfiles(x86)%`, `%systemdrive%`, and `%systemroot%`.

You can also use custom environment variables as long as they are defined at the system level.

The following examples depict out-of-box environment variables:

- `%programfiles%\Application\v1.2\run.exe`
- `%programfiles%\Application\*\run.exe`
- `%programfiles(x86)%\Application\v1.*\run.exe`

The following example depicts a custom system environment variable:

- Custom variable name: `app`
- Custom variable value: `%programfiles%\Application\`
- Allow list entry: `CTXCVC1,%app%\run.exe`

> **Note:**
>
> User environment variables are not supported.
>
> Environment variable support is available from Citrix Virtual Apps and Desktops version 2209.

Obtain virtual channel names and processes

The easiest way to obtain the name of the virtual channel and the process that opens it on the VDA machine is to get the information from the developer or a third-party vendor that provided the virtual channel.

Alternatively, you can obtain information by applying the feature's logs and following these steps:

1. Once the client and server components of the custom virtual channel are in place, launch a virtual application or virtual desktop.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the VDA machine's System event log, look for the custom virtual channel's name and the process that tried to open it. For more information on available events, see Event logs.
3. Log out from the session.
4. Add an entry in the virtual channel allow list policy settings for the identified virtual channel and process.
5. Restart the machine.
6. Once the VDA is registered, run the virtual application or virtual desktop to validate that the custom virtual channels open successfully.

Considerations for Citrix virtual channels

All built-in Citrix virtual channels are trusted and allowed to open without further configuration. However, the following two features require explicit entries in the allow list because of external dependencies:

- Multimedia Redirection
- HDX RealTime Optimization Pack for Skype for Business

Multimedia Redirection

If you use a media player other than Windows Media Player as your system media player, you need to add it to the allow list as a trusted process. The following information is required for the allow list entry:

- Virtual channel name: `CTXMM`
- Process: Path to the media player used in your VDA machine. For example, `C:\Program Files (x86)\Windows Media Player\wmplayer.exe`.
- Allow list entry: `CTXMM,C:\Program Files (x86)\Windows Media Player\wmplayer.exe`

HDX RealTime Optimization Pack for Skype for Business

The following information is required for the allow list entry:

- Virtual channel name: `CTXRMEP`
- Process: Path to the Skype for Business executable in your VDA machine, which can vary based on the version of Skype for Business or if you used a custom installation path. For example, `C:\Program Files\Microsoft Office\root\Office16\lync.exe`.
- Allow list entry: `CTXRMEP,C:\Program Files\Microsoft Office\root\Office16\lync.exe`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Considerations for third-party virtual channels

Select third-party virtual channels are trusted and allowed to open without further configuration. All other third-party virtual channels require explicit entries in the allow list. The trusted third-party virtual channels are:

- Microsoft Teams
- Zoom Meetings for VDI

> **IMPORTANT:**
>
> The trusted third-party virtual channels are only trusted automatically when the associated applications are installed in their default installation paths. If the applications are installed in a different path, you must explicitly add the virtual channels to the allow list.

Microsoft Teams

The following are the Microsoft Teams virtual channels and the processes' default installation path:

- Virtual channel names: `MSTEAMS`, `MSTEAM1`, and `MSTEAM2`
- Process: `ms-teams.exe`
- Default installation path: `C:\Program Files\WindowsApps\MSTeams.<app version>_x64_8wekyb3d8bbwe\`

Additional information on the Microsoft Teams virtual channels is available in the Microsoft documentation.

Zoom Meetings for VDI

The following are the Zoom Meetings for VDI virtual channels and the processes' default installation path:

- Virtual channel names: `ZOOMHDX`, `ZOOMHDC`, `ZOOMPHX`, `ZOOMCVX`, `ZOOMCCX`, `ZOOMAUS`
- Processes: `Zoom.exe` and `ZoomVDITool.exe`
- Default installation path:
  - 32-bit: `C:\Program Files (x86)\ZoomVDI\bin\`
  - 64-bit: `C:\Program Files\ZoomVDI\bin\`

Additional information on the Zoom Meetings for VDI virtual channels is available in the Zoom documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting

May 13, 2026

If your custom virtual channel fails to open, review the following steps:

1. Ensure you are using the correct VDA version.
2. Confirm that you have a policy applied to the VDA with the custom virtual channel in the virtual channel allow list and that there are no other policies with higher priority overwriting this configuration.
3. Check the event log in the VDA and confirm that the virtual channel name reported matches the one defined in the allow list.

    a) If you have multiple processes, ensure these are defined properly as described in Adding virtual channels to the allow list.
    b) If you are using wildcards in the defined process path, ensure you are adhering to the guidelines for Using wildcards.
    c) If you are using environment variables in the defined process path, ensure you are adhering to the guidelines in Using system environment variables.

Event logs

The following events are logged in the VDA machine's event log.

Single-session VDA

The following events are logged in the single-session VDA machine's event log:

Log Name	Id	Source	Level	Description
System	2001	`Picadd`	Information	Custom virtual channel <`vcName`> has been opened by process < `processName`>

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Log Name	Id	Source	Level	Description
System	2002	Picadd	Warning	Custom virtual channel <vcName> cannot be opened by process < processName>
System	2003	Picadd	Information	<username> opened custom virtual channel <vcName>
System	2004	Picadd	Warning	<username> tried to open custom virtual channel <vcName>
System	2005	Picadd	Error	Path given in policy < pathInPolicy > cannot resolve to process path
System	2007	Picadd	Information	Loaded process path is < processPath>
System	2008	Picadd	Error	Environment variable <varName> in VC policy path is not found

Multi-session VDA

The following events are logged in the multi-session VDA machine's event log:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Log Name	Id	Source	Level	Description
System	13	Rpm	Information	Custom virtual channel <vcName> has been opened by process <processName>
System	14	Rpm	Warning	Custom virtual channel <vcName> cannot be opened by process <processName>
System	15	Rpm	Information	<username> opened custom virtual channel <vcName>
System	16	Rpm	Warning	<username> tried to open custom virtual channel <vcName>
System	17	Rpm	Error	Path given in policy <pathInPolicy> cannot resolve to process path
System	18	Rpm	Information	Loaded process path is <processPath>
System	19	Rpm	Error	Environment variable <varName> in VC policy path is not found

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Known third-party virtual channels

May 13, 2026

The following are known third-party solutions that use custom Citrix® virtual channels. This list does not include every solution that uses a custom Citrix virtual channel.

- Cerner
- ControlUp
- Cisco WebEx Teams
- Cisco WebEx Meetings Virtual Desktop Software
- Epic Warp Drive
- Epic Slingshot
- Imprivata OneSign
- Microsoft Teams
- Midmark IQPath Client Extensions
- Nuance PowerMic Client Extensions
- Nuance Dragon Medical Network Edition 360 vSync
- Zoom Meetings for VDI
- Ultima IA-Connect

To obtain details for adding the associated virtual channels to the allow list, reach out to the solutions' vendors. Alternatively, follow the steps outlined in the Obtaining virtual channel names and processes section.

Virtual Channel Allow List for DVC

May 13, 2026

You can use the Virtual channel allow list for DVC to control which custom dynamic virtual channels are allowed in your environment. By default, no dynamic virtual channels are allowed. If there is a need to dynamic virtual channels, these need to be explicitly added to the allow list.

Configuration

The virtual channel allow list for DVC is enabled by default. You can configure this feature using the following setting in the Citrix® policy:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Virtual channel allow list for DVC: to enable or disable the feature and to add dynamic virtual channels to the list.
- Virtual channel allow list log throttling: sets the throttling period for the virtual channel allow list event logging.
- Virtual channel allow list logging: sets the logging level for the virtual channel allow list.

Adding dynamic virtual channels to the allow list

To add a dynamic virtual channel to the allow list, you need the following information:

1. The name of the DVC plug-in on the client. For example, `DvcPlugin1.dll`.
2. The name of the DVC listener(s). For example, `ListenerName1`.
3. The paths to the processes that accesses the dynamic virtual channel on the VDA machine. For example, `C:\Program Files\Application\run.exe`.

Once you have the required information, you must add the dynamic virtual channel to the allow list using the Virtual channel allow for DVC list policy setting. To add a dynamic virtual channel to the list, enter the path to the process that accesses the DVC in the session host followed by a comma, then the client-side plugin name followed by a comma, and the name of the listener used by the plugin. Multiple listener names can be added separated by commas.

For single listener

Using the previous examples, add the following entry to the list:
`C:\Program Files\App\run1.exe,DvcPlugin1,ListenerName1`

For multiple listeners

If there are multiple listeners, add the following entry to the list:
`C:\Program Files\App\run1.exe,DvcPlugin1,ListenerName1,ListenerName2`

Using wildcards

The use of wildcards (*) is supported. You can use wildcards when the names of directories or executables change based on the version of the application, or if the third-party component is installed in the users' profiles.

You can use wildcards in the following scenarios:

- To replace the full directory name. For example: `C:\Program Files\App\*\run1.exe`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To replace part of the directory name. For example: `C:\Program Files\App\v*\run1.exe`
- To replace the executable's name. For example: `C:\Program Files\App\v1.2\*.exe`
- To replace part of the executable's name. For example: `C:\Program Files\App\v1.2\run*.exe`

The following restrictions apply:

- The wildcard can only be used to replace a single directory. For example, if the executable is located in `C:\Program Files\App\v1.2\run1.exe`
  - Allowed: `C:\Program Files\App\*\run1.exe`
  - Not allowed: `C:\Program Files\*\run1.exe`
- Entries must contain the file name extension.
  - Allowed: `C:\Program Files\App\v1.2\*.exe`
  - Not allowed: `C:\Program Files\App\v1.2\*`
- All paths must be local.

Devices

May 13, 2026

HDX™ provides a high-definition user experience on any device, at any location. The articles in the Devices section describe these devices:

- Scanning
- Generic USB device
- Client Drive Mapping
- Mobile and touch screen devices
- Serial devices
- Specialty keyboards
- Webcams

Optimized vs. generic USB device

An optimized USB device is one for which Citrix Workspace™ app has specific support. For example, the ability to redirect webcams using the HDX Multimedia virtual channel. A generic device is a USB device for which there is no specific support in Citrix Workspace app.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, generic USB redirection can't redirect USB devices with optimized virtual channel support unless put into Generic mode.

In general, you get better performance for USB devices in Optimized mode than in Generic mode. However, there are cases where a USB device doesn't have full functionality in Optimized mode. It might be necessary to switch to Generic mode to gain full access to its features.

With USB mass storage devices, you can use either client drive mapping or generic USB redirection, or both, controlled by Citrix® polices. The main differences are:

If both generic USB redirection and the client drive mapping policies are enabled and a mass storage device is inserted either before or after a session starts, it's redirected using client drive mapping.

When these conditions are true, the mass storage device is redirected using generic USB redirection:

- Both generic USB redirection and the client drive mapping policies are enabled.
- A device is configured for automatic redirection.
- A mass storage device is inserted either before or after a session starts.

For more information, see http://support.citrix.com/article/CTX123015.

Feature	Client drive mapping	Generic USB redirection
Enabled by default	Yes	No
Read-only access configurable	Yes	No
Encrypted device access	Yes, if encryption is unlocked before the device is accessed on the virtual session.	Citrix Virtual Desktops™ only

Scanning

May 13, 2026

Scanner is a device that optically scans images, printed text, handwriting or an object and converts it to a digital image.

If you're using a scanner and your computer is running windows, there's a good chance you're using the WIA scanner driver. This driver is responsible for communicating between your computer and scanner.

- **Windows Image Acquisition** (WIA) is Microsoft's driver model and application programming interface (API) that enables software to communicate with imaging hardware like scanners.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **TWAIN** (Windows and Mac) is another protocol which is a scanning protocol that connects scanners and applications together by providing standard interface. TWAIN allows applications to acquire images from TWAIN compliant devices (scanners, digital cameras, etc.).
- **SANE:** scanning protocol is a set of standards and guidelines that allow software applications to communicate with and control image scanners. SANE stands for **S**canner **A**ccess **N**ow **E**asy, and its protocol defines how scanner hardware can be accessed, managed, and controlled by software running on different computer systems.

TWAIN Redirection

May 15, 2026

Introduction

Users can scan documents from applications within Citrix HDX™ sessions using TWAIN compliant scanners connected to the client endpoint. The Citrix scanning module redirects the scan request to the client endpoint to process the request. Upon completion, the scanned information is sent to back to the VDA host.

Requirements

Citrix Control Plane

- Citrix Virtual Apps and Desktops™ 1912 or later
- Citrix DaaS™

Session Host

- Operating system
  - Windows 10 1809 or later
  - Windows 11
  - Windows Server 2022 or later
- VDA
  - Version 1912 or later
- Application

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- 32-bit application
- 64-bit application

> **Note:**
>
> - To enable scanning functionality for 64-bit applications on the session host, the 64-bit TWAIN Data Source Manager (twaindsm.dll) is necessary. This component is not pre-installed by the operating system.
> - If your 64-bit scanning application does not include this file, please contact the application vendor to acquire the 64-bit twaindsm.dll.
> - Once obtained, administrators must manually copy the file into the **System32** folder on the session host and then restart the machine.

Client Device

- Operating system
  - Windows 10 1809 or later
  - Windows 11
- Workspace app
  - Windows: version 1912 or later
- Scanner
  - TWAIN-compliant scanner
  - Install TWAIN drivers on the client endpoint

Configuration

TWAIN redirection is enabled by default. The following policy settings are available to configure TWAIN redirection and optimize the scanning experience.

- **Client TWAIN device redirection:** to enable or disable TWAIN redirection.
- **TWAIN compression level:** to set compression levels for images trnasferred from the client to the VDA.

For more details, see TWAIN devices policy settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting

TWAIN redirection functionality can be tested with a publicly available test app Twacker, which can be downloaded from this URL.

Follow the steps to validate TWAIN functionality within an HDX session:

1. Install **Twacker** on the VDA host.
2. Launch **Twacker** (32-bit or 64-bit version).
3. Click **File > Select Source** and select your scanner from the list.
4. Click **File > Acquire**.
5. Click the **Scan button** to test your scanner.

If **Twacker** can scan successfully, it confirms that the **Citrix Virtual Apps and Desktops™** setup is:

- Correctly configured to use TWAIN redirection
- Meeting all local client device requirements

If you still have scanning issues within a particular application, then it's likely to be a software issue.

WIA devices

May 13, 2026

WIA devices, such as digital cameras and scanners, communicate with server-hosted image processing applications by using the WIA framework.

Prerequisites

- The scanner must be WIA compliant.
- Install the WIA drivers on the local device. They are not required on the server.
- Attach the scanner locally (for example, through USB).
- Ensure that the scanner is using the local Windows Image Acquisition service and not the TWAIN driver.
- Ensure that there is no policy applied to the user account that is used for the test, and which is limiting the bandwidth within the ICA® session. For example, client USB redirection bandwidth limit.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Requirements

Session Host

- Operating system
  - Windows 10 1809 or later
  - Windows 11
  - Windows Server 2022 or later
- VDA
  - Version 2511 or later

Client Device

- Operating system
  - Windows 10 1809 or later
  - Windows 11
- Workspace app
  - Windows: version 2411 or later

Configuration

WIA redirection is disabled by default. The following setting can be enabled in Citrix® policy:

- WIA redirection: This setting allows or prohibits users from accessing WIA devices on the user device.

No additional VDA side registry modifications are needed on Citrix Virtual Apps and Desktops 2511 or newer.

Known issues

For information about policy settings, see WIA devices policy settings.

Scanning on non-windows client platforms - SANE Redirection

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Introduction

Users can scan documents from TWAIN applications inside their Citrix® sessions from ChromeOS and Linux endpoints. When a user tries to scan a document from an application, the Citrix scanning module redirects the request to the client endpoint to achieve scanning from the scanner and the files are sent to the VDA once the scan is complete.

Requirements

Citrix Control Plane

- Citrix Virtual Apps and Desktops™ 2411 or later
- Citrix DaaS™

Session Host

- Operating system
  - Windows 10 1809 or later
  - Windows 11
  - Windows Server 2019 or later
- VDA
  - Version 2411 or later

Client Device

- Operating system
  - ChromeOS v129 or later
- Workspace app
  - ChromeOS: version 2409 or later
  - Linux: version 2508.10 or later
- Scanner
  - The scanner must be supported by the underlying client operating system.
  - Must be attached to the client endpoint locally through USB.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration

No additional configuration is required to enable this functionality. This feature is enabled by default.

> **Note:**
>
> To disable this feature, open the Web studio/DaaS console. Set the SANE scanner redirection policy setting to Prohibited.

Troubleshooting

Event logs

Administrators can view various scanning related event messages.

Listed below are the event messages that will be logged in the Event viewer on the VDA host for various scan related operations. They can be viewed under the Application section of the Windows Logs with HDX™ Scanner as the event source.

Event ID	Event Text	Explanation
2	AllowScannerSANERedirection policy is disabled. Scanner's not redirected.	Indicates that the SaneRedirection policy is disabled.
3	Scanning details: Pages - '[pages]', Application - '[application]', Scanner - '[scanner]', User - '[user]', Average time per page - '[time]' milliseconds.	Generated when a scan is completed.
101	No page found to scan.	Generated when no document is detected.
102	Scan failure - The device's document feeder is jammed.	Generated when a scan fails due to a paper jam in the scanner's document feeder.
103	Scan failure - '[failure]'. Close and restart the scanner application.	Generated when the scan fails due to errors like unsupported operations, end of file error, access denied errors, etc.
104	Memory failure in application. Restart the application.	Generated when a scan fails due to insufficient memory.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event ID	Event Text	Explanation
201	Scan operation cancelled by user.	Generated when the scan operation is cancelled by the user.
202	Session disconnected while scanning.	Generated when the HDX session disconnects while scanning.
203	Unsupported conversion between TWAIN and SANE for '[capability]'. Please check if the scanner/application is supported.	Indicates that the conversion between TWAIN and SANE for the specified capability is not supported.
205	Failed to set the scanner '[scanner]'as active. Please check if the scanner is switched on and connected.	Generated when a connection to a scanner fails to open.
206	Scanner not found. Please check if the scanner is switched on and connected.	Generated when no scanner is detected on the client endpoint.

Known Limitations

1. Network authorized scanners are not supported.
2. Some proprietary scanning applications such as the Fujitsu Paperstream app on the VDA may not list the redirected scanner as supported.
3. Some of the scanner settings such as page width, page height, paper size, brightness and contrast might not be honored due to 3rd party API limitations when using the Native UI.

USB devices

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

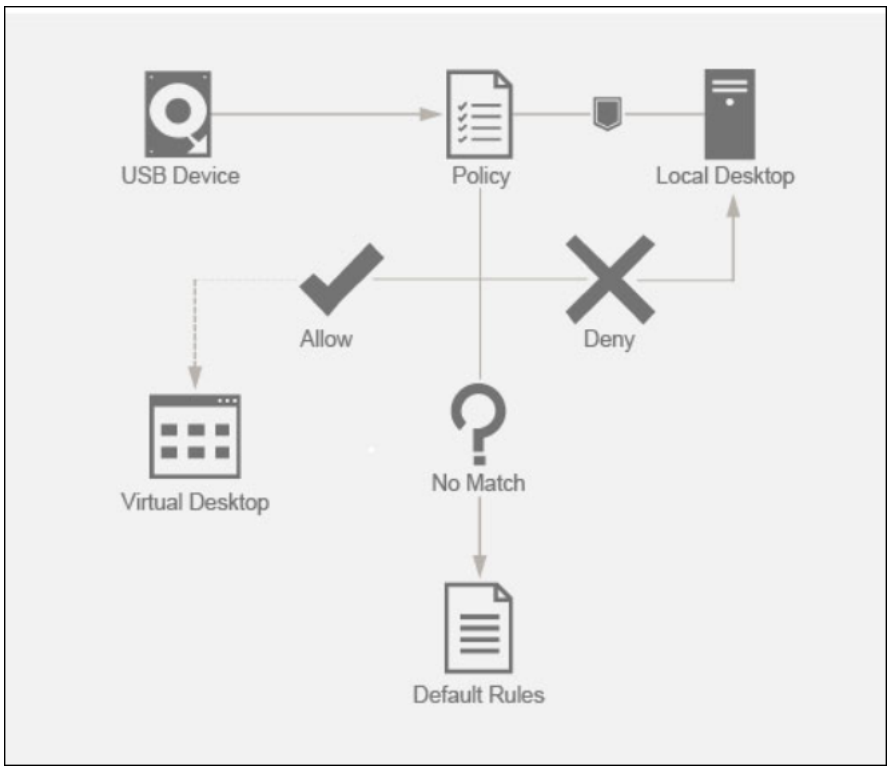
Introduction

The generic USB redirection feature allows redirection of USB devices from client machines to HDX™ sessions giving end users the ability to interact with a wide selection of generic USB devices in their HDX session. This is helpful in scenarios where users need to use speciality devices that don't have optimized support or where it is unsuitable.

> **Note:**
>
> USB Devices not optimized for virtual channel support will fall back to the Generic USB virtual channel using raw USB redirection.

How does it work?

Generic USB redirection works at a low level and redirects USB request and response messages between client machines and XenDesktop® virtual desktop.



It avoids the requirement for compatible device drivers on the client machine and the driver is expected to be supported on the virtual desktop only. USB redirection policy rules follow a certain order of precedence that allow client side policies and default rules to be honored after DDC policy rules have been evaluated and enforced. This allows Citrix admins to prevent any unauthorized/spoofed devices from being redirected inside a session.

Additionally, event logging of unauthorized devices attempting to access the remote session can be audited and flagged and admins can take additional action to prevent data exfiltration.

When a user plugs in a USB device, the session host checks it against each policy rule consecutively until a match is found. The first match for any device is considered definitive.

- If the first match is an Allow rule, the device is redirected to the virtual desktop.
- If the first match is a Deny rule, the device is not redirected to the session, and only available for use in the local user device. If no match is found, default rules are used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Compatibility with generic USB redirection

These Citrix Workspace™ apps support generic USB redirection:

- Citrix Workspace app for Windows, see Citrix Workspace app for Windows.
- Citrix Workspace app for Mac, see Citrix Workspace app for Mac.
- Citrix Workspace app for Linux, see Citrix Workspace app for Linux.
- Citrix Workspace app for Chrome OS, see Citrix Workspace app for Chrome.

For Citrix Workspace app versions, see the Citrix Workspace app feature matrix.

Configuration

May 13, 2026

USB redirection is disabled by default. You can configure generic USB redirection using the following settings in Citrix® policy:

- **Client USB device redirection**: to enable or disable USB redirection
- **Client USB device redirection rules**: to specify specific device action i.e. to allow or deny access to a particular device

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Client USB device redirection rules (Version 2)**: to specify rules for filtering, splitting and auto-connecting USB devices
- **Client USB device optimization rules**: to disable optimization or change the optimization mode
- **Allow existing USB devices to be automatically connected**: to allow or prevent automatic connection of existing USB devices that are connected to a client endpoint at the start of an HDX™ session
- **Allow newly arrived USB devices to be automatically detected**: to allow or prevent automatic connection of USB devices that are connected to a client endpoint during an HDX session

See, USB Policy Settings for more details.

How to configure USB redirection

By default, USB redirection configuration is disabled. To use it, USB redirection policy and specific redirection rules must be enabled and configured on the DDC.

> **Note:**
>
> If you are using any components older than version 2212 or you are using Workspace App for Linux/Mac, see Legacy USB Redirection Configuration for details on how to configure USB redirection.

Enabling Generic USB Redirection

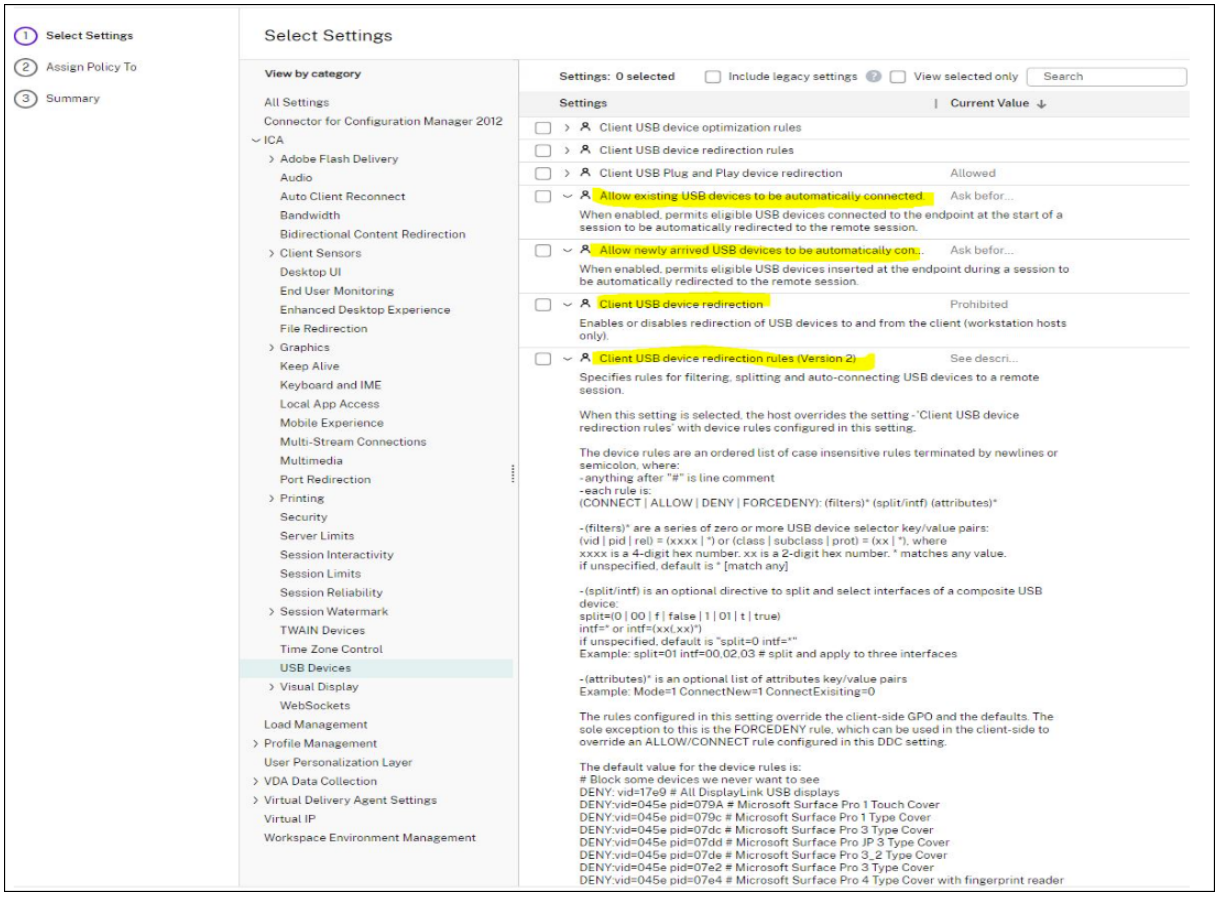
1. Open **Citrix Web Studio™ policies** and click on the **Policies** tab.
2. Click on **Create Policy** and expand the **ICA® > USB Devices policies**.
3. Edit the **Client USB device redirection policy**.
4. Select **Allowed** and click **Save**.

Creating USB Redirection Policy Rules

When the user tries to redirect a USB device to Virtual Desktop, it is checked against each USB policy rule in turn until a match is found. The first match for any devices is considered final. If the first match is an **Allow** rule, the matched device is allowed to be redirected to the virtual desktop. If the first match is a **Deny** rule, the matched device is only available in the local desktop. If no match is found, default rules are used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Device Rules As with regular USB devices, device rules set in the policy or client Citrix Workspace™ app configuration on the end point select the devices for forwarding. Citrix Workspace app uses these rules to decide which USB devices to allow or prevent from forwarding to the remote session.



Each rule consists of an action keyword (**Allow, Connect, or Deny**), a colon (:), and zero or more filter parameters that match actual devices at the endpoints USB subsystem. These filter parameters correspond to the USB device descriptor metadata used by every USB device to identify itself.

Device rules are clear text with each rule on a single line and an optional comment after a # character. Rules are matched top down (descending priority order). The first rule that matches the device or child interface is applied. Subsequent rules that select the same device or interface are ignored.

Example: ALLOW: VID=1050 PID=0421 #Device1
Example: CONNECT: VID=xxxx PID=yyyy Class=03 #Device2

Keyword	Description
CONNECT	Use this keyword to allow devices to be redirected over the USB virtual channel as well as enable them to be auto-redirected during session launch and upon insertion.
ALLOW	Use this keyword to allow devices to be redirected over the USB virtual channel
DENY	Use this keyword to deny devices from being redirected over the USB virtual channel

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Setting the policy on the DDC:

1. Open **Citrix Web Studio policies** and click on the **Policies** tab.
2. Click on **Create Policy** and expand the **ICA > USB Devices policies**.
3. Edit the **Client USB device redirection rules** (**Version 2**).
4. Set the value based on the examples provided in the description for each usb device that needs to be redirected and click Save.

   For Example: Allow: VID=056A PID=00A4 #STU-430
   Deny: Class=08 subclass=05 # Mass Storage

   > **Note:**
   >
   > If a Citrix admin checks **Use default value** and clicks on **Save**, the default rules can be found in the following registry in the VDA.
   >
   > **Caution!**
   >
   > Refer to the Disclaimer at the end of this article before using the Registry Editor.

   `HKLM\SOFTWARE\Wow6432Node\Citrix\PortICA\GenericUSB\DeviceRules`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Policies can still be set on the client device using group policy device rules but that is no longer needed on newer versions of CVAD and CWA.
>
> For legacy configuration of USB devices, see Legacy USB Redirection Configuration.

Configure automatic redirection of USB devices (Optional)

USB devices are automatically redirected when USB support is enabled. Also, the USB user preference settings are set to automatically connect USB devices. It is not always best to redirect all USB devices. Users can explicitly redirect devices from the USB device list that are not automatically redirected. To prevent USB devices from being listed or redirected, use DeviceRules on either the client endpoint or the DDC policy.
This policy can be set either on the DDC, on the client using a GPO, using Citrix Workspace Preferences or the Connections tab under CDViewer. All of these methods are described below:

Setting the policy on the DDC:

There are two policies on the DDC that can be set to allow auto redirection of USB devices-

- Allow existing USB devices to be automatically connected
- Allow newly arrived USB devices to be automatically connected

1. Open **Citrix Web Studio policies** and click on the **Policies** tab.
2. Click on **Create Policy** and expand the **ICA > USB Devices policies**.
3. Edit the setting **Allow** existing USB devices to be automatically connected.
4. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.
5. Edit the setting **Allow** newly arrived USB devices to be automatically connected.
6. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.

Understanding USB Device Redirection Rules

When using Citrix Client USB redirection, it's important to understand how different rules are prioritized and applied. Think of it like a set of instructions: the system checks for rules in a specific order, and the first rule it finds for a particular device is the one that sticks. Any other rules for that **same device** found further down the list are then ignored.

Here's the order in which your device rules are evaluated:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Client USB device redirection rules (Version 2)**: Device rules configured by this policy setting are given the highest priority. If a rule for a specific device is found here, that rule is applied, and no other rules for that particular device will be considered.
- **Client USB device redirection rules**: Next in line are rules defined in this legacy setting within Citrix Studio. If no rule for a device was found in the Version 2 policy, the system then checks rules defined in this policy setting. Again, if a rule for a device is found here, it's applied, and the system stops looking for rules for that specific device.

  > **Note:**
  >
  > The above policy setting is only applied if **Client USB device redirection rules (Version 2)** is not set in Studio or if the **Citrix Workspace App for Windows** version is older than 2212.

- **Client-side Group Policy Objects (GPOs)**: If a device still doesn't have an applied rule after checking both Studio policy settings, the system then defers to rules configured via client-side Group Policy Objects.
- **Client-side Registry Settings**: Finally, client-side registry settings are applied as the lowest priority.

This hierarchy ensures that more specific or newer configurations take precedence for a given device, providing a clear and predictable way to manage USB device redirection. It's important to remember that while the hierarchy determines the order of evaluation, a rule found for a device at a higher level will prevent rules for that **same device** from being applied at lower levels.
However, rules set at lower levels are not completely ignored; they are still evaluated for any devices that haven't had a rule applied yet.

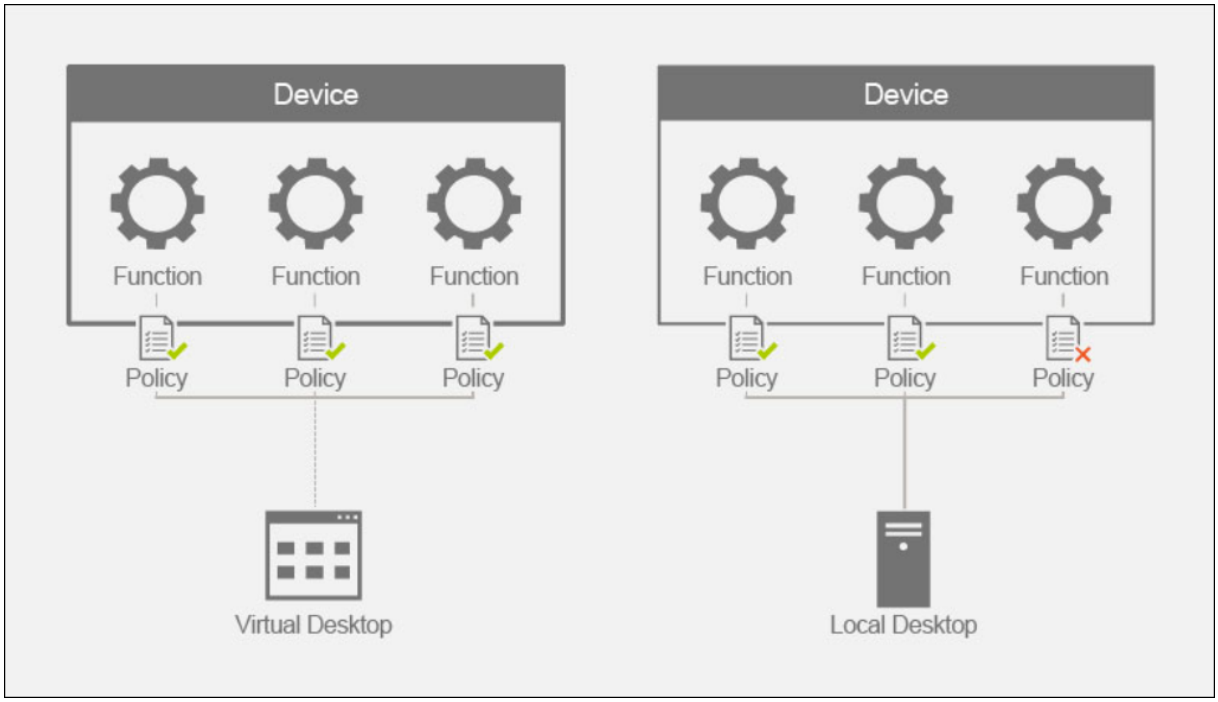
This tiered approach also guarantees **backwards compatibility**. When upgrading from older versions of Citrix Virtual Apps and Desktops™ or Citrix Workspace app, existing client-side configurations will be preserved. This gives enterprise admins time to plan the migration path to the more advanced **Version 2 device rules** policy setting in Studio without immediate disruption.

Example:

Let's say you have a specific USB device with Vendor ID (VID) `xxxx` and Product ID (PID) `yyyy`.

- In your **Client USB device redirection rules (Version 2)** policy setting in Citrix Studio, you have a rule set `CONNECT VID=xxxx PID=yyyy`.
- Separately, in a client-side **Group Policy Object (GPO)**, you have a `DENY` rule for the same device `DENY: VID=xxxx PID=yyyy`.

When this device is connected to the client endpoint, the system will first evaluate the rules in the Version 2 Studio policy. It finds the `CONNECT` rule `VID=xxxx PID=yyyy`. Because this rule is at the highest precedence level, it is immediately applied. The system then ignores any further rules for



© 1997–2026 Citrix Systems, Inc. All rights reserved.

this specific device. Therefore, even though a DENY rule exists in a client-side GPO, it will be ignored, and the device will successfully redirect.

Composite Devices and Device Splitting

May 13, 2026

A composite USB device is a single device that acts like multiple independent USB devices connected to a computer. It has a single USB connector but it can expose multiple interfaces to the computer with each having its own set of functionalities. When a user plugs in a composite USB device, the host device checks for all functions (interfaces) against each policy rule. If the first match for any function(interface) is a Deny rule, the rule is considered definitive for the composite device and the device is denied. If the first match for a function (interface) is an Allow rule, the host device continues to match the rules against the next function (interface). The composite device is allowed if no function (interface) is denied by a policy rule. If definitive match for composite device is a Deny Rule, the device is available only to the local desktop otherwise the device is remoted to the virtual desktop. If no match is found, default rules are used.

We can split the composite device using the appropriate rules in the Device redirection rules (Version 2) policy to allow only specific functionality of a composite device. For instance, we may want to use just the HID functions of a FIDO2 key but not the smartcard functionality. In that case, we would set the rules as illustrated below:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Connect: VID=1050 PID=0407 class=03 split=01 intf=00,01 #Yubikey series 5 allowed FIDO2 HID functions.
2. Deny: VID=1050 PID=0407 split=01 intf=02 # Yubikey series 5 smartcard function blocked.

> **Tip:**
>
> When creating new policy rules, refer to the USB Class Codes, available on the USB web site.

Configuring a signature pad

1. Install the appropriate device driver on the VDA host.
2. Enable the **Client USB device redirection** policy setting in **Citrix Web Studio™**.
3. Edit the **Client USB device redirection rules** (**Version 2**) policy setting.
    a) Set the **VID** and **PID** information for the signature pad that needs to be redirected and click **Save**. For example: **Connect**: VID=06A8 PID=0057 class=03 #Topaz HSB
4. Edit the policy setting **Client USB device optimization rules**.
    a) Set the mode along with other device information. For example: Mode=00000004 VID=06A8 PID=0057 class=03 #Input device operating in capture mode
5. Edit the policy setting **Allow existing USB devices to be automatically connected**.
6. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.
7. Edit the policy setting **Allow newly arrived USB devices to be automatically connected**.
8. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.

Once these settings are configured, subsequent session launches will have the device getting automatically redirected and will not require any additional end user action.

> **Note:**
>
> Replace the VID and PID with the actual VID and PID of the device to be redirected.

Configuring Bloomberg keyboard using USB redirection

1. Enable the **Client USB device redirection** policy setting in **Citrix Web Studio**.
2. Bloomberg 5 keyboards are set by default in the **Client USB device redirection rules (Version 2)** policy setting and no additional admin action is needed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Edit the policy setting **Allow existing USB devices to be automatically connected**.
4. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.
5. Edit the policy setting **Allow newly arrived USB devices to be automatically connected**.
6. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.

Once these settings are configured, Bloomberg keys will automatically be presented in subsequent HDX™ sessions and will not require any additional end user action.

Configuring a FIDO2 key using USB redirection

Citrix recommends using FIDO2 redirection for using FIDO2 keys in your HDX sessions. However, there might be situations in which you must redirect FIDO2 keys using USB redirection instead. These include scenarios where FIDO2 redirection is not available because the feature is not supported by the client, the VDA, or the operating system (e.g. Windows Server 2016).

There can also be situations in which the key has multiple modes enabled, but you only want to allow a subset of those in your HDX sessions. For example, you might want to allow FIDO2 and OTP, but block the smart card.

The following steps illustrate how you can configure a FIDO2 key using USB redirection (Yubikey vid=1050, pid=0407).

1. Enable the **Client USB device redirection** policy setting in **Citrix Web Studio**.
2. Edit the **Client USB device redirection rules (Version 2)** policy setting.
    a) Set the **VID** and **PID** information as well as the split device configuration for the FIDO2 key to be redirected in the session and click **Save**.
    b) **Connect**: VID=1050 PID=0407 class=03 split=01 intf=00,01 #Yubikey series 5 allowed FIDO2 HID functions.
    c) **Deny**: VID=1050 PID=0407 split=01 intf=02 # Yubikey series 5 smartcard function blocked.
3. Edit the policy setting **Allow existing USB devices to be automatically connected**.
4. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.
5. Edit the policy setting **Allow newly arrived USB devices to be automatically connected**.
6. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Once these settings are configured, FIDO2 keyboards will automatically be presented in subsequent HDX sessions and will not require any additional end user action.

Configuring a 3-d mouse using USB redirection

Today, the 3dConnexion space mouse drivers are only supported on workstation OSes (Win 10 and Win11). They do not work on server OS. The following are the steps to configure a SpaceMouse Enterprise on a workstation OS (vid=046D, pid=C016).

1. Install the latest Windows driver on the VDA host.
2. Enable the **Client USB device redirection** policy setting in **Citrix Web Studio**.
3. Edit the **Client USB device redirection rules** (**Version 2**) policy setting.
    a) Add the **VID** and **PID** information for the signature pad that needs to be redirected and click **Save**. For example: **Connect**: VID=046D PID=C016 #SpaceMouse Enterprise
4. Edit the policy setting **Client USB device optimization rules**.
    a) Set the mode along with other device information. For example: Mode=00000004 VID=046D PID=C016 class=03 #Input device operating in capture mode
5. Edit the policy setting **Allow existing USB devices to be automatically connected**.
6. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.
7. Edit the policy setting **Allow newly arrived USB devices to be automatically connected**.
8. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.

Configuring two or more devices using USB redirection with different device rules

Multiple devices can be redirected inside the HDX session with different device rules. An admin may want to redirect one device automatically while providing an option to the end user to redirect the other device. The following are the steps to configure two devices with different rules.

1. Enable the **Client USB device redirection** policy setting in **Citrix Web Studio**.
2. Edit the **Client USB device redirection rules** (**Version 2**) policy setting.
    a) Add the **VID** and **PID** information of the two devices to be redirected with the appropriate device rule in the session and click **Save**.
    b) **Allow**: VID=0911 PID=0c1c #Phillips speech mic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

c) **Connect**: VID=06A8 PID=0043 class=03 # Topaz HSB signature pad

3. Edit the policy setting **Allow existing USB devices to be automatically connected**.
4. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.
5. Edit the policy setting **Allow newly arrived USB devices to be automatically connected**.
6. Clear the **Use default value** checkbox and select **Automatically redirect available USB devices** from the drop down menu and click **Save**.

Once these settings are configured, the Topaz HSB signature pad will automatically be presented in subsequent HDX sessions and will not require any additional end user action. The Phillips speech mic on the other hand will require the end user to enable redirection in Connection Center or in the Devices tab of CDViewer.

Troubleshooting

May 13, 2026

The following steps should be followed to triage USB redirection related issues:

1. Validate system requirements are being met for USB redirection. This includes correct CVAD and CWA versions, supported devices and device drivers on the OS platform under consideration.
2. Ensure the configuration is appropriate based on the components' versions and platforms in use in your environment. See the note in Legacy USB Redirection Configuration for details on components that require legacy configuration settings.
3. Validate that device is listed under devices that the client has enumerated.

   a) Workspace Preferences toolbar: Look at the devices enumerated in the Devices tab of the Workspace app Preferences toolbar (Right click **CWA icon > Connection Center > Preferences**...Click on **Devices** tab).

   b) `CtxUsbDiagnostics.exe` (Recommended): Run this tool in a command prompt window. The output gives you device specific information for a specific session. It will tell you if a device is being redirected or not. It will also tell you if a device rule set is causing the device to not be redirected. See, Diagnostics Tool for more information.

   c) USBView or other 3rd party tools: Run a 3rd party tool like USBView in the endpoint / client machine to ensure that the device is detected at the endpoint.

4. If you see the device being enumerated:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

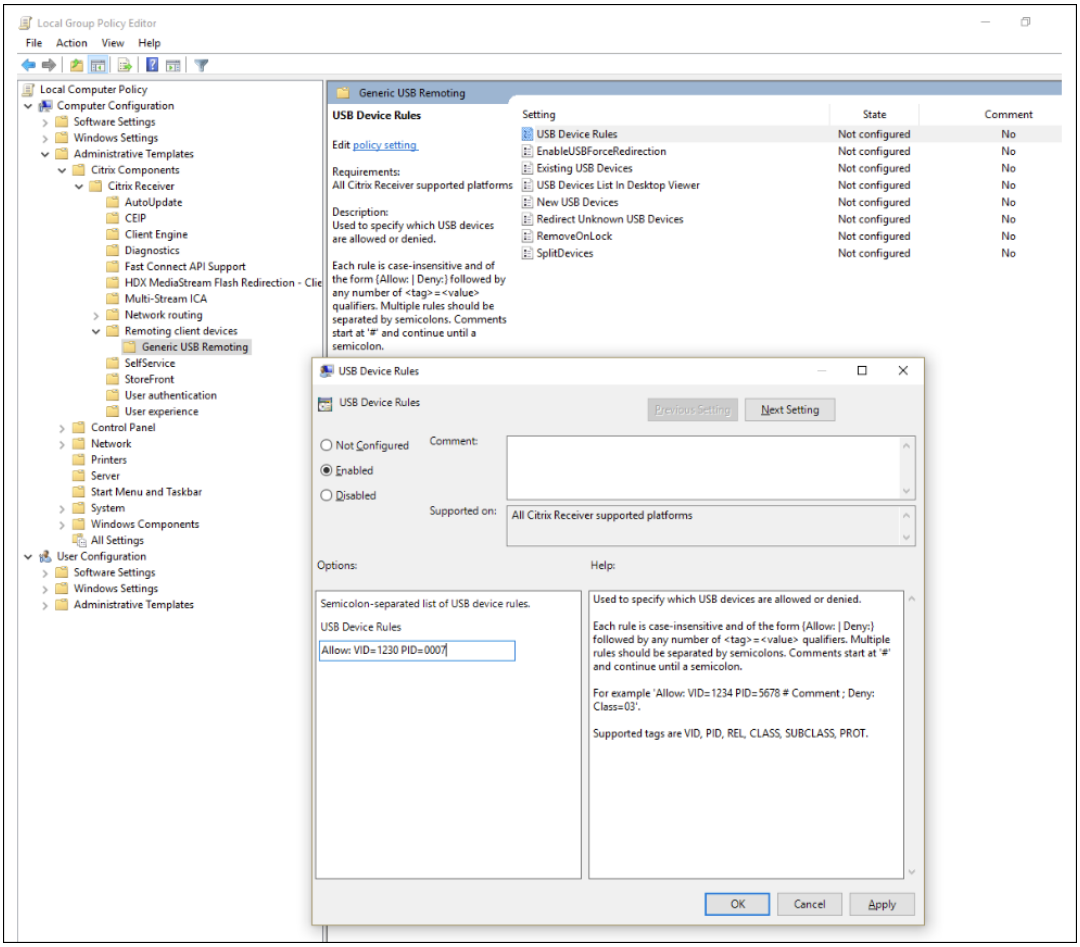
a) If you see a Deny rule in the CtxUsbDiagnostics tool output for a particular device, check the policies configured in Studio and ensure that the rules are correctly set in Version 2 policy. If the deny rule doesn't appear in the studio policy, check the client side policy and finally the client side defaults in that order to find the matching deny rule.

b) If there is no deny rule in the CtxUsbDiagnostics output, then CWA will allow redirection of the device by checking / clicking the appropriate button in the devices tab of the Preferences window (Devices > Manage devices). A device once redirected will be available in the session. This can be verified by checking the device manager / USBView or similar application in the HDX session.

5. If you do not see the device being presented inside the session:

   a) It is possible that the correct device driver is not installed correctly on the VDA host. Ensure that the latest versions of device drivers are correctly installed on the VDA host. Some device drivers are not supported on terminal server machines so ensure that is not the case with the device you are trying to redirect.

   b) Ensure that the device is not being used on the client endpoint. Some devices require drivers to be installed on the client endpoint as well and this could prevent them from being redirected in the session.



6. Validate USB related rules are set correctly on the client endpoint:

   a) **CWA for Windows** :

      i. Validate that group policy on the client (add more detail and SS for this) is appropriately set and does not conflict with the rules set in Studio.

      ii. Validate that default rules in the client's registry.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

(`HKLM\SOFTWARE\Wow6432Node\Citrix\PortICA\GenericUSB\DeviceRules`)are appropriately set and not in conflict with the rules set in Studio and client group policy.

b) CWA for Linux - To triage CWA for Linux issues, see USB documentation for CWA for Linux

c) CWA for Mac - To triage CWA for Mac issues, see CWA for Mac

Note:

- On TSVDA, audio devices are blocked by default from using USB redirection. The recommended way to use those devices is using the optimized Audio VC.
- Sometimes, USB composite devices might not be split automatically even though a correct device redirection rule is set to split the device. This issue occurs because the device is in low power mode. In these instances, the child device that enters low power mode might not be present in the device list. You can use the following workarounds to overcome this issue:
  - Disconnect the session, insert the USB device, and reconnect to the session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Unplug the USB device and plug it back in. This action results in the device moving out of low power mode.

- Sometimes, USB battery saver settings may be enabled to optimize battery life. If the client endpoint goes to sleep, the USB device may get disconnected. In such a scenario, you might have to disconnect and reconnect the device in order to present the device again in the session.

Event Logs

Administrators can now monitor for unauthorized devices that users may attempt to redirect and can take the appropriate action. Here are some of the event messages that will be logged in the Event viewer on the VDA host for devices that are allowed to be redirected and for devices that are not.

Id	1000
Name	UsbEventAcceptDevice
Severity	Informational
Facility	System
Text	The Citrix USB Service allows the USB Device with Product ID: %2, Vendor ID: %3, and Device ID: %4 to be remoted.
Comment	This message logs the device info of a device redirected in an HDX session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Id	1001
Name	UsbEventPolicyRejectsDeviceV1
Severity	Warning
Facility	System
Text	The USB device with Product ID: 0x%2, Vendor ID: 0x%3, and Device ID: 0x%4 is not being redirected because the Citrix USB policy, "DENY: ...%5..." is in effect. If you wish to redirect the device, please set an allow rule that matches the device in the "Client USB device redirection rules" policy in Citrix Studio.
Comment	This message displays a message of the device not getting redirected if a DENY rule is being enforced by the legacy “Client USB device redirection rules” policy rule.
Arguments	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Id	1002
Name	UsbEventPolicyRejectsDeviceV2
Severity	Warning
Facility	System
Text	The USB device with Product ID: 0x%2, Vendor ID: 0x%3, and Device ID: 0x%4 is not being redirected because the Citrix USB policy, "DENY: ...%5..." is in effect. If you wish to redirect the device, please set an allow rule that matches the device in the "Client USB device redirection rules (Version 2)" policy in Citrix Studio.
Comment	This message displays a message of the device not getting redirected if a DENY rule is being enforced by the "Client USB device redirection rules (Version 2)" policy rule. For instance, if the studio policy rule allows an approved set of devices and denies all other devices and an end user tries to create a new rule on the client endpoint via group policy, this event will get logged. This message would be indicative of an unauthorized device redirection attempt.
Arguments	

USB Diagnostics Tool

May 13, 2026

`CtxUsbDiagnostics.exe` is a command-line tool on the VDA to help Citrix admins diagnose and resolve USB device redirection issues experienced on the client in an expedited manner. This utility tool collects vital information required to triage configuration issues associated with USB devices attached to the client that are failing to redirect inside an HDX session.

> **Note :**
>
> - Running Command Prompt or Powershell as an administrator is required to ensure the tool has the necessary permissions to perform system-level operations.
> - `CtxUsbDiagnostics.exe` is located in `C:\Program Files\Citrix\HDX\bin\`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

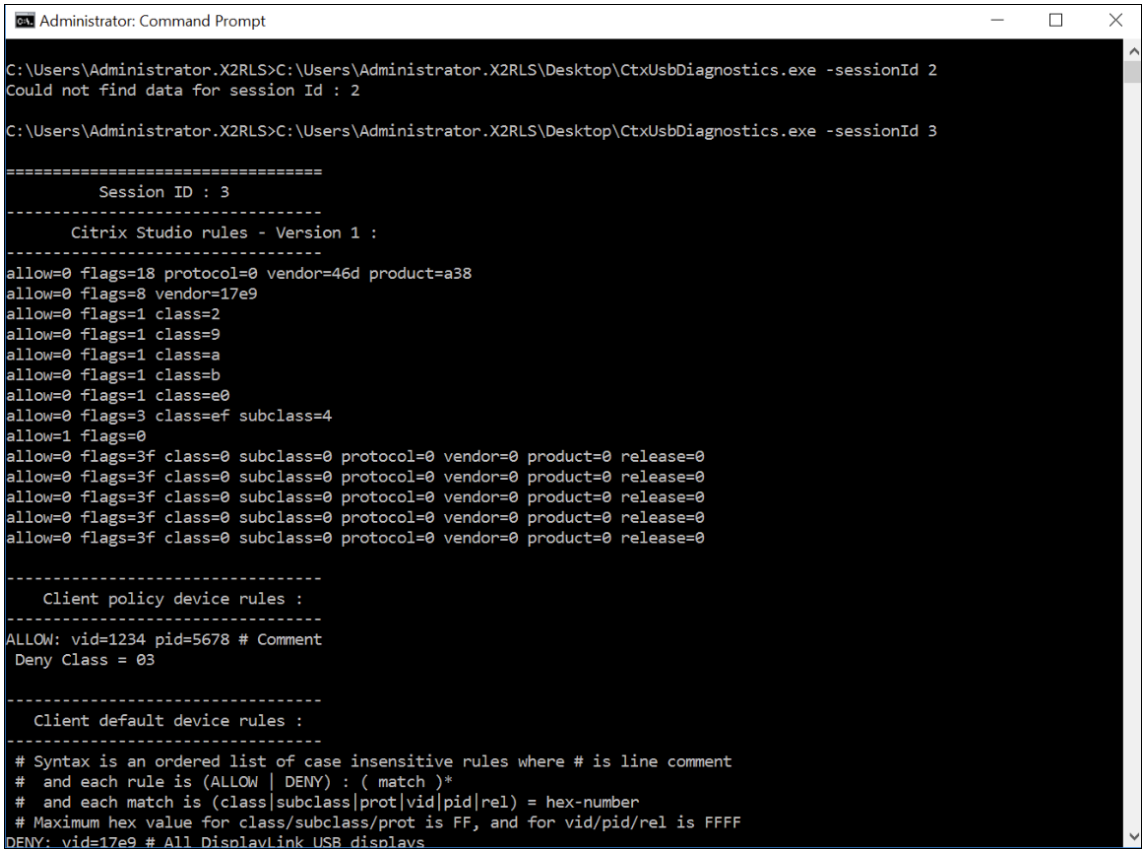
> `CtxUsbDiagnostics.exe`.
> and is already part of the environment variables. You need not navigate to this path and can directly run this tool on the command prompt with elevated privileges.

Requirements

Session host

- Operating system
  - Windows 10 1809 or later
  - Windows 11 21H2 or later
  - Windows Server 2016 or later
- VDA
  - Windows: Citrix Virtual Apps and Desktops™ Version 2311 or later

Client device



- Operating system
  - Windows 10 1809 or later
- Workspace App
  - Windows: version 2311 or later

What does the tool do?

The tool currently provides:

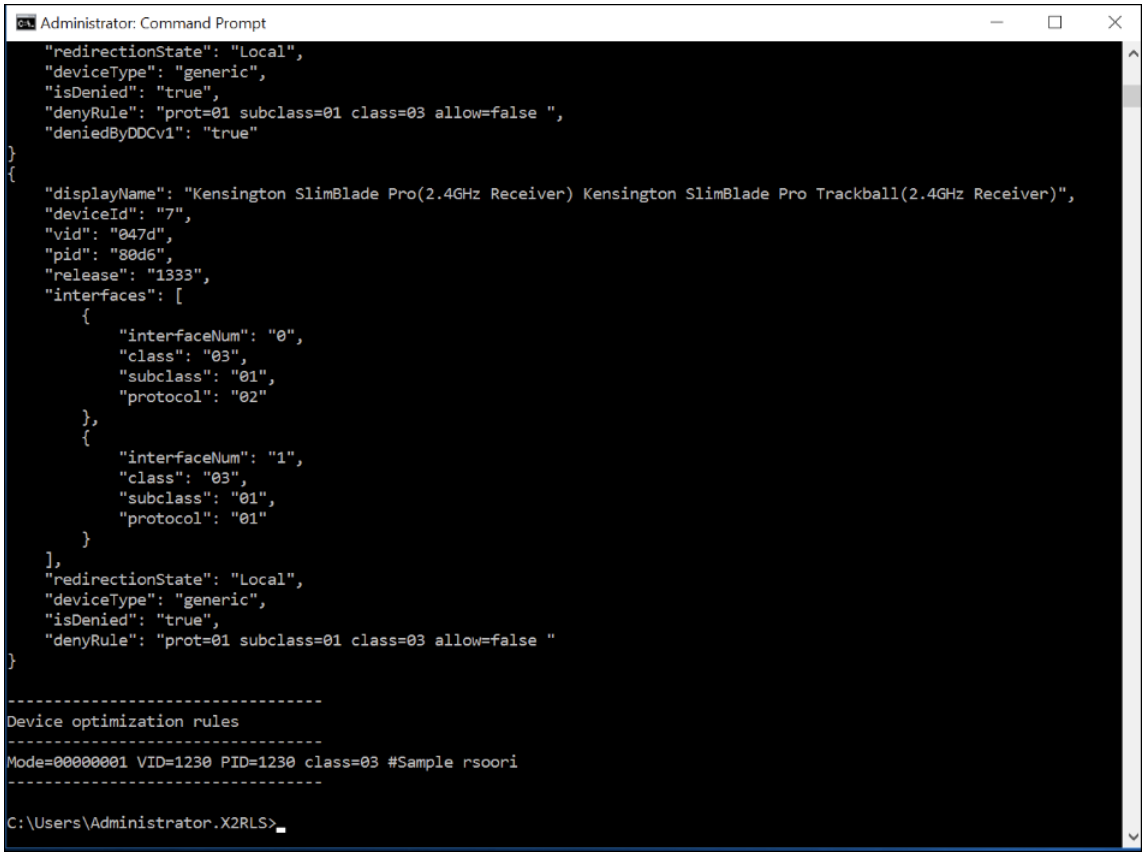
- SessionID
- VDA device policies (device rules set in Studio)
- Client devices and client device policies (device rules)
- List of devices, their redirection state, and why they were allowed or denied

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note :**
>
> The administrator can see device information for all active sessions.

Information Displayed

- **Citrix Studio rules - Version 1/2**
  - The DDC rules indicate the use of the legacy "**Client USB device redirection rules**"or "**Client USB device redirection rules (Version 2)**"policy in Studio. The information listed in this section lists all the rules configured by the Citrix® admin.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Client Default Device Rules**
  - This section lists the rules that are set in the registry on the client.

```
----------------------------------
   Client default device rules :
----------------------------------
 # Syntax is an ordered list of case insensitive rules where # is line comment
 #  and each rule is (ALLOW | DENY) : ( match )*
 #  and each match is (class|subclass|prot|vid|pid|rel) = hex-number
 # Maximum hex value for class/subclass/prot is FF, and for vid/pid/rel is FFFF
DENY: vid=17e9 # All DisplayLink USB displays
CONNECT: vid=1188 pid=A101 # Bloomberg 5 Biometric module
DENY: vid=1188 pid=A001 split=01 intf=00 # Bloomberg 5 Primary keyboard
CONNECT: vid=1188 pid=A001 split=01 intf=01 # Bloomberg 5 Keyboard HID
DENY: vid=1188 pid=A301 split=01 intf=02 # Bloomberg 5 Keyboard Audio Channel
CONNECT: vid=1188 pid=A301 split=01 intf=00,01 # Bloomberg 5 Keyboard Audio HID
DENY: class=02 # Communications and CDC-Control
DENY: class=09 # Hub devices
DENY:vid=045e pid=079A # Microsoft Surface Pro 1 Touch Cover
DENY:vid=045e pid=079c # Microsoft Surface Pro 1 Type Cover

DENY: class=0b # Smartcard
DENY: class=e0 # Wireless controller
DENY: class=ef subclass=04 # Miscellaneous network devices
ALLOW: # Otherwise allow everything else
```

- **Device optimization rules**
  - The section lists the device optimization rules as set in “Client USB device optimization rules.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Device List

This section lists valuable information about each device that is connected to the client endpoint, the hardware information, whether it is being redirected or not, whether the correct device redirection rule is set or not, and so on.

Tag Name	Description
displayName	Lists the common name of the device.
vid	Vendor ID
pid	Product ID
Interfaces	This subsection lists all the interfaces in case the composite device has been split into multiple child devices.
InterfaceNum	Indicates the index of the interface descriptor
class	Class code
subclass	Subclass Code

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Tag Name	Description
protocol	Protocol
redirectionState	**Local** indicates that the device is not redirected in the ICA® session. **ThisSession** indicates that the device is redirected in the ICA session. **OtherSession** indicates that the device is redirected in another ICA session.
deviceType	**generic** indicates that the device does not have an optimized virtual channel and the traffic is flowing through the USB virtual channel. **optimized** implies that the data transfer associated with the device is happening over a dedicated virtual channel.
isDenied	**true** indicates that the device is not redirected because of a policy rule set by the admin. `false` indicates that the device is redirected because of applied policy.
denyRule	This field is useful if **isDenied** is set to `true`. It tells the admin the specific rule set in the policy that is resulting in the device not getting redirected.
deviceDriver	This field indicates whether a corresponding driver is present or not on the VDI host.

Additionally, a summary section is included for each device which lets the user know the availability of the device inside the HDX session.

Recommendations

This section provides a brief summary of the various device rules and problems (if any) that need to be rectified or investigated.

Legacy USB Redirection Configuration

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you are using any components older than version 2212 or if you are using CWA for Linux, follow this guide for configuring USB redirection in your environment.

Enabling Generic USB Redirection

1. Open **Citrix Web Studio™ policies** and click on the **Policies** tab.
2. Click on **Create Policy** and expand the **ICA® > USB Devices policies**.
3. Edit the **Client USB device redirection** policy setting.
4. Select **Allowed** and click **Save**.

Creating USB Redirection Policy Rules

When the user tries to redirect a USB device to Virtual Desktop, it is checked against each USB policy rule in turn until a match is found. The first match for any devices is considered final. If the first match is an Allow rule, the matched device is allowed to be redirected to the virtual desktop. If the first match is a Deny rule, the matched device is only available in the local desktop. If no match is found, default rules are used.

Setting the appropriate device rules on the Studio console:

1. Open **Citrix Web Studio policies** and click on the **Policies** tab.
2. Click on **Create Policy** and expand the **ICA > USB Devices policies**.
3. Edit the **Client USB device redirection rules** policy setting.
4. Set the value based on the examples provided in the description for each usb device that needs to be redirected and click Save.
   For Example:
   Allow: VID=056A PID=00A4 #STU-430
   Deny: Class=08 subclass=05 # Mass Storage

   > **Note:**
   >
   > If a Citrix® admin checks Use default value and clicks on Save, the default rules can be found in the following registry in the VDA.
   >
   > **Caution:**
   >
   > Refer to the Disclaimer at the end of this article before using the Registry Editor.
   > `HKLM\SOFTWARE\Wow6432Node\Citrix\PortICA\GenericUSB\DeviceRules`

Setting appropriate GPOs on the client:

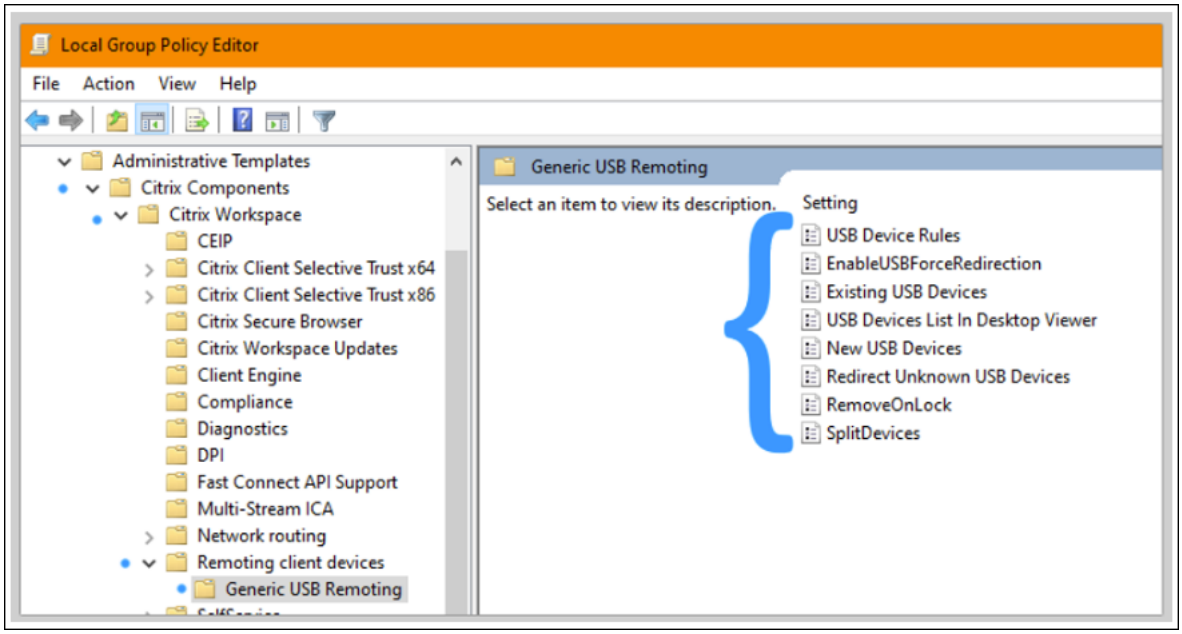
© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Open the **Local Group Policy Editor** and go to **Administrative Templates > Citrix Components > Citrix Receiver™ > Remoting client devices > Generic USB Remoting**.
2. Open the **USB Device Rules** setting and set it to **Enabled**. Add the USB Device rule as in this example,
   The Allow: VID=1230 PID=0007 rule allows the device with Vendor ID 1230 and Product ID 0007.

> **Note:**
>
> Use the Allow: VID=xxxx PID=xxxx rule when a specific device must be on top of the device rules list.

> **Note:**
>
> A tool like USBView or even the Connection toolbar can be used to determine the device details like VID and PID.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



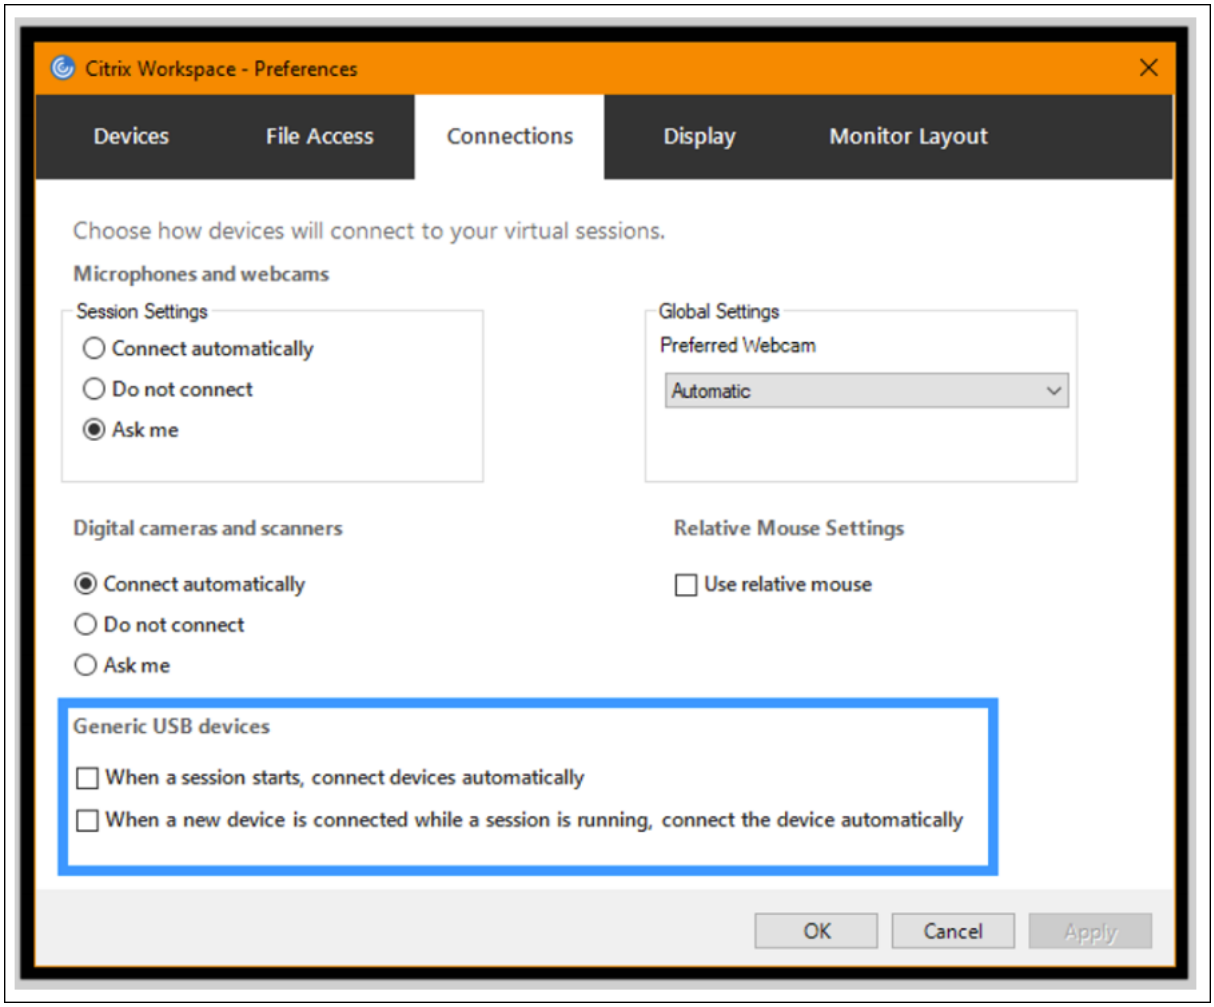
Configure automatic redirection of USB devices

USB devices are automatically redirected when USB support is enabled. Also, the USB user preference settings are set to automatically connect USB devices. It is not always best to redirect all USB devices. Users can explicitly redirect devices from the USB device list that are not automatically redirected. To prevent USB devices from being listed or redirected, use DeviceRules policy setting on the client endpoint.

This policy can be set on the client using a GPO, client side registry, using Citrix Workspace™ Preferences or the Connections tab under CDViewer. All of these methods are described below:

Using GPOs on the client:

1. Open **Local Group Policy Editor** and go to **Administrative Templates > Citrix Components > Citrix Receiver > Remoting client devices > Generic USB Remoting**.
2. Open **New USB Devices**, select **Enabled**, and click **OK**.
3. Open **Existing USB Devices**, select **Enabled**, and click **OK**.



Using Citrix Connection Center:

1. Go to **Citrix Workspace Preferences > Connections**.
2. Ensure that the following options are selected:
    a) When a session starts, connect devices automatically
    b) When a new device is connected while a session is running, connect the device automatically.
3. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using CDViewer Connection toolbar:

1. After a session starts, click on the **CDViewer** dropdown and select the **Citrix Workspace Preferences > Connections** tab.
2. Ensure that the following options are selected:
   a) When a session starts, connect devices automatically
   b) When a new device is connected while a session is running, connect the device automatically.
3. Click **Apply** and **OK** to save the policy.

For the client based configurations, the registry keys are set to the client device at the following location:

> **Caution:**
>
> Refer to the Disclaimer at the end of this article before using the Registry Editor.
> `HKLM\SOFTWARE\Wow6432Node\Citrix\ICA Client\GenericUSB`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring two or more devices using USB redirection with different device rules

Multiple devices can be redirected inside the HDX™ session with different device rules. An admin may want to redirect one device automatically while providing an option to the end user to redirect the other device. The following are the steps to configure two devices with different rules.

1. Enable the **Client USB device redirection** policy setting in **Citrix Web Studio**.
2. Edit the **USB device rules** setting in client side GPO.
    a) Open the **Local Group Policy Editor** and go to **Administrative Templates > Citrix Components > Citrix Receiver > Remoting client devices > Generic USB Remoting**.
    b) Open the **USB Device Rules setting** and enable the setting. Add the USB Device rule as in this example, The **Allow: VID=0911 PID=0c1c** rule allows the device with **Vendor ID 0911** and **Product ID 0c1c** but it will not be automatically redirected. The **Connect: VID=06A8 PID=0043** rule will automatically redirect the device with **Vendor ID 06A8** and **Product ID 0043** provided the the automatic redirection policies mentioned in step 3 are set.
    c) **Allow**: VID=0911 PID=0c1c #Phillips speech mic.
    d) **Connect**: VID=06A8 PID=0043 class=03 # Topaz HSB signature pad
3. Open **Local Group Policy Editor** and go to **Administrative Templates > Citrix Components > Citrix Receiver > Remoting client devices > Generic USB Remoting**.
4. Open **New USB Devices**, select **Enabled**, and click **OK**.
5. Open **Existing USB Devices**, select **Enabled**, and click **OK**.

Once these settings are configured, the Topaz signature pad will be automatically redirected inside the HDX session and additional end user action will be required (Select Redirect option in Connection center or CD Viewer Devices tab) to redirect the Phillips speech mic in the session.

> **Note:**
>
> The above settings in step 2 and 3 could be applied directly in the client side registry value **DeviceRules** under the GenericUSB key (HKLM\SOFTWARE\Wow6432Citrix\ICA Client\GenericUSB) but that is not the recommended way.

Generic USB redirection and client drive considerations

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HDX™ technology provides **optimized support** for most popular USB devices. Optimized support offers an improved user experience with better performance and bandwidth efficiency over a WAN. Optimized support is usually the best option, especially in high latency or security-sensitive environments.

HDX technology provides **generic USB redirection** for specialty devices that don't have optimized support or where it is unsuitable, for example:

- The USB device has more advanced features that are not part of optimized support, such as a mouse or webcam having more buttons.
- Users need functions which are not part of optimized support.
- The USB device is a specialized device, such as test and measurement equipment or an industrial controller.
- An application requires direct access to the device as a USB device.
- The USB device only has a Windows driver available. For example, a smart card reader might not have a driver available for the Citrix Workspace™ app for Android.
- The version of the Citrix Workspace app does not provide any optimized support for this type of USB device.

With generic USB redirection:

- Users do not need to install device drivers on the user device.
- USB client drivers are installed on the VDA machine.

> **Important:**
>
> - Generic USB redirection can be used together with optimized support. If you enable generic USB redirection, configure Citrix USB devices policy settings for both generic USB redirection and optimized support.
> - The Citrix policy setting in Client USB device optimization rules is a specific setting for generic USB redirection, for a particular USB device. It doesn't apply to optimized support as described here.

Performance considerations for USB devices

Network latency and bandwidth can affect user experience and USB device operation when using generic USB redirection for some types of USB devices. For example, timing-sensitive devices might not operate correctly over high-latency low-bandwidth links. Use optimized support instead where possible.

Some USB devices require high bandwidth to be usable, for example a 3D mouse (used with 3D apps that also typically require high bandwidth). If bandwidth cannot be increased, you might be able to mitigate the issue by tuning bandwidth usage of other components using the bandwidth policy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

settings. For more information, see Bandwidth policy settings for Client USB device redirection, and Multi-stream connection policy settings.

Security considerations for USB devices

Some USB devices are security-sensitive by nature, for example, smart card readers, fingerprint readers, and signature pads. Other USB devices such as USB storage devices can be used to transmit data that might be sensitive.

USB devices are often used to distribute malware. Configuration of Citrix Workspace app and Citrix Virtual Apps and Desktops™ can reduce, but not eliminate, risk from these USB devices. This situation applies whether generic USB redirection or optimized support is used.

> **Important:**
>
> For security-sensitive devices and data, always secure the HDX connection, see Communication between client and VDA.
>
> Only enable support for the USB devices that you need. Configure both generic USB redirection and optimized support to meet this need.
>
> Provide guidance to users for safe use of USB devices:
>
> - Use only USB devices that have been obtained from a trustworthy source.
> - Don't leave USB devices unattended in open environments - for example, a flash drive in an internet cafe.
> - Explain the risks of using a USB device on more than one computer.

Security controls for USB mass storage devices

Optimized support is provided for USB mass storage devices. This support is part of Citrix Virtual Apps and Desktops client drive mapping. Drives on the user device are automatically mapped to drive letters on the virtual desktop when users log on. The drives are displayed as shared folders that have mapped drive letters. To configure client drive mapping, use the **Client removable drives** setting. This setting is in the File Redirection policy settings section of the ICA policy settings.

With USB mass storage devices you can use either Client drive mapping or generic USB redirection, or both. Control them using Citrix® policies. The main differences are:

Feature	Client drive mapping	Generic USB redirection
Enabled by default	Yes	No
Read-only access configurable	Yes	No

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> USB redirection is supported over lower bandwidth connections, for example 50 Kbps. However, copying large files doesn't work.

Client Drive Mapping (CDM)

May 15, 2026

Client Drive Mapping makes storage drives on the client endpoint available inside a Citrix HDX™ session to allow files and folders to be transferred from the client to the session host, and vice versa. This feature is enabled by default with both read and write privileges. To prevent users from adding or changing files and folders on mapped client-devices, enable the **Read-only client drive access** policy setting. When adding this setting to a policy, ensure that the **Client drive redirection** setting is set to **Allowed** and is also added to the policy.

As a security precaution, endpoint drives are mapped without the run permission by default. To allow users to run executables directly from the mapped client drives, edit the **ExecuteFromMappedDrive** registry value in the session host. For details, see Mapped client drives in the **HDX features managed through the registry** section.

Requirements

The following are the requirements for using CDM:

Citrix Control plane

- Citrix Virtual Apps and Desktops™ 1912 or later
- Citrix DaaS™

Session host

- Operating system
  - Windows 10 1809 or later
  - Windows Server 2016 or later
  - Linux: Please refer to the Linux VDA system requirements
- VDA

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Windows: Citrix Virtual Apps and Desktops™ 1912 or later
- Linux: Please refer to the Linux VDA documentation

Client device

- Operating system
  - Windows 10 1809 or later
  - Linux: Please refer to the Workspace app for Linux system requirements

Related Policies

Please refer to Policy settings reference section for CDM settings.

Double-hop scenarios

CDM is supported in double-hop scenarios. By default, the client endpoint's drive is mapped to the second hop session and the first hop's drives are not available. However, this can be set so that the first hop's drives are mapped in the second hop's session instead of the client endpoint's drives.

To configure this functionality, edit the following registry value:

- Key: HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Citrix\ICA Client\Engine\Configuration\Advanced
- Value name: NativeDriveMapping
- Value type: REG_SZ
- Value data:
  - True - Maps the drives of the first hop session in the second hop session
  - False - Maps the drives of the client endpoint in the second hop session

> **Note:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Support for mobile and touch screen client devices

May 15, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops™ enables users to access their published applications and desktops from mobile and touch screen client devices.

Requirements

Citrix® control plane

- Citrix Virtual Apps and Desktops™ 1912 or later
- Citrix DaaS™

Session host

- Operating system
  - Windows 10 1903 or later
  - Windows 11 21H2 or later
- VDA
  - Windows: Citrix Virtual Apps and Desktops version 7.15 or later

Client device

- Operating system
  - Windows 10 1809 or later
  - Windows 11 21H2 or later
- Citrix Workspace™ app for Windows version 1808 or later

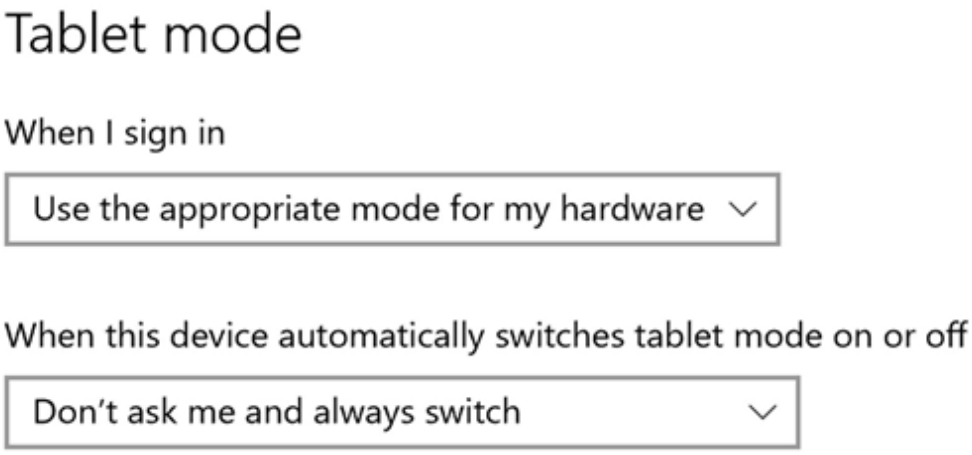
Tablet mode for touch screen devices using Windows Continuum

Continuum is a Windows 10 feature that adapts to the way the client device is used. When the VDA detects the presence of a keyboard or mouse on a touch enabled client, it puts the client in to desktop mode. If a keyboard or mouse is not present, the VDA puts the client in to tablet/mobile mode. This detection occurs on session connection and reconnection and also in-session when the keyboard or mouse is attached or detached.

The feature is enabled by default. To disable this feature, configure the policy settings Tablet mode toggle policy settings.

In addition to the requirements for touch screen devices mentioned above, the following are required for Windows Continuum:

© 1997–2026 Citrix Systems, Inc. All rights reserved.



XenServer (formerly Citrix Hypervisor™)

- Citrix Hypervisor 8.2 or higher
- Run the XenServer CLI command to allow laptop/tablet switching:
  xe vm-param-set uuid=<VM_UUID> platform:acpi_laptop_slate=1

> **Important:**
>
> Updating the base image for an existing machine catalog after changing the metadata setting doesn't affect any previously provisioned VMs. After changing the XenServer VM base image, create a catalog, choose the base image, and provision a new Machine Creation Services™ (MCS) machine.

Session host

- Operating system
  - Windows 10 1903 or later
  - Windows 11 21H2 or later
- VDA
  - Windows: version 7.16 or later
  - **Due to current limtations in the Operating system configurations, the user will have to set the following options from the drop-down menus after they start the first ICA® session and restart the VDA:**
    - **Settings > System > Tablet Mode**
      - Use the appropriate mode for my hardware
      - Don't ask me and always switch

The **tablet mode** offers a user interface that is better suited to touch screens:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Slightly larger buttons.
- The Start screen and any apps you start open in a full screen.
- Taskbar contains a back button.
- Icons deleted from the task bar.

You have access to the File Explorer.

Windows 10 loads the GPIO driver on the target virtual machine based on this updated BIOS. It is used for toggling between tablet and desktop modes within the virtual machine.

Citrix Workspace app for HTML5 does not support Windows Continuum features.

The **desktop mode** offers the traditional user interface where you interact in the same manner as using PC and a keyboard and mouse.

Microsoft Surface Pro and Surface Book pens

We support standard pen functionality with Windows Ink-based applications. Support includes pointing, erasing, pen pressure, Bluetooth signals, and other features depending on the operating system firmware and pen model. For example, pen pressure can be up to 4096 levels. This feature is enabled by default.

The following are the requirements for pen functionality support:

Citrix control plane

- Citrix Virtual Apps and Desktops 1903 or later
- Citrix DaaS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session host

- Operating system
  - Windows 10 1809 or later
  - Windows 11 21H2 or later
- VDA
  - Windows: Citrix Virtual Apps and Desktops 1903 or later

Client device

- Operating system
  - Windows 10 1809 or later
  - Windows 11 21H2 or later
- Citrix Workspace app for Windows version 1902 or later

For a demonstration of Windows Ink and the pen functionality, click this graphic:

To disable or enable this feature, see Microsoft Surface Pro and Surface Book pens in the list of features managed through the registry.

Known issues

The following are known issues with Pen support:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Due to OS limitations in Windows server 2k22, users will not be able to set pen shortcuts or make adjustmentes to pen/ink settings in Control Panel when connecting to 2k22 server applications or desktops.
- Pen shortcuts are not being honored from a pen enabled Windows 11 client due to OS limitation.

Serial ports

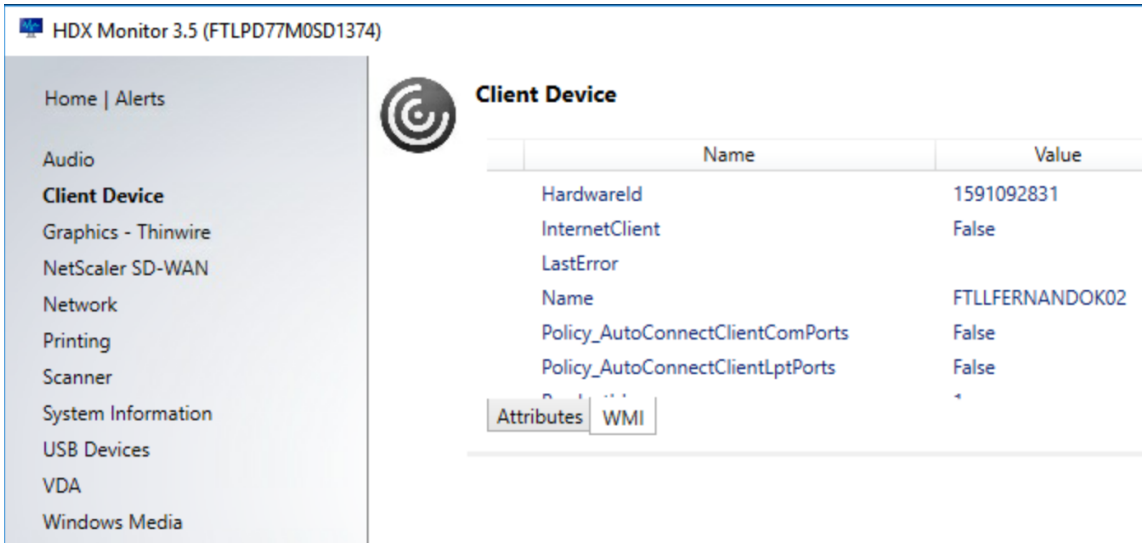
May 13, 2026

Most new PCs don't have built-in serial (COM) ports. The ports are easy to add by using USB converters. Applications suited for serial ports often involve sensors, controllers, old check readers, pads, and so forth. Some USB virtual COM-port devices use vendor-specific drivers in place of the Windows-provided drivers (usbser.sys). These drivers allow you to force the virtual COM port of the USB device so that it doesn't change even if connected to different USB sockets. This might be done from the **Device Manager > Ports (COM & LPT) > Properties** or from the application that controls the device.

Client COM port mapping allows devices attached to the COM ports on the user's endpoint to be used during virtual sessions. You can use these mappings like any other network mappings.

For each COM port, a driver in the operating system assigns a symbolic link name such as COM1 and COM2. The applications then use the link to access the port.

> **Important:**
>
> Because a device can attach to the endpoint by using USB directly, doesn't mean it can be redirected using generic USB redirection. Some USB devices function as virtual COM ports, which applications can access in the same way as physical serial port. The operating system can abstract COM ports and treat them like fileshares. Two common protocols for virtual COM are CDC ACM or MCT. When connected through an RS-485 port, applications might not work at all. Get an RS-485-to-RS232 converter to use RS-485 as a COM port.
>
> **Important:**
>
> Some applications recognize the device (for example, a signature pad) consistently only if it is connected to COM1 or COM2 on the client workstation.



Map a client COM port to a server COM port

You can map client COM ports to a Citrix® session in three ways:

- Studio policies. For more information about policies, see Port redirection policy settings.
- VDA command prompt.
- Remote Desktop (Terminal Services) configuration tool.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Enable the **Client COM port redirection** and the **Auto connect client COM ports Studio** policies. After applied, some information is available in HDX™ Monitor.

2. If **Auto connect client COM ports** failed to map the port, you can map the port manually or use logon scripts. Log on to the VDA, and at a command prompt window, type:

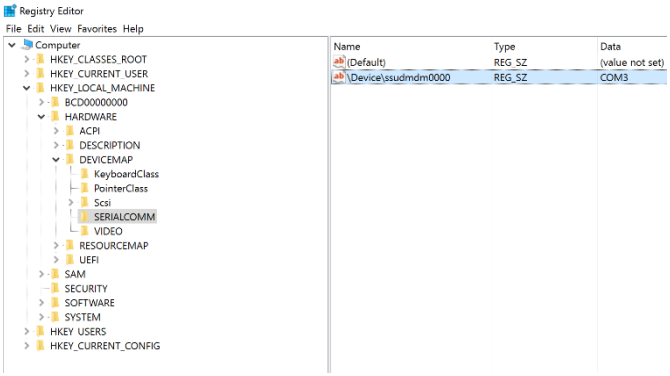
   NET USE COMX: \\CLIENT\COMZ:

   Or

   NET USE COMX: \\CLIENT\CLIENTPORT:COMZ:

   X is the number of the COM port on the VDA (ports 1 through 9 are available for mapping). **Z** is the number of the client COM port you want to map.

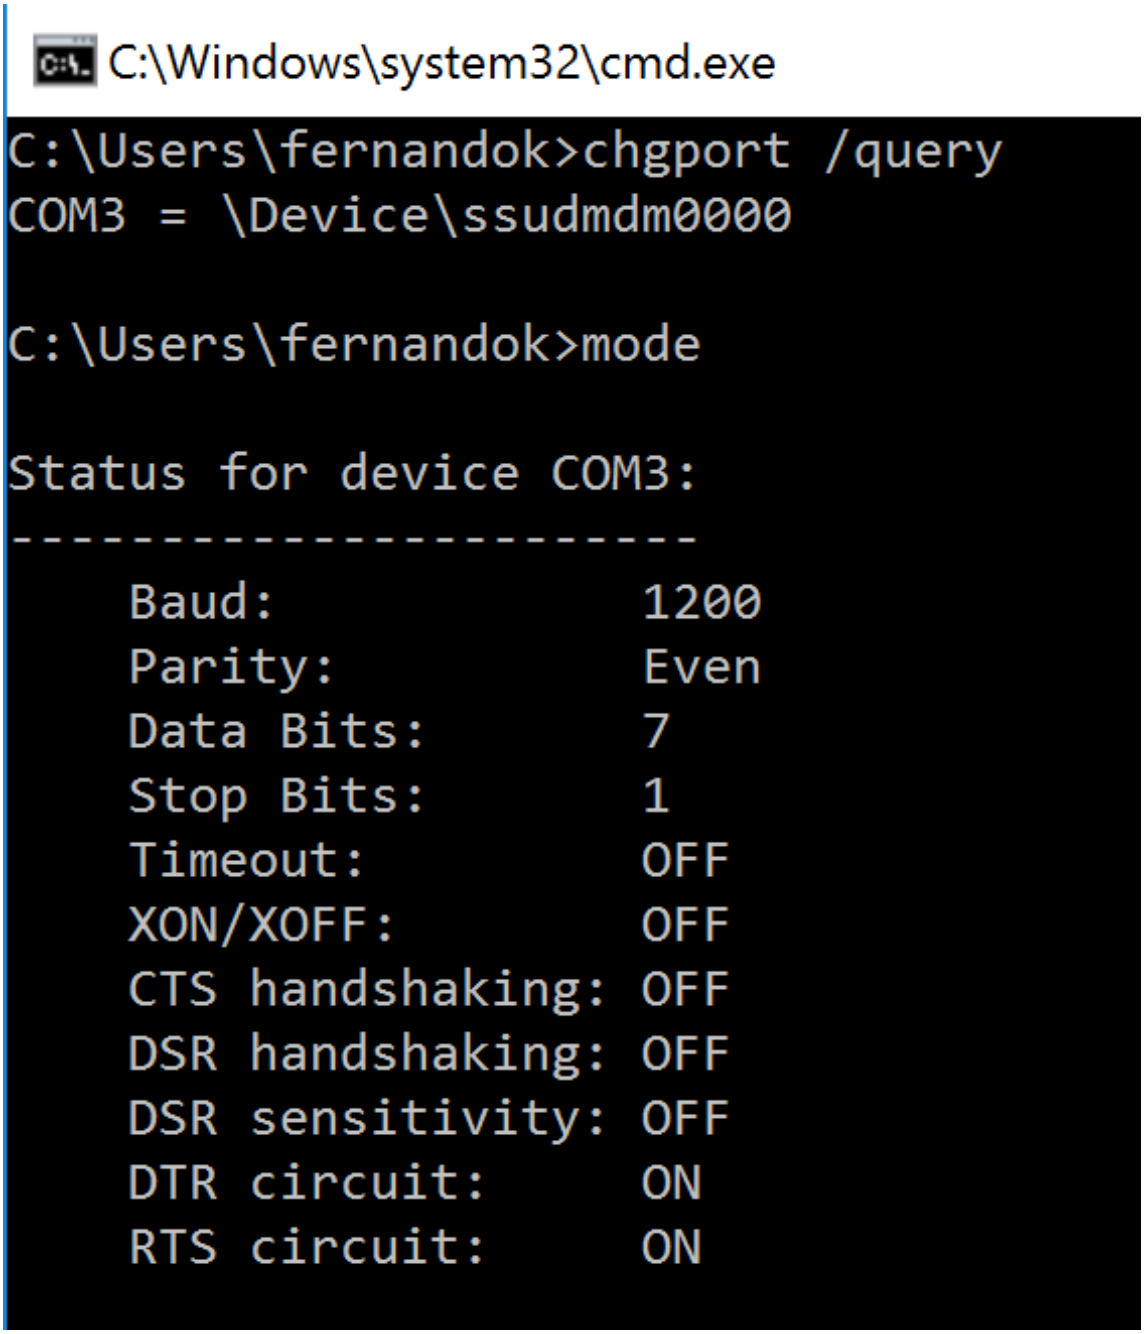
   To confirm that the operation was successful, type **NET USE** at a VDA command prompt. The list that appears contains mapped drives, LPT ports, and mapped COM ports.



3. To use this COM port in a virtual desktop or application, install your user device application and point it to the mapped COM port name. For example, if you map COM1 on the client to COM3 on the server, install your COM port device application in the VDA and point it to COM3 during the session. Use this mapped COM port as you would a COM port on the user device.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> COM port mapping is not TAPI-compatible. You can't map Windows Telephony Application Programming Interface (TAPI) devices to client COM ports. TAPI defines a standard way for applications to control telephone functions for data, fax, and voice calls. TAPI manages signaling, including dialing, answering, and ending calls. Also, supplemental services such as holding, transferring, and conference calls.



Troubleshoot

1. Ensure you can access the device directly from the endpoint, bypassing Citrix. While the port is not mapped to the VDA, you are not connected to a Citrix session. Follow any troubleshooting instructions that came with the device and verify that it works locally first.
   When a device is connected to a serial COM port, a registry key is created on the hive shown here:

   You can also find this information from the command prompt by running **chgport /query**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If troubleshooting instructions for the device aren't available, try opening a PuTTY session. Choose **Session** and in **Serial line** specify your COM Port.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can run **MODE** in a local command window. The output might display the COM port in use and the Baud/Parity/Data Bits/Stop Bits, which you need in your PuTTY session. If the PuTTY connection is successful, press **Enter** to see feedback from the device. Whatever characters you type might be repeated on the screen, or responded to. If this step is unsuccessful, you can't access the device from a virtual session.

2. Map the local COM port to the VDA (using policies or **NET USE COMX: \\CLIENT\COMZ:**) and repeat the same PuTTY procedures in the previous step, but this time from the VDA PuTTY. If PuTTY fails to show the error **Unable to open connection to COM1. Unable to open serial port**, another device might be using COM1.

3. Run **chgport /query**. If the built-in Windows serial driver on the VDA is auto-assigning \Device\Serial0 to a COM1 port of your VDA, do the following:
   A. Open CMD on the VDA and type **NET USE.**

   B. Delete any existing mapping (for example, COM1) on the VDA.

   NET USE COM1 /DELETE

   C. Map the device to the VDA.

   NET USE COM1: \\CLIENT\COM3:

   D. Point your application on the VDA to COM3.

   Lastly, try to map your local COM port (for example, COM3) to a different COM port on the VDA (other than COM1, for example COM3). Ensure that your application is pointing to it:
   NET USE COM3: \\CLIENT\COM3

4. If now you do see the port mapped, PuTTY is working but no data passing, it might be a race condition. The application might connect and open the port before it is mapped, locking it from being mapped. Try one of the following:

   - Open a second application published on the same server. Wait a few seconds for the port to be mapped, and then open the real application that tries to use the port.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Enable the COM port redirection policies from the Group Policy Editor in Active Directory instead of Studio. Those policies are **Client COM port redirection** and **Auto connect client COM ports**. Policies applied this way might be processed before the Studio policies, guaranteeing that the COM port is mapped. Citrix policies are pushed to the VDA and stored in: `HKLN\SOFTWARE\Policies\Citrix \<user session ID\>`
- Use this logon script for the user or instead of publishing the application, publish a .bat script that first deletes any mapping on the VDA, remaps the virtual COM port, and then starts the application:

```
@echo off
NET USE COM1 /delete
NET USE COM2 /delete
NET USE COM1: \\CLIENT\COM1:
NET USE COM2: \\CLIENT\COM2:
MODE COM1: BAUD=1200 (or whatever value needed)
MODE COM2: BAUD=9600 PARITY=N Data=8 Stop=1 (or whatever value needed)
START C:\Program Files\<Your Software Path>\<your_software.exe>
```

5. Process Monitor from Sysinternals is the tool of last resort. When running the tool on the VDA, find and filter objects like COM3, picaser.sys, CdmRedirector, but especially <your_app>.exe. Any errors might appear as Access Denied or similar.

Specialty keyboards

May 13, 2026

Bloomberg keyboards

> **Warning:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Citrix Virtual Apps and Desktops™ supports the Bloomberg model 5, model 4 Starboard keyboard (and earlier model 3). This keyboard enables customers in the financial sector to use the special features of the keyboard to access financial market data and perform trading quickly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> We recommend that you use the Bloomberg keyboard with only one session. We don't recommend using the keyboard with multiple concurrent sessions (one client to multiple sessions).

The Bloomberg keyboard is a USB composite device comprising multiple USB devices in one physical shell:

- Keyboard.
- Fingerprint reader.
- Audio device with keys to increase and decrease volume and mute the speaker and the microphone. This device includes onboard speaker, microphone, and jack for the microphone and headset.
- USB hub to connect all of these devices to the system.

Requirements:

- The session to which Citrix Workspace™ app for Windows is connecting must support USB devices.
- Minimum of Citrix Workspace app 2207 for Linux to support Bloomberg keyboard model 5.
- Minimum of Citrix Workspace app 2109 for Windows to support Bloomberg keyboard model 5.
- Minimum of Citrix Workspace app 1808 for Windows or Citrix Receiver for Windows 4.8 to support Bloomberg keyboard model 3 and 4.
- Minimum of Citrix Workspace app 1808 for Windows or Citrix Receiver for Windows 4.12 to use KVM mode (two USB cables with one routed through KVM) for Model 4.

For information about configuring Bloomberg keyboards on Citrix Workspace app for Windows, see Configuring Bloomberg keyboards.

To enable Bloomberg keyboard support, see Bloomberg keyboards in the list of features managed through the registry.

Verify support:

To determine if Bloomberg keyboard support is enabled in Citrix Workspace app, check if the Desktop Viewer correctly reports the Bloomberg keyboard's devices.

Desktop scenario:

Open the Desktop Viewer. If support for Bloomberg keyboard is enabled, the Desktop Viewer shows see three devices under the USB icon:

For Bloomberg 5 keyboard:

- Bloomberg LP Bloomberg Biometric Module
- Bloomberg LP Keyboard (Composite device with two interfaces)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Bloomberg LP Keyboard Audio (Composite device with three interfaces)

For Bloomberg 3 and 4 keyboards:

- Bloomberg Fingerprint Scanner
- Bloomberg Keyboard Features
- Bloomberg LP Keyboard 2013

Seamless Application only scenario:

Open the **Connection Center** menu from the Citrix Workspace app notification area icon. If support for the Bloomberg keyboard is enabled, the three devices appear in the **Devices** menu.

The check mark against each of these devices indicates that they are remoted to the session.

Support key event sequence processing in Windows VDA for double hop

May 13, 2026

This feature ensures that the key events are sent sequentially in the Windows Virtual Desktop Agent (VDA) when the client device is non-Windows and operates in Unicode mode. It addresses specific input-related issues, including

1. Double-hop scenarios with RDP as the second hop.
    - When using a German keyboard layout, holding the **AltGr** key and pressing **q** should produce **@** as the output. However, without this feature, the actual output is **q**.
2. Key shortcut functionality
    - The **Alt+Tab** shortcut may not function consistently in Windows VDA when using Citrix Workspace™ App (CWA) for Android.

By enabling this feature, these input inconsistencies are resolved. This ensures accurate key event handling and improved usability.

The feature is disbled by default. The toggle of this feature is `EnableSendUnicodeKeyQueue` in registry setting.

A new registry `HKLM\System\CurrentControlSet\Control\Terminal Server\Wds\icawd\EnableSendUnicodeKeyQueue` DWORD = 0/1 is used to to switch to the new implementation if the value is 1.

By default, the value is 0.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Set the above registry key in the 1st hop Windows VDA for double hop use scenarios.

Windows - Keyboard & IME Supportability Tool

May 13, 2026

This is a self-service command line tool which can diagnose relevant problems to the keyboard and Input Method Editor.

In order to meet a variety of user requirements, provide platform versatility, and provide users with personalized needs, the functions of the keyboard and Input Method Editor (IME) rely on different configurations and capabilities in VDAs and Citrix Workspace™ apps.

An incorrect setting in VDA or client side might result in unexpected input behaviors.

However, Citrix® provides the recommended settings for some common usage scenarios, and these recommendations are also included in the diagnose results.

With this tool, below categories of issues can be identified:

- **Keyboard type inconsistency:** will check VDA keyboard type and client keyboard type to confirm if there is inconsistency. For example, VDA is using 101 English keyboards, but the client is using a Japanese 106 keyboard. This diagnostic is targeted for JP 106/109 keyboard, and KO 103/106 keyboard use cases.
- **Keyboard layout sync mode inconsistency:** will check the keyboard layout sync settings, registry settings, group policies, and sort out problems in sync mode configurations in a given environment.
- **Client keyboard layout and VDA keyboard layout inconsistency:** will check if the client keyboard layout is the same as VDA keyboard layout
- **Remote Language Bar is now showing for application sessions:** will check if the remote language bar is showing when end users launch an application session and are using more than 1 keyboard layout.

This command line tool is hosted in Windows VDA - `CtxKbImeDiagnostics.exe`.
The command line interfaces are as below:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Interface	Description	Note
`CtxKbimeDiagnostics`	show diagnostic result only for current ICA® session	If the user has admin privilege, it shows diagnostic for all active ICA sessions. If the user has no admin privilege, it shows diagnostic for current users'ICA sessions
`CtxKbimeDiagnostics [-v]`	show setting information and diagnostic result for the current session	If the user has admin privilege, it shows diagnostic for all active ICA sessions
`CtxKbimeDiagnostics [-v] [-s Session_Id]`	show setting information and diagnostic result for this session	
`CtxKbimeDiagnostics [-s Session_Id]`	specific a session and show the respective diagnostic result for this session	Admin Privilege can query other ICA sessions/Normal user can only query their own ICA sessions
`CtxKbimeDiagnostics [-s Session_Id] [-v]`	specific a session and show all setting information and diagnostic result for this session	Admin Privilege can query other ICA sessions. Normal user can only query their own ICA sessions
`CtxKbimeDiagnostics [-h]`	show supported args/parameters and example	"help"interface
`CtxKbimeDiagnostics [-V]`	show current tool version	

> **Note:**
>
> In this version, only CWA Windows as a client is supported.

Webcams

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

High definition webcam streaming

Webcams can be used by video conferencing applications running within the virtual session. The application on the server selects the webcam format and resolution based on the supported format types. When a session starts, the client sends the webcam information to the server. Choose a webcam from the video conferencing application. When the webcam and the application both support high-definition rendering, the application uses high-definition resolution. We support webcam resolutions up to 1920x1080.

This feature requires the Citrix Receiver for Windows, minimum version 4.10. For a list of Citrix Workspace app platforms that support HDX webcam redirection, see Citrix Workspace app feature matrix.

For more information about high-definition webcam streaming, see HDX video conferencing and webcam video compression.

You can use a registry key to disable and enable the feature and then configure a specific resolution. For information, see High-definition webcam streaming and High-definition webcam resolution in the list of features managed through the registry.

Graphics

May 15, 2026

Citrix HDX graphics include an extensive set of graphics acceleration and encoding technologies that optimizes the delivery of rich graphics applications from Citrix Virtual Apps and Desktops. The graphic technologies provide the same experience as using a physical desktop when working remotely with virtual applications that are graphics intensive.

You can use software or hardware for graphics rendering. Software rendering requires a third-party library called software rasterizer. For example, Windows includes the WARP rasterizer for DirectX based graphics. Sometimes, you might want to use an alternative software renderer. Hardware rendering (hardware acceleration) requires a graphics processor (GPU).

HDX™ Graphics offers a default encoding configuration that is optimized for the most common use cases. By using Citrix policies, IT administrators can also configure various graphics-related settings to meet different requirements and provide the desired user experience.

Thinwire

Thinwire is the Citrix default display remoting technology used in Citrix Virtual Apps and Desktops™.

Display remoting technology allows graphics generated on one machine to be transmitted, typically across a network, to another machine for display. Graphics are generated as a result of user input, for

© 1997–2026 Citrix Systems, Inc. All rights reserved.

example, keystrokes or mouse actions.

HDX 3D Pro

The HDX 3D Pro capabilities in Citrix Virtual Apps and Desktops enable you to deliver desktops and applications that perform best using a graphics processing unit (GPU) for hardware acceleration. These applications include 3D professional graphics applications based on OpenGL and DirectX. The standard VDA supports GPU acceleration of DirectX only.

GPU acceleration for Windows Single-session OS

By using HDX 3D Pro, you can deliver graphically intensive applications as part of hosted desktops or applications on Single-session OS machines. HDX 3D Pro supports physical host computers (including desktop, blade, and rack workstations) and GPU Passthrough and GPU virtualization technologies offered by XenServer®, vSphere, and Hyper-V (passthrough only) hypervisors.

Using GPU Passthrough, you can create VMs that have exclusive access to dedicated graphics processing hardware. You can install multiple GPUs on the hypervisor and assign VMs to each of these GPUs on a one-to-one basis.

Using GPU virtualization, multiple virtual machines can directly access the graphics processing power of a single physical GPU.

GPU acceleration for Windows Multi-session OS

HDX 3D Pro allows graphics-heavy applications running in Windows Multi-session OS sessions to render on the server graphics processing unit (GPU). By moving OpenGL, DirectX, Direct3D, and Windows Presentation Foundation (WPF) rendering to the server GPU, graphics rendering doesn't slow down the server CPU. Also, the server is able to process more graphics because the workload is split among the CPU and GPU.

Framehawk

> **Important:**
>
> As of Citrix Virtual Apps and Desktops 7 1903, Framehawk is no longer supported. Instead, use Thinwire with adaptive transport enabled.

Framehawk is a display remoting technology for mobile workers on broadband wireless connections (Wi-Fi and 4G/LTE cellular networks). Framehawk overcomes the challenges of spectral interference and multipath propagation and delivers a fluid and interactive user experience to users of virtual apps and desktops.

Text-based session watermark

Text-based session watermarks help to deter and enable tracking data theft. This traceable information appears on the session desktop as a deterrent to those using photographs and screen captures to steal data. You can specify a watermark that is a layer of text. The watermark can display over

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the entire session screen without changing the content of the original document. Text-based session watermarks require VDA support.

Adaptive Refresh Rate

With the new scalability improvements, HDX matches the refresh rate of virtual monitors to match the target FPS policy set. Adaptive Refresh Rate (ARR) is available for both single and multisession VDAs, and works for both GPU-accelerated and non-GPU scenarios.

loss tolerant mode

The loss tolerant mode is thoroughly reworked to ensure the session remains interactive when packet loss is detected.

Related information

- HDX 3D Pro
- GPU acceleration for Windows Single-session OS
- GPU acceleration for Windows Multi-session OS
- Framehawk
- Thinwire
- Text-based session watermark

An introduction to Thinwire

May 13, 2026

HDX™ Graphics, powered by Thinwire, is Citrix's advanced display technology that delivers high-performance, adaptive, and efficient remote desktop and application experiences.

Thinwire ensures optimal performance across diverse network conditions and endpoint devices by intelligently analyzing, caching and compressing graphical data.

HDX™ 3D Pro

May 15, 2026

HDX 3D Pro, now known as HDX Graphics, delivers a high-performance user experience for demanding graphical workloads. By default, it leverages GPUs to provide hardware acceleration for both DirectX

© 1997–2026 Citrix Systems, Inc. All rights reserved.

and OpenGL applications. This functionality, previously associated with HDX 3D Pro, is now available out of the box for all users without requiring any additional policies or configuration.

Using hardware acceleration, you can provide users with a seamless and responsive experience for even the most graphically intensive applications, including those used in fields like design, engineering, and multimedia production.

The HDX 3D Pro capabilities of Citrix Virtual Apps and Desktops™ enable you to deliver desktops and applications that perform best using a graphics processing unit (GPU) for hardware acceleration. These applications include 3D professional graphics applications based on OpenGL and DirectX. The standard VDA supports GPU acceleration of DirectX only.

For the HDX 3D Pro policy settings, see Optimize for 3D graphics workload.

All supported Citrix Workspace apps can be used with 3D graphics. For best performance with complex 3D workloads, high-resolution monitors, multi-monitor configurations, and high frame rate applications, we recommend the latest versions of Citrix Workspace app for Windows and Citrix Workspace app for Linux. For more information on supported versions of Citrix Workspace app, see Lifecycle Milestones for Citrix Workspace app.

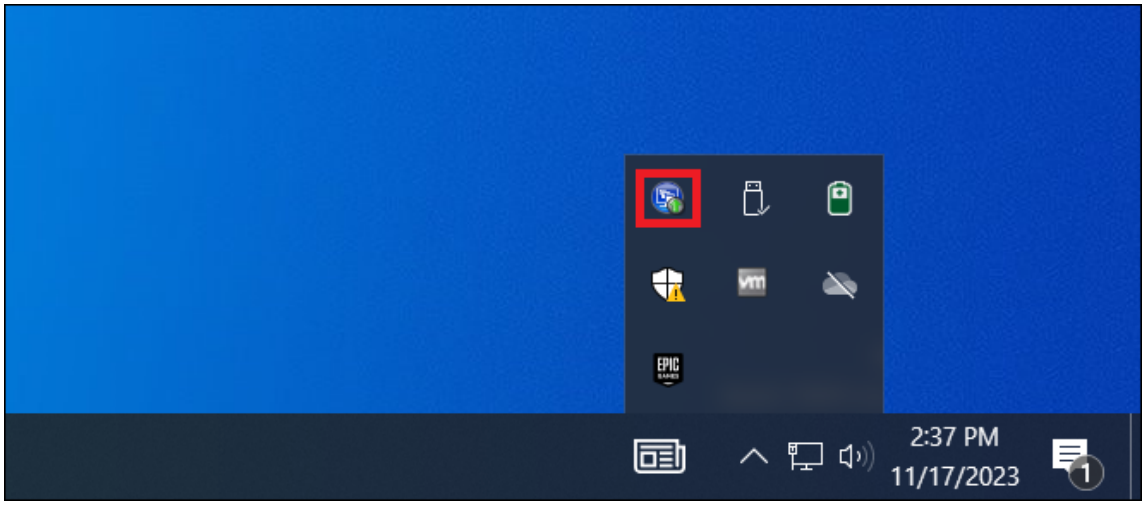
Examples of 3D professional applications include:

- Computer-aided design, manufacturing, and engineering (CAD/CAM/CAE) applications
- Geographical Information System (GIS) software
- Picture Archiving Communication System (PACS) for medical imaging
- Applications using the latest OpenGL, DirectX, NVIDIA CUDA, and OpenCL and WebGL versions
- Computationally intensive non-graphical applications that use NVIDIA Compute Unified Device Architecture (CUDA) GPUs for parallel computing

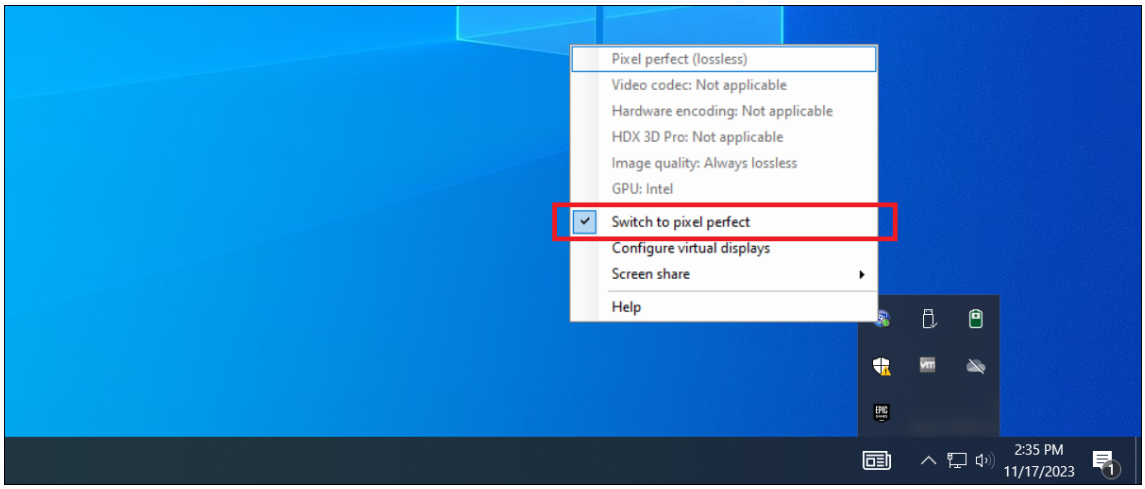
HDX 3D Pro provides the best user experience over any bandwidth:

- On WAN connections: Deliver an interactive user experience over WAN connections with bandwidths as low as 1.5 Mbps.
- On LAN connections: Deliver a user experience equivalent to that of a local desktop on LAN connections.

  You can replace complex and expensive workstations with simpler user devices by moving the graphics processing into the data center for centralized management.



Lossless compression option for specialized use cases



HDX 3D Pro also offers a CPU-based lossless codec to support applications where pixel-perfect graphics are required, such as medical imaging. True lossless compression is recommended only for specialized use cases because it consumes more network and processing resources.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When using lossless compression:

- The lossless indicator in the Graphic Status Indicator, a notification area icon, notifies the user if the screen displayed is a lossy frame or a lossless frame. This icon helps when the **Visual Quality** policy setting specifies **Build to lossless**. The lossless indicator turns green when the frames sent are lossless.

- The lossless switch enables the user to change to the **Always Lossless** mode anytime within the session. To select or clear **Lossless** within a session, right-click the icon and click **Switch to pixel perfect** or use the shortcut ALT+SHIFT+1.

    - For lossless compression: HDX 3D Pro uses the lossless codec for compression regardless of the codec selected through policy.
    - For lossy compression: HDX 3D Pro uses the original codec, either the default or the one selected through policy.

      Lossless switch settings are not retained for subsequent sessions. To use a lossless codec for every connection, select **Always lossless** in the **Visual quality policy** setting.

You can override the default shortcut, ALT+SHIFT+1, to select or deselect Lossless within a session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure a new registry setting at `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\HDX3D\LLIndicator`.

- Name: HKEY_LOCAL_MACHINE_HotKey, Type: String

The format to configure a shortcut combination is C=0	1, A=0	1, S=0	1, W=0	1, K=val. Keys must be comma “,”separated. The order of the keys does not matter.

-
- A, C, S, W and K are keys, where C=Control, A=ALT, S=SHIFT, W=Win, and K=a valid key. Allowed values for K are 0–9, a–z, and any virtual key code.
- For example:
  For F10, set K=0x79
  For Ctrl + F10, set C=1, K=0x79
  For Alt + A, set A=1, K=a or A=1, K=A or K=A, A=1
  For Ctrl + Alt + 5, set C=1, A=1, K=5 or A=1, K=5, C=1
  For Ctrl + Shift + F5, set A=1, S=1, K=0x74

Optimize the HDX 3D Pro user experience

When multiple users share a connection with limited bandwidth (for example, at a branch office), we recommend that you use the Overall session bandwidth limit policy setting to limit the bandwidth available to each user. Using this setting ensures that the available bandwidth does not fluctuate widely as users log on and off. Because HDX 3D Pro automatically adjusts to use all the available bandwidth, large variations in the available bandwidth throughout user sessions can negatively impact performance.

For example, if 20 users share a 60 Mbps connection, the bandwidth available to each user can vary between 3 Mbps and 60 Mbps, depending on the number of concurrent users. To optimize the user experience in this scenario, determine the bandwidth required per user at peak periods and limit users to this amount always.

For users of a 3D mouse, we recommend that you increase the priority of the Generic USB Redirection virtual channel to 0. For information about changing the virtual channel priority, see the Knowledge Center article CTX128190.

Use the HDX Monitor tool to validate the operation and configuration of HDX visualization technologies and to diagnose and troubleshoot HDX issues. The tool is available in the **Support** folder on the Citrix Virtual Apps and Desktops™ installation media.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

GPU Acceleration

May 13, 2026

HDX™ Graphics seamlessly leverages GPU hardware on both the Virtual Delivery Agent (VDA) and end-point devices.

This out-of-the-box hardware acceleration, previously known as HDX 3D Pro, is enabled by default and significantly boosts performance for graphically demanding DirectX and OpenGL applications, both in single and multi-session operating systems.

Citrix Virtual Apps and Desktops™ support graphics-heavy applications running in Windows Multi-session OS sessions to render on the server's graphics processing unit (GPU). By moving OpenGL, DirectX, Direct3D, and Windows Presentation Foundation (WPF) rendering to the server's GPU, the server's CPU can be used more efficiently.

Since Windows Server is a multi-user operating system, multiple users can share a GPU accessed by Citrix Virtual Apps™ without the need for GPU virtualization (vGPU).

For procedures that involve editing the registry, use caution: Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

GPU sharing

GPU Sharing enables GPU hardware rendering of OpenGL and DirectX applications in remote desktop sessions. It has the following characteristics:

- Can be used on bare metal or virtual machines to increase application scalability and performance.
- Enables multiple concurrent sessions to share GPU resources (most users do not require the rendering performance of a dedicated GPU).
- Requires no special settings.

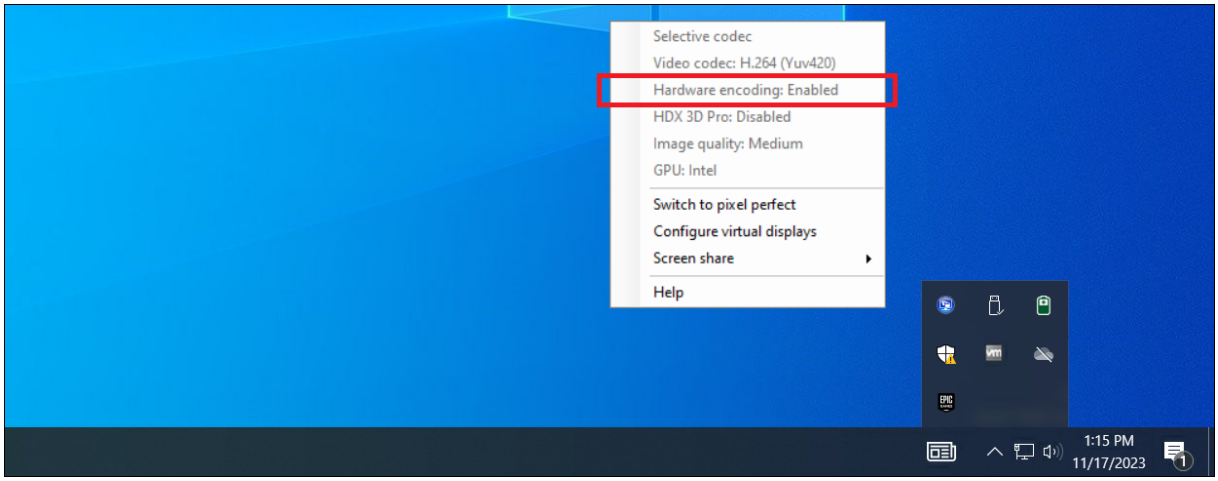
A GPU can be assigned to the Windows Server virtual machine in either full pass-through or virtual GPU (vGPU) modes following Hypervisor and GPU vendor requirements. Bare-metal deployments on physical Windows Server machines are also supported.

GPU Sharing does not depend on any specific graphics card.

- For virtual machines, select a graphics card that is compatible with the Hypervisor in use. For a XenServer hardware compatibility list, see Hypervisor Hardware Compatibility List.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When running on bare metal, it is recommended to have a single display adapter enabled by the operating system. If multiple GPUs are installed on the hardware, disable all but one of them using Device Manager.



Scalability using GPU Sharing depends on several factors:

- The applications being run
- The amount of video RAM they consume
- The graphics card's processing power

Some applications handle video RAM shortages better than others. If the hardware becomes overloaded, instability or a crash of the graphics card driver might occur. Limit the number of concurrent users to avoid such issues.

- Access to a high-performance video encoder for NVIDIA GPUs and Intel Iris Pro graphics processors. A policy setting (enabled by default) controls this feature and allows the use of hardware encoding for H.264 encoding (where available). If such hardware is not available, the VDA falls back to CPU-based encoding using the software video codec. For more information, see Graphics policy settings.

To confirm that GPU acceleration is occurring, the Graphics Status Indicator can be used:

DirectX, Direct3D, and WPF rendering

DirectX, Direct3D, and WPF rendering are only available on servers with a GPU that supports a display driver interface (DDI) version of 9ex, 10, or 11.

- On Windows Server 2016 and later, Remote Desktop Services (RDS) sessions on the RD Session Host server use the Microsoft Basic Render Driver as the default adapter. To use the GPU in RDS sessions on Windows Server 2016 and later, enable the **Use the hardware default graphics adapter for all Remote Desktop Services sessions** setting in the group policy **Local Computer**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy > **Computer Configuration** > **Administrative Templates** > **Windows Components** > **Remote Desktop Services** > **Remote Desktop Session Host** > **Remote Session Environment**.

- To enable WPF applications to render using the server's GPU, create the settings in the registry of the server running Windows Multi-session OS sessions. For information on the registry setting, see Windows Presentation Foundation (WPF) rendering in the list of features managed through the registry.

GPU acceleration for CUDA or OpenCL applications

GPU acceleration of CUDA and OpenCL applications running in a user session is disabled by default.

To use the CUDA acceleration features, enable the registry settings. For information, see GPU acceleration for CUDA or OpenCL applications in the list of features managed through the registry.

10-Bit High Dynamic Range (HDR)

May 13, 2026

With 10-bit High Dynamic Range (HDR) virtual desktop sessions, you can use enhanced encoding and decoding capabilities to render high-quality images and videos with an extended range of colors, and greater contrast and brightness.

System requirements

Endpoint:

- Citrix Workspace™ app for Windows 2209 or later for NVIDIA GPUs
- NVIDIA GPUs with 10-bit HEVC (H.265) 444 decoding support on the endpoint
- 10-bit HDR-supported monitors, 10-bit HDR must be enabled on all monitors using display settings.

Server:

- Windows single-session OS VDA 2209 or later for NVIDIA GPUs, and VDA 2308 or later for Intel GPUs
- NVIDIA GPUs with 10-bit HEVC 444 encoding support on the VDA

Required policies

Endpoint:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Enable H.265 decoding for graphics

Server:

- Optimize for 3D Graphics workload
- Graphics Status Indicator (optional)

Server configurations

Launching a Citrix® session on a 10-bit HDR-enabled endpoint monitor enables the HDR session by default. In multi-monitor HDR sessions, all endpoint monitors must have 10-bit HDR enabled. HDR sessions are supported in both windowed and full-screen modes.

Reference White Level

This setting defines the white luminance level by nit value. It controls the relative HDR screen brightness within the session. The default value is 80 nits. Set the following registry key to define a different nit value:

- HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Graphics
- Type: REG_DWORD
- Name: RefWhiteLevel

To activate the setting, you must either resize your session or disconnect and relaunch the session.

EDID override

You can configure the VDA to use the endpoint monitor EDID for your HDR sessions. This allows you to fully utilize the monitor's display capabilities by matching the color gamut and luminance range. By default, HDR sessions assume an HDR1000-capable display.
You can export endpoint monitor EDID using NVIDIA or other tools. Apply it to the VDA using the following registry key:

- HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Graphics
- Type: REG_BINARY
- Name: EDIDOverride

When you store the EDID in the registry, it must not have commas, spaces, or special characters. To activate the override EDID, sign out and launch a new session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Visual lossless experience

Enable the following policies for a visually lossless experience:

- Allow Visual Lossless Compression
- Visual Quality: Always Lossless or Build to Lossless

After the policies are set, you can control the HDR session quality using the Graphics Status Indicator by using the Image Quality Slider, or by switching to pixel-perfect mode.

Allow Windows screen lock

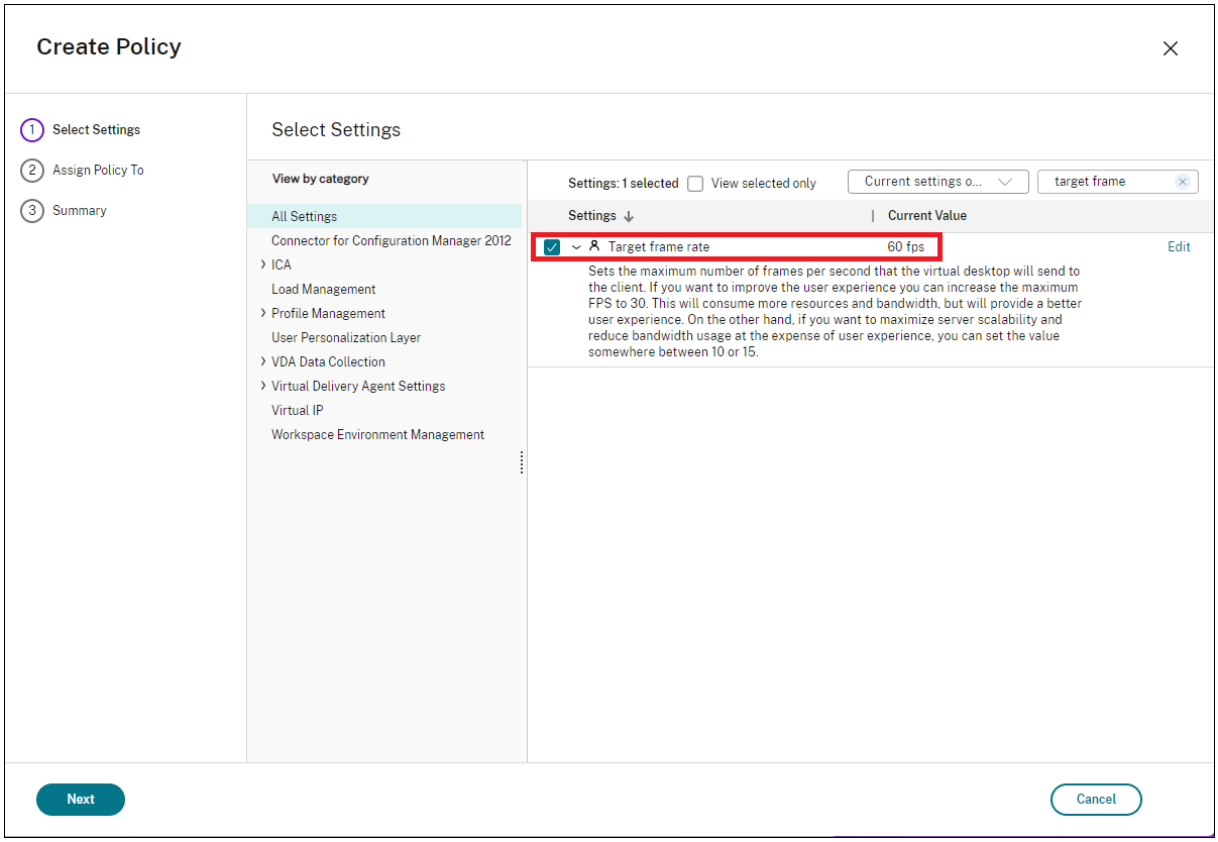
You can use this policy to allow all Windows display timeouts, including screen lock, to apply to a Citrix Virtual Desktop session on Workstation OS. This setting can be set using a Citrix Group Policy Object in Citrix Studio.

By default, when this setting is not enabled, a Citrix Virtual Desktop does not respond to timeouts for session lock, screensaver, or display off, during an active session.

When a password-protected screensaver is configured on a Workstation VDA, this setting must be enabled to allow the Citrix Virtual Desktop session to be automatically locked when the screen saver timeout is reached.

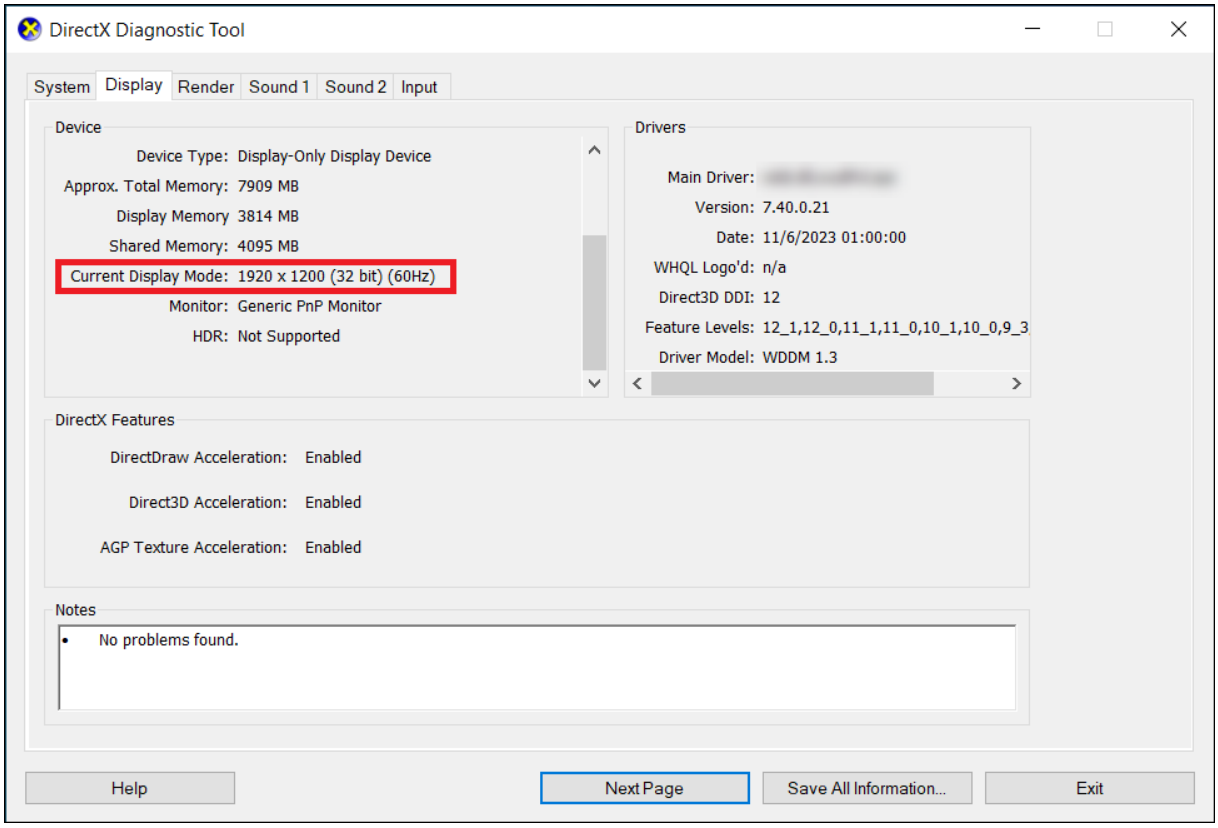
Enabling this setting when a display-off timeout is configured on the VDA causes the expiration of that timeout to result in a session that does not update until the user resumes interaction with the session. For instance, any time displayed is not updated, and new notifications are not displayed.

Other considerations



- You can launch 10-bit HDR sessions on up to four monitors on virtual GPUs.
- The Citrix session reverts to an 8-bit, non-HDR mode in the following instances:
    - If any endpoint monitors do not have 10-bit HDR enabled
    - Enabling screen sharing.
    - Setting a virtual display layout on the VDA.
    - Switching to pixel-perfect mode without setting the **Allow Visually Lossless Compression** policy.

Adaptive Refresh Rate



May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

With Adaptive Refresh Rate, HDX™ matches the refresh rate of virtual monitors to match the target FPS policy set. Adaptive Refresh rate provides better performance and scalability for both single and multi-session VDAs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note**
>
> Adaptive Refresh Rate is only available when Citrix Indirect Display or IDD is used (as per Citrix Virtual Apps and Desktops™ default) and is not available when using Vendor supplied Display Adapters.

Loss tolerant mode for graphics

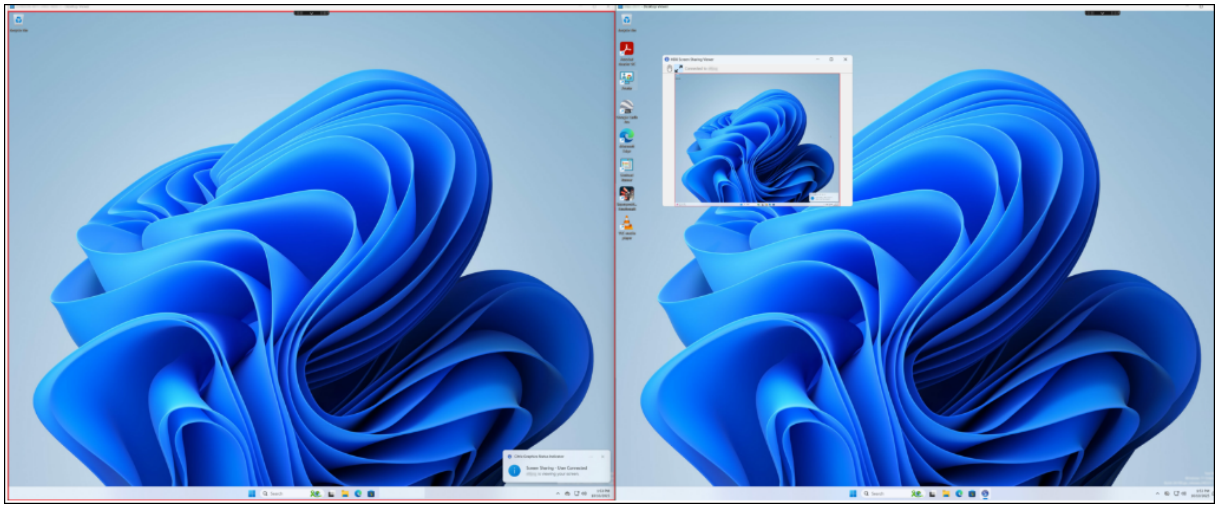
May 13, 2026

Loss tolerant mode ensures the best performance and interactivity over unreliable networks.

When network conditions degrade beyond pre-defined bandwidth, latency, and packet loss thresholds, the Citrix® graphics encoder automatically switches into a more aggressive mode of packet delivery to overcome the effect of packet loss.

The loss tolerant mode for graphics is thoroughly reworked to ensure the session remains interactive when packet loss is detected. When network conditions degrade beyond pre-defined bandwidth, latency, and packet loss thresholds, the Citrix graphics encoder automatically switches into a more aggressive mode of packet delivery to overcome the effect of packet loss. As a result, bandwidth usage increases by an amount proportional to the amount of packet loss. If conditions later improve,

© 1997–2026 Citrix Systems, Inc. All rights reserved.



the Citrix graphics encoder seamlessly switches back. The thresholds can be configured via policy, with the defaults being 300 ms latency and 5% packet loss.

Citrix Workspace™ app for Windows 2311 is currently supported. Support for other platforms will be added in later Citrix Workspace app releases. As with previous versions of this feature, HDX™ Adaptive Transport (EDT) must be enabled for this feature to work. In addition, if connecting via the Citrix Gateway Service, loss tolerant mode for graphics must also be enabled on the Gateway.

Overview

May 15, 2026

HDX Screen Sharing is a built-in, native, high-performance feature within Citrix Virtual Apps and Desktops that enables users to share their virtual session screens with others in real-time. It is designed to deliver low latency and high quality, providing a seamless experience for collaboration, support, and training scenarios without the need to implement thirdparty software solutions.

HDX Screen sharing functionality is integrated directly into the HDX protocol, which ensures that the sharing session is both secure and efficient, with minimal impact on session performance.

With HDX Screen Sharing, users can share their entire Citrix sessions content, including keyboard and mouse control, with one or more participants.

The feature supports high-resolution displays and can accommodate up to eight monitors.

HDX Screen Sharing is available on all VDA platforms, including Windows, Linux, and macOS, and offers cross-compatibility. This means that users on Windows VDAs can share their screens with users on Linux and macOS VDAs, and vice versa.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Furthermore, HDX Screen Sharing does not rely on any client components, making it accessible on all client platforms, including mobile devices.

Key Concepts

- **Sharer:** The user who initiates the screen sharing from their virtual desktop session and will be showing their virtual sessions desktop with others
- **Viewer:** The user (or users) who connects to the sharer's session to view their screen, also referred to as the screen sharing participants
- **Connection Code:** A unique, system-generated security code that the sharer provides to viewers for access to the shared session.
- **Graphics Status Indicator:** A user interface element located in the notification area that provides controls for starting, stopping, and managing screen sharing sessions.
- **Screen Sharing Player:** The in-session tool that viewers use to view the sharer's session.

Use Cases and example usage scenarios

Properly configuring and utilizing HDX Screen Sharing can address various organizational needs, from IT support to collaborative development and training

Scenario 1: IT Help Desk and Remote Support

An IT administrator needs to troubleshoot an issue a user is experiencing within their virtual desktop. Instead of trying to replicate the issue, the IT admin can start Remote Assist through HDX Screen sharing from Citrix Director.
The administrator sees the user's exact screen in real-time, leading to faster problem identification and resolution. The ability to request keyboard and mouse control allows the admin to take direct action.
HDX Screen sharing is also integrated into Citrix Director from CVAD 2511 and later versions. For more information about using HDX Screen sharing via Citrix Director see the Citrix Director documentation

Scenario 2: End user collaboration

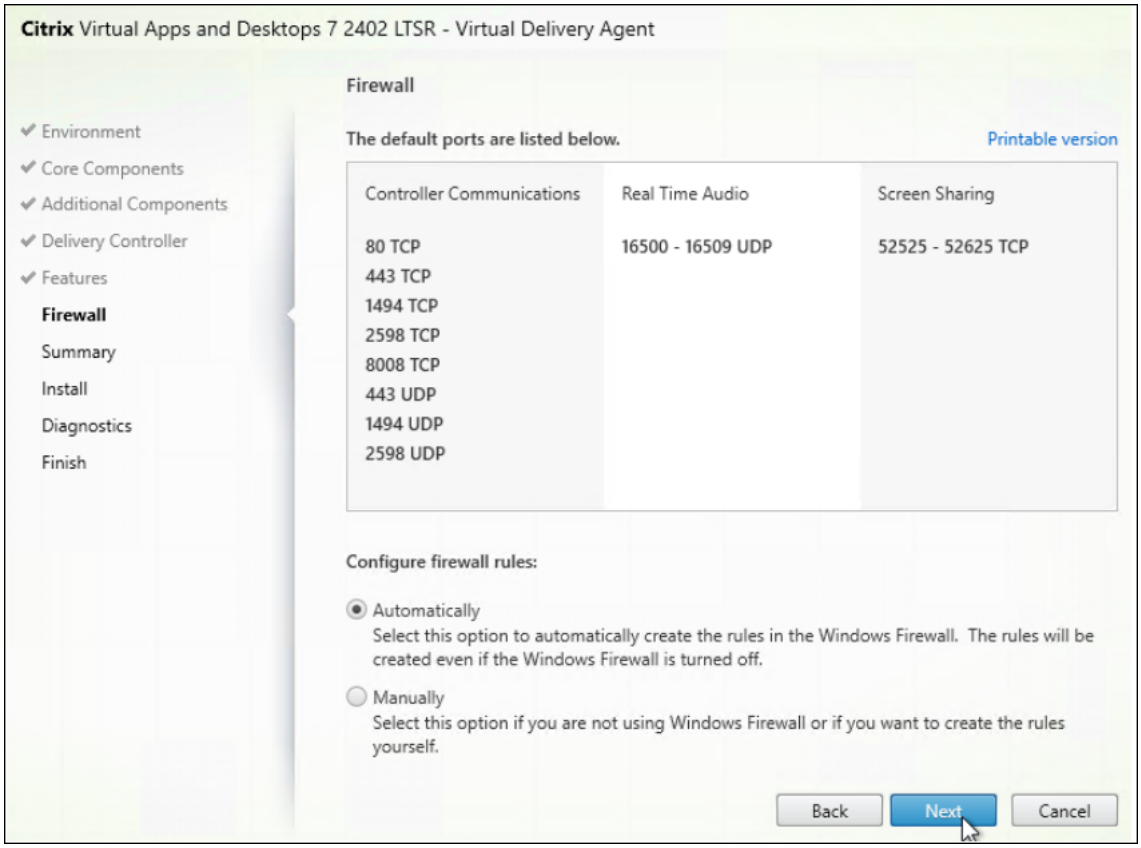
A team of engineers is working on a complex 3D model within a graphics-intensive application in their virtual desktops. They need to review the design together and make real-time adjustments.

One engineer can share their session, and the entire team can view the model, suggest changes, and even take turns controlling the application to make edits. This avoids the need for exporting files or using third-party screen-sharing tools.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Scenario 3: Employee Onboarding and Training

A new employee is learning how to use a proprietary line-of-business application. A trainer can demonstrate the application's features directly within the new hire's virtual session.



The trainer can guide the new employee step-by-step. The colored border indicator (red or yellow) clearly shows when the session is being shared, providing a visual cue for the learning environment.

System requirements

HDX Screen sharing is supported on all VDA platforms, however there might be additional requirements on certain platforms. See below for more information.

HDX Screen sharing uses TCP ports within the range of 52525 to 52625 by default.

When installing VDA version 2112 and onward, the VDA installer can be configured to automatically open the default firewall ports for HDX Screen sharing.

If this was not done during VDA installation or if a custom port range is configured, open these ports manually on the VDAs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> There must be network connectivity between the VDA hosting the session and the machines connecting to the shared sessions.

A maximum of 64 viewers can connect to a single screen sharing session. The Port range controls the maximum number of users in a multi-session environment that can start screen sharing. One port is required per user.

> **Note:**
>
> All monitors connected to the session are shared. You cannot select individual monitors.

AV1 and H.265 video codecs and 10-bit color mode are not supported. The session will automatically fall back to H.264 video encoding during active screen sharing. Once the screen sharing session has ended, AV1 and H.265 will be available again.

Windows VDA

- Windows: Single-session or multi-session OS VDA
- The graphics status indicator must be enabled.

> **Note:**
>
> Only desktop sessions can be shared.

Linux VDA

- If session sharing occurs between multiple Linux VDAs, it is recommended to upgrade to the same VDA version to avoid keyboard input issues.
- It is recommended for the Citrix Workspace™ app to be configured to use Scancode mode
- The system tray Icon must be enabled

More information on HDX Screen sharing for Linux VDAs can be found in the Linux VDA documentation for HDX Screen sharing

MacOS VDA

- Qt 5, revision 5.15.13 or later.

To align the unified user experience crossing all VDA regarding HDX Screen Sharing, you need install the Qt framework, the minimal compatible version is Qt 5 (rev. 5.15.13 or later).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

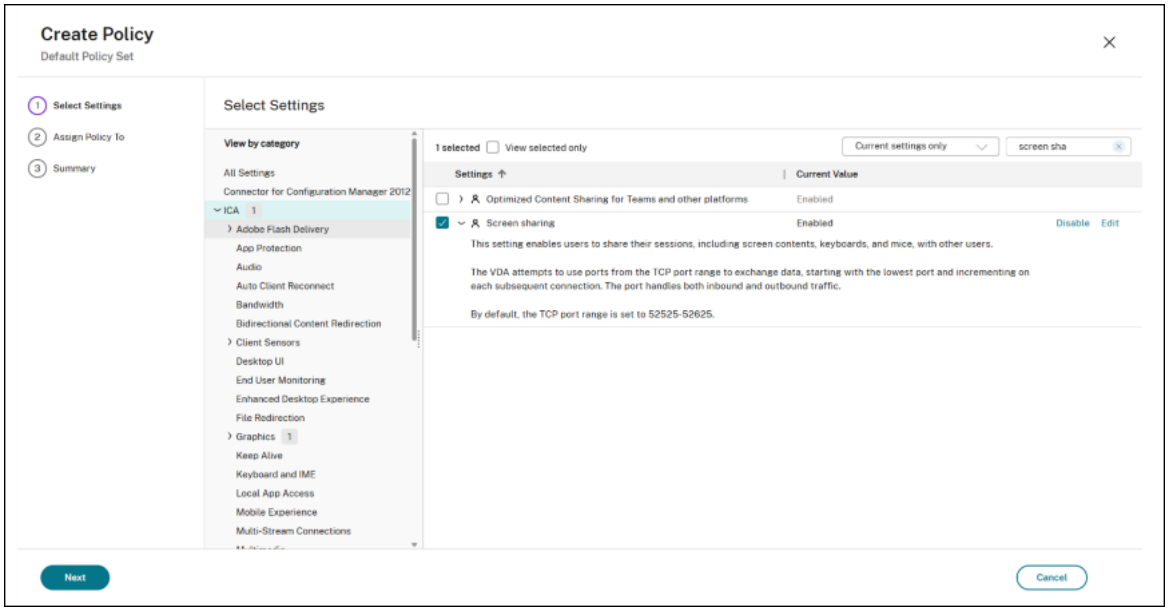
Install of Qt 5 on the VDA can be performed using, for example, homebrew by run following command:

```
brew install qt@5
```

More information on HDX Screen sharing for MacOS VDAs can be found in the MacOS VDA documentation for HDX Screen sharing

Configuration

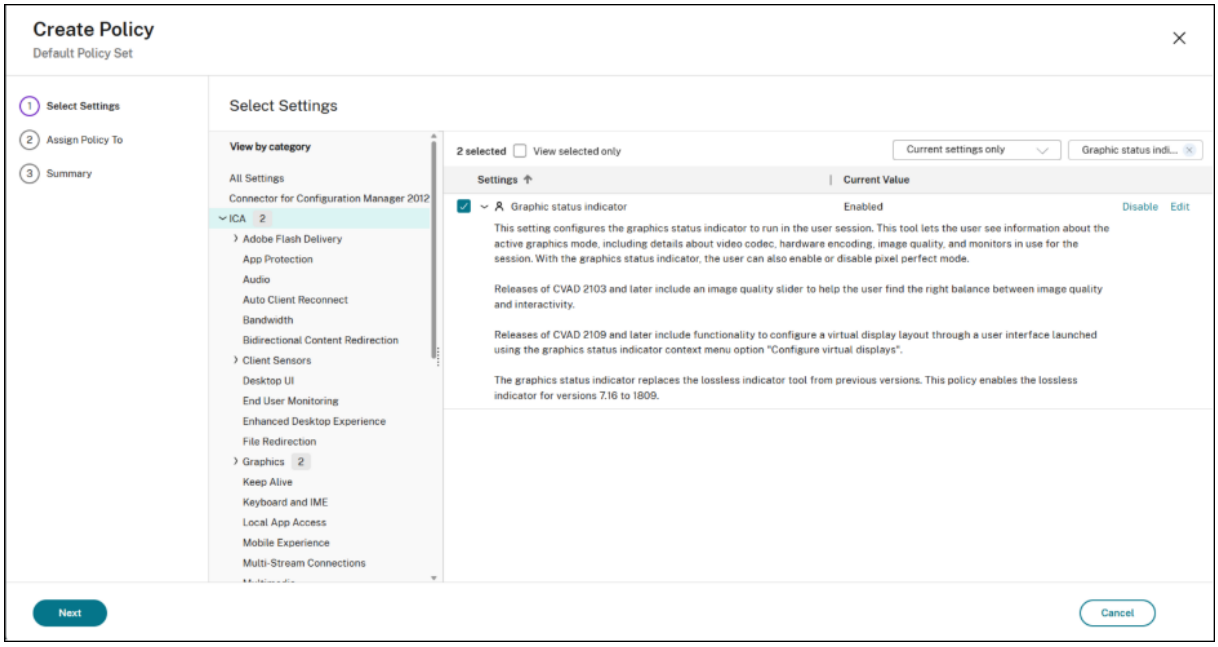
HDX Screen sharing is disabled by default, and the functionality can be enabled and configured through Citrix® policies.



The policies will give granular control to HDX Screen sharing configuration.

Enabling HDX Screen sharing for end users

HDX Screen sharing is disabled by default. To enable end users to share their screen via HDX Screen sharing the features needs to be enabled and configured as follows:



- Enable HDX Screen sharing policy
- Enable Graphics Status indicator
- **Optional:** configure and open custom ports in the VDA firewall

Step 1: Enable HDX Screen sharing To Enable HDX Screen sharing, browse to the **Screen sharing** policy and set the policy to **enabled**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 2: Enable the Graphics Status Indicator Browse to **Graphics Status Indicator** and set the policy to **Enabled**

Additional HDX Screen sharing configuration By default, HDX Screen sharing uses the following TCP ports for communication:

- TCP start port: 52525
- TCP end port: 52625

The default TCP port range can be adjusted by the 'HDX Screen sharing port'policy:

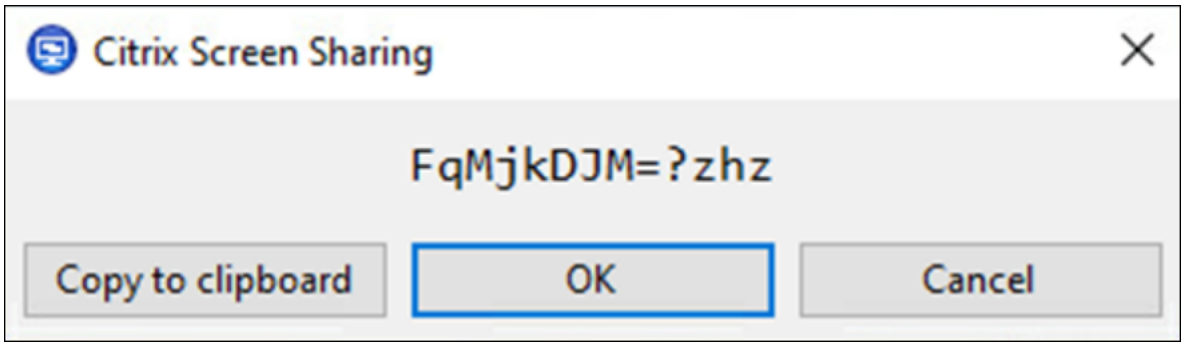
To adjust the TCP port range, browse to the 'HDX Screen sharing port'policy and set the port range to the desired port range.

The port configuration can be used to restrict the number of simultaneous users sharing their screen in a multi-session VDA.

> **Note:**
>
> The port configuration should not overlap with HDX Screen sharing for Director.

The HDX Screen sharing connection code will never expire by default and can be used indefinitely during a screen sharing session to join that session.

For enhanced security, a timeout setting can be configured, after which the connection code will expire. Once the specified timeout period has elapsed, the previously generated connection code becomes invalid, and new users will be unable to join the screen sharing session using this code. The sharer will need to regenerate a new session connection code.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Furthermore, when a screen sharing session has been started and no viewers have connected within the configured timeout period, screen sharing will automatically stop. To resume screen sharing, the sharer will need to restart HDX Screen sharing and share the connection code.

To configure a timeout for HDX Screen sharing sessions, browse to the 'HDX Screen sharing timeout' policy and set the desired timeout value in minutes.

Connection code configuration (Preview)

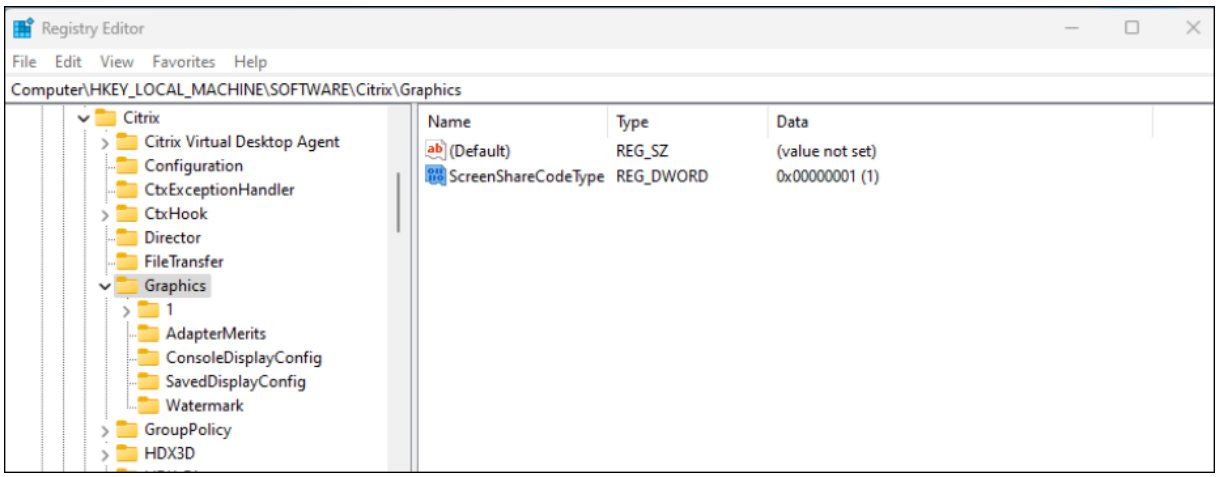
By default, HDX Screen sharing uses a 40-character connection code. Starting CVAD 2411, Admins can configure the usage of the new, shorter connection code for HDX Screen sharing. The new connection code is shorter at 13 characters and does not include ambiguous characters for easier verbal communication of the connection code to prospective viewers by the sharer.

Currently, the configuration is provided as a registry setting for the VDAs. Please note that the new, shorter connection code does not provide backwards
compatibility to older VDAS.

> **Note**:
>
> The new, shorter connection code does not provide backwards compatibility to older VDAS.

Prerequisites

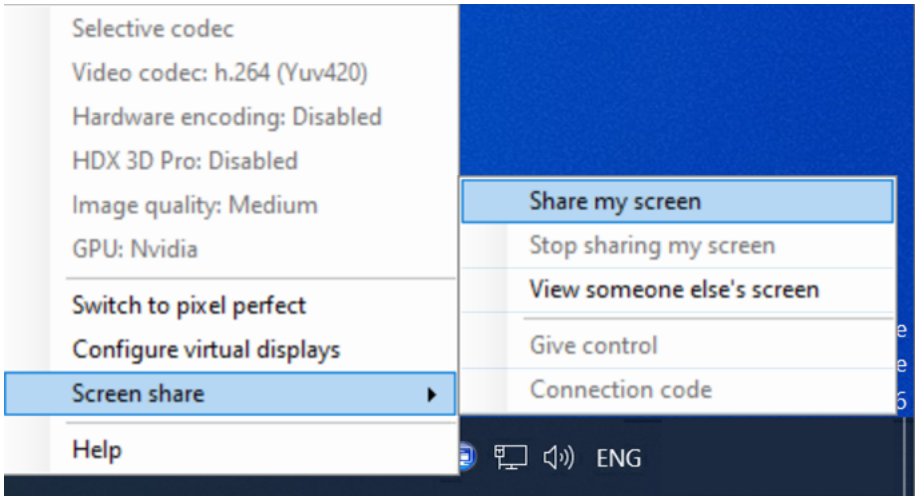
VDA - CVAD 2411 and later



Connection configuration

To enable the new shorter connection code:

1. Open the Windows Registry Editor using regedit.exe.
2. Navigate to `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Graphics\ScreenShare`
3. Create a **DWORD** value named **CodeType** and set the value to 1.



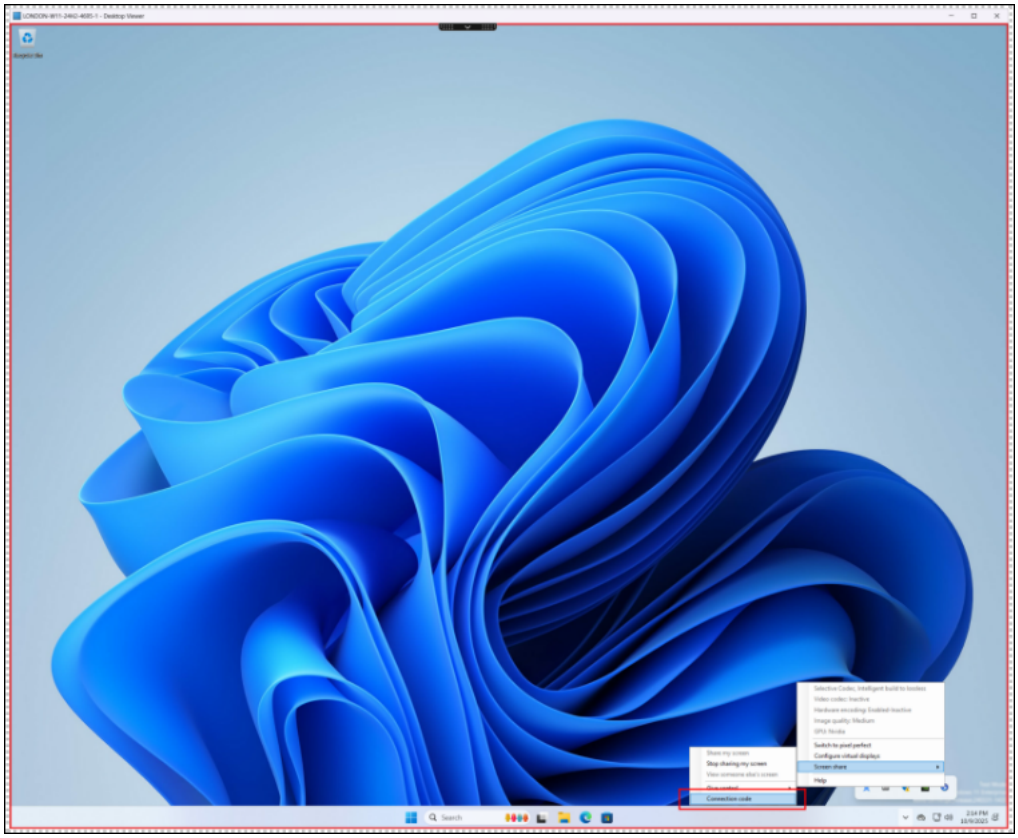
© 1997–2026 Citrix Systems, Inc. All rights reserved.

This key controls the connection code to use, 0 for older longer connection code, 1 for new short code.

Starting a Screen sharing session

As a sharer, to share a session, look for the HDX graphics status indicator icon on the Windows notification area. Right-click on it to display the menu and select ‘Screen share’> ‘Share my screen’.

After Screen sharing has been initiated, a dialogue box will appear with the connection code that can be used to join the Screen sharing session. This code can be used by one or more viewers to connect to your Screen sharing session.

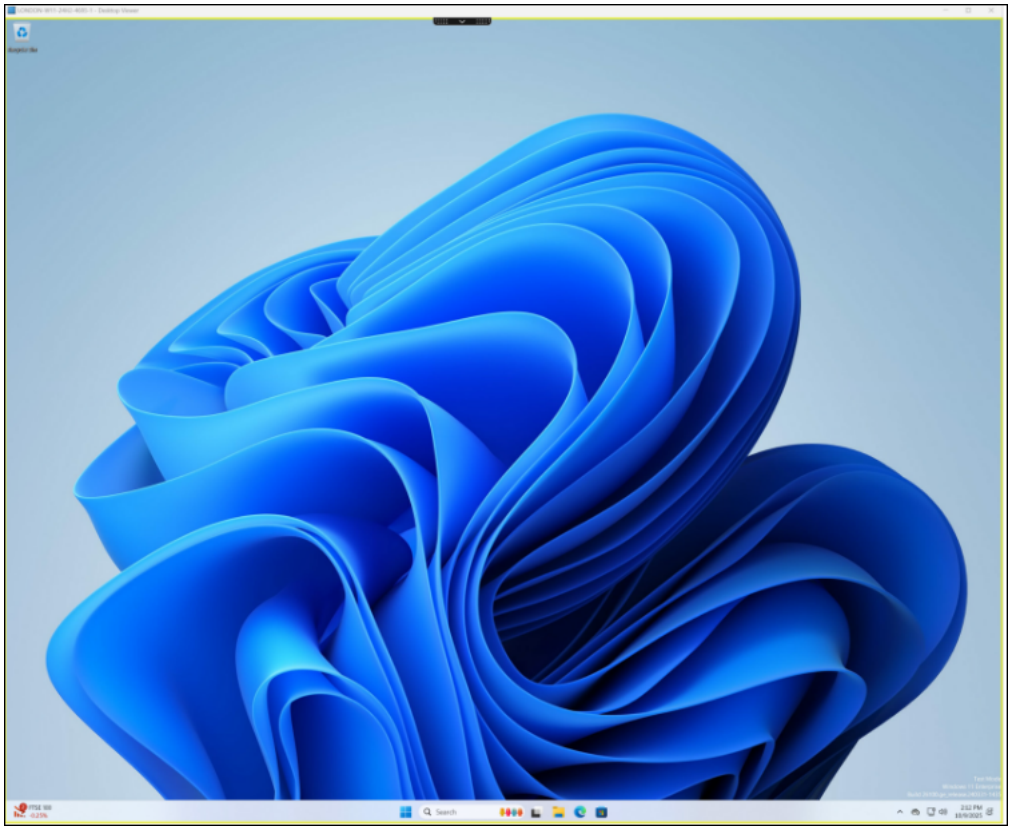


Click ‘Copy to clipboard’or manually select and copy the connection code shown in the dialog box.

The connection code can then be pasted into the application of choice, such as an email application or Microsoft Teams for example, to be distributed to other users.

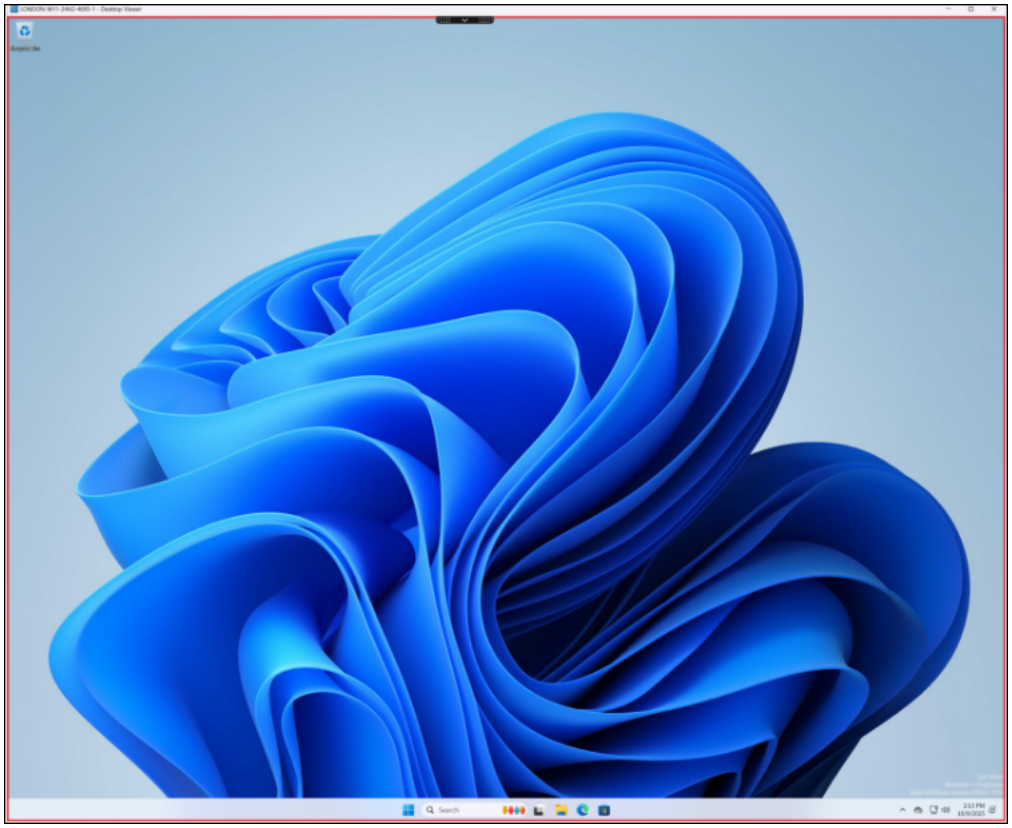
Once the connection code has been copied, the dialogue box can be closed by clicking ‘Ok’or the x in the top right.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



The current active connection code can be retrieved from the Screen share > Connection code menu option at any time while the session is shared.

> **Note:**
>
> Be careful about who you share the connection code with; all users with whom you have shared the connection code can potentially connect to your active Screen sharing session.



Once a Screen sharing session has been initiated, a yellow border will appear around the Citrix session to indicate that HDX Screen sharing is active, but no viewers have joined yet.

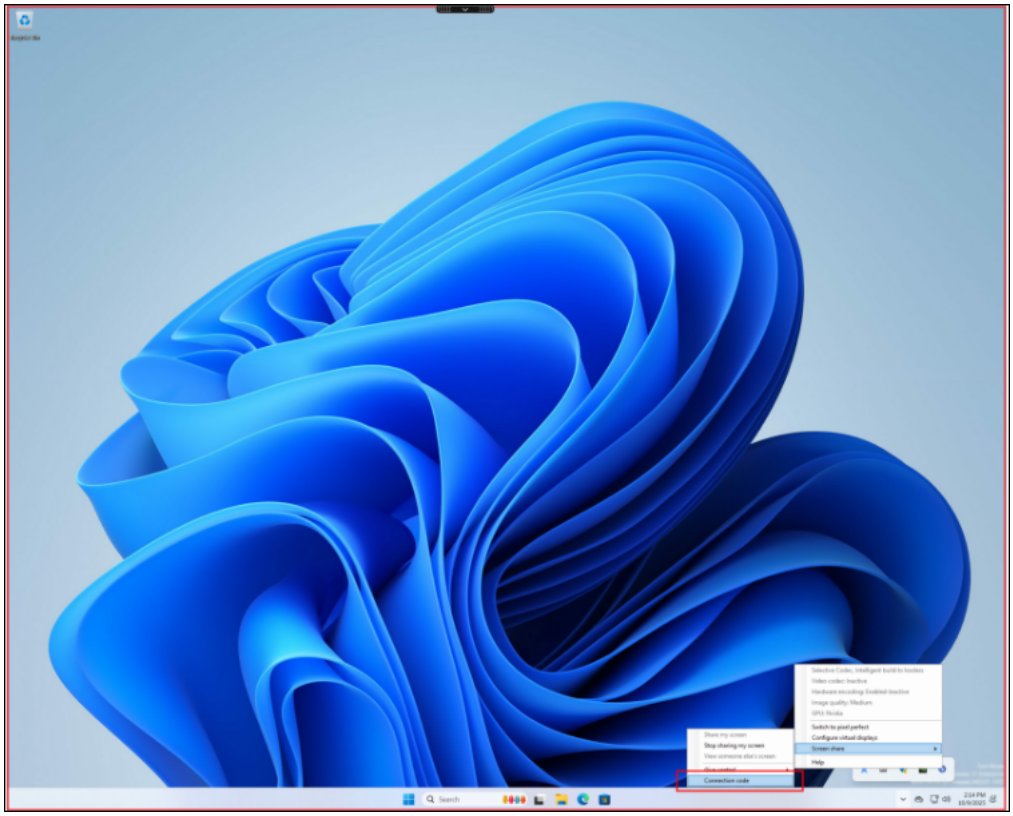
© 1997–2026 Citrix Systems, Inc. All rights reserved.

When a viewer has connected to the screen sharing session, the border will change color into red, indicating that the screen sharing session is active and has viewers connected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Please note that if you have multiple screens active in your Citrix session, all screens will be shared via screen sharing, and viewers will be able to see all connected screens in your session.

There is currently no support to share only a single monitor or a subset of connected monitors in your session.

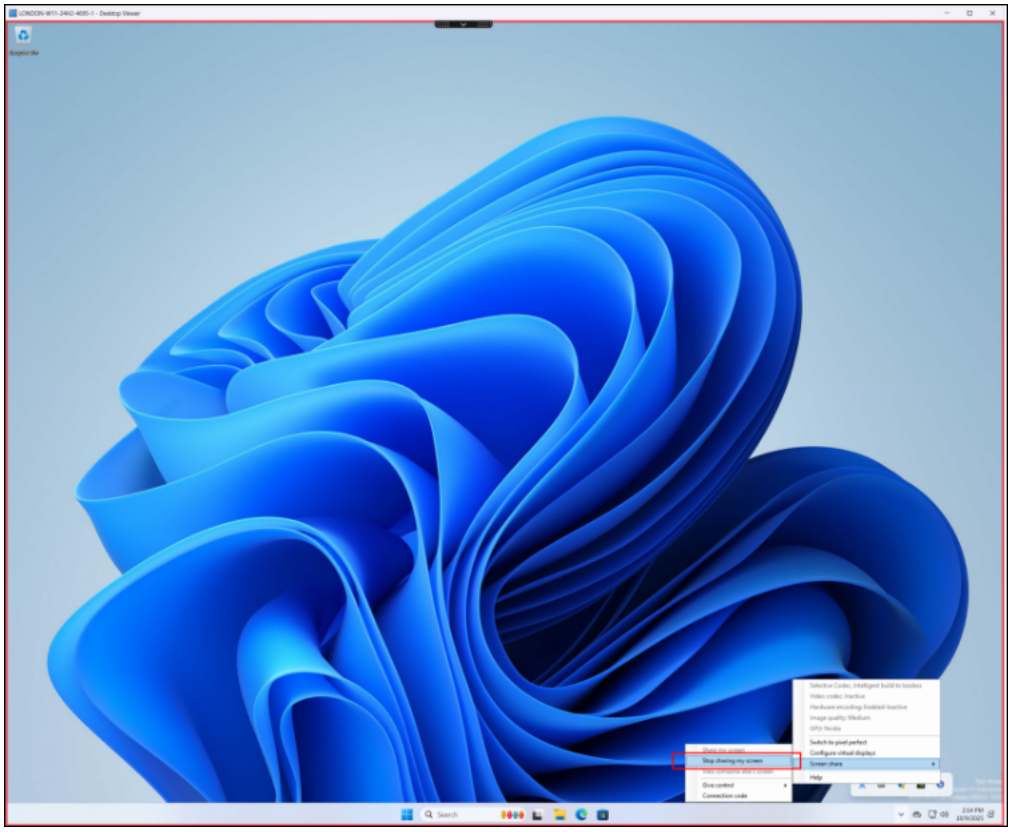


By default, up to 100 viewers can connect to a single screen sharing session, although this limit may be restricted by your Citrix administrator.

Regenerate new connection codes

As long as the connection code is active, new users can use the connection code to join your screen sharing session. If the code has expired, existing viewers will stay connected but no new users will be able to connect to your screen sharing session. To allow new users to connect to your session, you will need to regenerate a new connection code.

The new connection code can be retrieved from the ‘Screen share’> ‘Connection code’menu option at any time while the session is shared.

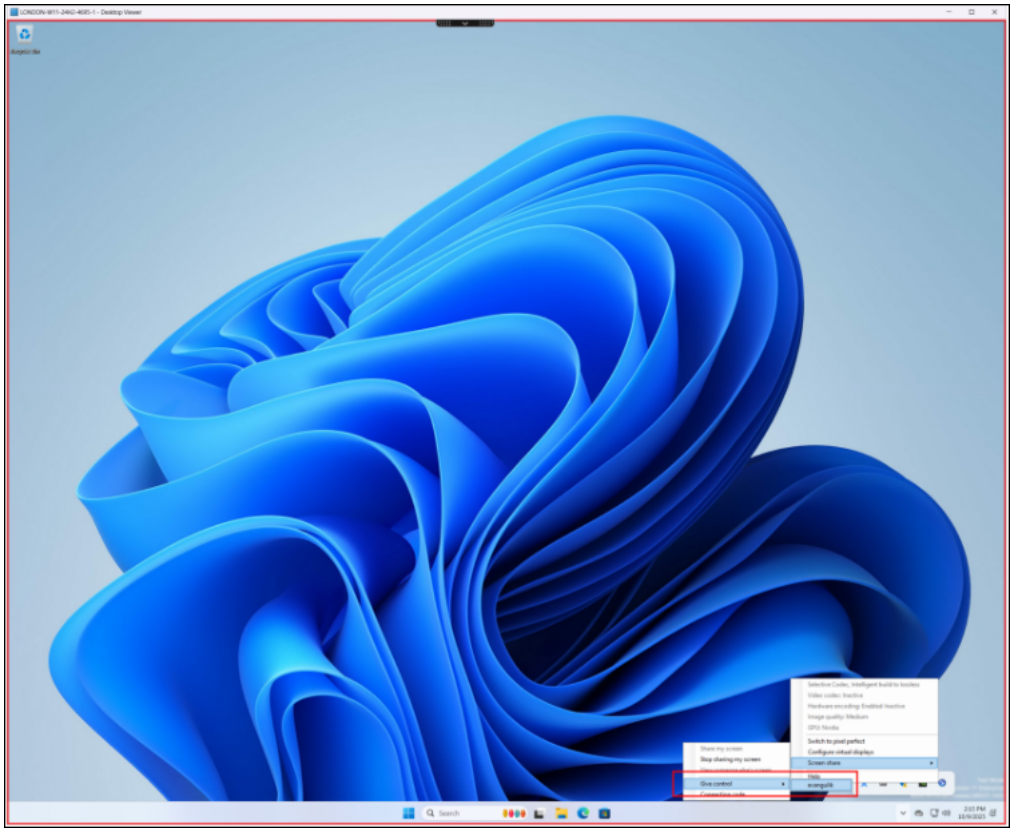


© 1997–2026 Citrix Systems, Inc. All rights reserved.

Stopping screen sharing

To stop Screen sharing, look for the HDX graphics status indicator icon in the Windows notification area. Right-click on it to display the menu and select ‘Screen share’> ‘Stop sharing my screen’. Screen sharing will stop immediately, and all current viewers will be disconnected from your session. The red border will disappear to indicate that Screen sharing has stopped.

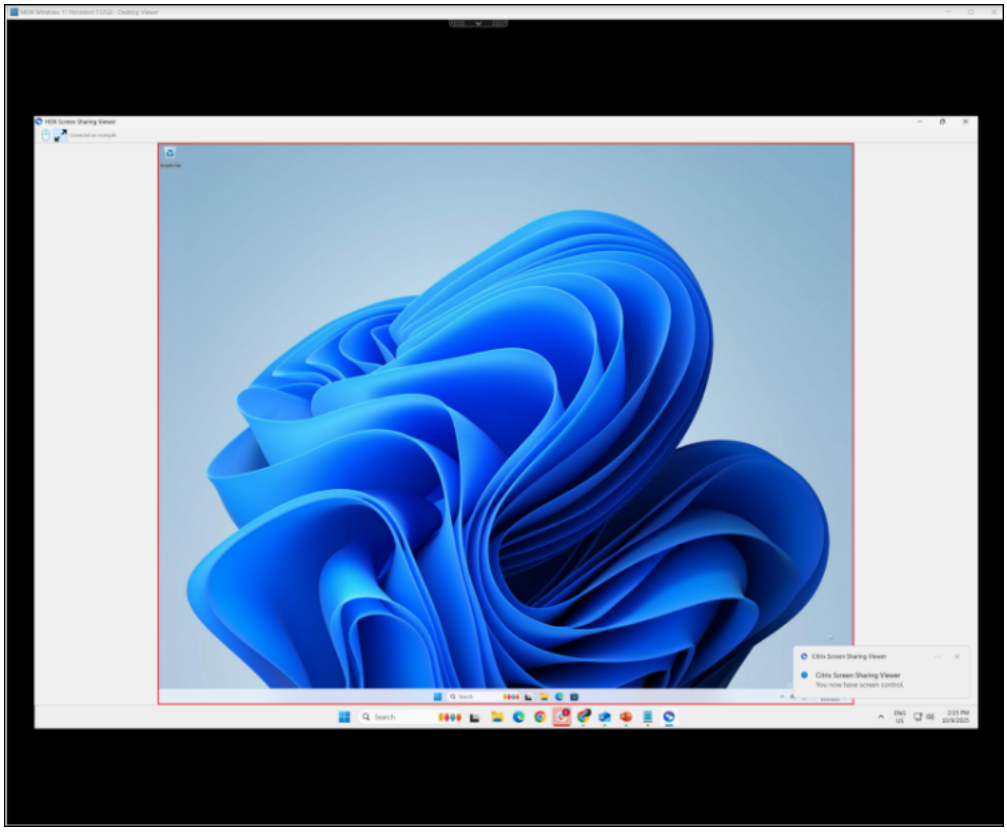
© 1997–2026 Citrix Systems, Inc. All rights reserved.



Give mouse and keyboard control

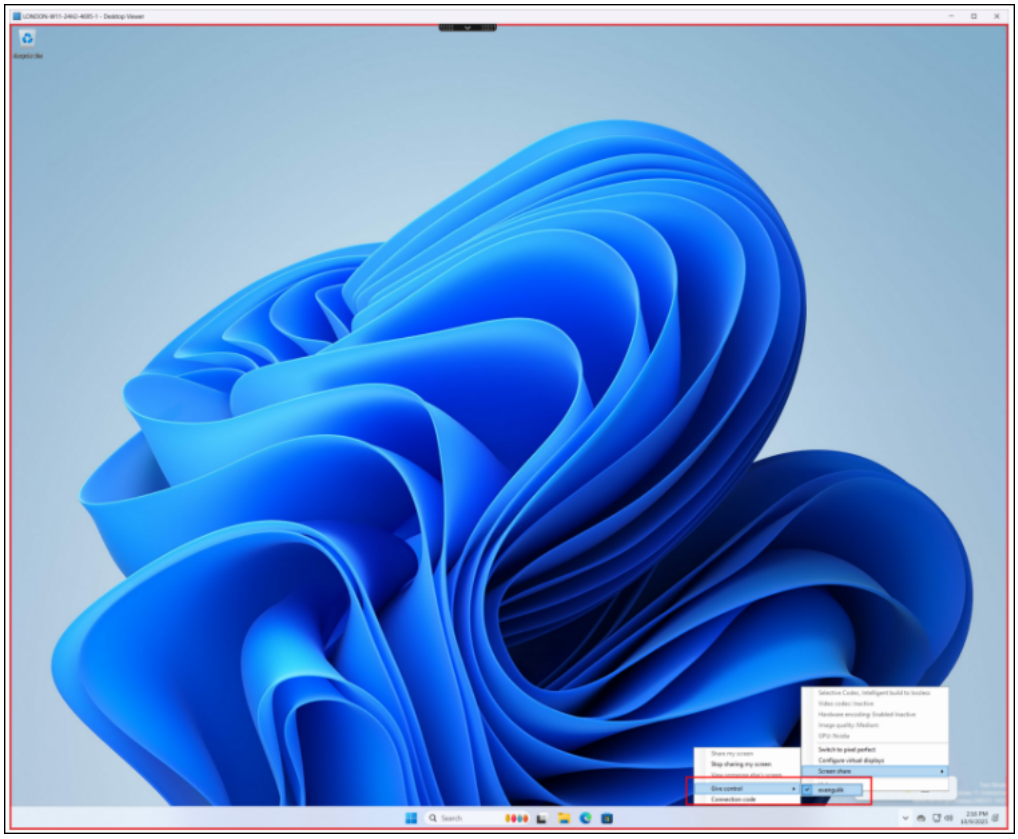
At any point in the screen sharing session, as a sharer you can hand over mouse and keyboard control to a specific viewer.

Once handed over, that viewer will share full control over your mouse and keyboard with you in your Citrix session.



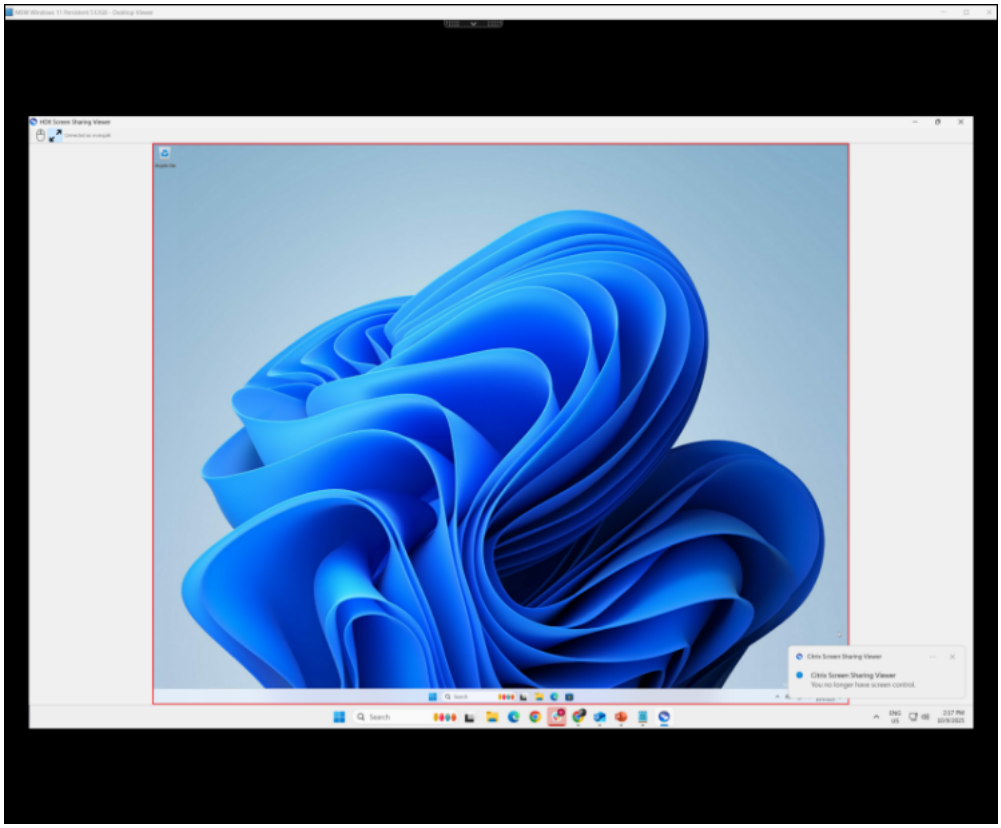
To share mouse and keyboard control, open the graphics status indicator icon on the Windows notification area. Right-click on it to display the menu and select ‘Screen share’> ‘Give control’and select one of the active viewers to hand the control over to.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



The selected viewer will get a notification indicating that he has mouse and keyboard control.

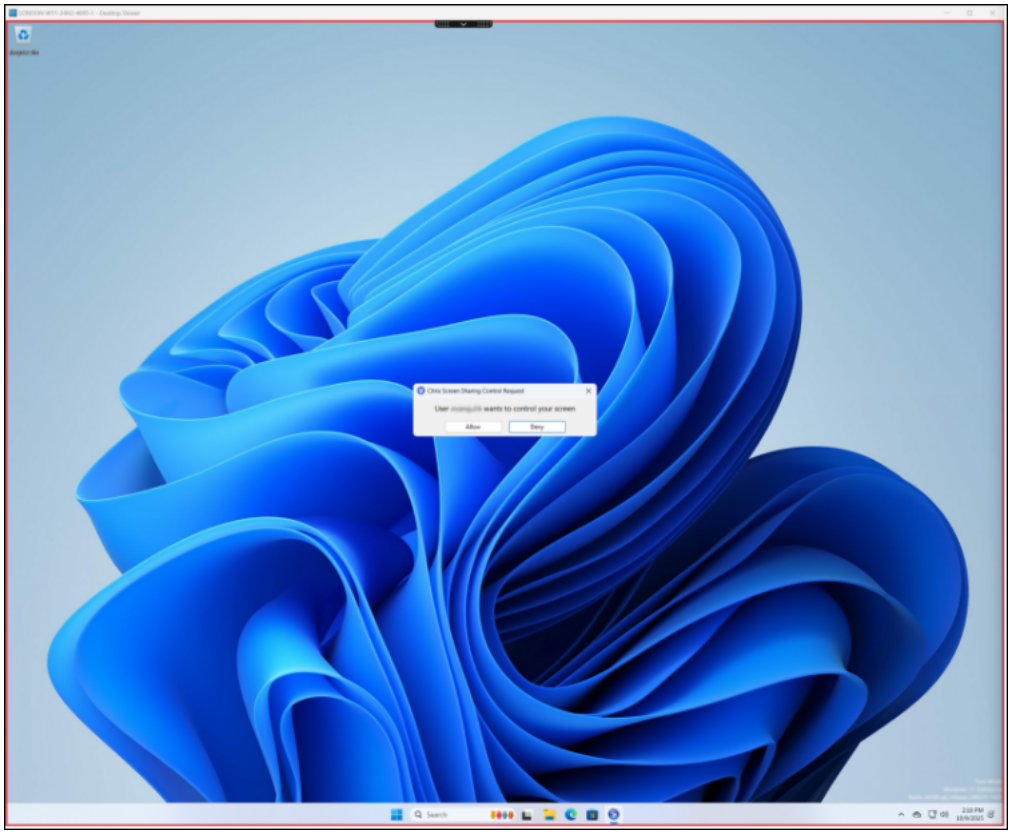
© 1997–2026 Citrix Systems, Inc. All rights reserved.



To stop mouse and keyboard sharing and to take back control, open the graphics status indicator icon on the Windows notification area. Right-click on it to display the menu and select ‘Screen share’> ‘Give control’and deselect the active viewers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The viewer will be notified that he has lost mouse and keyboard control.

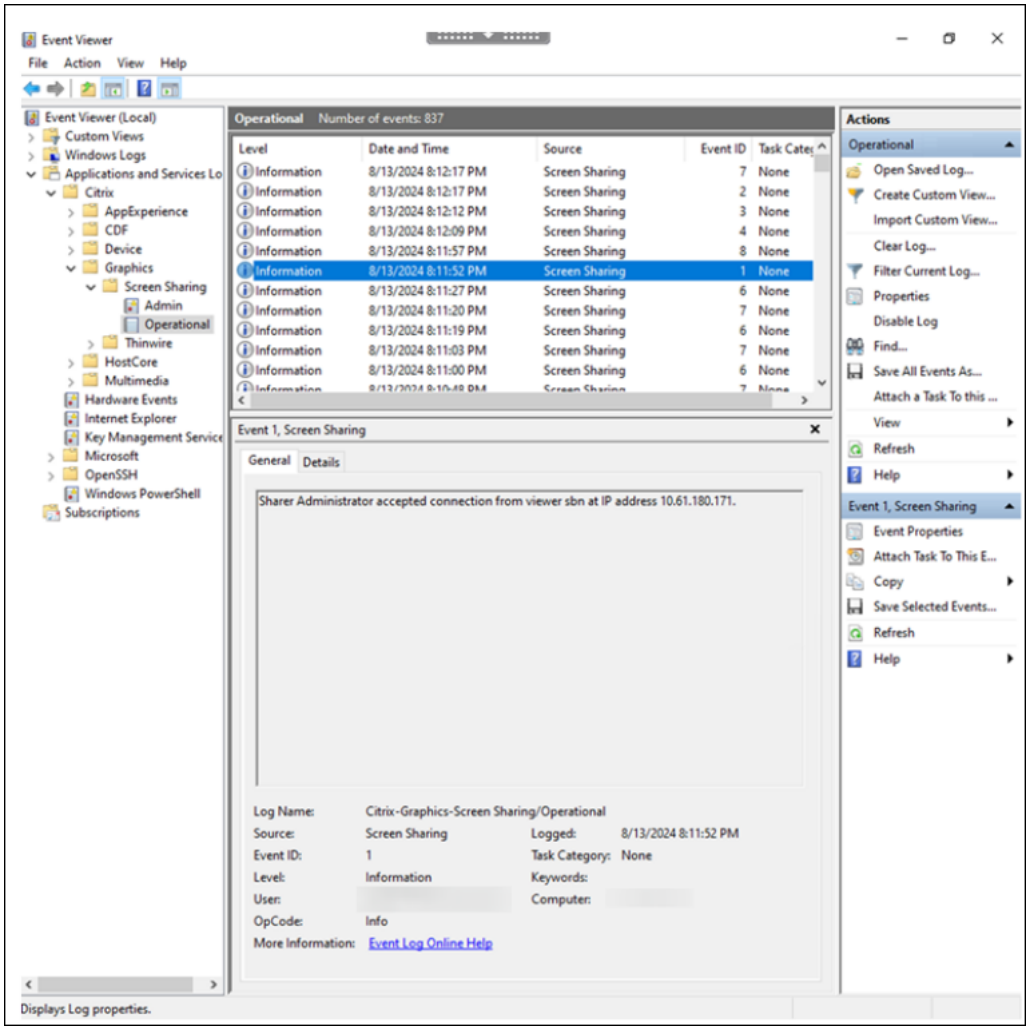


© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

You can only share mouse and keyboard control with one viewer at a time. A viewer can also request control of the mouse and keyboard. When this occurs, you will be notified of the request, and you can choose to allow or deny their request.

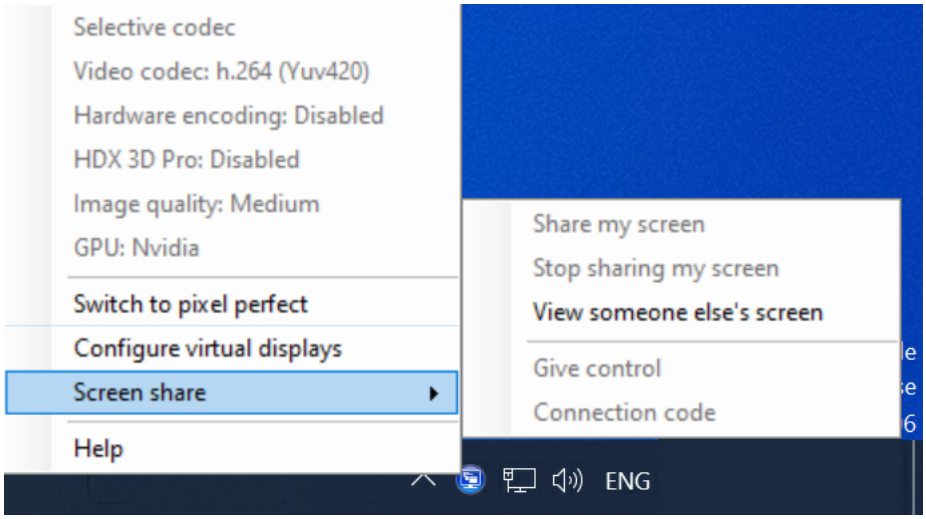
© 1997–2026 Citrix Systems, Inc. All rights reserved.



Event logging

For security and auditing purposes, the screen sharing events on the sharer VDA are now collected and logged, which will allow the administrator to track and the screen sharing activity on the sharer VDAs. The following information and events are logged during a screen sharing session:

- Sharing Start/Stop –Event denoting start and stop of the screen sharing session
- Connection requests –IP and username of the viewer that requested to connect along with the connection code that was used and the connection decision (granted/denied connection either because of an authentication failure or sharer decision)
- Screen Control Requests –Viewer IP and username that requested screen control along with the decision (granted/denied)
- Viewer Actions - Viewer IP and username that either disconnected from the screen sharing session or released control of the sharer's screen.

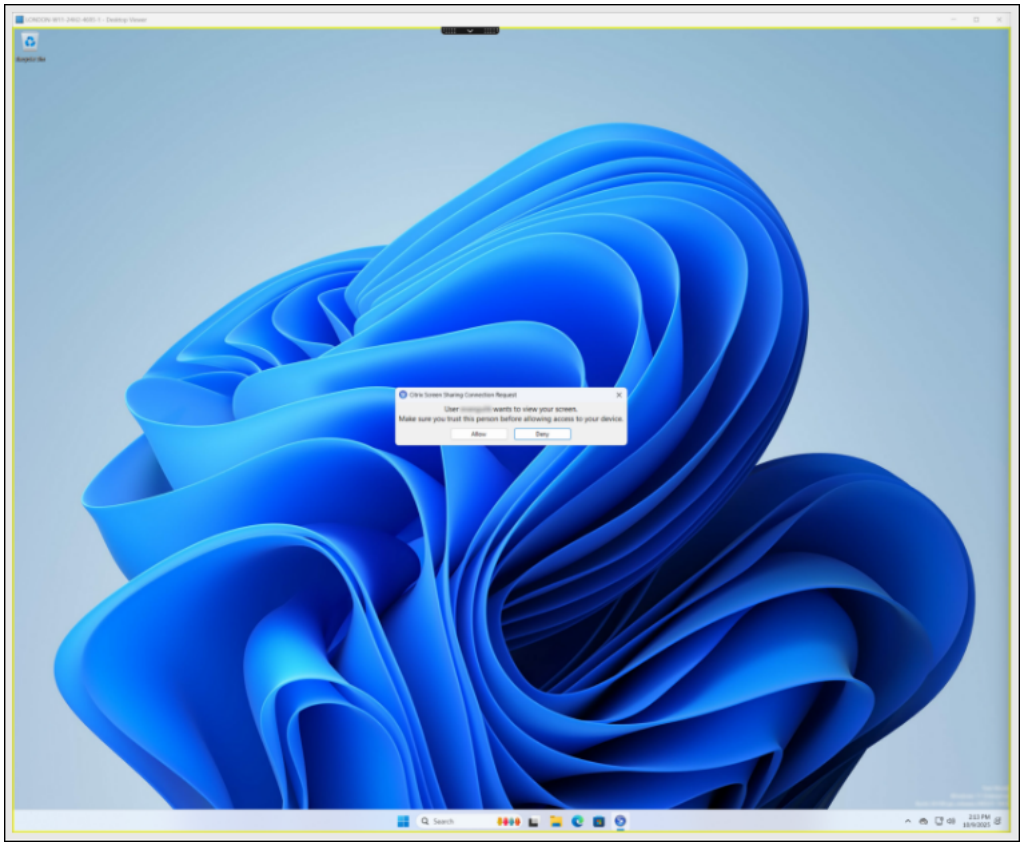


© 1997–2026 Citrix Systems, Inc. All rights reserved.

Viewing a Screen sharing session

To connect to someone else's sessions, look for the HDX graphics status indicator icon in the Windows notification area. Right-click on it to display the menu and select 'Screen share'> 'View someone else's screen'.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



You will be prompted to enter a connection code. The HDX Screen sharer will have provided this code to you. Enter or paste the session's connection string, as supplied by the user sharing the session, into the text box.

When you click 'Connect', the connection code will be validated, and if validation succeeds, the Screen sharing connection to the sharer's session will be established and the Screen sharing viewer will open automatically and show the sharer's screen (or screens).

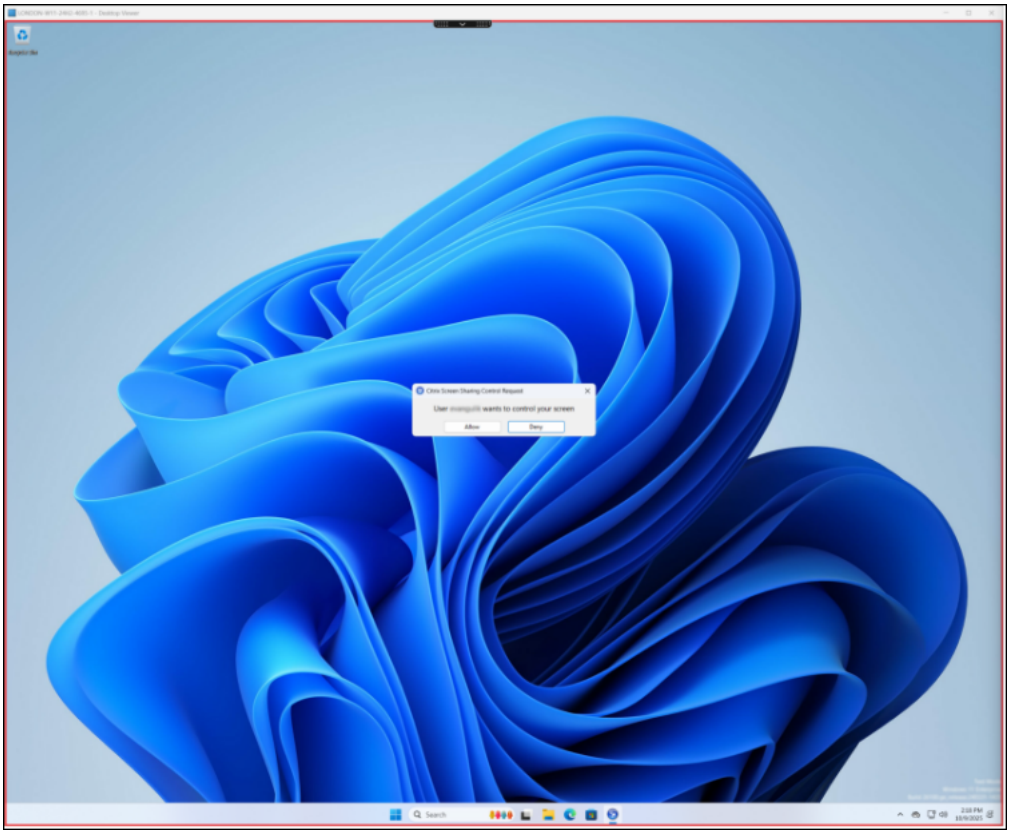
When you connect to the session, the sharer will be notified of your participation to his screen sharing session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Adjusting the display scaling

If the sharer uses a monitor resolution that is higher than yours or if they use multiple monitors during their session, the Screen sharing player will automatically adjust the resolution. To disable scaling and view the native resolution of the sharer's monitors, select the diagonal arrows in the top left corner of the Screen sharing player.

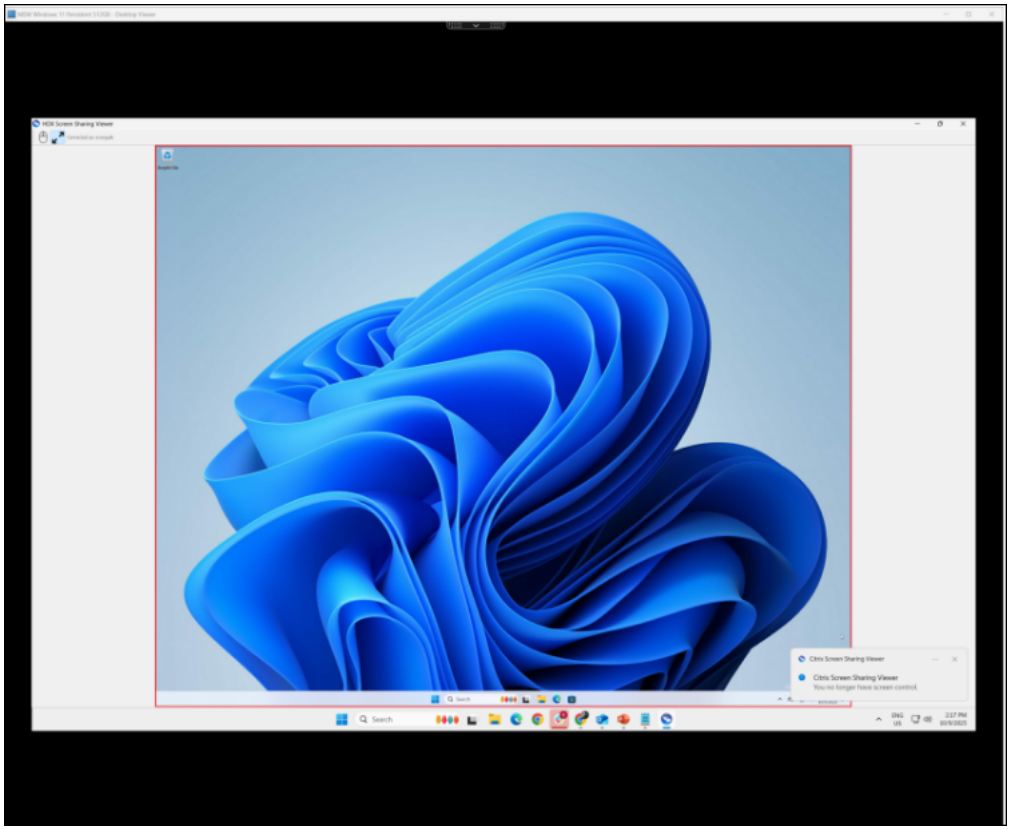
Disconnect from a screen sharing session



To disconnect from the Screen sharing session, close the Screen sharing player at any time. To reconnect, if the connection code has not expired, you can use the same code to rejoin the Screen sharing session with the sharer. If the connection code has expired, the sharer will need to regenerate a new code for you. The connection code expiration is controlled by the connection time-out Screen sharing Policy, which can be set by an Admin.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Request mouse and keyboard control



By default, the sharer has full control of the mouse and keyboard in the screen sharing session. As a viewer, you can request mouse and keyboard control from the sharer.

To request mouse and keyboard control, click on the ‘mouse icon’ in the top left of the screen sharing viewer. The sharer will be notified of your request and can allow or deny it. Once the sharer approves the request for mouse and keyboard control, both you as the viewer and the screen sharing sharer will share mouse and keyboard control within the session.

> **Note:**
>
> The sharer can take back exclusive control of the mouse and keyboard at any time.

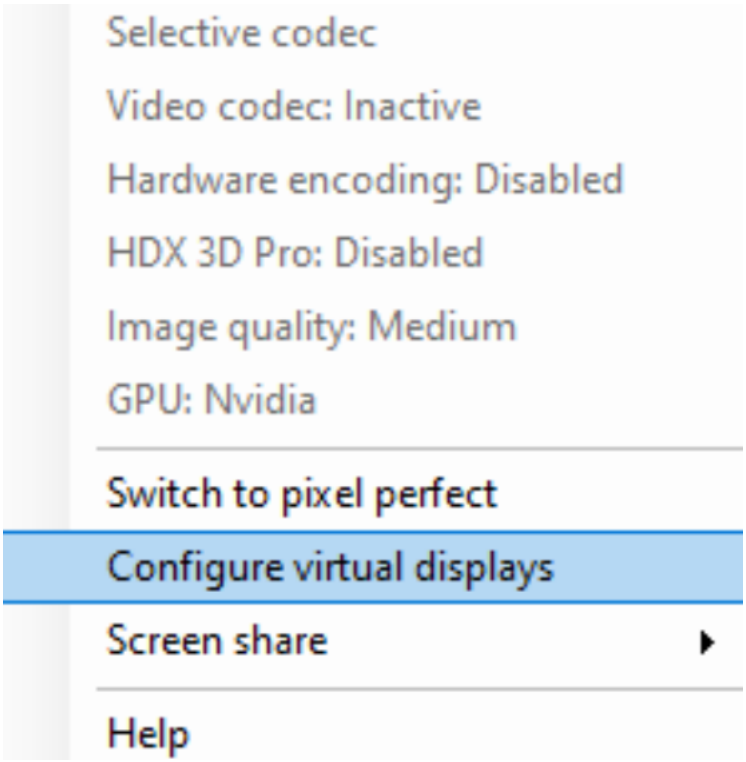
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual display layout

May 13, 2026

The virtual display configuration lets you define a virtual display layout per session monitor on the VDA, inside a live session. This feature allows you to split each session monitor independently into multiple virtual monitors.

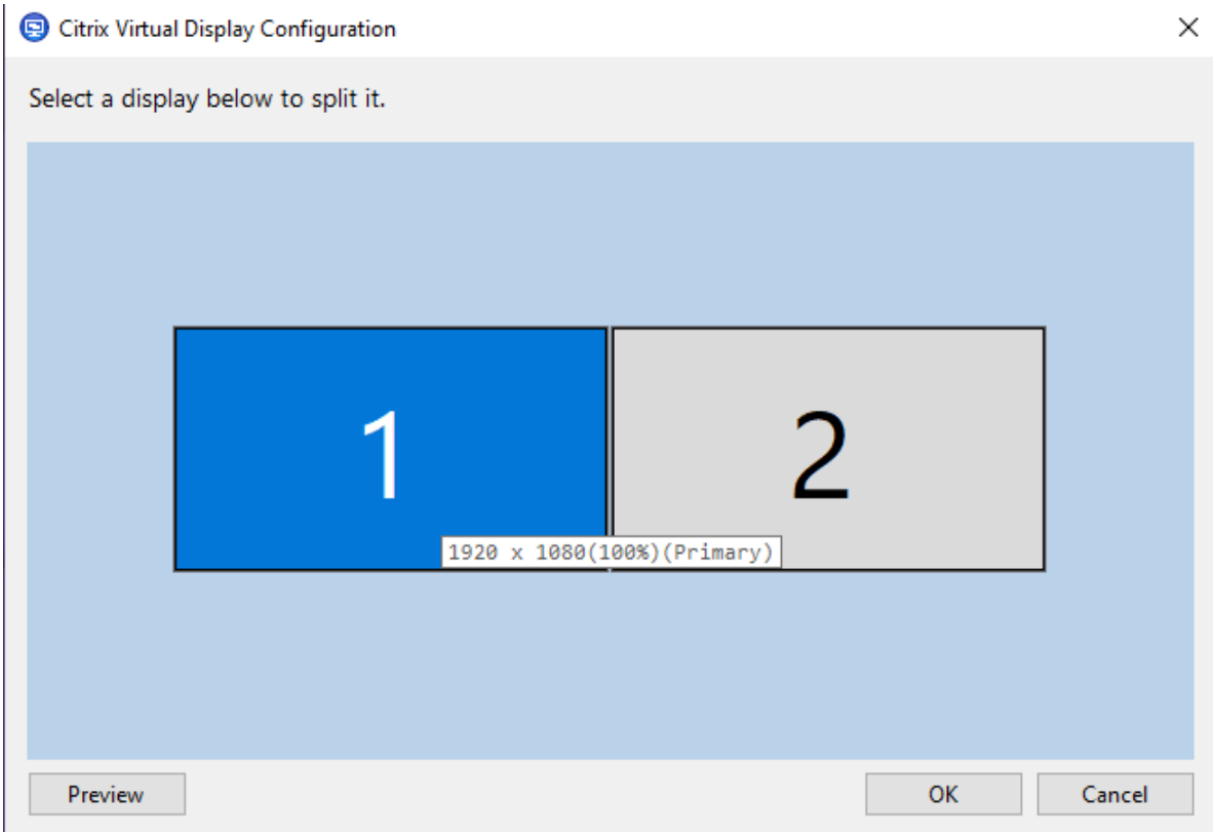
The virtual display configuration UI lets you define a virtual display layout per session monitor on the VDA, inside a live session. This feature allows you to split each session monitor independently into multiple virtual monitors. You can split into a total of 8 virtual monitors on the remote desktop. Also, you can update the session primary monitor and DPI settings for the displays.



System requirements

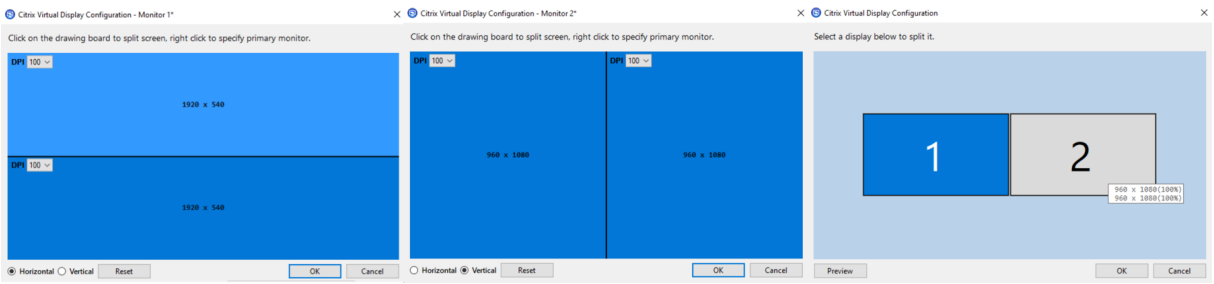
- Windows: Single-session or multi-session OS VDA
- Graphics status indicator policy must be enabled
- Only desktop sessions can be configured.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



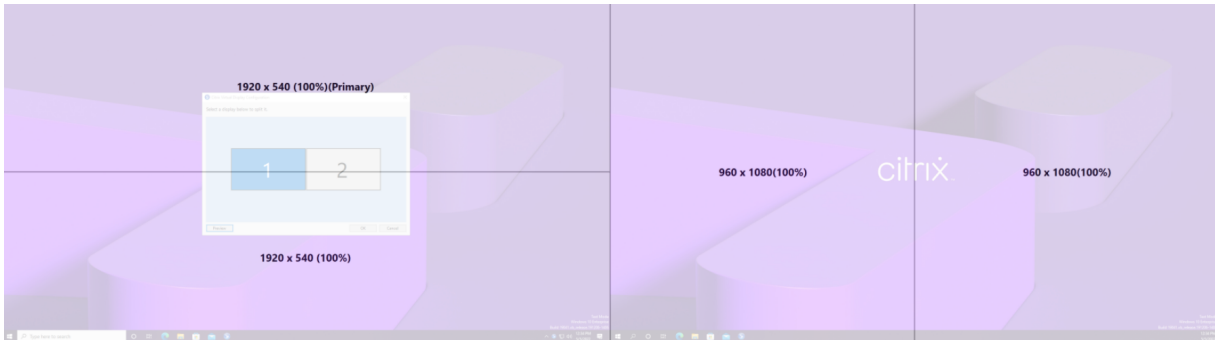
Configuration

To configure the virtual display layout, right-click the graphics status indicator icon and select the Configure virtual displays option. The virtual display configuration UI is launched.

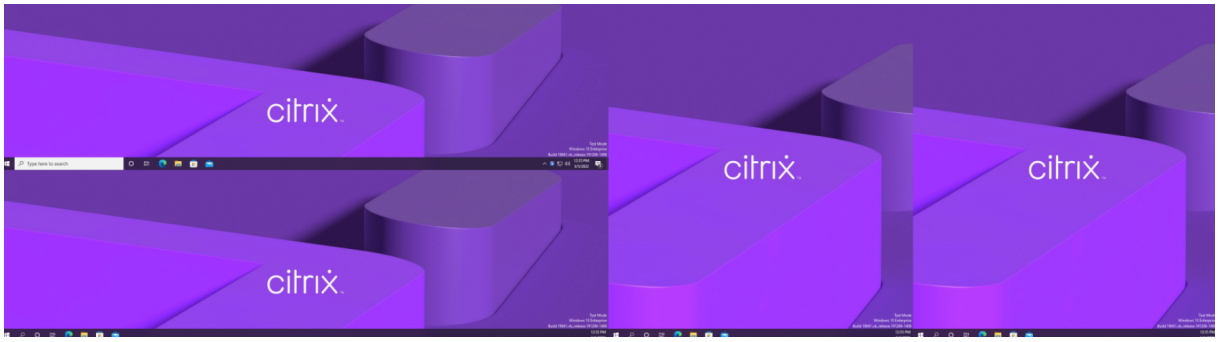


The UI shows the current session display layout, with blue denoting the session's primary monitor. You can see the Display settings tooltip when you hover on a display. The tooltip provides information about the current virtual display layout defined on a given session monitor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Select a display to transition to an interactive UI, which allows you to configure virtual displays for the selected session monitor. You can draw horizontal or vertical lines to separate the screen into virtual monitors. The screen is split according to specified percentages of the session monitor resolutions. Right-click on a virtual display to mark it as the primary monitor and use the DPI drop-down list to set a preferred scaling factor for the virtual display. After defining a virtual display layout, click **OK** to temporarily save the layout or **Cancel** to discard any changes. You can use **Reset** to undo the configuration and restore the original layout for the session monitor.



To preview the current configured virtual display layout, click the **Preview** button. A window appears to highlight the expected position and resolution of the virtual displays in the session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Click **OK** to immediately apply and save the virtual display layout. Click **Cancel** to close the UI and discard all changes.

Other considerations

- The minimum virtual display resolution required is 640 x 480.
- Virtual display DPI defined through the UI depends on OS scaling support for the given display resolution.
- Do not use this feature simultaneously with the existing virtual display feature in Citrix Workspace™ app.
- Preview functionality isn't supported on Server 2016.

Text-based watermark

May 13, 2026

Text-based session watermarks help to deter and enable tracking data theft. This traceable information appears on the session desktop as a deterrent to those using photographs and screen captures to steal data. You can specify a watermark that is a layer of text.

The watermark can display over the entire session screen without changing the content of the original document. Text-based session watermarks require VDA support.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> Text-based session watermarking is not a security feature. The solution does not prevent data theft completely, but it provides some level of deterrent and traceability. Although we do not guarantee complete information traceability when using this feature, we recommend that you combine this feature with other security solutions as applicable.

The session watermark is text and is applied to the session that is delivered to the user. The session watermark carries information for tracking data theft. The most important data is the identity of the logon user of the current session in which the screen image was taken. To trace the data leakage more effectively, include other information such as server or client internet protocol address and a connect time.

To adjust the user experience, use the Session Watermark policy settings to configure the placement and watermark appearance on the screen.

Requirements:

Virtual Delivery Agents:

Multi-session OS 7.17
Single-session OS 7.17

Limitations:

- Session watermarks are not supported in sessions where Local App Access, Windows media redirection, MediaStream, browser content redirection, and HTML5 video redirection are used. To use session watermark, ensure that these features are disabled.
- Session watermark is not supported and doesn't appear if the session is running in full-screen hardware accelerated modes (full-screen H.264 or H.265 encoding).
- If you set these HDX™ policies, watermark settings don't take effect and a watermark isn't displayed in the session display.

Use hardware encoding for video codec to **Enabled**
Use video codec for compression to **For the entire screen**

- If you set these HDX policies, the behavior is undetermined and the watermark might not display.

  Use hardware encoding for video codec to **Enabled**
  Use video codec for compression to **Use video codec when preferred**

  To ensure the watermark displays, set **Use hardware encoding for video codec** to **Disabled**, or set **Use video codec for compression** to **For actively changing regions** or **Do not use video codec**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Session watermark supports only the Thinwire graphics mode.
- If you use Session Recording, the recorded session doesn't include the watermark.
- If you use Windows remote assistance, the watermark is not shown.
- If a user presses the **Print Screen** key to capture the screen, the screen captured at the VDA side doesn't include the watermarks. We recommend that you take measures to avoid the captured image being copied.

Citrix snipping tool integration in Assistant

May 13, 2026

Overview

The Citrix Snipping Tool allows users to seamlessly capture screenshots of overlay and redirected content within their Citrix Virtual Apps and Desktops sessions.

Traditionally, native in-session screenshot tools cannot capture content that is optimized or offloaded to the client endpoint. Because this media is rendered locally rather than on the server (VDA), optimized elements—such as Microsoft Teams video or Browser Content Redirection (BCR) windows—typically appear as solid black boxes or placeholder graphics in standard screenshots.

The Citrix Snipping Tool bridges this gap by enabling in-session screenshotting of all redirected content. This ensures complete and accurate captures for documentation, troubleshooting, and collaboration, capturing the session exactly as the user sees it.

Supported Content

The Citrix Snipping Tool successfully captures content optimized by the following features:

- **Browser Content Redirection (BCR):** Captures offloaded web rendering. For details on the feature, see Browser Content Redirection documentation
- **HTML5 Multimedia Redirection:** Captures optimized HTML5 video elements. For details on the feature, see HTML5 Multimedia Redirection documentation
- **Windows Media Redirection:** Captures redirected Windows media playback. For details on the feature, see Windows Media redirection documentation

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Unified Communications (UC) Optimizations:** Captures overlay video and UI elements for HDX WebRTC / UCSDK optimized applications (such as Microsoft Teams VDI 1.0, Amazon Connect, Five9, Ring Central) and third-party optimized applications (such as Microsoft Teams VDI 2.0 (SlimCore), Zoom, and Webex)

System Requirements

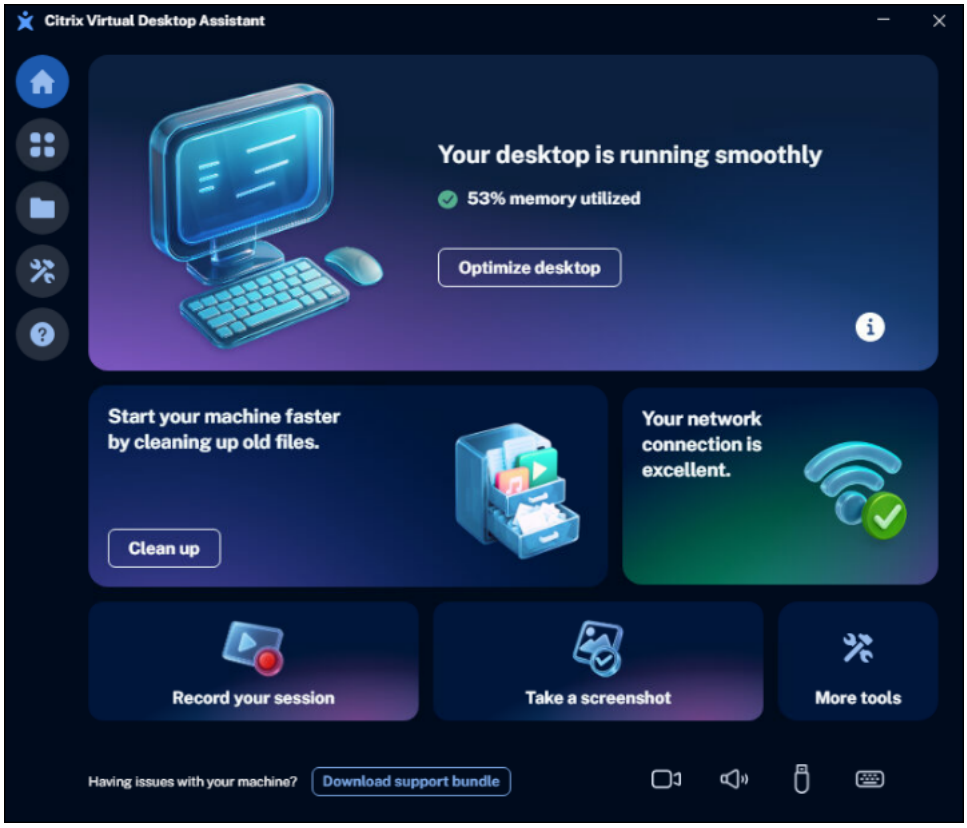
- **Virtual Delivery Agent (VDA):** Version 2607 LTSR or later.
- **Citrix Workspace app:** Citrix Workspace app for Windows version 2607 LTSR or later.
- **Supported Endpoint Operating Systems:** Windows only. (Note: macOS, Linux, and ChromeOS are not currently supported).

Configuration

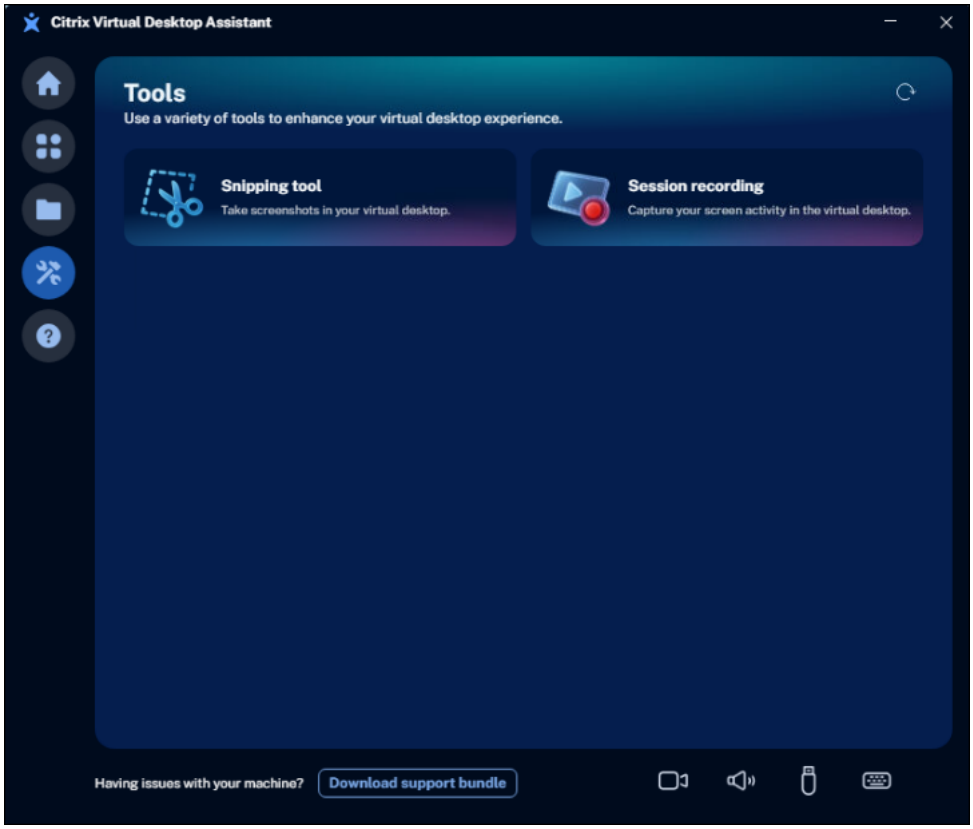
The Citrix Snipping Tool is controlled via Citrix policies. By default, the ability to capture redirected content is enabled.

To configure the policy:

1. Open **Citrix Studio (or Web Studio)** and navigate to Policies.
2. Locate **Screenshot Redirected Content** policy setting.
3. Select **Enabled** to allow users to capture overlay content or select Disabled if your environment has strict security requirements that prohibit screen captures.

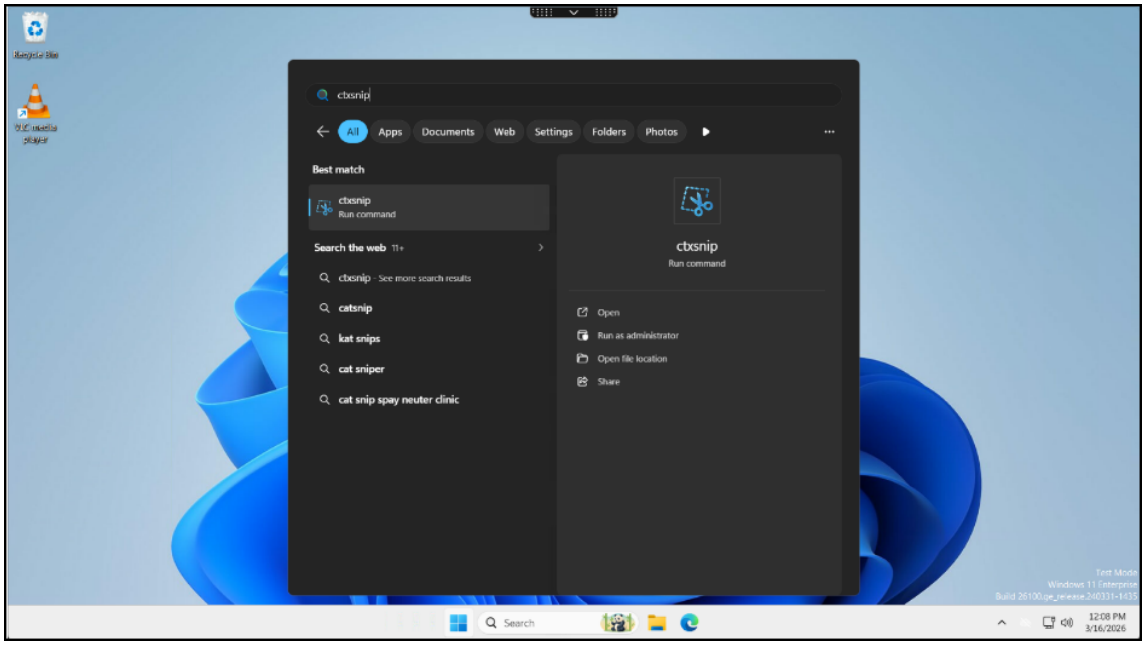


> **Note:**
>
> Citrix Snipping Tool respects existing security boundaries. If Citrix App Protection is active, the tool will automatically disable the capture of redirected content to prevent data leakage. For more information, see the App Protection documentation.



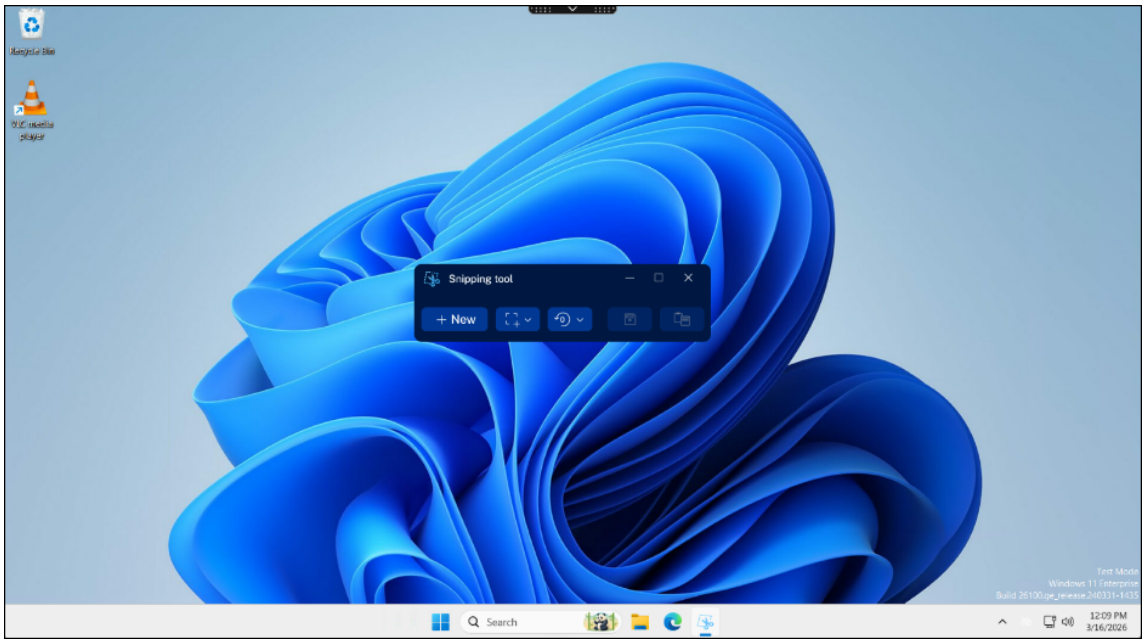
Usage

To capture in-session screenshots that include optimized or redirected overlay content, follow these steps:

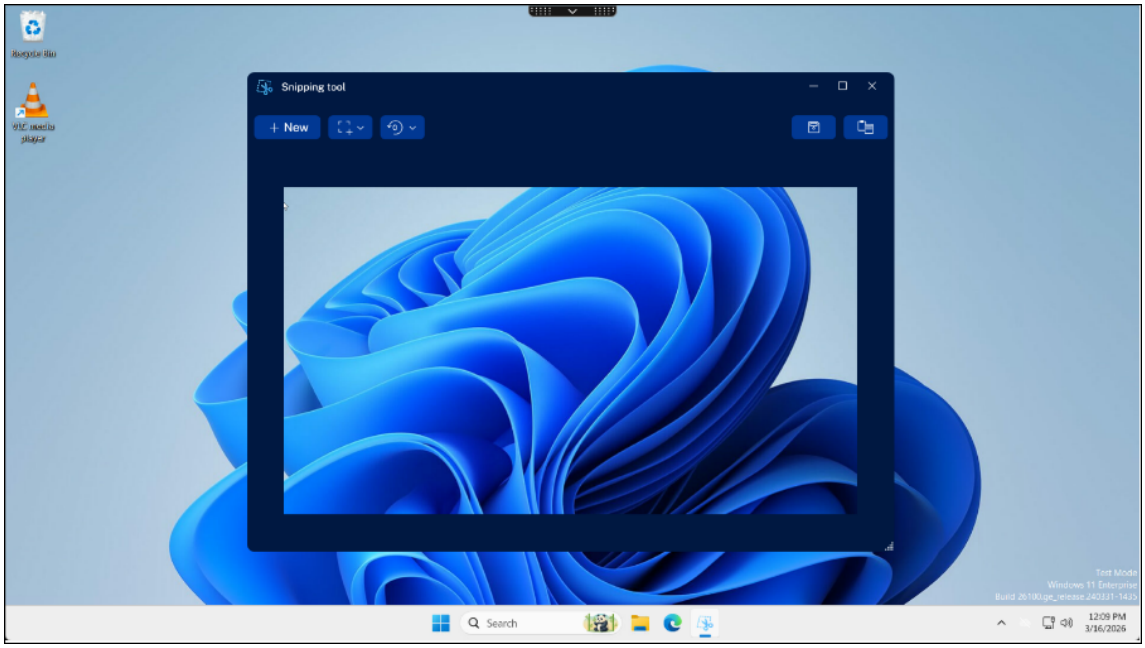


1. Citrix recommends launching the Citrix Snipping Tool directly from Citrix Assistant (from More tools in Home page). For more information on the application, see Citrix Assistant documentation. (Alternatively, you can open the Windows Start menu within your virtual desktop session to launch the Citrix Snipping Tool)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

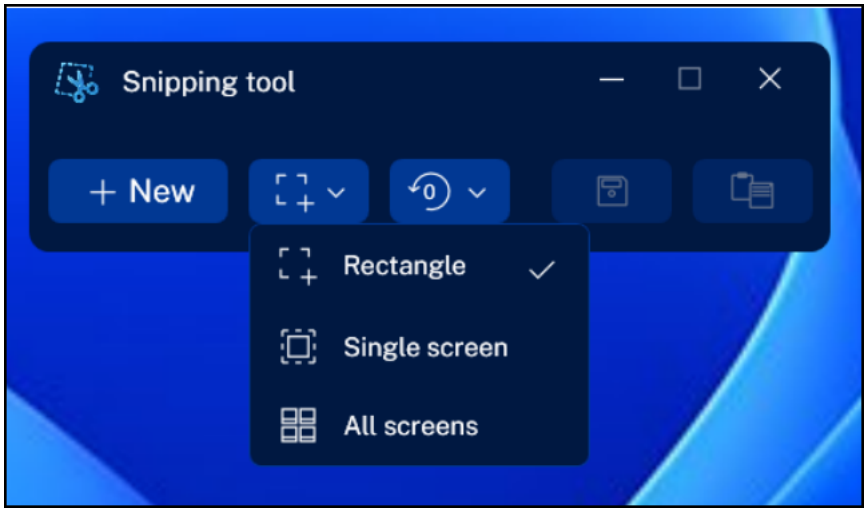


© 1997–2026 Citrix Systems, Inc. All rights reserved.



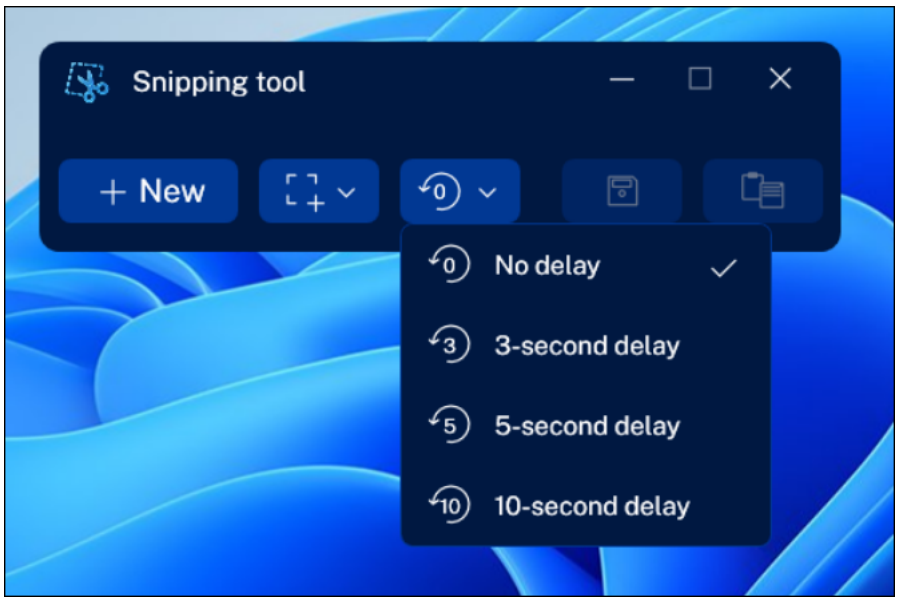
2. Click the New button to begin a capture.

3. Click and drag your cursor to select the specific area of the screen you want to capture. Once the screenshot is captured, you can copy the image directly to your clipboard, or save it as a .PNG or .BMP file.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Additional options



The Citrix Snipping Tool includes additional settings to customize your screenshots:

- **Snipping Area:** By default, the tool captures a custom, user-defined region of the screen. You can change this mode to capture a full-screen screenshot of the entire session. If you are using a multi-monitor setup, the full-screen mode will capture all active screens.

- Delay Timer: To capture temporary on-screen elements (such as drop-down menus or hover states), use the Delay button to select a countdown timer. The tool will wait for the specified duration before freezing the screen and capturing the snip.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting

Overlay content is not captured

- Verify that the Screenshot Redirected Content policy is set to Enabled in Citrix Studio.
- Ensure that both your Virtual Delivery Agent (VDA) and Citrix Workspace app meet the minimum version requirements (2607 LTSR or later).
- Check if App Protection or other anti-screen capture security policies are active. If these security boundaries are enabled, they will intentionally block the tool's functionality to prevent data leakage.

Black bars or placeholder messages persist in screenshots

- Verify that you are actively using the Citrix Snipping Tool to capture the screen. Native OS screenshot utilities (such as the default Windows Snipping Tool) and third-party capture applications cannot intercept optimized overlay content and will still result in black boxes.

The Citrix Snipping Tool is unavailable or missing

- Ensure that your Virtual Delivery Agent (VDA) is updated to version 2607 LTSR or later. The application will not be present or supported on older VDA releases.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Thinwire

May 13, 2026

Thinwire is the core display remoting technology within Citrix HDX, responsible for delivering smooth and interactive visual experiences in Citrix Virtual Apps and Desktops™ environments.

Thinwire analyzes screen content, identifies changes, and encodes the on-screen graphical data for efficient transmission over the network from the VDA to the user's endpoint device.. This ensures that the information is sent as efficiently as possible, minimizing bandwidth consumption and optimizing performance, especially in challenging network conditions.

HDX™ Graphics, powered by Thinwire, is Citrix's advanced display technology designed to deliver high-performance, adaptive, and efficient remote desktop and application experiences. By intelligently analyzing and compressing graphical data, Thinwire ensures optimal performance across diverse network conditions and endpoint devices.

Key Features of HDX Graphics and Thinwire

- **Adaptive Display Compression:** Thinwire dynamically adjusts compression algorithms based on the content type and network conditions, ensuring a balance between image quality and bandwidth efficiency. This adaptability allows for smooth performance even in bandwidth-constrained environments.
- **Graphics Processing Units:** HDX Graphics will automatically leverage the GPUs capabilities when available on the VDA for hardware encoding
- **Efficient Multimedia Redirection:** By redirecting multimedia content directly to the endpoint for local rendering, Thinwire reduces server-side processing and network load, resulting in a seamless multimedia experience for the user.
- **Optimized Text and Image Rendering:** Utilizing techniques like lossless text compression and intelligent image caching, Thinwire delivers crisp text and sharp images, enhancing readability and visual clarity.
- **Support for High-Resolution Displays:** Thinwire efficiently handles high-resolution and multi-monitor setups up to 8 monitors, providing users with a consistent and high-quality visual experience across various display configurations.
- **High Frame Rate Support:** HDX supports frame rates of up to 120 frames per second (fps), ensuring smooth and responsive performance for high-motion applications and scenarios. This capability enhances user experience, particularly in gaming, video editing, and other graphically demanding workloads.
- **10-bit High Dynamic Range:** With 10-bit High Dynamic Range (HDR) virtual desktop sessions, you can use enhanced encoding and decoding capabilities to render high-quality images and

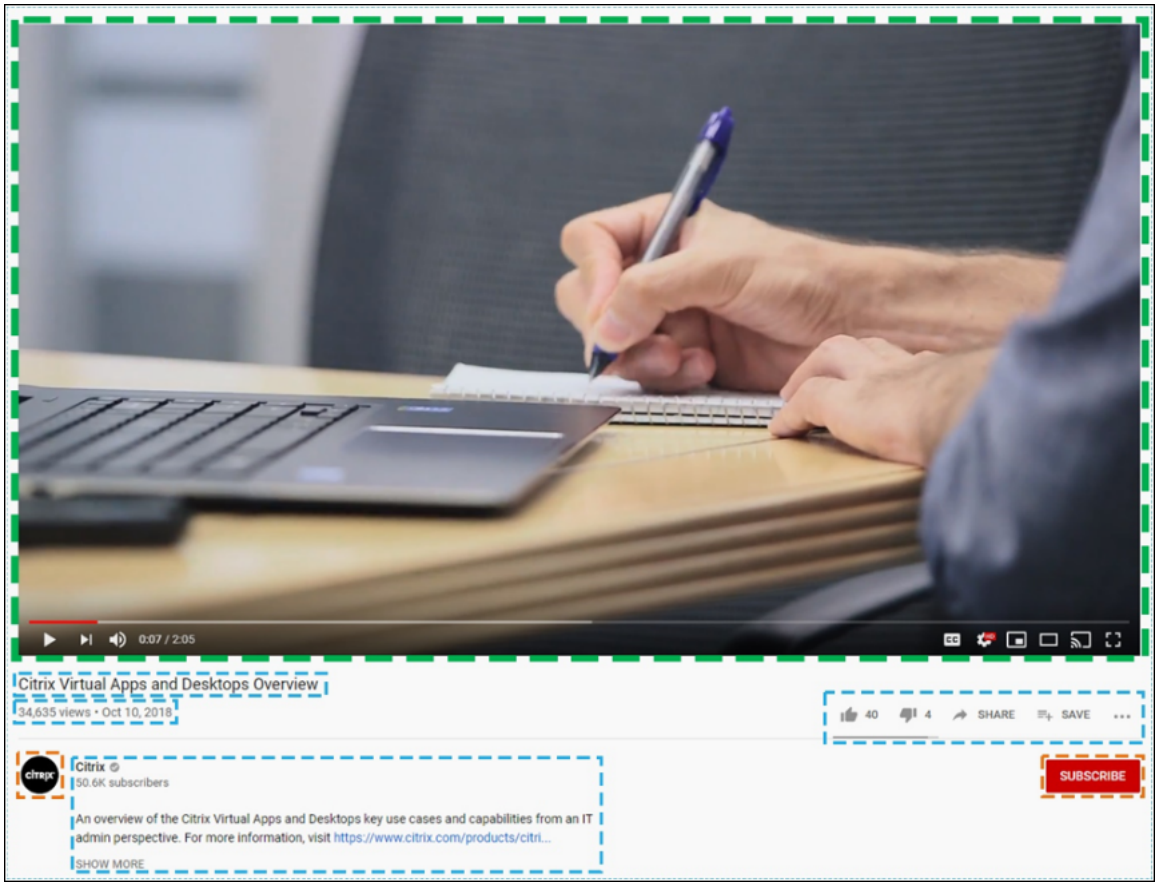
© 1997–2026 Citrix Systems, Inc. All rights reserved.

videos with an extended range of colors, and greater contrast and brightness.

In comparison to other industry solutions, such as Microsoft's Remote Desktop Protocol (RDP), VMware's Blast Extreme, and Amazon's NICE DCV, Citrix's HDX Graphics with Thinwire stands out by offering a comprehensive set of features tailored to meet the demands of modern remote work environments. Its ability to adapt to varying network conditions, combined with efficient resource utilization and superior image quality, positions it as a leading choice for organizations seeking a robust and flexible remote display solution.

HDX Graphics supports server side graphics processing units (GPU) on the VDA for hardware acceleration of encoding and rendering. HDX Graphics will automatically detect if a GPU is present and will automatically use the GPUs capabilities.

Adding a GPU to the VDA can also help to accelerate graphically intensive applications in use cases like graphics design, video rendering, 3D CAD, and data processing and visualization applications.



Thinwire Analysis

May 13, 2026

Thinwire analyzes the content on screen in real-time and dynamically categorizes the display data into three types:

- Text, Simple Images and Solid Colors
- Static Image Content
- Moving (or Fluid) Images

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In this example shown above, text or simple graphics are highlighted in blue, static images in orange and moving (or fluid) images in green.

After screen analysis, Twinwire will take different approaches to compress and encode each category of display data as efficiently as possible based on the VDAs capabilities and the Thinwire configuration policies set.

Thinwire Configuration

May 13, 2026

Thinwire can operate in different graphics encoding modes depending on its configuration.The main configuration policy for Thinwire is the ‘Use Video Codec for Compression’policy.

- Use when preferred (default)
- For actively changing regions
- For the Entire screen
- Do not use a video codec

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The sections below will describe each mode in more detail.

Use a video codec for compression setting	Text	Images	Moving images and videos	Use cases
Use when preferred (GPU)	Lossless	JPEG	Intelligent Build to Lossless / Video Codec*	Default for most most workloads, including graphically intensive applications
Use when preferred (no GPU)	Lossless	JPEG	Video Codec	Default for most workloads
For actively changing regions	Lossless	JPEG	Video Codec	
For the entire screen	Video Codec	Video Codec	Video Codec	Graphically intensive applications like gaming, when Build to Lossless is not preferred
Do not use a video codec	Lossless	JPEG	Adaptive JPEG	When image quality is preferred over session interactivity. Best scalability due to minimized GPU utilization

*Intelligent Build to Lossless is used only when certain conditions are met.

For most use cases, leaving the Thinwire configuration as default will result in the best performance and display quality.

For more information about the different use cases, refer to our Techzone documentation, HDX Graphics Design decisions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Thinwire Full Screen Encoder

May 13, 2026

Overview

With the release of Citrix Virtual Apps and Desktops™ 2503 and onward, the ‘Optimize for 3D Graphics workload’policy has been deprecated and removed.

This policy has been replaced by the Full Screen Encoder, which provides enhanced functionality and improved user experience for certain graphically intense workloads.

The Full Screen Encoder can be configured using the ‘Use video codec for compression’policy, set to ‘For the entire screen’.

The Full Screen Encoder simplifies configuration while offering robust performance for graphics-intensive workloads. It ensures the entire screen is encoded using a video codec, foregoing any screen analysis or bandwidth optimization to maximize frame rate and interactivity.

This mode is particularly suited for 3D applications and workloads where consistent graphical fidelity is paramount.

The primary benefit of the Full Screen Encoder is that it is able to leverage the YUV444 color space. Moreover, full Screen encoding can provide the highest frame rate possible, up to 120 Frames per second (FPS) compared to the Selective encoder, but uses more bandwidth and resources as a result.

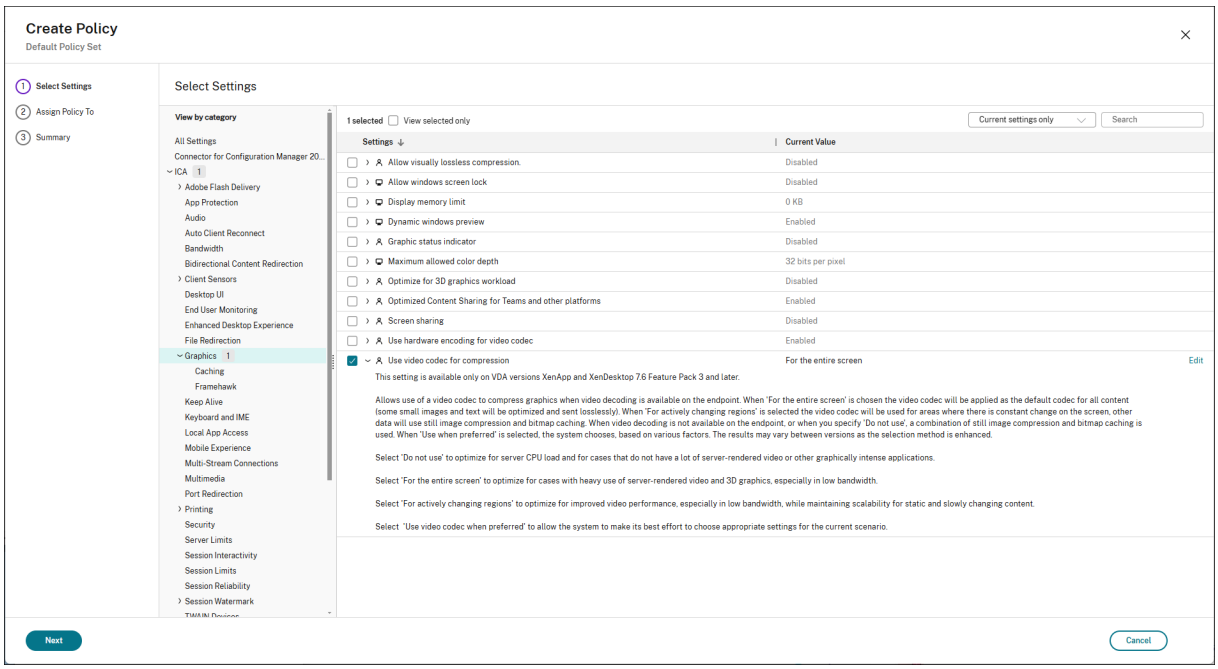
When to Use the Full Screen Encoder?

May 13, 2026

For graphically intensive applications, Build to Lossless should be considered before trying the Full Screen Encoder. Build to Lossless can be set by setting the Visual Quality policy to “Build to Lossless”and leaving the “Use Video Codec for Compression”policy at its default setting “Use when preferred.”

The Full Screen Encoder is only recommended if higher moving image quality is required as it supports the YUV444 color space (see “Allow Visually Lossless”policy). Video Editing is a good example of where this extra fidelity might be required, however, this will come at a considerably higher bandwidth cost.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Configuration

May 13, 2026

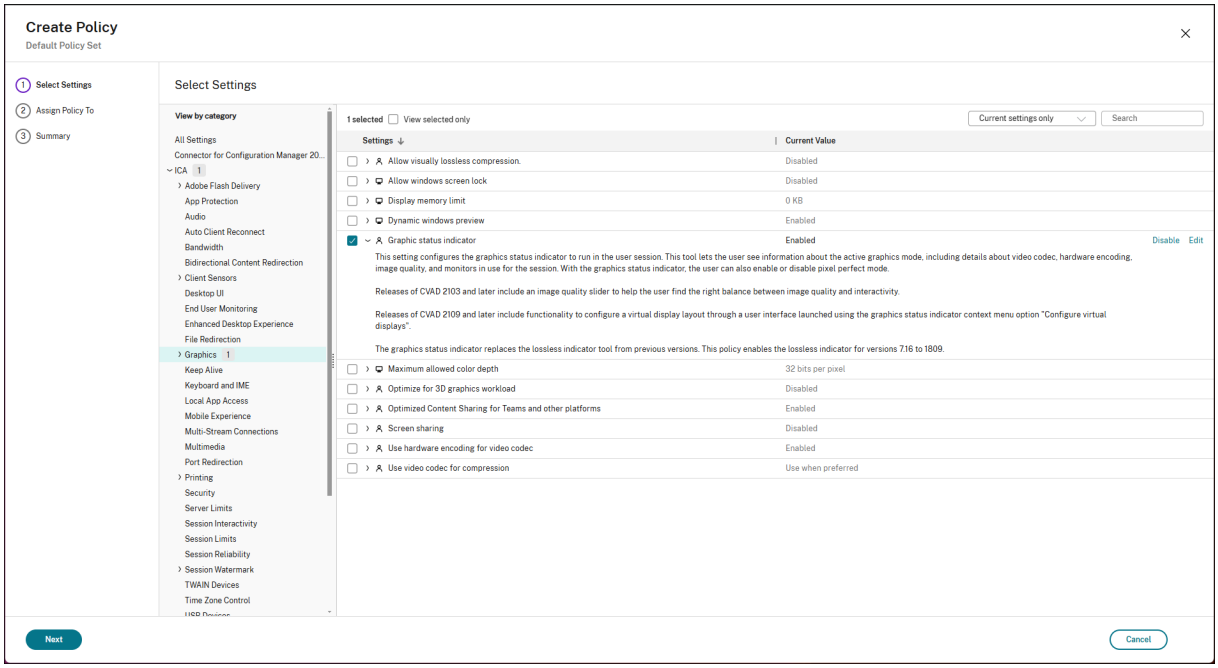
To enable the Full Screen Encoder:

1. Navigate to the graphics policy settings in Citrix Studio.
2. Locate the ‘Use video codec for compression’policy.
3. Set the policy to ‘For the entire screen’.
4. Apply and propagate the policy changes to your delivery groups.

For additional details on codec behavior and configuration, refer to the Automatic Video Codec Configuration documentation.

Monitoring

May 13, 2026

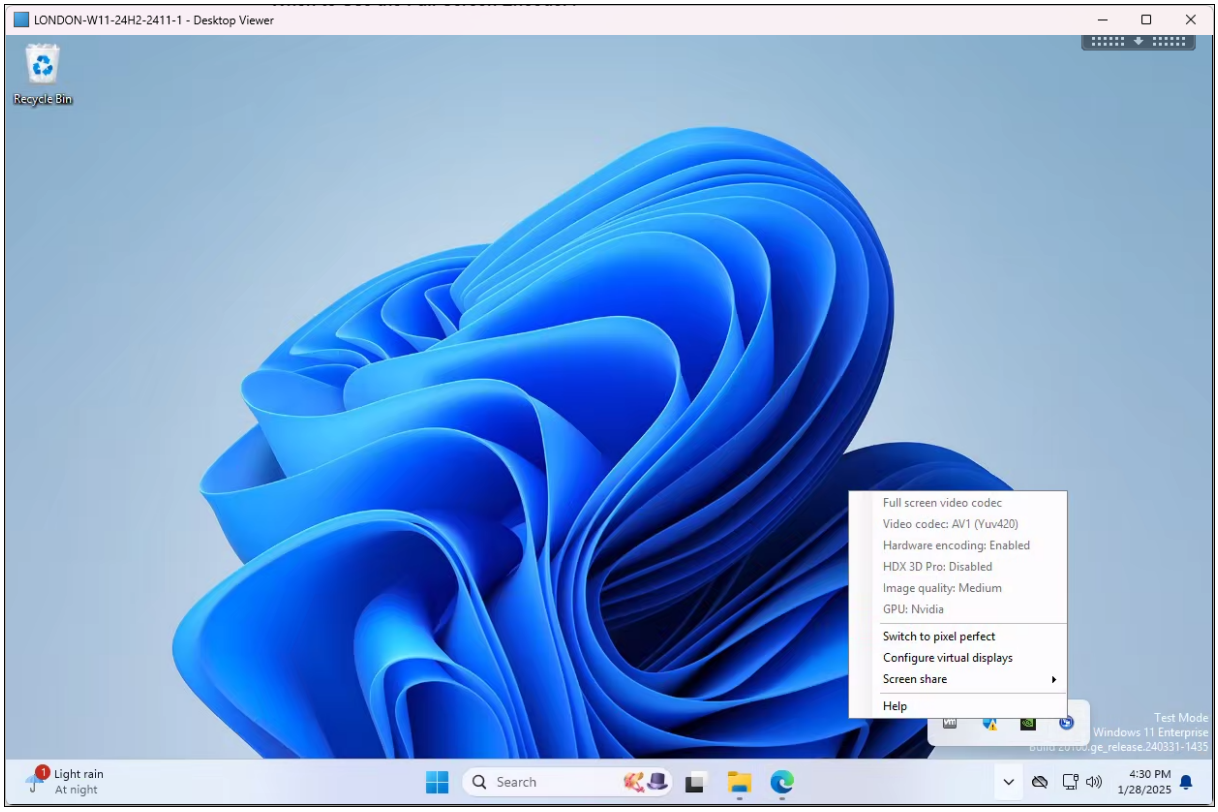


For monitoring the full screen encoder, the Graphics Status Indicator can be used in-session. Currently the Graphics Status Indicator is not enabled by default.

To enable the Graphics Status Indicator:

1. Navigate to the graphics policy settings in Citrix Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. Locate the ‘Graphics Status Indicator’policy.
3. Set the policy to ‘Enabled’.
4. Apply and propagate the policy changes to your delivery groups.

The Graphics Status Indicator will be available in the tasktray in the remote session.

When using the full screen encoder the Graphics Status Indicator will show:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Deprecated Policy - Optimize for 3D Graphics Workload

May 13, 2026

Previously, the ‘Optimize for 3D Graphics workload’policy provided functionality similar to the Full Screen Encoder. However, this policy lacked the advanced capabilities.

The removal of this policy streamlines configuration and ensures consistency in performance across varying workloads and environments.

Additional Notes

May 13, 2026

For environments utilizing high-performance GPUs, the Full Screen Encoder maximizes their potential, ensuring smooth delivery of complex visual applications.

Note that YUV444 offers higher color fidelity at the cost of increased bandwidth usage compared to the default YUV420. For more information, see the colour space section

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Overview

May 13, 2026

Selective encoding is the default mode of operations for Thinwire. In this mode Thinwire will analyze the screen contents in real-time and select the best method to encode each part of the screen for optimal visual quality, session fidelity and bandwidth usage.

Selective encoding will use:

- Text: Lossless encoding
- Simple Images & Solid Colors: Lossless encoding
- Complex/ Photographic Images: JPEG encoding
- Transient content and moving images: video codec, H.264 / H.265 / AV1 in YUV 4:2:0 colour mode.

Selective encoding has the following characteristics:

- Adaptive Display: The adaptive display technology in Thinwire identifies moving images (video, 3D in motion) and uses a video codec in the parts of the screen where the image is moving.
- Intelligent Build to Lossless: when a GPU is present, Intelligent Build to Lossless can be used to provide the best session interactivity when movement is detected and a guaranteed pixel perfect image once movement has stopped. Thinwire automatically enables Intelligent Build to Lossless on a per-monitor basis based on several factors, including response time monitoring and screen activity.
- Hardware Acceleration: If a GPU is present on the Virtual Delivery Agent (VDA), the Full Screen Encoder leverages the GPU for hardware-accelerated encoding, reducing CPU usage and enhancing performance.
- Automatic Video Codec Selection: The video codec used is dynamically selected based on the capabilities of the VDA and the client. Supported codecs include:
  - AV1: Preferred for its efficiency and high-quality compression.
  - H.265 (HEVC): Used as a fallback for systems that do not support AV1.
  - H.264 (AVC): Utilized in legacy or low-capability scenarios or when no GPU is present on the VDA

When to use Thinwire Selective Encoding

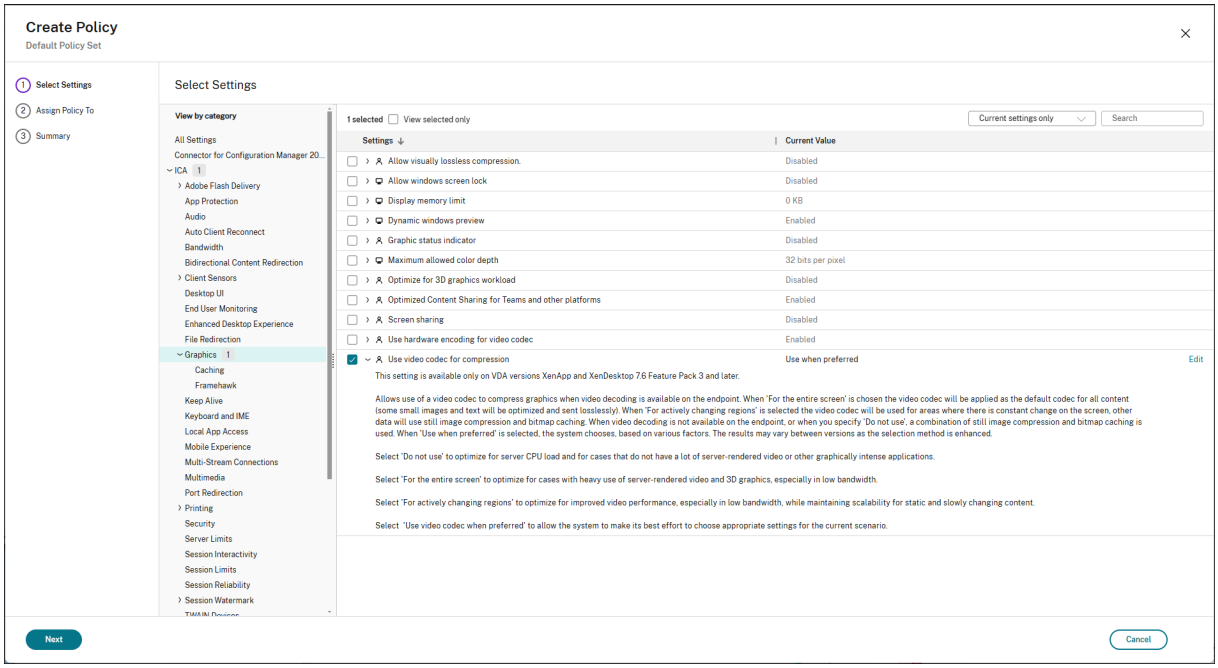
May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This mode is recommended for most use cases and will automatically adapt the visual quality based on the available bandwidth. These use cases include (but are not limited to):

- Office workers and developers. Office workers and Developers benefit from the high image quality and sharp text quality provided by the selective encoder
- Financial Traders: Financial traders typically use multiple high resolution monitors.
- 2D CAD: For 2D CAD use cases, sharp lines and high resolutions are important. Intelligent Build to Lossless, which is part of the Thinwire Selective Encoder, will ensure fast response times as well as a pixel perfect image when movement ceases.
- Medical Imaging: Selective encoding can be combined with lossless image quality to provide a pixel perfect image for medical use cases. (Pending FDA approval)

Configuration



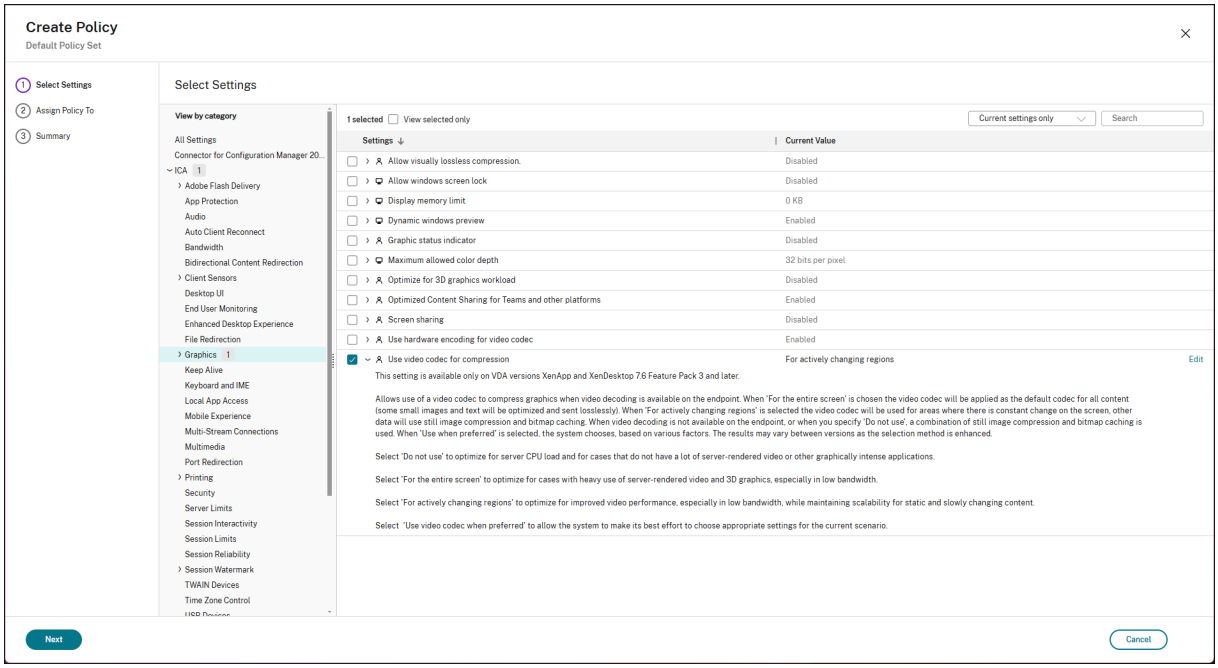
May 13, 2026

Selective encoding is the default mode of operation and therefore no additional configuration is necessary. By default, selective encoding will use Intelligent Build to Lossless when a Server side GPU is available.

To explicitly set selective encoding:

1. Navigate to the graphics policy settings in Citrix Studio.
2. Locate the 'Use video codec for compression' policy.
3. Set the policy to 'Use When Preferred'.
4. Apply and propagate the policy changes to your delivery groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Intelligent Build to Lossless was introduced with Citrix Virtual Apps and Desktops™ version 2503. For CVAD versions prior to 2503, selective encoding will work without Intelligent Build to lossless.

To use selective encoding without Intelligent Build to lossless for VDAs with a GPU (to set the legacy behaviour of versions prior to 2503):

1. Navigate to the graphics policy settings in Citrix Studio.
2. Locate the 'Use video codec for compression' policy.
3. Set the policy to 'For actively changing regions'.
4. Apply and propagate the policy changes to your delivery groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

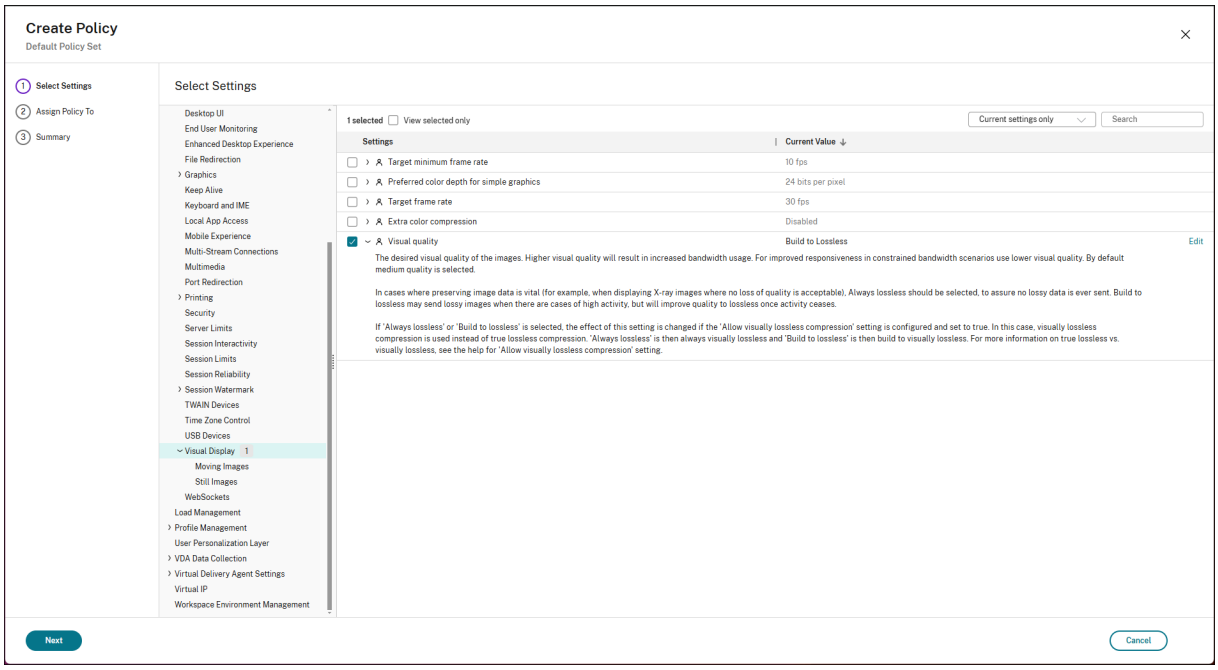
Note for versions prior to 2503, use when preferred and for actively changing regions were identical. In 2503, the default setting of use when preferred includes Intelligent Build to lossless when a GPU is available. In cases where there is no GPU, use when preferred is identical to for actively changing regions.

Build to Lossless

May 13, 2026

Build to Lossless is a special Thinwire configuration that optimizes graphics delivery for interactivity and final image quality. You can enable this setting by setting the Visual quality policy to Build to Lossless.

Build to Lossless is designed to be as lightweight as possible, and will disable most of the Thinwire image analysis performed in regular selective encoding. It employs a "fuzzy-first"approach, assuming a lossy codec will give better performance for moving images and when movement has stopped will gradually build up to a guaranteed lossless image.



Build to Lossless compresses the screen using the selected video codec (AV1, H.265 or H.264) during screen activity and sharpens to pixel perfect (lossless) when activity stops. The lossy image quality adapts to available resources to maintain the best possible frame rate. The sharpening step is performed gradually, radiating outwards from the mouse cursor. This allows for an immediate response if the user begins screen activity shortly after sharpening starts. For example, selecting a model and rotating it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

With regular Build to Lossless, all monitors will operate in Build to Lossless mode when enabled. If you are looking for the ability to run Build to Lossless on select monitors, please refer to our new Intelligent Build to Lossless feature below. [insert link to Intelligent Build to Lossless]

Build to lossless can be enabled by using the Visual Quality policy setting.

1. Navigate to the graphics policy settings in Citrix Studio.
2. Locate the 'Visual Quality'policy.
3. Set the policy to 'Build to lossless'.
4. Apply and propagate the policy changes to your delivery groups.

When to Use the Regular Build to Lossless?

May 13, 2026

The Regular Build to lossless is designed for following use cases

- Full screen 3D CAD
- Full screen 2D CAD
- Certain modalities for medical imaging
- Financial / Trader

For all of these use cases, please consider using Intelligent Build to Lossless over regular build to lossless when using multiple monitors within the Citrix® session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Intelligent Build to Lossless

May 13, 2026

This article describes the Intelligent Build to Lossless graphics mode for Citrix HDX. It explains how the feature works, how to configure it, and how to verify and monitor its operation. It also compares this mode to the existing Build to Lossless and Always Lossless Visual Quality settings.

Designed for mixed workloads in mind, Intelligent Build to Lossless is an evolution of Thinwire Selective Encoding and is the new default graphics mode. Similar to the existing Build to Lossless setting, Intelligent Build to Lossless uses a video codec on large, actively changing screen regions to maintain smooth session graphics. When the screen activity ceases, it progressively refines the image until it is pixel perfect. Where Intelligent Build to Lossless differs from the existing Build to Lossless setting is how the mode is toggled: the choice of whether to engage Build to Lossless or not is no longer just a policy decision, but instead based on screen activity and other factors. Moreover, this decision is made on a per-monitor basis, allowing - for the first time - a mix of Thinwire Selective Encoding and Build to Lossless all within the same session.

Intelligent Build to Lossless is enabled by default for Citrix Virtual Apps and Desktops™ version 2503 and later when a GPU is present on the VDA. When no GPU is present on the VDA, Selective Encoding without Intelligent Build to Lossless is used, which is essentially the same as how Selective Encoding worked prior to version 2503.

No Citrix Workspace™ app upgrades are required to take advantage of Intelligent Build to Lossless.

Comparing Graphics Modes - Intelligent BTL vs. BTL vs. Always Lossless

May 13, 2026

The following table highlights the key differences between Intelligent BTL, BTL and Always Lossless:

Feature	Intelligent Build to Lossless (Recommended)	Build to Lossless	Always Lossless
Configuration	Enabled by default, controlled via the Use video codec for compression policy on GPU-enabled VDAs	Visual Quality policy set to Build to Lossless	Visual Quality policy set to Always Lossless

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature	Intelligent Build to Lossless (Recommended)	Build to Lossless	Always Lossless
Activation	Dynamic. Thinwire intelligently activates and deactivates based on screen content.	Always on for the entire session duration.	Always on for the entire session duration.
Scope	Per-monitor. Activates and deactivates in real time only on the monitor(s) where Build to Lossless is required.	Affects all monitors connected to the session, which may result in productivity apps e.g., e-mail being rendered in two passes.	Affects all monitors connected to the session.
Bandwidth consumption	Moderate to Low, depending on screen activity.	Moderate, depending on screen activity.	High.
Use cases	The default mode for all use cases on GPU-enabled VDAs. For VDAs without a GPU, Selective Encoding will be used, similar to VDAs before 2503.	Superseded by Intelligent Build to Lossless. Not recommended for new deployments with GPU-enabled VDAs.	Use cases where every single frame, including during motion, must be lossless.

Prerequisites

May 15, 2026

Intelligent Build to Lossless is the new default mode for all use cases on GPU-enabled VDAs.

VDA

Intelligent Build to Lossless is available for Windows, Linux and Mac VDAs.

It is important to note that the CVAD version requirements vary by operating system.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Windows VDA:** CVAD 2503 or later
- **Linux VDA:** CVAD 2503 or later
- **MacOS VDA:** 2507 or later

VDA Hardware: A server-side GPU is required (NVIDIA, AMD, or Intel).

More information see, Intelligent Build to Lossless for Linux VDA.

> **Note**:
>
> Intelligent Build to Lossless is not available on VDAs without a GPU.

Citrix Workspace™ App

Citrix Workspace app: all currently supported versions.

Intelligent Build to Lossless is independent of the client's hardware and will work with all clients, whether or not they have a client-side GPU.

When to Use the Intelligent Build to Lossless?

May 13, 2026

Intelligent Build to Lossless is suitable for all workloads and networking scenarios. It is particularly well suited for mixed workloads and use cases where end users are using multiple monitors and high-resolution displays, like high-end financial traders, for example.

Intelligent Build to Lossless is enabled and on by default for VDAs running Citrix Virtual Apps and Desktops™ version 2503 or later and are equipped with a server-side GPU.

There are no additional endpoint requirements; however, Citrix® always recommends using the most recent available CWA client version.

VDA Version	Serverside GPU	Intelligent Build to Lossless
VDA version prior to 2503	yes	no
VDA version prior to 2503	no	no
VDA 2503 or later	**yes**	**yes**
VDA2503 or later	no	no

Citrix recommends using Intelligent Build to Lossless for the following scenarios:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Medical Imaging:

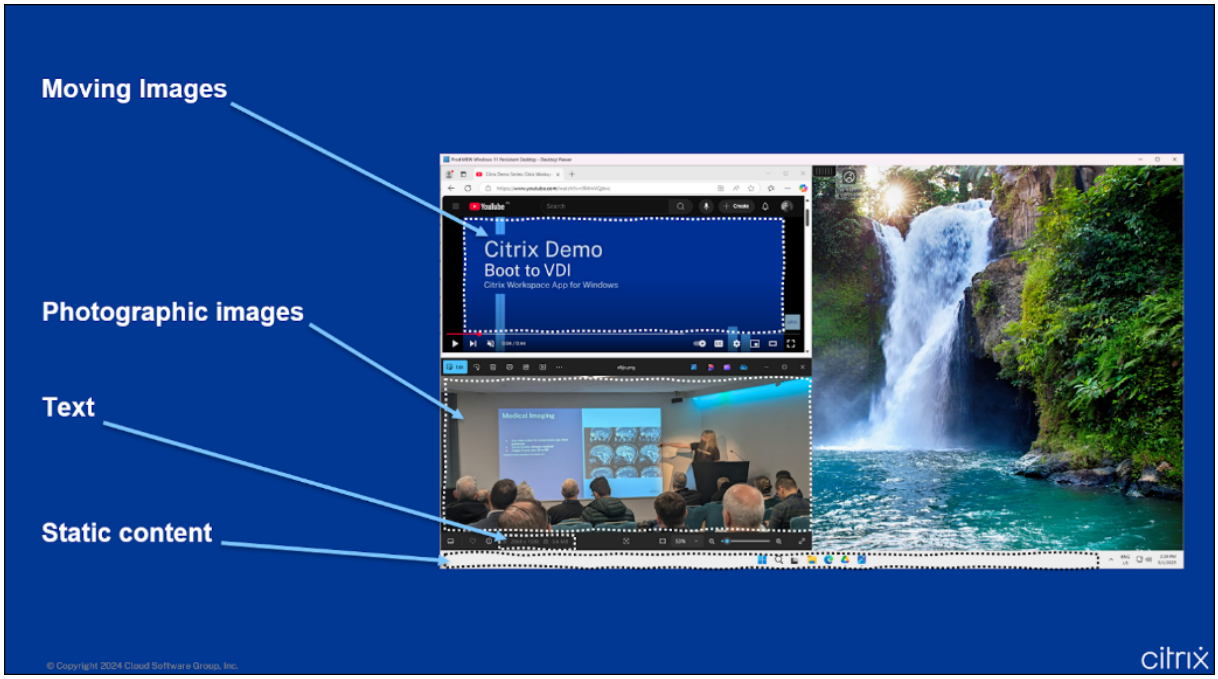
For viewing diagnostic images, such as X-rays, MRIs, or CT scans, where compression artefacts could obscure details and compromise clinical accuracy.

3D CAD/CAM & Engineering:

When working with intricate and complex models and blueprints, precise line clarity is essential for both design and manufacturing.

Pre-press and Graphic Design:

For reviewing color proofs, high-resolution images, or text layouts, where seeing the actual, high-quality source material is required for quality control.



Financial Services:

For displaying dense, real-time data on trading floors, where absolute clarity of static charts and figures is necessary for analysis when using multiple high-resolution monitors

How it works?

May 13, 2026

The feature operates as part of the HDX™ Thinwire display protocol.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Once Thinwire detects a screen region with moving images, it encodes the region using the configured video codec, H.264, H.265, or AV1, depending on the VDA and client's capabilities. This prioritises frame rate and responsiveness.
2. When the region of the screen becomes static, i.e., no movement is detected, Thinwire will gradually build up the area to a lossless state through a series of refinement updates for the static region.

Configuration

May 13, 2026

In Citrix Virtual Apps and Desktops™ release 2503 and later, Intelligent Build to Lossless is enabled by default on VDAs with a supported GPU. You do not need to create any policies to enable it. The behavior is controlled by the state of the "Use video codec for compression"policy:

To enable Intelligent Build to Lossless (Default Behaviour)

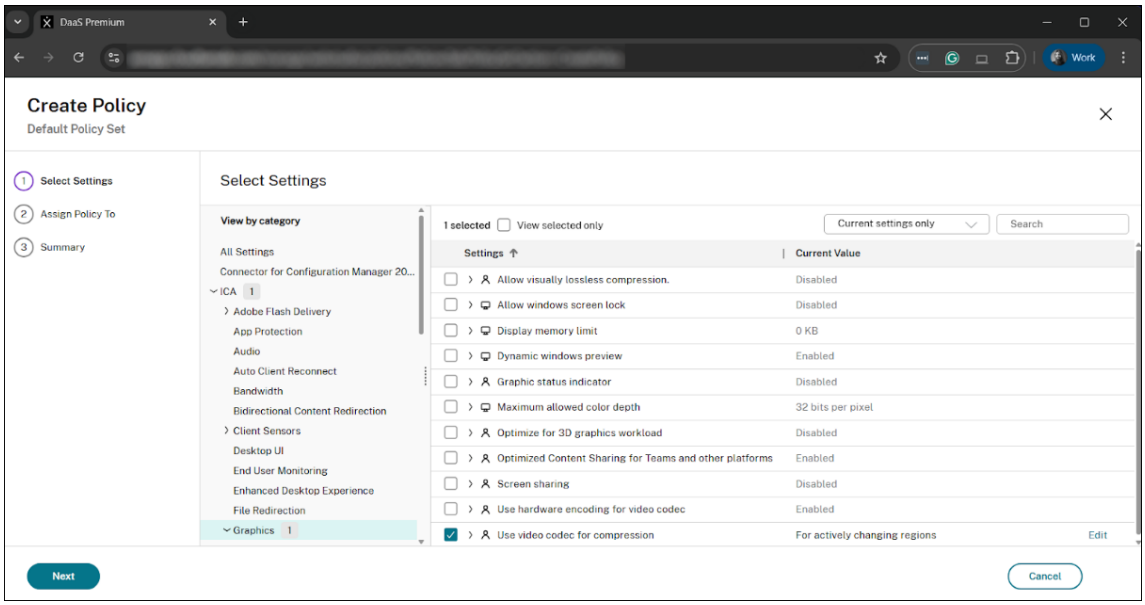
Leave the Use video codec for compression policy as *Not Configured*. Alternatively, you can explicitly set the *Use video codec for compression policy* to *Use when preferred*.

To disable Intelligent Build to Lossless (not recommended)

Explicitly set the "Use video codec for compression"policy to "For actively changing regions".

Selecting "for actively changing regions"will result in Thinwire using Selective Encoding like in pre-2503 VDAs with a server-side GPU.

Step-by-Step Instructions



To explicitly disable the Intelligent Build to Lossless policy using Citrix Studio, follow the instructions below.

Citrix Studio (GUI)

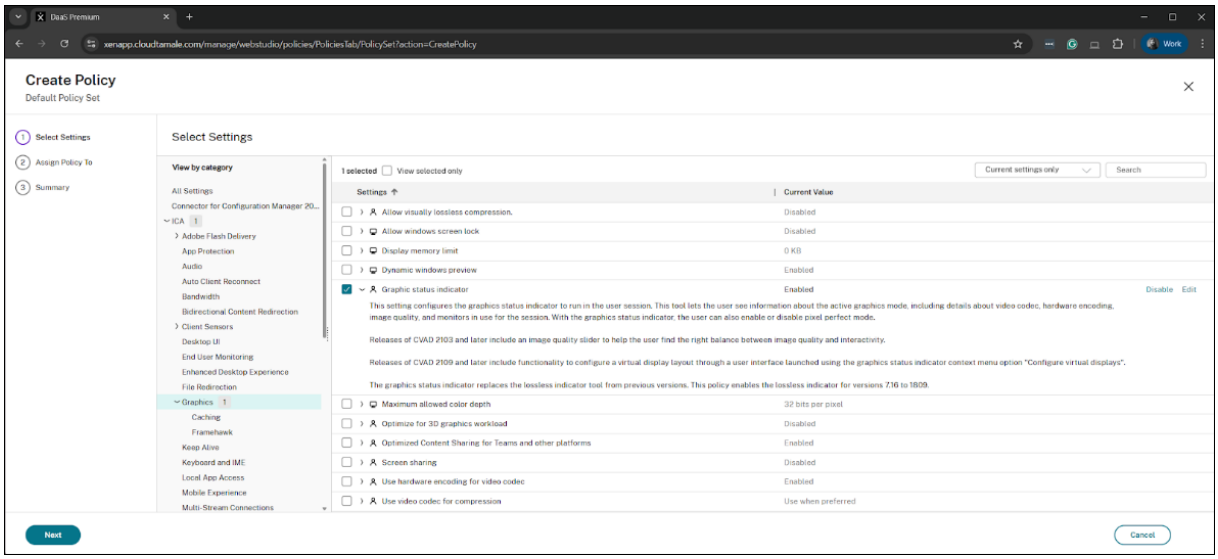
1. **Open** the Citrix Studio.
2. In the left-hand pane, navigate to **Policies**.
3. Click **Create Policy** or edit an existing policy that applies to the target users or delivery group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the policy configuration window, use the search bar to find the **Use video codec for compression** policy, which is located under the **ICA®** > **Graphics** category.
5. **Select** the policy and click **Edit**.
6. By default, this policy is set to **Use when preferred**. Uncheck the **Use default value** option.
7. Change the value to for actively changing regions.
8. Click **OK** to save the policy setting.
9. Ensure the policy is enabled, prioritized correctly, and applied to the appropriate **Delivery Group** or user filter.

> **Note:**
>
> If the Visual Quality policy is explicitly set to 'Build to Lossless' or 'Always Lossless', those settings will always take precedence and override the new Intelligent Build to Lossless feature. For best results, leave the "Visual Quality" policy and the "Use a video codec for compression" setting at their default values.

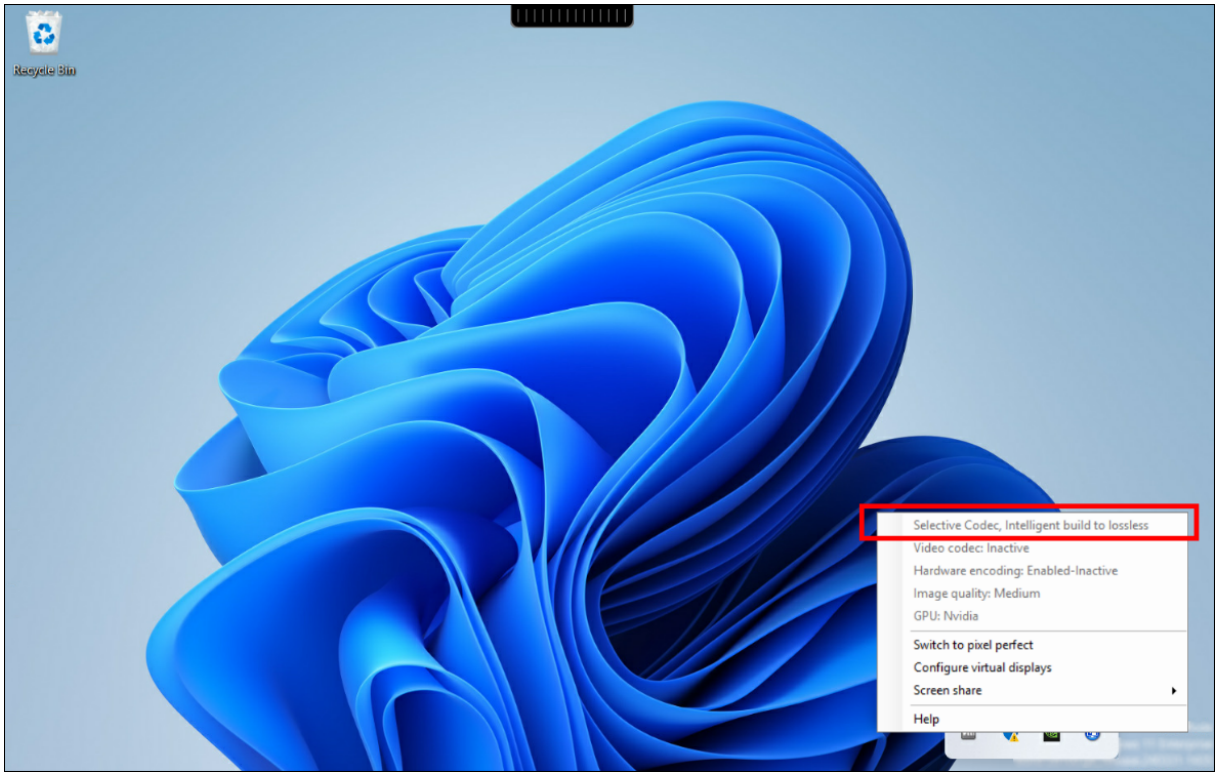
Monitoring Intelligent Build to Lossless



May 13, 2026

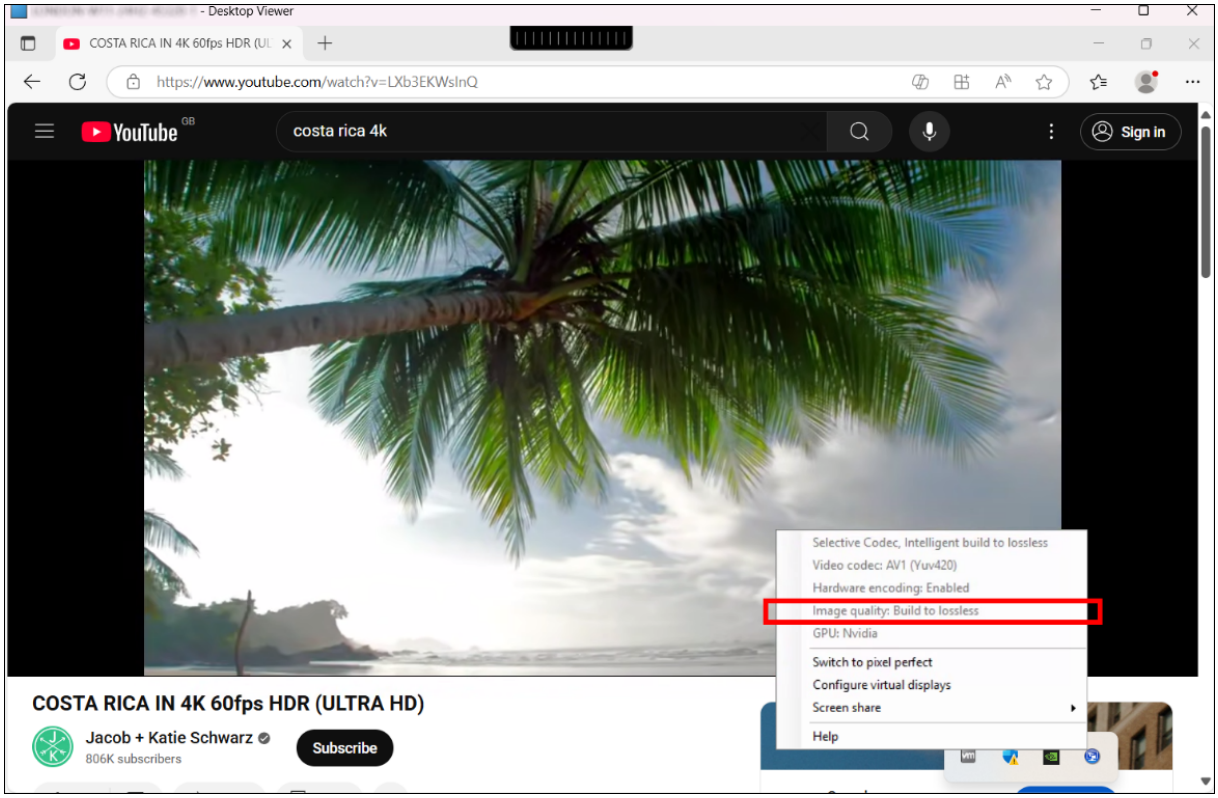
Intelligent Build to Lossless can be monitored with our Graphics Status Indicator from within a Citrix® session. Currently, the Graphics Status Indicator is not enabled by default.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



To enable the Graphics Status Indicator

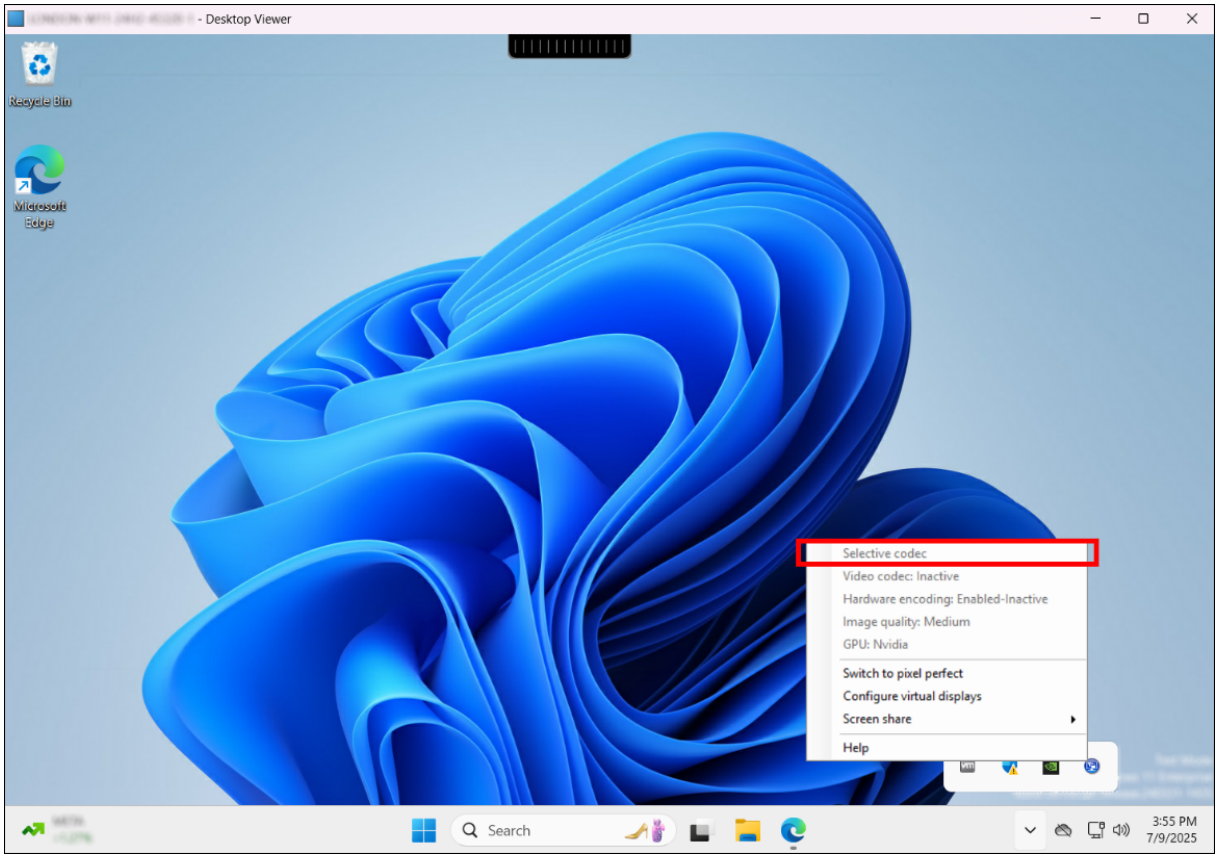
1. Open the Citrix Studio.
2. In the left-hand pane, navigate to **Policies**.
3. Click **Create Policy** or edit an existing policy that applies to the target users or delivery group.
4. In the policy configuration window, use the search bar to find the **Graphics Status Indicator** policy, which is located under the **ICA®** > **Graphics** category.
5. Select the **policy** and click **Enable**.
6. Click **OK** to save the policy setting.
7. Ensure the policy is enabled, prioritized correctly, and applied to the appropriate **Delivery Group** or user filter.



When Intelligent Build to Lossless is available in the user's session, but is not yet activated, the session will use regular Selective Encoding, and the Graphics Status Indicator will indicate this in the top row as 'Selective Codec, Intelligent Build to Lossless'. Because Intelligent Build to Lossless has not engaged yet, the 'Visual Quality'will list the currently configured Visual quality, e.g. Low, Medium or High.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When Thinwire detects the conditions favourable to enable Intelligent Build to Lossless on one or more connected monitors, the Graphics Status Indicator will change the Visual Quality in the fourth row to 'Build to Lossless'. This is the primary indicator that Intelligent Build to Lossless is active.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

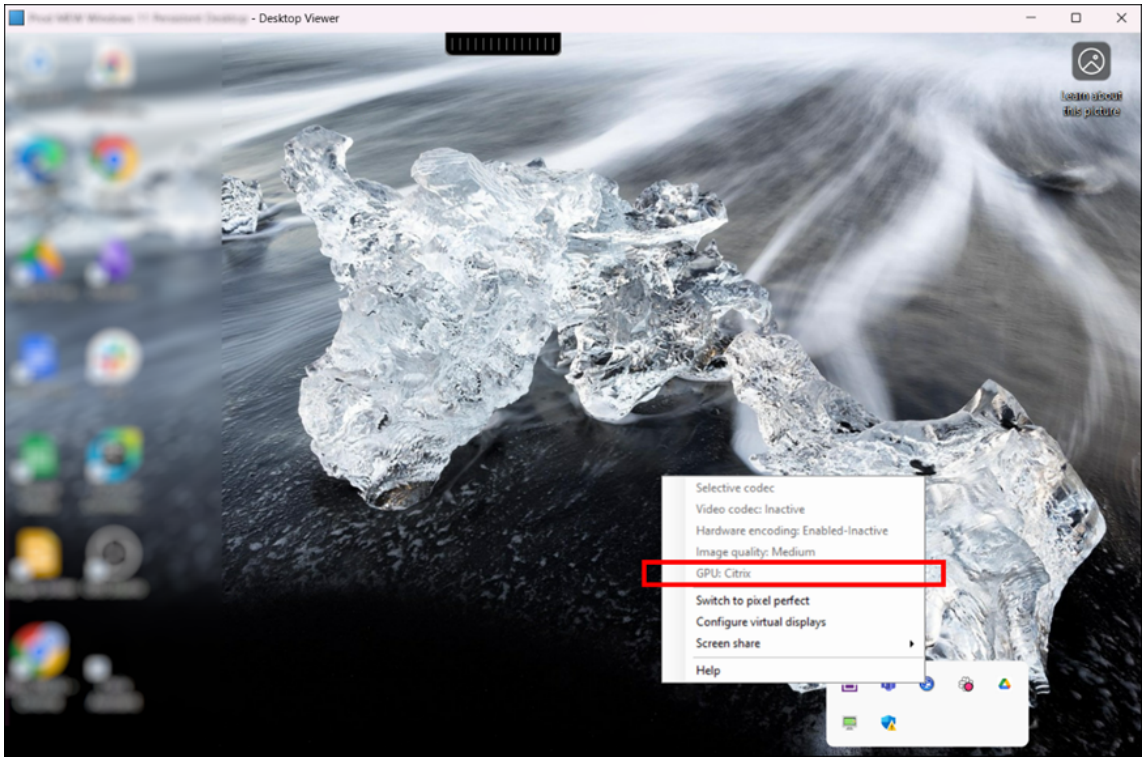
When Thinwire determines that the need for Build to Lossless has subsided, it will gradually build up to a pixel-perfect image and then revert back to regular Selective Encoding. The Graphic Status indicator will change the image quality back to the configured Visual Quality mode, e.g. Low, Medium or High.

If Intelligent Build to Lossless is not available, for example, when using a pre-2503 release VDA, a VDA without a server-side GPU, or if Intelligent Build to Lossless is explicitly disabled, the Graphics Status Indicator will show 'Selective Codec' in the top row instead:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more in-depth testing and monitoring of Intelligent Build to Lossless, you can also enable a per-monitor visual indicator that will show which monitor is in Build to Lossless mode.

This setting is intended for testing and troubleshooting only and should not be used in production. For more information, see the KB article to enable Intelligent Build to Lossless visual indicator.



Troubleshooting

May 13, 2026

If Intelligent Build to Lossless is not available in the session, please check the following requirements:

1. Make sure that the VDA is running version 2503 or later.
2. Make sure that a server-side GPU is available in the session. The easiest way to validate this is to use the Graphics Status Indicator and check if the GPU row displays the GPU vendor name, e.g. NVIDIA, Intel or AMD. If no GPU is present and available, the GPU vendor name will show 'Citrix' :

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Alternatively, you can use Citrix Monitor to view the presence of a server-side GPU for the VDA and troubleshoot GPU utilisation.

3. Validate that the "Use a video codec for compression"policy is either not set (and using the default value) or is set to 'Use when preferred'.

You can use the Policy Modelling Wizard to determine if the policy has been correctly applied to the session.

For more information on the DaaS side, see policy processes.

Overview

May 13, 2026

Using a videocodec for encoding the remote session has several advantages, it's fast and relatively lightweight. Video codecs are designed for and very good at moving images as is often the case with remote sessions.

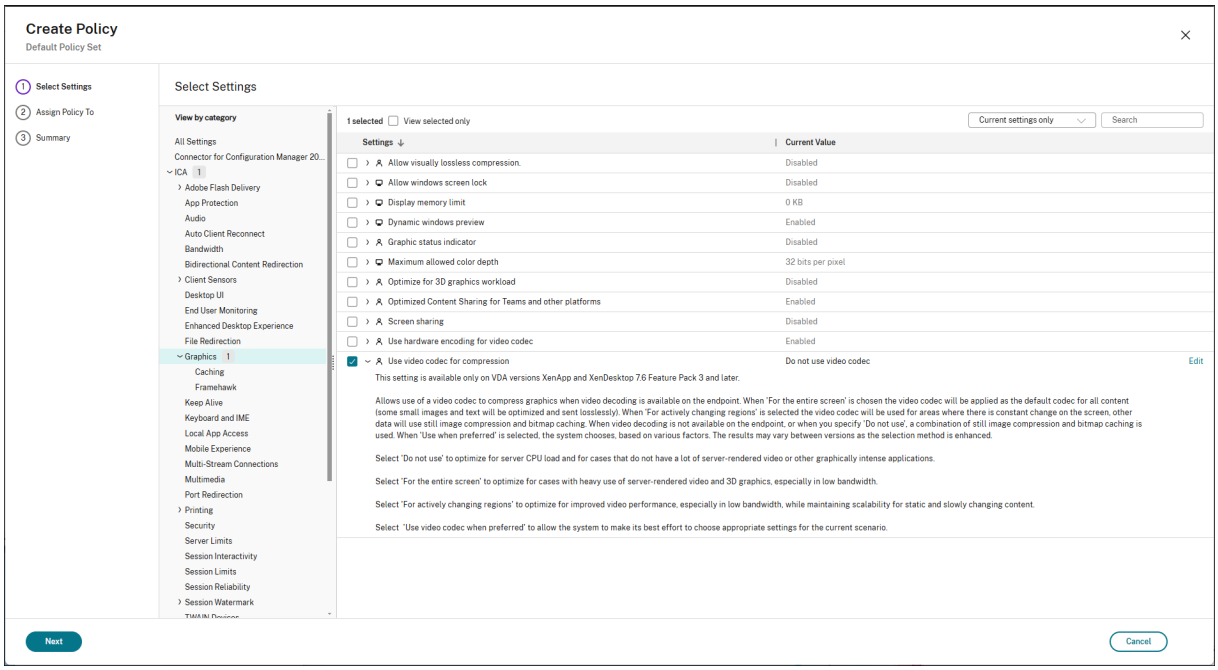
However, there might be scenarios where using a video codec might not be the best solution, like when image quality or colour accuracy is paramount. Our selective encoder will in most cases do a very good job to determine which parts of the screen benefit from encoding with a video codec, you can also force thinwire to never use a video codec for screen compression.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When Thinwire is set not to use a videocodec, Twinwire will only use JPEG and Lossless RLE for compression, maintaining the best image quality possible. Thinwire will use considerably more bandwidth than when using selective encoding or full screen encoding.

When to use do not use a video codec

May 13, 2026



In scenarios where image quality in combination with VDA scalability are the most important factors, you can consider using our Thinwire Full Screen Encoder mode. Not using a video codec can maximize VDA scalability as in general it has a lower CPU overhead than using a video codec for compression

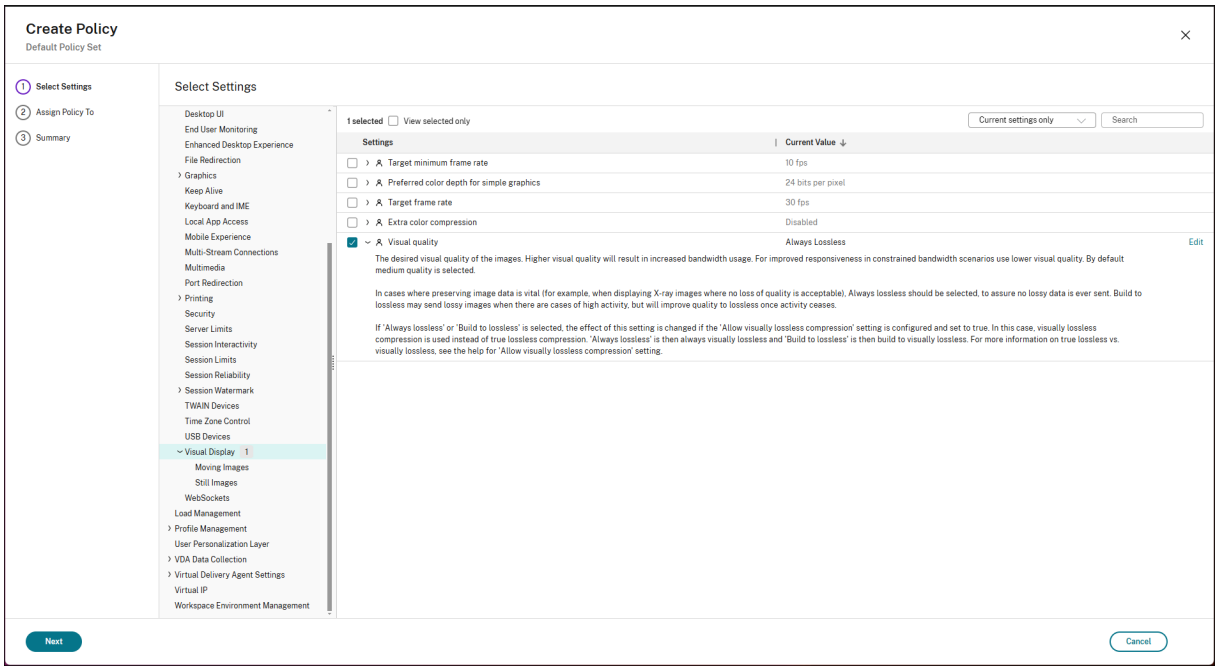
In most of these cases, however, our selective encoder, especially when paired with Build to lossless or intelligent build to lossless will deliver the same quality, better performance and lower bandwidth than when not using video codec compression.

Configuration

May 13, 2026

Set the Thinwire policy ‘Use a video codec for compression’to ‘Do not use a video codec’

© 1997–2026 Citrix Systems, Inc. All rights reserved.



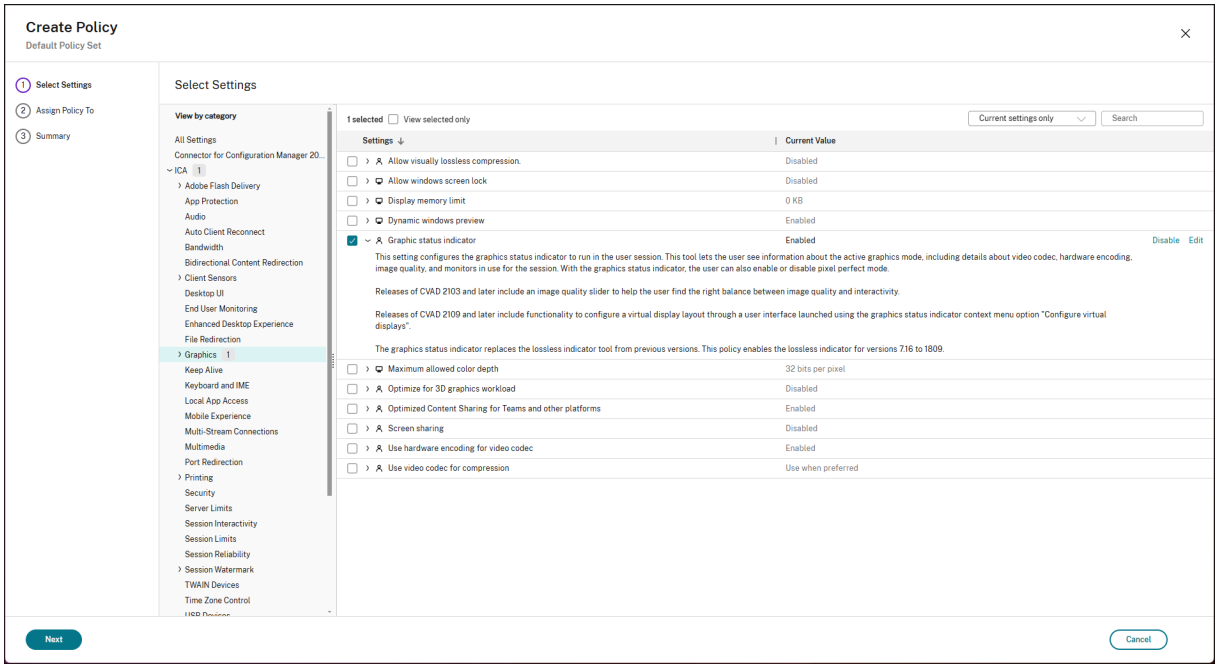
Always Lossless mode

May 13, 2026

Using Always lossless mode will ensure that no image lossy data is ever sent to the client. This means that every frame will only be encoded with a lossless codec and the quality will be pixel perfect.

The compression ratio of always lossless is not nearly as good as with using other modes and setting always lossless mode will use a significant amount of bandwidth. This can significantly impact interactivity when there is not enough bandwidth available.

Citrix® only recommends using this setting for specific use cases where lossless image quality is required such as medical imaging use cases.



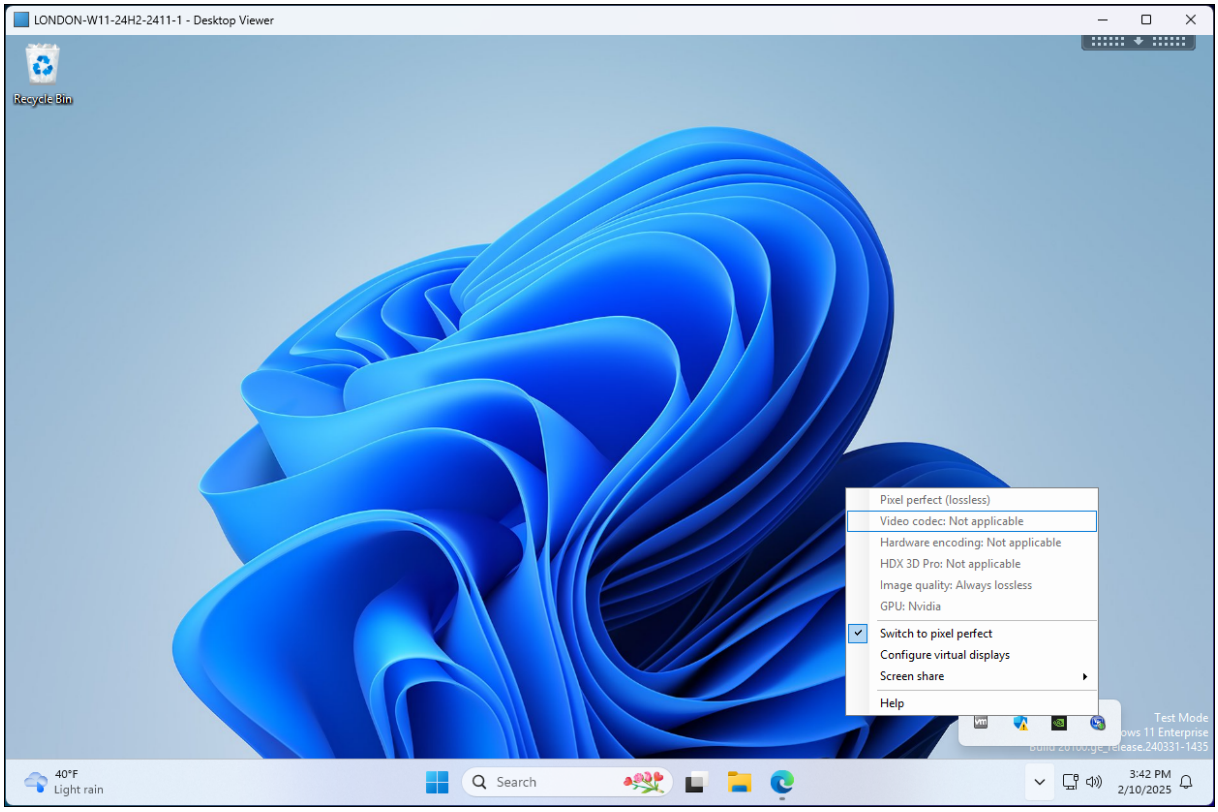
In addition to setting Always Lossless mode explicitly, end users can also toggle between Lossless mode in-session when the Graphics Status Indicator is available for them.

Currently the Graphics Status Indicator is not enabled by default.

To enable the Graphics Status Indicator:

1. Navigate to the graphics policy settings in Citrix Studio.
2. Locate the ‘Graphics Status Indicator”policy.
3. Set the policy to ‘Enabled’.
4. Apply and propagate the policy changes to your delivery groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

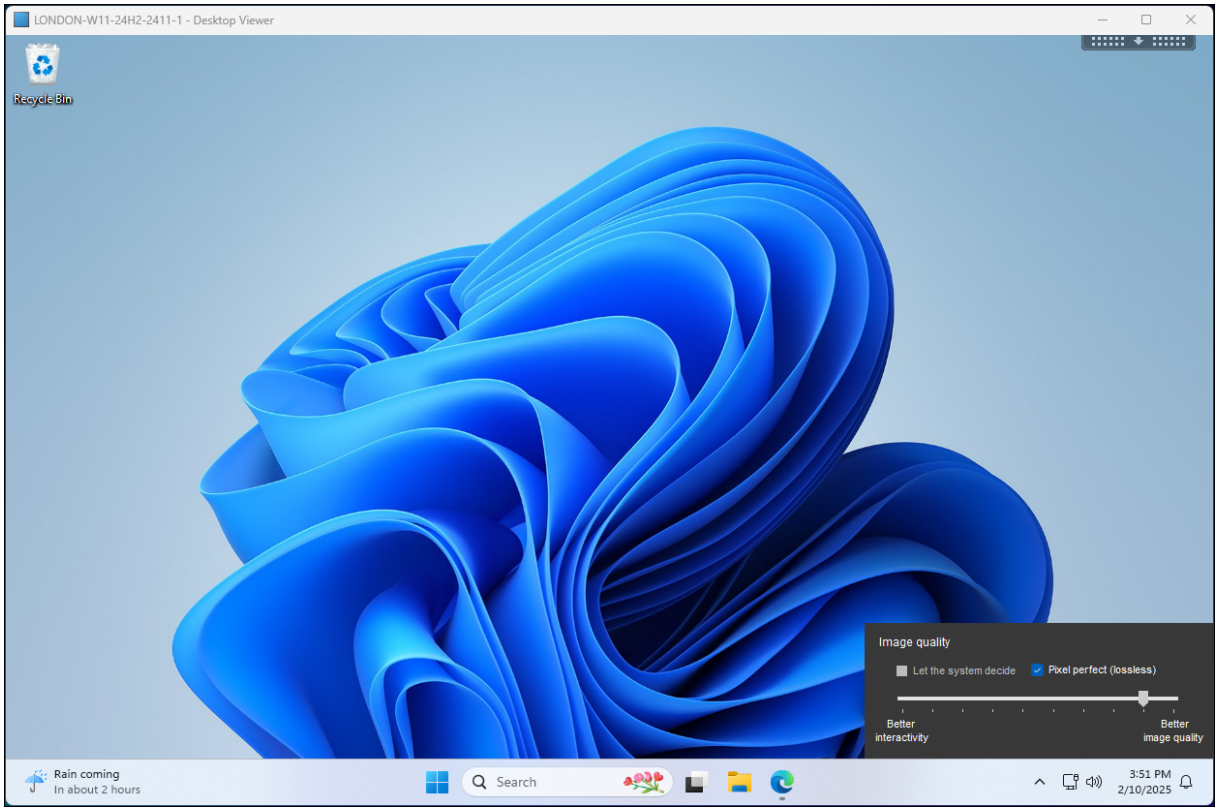


To Toggle Always Lossless mode as an end user:

1. Locate the Graphics Status Indicator in the tasktray.
2. Right-click on the Graphics Status 1. 1. Indicator in the tasktray of the VDA.
3. Select “Switch to Pixel Perfect”.

The Graphics Status indicator will show a green indicator in the icon to indicate that Lossless mode is enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Alternatively:

1. Locate the Graphics Status Indicator in the tasktray.
2. Click on the Graphics Status Indicator in the tasktray of the VDA.
3. Deselect “Let the system decide”.
4. Select “Pixel perfect (lossless)”.

The Graphics Status indicator will show a green indicator in the icon to indicate that Lossless mode is enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Color space

May 13, 2026

This is a new section to discuss the color space and color compression settings for YUV 4:2:0 and YUV 4:4:4.

Overview

The color space selected will determine if and what color compression mode (also known as chroma subsampling) will be used by HDX™ Graphics. By default, HDX Graphics uses YUV 4:2:0 chroma subsampling.

Chroma subsampling is a technique used to reduce the bandwidth needed to transmit video data from the VDA to the client. It works by reducing the amount of color information that is transmitted, since the human eye is more sensitive to changes in brightness (luminance) than to changes in color (chrominance).

Different chroma subsampling schemes exist, denoted by ratios like 4:2:0, 4:2:2, and 4:4:4. These ratios represent the amount of chrominance information sampled relative to the luminance informa-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

tion.

4:4:4 - No chroma subsampling. All color information is retained. This provides the highest image quality and color accuracy, but requires the most bandwidth.

4:2:0 - Chrominance information is subsampled both horizontally and vertically by a factor of 2. This offers the greatest bandwidth reduction but may result in noticeable color artifacts.

Citrix HDX graphics utilizes chroma subsampling to optimize bandwidth usage in virtual desktop environments. By default, HDX uses YUV 4:2:0 for encoding screen content. This provides a good balance between image quality and bandwidth efficiency for typical office productivity applications/ for the majority of the use cases.

When the entire screen is encoded with a video codec (by using the full screen encoder), color compression can degrade high-contrast details like text, making them fuzzy and harder to read.

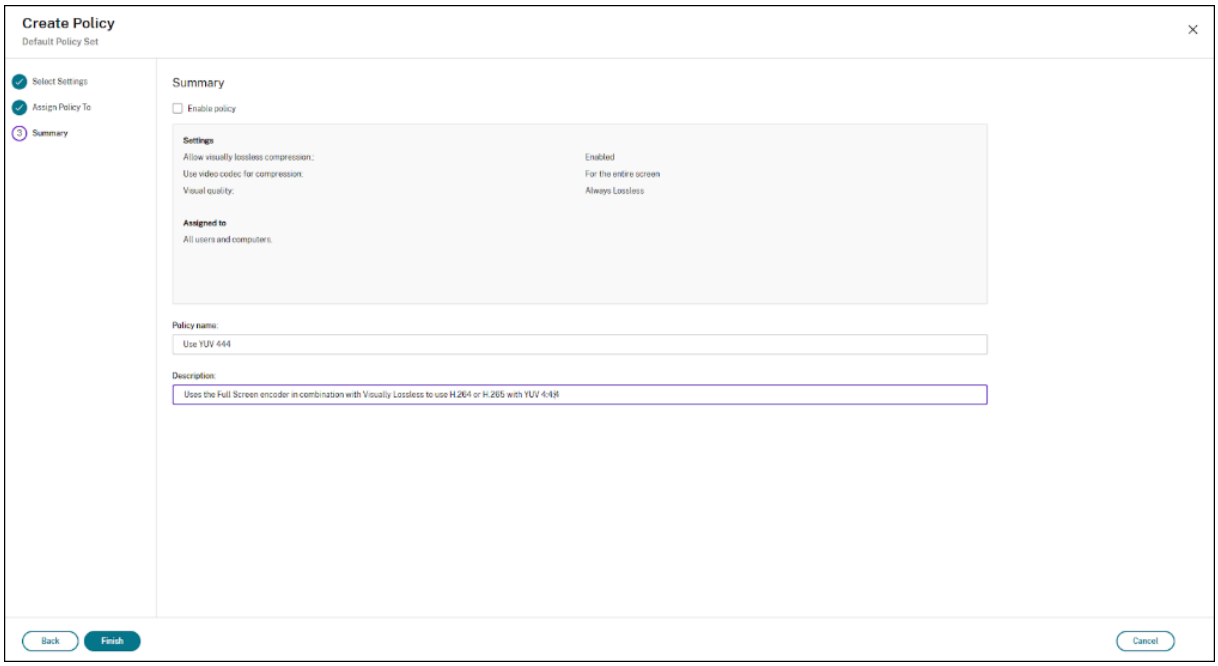
For scenarios where color accuracy is paramount, such as medical imaging, video editing, or CAD/CAM applications, HDX also supports YUV 4:4:4.

This ensures that no color information is lost during encoding, delivering the highest possible image fidelity and color accuracy. Please note that YUV 4:4:4 uses significantly more bandwidth than YUV 4:2:0.

Please validate the bandwidth usage in a test scenario before enabling YUV 4:4:4 in production environments to avoid bandwidth congestion related issues.

Configuration

May 13, 2026



To use the higher image quality and color accuracy with YUV 4:4:4, Enabling YUV 4:4:4 involves adjusting several HDX™ policy settings within Citrix Studio:

Use Video Codec for Compression: Set this to "For the Entire Screen"to apply the video codec (and thus the chosen chroma subsampling) to the entire screen content.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Visual Quality: Select "Build to Lossless"or "Always Lossless"to prioritize image quality over bandwidth consumption.

Allow Visually Lossless: Enable this policy to allow for visually lossless compression.

By default, Thinwire uses H.264 YUV 4:4:4 and if compatible hardware is detected on the client, thinwire will automatically use H.265 YUV 4:4:4 hardware decoding.

With H.265 YUV 4:4:4, internal testing shows a 4X increase in Frames per Second (FPS) compared to H.264 4:4:4 and a 2.5X reduction in size per frame compared to H.264, due to H265's superior efficiency.

Requirements

May 13, 2026

For YUV 4:4:4 with H.264 there are no additional requirements. H.265 YUV 4:4:4 has the following client requirements:

- Citrix Workspace™ App for Windows 2305 or newer
- Enable H.265 support
- Client GPU that supports H.265 4:4:4 decoding:
  - NVIDIA Turing or newer
  - Intel 10th Gen or newer

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> At the moment of writing, AMD does not support H.265 4:4:4 decoding.

H.265 YUV 4:4:4 will automatically be used when the VDA is configured to use YUV 4:4:4 with automatic video codec selection. See the Automatic Video Codec documentation for more information.

High resolution displays

May 13, 2026

Customers deploying high-resolution displays (6K, 8K, and equivalent megapixel counts) with Citrix Virtual Apps and Desktops™, might experience issues with performance or issues such as mouse tracking inconsistencies and display scaling and DPI-related problems.

Traditional resolutions for typical office monitors are 4K, 6k or 8K resolutions where the 'K' notation is specifying the horizontal resolution.

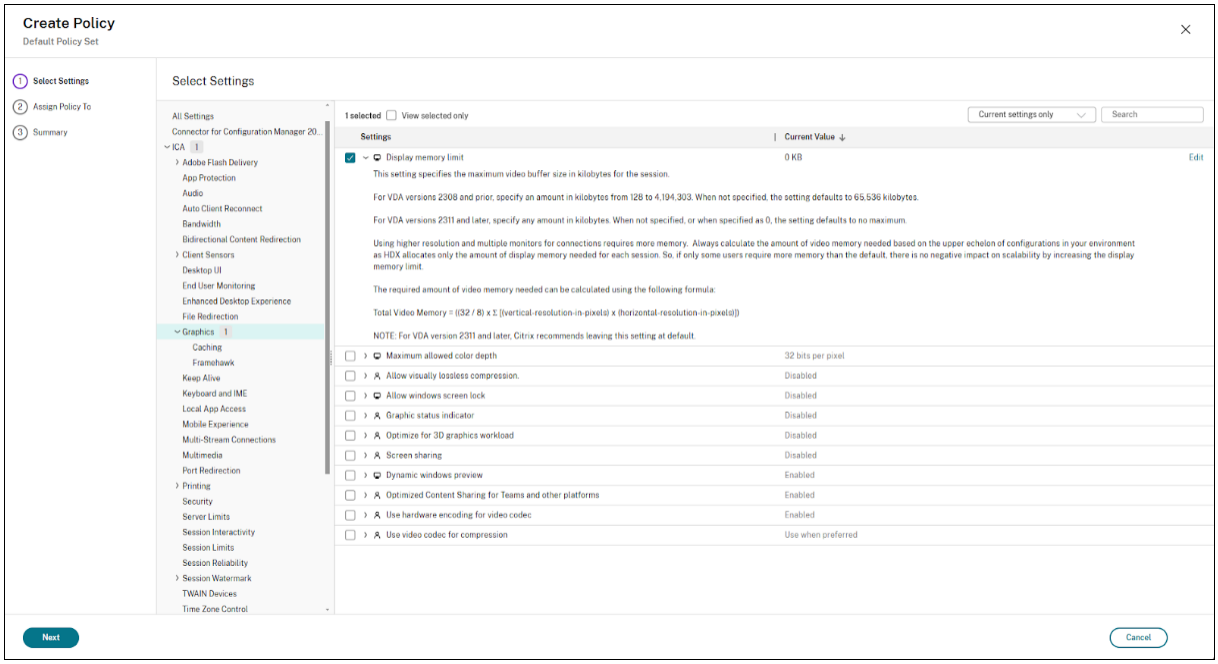
Examples of 6K displays are the Apple Pro Display XDR and Dell UltraSharp U3224KB, with a resolution of 6016×3384, and 6144×3456.

Currently there are only a handful of 8K monitors available, one such example is the Dell UltraSharp UP3218K with a resolution of 7680 x 4320.

Barco lists their monitors with a MP or Megapixel count instead of their resolution. The newest Barco monitors are 32MP monitors with an advertised resolution of 6848 x 4560.

Citrix® supports up to 8 monitors, depending on the hardware resources. Depending on the GPU used, there can be other hardware restrictions on this maximum.

To optimize performance and mitigate potential issues with high-resolution displays, Citrix recommends using CVAD 2402.



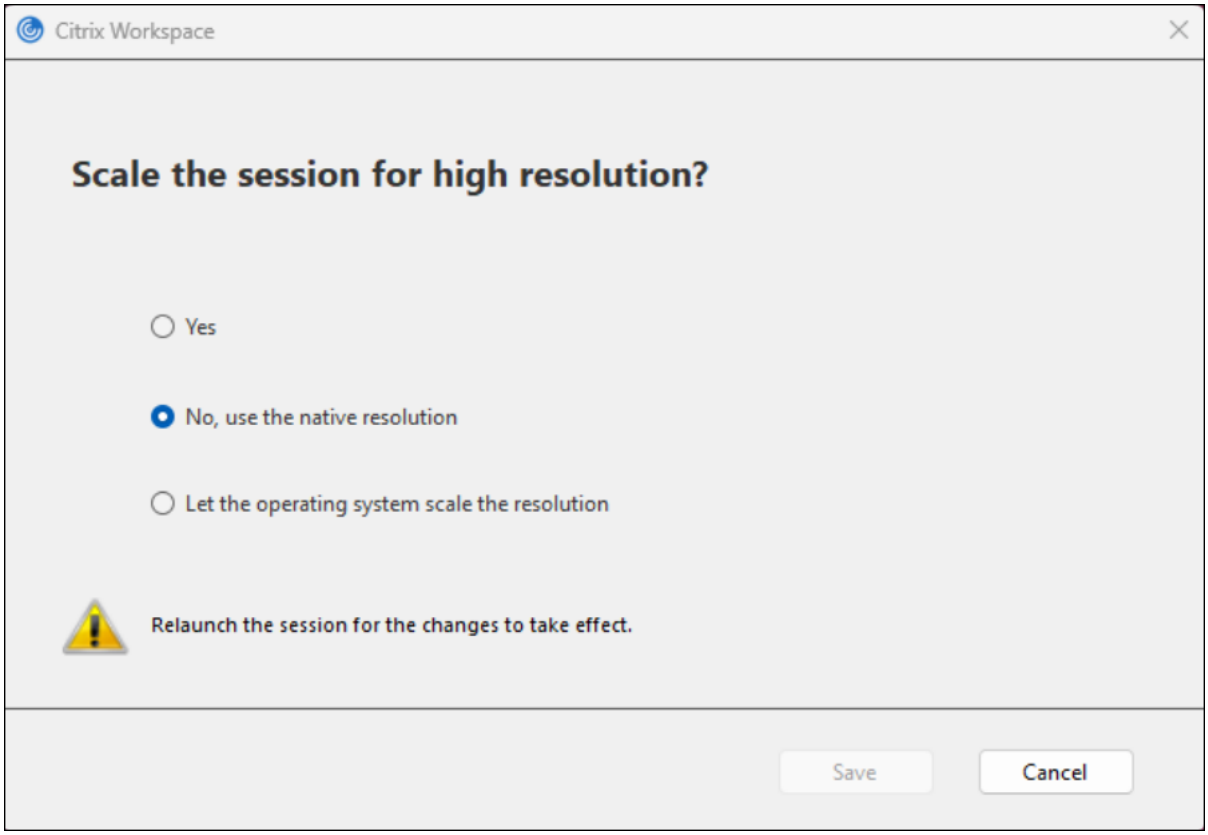
VDA versions 2402 and later

For VDA 2402 and later, leave the 'Display Memory Limit' policy to the default of 0, meaning no Display memory limit. This allows the VDA to dynamically allocate necessary display memory.

Older VDA Versions (Prior to 2402)

If upgrading to CVAD 2402 or later is not feasible, configure the "Display memory limit" policy to its maximum value of 4,194,303 KB. This provides the VDA with the maximum available display memory.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



DPI scaling

May 13, 2026

CWA for Windows will match display resolution and DPI scale settings of the local Windows client to the Citrix® session. This is the recommended mode for all cases that meet the following system requirements:

- Citrix Virtual Apps and Desktops™ 2203 LTSR or newer
- Multi-session OS VDAs running on Windows Server 2019 or newer
- Single-session OS VDAs running on Windows 10 or newer
- CWA for Windows 2203 LTSR or newer

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix recommends using Citrix Workspace™ App version 2402 or later.

For more information, please refer to the Citrix Workspace documentation.

GPU

May 13, 2026

For high resolution displays, please ensure the GPUs used (both on the VDA and endpoint) meet the requirements for driving high-resolution displays. Refer to your GPU vendor's documentation for supported resolutions and refresh rates.

When using a server side GPU, Citrix® recommends the following minimal GPU frame buffer sizes:

Monitors and resolution	Recommended Frame buffer size
1 x 4K	2GB
4 x 1080p	2GB
2 x 4K	4GB

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitors and resolution	Recommended Frame buffer size
1 x 6K	4GB
1 x 8K	8GB
2 x 6K	8GB
4 x 4K	8GB

> **Note:**
>
> These are the minimum recommended frame buffer sizes for HDX™ Graphics Encoding. Please consult the application frame buffer requirements and factor these into your sizing as well.

Refer to the NVIDIA sizing guide for more information about Frame buffer sizing for NVDIA GPUs.

Refer to the Intel Virtual Desktop Infrastructure (VDI) Performance on Intel® Data Center GPU Flex Series Whitepaper for more information about GPU Sizing for Intel GPUs.

Refer here for more information.

Performance and scalability considerations

May 13, 2026

Higher resolutions and the number of monitors directly impacts session performance and server scalability.

Bandwidth consumption will increase with higher resolutions and the multiple monitors in use. Bandwidth constraints could limit frame rates and reduce image quality affecting session interactivity and user experience as a result.

The endpoint device must have adequate hardware resources available to support the desired display configuration. This could mean having enough CPU resources and in some cases a GPU that can handle the graphics workload.

Known issues

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

There is a known issue with NVIDIA GPUs in combination with the Full Screen video codec, H.265 encoding and resolutions higher than 4096x4096.

Refer here for more information.

As a work around, use the default **Use video codec for compression"graphics policy setting or explicitly set the policy to either "Let the system decide"or for "Actively changing regions**.

Loss tolerant mode for graphics

May 13, 2026

Loss Tolerant Mode for Graphics enhances the user experience for interactive sessions on networks with high packet loss and latency.

It ensures the session remains responsive by dynamically adjusting the graphics data transmission strategy. Loss Tolerant Mode for Graphics is enabled by default.

When to use loss tolerant mode for graphics

May 13, 2026

When users connect to virtual apps and desktops over networks with challenging network conditions, like high packet loss and latency, their session interactivity and experience can suffer significantly.

This could result in a degraded user experience, characterised by lag and visual stuttering, which negatively impacts productivity and user satisfaction.

To mitigate the effects of these poor network conditions, Loss Tolerant Mode for Graphics automatically switches the Citrix® graphics encoder to a more aggressive packet delivery mechanism when packet loss and latency exceed the configured thresholds. This mode proactively increases bandwidth usage, proportional to the level of packet loss, to ensure data is delivered effectively and the session remains interactive.

Loss Tolerant mode for Graphics has the following benefits:

- **Improved User Experience:** Provides a smoother and more responsive graphics experience on challenging networks.
- **Seamless Operation:** The mode automatically activates and deactivates based on real-time network conditions, without the need for user intervention.
- **Maintained Productivity:** Users can continue to work effectively without being hindered by poor network quality.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

System Requirements

May 13, 2026

- Citrix Virtual Delivery Agent (VDA) version 2311 or later
- Citrix Workspace™ app for Windows 2311 or later.

> **Note:**
>
> Both the **HDX™ Adaptive Transport (EDT)** and **loss tolerant mode** for graphics policies must be enabled for this feature to work.

Important requirement considerations

Bandwidth Threshold

Starting with version CVAD 2507, a minimum bandwidth of 30 Mbps is required for Loss Tolerant Mode for Graphics to activate. Even if the latency and packet loss thresholds are met, the feature will not engage if the available in-session bandwidth is below 30 Mbps. This bandwidth threshold is a hardcoded value and cannot be configured.

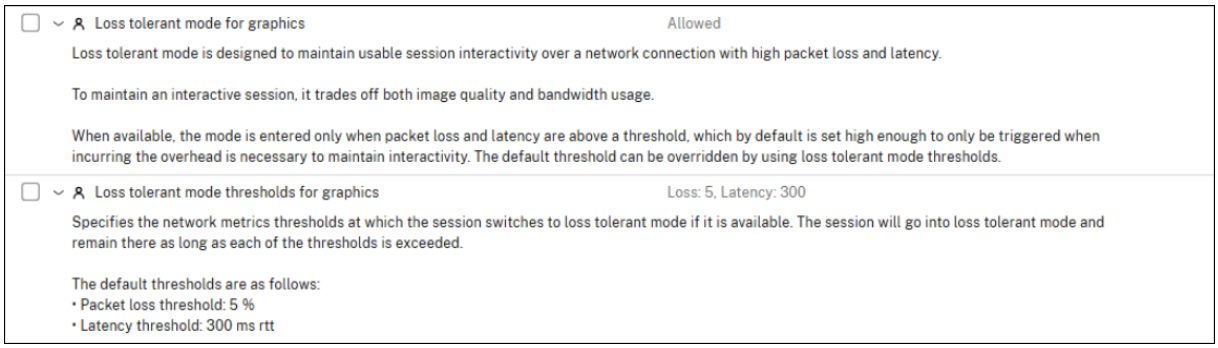
Configuration

May 13, 2026

The feature is managed through Citrix® policies in Web Studio or Group Policy Management.

Loss tolerant mode for Graphics is enabled by default:

- Policy: Loss tolerant mode for graphics
- Default: Enabled



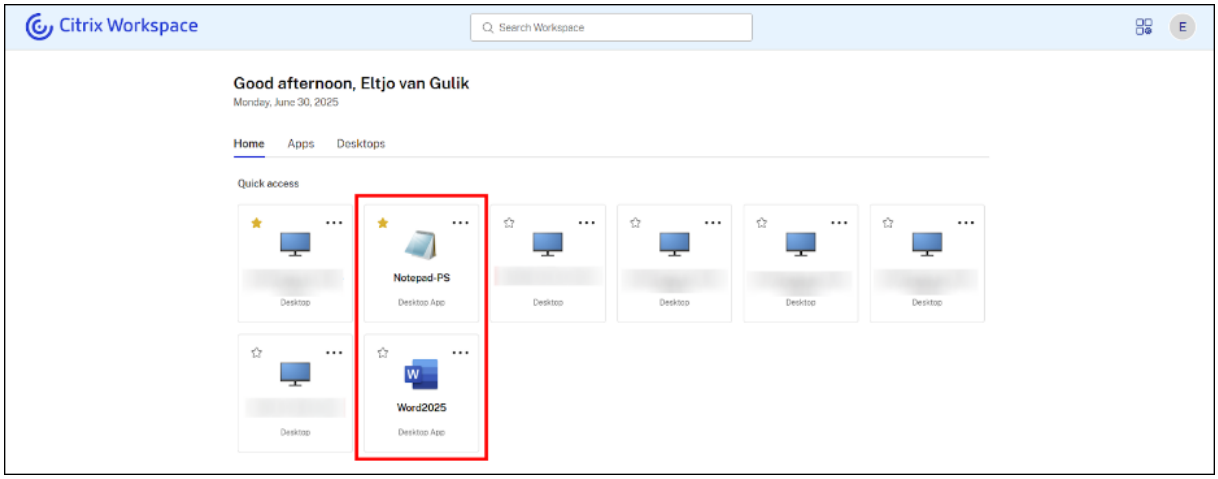
Set this policy to **Disabled** to turn off the loss tolerant mode for graphics feature.

To configure Loss Tolerant mode for Graphics thresholds:

- Policy: Loss tolerant mode thresholds for graphics
- Default Values:
    - Packet loss: 5%
    - Latency: 300 ms

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This policy allows you to adjust the network condition thresholds that trigger loss tolerant mode for Graphics. The mode will activate when both the packet loss and latency values are met or exceeded, and the available bandwidth is at least 30 Mbps.



Seamless

May 13, 2026

Citrix Published Applications are a central feature of Citrix Virtual Apps and Desktops. They enable customers to deliver individual Windows or Linux applications directly to users without requiring a full desktop.

This removes the need for users to install and manage applications locally, simplifying their workflow and easing the burden on IT. Instead of interacting with a full remote desktop environment, users interact directly with the application windows, creating a seamless and streamlined experience.

The technology behind published applications, also known as seamless applications, enables applications to be delivered to users so that they appear to be running directly on the user's local device, even though they are actually operating on a remote server. This is accomplished by concealing the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Windows Server desktop where the applications are hosted and presenting the applications to the user seamlessly.

Seamless applications are available from both Windows VDA and Linux VDAs. For Windows VDAs, seamless applications support TSVDA, running Microsoft Windows Server Operating Systems, as well as WSVDA, running Microsoft Windows 10 or Windows 11.

Seamless applications offer numerous benefits, including:

- **Improved user experience:** Users can access their applications from any device without worrying about the underlying operating system.
- **Increased security:** Applications are run on a remote server, which helps protect them from malware and other threats.
- **Reduced IT costs:** Seamless applications will help to reduce IT costs by simplifying application management and deployment.
- **Centralized Management:** Applications can be managed and updated in a central location, simplifying IT administration and ensuring consistency across the organization. This reduces the time and effort required to deploy patches, updates, and new applications.
- **Application Compatibility:** By running applications on a standardized server environment, you can mitigate compatibility issues that may arise from different client operating systems or hardware configurations.
- **Streamlined Application Delivery:** Citrix leverages advanced technologies like HDX™ to deliver a rich, interactive experience to users, even over limited bandwidth connections for both published desktops as well as published applications.
- **Heterogeneous application support:** Admins can publish Linux applications alongside Windows applications, allowing seamless access to application from both platforms.

Applications

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Introduction

If your deployment uses only delivery groups (and not application groups), you add applications to the delivery groups. If you also have application groups, generally you add applications to the application groups instead. This guidance provides easier administration. An application must always belong to at least one delivery group or application group.

In the Add Applications wizard, you can select one or more delivery groups, or one or more application groups, but not both. Although you can later change an application's group association (for example, moving an application from an application group to a delivery group), best practice discourages adding that complexity. Keep your applications in one type of group.

When you associate an application with more than one group, a visibility issue can occur if you do not have sufficient permission to view the application in all of those groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the groups with which the application is associated.

If you publish two applications with the same name (perhaps from different groups) to the same users, change the `Application name (for user)` property in Web Studio. Otherwise, users see duplicate names in Citrix Workspace™ app.

You can change an application's properties (settings) when you add it, or later. You can also change the application folder where the application is placed, either when you add the application, or later.

For details, see:

- Create delivery groups
- Create application groups
- Tags

Add applications

You can add applications when you create a delivery group or application group. Those procedures are detailed in Create delivery groups and Create application groups. The following procedure describes how to add applications after you create a group.

Good to know:

- You cannot add applications to Remote PC Access delivery groups.
- You cannot use the Add Application wizard to remove applications from delivery groups or application groups. That is a separate operation.

To add one or more applications:

1. Select **Applications** in the left pane and then select **Add Applications** in the action bar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. The Add Applications wizard launches with an **Introduction** page, which you can remove from future launches of this wizard.
3. The wizard guides you through the **Groups**, **Applications**, and **Summary** pages. When you are done with each page, click **Next** until you reach the **Summary** page.

Alternatives to step 1 if you want to add applications to a single delivery group or application group:

- **To add applications to only one delivery group:** In step 1, select **Delivery Groups** in the Web Studio left pane, select a delivery group in the middle pane, and then select **Add Applications** in the action bar. The wizard does not display the **Groups** page.
- **To add applications to only one application group:** In step 1, select **Applications** in the Web Studio left pane, select an application group in the middle pane, and then select the **Add Applications** entry under the application group's name in the action bar. The wizard does not display the **Groups** page.

Groups page

This page lists all the delivery groups in the site. If you have also created application groups, the page lists the application groups and delivery groups. You can choose from either group, but not from both groups. In other words, you cannot add applications to an application group and a delivery group at the same time. Generally, if you are using application groups, add applications to application groups, rather than delivery groups.

When adding an application, select the check box next to at least one delivery group (or application group, if available). Every application must always be associated with at least one group.

Applications page

Click **Add** to display the application sources.

- **From Start menu:** Applications that are discovered on a machine in the selected delivery groups. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add, and then click **OK**.

  This source cannot be selected if you (1) selected application groups with no associated delivery groups, (2) selected application groups with associated delivery groups that contain no machines, or (3) selected a delivery group containing no machines.

- **Manually:** Applications located on a VDA in the delivery group or elsewhere in your network. Selecting this source opens a new page where you specify an application to add in the following ways:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - Type the path to the executable, working directory, optional command line arguments, and display names for administrators and users.
  - Select an application from a VDA in the delivery group. To do so, click **Browse**, enter credentials for accessing the VDA, wait to be connected to the VDA, and then select an application from the VDA. The properties of the selected application automatically populate fields on the page.

- **Existing:** Applications previously added to the site. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add and then click **OK**.

  This source cannot be selected If the site has no applications.

- **Application packages:** Applications in App-V, MSIX, MSIX app attach, or FlexApp application packages. When you select this source, the **Add Applications from Packages** page launches. Select an application package source, select the applications you want to add from the resulting display, and then select **OK**. For more information, see Deploy and deliver App packages.

- **Application Group**: Application groups. When you select this source, a new page launches with a list of application groups. (Although the display also lists the applications in each group, you can select only the group, not individual applications.) All current and future applications in the selected groups are added. Select the check boxes of application groups to add, and then click **OK**.

  This source cannot be selected if (1) there are no application groups, or (2) if the selected delivery groups do not support application groups (for example, delivery groups with statically assigned machines).

As noted in the table, some sources in the **Add** list cannot be selected if there is no valid source of that type. Sources that are incompatible (for example, you cannot add application groups to application groups) are not included in the list. Applications that are already added to the groups you chose cannot be selected.

You can change an application's properties (settings) from this page, or later.

By default, added applications are placed in the application folder named `Applications`. You can change the application from this page, or later. If you try to add an application and one with the same name exists in the same folder, you are prompted to rename the application you're adding. You can accept the new name offered, or decline and then rename the application or select a different folder. For example, if `app` already exists in the **Applications** folder, and you attempt to add another application named `app` to that folder, the new name `app_1` is offered.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Summary page

If you are adding 10 or fewer applications, their names are listed in **Applications to add**. If you are adding more than 10 applications, the total number is specified.

Review the summary information and then click **Finish**.

Change an application's group association

After adding an application, you can change the delivery groups and application groups with which the application is associated.

You can drag an application to an additional group. This is an alternative to using commands in the action bar.

If an application is associated with more than one delivery group, either using an application group or directly, group priority can be used to specify the order in which multiple groups are evaluated. Groups can be excluded from consideration based on factors like access policy, user lists, or smart access tags, and the specific machine chosen from the group can be affected by factors like zone preference, and launch readiness, and any tag restrictions. By default, all groups are priority 0 (the highest). If the delivery groups have equal priority, then the least loaded delivery group is selected for launching the application. The vertical load balancing is not considered in this case.

An application can be associated with delivery groups containing shared (not private) machines that can deliver applications. You can also select delivery groups containing shared machines that deliver desktops only, if (1) the delivery group contains shared machines and was created with a XenDesktop 7.x version earlier than 7.9, and (2) you have `Edit delivery group` permission. The delivery group type is automatically converted to `desktops and applications` when the properties dialog is committed.

1. Sign in to Web Studio, select **Applications** in the left pane, and then select the application.
2. Select **Properties** in the action bar.
3. Select the **Groups** page.

    - To add a group, click **Add** and select **Application Groups** or **Delivery Groups**. (If you have not created any application groups, the only entry is **Delivery Groups**.) Then select one or more available groups. Groups that are incompatible with the application, or that are already associated with the application, cannot be selected.
    - To remove a group, select one or more groups and then click **Remove**. If removing group association would result in the application no longer being associated with any group, you are alerted that the application will be deleted.
    - To change the priority of a group, select the group and then click **Edit Priority**. Select a priority value and then click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. When you are finished, click **Apply** to apply the changes and leave the window open, or click **OK** to apply the changes and close the window.

Duplicate, enable or disable, rename, or delete an application

The following actions are available:

- **Duplicate:** You might want to duplicate an application to create a different version with different parameters or properties. When you duplicate an application, it is automatically renamed with a unique suffix and placed next to the original. You might also want to duplicate an application and then add it to a different group. (After duplicating, the easiest way to move an application is dragging it.)
- **Enable or disable:** Enabling and disabling an application is a different action than enabling and disabling a delivery group or application group.
- **Rename:** You can rename only one application at a time. If you try to rename an application and one with the same name exists in the same folder or group, you are prompted to specify a different name.
- **Delete:** Deleting an application removes it from the delivery groups and application groups with which it was associated, but not from the source that was used to add the application originally. Deleting an application is a different action than removing it from a delivery group or application group.

To duplicate, enable, disable, rename, or delete an application:

1. Select **Applications** in the left pane.
2. Select one or more applications in the middle pane and then select the appropriate task in the action bar.
3. Confirm the action, when prompted.

Remove applications from a delivery group

An application must be associated (belong) with at least one delivery group or application group. If you attempt to remove an application from a delivery group that would remove that application's association with any delivery group or application group, you are notified that the application will be deleted if you continue. When that happens, if you want to deliver that application, you must add it again from a valid source.

1. Select **Delivery Groups** in the left pane.
2. Select a delivery group. In the lower middle pane, on the **Applications** tab, select the application you want to remove.
3. Select **Remove Application** from the action bar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Confirm the removal.

Remove applications from an application group

An application must belong to at least one delivery group or application group. If you attempt to remove an application from an application group that will result in that application no longer belonging to any group, you are notified that the application will be deleted if you continue. When that happens, if you want to deliver that application, you must add it again from a valid source.

1. Select **Applications** in the left pane.
2. Select the application group in the middle pane, and then select one or more applications.
3. Select **Remove from Application Group** in the action bar.
4. Confirm the removal.

Change application properties

You can change the properties of only one application at a time.

To change the properties of an application:

1. Select **Applications** in the left pane.
2. Select an application and then select **Edit Application Properties** in the action bar.
3. Select the page containing the property you want to change.
4. When you are finished, click **Apply** to apply any changes you made and keep the window open, or click **OK** to apply changes and close the window.

In the following list, the page is shown in parentheses.

Property	Page
Category/folder where application appears in Citrix Workspace app	Delivery
Command line arguments; see Pass parameters to published applications	Location
Delivery groups and application groups where the application is available	Groups
Description	Identification
File name extensions and file type association: which extensions the application opens automatically	File Type Association
Icon	Delivery

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Property	Page
Keywords for StoreFront™	Identification
Limits; see Configure application limits	Delivery
Name: Names seen by the user and by the administrator	Identification
Path to executable; see Pass parameters to published applications	Location
Shortcut on user's desktop: enable or disable	Delivery
Visibility: Limits which users can see the application in Citrix Workspace app. An invisible application can still be started. To make it unavailable and invisible, add it to a different group.	Limit Visibility
Working directory	Location

Application changes might not take effect for current application users until they log off from their sessions.

Configure application limits

Configure application limits to help manage application use. For example, you can use application limits to manage the number of users accessing an application simultaneously. Similarly, application limits can be used to manage the number of simultaneous instances of resource-intensive applications. That limit can help maintain server performance and prevent deterioration in service.

This feature limits the number of application launches that are brokered by the Controller (for example, from Citrix Workspace app and StoreFront), and not the number of running applications that can be launched by other methods. This means that application limits assist administrators when managing concurrent usage, but do not provide enforcement in all scenarios. For example, application limits cannot be applied when the Controller is in outage mode.

By default, there is no limit on how many application instances can run at the same time. There are several application limit settings. You can configure any or all of them.

- The maximum number of concurrent instances of the application by all users in the delivery group.
- One instance of the application per user in the delivery group.
- The maximum number of concurrent instances of the application per machine (PowerShell only).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If a limit is configured, an error message is generated when a user attempts to launch an instance of the application that will exceed the configured limit. If more than one limit is configured, an error is reported when the first limit is reached.

Examples using application limits:

- **Maximum number of simultaneous instances limit:** In a delivery group, you configure the maximum number of simultaneous instances of application `Alpha` to 15. Later, users in that delivery group have 15 instances of that application running at the same time. If any user in that delivery group now attempts to launch `Alpha`, an error message is generated. `Alpha` is not launched because it would exceed the configured simultaneous application instance limit (15).
- **One-instance-per-user application limit:** In another delivery group, you enable the one-instance-per-user option for application `Beta`. User Tony launches application `Beta` successfully. Later in the day, while that application is still running in Tony's session, he attempts to launch another instance of `Beta`. An error message is generated and `Beta` is not launched because it would exceed the one-instance-per-user limit.
- **Maximum number of simultaneous instances and one-instance-per-user limits:** In another delivery group, you configure a maximum number of simultaneous instances of 10 and enable the one-instance-per-user option for application `Delta`. Later, when 10 users in that delivery group each have an instance of `Delta` running, any other user in that delivery group who tries to launch `Delta` will receive an error message. `Delta` is not launched. If any of the 10 current `Delta` users attempt to launch a second instance of that application, they will receive an error message and the second instance will not be launched.
- **Maximum number of simultaneous instances per machine, and using tag restrictions:** Application `Charlie` has licensing and performance requirements that dictate how many instances can be running at the same time on a specific server. Those requirements also dictate how many instances can be running simultaneously across all servers in the site.

  The application instances-per-machine limit affects any server in the site (not just machines in a particular delivery group). Let's say your site has three servers. For application `Charlie`, you configure the app instances per machine limit to 2. So, no more than six instances of application `Charlie` are allowed to launch site-wide. (That's a limit of two instances of Charlie on each of the three servers.)

  To restrict an application's usage to only certain machines within a delivery group (in addition to limiting the instances on all machines site-wide):

  - Use the tagging functionality for those machines.
  - Configure the maximum number of instances per machine limit for that application.

If applications are launched by methods other than Controller brokering (for example, while a Con-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

troller is in outage mode) and configured limits are exceeded, users cannot launch more instances until they close enough instances to no longer exceed the limits. The instances that exceeded the limit are not forcibly shut down. They will be allowed to continue until their users close them.

If you disable session roaming, then disable the one-instance-per-user application limit. If you enable the one-instance-per-user application limit, do not configure either of the two values that allow new sessions on new devices. For information about roaming, see Sessions.

To configure the maximum instances per delivery group limit, and the one-instance-per-user limit:

1. Select **Applications** in the left pane and then select an application.
2. Select the **Edit Application Properties** in the action bar.
3. On the **Delivery** page, choose one of the following options.
    - **Allow unlimited use of the application**. There is no limit to the number of instances running at the same time. This is the default.
    - **Set limits for the application**. There are two limit types; specify either or both.
        - Specify the maximum number of instances that can run concurrently per machine
        - Limit to one instance of the application per user
4. Click **OK** to apply the change and close the dialog box, or **Apply** to apply the change and leave the dialog box open.

To configure the maximum instances per machine limit (PowerShell only):

- In PowerShell (using the Remote PowerShell SDK for Citrix Cloud™ deployments, or the PowerShell SDK for on-premises deployments), enter the appropriate `BrokerApplication` cmdlet with the `MaxPerMachineInstances` parameter.
- For guidance, use the `Get-Help` cmdlet. For example:

  ```
  Get-Help Set-BrokerApplication -Parameter MaxPerMachineInstances
  ```

Pass parameters to published applications

Use the **Location** page of an application's properties to enter the command line and pass parameters to published applications.

When you associate a published application with file types, the symbols `"%*"` (percent and star symbols enclosed in double quotation marks) are appended to the end of the command line for the application. These symbols act as a placeholder for parameters passed to user devices.

If a published application does not launch when expected, verify that its command line contains the correct symbols. By default, parameters supplied by user devices are validated when the symbols `"%*"` are appended. For published applications that use customized parameters supplied by the user

© 1997–2026 Citrix Systems, Inc. All rights reserved.

device, the symbols `"%**"` are appended to the command line to bypass command-line validation. If you do not see these symbols in a command line for the application, add them manually.

If the path to the executable file includes directory names with spaces (such as `"C:\Program Files"`), enclose the command line for the application in double quotation marks to indicate that the space belongs in the command line. To do this, add double quotation marks around the path, and another set of double quotation marks around the `%*` symbols. Be sure to include a space between the closing quotation mark for the path and the opening quotation mark for the `%*` symbols.

For example, the command line for the published application Windows Media Player is:

```
"C:\Program Files\Windows Media Player\mplayer1.exe""%*"
```

> **Note:**
>
> The maximum number of characters, including arguments, in the command line for launching published applications is 203.

Troubleshooting session sign-out issues with Published Applications

When publishing applications, only the main executable file for the published application is specified. However, some applications might produce additional (child) processes that run in the background and are not closed by the corresponding main executable file when the main published application is closed. Additional processes might also be created, from scripts that are executed, or from specific registry keys, like `Run` and `RunOnceKey`. These applications can prevent a graceful sign-out, resulting in lingering or hanging sessions and might result in the session not closing and the user being signed out.

In this case, you need to reset or exit these sessions using Citrix Director.

To help identify and troubleshoot sessions not being signed out properly, Citrix has made three registry entries available. Identifying and troubleshooting of session not being logged off properly due to these issues is a three-step process:

1. Identifying which sessions have published applications are holding up a graceful sign-out
2. Identifying for those published applications if they produce any additional (child) processes
3. Add these processes to a specified registry entry to prevent them from holding up sign-out

Step 2: Identifying for those published applications if they produce any additional (child) processes

Once a published application is identified to hold up a graceful sign-out, the next step is to determine if this application produces additional processes when running.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can read `HKCU\Software\CitrixVolatile\Seamless\Sessions\[ID]\LogoffCheckerBloc` to determine if any processes are blocking a graceful sign-out when a published application is closed.

In the following example, the key `LogoffCheckerBlockingProcess` contains the following entries:

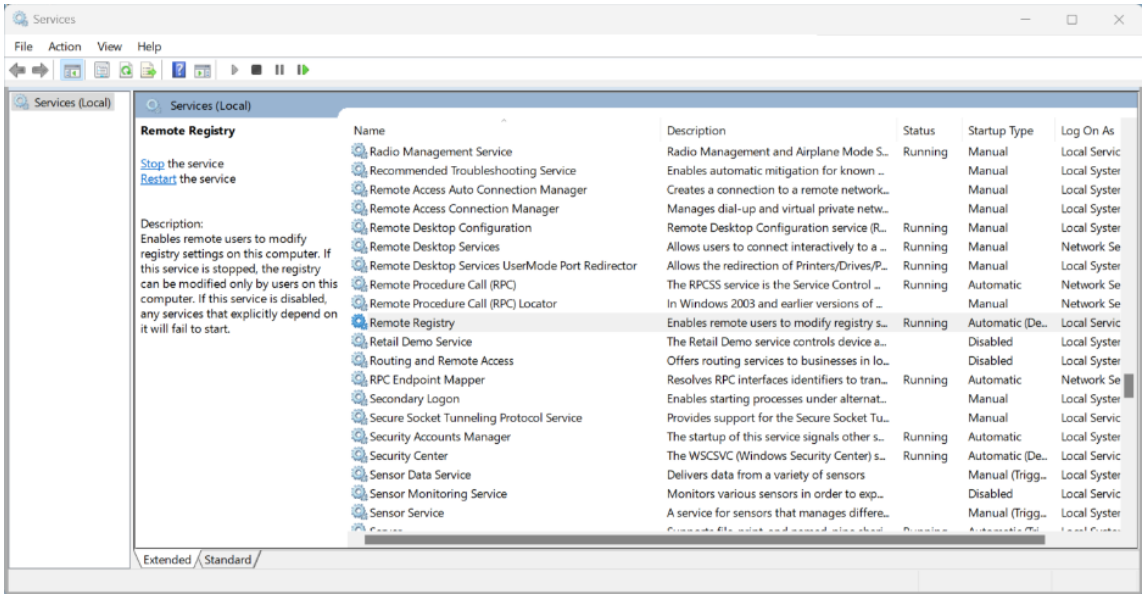
```
PhoneExperienceHost.exe
SkypeApp.exe
SkypeBackgroundHost.exe
```

These processes have held up the graceful sign-out.

> **Note:**
>
> Replace the [ID] with the correct session ID for the session you want to check.

Step 3: Add these processes to a specified registry entry to prevent them from holding up sign-out

You can add these processes to the following registry keys to prevent them from holding up sign-out in future sessions:



```
Add the process file name to the following registry key:
Caution! Refer to the Disclaimer at the end of this article before
   using the Registry Editor.
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWI
Value Name:LogoffCheckSysModules
Type:REG_SZ
String:MyAppName.exe
```

More information about `LogoffCheckSysModules`, see Graceful logoff from a published application renders the session in an active state.

Step-by-step troubleshooting guide

1. Start the remote registry Service under the VDA under test:
    a) In the Control Panel, select **Administrative Tools > Services**.
    b) Right-click **Remote Registry Service** and select **Properties**.
    c) Under **Startup Type**, select **Automatic** from the drop-down menu.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Turn off the Windows Firewall on the VDA under test or create an inbound firewall rule to enable port 455:

    a) In the Control Panel, select **Windows Defender Firewall > Advanced Settings**.

    b) Right-click **Inbound Rules** and select **New Rule**.

    c) In **New Inbound Rule Wizard**, select **Port**.

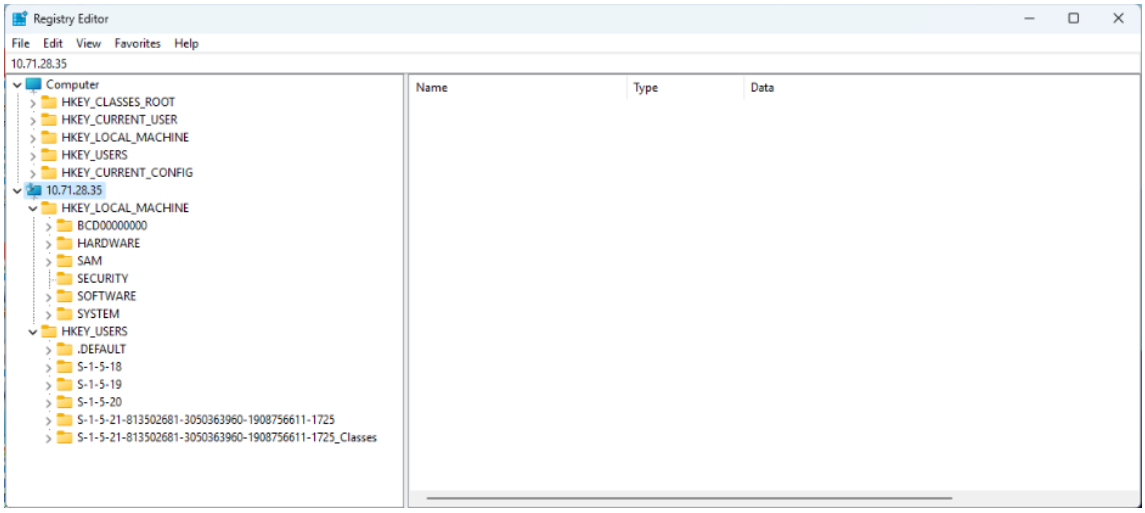
    d) On the **Protocols and Ports** page, select **TCP and Specific Local Ports**. Enter 445 as the local port.

    e) Select **Allow Connection** on the **Action** page.

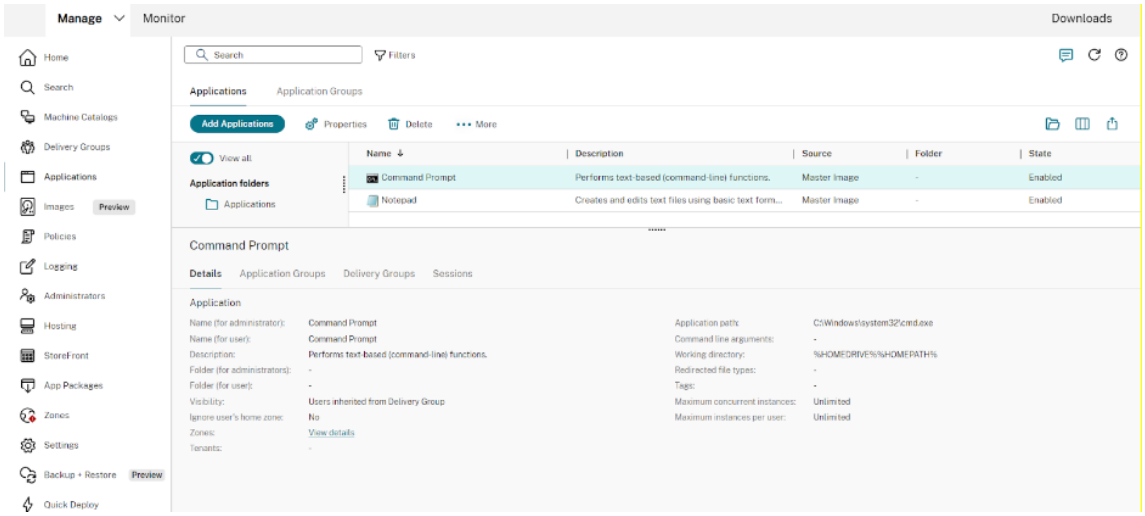
    f) Select the firewall profiles that you want to apply the new inbound rule.

    g) Name the firewall rule and select **Finish** to exit **New Inbound Rule wizard**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

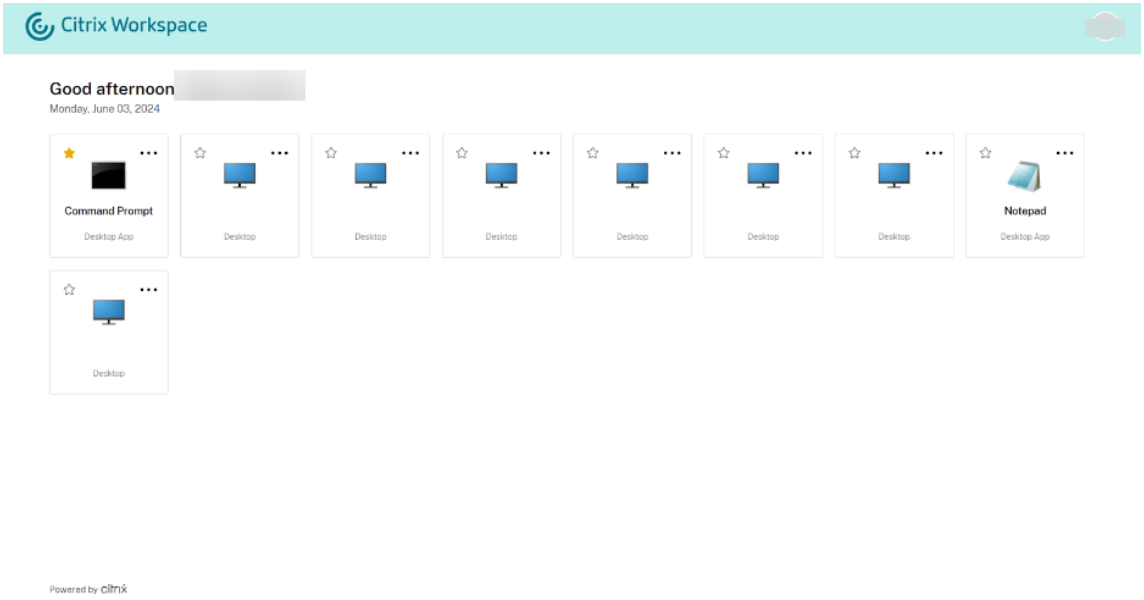


3. From another VM on the same domain (it could be DC, DDC, or another VDA), run `Regedit` and connect to a remote registry.

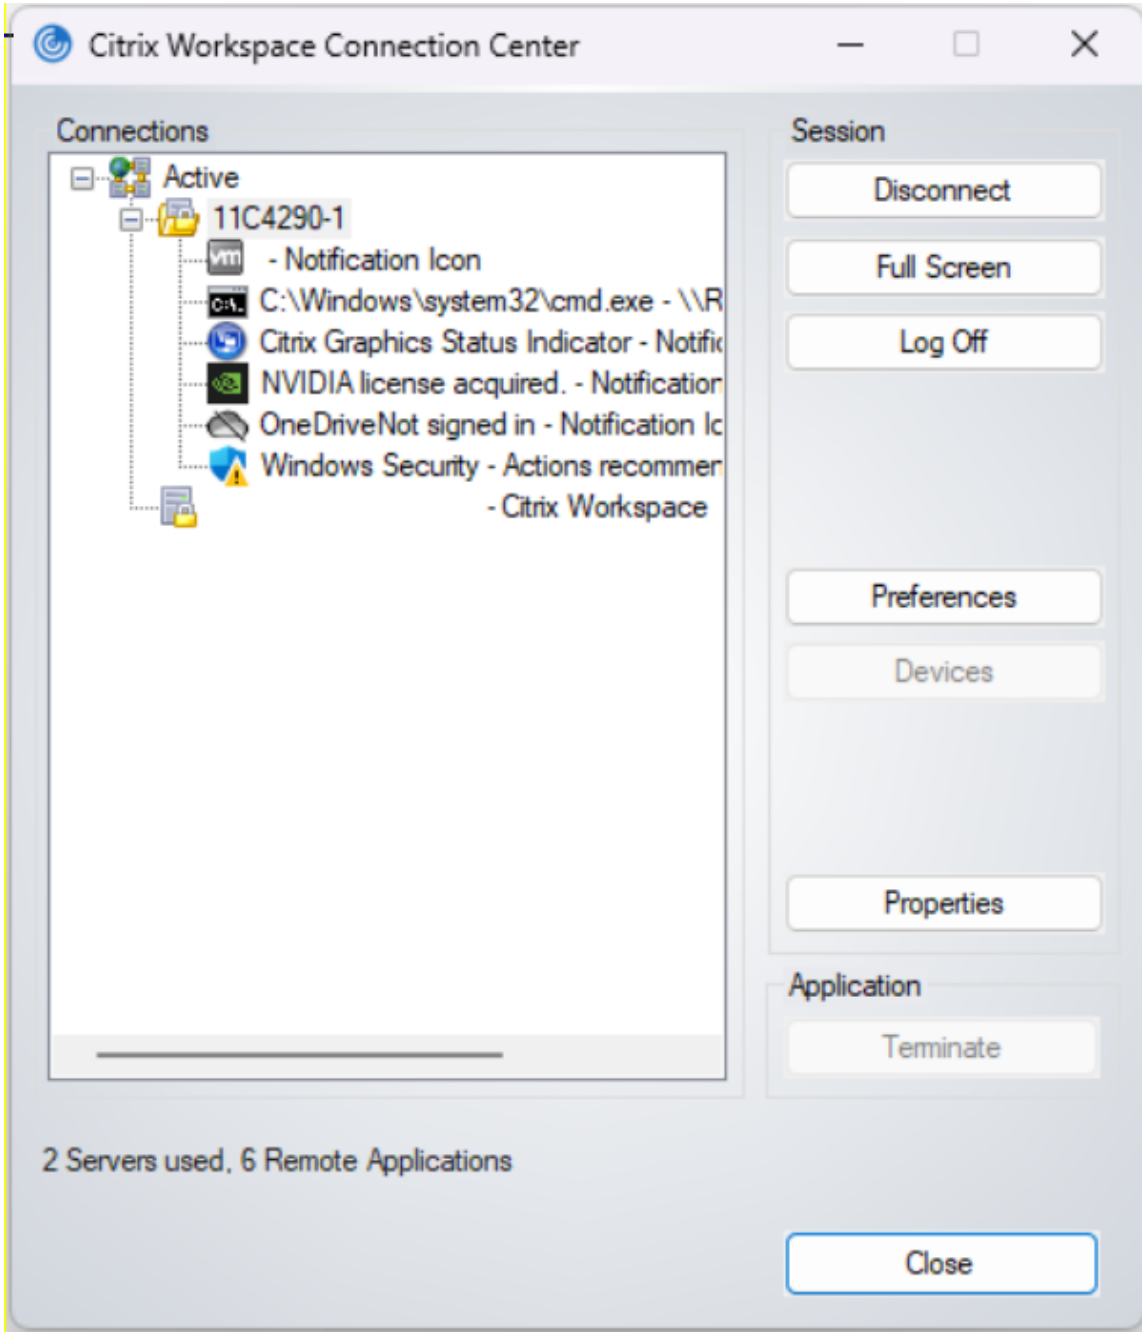


4. Enter the IP address of the VDA under test and click **OK**. The `regedit` tree must display branches for the VDA under test.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



5. Open the **Command Prompt** published application.



The **Command Prompt** app is displayed on Citrix Workspace.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Open **Connection Center** on the client. This is used for monitoring when a session is signed out, after closing an opened seamless app. We can see in the following image that the Command Prompt process `c:\Windows\system32\cmd.exe` is active on the remote VDI.

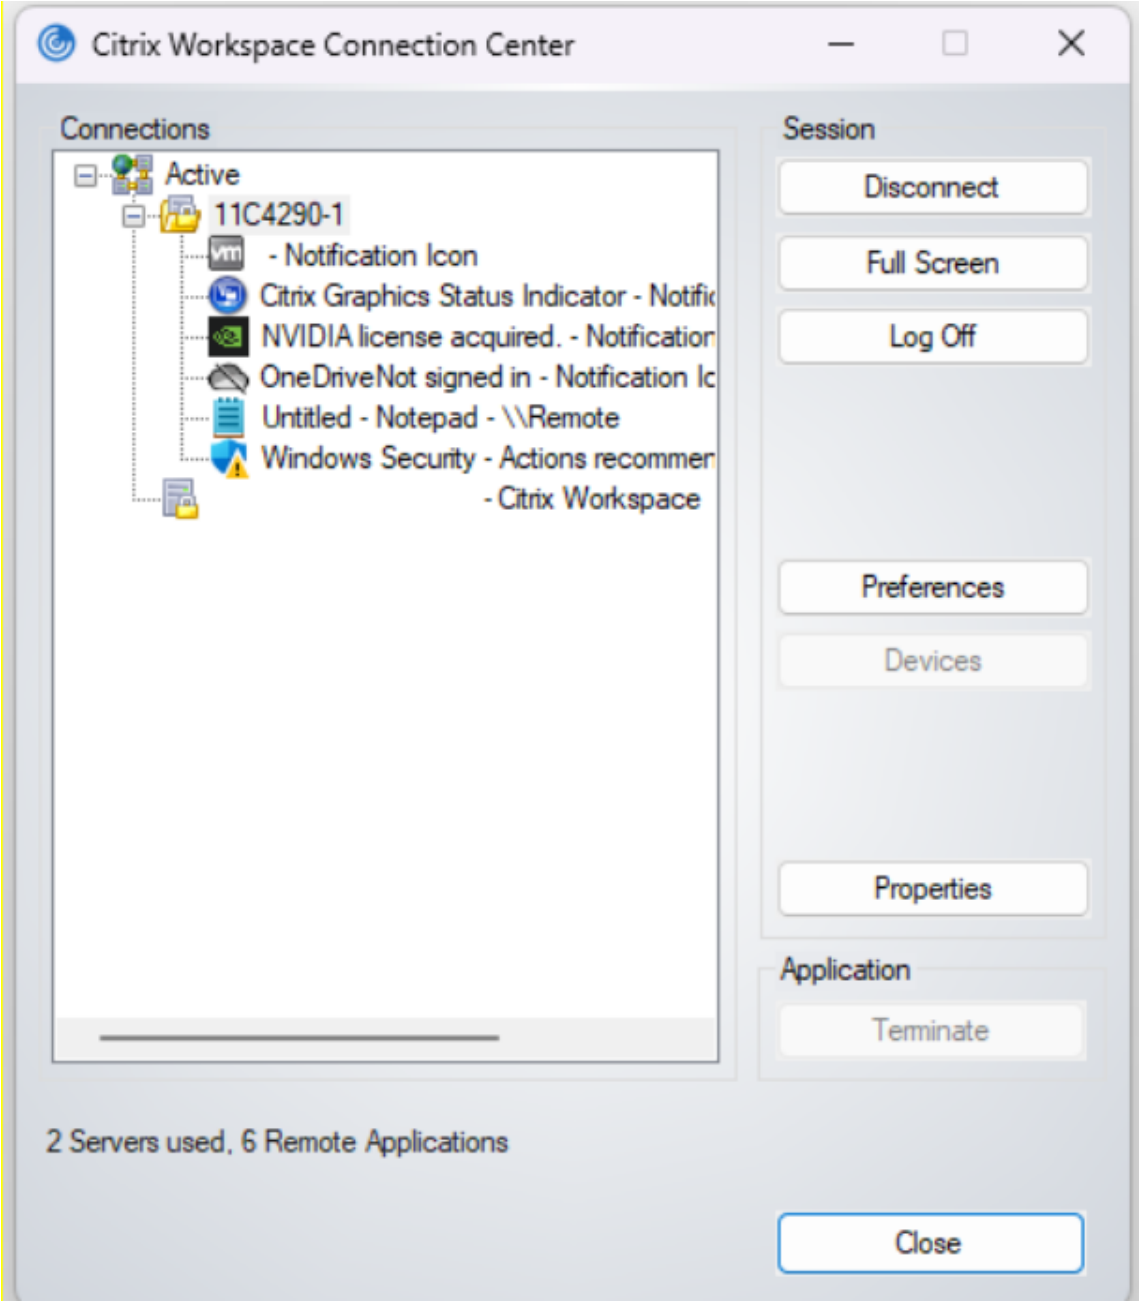
© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. From the VDA where **regedit** is running, go to the following remote IP location: `HKEY_USERS\S-1-X-XX-XXXXXXXX-XXXXXXXXXX-XXXXXXXXXX-XXXX\SOFTWARE\CitrixVolatile\Seamless\Sessions\X\`

   > **Note:**
   >
   > This path changes every time you open a new session.

8. There are two keys to read here (do not change them here): **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess**. These keys display any programs that are blocking

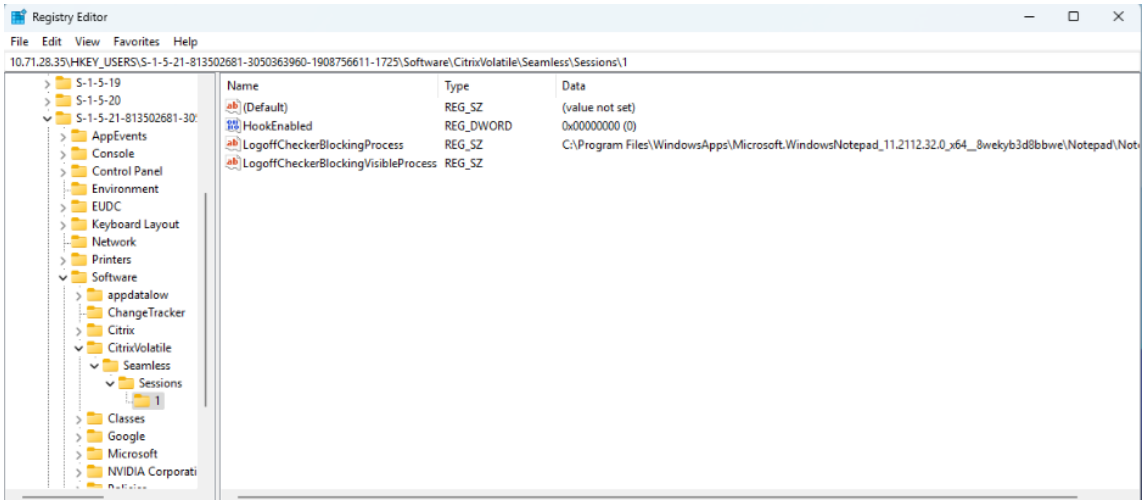
© 1997–2026 Citrix Systems, Inc. All rights reserved.



sign-out. The first one must display `C:\Windows\System32\cmd.exe` since that was open and has not been closed yet.

> **Note:**
>
> **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess** must not be manually edited. Manually editing these registry values could lead to unstable sessions.

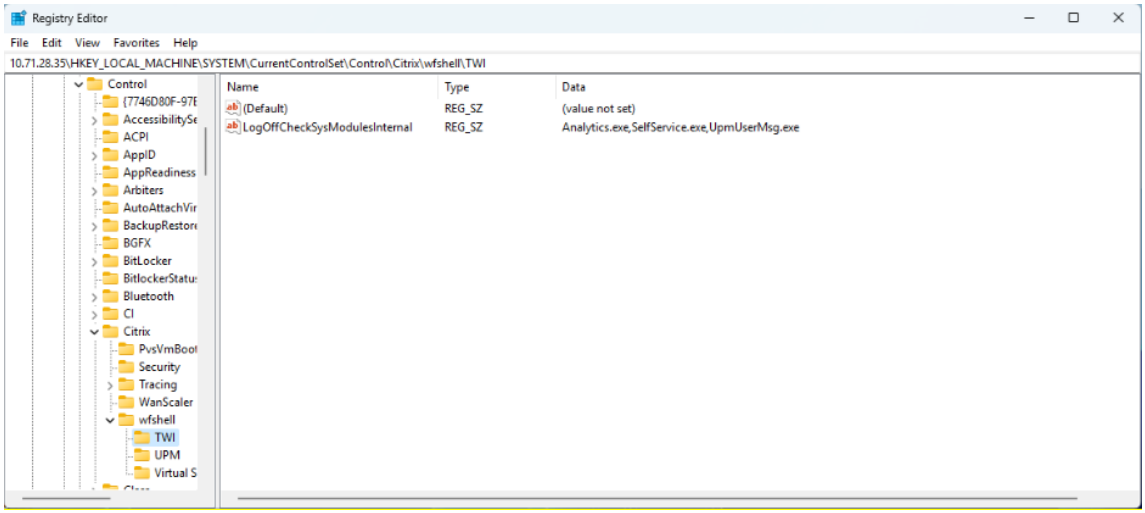
9. Click **X** in the upper-right hand corner to exit **Seamless CMD**.
10. Check the connection center to see if the session closes. It may take up to 30 seconds to close. If it closes, there have been no applications or processes that have prevented a graceful sign-out.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

11. If the session did not close, refresh the **regedit** output with F5.
12. Check the contents of **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess** again. CMD must no longer be present but there should be another listed process. Whatever process is currently blocking session sign-out must be displayed here.

    In this case, **Notepad.exe** is open from the published command prompt before the command prompt was closed and this remote notepad process is holding up a graceful sign-out.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

13. Make a note of the path to this executable, and which key it appeared in, and enter it in the following registry key, under the remote tree:

    - If it appears in **LogoffCheckBlockingProcess**: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWILogoffCheckSysModulesInternal`
    - If it appears in **LogoffCheckerBlockingVisibleProcess**: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWILogoffCheckVisibleSysModules`

    > **Note:**
    >
    > If there is already one or more entries in the key, add a comma to the end and put the new entry after the comma.

14. Sign out from the session from the connection center on the client, and re-open the Remote Application.
15. Repeat steps 9-16 until the session is signed out automatically within 30 seconds of closing the Remote Application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> After troubleshooting, revert the temporary Firewall changes to allow remote registry access if needed.

How to modify LogonUI to view Windows disclaimer message in full size when opening published applications

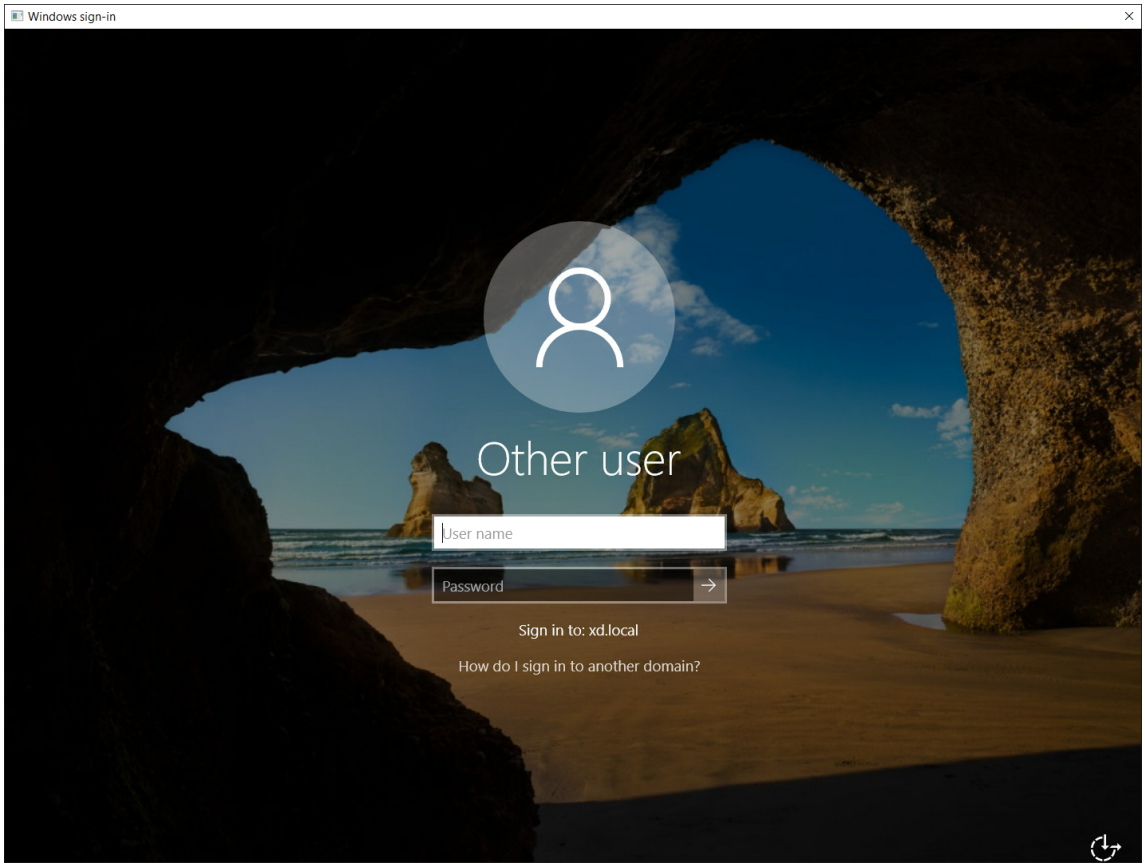
The **LogonUI** window scaling is improved for scenarios where authentication pass-through does not occur. The **LogonUI** window is scaled based on the monitor resolution and DPI settings used which ensures that the complete **LogonUI** window is visible without any clipping.

The window size in pixels can also be set manually in the registry.

1. Open the **Registry Editor** using `regedit` on the **Run** command.
2. Go to `HKEY_LOCAL_MACHINE\Software\Citrix\CtxHook\AppInit_DLLS\Seamless Hook\`.
3. Create two new DWORD keys: **LogonUIWidth** and **LogonUIHeight**.
4. Set the value of the keys to the required width and height in pixels for the **LogonUI** window.

   When manually setting the **LogonUI** windows size, automatic scaling is disabled.

> **Note:**
>
> These registry paths have changed from 2407 and later. The old registry values are ignored and deprecated.



By default, the **LogonUI** window includes a title bar with a close button which enables the end user to disconnect from the session if needed.

Disable a tilebar

You can disable the tile bar in the **LogonUI** window with the following registry key:

1. Open the Registry Editor using `regedit` on the **Run** command.
2. Go to `HKEY_LOCAL_MACHINE\Software\Citrix\CtxHook\AppInit_DLLS\Seamless Hook\`.
3. Create new DWORD keys: **LogonUICaption** and set the value of the key to `0`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage application folders

By default, new applications you add to delivery groups are placed in a folder named **Applications**. You can specify a different folder when you create the delivery group, when you add an application, or later.

Good to know:

- You cannot rename or delete the Applications folder, but you can move all the applications it contains to other folders you create.
- A folder name can contain 1–64 characters. Spaces are permitted.
- Folders can be nested up to five levels.
- Folders do not have to contain applications. Empty folders are allowed.
- Folders are listed alphabetically in Web Studio unless you move them or specify a different location when you create them.
- You can have more than one folder with the same name, as long as each has a different parent folder. Similarly, you can have more than one application with the same name, as long as each is in a different folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You must have `View Applications` permission to see the applications in folders, and you must have `Edit Application Properties` permission for all applications in the folder to remove, rename, or delete a folder that contains applications.
- Most of the following procedures request actions using the action bar in Web Studio. Alternatively, you can use right-click menus or drag the item. For example, if you create or move a folder in a location you did not intend, you can drag/drop it to the correct location.
- All nodes in Web Studio (such as **Machine Catalogs**, **Delivery Groups**, **Applications**, and **Application Groups**) share the same folder tree in the back end. To avoid name conflicts when renaming or moving folders, use unique names for first-level folders across different nodes.

  If you create a folder using the `New-BrokerAdminFolder` SDK cmdlet and want it to appear under the **Applications** node, you must add the `ContainsApplications` metadata using the `Set-BrokerAdminFolderMetadata` cmdlet.

  Example:

```
Set-BrokerAdminFolderMetadata -AdminFolderId {
adminFolderUid }
 -Name ContainsApplications -Value true
```

To manage application folders, select **Applications** in the left pane. Use the following list for guidance.

- **To view all folders (excluding nested folders):** Click **Show all** above the folder list.
- **To create a folder at the highest level (not nested):** Select the **Applications** folder. To place the new folder under an existing folder other than **Applications**, select that folder. Then, select **Create Folder** in the actions bar. Enter a name.
- **To move a folder:** Select the folder and then select **Move Folder** in the action bar. You can move only one folder at a time unless the folder contains nested folders. (The easiest way to move a folder is to drag it.)
- **To rename a folder:** Select the folder, and then select **Rename Folder** in the action bar. Enter a name.
- **To delete a folder:** Select the folder, and then select **Delete Folder** in the action bar. When you delete a folder that contains applications and other folders, those objects are also deleted. Deleting an application removes the application assignment from the delivery group. Tt does not remove it from the machine.
- **To move applications into a folder:** Select one or more applications. Then, select **Move Application** in the action bar. Select the folder.

You can also place applications you are adding in a folder on the **Application** page when creating a delivery group or an application group. By default, added applications go in the **Applications** folder. Click **Change** to select or create a folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Control local launch of applications on published desktops

When users launch a published application from within a published desktop, you can control whether the application is launched in that desktop session or as a published application. Citrix Workspace app searches for the installation path of the application in the Windows registry on the VDA and, if present, launches the local instance of the application. Otherwise, a hosted instance of the application is launched. If you launch an application that is not installed on the VDA, the hosted application is launched. For more information, see vPrefer launch.

In PowerShell (using the Remote PowerShell SDK in Citrix Cloud deployments or the PowerShell SDK in on-premises deployments), you can change this action.

In the `New-Broker` Application or `Set-BrokerApplication` cmdlet, use the `LocalLaunchDisabled` option. For example:

```
Set-BrokerApplication -LocalLaunchDisabled <Boolean>
```

By default, this option's value is false (`-LocalLaunchDisabled $false`). When launching a published application from within a published desktop, the application is launched in that desktop session.

If you set the option's value to true (`-LocalLaunchDisabled $true`), the published application is launched. This creates a separate, additional session from the published desktop (using Citrix Workspace app for Windows) to the published application.

Requirements and limits:

- The application's `ApplicationType` value must be `HostedOnDesktop`.
- This option is available only through the appropriate PowerShell SDK. It is not currently available in the Web Studio graphical interface.
- This option requires minimum: StoreFront 3.14, Citrix Receiver for Windows 4.11, and Delivery Controller 7.17.

Create application groups

May 15, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the in-

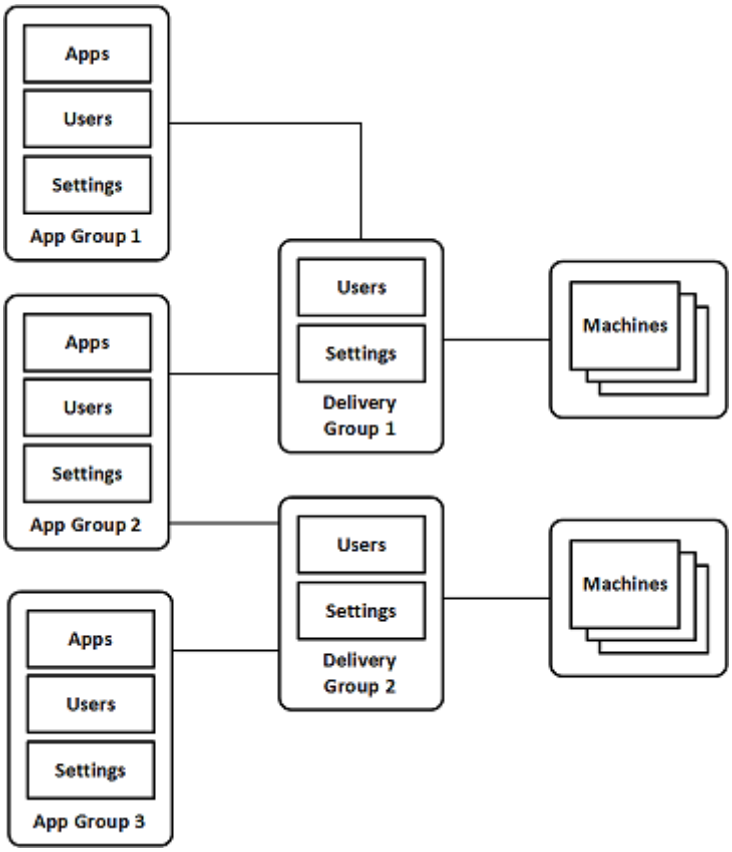
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> staller. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Introduction

Application groups let you manage collections of applications. Create application groups for applications shared across different delivery groups. Or, applications used by a subset of users within delivery groups. Application groups are optional; they offer an alternative to adding the same applications to multiple delivery groups. Associate delivery groups with more than one application group, and associate an application group with more than one delivery group.

Using application groups can provide application management and resource control advantages over using more delivery groups:



- The logical grouping of applications and their settings lets you manage those applications as a single unit. For example, you don't have to add (publish) the same application to individual delivery groups one at a time.
- Session sharing between application groups can conserve resource consumption. In other cases, disabling session sharing between application groups can be beneficial.
- You can use the tag restriction feature to publish applications from an application group, considering only a subset of the machines in selected delivery groups. With tag restrictions, you can use your existing machines for more than one publishing task, saving the costs associated with deploying and managing extra machines. A tag restriction can be thought of as subdividing (or partitioning) the machines in a delivery group. Using an application group or desktops with a tag restriction can be helpful when isolating and troubleshooting a subset of machines in a delivery group.

Example configurations

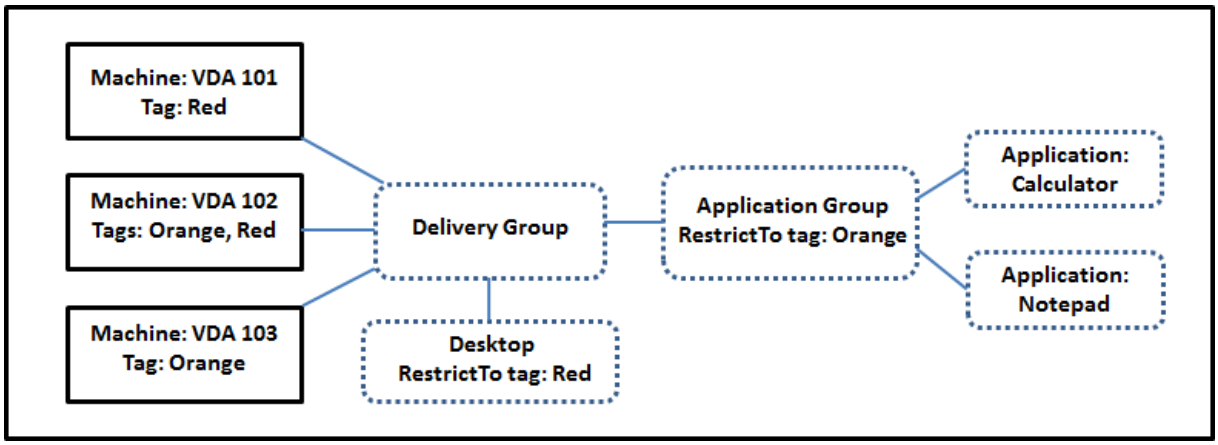
Example 1:

The following graphic shows a Citrix Virtual Apps and Desktops™ deployment that includes application groups:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In this configuration, applications are added to the application groups, not the delivery groups. The delivery groups specify which machines are used. (Although not shown, the machines are in machine catalogs.)

Application group 1 is associated with delivery group 1. Access the applications in application group 1 by the users specified in application group 1. These groups only appear as long as they are also in the user list for delivery group 1. This configuration follows the guidance that the user list for an application group is a subset (a restriction) of the user lists for the associated delivery groups. The settings in application group 1 (such as application session sharing between application groups, associated delivery groups) apply to applications and users in that group. The settings in delivery group 1 apply to users in application groups 1 and 2, because those application groups have been associated with that delivery group.



Application group 2 is associated with two delivery groups: 1 and 2. Each of those delivery groups is assigned a priority in application group 2, indicating the order in which the delivery groups are checked when an application is launched. Delivery groups with equal priority are load balanced. Access the applications in application group 2 by the users specified in application group 2. However, they must also appear in the user lists for delivery group 1 and delivery group 2.

Example 2:

This simple layout uses tag restrictions to limit which machines are considered for certain desktop

© 1997–2026 Citrix Systems, Inc. All rights reserved.

and application launches. The site has one shared delivery group, one published desktop, and one application group configured with two applications.

Tags have been added to each of the three machines (VDA 101–103).

The application group was created with the "Orange"tag restriction. Each of its applications is launched only on machines in that delivery group that have the tag "Orange,"VDA 102 and 103.

For more comprehensive examples and guidance for using tag restrictions in application groups (and for desktops), see Tags.

Guidance and considerations

Citrix recommends adding applications to either application groups or delivery groups, but not both. Otherwise, the additional complexity of having applications in two group types can make it more difficult to manage.

By default, an application group is enabled. After you create an application group, you can edit the group to change this setting. See Manage application groups.

By default, application session sharing between application groups is enabled. See Session sharing between application groups.

Citrix recommends upgrading your delivery groups to the current version. This process requires:

1. Upgrading VDAs on the machines used in the delivery group.
2. Upgrading the machine catalogs containing those machines.
3. Upgrading the delivery group.

For details, see Manage delivery groups.

To use application groups, your core components must be minimum version 7.9.

Creating application groups requires the delegated administration permission of the Delivery Group Administrator built-in role. See Delegated administration for details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This article refers to "associating" an application with more than one application group. It differentiates that action from adding instances of that application from an available source. Similarly, delivery groups are associated with application groups, rather than being additions or components of one another.

Session sharing with application groups

When application session sharing is enabled, all applications launch in the same application session. This saves the costs associated with launching more application sessions, and allows the use of application features that involve the clipboard, such as copy-paste operations. However, in some situations you can clear session sharing.

When you use application groups you can configure application session sharing in the following three ways which extend the standard session sharing behavior available when you are using only delivery groups:

- Session sharing enabled between application groups.
- Session sharing enabled only between applications in the same application group.
- Session sharing disabled.

Session sharing between application groups

You can enable application session sharing between application groups, or you can disable it to limit application session sharing only to applications in the same application group.

- **An example when enabling session sharing between application groups is helpful:**

  Application group 1 contains Microsoft Office applications such as Word and Excel. Application group 2 contains other applications such as Notepad and Calculator, and both application groups are attached to the same delivery group. A user who has access to both application groups starts an application session by launching Word, and then launches Notepad. If the controller finds that the user's existing session running Word is suitable for running Notepad then Notepad is started within the existing session. If Notepad cannot be run from the existing session—for example if the tag restriction excludes the machine that the session is running on—then a new session on a suitable machine is created rather than using session sharing.

- **An example when disabling session sharing between application groups is helpful:**

  A configuration with a set of applications that do not interoperate well with other applications that are installed on the same machines. Such as two different versions of the same software suite or two different versions of the same web browser. You prefer not to allow a user to launch both versions in the same session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create an application group for each version of the software suite, and add the applications for each version of the software suite to the corresponding application group. If session sharing between groups is disabled for each of those application groups, a user specified in those groups can run applications of the same version in the same session. The user can still run other applications at the same time, but not in the same session. When launching one of the different-versioned applications, or any application that is not contained in an application group, that application is launched in a new session.

This session sharing between application groups feature is not a security sandboxing feature. It is not foolproof, and it cannot prevent users from launching applications into their sessions through other means (for example, through Windows Explorer).

If a machine is at capacity, new sessions are not started on it. New applications are started in existing sessions on the machine as needed using session sharing.

You can only make prelaunched sessions available to application groups which have application session sharing allowed. (Sessions which use the session linger feature are available to all application groups.) These features must be enabled and configured in each of the delivery groups associated with the application group. You cannot configure them in the application groups.

By default, application session sharing between application groups is enabled when you create an application group. You cannot change this when you create the group. After you create an application group, you can edit the group to change this setting. See Manage application groups.

Disable session sharing within an application group

You can prevent application session sharing between applications which are in the same application group.

- **An example when disabling session sharing within application groups is helpful:**

  You want your users to access multiple simultaneous full screen sessions of an application on separate monitors.

  You create an application group and add the applications to it.

By default, application session sharing is enabled when you create an application group. You cannot change this setting when you create the group. After you create an application group, you can edit the group to change this setting. See Manage application groups.

Create an application group

To create an application group:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Sign in to Web Studio.
2. Select **Applications** in the left pane, and then select the **Application Groups** tab.
3. To organize application groups using folders, create folders under the **Application Groups** root folder. For more information, see Organize application groups using folders.
4. Select the folder where you want to create the group, and then click **Create Application Group**. The group creation wizard launches with an **Introduction** page. You can remove the page from future launches of this wizard.
5. Follow the wizard to configure settings on the pages described below. When you are done with each page, select **Next** until you reach the **Summary** page.

Step 1. Delivery Groups

The **Delivery Groups** page lists all delivery groups, with the number of machines each group contains.

- The **Compatible Delivery Groups** list contains delivery groups that you can select. Compatible delivery groups contain random (not permanently or statically assigned) multi-session or single-session OS machines.
- The **Incompatible Delivery Groups** list contains delivery groups that you cannot select. Each entry explains why it is not compatible, such as containing statically assigned machines.

An application group can be associated with delivery groups containing shared (not private) machines that can deliver applications.

You can also select delivery groups containing shared machines that deliver only desktops, if both of the following conditions are met:

- The delivery group contains shared machines and was created with a XenDesktop version earlier than 7.9.
- You have Edit Delivery Group permission.

The delivery group type is automatically converted to "desktops and applications"when the application group creation wizard is committed.

Although you can create an application group that has no associated delivery groups (perhaps to organize applications or to serve as storage for applications not currently used) the application group cannot be used to deliver applications until it specifies at least one delivery group. Also, you cannot add applications to the application group from the **From Start** menu source if there are no delivery groups specified.

The delivery groups that you select specify the machines that are used to deliver applications. Select the check boxes next to the delivery groups that you want to associate with the application group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To add a tag restriction, select **Restrict launches to machines with the tag** and then select the tag from the drop-down list.

Step 2. Users

Specify application users in the application group. Either allow all users and user groups in the delivery groups that you selected on the previous page, or select specific users and user groups from those delivery groups. If you restrict use to specified users, then only the users specified in the delivery group, the application group can access the applications in this group. Essentially, the user list in the application group provides a filter on the user lists in the delivery groups.

Enabling or disabling application use by unauthenticated users is available only in delivery groups, not in application groups.

For information about where user lists are specified in a deployment, see Where user lists are specified.

Step 3. Applications

Good to know:

- By default, new applications you add are placed in a folder named **Applications**. You can specify a different folder. If you try to add an application and one with the same name exists in that folder, you are prompted to rename the application you are adding. If you agree with the suggested unique name, the application is added with that new name. Otherwise, you must rename it yourself before it can be added. For details, see Manage application folders.
- You can change an application's properties (settings) when you add it, or later. See Change application properties. If you publish two applications with the same name to the same users, change the **Application name (for user)** property in Web Studio. Otherwise, users see duplicate names in Citrix Workspace app.
- When you add an application to more than one application group, a visibility issue can occur if you do not have sufficient permission to view the application in all of those groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the groups to which the application was added.

Click the **Add** from the drop-down menu to display the application sources.

- **From Start menu:** Applications that are discovered on a machine in the selected delivery groups. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add, and then click **OK**.

  This source cannot be selected if you selected any of the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - Application groups that have no associated delivery groups.
  - Application groups with associated delivery groups that contain no machines.
  - A delivery group containing no machines.

- **Manually defined:** Applications located in the site or elsewhere in your network. When you select this source, a new page launches where you type the path to the executable, working directory, optional command line arguments, and display names for administrators and users. After entering this information, click **OK**.
- **Existing**: Applications previously added to the site. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add and then click **OK**. This source cannot be selected If the site has no applications.
- **App-V**: Applications in App-V packages. When you select this source, a new page launches where you select **App-V server** or **Application Library**. From the resulting display, select the check boxes of applications to add, and then click **OK**. For more information, see Deploy and deliver App-V applications. This source cannot be selected (or might not appear) if App-V is not configured for the site.

As noted, certain entries in the **Add** drop-down menu are not selectable if there is no valid source of that type. Sources that are incompatible are not listed at all (for example, you cannot add application groups to application groups, so that source is not listed when you create an application group).

Step 4. Scopes

This page appears only if you have previously created a custom scope. By default, the **All** scope is selected. For more information, see Delegated administration.

Step 5. Summary

Enter a name for the application group. You can also (optionally) enter a description.

Review the summary information and then click **Finish**.

Publish content

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

You can publish an application that is simply a URL or UNC path to a resource, such as a Microsoft Word document or a web link. This feature is known as published content. The ability to publish content adds flexibility to how you deliver content to users. You benefit from the existing access control and management of applications. You can also specify whether to use local or published applications to open the content.

The published content appears just like other applications in StoreFront™ and Citrix Workspace™ app. Users access it in the same way they access applications. On the client, the resource opens as usual.

- If a locally installed application is appropriate, it is launched to open the resource.
- If a File Type Association has been defined, a published application launches to open the resource.

You publish content using the PowerShell SDK. You cannot use Web Studio to publish content. However, you can use Web Studio to edit application properties later, after they are published.

Configuration overview and preparation

Publishing content uses the `New-BrokerApplication` cmdlet with the following key properties. (See the cmdlet help for descriptions of all cmdlet properties.)

```
New-BrokerApplication –ApplicationType PublishedContent -
    CommandLineExecutable location -Name app-name -DesktopGroup delivery
    -group-name
```

The `ApplicationType` property must be `PublishedContent`.

The `CommandLineExecutable` property specifies the location of the published content. The following formats are supported, with a limit of 255 characters.

- HTML website address (for example, http://www.citrix.com)
- Document file on a web server (for example, `https://www.citrix.com/press/pressrelease.doc`)
- Directory on an FTP server (for example, `ftp://ftp.citrix.com/code`)
- Document file on an FTP server (for example, `ftp://ftp.citrix.com/code/Readme.txt`>)
- UNC directory path (for example, `file://myServer/myShare or \\\\\myServer\\myShare`)
- UNC file path (for example, `file://myServer/myShare/myFile.asf` or `\\myServer\myShare\myFile.asf`)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Ensure that you have the correct SDK.

- For Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) deployments, download and install the Citrix Virtual Apps and Desktops Remote PowerShell SDK.
- For on-premises Citrix Virtual Apps and Desktops deployments, use the PowerShell SDK that is installed with the Delivery Controller. Adding a published content application requires a minimum version 7.11 Delivery Controller.

The following procedures use examples. In the examples:

- A machine catalog has been created.
- A delivery group named `PublishedContentApps` has been created. The group uses a multi-session OS machine from the catalog. The WordPad application has been added to the group.
- Assignments are made for the delivery group name, the `CommandLineExecutable` location, and the application name.

Get started

On the machine containing the PowerShell SDK, open PowerShell.

The following cmdlet adds the appropriate PowerShell SDK snap-in, and assigns the returned delivery group record.

```
Add-PsSnapin Citrix\* $dg = Get-BrokerDesktopGroup –Name PublishedContentApps
```

If you are using Citrix DaaS, authenticate by entering your Citrix Cloud™ credentials. If there is more than one customer, choose one.

Publish a URL

After assigning the location and application name, the following cmdlet publishes the Citrix home page as an application.

```
1 $citrixUrl = "https://www.citrix.com/"
2 $appName = "Citrix Home Page"
3
4 New-BrokerApplication –ApplicationType PublishedContent –
    CommandLineExecutable $citrixURL –Name $appName –DesktopGroup $dg.
    Uid
```

Verify success:

- Open StoreFront and log on as a user who can access applications in the PublishedContentApps delivery group. The display includes the newly created application with the default icon. To

© 1997–2026 Citrix Systems, Inc. All rights reserved.

learn about customizing the icon, see https://www.citrix.com/blogs/2013/08/21/xd-tipster-changing-delivery-group-icons-revisited-xd7/.

- Click the **Citrix Home Page** application. The URL launches in a new tab in a locally running instance of your default browser.

Publish resources located at UNC paths

In this example, the administrator has already created a share named `PublishedResources`. After assigning the locations and application names, the following cmdlets publish an RTF and a DOCX file in that share as a resource.

```
$rtfUNC = "\\GMSXJ-EDGE0.xd.local\\PublishedResources\\PublishedRTF.rtf
    "
$rtfAppName = "PublishedRTF"

New-BrokerApplication  –ApplicationType PublishedContent
 –CommandLineExecutable $rtfUNC -Name $rtfAppName
-DesktopGroup $dg.Uid

$docxUNC = "\\GMSXJ-EDGE0.xd.local\PublishedResources\PublishedDOCX.
    docx"
$docxAppName = "PublishedDOCX"

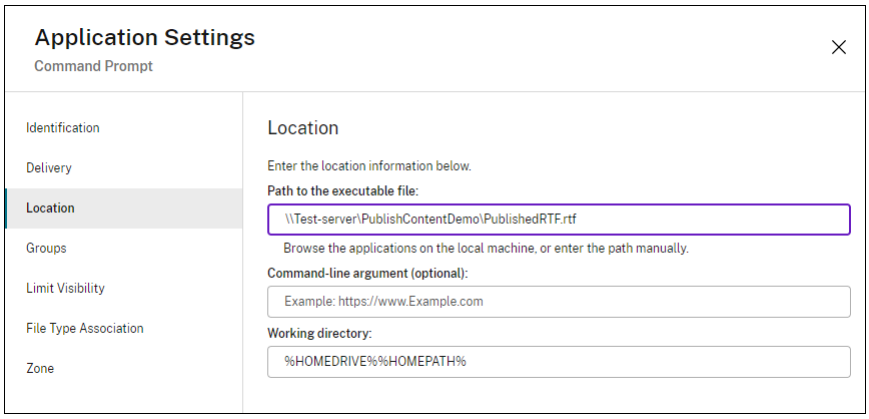
New-BrokerApplication  –ApplicationType PublishedContent
 –CommandLineExecutable $docxUNC -Name $docxAppName
-DesktopGroup $dg.Uid
```

Verify success:

- Refresh your StoreFront window to see the newly published documents.
- Click the **PublishedRTF** and **PublishedDOCX** applications. Each document opens in a locally running WordPad.

View and edit PublishedContent applications

You manage published content using the same methods that you use for other application types.



To view and edit `PublishedContent` applications, follow these steps:

1. Sign in to Web Studio and select **Applications** in the left pane.
2. On the **Applications** tab, select a PublishedContent application, and then select **Properties**.

   Application properties (such as user visibility, group association, and shortcut) apply to the published content. However, you cannot change the command-line argument or working directory properties on the **Location** page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. To change the resource, modify the **Path to the executable file** field on that page.

4. To use a published application to open a `PublishedContent` application (rather than a local application), follow these steps:

   In this example, the published WordPad application is edited to create a File Type Association for .rtf files.

   a) Turn on maintenance mode for the delivery group.

   b) Edit the **File Type Association** property.

   c) Turn off maintenance mode when you're done.

   d) Refresh StoreFront to load the File Type Association changes, and then click the **PublishedRTF** and **PublishedDOCX** applications. Notice the difference. **PublishedDOCX** still opens in the local WordPad. However, **PublishedRTF** now opens in the published WordPad due to the file type association.

App packages

May 13, 2026

App packages are pre-configured application deployments that Citrix® manages. They allow applications to be virtualized, which implies that the applications run independently of the user's device's operating system and interface.

App packages simplify application management, reduces IT overhead, and ensures that applications are secure and functional throughout their lifecycle.

Citrix supports the following packaging technologies for delivering applications to users:

- App-V applications
- MSIX and MSIX app attach applications
- FlexApp applications
- Elastic App applications
- Cloudpaging applications

This article walks you through how to deploy and deliver these packaged applications in your Citrix Virtual Apps and Desktops™ environment.

> **Note:**
>
> - Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.
> - We don't recommend using Web Studio and Citrix Studio interchangeably for deploying and delivering app packages. Each uses different mechanisms, which can lead to discrepancies, such as App-V server information appearing correctly in one but not the other. Also, note that Citrix Studio supports only App-V.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

App-V applications

Application Virtualization (App-V) is a Microsoft technology that allows applications to be streamed and accessed without requiring installation on the end user's device. Citrix Virtual Apps and Desktops can use App-V to deliver applications, providing a centralized and efficient way to manage applications across various client machines.

For more information about the components and concepts with which you interact when delivering App-V packaged applications, see the Microsoft documentation: Application Virtualization (App-V) for Windows client overview.

Important terms

- **Management server**: Provides a centralized console to manage App-V infrastructure and delivers virtual applications to both the App-V Desktop Client and a Remote Desktop Services Client. The App-V management server authenticates, requests, and provides the security, metering, monitoring, and data gathering required by the administrator. The server uses Active Directory and supporting tools to manage users and applications.
- **Publishing server**: Provides App-V clients with applications for specific users, and hosts the virtual application package for streaming. It fetches the packages from the management server.
- **Dynamic configuration files**: App-V packages can be customized using dynamic configuration files, that when applied to the package, can be used to change its characteristics. For example, you can use them to define extra application shortcuts and behaviors. For more information, see Dynamic configuration files

Dynamic configuration files

Citrix App-V supports both types of dynamic configuration files. File settings are applied when the application is launched:

- **Deployment Configuration files** provide machine-wide configuration for all users. These files are expected to be named `<packageFileName>_DeploymentConfig.xml` and in the same folder as the App-V package they apply to. These files are supported by single and dual admin management.
- **User Configuration files** provide user-specific configuration that supports per-user customizations to the package. Single Admin supports user config files named in the following format: `<packageFileName>_[UserSID | Username | GroupSID |GroupName_] UserConfig.xml` and located in the same folder as the App-V package they apply to.

  When multiple User Configuration files exist for a particular package, they are applied with the following priority:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. User SID
2. Username
3. AD Group SID (First found wins)
4. AD Group Name (First found wins)
5. Default

For example:

```
MyAppVPackage_S-1-5-21-000000001-0000000001-000000001-001
    _UserConfig.xml
MyAppVPackage_joeblogs_UserConfig.xml
MyAppVPackage_S-1-5-32-547_UserConfig.xml
MyAppVPackage_Power Users_UserConfig.xml
MyAppVPackage_UserConfig.xml
```

> **Note:**
>
> The user-specific portion of the file name can also optionally occur at the end (for example `MyAppVPackage_UserConfig_joeblogs.xml`).

> **Important:**
>
> You cannot apply changes to Dynamic Deployment Configuration when there are user sessions with an application in the package open. You can apply changes to Dynamic User Configuration files if other users (but not the current user) have the application from the package open.

Dynamic configuration file location

In single admin management, the Citrix App-V components only process dynamic configuration files, which are found in the same folder as their App-V package.

When applications in the package are launched, any changes to the corresponding dynamic configuration files are reapplied. If your dynamic configuration files are in a different location to their packages, use a mapping file to map packages to their deployment configuration files.

To create a mapping file:

1. Open a new text file.
2. For each dynamic configuration file, add a line that specifies the path to the package using the format `<PackageGuid> : path`.

   For example:

```
F1f4fd78ef044176aad9082073a0c780 : c:\widows\file\packagedeploy.
    xml
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Save the file as `ctxAppVDynamicConfigurations.cfg` in the same folder as the package.

The entire directory hierarchy on the same UNC share as the App-V package is searched recursively upwards for this file every time an application in the package is launched.

Methods

You can use the following methods to deliver and manage App-V packages:

- **Dual Admin**: In this method, Citrix Virtual Apps and Desktops and App-V servers work together to deliver and manage packages. This method requires Citrix Virtual Apps and Desktops to periodically refresh the snapshot view of the App-V server's state. It incurs hardware, infrastructure, and administration overhead. Citrix Virtual Apps and Desktops and App-V servers must stay synchronized, particularly for user permissions.

  This method works best in closely coupled App-V and Citrix deployments. In this method:

  - **App-V management server** handles the dynamic configuration files
  - **App Packages Delivery Component** installed on VDA machines: Manages the registration of the appropriate publishing server required for an application launch.

  This ensures that the publishing server is synchronized for the user at the appropriate time. The publishing server maintains other aspects of the app package life cycle (like refresh on logon and connection groups) using the settings that it is configured with.

- **Single Admin**: Application packages are stored on network shares. Citrix Virtual Apps and Desktops delivers and manages packages independently.

  This method reduces overhead because the App-V servers and database infrastructure aren't needed in the deployment.

  In this method, you store App-V packages on a network share and upload their metadata from that location to your environment. The App Packages Delivery Component installed on VDA machines then manages and delivers applications as follows:

  - Process the Deployment Configuration Files and User Configuration Files when an application is launched.
  - Manage all aspects of the life cycles for packages on the host machine.

> **Note:**
>
> - You can use one or both management methods simultaneously. In other words, when you add applications to Delivery Groups, the applications can come from App-V packages located on App-V servers or on a network share.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you are using both management methods simultaneously, and the App-V package has a dynamic configuration file in both locations, the file in the App-V server (dual management) is used.
- When you select App packages in the Web Studio navigation pane, the display shows package names and types. The **Package type** column indicates which technology is used to deliver the package and where they are referenced in the **Application Library**. When you select a package, the details pane lists the applications and shortcuts in the package.

MSIX and MSIX app attach applications

MSIX is a Windows app package format that provides a modern packaging experience to all Windows apps. MSIX is suitable for various Windows application types, including Win32, .NET, and UWP apps.

MSIX app attach utilizes MSIX packages that are pre-expanded onto virtual hard disks, which can be mounted to the target machine as required, rather than streaming the package contents. It can improve deployment times, reduce network traffic, and lower IOPS on the target machine, but requires additional work to create and maintain the app attach disks.

Citrix Virtual Apps and Desktops delivers MSIX and MSIX app attach applications to users through the **App Packages Delivery Component** installed on VDA machines. This component manages all aspects of the life cycles for packages on the host machine.

For more information about MSIX and MSIX app attach, see the Microsoft documentation: MSIX documentation and App Attach in Azure Virtual Desktop respectively.

Note:

- We support native MSIX Packages on Desktop and server VDAs and MSIX app attach on `.vhd`, `.vhdx`, and `.cim` disk image formats on Desktop VDAs only.
- Microsoft does not offer an AppAttach implementation for Server 2019. While AppAttach is present in Server 2022 and 2025, Microsoft does not support it on these versions. Therefore, we also do not support AppAttach on Server 2022 and 2025.
- Enable sideloading on Windows Server 2019.
- Ensure VDAs trust the certificates that packages are signed with.

FlexApp applications

FlexApp is an application layering solution developed by Liquidware that attaches any application to a Windows session without modifying the underlying base image through the traditional application installation process.

FlexApp One applications are encapsulated in a single, shareable file, allowing them to operate without requiring an additional application layer on Windows sessions. Users can initiate the application

© 1997–2026 Citrix Systems, Inc. All rights reserved.

by clicking the container file, which quickly integrates one or more applications into their Windows workspace.

Citrix delivers FlexApp applications to users through the App Packages Delivery Component and FlexApp delivery agent installed on VDA machines. These two components manage all aspects of the life cycles for packages on the host machine.

Elastic App applications

Elastic App technology is a feature of Citrix App Layering that lets you assign application layers to users dynamically at logon, rather than installing them into a base image. With Elastic App technology, applications follow the user across different virtual machines, ensuring that they always have access to the apps they need without bloating the master image.

Citrix Virtual Apps and Desktops delivers Elastic App applications to users through the Citrix Personalization component and Application Layering Enterprise Layer Manager (ELM). These two components manage all aspects of the life cycles for packages on the host machine. For more information about Application Layering Enterprise Layer Manager, see theCitrix App Layering™ document.

Cloudpaging applications

Cloudpaging is Numecent's application streaming technology that delivers applications to a Windows session without requiring changes to the base image.

With Cloudpaging, applications launch almost instantly because only a small portion of the code (typically less than 10%) is streamed initially. The remaining components stream in the background when users access them, providing a seamless experience.

For Citrix environments, the App Packages Delivery Component on the VDA works with the Numecent Cloudpaging Player to manage the application lifecycle. The Citrix component orchestrates delivery, while the Cloudpaging Player handles on-demand streaming and execution within the session.

Configuration requirements

Consider the following configuration details:

Cloudpaging Player and LogoffCheckSysModules When using virtual published applications with Cloudpaging containers, configure the following settings to allow a session to log off:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Setting	Value
TWI **Registry Key**	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\
Value Name	LogoffCheckSysModules
Value Type	REG_SZ
Value Data	CoreHelper.exe

URLs for whitelisting In addition to the standard URL whitelisting requirements, VDAs require access to the following endpoint:

Parameter	Value
URL	external-api.cloudpager.net
Port	443
Client	Cloudpager PoSh Module
Forward Proxy Config for Web-Based	• Outbound access allowed • Authentication bypass required
Description	Cloudpager PowerShell Module

Optionally, you can create a dedicated delivery group with a VDA used solely to perform Cloudpager discovery to limit required whitelisted URLs. We recommend creating a delivery group with a machine that has **VDA version 2511 or later** and **App packages Delivery Component** installed.

For more information about Cloudpager Client network and firewall requirements, see the Numecent knowledgebase article.

Deploy and deliver app packages

Prerequisites

To support the delivery of App-V, MSIX, MSIX app attach, FlexApp packages, Elastic App applications, and Cloudpaging packages, you must first install the **App Packages Delivery Component** on VDA machines. See Install the App Packages Delivery Component on VDA machines for details.

Install the App Packages Delivery Component on VDA machines The App Packages Delivery Component manages the publishing process for application packages in App-V, MSIX, MSIX app attach,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FlexApp, Elastic App, and Cloudpaging formats. This component isn't installed by default when you install a VDA. You can install the component during or after VDA installation.

To install the component during VDA installation, use either of the following ways:

- In the installation wizard, go to the **Additional Components** page and then select the **App Packages Delivery Component** checkbox.
- In the command line interface, use the `/includeadditional "Citrix Personalization for App-V – VDA"` option.

To install the component after VDA installation, follow these steps:

1. On the VDA machine, go to **Control Panel > Programs > Programs and Features**, right-click **Citrix Virtual Delivery Agent**, and then select **Change**.
2. In the wizard that appears, proceed to the **Additional Components** page and then enable the **App Packages Delivery Component** checkbox.

> **Note:**
>
> - Microsoft App-V Desktop Client is the component that runs virtual applications from App-V packages on user devices. Windows 10 (1607 or later), and Windows Server 2019 and later already include this App-V client software. You must only enable it on VDA machines. For more information, see this Microsoft documentation article: Enable the App-V in-box client.
> - For FlexApp applications, install the FlexApp One Agent on the VDA along with the App Packages Delivery Component.
> - For Elastic App applications, install the App Layering-enabled image on the VDA along with the App Packages Delivery Component.
> - For Cloudpaging applications, install the Cloudpaging Player on the VDA along with the App Packages Delivery Component.

Install the FlexApp One Agent

1. Launch an administrator command prompt on the VDA.
2. Locate the network path for any FlexApp One Package.
3. Input the following command:

```
\\path\to\any\FlexAppOnePackage.exe --install
```

4. Accept any prompts that appear.

Install the App Layering-enabled image

1. Set up app layering.
   Follow the instructions in the Citrix App Layering documentation. The process includes:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Set up the Enterprise Layer Manager (ELM).
b) Import a gold OS image.
c) Create a platform layer.
d) Create application layers.
e) In ELM, select the **Enable this App Layer for use with Studio App Packages** checkbox for each application layer you want to deliver.

2. Install an image including the Elastic Layering component on VDA machines. You can use one of the following ways:

a) Deploy the image from ELM with Elastic Layering enabled.
b) Install the VDA manually on the machine and select the Elastic Layering component during setup.

Install the Cloudpaging Player

1. Open an administrator command prompt on the VDA.
2. Go to the folder that contains the Cloudpaging Player installer.
3. Run the following command to install the player silently and configure the SaaS console URL. Replace the placeholder values as needed:

```
cloudpaging-player-setup-x64-release.exe /S /v"/qn ADDLOCAL=ALL
    REG_BASTOKENPATHORURL=https://your-tenant-url/api/token"
```

4. (Optional) Verify the configuration after installation by checking the following registry value:

- **Path:** `HKEY_LOCAL_MACHINE\SOFTWARE\Numecent\StreamingCore\Settings\Launcher`
- **Name:** `BaseTokenPathOrURL`
- **Data:** The value must match the URL you specified during installation.

Deliver packaged applications

After you complete installing the prerequisites, do the following to deliver packages applications to your users:

1. Store application packages on network shares.
2. Upload application packages into your environment.
3. Add applications to delivery groups.
4. To enable automatic delivery of interdependent App-V packages, create isolation groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Store application packages on network shares After you set up the infrastructure, generate the application packages and store them in a network location, such as a UNC or SMB network share, or on an Azure File Share.

Detailed steps are as follows:

1. Generate application packages. See the Microsoft documentation: Creating and managing App-V virtualized applications for details.
2. Store application packages in a network location:
    - For **App-V Single Admin**: Store the packages and the corresponding Dynamic Configuration Files (App-V) on a UNC or SMB network share or on an Azure File Share.
    - For **App-V Dual Admin**: Publish the packages onto the App-V management server from a UNC path. (Publishing from HTTP URLs isn't supported.)
    - For **MSIX or MSIX app attach**: Store the packages on a UNC or SMB network share or on an Azure File Share.
    - For **FlexApp**: Store the packages on a UNC or SMB network share or an Azure File Share.
    - For **Elastic App**: Store the packages on a UNC or SMB network share or an Azure File Share.
    - For **Cloudpaging**: Store the packages on a UNC or SMB network share or an Azure File Share.
3. Make sure that the VDA has read permission on the package storage path:
    - If you store packages on a UNC or SMB network share in your AD domain, grant the VDA machine read permission to the storage path. To do so, you can give the machine's AD account read permission to the share explicitly, or include the account in an AD group that has that permission.
    - If you store packages on an Azure File Share, first grant a user account read permission to the storage path in Azure. Next, configure `ctxAppVService` running on the VDA machine to use that user account to access the package storage path. See the Change the user logon account for the detailed steps.

Change the user logon account Change the user logon account in the following two scenarios:

- To access packages on an Azure File Share using a linked AD account:
    - The connecting entity must be a user account, not a machine account, as Microsoft Entra ID doesn't grant read permissions to machine accounts on File Shares.
- If MSIX and MSIX AppAttach packages contain services:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The package must be published using a user account with administrative privileges on the local machine before it can be published to any non-administrative users. This is necessary for packaged services to be installed and packages can only be published to users, not machines, making the default LocalService account unsuitable.

The VDA calls `ctxAppVService` to access package storage paths and perform operations that require administrative privileges. By default, `ctxAppVService` runs under the context of the machine's LocalService account that authenticates to AD using the machine's identity and is not suitable for the preceding scenarios.

In either case, the service must be reconfigured to use an AD user account that has administrative privileges locally and has been granted read access to the storage location for the packages, be that an SMB share or an Azure File Share, as follows:

1. Start **Services**, right-click **ctxAppVService**, and then select **Properties**.
2. On the **Log on** tab, select **This account**:
   a) Enter a user account that has local administrative privileges and read permission to the package storage path
   b) Enter the user's password twice.
3. Click **OK**.

Upload application packages into your environment After you store application packages to a network location as needed, upload them to your environment for delivery. Use either of the following methods as needed:

- Upload in bulk
- Upload one by one

Preparations Citrix Virtual Apps and Desktops uses a VDA machine to set up the connection to the network location for package discovery. Therefore, create a delivery group beforehand and make sure that at least one VDA in the group meets the following requirements:

- VDA version:
  - To discover App-V packages: 2203 or later
  - To discover MSIX and MSIX app attach packages: 2209 or later
  - To discover FlexApp packages: 2311 or later and the FlexApp Agent software
  - To discover ElasticApp packages: 2511 or later and the App Layering-enabled image
  - To discover Cloudpaging packages from the Cloudpager console: 2511 or later
  - To discover Cloudpaging packages from a network share: 2607 LTSR or later
- App Packages Delivery Component: Installed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Permission on the package location: Read (See Store application packages on network shares for details.)
- Power: On
- State: Registered

Upload application packages in bulk Upload packages in a network location to your environment. Make sure that you have the following items ready before the upload:

- A delivery group that meets the Preparations requirements
- The network location path

To upload packages in bulk, follow these steps:

1. In the left pane, select **App packages**.
2. On the **Packeage discovery** tab, click the **Create discovery profile** button. The **Create discovery profile** page appears.
3. In the **Name** field, enter a descriptive name for the profile.
4. In the **Delivery group** field, click **Select a delivery group**. Next, select a delivery group that meets the requirements stated in Preparations and then click **OK**.
5. In the **Location type** field, select **Microsoft App-V server**, **Network share**, or **Numecent Cloudpager** based on where you store the packages, and then complete the corresponding settings:
    - If you selected **Microsoft App-V server**, enter the following information:
        - URL of the Management server. Example: `http://appv-server.example.com`
        - Login credentials of the management server administrator.
        - URL and port number of the publishing server. Example: `http://appv-server.example.com:3330`
    - If you selected **Network share**, specify the following information:
        - Enter the UNC path of the network share (Example: `\\Package-Server\apps\`). For *Elastic App packages*, enter the UNC path from the **System's Network File Share SMB path** in ELM.
        - Select the package types that you want to upload. Options include **App-V**, **MSIX**, **MSIX app attach**, **FlexApp**, **Elastic App**, and **Cloudpaging**.
        - Specify whether to search subfolders for packages.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If you search for MSIX app attach packages on a folder structure containing `cim` images, ensure that you select the **Search** subfolders. Otherwise, the disks are not discovered correctly.

- If you selected **Numecent Cloudpager** (which means Cloudpaging apps are stored on Cloud Pager Console), enter the following information:
  - Cloudpager Console URL. Example: `https://cloudpagerconsole.my.org`
  - PowerShell API key.
  - AppLauncher MSID.

6. Click **Create discovery profile**.

   The **Create discovery profile** page closes and the newly added profile appears in the profile list. Citrix Virtual Apps and Desktops uploads the packages to your environment using a VDA in the delivery group. After the upload completes, the Status field shows *Import successful*. The corresponding packages appear on the **Packages** tab.

   > **Note:**
   >
   > To check for package updates in a source location and import them to your environment, select the location in the profile list and click **Check for Updates**.

Upload application packages one by one Upload an application package from a network share to your environment. Before the upload, make sure that you have the following items ready:

- A delivery group that meets the requirements stated in Preparations
- The network location path.

To upload a package to your environment, follow these steps:

1. In the left pane, select **App Packages**.
2. On the **Packages** tab, click the **Add Package** button. The **Add Package** page appears.
3. In the **Delivery group** field, click **Select a delivery group**. Next, select a delivery group that meets the requirements stated in Preparations, and then click **OK**.
4. In the **Package full path** field, enter a path as needed:
   - To upload several packages at a time, enter their full paths, separated by semicolons (`;`). Example: `\\Package-Server\apps\office365.appv;\\Package-Server\apps\skype.msix;\\Package-Server\apps\slack.vhd`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To upload all packages present on a network share, enter the storage path. Example: \package-Server\apps\

5. Click **Add Package**.

   The application package appears on the **Packages** tab.

Add applications to delivery groups After an application package is fully uploaded to your environment, add its applications to one or more delivery groups as needed. As a result, users associated with those delivery groups can access the applications.

> **Note:**
>
> - You can deliver packaged applications to single-session VDAs and multi-session VDAs through delivery groups.
> - By default, end users have access to all packaged applications assigned to the delivery groups associated with their *single-session* (or called *Desktop*) VDAs. To limit visibility of a packaged application on *desktop* VDAs to specific users or groups, go to the **Applications** node, select the application, and then select **Edit Application Properties > Limit Visibility** to make changes. See Limit visibility of applications

To add one or more applications in a package to several delivery groups, follow these steps:

1. In the left pane, select **App Packages**.
2. On the **Packages** tab, select a package as needed.
3. In the action bar, click **Add Delivery Groups**. The **Assign Applications to Delivery Groups** page appears.
4. Select one or more applications in the package as needed, and then click **Next**.
5. In the list of delivery groups, select the groups to which you want to assign the applications, and then click **Next**.

   > **Note:**
   >
   > - If you selected an MSIX or MSIX app attach package, only delivery groups whose VDA version is 2106 or later are shown in the list.
   > - If you selected a *FlexApp* package, only delivery groups whose VDA version is 2402 or later appear in the list.
   > - If you selected a *Elastic App* package, only delivery groups whose VDA version is 2511 or later appear in the list.
   > - If you selected a *Cloudpaging* package, only delivery groups whose VDA version is 2511 or later appear in the list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Click **Finish**.

To add applications in various packages to multiple delivery groups, follow these steps:

1. In the left pane, select **App Packages**.
2. On the **Applications** tab, select **Add Applications**.
3. On the **Groups** page, select one or more delivery groups as needed.
4. On the **Applications** page, select one or more application packages as follows:
    a) Click **Add** and then select **Application packages**.
    b) Select the type of package profile needed (for example, App-V Single Admin). All packages of this type appear.
    c) Select one or more packages as needed.
    d) Click **OK** and then **Next**.
    e) To add more applications of a different package type, repeat steps a through d.
5. Click **Finish**.

You can also add packaged applications to a delivery group when:

- Creating a delivery group. For more information, see Create delivery groups.
- Editing existing delivery groups or application groups. For more information, see Add applications.

(Optional) Create isolation groups for App-V packages You can create isolation groups to enable the automatic delivery of interdependent App-V packages.

> **Note:**
>
> Isolation groups are supported for the App-V Single Admin method. If you're using the App-V Dual Admin method, you can achieve the same goal by creating *connection groups* in the Microsoft App-V infrastructure. For more information, see this Microsoft documentation article: About the connection group file.

About isolation groups An isolation group is a collection of interdependent application packages that must run in the same Windows Sandbox to create a virtual environment. Citrix App-V isolation groups are similar but not identical to App-V connection groups. An isolation group includes two types of packages:

- **Explicit application packages**: Applications with specific licensing requirements. You can restrict those applications to a specific range of users by adding them to delivery groups.
- **Automatic application packages**: Applications that are always available to all users regardless of whether they are added to delivery groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, the application app−a requires JRE 1.7 to run. You can create an isolation group that contains app-a (marked as *Explicit*) and JRE 1.7 (marked as *Automatic*). Next, add the App-V package for app−a to one or more delivery groups. When a user launches app-a, JRE 1.7 is automatically deployed with it.

When a user starts an App-V application marked as *Explicit* in an isolation group, Citrix Virtual Apps and Desktops checks the user's access permission to the application in delivery groups. If the user has permission to access the application, any *Automatic* application packages in the same isolation group are made available to the user.

You do not need to add the *Automatic* packages to any delivery group. If there's another *Explicit* application package in the isolation group, that package is made available to the user only if it is in the same delivery group.

Create an App-V isolation group Create an isolation group and add interdependent application packages to it. Detailed steps are as follows:

1. On the **Isolation Groups** tab, click **Add Isolation Group**.
2. Enter a name and description for the isolation group. All App-V Single Admin packages in your environment appear in the **Available Packages** list.
3. From the **Available Packages** list, select an application as needed, and then click the right arrow. The selected application appears in the **Packages in Isolation Group** list.
4. In the **Deployment** field, select **Explicit** or **Automatic** for the application.
5. Repeat steps 2–3 to add more packages.
6. To adjust the order of packages in the list, click the up or down arrow.
7. Click **Save**.

> **Note:**
>
> Isolation Group configurations result in the creation of an App-V Connection Groups on the VDA. Deployment scenarios can become complex and the App-V client supports packages that are only in one active Connection Group at a time. We recommend that you avoid adding the same package to two different isolation groups that are added to the same delivery group.

Best practices

- To deploy App-V packages, enable the App-V subsystem on the VDA using the PowerShell command Enable−AppV.
- To deploy MSIX (and AppAttach) packages, the VDA must trust the certificates that the packages are signed with.
- On Windows Server 2019, enable sideloading to deploy MSIX packages. Sideloading is not needed for Windows 10, 11, Windows Server 2022, and 2025.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- App Attach has no implementation at all on Windows Server 2019 and is not currently supported by Microsoft (or Citrix by extension) on Windows Server 2022 or 2025.

Advanced

The following advanced topics provide additional configuration options and controls to fine-tune how packaged applications are discovered, updated, and delivered in Citrix Virtual Apps and Desktops beyond the basic app package workflow.

Automate packaged application publishing

You can use PowerShell commands to automate packaged application publishing:

On the Delivery Controller™, run the following PowerShell commands:

1. To load the commands present in the Package Discovery Module:

```
Import-Module "D:\Support\Tools\Scripts\Citrix.Cloud.AppLibrary.Admin.v1.psm1"
```

> **Note:**
>
> The version of the package discovery module can be found on the Citrix Virtual Apps and Desktops ISO on the path mentioned in step 1.

2. The package discovery module must be from the ISO of a Citrix Virtual Apps and Desktops version that also supports the package type you are publishing, that is, 2311 or higher is needed for FlexAppOne Applications. We recommend using the latest available.
3. To retrieve the relevant delivery group IDs and packaged application IDs:

```
Get-BrokerDesktopGroup | Format-Table Uid, Name
Get-AppLibAppVApplication | Format-Table Uid, Name
```

4. To publish the packages and create the appropriate BrokerMachineConfigurations:

```
Publish-PackagedApplication -AppLibararyApplicationUid <AppLibararyApplication.Uid > -DesktopGroupUid <DesktopGroup.Uid>
```

5. To synchronize the Broker configurations, which are later sent out to the Broker agent on VDA:

```
Update-DesktopGroupMachineConfigurations -DesktopGroupUid <DesktopGroup.Uid>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Ensure to run the PowerShell command `Update-DesktopGroupMachineConfigurations` after you publish or remove packaged applications from a delivery group through the PowerShell command line. Otherwise information about the published applications is not sent to the VDA correctly and launches fail.

Limit visibility of applications

In a Citrix Virtual Apps and Desktops environment, when applications from packages are published to desktops, the system respects Active Directory (AD) user and group visibility settings for those applications. However, even if a user only has visibility to one application within a package, the entire package must be deployed to the Virtual Desktop (or Seamless App) Session since individual package components cannot be subdivided on the VDA. Additionally, before VDA version 2503, changes that reduce application visibility after the initial publishing won't result in a clean-up of previously published packages on subsequent desktop launches. Furthermore, other visibility layers, such as desktop versus workspace visibility, operate on top of these AD visibility assignments.

You can control whether packaged applications must appear in Workspace or are deployed to the users'VDI Desktop sessions. Once a packaged application has been published you can update the `PackagedApplicationVisibility` property on the `BrokerApplictaion` using the PowerShell command `Set-BrokerApplication -Name "MyApp"-PackagedApplicationVisibility "Workspace|Desktop|WorkspaceAndDesktop"`.

The default value of `PackagedApplicationVisibility` is `WorkspaceAndDesktop`.

The value `Workspace`: app appears only in WorkspaceApp and is available for a seamless AppLaunch, but the app won't automatically be published to any desktop session that users start.

The value `Desktop`: hides the app's icon from WorkspaceApp making it unavailable for a seamless AppLaunch but the app can still be deployed to users'desktop sessions if users also have access to it through their AD Group settings.

> **Note:**
>
> Packaged Applications published to Single Session Static desktops are never available in Workspace App regardless of the value configured in this setting.

Migrate from App-V full infrastructure to Single Admin workflow

Microsoft App-V full infrastructure (Dual Admin) is approaching the end of life. To continue delivering App-V packages and other supported container formats, migrate to the Citrix Single Admin model.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The Single Admin model removes the dependency on the App-V Management and Publishing servers and centralizes package management in Studio.

Benefits of Single Admin model

Moving to the Single Admin workflow simplifies your architecture and streamlines package management.

Simplified architecture In the Single Admin model, the VDA retrieves packages directly from the file share. Citrix manages metadata, publishing, and isolation logic.

Feature	Full infrastructure (Dual Admin)	Single Admin (Citrix managed)
Management	App-V Management Console	Citrix Studio or Web Studio
Database	Required (SQL Server)	None (metadata stored in the Citrix site database)
Publishing	App-V Publishing Server	Citrix VDA (`ctxAppVService`)
Package source	UNC share (synchronized to Management Server)	UNC share, SMB share, or Azure Files
Logic	Connection Groups	Citrix Isolation Groups

Strategic advantage By moving to Single Admin, you also eliminate the **Synchronization Lag**.

- In the Dual Admin model, you must synchronize the App-V Management Server, and then synchronize Studio.
- In the Single Admin model, when you update a package on the file share and select **Refresh** in Studio, the updated package is available at the next user logon.

Migration workflow

Follow these steps to move your existing App-V full infrastructure to the Citrix Single Admin workflow:

1. Step 1: Prepare the target environment
2. Step 2: Import packages into the Citrix library

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 1: Prepare the target environment Before importing packages, ensure that your infrastructure and VDAs are ready to support the Single Admin model.

1. **Shared repository**
   a) Identify the UNC share that hosts your `.appv` packages.
   b) Ensure that VDA machine accounts (for example, Domain Computers) have **Read** access to both the share and NTFS permissions.
2. **VDAs**

   Ensure that all VDAs have the **App Packages Delivery Component** installed. To add this component after installation:

   a) Run the VDA installer.
   b) Select **Change** in **Programs and Features**.
   c) Add **App Packages Delivery Component**.
3. **XML configuration files**

   Move the `_DeploymentConfig.xml` and `_UserConfig.xml` files into the *same* folder as the corresponding `.appv` file.

   In the Single Admin model, the VDA reads configuration files from the package folder on the file share instead of from a central App-V database.

Step 2: Import packages into the Citrix library After you prepare the environment, import your existing App-V packages into the Citrix application library.

1. In Citrix Studio, go to **Configuration** > **App Packages**.
2. If you are fully migrating, remove any existing connections to the App-V Management Server.
3. Select **Add Package** and point it to the UNC path of your package.
4. Citrix scans the folder and imports package names, versions, and application IDs into the Citrix application library.

After import, you can assign applications to delivery groups as needed.

> **Note:**
>
> **vPrefer Policy (Optional)**: If you want applications to launch on the local VDA instead of redirecting to a remote server, enable the **vPrefer** GPO on your VDAs.

Troubleshoot App-V applications (Single Admin model)

If App-V packages (in the Single Admin model) fail to launch or don't appear in the user session, use the following guidance to identify and resolve common issues.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Issue	Description	Solution
Package discovery and "Failed to catalog"errors	When you add a package in Studio, an error indicates that the file cannot be accessed or that the metadata is invalid.	1. Verify permissions. Ensure that the Delivery Controller machine account (for example, `DOMAIN\DDC01$`) has **Read** permissions on both the share and NTFS levels of the UNC path that hosts the package. 2. Check XML integrity. Ensure that the `.appv` file and the `DeploymentConfig.xml` file have the same file name prefix and are located in the same folder.
Application fails to launch (error code: 0x80070005 or 0x80040154)	The user clicks the application icon and the **Citrix splash** screen appears, but the application does not open.	1. Verify the VDA component. Ensure that the **App Packages Delivery Component** is installed on the VDA. Confirm that the following file exists: `C:\Program Files\Citrix\AppV\ServerData\PackageStore\Catalog\Catalog.data`. 2. Verify VDA permissions. Because the VDA pulls packages as the logged-on user, the VDA machine account (for example, `DOMAIN\VDA-VM01$`) must have **Read** access to the package share.
Isolation group conflicts	A plugin, such as an Excel add-in, cannot see its parent application.	1. In Studio, go to **App Packages** > **Isolation Groups**. 2. Ensure that both packages are added to the same isolation group. In the Single Admin model, the App-V client on the VDA manages the virtual connection of those applications based on the configuration delivered by the Delivery Controller.
Slow initial launch (buffering)	The first launch of a large App-V package, such as AutoCAD or ArcGIS, takes several minutes.	1. On the VDA, run the following commands in PowerShell command on the VDA: `Get-AppvClientConfiguration`. 2. Set `PackageLoad` to 2 (auto-load all previously used packages) to improve subsequent launch performance. 3. Check network performance. Ensure that SMB signing or antivirus scanning on the network share isn't throttling the transfer speed. • If your package requires scripts, ensure that `EnablePackageScripts` is set to `$True`.

Useful PowerShell commands (run on the VDA)

To verify whether Citrix successfully delivered the package to the VDA, run the following commands in a PowerShell window:

Command	Purpose
`Get-AppvClientPackage`	Displays all App-V packages currently cached or published to the VDA.
`Get-CtxAppvPackage`	Displays the packages managed by the Citrix agent.
`Start-Service ctxAppVService`	Restarts the Citrix App-V service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Universal Windows Platform Apps

May 15, 2026

For information about Universal Windows Platform (UWP) apps, see the following Microsoft documentation:

- What's a Universal Windows Platform (UWP) app?
- Windows Package Manager

Requirements and limitations

Citrix Virtual Apps and Desktops™ supports the use of UWP apps with VDAs on the following Windows machines:

- Windows 10 and later versions
- Windows Server 2016 and later versions

VDAs must be minimum version 7.11.

The following Citrix Virtual Apps and Desktops™ features are either not supported or limited when using UWP apps:

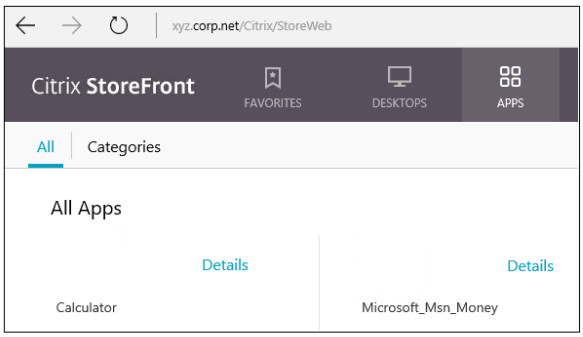
- File type association is not supported.
- Local App Access is not supported.
- Dynamic preview: If apps running in the session overlap, the preview shows the default icon. The Win32 APIs used for Dynamic Preview are not supported in UWP apps.
- Action Center remoting: UWP apps can use the Action Center for displaying the messages in the session. These messages are currently not redirected to the endpoint to be displayed to the user.

Launching UWP apps and non-UWP apps from the same server is not supported. Instead, place UWP apps and non-UWP apps in separate delivery groups or application groups.

Because all UWP apps installed on the machine are enumerated, Citrix® recommends disabling user access to the Windows Store. This precludes the UWP apps installed by one user from being accessed by a different user.

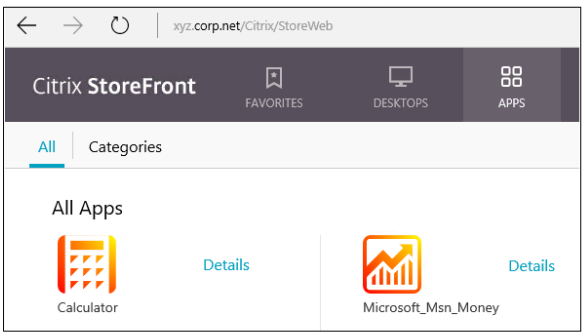
During sideloading, the UWP app is installed on the machine and is available for use by other users. When another user launches the app, then it is installed, and the OS updates its AppX database to indicate "as installed"by that user.

A graceful logoff started from a published UWP app that was launched in a fixed or seamless window might prevent the VDA session from closing and forcibly log off the user. When this occurs, several



© 1997–2026 Citrix Systems, Inc. All rights reserved.

processes remaining in the VDA session prevent it from properly closing. To resolve this, determine which process is preventing the VDA session from closing, and then add it to the "LogoffCheckSysModules"registry key value, following the guidance in CTX891671.



Application Display Names and Descriptions for UWP apps might not have correct names. Edit and correct these properties when adding the applications to the delivery group.

Check Known issues for any additional issues.

Currently, several UWP apps have white icons with transparency enabled, which results in the icon not being visible against the white background of the StoreFront display. To avoid this issue, you can change the background. For example, on the StoreFront machine, edit the file `C:\inetpub\wwwroot\Citrix\StoreWeb\custom\style.css`. At the end of the file, add `.storeapp-icon { background-image: radial-gradient( circle at top right, yellow, red ); }`. The following graphic illustrates the before-and-after for this example.

Before

After

On Windows Server 2016 and later versions, the Server Manager might also launch when a UWP app is launched. To prevent this from occurring, you can disable Server Manager from auto-starting during logon with the `HKLM\Software\Microsoft\ServerManager\DoNotOpenServerManagerAtLogon` registry key. For details, see https://blogs.technet.microsoft.com/rmilne/2014/05/30/how-to-hide-server-manager-at-logon/.

Install and publish UWP apps

Support for UWP apps is enabled by default.

To install one or more UWP apps on VDAs (or a master image), use one of the following methods:

- Complete an offline install from the Windows Store for Business, using a tool such as Deployment Image Servicing and Management (DISM) to deploy the apps to the desktop image. For more information, see Windows Package Manager.
- Sideload the apps. For more information, see Sideload line of business (LOB) apps in Windows client devices.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Install the UWP apps for each intended user directly from the Windows Store for Business.

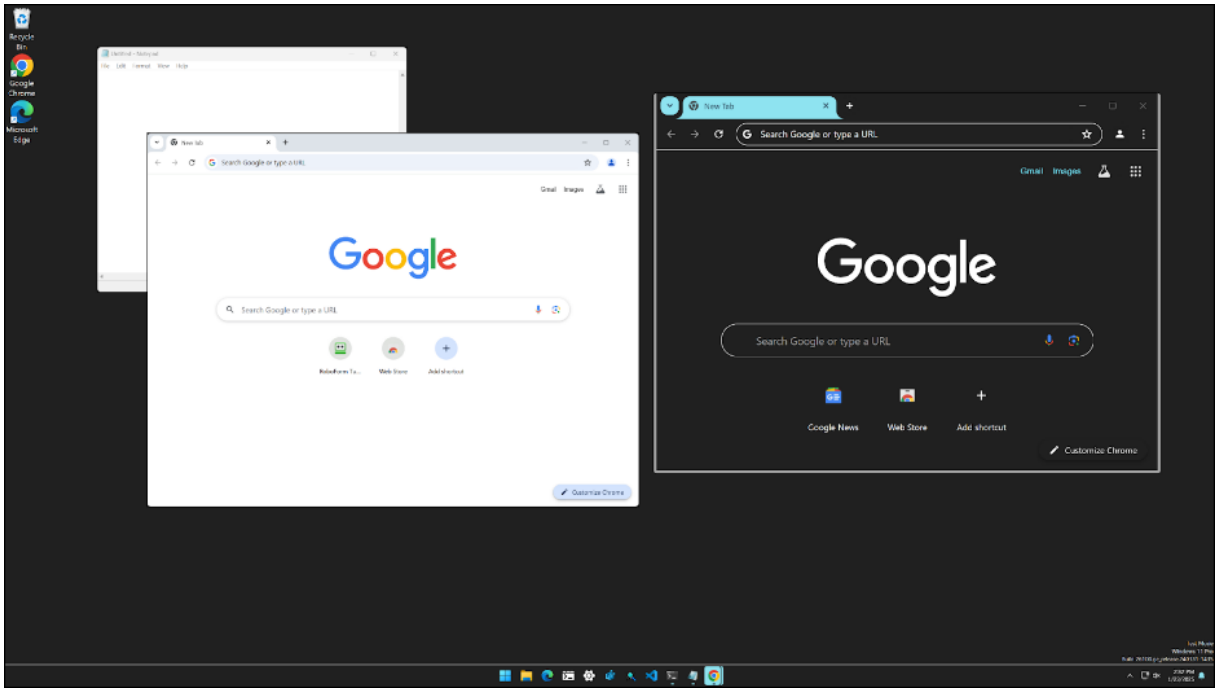
To add (publish) one or more UWP apps in Citrix Virtual Apps or Citrix Virtual Desktops™:

1. After the UWP apps are installed on the machine, add the UWP apps to a delivery group or application group. You can do this when you create a group, or later. On the **Applications** page, in the **Add** menu, select **From Start menu**.
2. When the applications list appears, select the UWP apps you want to publish.
3. Continue with the wizard or close the edit dialog.

To disable the use of Universal Apps on a VDA, add the registry setting **EnableUWASeamlessSupport** in `HKLM\Software\Citrix\VirtualDesktopAgent\FeatureToggle` and set to **0**.

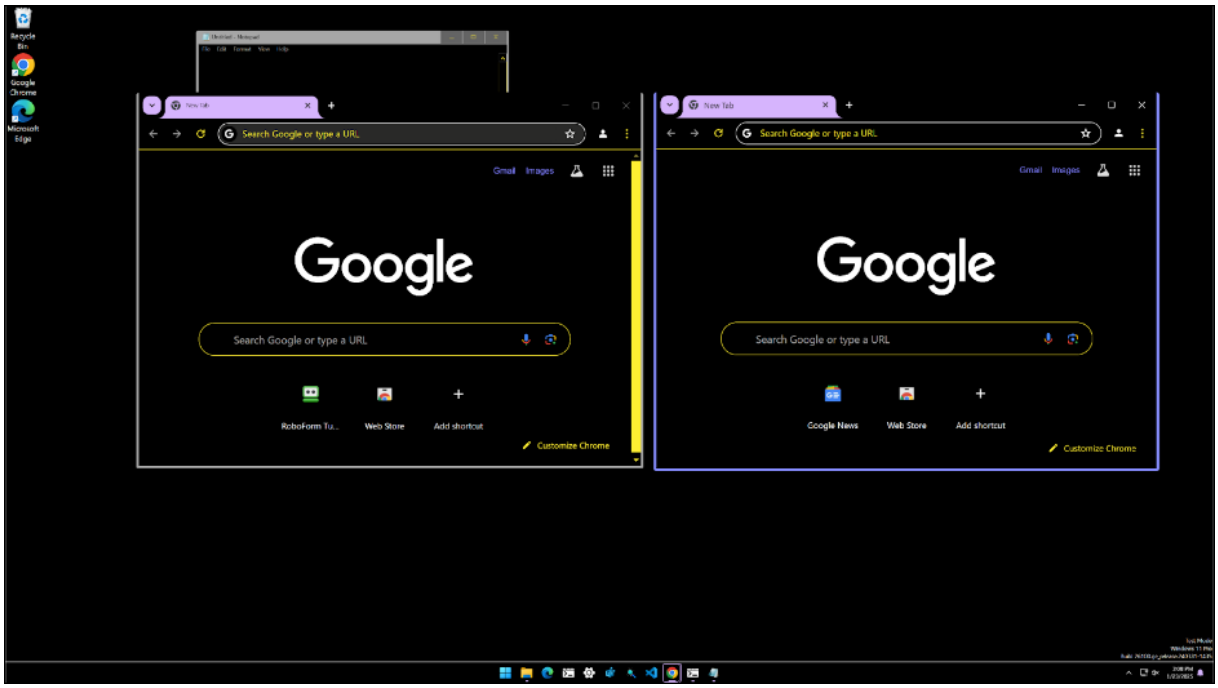
Uninstall UWP apps

When you uninstall a UWP app with a command such as `Remove-AppXPackage`, the item is uninstalled only for administrators. To remove the app from the machines of users who may have launched and used the app, run the removal command on each machine. You cannot uninstall the AppX package from all users' machines with one command.



Windows Accessibility Settings

May 13, 2026



Windows Accessibility settings for Seamless Applications will automatically mirror a subset of accessibility settings from the user's local endpoint to the published app session upon launch. During the session, changes to the local endpoint's accessibility settings will be automatically applied to the remote session, when possible.

Without Windows accessibility settings for Seamless applications enabled:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

With Windows accessibility settings for Seamless applications:

Windows accessibility settings for Seamless Applications will automatically and dynamically apply the settings to the remote application during the session:

Accessibility mirroring will automatically mirror the following local accessibility settings from the user's local endpoint to the VDA. Currently, the following accessibility settings are supported:

- High contrast themes

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Dark mode
- Mouse cursor size
- Text size

Prerequisites

May 13, 2026

The prerequisites for Accessibility settings for Seamless Applications are as follows:

- Windows endpoint running CWA for windows 2503 or later
- Windows VDA running VDA 2503 or later

Accessibility mirroring is available on the following VDA operating systems:

- Windows Server 2022
- Windows Server 2025
- Windows 10 Multi-session
- Windows 11 Single-session & Multi-session

And on the following client operating systems:

- Windows 10
- Windows 11

How to enable

May 13, 2026

Starting with Citrix Virtual Apps and Desktops 2511 and CWA for Windows 2511, accessibility settings propagation for Seamless applications are enabled by default.

No admin or end user configuration is needed for this feature.

For Admins

You can explicitly disable the mirroring of accessibility settings for VDAs running CVAD 2511 or later by registry.

1. Open the **Windows Registry Editor** using regedit.exe.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Navigate to `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWI\`
3. Create a **DWORD** value named AccessibilityMirroring and set the value to 0 to disable.

All users accessing seamless applications hosted on that VDA will not get their client accessibility settings propagated to their seamless application.

For End users

If you do not want to mirror the accessibility settings from your endpoint to your seamless applications, you can change the default behavior by explicitly disabling accessibility mirroring on your endpoint.

1. Open the Windows Registry Editor using regedit.exe.
2. Navigate to HKEY_CURRENT_USER\Software\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\TW
3. Create a DWORD value named AccessibilityMirroring and set its value to 0 to disable.

This will prevent the Windows accessibility settings set on the endpoint to propagate to all seamless applications that are launched from that endpoint.

Configuration for previous VDAs and client

For older VDAs (2503 and later) and endpoints (CWA for Windows 2503.10 and later) Windows Accessibility setting propagation for seamless applications is disabled by default.

On the VDA, Accessibility Settings for Seamless applications can be enabled with the following registry setting:

1. Open the **Windows Registry Editor** using `regedit.exe`.
2. Navigate to `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWI\`
3. Create a **DWORD** value named `AccessibilityMirroring` and set the value to **1** to enable.

With CWA 2503, Accessibility Setting for Seamless applications will also be disabled on the client by default and can be enabled with the following registry setting:

1. Open the **Windows Registry Editor** using `regedit.exe`.
2. Navigate to `HKEY_CURRENT_USER\Software\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\TWI`
3. Create a **DWORD** value named `AccessibilityMirroring` and set its value to **1** to enable.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> For Accessibility Settings for Seamless applications to function, the registry keys must be present on both the VDA and the client.
>
> No additional user intervention or configuration is required to enable the new accessibility settings for seamless applications.

Window Dragging

May 13, 2026

When interacting with seamless applications, such as window dragging, we distinguish between client-side dragging and server-side dragging. In most use cases, a client drag is preferred over a server drag. Client dragging will have a much smoother experience, and the Window dragging operation is performed locally instead of on the server.

In most cases HDX™ will automatically perform a client drag, however, certain applications might only allow for server dragging. A server drag can be identified by black bars being shown 'behind' the application while dragging the window. Selecting a different part of the titlebar will usually result in a client drag.

See below for the difference between client drag and server drag.

Applications like Google Chrome allow for their tabs to be rearranged by dragging them across.

This could, in some cases, also result in a server drag. This is expected behaviour.

Transparent Windows for Seamless applications

May 13, 2026

Overview

Starting with Citrix Virtual Apps and Desktops 2511, seamless applications now support transparent windows.
Window Transparency is a visual effect that makes window borders or entire application windows translucent instead of opaque, allowing users to see what's behind them, either the desktop background or other windows.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

{include image of seamless transparent app}

> **Note:**
>
> Using transparency in Seamless applications may impact server scalability and bandwidth usage. For optimal performance, disable any transparency effects within the applications, if possible.

Prerequisites

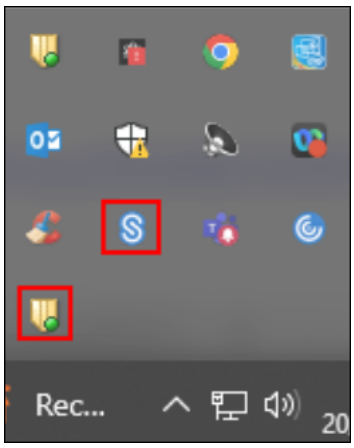
The prerequisites for transparent window support for seamless applications are as follows:

- Windows endpoint running CWA for windows 2511 or later
- Windows VDA running VDA 2511 or later

Transparent window support for seamless applications is available on the following VDA operating systems:

- Windows Server 2025
- Windows 11 Single-session & Multi-session

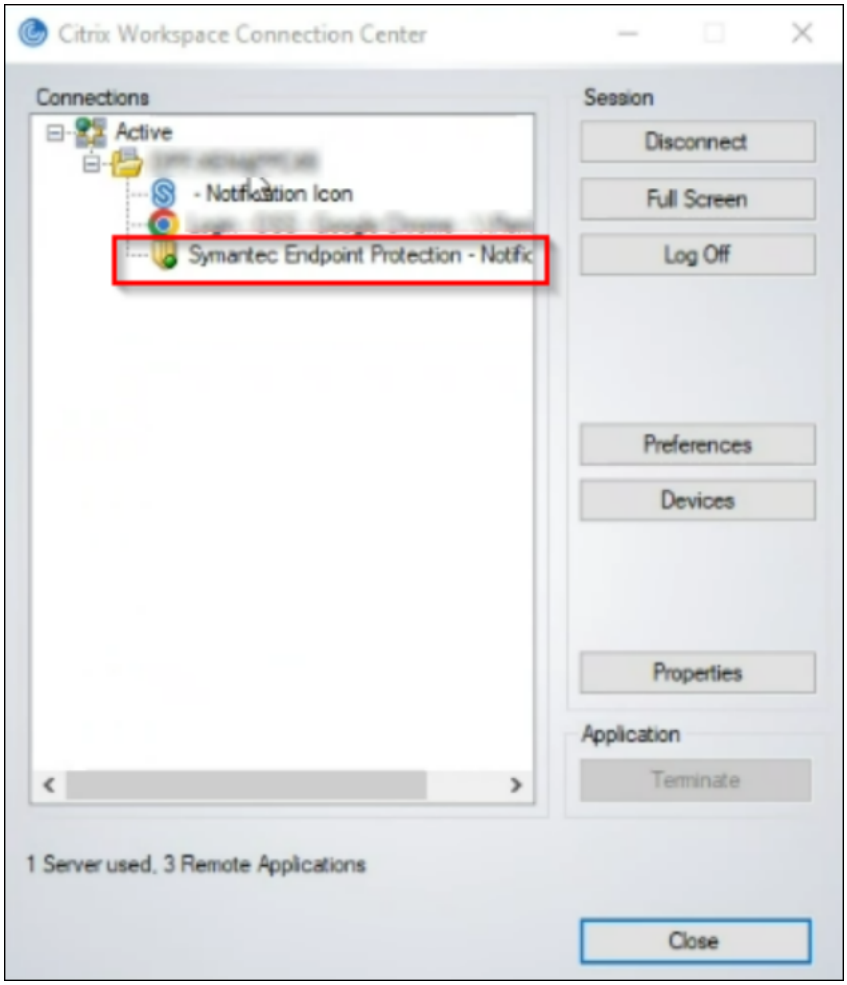
> **Note:**
>
> - Please note that transparent window support is not available for seamless applications published on Windows 10 or Server 2022 and earlier.
> - No additional configuration is required, and support is provided out-of-the-box.



System Tray Icon Redirection

May 13, 2026

Starting with Citrix Virtual Apps and Desktops™ release 2212, remote system tray icons that are present on the VDA will be automatically redirected to the client when using seamless applications.



All system tray icons on the VDA hosting the seamless application will be redirected to the endpoint.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the example above, the marked System Tray icons for Sharefile and Symantec are redirected from the VDA to the client.

These icons will also be present in the Citrix Workspace™ Connection Center.

End users can interact with these redirected system tray icons in the same way as local system tray icons.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When using seamless applications hosted on different VDAs, this could cause duplicate system tray icons to appear on the endpoint when the VDAs have identical system tray icons.

This behaviour is enabled by default and is currently non-configurable.

Session management configuration

August 11, 2026

By default, when a published application is closed, the user is logged off from the session host and the session is terminated. In the case where the user is using multiple published applications running on the same host, the session is only terminated when all applications have been closed.

In scenarios where users roam frequently or are expected to access open applications from the same hosts frequently throughout the day, the application launch times can be optimized by changing the session management behavior so that sessions are disconnected instead of logged off when the published application is closed. Therefore, allowing users to reconnect to an existing session instead of initiating a new session every time.

System requirements

- Control plane
  - Citrix DaaS Cloud
  - Citrix Virtual Apps and Desktops 2607 LTSR or later
- Virtual Delivery Agent
  - Windows: version 2607 or later

Configuration

Session management

You configure the behavior by configuring the following setting in Citrix policy:

- **Disconnect published app session after closing last app**: the setting is disabled by default. Set to Enabled to change the application close behavior from log off to disconnect.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Automatic application reopen

Optionally, it is possible to reopen an application in the disconnected session to further optimize the application launch time by also reducing the time to wait for the application to open when the session is reconnected.

To configure applications to reopen automatically:

1. Create a tag named CTX-DSMRELAUNCH
2. Apply the tag to the published application you wish to automatically reopen in the disconnected session.

For more information on tags, see the Tags documentation.

Considerations

Disconnect session timer

Changing the application close behavior to disconnect may lead to an increased number of disconnected sessions persisting on the session host. Therefore, it is strongly recommended to configure disconnect timers to ensure that sessions do not remain in a disconnected state indefinitely.
You can configure disconnect timeout through one of the following options:

1. Leverage the Disconnected session timer –Multi-session and Disconnected session timer interval –Multi-session settings in Citrix policy.
2. Use Group Policy to configure the **Set time limit for disconnected sessions** setting, located under **Computer Configuration > Administrative Templates > Windows Components > Remote Desktop Services > Remote Desktop Session Host > Session Time Limits**.

WEM multi-session optimization

Enabling WEM Multi-Session Optimization is highly recommended. This feature automatically reduces CPU and memory consumption for disconnected sessions after one minute, ensuring that resources are allocated to active users and enhancing overall server performance. Upon user reconnection, resource priorities and limits are restored accordingly.

For details, see the Workspace Environment Management (WEM) documentation.

Publish applications

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

With Linux VDA Version 7.13, Citrix added the seamless applications feature to all the supported Linux platforms. No specific installation procedures are required to use this feature.

> **Tip:**
>
> With Linux VDA version 1.4, Citrix added support for non-seamless published applications and session sharing.

Publish applications using Citrix Studio

You can publish applications installed on a Linux VDA when you create a delivery group or add applications to an existing delivery group. The process is similar to publishing applications installed on a Windows VDA. For more information, see the Citrix Virtual Apps and Desktops documentation (based on the version of Citrix Virtual Apps and Desktops being used).

> **Note:**
>
> - When configuring delivery groups, ensure that the delivery type is set to **Desktop and applications** or **Applications**.
> - We recommend that you create separate VDAs and delivery groups for app and desktop deliveries.
> - To use seamless applications, do not disable the seamless mode on StoreFront. The seamless mode is enabled by default. If you have already disabled it by setting "TWIMode=Off," remove this setting instead of changing it to "TWIMode=On."Otherwise you might not be able to launch a published desktop.

Limitation

The Linux VDA does not support the launch of multiple concurrent instances of the same application by a single user.

In an app session, only shortcuts that are specific to the app work as expected.

Known issues

The following known issues are identified during publishing applications:

- Non-rectangular windows are not supported. The corners of a window might show the server-side background.
- Preview of the content of a window from a published application is not supported.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When you run multiple LibreOffice applications, only the one launched first shows on Citrix Studio because these applications share the process.
- Published Qt5-based applications like "Dolphin"might not show icons. To resolve the issue, see the article at https://wiki.archlinux.org/title/Qt.
- Linux applications often have an About window containing information about the application in use, and web links for more information are commonly found in those windows. Clicking the web links in the About window can launch a web browser from within published applications such as **calc**, **gedit**, **calendar**, and **LibreOffice Suite**. The unintentional launch of a web browser bypasses application isolation and can compromise security. To address the issue, change the default web browser by completing the following steps:

  1. Create a none.sh file in a custom location, for example:

     ```
     sudo mkdir /home/none

     sudo touch /home/none/none.sh

     sudo chmod +x /home/none/none.sh
     ```

  2. Add the following lines to the none.sh file:

     ```
     #!/bin/bash

     echo "NONE"
     ```

  3. Create the /etc/xdg/mimeapps.list file with sudo, and then add the following lines to the mimeapps.list file:

     ```
     [Default Applications]

     text/html=none.desktop

     x-scheme-handler/http=none.desktop

     x-scheme-handler/https=none.desktop

     x-scheme-handler/about=none.desktop

     x-scheme-handler/unknown=none.desktop
     ```

  4. Create the /usr/share/applications/none.desktop file with sudo, and then add the following lines to the none.desktop file:

     ```
     [Desktop Entry]

     Encoding=UTF-8

     Version=1.0

     Type=Application
     ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
8
9  Terminal=false
10
11 Exec=/home/none/none.sh
12
13 Name=None
14
15 Icon=/home/none/none.sh
```

Because you can put the none.sh file in a custom location, make sure that none.desktop can reference the none.sh file correctly.

Troubleshooting

May 13, 2026

Troubleshooting session sign-out issues with Published Applications

When publishing applications, only the main executable file for the published application is specified. However, some applications might produce additional (child) processes that run in the background and are not closed by the corresponding main executable file when the main published application is closed. Additional processes might also be created, from scripts that are executed, or from specific registry keys, like `Run` and `RunOnceKey`. These applications can prevent a graceful sign-out, resulting in lingering or hanging sessions and might result in the session not closing and the user being signed out.

In this case, you need to reset or exit these sessions using Citrix Director.

To help identify and troubleshoot sessions not being signed out properly, Citrix has made three registry entries available. Identifying and troubleshooting of session not being logged off properly due to these issues is a three-step process:

1. Identifying which sessions have published applications are holding up a graceful sign-out
2. Identifying for those published applications if they produce any additional (child) processes
3. Add these processes to a specified registry entry to prevent them from holding up sign-out

Step 2: Identifying for those published applications if they produce any additional (child) processes

Once a published application is identified to hold up a graceful sign-out, the next step is to determine if this application produces additional processes when running.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can read `HKCU\Software\CitrixVolatile\Seamless\Sessions\[ID]\LogoffCheckerBloc` to determine if any processes are blocking a graceful sign-out when a published application is closed.

In the following example, the key `LogoffCheckerBlockingProcess` contains the following entries:

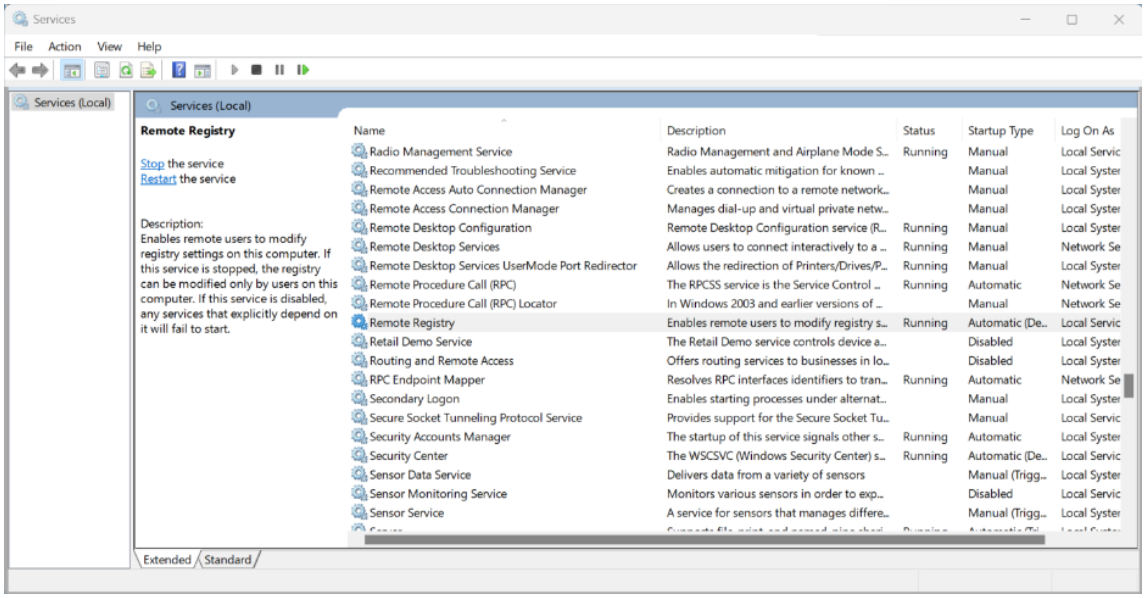
```
PhoneExperienceHost.exe
SkypeApp.exe
SkypeBackgroundHost.exe
```

These processes have held up the graceful sign-out.

> **Note:**
>
> Replace the [ID] with the correct session ID for the session you want to check.

Step 3: Add these processes to a specified registry entry to prevent them from holding up sign-out

You can add these processes to the following registry keys to prevent them from holding up sign-out in future sessions:



```
Add the process file name to the following registry key:
Caution! Refer to the Disclaimer at the end of this article before
   using the Registry Editor.
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWI
Value Name:LogoffCheckSysModules
Type:REG_SZ
String:MyAppName.exe
```

More information about `LogoffCheckSysModules`, see Graceful logoff from a published application renders the session in an active state.

Step-by-step troubleshooting guide

1. Start the remote registry Service under the VDA under test:
    a) In the Control Panel, select **Administrative Tools > Services**.
    b) Right-click **Remote Registry Service** and select **Properties**.
    c) Under **Startup Type**, select **Automatic** from the drop-down menu.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Turn off the Windows Firewall on the VDA under test or create an inbound firewall rule to enable port 455:

    a) In the Control Panel, select **Windows Defender Firewall > Advanced Settings**.

    b) Right-click **Inbound Rules** and select **New Rule**.

    c) In **New Inbound Rule Wizard**, select **Port**.

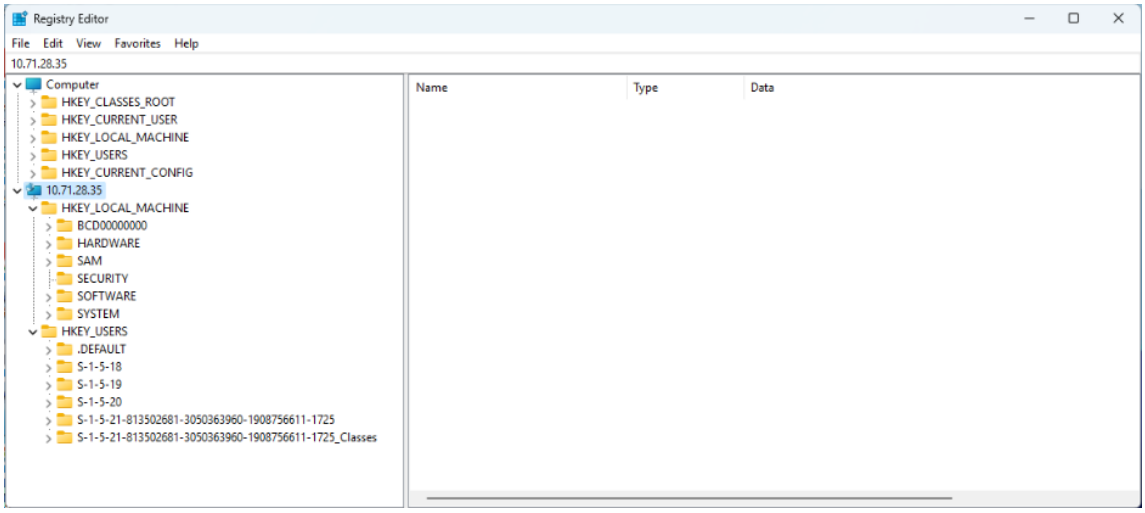
    d) On the **Protocols and Ports** page, select **TCP and Specific Local Ports**. Enter 445 as the local port.

    e) Select **Allow Connection** on the **Action** page.

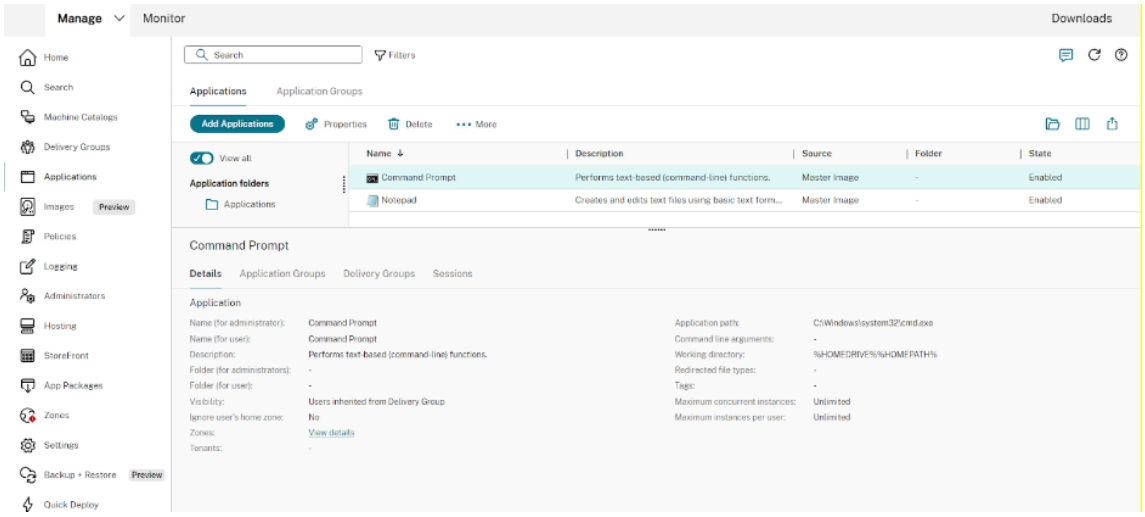
    f) Select the firewall profiles that you want to apply the new inbound rule.

    g) Name the firewall rule and select **Finish** to exit **New Inbound Rule wizard**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

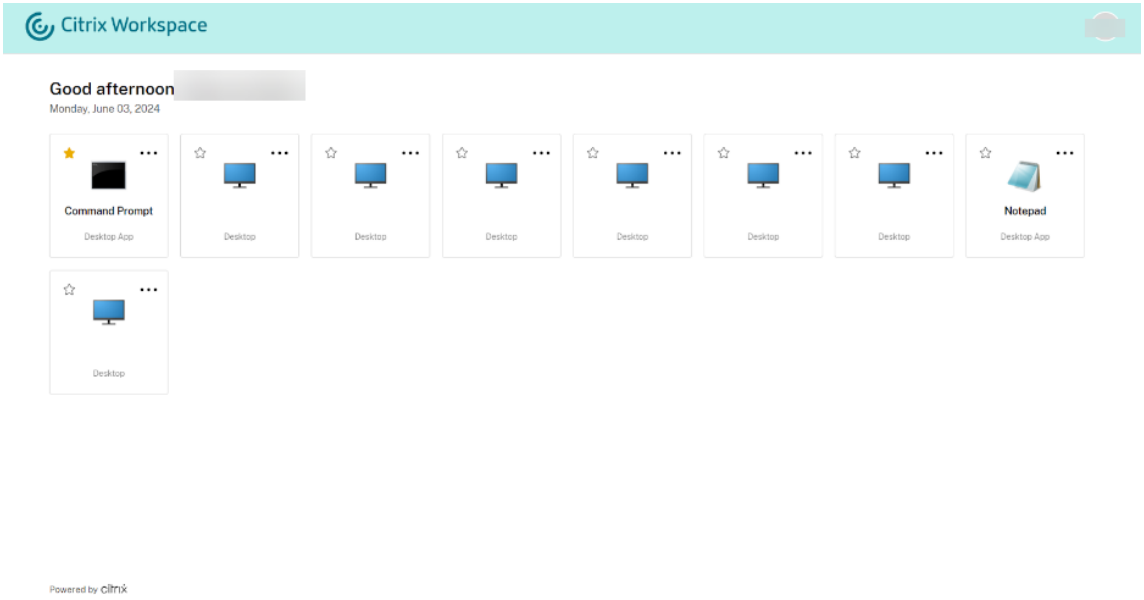


3. From another VM on the same domain (it could be DC, DDC, or another VDA), run `Regedit` and connect to a remote registry.

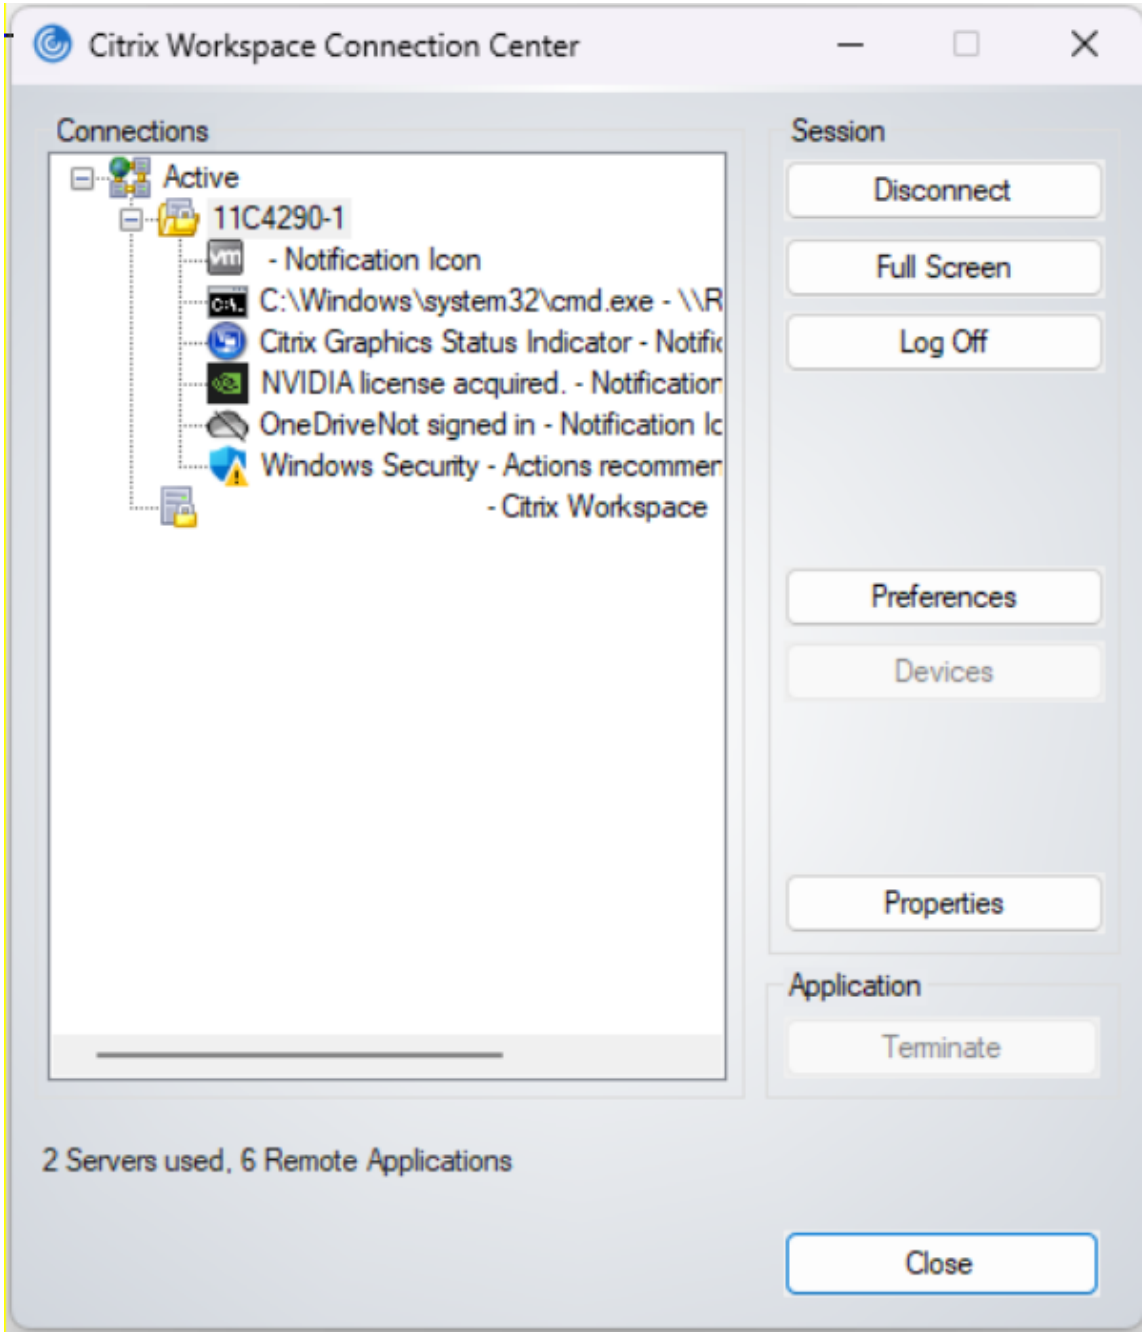


4. Enter the IP address of the VDA under test and click **OK**. The `regedit` tree must display branches for the VDA under test.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



5. Open the **Command Prompt** published application.



The **Command Prompt** app is displayed on Citrix Workspace.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Open **Connection Center** on the client. This is used for monitoring when a session is signed out, after closing an opened seamless app. We can see in the following image that the Command Prompt process `c:\Windows\system32\cmd.exe` is active on the remote VDI.

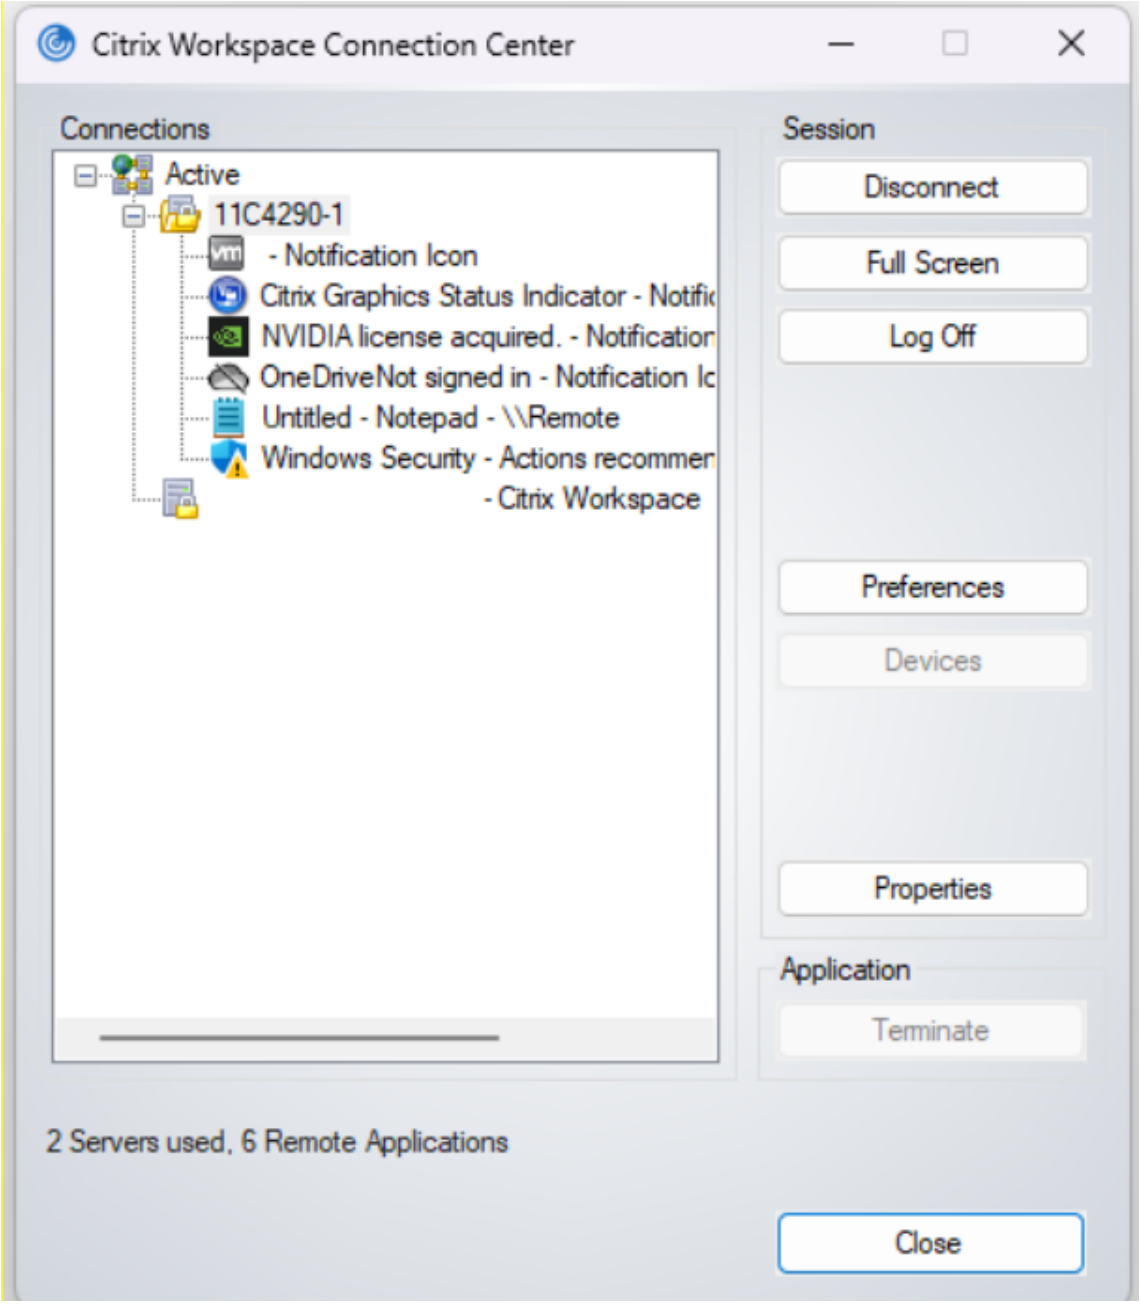
© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. From the VDA where **regedit** is running, go to the following remote IP location: `HKEY_USERS\S-1-X-XX-XXXXXXXX-XXXXXXXXXX-XXXXXXXXXX-XXXX\SOFTWARE\CitrixVolatile\Seamless\Sessions\X\`

   > **Note:**
   >
   > This path changes every time you open a new session.

8. There are two keys to read here (do not change them here): **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess**. These keys display any programs that are blocking

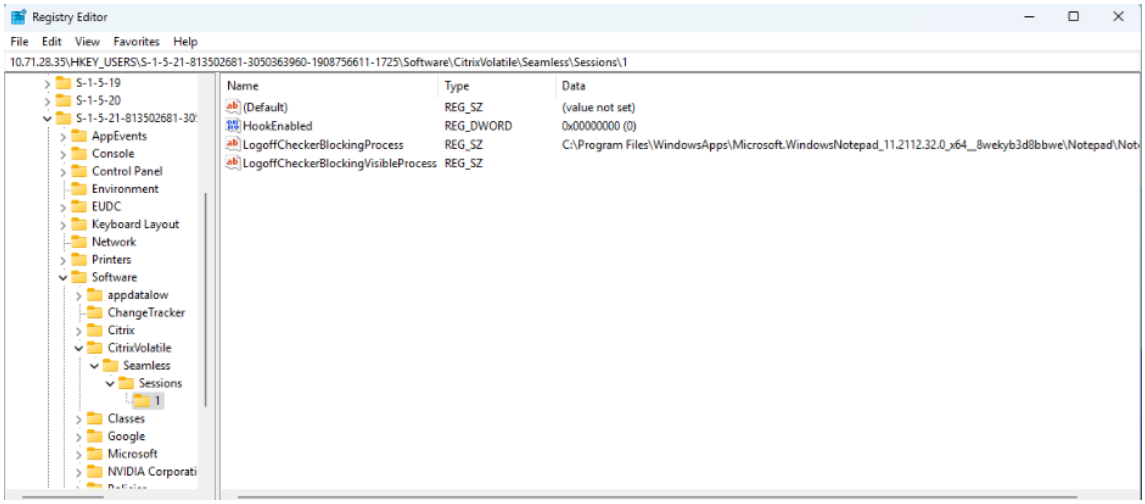
© 1997–2026 Citrix Systems, Inc. All rights reserved.



sign-out. The first one must display `C:\Windows\System32\cmd.exe` since that was open and has not been closed yet.

> **Note:**
>
> **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess** must not be manually edited. Manually editing these registry values could lead to unstable sessions.

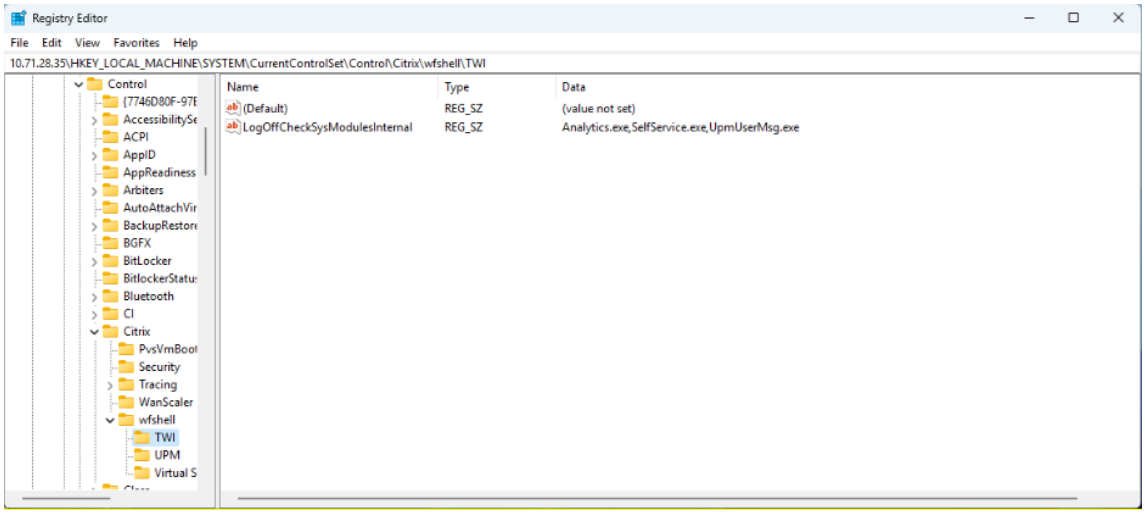
9. Click **X** in the upper-right hand corner to exit **Seamless CMD**.
10. Check the connection center to see if the session closes. It may take up to 30 seconds to close. If it closes, there have been no applications or processes that have prevented a graceful sign-out.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

11. If the session did not close, refresh the **regedit** output with F5.
12. Check the contents of **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess** again. CMD must no longer be present but there should be another listed process. Whatever process is currently blocking session sign-out must be displayed here.

    In this case, **Notepad.exe** is open from the published command prompt before the command prompt was closed and this remote notepad process is holding up a graceful sign-out.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

13. Make a note of the path to this executable, and which key it appeared in, and enter it in the following registry key, under the remote tree:

    - If it appears in **LogoffCheckBlockingProcess**: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWILogoffCheckSysModulesInternal`
    - If it appears in **LogoffCheckerBlockingVisibleProcess**: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWILogoffCheckVisibleSysModules`

    > **Note:**
    >
    > If there is already one or more entries in the key, add a comma to the end and put the new entry after the comma.

14. Sign out from the session from the connection center on the client, and re-open the Remote Application.
15. Repeat steps 9-16 until the session is signed out automatically within 30 seconds of closing the Remote Application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> After troubleshooting, revert the temporary Firewall changes to allow remote registry access if needed.

How to modify LogonUI to view Windows disclaimer message in full size when opening published applications

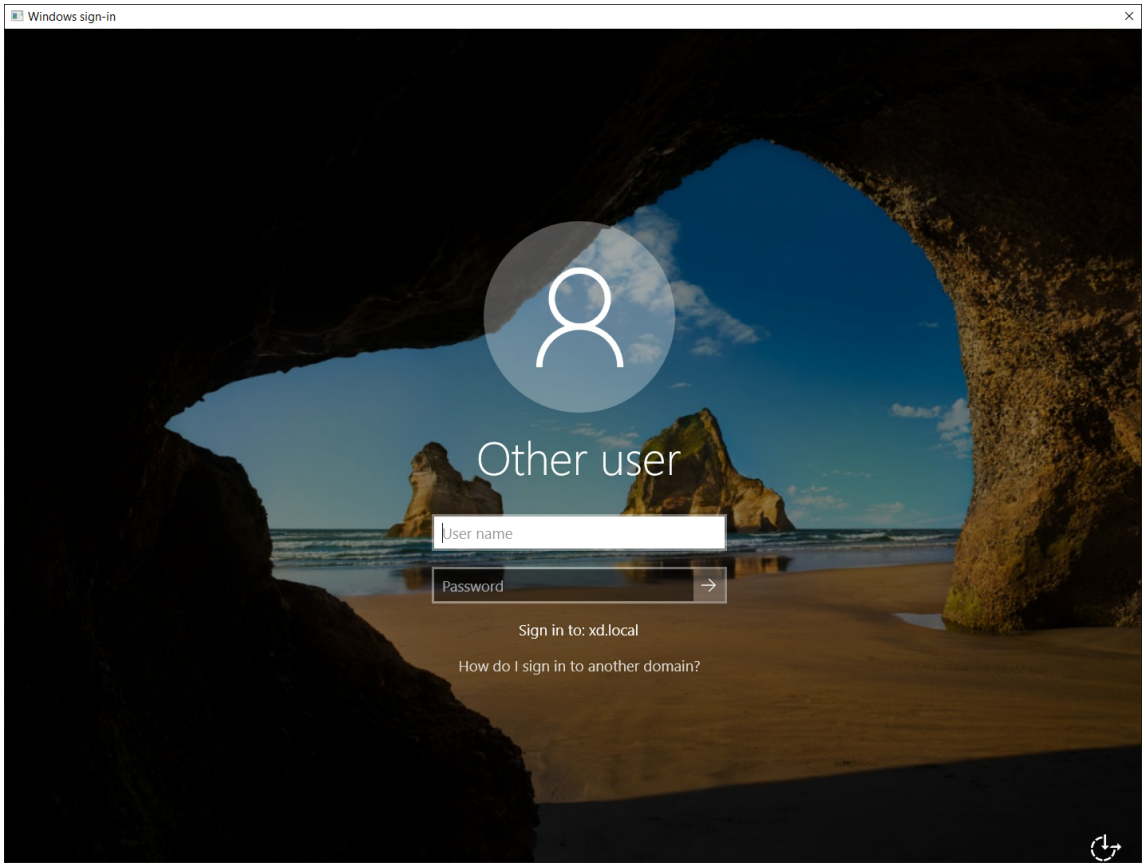
The **LogonUI** window scaling is improved for scenarios where authentication pass-through does not occur. The **LogonUI** window is scaled based on the monitor resolution and DPI settings used which ensures that the complete **LogonUI** window is visible without any clipping.

The window size in pixels can also be set manually in the registry.

1. Open the **Registry Editor** using `regedit` on the **Run** command.
2. Go to `HKEY_LOCAL_MACHINE\Software\Citrix\CtxHook\AppInit_DLLS\Seamless Hook\`.
3. Create two new DWORD keys: **LogonUIWidth** and **LogonUIHeight**.
4. Set the value of the keys to the required width and height in pixels for the **LogonUI** window.

   When manually setting the **LogonUI** windows size, automatic scaling is disabled.

> **Note:**
>
> These registry paths have changed from 2407 and later. The old registry values are ignored and deprecated.



By default, the **LogonUI** window includes a title bar with a close button which enables the end user to disconnect from the session if needed.

Disable a tilebar

You can disable the tile bar in the **LogonUI** window with the following registry key:

1. Open the Registry Editor using `regedit` on the **Run** command.
2. Go to `HKEY_LOCAL_MACHINE\Software\Citrix\CtxHook\AppInit_DLLS\Seamless Hook\`.
3. Create new DWORD keys: **LogonUICaption** and set the value of the key to `0`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Published application does not appear

Refer to the support articles to troubleshoot instances when the published application do not launch or disappear during launch or when it fails to appear.

To troubleshoot instances

Additional Seamless configuration settings

Under most circumstances, the default server settings are sufficient for the majority of applications, and no additional settings are required for published applications.

In some cases, additional configuration is required, including controlling the interaction and display of specified application windows, as well as settings within the published application environment itself.

> **Note:**
>
> Citrix does not recommend changing these configuration settings unless explicitly instructed by Citrix support

© 1997–2026 Citrix Systems, Inc. All rights reserved.

These settings are outlined in the Seamless configuration settings KB article.

Multimedia

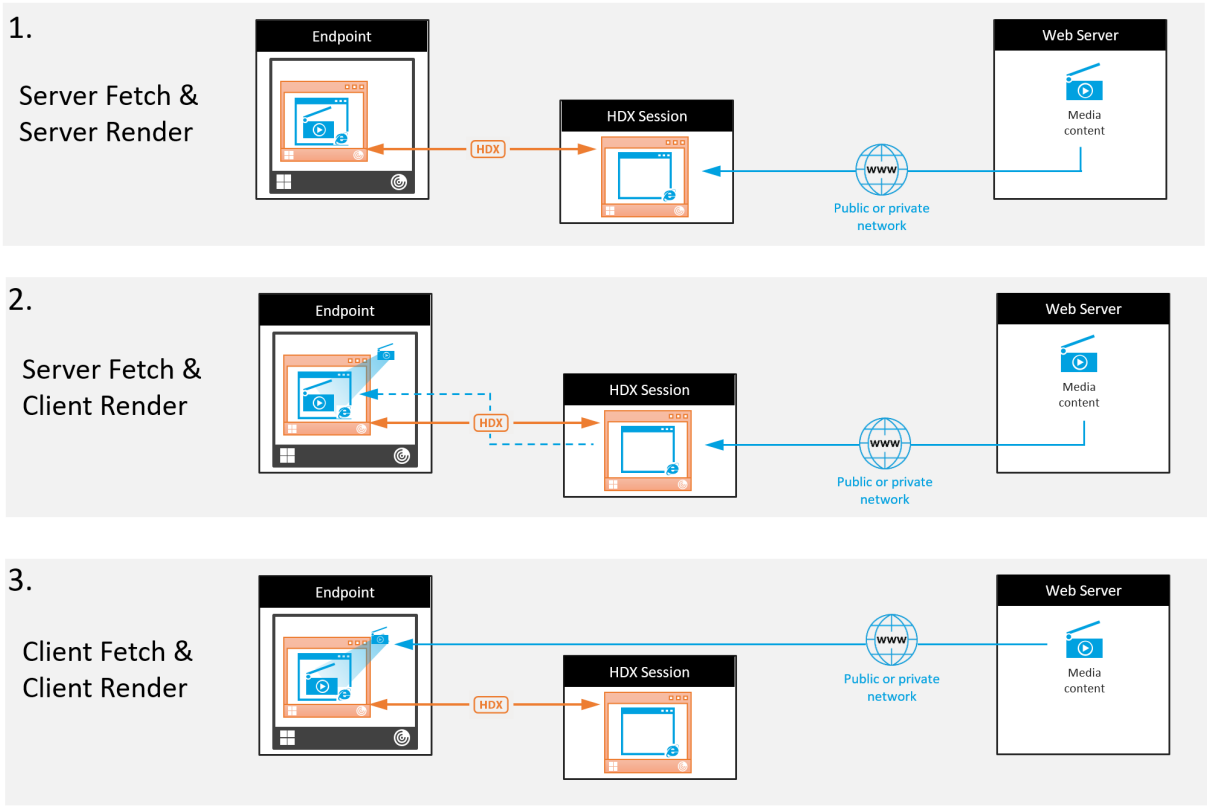
May 13, 2026

The HDX™ technology stack supports the delivery of multimedia applications through two complementary approaches:

- Server-side rendering multimedia delivery
- Client-side rendering multimedia redirection

This strategy ensures that you can deliver a full range of multimedia formats, with a great user experience, while maximizing server scalability to reduce the cost-per-user.

With server-rendered multimedia delivery, audio and video content is decoded and rendered on the Citrix Virtual Apps and Desktops server by the application. The content is then compressed and delivered using ICA protocol to Citrix Workspace app on the user device. This method provides the highest rate of compatibility with various applications and media formats. Because video processing is compute-intensive, server-rendered multimedia delivery benefits greatly from the onboard hardware acceleration. For example, support for DirectX Video Acceleration (DXVA) offloads the CPU by performing H.264 decoding in separate hardware. Intel Quick Sync, AMD RapidFire, and NVIDIA NVENC technologies provide hardware-accelerated H.264 encoding.



Because most servers do not offer any hardware acceleration for video compression, server scalability is negatively impacted if all video processing is done on the server CPU. You can maintain high server scalability, by redirecting many multimedia formats to the user device for local rendering.

- Windows Media redirection offloads the server for a wide variety of media formats typically associated with the Windows Media Player.
- HTML5 video has become popular, and Citrix® introduced a redirection technology for this type of content. We recommend the browser content redirection for websites using HTML5, HLS, DASH, or WebRTC.
- You can apply the general contact redirection technologies Host-to-client redirection and Local App Access to the multimedia content.

Putting these technologies together, if you don't configure redirection, HDX does Server-Side Rendering.
If you configure redirection, HDX uses either Server Fetch and Client Render or Client Fetch and Client Render. If those methods fail, HDX falls back to Server-Side Rendering as needed and is subject to the Fallback Prevention Policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example scenarios

Scenario 1. (Server Fetch and Server Rendering):

1. The server fetches the media file from its source, decodes, and then presents the content to an audio device or display device.
2. The server extracts the presented image or sound from the display device or audio device respectively.
3. The server optionally compresses it, and then transmits it to the client.

This approach incurs a high CPU cost, high bandwidth cost (if the extracted image/sound isn't compressed efficiently), and has low server scalability.

Thinwire and Audio virtual channels handle this approach. The advantage of this approach is that it reduces the hardware and software requirements for the clients. Using this approach the decoding happens on the server and it works for a wider variety of devices and formats.

Scenario 2. (Server Fetch and Client Render):

This approach relies on being able to intercept the media content before it is decoded and presented to the audio or display device. The compressed audio/video content is instead sent to the client where it is then decoded and presented locally. The advantage of this approach is that the are offloaded to the client devices, saving CPU cycles on the server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

However, it also introduces some additional hardware and software requirements for the client. The client must be able to decode each format that it might receive.

Scenario 3. (Client Fetching and Client Rendering):

This approach relies on being able to intercept the media content URL before it's fetched from the source. The URL is sent to the client where the media content is fetched, decoded, and presented locally. This approach is conceptually simple. Its advantage is that it saves both CPU cycles on the server and bandwidth because the server sends only control commands. However, the media content is not always accessible to the clients.

Framework and platform:

Single-session operating systems (Windows, Mac OS X, and Linux) provide multimedia frameworks that enable the faster development of multimedia applications. This table lists some of the more popular multimedia frameworks. Each framework divides media processing into several stages and uses a pipelined-based architecture.

Framework	Platform
DirectShow	Windows (98 and later)
Media Foundation	Windows (Vista and later)
Gstreamer	Linux
Quicktime	Mac OS X

Double hop support with media redirection technologies

	Audio redirection	No
	Browser content redirection	No
	HDX webcam redirection	Yes
	HTML5 Video redirection	Yes
	Windows Media redirection	Yes

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Audio features

August 13, 2026

You can configure and add the following Citrix policy settings to a policy that optimizes HDX audio features. For usage details plus relationships and dependencies with other policy settings, see Audio policy settings and Bandwidth policy settings and Multi-stream connections policy settings.

Adaptive audio

With adaptive audio, you don't need to manually configure the audio quality policies on the VDA. Adaptive audio optimizes settings for your environment and replaces obsolete audio compression formats to provide an excellent user experience.

Adaptive audio is enabled by default. To disable adaptive audio, see Audio policy settings.

> **Important:**
>
> Citrix® recommends delivering audio using User Datagram Protocol (UDP) rather than TCP when real-time audio applications are required. The following audio transport options are available over UDP:
>
> - Audio over UDP
> - HDX™ Adaptive Transport (Enlightened Data Transport)
>
> UDP audio encryption using DTLS is available only between Citrix Gateway and Citrix Workspace™ app. Therefore, sometimes it might be preferable to use TCP transport. TCP supports end-to-end TLS encryption from the VDA to Citrix Workspace app.
>
> For more information on adaptive audio and UDP audio, see Audio over UDP Real-time Transport and audio UDP port range.

Loss tolerant mode for audio

Starting with the 2308 version, loss tolerant mode supports audio. This feature enhances the user experience for real-time streaming and improves audio quality over EDT when users are connecting through a network with latency and packet loss.

For more information about the loss tolerant mode and EDT, see Additional information in the Citrix Virtual Apps and Desktops documentation.

Loss tolerant mode for audio is enabled by default. If disabled or to re-enable, complete the following steps:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Enable HDX adaptive transport (EDT).
2. Enable loss tolerant mode for audio.

Client requirements and settings

The following are the minimum Citrix Workspace app versions that support loss tolerant mode:

- Citrix Workspace app for Windows 2309
- Citrix Workspace app for Linux 2311
- Citrix Workspace app for Mac 2311

In addition, please note the following:

- (Optional) For direct connections between Citrix Workspace app and VDA, enabling DTLS on VDAs is required.
- (Optional) For remote connections, loss tolerant mode must also be supported on the Citrix Gateway Service or NetScaler Gateway.

Audio quality

In general, higher sound quality consumes more bandwidth and server CPU utilization by sending more audio data to user devices. Sound compression allows you to balance sound quality against overall session performance; use Citrix policy settings to configure the compression levels to apply to sound files.

By default, the **Audio quality policy** setting is set to High - high definition audio when TCP transport is used. The policy is set to Medium - optimized-for-speech when UDP transport (recommended) is used. The **High Definition audio** setting provides high fidelity stereo audio, but consumes more bandwidth than other quality settings. Do not use this audio quality for non-optimized voice chat or video chat applications (such as softphones). The reason is that it might introduce latency into the audio path that is not suitable for real-time communications. We recommend the optimized for speech policy setting for real-time audio, regardless of the selected transport protocol.

When the bandwidth is limited, for example satellite or dial-up connections, reducing audio quality to **Low** consumes the least possible bandwidth. In this situation, create separate policies for users on low-bandwidth connections so that users on high-bandwidth connections are not adversely impacted.

For setting details, see Audio policy settings. Remember to enable Client audio settings on the user device.

Bandwidth guidelines for audio playback and recording:

- Adaptive audio (default; recommended for VoIP and all use cases)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Bitrate: variable adaptive
    - Number of channels: 2 (Stereo) for playback, 1 (mono) for microphone capture
    - Frequency: 48000 Hz
    - Bit-depth: 16-bit

- High quality
    - Bitrate: ~100 kbps (min 75, max 175 kbps) for playback / ~70 kbps for microphone capture
    - Number of Channels: 2 (Stereo) for playback, 1 (mono) for microphone capture
    - Frequency: 44100 Hz
    - Bit-depth: 16-bit

- Medium quality
    - Bitrate: ~16 kbps (min 20, max 40 kbps) for playback, ~16 kbps for microphone capture
    - Number of Channels: 1 (Mono) for both playback and capture
    - Frequency: 16000 Hz (wideband)
    - Bit-depth: 16-bit

- Low quality
    - Bitrate: ~ 11 kbps (min 10; max 25 kbps) for playback, ~11 kbps for microphone capture
    - Number of Channels: 1 (Mono) for both playback and capture
    - Frequency: 8000 Hz (narrowband)
    - Bit-depth: 16-bit

Audio Quality Enhancer for EDT loss tolerant mode

Starting with the 2507 version, audio quality enhancer is enabled by default for adaptive audio over EDT loss tolerant mode for audio.

Audio quality enhancer maintains clear audio during brief network disruptions. This feature adapts to the network conditions to ensure consistent audio performance during playback and recording.

> **Note:**
>
> Adaptive audio must be enabled for this feature to work.

Client audio redirection

To allow users to receive audio from an application on a server through speakers or other sound devices on the user device, leave the **Client audio redirection** setting at **Allowed**. This is the default.

Client audio mapping puts extra load on the servers and the network. However, prohibiting client audio redirection disables all HDX audio functionality.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For setting details, see Audio policy settings. Remember to enable client audio settings on the user device.

Client microphone redirection

To allow users to record audio using input devices such as microphones on the user device, leave the **Client microphone redirection** setting at its default (Allowed).

For security, user devices alert their users, when servers they don't trust, try to access microphones. Users can choose to accept or reject access before using the microphone. Users can disable this alert on the Citrix Workspace app.

For setting details, see Audio policy settings. Remember to enable Client audio settings on the user device.

Audio Plug N Play

The Audio Plug N Play policy setting allows or prevents the use of multiple audio devices to record and play sound. This setting is **Enabled** by default. Audio Plug N Play enables audio devices to be recognized. The devices are recognized even if they are not plugged in until after the user session has started.

This setting applies only to Windows Multi-session OS machines.

For setting details, see Audio policy settings.

Audio redirection bandwidth limit and audio redirection bandwidth limit percent

The Audio redirection bandwidth limit policy setting specifies the maximum bandwidth (in kilobits per second) for a playing and recording audio in a session.

The Audio redirection bandwidth limit percent setting specifies the maximum bandwidth for audio redirection as a percentage of the total available bandwidth.

By default, zero (no maximum) is specified for both settings. If both settings are configured, the one with the lowest bandwidth limit is used.

For setting details, see Bandwidth policy settings. Remember to enable Client audio settings on the user device.

Audio over UDP Real-time Transport and Audio UDP port range

By default, Audio over User Datagram Protocol (UDP) Real-time Transport is allowed (when selected at the time of installation). It opens up a UDP port on the server for connections that use Audio over

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UDP Real-time Transport. If there is network congestion or packet loss, we recommend configuring UDP/RTP for audio to ensure the best possible user experience. For any real time audio such as soft-phone applications, UDP audio is preferred to EDT. UDP allows for packet loss without retransmission, ensuring that no latency is added on connections with high packet loss.

> **Important:**
>
> When Citrix Gateway is not in the path, audio data transmitted with UDP is not encrypted. If Citrix Gateway is configured to access Citrix Virtual Apps and Desktops™ resources, then audio traffic between the endpoint device and Citrix Gateway is secured using DTLS protocol.

The Audio UDP port range specifies the range of port numbers that the Windows VDA uses to exchange audio packet data with the user device.

By default, the range is 16500 through 16509.

> **Note:**
>
> If Audio over UDP Real-time Transport is not required for adaptive audio, Citrix recommends configuring the policy setting to Disabled. This helps avoid Citrix Workspace app clients requesting open UDP connections or triggering unwanted Citrix Workspace app client firewall configuration dialog windows to appear.

For setting details about Audio over UDP Real-time Transport, see Audio policy settings. For details about Audio UDP port range, see Multi-stream connections policy settings. Remember to enable Client audio settings on the user device.

Audio over UDP requires the Windows VDA. For supported policies on the Linux VDA, see Policy support list.

Audio setting policies for user devices

1. Load the group policy templates by following Configuring the Group Policy Object administrative template.
2. In the Group Policy Editor, expand **Administrative Templates > Citrix Components > Citrix Workspace > User Experience**.
3. For **Client audio settings**, select **Not Configured**, **Enabled**, or **Disabled**.
   - **Not Configured**. By default, Audio Redirection is enabled using high quality audio or the previously configured custom audio settings.
   - **Enabled**. Enables audio redirection using the selected options.
   - **Disabled**. Disables audio redirection.
4. If you select **Enabled**, choose a sound quality. For UDP audio, use **Medium** (default).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. For UDP audio only, select **Enable Real-Time Transport** and then set the range of incoming ports to open in the local Windows firewall.
6. To use UDP Audio with Citrix Gateway, select **Allow Real-Time Transport Through gateway**. Configure Citrix Gateway with DTLS. For more information, see this article.

As an Administrator, if you do not have control on endpoint devices to make these changes, use the default.ica attributes from StoreFront to enable UDP Audio. For example, for bring your own devices or home computers.

1. On the StoreFront machine, open C:\inetpub\wwwroot\Citrix\<Store Name>\App_Data\default.ica with an editor such as notepad.
2. Make the following entries under the [Application] section.

   ; This text enables Real-Time Transport

   EnableRtpAudio=true

   ; This text allows Real-Time Transport Through gateway

   EnableUDPThroughGateway=true

   ; This text sets audio quality to Medium

   AudioBandwidthLimit=1

   ; UDP Port range

   RtpAudioLowestPort=16500

   RtpAudioHighestPort=16509

If you enable User Datagram Protocol (UDP) audio by editing default.ica, then UDP audio is enabled for all users who are using that store.

Avoid echo during multimedia conferences

Users in audio or video conferences might hear an echo. Echoes usually occur when speakers and microphones are too close to each other. For that reason, we recommend the use of headsets for audio and video conferences.

HDX provides an echo cancellation option (enabled by default) that minimizes any echo. The effectiveness of echo cancellation is sensitive to the distance between the speakers and the microphone. Ensure that the devices aren't too close or too far away from each other.

You can change a registry setting to disable echo cancellation. For information, see Avoid echo during multimedia conferences in the list of features managed through the registry.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Softphones

A softphone is software acting as a phone interface. You use a softphone to make calls over the internet from a computer or other smart device. By using a softphone, you can dial phone numbers and carry out other phone-related functions using a screen.

Citrix Virtual Apps and Desktops™ support several alternatives for delivering softphones.

- **Control mode**. The hosted softphone controls a physical telephone set. In this mode, no audio traffic goes through the Citrix Virtual Apps and Desktops server.
- **HDX RealTime optimized softphone support (recommended)**. The media engine runs on user device, and Voice over Internet Protocol traffic flows peer-to-peer. For examples, see:
  - HDX Optimization for Microsoft Teams
  - HDX RealTime Optimization Pack, which optimizes the delivery of Microsoft Skype for Business
  - Cisco Jabber Softphone for VDI (formerly known as VXME)
  - Cisco Webex Meetings for VDI
  - Avaya VDI Equinox (formerly known as VDI Communicator)
  - Zoom VDI Plugin
  - Genesys PureEngage Cloud
  - Nuance Dragon PowerMic dictation device
- **Local App Access**. A Citrix Virtual Apps and Desktops feature that allows an application such as a softphone to run locally on the Windows user device yet appear seamlessly integrated with their virtual/published desktop. This feature offloads all audio processing to the user device. For more information, see Local App Access and URL redirection.
- **HDX RealTime generic softphone support.** Voice over Internet Protocol-over-ICA.

Generic softphone support

Generic softphone support enables you to host an unmodified softphone on XenApp or XenDesktop in the data center. The audio traffic goes over the Citrix ICA protocol (preferably using UDP/RTP) to the user device running the Citrix Workspace app.

Generic softphone support is a feature of HDX RealTime. This approach to softphone delivery is especially useful when:

- An optimized solution for delivering the softphone is not available and the user is not on a Windows device where Local App Access can be used.
- The media engine that is needed for optimized delivery of the softphone isn't installed on the user device or isn't available for the operating system version running on the user device. In this scenario, Generic HDX RealTime provides a valuable fallback solution.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

There are two softphone delivery considerations using Citrix Virtual Apps and Desktops:

- How the softphone application is delivered to the virtual/published desktop.
- How the audio is delivered to and from the user headset, microphone, and speakers, or USB telephone set.

Citrix Virtual Apps and Desktops include numerous technologies to support generic softphone delivery:

- Optimized-for-Speech codec for fast encode of the real-time audio and bandwidth efficiency.
- Low latency audio stack.
- Server-side jitter buffer to smooth out the audio when the network latency fluctuates.
- Packet tagging (DSCP and WMM) for Quality of Service.
    - DSCP tagging for RTP packets (Layer 3)
    - WMM tagging for Wi-Fi

The Citrix Workspace app versions for Windows, Linux, Chrome, and Mac also are Voice over Internet Protocol capable. Citrix Workspace app for Windows offers these features:

- Client-side jitter buffer - Ensures smooth audio even when the network latency fluctuates.
- Echo cancellation - Allows for greater variation in the distance between microphone and speakers for workers who do not use a headset.
- Audio plug-n-play - Audio devices do not need to be plugged in before starting a session. They can be plugged in at any time.
- Audio device routing - Users can direct ringtone to speakers but the voice path to their headset.
- Multi-stream ICA - Enables flexible Quality of Service-based routing over the network.
- ICA supports four TCP and two UDP streams. One of the UDP streams supports the real-time audio over RTP.

For a summary of Citrix Workspace app capabilities, see Citrix Receiver Feature Matrix.

System configuration recommendations

Client Hardware and Software:
For optimal audio quality, we recommend the latest version of Citrix Workspace app and a good quality headset that has acoustic echo cancellation (AEC). Citrix Workspace app versions for Windows, Linux, and Mac support Voice over Internet Protocol. Also, Dell Wyse offers Voice over Internet Protocol support for ThinOS (WTOS).

CPU Considerations:
Monitor CPU usage on the VDA to determine if it is necessary to assign two virtual CPUs to each virtual machine. Real-time voice and video are data intensive. Configuring two virtual CPUs reduces the thread switching latency. Therefore, we recommend that you configure two vCPUs in a Citrix Virtual Desktops™ VDI environment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Having two virtual CPUs does not necessarily mean doubling the number of physical CPUs, because physical CPUs can be shared across sessions.

Citrix Gateway Protocol (CGP), which is used for the Session Reliability feature, also increases CPU consumption. On high-quality network connections, you can disable this feature to reduce CPU consumption on the VDA. Neither of the preceding steps might be necessary on a powerful server.

UDP Audio:
Audio over UDP provides excellent tolerance of network congestion and packet loss. We recommend it instead of TCP when available.

LAN/WAN configuration:
Proper configuration of the network is critical for good real-time audio quality. Typically, you must configure virtual LANs (VLANs) because excessive broadcast packets can introduce jitter. IPv6-enabled devices might generate many broadcast packets. If IPv6 support is not needed, you can disable IPv6 on those devices. Configure to support Quality of Service.

Settings for use WAN connections:
You can use voice chat over LAN and WAN connections. On a WAN connection, audio quality depends on the latency, packet loss, and jitter on the connection. If delivering softphones to users on a WAN connection, we recommend using the NetScaler® SD-WAN between the data center and the remote office. Doing so maintains a high Quality of Service. NetScaler SD-WAN supports Multi-Stream ICA, including UDP. Also, for a single TCP stream, it's possible to distinguish the priorities of various ICA virtual channels to ensure that high priority real-time audio data receives preferential treatment.

Use Director or the HDX Monitor to validate your HDX configuration.

Remote user connections:
Citrix Gateway supports DTLS to deliver UDP/RTP traffic natively (without encapsulation in TCP). Open firewalls bidirectionally for UDP traffic over Port 443.

Codec selection and bandwidth consumption:
Between the user device and the VDA in the data center, we recommend using the **Optimized-for-Speech** codec setting, also known as Medium Quality audio. Between the VDA platform and the IP-PBX, the softphone uses whatever codec is configured or negotiated. For example:

- G711 provides good voice quality but has a bandwidth requirement of from 80 kilobits per second through 100 kilobits per second per call (depending on Network Layer2 overheads).
- G729 provides good voice quality and has a low bandwidth requirement of from 30 kilobits per second through 40 kilobits per second per call (depending on Network Layer 2 overheads).

Delivering softphone applications to the virtual desktop

There are two methods by which you can deliver a softphone to the XenDesktop® virtual desktop:

- The application can be installed in the virtual desktop image.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The application can be streamed to the virtual desktop using Microsoft App-V. This approach has manageability advantages because the virtual desktop image is kept uncluttered. After being streamed to the virtual desktop, the application runs in that environment as if it was installed in the usual manner. Not all applications are compatible with App-V.

Delivering audio to and from the user device

Generic HDX RealTime supports two methods of delivering audio to and from the user device:

- **Citrix Audio Virtual Channel**. We generally recommend the Citrix Audio Virtual Channel because it's designed specifically for audio transport.
- **Generic USB Redirection**. Supports audio devices having buttons or a display (or both), human interface device (HID), if the user device is on a LAN or LAN-like connection back to the Citrix Virtual Apps and Desktops server.

Citrix audio virtual channel

The bidirectional Citrix Audio Virtual Channel (CTXCAM) enables audio to be delivered efficiently over the network. Generic HDX RealTime takes the audio from the user headset or microphone and compresses it. Then, it sends it over ICA to the softphone application on the virtual desktop. Likewise, the audio output of the softphone is compressed and sent in the other direction to the user headset or speakers. This compression is independent of the compression used by the softphone itself (such as G.729 or G.711). It is done using the Optimized-for-Speech codec (Medium Quality). Its characteristics are ideal for Voice over Internet Protocol. It features quick encode time, and it consumes only approximately 56 Kilobits per second of network bandwidth (28 Kbps in each direction), peak. This codec must be explicitly selected in the Studio console because it is not the default audio codec. The default is the HD Audio codec (High Quality). This codec is excellent for high fidelity stereo soundtracks but is slower to encode compared to the Optimized-for-Speech codec.

Generic USB Redirection

Citrix Generic USB Redirection technology (CTXGUSB virtual channel) provides a generic means of remoting USB devices, including composite devices (audio plus HID) and isochronous USB devices. This approach is limited to LAN-connected users. This reason being that the USB protocol tends to be sensitive to network latency and requires considerable network bandwidth. Isochronous USB redirection works well when using some softphones. This redirection provides excellent voice quality and low latency. However, Citrix Audio Virtual Channel is preferred because it is optimized for audio traffic. The primary exception is when you're using an audio device with buttons. For example, a USB telephone attached to the user device that is LAN-connected to the data center. In this case, Generic USB Redirection supports buttons on the phone set or headset that control features by sending a signal back to the softphone. There isn't an issue with buttons that work locally on the device.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Audio diagnostic command line tool

The audio diagnostic command line tool on the VDA can be used to query session data related to audio policies, configuration, and data transport.

Usage

Open a command prompt and run `CtxAudio.exe` from the `C:\Program Files\Citrix\HDX\bin` folder.

- Running the tool as an administrator displays all active ICA session(s) audio information.
- Running the tool as a non-administrator displays the current user's ICA session audio information.

Output

The tool outputs various configuration settings that can help diagnose audio-related issues within a session.

Section	Description
Policy information	Audio policies applied to the current session(s).
Settings information	Audio related configuration settings stored in the registry.
State information	Audio state, version, codecs, and transport applied to the current session(s).
Devices information	Device names, their roles, and their statuses used in the session.

> **Note:**
>
> The output varies depending on if you run the tool on a multi-session (TS) VDA or a single-session VDA (WSVDA).

Limitation

You install an audio device on your client, enable the audio redirection, and start an RDS session. The audio files might fail to play and an error message appears.

As a workaround, add the registry key on the RDS machine, and then restart the machine. For information, see Audio limitation in the list of features managed through the registry.

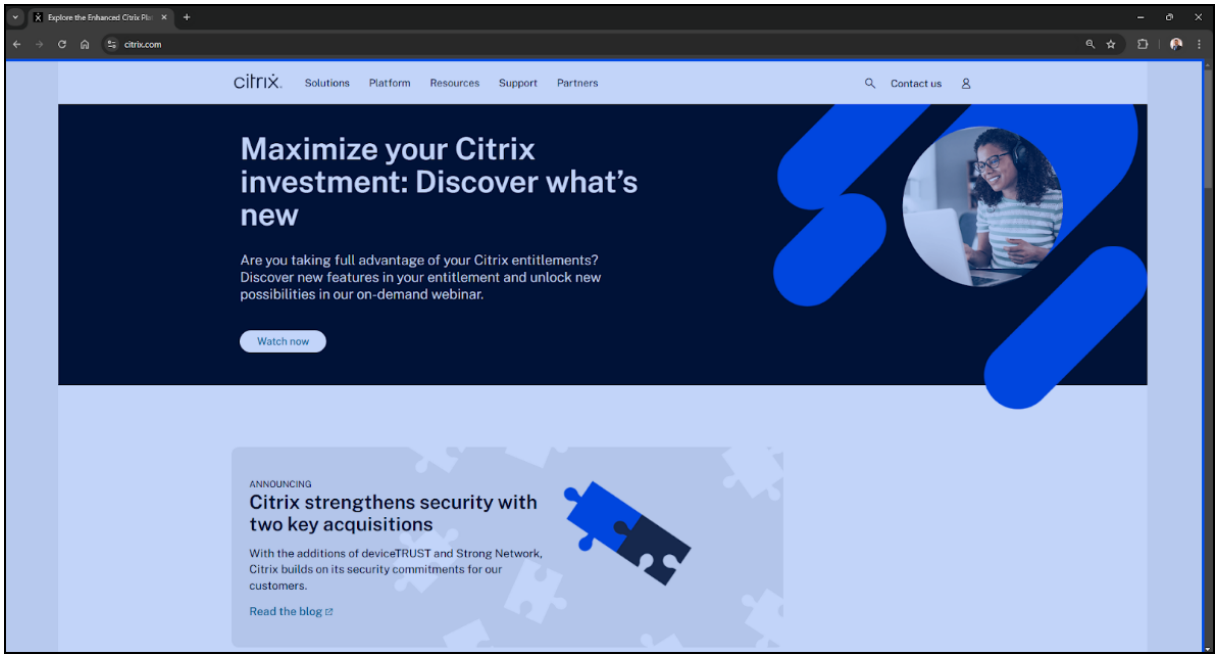
Browser content redirection

September 4, 2026



Introduction

Browser Content Redirection (BCR) enhances the user experience of web browsing within Citrix Virtual Apps and Desktops™ environments. By offloading the rendering of web pages to the user's local machine, BCR reduces server load and improves performance, especially for complex or resource-intensive websites.

How it works

BCR utilizes the Citrix Workspace™ app to create a secure browsing environment on the user's device. When a user accesses an allowed web page, the viewport of the browser window is redirected to the client. The client side browser engine then leverages the local machine's resources to render the page, resulting in faster loading times and smoother interaction.

Note that only the browser viewport is redirected. The viewport is the rectangular area in your browser where the content is displayed. The viewport doesn't include things like the Address Bar, Favorites Toolbar, or Status Bar. Those items are in the user interface, which is still running on the browser in the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Key Benefits

Browser content redirection intelligently manages the web traffic, delivering a superior experience for your users while reducing strain on your infrastructure.

Here's how they can benefit your organization:

- **Cost Savings:** Offload resource-intensive web pages to user devices, freeing up valuable server resources and reducing bandwidth consumption. This translates to lower hardware and network costs.
- **Enhanced User Experience:** Provide your users with a smoother, more responsive browsing experience, even with graphics-intensive websites. Deliver native-like performance, eliminating lag and improving productivity.
- **Improved Security:** Maintain a secure environment while allowing access to both internal and external resources.
- **Increased Flexibility:** Support a wide range of use cases, from basic web browsing to complex web applications that require proxy traversal or SSO authentication. Easily manage redirection settings with granular policy controls in Citrix Web Studio™

System Requirements

Server side components

Citrix Virtual Apps and Desktops

- Long Term Service Release
  - Minimum requirements - Any non end-of-life LTSR Citrix Virtual Apps and Desktops release
  - Recommended - Citrix Virtual Apps and Desktops 2402 or above
- Current Release
  - Minimum requirement - Any non end-of-life CR Citrix Virtual Apps and Desktops release
  - Recommended - Latest Citrix Virtual Apps and Desktops release

Browser Components

- Browsers
  - Microsoft Edge
  - Google Chrome
- Browser redirection extension

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Google Chrome Store
    - Microsoft Edge Store
- We recommend using the latest version of the browsers for best experience

> **Note:**
>
> To enable Browser Content Redirection or Bi-directional Content Redirection, ensure you have Virtual Delivery Agent (VDA) version 2503 if you intend to use the Browser redirection extension from the Microsoft Edge Add-ons store. For older VDA versions, you can achieve the same functionality by installing the extension from the Chrome Web Store within your Microsoft Edge browser.
>
> The extension links provided above are Generally Available (GA) and are relevant for production-level deployments. In addition to the GA extensions, Citrix also publishes a Beta (GA + 1) extension specifically on the Google Chrome Store.
>
> Citrix recommends that customers have test users on the Beta version so upcoming updates are tested and any issues are reported early. This ensures a smooth process when the GA extensions officially roll out.
>
> Extension releases typically match the Citrix Workspace App releases.

Client side components

Windows

- Windows 10 or 11
- Citrix Workspace App
    - Minimum Requirement - Any non end-of-life Citrix Workspace App
    - Recommended
        - Long Term Service Release - Citrix Workspace App for Windows 2402 CU4 or newer, Citrix Workspace App for Windows 2507
        - Current Release - Citrix Workspace App 2405 or newer

> **Note:**
>
> - Browser content redirection is not supported on Citrix Workspace App Windows LTSR releases 1912 and 2203.1
> - Client side browser engine needed for Browser content redirection is installed by default on Citrix Workspace App Current Releases
> - Client side browser engine needed for Browser content redirection is not installed by

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> default on Citrix Workspace App 2402 LTSR release. Administrators can leverage the ADDLOCAL switch to install BCR browser components on top of Citrix Workspace App.
>
> - Starting with the Citrix Workspace app 2507 for Windows, Browser Content Redirection (BCR) is managed as a modular component but is still packaged with Citrix Workspace App. The BCR component is now installed by default on LTSR versions as well, ensuring consistency between CR and LTSR. Additionally, standalone BCR packages will be published for situations that require independent updates or interim patches outside the regular Citrix Workspace app release cycle For more details, see Citrix Workspace App Windows documentation.

Linux

- Citrix Workspace App
  - Minimum requirement - Any non end-of-life Citrix Workspace App
  - Recommended - Citrix Workspace App 2408 or newer
    For more details, please refer to Citrix Workspace App for Linux documentation.

> **Note:**
>
> Starting with Citrix Workspace app 2601 for Linux, Browser Content Redirection (BCR) is managed as a modular component. The BCR component continues to be packaged & installed by default with Citrix Workspace app for Linux, ensuring a consistent user experience. Additionally, standalone BCR packages will be published for situations that require independent updates or interim patches outside the regular Citrix Workspace app release cycle. For more details, see Citrix Workspace App Linux documentation

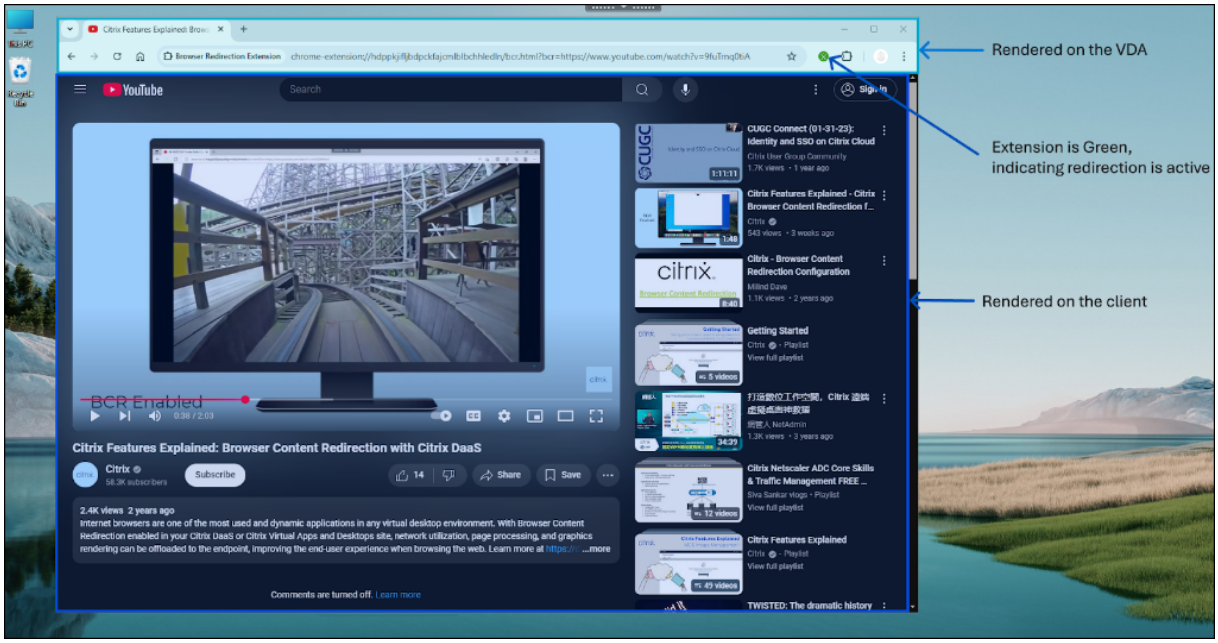
ChromeOS

- Citrix Workspace App
  - Latest version from Chrome Web Store

MacOS

- Citrix Workspace App
  - Minimum Requirement - Citrix Workspace App for Mac 2411 or newer

> **Note:**
>
> - For MacOS, Browser content redirection package is independent of Citrix Workspace App and is always the latest version. Hence, the package will be compatible with multiple CWA versions above the specified minimum version



© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - As the dependency on Citrix Workspace App Mac is not there, Browser Content Redirection version numbering will not match Citrix Workspace App Mac version
> - Client side browser engine is not packaged with Citrix Workspace App Mac. Download and install the client side for Mac on Citrix Downloads.
> - Intel and ARM packages are separate. Hence, you need to install the appropriate version that suits the MacOS endpoint
> - Starting with Citrix Workspace app 2511.1 for Mac, the Modular BCR component is installed by default but not packaged with Citrix Workspace App, eliminating the need to manually download and install the component from Citrix Downloads. Standalone BCR packages will be published for situations that require independent updates or interim patches outside the regular Citrix Workspace app release cycle. For more details see Citrix Workspace App Mac documentation.

Steps to Configure

1. Install the client side and server side components according to the system requirements
    - For details on extension deployment, refer Extension deployment section
2. Configure the studio policies
    - Web studio policies offer a granular way to configure Browser content redirection to suit a variety of use cases
    - The basic policies allow the administrator to configure URLs that need to be allowed / not allowed with Browser content redirection
    - The URLs can be configured with wild cards
3. Open a supported web browser and navigate to an allowed URL
    - If the match is found in the allow list, the website will be redirected to the client
    - Citrix Workspace app blends the view port onto the VDA side browser for a seamless experience
4. The color of the extension logo specifies the status of the content redirection
    - Green: Active and Connected
    - Gray: Not active / idle on the current tab
    - Red: Broken / Not Working

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

- HTML5 video redirection and browser content redirection are independent features. The HTML5 video redirection policies aren't needed for this feature to work. However, the Citrix HDX™ HTML5 Video Redirection Service is used for browser content redirection.
- We recommend doing all the configurations through Web Studio and not with registry keys.

Features and Configuration Options

Browser content redirection provides various ways to configure in order to suit the use cases of various customer environments. For detailed information on policy settings, refer Browser content redirection policy settings.

Redirection mechanisms

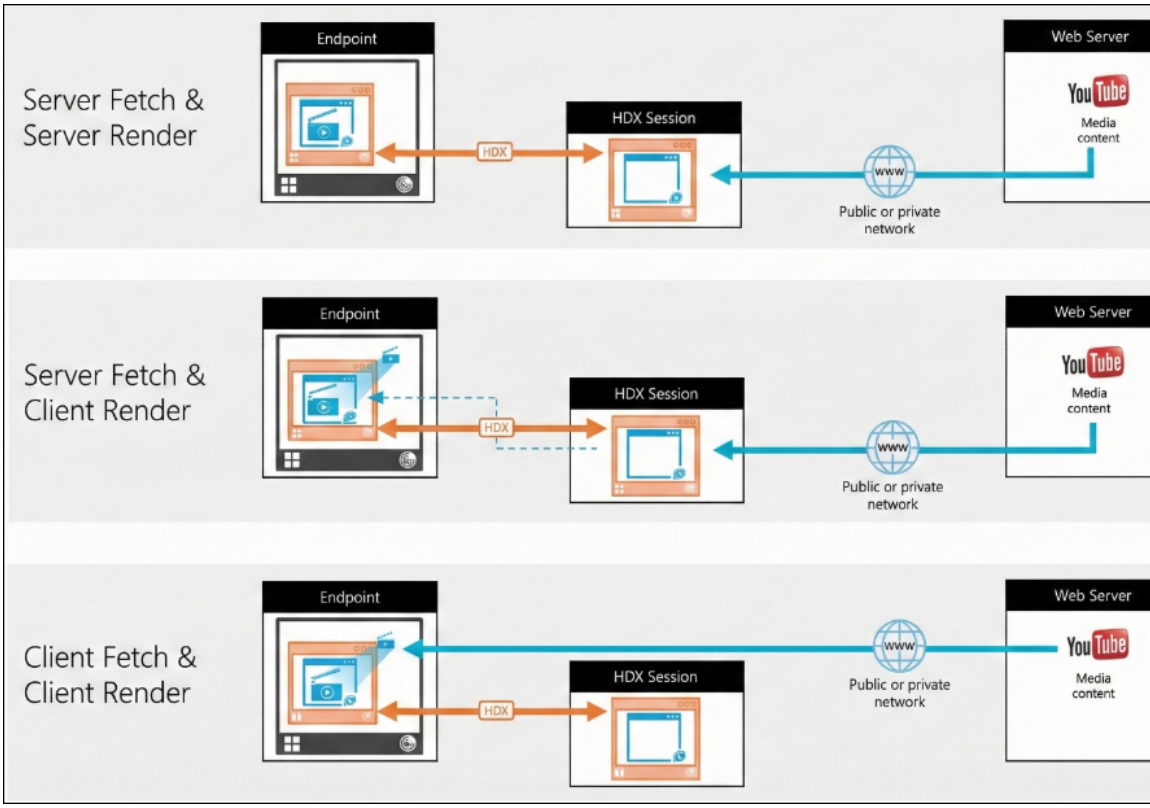
Client fetch client render By default, Browser content redirection operates in this mode i.e., the client side browser engine reaches out to the web page directly. This requires necessary access from the client network to the web page. Client fetch client render scenario offloads all the network, CPU and RAM usage from Citrix VDA to the client and is the most optimal way to configure Browser content redirection

Policy configuration options

- Browser content redirection: Allowed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Browser content redirection ACL configuration
    - Specify the URLs that need to be redirected. By default, YouTube is the only website configured for redirection
- Browser content redirection block list configuration
    - Optional configuration option to block any specific URLs / sub URLs from redirection. Leverage this option with the above to gain maximum customization.



Server fetch client render In this case, the client side browser engine contacts and fetches content from the web server through the VDA using a virtual channel. This option is useful when the client doesn't have internet access (for example, thin clients). Low CPU and RAM consumption on the VDA, but bandwidth is consumed on the ICA® virtual channel.

There are three modes of operation in this scenario. The term proxy refers to a proxy device that the VDA accesses to gain Internet access.

Policy configuration options

- In addition to the policies specified in the Client fetch client render section, configure the following
- Browser content redirection proxy configuration
    - **Direct or Transparent:** Configure this if you want to leverage server fetch client render and you have direct access or transparent proxy access to the web page from the VDA. The keyword "DIRECT"should be configured in the policy
    - **Explicit Proxy:** Configure this if you want to leverage server fetch client render and you have an explicit proxy access to the web page from the VDA
    - **PAC files:** Configure this if you rely on PAC files browsers in the VDA can automatically choose the appropriate proxy server for fetching a specified URL.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Fallback mode

There might be times when client redirection fails. For example, if the client machine does not have direct internet access, an error response might go back to the VDA. In such cases, the browser on the VDA can then reload and render the page on the server.

Authentication handling

Authentication sites In the current implementation of Browser Content Redirection, regardless of the redirection mechanism, authentication sites need to be configured in order for Browser content redirection to handle log in into websites.

Example:

1. When only https://www.youtube.com/*/ is configured in Browser content redirection ACL configuration and no authentication sites are configured, BCR will fall back to server side rendering when signing into the website and will continue there.
2. In this case, in order for BCR to handle authentication sites, configure https://www.accounts.google.com/*/ and any other auth sites such as IdP website as needed. Each website sign in works differently and hence ensure to list
3. When configured, BCR will handle the authentication. For example, with client fetch client render - the authentication will also happen from the client side browser engine for a seamless sign in experience.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy configuration options Configure the Browser content redirection authentication sites policy in addition to the policies mentioned in the redirection mechanisms section

> **Note:**
>
> - BCR client side browser does not persist cookies (including authentication) after the redirected window is closed. This would manifest as the need to re-login into websites when BCR windows are completely closed and re-opened.
> - BCR client side browser does not read cookies from the VDA side browser. Hence, user personalization and preferences don't synchronize with the VDA browser.

Integrated Windows Authentication Browser content redirection can provide a seamless way to authenticate to websites when configured with Integrated Windows Authentation (IWA) within the same domain as the VDA.

Policy configuration options

- Configure the Browser content redirection Integrated Windows Authentication support policy

Before enabling single sign-on, complete the following:

- Configure the Kerberos infrastructure to issue tickets for service principal names (SPNs) constructed from the host name. For example, HTTP/serverhostname.com.
- For server fetch client render: When you use browser content redirection in server fetch mode, ensure that DNS is configured properly on the VDA.
- For client fetch client render: When you use browser content redirection in client fetch mode, ensure that DNS is configured properly on the client device and that you allow TCP connections from the overlay to the web server's IP address.

Proxy Authentication Browser content redirection can provide a seamless way to authenticate to your web proxy when fetching content from the server. When enabled, Browser Content Redirection will automatically obtain and use a Kerberos service ticket to authenticate with the proxy

Policy configuration options

- Configure the Browser content redirection Server fetch proxy auth policy

Before enabling the server fetch proxy auth policy, complete the following:

- You need to configure your PAC file to route traffic through a downstream web proxy and set up the proxy to use Kerberos authentication

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Server-side certificate validation

Browser Content Redirection is further enhanced with certificate validation support. When accessing a redirected website from the client, the client overlay browser may not trust the certificate from the server or the MitM proxy. In such cases, BCR can now validate the Host or Proxy certificates against the VDAs certificate store.

Minimum requirements This feature is enabled by default, and no configuration is necessary once the below requirements are met:

- Citrix Virtual Apps and Desktops 2507
- Citrix Workspace App for Windows 2511
- Citrix Workspace App for Linux 2604
- Browser Redirection Extension (Chrome or Edge) 25.11 or later.

Single sign-on support

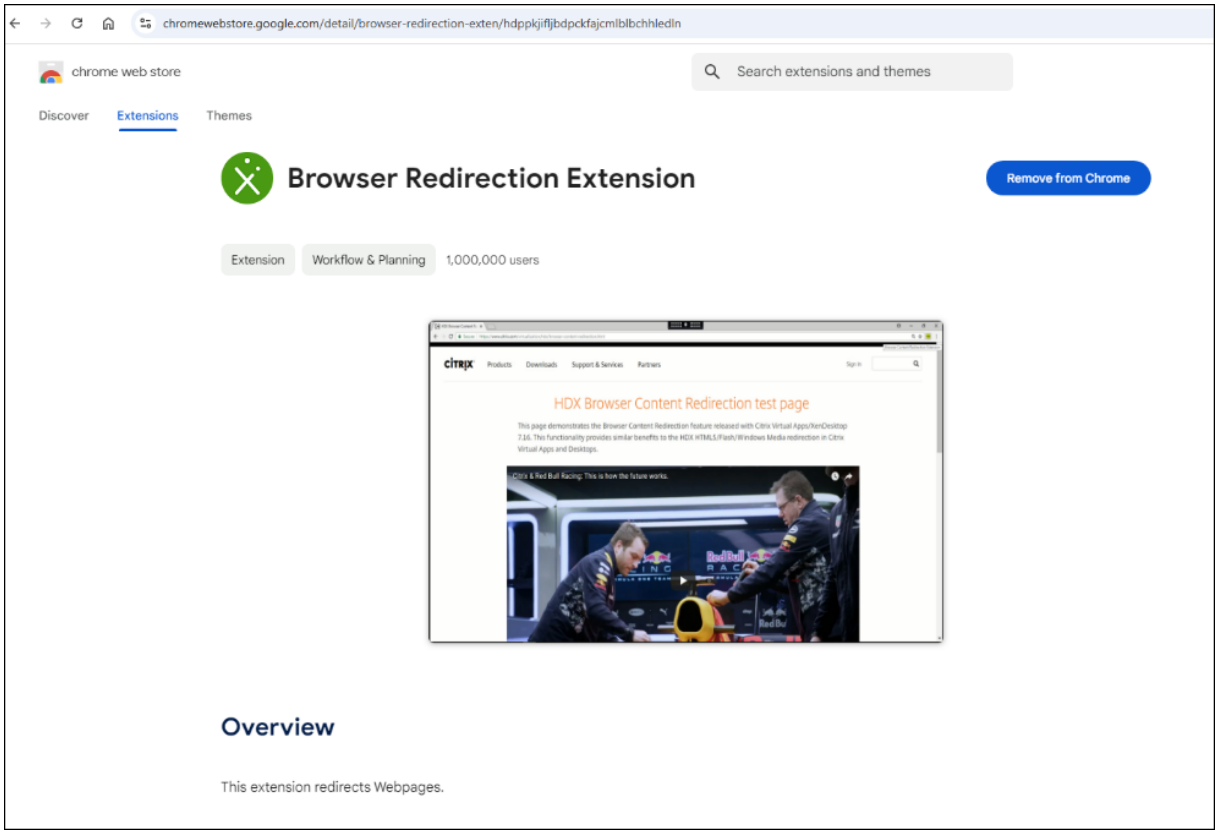
Browser Content Redirection now offers streamlined user experience with single sign-on support, enabling VDA-side authentication and cookie sharing. This enhancement eliminates redundant logins, boosting productivity by maintaining authentication and cookie persistence across BCR sessions, even after the BCR window is closed. This seamless experience further enhances security by ensuring authentication originates from the VDA, not the client.

For detailed information on the feature, see Single sign-on support section.

Capturing redirected content in screenshots

Browser content redirection renders web pages on the endpoint, so standard in-session screenshot tools capture the redirected content as a blank area. Use the Citrix Snipping Tool to include this content in your screenshots. Citrix recommends launching it from the Citrix Virtual Desktop Assistant to make it easy to find. For more information, see Citrix Virtual Desktop Assistant documentation.

Use Cases



Browser Content Redirection (BCR) can be utilized for a wide range of websites, particularly those that are resource-intensive and frequently accessed by enterprises. This includes video streaming platforms like YouTube, which can significantly benefit from offloading rendering to endpoint devices, thereby reducing server load and saving costs. Additionally, BCR is ideal for unified communications applications, such as video conferencing and collaboration tools (Google meet, Teams web, Zoom

© 1997–2026 Citrix Systems, Inc. All rights reserved.

web) and contact center applications (Genesys cloud), ensuring smooth performance and enhanced user experience. By leveraging BCR, enterprises can optimize their resources and improve efficiency across various web-based applications. Refer CTX238236 for information on how to configure specific websites.

Extension Deployment

Deploy Manually Browser redirection extension is published in Chrome and Edge web stores. The extension is needed only on the browser on the VDA and not on the client side. To install the extension, navigate to Chrome / Edge webstore, search for Browser redirection extension and Add to the respective browsers. This method works for individual users. To deploy the extension to a large group of users, deploy the extension using group policy

Deploy Using Group Policy

Prerequisites

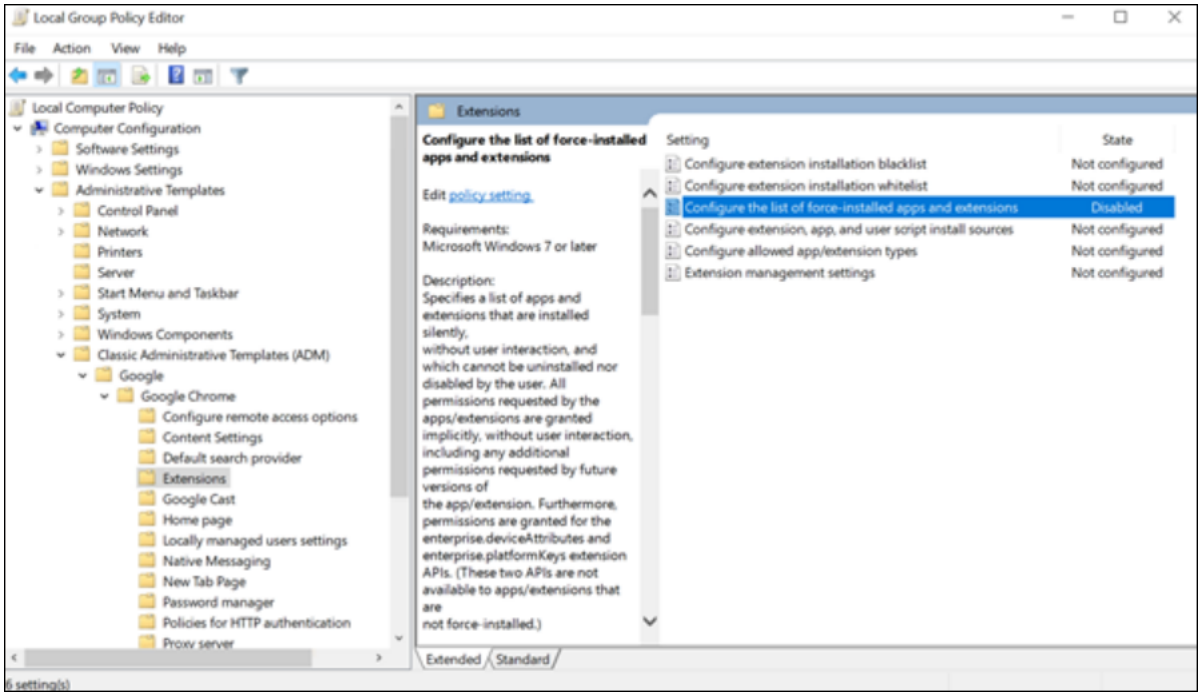
- **Access:** You'll need administrator privileges on the machine or within your Active Directory environment where you'll be configuring Group Policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

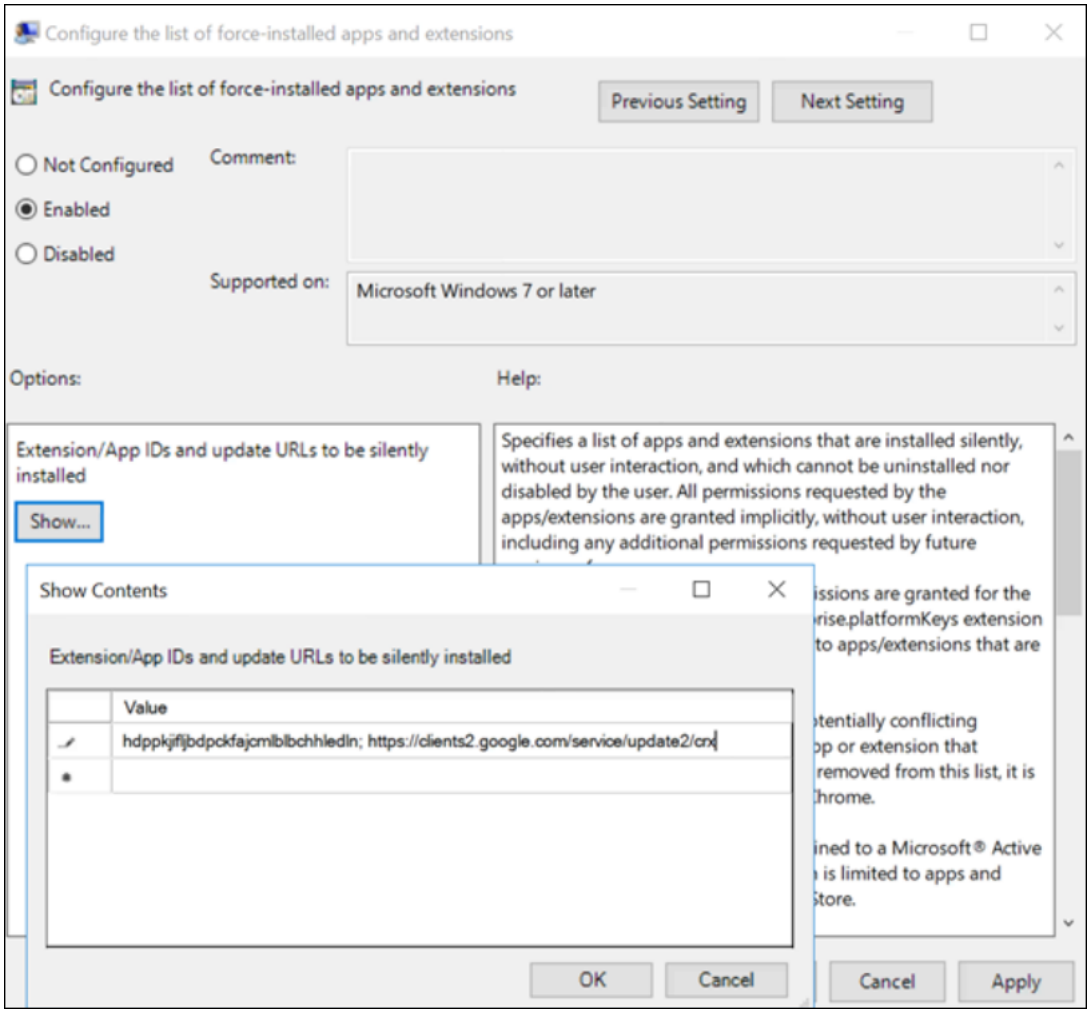
- **ADMX Files:** Download the Google Chrome ADMX files (administrative templates) for your version of Chrome. You can find these on the Google Chrome Enterprise Help page.
- **Edge Templates:** Download the Microsoft Edge administrative templates (ADMX files) from the Microsoft Edge Enterprise landing page.
- **Extension ID and Update URL:** The extension ID and update URL for the Citrix Browser Content Redirection extension.

Steps for Google Chrome

1. Import ADMX Files:
    - Copy the Chrome ADMX files to your central store for administrative templates. This is typically %SystemRoot%\PolicyDefinitions on your domain controller.
2. Open Group Policy Management:
    - Launch the Group Policy Management Console (gpmc.msc).
3. Create or Edit a GPO:
    - Either create a new Group Policy Object (GPO) or edit an existing one that applies to the users or computers where you want to deploy the extension.
4. Navigate to Extensions Settings:
    - In the GPO editor, go to:
        - User Configuration > Administrative Templates > Classic Administrative Templates (ADM) > Google > Google Chrome > Extensions
5. Enable "Configure the list of force-installed apps and extensions":
    - Double-click this policy setting and select "Enabled."
    - If the Configure the list of force-installed apps and extensions setting is set to Disabled, the extension is automatically removed from Chrome for all users.
6. Add the Extension ID and Update URL:
    - Click the "Show"button.
    - Enter the extension ID and update URL in the format: ;
    - Value: hdppkjifljbdpckfajcmlblbchhledln; https://clients2.google.com/service/update2/crx/ (Update URL)
7. Apply the GPO:
    - Link the GPO to the appropriate Organizational Unit (OU) in your Active Directory structure.
8. Update Group Policy:



© 1997–2026 Citrix Systems, Inc. All rights reserved.



- On the target machines, run gpupdate /force to apply the policy immediately, or wait for the policy to update automatically.

Steps for Microsoft Edge

1. Import ADMX Files:
   - Copy the Edge ADMX files to your central store for administrative templates (%SystemRoot%\PolicyDefinitions).
2. Open Group Policy Management:
   - Launch the Group Policy Management Console (gpmc.msc).
3. Create or Edit a GPO:
   - Create a new GPO or edit an existing one.
4. Navigate to Extensions Settings:
   - In the GPO editor, go to:
     - Computer Configuration > Policies > Administrative Templates > Microsoft Edge > Extensions
5. Enable "Control which extensions are installed silently":
   - Double-click this policy setting and select "Enabled."
6. Add the Extension ID and Update URL:
   - Click the "Show"button.
   - Enter the extension ID and update URL in the format: ;
   - Value: hdppkjifljbdpckfajcmlblbchhledln; https://clients2.google.com/service/update2/crx/ (Update URL)
7. Apply the GPO:
   - Link the GPO to the appropriate Organizational Unit (OU) in your Active Directory structure.
8. Update Group Policy:
   - On the target machines, run gpupdate /force or wait for the automatic update.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting

For troubleshooting information, see the How to troubleshoot browser content redirection knowledge center article.

Browser Content Redirection Limitations

Server side limitations (VDA)

Browser content redirection cannot support the following use cases. In case an enhancement is required for any mentioned scenarios or new scenarios, please reach out to the Citrix product team.

- Pop-up windows are not supported with Browser content redirection.
- HTML5 video redirection policy must be disabled with Browser content redirection is in use.
- In scenarios of session disconnect / reconnect, the VDA browser window needs to be refreshed in order for BCR to kick in again.
- Printing and file downloads from BCR'ed windows are not supported.
- When using Browser content redirection with Browser Profile Sharing, SSO persistence with multiple profiles is not supported.
- Incognito or private browsing mode is not supported with Browser content redirection.

Client side limitations (CWA)

- Browser content redirection is not supported on ARMhf framework.
- BCR supports a maximum of 25 redirected tabs on one browser and a combined 30 redirected tabs in two browsers.

Single sign-on support

August 4, 2026

Introduction

Browser Content Redirection now offers streamlined user experience with single sign-on support, enabling VDA-side authentication and cookie sharing.

This enhancement eliminates redundant logins, boosting productivity by maintaining authentication and cookie persistence across BCR sessions, even after the BCR window is closed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This seamless experience further enhances security by ensuring authentication originates from the VDA, not the client.

Without Single sign-on

- Opening an authenticated page within BCR required users to re-enter their credentials each time, breaking SSO persistence.
- SSO was only maintained while the BCR window remained open; closing and reopening the window forced users to repeat the login process.
- The authentication flow happened from the client, forcing administrators to provide network access to secure authentication sites from the client device.

With Single sign-on

- Users are no longer prompted for credentials (when already authenticated on the VDA), as SSO is seamlessly preserved from the VDA browser.
- Authentication happens from the VDA, which improves security posture by limiting client-side network requirements and exposure, providing a significantly improved and uninterrupted experience.

Minimum requirements

- Citrix Virtual Apps and Desktops 2507
- Citrix Workspace App for Windows 2511
- Citrix Workspace App for Linux 2601
- Browser Redirection Extension (Chrome or Edge) 25.11 or later

Supported authentication sequences

There are two types of authentication sequences that are currently supported with BCR Single sign-on.

Redirection based authentication

In this standard method, the application uses an HTTP redirect to force the user to a dedicated page for authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example, if a user attempts to reach https://my.intranet.app without the necessary session cookies, the web application will respond with an HTTP 302 Redirect to the authentication endpoint, like https://my.intranet.app/auth .

Once the user successfully authenticates on that page, the browser is redirected back to the original application URL, now including the required authentication cookies.

In-page forms-based authentication [Preview]

This method keeps the user on the intended application URL while dynamically presenting the login interface.

For example, if a user navigates to a protected page, such as https://my.intranet.app , the page loads the authentication form directly without triggering a redirection, because the necessary cookies are missing. This process may involve several internal exchanges between the page interface and the Identity Provider (IDP). These exchanges continue until a final, valid cookie is provided and utilized, granting the user access to the content on the original page.

> **Note:**
>
> In case your scenario is not covered by the mechanisms specified above and it's not possible to set up your webapp to use above mechanisms, reach out to Citrix Product team.

Configuration

Step 0: Introduction

There are two methods to configure Single sign-on with BCR. Choosing the method of configuration depends on the authentication mechanism for the desired BCR websites and the flexibility you need to configure multiple web applications for single sign on support.

Method 1: This method uses the existing BCR policies in Web Studio and uses them to achieve Single sign on support.

Before introduction of Single sign-on support, Browser content redirection authentication sites policy was used to specify the URLs used for authentication (or intermediary pages) to be redirected to the client to ensure there is no break in the flow.

With the introduction of Single sign-on support, BCR will leverage the authentication cookies on the VDA side browser and hence, the URLs in authentication sites policy now need to be configured in the Browser content redirection block list policy instead. This ensures that the authentication happens through the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Method 2: This method operates on a similar logic as Method 1, but the URLs are configured via JSON (`bcrconfig.json`) instead and the hosted JSON URL is called in BCR ACL policy. The JSON configuration offers additional flexibility.

1. Enterprises use several web applications in their environment, and each application may use a different authentication mechanism based on its implementation. The new JSON method allows configuration to be more intuitive, robust and scalable.
2. When dealing with **In-page forms-based authentication**, the Method 1 does not offer a way to set specific authentication cookie as there are no existing policies to support such configuration. Hence, if your website requires **In-page forms-based authentication**, JSON is the only way to do it.

Looking towards the future, JSON offers a scalable way to introduce more robust features, and Citrix recommends trying the JSON based configuration.

Step 1: Determining authentication mechanism

To determine which Method to use for your configuration, first step is to determine what kind of authentication mechanism your application is using. To accurately determine the web application's authentication method, the best approach is to contact the web application administrator.

If that is not an option, you must inspect the request/response interactions in the browser's developer tools, under the Network tab, while performing the authentication flow **without** the BCR extension installed. The following results can help you determine the authentication type:

For Redirection based authentication: Look under the Status column for one or more 302 (Redirection) responses. The 302 responses should contain a location header pointing to the authentication page. This page URL must be set in the Browser Content Redirection block list policy if you are using Method 1 and `denyList` section of the app configuration in the `bcrconfig.json` file if you are using Method 2.

For In-page forms-based authentication: Look under the Method column for several POST requests. One of the later responses to a POST request should return a set-cookie header with the web-app specific authentication cookie. This cookie should be set in the cookies section of the app configuration in the `bcrconfig.json` file. As Method 1 doesn't support In-page forms-based authentication, Method 2 is the only configuration option for this scenario.

Example: Here's an example with github.com. This method can be used for any website that you want to redirect with BCR and ensure that you have the right configuration

1. Open **Chrome**, then press **CTRL+SHIFT+I** to bring up its developer tools.
2. Click on the **Network** tab.
3. Check the **Preserve log** setting.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Click on the **Doc** filter to simplify the network logs.
5. Right click next to the **Name** and add the **URL** column.
6. Browser to **github.com** while the developer tools are still open.
7. Sign in to **github.com**
8. Note all the intermediate hops between github.com's initial page and its destination after logon has occurred.
9. Analyze the request/response headers to determine the authentication type as specified above.

Step 2: Choose a configuration method

1. If you're dealing with only Redirection based authentication and you don't have a need for redirecting multiple web applications with varying needs (e.g., one web application with Redirection based authentication and another web application with In-page forms based authentication), you can choose Method 1 to configure Single sign-on.
2. If you're dealing with In-page forms-based authentication (or) you are dealing with multiple web applications with different authentication mechanisms (or) simply want more flexibility even if you just have Redirection based authentication, you can choose Method 2.

Step 3: Configure

Method 1: Configure BCR Single sign-on with existing policies

1. Enable the feature in the VDA by creating the following registry value in the `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\HDXMediaStream key: Dword BrowserProfileSharing value 1`
2. Configure the Browser content redirection ACL configuration policy with the websites to be redirected. No change in configuration on this front.
3. In case you have URLs configured in authentication sites policy already, copy them into the Browser content redirection block list policy and disable the authentication sites policy.
4. In case you haven't configured authentication / intermediary sites previously, then identify the intermediary URLs (from the request/response interactions in the browser's developer tools, under the Network tab, while performing the authentication flow **without** the BCR extension installed) and configure them in the block list.

Method 2: Configure BCR Single sign-on with JSON

Creating bcrconfig.json The `bcrconfig.json` can contain several web app configurations. BCR extension will try to match the requested URL to one of the `allowList` specified by one of the apps in the apps array and dynamically apply its related rules to decide how to handle page redirection and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

single sign on processing. The following keys can be utilized to control how a web app is treated by the BCR extension (please note that *boolean* values must be lower case as per JSON specifications - **true** or **false** only):

- **appName** [string value, mandatory]: This is mainly used internally by the extension and for logging purposes.
- **allowList** [string array, mandatory]: An app must contain at least one URL in `allowList`, which is the URL that is intended to be redirected so that the client should render the page, not the VDA. Multiple URLs can be defined, and wildcards are accepted. The wildcard rules are exactly the same as Browser Content Redirection ACL configuration. For example, to configure all Google apps to be redirected, utilize the following array:

  [“*.google.com/*”, “*.google.com*”, “.youtube.com”, “*.youtube.com/*”]
- **denyList** [string value, optional]: Define the URLs to which the web application redirects the user when authentication is required. This configuration is primarily essential for redirection-based authentication, but it can also be used to prevent specific redirects in some forms-based authentication flows. URLs listed in this key will not be redirected so that server-side authentication occurs. You can also use this when profile sharing is not needed to restrict specific sub-URLs of a domain to not get redirected to the client.
- **profileSharing** [boolean value, mandatory]: This is the key value that needs to be set to ensure Single sign-on authentication cookies and other cookies that store user preferences to be shared, ensuring consistent behavior between server-side and client-side rendered pages.
- **cookies** [string array, optional]: Define one or more authentication cookies necessary for the web application to load without prompting the user. The extension will then prevent client-side redirection until all cookies listed here are detected as set for the given web app URL. This setting is primarily used for In-page forms-based authentication, but it can also be utilized for redirection-based authentication in addition to specifying denyList in certain scenarios.
- **deleteClientCache**[boolean value, optional]: If `bcrconfig.json` configuration mechanism is used, then the BCR client deletes its browser cache by default for enhanced security. This process happens when the user closes all redirected tabs or starts a redirected page for the first time in a session. Set this key’s value to **false** to prevent this behavior. If client device is trusted, then setting this key to **false** can enhance user experience. If client device is not trusted, then not setting this key (or) setting this key to **true** can enhance security posture.
- **schemaVersion** [string value, mandatory]: This is mainly used internally by the extension and for logging purposes. At the time of this writing, it should have its value set to **2511**.

Example Configuration

```
{

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
  "apps": [
    {

      "appName": "myWebApp1",
      "allowList": [
        "https://myWebApp1.com/*"
      ],
      "denyList": [],
      "requires": {

        "profileSharing": false,
        "cookies": []
       }

     }
,
    {

      "appName": "myWebApp2",
      "allowList": [
        "https://myWebApp2.com/*"
      ],
      "denyList": [
        "https://myWebApp2.com/authPortal/*"
      ],
      "requires": {

        "profileSharing": true,
        "cookies": []
       }

     }
,
    {

      "appName": "myWebApp3",
      "allowList": [
        "https://*.myWebApp3.com/"
      ],
      "denyList": [
        "https://myWebApp3.com/authPortal/*"
      ],
      "requires": {

        "profileSharing": true,
        "cookies": [
          "requiredAuthCookie1",
          "requiredAuthCookie2"
        ]
       }

     }

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
56    ],
57    "preferences": {
58
59      "deleteClientCache": true
60     }
61   ,
62    "schemaVersion": "2511"
63   }
```

Here is a sample `bcrconfig.json` file. Its elements are explained in detail below:

The JSON structure above contains 3 apps with different configurations:

myWebApp1 scenario, no SSO:

- The `allowList` key's string array value specifies that all paths within https://myWebApp1.com should be redirected to the client, except for values listed in the `denyList` key, if any.
- The `denyList` key's string array value is empty, so no authentication sites will be prevented from redirection. So, authentication will not be kept strictly on the server side.
- The `profileSharing` key's boolean value is set to **false**, so no cookies pertaining to the `allowList` entries will be shared with the client.
- The cookies key's string array is empty, but it would have been ignored anyways since the `profileSharing` sharing key is set to **false**.

myWebApp2, redirection-based authentication scenario:

- The `allowList` key's string array value specifies that all paths within https://myWebApp2.com should be redirected to the client, except for values listed in the `denyList` key, if any.
- The `denyList` key's string array value specifies that paths that start with `/authPortal/` under the **myWebApp2.com** domain will be prevented from client-side redirection so that server-side authentication can be performed.
- The `profileSharing` key's boolean value is set to **true**, so cookies pertaining to the allowList entries will be shared with the client and single sign-on goes through.
- The cookies key's string array is empty, so the extension will not wait for a specific cookie to be set post server-side authentication before they are shared with the client.

myWebApp3, forms-based authentication scenario:

- The `allowList` key's string array value specifies that all paths within https://myWebApp3.com should be redirected to the client, except for values listed in the `denyList` key, if any.
- The `denyList` key's string array value specifies that paths that start with `/authPortal/` under the **myWebApp3.com** domain will be prevented from client-side redirection so that server-side authentication can be performed.
- The `profileSharing` key's boolean value is set to **true**, so cookies pertaining to the `allowList` entries will be shared with the client.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The cookies key's string array contains a cookie name, so the extension will wait for this cookie to be set post server-side authentication. The cookie for the related URL in `allowList` will be shared with the client and client-side redirection will occur.

Preferences

- The `deleteClientCache` key is set to be **true**, so the BCR client deletes its browser cache by default for enhanced security. This is the default behavior even if the key is not set.

Configuring the BCR policy Once you have created the `bcrconfig.json`, follow the steps below to configure the Browser Content Redirection ACL configuration to use the content in the JSON file.

- Name the file with `.bcrconfig.json` extension, for example, `myrules.bcrconfig.json`
- Host the JSON file on a webserver accessible to the VDA and note the URL.

  > **Note:**
  >
  > The server must allow file downloads; Microsoft IIS sites permit JSON file downloads by default.

- In Citrix Studio, under the Policies, add the URL from the previous step to the Browser content redirection ACL configuration setting:

  > **Note:**
  >
  > Other entries in the Browser content redirection ACL configuration setting can remain. The BCR Extension prioritizes the `bcrconfig.json` settings if conflicts arise. Citrix recommends shifting the entire configuration to JSON for ease of management, application-level configuration and scalability.

- Save the policy and launch a session to test the policy configuration.

  > **Note:**
  >
  > After setting the policy, you can edit the hosted `bcrconfig.json` file anytime for tuning. The file reloads and applies changes only when the main browser process running the BCR extension launches or relaunches.

> **Note:**
>
> - In essence, from the policy perspective, you need to just enable Browser Content Redirection policy (which is enabled by default) and configure Browser Content Redirection ACL configuration policy with the URL which points to the JSON file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- JSON configuration currently applies to the following policies and makes them flexible, but the rest of the policies continue to do the same actions as before.
  - **Browser content redirection ACL configuration:** URLs in the ACL can now be configured via JSON through `allowList` key.
  - **Browser Content redirection block list configuration:** Blocklist can now be configured via JSON through `denyList` key.
  - **Browser Content redirection authentication sites:** Authentication sites can also be configured via JSON through `denyList` key.

Webcam redirection and video compression

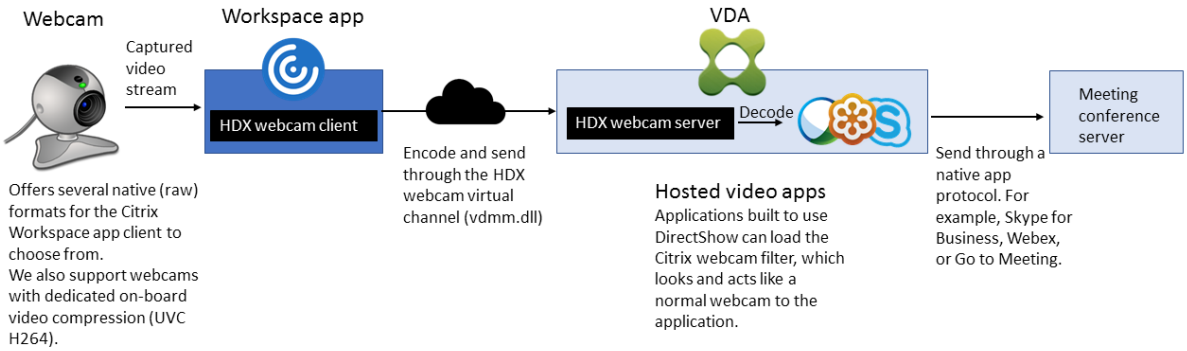
May 13, 2026

> **Warning:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Webcams can be used by applications running within the virtual session by using HDX webcam video compression or HDX plug-n-play generic USB redirection. Use **Citrix Workspace™ app > Preferences > Devices** to switch between modes. Citrix recommends you always use HDX webcam video compression if possible. HDX generic USB redirection is recommended only when there are application compatibility issues with HDX video compression or when you require advanced native functionalities of the webcam. For better performance, Citrix recommends the Virtual Delivery Agent to have at least two virtual CPUs.

To prevent users from switching from HDX webcam video compression, disable USB device redirection by using the policy settings under **ICA® policy settings > USB Devices policy** settings. Citrix Workspace app users can override the default behavior by choosing the Desktop Viewer Mic & Webcam setting **Don't use my microphone or webcam**.

HDX webcam video compression



HDX webcam video compression is also called **Optimized** webcam mode. This type of webcam video compression sends the H.264 video directly to the video conferencing application running in the virtual session. To optimize VDA resources, HDX webcam compression doesn't encode, transcode, and decode webcam video. This feature is enabled by default.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To disable direct video streaming from the server to the video conferencing app, set the registry key to 0 on the VDA. For information, see Webcam video compression in the list of features managed through the registry.

If you disable the default functionality for streaming video resources, HDX webcam video compression uses the multimedia framework technology that is part of the client operating system to intercept video from capture devices, transcode, and compress it. Manufacturers of capture devices supply the drivers that plug into the OS kernel streaming architecture.

The client handles communication with the webcam. The client then sends the video only to the server that can display it properly. The server doesn't deal directly with the webcam, but its integration gives you the same experience in your desktop. Workspace app compresses the video to save bandwidth and provide better resiliency on WAN scenarios.

The **Multimedia conferencing** policy must be enabled for HDX webcam video compression. This policy is enabled by default.

If a webcam supports hardware encoding, HDX video compression uses the hardware encoding by default. Hardware encoding might consume more bandwidth than software encoding. To force software compression, edit the registry key on the client. For information, see Webcam software compression in the list of features managed through the registry.

HDX webcam video compression requirements

HDX webcam video compression supports the following versions of Citrix Workspace app:

Platform	Processor
Citrix Workspace app for Windows	Citrix Workspace app for Windows supports webcam video compression for 32-bit and 64-bit apps on XenApp and XenDesktop 7.17 and later. On earlier versions, Citrix Workspace app for Windows supports only 32-bit apps.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Platform	Processor
Citrix Workspace app for Mac	Citrix Workspace app for Mac 2006 or later supports webcam video compression for 64-bit apps on XenApp and XenDesktop 7.17 and later. On earlier versions, Citrix Workspace app for Mac supports only 32-bit apps.
Citrix Workspace app for Linux	Citrix Workspace app for Linux supports both 32-bit and 64-bit apps on the virtual desktop.
Citrix Workspace app for Chrome	Because some ARM Chromebooks don't support H.264 encoding, only 32-bit apps can use the optimized HDX webcam video compression.

Media foundation-based video applications support HDX webcam video compression on Windows 10 or higher and Windows Server 2019 and higher. For more information, see Knowledge Center article CTX132764.

Other user device requirements:

- Appropriate hardware to produce sound.
- DirectShow-compatible webcam (use the webcam default settings). Webcams that are hardware encoding capable reduce client-side CPU usage.
- For HDX webcam video compression, install webcam drivers on the client, obtained from the camera manufacturer, if possible. Installation of the device drivers isn't required on the server.

Different webcams offer different frame rates and have different levels of brightness and contrast. Adjusting the contrast of the webcam can reduce upstream traffic significantly. Citrix uses the following webcams for initial feature validation:

- Microsoft LifeCam VX models (2000, 3000, 5000, 7000)
- Creative Live! Cam Optia Pro
- Logitech QuickCam Messenger
- Logitech C600, C920
- HP Deluxe Webcam

To adjust the preferred video frame rate, edit the registry key on the client. For information, see Webcam video compression frame rate in the list of features managed through the registry.

High-definition webcam streaming

The video conferencing application on the server selects the webcam format and resolution based on the supported format types. When a session starts, the client sends the webcam information to the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

server. Choose a webcam from the application. When the webcam and the video conferencing application support high-definition rendering then the application uses high-definition resolution. We support all webcam resolutions.

This feature requires the Citrix Workspace app for Windows, minimum version 1808 or Citrix Receiver for Windows, minimum version 4.10.

You can use a registry key to disable and enable the feature. For information, see High-definition webcam streaming in the list of features managed through the registry.

If the media type negotiation fails, HDX falls back to the default VGA resolution (640 x 480 pixels). You can use registry keys on the client to configure the default resolution. Ensure that the camera supports the specified resolution. For information, see High-definition webcam resolution in the list of features managed through the registry.

HDX webcam video compression uses significantly less bandwidth compared to plug-n-play generic USB redirection and works well over WAN connections. To adjust the bandwidth, set the registry key on the client. For information, see High-definition webcam bandwidth in the list of features managed through the registry.

Enter a value in bits per second. If you don't specify the bandwidth, the video conferencing applications use 350000 bps by default.

HDX plug-n-play generic USB redirection

HDX plug-n-play generic USB redirection (isochronous) is also called **Generic** webcam mode. The benefit of HDX plug-n-play generic USB redirection is that you don't have to install drivers on your thin client/endpoint. The USB stack is virtualized such that anything you plug into the local client is sent to the remote VM. The remote desktop acts as if you plugged it in natively. The Windows desktop handles all the interaction with the hardware and runs through the plug-n-play logic to find the correct drivers. Most webcams work if the drivers exist on the server and can work over ICA. Generic webcam mode uses significantly more bandwidth (many Megabits per second) because you are sending uncompressed video down with USB protocol over the network.

Support for Microsoft virtual camera with webcam redirection

Starting from 2607 LTSR, Windows VDA (Windows 11 and Windows Server 2025) upgrades webcam redirection and the camera experience using Microsoft's built-in virtual camera capabilities. Benefits include extended compatibility with more applications, improved security and privacy, and providing closer to local and native camera experience. This feature is enabled by default.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> This feature requires **Camera access** enabled in the system setting; the setting is disabled by default on Windows Server 2025.

HTML5 multimedia redirection

September 4, 2026

> **Note:**
>
> HTML5 Multimedia Redirection is targeted for deprecation in a future release. Customers are advised to transition to Browser Content Redirection (BCR), the recommended replacement technology, to ensure continued functionality

HTML5 multimedia redirection extends the multimedia redirection features of HDX™ MediaStream to include HTML5 audio and video. Because of the growth in online distribution of multimedia content, especially to mobile devices, the browser industry has developed more efficient ways to present audio and video.

Flash has been the standard, but it requires a plug-in, doesn't work on all devices, and has higher battery usage in mobile devices. Companies like YouTube, Netflix, and newer browsers versions of Mozilla, Google, and Microsoft are moving to HTML5 making it the new standard.

HTML5-based multimedia have many advantages over proprietary plug-ins, including:

- Company-independent standards (W3C)
- Simplified digital rights management (DRM) workflow
- Better performance without the security issues raised by plug-ins

HTTP progressive downloads

HTTP progressive download is an HTTP-based pseudo-streaming method that supports HTML5. In a progressive download, the browser plays back a single file (encoded at a single quality) while it is being downloaded from an HTTP web server. The video is stored on the drive as it's received and is played from the drive. If you rewatch the video, the browser can load the video from cache.

For an example of a progressive download, see the HTML5 video redirection test page. To inspect the video elements in the webpage and find the sources (mp4 container format) in HTML5 video tags, use the developer tools in your browser:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Comparing HTML5 and Flash

Feature	HTML5	Flash
Requires a proprietary player	No	Yes
Runs on mobile devices	Yes	Some
Running speed on different platforms	High	Slow
Supported by iOS	Yes	No
Resource usage	Less	More
Load faster	Yes	No

Requirements

We support only redirection for progressive downloads in mp4 format. We don't support WebM and Adaptive bitrate streaming technologies like DASH/HLS.

We support the following, and use policies to control them. For more information, see Multimedia policy settings.

- Server side render
- Server fetch client render
- Client side fetching and rendering

Minimum versions of Citrix Workspace™ app and Citrix Receiver™:

- Citrix Workspace app 1808 for Windows
- Citrix Receiver for Windows 4.5
- Citrix Workspace app 1808 for Linux
- Citrix Receiver for Linux 13.5

Minimum VDA browser version	Windows OS version/build/SP
Internet Explorer 11.0	Windows 10 x86 (1607 RS1) and x64 (1607 RS1); Windows 7 x86 and x64; Windows Server 2016 RTM 14393 (1607); Windows Server 2012 R2

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Minimum VDA browser version	Windows OS version/build/SP
Firefox 47 Manually add the certificates to the Firefox certificate store or configure Firefox to search for certificates from a Windows trusted certificate store. For more information, see https://wiki.mozilla.org/CA:AddRootToFirefox	Windows 10 x86 (1607 RS1) and x64 (1607 RS1); Windows 7 x86 and x64; Windows Server 2016 RTM 14393 (1607); Windows Server 2012 R2
Chrome 51	Windows 10 x86 (1607 RS1) and x64 (1607 RS1); Windows 7 x86 and x64; Windows Server 2016 RTM 14393 (1607); Windows Server 2012 R2

Components of the HTML5 video redirection solution

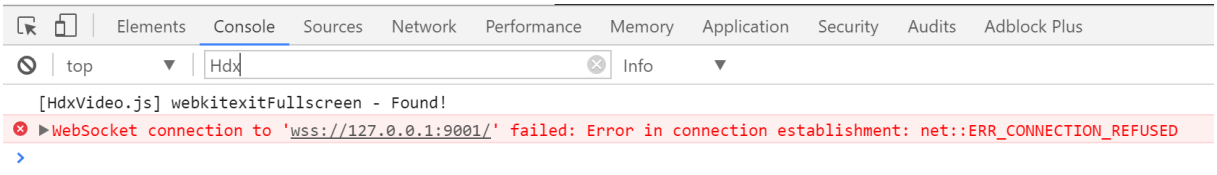
- **HdxVideo.js** - JavaScript hook-intercepting video commands on the website. HdxVideo.js communicates with WebSocketService using Secure WebSockets (SSL/TLS).
- **WebSocket SSL Certificates**
  - For the CA (root): **Citrix XenApp/XenDesktop HDX In-Product CA** (C = US; S = Florida; L = Fort Lauderdale; O = Citrix Systems, Inc.; OU = XenApp and XenDesktop Engineering; CN = Citrix XenApp and XenDesktop HDX In-Product CA)
    Location: **Certificates (Local Computer) > Trusted Root Certification Authorities > Certificates**.
  - For the end-entity (leaf): **Citrix XenApp/XenDesktop HDX Service** (C = US; S = Florida; L = Fort Lauderdale; O = Citrix Systems, Inc.; OU = XenApp and XenDesktop Engineering; CN = Citrix XenApp and XenDesktop HDX Service)
    Location: **Certificates (Local Computer) > Personal > Certificates**.
- **WebSocketService.exe** - Runs on the local system and performs SSL termination and user session mapping. TLS Secure WebSocket listening on 127.0.0.1 port 9001.
- **WebSocketAgent.exe** - Runs on the user session and renders the video as instructed from WebSocketService commands.

How do I enable HTML5 video redirection?

In this release, this feature is available for controlled webpages only. It requires the addition of the HdxVideo.js JavaScript (included in the Citrix Virtual Apps and Desktops Installation media) to the webpages where the HTML5 multimedia content is available. For example, videos on an internal training site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Websites like youtube.com, which are based on Adaptive Bitrate technologies (for example, HTTP Live Streaming (HLS) and Dynamic Adaptive Streaming over HTTP (DASH)), are not supported.



For more information, see *Multimedia policy settings*.

Capturing redirected content in screenshots

HTML5 multimedia redirection renders video on the endpoint, so standard in-session screenshot tools capture the redirected video as a blank area. Use the Citrix Snipping Tool to include this content in your screenshots. Citrix recommends launching it from the Citrix Virtual Desktop Assistant to make it easy to find. For more information, see Citrix Virtual Desktop Assistant documentation.

Troubleshooting Tips

Errors might occur when the webpage tries to run HdxVideo.js. If the JavaScript fails to load, the HTML5 redirection mechanism fails. Ensure that there are no errors related to HdxVideo.js by inspecting the console in the developers tool windows of your browser. For example:

Optimization for Microsoft Teams (New)

September 4, 2026

Citrix® supports two ways to optimize Microsoft Teams audio and video in a VDI environment: Citrix HDX™ Optimization and the New VDI solution for Teams from Microsoft. Classic Teams has reached end of life, so the optimization approaches described on this page apply to the current Microsoft Teams client.

> **Note:**
>
> Microsoft has announced the deprecation of WebRTC-based Citrix HDX Optimization for Microsoft Teams on Windows endpoints. Two milestones apply:
>
> - October 1, 2026 - End of Support: No longer officially supported by Microsoft or Citrix.
> - April 1, 2027 - End of Availability: WebRTC-based optimization stops functioning. Citrix Studio policies for the legacy optimization no longer take effect.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> Customers are recommended to migrate to the New VDI solution for Teams. This change affects Windows endpoints only. macOS, Linux, ChromeOS, and HTML5 endpoints are not impacted. For more details, see Microsoft Blog.

Optimization approaches

- **Citrix HDX Optimization (MTOP)**: A combined Citrix and Microsoft solution that uses a Citrix-owned virtual channel (CTXMTOP). Media offloading is handled by `HdxRtcEngine` in the Citrix Workspace™ app. This solution is traditionally referred to as MTOP.
- **New VDI solution for Teams**: A newer optimization that is owned and managed by Microsoft and uses Microsoft-owned virtual channels (MSTEAMS, MSTEAM1, and MSTEAM2). It is available on Windows and Mac endpoints. For full details, see New VDI solution for Teams in the Microsoft documentation.

> **Note:**
>
> Whichever optimization approach you use, Microsoft Teams video and screen sharing are rendered on the endpoint. As a result, standard in-session screenshot tools capture this content as a blank area. Use the Citrix Snipping Tool to include it in your screenshots. Citrix recommends launching it from the Citrix Virtual Desktop Assistant to make it easy to find. For more information, see Citrix Virtual Desktop Assistant documentation.

Key distinctions

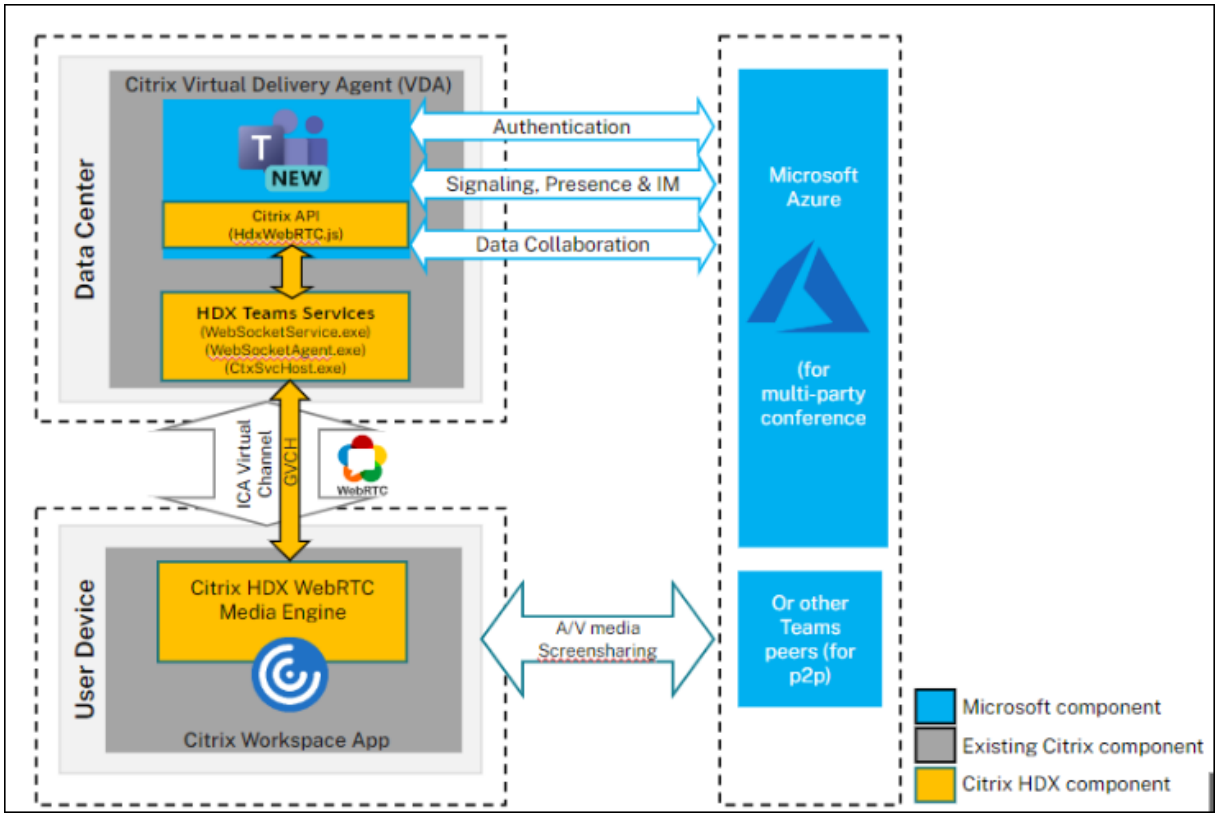
Citrix HDX Optimization	New VDI solution for Teams
Optimization is a combined solution of Citrix and Microsoft and uses a virtual channel owned by Citrix (CTXMTOP). Media offloading is handled by `HdxRtcEngine` which resides in Citrix Workspace app. No additional components needed on the endpoint except installation of Citrix Workspace app. Available on endpoint platforms - Windows, macOS, Linux, and ChromeOS.	Optimization solution is owned and managed by Microsoft and uses virtual channels owned by Microsoft (MSTEAMS, MSTEAM1, and MSTEAM2). Media offloading is handled by the SlimCore media engine on Windows and Mac endpoints. Additional component - **Teams VDI Plugin** needs to be deployed on the endpoint through various means. This plug-in manages the download and updates of the SlimCore media engine. Available on endpoint platforms - Windows and Mac.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix HDX Optimization	New VDI solution for Teams
New features are managed in conjunction between Citrix and Microsoft.	New features are managed by Microsoft. Users have access to some new features unavailable with Citrix HDX Optimization.
Supported by both Citrix and Microsoft, depending on the component involved. Customers can open a case with either Citrix or Microsoft and are redirected to the appropriate team as needed.	Owned and supported by Microsoft. Citrix supports the Citrix components involved, such as Citrix Workspace app, the virtual channel allow list, and plug-in deployment mechanisms.

Interoperability and roaming

Citrix HDX Optimization and the New VDI solution for Teams can exist in parallel, but the Teams client uses only one of them at a time.



- The optimization is selected when the Teams app launches, in the following order: New VDI solution for Teams, then Citrix HDX Optimization (WebRTC), then standard audio/video redirection.
- If the New VDI solution for Teams fails, Teams falls back directly to standard audio/video redirection rather than to WebRTC. A Teams app restart is required to re-run the selection and choose the optimization that fits.
- Roaming between endpoints is seamless and does not require a Teams app restart, including when a user roams between an endpoint that supports the New VDI solution for Teams and one that does not.

Citrix HDX™ Optimization

May 15, 2026

In Citrix HDX (WebRTC Optimization), the media engine (HdxRtcEngine) on the endpoint responsible for handling offloaded media is embedded in the Citrix Workspace™ app and installing the Citrix Workspace app automatically installs the engine as well.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

System requirements

This section depicts the minimum and recommended versions necessary to support the new Teams client. Note that in minimum versions some critical bug fixes or latest features might not be available. Deploy the recommended versions to have the best experience with the latest fixes and features.

VDI operating systems

For detailed information, see the recommendations provided in the Microsoft documentation.

> **Note:**
>
> - Windows Server 2016 is not supported. Citrix recommends you to plan your upgrades accordingly.
> - As versions are updated frequently, the versions mentioned here might become end-of-life. Hence, see the product lifecycle pages of Citrix Workspace app and Citrix Virtual Apps and Desktops to ensure you're using supported versions of different components.
> - If you're on Citrix Virtual Apps and Desktops™ 1912 LTSR, Citrix recommends planning an upgrade as it'll be end of life in December of 2024.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual Delivery Agent (VDA)

Minimum versions	Recommended versions
1912 LTSR CU8+; 2203 LTSR (any CU); 2212 CR	2203 LTSR CU5+ (or) 2402 LTSR and any CR versions above

Citrix Workspace app

Minimum versions	Recommended versions
Windows 2203 LTSR (latest CU); Windows 2302 CR; Linux 2207; Mac 2302; Chrome/HTML5 2301	Windows 2402 LTSR; Windows 2405 CR; Linux 2405; Mac 2405; ChromeOS/HTML5 2405

Deployment

1. Install the new Teams client on VDI. For detailed information, see Deploy new Teams for VDI.
2. Configure the following registry key on the VDA to optimize new Teams.
   - **Location**: `HKLM\SOFTWARE\WOW6432Node\Citrix\WebSocketService`
   - **Key (REG_Multi_SZ)**: `ProcessWhitelist`
   - **Value**: `msedgewebview2.exe`

     > **Note:**
     >
     > Starting with Citrix Virtual Apps and Desktops 2402 LTSR (or) Citrix Virtual Apps and Desktops 2203 LTSR CU5+, you don't need to manually configure the `msedgewebview2.exe` registry entry as it's allow-listed by default.
3. Ensure that the Microsoft Teams redirection policy is enabled. This policy is turned on by default.
4. No additional configuration is needed on the client side. Follow the wizard instructions to install the Citrix Workspace app.

App Layering

New Microsoft Teams has changed its installation method and now installs under C:\Program Files\WindowsApps. To support this change, you must run App Layering version 2403.2 or later. You can download an upgrade disk in the App Layering downloads page that includes this fix.

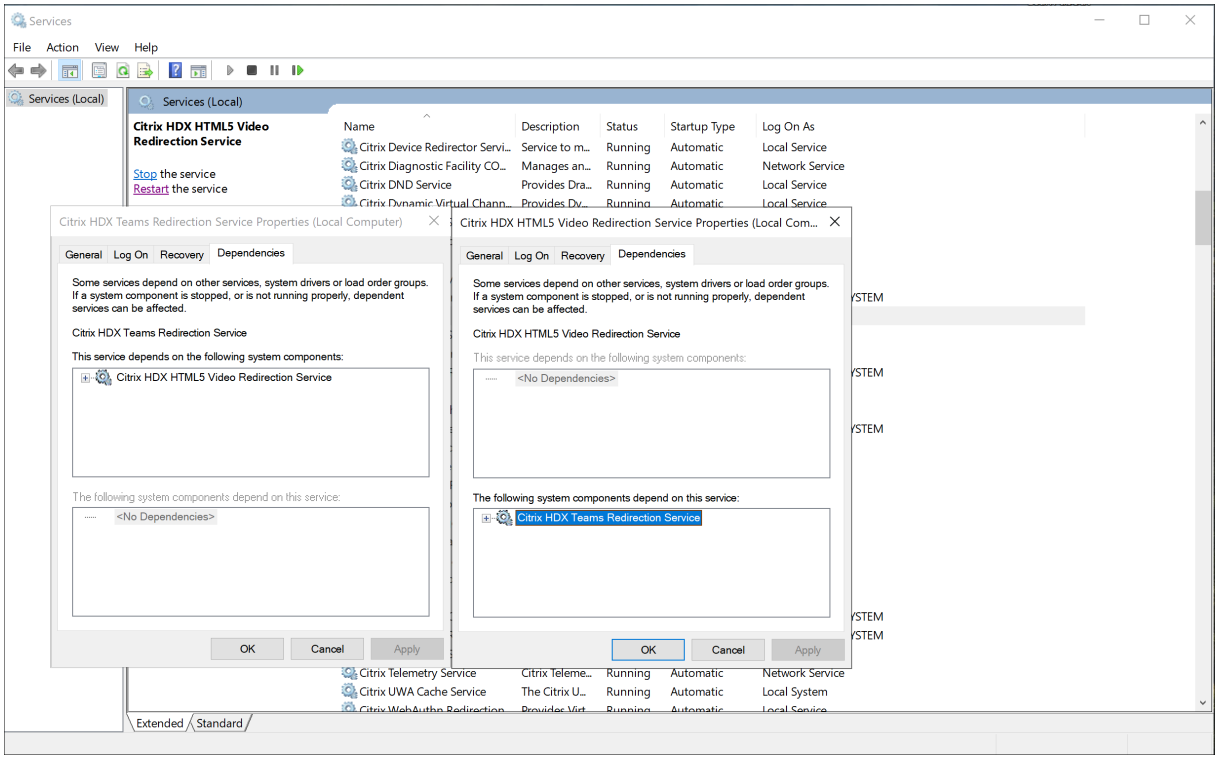
For detailed information, see the App Layering documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Profile Management

See the Citrix Profile Management documentation for information on how to enable roaming for New Microsoft Teams. Current minimum version guidance for Citrix Profile Management is 2402 LTSR (or) 2203 LTSR CU5+.

Networking considerations



Networking requirements for New Teams don't differ from Classic Teams. Hence, see the Network Requirement section in Classic Teams documentation.

Feature Reference

Explicit service dependency for Microsoft Teams Optimization

Starting with Citrix Virtual Apps / Desktops 2607 LTSR, the **Citrix HDX Teams Redirection Service** (used by HDX Optimized Microsoft Teams & UCSDK Optimized applications) now explicitly declares a dependency on the **Citrix HDX HTML5 Video Redirection Service (WebSocketService)**.

This update ensures that the HTML5 service is automatically verified and started when the Teams service launches, preventing optimization failures for Microsoft Teams and UCSDK-integrated applications in environments where services are strictly managed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Optimized Overlay Clipping for Enhanced Performance and User Experience

From CVAD 2511, the mechanism for handling redirected video overlays in features such as HDX Microsoft Teams Optimization and UCSDK Optimization, has been re-architected to improve both the user experience and server performance.

Key Benefits

- **Improved Visual Accuracy:** This enhancement resolves visual glitches where application elements, such as pop-up menus or notifications, would incorrectly appear behind video content. The new logic ensures all components are rendered in the correct order, providing a more seamless and predictable experience.
- **Enhanced Performance:** This optimization significantly reduces CPU utilization on the Virtual Delivery Agent. By replacing older, resource-intensive polling methods with a more efficient graphics-based approach, this change improves server scalability and allows for higher user density.

> **Note:**
>
> The functionality depends on a future version of Microsoft Teams (or other UCSDK partner application) and requires Citrix Workspace App for Windows 2511.

Feature matrix and version support

As versions are updated frequently, some older versions mentioned here might reach end of life. Hence, see the product lifecycle pages of Citrix Workspace App and Citrix Virtual Apps and Desktops to ensure you're using supported versions of different components.

> **Note:**
>
> - The versions mentioned here are the minimum versions from which the particular feature is supported (or) the minimum version in which New Teams is supported, whichever is higher.
> - Citrix Virtual Apps and Desktops™ 1912 LTSR CU8+ noted in the minimum versions section is not being mentioned in the table below as it will reach it's end of life in December 2024. However, it is still a supported version until then.
> - Features that have the minimum Citrix Virtual Apps and Desktops versions as N/A just imply that the feature didn't involve any changes from the VDA side.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature	VDA (Minimum Version)	Citrix Workspace app for Windows (minimum version)	Citrix Workspace app for Mac (minimum version)	Citrix Workspace app for Linux (minimum version)	Citrix Workspace app for ChromeOS (minimum version)
Audio / Video (p2p and conference)	2203 LTSR (any CU), 2212 CR	2203 LTSR latest CU, 2302 CR	2302	2207	2301

Troubleshooting and other considerations

For New Teams, see CTX253754 , Troubleshoot Microsoft Teams, For latest updates on anything related to New Teams, see CTX585013.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Known limitations

Limitations on Citrix Workspace app

- HID Support - Answer and end calls aren't supported. Volume up and down are supported.
- Users can't take screenshots of Microsoft Teams content while using a snipping tool on the VDA. However, if a snipping tool is used on the client side, the content can be captured.
- Share system audio limitations
  - Audio cannot be shared using this feature when sharing the screen with RAVE and BCR redirected apps or tabs.
  - This feature is supported only on published desktops

Limitations on the VDA

- New Teams as a published (seamless) application is not supported
  - Fixed in CVAD 2402 LTSR, 2203 LTSR CU5 and above
- When you configure the Citrix Workspace app High DPI setting to Yes, the redirected video window appears out of place. This limitation occurs when the monitor's DPI scaling factor is set to anything above 100%.
- Microsoft Teams 2.1 supports redirection of only one webcam at a time. However, it does not support multiple webcam redirection or plug and play (PnP) webcam redirection on single-session VDAs.

Limitations on Citrix Workspace app and the VDA

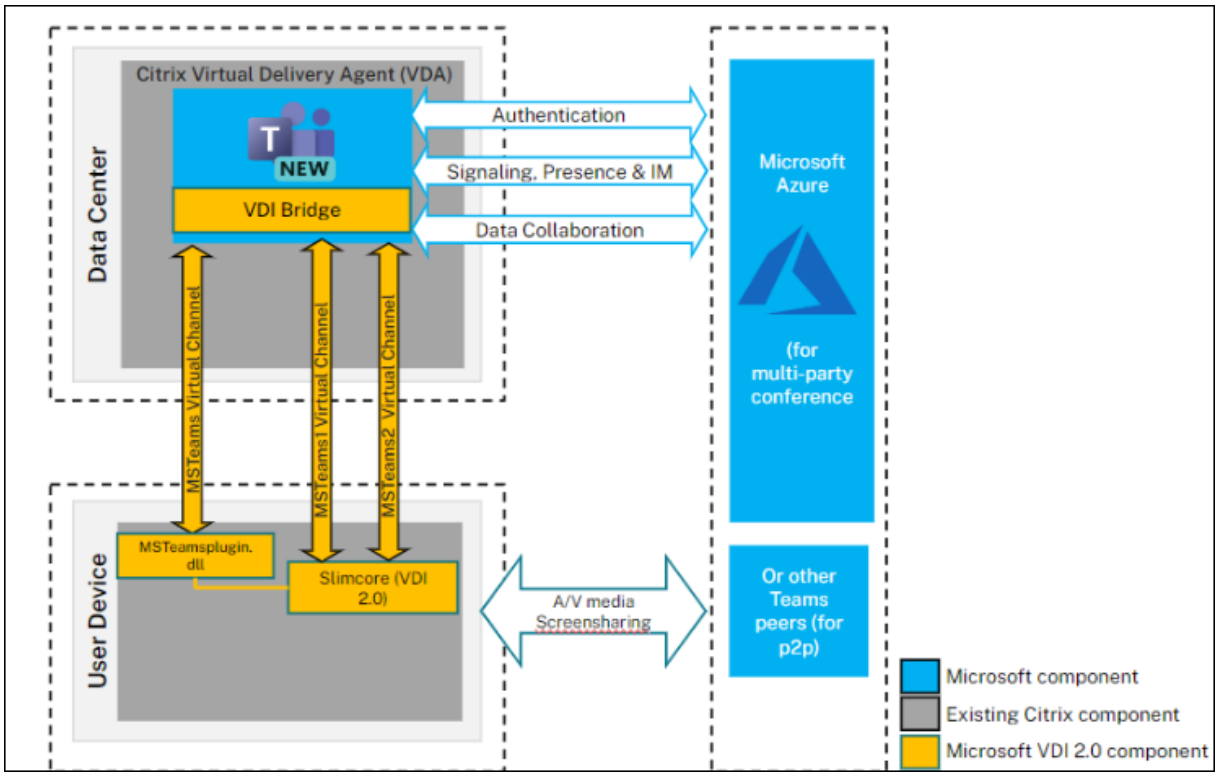
- You can only control the volume of an optimized call using the volume bar on the client machine –not on the VDA.

For more details on the limitations from Microsoft, see Features not supported in VDI.

New VDI solution for Teams

September 4, 2026

> **Note:**
>
> The New VDI solution for Teams is currently generally available for Windows and Mac endpoints



© 1997–2026 Citrix Systems, Inc. All rights reserved.

> on Citrix®. This solution requires a minimum Microsoft Teams version. See System requirements.

In the New VDI solution for Teams, Microsoft uses the Citrix Virtual Channel SDK to build custom virtual channels. On the endpoint, media is offloaded to the Microsoft media engine (SlimCore) instead of `HdxRtcEngine`. The custom virtual channels carry the communication between Teams on the VDA and the media engine on the endpoint.

> **Note:**
>
> Microsoft has announced the deprecation of WebRTC-based Citrix HDX™ Optimization for Microsoft Teams on Windows endpoints. Two milestones apply:
>
> - October 1, 2026 - End of Support: No longer officially supported by Microsoft or Citrix.
> - April 1, 2027 - End of Availability: WebRTC-based optimization stops functioning. Citrix Studio policies for the legacy optimization no longer take effect.
>
> Customers are recommended to migrate to the New VDI solution for Teams. This change affects Windows endpoints only. macOS, Linux, ChromeOS, and HTML5 endpoints are not impacted. For more details, see Microsoft Blog.

This solution is owned and managed by Microsoft. Citrix supports the Citrix components involved: Citrix Workspace™ app, the virtual channel allow list, and the plug-in deployment mechanisms described on this page. For the Microsoft-owned architecture and full details, see New VDI solution for Teams in the Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

System requirements

This section lists the minimum and recommended versions needed to support the New VDI solution for Teams. On minimum versions, some critical bug fixes or latest features might not be available. Deploy the recommended versions for the best experience.

Virtual Delivery Agent (VDA)

> **Note:**
>
> If you are on 2203 LTSR CU2 or below, or 2303 CR or below, see CTX682593 to understand the limitations in those versions and plan your upgrade.

Minimum versions	Recommended versions
2203 LTSR CU3; 2305 CR	2203 LTSR CU5+; 2402 LTSR and any later CR

Citrix Workspace app for Windows

Minimum versions	Recommended versions
2203 LTSR (latest CU); 2302 CR	2402 LTSR; 2405 CR or later

Citrix Workspace app for Mac

Minimum versions	Recommended versions
2508.10	2607 or later

Mac endpoints require macOS 14, 15, or 26. macOS 26 requires Citrix Workspace app 2511 or later. On Citrix Workspace app for Mac 2508.10, the plug-in must be installed manually. The option to install the plug-in through Citrix Workspace app, Client App Management, or the Virtual channel plug-in manager is available from Citrix Workspace app for Mac 2603.

For the minimum Microsoft Teams version, endpoint OS requirements, and hardware requirements, see the Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Components

- New Teams `vdiBridge`: the server-side virtual channel module, bundled with Teams.
- Custom virtual channel (VC): the custom VC owned by Microsoft Teams.
- Plug-in: the client-side VC dll. Responsible for the media engine download and clean-up.
- Media engine (SlimCore): the operating-system-specific media engine, delivered by Microsoft as an MSIX package.

Deployment

1. Ensure you have the Microsoft Teams version listed in Prerequisites.
2. Configure the **Virtual channel allow list** policy to allow the Microsoft Teams virtual channels. These channels let the Teams client connect to the client-side plug-in. For more information, see Virtual channel security.

   The solution needs three custom virtual channels. Use wildcards to allow the `ms-teams.exe` executable and the custom virtual channels:

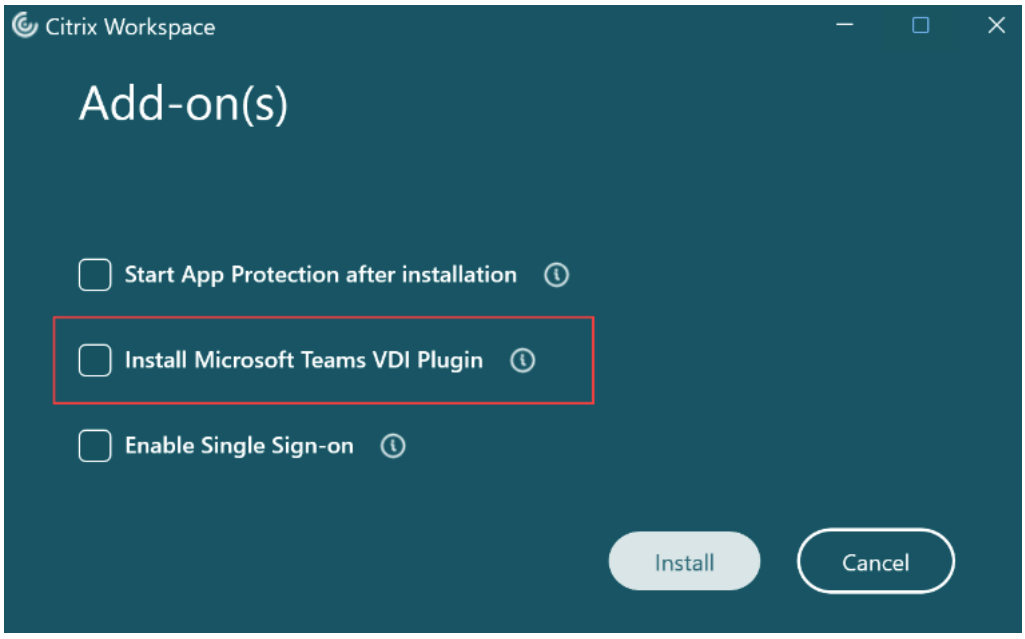
   ```
   MSTEAMS,C:\Program Files\WindowsApps\MSTeams*8wekyb3d8bbwe\ms-teams.exe
   MSTEAM1,C:\Program Files\WindowsApps\MSTeams*8wekyb3d8bbwe\ms-teams.exe
   MSTEAM2,C:\Program Files\WindowsApps\MSTeams*8wekyb3d8bbwe\ms-teams.exe
   ```

   > **Note:**
   >
   > - VDA 2603 and later allow these three virtual channels by default. No Studio policy configuration is required on those versions.
   > - Wildcards for the Virtual channel allow list policy are available in CVAD 2203 LTSR CU2 and later, or Citrix Virtual Apps and Desktops™ 2206 CR and later.
   > - The VDA machines must be rebooted for the policy to take effect.
   > - The MSTeams install path changes because it is an MSIX application, so wildcards are required. Allow the exact lines shown above.

3. This solution is controlled by a policy on the Microsoft Teams side, not by a Citrix policy. It is enabled by default. To enable or disable it for specific user groups, see the Microsoft documentation.
4. Deploy the Teams plug-in on your endpoints. See Options to install the Teams plug-in.
5. For media engine staging and registration, and the group policies that can block MSIX installation, see the Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Options to install the Teams plug-in



Regardless of the install method, the plug-in is placed in the Citrix Workspace app location on the endpoint:

- Windows (`MsTeamsPluginCitrix.dll`): 64-bit `C:\Program Files (x86)\Citrix\ICA Client`; 32-bit `C:\Program Files\Citrix\ICA Client`
- Mac: `/Applications/Utilities/MsTeamsVdi.Plugin.app`

> **Note:**
>
> - On Windows, install Citrix Workspace app in admin mode so virtual channels open correctly. Per-user installation of Citrix Workspace app is not supported.
> - The Microsoft Teams VDI plug-in is not supported when Citrix Workspace app is installed from the Microsoft Store.
> - Plug-in installation stops if no Citrix Workspace app is found on the endpoint.
> - On Windows, the plug-in and Citrix Workspace app must be the same architecture. A 32-bit Citrix Workspace app cannot load a 64-bit plug-in.
> - Plug-ins can be upgraded or repaired, but not downgraded, and only while there is no active session.

Option 1: Through Citrix Workspace app installation

- **Windows:** During a fresh install or manual upgrade, select **Install Microsoft Teams VDI Plugin** on the **Add-on(s)** page. From Citrix Workspace app for Windows 2508, this option is selected by default. Clear it to skip installation. Upgrades remember your previous selection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can also install from the command line with the `/InstallMSTeamsPlugin` switch. For example, `CitrixWorkspaceApp.exe /InstallMSTeamsPlugin=Y` installs the plug-in, and `/InstallMSTeamsPlugin=N` prevents it.

For a fresh install, the minimum is Citrix Workspace app for Windows 2402 LTSR. For in-place upgrades, the minimum is Citrix Workspace app for Windows 2405 CR. For the latest details, see Install third-party plug-ins.

- **Mac:** The option to install the plug-in during Citrix Workspace app installation is available from Citrix Workspace app for Mac 2603 and requires user action. Citrix Workspace app for Mac 2607 installs the plug-in automatically by default. On Citrix Workspace app for Mac 2508.10, install the plug-in manually. See Option 2: Download the plug-in directly.

Option 2: Download the plug-in directly

- **Windows:** Download the MSI and deploy it with tools like SCCM or Intune on top of any supported Citrix Workspace app version:
  - 32-bit Citrix Workspace app: aka.ms/plugin
  - 64-bit Citrix Workspace app: aka.ms/plugin_x64
  - Arm-based Citrix Workspace app: aka.ms/plugin_arm64
- **Mac:** Download the plug-in from aka.ms/macplugin and deploy it with tools like JAMF.

Option 3: Client App Management (formerly Global App Configuration service)

Client App Management (formerly Global App Configuration service, or GACS) manages app settings for managed and unmanaged endpoints, and can deploy the Teams plug-in across your endpoints. On Mac, this requires Citrix Workspace app for Mac 2603 or later. See Microsoft Teams VDI plug-in management.

Option 4: Virtual channel plug-in manager

The Virtual channel plug-in manager deploys plug-ins across client endpoints for applications that need endpoint components, including the New VDI solution for Teams. It detects the application running on the VDA and prompts the user to install the plug-in on the endpoint. Administrators can use it in BYOD scenarios. On Mac, this requires Citrix Workspace app for Mac 2603 or later. See Virtual channel plugin manager.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Plug-in update scenarios

Citrix handles Teams plug-in updates seamlessly when the plug-in is installed through Options 1, 3, or 4. If the plug-in is installed manually (Option 2), Citrix does not handle updates.

- Ensure Citrix Workspace app auto-update is on for plug-in auto-updates.
- Ensure a minimum of Citrix Workspace app for Windows 2405. Citrix Workspace app for Windows 2508 or later installs the plug-in automatically when Citrix Workspace app auto-updates.
- Citrix does not handle plug-in uninstallation. Uninstall the plug-in separately when needed.

> **Note:**
>
> Citrix handles updates to the Teams plug-in, not to the media engine. Microsoft delivers and updates the media engine.

Teams as a Citrix published app

Teams published as a Citrix Virtual Apps application can be optimized with this solution when all the necessary components meet the minimum versions. For the required versions and known limitations, see the Microsoft documentation.

Interoperability and roaming

See Optimization for Microsoft Teams for how the New VDI solution for Teams and Citrix HDX Optimization interoperate and how roaming behaves.

Networking considerations

See Networking considerations in the Microsoft documentation.

Feature support

The feature set and implementation are owned by Microsoft. See the feature list in the Microsoft documentation.

Troubleshooting

The Microsoft Teams client reports the optimization status and, when optimization fails, an error code. These status indicators and error codes are defined by Microsoft. For the full list and end-to-end troubleshooting, see Troubleshooting the New VDI solution for Teams in the Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Monitor provides visibility into the optimization state of this solution. In a session's details, the Session Topology view shows whether the application is optimized and flags any missing components, such as the plug-in manager, the plug-in and its version, the state of the virtual channel, and the virtual channel allow list status. For more information, see Real-time communications optimization visibility.

Some Microsoft error codes point to Citrix-side configuration. Common Citrix checks:

- If the Teams client reports that the custom virtual channels are blocked (Microsoft error 2003), confirm the virtual channel allow list includes MSTEAMS, MSTEAM1, and MSTEAM2.
- If the Teams client reports that no plug-in is detected (Microsoft error 2000), confirm the plug-in is installed and loaded. In Process Explorer, select `wfica32.exe`, show the lower pane, and check the DLL tab for `MsTeamsPluginCitrix.dll`.
- If the Teams client reports an unsupported Citrix Workspace app version (Microsoft error 2004), upgrade to a supported version. See System requirements.

Known limitations

The features and implementation are owned by Microsoft. See Known issues in the Microsoft documentation.

Optimization for Microsoft Teams (Classic)

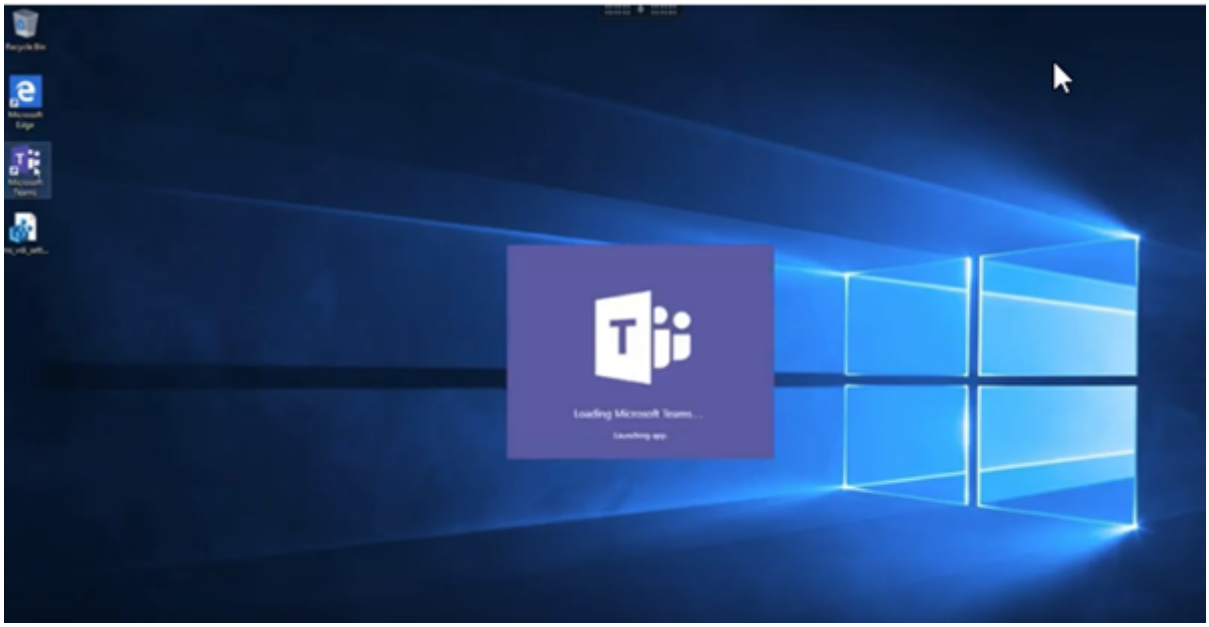
May 15, 2026

> **Note:**
>
> The new Microsoft Teams 2.1 is now generally available for VDA. This Microsoft Teams version is compatible with Citrix Microsoft Teams Optimization using WebRTC (VDI 1.0).
>
> Starting with Citrix Virtual Apps and Desktops 2402, you don't need to manually configure the `msedgewebview2.exe` registry entry as it's allow-listed by default.
>
> Published apps are now supported with the new Microsoft Teams.

Citrix delivers optimization for desktop-based Microsoft Teams using Citrix Virtual Apps and Desktops™ and Citrix Workspace™ app. By default, we bundle all the necessary components into the Citrix Workspace app and the Virtual Delivery Agent (VDA).

Our optimization for Microsoft Teams includes VDA-side HDX™ services and an API to interface with the Microsoft Teams hosted app to receive commands. These components open a control virtual channel (CTXMTOP) to the Citrix Workspace app-side media engine. The endpoint decodes and provides the

© 1997–2026 Citrix Systems, Inc. All rights reserved.



multimedia locally, moving the Citrix Workspace app window back into the hosted Microsoft Teams app.

Authentication and signaling occur natively on the Microsoft Teams-hosted app, just like the other Microsoft Teams services (for example chat or collaboration). Audio/video redirection doesn't affect them.

The `CTXMTOP` is a command and control virtual channel. That means that media isn't exchanged between the Citrix Workspace app and the VDA.

Only client-fetch/client-render is available.

This video demonstration gives you an idea of how Microsoft Teams works in a Citrix virtual environment.

Microsoft Teams installation

Citrix and Microsoft recommend the latest available version of Microsoft Teams and to keep it up to date.
Microsoft Teams desktop app versions with release dates that are more than 90 days older than the current version's release date aren't supported.
Unsupported Microsoft Teams desktop app versions show a blocking page to users and request to update the app.

For information on the latest available versions, see Update history for Microsoft Teams App (Desktop and Mac).

We recommend that you follow the Microsoft Teams machine-wide installation guidelines. Avoid using the .exe installer that installs Microsoft Teams in `AppData`. Instead, install in `C:\Program`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`Files (x86)\Microsoft\Teams` by using the `ALLUSER=1` flag from the command line.

```
msiexec /i <path_to_msi> /l*v <install_logfile_name> ALLUSER=1
ALLUSERS=1
```

This example also uses the `ALLUSERS=1` parameter. When you set this parameter, the Microsoft Teams Machine-Wide Installer appears in **Programs and Features** in the **Control Panel**. Also, in **Apps & features** in Windows Settings for all users of the computer. All users can then uninstall Microsoft Teams if they have administrator credentials.

It's important to understand the difference between `ALLUSERS=1` and `ALLUSER=1`. You can use the `ALLUSERS=1` parameter in non-VDI and VDI environments. Use the `ALLUSER=1` parameter only in VDI environments to specify a per-machine installation.

In `ALLUSER=1` mode, the Microsoft Teams application doesn't auto-update whenever there's a new version. We recommend this mode for non-persistent environments, such as hosted shared apps or desktops out of a Windows Server or Windows 10 random/pooled catalogs. For more information, see Install Microsoft Teams using MSI (VDI Installation section).

Suppose you have a Windows 10 dedicated persistent VDI environment. You want the Microsoft Teams application to auto-update and prefer Microsoft Teams to install per-user under `Appdata/Local`. In this case, use the `.exe` installer or the MSI without `ALLUSER=1`.

> **Note:**
>
> Citrix recommends installing the VDA before installing Microsoft Teams in the golden image. This installation order is needed for the `ALLUSER=1` flag to take effect. If you installed Microsoft Teams in the virtual machine before installing the VDA, uninstall and reinstall Microsoft Teams.

For Remote PC Access

Citrix recommends that you install Microsoft Teams version 1.4.00.22472 or later after installing the VDA. Otherwise, you need to sign out and sign in again for Microsoft Teams to detect the VDA as expected. Version 1.4.00.22472 and later includes augmented logic run at Microsoft Teams launch time and sign-in time for VDA detection. These versions also include active session type identification (HDX, RDP or locally connected to the client machine). If you're locally connected, previous versions of Microsoft Teams might fail to detect and disable certain features or UI elements. For example, Breakout Rooms, pop-out windows for meetings and chats, or meeting reactions.

> **Important:**
>
> When you roam from a local session to an HDX session and if Microsoft Teams is kept open and running on the background, you must exit and relaunch Microsoft Teams to optimize with HDX correctly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> Conversely, if you use Microsoft Teams remotely via an optimized HDX session, disconnect the HDX session and reconnect to the same Windows session locally at the device. When working from the office, you must relaunch Microsoft Teams so it can correctly detect the Remote PC Access state (HDX or local). Because Microsoft Teams can only assess VDI mode at app launch time, and not while it is already running on the background. Without a restart, Microsoft Teams might fail to load features like pop-out Windows, Breakout Rooms, or meeting reactions.

For App Layering

If using Citrix App Layering to manage VDA and Microsoft Teams installations in different layers, you must create a registry key on Windows VDAs before installing Microsoft Teams with the `ALLUSER=1` flag from the command line. For more information, see the *Optimization for Microsoft Teams with Citrix App Layering* section under Multimedia.

Profile Management recommendations

We recommend using the machine-wide installer for Windows Server and Pooled VDI Windows 10 environments.

When the **ALLUSER=1** flag is passed to the MSI from the command line (the machine-wide installer), the Microsoft Teams app installs under `C:\Program Files (x86)` (~300 MB). The app uses `AppData\Local\Microsoft\TeamsMeetingAddin` for logs and `AppData\Roaming\Microsoft\Teams` (~600–700 MB) for user-specific configurations, caching of elements in the user interface, and so forth.

> **Important:**
>
> If you don't pass the **ALLUSER=1** flag, the MSI places the Teams.exe installer and `setup.json` under `C:\Program Files (x86)\Teams Installer`. A registry key (TeamsMachineInstaller) is added under: `HKEY_LOCAL_MACHINE \SOFTWARE\WOW6432Node\Microsoft\Windows\CurrentVersion\Run`
>
> A subsequent user logon triggers the final installation in **AppData** instead.

Machine-wide installer

The following is an example of folders, desktop shortcuts, and registries created by installing a Microsoft Teams machine-wide installer on any Windows Server 64-bit VM:

Folder:

- `C:\Program Files (x86)\Microsoft\Teams`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- C:\Users\<username>\AppData\Roaming\Microsoft\Teams

Desktop Shortcut:

C:\Program Files (x86)\Microsoft\Teams\current\Teams.exe

Registry:

- HKEY_LOCAL_MACHINE \SOFTWARE\WOW6432Node\Microsoft\Windows\CurrentVersion\Run
- HKEY_LOCAL_MACHINE \SOFTWARE\Microsoft\Windows\CurrentVersion\Run
- HKEY_CURRENT_USER \SOFTWARE\Microsoft\Windows\CurrentVersion\Run
- Name: Teams
- Type: REG_SZ
- Value: C:\Program Files (x86)\Microsoft\Teams\current\Teams.exe

> **Note:**
>
> The registry location varies based on the underlying Operating Systems and bitness.

Recommendations

- We recommend disabling auto-start by deleting the Microsoft Teams registry keys. Doing so prevents many logons that occur at the same time (for example, at the beginning of your work day) from spiking up the VM's CPU.
- If the virtual desktop does not have a GPU/vGPU, we recommend setting **Disable GPU hardware acceleration** in the Microsoft Teams **Settings** to improve performance. This setting ("disableGpu":**true**) is stored in %Appdata%\Microsoft\Teams in desktop-config.json. You can use a logon script to edit that file and set the value to **true**.
- If using Citrix Workspace Environment Management™ (WEM), enable **CPU Spikes Protection** to manage processor consumption for Microsoft Teams.

Per-user installer

When using the .exe installer, the installation process differs. All the files are placed in AppData.

Folder:

- C:\Users\<username>\AppData\Local\Microsoft\Teams
- C:\Users\<username>\AppData\Local\Microsoft\TeamsPresenceAddin
- C:\Users\<username>\AppData\Local\Microsoft\TeamsMeetingAddin
- C:\Users\<username>\AppData\Local\SquirrelTemp
- C:\Users\<username>\AppData\Roaming\Microsoft\Teams

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Desktop shortcut:

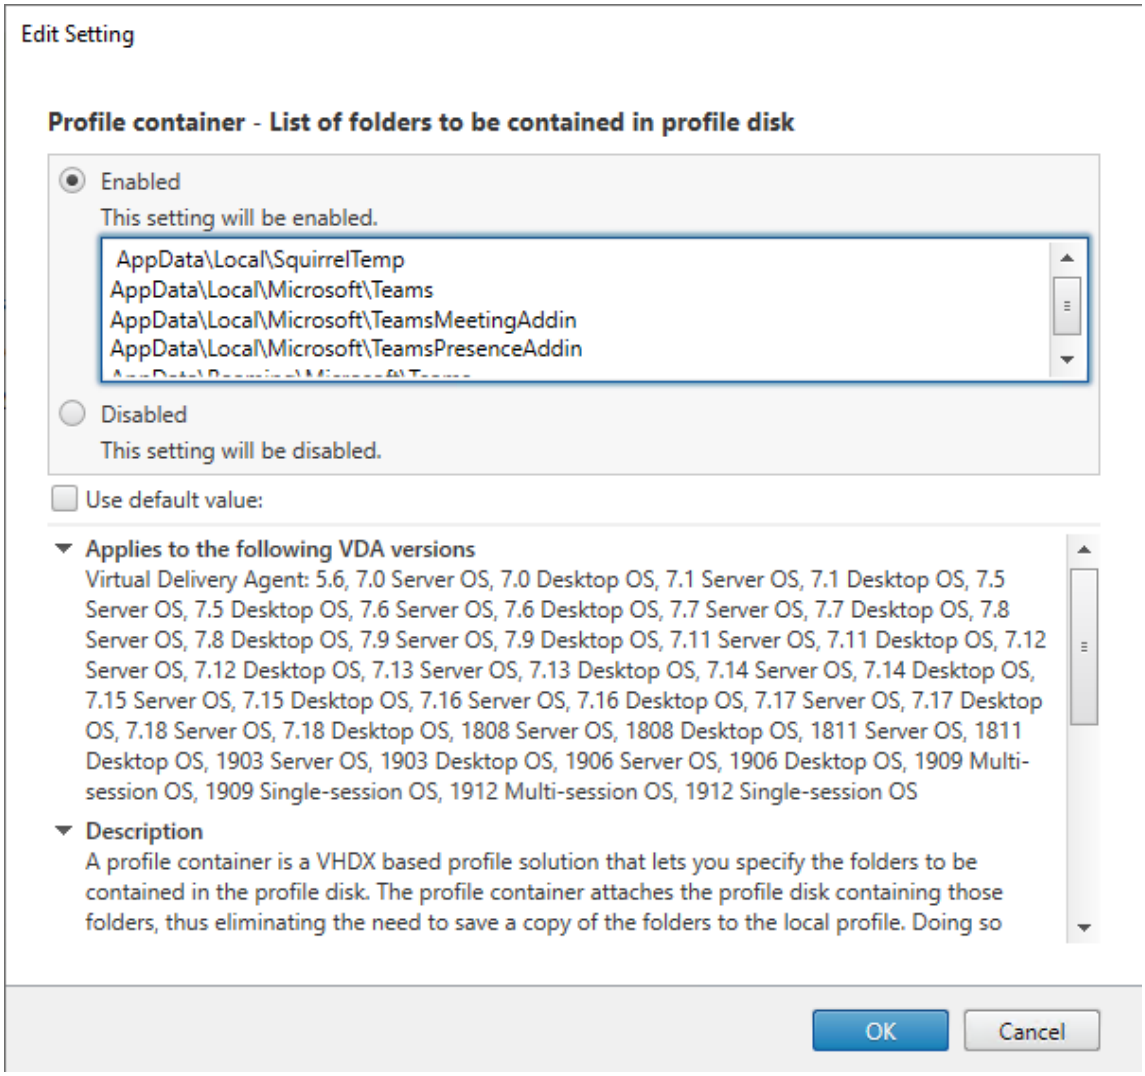
```
C:\Users\<username>\AppData\Local\Microsoft\Teams\Update.exe --
processStart "Teams.exe"
```

Registry:

```
HKEY_CURRENT_USER \SOFTWARE\Microsoft\Windows\CurrentVersion\Run
```

Best Practices

The best practice recommendations are based on the use-case scenarios.
Using Microsoft Teams with a non-persistent setup requires a profile caching manager for efficient Microsoft Teams runtime data synchronization. With a profile caching manager, the appropriate user-specific information is cached during the user session. For example, the user-specific information includes user data, profile, and settings. Synchronize the data in these two folders:



- `C:\Users\<username>\AppData\Local\Microsoft\IdentityCache`
- `C:\Users\<username>\AppData\Roaming\Microsoft\Teams`

Microsoft Teams cached content exclusion list for non-persistent setup Exclude the files and directories from the Microsoft Teams caching folder as described in the Microsoft documentation. This action helps you to reduce the user caching size to further optimize your non-persistent setup.

Use case: single-session scenario In this scenario, the end user uses Microsoft Teams in one location at a time. They don't need to run Microsoft Teams in two Windows sessions at the same time. In a common virtual desktop deployment, each user is assigned to one desktop, and Microsoft Teams is deployed in the virtual desktop as one application.
We recommend enabling the Citrix Profile container and redirecting the per-user directories listed in Per-user installer into the container.

1. Deploy the Microsoft Teams machine-wide installer (**ALLUSER=1**) in the golden image.
2. Enable Citrix Profile Management and set up the user profile store with the proper permissions.
3. Enable the following Profile Management policy setting: **File system > Synchronization > Profile container –List of folders to be contained in profile disk**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

List all the per-user directories in this configuration. You can also configure these settings using the Citrix Workspace Environment Management (WEM) service.

4. Apply the settings to the correct delivery group.
5. Log in to validate the deployment.

System requirements

Minimum recommended version - Delivery Controller (DDCs) 1906.2

If you're using an earlier version, see Enable optimization of Microsoft Teams:

Supported operating systems:

- Windows Server 2022, 2019, 2016, 2012R2 Standard and data center Editions, and with the Server Core option

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Minimum version - Virtual Delivery Agents (VDAs) 1906.2

Supported operating systems:

- Windows 11
- Windows 10 64-bit, versions 1607 and later. VM-hosted apps are supported in the Citrix Workspace app for Windows 2109.1 and later
- Windows Server 2022, 2019, 2016, and 2012 R2 (Standard and data center Editions)

Requirements:

- BCR_x64.msi - the MSI that includes the Microsoft Teams optimization code and starts automatically from the GUI. If you're using the command-line interface for the VDA installation, don't exclude it.

Recommended version –Citrix Workspace app for Windows latest CR and Minimum version - Citrix Workspace app 1907 for Windows

- Windows 11.
- Windows 10 (32-bit and 64-bit editions, including Embedded editions) (Support for Windows 7 stopped at Version 2006) (Support for Windows 8.1 stopped at version 2204.1).
- Windows 10 IoT Enterprise 2016 LTSB (v1607) and 2019 LTSC (v1809).
- Processor (CPU) architectures supported: x86 and x64 (ARM isn't supported).
- Endpoint requirement: Approximately 2.2–2.4 GHz dual-core CPU that can support 720p HD resolution during a peer-to-peer video conference call.
- Dual or quad-core CPUs with lower base speeds (~1.5 GHz) equipped with Intel Turbo Boost or AMD Turbo Core that can boost up to at least 2.4 GHz.
- HP Thin Clients verified: t630/t640, t730/t740, mt44/mt45.
- Dell Thin Clients verified: 5070, 5470 Mobile TC and AIO.
- 10ZiG Thin Clients verified: 4510 and 5810q.
- For a complete list of verified endpoints, see Thin Clients.
- Citrix Workspace app requires at least 600 MB of free disk space and 1 GB RAM.
- The Microsoft .NET Framework minimum requirement is version 4.8. Citrix Workspace app automatically downloads and installs the .NET Framework if it's not present in the system.

Administrators can enable/disable Microsoft Teams starting in optimized mode by changing the Microsoft Teams Optimization policy. Users starting in the optimized mode in the Citrix Workspace app can't disable Microsoft Teams.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Minimum version - Citrix Workspace app 2006 for Linux

For more information, see Optimization for Microsoft Teams in Citrix Workspace app for Linux documentation.

Software:

- GStreamer 1.0 or later or Cairo 2
- libc++-9.0 or later
- libgdk 3.22 or later
- OpenSSL 1.1.1d
- libnsl
- Ubuntu 20.04 or later

Authentication enhancement:

- Libsecret library
- libunwind-12 library. For more information, see Adding the libunwind-12 library dependency for llvm-12.

Hardware:

- Minimum 1.8 GHz dual-core CPU that can support 720p HD resolution during a peer-to-peer video conference call
- Dual or quad-core CPU with a base speed of 1.8 GHz and a high Intel Turbo Boost speed of at least 2.9 GHz

For a complete list of verified endpoints, see Thin Clients.

For more information, see Prerequisites to install Citrix Workspace app.

You can disable Microsoft Teams optimization by updating the value of the **VDWEBRTC** field to Off in the /opt/Citrix/ICAClient/config/module.ini file. The default is VDWEBRTC=On. After the update is completed, restart the Session. (Root permission is required).

Minimum version - Citrix Workspace app 2012 for Mac

Supported operating systems:

- macOS Catalina (10.15).
- macOS Big Sur 11.0.1 and later.
- macOS Monterey.

Features supported:

- Audio

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Video
- Screen sharing optimization (incoming and outgoing)

> **Note:**
>
> The Citrix Viewer app requires access to macOS Security and Privacy preferences for screen sharing to work. Users configure this preference in **Apple menu > System preferences > Security & Privacy > Privacy tab > Screen recording** and select **Citrix Viewer**.

Microsoft Teams optimization works by default with Citrix Workspace app 2012 and later and macOS 10.15.

If you want to disable Microsoft Teams optimization, run this command in a terminal and restart the Citrix Workspace app:

```
defaults write com.citrix.receiver.nomas mtopEnabled -bool NO
```

Minimum version - Latest version of Citrix Workspace app for ChromeOS running on the latest version of ChromeOS

Hardware:

- Processors performing at par or better than the Intel i3, quad core 2.4 GHz.

Features supported:

- Audio
- Video
- Screen sharing optimization (incoming and outgoing) - disabled by default. See these settings for instructions on how to turn it on.

Single Server Scalability

This section provides recommendations and guidance to estimate how many users or virtual machines (VMs) can be supported on a single physical host. This is commonly referred to as Citrix Virtual Apps and Desktops™ Single Server Scalability (SSS). In the context of Citrix Virtual Apps (CVA) or session virtualization, it is also commonly known as user density. The idea is to find out how many users or VMs can be ran on a single piece of hardware running a major hypervisor.

> **Note:**
>
> This section includes guidance to estimate SSS. The guidance is high level and might not necessarily be specific to your unique situation or environment. The only way to truly understand Citrix Virtual Apps and Desktops SSS is to use a scalability or load testing tool such as Login VSI.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> Citrix recommends using this guidance and these simple rules to quickly estimate SSS only. However, Citrix recommends using Login VSI or the load testing tool of your choice to validate results, especially before purchasing hardware or making any financial decisions.

Hardware (system under test)

- Dell PowerEdge R740
- Intel Xeon (Gold) 6126 @ 2.60 GHz (max Turbo 3.70 GHz), 12 cores per socket, dual socket with Hyperthreading enabled
- 382 GB of RAM
- Local SSD RAID 0 storage (11 disk) 6 TB

Software

A single virtual machine (40 logical processors) with Windows 2019 (TSVDA) running Citrix Virtual Apps and Desktops 2106
VMware ESXi 6.7

Terminology

- Knowledge worker workload: Includes Acrobat Reader, Freemind/Java, Photo viewer, Edge, and MS Office apps such as Excel, Outlook, PowerPoint, and Word.
- Baseline: Server Scalability tests run with knowledge worker workload (without Microsoft Teams).
- Microsoft Teams Workload: Knowledge worker typical workload + Microsoft Teams.

How Microsoft Teams is stress-tested

- Microsoft Teams is optimized with HDX. Hence, all the multimedia processing is offloaded to the endpoint or client and is not part of the measurement.
- All Microsoft Teams processes are stopped or killed, before the workload starts.
- Open Microsoft Teams (Cold start).
- Measure the time taken by Microsoft Teams to load and grab the focus of Microsoft Teams primary window.
- Switch to the chat window using keyboard shortcuts.
- Switch to the calendar window using keyboard shortcuts.
- Send the chat message to a specific user using keyboard shortcuts.
- Switch to the Microsoft Teams window using keyboard shortcuts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Results

- 40% scalability impact with Microsoft Teams Workload (81 users), when compared to Baseline (137 users).
- Increasing the server capacity by ~40% (in CPU) restores the number of users as with the Baseline workload.
- 20% extra memory required with Microsoft Teams Workload, when compared to Baseline.
- Increase per user storage size by 512-1024 MB.
- ~50% increase in IOPS write, ~100% increase in IOPS reads. Microsoft Teams can have a significant impact in an environment with slower storage.

Feature matrix and version support

Feature	Microsoft Teams (minimum version)	VDA (minimum version)	Citrix Workspace app for Windows CR (minimum version)	Citrix Workspace app for Mac (Minimum Version)	Citrix Workspace app for Linux (Minimum Version)	Citrix Workspace app for ChromeOS (Minimum Version)
Audio/Video (P2P and conference)	current version minus 90 days	1906	1907	2009	2004	2105.5
Screensharing	Current version minus 90 days	1906	1907	2012	2006	2105.5
i. Screen Indicator Red border	Current version minus 90 days	1906	2002	2012	2006	No
ii. Limit capture to Desktop Viewer	Current version minus 90 days	1906	2009.5	2012	2006	No

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature	Microsoft Teams (minimum version)	VDA (minimum version)	Citrix Workspace app for Windows CR (minimum version)	Citrix Workspace app for Mac (Minimum Version)	Citrix Workspace app for Linux (Minimum Version)	Citrix Workspace app for ChromeOS (Minimum Version)
iii. Multi-monitor	Current version minus 90 days	1912 CU6+	2106 (1)	2106	2106	No
DTMF	Current version minus 90 days	N/A	2102	2101	2101	2111.1

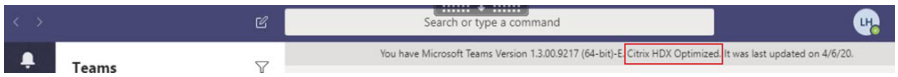
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature	Microsoft Teams (minimum version)	VDA (minimum version)	Citrix Workspace app for Windows CR (minimum version)	Citrix Workspace app for Mac (Minimum Version)	Citrix Workspace app for Linux (Minimum Version)	Citrix Workspace app for ChromeOS (Minimum Version)
MultiWindow	1.5.00.11865	2112, 1912 CU6 (5)	2112.1	2203.1	2203	2303
Meeting Transcrip-tions	Current version minus 90 days	2112.1, 1912 CU6+	2112	2203.1	2203	2303
Background Blurring	Current version minus 90 days	2112, 1912 CU6+	2207	2301	2212	2303

1. CD Viewer in full screen mode only. SHIFT+F2 is not supported.
2. Negotiate/Kerberos, NTLM, Basic, and Digest. Pac files are also supported.
3. Anonymous only.
4. If VDA is 2112 or higher, Live Captions only work if the Citrix Workspace app version is 2203.1 for MAC and 2203 Linux or 2112 for Windows. This is because Live Captions behave differently if Microsoft Teams is in Single Window UI mode or MultiWindow mode.
5. MultiWindow was introduced in the 2112 VDA but was back-ported to the VDA 1912 LTSR CU6 release.

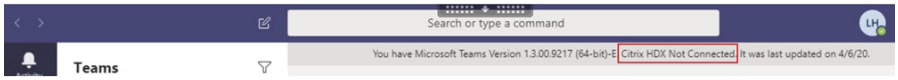
> **Note:**
>
> - All features listed in **Citrix Workspace app for Windows 1912 CU6 (or later)** are applicable to Citrix Workspace app for Windows 2203.1 LTSR CU1.
> - Microsoft has deprecated support for Single Window mode in Microsoft Teams. To comply, you must upgrade your VDA to 1912 CU6+ LTSR and Citrix Workspace app 2203 CU2+ or greater, which supports the MultiWindow mode.

Enable optimization of Microsoft Teams



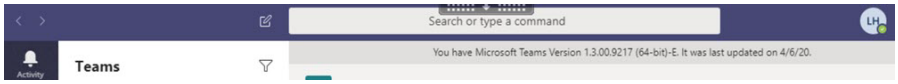
To enable optimization for Microsoft Teams, use the Manage policy described in the Microsoft Teams redirection policy. This policy is **ON** by default. In addition to this policy being enabled,

© 1997–2026 Citrix Systems, Inc. All rights reserved.



HDX checks to verify that the version of the Citrix Workspace app is at least the minimum required version. If you enabled the policy and the Citrix Workspace app version is supported, **HKEY_CURRENT_USER\Software\Citrix\HDXMediaStream\MSTeamsRedirSupport** is set to **1** automatically on the VDA. Microsoft Teams reads the key to load in VDI mode.

> **Note:**
>
> If you're using version 1906.2 or later VDAs or with older controller versions (for example, version 7.15) that don't have the policy available in the Manage console (Studio), your VDA can still be optimized. HDX optimization for Microsoft Teams is enabled by default in the VDA.



If you click **About > Version**, the **Citrix HDX Optimized** legend displays:

If you see **Citrix HDX Not Connected**, the Citrix API is loaded in Microsoft Teams. Loading the API is the first step toward redirection. But there's an error in later parts of the stack. The error is most likely in the VDA services or the Citrix Workspace app.

If you don't see any legend, Microsoft Teams failed to load the Citrix API. Exit Microsoft Teams by right-clicking the notification area icon and restarting. Make sure that the Manage policy isn't set to **Prohibited** and that the Citrix Workspace app version is supported.

> **Important: session reconnects**
>
> - You might require to relaunch Microsoft Teams to get an HDX optimized session when your connectivity changes. For example, if you are roaming from an unsupported endpoint (Workspace app for iOS, Android, or old versions of Windows/Linux/Mac) to a supported one (Workspace app for Windows/Linux/Mac/ChromeOS/HTML5), or the opposite way.
> - A Microsoft Teams relaunch is also required if you have installed the app using the Microsoft Teams .exe installer in the VDA. The .exe installer is recommended for persistent VDI deployments. In such cases, Microsoft Teams can auto-update while the HDX session is in the disconnected state. So, users reconnecting to an HDX session finds that the Microsoft Teams is not running optimized.
> - When you roam from a local session to an HDX session, you must relaunch Microsoft Teams to optimize with HDX. This action is required in a Remote PC Access scenario.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Network requirements

Microsoft Teams relies on Media Processor servers in Microsoft 365 for meetings or multiparty calls. Also, Microsoft Teams relies on Microsoft 365 Transport Relays for these scenarios:

- Two peers in a point-to-point call do not have direct connectivity
- A participant does not have direct connectivity to the media processor.

So the network health between the peer and the Microsoft 365 cloud determines the performance of the call. Refer to Microsoft 365 network connectivity principles for detailed guidelines around network planning.

We recommend evaluating your environment to identify any risks and requirements that can influence your overall cloud voice and video deployment.
Use the Skype for Business Network Assessment Tool to test if your network is ready for Microsoft Teams. For support information, see Support.

Summary of key network recommendations for Real Time Protocol (RTP) traffic

- Connect to the Microsoft 365 network as directly as possible from the branch office.
- Plan for and provide sufficient bandwidth at the branch office.
- Check each branch office for network connectivity and quality.
- If you must use any of the following at the branch office, make sure that RTP/UDP traffic (handled by HdxRtcEngine.exe in the Citrix Workspace app) is unhindered.
    - Bypass proxy servers
    - Network SSL intercept
    - Deep packet inspection devices
    - VPN hairpins (use split tunneling if possible)

> **Important: VPN Split tunnel configuration**
>
> HdxRtcEngine.exe traffic has to be diverted from the VPN tunnel and allowed to use the user's local Internet connection to connect directly to the service. The manner in which this is accomplished depends on the VPN product and machine platform used but most VPN solutions allow some simple configuration of policy to apply this logic. For more information on VPN platform-specific split tunnel guidance, see this Microsoft article.

The WebRTC media engine in the Workspace app (HdxRtcEngine.exe) uses the Secure Real-time Transport Protocol (SRTP) for multimedia streams that are offloaded to the client. SRTP provides confidentiality and authentication to RTP. For this feature, symmetric keys (negotiated with DTLS) are used to encrypt media and control messages using the AES encryption cipher.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following metrics are recommended for a positive user experience:

Metric	Endpoint to Microsoft 365
Latency (one way)	< 50 msec
Latency (RTT)	< 100 msec
Packet Loss	<1% during any 15s interval
Packet inter-arrival jitter	<30ms during any 15s interval

For more information, see Prepare your organization's network for Microsoft Teams.

For bandwidth requirements, optimization for Microsoft Teams can use a wide variety of codecs for audio (OPUS/G.722/PCM G711) and video (H264).

The peers negotiate these codecs during the call establishment process using the Session Description Protocol (SDP) Offer/Answer.
Citrix minimum recommendations per user are:

Type	Bandwidth	Codec
Audio (each way)	~ 90 kbps	G.722
Audio (each way)	~ 60 kbps	Opus*
Video (each way)	~ 700 kbps	H264 360p @ 30 fps 16:9
Screen sharing	~ 300 kbps	H264 1080p @ 15 fps

* Opus supports constant and variable bitrate encoding from 6 kbps up to 510 kbps.

Opus and H264 are the preferred codecs for peer-to-peer and conference calls.

> **Important:**
>
> About performance, encoding is more expensive than decoding for CPU use at the client machine. You can hardcode the maximum encoding resolution in the Citrix Workspace app for Linux and Windows. See Encoder performance estimator and Optimization for Microsoft Teams.

Proxy servers

Depending on the location of the proxy, consider the following:

- Proxy configuration on the VDA:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you configure an explicit proxy server in the VDA and route connections to localhost through a proxy, redirection fails. To configure the proxy correctly, you must select the **Bypass proxy servers for local address** setting in **Internet Options > Connections > LAN Settings > Proxy Servers** and bypass `127.0.0.1:9002`.

If you use a PAC file, your VDA proxy configuration script from the PAC file must return **DIRECT** for `wss://127.0.0.1:9002`. If not, optimization fails. To make sure that the script returns **DIRECT**, use `shExpMatch(url, "wss://127.0.0.1:9002/*")`.

- Proxy configuration on Citrix Workspace app:

  If the branch office is configured to access the internet through a proxy, these versions support proxy servers:

  - Citrix Workspace app for Windows version 2012 (Negotiate/Kerberos, NTLM, Basic, and Digest. `Pac` files are also supported)
  - Citrix Workspace app for Windows version 1912 CU5 (Negotiate/Kerberos, NTLM, Basic, and Digest. `Pac` files are also supported)
  - Citrix Workspace app for Linux version 2101 (anonymous authentication)
  - Citrix Workspace app for Mac version 2104 (anonymous authentication)

Client devices with earlier versions of the Citrix Workspace app can't read proxy configurations. These devices send traffic directly to Microsoft 365 TURN servers.

> **Important:**
>
> - Verify that the client device can connect to the DNS server to do DNS resolutions. A client device must be able to resolve the following Microsoft Teams Relay server's FQDNs:
>   - `worldaz.relay.teams.microsoft.com`
>   - `inaz.relay.teams.microsoft.com`
>   - `uaeaz.relay.teams.microsoft.com`
>   - `euaz.relay.teams.microsoft.com`
>   - `usaz.relay.teams.microsoft.com`
>   - `turn.dod.teams.microsoft.us`
>   - `turn.gov.teams.microsoft.us`
>
> If DNS requests are unsuccessful, P2P calls with outside users and conference calls with the media establishment fails.
>
> - The location of the conference server is selected based on the first participant's virtual desktop location (and not the client).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Call establishment and media flow paths

When possible, the HDX WebRTC media engine in the Citrix Workspace app (HdxRtcEngine.exe) tries to establish a direct network Secure Real-time Transport Protocol (SRTP) connection over User Datagram Protocol (UDP) in a peer-to-peer call. If the UDP high ports are blocked, the media engine falls back to TCP/TLS 443.

The HDX media engine supports ICE, Session Traversal Utilities for NAT (STUN), and Traversal Using Relays around NAT (TURN) for candidate discovery and establishing connection. This support means that the endpoint must be able to perform DNS resolutions.

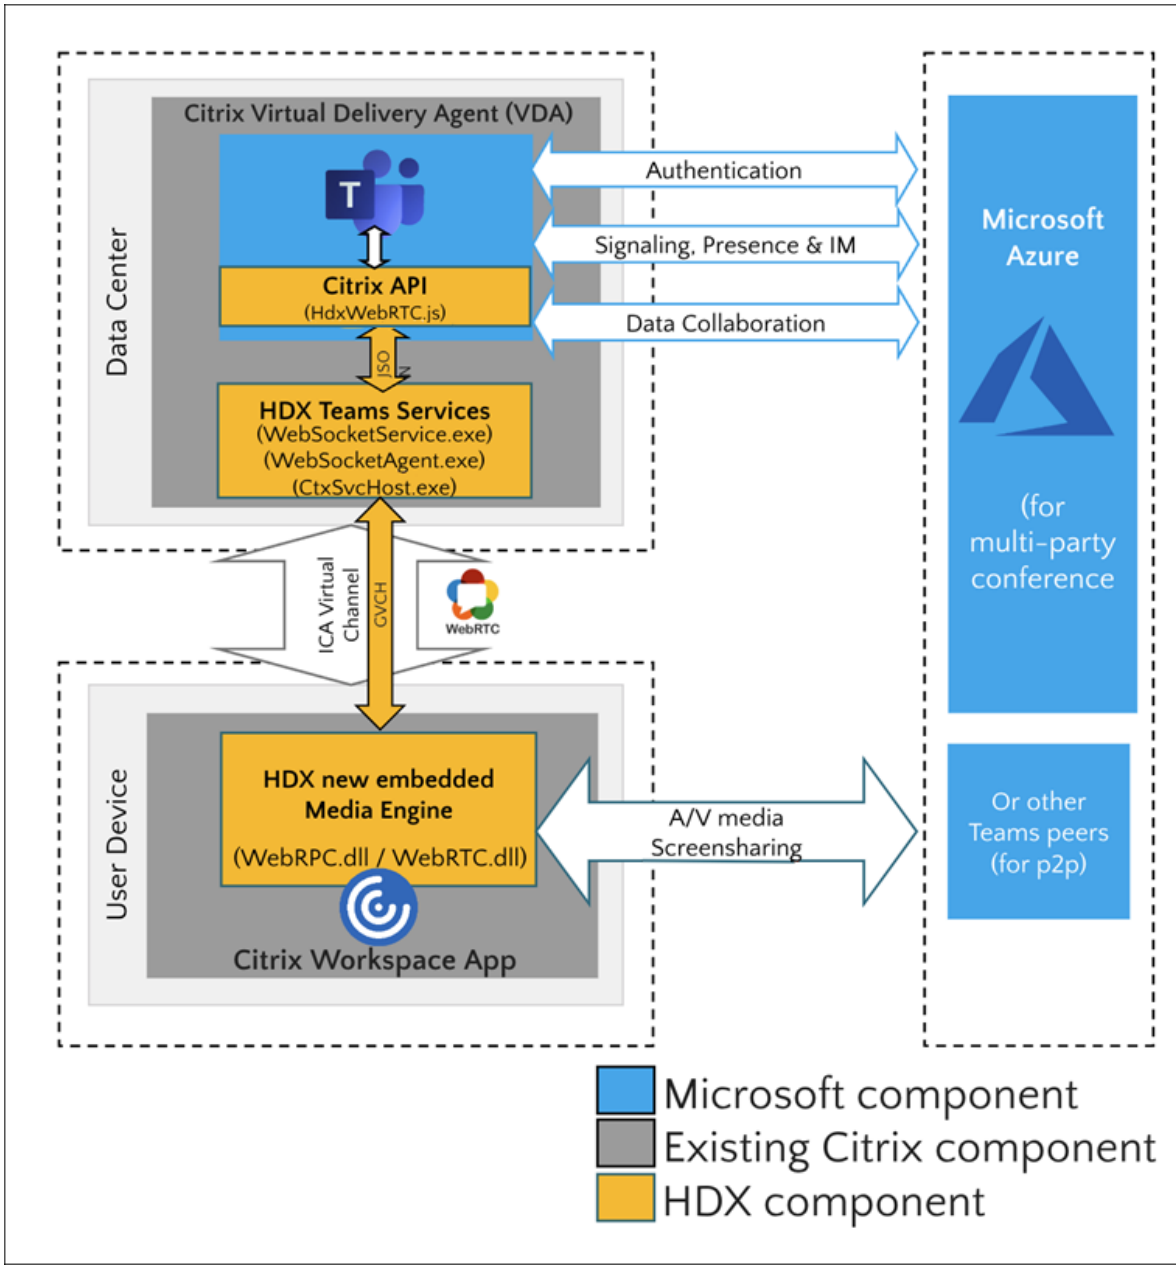
Consider a scenario where there is no direct path between the two peers or between a peer and a conference server and you are joining a multi-party call or meeting. The HdxRtcEngine.exe uses a Microsoft Teams transport relay server in Microsoft 365 to reach the other peer or the media processor, where meetings are hosted. Your client machine must have access to three Microsoft 365 subnet IP address ranges and four UDP ports (or TCP/TLS 443 as fallback if UDP is blocked). For more information, see the Architecture diagram in the Call setup and Office 365 URLs and IP address ranges ID 11.

ID	Category	Addresses	Destination Ports
11	Optimize required	13.107.64.0/18, 52.112.0.0/14, 52.122.0.0/15	**UDP:** 3478, 3479, 3480, 3481, **TCP:** 443 (fallback)

These ranges include both Transport Relays and media processors, front-ended by an Azure Load Balancer.
The Microsoft Teams Transport Relays provide STUN and TURN functionality, but they aren't ICE endpoints. Also, the Microsoft Teams Transport Relays don't terminate media, TLS, or do any transcoding. They can bridge TCP (if HdxRtcEngine.exe uses TCP) to UDP when they forward traffic to other peers or media processors.

Workspace app WebRTC media engine contacts the closest Microsoft Teams Transport Relay in the Microsoft 365 cloud. The media engine uses anycast IP and port 3478–3481 UDP (different UDP ports per workload, though multiplexing can happen) or 443 TCP/TLS for fallbacks. Call quality depends on the underlying network protocol. Because UDP is always recommended over TCP, we advise you to design your networks to accommodate UDP traffic in the branch office.

If Microsoft Teams loaded in optimized mode and HdxRtcEngine.exe is running on the endpoint, ICE failures might cause a call setup failure or one-way-only audio/video. When a call can't be completed or the media streams aren't full duplex, check the **Wireshark trace** on the endpoint first. For more information about the ICE candidate gathering process, see "Collecting logs"in the Support section.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If the endpoints don't have internet access, the users might still be able to make a peer-to-peer call if they are both on the same LAN. Meetings fail. In this case, there's a 30-second timeout before the call setup begins.

Call setup

Use this architecture diagram as a visual reference for the call flow sequence. The corresponding steps are indicated in the diagram.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Architecture

1. Start Microsoft Teams.
2. Microsoft Teams authenticates to O365. Tenant policies are pushed down to the Microsoft Teams client, and relevant TURN and signaling channel information is relayed to the app.
3. Microsoft Teams detects that it's running in a VDA and makes API calls to the Citrix JavaScript API.
4. Citrix JavaScript in Microsoft Teams opens a secure WebSocket connection to WebSocketService.exe running on the VDA, which spawns WebSocketAgent.exe inside the user session.
5. WebSocketAgent.exe instantiates a generic virtual channel by calling into the Citrix HDX

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Microsoft Teams Redirection Service (CtxSvcHost.exe).

6. Citrix Workspace app's wfica32.exe (HDX engine) spawns a new process called HdxRtcEngine.exe, which is the new WebRTC engine used for Microsoft Teams optimization.
7. Citrix media engine and Teams.exe have a 2-way virtual channel path and can start processing multimedia requests.

   ——User calls——

8. **Peer A** clicks the **call** button. Teams.exe communicates with the Microsoft Teams services in Microsoft 365, establishing an end-to-end signaling path with **Peer B**. Microsoft Teams asks HdxRtcEngine for a series of supported call parameters (codecs, resolutions, and so forth, which is known as a Session Description Protocol (SDP) offer). These call parameters are then relayed using the signaling path to the Microsoft Teams services in Microsoft 365 and from there to the other peer.
9. The SDP offer/answer (single-pass negotiation) takes place through the signaling channel, and the ICE connectivity checks (NAT and Firewall traversal using STUN bind requests) complete. Then, Secure Real-time Transport Protocol (SRTP) media flows directly between HdxRtcEngine.exe and the other peer (or Microsoft 365 conference servers if it's a meeting).

Microsoft Phone System

Phone System is Microsoft's technology that enables call control and PBX in the Microsoft 365 cloud with Microsoft Teams. Optimization for Microsoft Teams supports Phone System, using Microsoft 365 Calling Plans or Direct Routing. With Direct Routing, you can connect your own supported session border controller to the Microsoft Phone System directly without any additional on-premises software. Call queues, transfer, forward, hold, mute, and resume a call are supported.

DTMF

The dual-tone multi-frequency (DTMF) feature is supported with these versions of the Citrix Workspace app (and later):

- Citrix Workspace app for Windows version 2102
- Citrix Workspace app for Windows LTSR 1912 CU5 (Windows 10 OS only)
- Citrix Workspace app for Linux version 2101
- Citrix Workspace app for Mac version 2101
- Citrix Workspace app for ChromeOS version 2111.1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Support for dynamic e911

Starting with version 2112, the Citrix Workspace app supports dynamic emergency calling. When used in Microsoft Calling Plans, Operator Connect, and Direct Routing, it allows you to do the following:

- Configure and route emergency calls.
- Notify security personnel.

The notification is provided based on the current location of the Citrix Workspace app that runs on the endpoint, instead of the Microsoft Teams client that runs on the VDA.

Ray Baum's law requires the 911 caller's dispatchable location to be transmitted to the appropriate Public Safety Answering Point (PSAP). Microsoft Teams Optimization with HDX is compliant with Ray Baum's law when used with the following versions of the Citrix Workspace app:

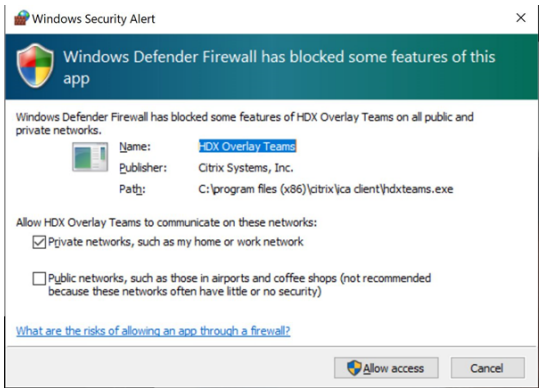
- Citrix Workspace app for Windows version 2112.1 and later
- Citrix Workspace app for Linux version 2112 and later
- Citrix Workspace app for Mac version 2112 and later
- Citrix Workspace app for ChromeOS version 2112 and later

To enable dynamic emergency calling, the administrator must use the Microsoft Teams Admin Center and configure the following to create a network or emergency location map:

- Network settings
- Location Information Service (LIS)

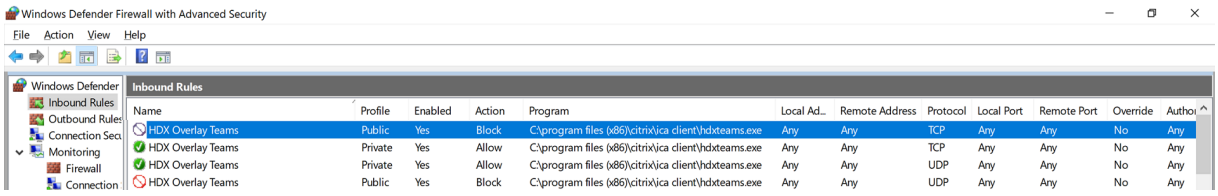
For more information on Dynamic emergency calling, see Microsoft's documentation.

The dispatchable location information that the Citrix Workspace app relays to Microsoft Teams are:



- Chassis ID / Port ID using Link Layer Discovery Protocol (LLDP) for Ethernet/Switch connections. Ethernet/Switch (LLDP) is supported on:
  - Windows versions 8.1 and 10
  - macOS, which requires LLDP enablement software. To download the LLDP enablement software, go to `www.microsoft.com` and search for LLDP enablement software.
  - Linux, which requires the LLDP library to be included in the operating system(OS) distribution of the Thin Client.
- WLAN BBSID and {IPv4-IPv6; Subnet; MAC Address} of the endpoint where Citrix Workspace app is installed.
  - Subnet and WiFi-based locations are supported on the Workspace app for Windows, Linux, and Mac.
- Latitude and Longitude, if user permission is granted at the OS-level where the Citrix Workspace app is installed (permission is set to HDX RTC Engine)

© 1997–2026 Citrix Systems, Inc. All rights reserved.



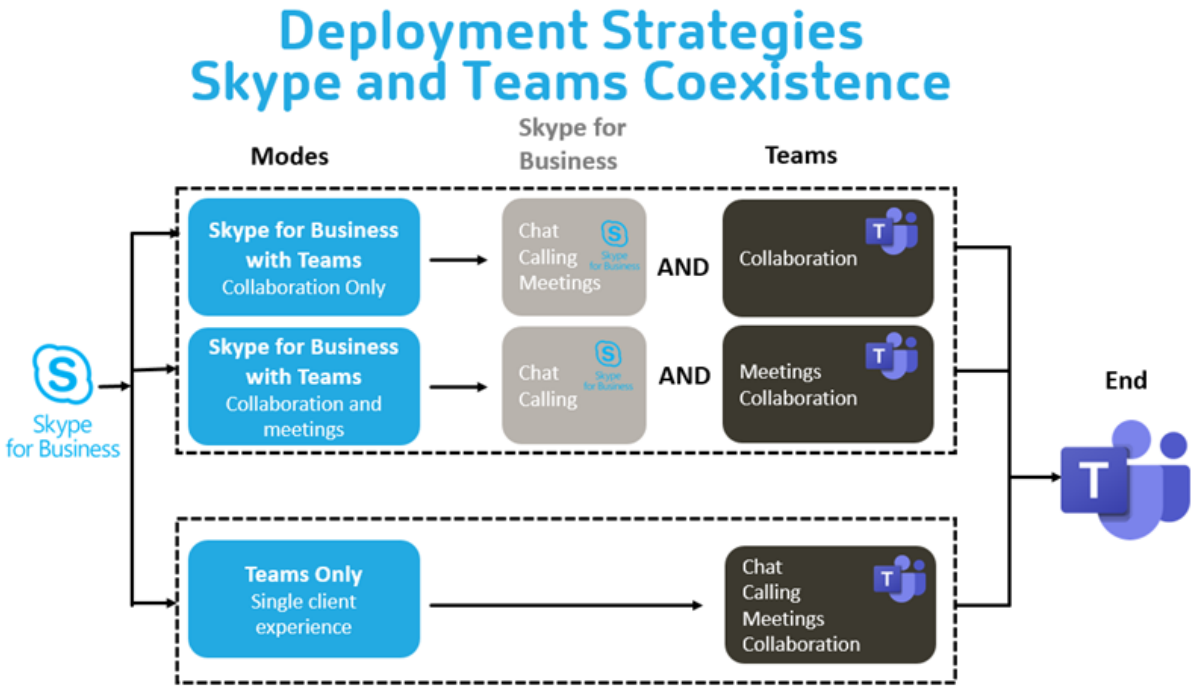
- Supported on all Workspace app platforms. However, for Citrix Workspace for Linux, you must include the `libgps` library in the OS distribution of the Thin Client (>sudo apt-get install libgps23 gpsd lldpd).

Firewall considerations

When users start an optimized call using the Microsoft Teams client for the first time, they might notice a warning with the **Windows firewall** settings. The warning asks for users to allow communication for HdxTeams.exe or HdxRtcEngine.exe (HDX Overlay Microsoft Teams).

The following four entries are added under **Inbound Rules** in the **Windows Defender Firewall > Advanced Security** console. You can apply more restrictive rules if you want.

Microsoft Teams and Skype for Business Coexistence



You can deploy Microsoft Teams and Skype for Business side by side as two separate solutions with overlapping capabilities.
For more information, see Understand Microsoft Teams and Skype for Business coexistence and interoperability.

Citrix RealTime Optimization Pack and HDX optimization for Microsoft Teams multimedia engines then honor the configuration set in your environment. Examples include island modes and Skype for Business with Microsoft Teams collaboration. Also, Skype for Business with Microsoft Teams collaboration and meetings.

Peripheral access can be granted only to a single application at the time. For example, webcam access by the RealTime Media Engine during a call locks the imaging device during a call. When the device is

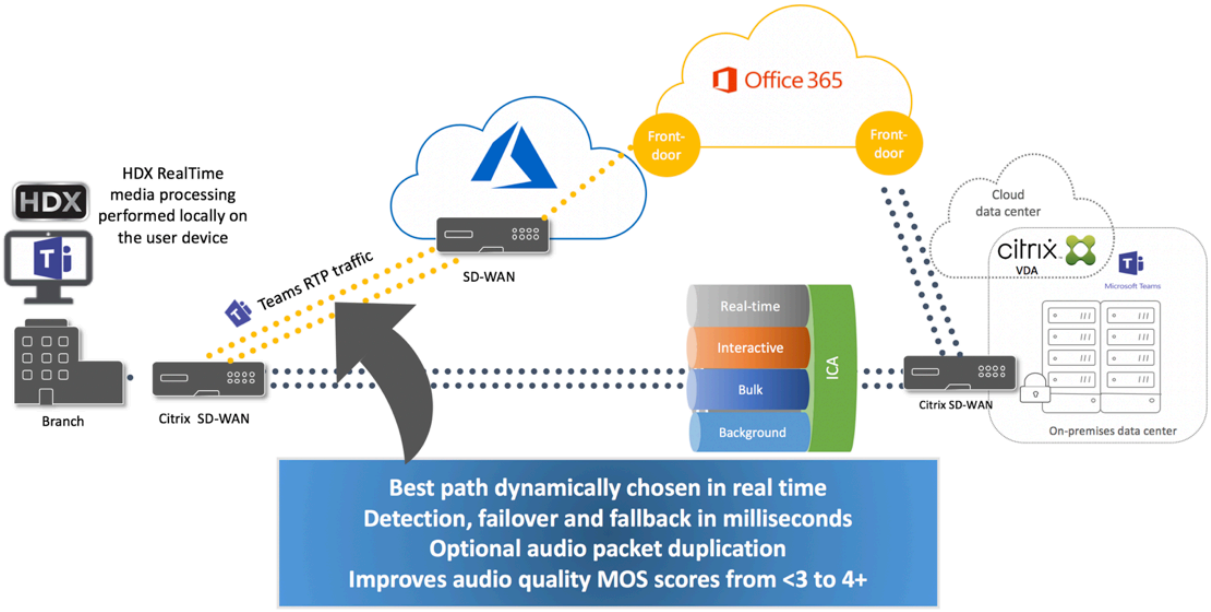
© 1997–2026 Citrix Systems, Inc. All rights reserved.

released, it becomes available for Microsoft Teams.

Citrix SD-WAN™: optimized network connectivity for Microsoft Teams

Optimal audio and video quality require a network connection to the Microsoft 365 cloud that has low latency, low jitter, and low packet loss. Backhauling of Microsoft Teams audio-video RTP traffic from Citrix Workspace app users at branch office locations to a data center before going to the internet can add excessive latency. It might also cause congestion on WAN links. Citrix SD-WAN optimizes connectivity for Microsoft Teams following Microsoft 365 network connectivity principles. Citrix SD-WAN uses the Microsoft REST-based Microsoft 365 IP address and web service and proximate DNS. This use is to identify, categorize, and steer Microsoft Teams traffic.

Business broadband internet connections in many areas suffer from intermittent packet loss, periods of excessive jitter, and outages.



Citrix SD-WAN offers two solutions to preserve Microsoft Teams audio-video quality when network health is variable or degraded.

- If you use Microsoft Azure, a Citrix SD-WAN virtual appliance (VPX) deployed in the Azure VNET provides advanced connectivity optimizations. These optimizations include seamless link failover and audio packet racing.
- Citrix SD-WAN customers can connect to Microsoft 365 through the Citrix Cloud™ Direct service. This service provides reliable and secure delivery for all internet-bound traffic.

If the quality of the branch office internet connection isn't a concern, it might be enough to minimize

© 1997–2026 Citrix Systems, Inc. All rights reserved.

latency. Steer Microsoft Teams traffic directly from the Citrix SD-WAN branch appliance to the nearest Microsoft 365 front door to minimize latency. For more information, see Citrix SD-WAN Office 365 optimization.

Multi-window meetings and chat

You can use multiple meetings or chat windows for Microsoft Teams in Windows. For details on the pop-out feature, see Microsoft Teams Pop-Out Windows for Chats and Meetings on the Microsoft 365 site.

> **Note:**
>
> This feature is supported with the Citrix Workspace app for Windows 2112.1, Mac 2203, Linux 2203, ChromeOS 2303. It requires VDA 2112 or greater and was back-ported to 1912 CU6+ LTSR.

Background blurring and background effects

Citrix Workspace app for Windows, Mac, Linux, and ChromeOS/HTML5 supports background blurring and background effects in Microsoft Teams optimization with HDX.

You can either blur or replace the background with a default image and avoid unexpected distractions by helping the conversation stay focused on the silhouette (body and face). You can use this feature with P2P or conference calls.

> **Note:**
>
> This feature is integrated with the Microsoft Teams UI/buttons. MultiWindow support is a pre-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> requisite that requires a VDA update to 2112 or later. For more information, see Multi-window meetings and chat.

Microsoft Teams UI controls on background blurring and effects require the following minimum versions:

- Citrix Workspace app for Windows 2207
- Citrix Workspace app for Mac 2301
- Citrix Workspace app for Linux 2307
- Citrix Workspace app for ChromeOS 2303

Limitations:

- The client must be connected to the internet while replacing the background image with a Microsoft Teams default image.
- Admin and user-defined background image replacement is not supported in the Microsoft Teams UI. Custom background images can be configured using configuration settings on the client, if the image is also stored on the client.

Setting a custom background image

The following registry keys are only required if you don't plan to use the Microsoft Teams UI to control the feature, or if an admin wants to override default behaviors. For example, disable background blurring because the endpoint is not powerful enough.

On Windows To set a custom background image, administrators or end-users must configure the following registry key on the client or endpoint:

Location: `HKEY_CURRENT_USER\SOFTWARE\Citrix\HDXMediaStream`

- Name: VideoBackgroundEffect
- Type: DWORD
- Value: 0 (disabled), 1 (enabled), 2 (background image replacement)

A value set to 1 blurs the background. The end-user or the administrator can set this value.

Value set to 2 also requires the **VideoBackgroundImage** key to be present as well. Only the administrator can set this value. The following key is required only if you want to replace the background image and not for blurring:

- Name: VideoBackgroundImage
- Type: REG_SZ
- Value: my_image_name.jpeg

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The video background image must be present in the `C:\Program Files (x86)\Citrix\ICA Client` directory.

This registry configuration can also be used to enable background blurring or image replacement in Citrix Workspace app 2206 without the Microsoft Teams UI selector. In other words, if your environment or VDA doesn't support multi-window, you can still apply the HKCU registry workaround with Citrix Workspace app 2206 or higher to achieve a similar result, although the user cannot control the functionality in the middle of the HDX session or Microsoft Teams call.

Registry key changes only take effect when the HDX session connects.

On Mac User downloaded picture location: */Users/username/Downloads/any_image.png*

Run the following commands to set the custom image as the default image:

```
defaults write com.citrix.HdxRtcEngine VideoBackgroundEffect -int 2
```

```
defaults write com.citrix.HdxRtcEngine VideoBackgroundImage -string "
/Users/username/Downloads/any_image.png"
```

On Linux User downloaded picture location: */home/username/Downloads/any_image.jpg*

Create the file */var/.config/citrix/hdx_rtc_engine/config.json* and add the following configuration keys in JSON format. For example,

```
{

"VideoBackgroundEffect":2,

"VideoBackgroundImage":"/home/username/Downloads/any_image.jpg"

 }
```

On HTML5

1. Navigate to the **configuration.js** file in the **HTML5Client** folder.
2. Add the **backgroundEffects** attribute and set the attribute to **true**. For example,

```
'features' : {

    'msTeamsOptimization' :
    {

        'backgroundEffects' : true
     }

 }
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

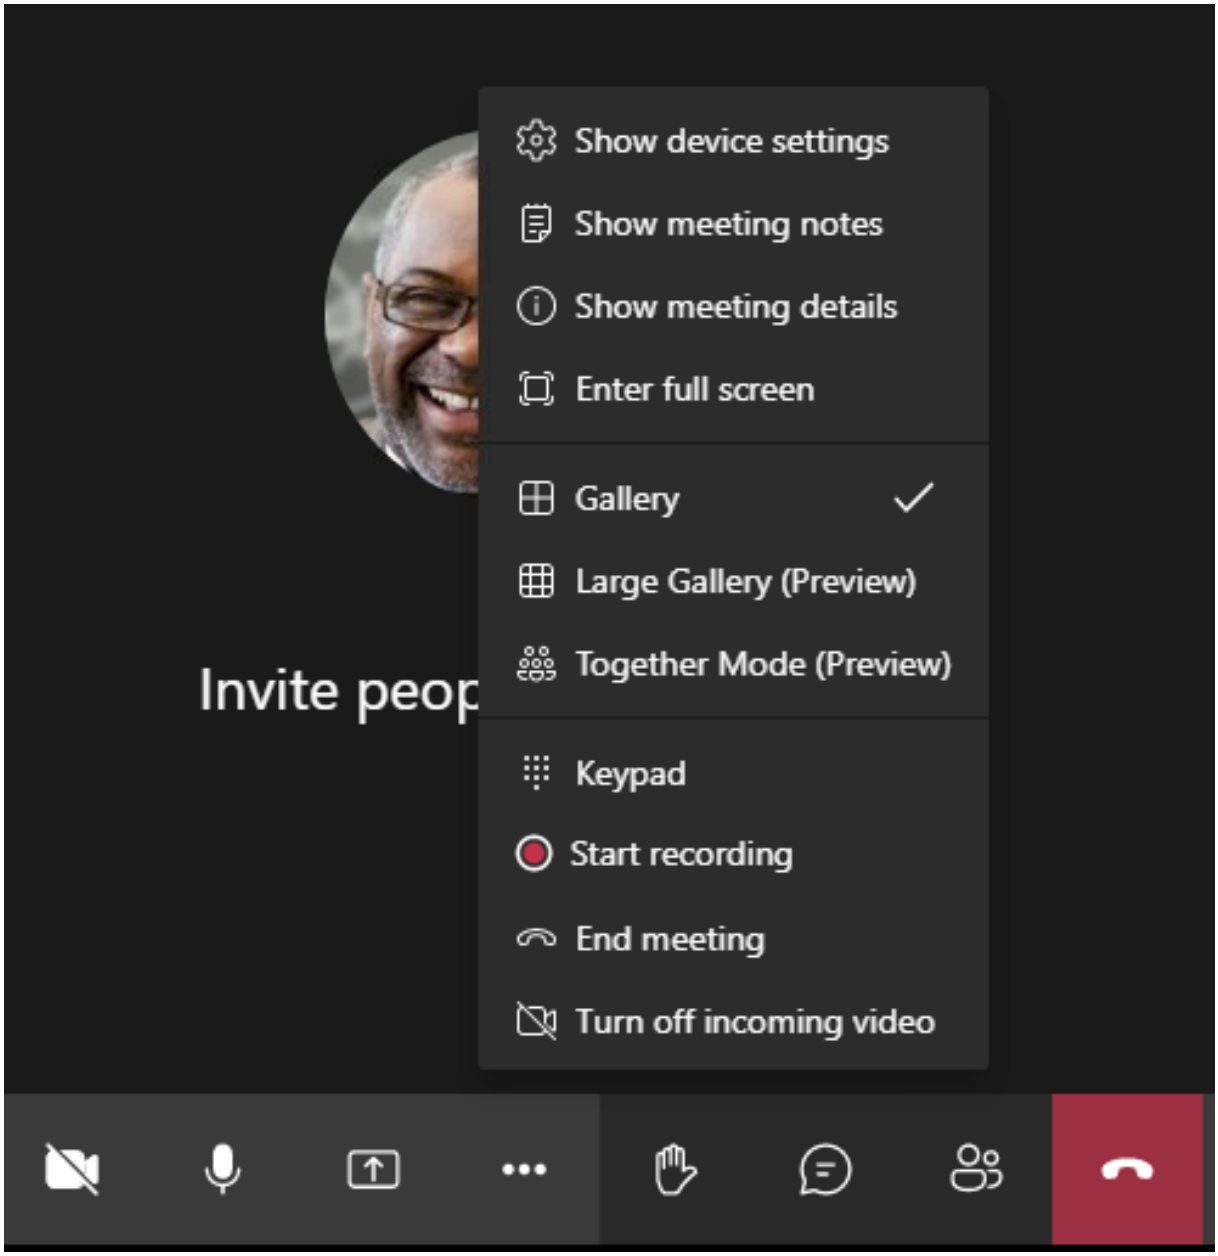
3. Save the changes.

Client CPU Consumption considerations

While the blurring feature is frugal on the CPU, you can expect an increase in consumption. For example, on a thin client with a 4 Core, 1.5 GHz Intel® Pentium® Silver chip with TurboBoost up to 2.8 GHz, the background blurring adds about 2% to the CPU usage. Average CPU usage is less than 20%.

Gallery view and active speakers in Microsoft Teams

Microsoft Teams supports **Gallery**, **Large gallery**, and **Together mode** layouts.



Microsoft Teams displays a 2x2 grid with video streams of four participants (known as **Gallery**). In this case, Microsoft Teams sends four video streams to the client device for decoding. When more than four participants share a video, only the last four most active speakers appear on the screen.

Microsoft Teams also provides the large gallery view with a grid up to 7x7. As a result, the Microsoft Teams conference server composites a single video feed and sends it to the client device for decoding, resulting in lower CPU consumption. This single, matrix-style feed might include users'self-preview videos as well.

Lastly, Microsoft Teams supports **Together mode**, which is part of the new meeting experience. Using AI segmentation technology to digitally place participants in a shared background, Microsoft Teams puts all participants in the same auditorium.

The user can control these modes during a conference call by selecting **Gallery**, **Large gallery**, or **Together mode** layouts in the ellipses menu.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Support for video aspect ratio constraints (Citrix Workspace app for Windows 2102, Citrix Workspace app for Linux 2106, Citrix Workspace app for MAC 2106 and later):

- The option **Fill to frame** is available in Gallery/Large Gallery View. This option crops the video size to fit it in the subwindow. **Fit to frame**, on the other hand, displays black bars (letterbox) on the sides of the video so there is no cropping.

The following table provides a comparison of Gallery and Large Gallery layouts:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

	Gallery view 2x2 (default)	Large Gallery view
Layout / Grid	Displays a 2x2 grid with video streams of four participants. Only the last four most active speakers appear on the screen and other participants do not appear on the grid.	Displays a 7x7 grid with video streams of 49 participants.
Mixing technique	A media router forwards individual streams from each participant to every user.	A central conference server mixes and transcodes all audio or video to create a tailored composite layout for every participant. This action introduces some additional latency.
Active speaker	The new active speaker replaces the least active speaker in the grid.	Displays all participants irrespective of whether they are active or inactive.
Encoding at the endpoint	One or more video streams might be encoded at the endpoint if Simulcast is enabled. For more information on Simulcast support, see Simulcast.	One or more video streams might be encoded at the endpoint if Simulcast is enabled. For more information on Simulcast support, see Simulcast.
Decoding at the endpoint	Each participant gets up to four individual media streams. This increases CPU consumption at the endpoint by HdxRtcEngine.exe (for decoding/rendering).	Each participant gets only a single stream for audio and video. This setting lowers the CPU consumption at the endpoint.
Maximum resolution	720p. When four participants are sharing video, the maximum resolution is 360p per video feed. If fewer than four participants are sharing video, the resolution per video feed might be higher.	720p for the composite layout or mixing. There's no need for a high-quality video stream per participant in a composite layout. Because of this condition, each sender reduces resolution or upload bitrate.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

	Gallery view 2x2 (default)	Large Gallery view
'Slow-user'problem	Sender modifies each modality's (audio/video/screenshare) quality to the lowest common network quality among the participants. This multimedia stream is then forwarded to all other participants. As a result, a participant with poor network condition impacts the quality for everyone else in the call.	Less susceptible to the lowest common network quality scenario. The conference server provides different qualities based on the network conditions of individual participants.
Self-preview	Displays yourself in a small thumbnail in real time.	Displays yourself in thumbnail and mixed with the rest of the video feeds. As a result, you might see yourself included in the main video layout with some additional delay.

Screen sharing in Microsoft Teams

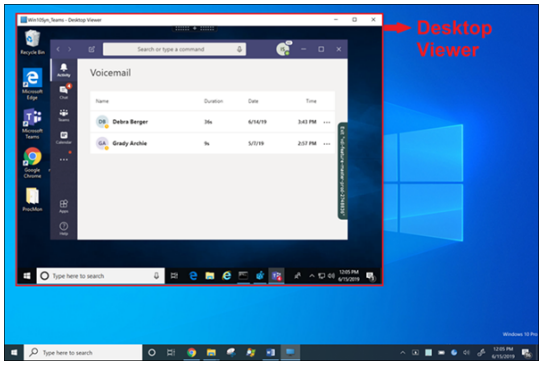
Microsoft Teams relies on video-based screen sharing (VBSS), effectively encoding the desktop being shared with video codecs like H264 and creating a high-definition stream. With HDX optimization, incoming screen sharing is treated as a video stream.

Starting from Citrix Workspace app 2109 or higher for Windows, Linux, Mac, and Citrix Workspace app 2303 for ChromeOS users can share their screens and video camera simultaneously.

With earlier versions, if you're in the middle of a video call and the other peer starts to share the desktop, the original camera video feed is paused. Instead, the screen sharing video feed shows. The peer must then manually resume the camera sharing.

> **Note for PowerPoint Live**
>
> This limitation does not exist if you're sharing content from PowerPoint Live. In that case, other peers can still see your webcam and content and navigate back and forth to review other slides. In this scenario, the slides are rendered on the VDA. To access a PowerPoint Live slide deck, click the 'Share tray'button and select one of the suggested PowerPoint slides, or click 'Browse'and find a PowerPoint file on your computer or in OneDrive.

Outgoing screen sharing is also optimized and offloaded to Citrix Workspace app. In this case, the



© 1997–2026 Citrix Systems, Inc. All rights reserved.

media engine captures and transmits only the Citrix Desktop Viewer (CDViewer.exe) window, with a red border drawn around it. Any local application overlapping with Desktop Viewer isn't captured.

> **Note**
>
> Set specific permission in Citrix Workspace app for Mac to enable screen sharing. For more information, see System Requirements.

Known limitation:

- If Desktop Viewer is disabled or if Desktop Lock is being used, multimonitor selection isn't available in the Microsoft Teams screen picker. The Desktop Viewer might be disabled either by editing the `.ICA` file template or `StoreFront web.config`. SHIFT+F2 hotkey isn't compatible with multimonitor screen sharing.
- In Workspace app versions older than 2106, only the primary monitor is shared. Drag the application in the virtual desktop to the primary monitor for the other peers on the call to see it.
- Multimonitor screen sharing might not work if you configure the Citrix Workspace app with the virtual monitor layout feature (logical partition of a single physical monitor). In this case, all virtual monitors are shared as a composite image.
- Older versions of the Citrix Workspace app for Windows (1907 up to 2008) also share a local application that runs in the client machine. This sharing is possible only if the local app is overlaid on top of the Desktop Viewer. This behavior was removed in 2009.6 or higher, and 1912 CU5 or higher.
- While screen sharing, if you change from windowed mode to full-screen, screen sharing stops. You must stop and share again for screen sharing to work.
- It is not possible to Pin the Sharing Controls to a specific location in Optimized Microsoft Teams.
- When sharing a minimized app, the title bar of the app might also be shared.

Screensharing from seamless application:

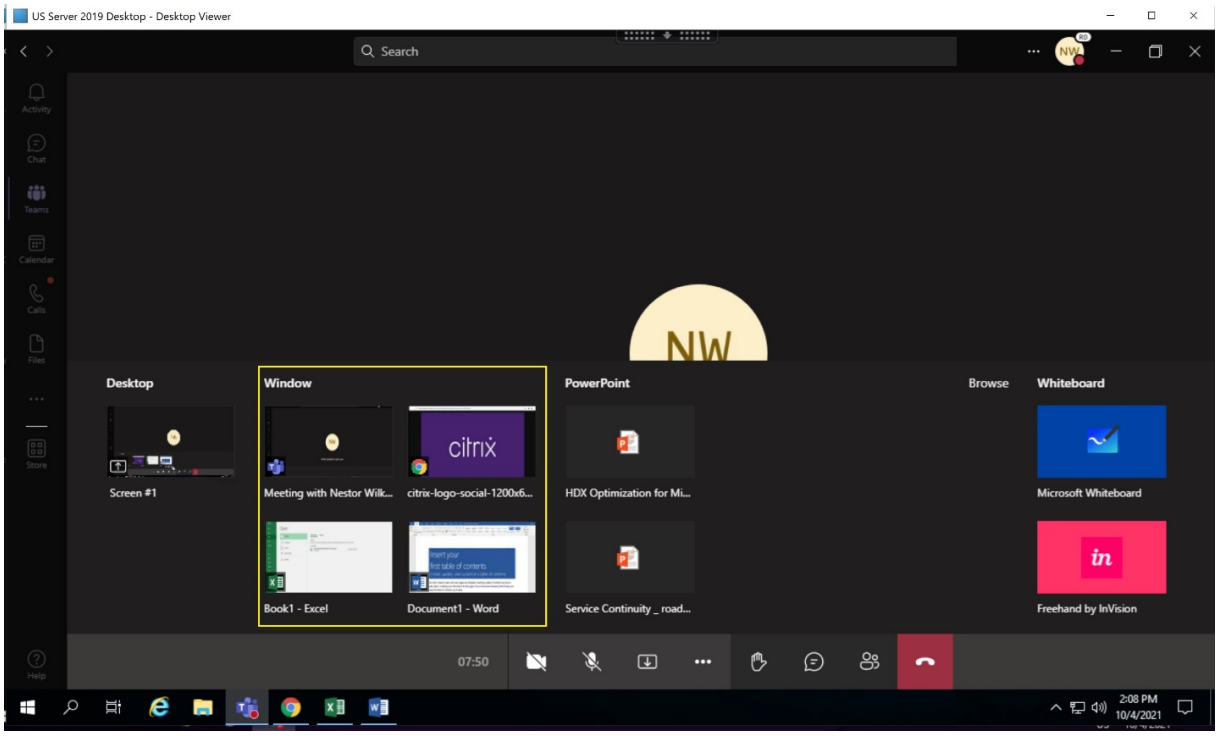
If you're publishing Microsoft Teams as a standalone, seamless application, screen sharing captures the local desktop of your physical endpoint. Citrix Workspace app minimum version 1909 is required.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

App sharing

Starting with the Citrix Workspace app for Windows 2112.1 and VDA 2112, Microsoft Teams supports app sharing.

Starting with the Citrix Workspace app for Windows 2109, Mac 2203, Linux 2209 and VDA 2109, Microsoft Teams supports screen sharing of specific apps running in the virtual session. You can also share custom in-house applications, like Java, using the optimized Microsoft Teams. To share a specific app:



1. Navigate to the Microsoft Teams app within your remote session.
2. Click **Share content** in your Microsoft Teams UI.
3. Select an app to share in the meeting. The red border appears around an app that you selected and the peers on the call can see the shared app.

To share a different app, click **Share content** again and select a new app.

If you want to disable app sharing, create the following registry key on the VDA at `HKLM\SOFTWARE\Citrix\Graphics`:
Name: `UseWsProvider`
Type: `DWORD`
Value: 0

> **Note:**
>
> - If you minimize an app, Microsoft Teams displays the last image from the shared app. You can maximize the window to resume screen sharing.
> - Screen sharing depends on the VDA-side capturing of the window. The content is then relayed at a maximum rate to the Citrix Workspace app. The maximum rate is 30 frames per second. The Citrix Workspace app forwards the content to the peer or conference server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Known limitations with screen sharing of specific app:

- The mouse pointer isn't visible when you are screen-sharing an app.
- If you minimize an app when you're sharing it, only the app icon appears in the screen picker. The thumbnail of the app isn't previewed in the screen picker. You can't share the content and the red border does not appear until you maximize the app.
- LAA apps show a list of apps that can be shared with desktop apps in the optimized Microsoft Teams in the VDA. However, when you select the app from the list, the result might not be as expected.

Compatibility with app protection

The screen sharing of a specific app is compatible with the app protection feature in HDX optimized Microsoft Teams. You can screen share a specific app, if you've launched the app or desktop from a delivery group that has app protection enabled.

When you click **Share content** in the Microsoft Teams UI, the screen picker removes the **Desktop** option. You can only select the **Window** option to share any open app.

> **Note:**
>
> When you launch apps or desktops from a delivery group with app protection enabled, you aren't able to see the incoming video or screen sharing if you are using the Citrix Workspace app for Windows 2202 or earlier.

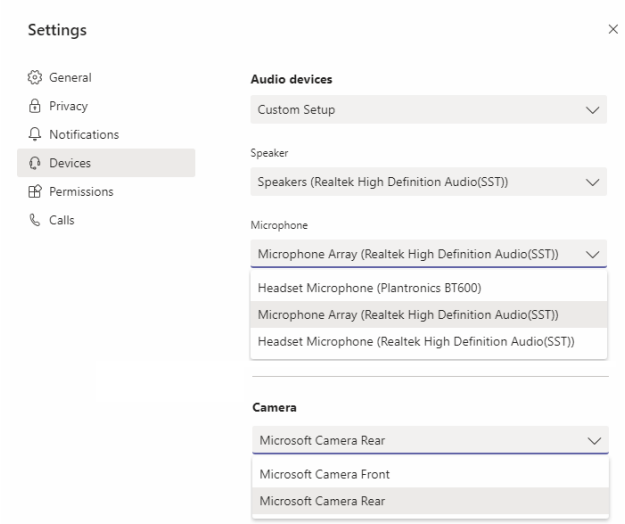
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Give and Request control in Microsoft Teams This feature is supported in the following versions of the Citrix Workspace app (there is no dependency on the VDA version or Operative System, single session or multisession):

- Citrix Workspace app for Windows version 2112.1 or later
- Citrix Workspace app for Mac version 2203.1 or later
- Citrix Workspace app for Linux version 2203 or later
- Citrix Workspace app for ChromeOS version 2303 or later

You can request control during a Microsoft Teams call when a participant is sharing the screen. Once you have control, you can make selections, edits, or other keyboard and mouse activities to the shared screen.

To take control when a screen is being shared, click the **Request control** button in the Microsoft Teams UI. The meeting participant who's sharing the screen can either allow or deny your request.



While you have control, you can make selections, edits, and other modifications to the shared screen. For these actions, you can use both a keyboard and a mouse. When you're done, click **Request control**.

> **Limitations:**
>
> - Give and Request controls are not available if the user is sharing a single app (also known as App sharing). The full desktop or monitor must be shared.
> - The feature to pin the control bar to a specific location is not available.

Peripherals in Microsoft Teams

When optimization for Microsoft Teams is active, the Citrix Workspace app accesses the peripherals (headsets, microphones, cameras, speakers, and so forth). Then the peripherals are properly listed in the Microsoft Teams UI (**Settings > Devices**).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Microsoft Teams does not access the devices directly. Instead, it relies on the Workspace app WebRTC media engine for acquiring, capturing, and processing the media. Microsoft Teams lists the devices for the user to select.

The peripherals that are inserted while Microsoft Teams are active aren't selected by default. You've to manually select the peripherals from the **Settings** > **Devices** screen of the Microsoft Teams UI. After the peripheral is selected, Microsoft Teams caches the information of the peripherals. As a result, the peripherals are automatically selected when you reconnect to a session from the same endpoint.

Recommendations:

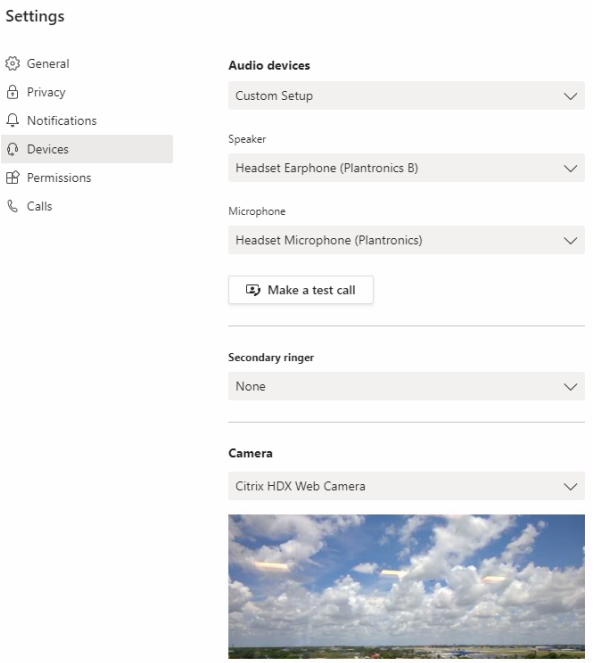
- Microsoft Teams certified headsets with built-in echo cancellation. In setups with extra peripherals, where the microphone and speakers are on separate devices, there might be an echo. An example is a webcam with a built-in microphone and a monitor with speakers. When using external speakers, place them as far as possible from the microphone. Also, place them away from any surface that might refract the sound into the microphone. For more information, go to `www.microsoft.com` and search for Microsoft Teams certified headsets.
- Microsoft Teams certified cameras, although Skype for Business certified peripherals are compatible with Microsoft Teams. For more information, go to and search for Microsoft Teams certified cameras and Skype for Business certified peripherals.
- Citrix Workspace app media engine can't take advantage of CPU offloading with webcams that perform on-board H.264 encoding -UVC 1.1 and 1.5.

> **Note:**
>
> Workspace app 2009.6 for Windows can now acquire peripherals with audio formats with 24-bit or with frequencies above 96 kHz.
>
> HdxTeams.exe (in the Citrix Workspace app for Windows 2009 or older) supports only these spe-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> cific audio device formats (channels, bit depth, and sample rate):
>
> - Playback Devices: up to 2 channels, 16 bit, frequencies up to 96,000 Hz
> - Recording Devices: up to 4 channels, 16 bit, frequencies up to 96,000 Hz
>
> Even if one speaker or microphone does not match the expected settings, device enumeration in Microsoft Teams fails and **None** displays under **Settings > Devices**.
>
> **Webrpc** logs in **HdxTeams.exe** show this type of information:
>
> ```
> Mar 27 20:58:22.885 webrtcapi.WebRTCEngine Info: init. initializing ...
> ```
>
> ```
> Mar 27 20:58:23.190 webrtcapi.WebRTCEngine Error: init. couldn't create audio module!
> ```
>
> As a workaround, disable the specific device or:
>
> 1. Open the **Sound Control Panel** (mmsys.cpl).
> 2. Select the playback or recording device.
> 3. Go to **Properties > Advanced** and change the settings to a supported mode.

Fallback mode



If Microsoft Teams fails to load in optimized VDI mode ("Citrix HDX Not Connected"in Microsoft Teams/About/Version), the VDA falls back to legacy HDX technologies. The legacy HDX technologies might be webcam redirection and client audio and microphone redirection. If you're using a Workspace app version/platform OS that does not support Microsoft Teams optimization, fallback registry keys do not apply.
In fallback mode, the peripherals are mapped to the VDA. The peripherals appear to the Microsoft Teams app as if they were locally attached to the virtual desktop.

You can now granularly control the fallback mechanism by setting the registry keys in the VDA. For more information, see Microsoft Teams fallback mode in the list of features managed through the registry.

This feature requires Microsoft Teams version 1.3.0.13565 or later.

To determine if you are in optimized or unoptimized mode when looking at the **Settings > Devices** tab in the Microsoft Teams app, the main difference is the camera name. If Microsoft Teams is loaded in unoptimized mode, legacy HDX technologies launch. The webcam name has the **Citrix HDX** suffix as shown in the following graphic. The speaker and microphone device names might be slightly different (or truncated) when compared to the optimized mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When legacy HDX technologies are used, Microsoft Teams doesn't offload audio, video, and screen-sharing processing to the endpoint's Citrix Workspace app WebRTC media engine. Instead, HDX technologies use server-side rendering. Expect high CPU consumption on the VDA when you turn on video. Real-time audio performance might not be optimal.

Known limitations

Citrix limitations

Limitations on Citrix Workspace app:

- HID buttons - Answer and end calls aren't supported. Volume up and down are supported.
- QoS settings in the Admin Center for Microsoft Teams don't apply for VDI users.
- Users can't take screenshots of Microsoft Teams content while using a snipping tool on the VDA. However, if a snipping tool is used on the client side, the content can be captured.

Limitation on the VDA:

- When you configure the **Citrix Workspace app High DPI** setting to `Yes`, the redirected video window appears out of place. This limitation occurs when the monitor's DPI scaling factor is set to anything above 100%.

Limitations on the Citrix Workspace app and the VDA:

- You can only control the volume of an optimized call using the volume bar on the client machine –not on the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Simulcast

Simulcast support is enabled for optimized Microsoft Teams video conference calls on Windows and Mac. For Linux check with your thin client vendor.
With Simulcast the quality and experience of video conference calls across different endpoints are improved by adapting to the proper resolution for the best call experience for all callers.

With this improved experience, each user might deliver multiple video streams in different resolutions (for example, 720p, 360p, and so on) depending on several factors including endpoint capability, network conditions, and so on. The receiving endpoint then requests the maximum quality resolution that it can handle thereby giving all users the optimum video experience.

> **Note:**
>
> This feature is available only after the roll-out of an update from Microsoft Teams. For information on ETA, go to https://www.microsoft.com/ and search for Microsoft 365 roadmap. When the update is rolled-out by Microsoft, you can check CTX253754 for the documentation update and the announcement.

Microsoft limitations

- A 3x3 gallery view isn't supported. Microsoft Teams dependency –contact Microsoft for when to expect a 3x3 grid.
- Interoperability with Skype for Business is limited to audio calls, no video modality.
- Incoming and outgoing video stream maximum resolution is 720p.
- PSTN call ringback tone isn't supported.
- Media bypass for Direct Routing isn't supported.
- Broadcast and live event producer and presenter roles aren't supported. Attendee role is supported but not optimized (renders on the VDA instead).
- The zoom in and zoom out function in Microsoft Teams isn't supported.
- Location-Based Routing and Media Bypass are not supported.
- Call merge is not supported (option not displayed in the user interface).

Citrix and Microsoft limitations

- When doing screen sharing, the **include system audio** option isn't available.
- Simulcast isn't supported on ChromeOS.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Upcoming Microsoft Teams Single-Window EOL

On January 31, 2024, Microsoft will retire the Microsoft Teams support for Single-window UI when using VDI Microsoft Teams optimization and support only the Multi-window experience. Microsoft gave notice of this deprecation on 9/8/2023 in the M365s Admin Center (Post ID: MC674419).
Public details about the Multi-window feature can be found in the Tech Community article: New Meeting and Calling Experience in Microsoft Teams.

> **Note:**
>
> Citrix recommends you upgrade your VDA and Citrix Workspace app to the supported versions to continue using Microsoft Teams in optimized mode for video and screen sharing. If you don't upgrade your infrastructure and endpoints to support multi-window, your calls, video calls, and screen sharing become unoptimized. This may result in call quality issues, increased latency, and increased load on the server.

The following table illustrates the minimum, LTSR, and recommended versions of VDA and Citrix Workspace app required to continue using optimized calling in Microsoft Teams on Citrix VDI:

Component	Minimum version (1)	LTSR supported version (2)	Recommended version (3)
Microsoft Teams	1.5.00.11865	Not applicable	Latest
VDA	1912 CU6 LTSR, 2109 CR, 2203 LTSR	1912 CU8+, 2203 LTSR CU2+ (4)	2308 CR+
Citrix Workspace app for Windows	2112.1 CR	2203 CU2+ (4)	2309 CR+
Citrix Workspace app for Mac	2203 CR	Not applicable	2308 CR+
Citrix Workspace app for Linux	2202 CR	Not applicable	2308 CR+
Citrix Workspace app for ChromeOS or HTML5	2303 CR	Not applicable	2309 CR+

> **Notes:**
>
> 1. Minimum Version: This is the version where Multi-window was first introduced. Some minimum versions listed here can be end-of-life.
> 2. LTSR Supported Version: This is the LTSR version that is supported by Citrix for Multi-window. Older versions of these LTSR releases can work but support is no longer available for those versions once a new LTSR CU version is released. For more in-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> formation on LTSR support policies, see https://support.citrix.com/support-home/kbsearch/article?articleNumber=CTX205549/faq-citrix-virtual-apps-and-desktops-and-citrix-hypervisor-long-term-service-release-ltsr.
> 3. Recommended Version: This is the version of software that Citrix recommends if the user/-customer chooses to upgrade their software. These are all CR versions.
> 4. Version 2203 LTSR for VDA and CWA base versions include the multi-window functionality. These versions have been superseded by the latest CU which is the officially supported version. Customers can continue to use these unsupported versions at their discretion. Citrix encourages customers on the LTSR release to upgrade to the latest CU.

Deprecation announcement of the SDP format (Plan B) from WebRTC

Citrix is planning to deprecate the current SDP format (Plan B) support from WebRTC in future releases. You must use Unified Plan in WebRTC to support optimized Microsoft Teams functionalities.

Products that are affected

In one of the future releases of the Citrix Workspace Application, calls between endpoints with the upcoming release for the Citrix Workspace app and endpoints with Citrix Workspace app 2108 or older versions will not be supported. This calling incompatibility includes 1912 LTSR Citrix Workspace app clients (CWA). The following CWA clients are impacted:

- Citrix Workspace app for Windows
- Citrix Workspace app for Linux
- Citrix Workspace app for Mac
- Citrix Workspace app for Chrome

Replacement for Plan B

If you are running the Citrix Workspace app version older than 2109, you must upgrade to a supported version (preferably the latest CR release). Otherwise, any calls with a future release or newer endpoints fail to connect. Calls between future releases and your federated communication partners might also fail to complete if the federated partner has not upgraded their Citrix Workspace.

Citrix Workspace app version 2108 has completed its support date in March 2023 and must be upgraded to a newer version. For more information, see Workspace App for details on Citrix Workspace app version support.

For more information on the Plan B deprecation, see the WebRTC documentation.

Monitor, troubleshoot, and support Microsoft Teams

May 13, 2026

Monitor Teams

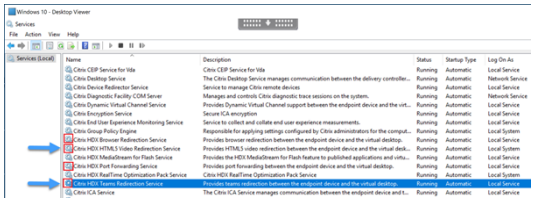
This section provides guidelines for monitoring Microsoft Teams optimization with HDX.
If you're running in optimized mode and `HdxRtcEngine.exe` is running on the client machine, a process on the VDA called `WebSocketAgent.exe` is running in the session. Use the **Activity Manager** in Director to see the application.

Microsoft Teams Optimization status can be viewed in the Director > **User Details** page > **Session Details** panel > **MS Teams Optimization** field. Microsoft Teams being optimized is critical for better user experience such as clear audio and video. This feature is available for VDA version 2311 and later. Citrix Workspace™ app versions supported are listed in Optimization for Microsoft Teams. Director displays the status of the Microsoft Teams optimization only if Microsoft Teams is running as a published app

© 1997–2026 Citrix Systems, Inc. All rights reserved.

or inside a published desktop.
For more information, see Microsoft Teams optimization status.

With the VDA minimum version 1912, you can monitor active Teams calls using the Citrix HDX Monitor (minimum version 3.11). The Citrix Virtual Apps and Desktops product ISO contains the latest `hdxmonitor.msi` in the folder `layout\image-full\Support\HDX Monitor`.
With the VDA minimum version 1912, you can monitor active Microsoft Teams calls using the Citrix HDX Monitor (minimum version 3.11). The Citrix Virtual Apps and Desktops product ISO contains the latest `hdxmonitor.msi` in the folder `layout\image-full\Support\HDX Monitor`.



For more information, see *Monitoring* in the Knowledge Center article CTX253754.

Troubleshoot

This section provides troubleshooting tips for issues that you might encounter when using optimization for Microsoft Teams. For more information, see CTX253754.

On the Virtual Delivery Agent

There are four services installed by BCR_x64.msi. Only two are responsible for Microsoft Teams redirection in the VDA.

- **Citrix HDX Teams Redirection Service** establishes the virtual channel used in Microsoft Teams. The service relies on CtxSvcHost.exe.
- **Citrix HDX HTML5 Video Redirection Service** runs as WebSocketService.exe listening on 127.0.0.1:9002 TCP. WebSocketService.exe performs two main functions:

  i. **TLS termination for secure WebSockets** receives a secure WebSocket connection from vdiCitrixPeerConnection.js, which is a component inside the Microsoft Teams app. You can track it with the Process Monitor. For more information about certificates, see the section TLS and HTML5 video redirection, and browser content redirection.

  Some antivirus and desktop security software interferes with the proper functioning of `WebSocketService.exe` and its certificates. While the Citrix HDX HTML5 Video Redirection service might be running in the `services.msc` console, the localhost `127.0.0.1:9002` TCP socket is never in listening mode as seen in netstat. Trying to restart the service causes it

© 1997–2026 Citrix Systems, Inc. All rights reserved.

to hang (“Stopping…”). Ensure you apply the proper exclusions for the `WebSocketService.exe` process.

ii. **User session mapping.** When the Microsoft Teams application starts, WebSocketService.exe starts the WebSocketAgent.exe process in the user’s session in the VDA. WebSocketService.exe runs in Session 0 as a LocalSystem account.

You can use `netstat` to check if the WebSocketService.exe service is in an active listening state in the VDA.

Run `netstat -anob -p tcp` from an elevated command prompt window:

```
 TCP    127.0.0.1:9001         0.0.0.0:0              LISTENING       11740
[WebSocketService.exe]
 TCP    127.0.0.1:9002         0.0.0.0:0              LISTENING       11740
[WebSocketService.exe]
```

On a successful connection, the state changes to ESTABLISHED:

```
 TCP    127.0.0.1:9002         127.0.0.1:58069        ESTABLISHED     8096
[WebSocketService.exe]
 TCP    127.0.0.1:58069        127.0.0.1:9002         ESTABLISHED     748
[Teams.exe]
```

> **Important:**
>
> WebSocketService.exe listens in two TCP sockets, 127.0.0.1:9001 and 127.0.0.1:9002. Port 9001 is used for browser content redirection and HTML5 video redirection. Port 9002 is used for Microsoft Teams redirection. Ensure that you don’t have any proxy configurations in the Windows OS of the VDA that can prevent a direct communication between Teams.exe and WebSocketService.exe. Sometimes, when you configure an explicit proxy in Internet Explorer 11 (**Internet Options > Connections > LAN settings > Proxy Server**), connections might flow through an assigned proxy server. Verify that **Bypass proxy server for local addresses** is checked when using a manual and explicit proxy setting.

Services locations and descriptions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Service	Path to executable in Windows Server OS	Log on as	Description
Citrix HTML5 Video Redirection Service	"C:\Program Files (x86)\Citrix\System32\WebSocketService.exe" /service	Local System account	Provides multiple HDX Multimedia services with the initial framework required to perform media redirection between the virtual desktop and the endpoint device.
Citrix HDX Browser Redirection Service	"C:\Program Files (x86)\Citrix\System32\CtxSvcHost.exe" -g BrowserRedirSvcs	This account (local Service)	Provides browser content redirection between the endpoint device and the virtual desktop.
Citrix Port Forwarding Service	"C:\Program Files (x86)\Citrix\System32\CtxSvcHost.exe" -g PortFwdSvcs	This account (local Service)	Provides port forwarding between the endpoint device and the virtual desktop for browser content redirection.
Citrix HDX Teams Redirection Service	"C:\Program Files (x86)\Citrix\System32\CtxSvcHost.exe" -g TeamsSvcs	Local System account	Provides Microsoft Teams redirection between the endpoint device and the virtual desktop.

Citrix Workspace app

On the user's endpoint, the Citrix Workspace app for Windows instantiates a new service called HdxTeams.exe or HdxRtcEngine.exe. It does so when Microsoft Teams launches in the VDA and the user tries to call or access the peripherals in self-preview. If you don't see this service, check the following:

1. Ensure that you installed as a minimum the Workspace App version 1905 for Windows. Do you see HdxTeams.exe or HdxRtcEngine.exe and the webrpc.dll binaries in the Workspace app installation path?

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. If you validated step1, do the following to check if HdxTeams.exe or HdxRtcEngine.exe is getting launched.

    a) Exit Microsoft Teams on the VDA.
    b) Start services.msc on VDA.
    c) Stop the Citrix HDX Teams Redirection Service.
    d) Disconnect the ICA® session.
    e) Connect the ICA session.
    f) Start the Citrix HDX Teams Redirection Service.
    g) Restart the Citrix HDX HTML5 Video Redirection Service.
    h) Launch Microsoft Teams on the VDA.

3. If you still don't see HdxTeams.exe or HdxRtcEngine.exe being launched on the client endpoint, do the following:

    a) Restart the VDA.
    b) Restart the client endpoint.

Support

Citrix and Microsoft jointly support the delivery of Microsoft Teams from Citrix Virtual Apps and Desktops™ using optimization for Microsoft Teams. This joint support is the result of close collaboration between the two companies. If you have valid support contracts and you experience an issue with this solution, open a support ticket with the vendor whose code you suspect to be causing the issue. That is, Microsoft for Teams or Citrix for the optimization components.
Citrix or Microsoft receives the ticket, triages the issue, and escalates as appropriate. There is no need for you to contact each company's support team.

When you have a problem, we recommend you click **Help > Report a Problem** in the Teams UI. VDA-side logs are automatically shared between Citrix and Microsoft to resolve technical issues faster.

Collecting logs

HDX media engine logs can be found on the user's machine (not on the VDA). In case of any issues, make sure you attach logs to your support case.

Windows logs:

You can locate Windows logs at %TEMP% inside the **HDXTeams** folder (AppData/Local/Temp/HDX-Teams or AppData/Local/Temp/HdxRtcEngine). Look for a .txt file called webrpc_Day_Month_timestamp_Year.txt. If you are using newer versions of Citrix Workspace app, for example Citrix Workspace app 2009.5 or later, store the logs in AppData\Local\Temp\HdxRtcEngine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Each session creates a separate folder for logs.

Mac logs:

1. VDWEBRTC log - records the execution of the virtual channel.

   Location: /Users/<User Name>/Library/Logs/Citrix Workspace/CitrixViewer_<Y_M_D_H_M_S>.txt

2. HdxRtcEngine log - records the execution of the processes on HdxRtcEngine.

   Location: $TMPDIR/hdxrtcengine/<W_M_D_H_M_S_Y>/hdxrtcengine.log

   HdxRtcEngine log is enabled by default.

3. Webrpc logs - are the most important logs that record the execution of the wrap-up of the webrtc library.

   Location: /Users/<USERNAME>/Library/Logs/HdxRtcEngine/<W_M_D_H_M_S_Y>/webrpc.log

Linux logs:

You can locate Linux logs in the /tmp/webrpc/<current date>/ and /tmp/hdxrtcengine/<current date>/ folders.
Webrtc log: /tmp/webrpc/<current date>/webrtc.log
Kernel log: /var/log/syslog

ICE/STUN/TURN/ logs:

When establishing a call, these four ICE phases are required:

- Candidate gathering
- candidate exchange
- Connectivity checks (STUN bind requests)
- Candidate promotion

In the HdxRtcEngine.exe logs, the following entries are the relevant Interactive Connectivity Establishment (ICE) entries. These entries must be there for a call set-up to succeed. See the following sample snippet for the gathering stage:

```
1 RPCStubs Info: -> device id = \\?\display#int3470#4&1835d135&0&uid13424
     #{
2  65e8773d-8f56-11d0-a3b9-00a0c9223196 }

```

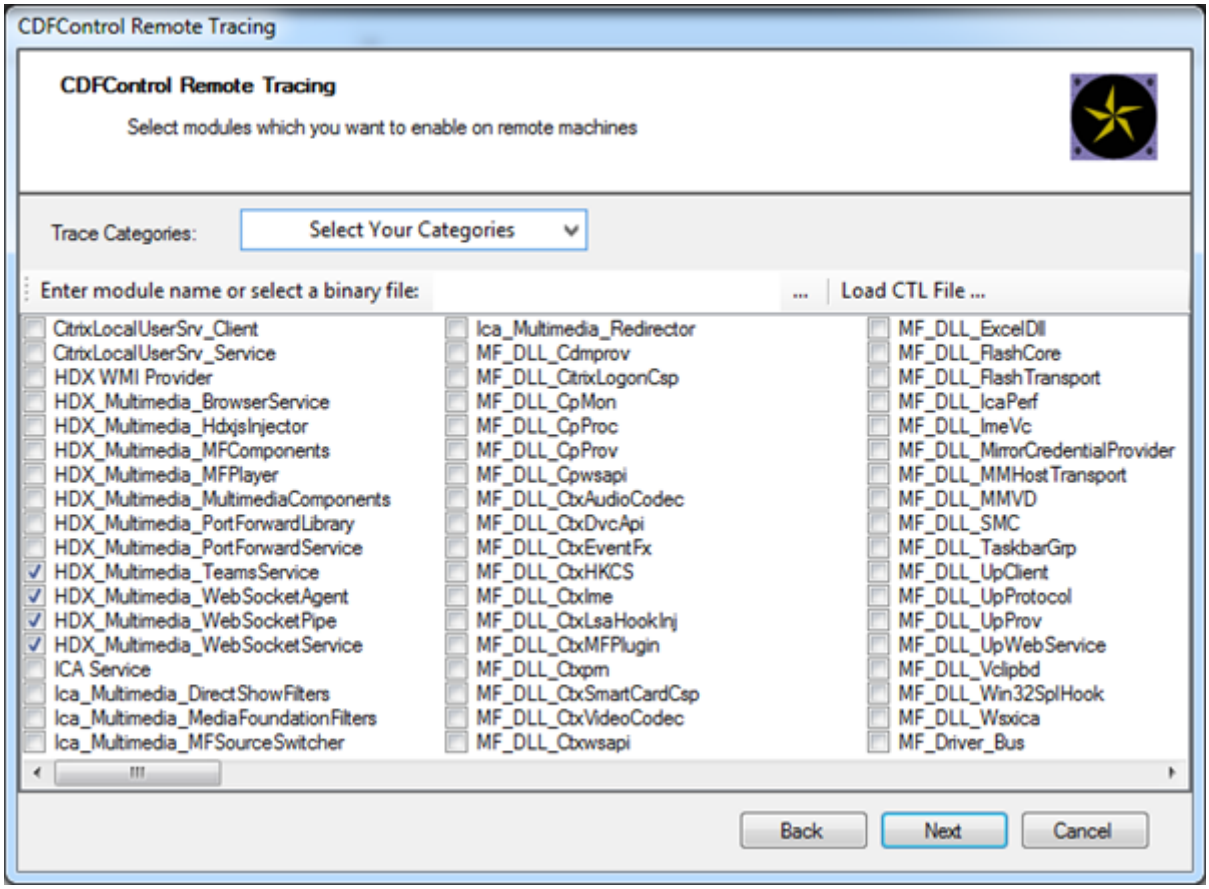
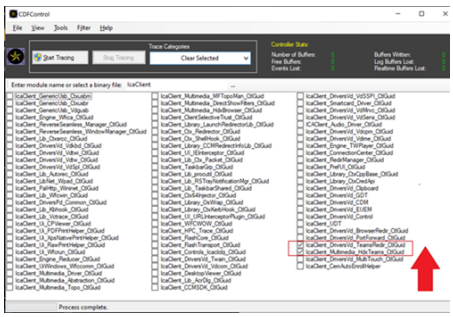
If there are multiple ICE candidates, the order of preference is:



1. host
2. peer reflexive
3. server reflexive
4. transport relay

If you encounter an issue and can reproduce it consistently, we recommend that you click **Help > Report a problem** in Microsoft Teams. Logs are shared between Citrix and Microsoft to resolve technical issues if you opened a case with Microsoft.
Capturing CDF traces before contacting Citrix Support is also beneficial. For more information, see the Knowledge Center article CDFcontrol.



For recommendations for collecting CDF Traces, see the Knowledge Center article Recommendations for Collecting the CDF Traces.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VDA side CDF traces - Enable the following CDF trace providers:

Workspace app side CDF traces - Enable the following CDF trace providers:

- IcaClient_DriversVd_TeamsRedir (optional)
- IcaClient_Multimedia_HdxTeams (requires Citrix Workspace app 2012 or later)

Windows Media redirection

September 4, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Windows Media redirection controls and optimizes the way servers deliver streaming audio and video to users. By playing the media run-time files on the client device rather than the server, Windows Media redirection reduces the bandwidth requirements for playing multimedia files. Windows Media redirection improves the performance of Windows Media Player and compatible players running on virtual Windows desktops.

If the requirements for Windows Media client-side content fetching are not met, media delivery automatically uses server-side fetching. This method is transparent to users. You can use the Citrix Scout to perform a Citrix Diagnosis Facility (CDF) trace from HostMMTransport.dll to determine the method used. For more information see, Citrix Scout.

Windows Media redirection intercepts the media pipeline at the host server, captures the media data in its native compressed format, and redirects the content to the client device. The client device then recreates the media pipeline to decompress and render the media data received from the host server. Windows Media redirection works well on client devices running a Windows operating system. Those devices have the multimedia framework required to rebuild the media pipeline as it existed on the host server. Linux clients use similar open-source media frameworks to rebuild the media pipeline.

The policy setting **Windows Media Redirection** controls this feature and is **Allowed** by default. Usually, this setting increases audio and video quality rendered from the server to a level that is comparable to content played locally on a client device. In the rare cases, media playing using Windows Media redirection appears worse than media rendered using basic ICA® compression and regular audio. You can disable this feature by adding the **Windows Media Redirection** setting to a policy and setting its value to **Prohibited**.

For more information about the policy settings, see Multimedia policy settings.

Capturing redirected content in screenshots

Windows Media redirection renders media on the endpoint, so standard in-session screenshot tools capture the redirected video as a blank area. Use the Citrix Snipping Tool to include this content in your screenshots. Citrix recommends launching it from the Citrix Virtual Desktop Assistant to make it easy to find. For more information, see Citrix Virtual Desktop Assistant documentation.

Limitations

When you're using Windows Media Player and Remote Audio & Video Extensions (RAVE) enabled inside a session, a black screen might appear. This black screen might appear if you right-click on the video content and select **Always show Now Playing on top**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual Channel Plugin Manager

May 13, 2026

Introduction

Virtual channel plugin manager is designed to deploy plugins across client endpoints for specified applications. The plugin manager detects specific applications running on the VDA and prompts the user to install the plugin on the endpoint to achieve the best experience when running the application.

Users can choose to install the plugin, skip it or deny the installation. The plugin manager provides flexibility to manage the plugins on all endpoints - managed or unmanaged

For Example: Microsoft Teams [New] has a new architecture (SlimCore Optimization), that requires a plugin to be installed on the endpoints for the optimization to work. The Virtual channel plugin manager can deploy the plugins across your endpoints. For more information, see new VDI solution for Teams

System Requirements

Following are the minimum requirements for Virtual channel plugin manager.

- Virtual Desktop Agent (VDA)
  - 2411 CR
- DDC
  - Cloud 121 Release
  - 2407 CR
- Citrix Workspace™ App (Citrix Workspace App)
  - Citrix Workspace App for Windows 2409
- Citrix Workspace App Mac 2508

> **Note:**
>
> This feature is currently applicable to Windows endpoints.

Supported applications

- Currently supported applications are listed below:
  - Microsoft Teams - See new VDI solution for Teams

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual Channel Plugin Manager

May 13, 2026

Understanding the Feature

Citrix® understands the customers'environments can be complex and deploying a plugin across managed and unmanaged endpoints requires significant effort. This feature is designed to simplify the process.

This feature includes two components:. One on the VDA side (detector process) and another on the Citrix Workspace™ App side (installer process). When administrators meet the prerequisites mentioned above, such as enabling policies, making registry entries and specifying an application to monitor:

- The VDA side detector process monitors for the application launch by the end user once they logon to the Virtual desktop
- The detector process informs the Citrix Workspace App side to prompt the user to install the plugin necessary to optimize the specified application
- Users receive a pop-up on their screen with brief details about the plugin. Users can choose to install the plugin, skip or choose to never install it
    - If users skip the installation process, they will not see the pop-up again in that session. The installation prompt will appear upon session reconnect.
    - If users choose to never install the plugin, the choice will be logged in their user profile for administrator visibility.
- If users choose to install the plugin, the Citrix Workspace App side will download and install the plugin on the endpoint.
    - On successful installation, the user will be shown a message to reconnect the session for the plugin to take effect. The user can choose to do it immediately or close the success message and do a reconnect later.
    - If the installation fails, the user will see an error message and the failure will be logged for administrator visibility.

Virtual Channel Plugin Manager

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Deployment

1. Check if the Microsoft Teams redirection policy is enabled: Refer Microsoft Teams redirection policy for more details.

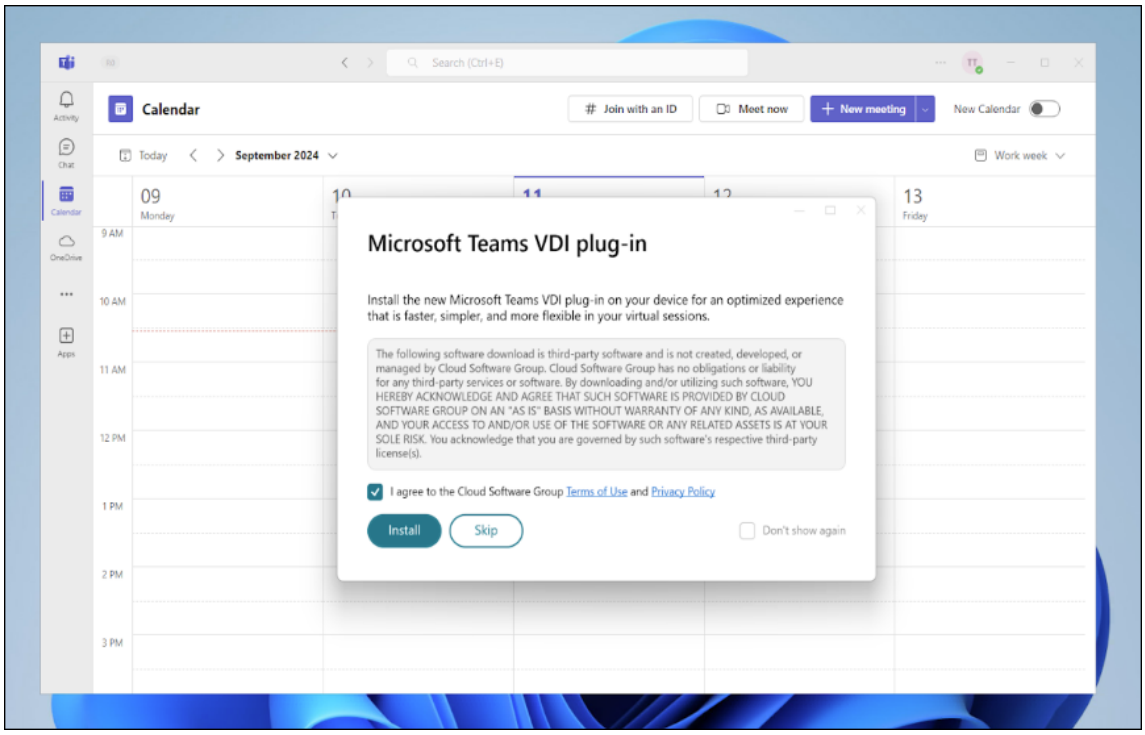
   This policy must be enabled regardless of the application being monitored. In the future, if more applications are supported and you want to monitor those applications instead of Microsoft Teams, this policy must still be enabled. Note that this policy is enabled by default.

2. Virtual channel plugin manager policy must be enabled: Refer Virtual channel plugin manager policy settings for detailed instructions on how to enable the policy.

   This policy is available in the Multimedia Policy Settings on Citrix Studio. Enabling the policy allows you to specify the application name to be monitored For Example., “Microsoft Teams”. This policy is disabled by default.

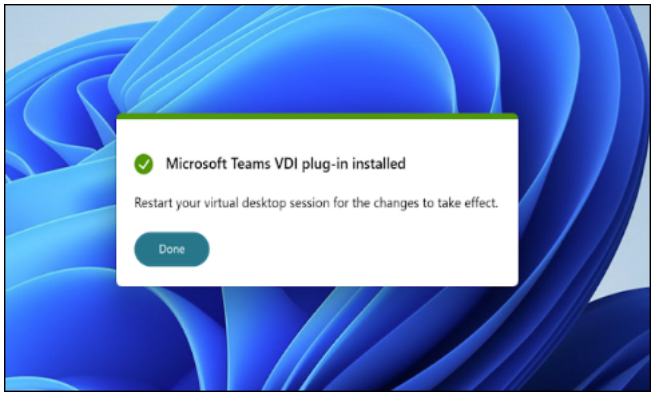
3. Citrix Workspace™ app must be installed in system wide mode.

> **Note:**
>
> The plugins are downloaded to the endpoint from the third party CDN. For example, if you select Microsoft Teams, the plugin will be downloaded from the Microsoft CDN. Therefore, the endpoint must have access to the third party CDN. Otherwise, the plugin installation will fail.



Procedure

1. User launches application on the Citrix session. For e.g., Microsoft Teams.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. User receives a pop up to install the Teams VDI plugin on the endpoint for better experience. The pop up is above the session and not inside the session as the plugin will be installed on the endpoint.

3. User clicks on the install button and the plugin is installed. Users need to restart the virtual desktop session for the changes to take effect.

Known Issues & Limitations

- In 2407 VDA, the following registry setting needs to be set to 1 on the VDA in addition to the policy for the feature to be activated. This registry setting is automatically allowed and not required to be configured from 2411 VDA

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
HKLM\SOFTWARE\Citrix\HDXMediaStream\ Name: EnableAppDetector Type
: DWORD
```

- More limitations to be added

Unified Communications SDK Optimization

September 4, 2026

Introduction

Citrix Virtual Apps and Desktops lets you deliver applications to your users on a wide variety of endpoint devices. Many of these applications include real-time communication (RTC) features, like audio and video conferencing. However, challenges can arise when delivering these applications in a virtualized environment. Traditional delivery methods route media streams (audio/video) from the client device to the VDI server in the data center before sending them back to the endpoint. This "hairpinning"introduces unnecessary traffic and processing overhead on the server, especially for bandwidth-intensive audio & video calls.

The Citrix Unified Communications SDK (UCSDK) is a technology that allows technology vendors to optimize these RTC applications for use in Citrix environments. When an application is optimized, it can provide a user experience that matches or even exceeds that of the application running on a local desktop. In today's world, seamless real-time communication is essential for productivity and collaboration. When using applications within a virtual environment, it's crucial that audio and video calls, screen sharing, and other communication features work as smoothly as they would on a local desktop. Optimized applications deliver this experience.

This product documentation details all that is needed for the Citrix customers to learn and deploy UCSDK optimized applications.

How it works

Citrix offers an optimized delivery method for real-time communication applications within VDIs. This approach leverages the Unified Communications SDK (UCSDK) to split the virtualized application into two parts:

- **User Interface (UI):** The user interface remains within the virtual host, displayed seamlessly within the virtual desktop or application window.
- **Media Engine:** The media processing tasks (encoding/decoding audio and video) are offloaded to the user's local device. This minimizes server load and optimizes network usage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Typically, Citrix offers UCSDK to technology vendors in the real-time communications space and works with them to get UCSDK integrated into those applications. Once integrated, any Citrix customer using a UCSDK optimized application will have an enhanced experience. Citrix UCSDK can also be consumed by Citrix customers in cases where a custom in-house application is being built. In most cases, however, customers do not need to consume & develop with UCSDK –they just need to configure the Citrix environment and the application to achieve an optimized experience.

> **Note:**
>
> References of Citrix WebRTC SDK (or) an HDX™ optimized application indicate integration with Citrix UCSDK and can be used interchangeably.

Key Benefits

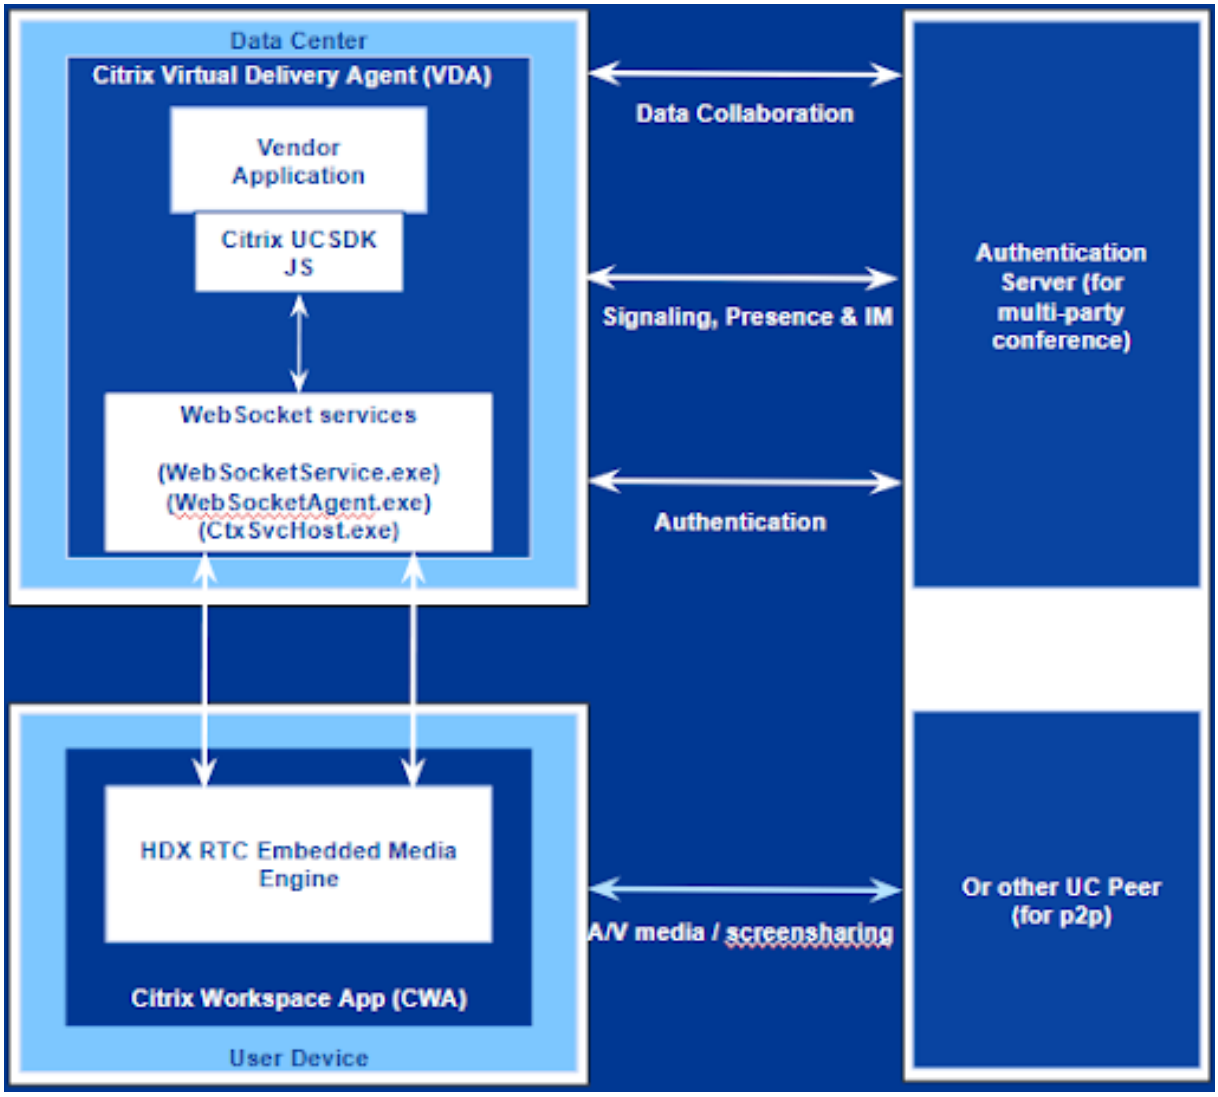
When you are using applications optimized with Citrix UCSDK, you can expect:

- Enhanced media processing performance by offloading processor-intensive media encoding/decoding from the Citrix Virtual Delivery Agent (VDA) to the client endpoint, increasing overall responsiveness for end users.
- Reduced CPU and bandwidth usage on Citrix VDA, allowing IT to support more concurrent users per host and enterprises to scale Citrix virtual desktop deployments cost-effectively.
- Lower total cost of ownership for enterprises, as optimized endpoints extend legacy virtual desktop lifespans and reduce host infrastructure needs, thus reducing capital expenditures and operating costs over time.
- Support for Windows, Mac, Linux, ChromeOS, and HTML5 endpoint platforms.

Use Cases

UCSDK is purpose-built to optimize real-time communication applications that adhere to the WebRTC standard. Here are key scenarios and the types of WebRTC-based applications that can / already use UCSDK.

- **Contact Center as a Service (CCaaS) / Cloud Contact Center Platforms:** Primarily manage customer interactions across multiple channels, optimizing agent workflows.
    - Examples: Amazon Connect, Twilio, Avaya Experience Platform, Talkdesk, Content Guru
- **Unified Communications as a Service (UCaaS) / Cloud Business Communications:** Integrate voice, video, team messaging, and presence for comprehensive business communication.
    - Examples: Ring Central, 8x8, Intermedia, Alcatel-Lucent Rainbow
- **Communications Platform as a Service (CPaaS):** Provide APIs for embedding real-time communication capabilities directly into custom applications.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Examples: Twilio, Ribbon Communications
- **Enterprise Video Conferencing and Collaboration:** Dedicated platforms for high-quality video meetings, conferencing, and advanced collaboration features.
    - Example: Pexip
- **Financial Trading Communications:** Engineered for the unique, high-performance, and compliant communication needs of financial markets.
    - Example: IPC Unigy
- **Virtual Learning and Training Platforms:** Designed for interactive, high-quality virtual classroom and training experiences.
    - Example: Vitero

The underlying WebRTC foundation of the Citrix UCSDK means its optimization capabilities can extend to any WebRTC-based communication applications. This opens the door for optimizing a wide array of applications that utilize WebRTC for real-time interactions, even if they are not currently listed as optimized with UCSDK. We encourage customers to reach out to Citrix with any use cases or applications they want to see optimized.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UCSDK Architecture

- Vendor application: This can be any third-party real-time communication application which is desktop-based or browser-based that integrated UCSDK.
- UCSDK JS: UCSDK JS provides the APIs that vendor applications utilize to offload the audio/video to the endpoint.
- HdxRtcEngine: This is the embedded WebRTC media engine in Citrix Workspace App that processes and handles the offloaded audio/video call.

Once the SDK is loaded and used, the `HdxRtcEngine.exe` process is launched on the client endpoint if redirection succeeds. Once `HdxRtcEngine.exe` is launched on the client endpoint, any signaling and payload data flows from Citrix VDA to the client endpoint, reaches the cloud, bounces back to the client endpoint, and then is forwarded to VDA. For example, a complete round trip of flow could be:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Vendor App -> CitrxWebrtc.js SDK -> Citrix VDA components -> Citrix
 Client Endpoint components -> Cloud -> Citrix Client Endpoint
components -> Citrix VDA components -> CitrxWebrtc.js SDK -> Vendor
App
```

System Requirements

The system requirements indicate the various versions of Citrix components needed with the latest version of UCSDK - 5.0.0. For compatibility details for older versions of the SDK and specific feature requirements, see Versions and Feature Matrix table below.

> **Note:**
>
> For customers to use any feature that is added to UCSDK –ensure that the vendor application has integrated the appropriate UCSDK version and enabled the feature and use the appropriate VDA and CWA versions in your environment.

Fully Compatible Versions

Fully compatible versions indicate that by using these versions of Citrix components along with the latest version of UCSDK, customers can take advantage of all the features available. For the current latest version of UCSDK –5.0.0, fully compatible versions of Citrix components are as below:

- **Citrix Virtual Apps and Desktops™:** 2607 LTSR
- **Citrix Workspace App Windows:** 2607 LTSR
- **Citrix Workspace App Mac:** To be Released
- **Citrix Workspace App Linux:** 2607 LTSR
- **Citrix Workspace App ChromeOS/HTML5:** To be Released

> **Note:**
>
> UCSDK Optimization is supported on all endpoint platforms: Windows, Mac, Linux, ChromeOS, and HTML5. If the list above shows "To be released"for a specific endpoint platform, it simply means that a version fully compatible with the latest UCSDK features hasn't been released yet. Hence, customers can still use older versions of the Citrix Workspace app to continue using existing features, even with the newer UCSDK.

Configuration

UCSDK feature functionality depends on three factors: the UCSDK version that the vendor has integrated and features that vendor has enabled, the Citrix Virtual Apps and Desktops, and the Citrix Workspace app version in use.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

On the Citrix Side, please ensure the following is configured so that the optimized application is allowed to be optimized:

1. Ensure the Microsoft Teams redirection policy is turned on. Refer to Multimedia Policy Settings for more information. Note that this policy is ON by default.
2. Third-party Electron or browser-based applications that utilize the `CitrixWebrtc.js` SDK are not supported by default. The `CtxHdxWebSocketService` (`WebSocketService.exe`) will not allow connections from applications that are not on the allowlist. The desired application binary executable name must be added to a whitelist registry key.

> **Note:**
>
> Starting with CVAD 2607 LTSR, optimization for applications using the Citrix Unified Communications SDK (UCSDK) is no longer dependent on the **Microsoft Teams redirection** policy. Administrators can now disable Microsoft Teams optimization without affecting other UCSDK-integrated applications. To use this separation, the vendor application must utilize the Bootstrap method (first introduced in UCSDK 4.0) alongside CVAD 2607 LTSR. For more detail, see Unified Communications SDK documentation.

On the VDA

- Create a Key Path: `HKLM\Software\WOW6432Node\Citrix\WebSocketService`
- KeyName: `ProcessWhitelist`
- Type: `MULTISZ`
- Key Value: `Mytestapp.exe`

If you have multiple applications, type each application in a new line. Do not copy and paste from a text file or insert commas. Make sure the name provided matches the executable name of the application. This registry value is not case-sensitive.

If the application is accessed through a browser instead of a full-fledged desktop application, then you need to allow for, e.g., `chrome.exe` in the registry value.

Once the above registry is configured successfully, reboot the VDA or restart `CtxHdxWebSocketService` to finish the Whitelist setup.

On the Client

No configuration is needed. Just install the Citrix Workspace app.

Each vendor might have a very specific application name. Hence, refer to the vendor documentation linked in the Current Vendor Support section to determine which application name must be allowed in the WebSocketService.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature Reference

Capturing redirected content in screenshots

When a UCSDK optimized application involves video or a shared-screen overlay, that content is rendered on the endpoint, so standard in-session screenshot tools capture it as a blank area. Use the Citrix Snipping Tool to include this content in your screenshots. Citrix recommends launching it from the Citrix Virtual Desktop Assistant to make it easy to find. For more information, see Citrix Virtual Desktop Assistant documentation.

Enhanced Call Connect times with Smart Sync

Introduced in UCSDK 5.0.0, the Smart Sync feature accelerates call connection times by streamlining communication between the VDA and the client endpoint. This enhancement delivers faster call setups across the board, providing the most significant performance improvements for high-latency network environments.

Citrix recommends that customers reach out to their application vendors to upgrade to UCSDK 5.0.0 to take advantage of this feature.

> **Note:**
>
> This feature depends only on UCSDK 5.0.0 and the Citrix Workspace app. See the Versions and Feature Matrix for exact client versions. There is no VDA version dependency, so older supported VDAs can still be used.

Decoupled UCSDK and HDX Microsoft Teams Optimization

This feature separates the optimization logic of the Unified Communications SDK (UCSDK) from the Microsoft Teams optimization policy. Previously, the "Microsoft Teams redirection"policy acted as a master switch; disabling it for Teams would inadvertently force all other UCSDK-based applications to fall back to server-side rendering.

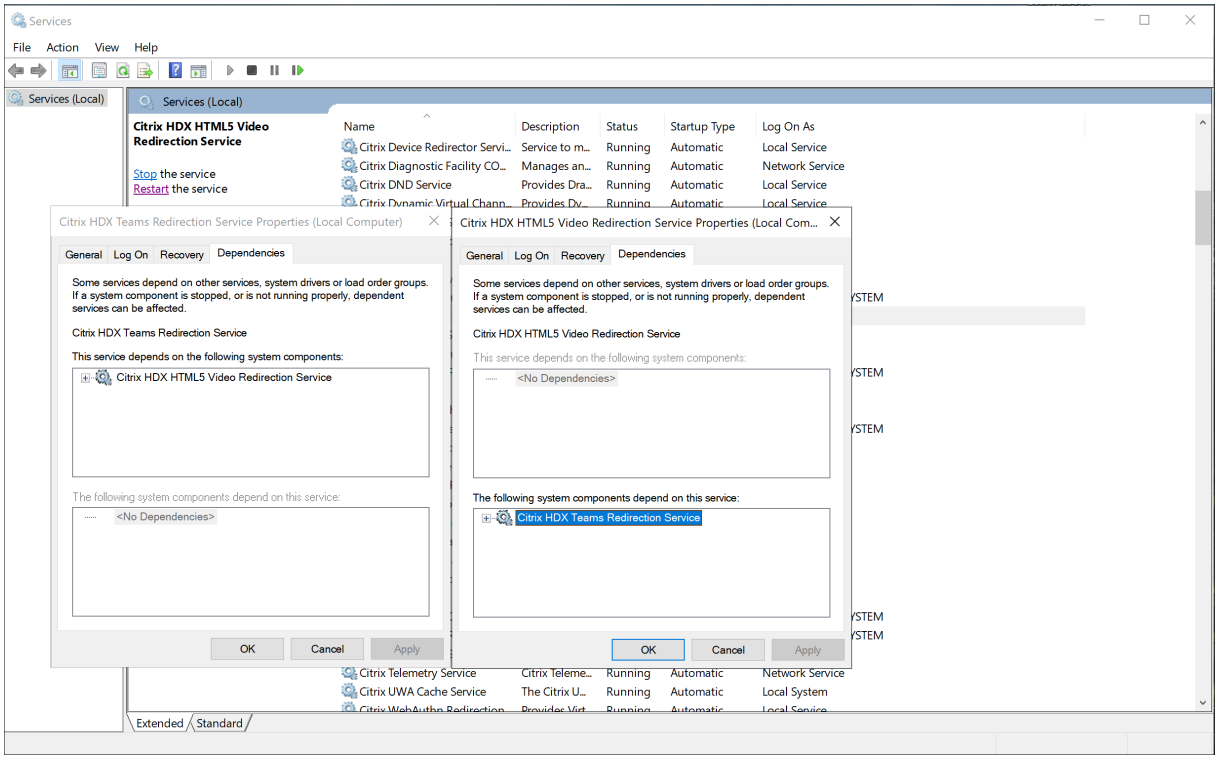
With this enhancement, the virtual channel required for WebRTC redirection remains available for third-party applications regardless of the Teams policy state.

- **Benefits**
  - **Granular Control:** Administrators can selectively manage Microsoft Teams optimization policy without impacting the optimization of critical business applications like Amazon Connect, Five9, RingCentral or other UCSDK-integrated applications.
  - **Operational Stability:** Ensures business continuity by preventing unintended performance degradation in UCSDK optimized applications. Administrators can disable HDX

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Teams optimization for troubleshooting or compliance reasons without breaking the high-definition audio/video experience of their primary business tools.

- **Requirements**
  - **VDA Requirement:** Citrix Virtual Apps/Desktops 2607 LTSR or later
  - **Application Compatibility:** The third-party application must utilize the UCSDK bootstrap initialization method



> **Note:**
>
> - This feature does not impact Microsoft Teams SlimCore optimization. SlimCore optimization operates independently using Microsoft-proprietary virtual channels and does not rely on the Citrix CTXMTOP virtual channel.
> - To leverage this feature, third-party applications must be built with UCSDK 4.0 or newer. Customers should verify with the application vendor (e.g., Amazon Connect, Five9, RingCentral) that their specific version uses bootstrap initialization.

Explicit service dependency for Microsoft Teams Optimization

Starting with Citrix Virtual Apps / Desktops 2607 LTSR, the **Citrix HDX Teams Redirection Service** (used by HDX Optimized Microsoft Teams & UCSDK Optimized applications) now explicitly declares a dependency on the **Citrix HDX HTML5 Video Redirection Service (WebSocketService)**.

This update ensures that the HTML5 service is automatically verified and started when the Teams service launches, preventing optimization failures for Microsoft Teams and UCSDK-integrated applications in environments where services are strictly managed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Optimized Overlay Clipping for Enhanced Performance and User Experience

From CVAD 2511, the mechanism for handling redirected video overlays in features such as HDX Microsoft Teams Optimization and UCSDK Optimization, has been re-architected to improve both the user experience and server performance.

Essential Benefits

- **Improved Visual Accuracy:** This enhancement resolves visual glitches where application elements, such as pop-up menus or notifications, would incorrectly appear behind video content. The new logic ensures all components are rendered in the correct order, providing a more seamless and predictable experience.
- **Enhanced Performance:** This optimization significantly reduces CPU utilization on the Virtual Delivery Agent. By replacing older, resource-intensive polling methods with a more efficient graphics-based approach, this change improves server scalability and allows for higher user density.

> **Note:**
>
> The functionality depends on a future version of Microsoft Teams (or other UCSDK partner application) and requires Citrix Workspace App for Windows 2511.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Versions and Feature Matrix

As version updates happen frequently, please refer to Citrix Virtual Apps and Desktops and Citrix Workspace app product lifecycle pages to ensure a particular version is supported. For many of the older features, the versions mentioned in the table are the last supported Current Release (CR) versions at the time of writing this document.

Feature	UCSDK Version	VDA	CWA Windows	CWA Mac	CWA Linux	CWA ChromeOS/HTML5

> We've introduced a new policy for screen recording, so you need the 2503 version of the delivery controller™, which comes with CVAD 2503.

Current Vendor Support

Several third-party vendors have integrated the Unified Communications SDK into their products. The current list of vendors and their supporting documentation is listed below:

Vendor	Documentation
Sprinklr	Citrix Media Offloading for Voice Calls - Sprinklr
Microsoft Dynamics 365	Dynamics 365 Contact Center Documentation
Amazon Connect	Optimize Amazon Connect audio for Citrix cloud desktops

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Vendor	Documentation
Ring Central	Using RingCentral in a Citrix VDI environment
Five9	Five9 WebRTC in Citrix Environments
Twilio	Twilio Flex on Citrix VDI
Avaya	Avaya Experience Platform Public Cloud VDI solution for Citrix
8x8	Citrix VDI Integration with 8x8 Work for Desktop & Web
Content Guru	Content Guru Citrix Integration
Ribbon Communications	Ribbon Communications Citrix WebRTC SDK
Intermedia	Installing Intermedia Unite on Citrix Virtual Apps and Desktops
Alcatel-Lucent Rainbow	Citrix Optimization for Rainbow Desktop Application
Talkdesk	Talkdesk Agent Workspace VDI Connect
IPC	IPC Unigy Soft Client Citrix VDI
Vitero	Vitero Inspire for Citrix VDI
Pexip	Deploying Connect desktop app in Citrix Pexip Infinity Docs
Zoom Web App	Configure WebRTC redirection for Zoom Web App

Troubleshooting

For troubleshooting information, see Troubleshooting Guidance for Apps Optimized with Citrix Unified Communications SDK.

Known Issues & Limitations

This section will document the current known issues and limitations as they are recognized.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

General content redirection

May 13, 2026

Content redirection allows you to control whether users access information by using applications published on servers or by using applications running locally on user devices.

Client folder redirection

Client folder redirection changes the way client-side files are accessible on the host-side session.

- When you enable only client drive mapping on the server, client-side full volumes are automatically mapped to the sessions as Universal Naming Convention (UNC) links.
- When you enable client folder redirection on the server and the user configures it on the Windows desktop device, the portion of the local volume specified by the user is redirected.

Host to client redirection

Consider using host to client redirection for specific uncommon use cases. Normally, other forms of content redirection might be better. We support this type of redirection only on Multi-session OS VDAs and not on Single-session OS VDAs.

Local App Access and URL redirection

Local App Access seamlessly integrates locally installed Windows applications in to a hosted desktop environment. It does so without changing from one computer to another.

Client folder redirection

May 13, 2026

Client folder redirection changes the way client-side files are accessible on the host-side session. If you enable only client drive mapping on the server, client-side full volumes are automatically mapped as Universal Naming Convention (UNC) links to the sessions. When you enable client folder redirection on the server and the user configures it on the user device, the portion of the local volume specified by the user is redirected.

Only the user-specified folders appear as UNC links inside sessions. That is, instead of the complete file system on the user device. If you disable UNC links through the registry, client folders appear as mapped drives inside the session.

Client folder redirection is supported on Windows Single-session OS machines only.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Client folder redirection for an external USB drive is not saved on detaching and reattaching the device.

Enable client folder redirection on the server. Then, on the client device, specify which folders to redirect. The application (CtxCFRUI.exe) you use to specify the client folder options is included with the Citrix Workspace app supplied with this release.

Requirements:

For servers:

- Windows Server 2022
- Windows Server 2019, Standard and Datacenter Editions

For Clients:

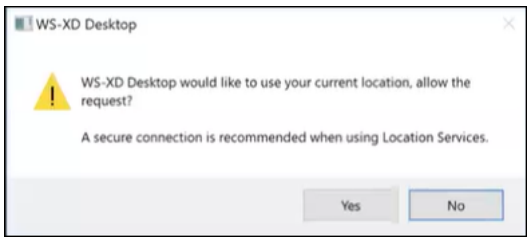
- Windows 10
- Windows 11

To enable client folder redirection on the server, see Client folder redirection in the list of features managed through the registry.

On the user device, specify which folders to redirect:

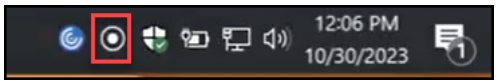
1. Ensure that the latest version of Citrix Workspace™ app is installed.
2. From the Citrix Workspace app installation directory, start CtxCFRUI.exe **(..\Citrix\ICA Client\CtxCFRUI.exe)**.
3. Choose the **Custom** radio button and add, edit, or remove folders.
4. Disconnect and reconnect your sessions for the setting to take effect.

Client location redirection



May 13, 2026

Client location redirection, when enabled, allows VDA-hosted apps and desktop sessions to seamlessly access the client's current location. On a multi-session operating system (TS VDA or Multi-Session WS VDA), each session has its own unique location provided by the connected client. Using this feature, applications on the VDA that depend on location have the accurate location of the client.



For more information, see the Microsoft documentation.

After client location redirection is enabled and location access is allowed on both the server and client side, when you launch a location-accessing application or desktop, the client prompts you to share its current location with the following dialog box:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When you enable the client location redirection, the following icon appears in the client's taskbar if/when the VDA-hosted app or desktop queries current location information.

System requirements

For servers:

- Single-Session (Win10/11) or Multi-Session (Win 11 22H2 and Server 2022 23H2 or later) OS VDA
- Citrix Workspace™ app for Windows, iOS, or Android

Configuration

Client location redirection must be enabled using the Citrix® policy for the feature to work. Client location redirection is disabled by default.

To enable client location redirection, complete the following steps:

On the Windows VDA and Client side:

1. In **Settings > Privacy > Location**, enable the following options:
    - **Allow access to location on this device**
    - **Allow apps to access your location**
    - **Allow desktop apps to access your location**
2. For multi-session OS, enable the **Location Override** setting.

On the Controller/DDC side:

Enable the **Studio > Policies > Location > Settings > Allow application to use the physical location of the client device** policy.
For more information, see Client sensors policy settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bidirectional content redirection

August 4, 2026

Bidirectional content redirection allows HTTP or HTTPS URLs in web browsers, or embedded into applications, to be forwarded between the Citrix VDA session and the client endpoint in both directions. A URL entered in a browser running in the Citrix session can be opened using the client's default browser. Conversely, a URL entered in a browser running on the client can be opened in a Citrix session, either with a published application or desktop. Some common use cases for bidirectional content redirection include:

- Redirection of web URLs in cases where the starting browser does not have network access to the source.
- Redirection of web URLs for browser compatibility and security reasons.
- Redirection of web URLs embedded in applications when running a web browser on the Citrix session or the client isn't wanted.

System requirements

- Single-session or multi-session OS VDAs
- Citrix Workspace™ app for Windows 2311 or above
- Citrix Workspace™ app for Linux 2503 or above
- Citrix Workspace™ app for Mac 2607 or above

Browsers:

- Google Chrome with Citrix Browser Redirection Extension
  - Google Chrome Extension
- Microsoft Edge with Citrix Browser Redirection Extension
  - Microsoft Edge Extension

Configuration

Starting in Citrix Virtual Apps and Desktops™ version 2311, bidirectional content redirection is configured through Citrix Studio only. Prior releases had policy settings configured on both the client endpoint and Studio. Bidirectional content redirection is disabled by default.

For VDA configuration, see Bidirectional content redirection in the **ICA policy** settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For browser redirection to work, browser extensions must be registered on the originating browser (where the URL is redirected from) using the commands shown. Run the commands as needed on the VDA and client, based on the browser in use.

Browser	VDA	Client
Google Chrome	"%Program-Files(x86)%\Citrix\HDX\bin\vdaredirect.exe" /regChrome	"%Program-Files(x86)%\Citrix\ICA Client\redirector.exe" /regChrome
Microsoft Edge	"%Program-Files(x86)%\Citrix\HDX\bin\vdaredirect.exe" /regEdge	"%Program-Files(x86)%\Citrix\ICA Client\redirector.exe"/regEdge
All Available Browsers	"%Program-Files(x86)%\Citrix\HDX\bin\vdaredirect.exe" /regall	"%Program-Files(x86)%\Citrix\ICA Client\redirector.exe"/regall

To unregister a browser extension:

Browser	VDA	Client
Google Chrome	"%Program-Files(x86)%\Citrix\HDX\bin\vdaredirect.exe" /unregChrome	"%Program-Files(x86)%\Citrix\ICA Client\redirector.exe" /unregChrome
Microsoft Edge	"%Program-Files(x86)%\Citrix\HDX\bin\vdaredirect.exe" /unregEdge	"%Program-Files(x86)%\Citrix\ICA Client\redirector.exe" /unregEdge
All Available Browsers	"%Program-Files(x86)%\Citrix\HDX\bin\vdaredirect.exe" /unregall	"%Program-Files(x86)%\Citrix\ICA Client\redirector.exe"/unregall

> **Note:**
>
> - Run these commands in a Command Prompt (CMD) window with administrator privileges.
> - The register command causes Chrome and Edge browsers to prompt users to enable the Citrix Browser Redirection Extension during first launch.
> - The registration command also links the Browser Redirection Extension to the native messaging host, which allows the extension to communicate with the native code. Without this,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> the browser blocks the communication.
> - You can also install the browser extension manually from the Google Chrome Web Store. To use the Browser Redirection Extension from the Microsoft Edge Add-ons store, you need Virtual Delivery Agent (VDA) version 2503 or later. For older VDA versions, install the extension from the Google Chrome Web Store within your Microsoft Edge browser (see Add an extension to Microsoft Edge from the Chrome Web Store).
> - The Citrix Workspace app versions listed in the system requirements are the minimum versions required to support both bidirectional content redirection and OAuth redirection.
> - For Mac: due to macOS security requirements for notarized applications, custom OAuth callback URL schemes must be pre-registered with Citrix and cannot be changed dynamically post-installation. Only `citrix-oauth-redir` is supported by default. Please reach out to the Citrix Product team to register your URL scheme.

Wildcard redirection from Citrix VDA to client

Bidirectional content redirection supports the use of wildcards when defining the URLs to be redirected. To configure bidirectional content redirection, see the configuration instructions.

Custom protocol redirection from VDA to client

Bidirectional content redirection supports redirecting custom protocols from the Citrix VDA to the client. Protocols other than HTTP or HTTPS are supported. To configure bidirectional content redirection, see the configuration instructions.

In Web Studio, set the custom protocol in **Bidirectional content redirection**.

> **Note:**
>
> - You must have administrator privileges to run these commands.
> - The client must have an application registered to handle the protocol. Otherwise, the URL redirects to the client and fails to launch.
> - Custom protocol URLs that you enter or launch in the Chrome and Edge browsers are not supported and not redirected.
> - The following protocols are not supported: `rtsp://`, `rtspu://`, `pnm://`, `mms://`.

Other considerations

- Browser requirements and configurations are only applicable to the browser starting the redirection. The destination browser, where the URL opens after redirection is successful, isn't con-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

sidered for support. When redirecting URLs from the VDA to a client, a supported browser configuration is only required on the VDA. Conversely, when redirecting URLs from the client to a VDA, a supported browser configuration is only required on the client. Redirected URLs are handed off to the default browser configured on the destination machine, either the client or the VDA, depending on direction. Using the same browser type on the VDA and the client is not required.

- Check that redirection rules do not result in a looping configuration. For example, a VDA policy is set to redirect `https://www.citrix.com`, and the client policy is set to redirect the same URL, resulting in infinite looping.
- URL shorteners aren't supported.
- Client-to-VDA redirection requires the Windows client to be installed with administrator rights.
- If the destination browser is already open, the redirected URL opens in a new tab. Otherwise, the URL opens in a new browser window.
- Bidirectional content redirection does not work when Local App Access (LAA) is enabled.

Host to client redirection

May 13, 2026

Host-to-client redirection allows URLs, embedded as hyperlinks in applications running on a Citrix® session, to open using the corresponding application on the user endpoint device. Some common use cases for host-to-client redirection include:

- Redirection of websites in cases where the Citrix server doesn't have Internet or network access to the source.
- Redirection of websites when running a web browser inside the Citrix session is not desired for security, performance, compatibility, or scalability reasons.
- Redirection of specific URL types in cases where the required applications to open the URL are not installed on the Citrix server.

Host-to-client redirection is not intended for URLs that you access on a webpage or type in the address bar of the web browser running in the Citrix session. For redirection of URLs in web browsers, see Bidirectional URL redirection or Browser content redirection.

System requirements

- Multi-session OS VDA
- Supported clients:
    - Citrix Workspace™ app for Windows

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Citrix Workspace app for Mac
- Citrix Workspace app for Linux
- Citrix Workspace app for HTML5
- Citrix Workspace app for Chrome

The client device must have an application installed and configured for handling the redirection of the URL types.

Configuration

Use the Host to client redirection Citrix policy to enable this functionality. **Host to client redirection** is disabled by default. After you enable the Host-to-client redirection policy, the Citrix Launcher application registers with the Windows server to ensure that it can intercept URLs and send them to the client device.

Then you must configure the Windows Group Policy to use Citrix Launcher as the default application for the required URL types. On the Citrix server VDA, create the ServerFTAdefaultPolicy.xml file and insert the following XML code.

```
<?xml version="1.0" encoding="UTF-8"?>

<DefaultAssociations>

<Association Identifier="http" ProgId="ServerFTAHTML" ApplicationName="
    ServerFTA" />

<Association Identifier="https" ProgId="ServerFTAHTML" ApplicationName=
    "ServerFTA" />

</DefaultAssociations>
```

From the Group Policy management console, go to **Computer configuration > Administrative Templates > Windows Components > File Explorer > Set a default associations configuration file**, and save your ServerFTAdefaultPolicy.xml file.

> **Note:**
>
> If a Citrix server doesn't have the Group Policy settings, Windows prompts users to select an application for opening URLs.

By default, we support redirection of the following URL types:

- HTTP
- HTTPS
- RTSP
- RTSPU

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- PNM
- MMS

To include additional standard or custom URL types on the list for redirection, create a new **Association Identifier** line in the ServerFTAdefaultPolicy.xml file referenced earlier. For example:

```
<Association Identifier="ftp"ProgId="ServerFTAHTML"ApplicationName="
ServerFTA"/>

<Association Identifier="mailto"ProgId="ServerFTAHTML"ApplicationName
="ServerFTA"/>

<Association Identifier="customtype1"ProgId="ServerFTAHTML"ApplicationName
="ServerFTA"/>

<Association Identifier="customtype2"ProgId="ServerFTAHTML"ApplicationName
="ServerFTA"/>
```

Adding URL types to the list also requires client configuration. Create the following registry key and values on the Windows client.

> **Note:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

- Key: HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Policies\Citrix\ICA Client\SFTA
- Value name: ExtraURLProtocols
- Value type: REG_SZ
- Value data: Specify the required URL types separated by semicolon. Include everything before the authority portion of the URL. For example:
  `ftp://;mailto:;customtype1://;custometype2://`

You can add URL types only for Windows clients. Clients missing the registry settings above reject redirection back to the Citrix session. The client must have an application installed and configured to handle the specified URL types.

To remove URL types from the default redirection list, create the following registry key and values on the server VDA.

- Key: HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\SFTA
- Value name: DisableServerFTA
- Value type: DWORD
- Value data: 1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Value name: NoRedirectClasses
- Value type: REG_MULTI_SZ
- Value data: Specify any combination of the values: `http`, `https`, `rtsp`, `rtspu`, `pnm`, or `mms`. Type multiple values on separate lines. For example:

```
http
https
rtsp
```

To enable host-to-client redirection for a specific set of websites, create a registry key and values on the server VDA.

- Key: HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\SFTA
- Value name: ValidSites
- Value type: REG_MULTI_SZ
- Value data: Specify any combination of fully qualified domain names (FQDNs). Type multiple FQDNs on separate lines. Include the FQDN only, without protocols (`http://` or `https://`). An FQDN can include an asterisk (`*`) as a wildcard character in the leftmost position only. This wildcard matches a single level of domain, which is consistent with the rules in RFC 6125. For example:

```
www.exmaple.com
*.example.com
```

> **Note:**
>
> You cannot use the **ValidSites** key with the **DisableServerFTA** and **NoRedirectClasses** keys.

Server VDA default browser configuration

Enabling host-to-client redirection as referenced in this section supersedes any previous default browser configuration on the server VDA. If a web URL is not redirected, the Citrix Launcher passes the URL to the browser configured in the `command_backup` registry key. The key points to Internet Explorer by default, but you can modify it to include the path to a different browser. For more information, see Server VDA default browser configuration in the list of features managed through the registry.

Local App Access and URL redirection

May 15, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Introduction

Local App Access seamlessly integrates locally installed Windows applications into a hosted desktop environment without switching from one desktop to another. With Local App Access, you can:

- Access applications installed locally on a physical laptop, PC, or other device directly from the virtual desktop.
- Provide a flexible application delivery solution. If users have local applications that you cannot virtualize or that IT does not maintain, those applications still behave as though they are installed on a virtual desktop.
- Eliminate the double-hop latency when applications are hosted separately from the virtual desktop. Do so by putting a shortcut to the published application on the user's Windows device.
- Use applications such as:
    - Video conferencing software such as GoToMeeting.
    - Specialty or niche applications that are not yet virtualized.
    - Applications and peripherals that would otherwise transfer large amounts of data from a user device to a server and back to the user device. For example, DVD burners and TV tuners.

In Citrix Virtual Apps and Desktops™, hosted desktop sessions use URL redirection to start Local App Access applications. URL redirection makes the application available under more than one URL address. It launches a local browser (based on the browser's URL block list) by selecting embedded links within a browser in a desktop session. If you navigate to a URL that is not present in the block list, the URL is opened in the desktop session again.

URL redirection works only for desktop sessions, not application sessions. The only redirection feature you can use for application sessions is host-to-client content redirection, which is a type of server FTA (File Type Association) redirection. This FTA redirects certain protocols to the client, such as HTTP, HTTPS, RTSP, or MMS. For example, if you only open embedded links with HTTP, the links directly open with the client application. There is no URL block list or allow list support.

When Local App Access is enabled, URLs that are displayed to users as links from locally running applications, from user-hosted applications, or as shortcuts on the desktop are redirected in one of the following ways:

- From the user's computer to the hosted desktop
- From the Citrix Virtual Apps and Desktops™ server to the user's computer
- Rendered in the environment in which they are started (not redirected)

To specify the redirection path of content from specific websites, configure the URL allow list and URL block list on the Virtual Delivery Agent. Those lists contain multi-string registry keys that specify the URL redirection policy settings. For more information, see the Local App Access policy settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

URLs can be rendered on the VDA with the following exceptions:

- Geo/Locale information —Websites that require locale information, such as msn.com or news.google.com (opens a country specific page based on the Geo). For example, if the VDA is provisioned from a data center in the UK and the client is connecting from India, the user expects to see in.msn.com. Instead, the user sees uk.msn.com.
- Multimedia content —Websites containing rich media content, when rendered on the client device, give the end users a native experience and also save bandwidth even in high latency networks. This feature redirects sites with other media types such as Silverlight. This process is in a secure environment. That is, the URLs that the administrator approves are run on the client while the rest of the URLs are redirected to the VDA.

In addition to URL redirection, you can use FTA redirection. FTA starts local applications when a file is encountered in the session. If the local app is started, the local app must have access to the file to open it. Therefore, you can only open files that reside on network shares or on client drives (using client drive mapping) using local applications. For example, when opening a PDF file, if a PDF reader is a local app, then the file opens using that PDF reader. Because the local app can access the file directly, there is no network transfer of the file through ICA® to open the file.

Requirements, considerations, and limitations

We support Local App Access on the valid operating systems for VDAs for Windows Multi-session OS and for VDAs for Windows Single-session OS. Local App Access requires Citrix Workspace app for Windows version 4.1 (minimum). The following browsers are supported:

- Edge, latest version
- Firefox, latest version and extended support release
- Chrome, latest version

Review the following considerations and limitations when using Local App Access and URL redirection.

- Local App Access is designed for full-screen, virtual desktops spanning all monitors:
    - The user experience can be confusing if you use Local App Access with a virtual desktop that runs in windowed mode or does not cover all monitors.
    - Multiple monitors —When one monitor is maximized, it becomes the default desktop for all applications started in that session. This default occurs even if the subsequent applications typically start on another monitor.
    - The feature supports one VDA. There is no integration with multiple concurrent VDAs.
- Some applications can behave unexpectedly, affecting users:
    - The drive letters might confuse users, such as local C: rather than virtual desktop C: drive.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - Available printers in the virtual desktop are not available to local applications.
  - Applications that require elevated permissions cannot be started as client-hosted applications.
  - There is no special handling for single-instance applications (such as Windows Media Player).
  - Local applications appear with the Windows theme of the local machine.
  - Full-screen applications are not supported. These applications include applications that open to a full screen, such as PowerPoint slide shows or photo viewers that cover the entire desktop.
  - Local App Access copies the properties of the local application (such as the shortcuts on the client's desktop and Start menu) on the VDA. However, it does not copy other properties such as shortcut keys and read-only attributes.
  - Applications that customize how overlapping window order is handled can have unpredictable results. For example, some windows might be hidden.
  - Shortcuts are not supported, including My Computer, Recycle Bin, Control Panel, Network Drive shortcuts, and folder shortcuts.
  - The following file types and files are not supported: custom file types, files with no associated programs, zip files, and hidden files.
  - Taskbar grouping is not supported for mixed 32-bit and 64-bit client-hosted or VDA applications. That is, grouping 32-bit local applications with 64-bit VDA applications.
  - Applications cannot be started using COM. For example, if you click an embedded Office document from within an Office application, the process start cannot be detected, and the local application integration fails.

- Double-hop scenarios, where a user is starting a virtual desktop from within another virtual desktop session, are not supported.
- URL redirection supports only explicit URLs (that is, URLs appearing in the browser's address bar or found using the in-browser navigation, depending on the browser).
- URL redirection works only with desktop sessions, not with application sessions.
- The local desktop folder in a VDA session does not allow users to create files.
- Multiple instances of a locally running application behave according to the taskbar settings established for the virtual desktop. However, shortcuts to locally running applications are not grouped with running instances of those applications. They are also not grouped with running instances of hosted applications or pinned shortcuts to hosted applications. Users can close only windows of locally running applications from the Taskbar. Although users can pin local application windows to the desktop Taskbar and Start menu, the applications might not start consistently when using these shortcuts.
- If you set the **Allow Local App Access** policy setting to **Enabled**, browser content redirection isn't supported. By default, Local App Access is prohibited.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Interaction with Windows

The Local App Access interaction with Windows includes the following behaviors.

- Windows 8 and Windows Server 2012 shortcut behavior
  - Windows Store applications installed on the client are not enumerated as part of Local App Access shortcuts.
  - Image and video files are opened by default using Windows store applications. However, Local App Access enumerates the Windows store applications and opens shortcuts with desktop applications.
- Local Programs
  - For Windows 7, the folder is available in the Start menu.
  - For Windows 8, Local Programs is available only when the user chooses **All Apps** as a category from the Start screen. Not all subfolders are displayed in Local Programs.
- Windows 8 graphics features for applications
  - Desktop applications are restricted to the desktop area and are covered by the Start screen and Windows 8 style applications.
  - Local App Access applications do not behave like desktop applications in multi-monitor mode. In multi-monitor mode, the Start screen and the desktop display on different monitors.
- Windows 8 and Local App Access URL Redirection
  - Because Windows 8 Internet Explorer has no add-ons enabled, use desktop Internet Explorer to enable URL redirection.
  - In Windows Server 2012, Internet Explorer disables add-ons by default. To implement URL Redirection, disable the Internet Explorer enhanced configuration. Then reset the Internet Explorer options and restart to ensure that add-ons are enabled for standard users.

Configure Local App Access and URL redirection

To use Local App Access and URL redirection with Citrix Workspace™ app:

- Install the Citrix Workspace app on the local client machine. You can enable both features during the Citrix Workspace app installation or you can enable Local App Access template using the Group Policy editor.
- Set the **Allow Local App Access** policy setting to **Enabled**. You can also configure URL allow list and block list policy settings for URL redirection. For more information, see Local App Access policy settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable Local App Access and URL redirection

To enable Local App Access for all local applications, follow these steps:

1. Sign in to Web Studio and click **Policies** in the left pane.
2. In the action bar, click **Create Policy**.
3. In the Create Policy window, type "Allow Local App Access"in the search box and then click **Select**.
4. In the Edit Setting window, select **Allowed**. By default, the **Allow local app access** policy is prohibited. When this setting is allowed, the VDA allows the end-user to decide whether published applications and Local App Access shortcuts are enabled in the session. (When this setting is prohibited, both published applications and Local App Access shortcuts do not work for the VDA.) This policy setting applies to the entire machine and the URL redirection policy.
5. In the Create Policy window, type "URL redirection allow list"in the search box and then click **Select**. The URL redirection allow list specifies URLs to open in the default browser of the remote session.
6. In the Edit Setting window, click **Add** to add the URLs and then click **OK**.
7. In the Create Policy window, type "URL redirection block list"in the search box and then click **Select**. The URL redirection block list specifies URLs that are redirected to the default browser running on the endpoint.
8. In the Edit Setting window, click **Add** to add the URLs and then click **OK**.
9. On the Settings page, click **Next**.
10. On the Users and Machines page, assign the policy to the applicable Delivery Groups and then click **Next**.
11. On the Summary page, review the settings and then click **Finish**.

To enable URL redirection for all local applications during Citrix Workspace app installation, follow these steps:

1. Enable URL redirection when you install the Citrix Workspace app for all users on a machine. Doing so also registers the browser add-ons required for URL redirection.
2. From the command prompt, run the appropriate command to install the Citrix Workspace app using one of the following options:
    - For CitrixReceiver.exe, use `/ALLOW_CLIENTHOSTEDAPPSURL=1`.
    - For CitrixReceiverWeb.exe, use `/ALLOW_CLIENTHOSTEDAPPSURL=1`.

Enable the Local App Access template using the Group Policy editor

> **Note:**
>
> - Before you enable the Local App Access template using the Group Policy editor, add the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> receiver.admx/adml template files to the local GPO.
> - Citrix Workspace app for Windows template files are available in the local GPO in **Administrative Templates > Citrix Components > Citrix Workspace** folder only when you add the CitrixBase.admx/CitrixBase.adml to the %systemroot%\policyDefinitions folder.

To enable the Local App Access template using the Group Policy editor, follow these steps:

1. Run **gpedit.msc**.
2. Go to **Computer Configuration > Administrative Templates > Classic Administrative Templates (ADM) > Citrix Components > Citrix Workspace > User Experience**.
3. Click **Local App Access settings**.
4. Select **Enabled** and then select **Allow URL Redirection**. For URL redirection, register browser add-ons using the command line described in the *Register browser add-ons* section further down in this article.

Provide access only to published applications

You can provide access to published applications using the Registry Editor or the PowerShell SDK.

To the Registry Editor, see The Local App Access for published applications in the list of features managed through the registry.

To use the PowerShell SDK:

1. Open PowerShell on the machine where the Delivery Controller™ is running.
2. Enter the following command: `set-configsitemetadata -name "studio_clientHostedApps"-value "true"`.

To have access to **Add Local App Access Application** in a Cloud service deployment, use the Citrix DaaS Remote PowerShell SDK. For more information, see Citrix DaaS Remote PowerShell SDK.

1. Download the installer:

   https://download.apps.cloud.com/CitrixPoshSdk.exe

2. Run these commands:

   a) `asnp citrix.*`
   b) `Get-XdAuthentication`

3. Enter the following command: `set-configsitemetadata -name "studio_clientHostedApps"-value "true"`.

After you complete the applicable preceding steps, follow these steps to continue.

1. Sign in to Web Studio and select **Applications** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the upper middle pane, right-click the blank area and select **Add Local App Access Application** from the context menu. You can also click **Add Local App Access Application** in the action bar. To display the Add Local App Access Application option in the action bar, click **Refresh**.
3. Publish Local App Access application.
    - The Local Application Access wizard launches with an Introduction page, which you can remove from future launches of the wizard.
    - The wizard guides you through the Groups, Location, Identification, Delivery, and Summary pages described below. When you are finished with each page, click **Next** until you reach the Summary page.
    - On the Groups page, select one or more Delivery Groups where the new applications will be added, and then click **Next**.
    - On the Location page, type the full executable path of the application on the user's local machine, and type the path to the folder where the application is located. Citrix recommends that you use the system environment variable path; for example, %ProgramFiles(x86)%\Internet Explorer\iexplore.exe.
    - On the Identification page, accept the default values or type the information that you want and then click **Next**.
    - On the Delivery page, configure how this application is delivered to users and then click **Next**. You can specify the icon for the selected application. You can also specify whether the shortcut to the local application on the virtual desktop is visible on the Start menu, the desktop, or both.
    - On the Summary page, review the settings and then click **Finish** to exit the Local Application Access wizard.

Register browser add-ons

> **Note:**
>
> The browser add-ons required for URL redirection are registered automatically when you install the Citrix Workspace app from the command line using the /ALLOW_CLIENTHOSTEDAPPSURL=1 option.

You can use the following commands to register and unregister one or all add-ons:

- To register add-ons on a client device: <*client-installation-folder*>\redirector.exe /reg<*browser*>
- To unregister add-ons on a client device: <*client-installation-folder*>\redirector.exe /unreg<*browser*>
- To register add-ons on a VDA: <*VDAinstallation-folder*>\VDARedirector.exe /reg<*browser*>

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To unregister add-ons on a VDA: <*VDAinstallation-folder*>\VDARedirector.exe /unreg<*browser*>

Where <*browser*> is Internet Explorer, Firefox, Chrome, or All.

For example, the following command registers Internet Explorer add-ons on a device running the Citrix Workspace app.

C:\Program Files\Citrix\ICA Client\redirector.exe/regIE

The following command registers all add-ons on a Windows Multi-session OS VDA.

C:\Program Files (x86)\Citrix\HDX\bin\VDARedirector.exe /regAll

URL interception across browsers

- By default, Internet Explorer redirects the specified URL. If the URL is not in the block list but the browser or website redirects it to another URL, the final URL is not redirected. It is not redirected even if it is on the block list.

For URL redirection to work correctly, enable the add-on when prompted by the browser. If the add-ons that are using Internet options or the add-ons in the prompt are disabled, URL redirection does not work correctly.

- The Firefox add-ons always redirect the URLs.

When an add-on is installed, Firefox prompts to allow or prevent installing the add-on on a new tab page. Allow the add-on for the feature to work.

- The Chrome add-on always redirects the final URL that is navigated, and not the entered URLs.

The extensions have been installed externally. When you disable the extension, the URL redirection feature does not work in Chrome. If the URL redirection is required in Incognito mode, allow the extension to run in that mode in the browser settings.

Configure local application behavior on logoff and disconnect

> **Note:**
>
> If you do not follow these steps to configure the settings, by default, local applications continue to run when a user logs off or disconnects from the virtual desktop. After reconnection, local applications are reintegrated if they are available on the virtual desktop.

To configure local application behavior on logoff and disconnect, see Local application behavior on logoff and disconnect in the list of features managed through the registry.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Overview

May 15, 2026

Effective print management is a cornerstone of productive and efficient IT operations within Citrix Virtual Apps and Desktops™ (CVAD) environments. Users require seamless and reliable access to printing resources, while administrators need robust tools to configure, manage, secure, and troubleshoot the printing infrastructure.

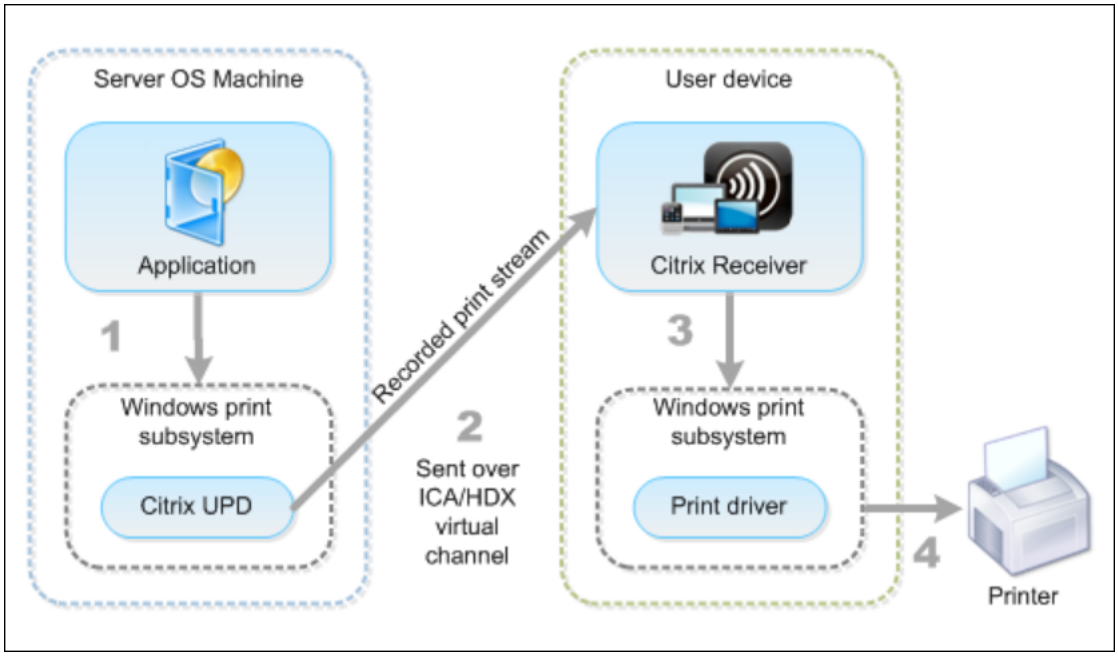
This document serves as a comprehensive, expert-level guide designed to revamp existing knowledge bases and provide IT administrators with a thorough understanding of all facets of CVAD printing.

Printing remains a fundamental requirement for many business workflows. Within Citrix Virtual Apps and Desktops™ (CVAD) environments, efficiently managing print requests from virtual sessions to physical devices presents unique challenges due to the separation between the user's session and the physical printer hardware.

CVAD provides a comprehensive suite of technologies and policies designed to bridge this gap, offering flexibility to accommodate diverse printer types, network conditions, and user requirements while aiming for optimal performance and administrative simplicity.

Citrix Universal™ Print Driver (UPD)

July 24, 2026



> **Important Note:**
>
> The default order of the **Universal Driver preference** policy setting will be changing in the Q4 release of Citrix Virtual Apps and Desktops™. The new default order would be:
>
> - EMF
> - XPS
> - PCL5c
> - PCL4
> - PDF
> - PS
>
> For additional details, please refer to the Universal Driver Preference page.

The Citrix Universal Print Driver (UPD) is not a single driver but a technology comprising components on both the server (VDA) and the client (endpoint with Workspace app).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Server Component:** Installed with the VDA, this includes the actual generic print drivers, such as the "Citrix Universal Printer"(which uses the EMF format) and the "Citrix XPS Universal Printer"(which uses the XPS format), along with support for PDF and PS formats. Its role is to capture the print output generated by applications running on the VDA in a device-independent format.
- **Client Component:** Included within the Citrix Workspace™ app installation, this component receives the print stream sent from the VDA. It then interacts with the local Windows printing subsystem on the endpoint device to render the print job using the appropriate device-specific driver installed locally for the target printer.

The following illustration shows the Universal Print driver components and a typical workflow for a printer locally attached to a device -

The primary goal of the UPD is to simplify printer driver management within the Citrix® environment. By using a built-in driver on the VDA, administrators can avoid installing and maintaining potentially hundreds of different manufacturer-specific drivers, which are a common source of instability and conflicts. The UPD aims to be compatible with a wide range of printers, providing a universal interface between the virtual session and the client's printing capabilities.

Supported Formats

The UPD technology supports several print data formats, allowing flexibility in how print jobs are processed and rendered:

- **EMF (Enhanced Metafile Format):** The default format used by the "Citrix Universal Printer"

© 1997–2026 Citrix Systems, Inc. All rights reserved.

driver. It's a 32-bit Windows-native vector format. Printing using EMF is generally efficient but typically requires a Windows-based client endpoint for rendering.

- **XPS (XML Paper Specification):** Used by the "Citrix XPS Universal Printer"driver. XPS is an XML-based page description language developed by Microsoft, similar in concept to PDF, designed to be platform-independent.
- **PS (PostScript):** A page description language developed by Adobe, known for its capabilities in handling complex graphics and typography, often used in publishing and by various printers and multifunction peripherals. Linux clients often utilize PostScript printing with UPD.
- **PDF:** PDF is a widely used open standard for document exchange. It encapsulates a complete description of a fixed-layout flat document, including the text, fonts, graphics, and other information needed to display it. It is designed to be platform-independent and is ideal for preserving document fidelity across different systems and applications.

Using the UPD offers several potential advantages:

- **Reduced Driver Management:** Significantly decreases the number of drivers needed on VDA images, simplifying image creation and maintenance.
- **Improved Stability:** Fewer drivers mean fewer potential conflicts and a lower risk of driver-related spooler crashes or system instability.
- **Optimized Print Jobs:** Certain UPD formats, particularly EMF, can sometimes result in smaller print job sizes compared to native drivers.
- **Advanced Feature Support:** The EMF and XPS UPD components can support advanced printing features (like stapling, tray selection) if the native driver on the client exposes these capabilities through Microsoft's standard Print Capability technology.

PDF Printing

Citrix Virtual Apps and Desktops supports PDF as a Page Description Language (PDL) for auto-created client printers through the Citrix Universal Print Driver (UPD). This provides a common UPD solution that works across all client platforms —Windows, Mac, and Linux —using PDF as the print format exchanged between the VDA and the client endpoint.

Previously, the Citrix Universal PDF Printer operated as a generic, session-level endpoint not linked to any specific client-side printer. The user would receive a PDF file on the client, open it in a local PDF viewer, and optionally print it from there. With enhanced PDF printing, print jobs are routed directly to the auto-created client printer, and print ticket settings selected in the VDA print dialog —such as duplex, orientation, color mode, and stapling —are passed through to the client printer and honored.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PDF Printing

July 27, 2026

Requirements

Citrix® Control Plane

- Citrix Virtual Apps and Desktops™ 2402 or later
- Citrix DaaS

Session Host

- Operating system
  - Windows 11
  - Windows Server 2019 or later
- VDA
  - Windows: version 2603 or later

Client

For more information, seee Universal Driver Preference page.

- Operating system
  - Windows 11
  - Linux
- Workspace app
  - Windows: version 2603 or later
  - Linux: version 2511 or later

Configuration

PDF printing can be enabled by updating the order of the **Universal driver preference** policy setting in the Studio console as described below.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy	Required Value
Universal driver preference	PDF:EMF:XPS:PS

No additional VDA side registry modifications are needed.

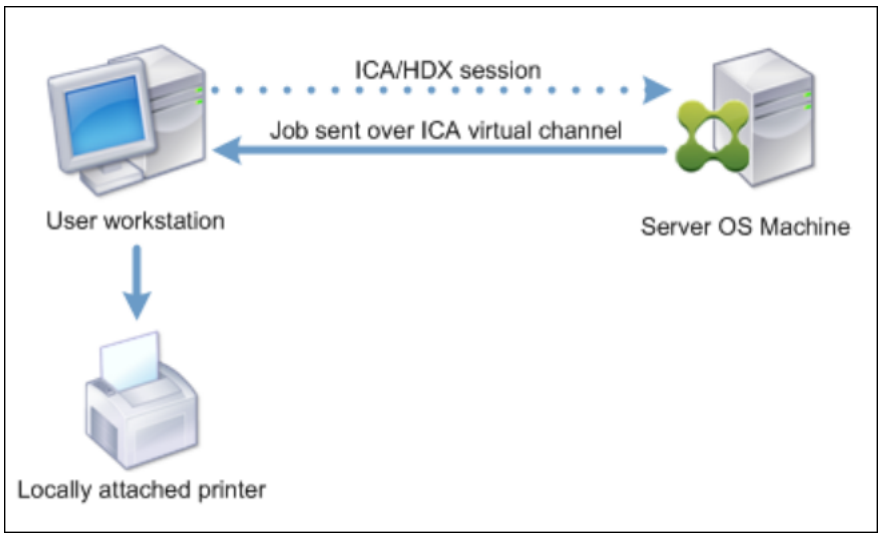
> **Note:**
>
> Setting PDF at the beginning of the **Universal driver preference** list gives it priority over PS, EMF, and XPS for auto-created printers.
> For additional details, please refer to the Universal Driver Preference page.

Configuration

May 13, 2026

Choosing the most appropriate printing configuration options for your needs and environment can simplify administration.

The options you can choose from are:



- Citrix Universal™ Print Servers
- Client Printer Redirection
- Network Printers

Client printer redirection

May 13, 2026

This is often the default mechanism, where printers configured on the user's endpoint device are automatically mapped into the Citrix® session when the user logs on. This includes printers directly attached to the client (USB, LPT, etc.) as well as network printers that are mapped on the client machine. End users typically cannot manually select which local printers get redirected; this is controlled by administrative policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Steps to setup

This functionality is enabled by default. Related settings and configurations can be found in the "Client Printers"template. The policy settings in this template can be used to further customize and optimize the client print redirection experience.

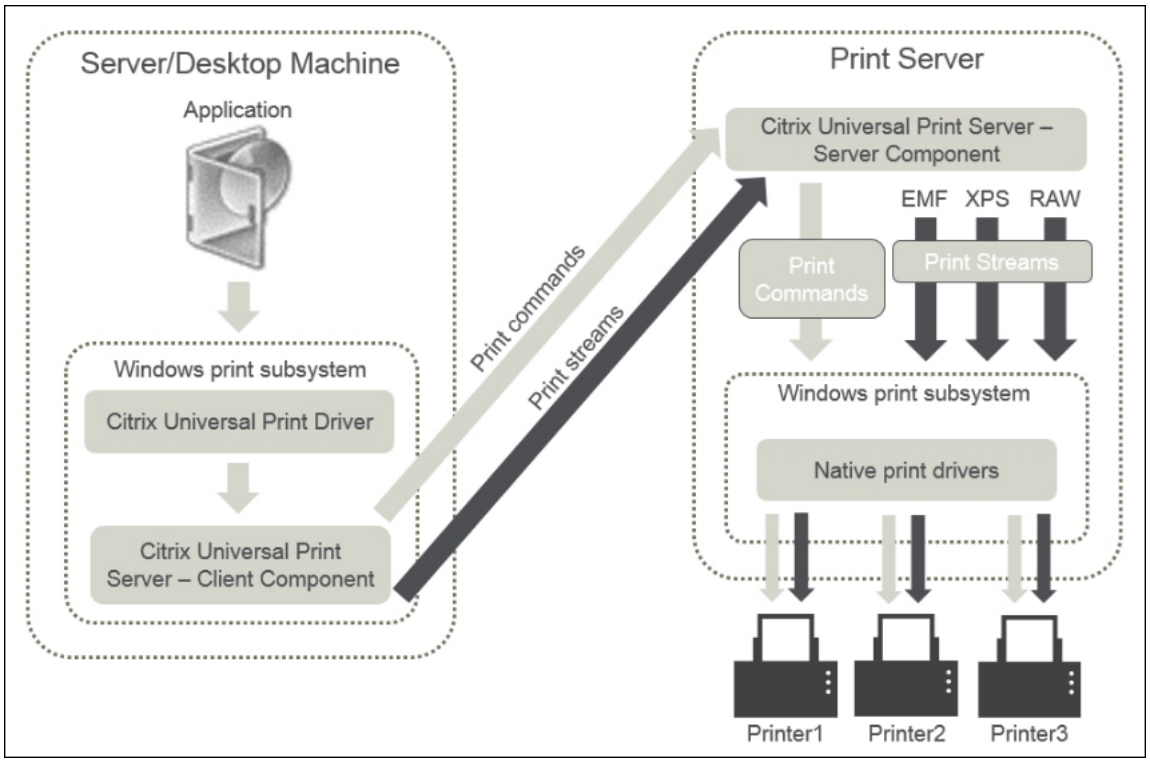
Policies associated with client printer redirection can be found Client printers policy settings.

Considerations

The primary challenge is the potential for performance degradation and instability if a large number of printers are mapped on the client endpoint and redirected. Additionally, printer mapping failures can occur due to driver incompatibilities or client-side issues. The reliability depends heavily on the configuration and health of the client device. Some administrators prefer to avoid autocreation of client printers altogether due to the potential load and driver management complexities.

Use Case

Users needing access to printers directly connected to their local machine (USB, LPT, COM, network printers mapped only on the client).



Citrix Universal™ Print Server (UPS)

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UPS is an optional Citrix® component designed to optimize and manage network printing. It consists of two parts:

- **UPServer** component is installed on one or more Windows Print Servers in the network.
- **UPClient** component, which is part of the VDA installation. When enabled via policy, VDAs communicate with the UPServer to establish connections to network printers, typically leveraging the Citrix Universal Print Driver (UPD).

UPS offers several advantages, particularly for network printing across WAN links or in large environments:

- Network Optimization: Print data sent between the VDA and UPServer is optimized and compressed, reducing bandwidth consumption, especially important over WAN connections.
- Centralized Driver Management: Allows leveraging the Citrix UPD for network printers, reducing the need to install and manage numerous native printer drivers on the VDAs.
- High Availability: Supports load balancing across multiple UPServers and automatic failover if a server becomes unavailable.

Requirements

- Microsoft Visual C++ 2015–2022 Redistributable
- Microsoft .NET Framework 4.8 (minimum)
- OS requirement for UPServer

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Windows Server 2025
- Windows Server 2022
- Windows Server 2019

Configuration/ Steps to setup

This functionality is disabled by default. Related settings and configurations can be found in the "Universal Print Server"template. The policy settings in this template can be used to further customize and optimize the Universal Print server experience.

Beyond the enable setting, several policy settings fine-tune UPS behavior:

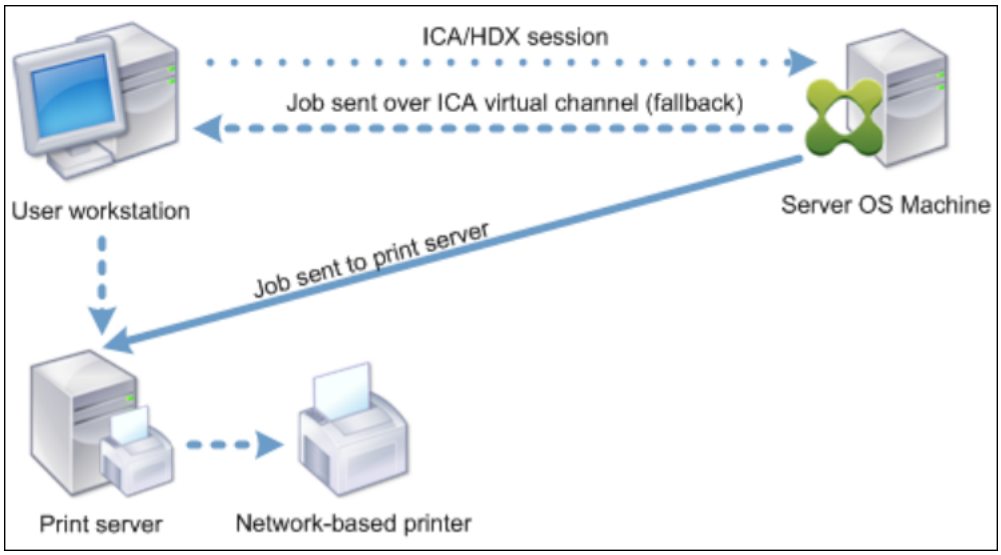
- Port configuration for communication (HTTP/SOAP, CGP, and their SSL/TLS equivalents).
- Input bandwidth limits for print streams.
- List of UPServers for load balancing.
  Out-of-service threshold for failover detection.
- Web service connection timeouts.
- SSL/TLS configuration settings for secure communication.

For more information, see Citrix UPS policy settings.

Best practices

- Use UPS for network printing across WAN links to optimize performance.
- Utilize the Citrix Universal Print Driver (UPD) to reduce driver management on VDAs.
- Configure load balancing across multiple UPServers for high availability.

Use cases



Citrix explicitly recommends UPS for remote print server scenarios involving WAN links.It's also ideal for environments seeking to minimize VDA driver footprint, improve network printing performance, provide high availability for network printing, or implement proximity printing based on network location. Thin clients that cannot directly connect to network printers can leverage UPS via the VDA.

Network Printers (on the VDA)

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Here, the print job is sent directly from the VDA across the network to a network print server (either a standard Windows Print Server or a Citrix Universal™ Print Server). This pathway is generally faster for printers located on the same Local Area Network (LAN) as the VDA. This is the default pathway for network printers when direct connections are enabled. Print jobs fall back to being routed over the ICA connection if the published application or desktop cannot access the print server or if the native printer driver is not installed on the multi-session OS machine.

Requirements

- The necessary printer driver depends on the type of print server hosting the network printer:
  - If the printer is hosted on a standard Windows Print Server, the corresponding native printer driver must be installed on the VDA.
  - If the printer is hosted on a Citrix Universal Print Server (UPS), the connection can use either the native driver or the Citrix UPD.
- Network connectivity from the VDA to the print server.
- Appropriate permissions for the logged in user.

Guidance on connecting and configuring network printers (Policy settings)

- Connect printers via UNC paths (ex. "\PrintServer\PrinterName")
- **Session printers:** The primary policy for this method. Administrators add printers by typing the UNC path or browsing the network. Filters can be applied to the policy to target specific users, groups, client IPs, etc.
- **Printer assignments:** An alternative policy, useful for assigning a large group of printers to multiple users or devices simultaneously. It allows setting both the session printers and the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

default printer for those assignments.

Best practices (Allow direct connections to N/W printers)

- Consider the "Direct connections to network printers"policy for routing (direct VDA-to-server or via client/ICA).
    - When enabled (default setting), printing performance will be optimal over LAN. The print traffic in this scenario is uncompressed.
    - Disable this policy setting if the VDA and the print server are not in the same network (WAN scenario). This would force the print traffic to flow through the client endpoint and leverage ICA® compression but will introduce latency.

Enabling direct connections favors LAN performance but uses uncompressed network traffic between the VDA and print server. Disabling it forces traffic through the client pathway, leveraging ICA compression, which is beneficial for WAN scenarios but adds latency.

Use case

Accessing shared departmental or office printers directly from the virtual session. Requires native drivers to be installed on the VDA.

Limitations

Printing performance will be poor in adverse network conditions (WAN). Additionally, driver management is a huge overhead for IT admins.

Troubleshooting

May 13, 2026

Systematic Approach

Troubleshooting printing problems in a complex Citrix Virtual Apps and Desktops™ (CVAD) environment requires a methodical approach rather than random guessing. A recommended process involves:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. **Identify Symptoms:** Clearly define the problem (e.g., printer not appearing, job stuck, wrong output, slow printing).
2. **Isolate Scope:** Determine who is affected (one user, multiple users, specific application), which printers are involved, and from which VDAs or client devices the issue occurs.
3. **Check Basics:** Verify network connectivity (VDA to print server, client to VDA), ensure the printer is online and functional outside Citrix®, check local printing from the client (for redirection issues).
4. **Review Policies:** Examine relevant Citrix policy settings applied to the affected user/session using tools like Citrix Group Policy Modeling wizard or by checking applied policy settings on the VDA. Ensure policy settings are configured as intended and that there are no obvious conflicts.
5. **Examine Logs:** Check Windows Event Logs (Application and System logs, PrintService logs) on the VDA, client device, and print server (if applicable). Check Citrix-specific logs if enabled.3
6. **Test Components:** Attempt to isolate the issue to a specific component –try printing from a different application, try a different printer, test with a generic driver (like UPD or Microsoft XPS Document Writer), check the status of the Print Spooler and Citrix Print Manager services.
7. **Consult Resources:** Leverage product documentation, support articles, and community forums for known issues and solutions.

Common Issues and Solutions

Some of the common printing issues reported in the field and recommended troubleshooting steps are documented below:

- **Failure to Auto-Create Printers / Printers Not Appearing in Session:**
  - **Potential Causes:** Client printer redirection policy disabled; Auto-create client printers policy set to 'None' or incorrectly filtered; Client device print spooler issue; Workspace app problem; Network connectivity issue between client and VDA; Citrix Print Manager Service (CpSvc.exe) not running or crashed on VDA; Required printer driver missing on VDA (if native driver needed); Citrix policy not applying correctly to the session.
  - **Troubleshooting Steps:**
    1. Verify Client printer redirection policy is 'Allowed' and Auto-create client printers is configured correctly for the user/session.
    2. Check CpSvc.exe service status on VDA; restart if necessary.
    3. Check Windows Print Spooler service status on both VDA and client; restart if necessary.
    4. Verify basic network connectivity.
    5. Test printing locally on the client device.
    6. Ensure a compatible Workspace app version is installed.
    7. Check VDA event logs for errors related to CpSvc or printer creation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. Force policy update on VDA (gpupdate /force).
9. Check applied policies on VDA to confirm expected settings are present.
10. If native drivers are expected, verify they are installed on the VDA.
11. Check RDS/Terminal Server printer redirection settings in local/group policy on VDA.
12. Look for and clean up orphaned printer entries in the VDA registry.

- **Print Spooler Crashes / Service Unresponsive (on VDA or Print Server):**
  - **Potential Causes:** Faulty or incompatible printer driver (often third-party); Corrupted print job in the queue; Driver conflicts; Insufficient system resources.
  - **Troubleshooting Steps:**
    1. Identify the faulting process/module using Windows Event Logs (Application log often shows spooler crashes).
    2. Attempt to restart the Print Spooler service.
    3. If restarting fails or the issue repeats, try to clear the print queue manually (Stop Spooler service, delete files in C:\Windows\System32\spool\PRINTERS, Start Spooler service).
    4. Identify and remove the problematic printer driver. Clean removal may require registry edits.
    5. Test with the Citrix UPD or a generic Microsoft driver.
    6. Check for and clean up orphaned print processors in the registry.
- **Policy Conflicts / Settings Ignored:**
  - **Potential Causes:** GPO settings overriding Citrix policies; Conflicting Citrix policy priorities or filters; Errors during policy processing.
  - **Troubleshooting Steps:**
    1. Use Citrix Group Policy Modeling wizard to simulate policy application for the affected user/VDA.
    2. Verify policy filters (user groups, client IPs, etc.) are correct.
    3. Check policy priorities in Studio/Web Studio.
    4. Temporarily block GPO inheritance on the VDA's OU to isolate Citrix policy issues.
    5. Examine policy processing results on the VDA (e.g., using gpresult /h report.html).
    6. Simplify the policy set applied to the user/VDA and add policies back incrementally to find the conflict.
- **Driver Issues (General - Compatibility, Corruption, Mapping):**
  - **Potential Causes:** Driver not compatible with VDA OS or Citrix version; Corrupted driver installation; Driver required by policy is missing on VDA; Conflict between multiple drivers; Incorrect configuration of Printer driver mapping policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Troubleshooting Steps:**
  1. Try printing with Citrix UPD (configure Universal print driver usage policy).
  2. Verify the correct driver (native or UPD) is being selected based on applied policies.
  3. Ensure required native drivers are installed correctly on the VDA (if used).
  4. Check vendor documentation for driver compatibility with CVAD and the VDA OS version.
  5. Perform a clean reinstall of the problematic driver (uninstall, reboot, install).
  6. Review and test Printer driver mapping policy rules carefully.
  7. Minimize the number of installed drivers on the VDA.

- **Slow Printing / Performance Issues:**
  - **Potential Causes:** Network congestion or high latency (especially WAN); Large, complex print jobs (e.g., high-resolution graphics); Inefficient printer driver; Print optimizations (compression, caching) disabled or misconfigured; Inefficient routing (e.g., direct connection over slow WAN).
  - **Troubleshooting Steps:**
    1. Analyze network path and performance between VDA, client, and print server.
    2. Configure Citrix bandwidth limiting policies for printing.
    3. Enable and configure UPD optimizations (image compression, font/image caching) via Universal Printing policies.
    4. For WAN links, disable Direct connections to print servers policy to force traffic over compressed ICA® channel.
    5. If using UPS, ensure it's optimally configured for the network.
    6. Analyze the print job itself –reduce resolution or complexity if possible.
    7. Test with a different driver (e.g., UPD vs. native).

- **Incorrect Output (Missing Characters, Formatting Errors, Wrong Orientation):**
  - **Potential Causes:** Missing fonts on VDA required by the document/application; Incorrect font substitution; Printer driver incompatibility; Issue with specific UPD format (e.g., EMF vs. XPS); Application bug; Conflict with advanced printing features enabled on the local client printer.
  - **Troubleshooting Steps:**
    1. Ensure all necessary fonts are installed on the VDA.
    2. Try changing the Universal driver preference policy order (e.g., try XPS before EMF).
    3. Test printing the same document from a different application.
    4. Test printing to a different physical printer or a virtual printer (e.g., Microsoft XPS Document Writer).
    5. Try using a different printer driver (UPD vs. native, or different native version).
    6. Check the application's print settings and page setup.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Disable "Advanced Printing Features"in the local printer properties on the client device.
8. Verify print orientation settings in user preferences and policies.

- **Citrix Print Manager Service (CpSvc.exe) Crashes/Hangs:**
  - **Potential Causes:** Unresponsive printer drivers leaving orphaned objects in the registry; Corrupted Citrix policy data related to printing; System resource contention.
  - **Troubleshooting Steps:**
    1. Follow steps to clean orphaned printer and print processor entries from the VDA registry. Requires stopping Print Spooler and CpSvc services first.
    2. Identify and remove the offending printer driver(s).
    3. Consider cleaning the Citrix policy cache folders/registry keys on the VDA and forcing a policy refresh.
    4. Monitor VDA resource usage (CPU, Memory).
    5. Restart CpSvc and Print Spooler services.
- **PDF Printer Issues:**
  - **Potential Causes:** Auto-create PDF Universal Printer policy disabled; Incompatible VDA or Workspace app version; No PDF viewer installed on the client endpoint; Unsupported browser used (e.g., Edge) or HTML5 configuration error (CSP headers, config.js).
  - **Troubleshooting Steps:**
    1. Verify the Auto-create PDF Universal Printer policy is enabled and applied.
    2. Confirm VDA and Workspace app meet minimum version requirements.
    3. Ensure a supported PDF viewer (e.g., Adobe Reader, Chrome) is installed and set as default on the client.
    4. If using HTML5 Workspace app, verify browser compatibility and check configuration.js and CSP header settings.
    5. Restart the Citrix session after policy changes.

Basic End user troubleshooting

If permitted by organizational policy, users experiencing simple printing issues can sometimes resolve them with basic steps before escalating to IT -

- Log off completely from the HDX™ session and log back in.
- Check the status of the local printer on the endpoint device (ensure it's online, not paused, no errors).
- Restart the local endpoint device.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

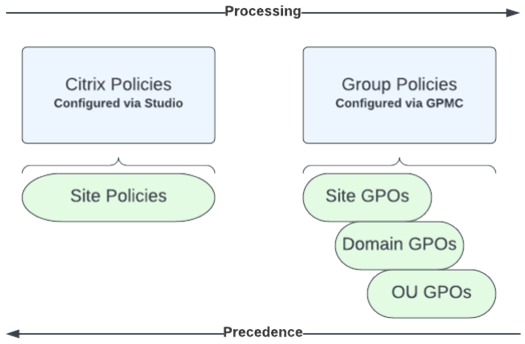
Best practices

May 13, 2026

- **Utilize Universal Print Server (UPS):** Recommended, especially for network printing across WANs, due to optimization and centralized management benefits.
- **Employ Universal Print Driver (UPD):** Use UPD as the primary driver strategy to minimize driver count and conflicts.
- **Use Vetted Native Drivers Selectively:** If native drivers are required for specific printer features, ensure they are thoroughly tested.
- **Minimize Driver Footprint:** Install the fewest possible number of printer drivers on VDA images.
- **Leverage Driver Mapping:** Use the Printer driver mapping and compatibility policy to substitute problematic drivers or enforce UPD usage.
- **Test Rigorously:** Never deploy untested drivers into production.
- **Manage Driver Updates Carefully:** Avoid in-place updates; prefer a clean uninstall, reboot, and reinstall process.
- **Clean Up Unused Drivers:** Regularly remove drivers that are no longer needed.
- **Optimize Routing:** Ensure print jobs take the most efficient path (e.g., direct VDA-to-print server on LAN via Direct connections to print servers enabled; route via ICA/client for WAN by disabling direct connections).
- **Consider Distributed Print Servers:** For large, geographically dispersed organizations without UPS, placing print servers at each physical location can aid management and load distribution (though UPS with load balancing offers a more integrated Citrix® solution).
- **Purge Old Print Jobs:** Periodically clear stuck or old jobs from print queues.

Design Considerations

- **Tailor Provisioning:** Choose provisioning methods (Autocreation, Session Printers, UPS, PDF Printer) based on user requirements (e.g., roaming users benefit from proximity printing or PDF printing; static workstations might use Session Printers).
- **Plan Routing:** Design print job routing based on the network locations of endpoints, VDAs, and print servers.
- **Ensure Redundancy:** Implement print server redundancy, particularly when using UPS, via load balancing policies.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policies

May 13, 2026

Policies are a collection of settings that define how sessions, bandwidth, and security are managed for a group of users, devices, or connection types.

You can apply policy settings to physical and virtual machines or to users. You can apply settings to individual users at the local level or in security groups in an Active Directory. The configurations define specific criteria and rules. If you don't specifically assign the policies, the settings are applied to all connections.

You can apply policies on different levels of the network. Policy settings placed at the Organizational Unit GPO level take the highest precedence on the network. Policies at the Domain GPO level override policies on the Site Group Policy Object level. The Site Group Policy Object level overrides any conflicting policies on both the Microsoft and Citrix Local Policies levels.

All Citrix Local Policies are created and managed in the Web Studio console and stored in the Site Database. Group Policies are created and managed by using the Microsoft Group Policy Management Console (GPMC) and stored in the Active Directory. Microsoft Local Policies are created in the Windows Operating System and are stored in the registry.

Studio uses a Modeling Wizard to help administrators compare configuration settings within templates and policies to help eliminate conflicting and redundant settings. Administrators can set GPOs using the GPMC to configure settings. Also, apply them to a target set of users at different levels of the network.

These GPOs are saved in the Active Directory. Access to the management of these settings is restricted for most of the IT personnel for security.

Settings are merged according to priority and their condition. Any disabled setting overrides a lower-ranked enabled setting. Unconfigured policy settings are ignored and don't override lower-ranked settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Local policies can also have conflicts with group policies in the Active Directory, which might override each other depending on the situation.

All policies are processed in the following order:

1. The end user logs on to a machine using domain credentials.
2. Credentials are sent to the domain controller.
3. Active Directory applies all policies (end user, endpoint, organizational unit, and domain).
4. The end user logs on to Citrix Workspace™ app and accesses an application or desktop.
5. Citrix and Microsoft policies are processed for the end user and machine hosting the resource.
6. Active Directory determines precedence for policy settings. It then applies them to the registries of the endpoint device and to the machine hosting the resource.
7. The end user logs off from the resource. Citrix policies for the end user and endpoint device are no longer active.
8. The end user logs off the user device, which releases the GPO user policies.
9. The end user turns off the device, which releases the GPO machine policies.

When creating policies for groups of users, devices, and machines, some members might have different requirements and would need exceptions to some policy settings. Exceptions are made by way of filters in the Studio and the GPMC that determine who or what the policy affects.

> **Note:**
>
> We do not support mixing Windows and Citrix policies in the same GPO.

Overview

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix® Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Policies are a collection of settings that define how sessions, bandwidth, and security are managed for a group of users, devices, or connection types. Citrix® policies provide an efficient way to manage these aspects centrally. Each policy can include multiple settings and filters (object assignments) tailored to your environment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Tools for managing policies

- Web Studio

  Policies that are created using Web Studio are stored in the site database, and the updates are pushed to the VDA when either of the following happens:

  - When that VDA registers with the broker
  - When a user launches a session

- Group Policy Management Console (GPMC)

  If your network environment uses Active Directory and you have permission to manage group policy, you can use the GPMC to create and edit policies.

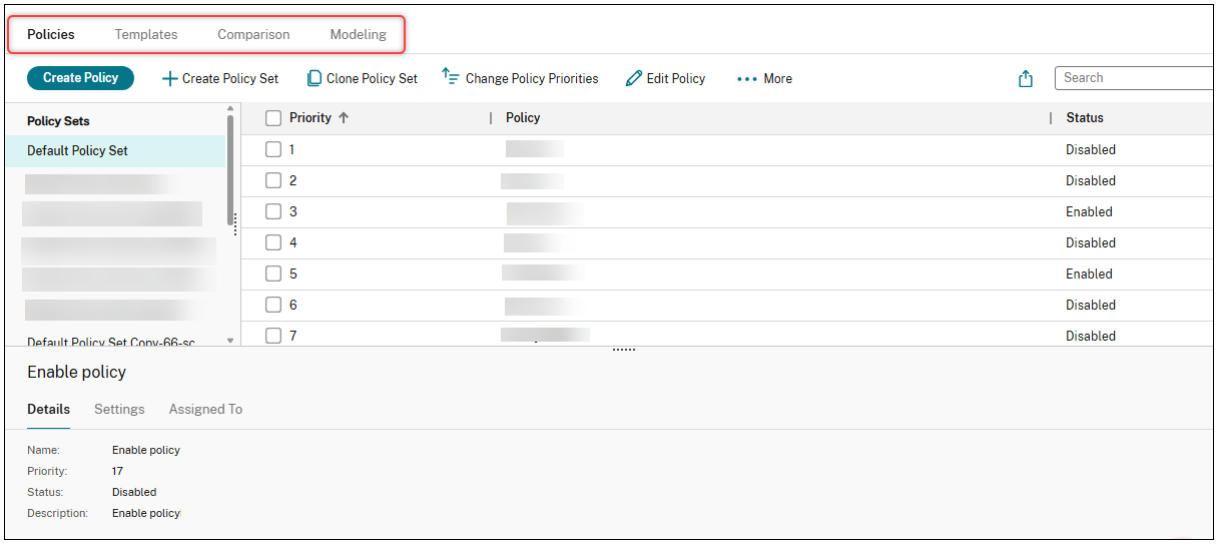
  In GPMC, you can configure Group Policy Objects (GPOs) with the settings and filters you need. These policies take priority over policies configured in Web Studio. For more information, see CTX238166.

Policy processing order

Group policy settings are processed in the following order:

1. Site-level GPO (stored in the site database)
2. Domain-level GPOs
3. Organizational Units (OU) GPOs

If different settings are applied for the same policy in two GPOs, the policy settings processed last overwrite the settings processed earlier. This configuration means that policy settings take precedence in the following order:



1. OU GPOs (highest priority)
2. Domain-level GPOs
3. Site-level GPOs (lowest priority)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you're using multiple policies with conflicting settings, you can control precedence by assigning policy priorities. For more information, see Manage policy assignment exceptions.

Learn about the Web Studio > Policies interface

To access policies, settings, or templates, sign in to Web Studio and then select **Policies** in the left pane.

- The **Policies** tab lets you create and manage policy sets and policies. When you select a policy from a policy set, the following tabs appear:
  - **Overview** –Displays the policy name, priority, status, and description.
  - **Settings** –Lists all configured settings.
  - **Assigned To** –Shows assigned delivery groups. You can edit or remove assignments. Policies are applied based on the delivery group of the desktop running the session. For details, see Create policies.
- The **Templates** tab lets you create policy templates and manage Citrix-provided and custom templates. When you select a template, the following tabs appear:
  - **Description** –Explains the purpose of the template.
  - **Settings** –Lists the configured settings. For details, see Create templates.
- The **Comparison** tab lets you compare settings in a policy or template with others. Use this feature to check for compliance or differences. For details, see Compare policies and templates.
- The **Modeling** tab lets you simulate connection scenarios and view effective policy results. For details, see Simulate and evaluate policies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy configuration workflow

To configure Citrix policies using Web Studio, follow this workflow:

1. Create the policy.
   a) Configure policy settings.
      Add and configure the settings required for your environment.
   b) Assign the policy.
      Assign the policy to the appropriate machine and user objects.
2. Set policy priority.
   Arrange policies in priority order to determine which settings take precedence.
3. Verify the effective policy.
   Use the Policy Modeling wizard to confirm the applied settings.

Create templates

June 4, 2026

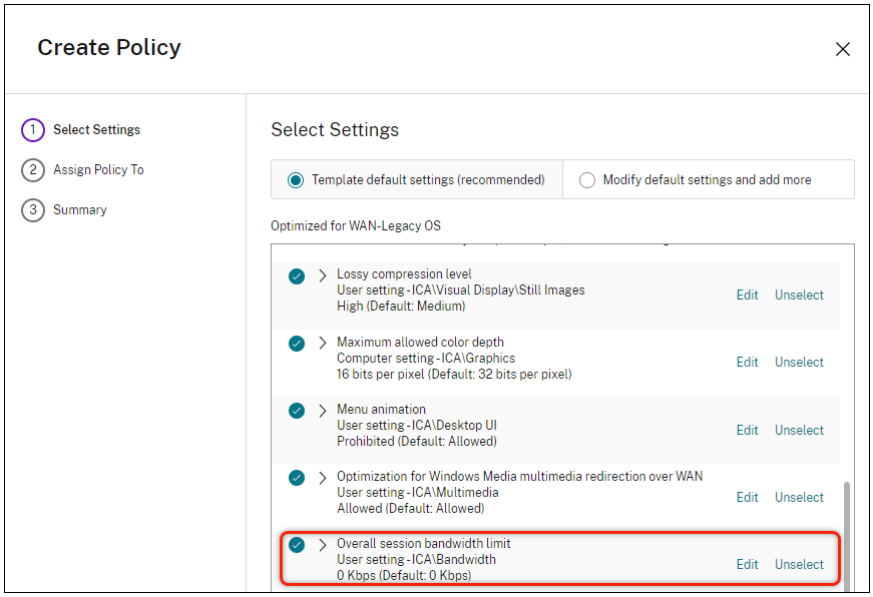
> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Templates provide a predefined starting point for creating policies. We offer built-in templates optimized for specific environments and network conditions. You can use these templates to:

- Create your own policies and templates to share across sites.
- Reference during comparisons across deployments. For example, "…when using the Citrix template X or Y…".
- Communicate policy configurations with Citrix Support or trusted third parties by importing or exporting templates.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Built-in templates



The following built-in templates are available:

- **Very High Definition User Experience**. This template enforces default settings that maximize the user experience. Use this template in scenarios where multiple policies are processed in order of precedence.
- **High Server Scalability**. Apply this template to economize on server resources. This template balances user experience and server scalability. It offers a good user experience while increasing the number of users that you can host on a single server. This template does not use a video codec for compression of graphics and prevents server-side multimedia rendering.
- **High Server Scalability-Legacy OS**. This High Server Scalability template applies only to VDAs running Windows Server 2008 R2 or Windows 7 and earlier. This template relies on the Legacy graphics mode, which is more efficient for those operating systems.
- **Optimized for NetScaler SD-WAN.** Apply this template for users working from branch offices with NetScaler SD-WAN for optimizing delivery of Citrix Virtual Desktops. (NetScaler SD-WAN is the new name for CloudBridge).
- **Optimized for WAN**. This template intends for task workers in branch offices who uses shared WAN or remote locations with low bandwidth connections. The workers access applications with graphically simple user interfaces and little multimedia content. This template trades off video playback experience and some server scalability for optimized bandwidth efficiency.
- **Optimized for WAN-Legacy OS**. This template applies only to VDAs running Windows Server 2008 R2 or Windows 7 and earlier. This template relies on the Legacy graphics mode, which is more efficient for those operating systems.
- **Security and Control**. Use this template in environments with low tolerance to risk, to minimize the features enabled by default in Citrix Virtual Apps and Desktops™. This template includes settings that disable access to the following:
  - Printing
  - Clipboard
  - Peripheral devices
  - Drive mapping
  - Port redirection
  - Flash acceleration on user devices

  Applying this template might use more bandwidth and reduce user density per server.

While we recommend using the default settings in built-in templates, some settings, such as **Overall session bandwidth limit** in the **WAN templates**, are left unconfigured to allow administrators to make deployment-specific adjustments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Consider that you are working with a deployment (policy management and VDAs) earlier than XenApp and XenDesktop 7.6 FP3. Also, require High Server Scalability and Optimized for WAN templates. In this case, use the Legacy OS versions of these templates when they apply.

> **Note:**
>
> We create and update built-in templates. You cannot modify or delete these templates.

Create templates

To create a template from a template:

1. In Web Studio, select **Policies** in the left pane.
2. Select the **Templates** tab and then select the template from which you create the template.
3. Select the **Create Template** tab. The **Select Settings** screen appears.
4. Select and configure the policy settings to include in the template.
5. Click **Next**. The **Summary** screen appears.
6. Enter a name for the template.
7. Click **Finish**. The new template appears on the **Templates** tab

To create a template based on a policy:

1. In Web Studio, select **Policies** in the left pane.
2. On the **Policies** tab, select the policy from which you create the template.
3. Click **More** tab.
4. Select **Save as Template**. The **Select Settings** screen appears.
5. Select and configure any new policy settings to include in the template.
6. Click **Next**. The **Summary** screen appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Enter a name and description for the template, and then click **Finish**.

Create policies

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

A policy defines two parts:

- A group of settings that define how sessions, bandwidth, and security are managed for a group of users, devices, or connection types.
- Users and machines to assign the policy to. Before creating a policy, decide which group of users or devices it affects. You might want to create a policy based on job function, connection type, device platform, or geographic location.

When you create a policy, you can base it on settings from a policy templateand customize them as needed. You can also start from scratch and manually add the necessary settings. This section covers the following topics:

- How policies work
- Create policies from scratch
- Create policies from templates

> **Tip**
>
> If a policy exists for a group, consider editing it rather than creating a one. Avoid creating policies solely to enable a specific setting or exclude specific users.

How policies work

When a user logs on, all policies that match the assignments for the connection are identified. Those policies are ranked by priority and multiple instances of any setting are compared. For each setting, the value from the highest-priority policy is applied. If a higher-priority policy disables a setting, that setting overrides any lower-priority policy where it's enabled. Settings that aren't configured are ignored.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> If you're configuring both Active Directory and Citrix policies using the Group Policy Management Console, assignments and settings might not apply as expected. For more information, see CTX127461.

The Unfiltered policy

We provide a default policy called **Unfiltered**.

- When you manage Citrix® policies in Web Studio, settings in the Unfiltered policy apply to all servers, desktops, and connections in the Site.
- For the settings to apply, the Site and connections must fall within the scope of the GPO containing the policy.

  Example: A GPO named **Sales-US** is linked to the **Sales** OU and includes all US sales team members. This GPO is configured with an **Unfiltered** policy with several user settings. When a sales manager logs on, the **Unfiltered** policy settings are applied because the user is in the **Sales-US** GPO.

Assignment modes

Assignment mode controls whether a policy applies based on how the connection criteria match.

- **Allow** (default): Applies the policy only if the connection matches the assignment criteria.
- **Deny**: Applies the policy if the connection doesn't match the criteria.

Example 1: Same assignment type, different modes

Policy 1 includes:

- Assignment A: Sales group, mode = Allow
- Assignment B: Sales manager's account, mode = Deny

Although the user is in the Sales group, the Deny assignment takes precedence. The policy doesn't apply when the sales manager logs on.

Example 2: Different assignment types, same mode

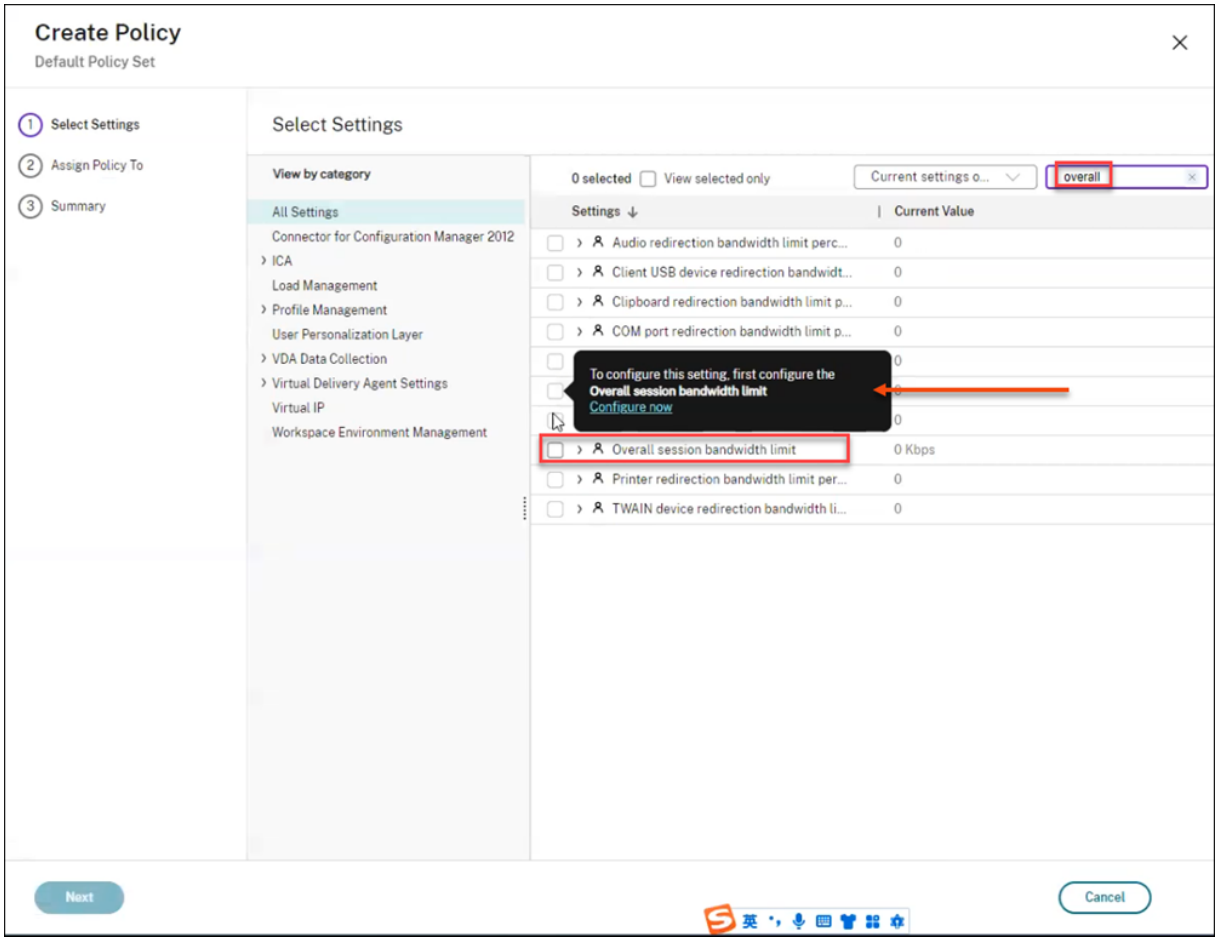
Policy 2 includes:

- Assignment C: Sales group (User), mode = Allow
- Assignment D: Corporate IP range (Client IP), mode = Allow

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The policy applies only when both assignments are satisfied. If the sales manager logs on from the office, both conditions are met, and the policy applies.

Policy 3 includes:



- Assignment E: Sales group (User), mode = Allow
- Assignment F: NetScaler Gateway connection (Access Control), mode = Allow

If the sales manager logs on from the office (not through NetScaler), Assignment F isn't satisfied, so the policy doesn't apply.

Policy settings: Parent-child relationships

Some policy settings depend on parent settings. For example, you must configure **Overall session bandwidth limit** before its child settings become available.

When configuring policies in Web Studio, hover over a child setting to see which parent must be configured first. If a parent is disabled, related child settings are automatically disabled.

The following table lists parent settings and their corresponding child settings:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

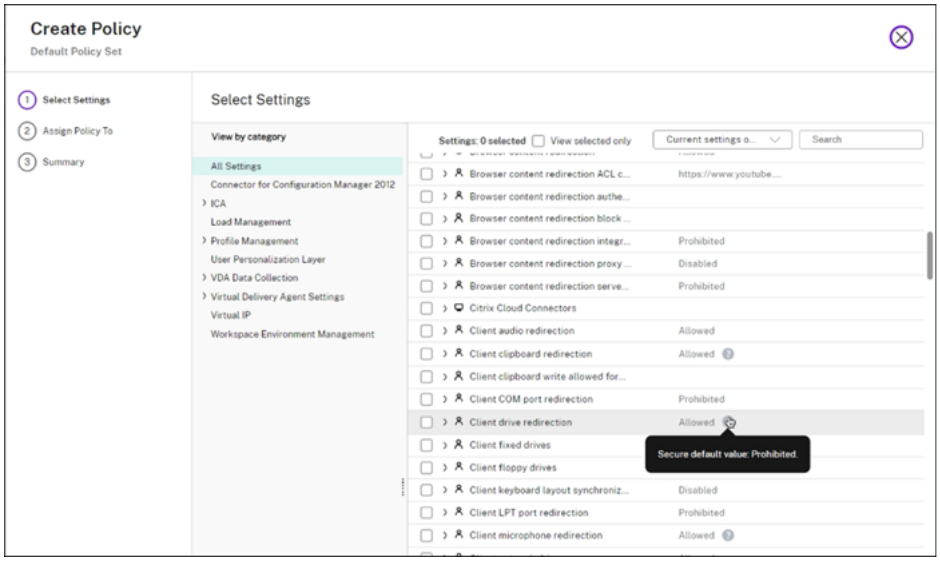
Parent policy	Dependent Child policies
Overall session bandwidth limit	Audio redirection bandwidth limit percent
	Clipboard redirection bandwidth limit percent
	COM port redirection bandwidth limit percent
	File redirection bandwidth limit percent
	HDX™ MediaStream Multimedia Acceleration bandwidth limit percent
	LPT port redirection bandwidth limit percent
	Printer redirection bandwidth limit percent
	Client USB device redirection bandwidth limit percent
	TWAIN device redirection bandwidth limit percent
Allow bidirectional content redirection	Allowed URLs to be redirected to Client
	Allowed URLs to be redirected to VDA
CPU usage	CPU usage excluded process priority
Legacy graphics mode	Progressive compression level
Enable session watermark	Watermark custom text
	Session watermark style
	Watermark transparency
HDX adaptive transport	Loss tolerant mode for audio

Policy setting states

Some policy settings can have one of the following states:

- **Allowed** or **Prohibited**: Allows or prevents the action controlled by the setting. Sometimes users are allowed or prevented from managing the setting's action in a session. For example, if the menu animation is set to Allowed, users can control it within their session.
- **Enabled** or **Disabled**: turns the setting on or off. If a setting is disabled in a higher-priority policy, it's not applied—even if enabled in a lower-priority policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Secure default settings

If the secure default setting is enabled during VDA installation, the priority of the policy settings is as follows:

1. Customized setting
2. Secure default setting
3. Default setting

To view the secure default value:

1. In Web Studio, click **Policies** in the left pane.
2. On the **Policies** tab, click **Create Policy**.
3. In the **Select Settings** table, when you hover-over the settings that have **Allowed** as their current value, the **Secure default value: Prohibited** is shown.

Policy setting effectiveness

Some settings must be used and enabled together. For example, to allow users to access network drives on their local device:

- **Client drive redirection** must be enabled
- **Client network drives** must also be included

If **Client drive redirection** is disabled, users can't access network drives even if **Client network drives** is enabled.

In general, changes to machine-related settings take effect when the VDA restarts or a user logs on. Changes to user-related settings apply at the next logon.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When adding a setting to a policy, you can select Use the default value to prevent changes. This option disables manual configuration and applies the default value only, regardless of previously entered values.

Best practices

- Assign policies to groups rather than individual users. If you assign policies to groups, assignments are updated automatically when you add or remove users from the group.
- Disable unused policies. Policies with no settings added incur unnecessary processing overhead.

Create policies from scratch

To create a policy:

1. In Web Studio, click **Policies** in the left pane.
2. On the **Policies** tab, click **Create Policy**.
3. On the **Select Settings** page, select and configure settings and then click **Next**.
4. On the **Assign Policy to** page, select the policy set where this policy resides, and then select the objects to assign the policy to. Click **Next**.
5. On the **Summary** page, complete the following settings:

    a) Enter a name and description for the policy.
    b) To enable the policy, select **Enable policy**.

6. Click **Finish**.

Step 1: Select and configure policy settings

Policy settings are grouped by function. For example, settings related to Profile Management are under the **Profile Management** category.

There are two types of settings:

- **Computer settings**: Apply to machines and take effect when the virtual desktop starts (even if no user is logged on). They define virtual desktop behaviors.
- **User settings**: Apply when a user connects or reconnects. They define the user experience.

To select and configure a setting:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. On the **Select Settings** page, to view settings by VDA versions, select one of the following options from the drop-down list option on the upper-right side:
   - **All settings**: View all settings for all VDA versions
   - **Current settings only**: View settings only for the current VDA versions
   - **Legacy settings only**: View settings only for deprecated VDA versions
2. To search for a setting, enter the complete or partial name of the setting in the search box.
3. Select a setting. Click **Enable** to turn it on or **Edit** to specify a value.
4. Repeat step 3 to select and configure more settings for the policy.

> **Note:**
>
> Policy settings can be Enabled, Disabled, or Not configured. By default, policy settings aren't configured, which means they aren't added to a policy. Settings are applied only when they're added to a policy.

Step 2: Specify policy assignments

Policy assignments define which users and machines a policy applies to. For information about how assignments affect policy behavior, see How policies work.

To specify policy assignments:

1. On the **Assign Policy To** page, select **Filtered users and computers**.
2. Select the users or computers by specifying assignments (also known as *filters*). Refer to the following table for available assignment types.

> **Note:**
>
> - If you do not specify any assignments or disable them, the policy applies to **all** connections.
> - Policy *assignments* are also known as policy *filters*. For more information, see Create, modify, or delete a filter for a policy and How do filters get applied?

Assignment type	Description
Access Control	Access control conditions through which a client is connecting: **Connection type**: Whether to apply the policy to connections made with or without NetScaler® Gateway. *NetScaler Gateway farm name* - Name of the NetScaler Gateway virtual server. *Access condition* - Name of the end point analysis policy or session policy to use. **NetScaler Gateway farm name**: Name of the NetScaler Gateway virtual server. *Access condition* - Name of the end point analysis policy or session policy to use. **Access condition**: Name of the end point

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix SD-WAN™	Whether a user session is launched through Citrix SD-WAN. **Note:** You can add only one Citrix SD-WAN assignment to a policy.
Client IP Address	IP address of the user device used to connect to the session: IPv4 examples: 12.0.0.0, 12.0.0.*, 12.0.0.1-12.0.0.70, 12.0.0.1/24; IPv6 examples: 2001:0db8:3c4d:0015:0:0:abcd:ef12, 2001:0db8:3c4d:0015::/54
Client Name	Name of the user device. Exact match: ClientABCName. Using wildcard: Client*Name.
Client Platform	OS type of the user device used to connect the session, such as Windows, Linux, iOS, Android, or HTML5. Required VDA version: 2503 or later.
Delivery Group	Delivery Group membership.
Delivery Group type	Type of desktop or application: private desktop, shared desktop, private application, or shared application.
Organizational Unit (OU)	Organizational unit.
Tag	Tags. **Note:** Apply this policy to all tagged machines. Application tags aren't included.
User or Group	User or group name. The supported identity types for users and groups include Active Directory, Microsoft Entra ID, Okta, and Google Cloud. Required VDA version: 2507 or later.

Create policies from templates

You can create a policy based on a Citrix-provided or custom template. The resulting policy is independent of the original template.

To create a policy from a template:

1. In Web Studio, select **Policies** in the left pane.
2. Select the **Templates** tab, and then select the template you want to use.
3. Click **Create Policy from Template** in the action bar. The **Create Policy** page appears, showing all settings preconfigured in the selected template.
4. Modify the settings and add more settings if needed, and then click **Next**.
5. On the **Assign Policy to** page, select the policy set where this policy resides, and then select the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

objects to assign the policy to. Click **Next**.

6. On the **Summary** page, enter a name and description for the policy.
7. Click **Finish**. The new policy appears in the specified policy set on the **Policies** tab.

Where to go next

- Prioritize policies
- Simulate and evaluate policies

Create policy sets

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Policy sets are objects in Citrix Virtual Apps and Desktops™ that aggregate policies to allow for simplified, role-based access, and easy management. Once created, scopes and delivery groups are assigned to policy sets so that only authorized administrators can manage the policies that apply to their relevant users and machines.

Policy sets help you manage Citrix® policies more efficiently by organizing them into logical groups. When you assign a policy set to a delivery group, the delivery group uses only the policies in that set.

This section explains how policy sets behave, how to create and assign them, and how they interact with scopes and filters.

Benefits

Policy sets offer several key benefits:

- Role-based access control for distributed administrator teams
- Simplified mergers, acquisitions, and consolidations
- Limited fault domain
- Multitenant support for policies

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following table compares how policies work with and without policy sets:

Without policy sets	With policy sets
All policies, settings, filters (assignments), and priorities are managed in one central location.	Each policy set has its own settings, filters (assignments), and priorities.
If you manage one policy, you must manage every policy.	Full administrators can delegate to lower-level admins the ability to manage a particular policy set on an individual basis.
Policies in large and distributed environments become complex and difficult to manage.	Policies in large and distributed environments can be divided and managed easily.

How it works

Policy sets are assigned to delivery groups and scoped to specific administrators. Policies within a set continue to use filters (assignments) to determine which users or machines they apply to.

Key behaviors:

- Policy sets are assigned to delivery groups
  - A delivery group can use only one policy set at a time.
  - A policy set can be assigned to multiple delivery groups.
  - If a delivery group doesn't have a policy set assigned, it uses **Default Policy Set**.
- Filters on policies still apply, regardless of whether the policy is in a set.
- A policy set can have one or multiple scopes.
  - A scope represents a collection of objects (for example, connections, catalogs, delivery groups, and application groups) that administrators can manage.
  - As administrators, you can define the scope of the policy set so that only authorized administrators can view or edit it. You can set scopes during policy set creation or when editing the set later.
- The **Default Policy Set** has **Bypass scope control for this resource** selected by default. This setting ensures that the policy set remains visible to all administrators. To apply scope control, edit the policy set, clear the **Bypass scope control for this resource** checkbox, and then select the desired scopes.

Policy filters and assignments work the same way as they do without policy sets. For more information, see How do filters get applied.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable policy sets

In Web Studio, go to **Settings > Site settings** and turn on the **Policy sets** setting.

> **Note:**
>
> - You must enable policy sets before creating a policy set.
> - When you enable policy sets, all existing policies are grouped into **Default Policy Set**. This set is automatically assigned to all delivery groups unless you assign a different set. After a new policy set is assigned to a delivery group, that group stops using the default policy set.

Create policy sets

You can create policy sets to mirror logical divisions in your administrator team and company. For example, you can create a policy set for each geographic region, business-unit, or for specific use case.

You can create policy sets in two ways:

- Create policy sets from scratch
- Create a policy set by copying an existing one

Alternatively, you can use the Citrix Virtual Apps and Desktops PowerShell SDK to create and manage policy sets.

Create policy sets from scratch

1. In Web Studio, select the **Policies** node in the left pane.
2. Click the **Policies** tab.
3. Select **Create Policy Set**.
4. Click the **Name and Description** tab, and enter the name and description for the policy set.
5. Click the **Assignments** tab, and select one or more delivery groups.
6. Click the **Scopes** tab, and select the scopes that define the objects that the policy set can apply to.
7. Click **Create** to finish.

Clone policy sets

1. In Web Studio, select the **Policies** node in the left pane.
2. Click the **Policies** tab.
3. Select **Clone Policy Set**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Update the name of the policy set.
5. Update or create assignments for the policy set and click **Next**.
6. Select or clear policies to include in the cloned policy set.
7. Update the scope of the policy.
8. Click **Create**.

Prioritize policies

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

When multiple policies apply to a connection, Citrix Virtual Apps and Desktops™ evaluates them in priority order. A lower number means a higher priority (1 is the highest). When conflicting settings exist across policies, the setting from the highest-priority policy takes effect.

You can change policy priority using Web Studio or PowerShell.

Change policy priority using Web Studio

1. In **Web Studio**, select **Policies** in the left pane.
2. On the **Policies** tab, select **Change Policy Priorities** from the action bar.
3. On the **Change Policy Priorities** page, reorder policies using any of the following methods:
   - Drag a policy to a desired position.
   - Click the **Up** or **Down** arrow icon to move it one position.
   - Click the **Top** or **Bottom** arrow icon to move it to the first or last position.
   - Click the **Edit** icon, enter a priority number, and then click **Save**.
4. Click **Save** to apply changes.

Change policy priority using PowerShell

Use the `Set-GpoPolicyPriority.ps1` script to programmatically reorder policy priorities. The script accepts a policy name and a target priority number, resolves policy GUIDs internally, and ap-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

plies the updated order using `Set-BrokerGpoPolicyPriorities`. Use this approach when you manage policy priorities through automation instead of the Web Studio console.

The native `Set-BrokerGpoPolicyPriorities` cmdlet requires a fully ordered list of policy GUIDs. This script removes that complexity by accepting a policy name and desired priority, then handling GUID resolution automatically.

Before you begin

Make sure you meet these requirements before you run the script:

- A supported version of Citrix Virtual Apps and Desktops with the Broker SDK installed
- The script must run on a Delivery Controller™ with the Citrix Broker SDK installed
- PowerShell snap-in: `Citrix.Broker.Admin.V2` (loaded automatically by the script)

Run the script

1. Copy `Set-GpoPolicyPriority.ps1` to the Delivery Controller.
2. Open a PowerShell session on the Delivery Controller.
3. Run the script with the required parameters.

```
.\Set-GpoPolicyPriority.ps1 -PolicyName "<PolicyName>" -
   NewPriority <Number>
```

   Replace <PolicyName> with the name of the policy and <Number> with the target priority.

The script outputs the current and target priority, confirms the change, and runs a verification step. Add `-Verbose` for a detailed view of the reorder before the script applies it.

Parameters

Parameter	Required	Description
`-PolicyName`	Yes	Name of the policy to reprioritize
`-NewPriority`	Yes	Target priority (1 = highest). Use 0 or a negative number to move the policy to the highest position; use a number exceeding the policy count to move it to the lowest position

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Required	Description
`-PolicySetGuid`	No	GUID of a specific policy set. Omit to target `DefaultSitePolicies`

Examples

Set a policy to the highest priority in the default policy set:

```
.\Set-GpoPolicyPriority.ps1 -PolicyName "MyPolicy" -NewPriority 1
```

Set a policy to the lowest priority:

```
.\Set-GpoPolicyPriority.ps1 -PolicyName "MyPolicy" -NewPriority 9999
```

Set a policy to priority 5 in a specific policy set:

```
.\Set-GpoPolicyPriority.ps1 -PolicyName "MyPolicy" -NewPriority 5 -
   PolicySetGuid "12345678-1234-1234-1234-123456789012"
```

Manage policy assignment exceptions

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

When you assign policies to groups of users, user devices, or machines using filters, some members of the group might need different settings. You can handle these cases without creating entirely separate policies for each individual.

You can make exceptions for certain users or machines within a group by:

- Creating a separate policy only for those group members and giving it higher priority
- Using the *Deny* mode for an assignment added to the policy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use Deny mode for exceptions

An assignment with the mode set to *Deny* means that the policy applies to connections that don't match the assignment criteria. For example, a policy includes the following assignments:

- *Assignment A*: Client IP address assignment range `208.77.88.*`, mode = *Allow*.
- *Assignment B*: Specific user account, mode = *Deny*.

This policy applies to users connecting from the specified IP range, **except** the user defined in *Assignment B*.

> **Note:**
>
> In the **Assign Policy** step, if you clear the **Enable** checkbox, the assignment is disabled. If a policy has no enabled assignments, it applies to all objects in the site.

Simulate and evaluate policies

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Use the comparison and Policy Modeling tools in Web Studio to verify your configurations, test policy behavior, and evaluate which settings apply before deploying them.

> **Note:**
>
> - The **Modeling** tab is available only if enabled by customer request.
> - Only enabled policies with filters are modeled. Disabled policies are never applied; enabled policies without filters are always applied.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Compare policies and templates

Use the comparison feature in Web Studio to view the differences between policies, templates, or default settings. This helps you verify configuration consistency, maintain compliance with best practices, and troubleshoot unexpected behavior.

You can:

- Compare the settings of a policy or template with another
- Compare settings against default values
- Identify conflicting or missing configurations across policies

To compare policies and templates:

1. In Web Studio, select **Policies** in the left pane.
2. Click the **Comparison** tab and then click **Select**.
3. Choose the policies or templates to compare.
4. (Optional) Select **Compare to default settings** to include defaults.
5. Click **Compare**. Settings appear in columns.
    - To see all settings, select **Show All Settings**.
    - To return to the default view, select **Show Common Settings**.

Run the Policy Modeling wizard

1. In Web Studio, select **Policies**.
2. Select the **Modeling** tab.
3. Select **Policy Modeling** in the action bar.
4. Read the **Introduction** page and click **Next**.
5. Select users or computers. You can also browse for containers or specific users or computers. Click **Next**.
6. Choose your filter evidence. Optionally, refine the simulation by specifying details such as **Delivery group**, **Tags**, and **Client IP address**. Click **Next**.
7. Review the summary and click **Run**.

View and manage modeling results

After the wizard runs, it generates a report you can review, act on, and export.

Review the report

- Use the drop-down menu to view **All settings**, **Computer settings**, or **User settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Search for specific settings.
- Click a setting to see why it was or was not applied.
- Export results in JSON or HTML format.

Manage the report

The following options are available in the action bar after a simulation runs:

Option	Description
View Modeling Report	Review or export the results.
Rerun Policy Modeling	Run again using the same criteria.
Delete Modeling Report	Remove the current report.

Evaluate policy application using Resultant Set of Policy

If a connection does not behave as expected, conflicting policies might be the cause. Higher-priority policies can override others. Use Resultant Set of Policy (RSoP) to evaluate which settings apply to a given connection.

Two RSoP methods are available:

- **Citrix Group Policy Modeling Wizard**

  Simulate a connection scenario by specifying users and assignment conditions.

- **Group Policy Results**

  Generate a report of Citrix policies applied to a user and Virtual Delivery Agent (VDA).

> **Note:**
>
> Site policy settings created in **Web Studio** are not included in the Resultant Set of Policy when you run the Citrix Group Policy Modeling wizard from the Group Policy Management Console (GPMC). For the most comprehensive results, start the Policy Modeling wizard from **Web Studio**, unless you create policies using only the GPMC.

Troubleshoot policy issues

Users, IP addresses, and other assigned objects can have multiple policies applying simultaneously, which can lead to unexpected behavior.

If you run the Policy Modeling wizard and no policies apply to user connections, it might be because:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- No policies have assignments that match the evaluation criteria.
- Policies that match the assignment have no settings configured.
- Policies that match the assignment are disabled.

To resolve these issues:

- Enable the relevant policies.
- Configure at least one setting for each policy.

> **Note:**
>
> In double-hop scenarios (for example, a single-session OS VDA connecting to a multi-session OS VDA) Citrix policies treat the single-session OS VDA as the user device. Images cached for the second hop apply to the first-hop machine.

View applied policies in Director

Non-administrators can use **Director** to view the policies that apply to a user session. This is useful for verifying which policy settings are in effect without requiring access to Web Studio.

Migrate legacy MMC Group Policy templates to Web Studio

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio™ (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Legacy MMC Studio Group Policy templates are stored in the administrator's user profile on the local computer where MMC Studio runs. Web Studio templates are stored in the site database and are accessible to all administrators from any computer. Because no direct export or import path exists between the two formats, migrate a legacy template by using a policy as an intermediary.

Before you begin

- Make sure you have access to the MMC Studio installation where the legacy templates are stored.
- Make sure Web Studio has access to the same Citrix Virtual Apps and Desktops™ site.
- Note the settings in the legacy template so that you can verify them after migration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

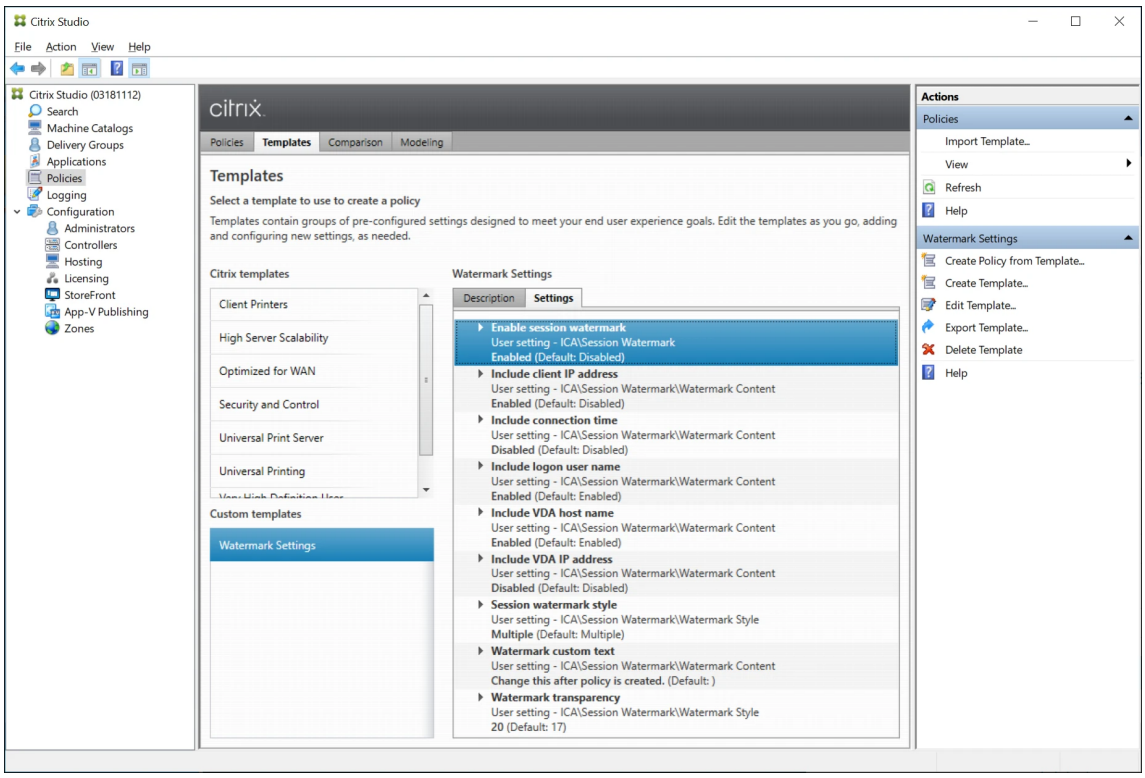
Migrate a template

1. In MMC Studio, navigate to the template you want to migrate.
2. In the **Actions** pane, select **Create Policy from Template**.
3. Follow the wizard to create a policy. For convenience, use the same name as the template.
4. Wait up to 5 minutes for the policy to appear in Web Studio. This time is required for the site service to convert the policy data from the MMC format to the Web Studio format.
5. Open Web Studio and select **Policies** in the left pane.
6. Confirm that the policy is visible in the policies list.
7. Select the policy, then select **...More** in the ribbon and click **Save as Template**.
8. Follow the wizard to create the Web Studio template.

After migration, the template is stored in the site database and is accessible to all administrators who use Web Studio from any computer.

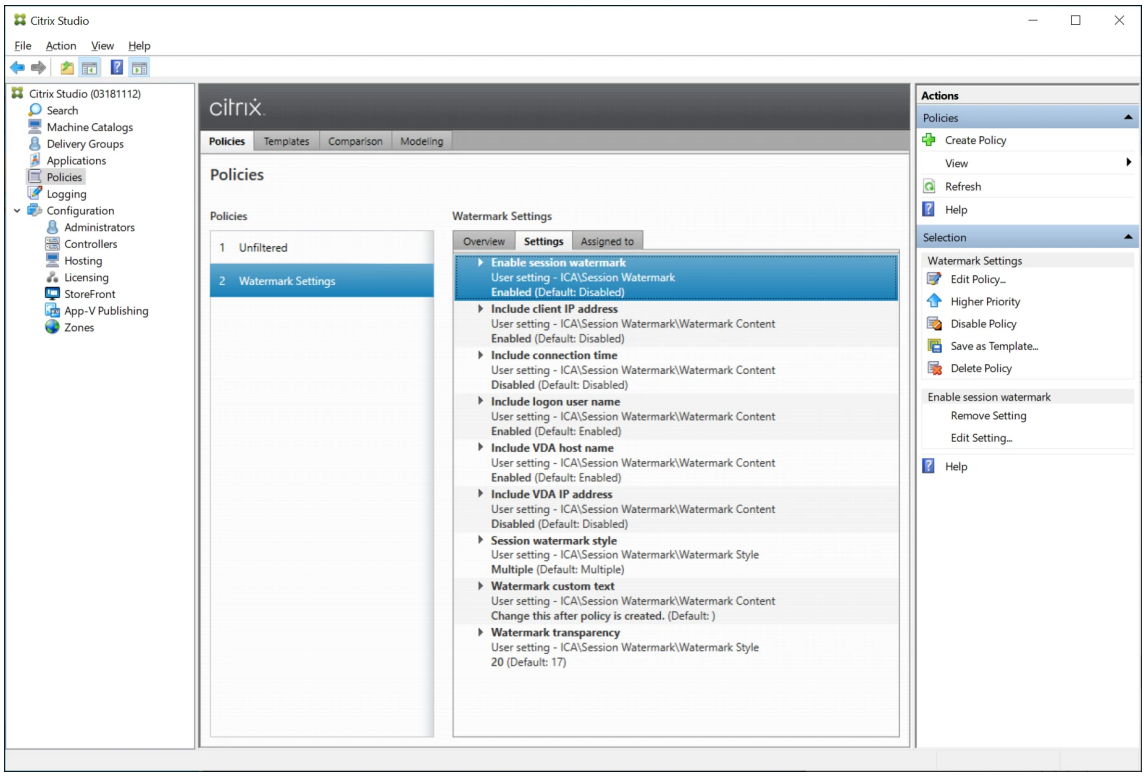
Verify the migration

1. In Web Studio, select the **Templates** tab in the **Policies** node.
2. Confirm that the migrated template is visible.
3. Compare the settings with the original MMC template to confirm they match.



After you verify the migration, you can retire the original MMC template. The MMC template remains local to the computer where it was created.

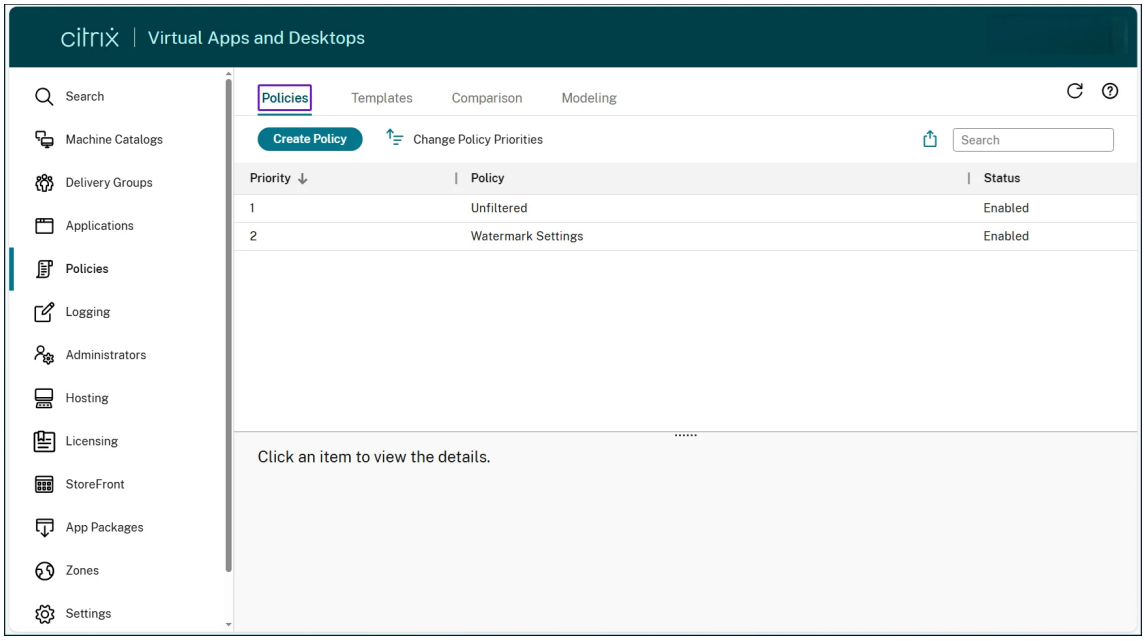
Example



The following example shows how to migrate a template named *Watermark Settings* that contains watermark configurations shared across multiple sites.

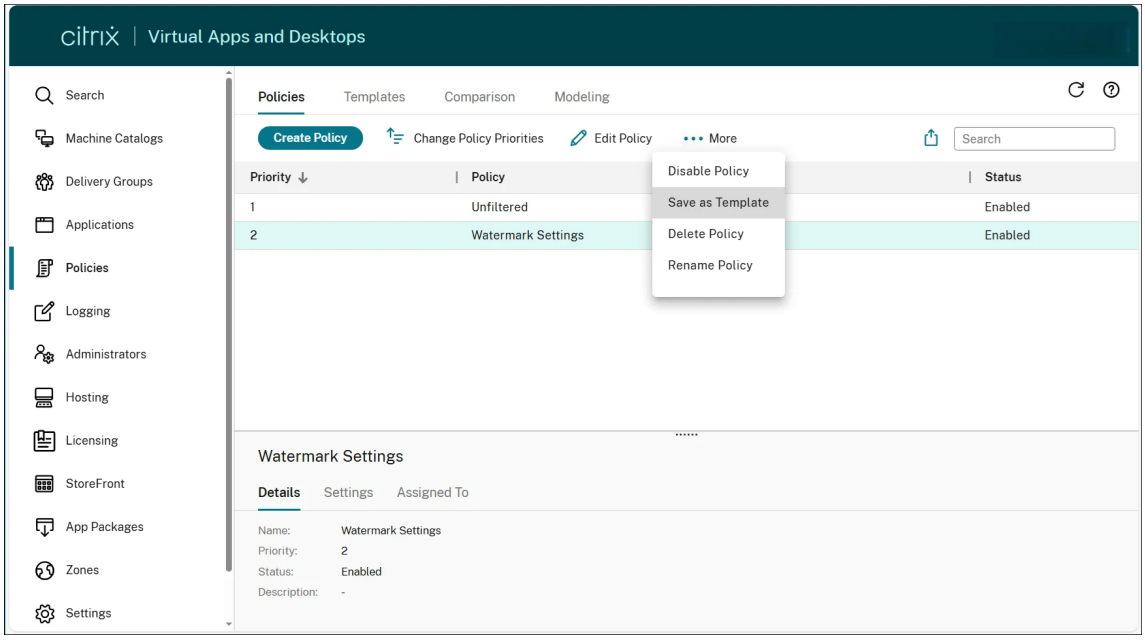
1. In MMC Studio, locate the *Watermark Settings* template. In the **Actions** pane, click **Create Policy from Template**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. Follow the wizard to create a policy. For convenience, name the policy *Watermark Settings* to match the template.

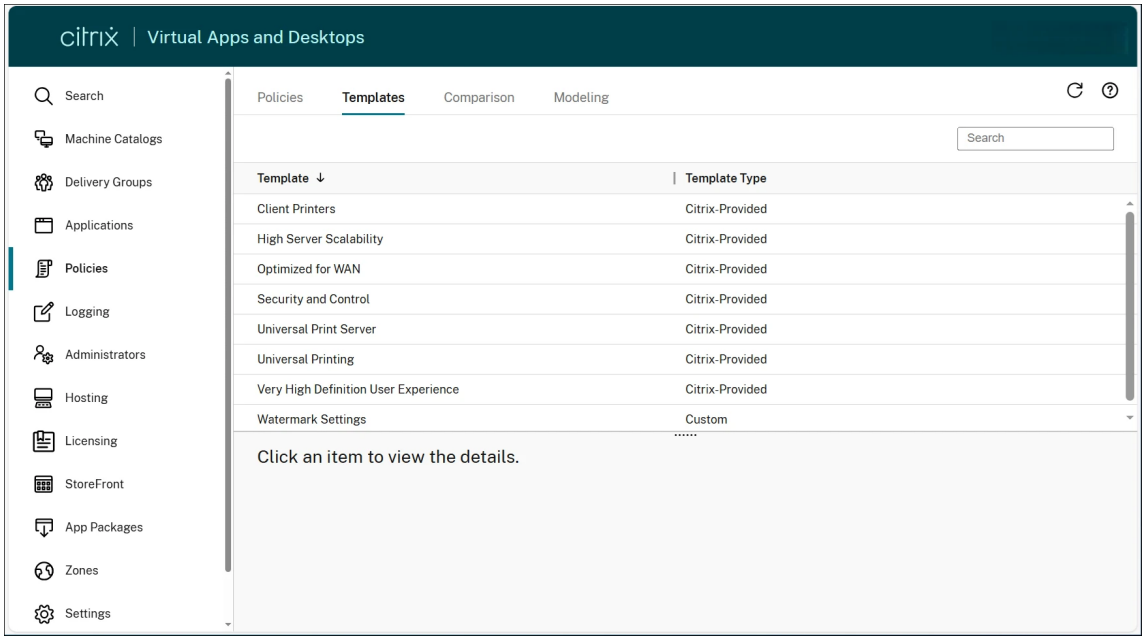
3. Wait up to 5 minutes, then open Web Studio. Verify that the policy *Watermark Settings* appears



© 1997–2026 Citrix Systems, Inc. All rights reserved.

in the policies list.

> **Note:**
>
> At this point, the template does not yet appear on the **Templates** tab. The policy is the intermediary —you use it to create the Web Studio template in the next step.



4. Select the *Watermark Settings* policy, then select **...More** in the ribbon and click **Save as Template**.

5. Follow the wizard to create the Web Studio template.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Select the **Templates** tab. The *Watermark Settings* template is now visible and accessible to all administrators from any computer that has access to the site.

For more information about managing templates in Web Studio, see Manage policy templates.

Remove deprecated policy settings after an upgrade

June 4, 2026

When Citrix® deprecates a product component, its associated policy settings become invalid. Use `GpoClean.ps1` to identify and remove these deprecated settings from Citrix Virtual Apps and Desktops™ policies after an upgrade, including any policies that become empty as a result.

Before you begin

Make sure you meet these requirements before you run the script:

- A supported version of Citrix Virtual Apps and Desktops with **Broker SDK** and **Group Policy Management** installed
- **Citrix policy administration** permissions on a Delivery Controller™

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The script automatically loads the `Citrix.Broker.Admin.V2` and `Citrix.Common.GroupPolicy` snap-ins.

Remove deprecated policy settings

Run `GpoClean.ps1` to remove deprecated policy settings:

1. Copy `GpoClean.ps1` to a Delivery Controller on which you have **Citrix policy administration** permissions.
2. Open a PowerShell session on the Delivery Controller.
3. Run the script. No parameters are required.

```
.\GpoClean.ps1
```

> **Note:**
>
> Add `-Verbose` for detailed per-setting logging: `.\GpoClean.ps1 -Verbose`.

The script runs in two phases:

Phase	What happens
Phase 1	Runs `Test-BrokerDesktopPolicy`, identifies `DeprecatedSetting` errors, and sets each affected setting to `NotConfigured`
Phase 2	Re-runs `Test-BrokerDesktopPolicy`, identifies policies with no configured settings (`PolicyHasNoSettings`), and removes them

All changes are saved in a single write operation. A summary reports the number of settings and policies removed. If no deprecated settings are found, the script exits with no changes.

> **Note:**
>
> - The `Unfiltered` policy is never removed, even if it contains no configured settings.

Related content

For more information about deprecated settings in each release, see Policy changes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy settings reference

May 13, 2026

Policies include settings that are applied when the policy is enforced. Descriptions in this section also indicate if more settings are required to enable a feature or are similar to a setting.

Quick reference

The following tables list the settings that you can configure within a policy. Find the task that you want to complete in the left column, then locate its corresponding setting in the right column.

A full listing of all policy settings is available in .CHM (Compiled HTML) format and .CSV format. These files are available in the `\program files\citrix\grouppolicy` folder on the server where the broker (delivery controller) is installed. You can also download the latest version of the policy settings by clicking here.

Audio

For this task	Use this policy setting
Control whether to allow the use of multiple audio devices	Audio Plug N Play
Control whether to allow audio input from microphones on the user device	Client microphone redirection
Control audio quality on the user device	Audio quality
Control audio mapping to speakers on the user device	Client audio redirection

Bandwidth for user devices

To limit bandwidth used for	Use this policy setting
Client audio mapping	Audio redirection bandwidth limit or Audio redirection bandwidth limit percent
Cut-and-paste using a local clipboard	Clipboard redirection bandwidth limit or Clipboard redirection bandwidth limit percent

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To limit bandwidth used for	Use this policy setting
Access in a session to local client drives	File redirection bandwidth limit or File redirection bandwidth limit percent
HDX™ MediaStream Multimedia Acceleration	HDX MediaStream Multimedia Acceleration bandwidth limit or HDX MediaStream Multimedia Acceleration bandwidth limit percent
Client session	Overall session bandwidth limit
Printing	Printer redirection bandwidth limit or Printer redirection bandwidth limit percent
TWAIN devices (such as a camera or scanner)	TWAIN device redirection bandwidth limit or TWAIN device redirection bandwidth limit percent
USB devices	Client USB device redirection bandwidth limit or Client USB device redirection bandwidth limit percent

Redirection of client drives and user devices

For this task	Use this policy setting
Control whether drives on the user device are connected when users log on to the server or not	Auto connect client drives
Control cut-and-paste data transfer between the server and the local clipboard	Client clipboard redirection
Control how drives map from the user device	Client drive redirection
Control whether users' local hard drives are available in a session	Client fixed drives and Client drive redirection
Control whether users' local floppy drives are available in a session	Client floppy drives and Client drive redirection
Control whether users' network drives are available in a session	Client network drives and Client drive redirection
Control whether users' local CD, DVD, or Blu-ray drives are available in a session	Client optical drives and Client drive redirection
Control whether users' local removable drives are available in a session	Client removable drives and Client drive redirection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For this task	Use this policy setting
Control whether users'TWAIN devices, such as scanners and cameras, are available in a session and control compression of image data transfers	Client TWAIN device redirection; TWAIN compression redirection
Control whether USB devices are available in a session	Client USB device redirection and Client USB device redirection rules
Improve the speed of writing and copying files to a client disk over a WAN	Use asynchronous writes

Content redirection

For this task	Use this policy setting
Control whether to use content redirection from the server to the user device	Host to client redirection

Desktop UI

For this task	Use this policy setting
Control whether Desktop wallpaper is used in users'sessions or not	Desktop wallpaper
View window contents while a window is dragged	View window contents while dragging

Graphics and multimedia

> **Important:**
>
> The Flash policy remains only to allow customers with older VDAs to use newer controllers (for example, version 1912 controllers) and still use Flash. This VDA version does not support Flash.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For this task	Use this policy setting
Control the maximum number of frames per second sent to user devices from virtual desktops	Target frame rate
Control the visual quality of images displayed on the user device	Visual quality
Control whether websites can display Flash content when accessed in sessions	Flash server-side content fetching URL list; Flash URL compatibility list; Flash video fallback prevention policy setting; Flash video fallback prevention error *.swf
Control compression of server-rendered video	Use video codec for compression; Use hardware encoding for video codec
Control the delivery of HTML5 multimedia web content to users	HTML5 video redirection

Prioritize Multi-Stream network traffic

For this task	Use this policy setting
Specify ports for ICA® traffic across multiple connections and establish network priorities	Multi-Port policy
Enable support for multi-stream connections among servers and user devices	Multi-Stream (computer and user settings)

Print

For this task	Use this policy setting
Control creation of client printers on the user device	Auto-create client printers and Client printer redirection
Control the location where printer properties are stored	Printer properties retention
Control whether the client or the server processes the print requests	Direct connections to print servers
Control whether users can access printers connected to their user devices	Client printer redirection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For this task	Use this policy setting
Control installation of native Windows drivers when automatically creating client and network printers	Automatic installation of in-box printer drivers
Control when to use the Universal Printer Driver	Universal print driver usage
Choose a printer based on a roaming user session information	Default printer
Load balance and set failover threshold for Universal Print Servers	Universal Print Servers for load balancing; Universal Print Servers out-of-service threshold

> **Note:**
>
> Policies can't be used to enable a screen saver in a desktop or application session. For users who require screen savers, the screen saver can be implemented on the user device.

ICA® policy settings

August 11, 2026

> **Note:**
>
> This page provides you descriptions and supported configuration values for ICA policy settings. For more information on working with policies, see Work with policies section.

Adaptive transport

Adaptive transport

This setting allows or prevents data transport over EDT as primary and over TCP as fallback.

By default, adaptive transport is enabled (**Preferred**), and EDT is used when possible, with fallback to TCP. You can change its setting as needed:

- **Preferred**. Adaptive transport over EDT is used when possible, with fallback to TCP.
- **Diagnostic mode**. EDT is forced on and fallback to TCP is disabled. We recommend this setting only for troubleshooting.
- **Off**. TCP is forced on, and EDT is disabled.

For more information, see Adaptive transport.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

MTU Rediscovery

MTU Rediscovery allows detecting changes in an active session that uses EDT as transport protocol and adjusting the session's MTU to prevent performance issues.

This setting can be configured as follows:

- Off: MTU Rediscovery is disabled.
- Static: when a decrease in MTU is detected, the session's MTU is set to 1200 for the remainder of the session.
- Dynamic: when a decrease in MTU is detected in an active session, MTU discovery is trigerred to determine an optimal MTU for the connection.

By default, this setting is disabled.

Application launch wait timeout

This setting specifies the wait timeout value in milliseconds for a session to wait for the first application to start. If the start of the application exceeds this time period, the session ends.

You can choose the default time (10,000 milliseconds) or specify a number in milliseconds.

Client clipboard redirection

This setting allows or prevents the clipboard on the user device being mapped to the clipboard on the server.

By default, clipboard redirection is allowed.

To prevent copy-and-paste data transfer between a session and the local clipboard, select **Prohibit**. Users can still copy and paste data between applications running in sessions.

After allowing this setting, configure the maximum allowed bandwidth the clipboard can consume in a client connection. Use the **Clipboard redirection bandwidth limit** or the **Clipboard redirection bandwidth limit percent** settings.

Client clipboard write allowed formats

When the **Restrict client clipboard write** setting is **Enabled**, host clipboard data cannot be shared with the client endpoint. You can use this setting to allow specific data formats to be shared with the client endpoint clipboard. To use this setting, enable it and add the specific formats to be allowed.

The following clipboard formats are system defined:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- CF_TEXT
- CF_BITMAP
- CF_METAFILEPICT
- CF_SYLK
- CF_DIF
- CF_TIFF
- CF_OEMTEXT
- CF_DIB
- CF_PALETTE
- CF_PENDATA
- CF_RIFF
- CF_WAVE
- CF_UNICODETEXT
- CF_ENHMETAFILE
- CF_HDROP
- CF_LOCALE
- CF_DIBV5
- CF_OWNERDISPLAY
- CF_DSPTEXT
- CF_DSPBITMAP
- CF_DSPMETAFILEPICT
- CF_DISPENHMETAFILE
- CF_HTML

The following custom formats are predefined in XenApp and XenDesktop and Citrix Virtual Apps and Desktops™:

- CFX_RICHTEXT
- CFX_OfficeDrawingShape
- CFX_BIFF8
- CFX_FILE

HTML format is disabled by default. To enable this feature:

- Verify that **Client clipboard redirection** is set to **Allowed**.
- Verify that **Restrict client clipboard write** is set to **Enabled**.
- Add an entry for **CF_HTML** (and any other formats that you want supported) in **Client clipboard write allowed formats**.

You can add more custom formats. The custom format name must match the formats to be registered with the system. Format names are case-sensitive.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This setting does not apply if the **Client clipboard redirection** policy is set to **Prohibited** or the **Restrict client clipboard write** policy is set to **Disabled**.

> **Note:**
>
> Enabling HTML format clipboard copy support (CF_HTML) copies any scripts from the source of the copied content to the destination. Check that you trust the source before proceeding to copy. If you do copy content containing scripts, they are live only if you save the destination file as an HTML file and run it.

Limit clipboard client to session transfer size

This setting specifies the maximum size of clipboard data that a user can transfer from a client endpoint to a virtual session during a single copy-and-paste operation.

To limit clipboard transfer size, enable the **Limit clipboard client to session transfer size** setting. Then, in the **Size Limit** field, enter a value in kilobytes to define the size of data transfer between the local clipboard and a session.

By default, this setting is disabled and there's no limit on client to session transfers.

Limit clipboard session to client transfer size

This setting specifies the maximum size of clipboard data that a user can transfer from a virtual session to a client endpoint during a single copy-and-paste operation.

To limit clipboard transfer size, enable the **Limit clipboard session to client transfer size** setting. Then, in the **Size Limit** field, enter a value in kilobytes to define the size of data transfer between a session and the local clipboard.

By default, this setting is disabled and there's no limit on session to client transfers.

Restrict client clipboard write

If this setting is **Enabled**, host clipboard data cannot be shared with the client endpoint. You can allow specific formats by enabling the **Client clipboard write allowed formats** setting.

By default, this setting is **Disabled**.

Restrict session clipboard write

When this setting is **Enabled**, client clipboard data cannot be shared with session applications. You can allow specific formats by enabling the **Session clipboard write allowed formats** setting.

By default, this setting is **Disabled**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session clipboard write allowed formats

When the **Restrict session clipboard write** setting is **Enabled**, client clipboard data cannot be shared with session applications. You can use this setting to allow specific data formats to be shared with the session clipboard.

The following clipboard formats are system defined:

- CF_TEXT
- CF_BITMAP
- CF_METAFILEPICT
- CF_SYLK
- CF_DIF
- CF_TIFF
- CF_OEMTEXT
- CF_DIB
- CF_PALETTE
- CF_PENDATA
- CF_RIFF
- CF_WAVE
- CF_UNICODETEXT
- CF_ENHMETAFILE
- CF_HDROP
- CF_LOCALE
- CF_DIBV5
- CF_OWNERDISPLAY
- CF_DSPTEXT
- CF_DSPBITMAP
- CF_DSPMETAFILEPICT
- CF_DISPENHMETAFILE
- CF_HTML

The following custom formats are predefined in XenApp and XenDesktop and Citrix Virtual Apps™ and Desktops:

- CFX_RICHTEXT
- CFX_OfficeDrawingShape
- CFX_BIFF8

HTML format is disabled by default. To enable this feature:

- Verify that **Client clipboard redirection** is set to **Allowed**.
- Verify that **Restrict session clipboard write** is set to **Enabled**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Add an entry for **CF_HTML** (and any other formats that you want supported) in **Session clipboard write allowed formats**.

You can add more custom formats. The custom format name must match the formats to be registered with the system. Format names are case-sensitive.

This setting does not apply if the **Client clipboard redirection** policy is set to **Prohibited** or the **Restrict session clipboard write** policy is set to **Disabled**.

> **Note:**
>
> Enabling HTML format clipboard copy support (CF_HTML) copies any scripts from the source of the copied content to the destination. Check that you trust the source before proceeding to copy. If you do copy content containing scripts, they are live only if you save the destination file as an HTML file and run it.

Desktop starts

This setting allows or prevents connections to a session on that VDA using an ICA connection by non-administrative users in a VDA Direct Access Users group.

By default, non-administrative users can't connect to these sessions.

This setting doesn't affect non-administrative users in a VDA Direct Access Users group who are using an RDP connection. These users can connect to the VDA when this setting is enabled or disabled. This setting doesn't affect non-administrative users who aren't in a VDA Direct Access Users group. These users can't connect to the VDA when this setting is enabled or disabled.

Drag and drop setting

This setting allows or prevents the dragging of files between the client and virtual applications or desktops. By default, the drag and drop policy is disabled. You can enable this policy if needed.

FIDO2

FIDO2 redirection

This setting enables or disables FIDO2 redirection. FIDO2 redirection lets users take advantage of the local endpoint FIDO2 components in a virtual machine. Users can authenticate virtual session through FIDO2 security keys or integrated biometrics on devices that have TPM 2.0 and Windows Hello.

When this setting is **Allowed**, users can do FIDO2 authentication by using the local endpoint capabilities. By default, this setting is **Allowed**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FIDO2 allowed processes

The setting allows the admins to specify which applications are allowed to use FIDO2 and WebAuthn redirection within a virtual session.

Applications in the allowlist must have the full local path to the application executable. Network paths are not supported.

Wildcards(*) can be used in the application path to replace a single directory, a part of the directory name, the executable base name or a part of the executable base name.

HDX™ Direct

HDX™ Direct

HDX Direct allows the client to automatically establish a direct connection with the session host when direct communication is available. Connections are established securely using network-level encryption.

HDX Direct mode

HDX Direct can be used to establish direct connections with session hosts for internal and external clients. This setting determines if HDX Direct is available for internal clients only or for both internal and external clients.

When set to **Internal** only, HDX Direct attempts to establish direct connections for clients in the internal network only.

When set to **Internal** and **external**, HDX Direct attempts to establish direct connections for internal and external clients.

By default, HDX Direct is set for internal clients only.

HDX Direct port range

The range of ports that are used by HDX Direct for connections from external users.
By default, HDX Direct uses the port range: 55000–55250.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ICA listener

ICA listener connection timeout

This setting specifies the maximum wait time for a connection using the ICA protocol to be completed.

By default, the maximum wait time is 120,000 milliseconds, or two minutes.

ICA listener port number

This setting specifies the TCP/IP port number used by the ICA protocol on the server.

By default, the port number is set to 1494.

Valid port numbers must be in the range of 0-65535 and must not conflict with other well-known port numbers. If you change the port number, restart the server for the new value to take effect. If you change the port number on the server, you must also change it on every Citrix Workspace™ app or plug-in that connects to the server.

Keyboard and Input Method Editor (IME)

This setting enables or disables the following:

- Dynamic keyboard layout synchronization
- Input Method Editor (IME)
- Unicode keyboard layout mapping
- Hides or shows the keyboard layout switch notification dialog message
- Automatic touch keyboard display for touch device end users

1. In Web Studio, select **Keyboard and IME**.
2. Select **Client keyboard layout synchronization and IME improvement** to control the dynamic keyboard layout synchronization and generic client Input Method Editor (IME) features in the VDA. You can configure:

   Disabled - dynamic keyboard layout synchronization and generic client Input Method Editor (IME).

   Support dynamic client keyboard layout synchronization - enables dynamic keyboard layout synchronization.

   Support dynamic client keyboard layout synchronization and IME improvement - enables both dynamic keyboard layout synchronization and generic client Input Method Editor (IME).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select **Enable Unicode keyboard layout mapping** to enable or disable Unicode keyboard mapping.
4. Select **Hide keyboard layout switch pop-up message box** to control whether or not a message appears, indicating that the keyboard layout is synchronizing when the user changes the client keyboard layout. If you prevent the message from appearing, the users must wait for a few moments before typing to avoid incorrect character input.
5. Select **Automatic keyboard display** to allow or prohibit whether the client side soft/touch keyboard shows or hides automatically when you enter or leave an input field.

Default settings:

- **Client keyboard layout synchronization and IME improvement**
  - Disabled in Windows Server 2019/2022/2025, and multi-session Win 10/11
  - Enabled in single-session Win 10/11
- **Unicode keyboard layout mapping**
  - Prohibited (indicates Unicode keyboard layout mapping is disabled by default, need to configure and allow it if end users are using Unicode input mode on the CWAs)
- **Hide keyboard layout switch pop-up message box**
  - Prohibited (indicates it will show the pop-up message box)
- **Automatic keyboard display**
  - Prohibited (indicated the client side soft/touch keyboard will not show or hide automatically when you enter or leave an input field)

This policy replaces the registry settings that are listed in the **Description** section of the policy settings.

Logoff checker startup delay

This setting specifies the duration to delay the logoff checker startup. Use this policy to set the time (in seconds) that a client session waits before disconnecting the session.

This setting also increases the time that it takes for a user to log off from the server.

Loss tolerant mode

> **Important:**
>
> - The feature requires a minimum of Citrix Workspace app 2002 for Windows. This version of

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> the VDA supports it when it becomes available.
>
> - Loss tolerant mode for graphics is supported on Citrix Gateway and Citrix Gateway Service. This mode is available only with direct connections.

This setting enables or disables loss tolerant mode for graphics.

By default, loss tolerant mode for graphics is **Allowed**.

When allowed, the mode is entered when the packet loss and latency are above a threshold. You can set the thresholds using the loss tolerant thresholds policy.

Loss tolerant thresholds

When the Loss tolerant mode is available, this setting specifies the network metrics thresholds at which the session switches to loss tolerant mode for graphics.

The default thresholds are:

- Packet loss: 5%
- Latency: 300 ms (RTT)

For more information, see loss tolerant mode.

Loss tolerant mode for audio

This setting enables or disables the loss tolerant mode for audio.

When enabled, audio is sent over the loss tolerant mode.

By default, loss tolerant mode for audio is **Prohibited**.

To enable the policy, edit the registry of the loss tolerant mode for audio policy to **Allowed**.

EDT transport is required to enable loss tolerant mode for audio.

Rendezvous

Rendezvous protocol

This setting changes how HDX sessions are proxied when using the Citrix Gateway Service. When enabled, HDX traffic no longer flows through the Citrix Cloud Connector. Instead, the VDA establishes an outbound connection directly to the Citrix Gateway Service (enhancing Cloud Connector scalability).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> A feature toggle in Citrix Cloud™ and an HDX policy setting controls this feature. The Citrix Cloud feature toggle is enabled by default while the HDX setting is disabled by default. The HDX setting affects only HDX sessions established through the Citrix Gateway Service. This setting does not affect sessions established directly between client and VDA or through an on-premises Citrix Gateway.

For information, see Rendezvous protocol.

Rendezvous proxy configuration

This setting allows you to configure an explicit proxy for use with the Rendezvous protocol. If using a transparent proxy, this setting does not need to be enabled.

By default, this setting is disabled.

When disabled, the VDA doesn't route outbound traffic through any non-transparent proxies when trying to establish a Rendezvous connection with the Gateway Service.

When enabled, the VDA attempts to establish a Rendezvous connection with the Gateway Service through the proxy defined in this setting.

The VDA supports using HTTP and SOCKS5 proxies for Rendezvous connections. To configure the VDA to use a proxy for the Rendezvous connection, you must enable this setting. Also, specify either the address of the proxy or the path to the PAC file. For example:

- Proxy address: `http://<URL or IP>:<port>` or `socks5://<URL or IP>:<port>`
- PAC file: `http://<URL or IP>/<path>/<filename>.pac`

  VDA version 2103 is the minimum supported version for proxy configuration with a PAC file. For more information on the PAC file schema for SOCKS5 proxies, see Proxy configuration.

> **Note:**
>
> Only SOCKS5 proxies support data transport through EDT. For an HTTP proxy, use TCP as the transport protocol for ICA.

For more information, see Rendezvous protocol.

Secure HDX

This setting enables or disables the use of Secure HDX.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Secure HDX uses application-level encryption to secure the HDX protocol to provide true End-to-End encryption for HDX sessions.

When enabled, Secure HDX is enforced, and connections to clients that do not support Secure HDX are blocked. Secure HDX is disabled by default.

Starting of non-published programs during client connection

This setting specifies whether to allow starting initial applications through RDP on the server.

By default, starting initial applications through RDP on the server isn't allowed.

Session metric collection

This setting allows Citrix to collect user and machine session metrics between the VDA and Workspace to improve the user experience.

Citrix collects data such as operating system, uptime, computer system information, video controller details, VDA version, deployment type, and domain joined status are collected. Additionally, you can gather some session configurations, along with performance and reliability data, to aid product improvement efforts. For more information on our Customer Experience Improvement Program, see:

- https://more.citrix.com/XD-CEIP
- https://docs.citrix.com/en-us/linux-virtual-delivery-agent/2607-ltsr/configure/administration/linux-vda-data-collection-program
- https://docs.citrix.com/en-us/mac-vda/configure/session/supportability-service

By default, this setting is enabled.

Tablet mode toggle policy settings

Tablet mode toggle optimizes the look and behavior of Store apps, Win32 apps, and the Windows shell on the VDA. It does so by automatically toggling the virtual desktop to Tablet mode when connecting from small form factor devices like phones and tablets, or any touch-enabled device.

If this policy is disabled, the VDA is in the mode the user sets it to and maintains the same mode throughout, regardless of the type of client.

Authentication policy settings

August 11, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The **authentication** section includes policy settings that control authentication settings.

Microsoft Entra single sign-on

This setting enables or disables the use of Microsoft Entra single sign-on in the VDA. This setting is enabled by default.

Auto client reconnect policy settings

May 13, 2026

The **Auto Client Reconnect** section contains policy settings for controlling the automatic reconnection of sessions.

Auto client reconnect

This setting allows or prevents automatic reconnection by the same client after a connection has been interrupted.

For Citrix Receiver for Windows 4.7 and later and Citrix Workspace app 1808 and later, auto client reconnect uses only the policy settings from Citrix Studio. Updates to these policies in Studio synchronize auto client reconnect from server to client. With older versions of Citrix Receiver for Windows, to configure auto client reconnect, use a Studio policy and change the registry or the default.ica file.

Allowing automatic client reconnect allows users to resume working where they were interrupted when a connection was broken. Automatic reconnection detects broken connections and then reconnects the users to their sessions.

If the Citrix Workspace™ app cookie containing the key to the session ID and credentials isn't used, automatic reconnection might result in a new session being started. That is, instead of reconnecting to an existing session. The cookie is not used if it has expired. For example, the cookie might expire because of a delay in reconnection, or if credentials must be reentered. If users intentionally disconnect, auto client reconnect is not triggered.

A session window is grayed out when a reconnection is in progress. A countdown timer displays the time remaining before the session is reconnected. When a session times out, it is disconnected.

For application sessions, when automatic reconnect is allowed, a countdown timer appears in the notification area. This timer specifies the time remaining before the session is reconnected. Citrix Workspace app tries to reconnect to the session until there is a successful reconnection or the user cancels the reconnection attempts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For user sessions, when automatic reconnect is allowed, Citrix Workspace app tries to reconnect to the session for a specified period, unless there's a successful reconnection or the user cancels the reconnection attempts. By default, this period is two minutes. To change this period, edit the policy.

By default, automatic client reconnect is allowed. You can disable it by setting the policy to **Prohibited**.

Auto client reconnect authentication

This setting specifies whether authentication is required for automatic client reconnections.

When a user initially logs on, the credentials are encrypted, stored in memory, and a cookie is created containing the encryption key. The cookie is sent to Citrix Workspace app. When this setting is configured, cookies are not used. Instead, a dialog box is displayed to users requesting credentials when Citrix Workspace app attempts to reconnect automatically.

By default, authentication is not required.

Auto client reconnect logging

This setting enables or disables recording of auto client reconnections in the event log.

When logging is enabled, the server System Log captures information about successful and failed automatic reconnection events. A site does not provide a combined log of reconnection events for all servers.

By default, logging is disabled.

Auto client reconnect timeout

By default, auto-client reconnect timeout is set to 120 seconds, the maximum configurable value for an auto-client reconnect timeout is 300 seconds. Use this policy to set the timeout value.

Reconnect UI transparency level

This setting lets you specify the opacity level applied to the XenApp or XenDesktop® session window during session reliability reconnection time.

By default, Reconnect UI transparency is set to 80%.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Audio policy settings

May 13, 2026

The **Audio** section includes policy settings that allow user devices to send and receive audio in sessions without reducing performance.

Adaptive Audio

This setting enables or disables adaptive audio. When you enable this policy, the audio quality settings are adjusted dynamically to provide the best user experience. This setting applies to both single-session OS and multi-session OS sessions of VDAs using Citrix Virtual Apps and Desktops™ 2109 or later.

When this setting is prohibited, the audio quality policy is applied. For more information see, Audio quality.

By default, the adaptive audio policy is enabled.

Audio over UDP real-time transport

This setting allows or prevents the transmission and receipt of audio between the VDA and user device over RTP using the User Datagram Protocol (UDP). When this setting is disabled, audio is sent and received over TCP.

By default, audio over UDP is allowed.

Audio Plug N Play

This setting allows or prevents the use of multiple audio devices to record and play sound.

By default, the use of multiple audio devices is allowed.

This setting applies only to Windows Multi-session OS machines.

Audio quality

This setting specifies the quality level of sound received in user sessions.

By default, sound quality is set to High - high definition audio.

To control sound quality, choose one of the following options:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Select Low - for low speed connections for low-bandwidth connections. Sounds sent to the user device are compressed up to 16 Kbps. This compression results in a significant reduction in the quality of the sound. But also allows reasonable performance for a low-bandwidth connection.
- Select Medium - optimized for speech to deliver Voice over Internet Protocol applications. This setting delivers media applications in challenging network connections with lines less than 512 Kbps, or significant congestion and packet loss. This codec offers fast encode time, making it ideal for use with softphones and Unified Communications applications when you require server-side media processing.

  Audio sent to the user device is compressed up to 64 Kbps. This compression results in a moderate reduction in the quality of the audio played on the user device while providing low latency and consuming low bandwidth. If Voice over Internet Protocol quality is unsatisfactory, ensure that the Audio over UDP Real-time Transport policy setting is set to Allowed.

  Now, Real-time Transport (RTP) over UDP is only supported when this audio quality is selected. Use this audio quality even for delivering media applications for challenging network connections like low (fewer than 512 Kbps) lines. Also, when there is congestion and packet loss in the network.
- Select High - high definition audio for connections where bandwidth is plentiful and sound quality is important. Clients can play sound at its native rate. Sounds are compressed at a high quality level maintaining up to CD quality, and using up to 112 Kbps of bandwidth. Transmitting this amount of data can result in increased CPU usage and network congestion.

Bandwidth is consumed only while audio is recording or playing. If both occur at the same time, the bandwidth consumption doubles.

To specify the maximum amount of bandwidth, configure the **Audio redirection bandwidth limit** or the **Audio redirection bandwidth limit percent** settings.

Client audio redirection

This setting specifies whether applications hosted on the server can play sounds through a sound device installed on the user device. This setting also specifies whether users can record audio input.

By default, audio redirection is allowed.

After allowing this setting, you can limit the bandwidth consumed by playing or recording audio. Limiting the amount of bandwidth consumed by audio can improve application performance but might also degrade audio quality. Bandwidth is consumed only while audio is recording or playing. If both occur at the same time, the bandwidth consumption doubles. To specify the maximum amount of bandwidth, configure the **Audio redirection bandwidth limit** or the **Audio redirection bandwidth limit percent** settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

On Windows Multi-session OS machines, ensure that the **Audio Plug N Play** setting is enabled to support multiple audio devices.

Important: Prohibiting Client audio redirection disables all HDX™ audio functionality.

Client microphone redirection

This setting enables or disables client microphone redirection. When enabled, users can use microphones to record audio input in a session.

By default, microphone redirection is allowed.

For security, users are alerted when untrusted servers by their devices try to access microphones. Users can choose to accept or not accept access. Users can disable the alert on Citrix Workspace™ app.

On Windows Multi-session OS machines, ensure that the Audio Plug N Play setting is Enabled to support multiple audio devices.

If the **Client audio redirection** setting is disabled on the user device, this rule has no effect.

Bandwidth policy settings

May 13, 2026

The **Bandwidth** section includes policy settings to avoid performance problems related to client session bandwidth use.

Important: Using these policy settings with the **Multi-Stream policy** settings might produce unexpected results. If you use Multi-Stream settings in a policy, ensure that these bandwidth limit policy settings aren't included.

Audio redirection bandwidth limit

This setting specifies the maximum allowed bandwidth for playing or recording audio in a user session. The maximum allowed bandwidth is specified in kilobits per second.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Audio redirection bandwidth limit percent** setting, the most restrictive setting (lower value) is applied.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Audio redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth limit for playing or recording audio as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Audio redirection bandwidth limit** setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

Client USB device redirection bandwidth limit

This setting specifies the maximum allowed bandwidth for the redirection of USB devices to and from the client. The maximum allowed bandwidth is specified in kilobits per second.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Client USB device redirection bandwidth limit percent** setting, the most restrictive setting (the lower value) is applied.

Client USB device redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth for the redirection of USB devices to and from the client as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Client USB device redirection bandwidth limit** setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

Clipboard redirection bandwidth limit

This setting specifies the maximum allowed bandwidth for data transfer between a session and the local clipboard. The maximum allowed bandwidth is specified in kilobits per second.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Clipboard redirection bandwidth limit percent** setting, the most restrictive setting (the lower value) is applied.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clipboard redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth for data transfer between a session and the local clipboard as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Clipboard redirection bandwidth limit** setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

COM port redirection bandwidth limit

> **Note:**
>
> For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth in kilobits per second for accessing a COM port in a client connection. If you enter a value for this setting and a value for the **COM port redirection bandwidth limit percent** setting, the most restrictive setting (the lower value) is applied.

COM port redirection bandwidth limit percent

Note: For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth for accessing COM ports in a client connection as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified

If you enter a value for this setting and a value for the **COM port redirection bandwidth limit** setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions

File redirection bandwidth limit

This setting specifies the maximum allowed bandwidth for accessing a client drive in a user session. The maximum allowed bandwidth is specified in kilobits per second.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **File redirection bandwidth limit percent** setting, the most restrictive setting (the lower value) takes effect.

File redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth limit for accessing client drives as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **File redirection bandwidth limit** setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

HDX™ MediaStream Multimedia Acceleration bandwidth limit

This setting specifies the maximum allowed bandwidth limit for delivering streaming audio and video using HDX MediaStream Multimedia Acceleration. The maximum allowed bandwidth is specified in kilobits per second.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **HDX MediaStream Multimedia Acceleration bandwidth limit percent** setting, the most restrictive setting (the lower value) takes effect.

HDX MediaStream Multimedia Acceleration bandwidth limit percent

This setting specifies the maximum allowed bandwidth for delivering streaming audio and video using HDX MediaStream Multimedia Acceleration as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **HDX MediaStream Multimedia Acceleration bandwidth limit** setting, the most restrictive setting (the lower value) takes effect.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

LPT port redirection bandwidth limit

Note: For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth for print jobs using an LPT port in a single user session. The maximum allowed bandwidth is specified in kilobits per second.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **LPT port redirection bandwidth limit percent** setting, the most restrictive setting (the lower value) is applied.

LPT port redirection bandwidth limit percent

Note: For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the bandwidth limit for print jobs using an LPT port in a single client session as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **LPT port redirection bandwidth limit** setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

Overall session bandwidth limit

This setting specifies the total amount of bandwidth available, in kilobits per second, for user sessions.

The maximum enforceable bandwidth cap is 20 Mbps (20,000 Kbps). By default, no maximum (zero) is specified.

Limiting the amount of bandwidth consumed by a client connection can improve performance when other applications outside the client connection are competing for limited bandwidth.

Printer redirection bandwidth limit

This setting specifies the maximum allowed bandwidth for accessing client printers in a user session. The maximum allowed bandwidth is specified in kilobits per second.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Printer redirection bandwidth limit percent** setting, the most restrictive setting (the lower value) is applied.

Printer redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth for accessing client printers as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **Printer redirection bandwidth limit** setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

TWAIN device redirection bandwidth limit

This setting specifies the maximum allowed bandwidth for controlling TWAIN imaging devices from published applications. The maximum allowed bandwidth is specified in kilobits per second.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **TWAIN device redirection bandwidth limit percent** setting, the most restrictive setting (the lower value) is applied.

TWAIN device redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth for controlling TWAIN imaging devices from published applications as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the **TWAIN device redirection bandwidth limit** setting, the most restrictive setting (having the lower value) is applied.

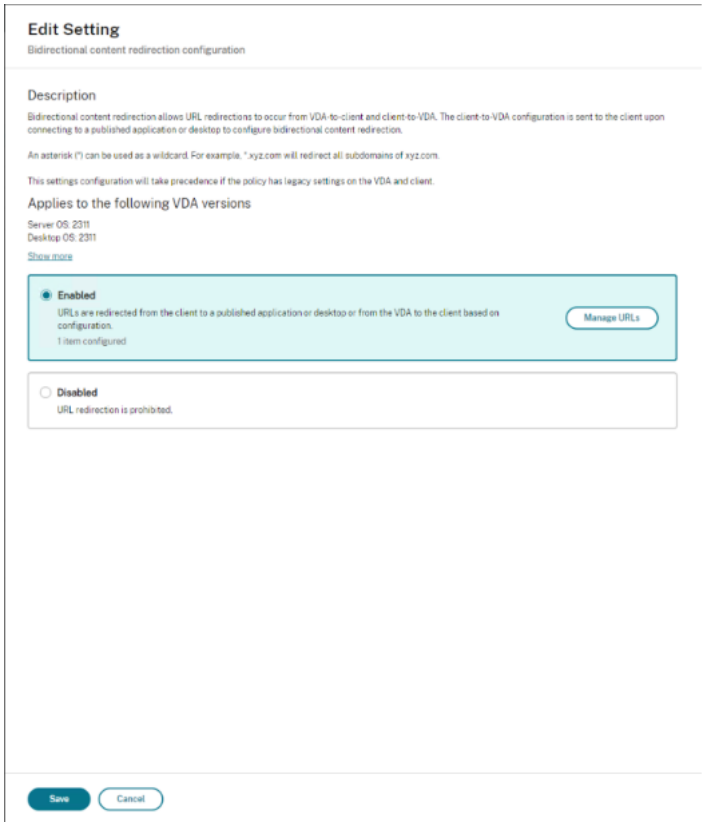
If you configure this setting, you must also configure the **Overall session bandwidth limit** setting, which specifies the total amount of bandwidth available for client sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Bidirectional content redirection policy settings

September 1, 2026

The **Bidirectional Content Redirection** section has policy settings to enable or disable the client-to-VDA and VDA-to-client URL redirection.



Server policies are set in Web Studio. Starting with the Citrix Workspace™ app version 2311, this setting replaces the following three legacy settings in Web Studio which are deprecated:

- Allow bidirectional content redirection
- Allowed URLs to be redirected to VDA
- Allowed URLs to be redirected to Client

It also replaces the following three local Group Policy Object (GPO) settings on Windows clients:

- Bidirectional content redirection
- Bidirectional content redirection overrides
- OAuth redirection

If this setting is enabled, the client-to-VDA settings are sent to the client upon connecting to a published app or desktop to configure bidirectional content redirection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If this setting is configured, it takes precedence over the legacy settings in Web Studio and on the client. Citrix® recommends using only the new policy settings and deleting any legacy settings to avoid unexpected behavior.

Client policies must not be set if the VDA and DDC are running version 2311 or later. Otherwise, client policies are set from the Citrix Workspace app Group Policy Object administration template.

Citrix offers host-to-client redirection and Local App Access for client-to-URL redirection. However, Citrix recommends that you use bidirectional content redirection for domain-joined Windows clients.

Citrix recommends using the new UI in Web Studio to configure the feature.

Wildcard redirection

Bidirectional content redirection supports the use of wildcards when defining the URLs to be redirected. For more details and to configure bidirectional content redirection, see the Configuration instructions.
In Web Studio, set the wildcard URL by editing the JSON string as a value in the `url` key in the `hostToClientUrls` array or the `clientToHostUrls` array.

> **Note:**
>
> - Don't set the same URL in `hostToClientUrls` and `clientToHostUrls` to avoid infinite loops.
> - Top-level domains are not supported. For example, https://www.citrix.* or http://www.citrix.co* is not redirected.

Bidirectional content redirection configuration

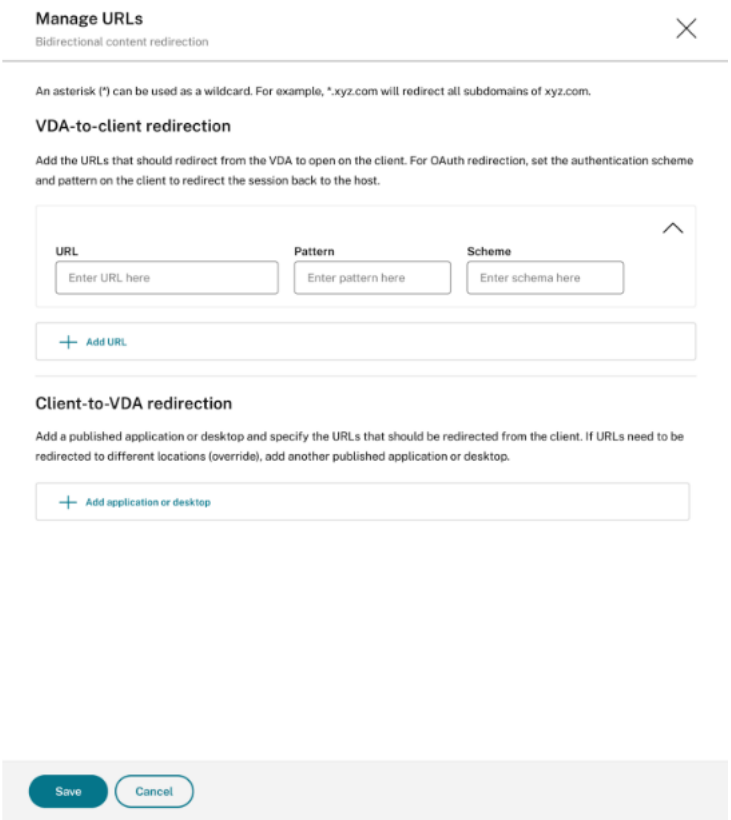
Set this policy to `Enabled` to start configuring the feature and click **Manage URLs**. Set the following configurations:

- **VDA-to-client redirection**
- **Client-to-VDA redirection**

VDA-to-client redirection

To redirect URLs from VDA to the client, enter one URL per line. Wildcards are allowed.
OAuth redirection enables you to use the browser on the client endpoint to perform authentication and send the token back to the VDA.

Benefits:



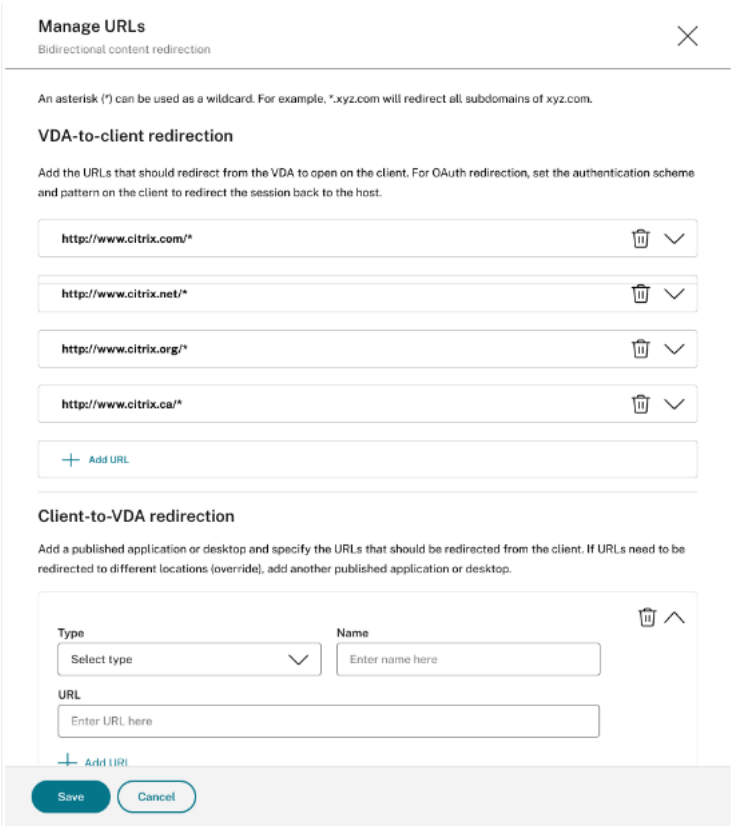
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You can avoid storing these credentials in the hosted environment.
- You can use biometric capabilities that are available on the endpoint and not on the VDA.

Configurations:

To configure VDA-to-client redirection for the URL, specify the following:

- **URL** (Required) Add the URL that must redirect from the VDA to open on the client. For **OAuth Redirection**, set the authentication scheme and pattern on the client to redirect the session back to the host.
- **Pattern**: (Optional) URL regular expression that, when redirected to the client through VDA-to-Client URL redirection, is tracked as if an OAuth authentication flow has begun, and when the flow completes (detected by the resulting scheme or redirect URL pattern being opened), that resulting URL is redirected back into the host VDA that initiated that flow.
- **Scheme**: (Optional) If **Scheme** is specified, the terminating URL is expected to be of the form: `<scheme>://<something>`. Consider Scheme is not specified (empty). In that case, the original resulting URL pattern is extracted from the Pattern through a regular expression capture group (must be specified in the Pattern), and the original URL is rewritten to use a `citrix-oauth-redir://` redirect URL. When the flow completes, the original redirect URL is then redirected back into the Host (VDA). In this case, any OAuth Authorization server must be configured to allow `citrix-oauth-redir://byIndex/1 (2, 3, ... N)` redirect URLs.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Though both **Pattern** and **Scheme** are optional, if **Pattern** is specified, you must also specify **Scheme**.

Client-to-VDA redirection

To redirect URLs from the client to VDA, complete the following steps:

1. Configure the destination for client URLs.
2. Select either Published Application or Published Desktop.
3. Specify the name of that resource.
4. Add all URLs that must be redirected to that resource.
   You can override this default resource by adding a new application or desktop and then specifying the URLs to redirect to that resource.

OAuth redirection

OAuth redirection enables you to use the client endpoint browser to authenticate and send the token back to the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Benefits:

- You can avoid storing these credentials in the hosted environment.
- You can use biometric capabilities that are available on the endpoint and not on the VDA.

To configure OAuth redirection for the URL, specify the following parameters:

- **oAuthRedirectionPattern**: (Optional) URL regular expression that, when redirected to the client via VDA-to-Client URL redirection, is tracked as if an OAuth authentication flow has begun, and when the flow completes (detected by the resulting scheme or redirect URL pattern being opened), that resulting URL is redirected back into the host VDA that initiated that flow.
- **oAuthScheme**: (Optional) If a Scheme is specified, the terminating URL is expected to be in the form: `<scheme>://<something>`. Consider Scheme is not specified (empty). In that case, the original resulting URL pattern is extracted from the Pattern through a regular expression capture group (must be specified in the Pattern), and the original URL is rewritten to use a `citrix-oauth-redir://` redirect URL. When the flow completes, the original redirect URL is then redirected back into the Host (VDA). In this case, any OAuth Authorization server must be configured to allow `citrix-oauth-redir://byIndex/1 (2, 3, ... N)` redirect URLs.

For a client-to-VDA redirection, create **clientToHostConfig** for each resource to redirect.
For each resource, include the following parameters:

- **publishedAppOrDesktopNameType**: (Required) Either a published desktop (“Desktop”) or a published application (“Application”) configured in Web Studio. If the resource is not valid, redirection does not function correctly.
- **publishedAppOrDesktopName**: (Required) Resource name as configured in Web Studio.
- **clientToHostUrls**: (Required) List of URLs to be redirected from client to host (VDA). Wildcards are allowed.

Known limitation

When you launch a browser using PowerShell with a custom URL scheme (not HTTP or HTTPS), the custom URLs are not redirected to the client.

Browser content redirection policy settings

May 13, 2026

Browser Content Redirection (BCR) enhances the user experience of web browsing within Citrix Virtual Apps and Desktops™ environments. By offloading the rendering of web pages to the user’s local

© 1997–2026 Citrix Systems, Inc. All rights reserved.

machine, BCR reduces server load and improves performance, especially for complex or resource-intensive websites.
This documentation details each of the policy setting option available for Browser Content Redirection

Browser content redirection

This setting acts as the main on/off switch for Browser Content Redirection.

- **What it does:** Determines whether web pages are rendered on the server or your local device. When enabled, Citrix Workspace™ app tries to fetch and display web content on your device for a smoother experience. If that fails, it falls back to rendering on the server.
- **Options:**
  - **Allowed:** (Default) Enables Browser Content Redirection.
  - **Prohibited:** Disables Browser Content Redirection.
- **Things to note:** If allowed, Citrix Workspace app attempts client fetch and client render. If client fetch and client render fails, Browser content redirection will fall back to server side rendering. To enable server fetch and client render, enable the "Browser Content Redirection Proxy Configuration"setting.

Browser content redirection ACL configuration

This setting lets you create a list of websites (URLs) that are allowed or not allowed from using Browser Content Redirection.

- **What it does:** Gives you fine-grained control over which websites are optimized with Browser Content Redirection. You can specify entire websites or specific pages.
- **How it works:**
  - **Allowed URLs:** Websites on this list will have their content displayed on your device. You can use wildcards (*) to include multiple pages or subdomains (e.g., *https://www.example.com/* or http://*.example.com/). Wild cards are not permitted within the protocol of the URL.
- **Default:** https://www.youtube.com/*
- **Example:**
  - **Allowed Patterns:** http://www.xyz.com/index.html, <https://www.xyz.com/* , http://www.xyz.com/*vi*
, http://*.xyz.com/%3C>
  - **Not Allowed:** http://*.*.com/
  - You can achieve better granularity by specifying paths in the URL. For example, if you specify https://www.xyz.com/sports/index.html , only the index.html page is redirected

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Browser content redirection block list configuration

This setting works in conjunction with the "Browser Content Redirection ACL Configuration"setting.

- **What it does:** Provides an extra layer of control by letting you block specific websites or pages, even if they are allowed in the ACL configuration. The block list takes priority.
- **How it works:** You specify websites or pages that you don't want to be redirected to your device, even if they are generally allowed by the ACL configuration.
- **Default:** No URL is configured
- **Wildcards:** Similar to the ACL configuration, you can use wildcards (*) to block multiple pages or subdomains.
- **Example:** To block only the index.html page on a website, you would enter: https://www.example.com/sports/index.html

Browser content redirection authentication sites

This setting lets you manage how Browser Content Redirection works with websites that use external identity providers (IdPs) for logins.

- **What it does:** Ensures that Browser Content Redirection stays active even when you're redirected to a different website for authentication (like when a website uses Okta or another service for login).
- **How it works:** You add the URLs of the authentication websites to this list so that the redirection process isn't interrupted during login.
- **Default:** No URL is configured
- **Example:** If www.example.com uses www.example.okta.com for authentication, you would add www.example.com/ to the Browser content redirection ACL configuration and the authentication websites www.example.okta.com to the Browser content redirection authentication sites
- **More info:** See Citrix Knowledge Center article CTX238236 and Multimedia section in Browser Content Redirection for detailed information.

Browser content redirection proxy configuration

This setting gives you more control over how Browser Content Redirection uses your network's proxy server as well as facilitate server fetch client render in case your environment doesn't allow for client fetch client render.

- **What it does:** Forces Citrix Workspace app to use a server fetch method for fetching web content. When enabled, it always tries to fetch content from the server and display it on your device.
- **Options:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Explicit Proxy: Use a specific proxy server. You'll need to provide the proxy server's address and port number (e.g., http://proxy.example.com:80)
  - Allowed patterns:

http://<hostname/ip address>:	Example: http://proxy.example.citrix.com:80 http://10.10.10.10:8080

  -
- PAC/WPAD: Use a PAC file or WPAD to automatically determine proxy settings. You'll need to provide the URL of the PAC file (e.g., http://wpad.myproxy.com:30/configuration/pac/Proxy.pac).
  - Allowed patterns for PAC/WPAD files:

http://<hostname/ip address>://.pac	Example: http://wpad.myproxy.com:30/configuration/pac/Proxy.pac

  -

https://<hostname/ip address>://	Example: http://10.10.10.10/configuration/pac/wpad.dat

  -
- Direct/Transparent: Do not use a proxy server, or use a transparent proxy.
  - Configure the key word "DIRECT"
  - The keyword is case sensitive

- **Default:** Prohibited (disabled)

Browser content redirection Integrated Windows authentication support

This setting simplifies logins to websites that use Integrated Windows Authentication (IWA).

- **What it does:** Allows Browser Content Redirection to use your existing Windows credentials to log in to websites automatically. This means you won't have to enter your username and password repeatedly.
- **Options:**
  - **Allowed:** Enables single sign-on (SSO) for websites using IWA.
  - **Prohibited:** (Default) Disables SSO, requiring you to enter your credentials each time.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Browser content redirection server fetch proxy auth

This setting controls how Browser Content Redirection interacts with your web proxy when fetching content from the server.

- **What it does:** Allows Browser Content Redirection to use your Windows credentials to authenticate with the proxy server, ensuring secure access to web content.
- **How it works:** When enabled, Browser Content Redirection will automatically obtain and use a Kerberos service ticket to authenticate with the proxy.
- **Requirements:** You need to configure your PAC file to route traffic through a downstream web proxy and set up the proxy to use Kerberos authentication.
- **Options:**
  - **Allowed:** Enables Kerberos authentication with the proxy server.
  - **Prohibited:** (Default) Browser Content Redirection will use basic authentication or other available credentials to authenticate with the proxy.

Client sensors policy settings

May 13, 2026

The **Client Sensors** section includes policy settings for controlling how mobile device sensor information is handled in a user session.

Allow applications to use the physical location of the client device

This setting determines whether applications running in a session on a mobile device are allowed to use the physical location of the user device.

By default, the use of location information is prohibited

When this setting is prohibited, attempts by an application to retrieve location information return a ‘‘permission denied’’value.

When this setting is allowed, a user can prohibit use of location information by denying a Citrix Workspace™ app request to access the location. Android and iOS devices prompt at the first request for location information in each session.

When developing hosted applications that use the Allow applications to use the physical location of the client device setting, consider the following:

- Ensure that a location-enabled application doesn’t rely on location information being available because:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - A user might not allow access to location information.
    - The location might not be available or might change while the application is running.
    - A user might connect to the application session from a different device that does not support location information.

- A location-enabled application must:
    - Have the location feature off by default.
    - Provide the user an option to allow or disallow the feature while the application is running.
    - Provide the user an option to clear location data that the application caches. (Citrix Workspace app does not cache location data.)
- A location-enabled application must manage the granularity of the location information. This management ensures that the data acquired is appropriate to the purpose of the application. Also, conforms to regulations in all relevant jurisdictions.
- Enforce a secure connection (for example, using TLS or a VPN) when using location services. Connect Citrix Workspace app to trusted servers.
- Consider obtaining legal advice regarding the use of location services.

Desktop UI policy settings

May 13, 2026

The **Desktop UI** section includes policy settings that control visual effects such as desktop wallpaper, menu animations, and drag images. These policy settings help to manage the bandwidth used in client connections. You can improve application performance on a WAN by limiting bandwidth usage.

> **Important:**
>
> We do not support legacy graphics mode and Desktop Composition Redirection (DCR) in this release. This policy is included only for backward compatibility when using:
>
> - XenApp 7.15 LTSR
> - XenDesktop 7.15 LTSR
> - Previous VDA releases with Windows 7 and Windows 2008 R2.

Desktop Composition Redirection

This setting specifies whether to use the processing capabilities of the following for local DirectX graphics rendering to provide users with a more fluid Windows desktop experience:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Graphics processing unit (GPU) on the user device
- Or,
- Integrated graphics processor (IGP) on the user device

When enabled, **Desktop Composition Redirection** delivers a highly responsive Windows experience while maintaining high scalability on the server.

By default, **Desktop Composition Redirection** is disabled.

To deselect **Desktop Composition Redirection** and reduce the bandwidth required in user sessions, select **Disabled** when you add this setting to a policy.

Desktop Composition Redirection graphics quality

This setting specifies the quality of graphics used for Desktop Composition Redirection.

The default is High.

Choose from High, Medium, Low, or Lossless quality.

Desktop wallpaper

This setting allows or prevents wallpaper showing in user sessions.

By default, user sessions can show wallpaper.

To deselect desktop wallpaper and reduce the bandwidth required in user sessions, select **Prohibited** when adding this setting to a policy.

Menu animation

This setting allows or prevents menu animation in user sessions.

By default, menu animation is allowed.

Menu animation is a Microsoft personal preference setting for ease of access. When enabled, it causes a menu to appear after a short delay, either by scrolling or fading in. An arrow icon appears at the bottom of the menu. The menu appears when you point to that arrow.

Menu animation is enabled on a desktop if this policy setting is set to **Allowed** and the menu animation Microsoft personal preference setting is enabled.

> **Note:**
>
> Changes to the menu animation Microsoft personal preference setting affect the desktop. Consider that you set the desktop to discard changes when the session ends. In this case, a user,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> who has enabled menu animations, might not have menu animation in subsequent sessions. For users who require menu animation, enable the Microsoft setting in the main image for the desktop or ensure that the desktop retains user changes.

View window contents while dragging

This setting allows or prevents the display of window contents when dragging a window across the screen.

By default, viewing window contents is allowed.

When set to **Allowed**, the entire window appears to move when you drag it. When set to **Prohibited**, only the window outline appears to move until you drop it.

End user monitoring policy settings

May 13, 2026

The **End User Monitoring** section includes policy settings for measuring session traffic.

Endpoint location data collection

By default, this policy is disabled.
When enabled, endpoint location data is collected, including the public IP address, country, city, and Internet Service Provider (ISP) of the endpoint device.
Data collected is shown in Citrix Director or Monitor under the **Session Performance** tab for a selected user session.

Endpoint network latency measurement interval

By default, this policy is disabled.
This setting specifies the frequency, in seconds, at which the endpoint measures the network latency.
When enabled, data collected is shown in Citrix Director or Monitor under the **Session Performance** tab for a selected user session.

Endpoint statistics interval

Endpoint statistics like Network interface type, Signal strength, Link speed, Throughput outgoing, Throughput incoming etc. are available as endpoint telemetry in the session topology on the Director

© 1997–2026 Citrix Systems, Inc. All rights reserved.

or Monitor UI. This telemetry helps with triaging end-user session issues.
Endpoint statistics interval indicates the frequency, in seconds, at which endpoint telemetry is refreshed in the Session topology within Director or Monitor UI. By default, endpoint telemetry is enabled and refreshed every 60 seconds.
Data collected is shown in Citrix Director or Monitor under the **Session Performance** tab for a selected user session.

ICA® round trip calculation

This setting determines whether ICA round trip calculations are done for active connections.

By default, calculations for active connections are enabled.

By default, each ICA round trip measurement initiation is delayed. This delay is until some traffic occurs that indicates user interaction. This delay can be indefinite in length and is designed to prevent the ICA round trip measurement being the sole reason for ICA traffic.

ICA round trip calculation interval

This setting specifies the frequency, in seconds, at which ICA round trip calculations are performed.

By default, the ICA round trip is calculated every 15 seconds.

ICA round trip calculations for idle connections

This setting determines whether ICA round trip calculations are done for idle connections.

By default, calculations are not performed for idle connections.

By default, each ICA round trip measurement initiation is delayed. This delay is until some traffic occurs that indicates user interaction. This delay can be indefinite in length and is designed to prevent the ICA round trip measurement being the sole reason for ICA traffic.

Enhanced desktop experience policy setting

May 13, 2026

The Enhanced desktop experience policy setting runs sessions on server-operating systems that look like local Windows 7 desktops.

By default, this setting is allowed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If a user profile with the Windows Classic theme exists on the virtual desktop, this policy does not provide an enhanced desktop experience for that user. Consider a user with a Windows 7 theme user profile logs on to a virtual desktop running Windows Server 2012. Also, this policy is either not configured or disabled. In this case, that user sees an error message indicating failure to apply the theme.

In both cases, resetting the user profile resolves the issue.

If you disable the policy on a virtual desktop with active user sessions, the interface of those sessions becomes inconsistent on Windows 7 and Windows Classic desktops. To avoid this inconsistency, ensure you restart the virtual desktop after changing this policy setting. Then delete any roaming profiles on the virtual desktop. Citrix® also recommends deleting any other user profiles on the virtual desktop to avoid inconsistencies between profiles.

Consider that you are using roaming user profiles in your environment. In this case, ensure that the Enhanced Desktop Experience feature is enabled or disabled for all virtual desktops that share a profile.

Citrix does not recommend sharing roaming profiles between virtual desktops running server operating systems and client operating systems. Profiles for client and server operating systems differ. Sharing roaming profiles across both types can lead to inconsistencies in profile properties when a user moves between the two.

File Redirection policy settings

May 13, 2026

The **File Redirection** section includes policy settings relating to client drive mapping and client drive optimization.

Auto connect client drives

This setting allows or prevents automatic connection of client drives when users log on.

By default, automatic connection is allowed.

When adding this setting to a policy, ensure to enable the settings for the drive types you want automatically connected. For example, to allow automatic connection of users' CD-ROM drives, configure this setting and the **Client optical drives** setting.

The following policy settings are related:

- **Client drive redirection**
- **Client floppy drives**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Client optical drives**
- **Client fixed drives**
- **Client network drives**
- **Client removable drives**

Client drive redirection

This setting enables or disables file redirection to and from drives on the user device.

By default, file redirection is enabled.

> **Note:**
>
> Client drive redirection policy settings do not apply to drives mapped to sessions using generic USB redirection.

When enabled, users can save files to all their client drives. When disabled, all file redirection is prevented. This configuration is applicable regardless of the state of the individual file redirection settings. The individual file redirection settings include Client floppy drives and Client network drives.

The following policy settings are related:

- **Client floppy drives**
- **Client optical drives**
- **Client fixed drives**
- **Client network drives**
- **Client removable drives**

Client fixed drives

This setting allows or prevents users from accessing or saving files to fixed drives on the user device.

By default, accessing client-fixed drives is allowed.

When adding this setting to a policy, ensure that the **Client drive redirection** setting is present and set to Allowed. If these settings are disabled, client-fixed drives are not mapped and users cannot access these drives manually, regardless of the state of the **Client fixed drives** setting.

Configure the **Auto connect client drives** setting to ensure that fixed drives are automatically connected when users log on.

Client floppy drives

This setting allows or prevents users from accessing or saving files to floppy drives on the user device.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, accessing client-floppy drives is allowed.

When adding this setting to a policy, ensure that the **Client drive redirection** setting is present and set to Allowed. If these settings are disabled, client-floppy drives are not mapped and users cannot access these drives manually, regardless of the state of the **Client floppy drives** setting.

To ensure that floppy drives are automatically connected when users log on, configure the **Auto connect client drives** setting.

Client network drives

This setting allows or prevents users from accessing and saving files to network (remote) drives through the user device.

By default, accessing client network drives is allowed.

When adding this setting to a policy, ensure that the **Client drive redirection** setting is present and set to Allowed. If these settings are disabled, client network drives are not mapped and users cannot access these drives manually. This configuration is applicable regardless of the state of the **Client network drives** setting.

To ensure that network drives are automatically connected when users log on, configure the **Auto connect client drives** setting.

Client optical drives

This setting allows or prevents users from accessing or saving files to the following:

- CD-ROM on the user device
- DVD-ROM on the user device
- BD-ROM drives on the user device.

By default, accessing client-optical drives is allowed.

When adding this setting to a policy, ensure that the **Client drive redirection** setting is present and set to **Allowed**. If these settings are disabled, client-optical drives aren't mapped and users can't access these drives manually. This configuration is applicable regardless of the state of the **Client optical drives** setting.

To ensure that optical drives are automatically connected when users log on, configure the **Auto connect client drives** setting.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Client removable drives

This setting allows or prevents users from accessing or saving files to USB drives on the user device.

By default, accessing client-removable drives is allowed.

When adding this setting to a policy, verify that the **Client drive redirection** setting is present and set to Allowed. If these settings are disabled, client-removable drives are not mapped and users cannot access these drives manually. This configuration is applicable regardless of the state of the **Client removable drives** setting.

Configure the **Auto connect client drives** setting to ensure that removable drives are automatically connected when users log on.

Host to client redirection

This setting enables or disables file type associations for URLs and some media content to be opened on the user device. When disabled, content opens on the server.

By default, file type association is disabled.

These URL types are opened locally when you enable this setting:

- HTTP
- HTTPS
- Real Player and QuickTime (RTSP)
- Real Player and QuickTime (RTSPU)
- Legacy Real Player (PNM)
- Microsoft Media Server (MMS)

Preserve client drive letters

This setting enables or disables mapping of client drives to the same drive letter in the session.

By default, client drive letters are not preserved.

When adding this setting to a policy, ensure that the **Client drive redirection** setting is present and set to Allowed.

Read-only client drive access

This setting allows or prevents users and applications from the following:

- Creating files on mapped client drives

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Changing files on mapped client drives
- Changing folders on mapped client drives

By default, files and folders on mapped client drives can be changed.

If set to Enabled, files and folders are accessible with read-only permissions.

When adding this setting to a policy, ensure the **Client drive redirection** setting is present and set to Allowed.

Special folder redirection

This setting allows or prevents Citrix Workspace™ app and Web Interface users to see their local Documents and Desktop special folders from a session.

By default, special folder redirection is allowed.

This setting prevents any objects filtered through a policy from having special folder redirection, regardless of settings that exist elsewhere. When this setting is prohibited, any related settings specified for StoreFront™, Web Interface, or Citrix Workspace app are ignored.

To define which users can have special folder redirection, select **Allowed** and include this setting in a policy filtered on the users you want to have this feature. This setting overrides all other special folder redirection settings.

Policy settings that prevent users from accessing or saving files to their local hard drives also prevent special folder redirection from working. This situation occurs because special folder redirection must interact with the user device.

When adding this setting to a policy, ensure that the **Client fixed drives** setting is present and set to Allowed.

File transfer policies

By default, file transfer is enabled. Use Web Studio to change these policies, located under **User setting - ICA\File Redirection**. Consider the following when using file transfer policies:

- **File transfer for Citrix Workspace app for Chrome OS/HTML5** - Allows or prevents users from transferring files between a Citrix Virtual Apps and Desktops session and their devices.
- **Upload file for Citrix Workspace app for Chrome OS/HTML5** - Allows or prevents users from uploading files from their device to a Citrix Virtual Apps and Desktops session.
- **Download file for Citrix Workspace app for Chrome OS/HTML5** - Allows or prevents users from downloading files from a Citrix Virtual Apps and Desktops session to their device.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The file transfer policies are applicable only for Citrix Workspace app for HTML5 and for Citrix Workspace app for Chrome OS.

Use asynchronous writes

This setting enables or disables asynchronous disk writes.

By default, asynchronous writes are disabled.

Asynchronous disk writes can improve the speed of file transfers and writing to client disks over WANs, which relatively high bandwidth and high latency typically characterize. However, if there is a connection or disk fault, the client file or files being written might end in an undefined state. If this undefined state occurs, a pop-up window informs the user of the files affected. The user can then take remedial action such as restarting an interrupted file transfer on reconnection or when the disk fault is corrected.

Citrix® recommends enabling asynchronous disk writes only for users requiring remote connectivity having good file access speed. And who can easily recover files or data lost if there is a connection or disk failure.

When adding this setting to a policy, verify that the **Client drive redirection** setting is present and set to Allowed. If this setting is disabled, asynchronous writes don't occur.

Overview

May 15, 2026

Clipboard redirection is a fundamental feature in Citrix Virtual Apps and Desktops™, enabling seamless copy and paste of data between the user's local endpoint and their virtual Citrix sessions.

Clipboard redirection allows users to copy and paste data, such as text, images, and files, between applications running on their local device and those within their Citrix session. This is achieved by mapping the clipboard on the user device to the clipboard on the VDA. By default, clipboard redirection is allowed.

Clipboard redirection works over a separate virtual channel within the HDX™ protocol. An additional virtual channel is used for file transfer and Drag and Drop. When a user copies data on their local device, the Citrix Workspace™ app intercepts the data and makes it available for pasting into applications running in the session. Actual data will be transferred if and when the data is pasted to an application on the VDA. The process works in reverse when copying from the Citrix session to the client.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This combination of client to session and session to client clipboard redirection is also known as bidirectional clipboard redirection.

> **Note:**
>
> More information see, Citrix Virtual Channels

Key concepts

Client to session, also referred to as Endpoint to Session or client to VDA. Data copied (placed on the clipboard) on the user's local device is made available to be pasted inside the virtual session.

Session to Client, also referred to as Session to Endpoint or VDA to client). Data copied from an application within the virtual session is made available to be pasted on the user's local device.

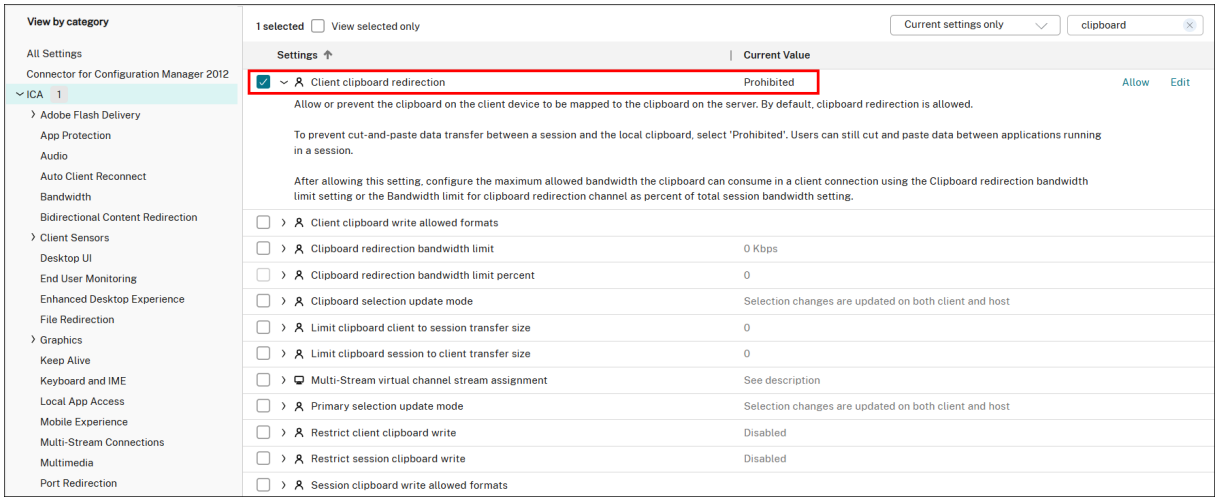
Cross session (session to session or VDA to VDA). A new clipboard transfer method where data copied from one Citris session can be pasted into another Citrix session without ever being stored on the local endpoint's clipboard. This functionality is available on Citrix Virtual Apps and Desktops™ version 2507 as a Preview feature and is referred to as the Cross-session clipboard exchange feature. See 'Cross session clipboard' for more information.

Configuration

May 13, 2026

Clipboard redirection is controlled through Citrix® policies. These policies offer a range of settings to fine-tune the clipboard redirection behavior.

By default, bidirectional clipboard redirection is enabled: users can copy and paste data from their Citrix session to their local endpoint and vice versa.



Core Setting

The core clipboard redirection configuration is the 'Client clipboard redirection policy'. This policy controls whether clipboard redirection is allowed. By default, clipboard redirection is allowed.

Disabling clipboard redirection can improve security by preventing accidental or malicious transfer of sensitive data outside the Citrix virtual environment. It also helps in preventing the introduction of potentially harmful data into the Citrix environment via the clipboard. However, this may negatively affect the end-user experience.

To prohibit clipboard redirection, set the 'Client clipboard redirection policy' to 'prohibited':

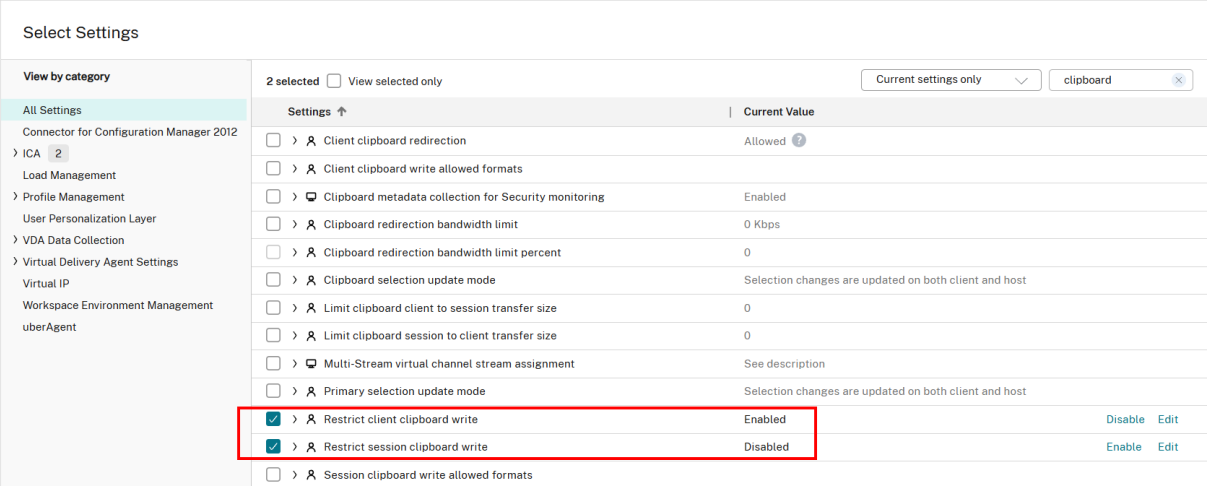
© 1997–2026 Citrix Systems, Inc. All rights reserved.

If set to Prohibited, clipboard redirection is disabled entirely and all other clipboard-related policies are ignored.

Users can still copy and paste data between applications running inside their Citrix sessions and on their local endpoint device; however, copying and pasting from and to their Citrix session is not available.

Directional clipboard control

With directional clipboard control, admins have granular control over the direction of clipboard data flow. This is also known as unidirectional clipboard control.



There are two primary modes of unidirectional control available:

- **Client-to-session:** In this configuration, the 'Restrict client clipboard write'policy is used, and clipboard data is permitted to flow exclusively from the user's endpoint device (client) to the remote Citrix session. This means that users can copy information from their local machine and paste it into applications running within the Citrix session, but they cannot copy data from the Citrix session and paste it back to their local machine. This mode is beneficial for scenarios where data leakage from the secure session to the less-controlled endpoint is a significant concern.
- **Session-to-client:** In this configuration, the 'Restrict session clipboard write policy'allows clipboard data to flow exclusively from the Citrix session to the client device. Users can copy information from applications within the remote session and paste it onto their local machine, but they are prevented from copying data from their local machine and pasting it into the Citrix session. This setting is often used when the primary goal is to prevent the introduction of potentially malicious or unauthorized data from the endpoint into the secure Citrix environment.

The following table describes the Citrix clipboard policies for unidirectional clipboard control:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clipboard Directionality	Clipboard Policies
Bidirectional - Session to Client and Client to Session	Client clipboard redirection: Enabled (Default)
Unidirectional - Client to Session only	Client clipboard redirection: Enabled (Default)
Restrict client clipboard write: Enabled	Unidirectional - Session to Client only
Client clipboard redirection: Enabled (Default)	Restrict session clipboard write: Enabled

In the example above, both directional clipboard policies are highlighted, and in this configuration, only client-to-session clipboard redirection is permitted because the 'Restrict client clipboard write' setting is set to 'Enabled'.

Clipboard Format control

May 13, 2026

Citrix Clipboard format control policies enhance clipboard security by limiting data transfer to specific clipboard formats, thereby controlling the types of data that can be copied and pasted between session and client and vice versa. It can be used to selectively allow or deny certain clipboard data formats.

Clipboard exchange formats are used to enable seamless transfer of information between diverse applications, ranging from multimedia programs to complex spreadsheets and word processors. These formats define the structure and encoding of data that can be copied, cut, and pasted, allowing applications to understand and process the content exchanged.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For instance, when copying text from a web browser and pasting it into a word document, the clipboard employs a text-based format. However, if the copied content includes images, tables, or rich text formatting, the clipboard will utilize more sophisticated formats like RTF (Rich Text Format) or HTML (HyperText Markup Language) to preserve the original appearance and structure. Similarly, when exchanging data between specialized applications, such as a CAD program and a presentation tool, the clipboard might use application-specific formats or common metafile formats to ensure accurate representation of the graphical or complex data.

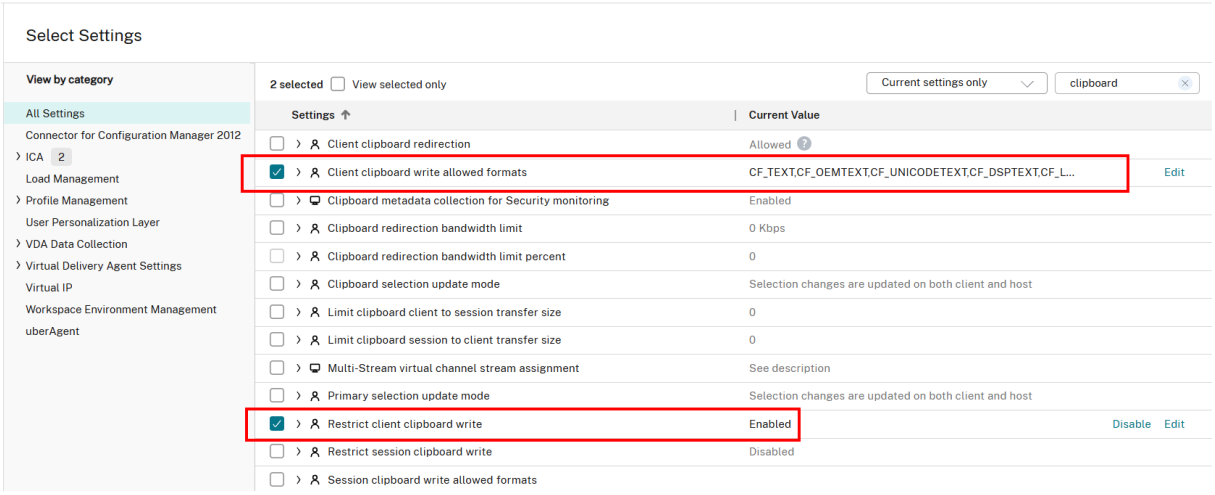
The clipboard format control policies are designed to work in conjunction with the directional clipboard control policies.

With Clipboard Format control, admins can which formats are allowed for example:

- Allow plain text only in both directions
- Allow session to client clipboard transfer only for plain text and images

Or a combination where you can limit the formats that can be pasted from the client to the session, but allow all formats to be pasted from the session back to the client.

Two primary policies control the behavior of clipboard formats:



Client Clipboard Write Allowed Formats: This policy dictates explicitly which clipboard data formats are permitted to be written from the remote session to the client clipboard. For example, an administrator might configure this policy to allow only plain text to be copied to the client, preventing the transfer of potentially malicious rich text, images, or files.

Session Clipboard Write Allowed Formats: Secondly, this policy specifies which clipboard data formats are allowed to be copied from the client to the remote session. This policy is vital for controlling what kind of information can be transferred into the remote environment. An organization might restrict this to only allow plain text, preventing users from inadvertently or intentionally pasting sensitive files or images from their local machine into a less secure or unauthorized remote application.

> **Note:**
>
> The Clipboard allowed formats are only evaluated if the corresponding unidirectional clipboard policy is also set.

To restrict the client clipboard write formats to accept only text-based data formats, both the ‘Restrict client clipboard write’policy AND ‘Client Clipboard Write Allowed Formats’need to be configured. In this example, ‘Restrict client clipboard write’needs to be set to **Enabled**, and the ‘Client Clipboard Write Allowed Formats’needs to contain all clipboard text formats:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure the write format restriction, please edit the corresponding policy and ensure each entry is placed on a separate line.

As an example:

CF_TEXT
CF_BITMAP

Is correct, however the following is incorrect:

CF_TEXT,CF_BITMAP

Standard clipboard data formats

May 13, 2026

The table below describes the standard clipboard formats.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clipboard Format	Type	Description
CF_TEXT	Text format	Text in the standard ANSI character set. Each line ends with a carriage return/linefeed (CR-LF) combination.
CF_OEMTEXT	Text format	Text using the Original Equipment Manufacturer (OEM) character set. Similar to CF_TEXT.
CF_UNICODETEXT	Text format	Text in Unicode format. It does not require a null terminator.
CF_LOCALE	Text format	A handle to the locale identifier associated with clipboard text. This helps in correctly interpreting the text's language and regional settings.
CF_HTML*	Text format	Represents HTML-formatted text, allowing for rich text, links, and images to be copied and pasted between applications that support it.
CF_BITMAP	Image Format	A device-dependent bitmap. The image data is specific to a particular output device.
CF_DIB	Image Format	A Device-Independent Bitmap. This format contains color information and dimensions, allowing it to be displayed correctly on any device.
CF_DIBV5	Image Format	An extension of CF_DIB (Device-Independent Bitmap, Version 5) that includes more advanced features like color profiles and alpha channels for transparency.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clipboard Format	Type	Description
CF_PALETTE	Image Format	A handle to a color palette. It's used by applications to control the colors of other clipboard data, typically a bitmap.
CF_TIFF	Image Format	Tagged Image File Format. A common, high-quality image format used in publishing and photography.
CF_METAFILEPIC	Metafile format	A handle to a metafile picture structure. This is an older format for storing a collection of GDI (Graphics Device Interface) functions to recreate an image
CF_ENHMETAFILE**		A handle to an enhanced metafile. This is a more modern and robust version of CF_METAFILEPICT, offering better image quality and device independence.

Note:

- HTML format is disabled by default. Enabling HTML format clipboard support can introduce a security risk. When content is copied from a web page, any embedded scripts are also copied. If this content is then pasted into an application that renders HTML, the scripts could be executed. Use caution when enabling this format.
- Enhanced metafile clipboard transfer is not available on Citrix Virtual Apps and Desktops™ version prior to 2511.
  Besides these standard formats, Citrix® also supports the following specific clipboard data formats like Data Exchange Formats and specialized formats.

Data Exchange formats

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clipboard data exchange formats facilitate the transfer of data between various applications, such as multimedia programs or spreadsheets.

Clipboard Format	Description
CF_SYLK	Symbolic Link format. An older format created by Microsoft for exchanging data between spreadsheet applications like Microsoft Excel.
CF_DIF	Data Interchange Format. A text-based format for exchanging data between spreadsheet programs.
CF_RIFF	Resource Interchange File Format. A container format for storing multimedia data, such as audio and video.
CF_WAVE	Waveform audio format. Represents audio data.

Special & System Formats

May 13, 2026

These formats serve specialized purposes, such as handling file drops, private data, or custom rendering.

Clipboard Format	Description
CF_HDROP	A handle to a list of dropped files. This is used for drag-and-drop operations from the file system (e.g., dropping files into an application window).
CF_PENDATA	Represents data from a pen or stylus, used in pen computing applications.
CF_OWNERDISPLAY	A format where the original window that placed data on the clipboard is responsible for drawing and updating the content in the clipboard viewer.

CF_DSPTEXT, CF_DSPBITMAP, CF_DSPMETAFILEPICT, CF_DISPENHMETAFILE are "display"formats that correspond to standard formats (TEXT, BITMAP, etc.) but are used for private data that can be rendered within the clipboard viewer application. They are intended for application-specific use.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops™ clipboard formats

May 15, 2026

CFX clipboard formats are customized Citrix Virtual Apps and Desktops™ clipboard formats. These are highly optimized compared to the regular clipboard formats.

Clipboard Format	Description
CFX_RICHTEXT	Used to efficiently transfer formatted text—including different fonts, sizes, colors, and styles like bold or italic
CFX_OfficeDrawingShape	Handles Microsoft Office drawing objects. It allows users to copy and paste vector shapes, diagrams, and other graphics created within Office applications (like Word, Excel, or PowerPoint)
CFX_BIFF8	This corresponds to the BIFF8 (Binary Interchange File Format 8), which is the native file format for Microsoft Excel 97-2003. CFX_BIFF8 is the Citrix-optimized version for copying and pasting data and formulas between Excel spreadsheets.
CFX_FILE*	Used for file object transfers. When you copy a file on your local computer and paste it into a virtual desktop (or vice-versa), this format manages the data transfer. It's an optimized alternative to the standard CF_HDROP format

> **Note:**
>
> To allow file copy and paste and drag and drop, you must explicitly add CFX_FILE to the allowed formats.

Custom Clipboard Format

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Besides these clipboard formats, you can also configure additional custom clipboard formats. This is only applicable to those formats which are registered with the operating system on the VDA.

For more information, see custom registered clipboard formats.

Convertible clipboard formats

May 13, 2026

Microsoft Windows natively supports different clipboard formats. When copying and pasting clipboard content, Windows will automatically attempt to convert the clipboard data to other compatible clipboard formats, making it easier to paste the content into different applications.

When data formats are posted to the clipboard, Windows will automatically add additional formats that can be obtained by converting from any of the formats that were originally posted in order to increase the likelihood of successful pasting into other applications.

Windows will then automatically convert the clipboard data from one format to another if the target application requests a format that the source cannot directly provide.

For example, when copying formatted text from a Word processor, Windows will make other formats available to a requesting application, such as plain text as well as the originally posted formatted text.

As another example, if the clipboard data contains plain text data in the CF_TEXT clipboard format and the application that the data is pasted into requests Unicode text in the format of CF_UNICODETEXT, Windows will automatically convert the clipboard data during the pasting process.

> **Note:**
>
> With some conversion, information might be lost, for example with automatically converting rich text to plain text.

Clipboard Format	Description
CF_TEXT	CF_TEXT CF_OEMTEXT CF_UNICODETEXT CF_LOCALE
CF_BITMAP	CF_BITMAP

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clipboard Format	Description
	CF_DIB
	CF_DIBV5
CF_METAFILEPICT	CF_METAFILEPICT
	CF_ENHMETAFILE
CF_OEMTEXT	CF_TEXT
	CF_OEMTEXT
	CF_UNICODETEXT
	CF_LOCALE
CF_DIB	CF_BITMAP
	CF_DIB
	CF_DIBV5
CF_UNICODETEXT	CF_TEXT
	CF_OEMTEXT
	CF_UNICODETEXT
	CF_LOCALE
CF_ENHMETAFILE	CF_METAFILEPICT
	CF_ENHMETAFILE
CF_DIBV5	CF_BITMAP
	CF_DIB
	CF_DIBV5

> **Note:**
>
> The clipboard format conversion is Windows OS dependent and this table could change in future OS versions.

It's important to understand that the Windows clipboard system doesn't convert between all formats freely. Automatic conversions, are limited to a few core types, primarily between different text encodings and between bitmap variations.

For most other formats, compatibility is achieved when the source application places multiple formats onto the clipboard at once. For example, when you copy a chart from Excel, it might place the data as an Office Drawing Shape (CFX_OfficeDrawingShape), an Enhanced Metafile (CF_ENHMETAFILE), and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a simple Bitmap (CF_DIB). This isn't a conversion by the clipboard, but rather the source application providing multiple representations for different pasting scenarios.

Clipboard Format control & convertible formats

Convertible formats should be taken into consideration when designing the clipboard format control policies and the cross session clipboard configuration. For example, if you want to explicitly allow only text-based content to be copied from the client to the clipboard, you must add all text-based formats to the "Session Clipboard Write Allowed Formats"policy. In this example, you must add the following formats to the policy:

CF_TEXT

CF_UNICODETEXT

CF_DSPTEXT

CF_LOCALE

CF_OEMTEXT

Likewise, if you want to funnel all file formats through cross session when copying those types of data from one session to another, you will need to add all the file clipboard formats to the CrossSession-Formats configuration:

CFX_FILES

CFX_HFDROP

Clipboard transfer size limits

May 13, 2026

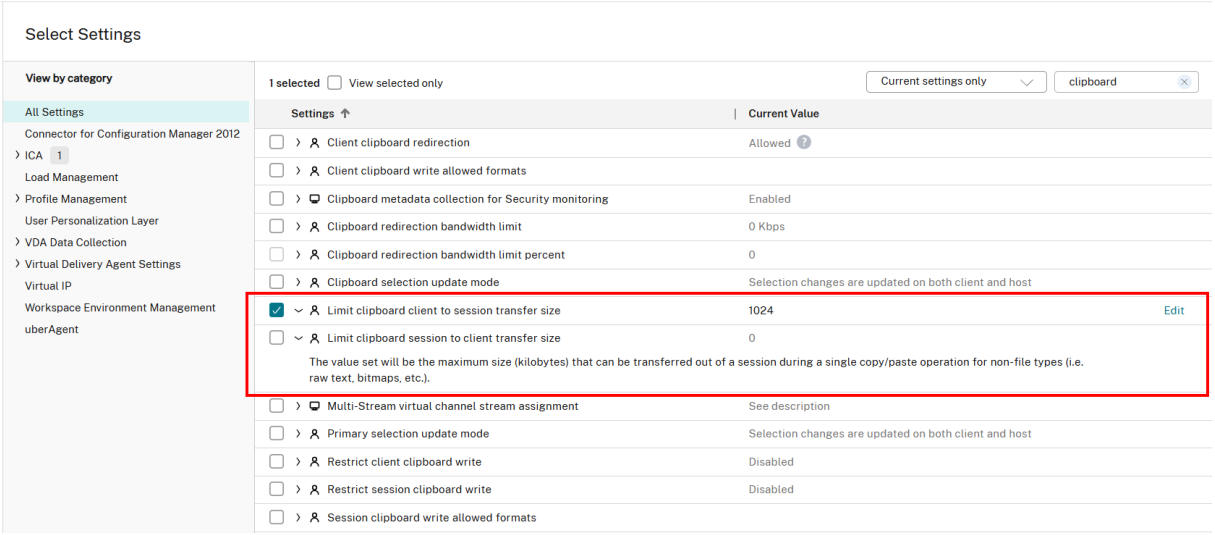
With Clipboard transfer size limits you can set limits on the size of data that can be transferred in a single copy-and-paste clipboard operation. By default, these settings are disabled and there's no limit on client to session and session to client clipboard transfers.

Transfer size limits can help in bandwidth management. Large clipboard transfers can consume significant network bandwidth, especially in environments with many concurrent users. By setting limits, administrators can ensure smoother performance for all users and prevent network congestion.

Unrestricted clipboard transfers can potentially pose a security risk. Malicious software or unauthorized users could potentially copy large amounts of sensitive data in or out of the session. Limiting transfer sizes acts as a preventative measure against such data breaches.

When configuring clipboard transfer size limits, administrators should consider:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

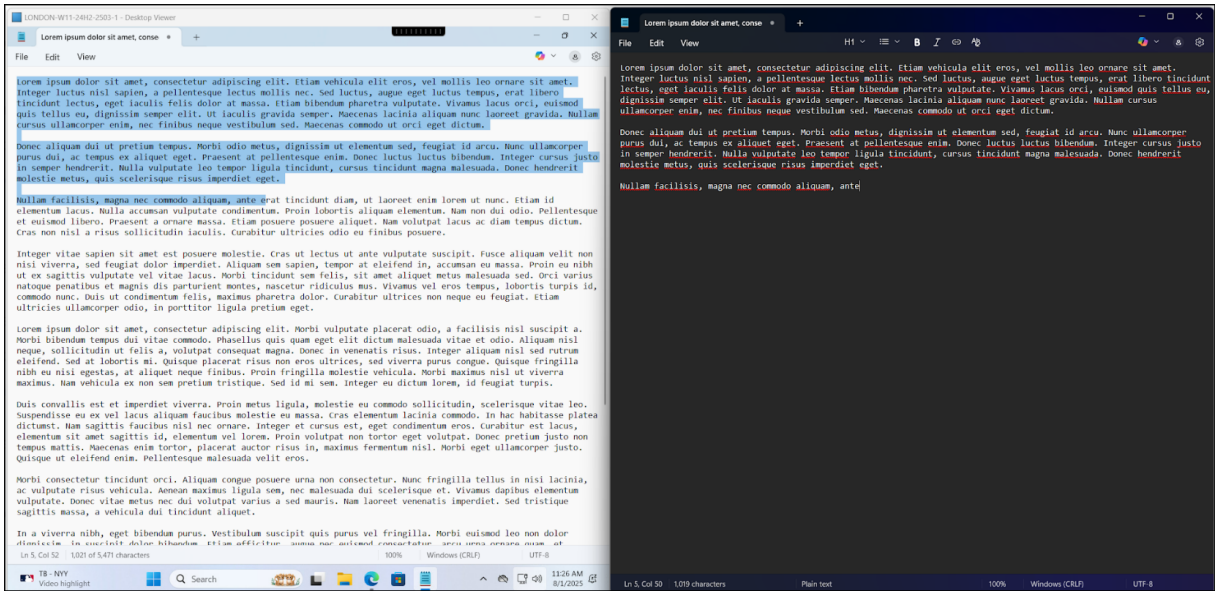


- User Needs: What are the typical copy-and-paste requirements of the users? Imposing overly restrictive limits can hinder productivity.
- Bandwidth usage: What is the available network bandwidth, and how many concurrent users are expected?
- Relevant Security policies: What are the organization's data security and compliance requirements?

Two primary settings provide granular control over clipboard data transfer:

Limit clipboard client to session transfer size: This setting configures the maximum size of data, in kilobytes, that can be copied from the user's local device (the client) and pasted into the remote session (e.g., a virtual desktop or seamless application).

Limit clipboard session to client transfer size: Secondly, this setting controls the maximum size of data, in kilobytes, that can be copied from within the remote session and pasted back to the user's local device. This is particularly relevant when users are working with sensitive data within the virtualized environment and need to prevent large data exfiltrations to the client.



In this example, the client to session clipboard limit was restricted to 1024 kilobytes:

> **Note:**
>
> The size limit is based on data size (in kilobytes, KB), not a fixed character count. Due to variable character encodings (like for example, Unicode), the number of characters that can be copied will vary. For example, a 10 KB limit will hold fewer characters for Unicode text than for standard ANSI text.

In the following example, the 'Limit clipboard session to client transfer size'policy has been set to 1 KB.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

With this clipboard transfer size limit in place, the selected text is the maximum number of characters that can be transferred from the Citrix® session on the left to the local Notepad on the right. If a user were to attempt to copy more characters from this Citrix session to his client, the text would not be truncated, but instead the entire paste operation would fail. Attempting to copy other data types, such as images or files will also fail if the content is larger than the maximum configured transfer size.

When setting this policy, consider the type of text data your users handle. If they frequently work with multilingual content or rich text, you may need to set a higher kilobyte limit to accommodate the larger data size of Unicode text.

The clipboard transfer size limits will be applied to **all allowed clipboard formats**.

Clipboard size limits are universally enforced across all permitted clipboard formats. This means that the limit determines the maximum amount of data that can be transferred, regardless of data type (e.g., text, images, files).

Clipboard Sharing Scope

August 20, 2026

> **Note:**
>
> Clipboard sharing scope is the generally available (GA) version of the feature previously released as a Preview under the name Cross-session clipboard exchange (Citrix Virtual Apps and Desktops 2507). It replaces the earlier Tech Preview functionality and documentation. At GA the feature is extended beyond session-to-session sharing to also support Chrome Enterprise Premium (CEP)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> as a destination.

Overview

Many organizations prevent users from copying data out of their Citrix sessions to the local device to reduce the risk of data leakage. Clipboard sharing scope lets you keep that protection in place while still allowing clipboard data to move between approved, controlled destinations.

Clipboard sharing scope can be used to restrict where clipboard data copied from a VDA session can be shared, without making that data available on the local device clipboard. Data copied from a session can be shared with another VDA session, or with Chrome Enterprise Premium (CEP), or both, but when Clipboard sharing scope is configured; it is never written to the endpoint's local clipboard. This keeps sensitive data inside a controlled environment.

How it works

Clipboard sharing scope is controlled by a single Citrix Studio policy: **Clipboard sharing scope.** The policy defines the set of destinations that a session is allowed to share clipboard data with:

VDA → VDA. Clipboard data is tunneled directly between the user's Citrix sessions. These can be Published Desktops, Published Applications or a combination of both. The data is never placed on the local device clipboard.

VDA → CEP. Clipboard data is shared from a VDA session to Chrome Enterprise Premium only. The data is never placed on the local device clipboard, and clipboard data from VDA to VDA is not possible.

When the policy is left at its default (e.g. the Clipboard sharing scope is *Unlimited*), clipboard data follows the standard clipboard redirection behavior governed by your existing clipboard policies, and no sharing-scope restrictions apply. The Unlimited behavior is the same as the clipboard behavior before CVAD 2607: the default behavior does not change, so existing deployments are unaffected unless you explicitly configure a different scope.

In every scope other than Unlimited, two things are always true:

VDA → Client is blocked. Clipboard data is never written to the local device clipboard. This is the core protection the feature provides.

Client → VDA is blocked by default, copying from the local device into the session is also blocked. This is by design and currently not configurable.

Requirements

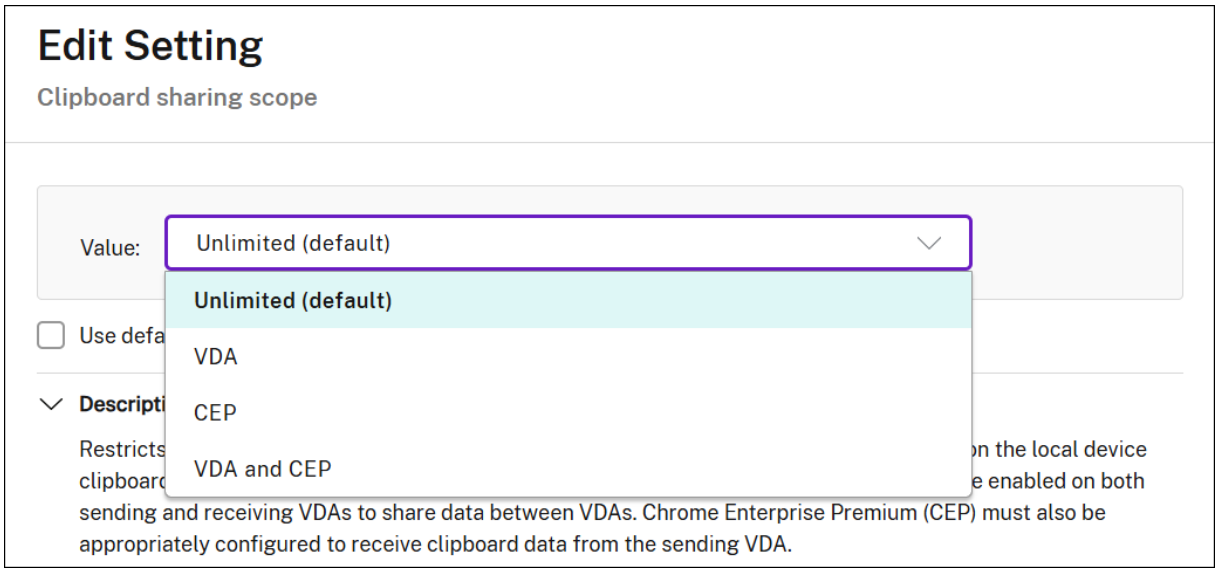
Windows VDA 2607 LTSR with Citrix Workspace App for Windows 2603.10, or later. Clipboard sharing scope is available only on Windows VDA 2607 LTSR in combination with CWA for Windows 2608. Both

© 1997–2026 Citrix Systems, Inc. All rights reserved.

are required to use any configured scope other than the default.

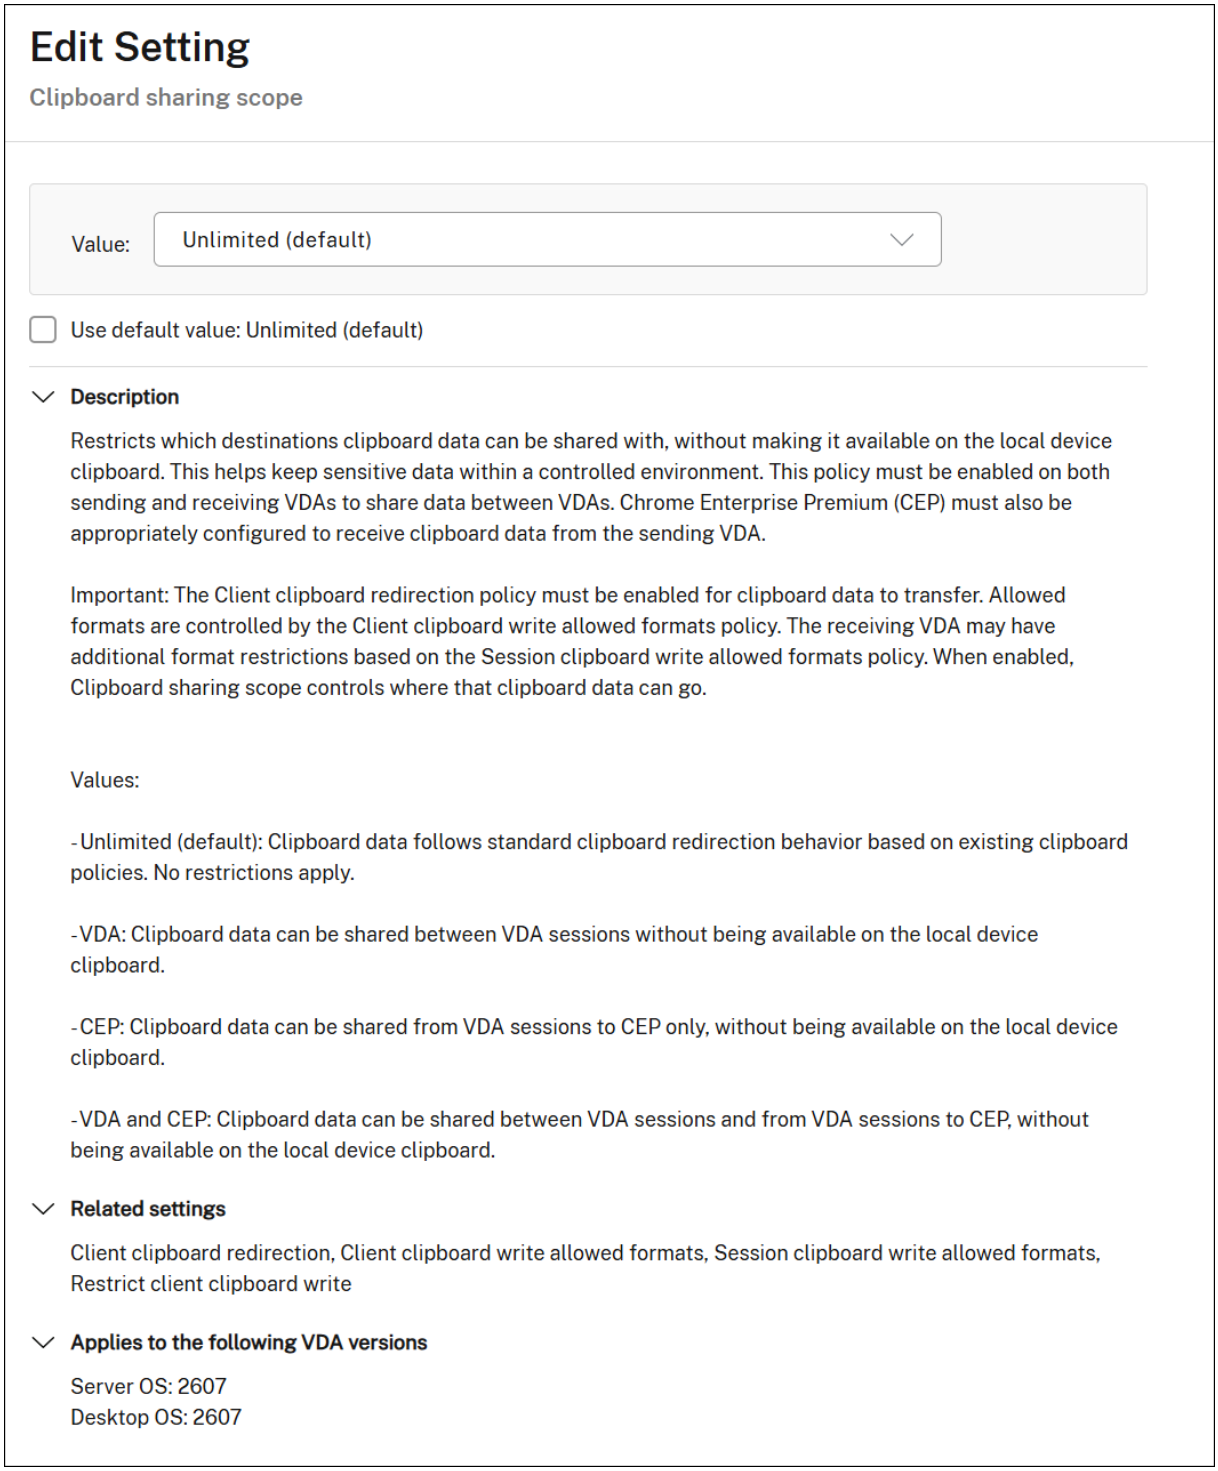
Older Citrix Workspace app clients are not supported. Any configured scope other than the default (VDA, CEP, or VDA and CEP) requires CWA for Windows 2603.10 or later. The default Unlimited scope preserves the existing (pre-2607) clipboard behavior and has no new client requirement.

When Clipboard sharing scope is configured for a VDA to anything other than the default, unlimited scope, clipboard transfer is not possible between the VDA and the client (and vice versa). To allow clipboard transfer between pre-CWA 2608 clients and the VDA that has clipboard sharing scope enabled, the client *MUST* update to CWA 2608 or later.



Both VDAs must have the policy enabled (VDA-to-VDA sharing). To share clipboard data between two VDA sessions, the Clipboard sharing scope policy must be enabled on both the sending and the receiving VDA. This is by design to prevent (accidental) data leakage via the receiving destination VDA.

CEP must be configured (CEP sharing). To share clipboard data from a VDA session to Chrome Enterprise Premium, CEP must be appropriately configured to receive clipboard data from the sending VDA.



Client clipboard redirection must be enabled. Clipboard data only transfers when the Client clipboard redirection policy is enabled. See Dependencies and related policies.

Configuration

Use the Clipboard sharing scope policy to restrict which destinations clipboard data can be shared with, without making it available on the local device clipboard. This helps keep sensitive data within a controlled environment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This policy must be enabled on both sending and receiving VDAs to share data between VDAs. Chrome Enterprise Premium (CEP) must also be appropriately configured to receive clipboard data from the sending VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> The Client clipboard redirection policy must be enabled for clipboard data to transfer. The receiving VDA may have additional format restrictions based on the Session clipboard write allowed formats policy. When enabled, Clipboard sharing scope controls where that clipboard data can go.

Value	Behavior
Unlimited (default)	Clipboard data follows standard clipboard redirection behavior based on existing clipboard policies. No restrictions apply. This matches the clipboard behavior before 2607 —the default behavior is unchanged.
VDA	Clipboard data can be shared between VDA sessions without being available on the local device clipboard. Clipboard data cannot be shared with the local endpoints.
CEP	Clipboard data can be shared from VDA sessions to CEP only, without being available on the local device clipboard.
VDA and CEP	Clipboard data can be shared between VDA sessions and from VDA sessions to CEP, without being available on the local device clipboard. Clipboard data cannot be shared with the local endpoints.

> **Important:**
>
> behavior change at GA: When Clipboard sharing scope is set to any value other than Unlimited (that is, VDA, CEP, or VDA and CEP), client-to-VDA clipboard redirection (copying from the local device into the session) is also blocked by default. This ensures that, once a controlled sharing scope is in effect, data does not flow in from the local endpoint clipboard unless you explicitly allow it.

Dependencies and related policies

Clipboard sharing scope works in conjunction with your existing clipboard policies. Configure the following alongside it:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Client clipboard redirection

This policy must be enabled for any clipboard data to transfer. Allowed by default.

More information: Client clipboard redirection

Client clipboard write allowed formats

This policy controls which clipboard data formats are permitted to be shared with the client.

More information: Client clipboard write allowed formats

Session clipboard write allowed formats

When Clipboard Scope is configured, the receiving VDA may apply additional format restrictions through this policy.

More information: Session clipboard write allowed formats

Limitations and notes

Any scope other than Unlimited requires Citrix Workspace app for Windows 2608 or later. Older clients are not supported with these scopes.

For VDA-to-VDA sharing, the policy must be enabled on both the sending and the receiving VDA. If it is enabled on only one side, sharing does not occur.

For CEP sharing, CEP must be configured to receive clipboard data from the sending VDA.

Setting the scope to any value other than Unlimited blocks client-to-VDA clipboard by default. See Client-to-VDA clipboard behavior.

Configuration examples

Example 1

Clipboard policies configured for VDA1:

- **Client clipboard redirection**: Enabled
- **Clipboard Sharing scope**: Set to VDA only

Clipboard policies configured for VDA2:

- **Client clipboard redirection**: Enabled

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Clipboard Sharing scope**: Set to VDA only

In this example, both VDAs have the same clipboard sharing scope configured, and the end user will be able to copy data from VDA1 to VDA2 securely without the clipboard data being available on the local endpoint clipboard.

Client-to-VDA and VDA-to-client clipboard transfers are blocked for both VDAs; clipboard sharing is only possible between VDA1 and VDA2.

Example 2

Clipboard policies configured for VDA1:

- **Client clipboard redirection**: Enabled
- **Clipboard Sharing scope**: Set to VDA only

Clipboard policies configured for VDA2:

- **Client clipboard redirection**: Enabled
- **Clipboard Sharing scope**: Set to VDA and CEP

This example is similar to the previous example, because both VDAs have a clipboard sharing scope configured that contains the VDA scope, the end user will be able to copy data from VDA1 to VDA2 securely without the clipboard data being available on the local endpoint clipboard.

Client-to-VDA and VDA-to-client clipboard transfers are blocked for both VDAs; clipboard sharing is only possible between VDA1 and VDA2.

Additionally, VDA2 will be able to securely share clipboard data with CEP.

Example 3

Clipboard policies configured for VDA1:

- **Client clipboard redirection**: Enabled
- **Clipboard Sharing scope**: not set or default

Clipboard policies configured for VDA2:

- **Client clipboard redirection**: Enabled
- **Clipboard Sharing scope**: Set to VDA only

Here, a user can copy clipboard data from VDA1 to VDA2. Because Clipboard sharing scope is *not configured* on VDA1, the clipboard data will also be available on the local endpoint.

The user *cannot* copy from VDA2 to VDA1, because VDA2 has clipboard sharing scope enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clipboard sharing from client to VDA is also not restricted to VDA1, but VDA2 cannot copy from, or to the client because it has Clipboard sharing scope configured for VDA only sharing.

Example 4

Clipboard policies configured for VDA1:

- **Client clipboard redirection**: Enabled
- **Clipboard Sharing scope**: set to VDA only

Clipboard policies configured for VDA2:

- **Client clipboard redirection**: Enabled
- **Clipboard Sharing scope**: Set to VDA only
- **Session clipboard write allowed format**: set to text-based formats only

Both VDAs have the same clipboard sharing scope configured, and the end user will be able to copy data from VDA1 to VDA2 securely without the clipboard data being available on the local endpoint clipboard; however, because there are additional constraints that have been set on clipboard data formats that VDA2 will accept, only text-based clipboard data may be pasted into VDA2. From VDA1 to VDA2, no clipboard-type restrictions are defined, and as such, any clipboard data type can be pasted from VDA2 into VDA1.

Client-to-VDA and VDA-to-client clipboard transfers are blocked for both VDAs; clipboard sharing is only possible between VDA1 and VDA2.

Scenarios and use case examples

May 13, 2026

Properly configuring clipboard redirection policies is key to balancing user productivity and corporate security. The optimal configuration depends on the specific use cases.

The following are some common use case examples:

Standard knowledge worker

For most users like knowledge workers and the typical office users, the goal is seamless copy-paste of text and simple images between local and remote applications. In this scenario, the default policy configuration is often sufficient.

Configuration:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Client clipboard redirection: **Allowed** (Default)

Sensitive data use cases

Consider a healthcare or financial institution where users need to paste information into a secure session (e.g., patient data into an EHR) but must be prevented from copying sensitive data out to their local device. This can help prevent accidental data exfiltration via the clipboard:

Configuration:

- Client clipboard redirection: **Allowed**
- Restrict client clipboard write: **Enabled** (Blocks copy from session to client)
- For added security, enable Restrict session clipboard write and use Session clipboard write allowed formats to only permit plain text (CF_TEXT).

Alternatively, customers can use the new Cross session clipboard functionality (PREVIEW) to allow clipboard session-to-session while preventing session-to-client redirection.

Developers and IT Administrators

These users often require the ability to copy files, such as scripts, log files, or installers, between their local machine and the VDA. This requires a more permissive configuration.

Configuration:

- Client clipboard redirection: **Allowed**
- To enable file copy from session to client, ensure Restrict client clipboard write is **Disabled**, or if enabled, add the CFX_FILE format to the Client clipboard write allowed formats list.
- To enable file copy from client to session, ensure Restrict session clipboard write is **Disabled**, or if enabled, add CFX_FILE to the Session clipboard write allowed formats list.

Configure these policies to target the relevant groups containing the developer or IT Admins instead of individually adding users to the policy.

Graphics policy settings

May 15, 2026

The **Graphics** section includes policy settings for controlling how images are handled in user sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Allow visually lossless compression

This setting allows visually lossless compression to be used instead of true lossless compression for graphics. Visually lossless improves performance over true lossless, but has minor loss that is unnoticeable by sight. This setting changes the way the values of the Visual quality setting are used.

By default this setting is disabled.

Graphics status indicator

This setting configures the graphics status indicator to run in the user session. This tool lets the user see information about the active graphics mode.

The information includes details about video codec, hardware encoding, image quality, and monitors in use for the session. With the graphics status indicator, the user can also enable or disable pixel-perfect mode.

Releases of Citrix Virtual Apps and Desktops™ 2103 and later include an image quality slider to help the user find the right balance between image quality and interactivity.

Releases of Citrix Virtual Apps and Desktops™ 2109 and later include functionality to configure a virtual display layout through a user interface launched using the graphics status indicator.

The graphics status indicator replaces the lossless indicator tool from previous versions. This policy enables the lossless indicator for Citrix Virtual Apps and Desktops versions 7.16 through 1809.

> **Note:**
>
> The **Graphics Status Indicator** is only available for Desktop Sessions and will not be available for Seamless Application sessions.

Screen sharing

This setting enables users to share their sessions, including screen contents, keyboards, and mice, with other users.

By default, the setting is disabled.

The VDA attempts to use ports from the TCP port range to exchange data, starting with the lowest port and incrementing on each subsequent connection. The port handles both inbound and outbound traffic.

By default, the TCP port range is set to 52525-52625.

The port used for screen sharing must be added to the firewall exception list. This option is shown as a check box when installing the VDA. By default, this option is not checked.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Display memory limit

This setting specifies the maximum video buffer size in kilobytes for the session.

For VDA versions 2308 and prior, specify an amount in kilobytes from 128 to 4,194,303. When not specified, the setting defaults to 65,536 kilobytes.

For VDA versions 2311 and later, specify any amount in kilobytes. When not specified, or when specified as 0, the setting defaults to no maximum.

> **Note:**
>
> For VDA version 2311 and later, Citrix® recommends leaving this setting at default.

Using higher resolution and multiple monitors for connections requires more memory. Always calculate the amount of video memory needed based on the upper echelon of configurations in your environment as HDX™ allocates only the amount of display memory needed for each session. So, if only some users require more than the default, there is no negative impact on scalability by increasing the display memory limit.

The required amount of video memory needed be calculated using the following formula:

Total Video Memory = ((32 / 8) x Σ [(vertical-resolution-in-pixels) x (horizontal-resolution-in-pixels)])

Example 1

In the following example we'll use a session with two monitors, one with a resolution of 1920x1080 and the other with a resolution of 1280x720.

1. Calculate the sum of the products of resolutions:
    - (1080 x 1920) + (720 x 1280)
    - = 2073600 + 921600
    - = 2995200
2. Calculate total video memory:
    - ((32 / 8) x 2995200)
    - = (4 x 2995200)
    - = 11,980,800 bytes or 11,700 Kilobytes

In this example, 11,700 kilobytes of video memory would be needed to support a session with these two monitor configurations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example 2

When using 4 x 4K monitors, using the formula specified above, these sessions would need a minimum of 129,600 kilobytes of video memory.

For both examples, when using VDA versions 2311 or later, Citrix recommends leaving the display memory limit at the default.

Display mode degrade preference

> **Note:**
>
> For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

When the session display memory limit is reached, this setting specifies whether color depth or resolution degrades first.

By default, color depth is degraded first.

When the session memory limit is reached, you can reduce the quality of displayed images. You can reduce this quality by choosing whether color depth or resolution is degraded first. When color depth is degraded first, displayed images use fewer colors. When resolution is degraded first, displayed images use fewer pixels per inch.

To notify users when either color depth or resolution is degraded, configure the Notify user when display mode is degraded setting.

Dynamic windows preview

This setting enables or disables the display of seamless windows in:

- Flip-
- Flip 3D
- Taskbar preview
- Windows peek

Windows Aero preview option	Description
Taskbar Preview	When the user hovers over a window's taskbar icon, an image of that window appears above the taskbar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Windows Aero preview option	Description
Windows Peek	When the user hovers over a taskbar preview image, a full-sized image of the window appears on the screen.
Flip	When the user presses ALT+TAB, small preview icons are shown for each open window.
Flip 3D	When the user presses the TAB+Windows logo key, large images of the open windows cascade across the screen.

By default, this setting is enabled.

Image caching

> **Note:**
>
> For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting enables or disables the caching and retrieving of sections of images in sessions. Caching images in sections and retrieving these sections when needed makes the following:

- Scrolling smoother on the user device
- Reduces the amount of data transmitted over the network on the user device
- Reduces the processing required on the user device

By default, the image caching setting is enabled.

> **Note:**
>
> The image caching setting controls how images are cached and retrieved. The setting does not control whether images are cached. Images are cached if the Legacy graphics mode setting is enabled.

Legacy graphics mode - not supported. For backward compatibility only

> **Important:**
>
> We do not support legacy graphics mode and Desktop Composition Redirection (DCR) in this release. This policy is included only for backward compatibility when using XenApp 7.15 LTSR, XenDesktop 7.15 LTSR, and previous VDA releases with Windows 7 and Windows 2008 R2.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This setting disables the rich graphics experience. Use this setting to revert to the legacy graphics experience, reducing bandwidth consumption over a WAN or mobile connection. Bandwidth reductions introduced in XenApp and XenDesktop 7.13 make this mode obsolete.

By default, this setting is disabled and users are provided with the rich graphics experience.

Legacy graphics mode is supported on the following:

- Windows 7
- Windows Server 2008 R2 VDAs.

Legacy graphics mode is not supported on the following:

- Windows 8.x and 10
- Windows Server 2012, 2012 R2, and 2016.

See CTX202687 for more on optimizing graphics modes and policies in XenApp and XenDesktop 7.6 FP3 or higher.

Maximum allowed color depth

> **Note:**
>
> For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting specifies the maximum color depth allowed for a session.

By default, the maximum allowed color depth is 32 bits per pixel.

This setting applies only to Thinwire drivers and connections. It does not apply to VDAs that have a non-ThinWire driver as the primary display driver. These VDAs are VDAs that use a Windows Display Driver Model (WDDM) driver as the primary display driver. For Single-session OS VDAs using a WDDM driver as the primary display driver, such as Windows 8, this setting has no effect. For Windows Multi-session OS VDAs using a WDDM driver, such as Windows Server 2019, this setting might prevent users from connecting to the VDA.

Setting a high color depth requires more memory. To degrade color depth when the memory limit is reached, configure the **Display mode degrade preference** setting. When color depth is degraded, displayed images use fewer colors.

Notify user when display mode is degraded

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting displays a brief explanation to the user when the color depth or resolution is degraded.

By default, notifying users is disabled.

Optimize for 3D graphics workload

This setting configures the appropriate default settings that best suit graphically intense workloads. Enable this setting for users whose workload focuses on graphically intense applications. Apply this policy only in cases where a GPU is available to the session. Any other settings that explicitly override the default settings set by this policy take precedence.

By default, optimize for the 3D graphics workload is disabled.

Queuing and tossing

> **Note:**
>
> For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting discards queued images that another image replaces.

By default, queuing and tossing is enabled.

This setting improves response when graphics are sent to the user device. Configuring this setting can cause animations to become choppy because of dropped frames.

Use video codec for compression

Allows use of a video codec to compress graphics when video decoding is available on the endpoint. When **For the entire screen** is chosen the video codec is applied as the default codec for all. When **For actively changing regions** is selected the video codec is used for areas where there is constant change on the screen, other data uses still image compression and bitmap caching. When video decoding is not available on the endpoint, or when you specify **Do not use video codec**, a combination of still image compression and bitmap caching is used. When **Use when preferred** is selected, the system chooses, based on various factors. The results might vary between versions as the selection method is enhanced.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Select **Use when preferred** to allow the system to make its best effort to choose appropriate settings for the current scenario.

Select **For the entire screen** to optimize for improved user experience and bandwidth, especially in cases with heavy use of server-rendered video and 3D graphics.

Select **For actively changing regions** to optimize for improved video performance, especially in low bandwidth, while maintaining scalability for static and slowly changing content. This setting is supported in multi-monitor deployments.

Select **Do not use video codec** to optimize for server CPU load and for cases that do not have numerous server-rendered videos or other graphically intense applications.

The default is **Use when preferred**.

Use hardware encoding for video

This setting allows the use of graphics hardware, if available, to compress screen elements with the video codec. If such hardware is not available, the VDA falls back to CPU-based encoding using the software video codec.

The default option for this policy setting is **Enabled**.

Multiple monitors are supported.

Any Citrix Workspace™ app that supports video decoding can be used with hardware encoding.

NVIDIA

For NVIDIA GRID GPUs, hardware encoding is supported with VDAs for Multi-session OS and Single-session OS.

NVIDIA GPUs must support NVENC hardware encoding. See NVIDIA video codec SDK for a list of supported GPUs.

NVIDIA GRID requires driver version 3.1 or higher. NVIDIA Quadro requires driver version 362.56 or higher. Citrix recommends drivers from the NVIDIA Release R361 branch.

Lossless text is not compatible with NVENC hardware encoding. If you enabled lossless text, lossless text takes priority over NVENC hardware encoding.

Selective use of the H.264 hardware codec for actively changing regions is supported.

Visually lossless (YUV 4:4:4) compression is supported. Visually lossless (graphics policy setting, Allow visually lossless compression) requires Citrix Workspace app 1808 or higher or Citrix Receiver for Windows 4.5 or higher.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Intel

For Intel Iris Pro graphics processors, hardware encoding is supported with VDAs for Single-session OS and Multi-session OS.

Intel Iris Pro graphics processors in the Intel Broadwell processor family and later are supported. Intel Remote Displays SDK version 1.0 is required and can be downloaded from the Intel website: Remote Displays SDK.

Lossless text is supported only when the Video codec policy is set for the entire screen and the **Optimize for 3D graphics workload** policy is disabled.

Visually lossless (YUV 4:4:4) is not supported.

The Intel encoder provides a good user experience for up to eight encoding sessions (for example one user using eight monitors or eight users using a monitor each). If more than eight encoding sessions are required, check how many monitors the virtual machine connects with. The administrator decides to configure this policy setting on a per user or per machine basis to maintain a good user experience.

AMD

For AMD, hardware encoding is supported with VDAs for a Single-session OS.

AMD GPUs must support the RapidFire SDK. For example, the AMD Radeon Pro or FirePro GPUs.

For encoding to work, install the latest AMD drivers. You can download those drivers from https://www.amd.com/en/support.

Lossless text isn't compatible with AMD hardware encoding. If you enabled lossless text, lossless text takes priority over AMD hardware encoding.

Selective use of the H.264 hardware codec for actively changing regions is supported.

Caching policy settings

May 13, 2026

This section includes policy settings that enable caching image data on user devices when client connections are limited in bandwidth.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Persistent cache threshold

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the **Legacy graphics mode** policy setting is enabled.

This setting caches bitmaps on the hard drive of the user device and thus enables reuse of large, frequently used images from previous sessions.

By default, the threshold is 3000000 bits per second.

The threshold value represents the point below which the Persistent Cache feature takes effect. For example, using the default value, bitmaps are cached on the hard drive of the user device when bandwidth falls below 3000000 bps.

Keep alive policy settings

May 13, 2026

The **Keep Alive** section contains policy settings for managing ICA® keep-alive messages.

ICA keep-alive timeout

This setting specifies the number of seconds between successive ICA keep-alive messages.

By default, the interval between keep-alive messages is 60 seconds.

Specify an interval between 1-3600 seconds in which to send ICA keep-alive messages. Do not configure this setting if your network monitoring software is responsible for closing inactive connections.

ICA keep-alive messages

This setting enables or disables sending ICA keep-alive messages periodically.

By default, keep-alive messages are not sent.

Enabling this setting prevents broken connections from being disconnected. If the server detects no activity, this setting prevents Remote Desktop Services (RDS) from disconnecting the session. The server sends keep-alive messages every few seconds to detect if the session is active. If the session is no longer active, the server marks the session as disconnected.

ICA keep-alive does not work if you are using session reliability. Configure ICA keep-alive only for connections that are not using Session Reliability.

Related policy settings: Session reliability connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Local App Access policy settings

May 13, 2026

The **Local App Access** section includes policy settings that manage the users' locally installed applications with hosted applications. These policy settings manage integration in a hosted desktop environment.

Allow Local App Access

This setting allows or prevents the integration of users' locally installed applications with hosted applications. These policy settings manage integration in a hosted desktop environment.

When a user starts a locally installed application, that application appears to run within their virtual desktop, even though it's actually running locally.

If you set the **Allow local app access** policy setting to **Enabled**, browser content redirection isn't supported and the client-side notification area battery status does not appear in desktop sessions.

By default, **Allow Local App Access** is prohibited.

URL redirection block list

This setting specifies websites that are redirected to and started in the local Web browser. These websites might include the following:

- Websites requiring locale information, such as msn.com or newsgoogle.com
- Websites containing rich media content that are better rendered on the user device.

By default, no sites are specified.

URL redirection allow list

This setting specifies websites that are rendered in the environment in which they're started.

By default, no sites are specified.

Mobile experience policy settings

May 13, 2026

The **Mobile Experience** section includes policy settings for handling the Citrix Mobility Pack.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Automatic keyboard display

This setting enables or disables the automatic display of the keyboard on mobile device screens.

By default, the automatic display of the keyboard is disabled.

Launch touch-optimized desktop

This setting is disabled and not available for Windows 10 or Windows Server 2016 machines.

This setting determines the overall Citrix Workspace™ app interface behavior. This setting allows or prohibits a touch-friendly interface that is optimized for tablet devices.

By default, a touch-friendly interface is used.

To use only the Windows interface, set this policy setting to Prohibited.

Remote the combo box

This setting determines the types of combo boxes that you can display in sessions on mobile devices. Set this policy setting to Allowed to display the device-native combo box control. When this setting is allowed, a user can change a Citrix Workspace app for iOS session setting to use the Windows combo box.

By default, the **Remote the combo box** feature is prohibited.

Multimedia policy settings

May 15, 2026

The **Multimedia** section includes policy settings for managing streaming HTML5 and Windows audio and video in user sessions.

> **Warning**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® can't guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back up the registry before you edit it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

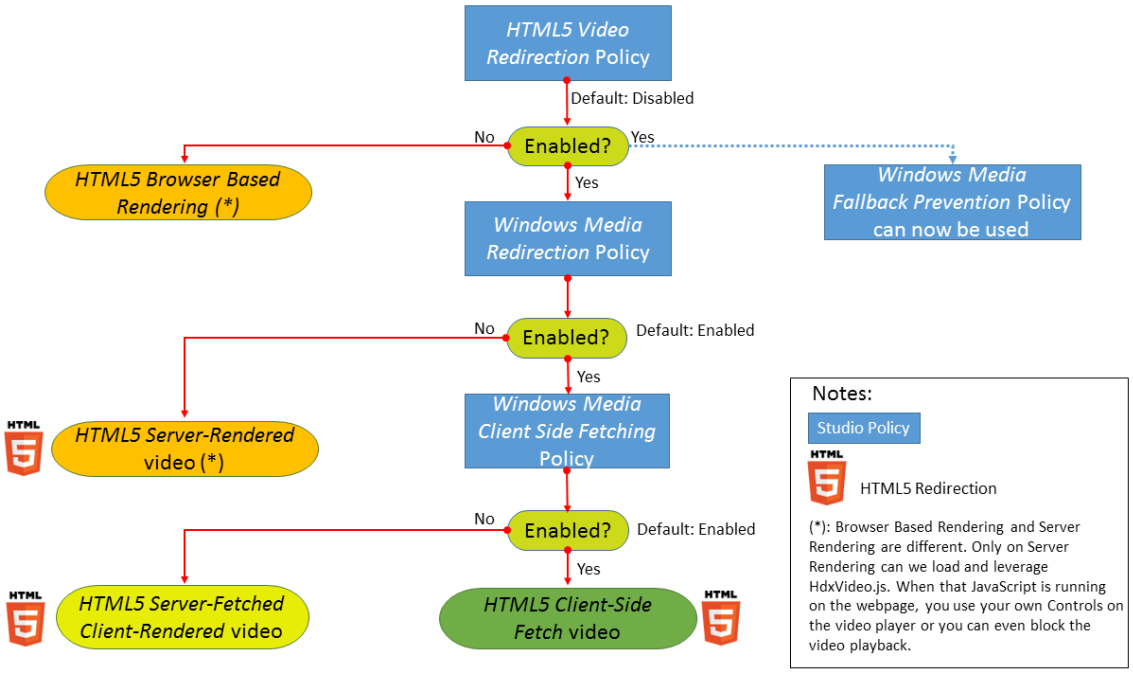
Multimedia policies

By default, all multimedia policies set on the Delivery Controller™ are stored in these registries:

Machine policies:

HKEY_LOCAL_MACHINE\Software\Policies\Citrix\MultimediaPolicies

User policies:



HKEY_LOCAL_MACHINE\Software\Policies\Citrix{User Session ID}\User\MultimediaPolicies

To locate the current user session ID, issue the **qwinsta** command on the Windows command line.

HTML5 video redirection

Controls and optimizes the way Citrix Virtual Apps and Desktops™ servers deliver HTML5 multimedia web content to users.

By default, this setting is disabled.

In this release, this feature is available for controlled webpages only. It requires the addition of JavaScript to the webpages where the HTML5 multimedia content is available, for example, videos on an internal training site.

To configure HTML5 video redirection:

1. Copy the file, **HdxVideo.js**, from %Program Files%/Citrix/ICA Service/HTML5 Video Redirection on the VDA install to the location of your internal webpage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Insert this line into your webpage (if your webpage has other scripts, include **HdxVideo.js** before those scripts):
   ```
   <script src="HdxVideo.js"type="text/javascript"\></script>
   ```

Note: If HdxVideo.js isn't in the same location as your webpage, use the **src** attribute to specify the full path to it.

Consider that the JavaScript isn't added to your controlled webpages and the user plays an HTML5 video. In this case, Citrix Virtual Apps and Desktops™ default to the server-side rendering.

For redirection of HTML5 videos to work, allow ***Windows Media Redirection***. This policy is mandatory for Server Fetch Client Render, and necessary for Client Side Fetching. Client Side Fetching in turn also requires *Windows Media client-side content fetching* to be Allowed.

Microsoft Edge doesn't support this feature.

HdxVideo.js replaces the browser HTML5 Player controls with its own. To check that the HTML5 video redirection policy is in effect on a certain website, compare the player controls to a scenario where the **HTML5 video redirection** policy is Prohibited:

(Citrix custom controls when the policy is Allowed)

(Native webpage controls when the policy is Prohibited or not configured)

The following video controls are supported:

- play
- pause
- seek
- repeat
- audio
- full screen

You can view an HTML5 video redirection test page.

TLS, HTML5 video redirection, and browser content redirection

You can use HTML5 video redirection to:

- Redirect videos from HTTPS websites
- Or

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Browser content redirection to redirect the entire website

The JavaScript injected into those websites must establish a TLS connection to the Citrix HDX HTML5 Video Redirection Service (WebSocketService.exe) running on the VDA. Citrix HDX HTML5 Video Redirection Service in the certificate store on the VDA generates two custom certificates to:

- Achieve video redirection
- Maintain the TLS integrity of the webpage

HdxVideo.js uses Secure WebSockets to communicate with WebSocketService.exe running on the VDA. This process runs as a Local System account, and does SSL termination and user session mapping.

WebSocketService.exe is listening on 127.0.0.1 port 9001.

Limit video quality

This setting applies only to Windows Media and not to HTML5. It requires you enable **Optimization for Windows Media multimedia redirection over WAN**.

This setting specifies the maximum video quality level allowed for an HDX™ connection. When configured, maximum video quality is limited to the specified value, ensuring that multimedia Quality of Service (QoS) is maintained within an environment.

By default, this setting isn't configured.

To limit the maximum video quality level allowed, choose one of the following options:

- 1080p/8.5mbps
- 720p/4.0mbps
- 480p/720kbps
- 380p/400kbps
- 240p/200kbps

Playing multiple videos simultaneously on the same server consumes large amounts of resources and can impact server scalability.

Microsoft Teams redirection

This setting enables optimization of Microsoft Teams, based on the HDX technology.

If this policy is enabled, and you're using a supported version of Citrix Workspace™ app, this registry key is set to **1** on the VDA. The Microsoft Teams application reads the key to load in VDI mode.
Note it is not required to set the registry key manually.

HKEY_CURRENT_USER\Software\Citrix\HDXMediaStream

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name: MSTeamsRedirSupport

Value: DWORD (1 - on, 0 - off)

> **Note:**
>
> Consider that you're using version 1906.2 VDAs or later with older versions of the Controller, which do not have the policy available in Web Studio. An example for an older version of the controller is version 7.15. In this case, HDX optimization is enabled by default on the VDA. If the Workspace app version is 1907 or later, Microsoft Teams launches in optimized mode. For information about caveats in mixing 7.15 LTSR Controllers and CR VDAs, see Knowledge Center article CTX205549.
>
> In this case, to disable the feature for specific users, you can override the registry setting. Override the registry settings by using a group policy to apply a logon script to the user's organizational unit.

By default, Microsoft Teams redirection is enabled.

Multimedia conferencing

This setting allows or prevents the use of optimized webcam redirection technology by video conferencing applications.

By default, video conferencing support is allowed.

When adding this setting to a policy, verify that the **Windows Media redirection** setting is present and set to **Allowed** (the default).

When using **Multimedia conferencing**, verify that the following conditions are met:

- Manufacturer-supplied drivers for the webcam used for multimedia conferencing are installed on the client.
- Connect the webcam to the user device before starting a video conferencing session. The server uses only one installed webcam at any given time. If multiple webcams are installed on the user device, the server attempts to use each webcam in succession. This attempt continues until a video conferencing session is created successfully.

This policy isn't needed when redirecting the web cam using Generic USB redirection. In that case, install the webcam drivers on the VDA.

Optimization for Windows Media multimedia redirection over WAN

This setting applies only to Windows Media and not to HTML5. The setting enables the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Real-time multimedia transcoding
- Allows audio and video media streaming to mobile devices over degraded networks
- Enhances the user experience by improving how Windows Media content is delivered over a WAN.

By default, the delivery of Windows Media content over the WAN is optimized.

When adding this setting to a policy, make sure the **Windows Media Redirection** setting is present and set to **Allowed**.

When this setting is enabled, real-time multimedia transcoding is deployed automatically as needed to enable media streaming. Also, provide a seamless user experience even in extreme network conditions.

Use GPU for optimizing Windows Media multimedia redirection over WAN

This setting applies only to Windows Media and enables real-time multimedia transcoding to be done in the Graphics Processing Unit (GPU) on the Virtual Delivery Agent (VDA). It improves server scalability. GPU transcoding is available only if the VDA has a supported GPU for hardware acceleration. Otherwise, transcoding falls back to the CPU.

Note: GPU transcoding is supported only on NVIDIA GPUs.

By default, using the GPU on the VDA to optimize the delivery of Windows Media content over the WAN is prohibited.

When adding this setting to a policy, make sure that the following settings are present and set to Allowed:

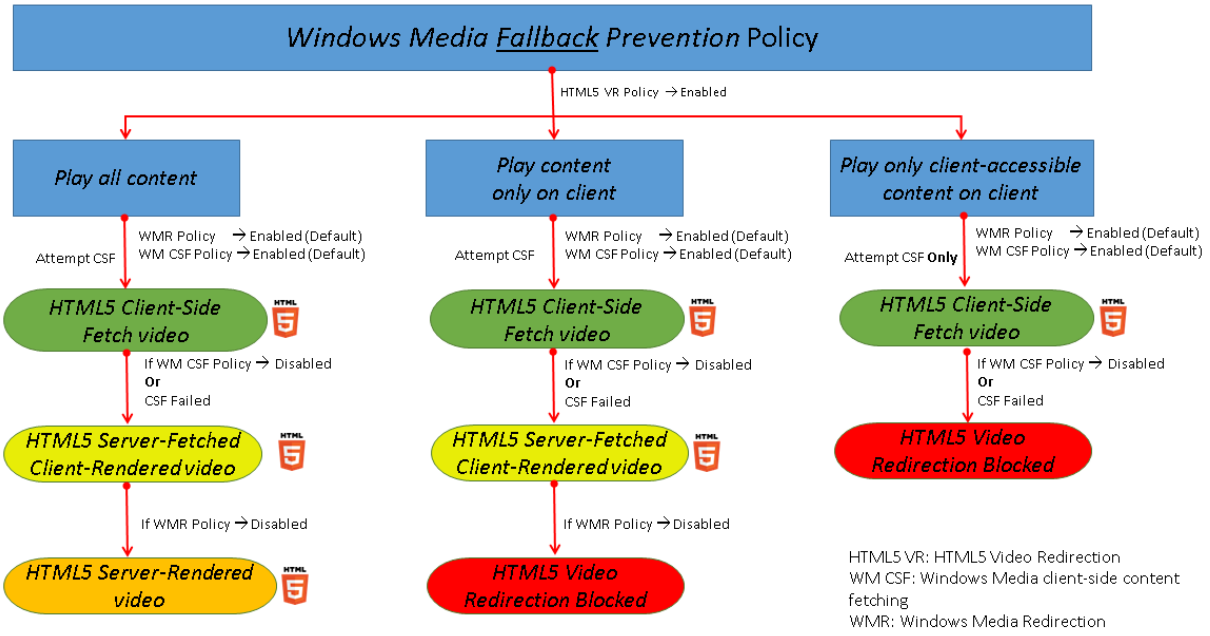
- **Windows Media redirection**
- **Optimization for Windows Media multimedia redirection over WAN settings**

Windows Media fallback prevention

This setting applies to browser content redirection, HTML5, and Windows Media. For it to support HTML5, set the **HTML5 video redirection** policy to **Allowed**.

Administrators can use the **Windows Media fallback prevention** policy setting to specify the methods that is attempted to deliver streamed content to users.

By default, this setting isn't configured. When the setting is set to Not Configured, the behavior is the same as **Play all content**.



To configure this setting, choose one of the following options:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Play all content**. Attempt client-side content fetching, then Windows Media Redirection. If unsuccessful, play content on the server.
- **Play all content only on client**. Attempt client-side fetching, then Windows Media Redirection. If unsuccessful, the content does not play.
- **Play only client-accessible content on client**. Attempt only client-side fetching. If unsuccessful, the content does not play.

When the content does not play, the following error message displays in the player window (for a default duration of 5 seconds):

"Company has blocked video because of lack of resources"

The duration of this error message can be customized with the following registry key on the VDA. If the registry entry does not exist, the duration defaults to 5 seconds.

The registry path varies depending on the architecture of the VDA:

`\HKLM\SOFTWARE\Wow6432Node\Citrix\HdxMediastream`

Or

\HKLM\SOFTWARE\Citrix\HdxMediastream

Registry key:

Name: VideoLoadManagementErrDuration

Type: DWORD

Range: 1 - up to DWORD limit (default = 5)

Unit: seconds

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Windows Media client-side content fetching

This setting applies to both HTML5 and Windows Media. The setting enables a user device to stream multimedia files directly from the source provider on the internet or intranet, rather than through the XenApp or XenDesktop® host server.

By default, this setting is **Allowed**. Allowing this setting improves network usage and server scalability. This improvement is achieved by moving any processing on the media from the host server to the user device. It also removes the requirement that an advanced multimedia framework such as Microsoft DirectShow or Media Foundation be installed on the user device. The user device requires only the ability to play a file from a URL

When adding this setting to a policy, make sure the **Windows Media Redirection** setting is present and set to **Allowed**. If **Windows Media Redirection** is disabled, the streaming of multimedia files to the user device direct from the source provider is also disabled.

Windows Media redirection

This setting applies to both HTML5 and Windows Media and controls and optimizes the way servers deliver streaming audio and video to users.

By default, this setting is **Allowed**. For HTML5, this setting doesn't take effect if the policy **HTML5 video redirection** is **Prohibited**.

When this setting is enabled the quality of audio and video rendered from the server increases to a level that compares with audio and video that played locally on a user device. The server streams multimedia to the client in the original, compressed form and allows the user device to decompress and render the media.

Windows Media redirection optimizes multimedia files that are encoded with codecs that adhere to Microsoft DirectShow, DirectX Media Objects (DMO), and Media Foundation standards. To play back a given multimedia file, a codec compatible with the encoding format of the multimedia file must be present on the user device.

By default, audio is disabled on Citrix Workspace app. To allow users to run multimedia applications in ICA® sessions, turn on audio or give users permission to turn on audio in their Citrix Workspace app interface.

Select **Prohibited** only if playing media using Windows Media redirection appears worse than when rendered using basic ICA compression and regular audio. This situation is rare but can happen under low bandwidth conditions, for example, with media with a low frequency of key frames.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Windows Media Redirection buffer size

This setting is a legacy and does not apply to HTML5.

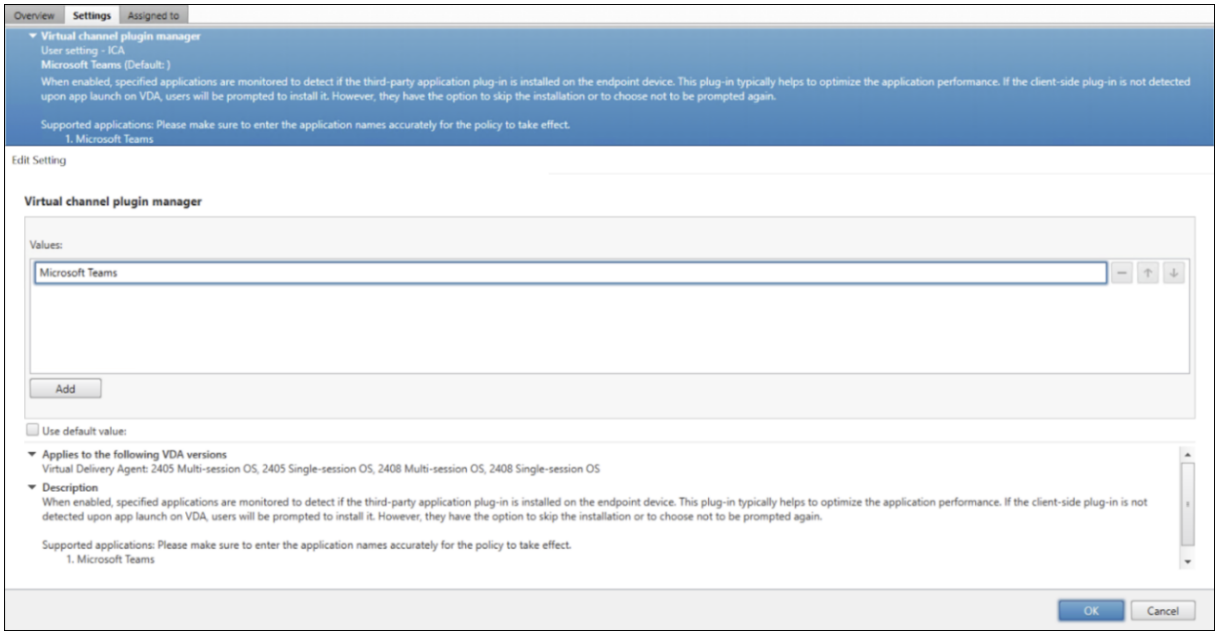
This setting specifies a buffer size from 1 to 10 seconds for multimedia acceleration.

By default, the buffer size is 5 seconds.

Windows Media Redirection buffer size use

This setting is a legacy and does not apply to HTML5.

This setting enables or disables using the buffer size specified in the **Windows Media Redirection buffer size** setting.



By default, the buffer size specified isn't used.

If this setting is disabled or if the **Windows Media Redirection buffer size** setting is not configured, the server uses the default buffer size value (five seconds).

Virtual channel plugin manager policy

The Virtual channel plugin manager section includes policy settings to configure this feature.

Virtual channel plugin manager is designed to deploy plugins across client endpoints for certain specified applications. The plugin manager detects specific applications running on the VDA and prompts the user to install the plugin on the endpoint for attaining best experience when running the application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Administrators can use the policy and specify the application for which they need the plugin to be installed across their endpoints.
- Application name should be the same as the name mentioned in the Supported applications in the policy description.
- By default, the policy is disabled.
- Currently supported applications
    - ‘‘Microsoft Teams’’
- In the future, more applications are planned to be supported.

Multi-stream connections policy settings

May 13, 2026

The **Multi-Stream connections** section includes policy settings for managing Quality of Service prioritization for multiple ICA® connections in a session.

> **Note:**
>
> MTU Discovery is not supported if the Multi-Stream connections policy is enabled.

Audio over UDP

This setting allows or prevents audio over UDP on the server.

By default, audio over UDP is allowed on the server.

When enabled, this setting opens a UDP port on the server to support all connections configured to use Audio over UDP Real-time Transport.

Audio UDP port range

This setting specifies the range of port numbers (lowest port number, highest port number) used by the Virtual Delivery Agent (VDA). This specification helps to exchange audio packet data with the user device. The VDA attempts to use each UDP port pair to exchange data with the user device, starting with the lowest and incrementing by two for each subsequent attempt. Each port handles both inbound and outbound traffic.

By default, this range is set to 16500,16509.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Multi-Port policy

This setting specifies the TCP ports to be used for ICA traffic and establishes the network priority for each port.

By default, the primary port (2598) has a High priority.

When you configure ports, you can assign the following priorities:

- **Very High:** for real-time activities, such as webcam conferences
- **High:** for interactive elements, such as screen, keyboard, and mouse
- **Medium:** for bulk processes, such as client drive mapping
- **Low:** for background activities, such as printing

Each port must have a unique priority. For example, you cannot assign a Very High priority to both CGP port 1 and CGP port 3.

To remove a port from prioritization, set the port number to 0. You cannot remove the primary port and you cannot change its priority level.

When configuring this setting, restart the server. This setting takes effect only when the **Multi-Stream computer** setting policy setting is enabled.

Multi-Stream computer setting

This setting enables or disables Multi-Stream on the server.

By default, Multi-Stream is disabled. Configure the Multi-Stream computer policy setting if you use Citrix SD-WAN™ or third-party routers to achieve the desired Quality of Service.

If Multi-Stream is enabled, MTU Discovery, a feature of Adaptive Transport, is not supported.

When configuring this setting, reboot the server to ensure that changes take effect.

> **Important:**
>
> Using this policy setting with bandwidth limit policy settings such as Overall session bandwidth limit might produce unexpected results. When including this setting in a policy, ensure that bandwidth limit settings are not included.

Multi-Stream user setting

This setting enables or disables Multi-Stream on the user device.

By default, Multi-Stream is disabled for all users. Configure the Multi-Stream user setting if you use Citrix SD-WAN or third-party routers to achieve the desired Quality of Service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This setting takes effect only on hosts where the **Multi-Stream computer** setting policy setting is enabled.

> **Important:**
>
> Using this policy setting with bandwidth limit policy settings such as Overall session bandwidth limit might produce unexpected results. When including this setting in a policy, ensure that bandwidth limit settings are not included.

Multi-Stream virtual channel assignment settings

This setting specifies the ICA stream the virtual channels are assigned to when multi-stream is used.

If you do not configure these settings, virtual channels are kept in their default stream. To assign a virtual channel to an ICA stream, select the desired stream number (0, 1, 2, 3) from the **Stream Number** list next to the virtual channel name.

If there is a custom virtual channel in use in the environment, click **Add**, specify the virtual channel name in the text box under **Virtual Channels**, and select the desired stream number from the **Stream Number** list next to it. The name you specify must be the actual virtual channel name and not a friendly name. For example, CTXSBR instead of Citrix Browser Acceleration.

These settings take effect only when you've enabled the multi-stream computer setting.

By default, the virtual channels and their stream assignments are:

- AppFlow®: 2
- Audio: 0
- Browser Content Redirection: 2
- Client COM Port Mapping: 3
- Client Drive Mapping: 2
- Client Printer Mapping: 3
- Clipboard: 2
- CTXDND: 1 (**Note:** This supports the dragging and dropping files between a Citrix session and a local endpoint.)
- DVC Plug-in (Static VC name auto-generated from DVC Plug-in Friendly Name, or admin-assigned): 2
- End User Experience Monitoring: 1
- File Transfer (HTML5 Receiver): 2
- Generic Data Transfer: 2
- ICA Control: 1
- Input Method Editor: 1
- Legacy Client Printer Mapping (COM1): 1, 3
- Legacy Client Printer Mapping (COM2): 2, 3

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Legacy Client Printer Mapping (LPT1): 1, 3
- Legacy Client Printer Mapping (LPT2): 2, 3
- License Management: 1
- Microsoft Teams/WebRTC Redirection: 1
- Mobile Receiver: 1
- MultiTouch: 1
- Port Forwarding: 2
- Remote Audio and Video Extensions (RAVE): 2
- Seamless (Transparent Window Integration): 1
- Sensor and Location: 1
- Smart Card: 1
- Thinwire Graphics: 1
- Transparent UI Integration/Logon Status: 2
- TWAIN Redirection: 2
- USB: 2
- Zero Latency Font and Keyboard: 2
- Zero Latency Data Channel: 2

For more information on virtual channel assignments and priorities, see the Knowledge Center article CTX131001.

Port redirection policy settings

May 13, 2026

The **Port Redirection** section contains policy settings for client LPT and COM port mapping.

For Virtual Delivery Agent versions **earlier than 7.0**, use the following policy settings to configure port redirection. For the VDA versions **7.0 through 7.8**, configure these settings using the registry; see Configure COM Port and LPT Port Redirection settings using the registry. For the VDA version **7.9**, use the following policy settings.

Auto connect client COM ports

This setting enables or disables automatic connection of COM ports on user devices when users log on to a site.

By default, client COM ports are not automatically connected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Auto connect client LPT ports

This setting enables or disables automatic connection of LPT ports on user devices when users log on to a site.

By default, client LPT ports are not connected automatically.

Client COM port redirection

This setting allows or prevents access to COM ports on the user device.

By default, COM port redirection is prohibited.

The following policy settings are related:

- COM port redirection bandwidth limit
- COM port redirection bandwidth limit percent

Client LPT port redirection

This setting allows or prevents access to LPT ports on the user device.

By default, LPT port redirection is prohibited.

LPT ports are used only by legacy applications that send print jobs to the LPT ports. These ports are not used by legacy applications that send print jobs to the print objects on the user device. Most applications today can send print jobs to printer objects. This policy setting is necessary only for servers that host legacy applications that print to LPT ports.

Note, although Client COM port redirection is bi-directional, LPT port redirection is output only and limited to \\client\LPT1 and \\client\LPT2 within an ICA session.

The following policy settings are related:

- LPT port redirection bandwidth limit
- LPT port redirection bandwidth limit percent

FIDO2 redirection

May 13, 2026

This setting enables or disables FIDO2 redirection. FIDO2 redirection lets users take advantage of the local endpoint FIDO2 components in a virtual machine. Users can authenticate virtual session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

through FIDO2 security keys or integrated biometrics on devices that have TPM 2.0 and Windows Hello.

When this setting is **Allowed**, users can do FIDO2 authentication by using the local endpoint capabilities. By default, this setting is **Allowed**.

Printing policy settings

May 13, 2026

The Printing section contains policy settings for managing client printing.

Client printer redirection

This setting controls whether client printers are mapped to a server when a user logs on to a session.

By default, client printer mapping is allowed. If this setting is disabled, the PDF printer for the session is not auto-created.

Related policy settings: auto-create client printers

Default printer

This setting specifies how the default printer on the user device is established in a session.

By default, the user's current printer is used as the default printer for the session.

To use the current Remote Desktop Services or Windows user profile setting for the default printer, select Do not adjust the user's default printer. If you choose this option, the default printer is not saved in the profile and it does not change according to other session or client properties. The default printer in a session is the first printer auto-created in the session, which is either:

- The first printer added locally to the Windows server in **Control Panel > Devices** and **Printers**.
- The first auto-created printer, if there are no printers added locally to the server.

You can use this option to present users with the nearest printer through profile settings (known as proximity printing).

Printer assignments

This setting provides an alternative to the Default printer and Session printers settings. Use the individual Default printer and Session printers settings to configure behaviors for a site, large group, or

© 1997–2026 Citrix Systems, Inc. All rights reserved.

organizational unit. Use the **Printer assignments** setting to assign a large group of printers to multiple users.

This setting specifies how the default printer on the listed user devices is established in a session.

By default, the user's current printer is used as the default printer for the session.

It also specifies the network printers to be auto-created in a session for each user device. By default, no printers are specified.

- When setting the default printer value:

  To use the current default printer for the user device, select Do not adjust.

  To use the current Remote Desktop Services or Windows user profile setting for the default printer, select Do no adjust. If you choose this option, the default printer is not saved in the profile and it does not change according to other session or client properties. The default printer in a session is the first printer auto-created in the session, which is either:

  - The first printer added locally to the Windows server in **Control Panel > Devices** and Printers.
  - The first auto-created printer, if there are no printers added locally to the server.

- When setting **session printers value: to add printers**, type the UNC path of the printer you want to auto-create. Alternatively, click **Browser** to search the entire network for a printer. You can also browse for printers by entering the printer server's FQDN or NetBIOS name. For more information, see Session printers. After adding the printer, you can apply customized settings for the current session at every logon.

Printer auto-creation event log preference

This setting specifies the events that are logged during the printer auto-creation process. You can choose to log no errors or warnings, only errors, or errors and warnings.

By default, errors and warnings are logged.

An example of a warning is an event in which a printer's native driver cannot be installed and the Universal print driver is installed instead. To use the Universal print driver in this scenario, configure the Universal print driver usage setting to Use universal printing only or Use universal printing only if the requested driver is unavailable.

Session printers

This setting specifies the network printers to be auto-created in a session. Inside the ICA/HDX session, the Citrix Print Manager service (CpSvc.exe) creates a network printer connection during the session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

logon for each network printer specified in the **Session Printer** policy setting. It deletes the printers during the session logoff. By default, no printers are specified.

In the **Session Printer** policy setting, the network printers can reside on a Windows Print Server or a Citrix Universal™ Print Server.

- **Windows Print Server:** Shares one or more network printers. It also has the native printer drivers required to use the network printers.
- **Universal Print Server:** A Windows Print Server where the Citrix Universal Print Server software has been installed.

When using a Windows Print Server, the Citrix Print Manager service creates the network printer connections using native printer drivers. The Citrix Virtual Apps™ server must have the native printer drivers installed on it.

When using a Citrix Universal Print Server, the Citrix Print Manager service creates the network printer connections using either native printer drivers, Citrix Universal Printer Driver, or Citrix Universal XPS Printer Driver. The driver that you use is controlled by the Universal Print Driver usage policy setting.

All Windows printer drivers currently fall within either the v3 or v4 driver version. For more information, see Support for the Microsoft V3 and V4 Printer Driver Architectures.

To add session printers and verify if they appear in the sessions, complete the following procedure:

1. Sign in to Web Studio, select **Policies** in the left pane, and then click the **Policies** tab.
2. Select the **Session printers** policy and click **Edit**.
3. On the **Edit Setting** page, clear the **Use default value** checkbox, and then click **Add** to add a printer by following these steps:

    a) Enter the UNC path of the printer in the format of `\\<FQDN of the printer server>\<printer name>`. Alternatively, click **Browse** to search the entire network for a printer. You can also browse for printers by entering the printer server's FQDN or NetBIOS name.

    > **Note:**
    >
    > To ensure you can search for a specific printer using **Browse**, when configuring the printer, make sure that the **List in the directory** option is selected under **Printer Settings > Printer Properties > Sharing**.

    b) By default, your user name and password are used to browse printer servers. If different domain credentials are required, select **Use different domain credentials to browse**, enter the necessary user name and password, and then click **Browse**.

    c) Click **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. After the policy has been set, the published application might not display session printers. This issue might occur because the printer driver is missing from the Citrix Virtual Apps server or the policy has been created but not enabled.

   > **Note:**
   >
   > If a session printer needs a native printer driver and the native printer driver is not installed on the VDA, then the session printer might not be created in the session.

5. Start the published desktop and manually add the session printer in **Devices and Printers > Control Panel**.
6. If this fails, investigate the communication between the Citrix Virtual Apps server and the print server. Consider running a test with RDP.

Wait for printers to be created

Use the policy on the Delivery Controller to enable the feature on Citrix Virtual Desktops.

Wait for printers to be created (Server Desktop):

This setting allows a delay in connecting to a session so that client-redirected printers can be auto-created.

By default, a connection delay does not occur.

Wait for printers to be created (Citrix Virtual Apps):

Running the following PowerShell cmdlet allows a delay in connecting to virtual apps running on multi-session hosts so that client-redirected printers can be auto-created before the application is opened.

```
Set-BrokerApplication -Name <VirtualAppName> -WaitForPrinterCreation $true
```

By default, a connection delay does not occur.

Client printers policy settings

May 13, 2026

The **Client Printers** section includes policy settings for client printers, including settings to auto-create client printers, retain printer properties, and connect to print servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Auto-create client printers

This setting specifies the client printers that are auto-created. This setting overrides default client printer auto-creation settings.

By default, all client printers are auto-created.

This setting takes effect only if the **Client printer redirection** setting is present and set to **Allowed**.

When adding this setting to a policy, select an option:

- **Auto-create all client printers** automatically creates all printers on a user device.
- **Auto-create the client's default printer only** automatically creates only the printer selected as the default printer on the user device.
- **Auto-create local (non-network) client printers only** automatically creates only printers directly connected to the user device through an LPT, COM, USB, TCP/IP, or other local port.
- **Do not auto-create client printers** turns off autocreation for all client printers when users log on. Choosing this option causes the Remote Desktop Services (RDS) settings for autocreating client printers to override this setting in lower priority policies.

Auto-create generic universal printer

This setting enables or disables auto-creation of the generic Citrix Universal™ Printer object for sessions. These sessions include only the sessions where a user device compatible with Universal Printing is in use.

By default, the generic Universal Printer object isn't auto-created.

The following policy settings are related:

- Universal print driver usage
- Universal driver preference

Auto-create PDF universal printer

This setting enables or disables auto-creation of the Citrix PDF printer for sessions using:

- Citrix Workspace app for Windows (starting from VDA 7.19)
- Citrix Workspace™ app for Linux
- Citrix Workspace app for MacOS
- Citrix Workspace app for HTML5
- Citrix Workspace app for Chrome

By default, the Citrix PDF printer is not auto-created.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Client printer names

This setting selects the naming convention for auto-created client printers.

By default, standard printer names are used.

Select **Standard printer names** to use printer names such as "HPLaserJet 4 from client name in session 3."

Select **Legacy printer names** to use old-style client printer names and to preserve backward compatibility with legacy printers names as present in the XenDesktop versions of the product. You can use this option with the current, Citrix Virtual Apps and Desktops versions of the product. An example of a legacy printer name is "Client/clientname#/HPLaserJet 4."This option is less secure.

When you use Citrix PDF printer in a session launched from Citrix Workspace app for HTML5, set the **Client printer names** setting as default or select **Standard printer names**. If you select **Legacy printer names**, Citrix Workspace app for HTML5 doesn't support the Citrix PDF Printer option.

Direct connections to print servers

This setting enables or disables direct connections from the virtual desktop or server-hosting applications to a print server for client printers. Here, the client printers are hosted on an accessible network share.

By default, direct connections are enabled.

Enable direct connections if the network print server is not across a WAN from the virtual desktop or server-hosting applications. Direct communication results in faster printing if the network print server and the virtual desktop or server-hosting applications are on the same LAN.

Disable direct connections if the network is across a WAN or has substantial latency or limited bandwidth. Print jobs are routed through the user device where they're redirected to the network print server. Data sent to the user device is compressed, so less bandwidth is consumed as the data travels across the WAN.

If two network printers have the same name, the printer on the same network as the user device is used.

Printer driver mapping and compatibility

This setting specifies the driver substitution rules for auto-created client printers.

This setting is configured to exclude Microsoft OneNote and XPS Document Writer from the auto-created client printers list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When you define driver substitution rules, you can allow or prevent printers to be created with the specified driver. Also, you can allow created printers to use only universal print drivers. Driver substitution overrides or maps the printer driver names the user device provides, substituting an equivalent driver on the server. These rules give server applications access to client printers that have the same drivers as the server, but different driver names.

You can do the following:

- Add a driver mapping
- Edit an existing mapping
- Override custom settings for a mapping
- Remove a mapping
- Change the order of driver entries in the list

When adding a mapping, enter the client printer driver name and then select the server driver you want to replace.

Printer properties retention

This setting specifies whether to store printer properties and where to store them.

By default, the system determines if printer properties are stored on the user device, if available, or in the user profile.

When adding this setting to a policy, select an option:

- Saved on the client device only is for user devices that have a mandatory or roaming profile that is not saved.
- Retained in user profile only is for user devices constrained by bandwidth (this option reduces network traffic) and logon speed or for users with legacy plug-ins. This option stores printer properties in the user profile on the server and prevents any properties exchange with the user device. This option is applicable only if a Remote Desktop Services (RDS) roaming profile is used.
- Held in profile only if not saved on the client allows the system to determine where printer properties are stored. Printer properties are stored either on the user device, if available, or in the user profile. Although this option is the most flexible, it can also slow logon time and use extra bandwidth for system-checking.
- Do not retain printer properties prevents storing printer properties.

Retained and restored client printers

This setting enables or disables the retention and re-creation of printers on the user device. By default, client printers are auto-retained and auto-restored.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Retained printers are user-created printers that are created again, or remembered, at the start of the next session. When Citrix Virtual Apps™ recreates a retained printer, it considers all policy settings except the **Auto-create client printers** setting.

Restored printers are printers fully customized by an administrator, with a saved state that is permanently attached to a client port.

Citrix PDF Universal Printer driver

The Citrix PDF Universal Printer driver enables users to print documents opened with hosted applications or applications that are running on virtual desktops delivered by Citrix Virtual Apps and Desktops. When a user selects the **Citrix PDF Printer** option, the driver converts the file to PDF and transfers the PDF to the local device. The PDF is then opened for viewing and printing from a locally attached printer. PDF is one of the formats supported with Citrix Universal Printing (in addition to EMF and XPS).
The PDF printer can be enabled, configured, and set as default using a Citrix Policy. The **Citrix PDF Printer** option is available to users of the Citrix Workspace app for Windows, Linux, MacOS, Chrome, and HTML5.

> **Note:**
>
> A PDF viewer is required for Windows endpoints. The client must have an application that has file type association registered on Windows to open PDF files.

Drivers policy settings

May 13, 2026

The **Drivers** section includes policy settings related to printer drivers.

Automatic installation of in-box printer drivers

> **Note**
>
> This policy does not support VDAs in this release.

This setting enables or disables the automatic installation of printer drivers from the following:

- Windows in-box driver set
- Driver packages staged on the host using `pnputil.exe /a`

By default, these drivers are installed as needed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Universal driver preference

> **Note:**
>
> The default order of this policy setting will be changing in the Q4 release of Citrix Virtual Apps and Desktops™. The new default order would be:
>
> - EMF
> - XPS
> - PCL5c
> - PCL4
> - PDF
> - PS

This setting specifies the order in which universal printer drivers are used, beginning with the first entry in the list.

By default, the preference order is:

- EMF
- XPS
- PCL5c
- PCL4
- PS

You can add, edit, or remove drivers, and change the order of drivers in the list.

Universal print driver usage

This setting specifies when to use universal printing.

By default, universal printing is used only if the requested driver is unavailable.

Universal printing employs generic printer drivers instead of standard model-specific drivers, potentially simplifying the burden of driver management on host computers. The availability of universal print drivers depends on the capabilities of the user device, host, and print server software. In certain configurations, universal printing might not be available.

When adding this setting to a policy, select an option from the following table:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Option	Description
Use only printer model specific drivers	Specifies that the client printer uses only the standard model-specific drivers that are auto-created during sign in. If the requested driver is unavailable, the client printer cannot be auto-created.
Use universal printing only	Specifies that no standard model-specific drivers are used. Only universal print drivers are used to create printers.
Use universal printing only if requested driver is unavailable	Uses standard model-specific drivers for printer creation if they are available. If the driver is not available on the server, the client printer is created automatically with the appropriate universal driver.
Use printer model specific drivers only if universal printing is unavailable	Uses the universal print driver if it is available. If the driver is not available on the server, the client printer is created automatically with the appropriate model-specific printer driver.

Universal Print Server policy settings

May 13, 2026

The **Universal Print Server** section includes policy settings for handling the Universal Print Server.

SSL cipher suite

This setting specifies the set of SSL/TLS cipher suites that are used in the Universal Print Client for encrypted print data stream (CGP) connections.

To control the cipher suite package used by the Universal Print Client for encrypted print web service (HTTPS/SOAP) connections, see [SCHANNEL].

Default value: ALL

This setting has the following values: ALL, COM or GOV.

The cipher suites corresponding to each value are the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ALL:

TLS_ECDHE_RSA_AES256_GCM_SHA384

TLS_ECDHE_RSA_AES256_CBC_SHA384

TLS_ECDHE_RSA_AES128_CBC_SHA

COM:

TLS_ECDHE_RSA_AES128_CBC_SHA

GOV:

TLS_ECDHE_RSA_AES256_GCM_SHA384

TLS_ECDHE_RSA_AES256_CBC_SHA384

SSL compliance mode

This setting specifies the level of compliance with NIST Special Publication 800-52 that is used by the Universal Print Client for encrypted print data stream (CGP) connections.

Default value: None.

This setting has the following values:

None.

The encrypted print data stream (CGP) connections use the default compliance mode.

SP800-52.

The encrypted print data stream (CGP) connections use the NIST Special Publication 800-52 compliance mode.

SSL enabled

This setting specifies whether SSL/TLS is used by the Universal Print Client for the following:

- Print data stream (CGP) connections
- Web service (HTTP/SOAP) connections

When you set **Universal Print Server enable** to **Enabled with fallback to Windows' native remote printing**, fallback connections are made by the Microsoft Windows Network Print Provider. This setting does not affect these fallback connections.

Default value: Disabled

This setting has the following values:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enabled.

The Universal Print Client uses SSL/TLS to connect to the Universal Print Server.

Disabled.

The Universal Print Client uses SSL/TLS to connect to the Universal Print Server.

SSL FIPS mode

This setting specifies whether the SSL/TLS cryptographic module used by the Universal Print Client for print data stream (CGP) connections run in FIPS mode.

Default value: Disabled

This setting has the following values:

Enabled.

FIPS mode is on.

Disabled.

FIPS mode is off.

SSL protocol version

This setting specifies the SSL/TLS protocol version used by the Universal Print Client.

Default value: ALL

This setting has the following values:

ALL.

Use TLS versions 1.0, 1.1 or 1.2.

TLSv1.

Use TLS version 1.0.

TLSv1.1.

Use TLS version 1.1.

TLSv1.2.

Use TLS version 1.2.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SSL Universal Print Server encrypted print data stream (CGP) port

This setting specifies the TCP port number of the Universal Print Server encrypted print data stream (CGP) port. This port receives data for print jobs.

Default value: 443

SSL Universal Print Server encrypted web service (HTTPS/SOAP) port

This setting specifies the TCP port number of the Universal Print Server encrypted web service (HTTP-S/SOAP) port. This port receives data for print commands.

Default value: 8443

Universal Print Server enable

This policy enables or disables the use of the Citrix Universal Print Server (UPS). Apply this policy setting to Organizational Units (OUs) that includes the virtual desktop or server-hosting applications.This policy settings include fallback options to allow connections to print servers using the native Windows remote printing service in the event that the Citrix UPS component is not installed or unavailable on the requested print server. Changes to this policy is applicable only after the VDA is restarted.

By default, the Universal Print Server is disabled.

When adding this setting to a policy, select one of the following options:

- **Enabled with fallback to Windows native remote printing**: The Universal Print Server services the Network printer connections, if possible. If the Universal Print Server is not available, the Windows Print Provider is used. The Windows Print Provider continues to handle all printers previously created with the Windows Print Provider.
- **Enabled with no fallback to Windows native remote printing**: The Universal Print Server services the Network printer connections exclusively. If the Universal Print Server is unavailable, the network printer connection fails. This setting effectively disables network printing through the Windows Print Provider. Printers previously created with the Windows Print Provider are not created while a policy containing this setting is active.
- **Disabled**: The Universal Print Server feature is disabled. No attempt is made to connect with the Universal Print Server when connecting to a network printer with a UNC name. Connections to remote printers continue to use the Windows native remote printing facility.

Universal Print Server print data stream (CGP) port

This setting specifies the TCP port number used by the Universal Print Server print data stream Common Gateway Protocol (CGP) listener. Apply this policy setting only to OUs containing the print

© 1997–2026 Citrix Systems, Inc. All rights reserved.

server.

By default, the port number is set to 7229.

Valid port numbers must be in the range of 1-65535.

Universal Print Server print stream input bandwidth limit (Kbps)

This setting specifies the upper boundary (in kilobits per second) for the transfer rate of print data. The transfer rate is calculated for the print data that is delivered from each print job to the Universal Print Server using CGP. Apply this policy setting to OUs containing the virtual desktop or server-hosting applications.

By default, the value is 0, which specifies no upper boundary.

Universal Print Server web service (HTTP/SOAP) port

This setting specifies the TCP port number used by the Universal Print Server's web service (HTTP/-SOAP) listener. The Universal Print Server is an optional component that enables the use of Citrix universal print drivers for network printing scenarios.

When the Universal Print Server is used, printing commands are sent from Citrix Virtual Apps and Desktops hosts to the Universal Print Server via SOAP over HTTP. This setting modifies the default TCP port on which the Universal Print Server listens for incoming HTTP/SOAP requests.

You must configure both host and print server HTTP port identically. If you do not configure the ports identically, the host software doesn't connect to the Universal Print Server. This setting changes the VDA on Citrix Virtual Apps and Desktops. In addition, you must change the default port on the Universal Print Server.

By default, the port number is set to 8080.

Valid port numbers must be in the range of 0-65535.

Universal Print Servers for load balancing

This setting lists the Universal Print Servers to be used to load balance printer connections established at session launch, after evaluating other Citrix® printing policy settings. To optimize printer creation time, Citrix recommends that all print servers have the same set of shared printers. There is no upper limit to the number of print servers which can be added for load balancing.

This setting also implements print server failover detection and printer connections recovery. The print servers are checked periodically for availability. If a server failure is detected, that server is removed from the load balancing scheme. Also, the printer connections on that server are redistributed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

among other available print servers. When the failed print server recovers, it is returned to the load balancing scheme.

Click **Validate Servers** to check that each server is a print server, that the server list doesn't include duplicate server names, and that all servers have an identical set of shared printers installed. This operation might take some time.

Universal Print Servers out-of-service threshold

This setting specifies how long the load balancer must wait for an unavailable print server to recover before it determines that the server is permanently offline and redistributes its load to other available print servers.

By default, the threshold value is set to 180 (seconds).

Universal Print Server web service (HTTP/SOAP) connect timeout

This setting specifies the number of seconds that the Universal Print Client must wait until a Universal Print Server web service connect() operation times out. This setting has the following values. All these values are numeric and the units (of time) are seconds.

- The minimum value is 0.
- The maximum value is 60.
- The default value is 10.

When the timeout is between 1 and 60 (inclusive), the Universal Print Client waits for the specified time for the operation to complete. The operation is a connect TCP socket operation. Sockets are a facility of the Windows operating system that allows interprocess communication over TCP/IP networks.

When the timeout is 0, the Universal Print Client uses the default timeout defined by the operating system. This configuration was the available configuration present in the previous versions of the Universal Print Client before this change.

The Universal Print Client is the component of the Virtual Delivery Agent (VDA) that communicates with the Universal Print Server.

> **Note:**
>
> This policy setting is applicable in the VDA version 7.35 and later.

Universal Print Server web service (HTTP/SOAP) receive timeout

This setting specifies the number of seconds that the Universal Print Client must wait until a Universal Print Server web service recv() operation times out. This setting has the following values and all these

© 1997–2026 Citrix Systems, Inc. All rights reserved.

values are numeric and the units (of time) are seconds.

- The minimum value is 0.
- The maximum value is 60.
- The default value is 10.

When the timeout is between 1 and 60 (inclusive), the Universal Print Client waits for the specified time for the operation to complete. The operation is a receive TCP socket operation. Sockets are a facility of the Windows operating system that allows interprocess communication over TCP/IP networks.

When the timeout is 0, the Universal Print Client uses the default timeout defined by the operating system. This configuration was the available configuration present in the previous versions of the Universal Print Client before this change.

Universal Print Client is the component of the Virtual Delivery Agent (VDA) that communicates with the Universal Print Server.

> **Note:**
>
> This policy setting is applicable in the VDA version 7.35 and later.

Universal Print Server web service (HTTP/SOAP) send timeout

This setting specifies the number of seconds that the Universal Print Client must wait until a Universal Print Server web service send() operation times out. This setting has the following values. All these values are numeric and the units (of time) are seconds.

- The minimum value is 0.
- The maximum value is 60.
- The default value is 10.

When the timeout is between 1 and 60 (inclusive), the Universal Print Client waits for the specified time for the operation to complete. The operation is a send TCP socket operation. Sockets are a facility of the Windows operating system that allows interprocess communication over TCP/IP networks.

When the timeout is 0, the Universal Print Client uses the default timeout defined by the operating system. This configuration was the available configuration present in the previous versions of the Universal Print Client before this change.

Universal Print Client is the component of the VDA that communicates with the Universal Print Server.

> **Note:**
>
> This policy setting is applicable in the VDA version 7.35 and later.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Universal printing policy settings

May 13, 2026

The **Universal Printing** section includes policy settings for managing universal printing.

Universal printing EMF processing mode

This setting controls the method of processing the EMF spool file on the Windows user device.

By default, EMF records are spooled directly to the printer.

When adding this setting to a policy, select an option:

- Reprocess EMFs for printer forces the EMF spool file to be reprocessed and sent through the GDI subsystem on the user device. You can use this setting for drivers that require EMF reprocessing but that might not be selected automatically in a session.
- Spool directly to printer, when used with the Citrix Universal™ print driver, ensures the EMF records are spooled and delivered to the user device for processing. Typically, these EMF spool files are injected directly to the client's spool queue. For printers and drivers that are compatible with the EMF format, this is the fastest printing method.

Universal printing image compression limit

This setting specifies the following:

- Maximum quality available for images printed with the Citrix Universal print driver
- Minimum compression level available for images printed with the Citrix Universal print driver

By default, the image compression limit is set to Best quality (lossless compression).

If No Compression is selected, compression is disabled for EMF printing only.

When adding this setting to a policy, select an option:

- No compression
- Best quality (lossless compression)
- High quality
- Standard quality
- Reduced quality (maximum compression)

When adding this setting to a policy that includes the **Universal printing optimization defaults** setting, be aware of the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Consider the compression level in the **Universal printing image compression limit** setting is lower than the level defined in the **Universal printing optimization defaults** setting. In this case, the images are compressed at the level defined in the Universal printing image compression limits setting.
- If compression is disabled, the Desired image quality and Enable heavyweight compression options of the Universal printing optimization defaults setting have no effect in the policy.

Universal printing optimization defaults

This setting specifies the default values for printing optimization when the universal print driver is created for a session.

- Desired image quality specifies the default image compression limit applied to universal printing. By default, Standard Quality is enabled, meaning that users can only print images using standard or reduced quality compression.
- Enable heavyweight compression enables or disables reducing bandwidth beyond the compression level set by Desired image quality, without losing image quality. By default, heavyweight compression is disabled.
- Image and Font Caching settings specify whether to cache images and fonts that appear multiple times in the print stream or not. This setting ensures that each unique image or font is sent to the printer only once. By default, embedded images and fonts are cached. These settings apply only if the user device supports this behavior.
- Allow non-administrators to modify these settings specifies whether users can change the default print optimization settings within a session or not. By default, users aren't allowed to change the default print optimization settings.

Note: All of these options are supported for EMF printing. For XPS printing, only the Desired image quality option is supported.

When adding this setting to a policy that includes the **Universal printing image compression limit** setting, be aware of the following:

- Consider the compression level in the **Universal printing image compression limit** setting is lower than the level defined in the **Universal printing optimization defaults** setting. In this case, the images are compressed at the level defined in the Universal printing image compression limits setting.
- If compression is disabled, the Desired image quality and Enable heavyweight compression options of the Universal printing optimization defaults setting have no effect in the policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Universal printing preview preference

This setting specifies whether to use the print preview function for auto-created or generic universal printers.

By default, print preview isn't used for auto-created or generic universal printers.

When adding this setting to a policy, select an option:

- Do not use print preview for auto-created or generic universal printers
- Use print preview for auto-created printers only
- Use print preview for generic universal printers only
- Use print preview for both auto-created and generic universal printers

Universal printing print quality limit

This setting specifies the maximum dots per inch (dpi) available for generating printed output in a session.

By default, No Limit is enabled, meaning users can select the maximum print quality allowed by the printer to which they connect.

If this setting is configured, it limits the maximum print quality available to users in terms of output resolution. Both the print quality itself and the print quality capabilities of the printer to which the user connects are restricted to the configured setting.

For example, if configured to Medium Resolution (600 DPI), users can print the output with a maximum quality of 600 DPI only. Also, the **Print Quality** setting on the **Advanced** tab of the **Universal Printer** dialog box shows resolution settings only up to and including Medium Quality (600 DPI).

When adding this setting to a policy, select an option:

- Draft (150 DPI)
- Low Resolution (300 DPI)
- Medium Resolution (600 DPI)
- High Resolution (1200 DPI)
- No Limit

Security policy settings

May 13, 2026

The **Security** section includes the policy setting for configuring session encryption and encryption of logon data.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SecureICA minimum encryption level

This setting specifies the minimum level at which to encrypt session data sent between the server and a user device.

Important: For the Virtual Delivery Agent 7.x, this policy setting can be used only to enable the encryption of the logon data with RC5 128-bit encryption. Other settings are provided only for backwards compatibility with legacy versions of Citrix Virtual Apps and Desktops.

For the VDA 7.x, encryption of session data is set using the basic settings of the VDA's Delivery Group. If Enable Secure ICA is selected for the Delivery Group, session data is encrypted using RC5 (128 bit) encryption. If Enable Secure ICA is not selected for the Delivery Group, session data is encrypted with Basic encryption.

When adding this setting to a policy, select an option:

- Basic encrypts the client connection using a non-RC5 algorithm. It protects the data stream from being read directly, but it can be decrypted. By default, the server uses Basic encryption for client-server traffic.
- RC5 (128 bit) logon only encrypts the logon data using RC5 128-bit encryption and the client connection using Basic encryption.
- RC5 (40 bit) encrypts the client connection using RC5 40-bit encryption.
- RC5 (56 bit) encrypts the client connection using RC5 56-bit encryption.
- RC5 (128 bit) encrypts the client connection using RC5 128-bit encryption.

The settings you specify for client-server encryption can interact with any other encryption settings in your environment and your Windows operating system. Consider a higher priority encryption level is set on either a server or user device. In this case, the settings you specify for published resources can be overridden.

You can raise encryption levels to further secure communications and message integrity for certain users. If a policy requires a higher encryption level, Citrix Receivers using a lower encryption level are denied connection.

SecureICA does not perform authentication or check data integrity. To provide end-to-end encryption for your site, use SecureICA with TLS encryption.

SecureICA does not use FIPS-compliant algorithms. If this setting is an issue, configure the server and Citrix Receivers to avoid using SecureICA.

SecureICA uses the RC5 block cipher as described in RFC 2040 for confidentiality. The block size is 64 bits (a multiple of 32-bit word units). The key length is 128 bits. The number of rounds is 12.

Keys for the RC5 block cipher are negotiated when a session is created. Negotiation is performed using the Diffie-Hellman algorithm. This negotiation uses Diffie-Hellman public parameters. These parameters are stored in the Windows registry when the Virtual Delivery Agent is installed. Public

© 1997–2026 Citrix Systems, Inc. All rights reserved.

parameters are not secret. The result of the Diffie-Hellman negotiation is a secret key, from which the session keys for the RC5 block cipher are derived. Separate session keys are used for user logon, and for data transfer. Also, separate session keys are used for traffic to and from the Virtual Delivery Agent. Therefore there are four session keys for each session. The secret keys and session keys are not stored. Initialization vectors for the RC5 block cipher are also derived from the secret key.

Server limits policy settings

May 13, 2026

The **Server Limits** section includes the policy setting for controlling idle connections.

Server idle timer interval

This setting determines how long an uninterrupted user session is maintained if there is no input from the user. The data is calculated in milliseconds.

By default, idle connections are not disconnected (server idle timer interval = 0). Citrix® recommends setting this value to a minimum of 60000 milliseconds (60 seconds).

To display the policy, select **Multiple Versions**, clear the Single-session OS versions, and then select **Server Limits**.

> **Note**
>
> When this policy setting is used, an "Idle timer expired"dialog box might appear to users when the session has been idle for the specified time. Citrix policy settings don't control this Microsoft dialog box message. For more information, see http://support.citrix.com/article/CTX118618.

Session limits policy settings

May 13, 2026

The **Session Limits** section includes policy settings that control how long sessions remain connected before they are forced to log off.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Disconnected session timer

This setting enables or disables a timer that specifies how long a disconnected, locked desktop remains locked before the session is logged off.

If this timer is enabled, the disconnected session is logged off when the timer expires.

By default, disconnected sessions aren't logged off.

Remote PC Access disconnected session timer

This setting enables or disables a timer that logs off a disconnected user session after the timer expires. If you enable this setting, use the **Disconnected session timer interval** setting to specify how many minutes a disconnected desktop remain locked before the user session is logged off.

By default, this setting is disabled.

Disconnected session timer interval

This setting specifies how many minutes a disconnected, locked desktop remain locked before the session is logged off.

By default, the time period is 1,440 minutes (24 hours).

Disconnected session timer –Multi-session

This setting enables or disables a timer to determine how long a disconnected RDS session can persist before the session logs off. By default, this timer is disabled and disconnected sessions are not logged off.

Disconnected session timer interval –Multi-session

This setting determines how many minutes, a disconnected RDS session can persist before the session is logged off. By default, the time period is 1440 minutes (24 hours).

Session connection timer

This setting enables or disables a timer that specifies the maximum duration of an uninterrupted connection between a user device and a desktop. If this timer is enabled, the session is disconnected or logged off when the timer expires. The Microsoft **End session when time limits are reached** setting determines the next state for the session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, this timer is disabled.

Session connection timer interval

This setting specifies the maximum number of minutes for an uninterrupted connection between a user device and a desktop.

By default, the maximum duration is 1,440 minutes (24 hours).

Session connection timer –Multi-session

This setting enables or disables a timer that specifies the maximum duration of an uninterrupted connection between a user device and a terminal server. By default, this timer is disabled.

Session connection timer interval –Multi-session

This setting specifies the maximum number of minutes for an uninterrupted connection between a user-device and an RDS session. By default, the maximum duration is 1440 minutes (24 hours).

Session idle timer

When a user supplies no input, this setting is used to enable or disable:

- A timer that specifies how long an uninterrupted user device connection to a desktop is maintained.

When this timer expires, the session is placed in the disconnected state and the **Disconnected session timer** applies. If the **Disconnected session timer** is disabled, the session is not logged off.

By default, this timer is enabled.

Session idle timer interval

When there is no input from the user, this setting is used to specify:

- The number of minutes for which an uninterrupted user device connection to a desktop is maintained.

By default, idle connections are maintained for 1,440 minutes (24 hours).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session idle timer –Multi-session

This setting enables or disables a timer to determine the maximum duration of an idle connection between a user device and a terminal server. By default, this timer is disabled.

Session idle timer interval–Multi-session

This setting specifies how many minutes an idle connection between a user device and an RDS session. By default, the maximum duration is 1440 minutes (24 hours).

> **Note:**
>
> Timer settings for multi-session machines configured using Citrix® policies are expected to override timer settings configured through Microsoft Group Policies. To avoid unexpected behavior, we recommend you configure timer settings using one of the two methods.

Session management policy settings

August 11, 2026

The **session management** section includes policy settings that control how sessions are managed.

Disconnect published app session after closing last app

When enabled, end users are disconnected rather than logged off from a published app session once all the published apps in that session are closed.

By default, this setting is disabled and user sessions are logged off when all published apps in the session are closed.

Session reliability policy settings

May 13, 2026

The **session reliability** section includes policy settings for managing session reliability connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session reliability connections

This setting allows or prevents sessions to be kept open during a loss of network connectivity. Session reliability, along with auto client reconnection, allows users to reconnect automatically to their Citrix Workspace™ app sessions after recovering from network disruptions. By default, session reliability is Allowed.

The settings in Web Studio are enforced on the client for the following:

- Citrix Workspace app 1808 and later
- Citrix Receiver for Windows 4.7 and later.

Web Studio policy overrides Citrix Receiver™ Group Policy Object on the clients. Updates to these policies in Web Studio synchronize session reliability from server to client.

> **Note:**
>
> - Citrix Receiver for Windows 4.7 and later and Citrix Workspace apps for Windows - Set the policy in Web Studio.
> - Citrix Receivers for Windows earlier than 4.7 - Set policies in Web Studio. Also set the Citrix Receiver Group Policy Object template on the client for consistent behavior.

Session reliability keeps sessions active and on the user's screen when network connectivity is interrupted. Users continue to see the application that they're using until network connectivity resumes.

Use session reliability, to keep the session active on the server. To indicate that connectivity is lost, the user display becomes opaque. The user might see a frozen session during the interruption. User can resume interacting with the application when the network connection is restored. Session reliability reconnects users without reauthentication prompts.

If you use both session reliability and auto client reconnect, the two features work in sequence. Session reliability closes (or disconnects) the user session after the time specified in the session reliability timeout setting. After that, the auto client reconnect settings take effect, trying to reconnect the user to the disconnected session.

By default, session reliability is Allowed.

> **Note:**
>
> When Citrix ADC is in use, you must select **Enable session reliability** in the Citrix StoreFront > **Manage Citrix Gateways** / **Secure Ticket Authority** to proxy ICA connections.

Session reliability port number

This setting specifies the TCP port number for incoming session reliability connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, the port number is set to 2598.

Session reliability timeout

This setting specifies the length of time, in seconds. This time is the time that the session reliability proxy waits for a user to reconnect before allowing the session to be disconnected.

Although you can extend the amount of time a session is kept open, this feature is a convenience and doesn't prompt the user for reauthentication. The longer a session is open, the chances increase that a user might leave the device unattended and potentially accessible to unauthorized users.

By default, the timeout is set to 180 seconds, or three minutes.

Session watermark policy settings

May 13, 2026

The **session watermark** section includes policy settings to configure this feature.
Enabling this feature causes a significant rise in the network bandwidth and CPU usage by the VDA machine. We recommend that you configure the session watermark for selected VDA machines based on your available hardware resources.

> **Important**
>
> Enable session watermark for the other watermark policy settings to be effective. To achieve a better user experience, don't enable more than two watermark text items.

Enable session watermark

When you enable this setting, the session display has an opaque textual watermark displaying session-specific information. The other watermark settings depend on this one being enabled.

By default, the session watermark is disabled.

Include client IP address

When you enable this setting, the session displays the current client IP address as a watermark.

By default, Include client IP address is disabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Include connection time

When you enable this setting, the session watermark displays a connect time. The format is yyyy/mm/dd hh:mm. The time displayed is based on the system clock and time zone.

By default, Include connection time is disabled.

Include logon user name

When you enable this setting, the session displays the current logon user name as a watermark. The display format is USERNAME@DOMAINNAME. We recommend that the user name is a maximum of 20 characters. When a user name is more than 20 characters, excessively small character fonts or truncation might occur and lessen the watermark effectiveness.

By default, Include logon user name is enabled.

Include VDA host name

When you enable this setting, the session displays the VDA host name of the current ICA® session as a watermark.

By default, Include VDA host name is enabled.

Include VDA IP address

When you enable this setting, the session displays the VDA IP address of the current ICA session as a watermark.

By default, the VDA IP address is disabled.

Session watermark style

This setting controls whether you display a single watermark text label or multiple labels. Choose **Multiple** or **Single** from the **Value** drop-down menu.

Multiple displays five watermark labels in the session. One in the center and four in the corners.

Single displays a single watermark label in the center of the session.

By default, the Session watermark style is Multiple.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Watermark custom text

This setting lets you apply custom text (for example, the corporate name) to display in the session watermark. When you configure a non-empty string, it displays the text in a new line appending other information enabled in the watermark. The watermark custom text is limited to 25 Unicode characters. If you configure a longer string, it is truncated to 25 characters.

There is no default text.

Starting with Citrix Virtual Apps and Desktops™ 7 2206, you can add more customization using custom tags in the text. As a result, the maximum number of characters in the custom text is increased to 1024.

The available tags for watermark settings are described in the following table:

Tag	Description	Example
`<font=value>`	Allows you to change the font of watermark text. The value is the name of a font available on the VDA.	`<font=Courier New>`
`<fontzoom=value>`	Allows you to set the percentage of the font zoom factor. The value is 200 for 200% zoom on watermark text.	`<fontzoom=200>`
`<position=value>`	Allows you to change the position of the watermark text. The values are `center`, `topleft`, `topright`, `bottomleft`, and `bottomright`. This tag is only applicable with single style.	`<position=topright>`
`<rotation=value>`	Allows you to rotate watermark text. The value is specified in degree and the range is from -360 and 360.	`<rotation=45>`
`<style=value>`	Allows you to change the display style. This tag overrides the Session watermark style policy.	`<style=single>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following watermark styles are available:

- Single style - A single watermark text label appears at the center of the session. You can use the position tag to change the location.
- xstyle or multiple - Five watermark labels appear in the session - one in the center and one in each corner.
- Tile - Multiple labels appear in the session. Watermark text is placed equally across the entire screen.

The available tags for changing watermark text are described in the following table:

Tag	Description
<clientip>	The IP address of the endpoint.
<date>	The date the session was established.
<domain>	The domain name of the logged-in user account.
<hostname>	The machine name of the VDA.
<newline>	Creates an extra line.
<serverip>	The IP address of the VDA.
<time>	The time the session was established.
<username>	The name of the user.

> **Note:**
>
> - The **Watermark custom text** policy takes effect only when the **Enable session watermark** policy is enabled. Its default value is *Disabled*.
> - If you use the tags for changing watermark text, all other session watermark policies, except **Enable session watermark**, are ignored. If you use the tags for watermark text settings, you can use all other watermark policies.

Watermark transparency

You can specify watermark opacity from 0 through 100. The larger the value specified, the more opaque the watermark.

By default, the value is 17.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Time zone control policy settings

May 13, 2026

The **Time Zone Control** section includes policy settings related to using local time in sessions.

Estimate local time for legacy clients

This setting enables or disables estimating the local time zone of user devices. These devices include the user devices that send inaccurate time zone information to the server.

By default, the server estimates the local time zone when necessary.

This setting is intended for use with legacy Citrix Receivers or ICA clients that do not send detailed time zone information to the server. Consider that this setting is used with Citrix Receivers that send detailed time zone information to the server. For example, supported versions of Citrix Receiver™ for Windows. In this case, this setting has no effect.

Restore desktop OS time zone on session disconnect or logoff

Consider that the user disconnects or logs off a session. In this case, this setting determines whether the time zone setting for a Single-session OS VDA is restored to the machine's original time zone. If you enable this setting, the VDA restores the machine's time zone to its original setting when the user disconnects or logs off. For this setting to take effect, set the **Use local time of client** to **Use client time zone**.

By default, this setting is enabled.

Use local time of client

This setting determines the time zone setting of the user session. The choices are the time zone of the session host (server time zone) or the time zone of the user device (client time zone).

By default, the time zone of the session host is used.

For this setting to take effect in **multi-session** session hosts, enable the **Allow time zone redirection** setting in the Group Policy Editor. The setting is in **Local Computer Policy** > **Computer Configuration** > **Administrative Templates** > **Windows Components** > **Remote Desktop Services** > **Remote Desktop Session Host** > **Device and Resource Redirection**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **IMPORTANT:**
>
> When using the single-session VDA, the **Citrix Portica Timezone Service (CtxPicaTzSvc)** is automatically added to the **Change the time zone** User Rights Assignment policy during the VDA installation. If you have any policies or processes in place that remove users or processes from these policies, make sure to modify them so that the Citrix services are not removed. Otherwise, time zone redirection will not work.

TWAIN devices policy settings

May 13, 2026

The **TWAIN devices** section includes policy settings related to the following:

- Mapping client TWAIN devices, such as digital cameras or scanners
- Optimizing image transfers from server to client

> **Note:**
>
> TWAIN 2.0 is supported with Citrix Receiver for Windows 4.5.

Client TWAIN device redirection

TWAIN devices communicate with server-hosted image processing applications by using the TWAIN protocol.

This setting allows or prevents users from accessing TWAIN devices on the user device. By default, TWAIN device redirection is allowed.

The following policy settings are related:

- TWAIN compression level
- TWAIN device redirection bandwidth limit
- TWAIN device redirection bandwidth limit percent

TWAIN compression level

This setting specifies the level of compression of image transfers from client to server. Use Low for best image quality, Medium for good image quality, or High for low image quality. By default, medium compression is applied.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

USB devices policy settings

May 15, 2026

The **USB devices** section includes policy settings for managing file redirection for USB devices.

Client USB device optimization rules

Client USB device optimization rules can be applied to devices to disable optimization, or to change the optimization mode.

When a user plugs in a USB input device, the host checks if the **USB policy** settings allow the device. If the device is allowed, the host then checks the **Client USB device optimization rules** for the device. If no rule is specified, then the device is not optimized. Capture mode (04) is the recommended mode for signature devices. For other devices which have degraded performance over higher latency, administrators can enable Interactive mode (02). See descriptions of the available modes in the table in this article.

Good to know

- For the use of Wacom signature pads and tablets, we recommend that you disable the screen saver. Steps on how to disable the screen saver are at the end of this section.
- Support for the optimization of Wacom STU signature pads and tablets series of products has been preconfigured in the installation of Citrix Virtual Apps and Desktops™ policies.
- Signature devices work across Citrix Virtual Apps and Desktops and do not require a driver to be used as a signature device. Wacom has more software that can be installed to customize the device further. See http://www.wacom.com/.
- Drawing tablets. Certain drawing input devices might present as an HID device on PCI/ACPI buses and are not supported. Attach these devices on a USB host controller on the client to be redirected inside a Citrix Virtual Desktops session.

Policy rules take the format of tag=value expressions separated by whitespace. The following tags are supported:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Tag Name	Description
Mode	The optimization mode is supported for input devices for class=**03**. Supported modes are: No optimization - value **01**. Interactive mode - value **02**. Recommended for devices such as pen tablets and 3D Pro mice. Capture mode - value **04**. Preferred for devices such as signature pads.
VID	Vendor ID from the device descriptor, as a four-digit hexadecimal number.
PID	Product ID from the device descriptor, as a four-digit hexadecimal number.
REV	Revision ID from the device descriptor, as a four-digit hexadecimal number.
Class	Class from either the device descriptor or an interface descriptor.
SubClass	Subclass from either the device descriptor or an interface descriptor.
Prot	Protocol from either the device descriptor or an interface descriptor.

Examples

Mode=00000004 VID=067B PID=1230 class=03 #Input device operating in capture mode

Mode=00000002 VID=067B PID=1230 class=03 #Input device operating in interactive mode (default)

Mode=00000001 VID=067B PID=1230 class=03 #Input device operating without any optimization

Mode=00000100 VID=067B PID=1230 # Device setup optimization disabled (default)

Mode=00000200 VID=067B PID=1230 # Device setup optimization enabled

Disabling the screen saver for Wacom signature pad devices

For the use of Wacom signature pads and tablets, Citrix® recommends that you disable the screen saver as follows:

1. Install the **Wacom-STU-Driver** after redirecting the device.
2. Install **Wacom-STU-Display MSI** to gain access to the signature pad control panel.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Go to **Control Panel > Wacom STU Display > STU430** or **STU530**, and select the tab for your model.
4. Choose **Change**, then select **Yes** when the UAC security window pops up.
5. Select **Disable slideshow**, then **Apply**.

After the setting is set for one signature pad model, it is applied to all models.

Client USB device redirection

This setting allows or prevents redirection of USB devices to and from the user device.

By default, USB devices are not redirected.

Client USB device redirection rules

This setting specifies the redirection rules for USB devices.

By default, no rules are specified.

When a user plugs in a USB device, the host device checks it against each policy rule in turn until a match is found. The first match for any device is considered definitive. If the first match is an Allow rule, the device is remoted to the virtual desktop. If the first match is a Deny rule, the device is available only to the local desktop. If no match is found, default rules are used.

Policy rules take the format {Allow: | Deny:} followed by a set of tag= value expressions separated by whitespace. The following tags are supported:

Tag Name	Description
VID	Vendor ID from the device descriptor
PID	Product ID from the device descriptor
REL	Release ID from the device descriptor
Class	Class from either the device descriptor or an interface descriptor
SubClass	Subclass from either the device descriptor or an interface descriptor
Prot	Protocol from either the device descriptor or an interface descriptor

When creating policy rules, remember:

- Rules are case-insensitive.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Rules can have an optional comment at the end, introduced by #.
- Blank and pure comment lines are ignored.
- Tags must use the matching operator = (for example, VID=067B_.
- Each rule must start on a new line or form part of a semicolon-separated list.
- See the USB class codes available from the USB Implementers Forum, Inc. website.

Examples of administrator-defined USB policy rules:

- Allow: VID=067B PID=0007 # Another Industries, Another Flash Drive
- Deny: Class=08 subclass=05 # Mass Storage
- To create a rule that denies all USB devices, use "DENY:"without other tags.

Client USB plug and play device redirection

This setting allows or prevents plug-and-play devices such as cameras or point-of-sale (POS) devices to be used in a client session.

By default, plug-and-play device redirection is allowed. When set to Allowed, all plug-and-play devices for a specific user or group are redirected. When set to Prohibited, no devices are redirected.

Configure automatic redirection of USB devices

USB devices are automatically redirected when USB support is enabled. Also, the USB user preference settings are set to automatically connect USB devices.

> **Note:**
>
> In Receiver for Windows 4.2, USB devices are also automatically redirected when operating in Desktop Appliance mode. Also, the connection bar is not present. In earlier versions of Citrix Receiver for Windows, USB devices are also auto-redirected when operate in the following:
>
> - Desktop appliance mode
> - Virtual machine (VM) hosted applications

It is not always best to redirect all USB devices. Users can explicitly redirect devices from the USB device list that is not automatically redirected. To prevent USB devices from being listed or redirected, use DeviceRules on either the client endpoint or the DDC policy. See Administration Guides for further details.

> **Caution:**
>
> Using the Registry Editor incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> up the registry before you edit it.

User preferences settings for auto redirection of USB devices

Policy:

1. Open **Local Group Policy Editor** and go to **Administrative Templates > Citrix Components > Citrix Receiver™ > Remoting client devices > Generic USB Remoting**.
2. Open **New USB Devices**, select **Enabled**, and click **OK**.
3. Open **Existing USB Devices**, select **Enabled**, and click **OK**.

Citrix Receiver:

1. Go to **Citrix Receiver Preferences > Connections**.
2. Ensure that the following options are selected:
    - When a session starts, connect devices automatically
    - When a new device is connected while a session is running, connect the device automatically.
3. Click **OK**.

All the registry keys and the policy changes are applied to the Windows client device.

Plain USB printers redirection

The best solution for plain USB printers is to use the dedicated Universal Printer Driver and virtual channel to perform printing. By default, plain USB printers are not automatically redirected.

Plain printers are detected using heuristics. Also, it is expected that advanced printers with scanning functions for example, might need to be redirected using USB support to work completely.

Use this registry to configure whether plain printers are automatically redirected:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectPrinters

Type: DWORD

Data: 00000000

The default value is 0 (does not automatically redirect). Changing the value to any number greater than zero enables USB support to redirect plain USB printers.

You can also deploy Active Directory policies to this registry key and override the non-policy value if both are present:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectPrinters

Type: DWORD

Data: 00000000

Plain audio devices redirection

Like plain printers, the best user experience is achieved using the dedicated audio virtual channel of ICA® to send audio data from plain audio devices. However, you might need to redirect some specialty devices using USB support. Heuristics are used to determine which devices are plain audio devices.

Use this registry on client endpoint to configure whether plain audio devices are automatically redirected:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectAudio

Type: DWORD

Data: 00000000

The default is set to 0 (does not automatically redirect). Changing the value to non-zero, redirects plain USB audio devices with USB support.

You can use Active Directory policies to deploy this value to the registry key and override the non-policy value if both are present:

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectAudio

Type: DWORD

Data: 00000000

Plain storage devices (mass storage device) redirection

For plain storage devices, you achieve the best user experience using the dedicated virtual channel, such as client drive mapping that also performs optimization. In addition to simple reading or writing files, to perform certain special tasks like burning a CD/DVD or accessing encrypted file systems devices, the device might still need to be redirected using generic USB support.

Heuristics are used to determine which devices are plain storage devices. Use this registry key to configure whether plain storage devices are automatically redirected:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectStorage

Type: DWORD

Data: 00000000

The default is set to 0 (does not automatically redirect). Changing the value to non-zero, redirects plain USB storage devices using generic USB support.

You can also use Active Directory policies to deploy this value to the following registry key and override the non-policy value if both are present:

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectStorage

Type: DWORD

Data: 00000000

> **Note:**
>
> Read only access to the plain storage device is not configurable if you are using generic USB support, while it is configurable if using CDM.

USB flash drives with hardware encryption redirection

USB flash drives with hardware encryption typically consist of an encrypted storage partition and a second *utility* partition that contains a utility for unlocking the encrypted partition. For USB Flash Drive devices, achieve the best user experience using the dedicated client drive mapping/dynamic thumb drive mapping HDX virtual channel that also performs optimization.

Generic USB redirection is necessary for the following:

- Non-Windows clients (for example, Linux clients)
- Clients where the customer has restricted (locked down) user access to local functions on the client

Generic USB redirection can redirect any USB storage device without hardware encryption into both Single-session OS and Multi-session OS VDA sessions.

Before Citrix Virtual Apps and Desktops™ 7 1808, USB flash drives with hardware encryption could not be redirected in any useful way into Single-session OS or Multi-session OS VDA sessions. A new feature enhancement introduced in Citrix Virtual Apps and Desktops 7 1808 supports generic USB redirection of USB flash drives with hardware encryption into Single-session OS and Multi-session OS VDA sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After the device is redirected, none of its drives appear on the local client. So, if unlocking the drive is required, perform it in the session. This feature requires Windows update KB4074590.

Plain still image devices (scanners and digital cameras)

For plain still image devices, achieve the best user experience using the dedicated virtual channel (such as the TWAIN virtual channel) that also performs optimization. These devices must adhere to industry standards. Consider that a device is non-compliant or it is not used according to the original intentions. In this case, generic USB redirection might be the only way to use the device. Heuristics are used to determine which devices are plain still image devices.

Use this registry key to configure whether plain still image devices are automatically redirected:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectImage

Type: DWORD

Data: 00000000

The default is set to 0 (does not automatically redirect). Changing the value to non-zero, redirects plain USB still image devices with generic USB.

You can also use Active Directory policies to deploy this value to this registry key and override the non-policy value if both are present:

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectImage

Type: DWORD

Data: 00000000

Device specific settings

The heuristics used to select Citrix optimizable devices do not always match what you want. The examples for Citrix optimizable devices are printers, audio, video, storage, and still image devices. You might want to control automatic redirection of devices that are not listed above. You can control automatic redirection on a device specific basis.

As an example, the DemoTech 2,000 bar code reader doesn't need to be redirected using USB support. It has a vendor identifier of 12AB and a product identifier of 5678. These hexadecimal numbers can be found in Device Manager.

To prevent this being automatically redirected, create this device specific registry key:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices\VID12AB PID5678

Name: AutoRedirect

Type: DWORD

Data: 00000000

A value of 0 prevents the device from being automatically redirected. A non-zero value indicates that the device must be considered for automatic redirection (subject to user preferences). There is a single space character between the vendor and product identifiers.

You can also deploy this value using Active Directory policies to this registry key. It overrides the non-policy value if both are present:

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices\VID12AB PID5678

Name: AutoRedirect

Type: DWORD

Data: 00000000

Device specific AutoRedirect settings take precedence over the more general AutoRedirectXXX values explained above. The default heuristics for Citrix optimized devices might misinterpret a device as generic. Therefore, set the device specific AutoRedirect value to 1 to redirect it automatically.

Allow existing USB devices to be automatically connected

This setting allows or prevents the automatic connection of the existing USB devices that are connected to the endpoint at the start of a session to the remote session.

When adding this setting to a policy, select one of the following options:

- Ask before redirecting available USB devices.
- Do not automatically redirect available USB devices.
- Automatically redirect available USB devices.

By default, the **Ask before redirecting available USB devices** option is selected. Based on the policy selected, the option selected at the client's **Preferences** > **Devices** section can be overridden.

> **Note:**
>
> Currently, the **Allow existing USB devices to be automatically connected** policy is applicable only for Citrix Workspace™ app for Windows.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Allow newly arrived USB devices to be automatically connected

This setting allows or prevents the automatic connection of the USB devices that are inserted at the endpoint during a session to the remote session.

When adding this setting to a policy, select one of the following options:

- Ask before redirecting available USB devices.
- Do not automatically redirect available USB devices.
- Automatically redirect available USB devices.

By default, the **Ask before redirecting available USB devices** option is selected. Based on the policy selected, the option selected at the client's **Preferences** > **Devices** section can be overridden.

> **Note:**
>
> Currently, the **Allow newly arrived USB devices to be automatically connected** policy is applicable only for Citrix Workspace app for Windows.

Client USB device redirection rules (Version 2)

This setting specifies rules for filtering, splitting, and auto-connecting USB devices to a remote session.

When this setting is selected, the host overrides the *Client USB device redirection rules* setting with the device rules configured in this setting.

For more information, see Configuring composite USB device redirection.

Virtual channel allow list policy settings

May 13, 2026

The **Virtual channel allow list** policy setting enables the use of an allow list that specifies which virtual channels are allowed to be opened in an ICA® session.

When disabled, all virtual channels are allowed.

When enabled, only Citrix® virtual channels are allowed.

To use custom or third-party virtual channels, add the virtual channels to the list. To add a virtual channel to the list:

1. Enter the virtual channel name followed by a comma.
2. Enter the path to the process that accesses the virtual channel.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

More executable paths can be listed, and the paths are separated by commas.

For example,

```
CTXCVC1,C:\VC1\vchost.exe
```

```
CTXCVC2,C:\VC2\vchost.exe,C:\Program Files\Third Party\vcaccess.exe
```

Starting with Citrix Virtual Apps and Desktops 7 2109, virtual channel allow lists are enabled by default. For more information on adding virtual channels to the allow list, see Adding virtual channels to the allow list

If you're using the HDX RealTime Optimization Pack for Skype for Business, add the virtual channel to the allow list. For more information, see the HDX RealTime Optimization Pack documentation.

> **Important:**
>
> The VDA machines must be rebooted for the setting to take effect.

For more information about virtual channels, see ICA virtual channels.

Virtual channel allow list logging

You can use this policy setting to configure the level for Virtual Channel Allow List logging.

The following options are available:

Options	Description
Disabled	Disables all log events.
Log warnings only	Events are logged only for custom Virtual Channels that try to open and that are not part of the allow list.
Log all events	All events are logged

Virtual channel allow list log throttling

You can use this policy setting to configure the frequency for logging events for an active session.

All events for each virtual channel will be logged on their first occurrence. Repeated events will be suppressed for the duration of the throttling period while the session is active. If a session is disconnected, the throttling period is reset.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual channel allow list for DVC

Enables the use of an allow list that specifies which dynamic virtual channels are allowed to be opened in an ICA session.

When disabled, all dynamic virtual channels are allowed.

When enabled, no dynamic virtual channels are allowed. To use dynamic virtual channels (DVC) with this feature, the DVCs must be added to the list. To add a DVC to the list, enter the path to the process that accesses the DVC in the session host followed by a comma, then the client-side plugin name followed by a comma and the name of the listener used by the plugin. Multiple listener names can be added separated by commas.

You may use a wildcard to allow all the listeners supported by the plugin.

You may also use a wildcard to replace a single directory name in the process path, part of a directory name in the process path, replace the executable's name, or replace part of the executable's name.

Changes to this setting will only apply after restarting the session host.

Example:
Client-side plugins: `DvcPlugin1.dll`, `DvcPlugin2.dll`, `DvcPlugin3.dll`

Allow list entry:

```
C:\Program Files\App\run1.2.exe,DvcPlugin1,ListenerName1

```

Visual display policy settings

May 13, 2026

The **Visual Display** section includes policy settings for controlling the quality of images that are sent from virtual desktops to the user device.

Preferred color depth for simple graphics

This policy setting is available in VDA versions 7.6 FP3 and later. The 8-bit option is available in VDA versions 7.12 and later.

This setting makes it possible to lower the color depth at which simple graphics are sent over the network. Lowering to 8-bit or 16-bit per pixel potentially improves responsiveness over low bandwidth connections. However, this action might cost slight degradation in image quality. The 8-bit color

© 1997–2026 Citrix Systems, Inc. All rights reserved.

depth is not supported when the Use video codec for compression policy setting is set to **For the entire screen**.

The default preferred color depth is 24-bits per pixel.

VDAs fall back to 24-bit (default) color depth if the 8-bit setting is applied on VDA version 7.11 and earlier.

Target frame rate

This setting specifies the maximum number of frames per second sent from the virtual desktop to the user device.

By default, the maximum is 30 frames per second.

Setting a high number of frames per second (for example, 30) improves the user experience, but requires more bandwidth. Decreasing the number of frames per second (for example, 10) maximizes server scalability at the expense of user experience. For user devices with slower CPUs, specify a lower value to improve the user experience.

The maximum supported frame rate per second is 60.

Visual quality

This setting specifies the desired visual quality for images displayed on the user device.

By default, this setting is Medium.

To specify the quality of images, choose one of the following options:

- **Low** - Recommended for bandwidth-constrained networks where visual quality can be sacrificed for interactivity
- **Medium** - Offers the best performance and bandwidth efficiency in most use cases
- **High** - Recommended if you require visually lossless image quality
- **Build to lossless** - Sends lossy images to the user device during periods of high network activity and lossless images after network activity reduces. This setting improves performance over bandwidth-constrained network connections
- **Always lossless** - When preserving image data is vital, select **Always lossless** to ensure that lossy data is never sent to the user device. For example, when displaying X-ray images where no loss of quality is acceptable.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Moving images policy settings

May 13, 2026

The **Moving Images** section contains settings that enable you to remove or alter compression for dynamic images.

Minimum image quality

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting specifies the minimum acceptable image quality for Adaptive Display. The less compression used, the higher the quality of images displayed. Choose from Ultra High, Very High, High, Normal, or Low compression.

By default, this is set to Normal.

Moving image compression

This setting specifies whether or not Adaptive Display is enabled. Adaptive Display automatically adjusts the image quality of videos and transitional slides in slide shows based on available bandwidth. With Adaptive Display enabled, users should see smooth-running presentations with no reduction in quality.

By default, Adaptive Display is enabled.

For VDA versions 7.0 through 7.6, this setting applies only when Legacy graphics mode is enabled. For VDA versions 7.6 FP1 and later, this setting applies when Legacy graphics mode is enabled, or when the legacy graphics mode is disabled and a video codec is not used to compress graphics.

When legacy graphics mode is enabled, the session must be restarted before policy changes take effect. Adaptive Display is mutually exclusive with Progressive Display; enabling Adaptive Display disables Progressive Display and vice versa. However, both Progressive Display and Adaptive Display can be disabled at the same time. Progressive Display, as a legacy feature, is not recommended for XenApp or XenDesktop. Setting Progressive threshold Level will disable Adaptive Display.

Progressive compression level

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This setting provides a less detailed but faster initial display of images.

By default, no progressive compression is applied.

The more detailed image, defined by the normal lossy compression setting, appears when it becomes available. Use Very High or Ultra High compression for improved viewing of bandwidth-intensive graphics such as photographs.

For progressive compression to be effective, its compression level must be higher than the Lossy compression level setting.

Note: The increased level of compression associated with progressive compression also enhances the interactivity of dynamic images over client connections. The quality of a dynamic image, such as a rotating three-dimensional model, is temporarily decreased until the image stops moving, at which time the normal lossy compression setting is applied.

The following policy settings are related:

- Progressive compression threshold value
- Progressive heavyweight compression

Progressive compression threshold value

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting represents the maximum bandwidth in kilobits per second for a connection to which progressive compression is applied. This is applied only to client connections under this bandwidth.

By default, the threshold value is 2147483647 kilobits per second.

The following policy settings are related:

- Progressive compression threshold value
- Progressive heavyweight compression

Target minimum frame rate

This setting specifies the minimum frame rate per second the system attempts to maintain, for dynamic images, under low bandwidth conditions.

By default, this is set to 10fps.

For VDA versions 7.0 through 7.6, this setting applies only when Legacy graphics mode is enabled. For VDA versions 7.6 FP1 and later, this setting applies when the Legacy graphics mode is disabled or enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The target minimum framerate policy has been deprecated and is set to 10 fps. This can be changed by end users by using the Quality slider in the Graphic status indicator.

Still images policy settings

May 13, 2026

The **Still Images** section contains settings that enable you to remove or alter compression for static images.

Extra color compression

This setting enables or disables the use of extra color compression on images delivered over client connections that are limited in bandwidth, improving responsiveness by reducing the quality of displayed images.

By default, extra color compression is disabled.

When enabled, extra color compression is applied only when the client connection bandwidth is below the Extra color compression threshold value. When the client connection bandwidth is above the threshold value or Disabled is selected, extra color compression is not applied.

Extra color compression threshold

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting represents the maximum bandwidth in kilobits per second for a connection below which extra color compression is applied. If the client connection bandwidth drops below the set value, extra color compression, if enabled, is applied.

By default, the threshold value is 8192 kilobits per second.

Heavyweight compression

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This setting enables or disables reducing bandwidth beyond progressive compression without losing image quality by using a more advanced, but more CPU-intensive, graphical algorithm.

By default, heavyweight compression is disabled.

If enabled, heavyweight compression applies to all lossy compression settings. It is supported on Citrix Workspace™ app but has no effect on other plug-ins.

The following policy settings are related:

- Progressive compression level
- Progressive compression threshold value

Lossy compression level

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting controls the degree of lossy compression used on images delivered over client connections that are limited in bandwidth. In such cases, displaying images without compression can be slow.

By default, medium compression is selected.

For improved responsiveness with bandwidth-intensive images, use high compression. Where preserving image data is vital; for example, when displaying X-ray images where no loss of quality is acceptable, you may not want to use lossy compression.

Related policy setting: Lossy compression threshold value

Lossy compression threshold value

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting represents the maximum bandwidth in kilobits per second for a connection to which lossy compression is applied.

By default, the threshold value is 2147483647 kilobits per second.

Adding the Lossy compression level setting to a policy and including no specified threshold can improve the display speed of high-detail bitmaps, such as photographs, over a LAN.

Related policy setting: Lossy compression level

© 1997–2026 Citrix Systems, Inc. All rights reserved.

WebSockets policy settings

May 13, 2026

The **WebSockets** section includes policy settings for accessing virtual desktops and hosted applications using the Citrix Workspace™ app for HTML5. The WebSockets feature increases security and reduces overhead by conducting two-way communication between browser-based applications and servers. The feature does so without opening multiple HTTP connections.

WebSockets connections

This setting allows or prohibits WebSockets connections.

By default, WebSocket connections are prohibited.

WebSockets port number

This setting identifies the port for incoming WebSocket connections.

By default, the value is 8008.

WebSockets trusted origin server list

This setting provides a comma-separated list of trusted origin servers, usually the Citrix Workspace app for Web, expressed as URLs. The server accepts only WebSockets connections originating from one of these addresses.

By default, the wildcard * is used to trust all Citrix Workspace app for Web URLs.

If you choose to type an address in the list, use this syntax:

<protocol>://<Fully qualified domain name of host>:[port]

The protocol must be HTTP or HTTPS. If the port is not specified, port 80 is used for HTTP and port 443 is used for HTTPS.

The wildcard * can be used within the URL, except as part of an IP address (`10.105.*.*`).

WIA devices policy settings

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The **WIA devices** section includes policy settings for managing scanner redirection using Windows Image Acquisition (WIA).

WIA redirection

WIA devices, such as digital cameras and scanners, communicate with server-hosted image processing applications by using the WIA framework. This setting allows or prohibits users from accessing WIA devices on the user device. By default, WIA redirection is prohibited.

For information about WIA-compliant devices, see WIA devices.

HDX™ features managed through the registry

May 15, 2026

> **Note:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

To open the Registry Editor, run `regedit.exe` on the server. Then navigate to the registry key to add or edit the settings.

Devices

Bloomberg keyboards

Citrix Virtual Apps and Desktops™ support the Bloomberg model 4 and model 3 starboard keyboard. By default, the support for the enhanced Bloomberg keyboard is disabled.

To enable support for the Bloomberg keyboard, set the following registry value on the client machine before you start a connection:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICAClient\GenericUSB`
- **Value name**: `EnableBloombergHID`
- **Value type**: `DWORD`
- **Value data**:
  - `0` - Disable

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- 1 - Enable

For more information, see Bloomberg keyboard.

Mapped client drives

As a security precaution, when a user logs in to Citrix Virtual Apps and Desktops™, by default, the server maps client drives without user run permission. To enable users to run executable files residing on mapped client drives, override this default by editing the registry on the server.

To allow access, edit the following registry value (create **CDMSettings** if it doesn't exist):

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\CDMSettings`
- **Value name**: `ExecuteFromMappedDrive`
- **Value type**: `DWORD`
- **Value data**:
  - 1 - Allow permission
  - 0 - Deny permission on mapped drives

The change takes effect for sessions connected after you edit the registry.

Citrix Virtual Apps and Desktops 7 2006 is the first version to contain this registry location. Earlier versions of Citrix Virtual Apps and Desktops used a different registry location.

For more information, see Client Drive Mapping.

Microsoft Surface Pro and Surface Book pens

Citrix Virtual Apps and Desktops support standard pen functionality with Windows Ink-based applications. By default, this feature is enabled.

To disable or enable this feature, set the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Citrix Virtual Desktop Agent\PenApi`
- **Value name**: `DisablePen`
- **Value type**: `DWORD`
- **Value data**:
  - 1 - Disable
  - 0 - Enable

For more information, see Microsoft Surface Pro and Surface Book pens.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Windows Image Acquisition application allow list

This setting lets you control which applications on the VDA can access the Windows Image Acquisition scanner redirection.

By default, no applications have access to Windows Image Acquisition.

To adjust Windows Image Acquisition for applications on the VDA, create the following registry setting:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix`
- **Value name**: `WIAAllowedProcesses`

  Select and right-click **WIAAllowedProcesses**. Choose **New > Multi-String Value** and rename the new value to **AllowProcesses**.
- Value data: Enter the full path and process name for each application that can access Windows Image Acquisition. Provide each application on a new line.

Any changes to this setting take effect the next time you launch a session on the VDA.

General

Secure Connection Port

When TLS/DTLS is enabled on the VDA, the default connection port number is 443. To change the port, modify the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd`
- **Value name**: `SSLPort`
- **Value type**: `DWORD`
- **Value data**: `443` (Decimal)

HDX Direct

The default timeout for HDX Direct in multi-session session hosts is 60 seconds. To change the timeout, modify the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd\HdxDirect`
- **Value name**: `HdxDirectInitiateTimeoutInSeconds`
- **Value type**: `DWORD`
- **Value data**: `60` (Decimal)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HDX Reducer

You can configure the version of the HDX compression algorithm (Reducer) that you want to use in the session host.

To enable Reducer V4 in a single-session VDA, set the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\GroupPolicy\Defaults\WDSettings`
- **Value name**: `ReducerOverrideMask`
- **Value type**: `DWORD`
- **Value data**: `23` (Decimal)

To enable Reducer V4 in a multi-session VDA, set the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd`
- **Value name**: `ReducerOverrideMask`
- **Value type**: `DWORD`
- **Value data**: `23` (Decimal)

Configure Rendezvous version

To configure the version of Rendezvous to use, set the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\VirtualDesktopAgent`
- **Value type**: `DWORD`
- **Value name**: `GctRegistration`
- **Value data**:
  - `1` - To enable V2
  - `0` - To enable V1

Configure automatic logon to the VDA

This setting lets you enable or disable the **Always prompt for password** Microsoft policy setting on the Windows 10 single-session OS and multi-session OS VDAs.

If **Always prompt for password** is enabled, users must enter credentials on the VDA when they start a remote session. If this setting is disabled, users automatically connect to the remote session without providing credentials on the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, the Microsoft policy setting is disabled. To enable or disable the **Always prompt for password** setting, set the following registry value on the VDA:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Portica`
- **Value name**: `AutoLogon`
- **Value type**: `DWORD`
- **Value data**:
  - `1` - Disables the Microsoft policy setting and lets users automatically sign in to a remote session.
  - `0` –Enables the Microsoft policy setting and prompts users to provide credentials when they launch a remote session.

Disable timeout warning

By default, users with inactive or idle sessions receive a warning message two minutes before their session automatically disconnects.

This setting disables and removes the warning message for users reaching the idle session timeout limit on the following:

- Windows Server 2004
- Windows 10 multi-session 2004 or later multi-session OS

To remove the warning, set the following registry value on the VDA:

- **Key**: `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Winstations\ICA-CGP`
- **Value name**: `fEnableTimeoutWarning`
- **Value type**: `DWORD`
- **Value data**:
  - `1` - Disable the warning message
  - `0` - Enable the warning message

To display the warning message, delete the registry value or set it to `0`.

EDT MTU Discovery

MTU Discovery allows EDT to automatically determine the Maximum Transmission Unit (MTU) when establishing a session. Doing so prevents EDT packet fragmentation that might result in performance degradation or failure to establish a session.

This setting is enabled by default. To disable EDT MTU Discovery, configure the following registry value and restart the session host:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Key**: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd
- **Value name**: MtuDiscovery
- **Value type**: DWORD
- **Value data**: 0

To enable MTU Rediscovery, configure the following registry values and restart the session host:

- **Key:** HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd\MtuRediscovery
- **Value name:** MtuReDiscovery
- **Value type:** DWORD
- **Value data:** 1
- **Key:** HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd\MtuRediscovery
- **Value name:** MtuReDiscoveryFrequency
- **Value type:** DWORD
- **Value data:** 1

These settings are machine-wide and affect all sessions connecting from a supported client.

EDT timeout

You can set the EDT timeout in the VDA to any value between 5 and 25 seconds. The default EDT timeout value is 10 seconds.

- **Key**: HKLM\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd\Tds\udp\UDPStackParameters
- **Value type**: DWORD
- **Value name**: edtConnectionTimeout
- **Value data**: time in seconds between 5 and 25 (decimal)

You can also set the EDT timeout for Citrix Workspace app for Windows version 2409.10 and older:

- **Key**: HKLM\SOFTWARE\WOW6432Node\Citrix\ICA Client\Engine\Lockdown Profiles\All Regions\Lockdown\Network\EDT
- **Value type**: String / REG_SZ
- **Value name**: edtConnectionTimeout
- **Value data**: time in seconds between 5 and 25 (decimal)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **NOTE:**
>
> The timeout setting from the VDA will be used by Citrix Workspace app starting with version 2503, eliminating the need to configure the timeout on the client device.

General content redirection

Add URL types for host to client redirection

By default, we support redirection of the following URL types: HTTP, HTTPS, RTSP, RTSPU, PNM, and MMS. You can add URL types to the list by creating the following registry keys and values on the Windows client.

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Policies\Citrix\ICA Client\SFTA`
- **Value name**: `ExtraURLProtocols`
- **Value type**: `REG_SZ`
- **Value data**: Specify the required URL types separated by semicolon. Include everything before the authority portion of the URL. For example: `ftp://;mailto:;customtype1:///;custometype2://`

You can add URL types only for Windows clients. Clients missing this registry setting reject redirection back to the Citrix session. The client must have an application installed and configured to handle the specified URL types.

For more information, see Host to client redirection.

Client folder redirection

Client folder redirection changes the way client-side files are accessible on the host-side session. Consider that you enable client folder redirection on the server and the user configures it on the user device. In this case, the portion of the local volume specified by the user is redirected.

To enable client folder redirection on the server, set the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\Client Folder Redirection`
- **Value name**: `CFROnlyModeAvailable`
- **Value type**: `DWORD`
- **Value data**: `1`

For more information, see Client folder redirection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Host to client redirection for a specific set of websites

To enable host to client redirection for a specific set of websites, set the following registry value on the server VDA.

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\SFTA`
- **Value name**: `ValidSites`
- **Value type**: `REG_MULTI_SZ`
- **Value data**: Specify any combination of fully qualified domain names (FQDNs). Type multiple FQDNs on separate lines. Include the FQDN only, without protocols (`http://` or `https://`). An FQDN can include an asterisk (`*`) as a wildcard character in the leftmost position only. This wildcard matches a single level of domain, which is consistent with the rules in RFC 6125. For example:

`www.example.com`

`*.example.com`

For more information, see Host to client redirection.

Local application behavior on logoff and disconnect

By default, local applications continue to run when a user logs off or disconnects from the virtual desktop. After reconnection, local applications are reintegrated if they are available on the virtual desktop. To configure local application behavior on logoff and disconnect, set the following registry value in the hosted desktop:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\wow6432node\Citrix\Client Hosted Apps\Policies`
- **Value name**: `Session State`
- **Value type**: `DWORD`
- **Value data**:
  - `1` - Local applications continue to run when a user logs off or disconnects from the virtual desktop. Upon reconnection, local applications are reintegrated if they are available on the virtual desktop.
  - `3` - Local applications close when a user logs off or disconnects from the virtual desktop.

For more information, see Local App Access and URL redirection.

Remove URL types from the default list for host to client redirection

To remove URL types from the default redirection list, create the following registry keys and values on the server VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Key**: HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\SFTA
- **Value name**: DisableServerFTA
- **Value type**: DWORD
- **Value data**: 1
- **Value name**: NoRedirectClasses
- **Value type**: REG_MULTI_SZ
- **Value data**: Specify any combination of the values: http, https, rtsp, rtspu, pnm, or mms. Type multiple values on separate lines. For example:

```
http
https
rtsp
```

For more information, see Host to client redirection.

Server VDA default browser configuration

You can enable host to client redirection to supersede any default browser configuration on the Server VDA. If a web URL is not redirected, the Citrix launcher passes the URL to the browser configured in the command_backup registry key. The key points to Internet Explorer by default, but you can modify it to include the path to a different browser.

- Internet Explorer (Default)
  - **Key**: HKEY_CLASSES_ROOT\http\shell\open\command_backup
  - **Value name**: Default
  - **Value type**: REG_SZ
  - **Value data**: "c:\program files\internet explorer\iexplore.exe""%1"
  - **Key**: HKEY_CLASSES_ROOT\https\shell\open\command_backup
  - **Value name**: Default
  - **Value type**: REG_SZ
  - **Value data**: "c:\program files\internet explorer\iexplore.exe""%1"
- Google Chrome
  - **Key**: HKEY_CLASSES_ROOT\http\shell\open\command_backup
  - **Value name**: Default

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - **Value type**: REG_SZ
    - **Value data**: "C:\Program Files (x86)\Google\Chrome\Application\chrome.exe""%1"
    - **Key**: HKEY_CLASSES_ROOT\https\shell\open\command_backup
    - **Value name**: Default
    - **Value type**: REG_SZ
    - **Value data**: "C:\Program Files (x86)\Google\Chrome\Application\chrome.exe""%1"
- Microsoft Edge
    - **Key**: HKEY_CLASSES_ROOT\http\shell\open\command_backup
    - **Value name**: Default
    - **Value type**: REG_SZ
    - **Value data**:"C:\Program Files (x86)\Microsoft\Edge\Application\msedge.exe""%1"
    - **Key**: HKEY_CLASSES_ROOT\https\shell\open\command_backup
    - **Value name**: Default
    - **Value type**: REG_SZ
    - **Value data**:"C:\Program Files (x86)\Microsoft\Edge\Application\msedge.exe""%1"

The Local App Access for published applications

Local App Access seamlessly integrates locally installed Windows applications into a hosted desktop environment without switching from one desktop to another. To provide access to published applications, set the following registry value on the server:

- **Key**: HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\DesktopStudio
- **Value name**: ClientHostedAppsEnabled
- **Value type**: DWORD
- **Value data**:
    - 1 - Enable
    - 0 - Disable

For more information, see Local App Access and URL redirection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Graphics

GPU acceleration for CUDA or OpenCL applications

GPU acceleration of CUDA and OpenCL applications running in a user session is disabled by default.

To use the CUDA acceleration POC features, enable the following registry setting:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\CtxHook\AppInit_Dlls\Graphics Helper`
- **Value name**: `CUDA`
- **Value type**: `DWORD`
- **Value data**: `00000001`

To use the OpenCL acceleration POC features, enable the following registry setting:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\CtxHook\AppInit_Dlls\Graphics Helper`
- **Value name**: `OpenCL`
- **Value type**: `DWORD`
- **Value data**: `00000001`

For more information, see GPU acceleration for Windows multi-session OS

Progressive mode

Progressive mode is disabled by default. You can change the progressive mode state with the following registry value:

- **Key**: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Graphics`
- **Value type**: `REG_DWORD`
- **Value name**: `ProgressiveDisplay`
- **Value data**:
  - `0` - Always off (Disables progressive mode. This value is the default.)
  - `1` - Automatic (Toggle based on network conditions.)
  - 2 = Always on

For more information, see Progressive mode.

> **Note:**
>
> Progressive mode has been deprecated. Thinwire is an alternative option that optimizes image

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> delivery and maintains cache efficiency while providing nearly all of the benefits of the progressive mode.

Windows Presentation Foundation (WPF) rendering

HDX 3D Pro allows graphics-heavy applications running in Windows Multi-session OS sessions to render on the server's graphics processing unit (GPU). By moving Windows Presentation Foundation (WPF) rendering to the server's GPU, graphics rendering does not slow the server's CPU.

To enable WPF application rendering using the server's GPU, create the following setting in the registry of the server running Windows multi-session OS:

1. Open the Registry Editor on the VDA and go to the following key:

   `HKLM\Software\Citrix\CtxHook\AppInit_DLLs\Graphics Helper`

2. Create or edit the following registry values:

   - [REG_DWORD] AdapterHandle = 0x00000001
   - [REG_DWORD] DevicePath = 0x00000001
   - [REG_DWORD] Flag = 0x00000412
   - [REG_DWORD] WPF = 0x00000001

3. Create a sub-key with the executable name of your WPF app. For example, if your app is called "mywpfapp.exe", create the following key:

   `HKLM\Software\Citrix\CtxHook\AppInit_DLLs\Graphics Helper\mywpfapp.exe`

4. Reboot the server for the setting to take effect.

For more information, see GPU acceleration for Windows multi-session OS and the blog on Getting the best out of WPF apps on Windows multi-session OS.

Multimedia

Webcam software compression

If a webcam supports hardware encoding, HDX video compression uses the hardware encoding by default. Hardware encoding might consume more bandwidth than software encoding. To force software compression, add the following values to the client:

- **Key**: `HKEY_CURRENT_USER\SOFTWARE\Citrix\HdxRealTime`
- **Value name**: `DeepCompress_ForceSWEncode`
- **Value type**: `DWORD`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Value data**: 1

For more information, see HDX webcam video compression.

Webcam video resolution

If the media type negotiation fails, HDX falls back to the default VGA resolution (640 x 480 pixels). You can use registry keys on the client to configure the default resolution. Before setting the following registry keys, ensure that the camera supports the specified resolution.

- **Key**: `HKEY_CURRENT_USER\SOFTWARE\Citrix\HDXRealTime`
- Width
  - **Value name**: `DefaultWidth`
  - **Value type**: `DWORD`
  - **Value data**: desired width in decimal (for example: 1280)
- Height
  - **Value name**: `DefaultHeight`
  - **Value type**: `DWORD`
  - **Value data**: desired height in decimal (for example 720)

Webcam video compression frame rate

To adjust the preferred video frame rate, edit the following registry value on the client:

- **Key**: `HKEY_CURRENT_USER\SOFTWARE\Citrix\HDXRealTime`
- **Value name**: `FramesPerSecond`
- **Value type**: `DWORD`
- **Value data**: 15

If the webcam doesn't support the specified frame rate, the application uses 15 FPS by default.

For more information, see HDX webcam video compression.

Microsoft Teams fallback mode

If Microsoft Teams fails to load in optimized VDI mode ("Citrix HDX Not Connected"in Teams/About/Version), the VDA falls back to legacy HDX technologies, such as webcam redirection and client audio and microphone redirection. If you are using a Workspace app version/platform OS that does not support Microsoft Teams optimization, fallback registry keys do not apply.

To control the fallback mechanism, set one of the following registry values on the VDA:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Key** (only one needed):
  - **Computer setting:** `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Teams`
  - **User setting:** `HKEY_CURRENT_USER\SOFTWARE\Microsoft\Office\Teams`
- **Value name**: `DisableFallback`
- **Value type**: `DWORD`
- Value data:
  - 1 - Disable fallback mode
  - 2 - Enable audio only

If the value isn't present or is set to 0, fallback mode is enabled. This feature requires Microsoft Teams version 1.3.0.13565 or later. For more information, see Optimization for Microsoft Teams.

Optimization for Microsoft Teams with Citrix App Layering™

If using Citrix App Layering to manage VDA and Microsoft Teams installations in different layers, create an empty registry key named **PortICA** on Windows before installing Microsoft Teams with the `ALLUSER=1` flag from the command line. Leave the default value name, type, and data.

- Key for 32-bit Version of Registry Editor: `HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Citrix\PortICA`
- Key for 64-bit Version of Registry Editor: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA`

For more information, see Optimization for Microsoft Teams.

Load management policy settings

May 15, 2026

The **Load Management** section includes policy settings for enabling and configuring load management between servers delivering Windows Multi-session OS machines.

For information about calculating the load evaluator index, see CTX202150.

Concurrent logon tolerance

This setting specifies the maximum number of concurrent logons that a server can accept.

By default, this value is set to 2.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When this setting is enabled, load balancing tries to avoid having more than the specified number of logons active on a Server VDA at the same time. However, the limit is not strictly enforced. To enforce the limit (and cause concurrent logons that exceed the specified number to fail), create the following registry key:

> HKLM\Software\Citrix\DesktopServer\LogonToleranceIsHardLimit
> Type: DWORD
> Value: 1

CPU usage

This setting specifies the level of CPU usage, as a percentage, at which the server reports a full load. When enabled, the default value at which the server reports a full load is 90%.

By default, this setting is disabled and CPU usage is excluded from load calculations.

CPU usage excluded process priority

> **Note:**
>
> In scenarios where Workspace Environment Management manages machines, using this setting along with the CPU Priority settings can have unintended results. We recommend that you disable this setting if you choose to use the CPU Priority settings.

This setting specifies the priority level at which a process'CPU usage is excluded from the CPU Usage load index.

By default, this value is set to **Below Normal** or **Low**.

Disk usage

This setting specifies the disk queue length at which the server reports a 75% full load. When enabled, the default value for disk queue length is 8.

By default, this setting is disabled and disk usage is excluded from load calculations.

Maximum number of sessions

This setting specifies the maximum number of sessions a server can host. When enabled, the default setting for the maximum number of sessions a server can host is 250.

By default, this setting is enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Memory usage

This setting specifies the level of memory usage, as a percentage, at which the server reports a full load. When enabled, the default value at which the server reports a full load is 90%.

By default, this setting is disabled and memory usage is excluded from load calculations.

Memory usage base load

This setting specifies an approximation of the base operating system's memory usage. Also, defines, in MB, the memory usage below which a server is considered to have zero load.

By default, this value is set to 768 MB.

Profile Management policy settings

May 15, 2026

This section contains policy settings for enabling and configuring Profile Management.

For other information, such as the following, see Profile Management policies:

- Names of the equivalent .ini file setting
- Which version of Profile Management is required for a policy setting

Advanced policy settings

May 13, 2026

Number of retries when accessing locked files

Sets the number of retries when accessing locked files.

If this policy is disabled, the default value of five retries is used. If this policy isn't configured here, the value from the .ini file is used. If this policy isn't configured here or in the .ini file, the default value is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Process Internet cookie files on logoff

Some deployments leave extra Internet cookies that `Index.dat` does not reference. The extra cookies left in the file system after sustained browsing can lead to profile bloat. This policy lets you enable Profile Management to force processing of Index.dat and remove the extra cookies. The policy increases logoff times, so enable it only after you experience this issue.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured here or in the .ini file, no processing of Index.dat takes place.

Disable automatic configuration

Profile Management examines any Citrix Virtual Desktops™ environment, for example for the presence of personal vDisks, and configures Group Policy accordingly. Only Profile Management policies in the Not Configured state are adjusted, so any customizations you have made are preserved.

This policy lets you speed up deployment and simplifies optimization. You do not need to configure this policy. However, you can disable automatic configuration when doing one of the following:

- Upgrading to retain settings from earlier versions
- Troubleshooting

You can regard automatic configuration as a dynamic configuration checker that automatically configures the default policy settings according to environments at runtime. It eliminates the need to configure the settings manually. Runtime environments include:

- Windows OS
- Windows OS versions
- Presence of Citrix Virtual Desktops
- Presence of personal vDisks

Automatic configuration might change the following policies if the environment changes:

- Active write-back
- Always cache
- Delete locally cached profiles on logoff
- Delay before deleting cached profiles
- Profile streaming

See the following table for the default status of the policies on different OSs:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

	Multi-session OS	Single-session OS
Active write back	Enabled	*Disabled* if Personal vDisk is in use; otherwise, enabled.
Always cache	Disabled	*Disabled* if Personal vDisk is in use; otherwise, enabled.
Delete locally cached profiles on logoff	Enabled	*Disabled* if one of the following situations occurs: Personal vDisk is in use, Citrix Virtual Desktops is assigned, or Citrix Virtual Desktops isn't installed; otherwise, enabled.
Delay before deleting cached profiles	0 seconds	60 seconds if user changes are not persistent; otherwise, 0 seconds.
Profile streaming	Enabled	*Disabled* if Personal vDisk is in use; otherwise, enabled.

However, with automatic configuration disabled, all policies above default to **Disabled**.

> **Important:**
>
> Personal vDisk is deprecated. For details, see Remove PVD, AppDisks, and unsupported hosts.

Starting with Profile Management 1909, you can have an improved experience with the Start menu on Windows 10 (version 1607 and later). This improvement is achieved through automatic configuration of the following policies:

- Add `Appdata\Local\Microsoft\Windows\Caches` and `Appdata\Local\Packages` to **Folders to Mirror**.
- Add `Appdata\Local\Microsoft\Windows\UsrClass.Dat*` to **Files to synchronize**.

Configuration precedence:

1. If this setting isn't configured here, the value from the .ini file is used.
2. If this setting isn't configured here or in the .ini file, automatic configuration is turned on. In this case, Profile Management settings might change if the environment changes.

Log off user if a problem is encountered

Lets you specify whether Profile Management logs off users if a problem is encountered.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If this policy is disabled or not configured, Profile Management gives a temporary profile to users if a problem is encountered. For example, the user store is unavailable.

If it is enabled, an error message is displayed and users are logged off. This setup can simplify troubleshooting of the problem.

Configuration precedence:

1. If this setting isn't configured here, the value from the .ini file is used.
2. If this setting isn't configured here or in the .ini file, a temporary profile is provided.

Customer Experience Improvement Program

By default, the Customer Experience Improvement Program is enabled to help improve the quality and performance of Citrix® products by collecting anonymous statistics and usage data.

If this setting isn't configured here, the value from the .ini file is used.

Enable search index roaming for Outlook

Allow user-based Outlook search experience by automatically roaming Outlook search data along with user profile. This feature requires extra spaces in the user store to store search indexes for Outlook.

Log off and then log on again for this policy to take effect.

Outlook search index database –backup and restore

Lets you specify what Profile Management does during logon when the Enable search index roaming for Outlook policy is enabled.

If this policy is enabled, Profile Management backs up the search index database each time the database is mounted successfully on logon. Profile Management treats the backup as the good copy of the search index database. When an attempt to mount the search index database fails due to database corruption, Profile Management reverts the search index database to the last-known good copy.

> Note:
>
> Profile Management deletes the previously saved backup after a new backup is saved successfully. The backup consumes the available VHDX storage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable concurrent session support for Outlook search data roaming

Lets Profile Management provide native Outlook search experience in concurrent sessions of the same user. Use this policy with the Search index roaming for Outlook policy.

With this policy enabled, each concurrent session uses a separate Outlook OST file.

By default, only two VHDX disks can be used to store Outlook OST files (one file per disk). If the user starts more sessions, their Outlook OST files are stored in the local user profile. You can specify the maximum number of VHDX disks for storing Outlook OST files.

Enable OneDrive container

Lets OneDrive folders roam with users.

The OneDrive container is a VHDX-based folder roaming solution. Profile Management creates a VHDX file per user on a file share and stores the users'OneDrive folders into the VHDX files. The VHDX files are attached when users log on and detached when users log off.

UWP app roaming

Lets you enable UWP (Universal Windows Platform) apps to roam with users. As a result, users can access the same UWP apps from different devices.

With this policy enabled, Profile Management lets UWP apps roam with users by storing the apps on separate VHDX disks. Those disks are attached during user logons and detached during user logoffs.

Configuration precedence:

1. If this setting isn't configured here, the value from the .ini file is used.
2. If this setting isn't configured here or in the .ini file, this feature is disabled.

Enable UWP app load acceleration

Enable UWP app load acceleration. Lets you accelerate the loading of UWP apps and improve their consistency in non-persistent environments. By default, Windows stores UWP App registration information locally on each machine, which can be lost upon restart in non-persistent environments. With this policy enabled, Profile Management creates a VHDX container for each machine to store the UWP app registration data, speeding up user logon and preventing data loss on restarts.

Configuration precedence:

1. If this setting isn't configured using a GPO, Studio, or Workspace Experience Management (WEM), the value from the .ini file is used.
2. If this setting isn't configured anywhere, this feature is disabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable asynchronous processing for user Group Policy on logon

Windows provides two processing modes for user Group Policy: synchronous and asynchronous. Windows uses a registry value to determine the processing mode for the next user logon. If the registry value doesn't exist, synchronous mode is applied. The registry value is a machine-level setting and doesn't roam with users. Thus, asynchronous mode will not be applied as expected if users:

- Log on to different machines.
- Log on to the same machine where the Delete locally cached profiles on logoff policy is enabled.

With this policy enabled, the registry value roams with users. As a result, processing mode is applied each time users log on.

Free space ratio to trigger VHD disk compaction

Applicable when Enable VHD disk compaction is enabled. Lets you specify the free space ratio to trigger VHD disk compaction. When the free space ratio exceeds the specified value on user logoff, disk compaction is triggered.

Free space ratio = (current VHD file size –required minimum VHD file size*) ÷ current VHD file size

* Obtained using the GetSupportedSize method of the `MSFT_Partition` class from the Microsoft Windows operating system.

Number of logoffs to trigger VHD disk compaction

Applicable when Enable VHD disk compaction is enabled. Lets you specify the number of user logoffs to trigger VHD disk compaction.

When the number of logoffs since the last compaction reaches the specified value, disk compaction is triggered again.

Disable defragmentation for VHD disk compaction

Applicable when Enable VHD disk compaction is enabled. Lets you specify whether to disable file defragmentation for VHD disk compaction.

When VHD disk compaction is enabled, the VHD disk file is first automatically defragmented using the Windows built-in `defrag` tool, and then compacted. VHD disk defragmentation produces better compaction results while disabling it can save system resources.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable multi-session write-back for profile containers

Enables write-back for profile containers in multi-session scenarios. If enabled, changes in all sessions are written back to profile containers. Otherwise, only changes in the first session are saved because only the first session is in read/write mode in profile containers. Citrix Profile Management profile containers are supported starting with Citrix Profile Management 2103. FSLogix Profile Container is supported starting with Citrix Profile Management 2003.

To use this policy for the FSLogix Profile Container, ensure that the following prerequisites are met:

- The FSLogix Profile Container feature is installed and enabled.
- The profile type is set to **Try for read-write profile and fallback to read-only** in FSLogix.

Replicate user stores

Lets you replicate the remote user profile store to multiple paths on each logon and logoff. Doing so lets Profile Management provide profile redundancy for user logons.

Enabling the policy increases system I/O and might prolong logoffs.

> **Note:**
>
> This feature is available for both the file-based and container-based profile solutions.

Enable credential-based access to user stores

By default, Citrix Profile Management impersonates the current user to access the user store. Enable this feature if you do not want Profile Management to impersonate the current user when accessing the user store. You can put user stores in storage repositories (for example, Azure Files) that the current user has no permission to access.

To ensure that Profile Management can access user stores, save the profile storage server's credentials in Workspace Environment Management™ (WEM) or Windows Credential Manager. We recommend you use Workspace Environment Management to eliminate the need of configuring the same credentials for each machine where Profile Management runs. If you use the Windows Credential Manager, use the Local System account to securely save the credentials.

> **Note:**
>
> This policy is available both for file-based and VHDX-based user stores. For Profile Management versions earlier than 2212, this policy is available only for VHDX-based user stores.

Configuration precedence:

1. If this setting isn't configured here, the value from the .ini file is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. If this setting isn't configured here or in the .ini file, it is disabled by default.

Customize storage path for VHDX files

Profile Management provides the following VHDX-based policies: Profile container, Search index roaming for Outlook, and Accelerate folder mirroring. By default, VHDX files are stored in the user store. This policy lets you specify a separate path to store them.

Default capacity of VHD containers

Lets you specify the default storage capacity (in GB) of VHD containers.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured here or in the .ini file, the default is 50 (GB).

Automatically reattach VHDX disks in sessions

With this policy enabled, Profile Management ensures a high level of stability of VHDX-based policies. By default, this policy is enabled.

When this policy is enabled, Profile Management monitors VHDX disks that are in use by VHDX-based policies. If any of the disks is detached, Profile Management reattaches the disk automatically.

Profile container auto-expansion threshold

Lets you specify the utilization percentage of storage capacity at which profile containers trigger auto-expansion.

Configuration precedence:

- If this policy isn't configured here, the value from the .ini file is used.
- If this policy isn't configured here or in the .ini file, the default is 90 (%) of storage capacity.

Profile container auto-expansion increment

Lets you specify the amount of storage capacity (in GB) by which profile containers automatically expand when auto-expansion is triggered.

Configuration precedence:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If this policy isn't configured here, the value from the .ini file is used.
- If this policy isn't configured here or in the .ini file, the default is 10 (GB).

Profile container auto-expansion limit

Lets you specify the maximum storage capacity (in GB) to which profile containers can automatically expand when auto-expansion is triggered.

Configuration precedence:

- If this policy isn't configured here, the value from the .ini file is used.
- If this policy isn't configured here or in the .ini file, the default is 80 (GB).

Enable user-level policy settings

With this policy enabled, machine-level policy settings can work at the user level, and user-level settings override machine-level settings.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured here or in the .ini file, it is disabled.

Set priority order for user groups

Lets you specify the priority order for user groups. The order determines which group takes precedence when a user belongs to multiple groups with different policy settings.

When a user belongs to multiple groups with conflicting policy settings, consider the following:

- If the user belongs to one or more groups defined in this policy, the group with the highest priority takes precedence.
- If the user doesn't belong to any of the groups defined in this policy, the group with the SID listed earliest in alphabetical order takes precedence.

User store selection method

Lets you specify the user store selection method when multiple user stores are available. Options include:

- **Configuration order.** Profile Management selects the earliest configured store.
- **Access performance.** Profile Management selects the store with the best access performance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration precedence:

1. If this setting isn't configured here, the value from the .ini file is used.
2. If this setting isn't configured here or in the .ini file, **Configuration order** is used.

Enable in-session profile container failover among user stores

By default, when multiple user stores are deployed, profile container failover occurs only at user logon. As a result, profile redundancy is available only at user logon. This policy lets you expand the failover scope to the entire session, ensuring profile redundancy throughout the session. With the policy enabled, if Profile Management loses connection to the active profile container during a session, it automatically switches to another available one.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured here or in the .ini file, the setting is disabled.

Profile load timeout

Lets you enable the profile load timeout feature and configure the timeout duration. Citrix Profile Management waits for the specified timeout for a user profile to load before switching to a temporary profile.
By default, the **Profile load timeout** setting is 45 seconds, with a valid range of 0–1800 seconds. To bypass profile loading and use a temporary profile, set the timeout to 0 seconds.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured either here or in the .ini file, the policy is disabled by default.

Limit profile synchronization during logoff

Lets you specify how many user stores are synced on user logoff.
By default, Citrix Profile Management syncs all user stores during logoff, and the logoff isn't completed until the profile has been synced across all stores.
Reducing the number of stores synced speeds up logoff. For non-persistent machines, the unsynced stores will be updated during the next user session while for persistent machines, the unsynced stores will be synced in the background.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. If this policy isn't configured either here or in the .ini file, the policy is disabled by default.\n\nNote: This setting applies only when the Replicate user stores policy is enabled.

Notify user when profile size exceeds quota

Lets you set a quota for the user profile and notify users when their profile size exceeds it.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured here or in the .ini file, the setting is disabled.

Notification message when profile size exceeds quota

Applicable when the **Notify user when profile size exceeds quota** policy is enabled. Lets you set the notification message users receive.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured here or in the .ini file, the setting is disabled.

Enable multi-session support for machine hibernation

Lets you enable support for system hibernation by maintaining the disk state during hibernation. It ensures that VHDX disks used by a hibernated session are not reassigned to other concurrent sessions. As a result, the user profile can be resumed after the machine recovers from hibernation, ensuring consistent session continuity.

Configuration precedence:

1. If this policy isn't configured here, the value from the .ini file is used.
2. If this policy isn't configured here or in the .ini file, the setting is disabled.

Basic policy settings

May 13, 2026

This section contains policy settings relating to the basic configuration of Profile Management.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable Profile Management

By default, to facilitate deployment, Profile Management does not process logons or logoffs. Enable Profile Management only after carrying out all other setup tasks and testing how Citrix® user profiles perform in your environment.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, Profile Management does not process Windows user profiles in any way.

Processed groups

Both computer-local groups and domain groups (local, global, and universal) can be used. Domain groups must be specified in the format: DOMAIN NAME\GROUP NAME.

If this policy is configured here, Profile Management processes only members of these user groups. If this policy is disabled, Profile Management processes all users. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, members of all user groups are processed.

Excluded groups

You can use computer local groups and domain groups (local, global, and universal) to prevent particular user profiles from being processed. Specify domain groups in the form DOMAIN NAME\ GROUP NAME.

If this setting is configured here, Profile Management excludes members of these user groups. If this setting is disabled, Profile Management does not exclude any users. If this setting is not configured here, the value from the .ini file is used. If this setting is not configured here or in the .ini file, no members of any groups are excluded.

Process logons of local administrators

Specifies whether logons of members of the BUILTIN\Administrators group are processed. Consider this policy is disabled or not configured on multi-session operating systems, such as Citrix Virtual Apps environments. In this case, Profile Management assumes that logons by domain users, but not local administrators, must be processed. On single-session operating systems (such as Citrix Virtual Desktops environments), local administrator logons are processed. This policy allows domain users with local administrator rights, typically Citrix Virtual Desktops users with assigned virtual desktops, to:

- Bypass any processing
- Log on

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Troubleshoot the desktop-experiencing problems with Profile Management

Note: Domain users' logons might be subject to restrictions imposed by group membership, typically to ensure compliance with product licensing.
If this policy is disabled, Profile Management does not process logons by local administrators. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, administrators are not processed.

Path to user store

Sets the path to the directory (the user store) in which the user settings (registry changes and synchronized files) are saved.

The path can be:

- A relative path. It must be relative to the home directory (which is typically configured as the #homeDirectory# attribute for a user in the Active Directory).
- A UNC path. It typically specifies a server share or a DFS namespace.
- Disabled or unconfigured. In this case, a value of #homeDirectory#\Windows is assumed.

The following types of variables can be used for this policy:

- System environment variables enclosed in percent signs (for example, %ProfVer%). System environment variables generally require extra setup.
- Attributes of the Active Directory user object enclosed in hashes (for example, #sAMAccountName#).
- Profile Management variables. For more information, see the Profile Management variables product document.

User environment variables cannot be used, except for %username% and %userdomain%. You can also create custom attributes to define organizational variables such as location or users fully. Attributes are case-sensitive.

Examples:

- \server\share#sAMAccountName# stores the user settings to the UNC path \server\share\JohnSmith (if #sAMAccountName# resolves to JohnSmith for the current user)
- \server\profiles$\%USERNAME%.%USERDOMAIN%!CTX_OSNAME!!CTX_OSBITNESS! might expand to \server\profiles$\JohnSmith.DOMAINCONTROLLER1\Win8x64

Important: Whichever attributes or variables you use, check that this policy expands to the folder one level higher than the folder containing NTUSER.DAT. For example, if this file is contained in \server\profiles$\JohnSmith.Finance\Win8x64\UPM_Profile, set the path to the user store as \server\profiles$\JohnSmith.Finance\Win8x64 (not the \UPM_Profile subfolder).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information on using variables when specifying the path to the user store, see the following topics:

- Share Citrix user profiles on multiple file servers
- Administer profiles within and across OUs
- High availability and disaster recovery with Profile Management

If Path to user store is disabled, the user settings are saved in the Windows subdirectory of the home directory.

If this policy is disabled, the user settings are saved in the Windows subdirectory of the home directory. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, the Windows directory on the home drive is used.

Migrate user store

Specifies the path to the folder where the user settings (registry changes and synchronized files) were previously saved (the user store path that you previously used).

If this setting is configured, the user settings that are stored in the previous user store are migrated to the current user store specified in the "Path to user store"policy.

The path can be an absolute UNC path or a path relative to the home directory.

In both cases, you can use the following types of variables:

- System environment variables enclosed in percent signs
- Attributes of the Active Directory user object enclosed in hash signs

Examples:

- The folder `Windows\\%ProfileVer%` stores the user settings in a subfolder called `Windows\W2K3` of the user store (if %ProfileVer% is a system environment variable that resolves to W2K3).
- `\\server\share\\#SAMAccountName#` stores the user settings to the UNC path `\\server\share\<JohnSmith>` (if `#SAMAccountName#` resolves to JohnSmith for the current user).

In the path, you can use user environment variables except `%username%` and `%userdomain%`.

If this setting is disabled, the user settings are saved in the current user store.

If this setting is not configured here, the corresponding setting from the .ini file is used.

If this setting is not configured here or in the .ini file, the user settings are saved in the current user store.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Active write back

Files and folders (but not registry entries) that are modified can be synchronized to the user store in the middle of a session, before logoff.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, it is enabled.

Offline profile support

This policy allows profiles to synchronize with the user store at the earliest possible opportunity. It is aimed at laptop or mobile device users who roam. When a network disconnection occurs, profiles remain intact on the laptop or device even after rebooting or hibernating. As mobile users work, their profiles are updated locally. Also, eventually synchronized with the user store when the network connection is re-established.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, offline profiles are disabled.

Active write back registry

Use this policy along with "Active write back."Registry entries that are modified can be synchronized to the user store in the middle of a session.

If you do not configure this setting here, the value from the .ini file is used.

If you do not configure this setting here or in the .ini file, the active write back registry is disabled.

Active write back on session lock and disconnection

With both this policy and the **Active write back** policy enabled, profile files and folders are written back only when a session is locked or disconnected.

With this policy and both the **Active write back** and **Active write back registry** policies enabled, registry entries are written back only when a session is locked or disconnected.

Offline profile support

Enables the offline profiles feature. This feature is intended for computers that are commonly removed from networks. For example, laptops or mobile devices not servers or desktops.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, offline profile support is disabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cross-platform policy settings

May 13, 2026

This section contains policy settings relating to configuring the **Profile Management cross-platform** settings feature.

Enable cross-platform settings

By default, to facilitate deployment, cross-platform settings are disabled. Turn on processing by enabling this policy but only after thorough planning and testing of this feature.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no cross-platform settings are applied.

Cross-platform settings user groups

Enter one or more Windows user groups. For example, you might use this policy to process only the profiles from a test user group. If this policy is configured, the cross-platform settings feature of Profile Management processes only members of these user groups. If this policy is disabled, the feature processes all users specified by the Processed groups policy.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, all user groups are processed.

Path to cross-platform definitions

Identifies the network location of the definition files that you copied from the download package. This path must be a UNC path. Users must have read access to this location, and administrators must have write access to it. The location must be a Server Message Block (SMB) or Common Internet File System (CIFS) file share.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no cross-platform settings are applied.

Path to cross-platform settings store

Sets the path to the cross-platform settings store, the folder in which users'cross-platform settings are saved. Users must have write access to this area. The path can be an absolute UNC path or a path relative to the home directory.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This area is the common area of the user store where profile data shared by multiple platforms is located. Users must have write access to this area. The path can be an absolute UNC path or a path relative to the home directory. You can use the same variables as for the **Path to user store**.

If this policy is disabled, the path Windows\PM_CP is used. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, the default value is used.

Source for creating cross-platform settings

Specifies a platform as the base platform if this policy is enabled in that platform's OU. This policy migrates data from the base platform's profiles to the cross-platform settings store.

Each platform's own set of profiles are stored in a separate OU. You must decide which platform's profile data to use to seed the cross-platform settings store. It is referred to as the base platform. Consider the cross-platform settings store contains a definition file with no data, or the cached data in a single-platform profile is newer than the definition's data in the store. In this case, the Profile Management migrates the data from the single-platform profile to the store unless you disable this policy.

> **Important:**
>
> If this policy is enabled in multiple OUs, or multiple user or machine objects, the platform that the first user logs on to becomes the base profile.
> By default this policy is Enabled.

File system policy settings

May 13, 2026

This section contains policies that set the following:

- Which files in a user profile are synchronized between the system where the profile is installed and the user store
- Which directories in a user profile are synchronized between the system where the profile is installed and the user store

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Exclusions policy settings

May 13, 2026

This section describes policy settings for configuring which files and directories in a users profile are excluded from the synchronization process.

Exclusion list - files

List of files that are ignored during synchronization. File names must be paths relative to the user profile (%USERPROFILE%). Wildcards are supported in file names and in folder names, but only wildcards in file names are applied recursively.

Examples:

- `Desktop\Desktop.ini` ignores the file `Desktop.ini` in the `Desktop` folder
- `%USERPROFILE%\*.tmp` ignores all files with the extension `.tmp` in the entire profile
- `AppData\Roaming\MyApp\*.tmp` ignores all files with the extension `.tmp` in one part of the profile
- `Downloads\*\a.txt` ignores `a.txt` in any immediate subfolder of the `Downloads` folder.

If this policy is disabled, no files are excluded. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no files are excluded.

Enable Default Exclusion List - directories

Default list of directories ignored during synchronization. Use this policy to specify GPO exclusion directories without having to fill them in manually.

If you disable this policy, Profile Management does not exclude any directories by default.

If you do not configure this policy here, Profile Management uses the value from the .ini file. If you do not configure this policy here or in the .ini file, Profile Management does not exclude any directories by default.

Exclusion list - directories

List of folders that are ignored during synchronization. Folder names must be specified as paths relative to the user profile (%USERPROFILE%). Wildcards in folder names are supported but are not applied recursively.

Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `Desktop` ignores the `Desktop` folder in the user profile

If this policy is disabled, no folders are excluded. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no folders are excluded.

Logon Exclusion Check

This setting configures what Profile Management does if a profile in the user store contains excluded files or folders. The possible policy settings and the corresponding actions are listed in the following table:

Policy setting	Action
Setting is disabled or the value of "Synchronize excluded files or folders on logon"is set to default	Profile Management synchronizes excluded files or folders from the user store to the local profile when a user logs on.
Setting is set to "Ignore excluded files or folders on logon"	Profile Management ignores the excluded files or folders in the user store when a user logs on.
Setting is set to "Delete excluded files or folder on logon"	Profile Management deletes the excluded files or folders in the user store when a user logs on.
Setting is not configured in the Web Studio	The value from the .ini file is used
Setting is not configured in the Web Studio or in the .ini file	The excluded files or folders are synchronized from the user store to a local profile when a user logs on.

Large File Handling - Files to be created as symbolic links

To improve logon performance and to process large-size files, Profile Management creates a symbolic link instead of copying files in this list.

You can use wildcards in policies that refer to files; for example, `!ctx_localappdata!\Microsoft\Outlook\*.OST`.

To process the offline folder file (`*.ost`) of Microsoft Outlook, make sure that the **Outlook** folder is not excluded for Profile Management.

Those files cannot be accessed in multiple sessions simultaneously.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Synchronization policy settings

May 13, 2026

The **Synchronization** section describes policy settings for specifying which files and folders in a users profile are synchronized between the system where the profile is installed and the user store.

Directories to synchronize

Be default, Profile Management synchronizes the user profile between the system it is installed on and the user store. If you exclude a folder from the synchronization, this policy lets you include the subfolders of the excluded folder back to the synchronization.

Paths on this list must be relative to the user profile. Wildcards in folder names are supported but are not applied recursively.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, only non-excluded folders in the user profile are synchronized.

Files to synchronize

Be default, Profile Management synchronizes the user profile between the system it is installed on and the user store. If you exclude a folder from the synchronization, this policy lets you include the files inside the excluded folder back to the synchronization.

Paths on this list must be relative to the user profile. Wildcards are supported in file names and in folder names, but only wildcards in file names are applied recursively. Wildcards cannot be nested.

Examples:

- `AppData\Local\Microsoft\Office\Access.qat` specifies a file below a folder that is excluded in the default configuration
- `AppData\Local\MyApp\*.cfg` specifies all files with the extension `.cfg` in the profile folder `AppData\Local\MyApp` and its subfolders

Disabling this policy has the same effect as enabling it and configuring an empty list.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, only non-excluded files in the user profile are synchronized.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Folders to mirror

This policy lets you solve issues involving any transactional folder (also known as a referential folder). That folder contains interdependent files, where one file references the other.

Mirroring folders enables Profile Management to process a transactional folder and its contents as a single entity, avoiding profile bloat. For example, you can mirror the **Internet Explorer cookies** folder so that Index.dat is synchronized with the cookies that it indexes. In these situations the "last write wins."So files in mirrored folders that have been modified in more than one session are overwritten by the last update, resulting in loss of profile changes.

For example, the following table describes how Index.dat references cookies while a user browses the Internet:

Scenario	How Index.dat references cookies	
A user has two Internet Explorer sessions, each on a different server, and they visit different sites in each session.	Cookies from each site are added to the appropriate server.	Cookies from each site are added to the appropriate server.
User logs off from the first session or in the middle of a session (if the active write back feature is configured)	Cookies from the second session must replace those cookies from the first session.	
First and second sessions are merged and the references to the cookies in Index.dat become out of date	Further browsing in new sessions results in repeated merging and a bloated cookie folder	

Mirroring the cookie folder solves the issue. In this case, the cookies are overwritten with those cookies from the last session each time the user logs off. So Index.dat stays up to date.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no folders are mirrored.

Accelerate folder mirroring

With both this policy and the **Folders to mirror** policy enabled, **Profile Management stores mirrored** folders on a VHDX-based virtual disk. It attaches the virtual disk during logons and detaches it during logoffs. Enabling this policy eliminates the need to copy the folders between the user store and local profiles and accelerates folder mirroring.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Folder redirection policy settings

May 13, 2026

This section contains policy settings that specify whether to redirect folders that commonly appear in profiles to a shared network location.

Grant administrator access

This setting enables an administrator to access the contents of a user's redirected folders.

> **Note:**
>
> This setting grants permissions to administrators who have complete and unrestricted access to the domain.

By default, this setting is disabled and users are granted exclusive access to the contents of their redirected folders.

Include domain name

This setting enables the inclusion of the `%userdomain%` environment variable as part of the UNC path. This UNC path is specified for redirected folders.

By default, this setting is disabled. And the `%userdomain%` environment variable is not included as part of the UNC path that is specified for redirected folders.

AppData(Roaming) policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **AppData(Roaming)** folder to a shared network location.

AppData(Roaming) path

This setting specifies the network location to which the contents of the **AppData(Roaming)** folder are redirected.

By default, this setting is disabled and no location is specified.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for AppData(Roaming)

This setting specifies how to redirect the contents of the **AppData(Roaming)** folder.

By default, contents are redirected to a UNC path. For more information, see the Path to user store section.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Contacts policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Contacts** folder to a shared network location.

Contacts path

This setting specifies the network location to which the contents of the **Contacts** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Contacts

This setting specifies how to redirect the contents of the **Contacts** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Desktop policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the `Desktop` folder to a shared network location.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Desktop path

This setting specifies the network location to which the contents of the **Desktop** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Desktop

This setting specifies how to redirect the contents of the **Desktop** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Documents policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Documents** folder to a shared network location.

Documents path

This setting specifies the network location to which files in the **Documents** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

The **Documents path** setting must be enabled not only to redirect files to the **Documents** folder, but also to redirect files to the **Music**, **Pictures**, and **Videos** folders.

Redirection settings for Documents

This setting specifies how to redirect the contents of the **Documents** folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the **Documents** folder, choose one of the following options:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Documents path policy setting.
- Redirect to the users home directory. Redirects content to the users home directory, typically configured as the #homeDirectory# attribute for a user in the Active Directory.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Downloads policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Downloads** folder to a shared network location.

Downloads path

This setting specifies the network location to which files in the **Downloads** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Downloads

This setting specifies how to redirect the contents of the **Downloads** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Favorites policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Favorites** folder to a shared network location.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Favorites path

This setting specifies the network location to which the contents of the **Favorites** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Favorites

This setting specifies how to redirect the contents of the **Favorites** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Links policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Links** folder to a shared network location.

Links path

This setting specifies the network location to which the contents of the **Links** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Links

This setting specifies how to redirect the contents of the **Links** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Music policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Music** folder to a shared network location.

Music path

This setting specifies the network location to which the contents of the **Music** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Music

This setting specifies how to redirect the contents of the **Music** folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the **Music** folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Music path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.

To redirect content to a folder relative to the **Documents** folder, the **Documents path** setting must be enabled.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Pictures policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Pictures** folder to a shared network location.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Pictures path

This setting specifies the network location to which the contents of the **Pictures** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Pictures

This setting specifies how to redirect the contents of the **Pictures** folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the **Pictures** folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Pictures path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.

To redirect content to a folder relative to the **Documents** folder, the **Documents path** setting must be enabled.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Saved Games policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Saved Games** folder to a shared network location.

Redirection settings for Saved Games

This setting specifies how to redirect the contents of the **Saved Games** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Saved Games path

This setting specifies the network location to which the contents of the **Saved Games** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Start menu policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Start Menu** folder to a shared network location.

Redirection settings for Start Menu

This setting specifies how to redirect the contents of the **Start Menu** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Start Menu path

This setting specifies the network location to which the contents of the **Start Menu** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Searches policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Searches** folder to a shared network location.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Redirection settings for Searches

This setting specifies how to redirect the contents of the **Searches** folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Searches path

This setting specifies the network location to which the contents of the **Searches** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Video policy settings

May 13, 2026

This section contains policy settings for redirecting the contents of the **Video** folder to a shared network location.

Redirection settings for Video

This setting specifies how to redirect the contents of the **Video** folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the **Video** folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Video path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.

To redirect content to a folder relative to the **Documents** folder, the **Documents path** setting must be enabled.

If this setting is not configured here, Profile Management does not redirect the specified folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Video path

This setting specifies the network location to which the contents of the **Video** folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Log policy settings

May 13, 2026

This section contains policy settings that configure Profile Management logging.

Active Directory actions

This setting enables or disables verbose logging of actions performed in the Active Directory.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured in the Web Studio, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

Common information

This setting enables or disables verbose logging of common information.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Common warnings

This setting enables or disables verbose logging of common warnings.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

Enable logging

This setting enables or disables Profile Management logging in debug (verbose logging) mode. In debug mode, extensive status information is logged in the log files located in "%SystemRoot%\System32\Logfiles\UserProfileManager".

By default, this setting is disabled and only errors are logged.

Citrix® recommends enabling this setting only if you are troubleshooting Profile Management.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only errors are logged.

File system actions

This setting enables or disables verbose logging of actions performed in the file system.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

File system notifications

This setting enables or disables verbose logging of file systems notifications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

Logoff

This setting enables or disables verbose logging of user logoffs.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

Logon

This setting enables or disables verbose logging of user logons.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

Maximum size of the log file

This setting specifies the maximum permitted size for the Profile Management log file, in bytes.

By default, this value is set to 1048576 bytes (1 MB).

Citrix recommends increasing the size of this file to 5 MB or more, if you have sufficient disk space. If the log file grows beyond the maximum size:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- An existing backup of the file (.bak) is deleted
- The log file is renamed to .bak
- A new log file is created

The log file is created in %SystemRoot%\System32\Logfiles\UserProfileManager.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value is used.

Path to log file

This setting specifies an alternative path to save the Profile Management log file.

By default, this setting is disabled and log files are saved in the default location: %SystemRoot%\System32\Logfiles\UserProfileManager.

The path can point to a local drive or a remote network-based drive (UNC path). Remote paths can be useful in large distributed environments but they might create significant network traffic, which might be inappropriate for log files. For provisioned, virtual machines with a persistent hard drive, set a local path to that drive. This setting ensures that the log files are preserved when the machine restarts. For virtual machines without a persistent hard drive, setting a UNC path allows you to retain the log files. However, the system account for the machines must have write access to the UNC share. Use a local path for any laptops managed by the offline profiles feature.

If a UNC path is used for log files, Citrix recommends that an appropriate access control list is applied to the log file folder. This setting ensures that only authorized user or computer accounts can access the stored files.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default location %SystemRoot%\System32\Logfiles\UserPr
is used.

Personalized user information

This setting enables or disables verbose logging of personalized user information.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy values at logon and logoff

This setting enables or disables verbose logging of policy values when a user logs on and off.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

Registry actions

This setting enables or disables verbose logging of actions performed in the registry.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

Registry differences at logoff

This setting enables or disables verbose logging of any differences in the registry when a user logs off.

By default, this setting is disabled.

When enabling this setting, make sure the **Enable logging** setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured in the Web Studio or in the .ini file, the following is logged:

- Errors
- General information

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Profile handling policy settings

May 13, 2026

This section includes policy settings that specify how Profile Management handles user profiles.

Delay before deleting cached profiles

This setting specifies an optional extension to the delay, in minutes, before Profile Management deletes locally cached profiles at logoff.

A value of 0 deletes the profiles immediately at the end of the logoff process. Profile Management checks for logoffs every minute. As as result, a value of 60 ensures that profiles are deleted between one and two minutes after users log off. This action depends on when the last check occurred. Extending the delay is useful if you know that a process keeps files or the user registry hive open during logoff. With large profiles, this process can also speed up logoff.

By default, this value is set to 0 and Profile Management deletes locally cached profiles immediately.

When enabling this setting, ensure the Delete locally cached profiles on logoff is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, profiles are deleted immediately.

Delete locally cached profiles on logoff

This setting specifies whether locally cached profiles are deleted after a user logs off.

When this setting is enabled, a user's local profile cache is deleted after they have logged off. Citrix® recommends enabling this setting for terminal servers.

By default, this setting is disabled and a users local profile cache is retained after they log off.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, cached profiles are not deleted.

Local profile conflict handling

This setting configures how Profile Management behaves if a user profile exists in both of the following:

- User store

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Local Windows user profile (not a Citrix user profile)

By default, Profile Management uses the local Windows profile, but does not change it in any way.

To control how Profile Management behaves, choose one of the following options:

- Use local profile. Profile Management uses the local profile, but does not change it in any way.
- Delete local profile. Profile Management deletes the local Windows user profile, and then imports the Citrix user profile from the user store.
- Rename local profile. Profile Management renames the local Windows user profile (for backup purposes) and then imports the Citrix user profile from the user store.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, existing local profiles are used.

Migration of existing profiles

This setting specifies the types of profile migrated to the user store during logon if a user has no current profile in the user store.

Profile Management can migrate existing profiles "on the fly" during logon if a user has no profile in the user store. After that, the user store profile is used by Profile Management in both of the following:

- Current session
- Any other session configured with the path to the same user store

By default, both local and roaming profiles are migrated to the user store during logon.

To specify the types of profile migrated to the user store during logon, choose one of the following options:

- Local and roaming profiles
- Local
- Roaming
- None (Disabled)

If you select **None**, the system uses the existing Windows mechanism to create profiles, as if in an environment where Profile Management is not installed.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, existing local and roaming profiles are migrated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Automatic migration of existing application profiles

This setting enables or disables the automatic migration of existing application profiles across different operating systems. The application profiles include both the application data in the `AppData` folder and the registry entries under `HKEY_CURRENT_USER\SOFTWARE`. This setting can be useful in cases where you want to migrate your application profiles across different operating systems.

For example, suppose you upgrade your operating system (OS) from Windows 10 version 1803 to Windows 10 version 1809. If this setting is enabled, Profile Management automatically migrates the existing application settings to Windows 10 version 1809 the first time each user logs on. As a result, the application data in the `AppData` folder and the registry entries under HKEY_CURRENT_USER\SOFTWARE are migrated.

If there are multiple existing application profiles, Profile Management performs the migration in the following order of priority:

1. Profiles of the same OS type (single-session OS to single-session OS and multi-session OS to multi-session OS).
2. Profiles of the same Windows OS family; for example, Windows 10 to Windows 10, or Windows Server 2016 to Windows Server 2016).
3. Profiles of an earlier version of the OS; for example, Windows 7 to Windows 10, or Windows Server 2012 to Windows 2016.
4. Profiles of the closest OS.

Note: You must specify the short name of the OS by including the variable "!CTX_OSNAME!"in the user store path. Doing so lets Profile Management locate the existing application profiles.

If this setting is not configured here, the setting from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled by default.

Path to the template profile

This setting specifies the path to the profile that you want Profile Management to use as a template to create user profiles.

The specified path must be the full path to the folder containing the NTUSER.DAT registry file and any other folders and files required for the template profile.

Note: Do not include NTUSER.DAT in the path. For example, with the file \\myservername\myprofiles\template\ntu
set the location as \\myservername\myprofiles\template.

Use absolute paths, which can be either UNC paths or paths on the local machine. Use the latter, for example, to specify a template profile permanently on a Citrix Provisioning™ Services image. Relative paths are not supported.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note: This setting does not support expansion of Active Directory attributes, system environment variables, or the %USERNAME% and %USERDOMAIN% variables.

By default, this setting is disabled and new user profiles are created from the default user profile on the device where a user first logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Template profile overrides local profile

This setting enables the template profile to override the local profile when creating user profiles.

Consider that a user has no Citrix user profile, but has a local Windows user profile. In this case, by default the local profile is used and migrated to the user store, if this value is enabled. Enabling this policy setting allows the template profile to override the local profile used when creating user profiles.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Template profile overrides roaming profile

This setting enables the template profile to override a roaming profile when creating user profiles.

Consider that a user has no Citrix user profile, but has a roaming Windows user profile. In this case, by default the roaming profile is used and migrated to the user store, if this value is enabled. Enabling this policy setting allows the template profile to override the roaming profile used when creating user profiles.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

Template profile used as a Citrix mandatory profile for all logons

This setting enables Profile Management to use the template profile as the default profile for creating all user profiles.

By default, this setting is disabled and new user profiles are created from the default user profile on the device where a user first logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Registry policy settings

May 13, 2026

This section contains policy settings that specify which registry keys are included or excluded from Profile Management processing.

Exclusion list

List of registry keys in the HKCU hive which are ignored during logoff.

Example: Software\Policies

If this policy is disabled, no registry keys are excluded. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no registry keys are excluded.

Inclusion list

List of registry keys in the HKCU hive that are processed during logoff.

Example: Software\Adobe.

If this policy is enabled, only keys on this list are processed. If this policy is disabled, the complete HKCU hive is processed. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, all of HKCU is processed.

Enable Default Exclusion List - Profile Management 5.5

Default list of registry keys in the HKCU hive that are not synchronized to the user's profile. Use this policy to specify GPO exclusion files without having to fill them in manually.

If you disable this policy, Profile Management does not exclude any registry keys by default. If you do not configure this policy here, Profile Management uses the value from the .ini file. If you do not configure this policy here or in the .ini file, Profile Management does not exclude any registry keys by default.

NTUSER.DAT backup

Enables a backup of the last known good copy of NTUSER.DAT and rollback in there is corruption.

If you do not configure this policy here, Profile Management uses the value from the .ini file. If you do not configure this policy here or in the .ini file, Profile Management does not back up NTUSER.DAT.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Streamed user profiles policy settings

May 15, 2026

This section contains policy settings that specify how Profile Management processes streamed user profiles.

Always cache

This setting specifies whether Profile Management caches streamed files as soon as possible after a user logs on. Caching files after a user logs on saves network bandwidth, enhancing the user experience.

Use this setting with the **Profile streaming** setting.

By default, this setting is disabled and streamed files aren't cached as soon as possible after a user logs on.

If this setting isn't configured here, the value from the .ini file is used.

If this setting is configured neither here nor in the .ini file, it is disabled.

Always cache size

This setting specifies a lower limit, in MB, on the size of files that are streamed. Profile Management caches any files in this size or larger as soon as possible after a user logs on.

By default, the value is set to 0 (zero) and the cache entire profile feature is used. When the cache entire profile feature is enabled, Profile Management fetches all profile contents in the user store, after a user logs on, as a background task.

If this setting isn't configured here, the value from the .ini file is used.

If this setting is configured neither here nor in the .ini file, it is disabled.

Profile streaming

This setting enables and disables the Citrix® streamed user profiles feature. When enabled, profile files and folders are fetched from the user store to the local computer only when users access them after logon. Registry entries and files in the pending area are fetched immediately.

By default, profile streaming is disabled.

If this setting isn't configured here, the value from the .ini file is used.

If this setting is configured neither here nor in the .ini file, it is disabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Streamed user profile groups

This setting specifies which user profiles within an OU are streamed, based on Windows user groups.

When enabled, only user profiles within the specified user groups are streamed. All other user profiles are processed normally.

By default, this setting is disabled and all user profiles within an OU are processed normally.

If this setting isn't configured here, the value from the .ini file is used.

If this setting is configured neither here nor in the .ini file, all user profiles are processed.

Enable profile streaming exclusion

When profile streaming exclusion is enabled:

- Profile Management does not stream folders in the exclusion list
- All the folders are fetched immediately from the user store to the local computer when a user logs on

For more information, see Stream user profiles.

Timeout for pending area lock files

This setting specifies the number of days after which users' files are written back to the user store from the pending area, if the user store remains locked when its storage server becomes unresponsive. This behavior prevents bloat in the pending area and ensures that the user store always contains the most up-to-date files.

By default, this setting is set to 1 (one) day.

If this setting isn't configured here, the value from the .ini file is used.

If this setting is configured neither here nor in the .ini file, the default value is used.

Enable profile streaming for pending area

Lets you enable the profile streaming feature for files and folders in the pending area.

The pending area is used to ensure profile consistency while profile streaming is enabled. It temporarily stores profile files and folders changed in concurrent sessions.

By default, this policy is disabled, and all files and folders in the pending area are fetched to the local profile on logon. With this policy enabled, files in the pending area are fetched to the local profile only

© 1997–2026 Citrix Systems, Inc. All rights reserved.

when they are requested. Use the policy with the Profile streaming policy to ensure optimal logon experience in concurrent session scenarios.

The policy applies to folders in the pending area when the Enable profile streaming for folders policy is enabled.

User personalization layer policy settings

May 13, 2026

To enable the mounting of user layers within the Virtual Delivery Agents, use the configuration parameters to specify:

- Where on the network to access the user layers.
- How large any new user layer disks can grow.

To do so, these two policies appear in the list of available policies:

- User Layer Repository Path - Enter a path in the format '\server name or address\folder name' in the Value field.
- User Layer Size GB - The default user layer size of 10 GB is the minimum that Citrix® recommends. A user layer is a thin-provisioned disk that expands to the set size as space is used. User layers never decrease in size.

> **Note:**
>
> Increasing the User Layer Size affects new user layers and expands existing ones. Decreasing the layer size only affects new user layers. Existing user layers never decrease in size.

For more information, see User personalization layer.

Virtual Delivery Agent policy settings

May 13, 2026

The Virtual Delivery Agent (VDA) section contains policy settings that control communication between the VDA and controllers for a site.

Important: The VDA requires information provided by these settings to register with a Delivery Controller™, if you are not using the auto-update feature. Because this information is required for registration, you must configure the following settings using the Group Policy Editor, unless you provide this information during the VDA installation:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Controller registration IPv6 netmask
- Controller registration port
- Controller SIDs
- Controllers
- Only use IPv6 controller registration
- Site GUID

Controller registration IPv6 netmask

This policy setting allows administrators to restrict the VDA to only a preferred subnet (rather than a global IP, if one is registered). This setting specifies the IPv6 address and network where the VDA register. The VDA register only on the first address that matches the specified netmask. This setting is valid only if the Only use IPv6 controller registration policy setting is enabled.

By default this setting is blank.

Controller registration port

Use this setting only if the **Enable auto update of controllers** setting is disabled.

This setting specifies the TCP/IP port number that the VDA uses to register with a Controller when using registry-based registration.

By default, the port number is set to 80.

Controller SIDs

Use this setting only if the **Enable auto update of controllers** setting is disabled.

This setting specifies a space-separated list of controller Security Identifiers (SIDs) the VDA uses to register with a Controller when using registry-based registration. This setting is an optional and might be used with the **Controllers** setting to restrict the list of Controllers used for registration.

By default, this setting is blank.

Controllers

Use this setting only if the **Enable auto update of controllers** setting is disabled.

This setting specifies a space-separated list of controller Fully Qualified Domain Names (FQDNs) the VDA uses to register with a Controller when using registry-based registration. This setting is an optional and might be used with the **Controller SIDs** setting.

By default, this setting is blank.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable auto update of controllers

This setting enables the VDA to register with a Controller automatically after installation.

After the VDA registers, the Controller with which it registered sends a list of the current controller FQDNs and SIDs to the VDA. The VDA writes this list to persistent storage. Each Controller also checks the Site database every 90 minutes for Controller information. The Controller sends updated lists to its registered VDAs if one of the following occurs:

- A Controller has been added or removed since the last check
- A policy change has occurred

The VDA accepts connections from all the Controllers in the most recent list that it received.

By default, this setting is enabled.

Only use IPv6 controller registration

This setting controls which form of address the VDA uses to register with the Controller:

- When enabled, the VDA registers with the Controller using the machine's IPv6 address. When the VDA communicates with the Controller, it uses the following address order: global IP address, Unique Local Address (ULA), link-local address (if no other IPv6 addresses are available).
- When disabled, the VDA registers and communicates with the Controller using the machine's IPv4 address.

By default, this setting is disabled.

Site GUID

Use this setting only if the **Enable auto update of controllers** setting is disabled.

This setting specifies the Globally Unique Identifier (GUID) of the site that the VDA uses to register with a Controller when using Active Directory-based registration.

By default, this setting is blank.

HDX™ 3D Pro policy settings

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The HDX 3D Pro section includes policy settings for enabling and configuring the image quality configuration tool for users. This tool enables users to optimize the use of available bandwidth. For this optimization, the balance between image quality and responsiveness is adjusted in real time.

Enable lossless

This setting specifies whether users can enable and disable lossless compression using the image quality configuration tool. By default, users are not given the option to enable lossless compression.

Consider that a user enables lossless compression. In this case, the image quality is automatically set to the maximum value available in the image configuration tool. By default, either GPU or CPU-based compression can be used, according to the capabilities of the user device and the host computer.

HDX 3D Pro quality settings

This setting specifies the minimum and maximum values available to users in the image quality configuration tool. Using these values, uses can define the range of image quality adjustment in the image quality configuration tool.

Specify image quality values of between 0 and 100, inclusive. The maximum value must be greater than or equal to the minimum value.

Monitoring policy settings

August 11, 2026

The **Monitoring** section includes policy settings for process, resource monitoring, and application failure monitoring.

The scope of these policies can be defined based on the following:

- Site
- Delivery group
- Type of delivery group
- Organizational unit
- Tags

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Network telemetry

Enabling this setting allows collecting network metrics, such as session throughput, retransmissions, and L7 latency, for real-time troubleshooting and historical reporting in Citrix DaaS Monitor.

Enabling this setting also enables the enhanced HDX Insight channel for NetScaler Gateway and NetScaler Console. This is required for HDX Insight if Secure HDX is enabled.

Policies for process and resource monitoring

Each data point for CPU, memory, and processes is collected from the VDA and stored on the Monitoring database. Sending the data points from the VDA consumes network bandwidth and storing them consumes considerable space in the monitoring database. Consider that you do not want to monitor either resource data or process data or both for a specific scope. For example, a specific delivery group or organizational unit. In this case, it is recommended to disable the policy.

Enable process monitoring

Enable this setting to allow monitoring of processes running on machines with VDAs. Statistics such as CPU and memory use are sent to the Monitoring Service. The statistics are used for real-time notifications and historical reporting in the Director.

The default for this setting is Disabled.

Enable resource monitoring

Enable this setting to allow monitoring of critical performance counters on machines with VDAs. Statistics (such as CPU and memory use, IOPS, and disk latency data) are sent to the Monitoring Service. The statistics are used for real-time notification and historical reporting in the Director.

The default for this setting is Enabled.

Scalability

The CPU and memory data is pushed to the database from each VDA at 5-minute intervals. Process data (if enabled) is pushed to the database at 10-minute intervals. IOPS and disk latency data is pushed to the database at 1-hour intervals.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CPU and memory data

CPU and memory data is **enabled** by default. The data retention values are as follows (Platinum license):

Data granularity	Number of Days
5 Minute Data	1 Day
10 Minute Data	7 Days
Hourly Data	30 Days
Daily Data	90 Days

IOPS and disk latency data

IOPS and disk latency data is **Enabled** by default. The data retention values are as follows (Platinum license):

Data granularity	Number of Days
Hourly Data	3 Days
Daily Data	90 Days

With the data retention settings, approximately 276 KB of disk space is required to store the following for one VDA over a period of one year:

- CPU
- Memory
- IOPS
- Disk latency data

Number of machines	Approximate storage required
1	276 KB
1K	270 MB
40K	10.6 GB

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Process data

Process data is **Disabled** by default. It is recommended to enable process data on a subset of machines on a need basis. The default data retention settings for the process data are as follows:

Data granularity	Number of Days
10-minute Data	1 Day
Hourly Data	7 Days

If process data is enabled with the default retention settings, process data would consume approximately 1.5 MB per VDA and 3 MB per Terminal Services VDA (TS VDA) over a period of one year.

Number of machines	Approximate storage required VDA	Approximate storage required TS VDA
1	1.5 MB	3 MB
1K	1.5 GB	3 GB

> **Note:**
>
> The numbers provided earlier do not include the Index space. And all the calculations are approximate and vary depending on the deployment.

Optional Configurations

You can modify the default retention settings to suit your needs. However, this configuration consumes extra storage. By enabling the settings below you can gain more accuracy in the process utilization data. The configurations which can be enabled are:

EnableMinuteLevelGranularityProcessUtilization

EnableDayLevelGranularityProcessUtilization

These Configurations can be enabled from the Monitoring PowerShell cmdlet: Set-MonitorConfiguration

Policies for application failure monitoring

The **Application Failure** tab, by default, displays only application faults from Multi-session OS VDAs. Settings of Application failure monitoring can be modified with the following Monitoring policies:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable monitoring of application failures

Use this setting to configure application failure monitoring to monitor either application errors or faults (crashes and unhandled exceptions), or both.
Disable application failure monitoring by setting the **Value** to **None**.
The default for this setting is Application faults only.

Enable monitoring of application failures on Single-session OS VDAs

By default, failures only from applications hosted on the Multi-session OS VDAs are monitored. To monitor Single-session OS VDAs, set the policy to **Allowed**.
The default for this setting is **Prohibited**.

List of applications excluded from failure monitoring

Specify a list of applications that are not to be monitored for failure.
By default this list is empty.

Policy for collecting data for Analytics

VDA Data Collection for Analytics

Use the policy to enable or disable the Monitor service from collecting performance and security related metrics of the VDAs for Performance and Security Analytics. By default, the policy is **Allowed**. Set the policy to **Prohibited** to stop the collection of data from the VDAs.

Clipboard place metadata collection for Security monitoring

Use the policy to enable or disable the clipboard place metadata collection by Broker service for Security monitoring, auditing, and compliance. By default, the policy is **Enabled**. Set the policy to **Disabled** to stop the collection of data from the VDAs.

Diagnostic data collection for performance monitoring

Use this policy to enable the monitoring service to gather diagnostic data such as session information, UPM/EUEM service states, Microsoft Teams optimization, and connection protocols. By default, the policy is **Enabled**. Set the policy to **Disabled** to stop the collection of data from the VDAs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Storage planning tips

Group policy. If you are not interested in monitoring the Resource Data or Process Data, either or both can be turned off using the group policy. For more information, see the **Group Policy** section of Create policies.

Data grooming. The default data retention settings can be modified to groom the data early and free up storage space. For more information on grooming settings, see Data granularity and retention in Accessing data using the API.

Virtual IP policy settings

May 13, 2026

> **Important:**
>
> - Windows 10 Enterprise multi-session doesn't support Remote Desktop IP Virtualization (Virtual IP) and we don't support Remote Desktop IP Virtualization or virtual loopback on Windows 10 Enterprise multi-session.
> - Remote Desktop IP Virtualization (Virtual IP) isn't supported on cloud-hosted machines. For more information, see Microsoft documentation.

The **Virtual IP** section includes policy settings that control whether sessions have their own virtual loopback address.

Virtual IP loopback support

When this setting is enabled, each session has its own virtual loopback address. When disabled, sessions do not have individual loopback addresses.

By default, this setting is disabled.

Virtual IP virtual loopback programs list

This setting specifies the application executables that can use virtual loopback addresses. When adding programs to the list, specify only the executable name. You do not need to specify the entire path.

By default, no executables are specified.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual IP loopback port exclusion

When an application calls the loopback address on any ports specified in this setting, virtual loopback does not change the call to the session-specific loopback address

Workspace Environment Management™ policy settings

May 13, 2026

The **Workspace Environment Management** (WEM) section includes policy settings that help you manage how WEM agents operate.

(WEM service only) Agent proxy configuration

Currently available only for DaaS deployments.

Specify a proxy server that WEM agents use to communicate with Citrix Cloud. Format: `http://<FQDN or IP address>:<port number>`, for example http://10.108.125.51:8080.

(On-premises WEM only) Agent service port

Currently available only for DaaS deployments.

Specify the port that WEM agents use to connect to the WEM infrastructure server. The default port is **8286** and corresponds to the `AgentPort` command-line argument.

(On-premises WEM only) Cached data synchronization port

Currently available only for DaaS deployments.

(Applicable to WEM 1912 and later) Specify the port that WEM agents use to synchronize their local cache with the WEM infrastructure server. The default prt is **8288** and corresponds to the `CachedDataSyncPort` command-line argument.

(WEM service only) Citrix Cloud Connectors

Specify Citrix Cloud Connector machines that WEM agents connect to. To ensure high availability, deploy at least two Cloud Connectors in each resource location. Make sure that Cloud Connector and agent machines are in the same AD domain.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Custom settings for basic deployment

Currently available only for DaaS deployments.

Customize agent settings used for basic deployments. For more information about available settings, see the Workspace Environment Management documentation.

(WEM service only) Discover Citrix Cloud Connectors from CVAD service

Currently available only for DaaS deployments.

Enable the WEM agents to automatically discover Cloud Connectors from the Citrix DaaS deployment when Cloud Connectors aren't configured. Upon successful discovery, the agents connect to the corresponding Cloud Connector machines.

Important: This setting doesn't apply if Cloud Connectors were configured during agent installation or if the **Citrix Cloud Connectors** policy setting is already enabled.

(On-premises WEM only) Infrastructure server

Currently available only for DaaS deployments.

Specify the Fully Qualified Domain Name (FQDN) or IP address of the WEM infrastructure server. WEM agents connect to this server to retrieve configurations, update their local cache, and report monitoring data.

Override Agent Deployment Type

Currently available only for DaaS deployments.

Override the default WEM agent deployment type. Choose one of the following options:

- Cloud service –Connects agents to the WEM service in Citrix Cloud, providing full WEM capabilities.
- On-premises –Connects agents to an on-premises WEM deployment, providing full WEM capabilities.
- Basic deployment –Runs WEM in a single-machine mode with limited functionality, without connecting to a WEM infrastructure.
- Disabled –Disables all WEM functions on machines where agents are installed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure COM Port and LPT Port Redirection settings using the registry

May 13, 2026

In VDA versions 7.0 through 7.8, **COM Port and LPT Port** settings are only configurable using the registry. For VDA versions earlier than 7.0 and for VDA versions 7.9 and later, these settings are configurable in Web Studio. For more information, see Port redirection policy settings and Bandwidth policy settings.

Policy settings for COM Port and LPT Port Redirection are located under HKLM\Software\Citrix\GroupPolicy\Default on the VDA image or machine.

To enable COM port and LPT port redirection, add new registry keys of type REG_DWORD, as follows:

Caution: Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Registry key	Description	Permitted values
AllowComPortRedirection	Allow or prohibit COM port redirection	1 (Allow) or 0 (Prohibit)
LimitComBw	Bandwidth limit for COM port redirection channel	Numeric value
LimitComBWPercent	Bandwidth limit for COM port redirection channel as a percentage of total session bandwidth	Numeric value between 0 and 100
AutoConnectClientComPorts	Automatically connect COM ports from the user device	1 (Allow) or 0 (Prohibit)
AllowLptPortRedirection	Allow or prohibit LPT port redirection	1 (Allow) or 0 (Prohibit)
LimitLptBw	Bandwidth limit for LPT port redirection channel	Numeric value
LimitLptBwPercent	Bandwidth limit for LPT port redirection channel as a percentage of total session bandwidth	Numeric value between 0 and 100
AutoConnectClientLptPorts	Automatically connect LPT ports from the user device	1 (Allow) or 0 (Prohibit)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After configuring these settings, change your machine catalogs to use the new master image or updated physical machine. Desktops are updated with the new settings that the next time users log off.

Policy changes

June 29, 2026

There are no policy changes in Citrix Virtual Apps and Desktops™ 7 2607 LTSR.

Manage

May 15, 2026

Managing a Citrix Virtual Apps and Desktops™ site covers various items and tasks.

Licensing

A valid connection to the Citrix License Server is required when you create a site. Later, you can complete several licensing tasks from Studio, including adding licenses, changing license types or models, and managing license administrators. You can also access the License Administration Console from Studio.

Applications

Manage applications in Delivery Groups and optionally, Application Groups.

Zones

In a geographically disperse deployment, you can use zones to keep applications and desktops closer to end users, which can improve performance. When you install and configure a site, all Controllers, machine catalogs, and host connections are in one primary zone. Later, you can use Studio to create satellite zones containing those items. After your site has more than one zone, you will be able to indicate in which zone any newly created machine catalogs, host connections, or added Controllers will be placed. You can also move items between zones.

Connections and resources

If you are using a hypervisor or other service to host machines that deliver applications and desktops to users, you create your first connection to that hypervisor or other service when you create a site. The storage and network details for that connection form its resources. Later, you can change that

© 1997–2026 Citrix Systems, Inc. All rights reserved.

connection and its resources, and create more connections. You can also manage the machines that use a configured connection.

Local Host Cache

Local Host Cache allows connection brokering operations in a site to continue when the connection between a Delivery Controller™ and the site database fails.

Virtual IP and virtual loopback

The Microsoft virtual IP address feature provides a published application with a unique dynamically assigned IP address for each session. The Citrix virtual loopback feature allows you to configure applications that depend on communications with localhost to use a unique virtual loopback address in the localhost range.

Delivery Controllers

This article contains considerations and procedures when adding and removing Controllers from a site. It also describes how to move Controllers to another zone or site, and how to move a VDA to another site.

VDA registration with Controllers

Before a VDA can help deliver applications and desktops, it must register (establish communication) with a Controller. Controller addresses can be specified in several ways, which are described in this article. It is critical that VDAs have current information as Controllers are added, moved, and removed in the site.

Sessions

Maintaining session activity is critical to providing the best user experience. Several features can optimize the reliability of sessions, reduce inconvenience, downtime, and loss of productivity.

- Session reliability
- Auto Client Reconnect
- ICA® Keep-Alive
- Workspace control
- Session roaming

Use search in Studio

When you want to view information about machines, sessions, machine catalogs, applications, or Delivery Groups in Studio, use the flexible search feature.

Tags

Use tags to identify items such as machines, applications, groups, and policies. You can then tailor certain operations to apply on to items with a specific tag.

IPv4/IPv6

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops™ supports pure IPv4, pure IPv6, and dual-stack deployments that use overlapping IPv4 and IPv6 networks. This article describes and illustrates these deployments. It also describes the Citrix policy settings that control the use of IPv4 or IPv6.

User profiles

By default, Citrix Profile Management is installed automatically when you install a VDA. If you use this profile solution, review this article for general information. See the Profile Management documentation for details.

Collect Citrix Diagnostic Facility (CDF) traces

The CDFControl utility is an event tracing controller or consumer for capturing Citrix Diagnostic Facility (CDF) trace messages displayed from various Citrix tracing providers. It is made to troubleshoot complex Citrix related issues, parse filter support, and collect performance data.

Citrix Insight Services

Citrix Insight Services (CIS) is a Citrix platform for instrumentation, telemetry, and business insight generation.

Citrix Scout

Citrix Scout collects diagnostics and runs health checks. You can use the results for proactive maintenance in your Citrix Virtual Apps and Desktops deployment. Citrix offers comprehensive, automated analysis of diagnostics collections through Citrix Insight Services. You can also use Scout to troubleshoot issues, on your own or with Citrix Support guidance.

Applications

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Introduction

If your deployment uses only delivery groups (and not application groups), you add applications to the delivery groups. If you also have application groups, generally you add applications to the application

© 1997–2026 Citrix Systems, Inc. All rights reserved.

groups instead. This guidance provides easier administration. An application must always belong to at least one delivery group or application group.

In the Add Applications wizard, you can select one or more delivery groups, or one or more application groups, but not both. Although you can later change an application's group association (for example, moving an application from an application group to a delivery group), best practice discourages adding that complexity. Keep your applications in one type of group.

When you associate an application with more than one group, a visibility issue can occur if you do not have sufficient permission to view the application in all of those groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the groups with which the application is associated.

If you publish two applications with the same name (perhaps from different groups) to the same users, change the `Application name (for user)` property in Web Studio. Otherwise, users see duplicate names in Citrix Workspace™ app.

You can change an application's properties (settings) when you add it, or later. You can also change the application folder where the application is placed, either when you add the application, or later.

For details, see:

- Create delivery groups
- Create application groups
- Tags

Add applications

You can add applications when you create a delivery group or application group. Those procedures are detailed in Create delivery groups and Create application groups. The following procedure describes how to add applications after you create a group.

Good to know:

- You cannot add applications to Remote PC Access delivery groups.
- You cannot use the Add Application wizard to remove applications from delivery groups or application groups. That is a separate operation.

To add one or more applications:

1. Select **Applications** in the left pane and then select **Add Applications** in the action bar.
2. The Add Applications wizard launches with an **Introduction** page, which you can remove from future launches of this wizard.
3. The wizard guides you through the **Groups**, **Applications**, and **Summary** pages. When you are done with each page, click **Next** until you reach the **Summary** page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Alternatives to step 1 if you want to add applications to a single delivery group or application group:

- **To add applications to only one delivery group:** In step 1, select **Delivery Groups** in the Web Studio left pane, select a delivery group in the middle pane, and then select **Add Applications** in the action bar. The wizard does not display the **Groups** page.
- **To add applications to only one application group:** In step 1, select **Applications** in the Web Studio left pane, select an application group in the middle pane, and then select the **Add Applications** entry under the application group's name in the action bar. The wizard does not display the **Groups** page.

Groups page

This page lists all the delivery groups in the site. If you have also created application groups, the page lists the application groups and delivery groups. You can choose from either group, but not from both groups. In other words, you cannot add applications to an application group and a delivery group at the same time. Generally, if you are using application groups, add applications to application groups, rather than delivery groups.

When adding an application, select the check box next to at least one delivery group (or application group, if available). Every application must always be associated with at least one group.

Applications page

Click **Add** to display the application sources.

- **From Start menu:** Applications that are discovered on a machine in the selected delivery groups. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add, and then click **OK**.

  This source cannot be selected if you (1) selected application groups with no associated delivery groups, (2) selected application groups with associated delivery groups that contain no machines, or (3) selected a delivery group containing no machines.

- **Manually:** Applications located on a VDA in the delivery group or elsewhere in your network. Selecting this source opens a new page where you specify an application to add in the following ways:

  - Type the path to the executable, working directory, optional command line arguments, and display names for administrators and users.
  - Select an application from a VDA in the delivery group. To do so, click **Browse**, enter credentials for accessing the VDA, wait to be connected to the VDA, and then select an application from the VDA. The properties of the selected application automatically populate fields on the page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Existing:** Applications previously added to the site. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add and then click **OK**.

  This source cannot be selected If the site has no applications.

- **Application packages:** Applications in App-V, MSIX, MSIX app attach, or FlexApp application packages. When you select this source, the **Add Applications from Packages** page launches. Select an application package source, select the applications you want to add from the resulting display, and then select **OK**. For more information, see Deploy and deliver App packages.

- **Application Group**: Application groups. When you select this source, a new page launches with a list of application groups. (Although the display also lists the applications in each group, you can select only the group, not individual applications.) All current and future applications in the selected groups are added. Select the check boxes of application groups to add, and then click **OK**.

  This source cannot be selected if (1) there are no application groups, or (2) if the selected delivery groups do not support application groups (for example, delivery groups with statically assigned machines).

As noted in the table, some sources in the **Add** list cannot be selected if there is no valid source of that type. Sources that are incompatible (for example, you cannot add application groups to application groups) are not included in the list. Applications that are already added to the groups you chose cannot be selected.

You can change an application's properties (settings) from this page, or later.

By default, added applications are placed in the application folder named `Applications`. You can change the application from this page, or later. If you try to add an application and one with the same name exists in the same folder, you are prompted to rename the application you're adding. You can accept the new name offered, or decline and then rename the application or select a different folder. For example, if `app` already exists in the **Applications** folder, and you attempt to add another application named `app` to that folder, the new name `app_1` is offered.

Summary page

If you are adding 10 or fewer applications, their names are listed in **Applications to add**. If you are adding more than 10 applications, the total number is specified.

Review the summary information and then click **Finish**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Change an application's group association

After adding an application, you can change the delivery groups and application groups with which the application is associated.

You can drag an application to an additional group. This is an alternative to using commands in the action bar.

If an application is associated with more than one delivery group, either using an application group or directly, group priority can be used to specify the order in which multiple groups are evaluated. Groups can be excluded from consideration based on factors like access policy, user lists, or smart access tags, and the specific machine chosen from the group can be affected by factors like zone preference, and launch readiness, and any tag restrictions. By default, all groups are priority 0 (the highest). If the delivery groups have equal priority, then the least loaded delivery group is selected for launching the application. The vertical load balancing is not considered in this case.

An application can be associated with delivery groups containing shared (not private) machines that can deliver applications. You can also select delivery groups containing shared machines that deliver desktops only, if (1) the delivery group contains shared machines and was created with a XenDesktop 7.x version earlier than 7.9, and (2) you have `Edit delivery group` permission. The delivery group type is automatically converted to `desktops and applications` when the properties dialog is committed.

1. Sign in to Web Studio, select **Applications** in the left pane, and then select the application.
2. Select **Properties** in the action bar.
3. Select the **Groups** page.
    - To add a group, click **Add** and select **Application Groups** or **Delivery Groups**. (If you have not created any application groups, the only entry is **Delivery Groups**.) Then select one or more available groups. Groups that are incompatible with the application, or that are already associated with the application, cannot be selected.
    - To remove a group, select one or more groups and then click **Remove**. If removing group association would result in the application no longer being associated with any group, you are alerted that the application will be deleted.
    - To change the priority of a group, select the group and then click **Edit Priority**. Select a priority value and then click **OK**.
4. When you are finished, click **Apply** to apply the changes and leave the window open, or click **OK** to apply the changes and close the window.

Duplicate, enable or disable, rename, or delete an application

The following actions are available:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Duplicate:** You might want to duplicate an application to create a different version with different parameters or properties. When you duplicate an application, it is automatically renamed with a unique suffix and placed next to the original. You might also want to duplicate an application and then add it to a different group. (After duplicating, the easiest way to move an application is dragging it.)
- **Enable or disable:** Enabling and disabling an application is a different action than enabling and disabling a delivery group or application group.
- **Rename:** You can rename only one application at a time. If you try to rename an application and one with the same name exists in the same folder or group, you are prompted to specify a different name.
- **Delete:** Deleting an application removes it from the delivery groups and application groups with which it was associated, but not from the source that was used to add the application originally. Deleting an application is a different action than removing it from a delivery group or application group.

To duplicate, enable, disable, rename, or delete an application:

1. Select **Applications** in the left pane.
2. Select one or more applications in the middle pane and then select the appropriate task in the action bar.
3. Confirm the action, when prompted.

Remove applications from a delivery group

An application must be associated (belong) with at least one delivery group or application group. If you attempt to remove an application from a delivery group that would remove that application's association with any delivery group or application group, you are notified that the application will be deleted if you continue. When that happens, if you want to deliver that application, you must add it again from a valid source.

1. Select **Delivery Groups** in the left pane.
2. Select a delivery group. In the lower middle pane, on the **Applications** tab, select the application you want to remove.
3. Select **Remove Application** from the action bar.
4. Confirm the removal.

Remove applications from an application group

An application must belong to at least one delivery group or application group. If you attempt to remove an application from an application group that will result in that application no longer belonging

© 1997–2026 Citrix Systems, Inc. All rights reserved.

to any group, you are notified that the application will be deleted if you continue. When that happens, if you want to deliver that application, you must add it again from a valid source.

1. Select **Applications** in the left pane.
2. Select the application group in the middle pane, and then select one or more applications.
3. Select **Remove from Application Group** in the action bar.
4. Confirm the removal.

Change application properties

You can change the properties of only one application at a time.

To change the properties of an application:

1. Select **Applications** in the left pane.
2. Select an application and then select **Edit Application Properties** in the action bar.
3. Select the page containing the property you want to change.
4. When you are finished, click **Apply** to apply any changes you made and keep the window open, or click **OK** to apply changes and close the window.

In the following list, the page is shown in parentheses.

Property	Page
Category/folder where application appears in Citrix Workspace app	Delivery
Command line arguments; see Pass parameters to published applications	Location
Delivery groups and application groups where the application is available	Groups
Description	Identification
File name extensions and file type association: which extensions the application opens automatically	File Type Association
Icon	Delivery
Keywords for StoreFront™	Identification
Limits; see Configure application limits	Delivery
Name: Names seen by the user and by the administrator	Identification

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Property	Page
Path to executable; see Pass parameters to published applications	Location
Shortcut on user's desktop: enable or disable	Delivery
Visibility: Limits which users can see the application in Citrix Workspace app. An invisible application can still be started. To make it unavailable and invisible, add it to a different group.	Limit Visibility
Working directory	Location

Application changes might not take effect for current application users until they log off from their sessions.

Configure application limits

Configure application limits to help manage application use. For example, you can use application limits to manage the number of users accessing an application simultaneously. Similarly, application limits can be used to manage the number of simultaneous instances of resource-intensive applications. That limit can help maintain server performance and prevent deterioration in service.

This feature limits the number of application launches that are brokered by the Controller (for example, from Citrix Workspace app and StoreFront), and not the number of running applications that can be launched by other methods. This means that application limits assist administrators when managing concurrent usage, but do not provide enforcement in all scenarios. For example, application limits cannot be applied when the Controller is in outage mode.

By default, there is no limit on how many application instances can run at the same time. There are several application limit settings. You can configure any or all of them.

- The maximum number of concurrent instances of the application by all users in the delivery group.
- One instance of the application per user in the delivery group.
- The maximum number of concurrent instances of the application per machine (PowerShell only).

If a limit is configured, an error message is generated when a user attempts to launch an instance of the application that will exceed the configured limit. If more than one limit is configured, an error is reported when the first limit is reached.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Examples using application limits:

- **Maximum number of simultaneous instances limit:** In a delivery group, you configure the maximum number of simultaneous instances of application `Alpha` to 15. Later, users in that delivery group have 15 instances of that application running at the same time. If any user in that delivery group now attempts to launch `Alpha`, an error message is generated. `Alpha` is not launched because it would exceed the configured simultaneous application instance limit (15).
- **One-instance-per-user application limit:** In another delivery group, you enable the one-instance-per-user option for application `Beta`. User Tony launches application `Beta` successfully. Later in the day, while that application is still running in Tony's session, he attempts to launch another instance of `Beta`. An error message is generated and `Beta` is not launched because it would exceed the one-instance-per-user limit.
- **Maximum number of simultaneous instances and one-instance-per-user limits:** In another delivery group, you configure a maximum number of simultaneous instances of 10 and enable the one-instance-per-user option for application `Delta`. Later, when 10 users in that delivery group each have an instance of `Delta` running, any other user in that delivery group who tries to launch `Delta` will receive an error message. `Delta` is not launched. If any of the 10 current `Delta` users attempt to launch a second instance of that application, they will receive an error message and the second instance will not be launched.
- **Maximum number of simultaneous instances per machine, and using tag restrictions:** Application `Charlie` has licensing and performance requirements that dictate how many instances can be running at the same time on a specific server. Those requirements also dictate how many instances can be running simultaneously across all servers in the site.

  The application instances-per-machine limit affects any server in the site (not just machines in a particular delivery group). Let's say your site has three servers. For application `Charlie`, you configure the app instances per machine limit to 2. So, no more than six instances of application `Charlie` are allowed to launch site-wide. (That's a limit of two instances of Charlie on each of the three servers.)

  To restrict an application's usage to only certain machines within a delivery group (in addition to limiting the instances on all machines site-wide):

  - Use the tagging functionality for those machines.
  - Configure the maximum number of instances per machine limit for that application.

If applications are launched by methods other than Controller brokering (for example, while a Controller is in outage mode) and configured limits are exceeded, users cannot launch more instances until they close enough instances to no longer exceed the limits. The instances that exceeded the limit are not forcibly shut down. They will be allowed to continue until their users close them.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you disable session roaming, then disable the one-instance-per-user application limit. If you enable the one-instance-per-user application limit, do not configure either of the two values that allow new sessions on new devices. For information about roaming, see Sessions.

To configure the maximum instances per delivery group limit, and the one-instance-per-user limit:

1. Select **Applications** in the left pane and then select an application.
2. Select the **Edit Application Properties** in the action bar.
3. On the **Delivery** page, choose one of the following options.
    - **Allow unlimited use of the application**. There is no limit to the number of instances running at the same time. This is the default.
    - **Set limits for the application**. There are two limit types; specify either or both.
        - Specify the maximum number of instances that can run concurrently per machine
        - Limit to one instance of the application per user
4. Click **OK** to apply the change and close the dialog box, or **Apply** to apply the change and leave the dialog box open.

To configure the maximum instances per machine limit (PowerShell only):

- In PowerShell (using the Remote PowerShell SDK for Citrix Cloud™ deployments, or the PowerShell SDK for on-premises deployments), enter the appropriate `BrokerApplication` cmdlet with the `MaxPerMachineInstances` parameter.
- For guidance, use the `Get-Help` cmdlet. For example:

  ```
  Get-Help Set-BrokerApplication –Parameter MaxPerMachineInstances
  ```

Pass parameters to published applications

Use the **Location** page of an application's properties to enter the command line and pass parameters to published applications.

When you associate a published application with file types, the symbols `"%*"` (percent and star symbols enclosed in double quotation marks) are appended to the end of the command line for the application. These symbols act as a placeholder for parameters passed to user devices.

If a published application does not launch when expected, verify that its command line contains the correct symbols. By default, parameters supplied by user devices are validated when the symbols `"%*"` are appended. For published applications that use customized parameters supplied by the user device, the symbols `"%**"` are appended to the command line to bypass command-line validation. If you do not see these symbols in a command line for the application, add them manually.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If the path to the executable file includes directory names with spaces (such as `"C:\Program Files"`), enclose the command line for the application in double quotation marks to indicate that the space belongs in the command line. To do this, add double quotation marks around the path, and another set of double quotation marks around the `%*` symbols. Be sure to include a space between the closing quotation mark for the path and the opening quotation mark for the `%*` symbols.

For example, the command line for the published application Windows Media Player is:

```
"C:\Program Files\Windows Media Player\mplayer1.exe""%*"
```

> **Note:**
>
> The maximum number of characters, including arguments, in the command line for launching published applications is 203.

Troubleshooting session sign-out issues with Published Applications

When publishing applications, only the main executable file for the published application is specified. However, some applications might produce additional (child) processes that run in the background and are not closed by the corresponding main executable file when the main published application is closed. Additional processes might also be created, from scripts that are executed, or from specific registry keys, like `Run` and `RunOnceKey`. These applications can prevent a graceful sign-out, resulting in lingering or hanging sessions and might result in the session not closing and the user being signed out.

In this case, you need to reset or exit these sessions using Citrix Director.

To help identify and troubleshoot sessions not being signed out properly, Citrix has made three registry entries available. Identifying and troubleshooting of session not being logged off properly due to these issues is a three-step process:

1. Identifying which sessions have published applications are holding up a graceful sign-out
2. Identifying for those published applications if they produce any additional (child) processes
3. Add these processes to a specified registry entry to prevent them from holding up sign-out

Step 2: Identifying for those published applications if they produce any additional (child) processes

Once a published application is identified to hold up a graceful sign-out, the next step is to determine if this application produces additional processes when running.

You can read `HKCU\Software\CitrixVolatile\Seamless\Sessions\[ID]\LogoffCheckerBloc` to determine if any processes are blocking a graceful sign-out when a published application is closed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the following example, the key `LogoffCheckerBlockingProcess` contains the following entries:

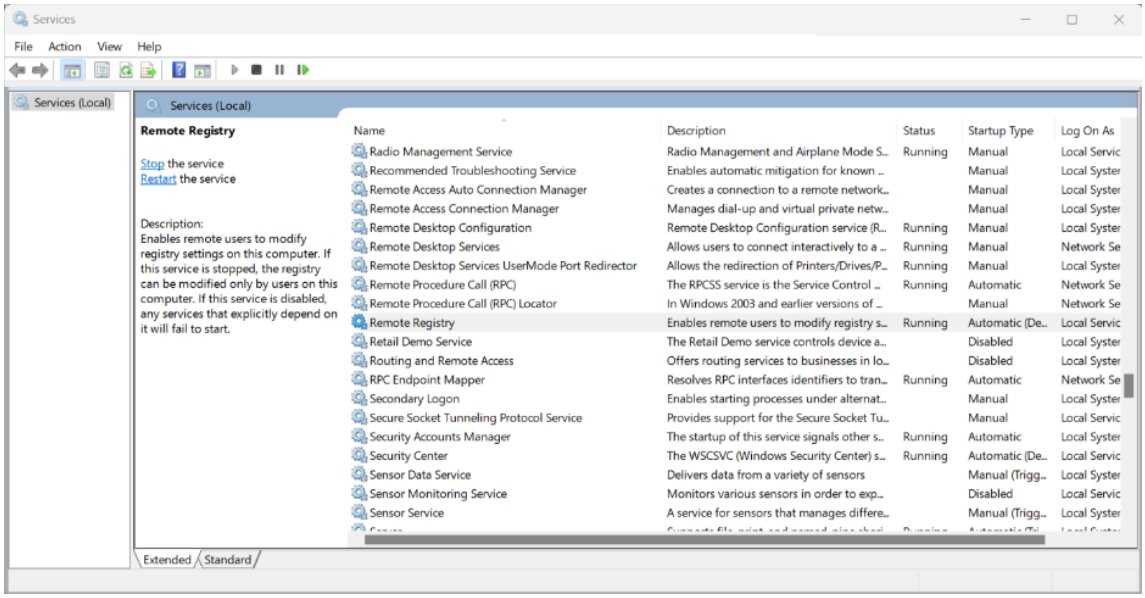
```
PhoneExperienceHost.exe
SkypeApp.exe
SkypeBackgroundHost.exe
```

These processes have held up the graceful sign-out.

> **Note:**
>
> Replace the [ID] with the correct session ID for the session you want to check.

Step 3: Add these processes to a specified registry entry to prevent them from holding up sign-out

You can add these processes to the following registry keys to prevent them from holding up sign-out in future sessions:



```
Add the process file name to the following registry key:
Caution! Refer to the Disclaimer at the end of this article before
   using the Registry Editor.
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWI
Value Name:LogoffCheckSysModules
Type:REG_SZ
String:MyAppName.exe
```

More information about `LogoffCheckSysModules`, see Graceful logoff from a published application renders the session in an active state.

Step-by-step troubleshooting guide

1. Start the remote registry Service under the VDA under test:
   a) In the Control Panel, select **Administrative Tools > Services**.
   b) Right-click **Remote Registry Service** and select **Properties**.
   c) Under **Startup Type**, select **Automatic** from the drop-down menu.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Turn off the Windows Firewall on the VDA under test or create an inbound firewall rule to enable port 455:

    a) In the Control Panel, select **Windows Defender Firewall > Advanced Settings**.

    b) Right-click **Inbound Rules** and select **New Rule**.

    c) In **New Inbound Rule Wizard**, select **Port**.

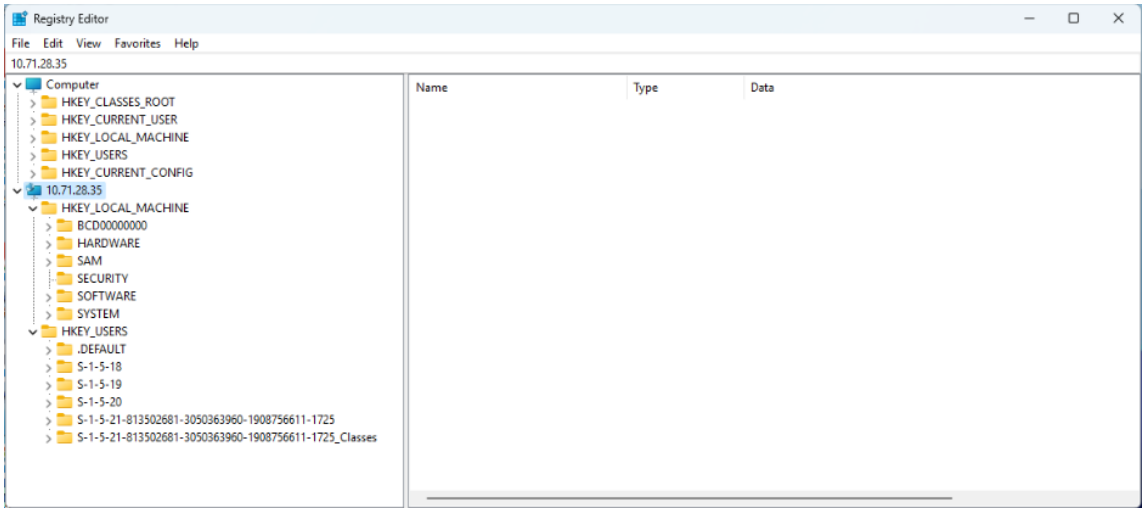
    d) On the **Protocols and Ports** page, select **TCP and Specific Local Ports**. Enter 445 as the local port.

    e) Select **Allow Connection** on the **Action** page.

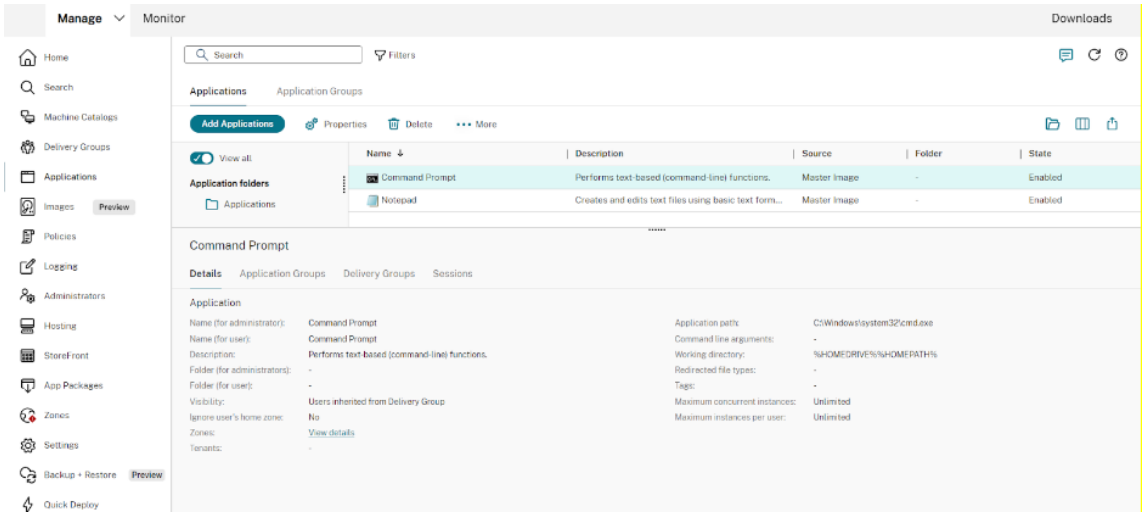
    f) Select the firewall profiles that you want to apply the new inbound rule.

    g) Name the firewall rule and select **Finish** to exit **New Inbound Rule wizard**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

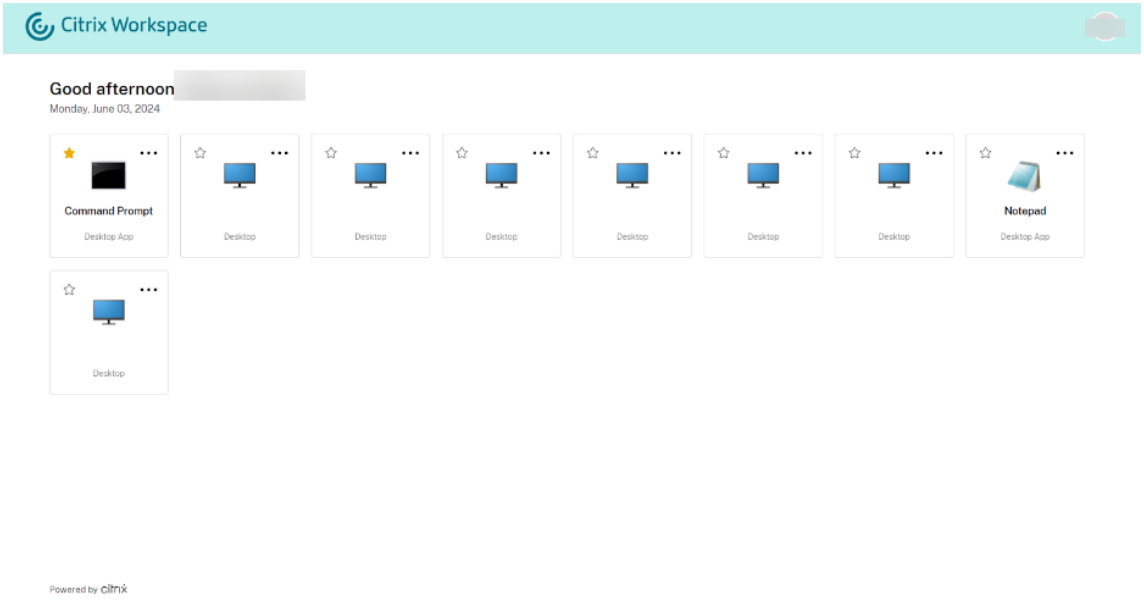


3. From another VM on the same domain (it could be DC, DDC, or another VDA), run `Regedit` and connect to a remote registry.

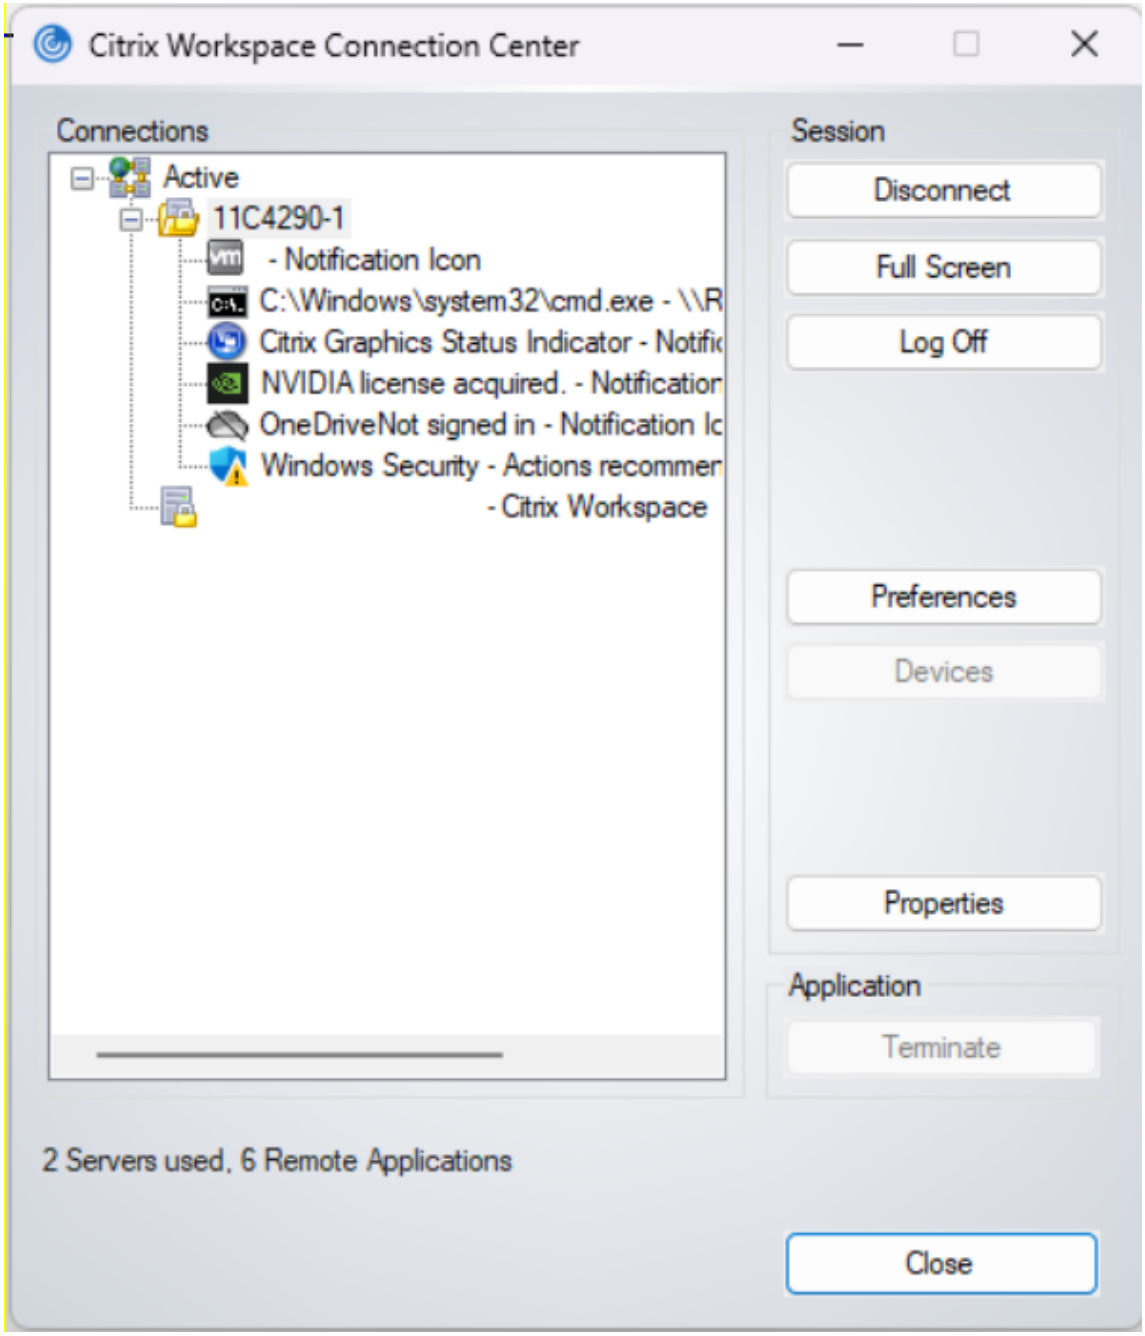


4. Enter the IP address of the VDA under test and click **OK**. The `regedit` tree must display branches for the VDA under test.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



5. Open the **Command Prompt** published application.



The **Command Prompt** app is displayed on Citrix Workspace.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Open **Connection Center** on the client. This is used for monitoring when a session is signed out, after closing an opened seamless app. We can see in the following image that the Command Prompt process `c:\Windows\system32\cmd.exe` is active on the remote VDI.

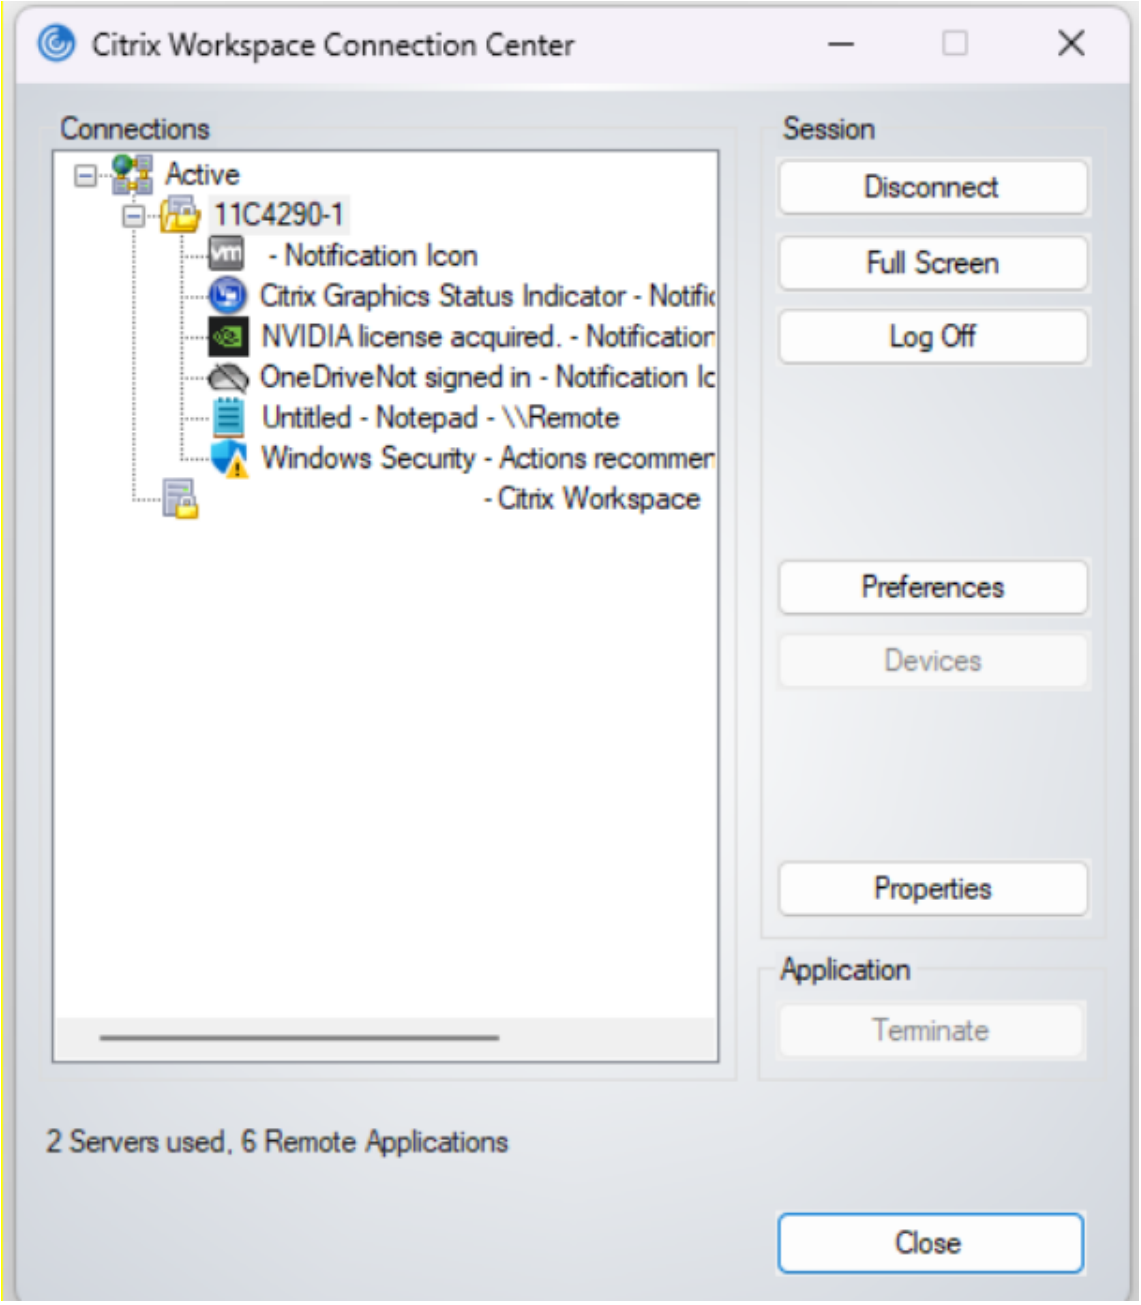
© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. From the VDA where **regedit** is running, go to the following remote IP location: `HKEY_USERS\S-1-X-XX-XXXXXXXX-XXXXXXXXXX-XXXXXXXXXX-XXXX\SOFTWARE\CitrixVolatile\Seamless\Sessions\X\`

   > **Note:**
   >
   > This path changes every time you open a new session.

8. There are two keys to read here (do not change them here): **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess**. These keys display any programs that are blocking

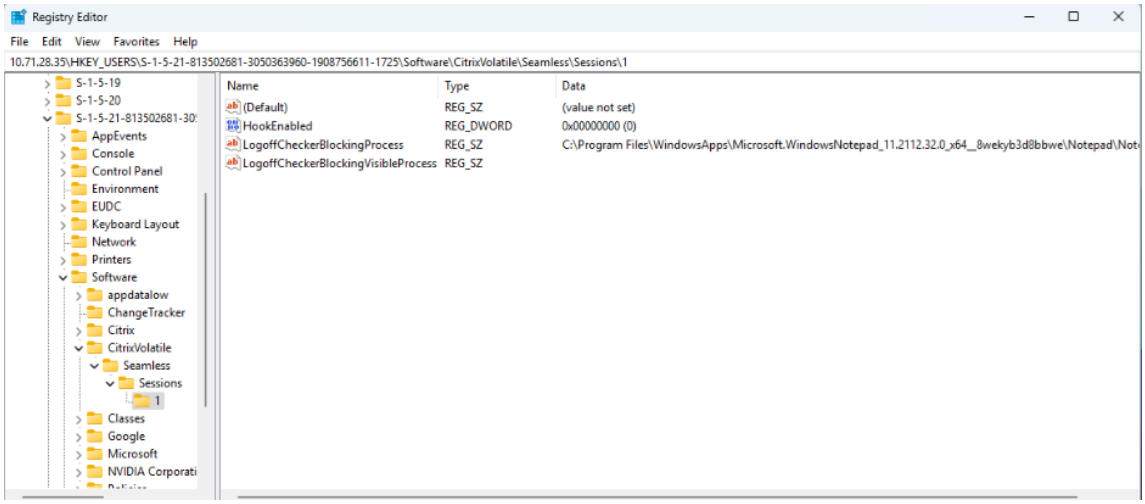
© 1997–2026 Citrix Systems, Inc. All rights reserved.



sign-out. The first one must display `C:\Windows\System32\cmd.exe` since that was open and has not been closed yet.

> **Note:**
>
> **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess** must not be manually edited. Manually editing these registry values could lead to unstable sessions.

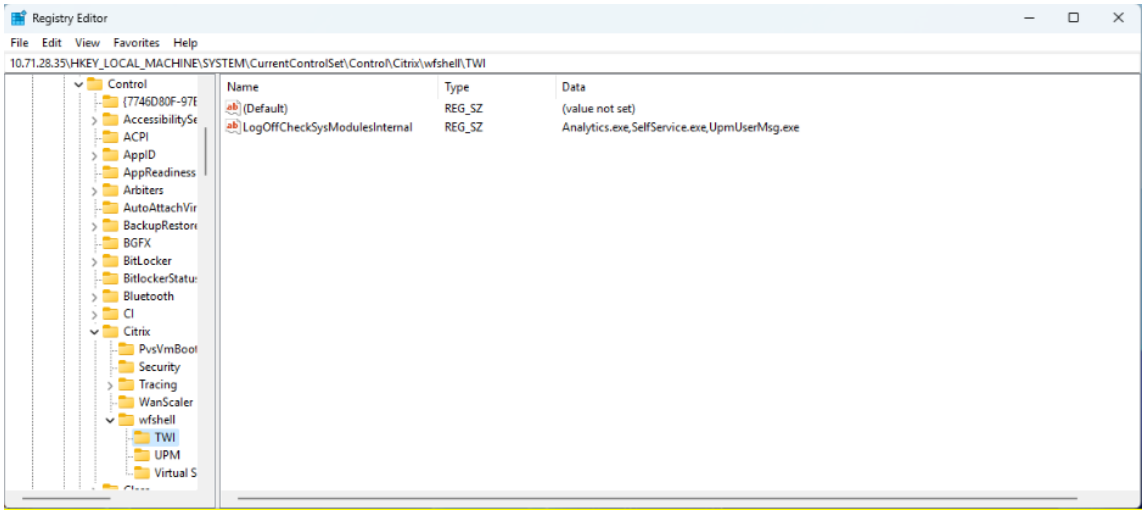
9. Click **X** in the upper-right hand corner to exit **Seamless CMD**.
10. Check the connection center to see if the session closes. It may take up to 30 seconds to close. If it closes, there have been no applications or processes that have prevented a graceful sign-out.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

11. If the session did not close, refresh the **regedit** output with F5.
12. Check the contents of **LogoffCheckBlockingProcess** and **LogoffCheckerBlockingVisibleProcess** again. CMD must no longer be present but there should be another listed process. Whatever process is currently blocking session sign-out must be displayed here.

    In this case, **Notepad.exe** is open from the published command prompt before the command prompt was closed and this remote notepad process is holding up a graceful sign-out.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

13. Make a note of the path to this executable, and which key it appeared in, and enter it in the following registry key, under the remote tree:

    - If it appears in **LogoffCheckBlockingProcess**: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWILogoffCheckSysModulesInternal`
    - If it appears in **LogoffCheckerBlockingVisibleProcess**: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWILogoffCheckVisibleSysModules`

    > **Note:**
    >
    > If there is already one or more entries in the key, add a comma to the end and put the new entry after the comma.

14. Sign out from the session from the connection center on the client, and re-open the Remote Application.
15. Repeat steps 9-16 until the session is signed out automatically within 30 seconds of closing the Remote Application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> After troubleshooting, revert the temporary Firewall changes to allow remote registry access if needed.

How to modify LogonUI to view Windows disclaimer message in full size when opening published applications

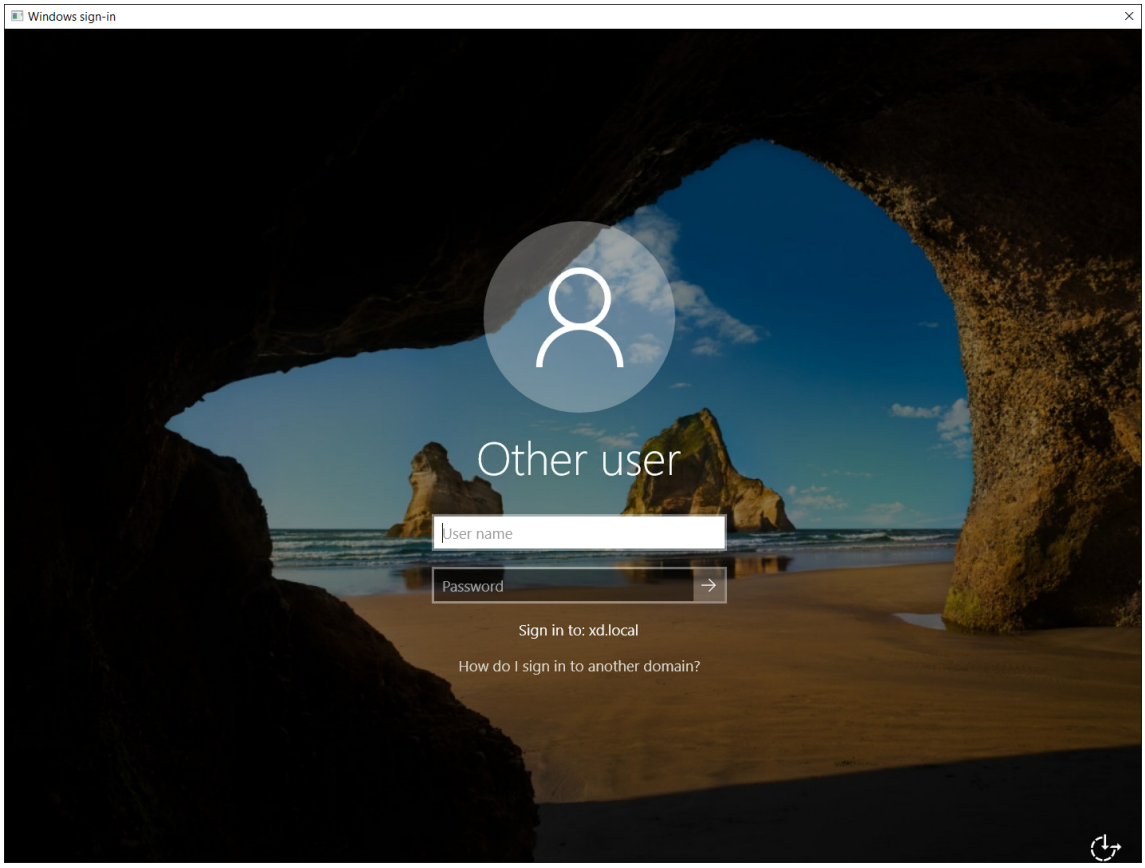
The **LogonUI** window scaling is improved for scenarios where authentication pass-through does not occur. The **LogonUI** window is scaled based on the monitor resolution and DPI settings used which ensures that the complete **LogonUI** window is visible without any clipping.

The window size in pixels can also be set manually in the registry.

1. Open the **Registry Editor** using `regedit` on the **Run** command.
2. Go to `HKEY_LOCAL_MACHINE\Software\Citrix\CtxHook\AppInit_DLLS\Seamless Hook\`.
3. Create two new DWORD keys: **LogonUIWidth** and **LogonUIHeight**.
4. Set the value of the keys to the required width and height in pixels for the **LogonUI** window.

   When manually setting the **LogonUI** windows size, automatic scaling is disabled.

> **Note:**
>
> These registry paths have changed from 2407 and later. The old registry values are ignored and deprecated.



By default, the **LogonUI** window includes a title bar with a close button which enables the end user to disconnect from the session if needed.

Disable a tilebar

You can disable the tile bar in the **LogonUI** window with the following registry key:

1. Open the Registry Editor using `regedit` on the **Run** command.
2. Go to `HKEY_LOCAL_MACHINE\Software\Citrix\CtxHook\AppInit_DLLS\Seamless Hook\`.
3. Create new DWORD keys: **LogonUICaption** and set the value of the key to `0`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage application folders

By default, new applications you add to delivery groups are placed in a folder named **Applications**. You can specify a different folder when you create the delivery group, when you add an application, or later.

Good to know:

- You cannot rename or delete the Applications folder, but you can move all the applications it contains to other folders you create.
- A folder name can contain 1–64 characters. Spaces are permitted.
- Folders can be nested up to five levels.
- Folders do not have to contain applications. Empty folders are allowed.
- Folders are listed alphabetically in Web Studio unless you move them or specify a different location when you create them.
- You can have more than one folder with the same name, as long as each has a different parent folder. Similarly, you can have more than one application with the same name, as long as each is in a different folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You must have `View Applications` permission to see the applications in folders, and you must have `Edit Application Properties` permission for all applications in the folder to remove, rename, or delete a folder that contains applications.
- Most of the following procedures request actions using the action bar in Web Studio. Alternatively, you can use right-click menus or drag the item. For example, if you create or move a folder in a location you did not intend, you can drag/drop it to the correct location.
- All nodes in Web Studio (such as **Machine Catalogs**, **Delivery Groups**, **Applications**, and **Application Groups**) share the same folder tree in the back end. To avoid name conflicts when renaming or moving folders, use unique names for first-level folders across different nodes.

  If you create a folder using the `New-BrokerAdminFolder` SDK cmdlet and want it to appear under the **Applications** node, you must add the `ContainsApplications` metadata using the `Set-BrokerAdminFolderMetadata` cmdlet.

  Example:

```
Set-BrokerAdminFolderMetadata -AdminFolderId {
adminFolderUid }
 -Name ContainsApplications -Value true
```

To manage application folders, select **Applications** in the left pane. Use the following list for guidance.

- **To view all folders (excluding nested folders):** Click **Show all** above the folder list.
- **To create a folder at the highest level (not nested):** Select the **Applications** folder. To place the new folder under an existing folder other than **Applications**, select that folder. Then, select **Create Folder** in the actions bar. Enter a name.
- **To move a folder:** Select the folder and then select **Move Folder** in the action bar. You can move only one folder at a time unless the folder contains nested folders. (The easiest way to move a folder is to drag it.)
- **To rename a folder:** Select the folder, and then select **Rename Folder** in the action bar. Enter a name.
- **To delete a folder:** Select the folder, and then select **Delete Folder** in the action bar. When you delete a folder that contains applications and other folders, those objects are also deleted. Deleting an application removes the application assignment from the delivery group. Tt does not remove it from the machine.
- **To move applications into a folder:** Select one or more applications. Then, select **Move Application** in the action bar. Select the folder.

You can also place applications you are adding in a folder on the **Application** page when creating a delivery group or an application group. By default, added applications go in the **Applications** folder. Click **Change** to select or create a folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Control local launch of applications on published desktops

When users launch a published application from within a published desktop, you can control whether the application is launched in that desktop session or as a published application. Citrix Workspace app searches for the installation path of the application in the Windows registry on the VDA and, if present, launches the local instance of the application. Otherwise, a hosted instance of the application is launched. If you launch an application that is not installed on the VDA, the hosted application is launched. For more information, see vPrefer launch.

In PowerShell (using the Remote PowerShell SDK in Citrix Cloud deployments or the PowerShell SDK in on-premises deployments), you can change this action.

In the `New-Broker` Application or `Set-BrokerApplication` cmdlet, use the `LocalLaunchDisabled` option. For example:

```
Set-BrokerApplication -LocalLaunchDisabled <Boolean>
```

By default, this option's value is false (`-LocalLaunchDisabled $false`). When launching a published application from within a published desktop, the application is launched in that desktop session.

If you set the option's value to true (`-LocalLaunchDisabled $true`), the published application is launched. This creates a separate, additional session from the published desktop (using Citrix Workspace app for Windows) to the published application.

Requirements and limits:

- The application's `ApplicationType` value must be `HostedOnDesktop`.
- This option is available only through the appropriate PowerShell SDK. It is not currently available in the Web Studio graphical interface.
- This option requires minimum: StoreFront 3.14, Citrix Receiver for Windows 4.11, and Delivery Controller 7.17.

App packages

May 13, 2026

App packages are pre-configured application deployments that Citrix® manages. They allow applications to be virtualized, which implies that the applications run independently of the user's device's operating system and interface.

App packages simplify application management, reduces IT overhead, and ensures that applications are secure and functional throughout their lifecycle.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix supports the following packaging technologies for delivering applications to users:

- App-V applications
- MSIX and MSIX app attach applications
- FlexApp applications
- Elastic App applications
- Cloudpaging applications

This article walks you through how to deploy and deliver these packaged applications in your Citrix Virtual Apps and Desktops™ environment.

> **Note:**
>
> - Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.
> - We don't recommend using Web Studio and Citrix Studio interchangeably for deploying and delivering app packages. Each uses different mechanisms, which can lead to discrepancies, such as App-V server information appearing correctly in one but not the other. Also, note that Citrix Studio supports only App-V.

App-V applications

Application Virtualization (App-V) is a Microsoft technology that allows applications to be streamed and accessed without requiring installation on the end user's device. Citrix Virtual Apps and Desktops can use App-V to deliver applications, providing a centralized and efficient way to manage applications across various client machines.

For more information about the components and concepts with which you interact when delivering App-V packaged applications, see the Microsoft documentation: Application Virtualization (App-V) for Windows client overview.

Important terms

- **Management server**: Provides a centralized console to manage App-V infrastructure and delivers virtual applications to both the App-V Desktop Client and a Remote Desktop Services Client. The App-V management server authenticates, requests, and provides the security, metering, monitoring, and data gathering required by the administrator. The server uses Active Directory and supporting tools to manage users and applications.
- **Publishing server**: Provides App-V clients with applications for specific users, and hosts the virtual application package for streaming. It fetches the packages from the management server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Dynamic configuration files**: App-V packages can be customized using dynamic configuration files, that when applied to the package, can be used to change its characteristics. For example, you can use them to define extra application shortcuts and behaviors. For more information, see Dynamic configuration files

Dynamic configuration files

Citrix App-V supports both types of dynamic configuration files. File settings are applied when the application is launched:

- **Deployment Configuration files** provide machine-wide configuration for all users. These files are expected to be named <packageFileName>_DeploymentConfig.xml and in the same folder as the App-V package they apply to. These files are supported by single and dual admin management.
- **User Configuration files** provide user-specific configuration that supports per-user customizations to the package. Single Admin supports user config files named in the following format: <packageFileName>_[UserSID | Username | GroupSID |GroupName_] UserConfig.xml and located in the same folder as the App-V package they apply to.

  When multiple User Configuration files exist for a particular package, they are applied with the following priority:

  1. User SID
  2. Username
  3. AD Group SID (First found wins)
  4. AD Group Name (First found wins)
  5. Default

  For example:

```
MyAppVPackage_S-1-5-21-000000001-0000000001-000000001-001
    _UserConfig.xml
MyAppVPackage_joeblogs_UserConfig.xml
MyAppVPackage_S-1-5-32-547_UserConfig.xml
MyAppVPackage_Power Users_UserConfig.xml
MyAppVPackage_UserConfig.xml
```

> **Note:**
>
> The user-specific portion of the file name can also optionally occur at the end (for example MyAppVPackage_UserConfig_joeblogs.xml).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> You cannot apply changes to Dynamic Deployment Configuration when there are user sessions with an application in the package open. You can apply changes to Dynamic User Configuration files if other users (but not the current user) have the application from the package open.

Dynamic configuration file location

In single admin management, the Citrix App-V components only process dynamic configuration files, which are found in the same folder as their App-V package.

When applications in the package are launched, any changes to the corresponding dynamic configuration files are reapplied. If your dynamic configuration files are in a different location to their packages, use a mapping file to map packages to their deployment configuration files.

To create a mapping file:

1. Open a new text file.
2. For each dynamic configuration file, add a line that specifies the path to the package using the format `<PackageGuid> : path`.

   For example:

   ```
   F1f4fd78ef044176aad9082073a0c780 : c:\widows\file\packagedeploy.
       xml
   ```

3. Save the file as `ctxAppVDynamicConfigurations.cfg` in the same folder as the package.

The entire directory hierarchy on the same UNC share as the App-V package is searched recursively upwards for this file every time an application in the package is launched.

Methods

You can use the following methods to deliver and manage App-V packages:

- **Dual Admin**: In this method, Citrix Virtual Apps and Desktops and App-V servers work together to deliver and manage packages. This method requires Citrix Virtual Apps and Desktops to periodically refresh the snapshot view of the App-V server's state. It incurs hardware, infrastructure, and administration overhead. Citrix Virtual Apps and Desktops and App-V servers must stay synchronized, particularly for user permissions.

  This method works best in closely coupled App-V and Citrix deployments. In this method:

  - **App-V management server** handles the dynamic configuration files

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **App Packages Delivery Component** installed on VDA machines: Manages the registration of the appropriate publishing server required for an application launch.

This ensures that the publishing server is synchronized for the user at the appropriate time. The publishing server maintains other aspects of the app package life cycle (like refresh on logon and connection groups) using the settings that it is configured with.

- **Single Admin**: Application packages are stored on network shares. Citrix Virtual Apps and Desktops delivers and manages packages independently.

  This method reduces overhead because the App-V servers and database infrastructure aren't needed in the deployment.

  In this method, you store App-V packages on a network share and upload their metadata from that location to your environment. The App Packages Delivery Component installed on VDA machines then manages and delivers applications as follows:

  - Process the Deployment Configuration Files and User Configuration Files when an application is launched.
  - Manage all aspects of the life cycles for packages on the host machine.

> **Note:**
>
> - You can use one or both management methods simultaneously. In other words, when you add applications to Delivery Groups, the applications can come from App-V packages located on App-V servers or on a network share.
> - If you are using both management methods simultaneously, and the App-V package has a dynamic configuration file in both locations, the file in the App-V server (dual management) is used.
> - When you select App packages in the Web Studio navigation pane, the display shows package names and types. The **Package type** column indicates which technology is used to deliver the package and where they are referenced in the **Application Library**. When you select a package, the details pane lists the applications and shortcuts in the package.

MSIX and MSIX app attach applications

MSIX is a Windows app package format that provides a modern packaging experience to all Windows apps. MSIX is suitable for various Windows application types, including Win32, .NET, and UWP apps.

MSIX app attach utilizes MSIX packages that are pre-expanded onto virtual hard disks, which can be mounted to the target machine as required, rather than streaming the package contents. It can improve deployment times, reduce network traffic, and lower IOPS on the target machine, but requires additional work to create and maintain the app attach disks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops delivers MSIX and MSIX app attach applications to users through the **App Packages Delivery Component** installed on VDA machines. This component manages all aspects of the life cycles for packages on the host machine.

For more information about MSIX and MSIX app attach, see the Microsoft documentation: MSIX documentation and App Attach in Azure Virtual Desktop respectively.

> **Note:**
>
> - We support native MSIX Packages on Desktop and server VDAs and MSIX app attach on `.vhd`, `.vhdx`, and `.cim` disk image formats on Desktop VDAs only.
> - Microsoft does not offer an AppAttach implementation for Server 2019. While AppAttach is present in Server 2022 and 2025, Microsoft does not support it on these versions. Therefore, we also do not support AppAttach on Server 2022 and 2025.
> - Enable sideloading on Windows Server 2019.
> - Ensure VDAs trust the certificates that packages are signed with.

FlexApp applications

FlexApp is an application layering solution developed by Liquidware that attaches any application to a Windows session without modifying the underlying base image through the traditional application installation process.

FlexApp One applications are encapsulated in a single, shareable file, allowing them to operate without requiring an additional application layer on Windows sessions. Users can initiate the application by clicking the container file, which quickly integrates one or more applications into their Windows workspace.

Citrix delivers FlexApp applications to users through the App Packages Delivery Component and FlexApp delivery agent installed on VDA machines. These two components manage all aspects of the life cycles for packages on the host machine.

Elastic App applications

Elastic App technology is a feature of Citrix App Layering that lets you assign application layers to users dynamically at logon, rather than installing them into a base image. With Elastic App technology, applications follow the user across different virtual machines, ensuring that they always have access to the apps they need without bloating the master image.

Citrix Virtual Apps and Desktops delivers Elastic App applications to users through the Citrix Personalization component and Application Layering Enterprise Layer Manager (ELM). These two components manage all aspects of the life cycles for packages on the host machine. For more information about Application Layering Enterprise Layer Manager, see theCitrix App Layering™ document.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cloudpaging applications

Cloudpaging is Numecent's application streaming technology that delivers applications to a Windows session without requiring changes to the base image.

With Cloudpaging, applications launch almost instantly because only a small portion of the code (typically less than 10%) is streamed initially. The remaining components stream in the background when users access them, providing a seamless experience.

For Citrix environments, the App Packages Delivery Component on the VDA works with the Numecent Cloudpaging Player to manage the application lifecycle. The Citrix component orchestrates delivery, while the Cloudpaging Player handles on-demand streaming and execution within the session.

Configuration requirements

Consider the following configuration details:

Cloudpaging Player and LogoffCheckSysModules When using virtual published applications with Cloudpaging containers, configure the following settings to allow a session to log off:

Setting	Value
Registry Key	`HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\TWI`
Value Name	`LogoffCheckSysModules`
Value Type	`REG_SZ`
Value Data	`CoreHelper.exe`

URLs for whitelisting In addition to the standard URL whitelisting requirements, VDAs require access to the following endpoint:

Parameter	Value
URL	`external-api.cloudpager.net`
Port	443
Client	Cloudpager PoSh Module
Forward Proxy Config for Web-Based	• Outbound access allowed • Authentication bypass required

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Value
Description	Cloudpager PowerShell Module

Optionally, you can create a dedicated delivery group with a VDA used solely to perform Cloudpager discovery to limit required whitelisted URLs. We recommend creating a delivery group with a machine that has **VDA version 2511 or later** and **App packages Delivery Component** installed.

For more information about Cloudpager Client network and firewall requirements, see the Numecent knowledgebase article.

Deploy and deliver app packages

Prerequisites

To support the delivery of App-V, MSIX, MSIX app attach, FlexApp packages, Elastic App applications, and Cloudpaging packages, you must first install the **App Packages Delivery Component** on VDA machines. See Install the App Packages Delivery Component on VDA machines for details.

Install the App Packages Delivery Component on VDA machines The App Packages Delivery Component manages the publishing process for application packages in App-V, MSIX, MSIX app attach, FlexApp, Elastic App, and Cloudpaging formats. This component isn't installed by default when you install a VDA. You can install the component during or after VDA installation.

To install the component during VDA installation, use either of the following ways:

- In the installation wizard, go to the **Additional Components** page and then select the **App Packages Delivery Component** checkbox.
- In the command line interface, use the `/includeadditional "Citrix Personalization for App-V – VDA"` option.

To install the component after VDA installation, follow these steps:

1. On the VDA machine, go to **Control Panel > Programs > Programs and Features**, right-click **Citrix Virtual Delivery Agent**, and then select **Change**.
2. In the wizard that appears, proceed to the **Additional Components** page and then enable the **App Packages Delivery Component** checkbox.

> **Note:**
>
> - Microsoft App-V Desktop Client is the component that runs virtual applications from App-V packages on user devices. Windows 10 (1607 or later), and Windows Server 2019 and later

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> already include this App-V client software. You must only enable it on VDA machines. For more information, see this Microsoft documentation article: Enable the App-V in-box client.
> - For FlexApp applications, install the FlexApp One Agent on the VDA along with the App Packages Delivery Component.
> - For Elastic App applications, install the App Layering-enabled image on the VDA along with the App Packages Delivery Component.
> - For Cloudpaging applications, install the Cloudpaging Player on the VDA along with the App Packages Delivery Component.

Install the FlexApp One Agent

1. Launch an administrator command prompt on the VDA.
2. Locate the network path for any FlexApp One Package.
3. Input the following command:

```
\\path\to\any\FlexAppOnePackage.exe --install
```

4. Accept any prompts that appear.

Install the App Layering-enabled image

1. Set up app layering.
   Follow the instructions in the Citrix App Layering documentation. The process includes:
   a) Set up the Enterprise Layer Manager (ELM).
   b) Import a gold OS image.
   c) Create a platform layer.
   d) Create application layers.
   e) In ELM, select the **Enable this App Layer for use with Studio App Packages** checkbox for each application layer you want to deliver.
2. Install an image including the Elastic Layering component on VDA machines. You can use one of the following ways:
   a) Deploy the image from ELM with Elastic Layering enabled.
   b) Install the VDA manually on the machine and select the Elastic Layering component during setup.

Install the Cloudpaging Player

1. Open an administrator command prompt on the VDA.
2. Go to the folder that contains the Cloudpaging Player installer.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Run the following command to install the player silently and configure the SaaS console URL. Replace the placeholder values as needed:

```
cloudpaging-player-setup-x64-release.exe /S /v"/qn ADDLOCAL=ALL
    REG_BASTOKENPATHORURL=https://your-tenant-url/api/token"
```

4. (Optional) Verify the configuration after installation by checking the following registry value:

   - **Path:** `HKEY_LOCAL_MACHINE\SOFTWARE\Numecent\StreamingCore\Settings\Launcher`
   - **Name:** `BaseTokenPathOrURL`
   - **Data:** The value must match the URL you specified during installation.

Deliver packaged applications

After you complete installing the prerequisites, do the following to deliver packages applications to your users:

1. Store application packages on network shares.
2. Upload application packages into your environment.
3. Add applications to delivery groups.
4. To enable automatic delivery of interdependent App-V packages, create isolation groups.

Store application packages on network shares After you set up the infrastructure, generate the application packages and store them in a network location, such as a UNC or SMB network share, or on an Azure File Share.

Detailed steps are as follows:

1. Generate application packages. See the Microsoft documentation: Creating and managing App-V virtualized applications for details.
2. Store application packages in a network location:

   - For **App-V Single Admin**: Store the packages and the corresponding Dynamic Configuration Files (App-V) on a UNC or SMB network share or on an Azure File Share.
   - For **App-V Dual Admin**: Publish the packages onto the App-V management server from a UNC path. (Publishing from HTTP URLs isn't supported.)
   - For **MSIX or MSIX app attach**: Store the packages on a UNC or SMB network share or on an Azure File Share.
   - For **FlexApp**: Store the packages on a UNC or SMB network share or an Azure File Share.
   - For **Elastic App**: Store the packages on a UNC or SMB network share or an Azure File Share.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For **Cloudpaging**: Store the packages on a UNC or SMB network share or an Azure File Share.

3. Make sure that the VDA has read permission on the package storage path:

   - If you store packages on a UNC or SMB network share in your AD domain, grant the VDA machine read permission to the storage path. To do so, you can give the machine's AD account read permission to the share explicitly, or include the account in an AD group that has that permission.
   - If you store packages on an Azure File Share, first grant a user account read permission to the storage path in Azure. Next, configure `ctxAppVService` running on the VDA machine to use that user account to access the package storage path. See the Change the user logon account for the detailed steps.

Change the user logon account Change the user logon account in the following two scenarios:

- To access packages on an Azure File Share using a linked AD account:
  - The connecting entity must be a user account, not a machine account, as Microsoft Entra ID doesn't grant read permissions to machine accounts on File Shares.
- If MSIX and MSIX AppAttach packages contain services:
  - The package must be published using a user account with administrative privileges on the local machine before it can be published to any non-administrative users. This is necessary for packaged services to be installed and packages can only be published to users, not machines, making the default LocalService account unsuitable.

The VDA calls `ctxAppVService` to access package storage paths and perform operations that require administrative privileges. By default, `ctxAppVService` runs under the context of the machine's LocalService account that authenticates to AD using the machine's identity and is not suitable for the preceding scenarios.

In either case, the service must be reconfigured to use an AD user account that has administrative privileges locally and has been granted read access to the storage location for the packages, be that an SMB share or an Azure File Share, as follows:

1. Start **Services**, right-click **ctxAppVService**, and then select **Properties**.
2. On the **Log on** tab, select **This account**:
   a) Enter a user account that has local administrative privileges and read permission to the package storage path
   b) Enter the user's password twice.
3. Click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Upload application packages into your environment After you store application packages to a network location as needed, upload them to your environment for delivery. Use either of the following methods as needed:

- Upload in bulk
- Upload one by one

Preparations Citrix Virtual Apps and Desktops uses a VDA machine to set up the connection to the network location for package discovery. Therefore, create a delivery group beforehand and make sure that at least one VDA in the group meets the following requirements:

- VDA version:
  - To discover App-V packages: 2203 or later
  - To discover MSIX and MSIX app attach packages: 2209 or later
  - To discover FlexApp packages: 2311 or later and the FlexApp Agent software
  - To discover ElasticApp packages: 2511 or later and the App Layering-enabled image
  - To discover Cloudpaging packages from the Cloudpager console: 2511 or later
  - To discover Cloudpaging packages from a network share: 2607 LTSR or later
- App Packages Delivery Component: Installed
- Permission on the package location: Read (See Store application packages on network shares for details.)
- Power: On
- State: Registered

Upload application packages in bulk Upload packages in a network location to your environment. Make sure that you have the following items ready before the upload:

- A delivery group that meets the Preparations requirements
- The network location path

To upload packages in bulk, follow these steps:

1. In the left pane, select **App packages**.
2. On the **Packeage discovery** tab, click the **Create discovery profile** button. The **Create discovery profile** page appears.
3. In the **Name** field, enter a descriptive name for the profile.
4. In the **Delivery group** field, click **Select a delivery group**. Next, select a delivery group that meets the requirements stated in Preparations and then click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. In the **Location type** field, select **Microsoft App-V server**, **Network share**, or **Numecent Cloudpager** based on where you store the packages, and then complete the corresponding settings:

   - If you selected **Microsoft App-V server**, enter the following information:
     - URL of the Management server. Example: `http://appv-server.example.com`
     - Login credentials of the management server administrator.
     - URL and port number of the publishing server. Example: `http://appv-server.example.com:3330`
   - If you selected **Network share**, specify the following information:
     - Enter the UNC path of the network share (Example: `\\Package-Server\apps\`). For *Elastic App packages*, enter the UNC path from the **System's Network File Share SMB path** in ELM.
     - Select the package types that you want to upload. Options include **App-V**, **MSIX**, **MSIX app attach**, **FlexApp**, **Elastic App**, and **Cloudpaging**.
     - Specify whether to search subfolders for packages.

       > **Note:**
       >
       > If you search for MSIX app attach packages on a folder structure containing `cim` images, ensure that you select the **Search** subfolders. Otherwise, the disks are not discovered correctly.

   - If you selected **Numecent Cloudpager** (which means Cloudpaging apps are stored on Cloud Pager Console), enter the following information:
     - Cloudpager Console URL. Example: `https://cloudpagerconsole.my.org`
     - PowerShell API key.
     - AppLauncher MSID.

6. Click **Create discovery profile**.

   The **Create discovery profile** page closes and the newly added profile appears in the profile list. Citrix Virtual Apps and Desktops uploads the packages to your environment using a VDA in the delivery group. After the upload completes, the Status field shows *Import successful*. The corresponding packages appear on the **Packages** tab.

   > **Note:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> To check for package updates in a source location and import them to your environment, select the location in the profile list and click **Check for Updates**.

Upload application packages one by one Upload an application package from a network share to your environment. Before the upload, make sure that you have the following items ready:

- A delivery group that meets the requirements stated in Preparations
- The network location path.

To upload a package to your environment, follow these steps:

1. In the left pane, select **App Packages**.
2. On the **Packages** tab, click the **Add Package** button. The **Add Package** page appears.
3. In the **Delivery group** field, click **Select a delivery group**. Next, select a delivery group that meets the requirements stated in Preparations, and then click **OK**.
4. In the **Package full path** field, enter a path as needed:
   - To upload several packages at a time, enter their full paths, separated by semicolons (`;`). Example: `\\Package-Server\apps\office365.appv;\\Package-Server\apps\skype.msix;\\Package-Server\apps\slack.vhd`
   - To upload all packages present on a network share, enter the storage path. Example: \package-Server\apps\
5. Click **Add Package**.

   The application package appears on the **Packages** tab.

Add applications to delivery groups After an application package is fully uploaded to your environment, add its applications to one or more delivery groups as needed. As a result, users associated with those delivery groups can access the applications.

> **Note:**
>
> - You can deliver packaged applications to single-session VDAs and multi-session VDAs through delivery groups.
> - By default, end users have access to all packaged applications assigned to the delivery groups associated with their *single-session* (or called *Desktop*) VDAs. To limit visibility of a packaged application on *desktop* VDAs to specific users or groups, go to the **Applications** node, select the application, and then select **Edit Application Properties > Limit Visibility** to make changes. See Limit visibility of applications

To add one or more applications in a package to several delivery groups, follow these steps:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. In the left pane, select **App Packages**.
2. On the **Packages** tab, select a package as needed.
3. In the action bar, click **Add Delivery Groups**. The **Assign Applications to Delivery Groups** page appears.
4. Select one or more applications in the package as needed, and then click **Next**.
5. In the list of delivery groups, select the groups to which you want to assign the applications, and then click **Next**.

   > **Note:**
   >
   > - If you selected an MSIX or MSIX app attach package, only delivery groups whose VDA version is 2106 or later are shown in the list.
   > - If you selected a *FlexApp* package, only delivery groups whose VDA version is 2402 or later appear in the list.
   > - If you selected a *Elastic App* package, only delivery groups whose VDA version is 2511 or later appear in the list.
   > - If you selected a *Cloudpaging* package, only delivery groups whose VDA version is 2511 or later appear in the list.

6. Click **Finish**.

To add applications in various packages to multiple delivery groups, follow these steps:

1. In the left pane, select **App Packages**.
2. On the **Applications** tab, select **Add Applications**.
3. On the **Groups** page, select one or more delivery groups as needed.
4. On the **Applications** page, select one or more application packages as follows:

   a) Click **Add** and then select **Application packages**.
   b) Select the type of package profile needed (for example, App-V Single Admin). All packages of this type appear.
   c) Select one or more packages as needed.
   d) Click **OK** and then **Next**.
   e) To add more applications of a different package type, repeat steps a through d.

5. Click **Finish**.

You can also add packaged applications to a delivery group when:

- Creating a delivery group. For more information, see Create delivery groups.
- Editing existing delivery groups or application groups. For more information, see Add applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

(Optional) Create isolation groups for App-V packages You can create isolation groups to enable the automatic delivery of interdependent App-V packages.

> **Note:**
>
> Isolation groups are supported for the App-V Single Admin method. If you're using the App-V Dual Admin method, you can achieve the same goal by creating *connection groups* in the Microsoft App-V infrastructure. For more information, see this Microsoft documentation article: About the connection group file.

About isolation groups An isolation group is a collection of interdependent application packages that must run in the same Windows Sandbox to create a virtual environment. Citrix App-V isolation groups are similar but not identical to App-V connection groups. An isolation group includes two types of packages:

- **Explicit application packages**: Applications with specific licensing requirements. You can restrict those applications to a specific range of users by adding them to delivery groups.
- **Automatic application packages**: Applications that are always available to all users regardless of whether they are added to delivery groups.

For example, the application app-a requires JRE 1.7 to run. You can create an isolation group that contains app-a (marked as *Explicit*) and JRE 1.7 (marked as *Automatic*). Next, add the App-V package for app-a to one or more delivery groups. When a user launches app-a, JRE 1.7 is automatically deployed with it.

When a user starts an App-V application marked as *Explicit* in an isolation group, Citrix Virtual Apps and Desktops checks the user's access permission to the application in delivery groups. If the user has permission to access the application, any *Automatic* application packages in the same isolation group are made available to the user.

You do not need to add the *Automatic* packages to any delivery group. If there's another *Explicit* application package in the isolation group, that package is made available to the user only if it is in the same delivery group.

Create an App-V isolation group Create an isolation group and add interdependent application packages to it. Detailed steps are as follows:

1. On the **Isolation Groups** tab, click **Add Isolation Group**.
2. Enter a name and description for the isolation group. All App-V Single Admin packages in your environment appear in the **Available Packages** list.
3. From the **Available Packages** list, select an application as needed, and then click the right arrow. The selected application appears in the **Packages in Isolation Group** list.
4. In the **Deployment** field, select **Explicit** or **Automatic** for the application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Repeat steps 2–3 to add more packages.
6. To adjust the order of packages in the list, click the up or down arrow.
7. Click **Save**.

> **Note:**
>
> Isolation Group configurations result in the creation of an App-V Connection Groups on the VDA. Deployment scenarios can become complex and the App-V client supports packages that are only in one active Connection Group at a time. We recommend that you avoid adding the same package to two different isolation groups that are added to the same delivery group.

Best practices

- To deploy App-V packages, enable the App-V subsystem on the VDA using the PowerShell command `Enable-AppV`.
- To deploy MSIX (and AppAttach) packages, the VDA must trust the certificates that the packages are signed with.
- On Windows Server 2019, enable sideloading to deploy MSIX packages. Sideloading is not needed for Windows 10, 11, Windows Server 2022, and 2025.
- App Attach has no implementation at all on Windows Server 2019 and is not currently supported by Microsoft (or Citrix by extension) on Windows Server 2022 or 2025.

Advanced

The following advanced topics provide additional configuration options and controls to fine-tune how packaged applications are discovered, updated, and delivered in Citrix Virtual Apps and Desktops beyond the basic app package workflow.

Automate packaged application publishing

You can use PowerShell commands to automate packaged application publishing:

On the Delivery Controller™, run the following PowerShell commands:

1. To load the commands present in the Package Discovery Module:

```
Import-Module "D:\Support\Tools\Scripts\Citrix.Cloud.AppLibrary.Admin.v1.psm1"
```

> **Note:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> The version of the package discovery module can be found on the Citrix Virtual Apps and Desktops ISO on the path mentioned in step 1.

2. The package discovery module must be from the ISO of a Citrix Virtual Apps and Desktops version that also supports the package type you are publishing, that is, 2311 or higher is needed for FlexAppOne Applications. We recommend using the latest available.
3. To retrieve the relevant delivery group IDs and packaged application IDs:

```
Get-BrokerDesktopGroup | Format-Table Uid, Name
Get-AppLibAppVApplication | Format-Table Uid, Name
```

4. To publish the packages and create the appropriate BrokerMachineConfigurations:

```
Publish-PackagedApplication -AppLibararyApplicationUid <
    AppLibararyApplication.Uid > -DesktopGroupUid <DesktopGroup.Uid
    >
```

5. To synchronize the Broker configurations, which are later sent out to the Broker agent on VDA:

```
Update-DesktopGroupMachineConfigurations -DesktopGroupUid <
    DesktopGroup.Uid>
```

> **Note:**
>
> Ensure to run the PowerShell command `Update-DesktopGroupMachineConfigurations` after you publish or remove packaged applications from a delivery group through the PowerShell command line. Otherwise information about the published applications is not sent to the VDA correctly and launches fail.

Limit visibility of applications

In a Citrix Virtual Apps and Desktops environment, when applications from packages are published to desktops, the system respects Active Directory (AD) user and group visibility settings for those applications. However, even if a user only has visibility to one application within a package, the entire package must be deployed to the Virtual Desktop (or Seamless App) Session since individual package components cannot be subdivided on the VDA. Additionally, before VDA version 2503, changes that reduce application visibility after the initial publishing won't result in a clean-up of previously published packages on subsequent desktop launches. Furthermore, other visibility layers, such as desktop versus workspace visibility, operate on top of these AD visibility assignments.

You can control whether packaged applications must appear in Workspace or are deployed to the users'VDI Desktop sessions. Once a packaged application has been published you can update the `PackagedApplicationVisibility` property on the `BrokerApplictaion` using the PowerShell command `Set-BrokerApplication -Name "MyApp"-PackagedApplicationVisibility "Workspace|Desktop|WorkspaceAndDesktop"`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The default value of `PackagedApplicationVisibility` is `WorkspaceAndDesktop`.

The value `Workspace`: app appears only in WorkspaceApp and is available for a seamless AppLaunch, but the app won't automatically be published to any desktop session that users start.

The value `Desktop`: hides the app's icon from WorkspaceApp making it unavailable for a seamless AppLaunch but the app can still be deployed to users'desktop sessions if users also have access to it through their AD Group settings.

> **Note:**
>
> Packaged Applications published to Single Session Static desktops are never available in Workspace App regardless of the value configured in this setting.

Migrate from App-V full infrastructure to Single Admin workflow

Microsoft App-V full infrastructure (Dual Admin) is approaching the end of life. To continue delivering App-V packages and other supported container formats, migrate to the Citrix Single Admin model.

The Single Admin model removes the dependency on the App-V Management and Publishing servers and centralizes package management in Studio.

Benefits of Single Admin model

Moving to the Single Admin workflow simplifies your architecture and streamlines package management.

Simplified architecture In the Single Admin model, the VDA retrieves packages directly from the file share. Citrix manages metadata, publishing, and isolation logic.

Feature	Full infrastructure (Dual Admin)	Single Admin (Citrix managed)
Management	App-V Management Console	Citrix Studio or Web Studio
Database	Required (SQL Server)	None (metadata stored in the Citrix site database)
Publishing	App-V Publishing Server	Citrix VDA (`ctxAppVService`)
Package source	UNC share (synchronized to Management Server)	UNC share, SMB share, or Azure Files
Logic	Connection Groups	Citrix Isolation Groups

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Strategic advantage By moving to Single Admin, you also eliminate the **Synchronization Lag**.

- In the Dual Admin model, you must synchronize the App-V Management Server, and then synchronize Studio.
- In the Single Admin model, when you update a package on the file share and select **Refresh** in Studio, the updated package is available at the next user logon.

Migration workflow

Follow these steps to move your existing App-V full infrastructure to the Citrix Single Admin workflow:

1. Step 1: Prepare the target environment
2. Step 2: Import packages into the Citrix library

Step 1: Prepare the target environment Before importing packages, ensure that your infrastructure and VDAs are ready to support the Single Admin model.

1. **Shared repository**

   a) Identify the UNC share that hosts your `.appv` packages.

   b) Ensure that VDA machine accounts (for example, Domain Computers) have **Read** access to both the share and NTFS permissions.

2. **VDAs**

   Ensure that all VDAs have the **App Packages Delivery Component** installed. To add this component after installation:

   a) Run the VDA installer.
   b) Select **Change** in **Programs and Features**.
   c) Add **App Packages Delivery Component**.

3. **XML configuration files**

   Move the `_DeploymentConfig.xml` and `_UserConfig.xml` files into the *same* folder as the corresponding `.appv` file.

   In the Single Admin model, the VDA reads configuration files from the package folder on the file share instead of from a central App-V database.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 2: Import packages into the Citrix library After you prepare the environment, import your existing App-V packages into the Citrix application library.

1. In Citrix Studio, go to **Configuration** > **App Packages**.
2. If you are fully migrating, remove any existing connections to the App-V Management Server.
3. Select **Add Package** and point it to the UNC path of your package.
4. Citrix scans the folder and imports package names, versions, and application IDs into the Citrix application library.

After import, you can assign applications to delivery groups as needed.

> **Note:**
>
> **vPrefer Policy (Optional)**: If you want applications to launch on the local VDA instead of redirecting to a remote server, enable the **vPrefer** GPO on your VDAs.

Troubleshoot App-V applications (Single Admin model)

If App-V packages (in the Single Admin model) fail to launch or don't appear in the user session, use the following guidance to identify and resolve common issues.

Issue	Description	Solution
Package discovery and "Failed to catalog" errors	When you add a package in Studio, an error indicates that the file cannot be accessed or that the metadata is invalid.	1. Verify permissions. Ensure that the Delivery Controller machine account (for example, `DOMAIN\DDC01$`) has **Read** permissions on both the share and NTFS levels of the UNC path that hosts the package. 2. Check XML integrity. Ensure that the `.appv` file and the `DeploymentConfig.xml` file have the same file name prefix and are located in the same folder.
Application fails to launch (error code: 0x80070005 or 0x80040154)	The user clicks the application icon and the **Citrix splash** screen appears, but the application does not open.	1. Verify the VDA component. Ensure that the **App Packages Delivery Component** is installed on the VDA. Confirm that the following file exists: `C:\Program Files\Citrix\AppV\AppDeliveryService.exe` 2. Check VDA permissions. Because the VDA pulls the package from the file share, the VDA machine account (for example, `DOMAIN\VDA-VR01$`) must have **Read** access to the UNC path.
Isolation group conflicts	A plugin, such as an Excel add-in, cannot see its parent application.	1. In Studio, go to **App Packages** > **Isolation Groups**. 2. Ensure that both packages are added to the same isolation group. In the Single Admin model, the App-V client on the VDA manages the virtual connection of 3. Validate the App-V client

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Issue	Description	Solution
Slow initial launch (buffering)	The first launch of a large App-V package, such as AutoCAD or ArcGIS, takes several minutes.	1. On the VDA, check the following registry: `HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\AppV\Client\Streaming` 2. Set `Autoload` to 2 (auto-load all previously used packages) to improve subsequent launch performance. 3. Check network performance. Ensure that SMB signing or antivirus scanning on the network share isn't limiting transfer speed.

Useful PowerShell commands (run on the VDA)

To verify whether Citrix successfully delivered the package to the VDA, run the following commands in a PowerShell window:

Command	Purpose
`Get-AppvClientPackage`	Displays all App-V packages currently cached or published to the VDA.
`Get-CtxAppvPackage`	Displays the packages managed by the Citrix agent.
`Start-Service ctxAppVService`	Restarts the Citrix App-V orchestration service.

Universal Windows Platform Apps

May 15, 2026

For information about Universal Windows Platform (UWP) apps, see the following Microsoft documentation:

- What's a Universal Windows Platform (UWP) app?
- Windows Package Manager

Requirements and limitations

Citrix Virtual Apps and Desktops™ supports the use of UWP apps with VDAs on the following Windows machines:

- Windows 10 and later versions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Windows Server 2016 and later versions

VDAs must be minimum version 7.11.

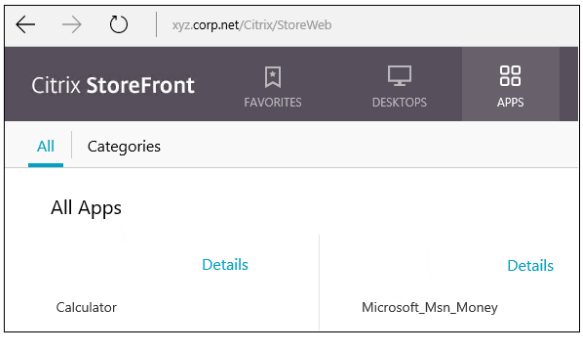
The following Citrix Virtual Apps and Desktops™ features are either not supported or limited when using UWP apps:

- File type association is not supported.
- Local App Access is not supported.
- Dynamic preview: If apps running in the session overlap, the preview shows the default icon. The Win32 APIs used for Dynamic Preview are not supported in UWP apps.
- Action Center remoting: UWP apps can use the Action Center for displaying the messages in the session. These messages are currently not redirected to the endpoint to be displayed to the user.

Launching UWP apps and non-UWP apps from the same server is not supported. Instead, place UWP apps and non-UWP apps in separate delivery groups or application groups.

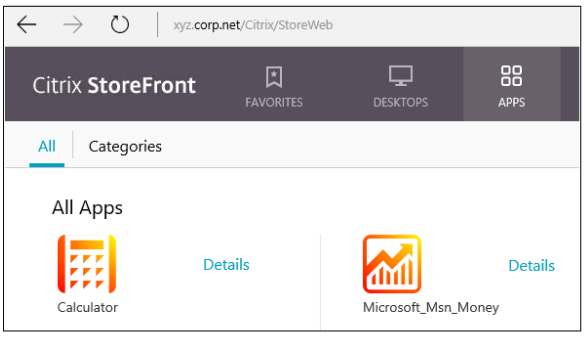
Because all UWP apps installed on the machine are enumerated, Citrix® recommends disabling user access to the Windows Store. This precludes the UWP apps installed by one user from being accessed by a different user.

During sideloading, the UWP app is installed on the machine and is available for use by other users. When another user launches the app, then it is installed, and the OS updates its AppX database to indicate "as installed"by that user.



A graceful logoff started from a published UWP app that was launched in a fixed or seamless window might prevent the VDA session from closing and forcibly log off the user. When this occurs, several processes remaining in the VDA session prevent it from properly closing. To resolve this, determine which process is preventing the VDA session from closing, and then add it to the "LogoffCheckSysModules"registry key value, following the guidance in CTX891671.

Application Display Names and Descriptions for UWP apps might not have correct names. Edit and correct these properties when adding the applications to the delivery group.



Check Known issues for any additional issues.

Currently, several UWP apps have white icons with transparency enabled, which results in the icon not being visible against the white background of the StoreFront display. To avoid this issue, you can change the background. For example, on the StoreFront machine, edit the file `C:\inetpub\wwwroot\Citrix\StoreWeb\custom\style.css`. At the end of the file, add `.storeapp-icon { background-image: radial-gradient( circle at top right, yellow, red ); }`. The following graphic illustrates the before-and-after for this example.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Before

After

On Windows Server 2016 and later versions, the Server Manager might also launch when a UWP app is launched. To prevent this from occurring, you can disable Server Manager from auto-starting during logon with the `HKLM\Software\Microsoft\ServerManager\DoNotOpenServerManagerAtLogon` registry key. For details, see https://blogs.technet.microsoft.com/rmilne/2014/05/30/how-to-hide-server-manager-at-logon/.

Install and publish UWP apps

Support for UWP apps is enabled by default.

To install one or more UWP apps on VDAs (or a master image), use one of the following methods:

- Complete an offline install from the Windows Store for Business, using a tool such as Deployment Image Servicing and Management (DISM) to deploy the apps to the desktop image. For more information, see Windows Package Manager.
- Sideload the apps. For more information, see Sideload line of business (LOB) apps in Windows client devices.
- Install the UWP apps for each intended user directly from the Windows Store for Business.

To add (publish) one or more UWP apps in Citrix Virtual Apps or Citrix Virtual Desktops™:

1. After the UWP apps are installed on the machine, add the UWP apps to a delivery group or application group. You can do this when you create a group, or later. On the **Applications** page, in the **Add** menu, select **From Start menu**.
2. When the applications list appears, select the UWP apps you want to publish.
3. Continue with the wizard or close the edit dialog.

To disable the use of Universal Apps on a VDA, add the registry setting **EnableUWASeamlessSupport** in `HKLM\Software\Citrix\VirtualDesktopAgent\FeatureToggle` and set to **0**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Uninstall UWP apps

When you uninstall a UWP app with a command such as `Remove-AppXPackage`, the item is uninstalled only for administrators. To remove the app from the machines of users who may have launched and used the app, run the removal command on each machine. You cannot uninstall the AppX package from all users' machines with one command.

Backup or Migrate your configuration

May 13, 2026

This feature helps you take a backup of your configurations. Backup along with the restore feature facilitates the migration of site information from on-premises to the cloud or from one cloud site to another with ease. It also facilitates immediate rebounding of a site in times of emergencies.

You can use the following methods to take backups:

1. Backup + Restore
    a) Integrated with Web Studio.
2. Automated Configuration Tool (ACT)
    a) Powershell-based tool. Install the tool to use it. See Download Automated Configuration.

The backups can be used for:

1. Restoration
2. Migration

Citrix® recommends the following tools for the described scenarios.

Backup

Environment	Use Case	Recommended Tool	Special Considerations	Link
DaaS and on-premises	On-demand and scheduled backups	Backup + Restore	Citrix keeps the backup and the user can download it if needed	Backup and Restore using Web Studio

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Environment	Use Case	Recommended Tool	Special Considerations	Link
DaaS and on-premises	On-demand and scheduled backups	ACT	User keeps the backup	Backup and Restore using Automated Configuration Tool

Migration

Environment	Use Case	Recommended Tool	Special Considerations	Link
On-premise to cloud	Migrate one on-premises site to DaaS	ACT		Migrate from on-premises to cloud
	Consolidate multiple on-premises sites to one DaaS site	ACT	Site merging	Merge multiple on-premises sites to a single cloud site
On-premise to on-premise	Migrate one on-premises site to another on-premises site	ACT		POC Guide:Automated Configuration Tool-On-premises to On-premises migration
	Consolidate multiple on-premises sites to another on-premise site	ACT	Site merging	POC Guide:Automated Configuration Tool On-premises to On-premises migration Merge multiple on-premises sites to a single cloud site

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Environment	Use Case	Recommended Tool	Special Considerations	Link
Cloud to cloud	Migrate one DaaS site to another DaaS site	ACT		Migrate from cloud to cloud
Consolidate multiple DaaS sites to one DaaS site	Site merging	ACT		Migrate from cloud to cloud Migrate multiple on-premises sites to a single cloud site

Backup and Restore configuration

May 13, 2026

This feature allows administrators to take a backup of your cloud configurations. It ensures that there is always a copy of your Citrix® configurations available, ready to be used. Backup along with the restore feature facilitates the migration of site information from on-premises to the cloud or from one cloud site to another with ease. If accidental changes arise, choose a backup, and select restore, and with a few clicks, you're up and running again. You can also choose to backup and restore specific components.

The feature allows you to back up and restore the following:

- Tags
- AdminRoles
- AdminScopes
- HostConnections

  > **Note:**
  >
  > You can now backup host connections. Secrets must be entered each time. A pre-import check mode is performed to only ask secrets for those host connections that are imported or updated.

- StoreFront™

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Delivery groups
- ApplicationGroups
- Applications
- AppVIsolationGroups
- AppLibPackageDiscovery
- GroupPolicies
- UserZonePreference
- Manually provisioned or PVS provisioned machine catalogs
- Admin folders
    - Application folders
    - Delivery group folders
    - Machine catalog folders
- SiteSettings

> **Important:**
>
> - Make sure that you follow the order of the list to restore different components. For example, if you want to restore Applications, Delivery groups, and Group policies, you must follow the order:
>   - Delivery groups
>   - Applications
>   - Group policies
> - You cannot back up or restore MCS machine catalogs.

Type of backups

Use the following options to perform backups according to your requirements:

- **On-demand**: Backs up site configurations in real time. This action backs up the current Citrix Cloud™ site configurations.
- **Scheduled**: Backs up site configurations at scheduled intervals. This recurs at the intervals mentioned.

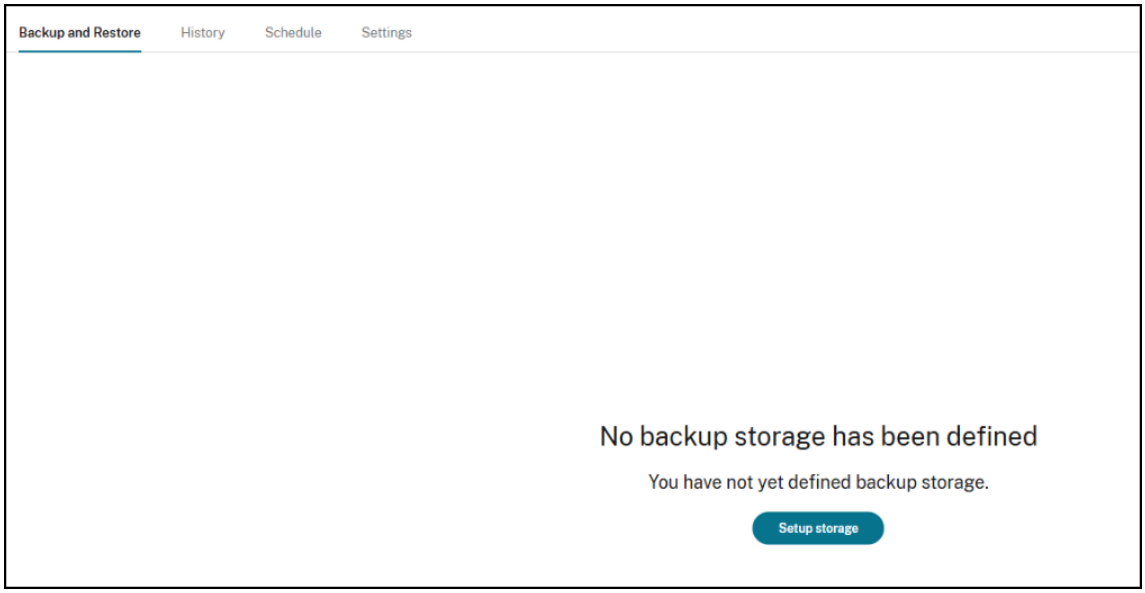
> **Note:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> Only administrators with full rights and cloud administrators can do on-demand or scheduled backups and restoration.

Backup and Restore using Web Studio

May 13, 2026



This article describes the actions that you can perform on the **Backup and Restore** node available in the left pane of your console.

Backup and Restore allows the administrator to take backups from the Web Studio.

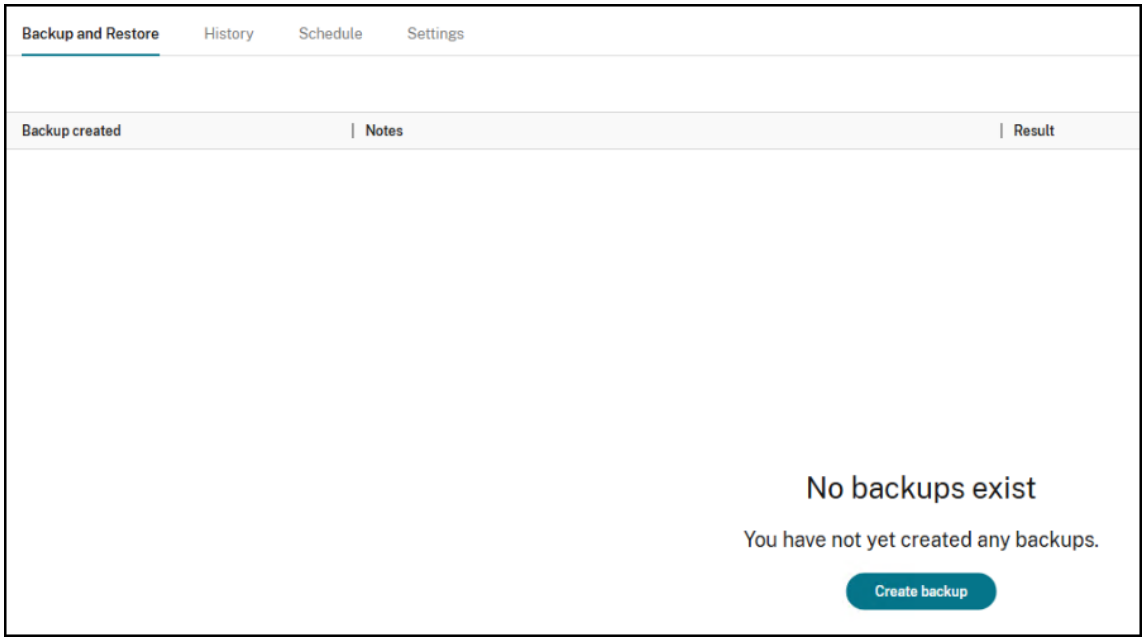
Set up storage location

Before creating backups, you must set up a storage location to store backups.

1. From Web Studio, click **Manage**.
2. From the left-menu, select **Backup+Restore**.
3. Within the **Backup and Restore** tab, click **Setup storage**.

4. From the drop-down list, select a **Storage type**. The Storage type can be a File Storage or an Azure Storage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



> **Note:**
>
> - The location must be accessible to all Delivery Controllers.
> - If access to the folder requires a username and password, make sure that corporate password policies do not limit the lifespan of the password.

5. Select the following:
   - Maximum backups
   - Maximum pinned backups
   - Maximum auto-pinned backups
6. Click **Save** to save the storage location or **Save and create backup** to save the storage location and create backups.

After you set up a storage location, you can create backups.

Create on-demand backups

1. From Web Studio, click **Manage**.
2. From the left-menu, select **Backup and Restore**.
3. If the storage location is set up but no backup exists, you are prompted to create a backup.

   If there are existing backups, you can click **Create backup**.
4. On the **Create backup** page, enter the notes, and click **Create backup**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A summary activity is displayed showing the backup components being backed up in the admin's name who triggers the back up.

5. After the backup completes successfully, it is listed as a line item under the **Backup and Restore** tab.
6. Select a particular backup to see more information on the backup in the **Details** tab.
7. To delete a backup, right-click a backup and click **Delete backup**.

Pin a backup

Citrix® stores the last 30 backups. When you create more than 30 backups, the system deletes old backups in the order they were created. For every new backup that is created in addition to the 30 backup limit, the system deletes the backup that was created first. Pin backup is used to prevent automatic deletion of a particular backup. You can pin up to 5 backups. In case there are pinned backups, we retain all pinned backups in addition to 30 backups that is at most, you can retain 35 backups –30 non-pinned, and 5 pinned backups.

1. Right-click a backup to pin.

Create scheduled backups

Create a backup schedule that aligns with your organization's requirements to automate your backup and restore processes. Backups operate in the background at a frequency that you select (daily, weekly, monthly, or other suitable frequency).

1. Go to the schedule tab and select **Create Schedule**.
2. On the **Create schedule** page, enter the following:
    - **Enable this schedule**: Choose **yes** to enable this backup schedule.
    - **Name**: Enter a name for the backup schedule.
    - **Description**: Enter a description.
    - **Time zone**: Select the time zone of your choice.
    - **Frequency**: Select the frequency to run the backup.
    - **Repeats every**: Enter the number of days after which the schedule must be repeated.
    - **Start date**: Enter the start date.
    - **Begin backup at**: Enter the time when you want the backup to begin in a 24-hour format.
3. Select **Done**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Limit scheduled backups

You can limit scheduled backups to one per day to avoid identical backups.

1. Go to the **Settings** tab of the **Backup and Restore** node.
2. Click **Change** in **Scheduled backups** box.
3. Switch the toggle to enable limit scheduled backups to one per day.

Auto-pin scheduled backups

Auto-Pin scheduled backups automatically pins backups created by the selected schedule. Only one schedule can be selected for auto-pinning.

Using auto-pin scheduled backups you can retain a maximum of six scheduled backups. When the maximum limit is reached, the oldest auto-pinned backup is deleted.

> **Note:**
>
> Citrix stores up to six auto-pinned backups. The system deletes old backups in the order that they were created after the sixth backup. For every new backup that is created in addition to the six backup limit, the system deletes the backup that was created first.

1. Go to the **Settings** tab of the **Backup and Restore** node.
2. Select a scheduled backup for auto-pinning.
3. Switch the toggle to enable auto-pinned schedules.
4. Select a schedule and click **Save**.

Edit backup storage

You can edit the backup storage settings to change the storage type and location, maximum backups, maximum pinned backups, and maximum auto-pinned backups.

1. Go to the **Settings** tab of the **Backup and Restore** node.
2. Click **Change** in **Storage** box.
3. Change the storage settings in the **Edit backup storage** dialog.

Restore

This feature allows the administrators to restore the site configurations from the backups. We allow you to restore one component at a time.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - Restoring only one component at a time ensures that there are no conflicts during restoration due to the dependencies between the components.
> - The workflow for restoring host connections is different from other components as you would need to enter the secret every time you try to restore the host connection. After you click **Restore Backup**, you must see a dialog to enter the secret. For example, in Azure, enter the alphanumeric application secret used to create the connection.

1. From Web Studio, click **Manage**.
2. From the left menu, select **Backup and Restore**.
3. Click a specific backup from the list.
4. Click **Restore Backup**.
5. On the **Restore Backup** window, enter the following:

    - **Components**: Select the components that you want to restore.
    - **Filters**: Specify the member names that you want to restore in a comma-separated list. For example, filtering for the word *chrome* restores only objects with the name chrome. Similarly, the phrase `chr` restores objects beginning with `chr`.

      To view the component members, select a backup and navigate to **Detail > Components**. Select a component and click **View component members**.
    - **Check mode**: Choose **yes** to confirm what must be restored when an actual restore operation is done. This option pre-evaluates everything needed for a restore without actually triggering one. For example, it displays the list of applications that will be restored when the restore process is run for the applications component.

      > **Note:**
      >
      > Check mode does not run the actual restore. This option also does not check for any dependencies between the components. For optimal results, we recommend using the check mode on one component at a time.

    - **Restore type**: Choose either one:

        - **Missing only**: Use this restore type to add components and members to a site. This option does not change the existing components and members even if the backup being restored has different configurations.
        - **Missing and updating existing**: Use this restore type to add and update components to a site. This option updates the existing components and members with the configurations of the backup if both have different configurations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Notes**: Enter any notes.

6. Select **Restore**.

The restore results are listed in the **Restore** window after the restore action is completed. All restore actions are listed under the **History** tab.

History

You can track all the backup and restore actions in the **History** tab.

Under **Actions**, you can see all deleted backup and backup history.

To view details about a backup:

1. Go to the **History** tab.
2. Select a backup action and click **View details**.

The backup results give you the following details:

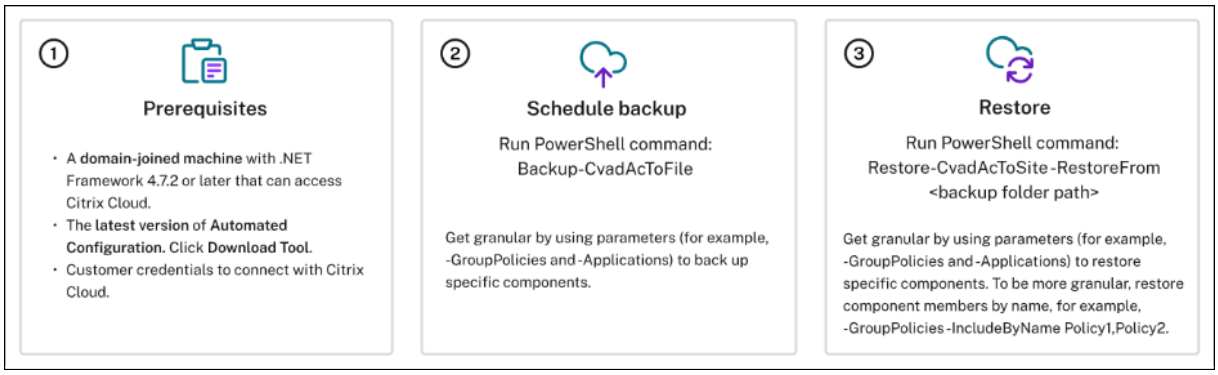
- Duration
- Notes
- Administrator name
- Components backed up

Use the search bar on the top right corner of the **History** page to search for a specific backup. For example: you can search for backups taken by a particular admin or taken on a particular day.

Backup and Restore using the Automated Configuration tool

May 15, 2026

Automated Configuration tool allows you to take on-demand and scheduled backups in the following environments:



- Citrix Virtual Apps and Desktops™
- DaaS

Automated Configuration tool can be used for the following:

- Backup and restore (on-demand and scheduled backups)
- Migration (on-demand backups)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Automated Configuration tool for migration

Citrix Virtual Apps and Desktops™

Prerequisites for backing up your configurations

- All versions of Citrix Virtual Apps and Desktops.
- A machine to run Auto Config. This device can be either:
  - A delivery controller™
  - A domain joined machine with .NET Framework 4.7.2 or later and the Citrix PowerShell SDK. For Citrix PowerShell, you must install Web Studio.

Back up

1. Install Automated Configuration. For more information, see Download Automated Configuration.
2. Double-click **Auto-Config**.
3. On the PowerShell window, run the command `Backup-CvadAcToFile` to export all components. Exporting your on-premises configuration does not modify it.

After you run the command for the first time, the process creates a folder with the `.yml` configuration files at the following location:
`%HOMEPATH%\Documents\Citrix\AutoConfig`.

The folder contains the backup files from the recent export, and each previous backup is stored in a subfolder.

Restore

1. Double-click **Auto-Config**.
2. Run the following command to do the restore:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Restore-CvadAcToSite -Environment OnPrem -RestoreFolder <folder
    path of the backup files>
```

3. After you run the command, verify the state of the export, and the log folder is available at: `%HOMEPATH%\Documents\Citrix\AutoConfig`.
4. If there are any errors or exceptions, see the **Fixups** section in the log file.

DaaS

Prerequisites for backing up your configurations

- A DaaS environment with an active resource location and Connector installed.
- Connectivity to sites accessing Citrix Cloud. For more information, see System and Connectivity Requirements.

> **Note**
>
> You cannot backup MCS from the cloud using Automated Configuration.

Back up Backs up the following files:

- The `CustomerInfo.yml` file with your customer ID, client ID, and secret key information. For more information on the process to retrieve your customer ID, client ID, and secret key, see Generating the customer ID, client ID, and secret key. For information on how to add this information to the `CustomerInfo.yml` file, see Populating customer info file.
- The `ZoneMapping.yml` file with information that maps your resource locations in the cloud. For more information on how to map your zones, see the Populating zone mapping file.
- The `CvadAcSecurity.yml` file with information on host connections.

1. Install Automated Configuration. For more information, Install Automated Configuration.

> **Note**
>
> For DaaS backups, install the Automated Configuration on a machine with Internet access and to which the administrator has direct access as well.

1. Double-click **Auto Config**.
2. On the PowerShell window, run the following command to take a backup: `Export-CvadAcToFile`

After you run the command for the first time, the process creates a folder with the .yml configuration files at the following location:
`%HOMEPATH%\Documents\Citrix\AutoConfig`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The folder contains the backup files from the recent export, and each previous backup is stored in a subfolder.

Restore

1. Double-click the **Auto Config**.
2. On the PowerShell window, run the following command to do the restore:

```
Restore-CvadAcToSite -RestoreFolder <folder path of the backup
    files>
```

3. After you run the command, verify the state of the export, and you can locate the log folder at `%HOMEPATH%\Documents\Citrix\AutoConfig`.
4. If there are any errors or exceptions, see the **Fixups** section in the log file.

Granular migration

> **Note**
>
> For more information on the component migration order, see Component Migration Order.

Restore entire components To restore a component, you must select one or more parameters.

For example, to restore the entire delivery group and machine catalog components, run the following command:

```
Restore-CvadAcToSite -RestoreFolder %HOMEPATH%\Documents\Citrix\
    AutoConfig/Backup_yyyy_mm_dd_hh_mm_ss -DeliveryGroups -
    MachineCatalogs
```

Restore component members To restore one or more component members, use the `IncludeByName` feature. You must invoke the `Restore` cmdlet with the `Restorefolder` parameter along with the selected component, and the inclusion list.

For example, to restore two group policies from a backup:

```
Restore-CvadAcToSite -RestoreFolder %HOMEPATH%\Documents\Citrix\
    AutoConfig/Backup_yyyy_mm_dd_hh_mm_ss -GroupPolicies -IncludeByName
    Policy1,Policy2
```

Restore complete cloud site configuration To restore all the components or the entire cloud site, run the following command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Restore-CvadAcToSite -RestoreFolder %HOMEPATH%\Documents\Citrix\
    AutoConfig/Backup_yyyy_mm_dd_hh_mm_ss
```

Automated Configuration tool for backup and restore

The Automated Configuration tool commands trigger the backup and restore APIs that Web Studio uses.

The `BckRstr` cmdlets log to console. Folders with logging information are not created in `\Documents\Citrix\AutoConfig`.

> **Note:**
>
> The prerequisites for backing up your configurations in Citrix Virtual Apps and Desktops and Citrix DaaS™ is same as Automated Configuration tool in the PowerShell session.

Backup

For starting a new backup action on the Delivery Controller, run `New-BckRstrBackup` on the PowerShell window.

Restore

For restoring members from a single component from an existing backup, run `Restore-BckRstrBackups` on the PowerShell window.

For the complete list of commands, see Automated configuration tool cmdlets for backup and restore.

Best practices for backup and restore

May 13, 2026

This article provides several recommendations that can help in better planning of backup and restore.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Best Practice
Scheduling backups	Set up a default backup schedule, which can run at a daily, weekly, or monthly frequency based on how frequently you expect your site configuration to change. Set this default schedule for a less active window, possibly weekends, or midnight. For information on scheduled backups. See Create scheduled backups. If you have multiple backup schedules defined that might run on the same day, then use the **Settings** tab on the **Backup and Restore** node to reset the limit to one backup per day.
Managing backups	Always pin golden copy backups so that they are retained when the 30 backup limit is reached. Right-click a backup to pin the selected backup.

FAQ

Can custom admins do backup and restore?

No. Backup and restore functionality is limited to administrators with full rights.

Can we backup selective components?

No. Currently, the on-demand and scheduled backups back up the entire site configuration. Components have several dependencies and pre-requisites. To ensure proper resolution of these dependencies, you can back up components in entirety. You can however, restore selective components.

Can we download backups?

Currently, use ACT to download backups. You can download ACT from Automated Configuration for Virtual Apps and Desktops.

Can we backup and restore MCS catalogs?

Currently, we cannot backup and restore MCS catalogs. You can use ACT to back up your MCS catalogs and import them into another site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Migrate configuration to Citrix Cloud™

May 15, 2026

Automated Configuration Tool (ACT) allows migration of Citrix Virtual Apps and Desktops™ configuration (policies, applications, catalogs, admin roles, scopes, and others) from one or more on-premises sites to Citrix DaaS hosted on Citrix Cloud. It can also be used to migrate information between different Cloud regions or tenants.

This tool discovers and exports one or more on-premises sites as a collection of configuration files, which you can optionally edit. These files' configuration can then be imported into Citrix DaaS.
The migration is done in stages by running the tool multiple times, allowing you to easily achieve the desired configuration state.

ACT isn't just a one and done migration tool. You can use it to manage your day-to-day cloud operations such as:

- Automating the transfer from test or stage cloud accounts to production cloud accounts
- Backing up and restoring your configuration
- Splitting one cloud environment into multiple clouds

The following *2-minute* video provides a quick tour of Automated Configuration.

This is an embedded video. Click the link to watch the video

For additional information on Automated Configuration, see Proof of Concept: Automated Configuration Tool on Tech Zone.

For a deeper look into moving your deployment and readying your on-premises configuration for migration, see Deployment Guide: Migrating Citrix Virtual Apps and Desktops from on-premises to Citrix Cloud on Tech Zone.

Known limitations

- Machine catalogs provisioned through Machine Creation Services™ have special considerations. For more information on MCS, see Understand migrating Machine Creation Services provisioned catalogs.

Prerequisites for migrating your configuration

For *exporting* your configuration from Citrix Virtual Apps and Desktops™, you need:

- Citrix Virtual Apps and Desktops: current release and its immediate predecessor or Citrix Virtual Apps and Desktops, XenApp and XenDesktop® LTSRs: all versions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A domain-joined machine with .NET Framework 4.7.2 or later and the Citrix PowerShell SDK. This is automatically installed on the Delivery Controller. (To run on machine other than the on-premises Delivery Controller, Citrix Studio must be installed, as Studio installs the correct PowerShell snap-ins. The Studio installer can be found on the Citrix Virtual Apps and Desktops installation media.)

For *importing* your configuration into Citrix DaaS, you need:

- A machine with access to Citrix Cloud. This does not have to be a Delivery Controller™ or a domain-joined machine.
- Citrix DaaS provisioned.
- An active resource location with Connector installed and domain-joined to the same domain as the on-premises setup.
- Connectivity to sites accessing Citrix Cloud must be allowed and available. For more information, see System and Connectivity Requirements.

> **Note:**
>
> Automated Configuration cannot be installed on a Cloud Connector system.

Key steps

1. Download the Automated Configuration Tool and review the system requirements. See Download Automated Configuration.
2. Populate the `CustomerInfo.yml` file with your `CustomerName`, `CustomerID`, and `SecretKey` values generated from the Citrix Cloud portal. See Generate the customer ID, client ID, and secret key and Populate the customer info file.
3. If the on-premises site contains multiple zones, update the `ZoneMapping.yml` file to map zones to Citrix DaaS resource locations. See Populate zone mapping file.
4. If the site contains multiple hosting connections, update the `CvadAcSecurity.yml` file with the connection information for each host type migrating into Citrix DaaS. If only a single host connection, update the `CvadACSecurity.yml` file with the connection information for the host connection. See Update the security file for host connections.
5. Open ACT and export your on-premises site using the `Export-CvadAcToFile` command. See Supported migration objects for the list of components supported for migration. For information on the steps to export, see Export on-premises configuration.
6. Import components in stages using the `Merge-CvadAcToSite` command. Alternatively, migrate the entire site at once. Ensure you migrate components in the order listed in Component migration order. For information on the steps to import, see Run an import.
7. Activate the cloud site. See Activate sites.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Download Automated Configuration

Download and install the Automated Configuration tool from Citrix Downloads.

Upgrade Automated Configuration

To prevent errors in functionality, always use the latest available version of ACT.

To know about your tool version, do the following:

1. Double-click the **Auto Config** icon. A PowerShell window appears.
2. Run the following command to check your version number.

```
1 Get-CvadAcStatus
```

3. Check your tool version against the version listed in Citrix Downloads. The latest version of the tool is located there.
4. Download and install the latest version of the tool. You do *not* need to uninstall the old version to upgrade Automated Configuration.

> **Note:**
>
> When you run cmdlets to access the cloud in Automated Configuration, the tool alerts you when there is a newer version available for download. For more information on cmdlets, see Automated Configuration tool cmdlets.

Generate the customer ID, client ID, and secret key

To migrate the on-premises site to Citrix DaaS, populate the `CustomerInfo.yml` file with the customer ID, client ID, and secret key from Citrix Cloud portal.

To retrieve the Customer ID:

1. Sign into your Citrix Cloud account and select the customer.
2. Click the grid icon and select **Identity and Access Management**.
3. Navigate to **API access > Secure clients**. The customer Id is displayed on the page.

To retrieve the Client ID and Secret Key:

1. On the **Secure clients** page, enter a name in the box. This name is used to differentiate between multiple client IDs and secret keys.
2. Click Create Client to create the client ID and the secret key.
3. Copy the client ID and secret key to a secure location and download the `.csv` file containing this information. Use the `.csv` file to populate the `CustomerInfo.yml` file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - The client ID and secret key do not expire. If they are compromised, immediately remove them by using the **Trash** icon and create new ones.
> - The secret key cannot be retrieved if it is lost or forgotten; a new client ID and secret key must be created.

Populate customer info file

The `CustomerInfo.yml` file eliminates the need to provide customer information parameters every time while running the cmdlet. Any of the customer information can be overridden by using cmdlet parameters.

Use `New-CvadAcCustomerInfoFile` cmdlet to create the `CustomerInfo.yml` file.

> **Important:**
>
> Do not manually edit the `CustomerInfo.yml` file. Doing so can cause inadvertent formatting errors.

The `New-CvadAcCustomerInfoFile` cmdlet has the following required parameters.

- CustomerId: customer's ID.
- ClientId: customer's client ID created on Citrix Cloud.
- Secret: customer's secret created on Citrix Cloud.

Example:

```
New-CvadAcCustomerInfoFile -CustomerId markhof123 -ClientId 6813EEA6-46
    CC-4F8A-BC71-539F2DAC5984 -Secret TwBLaaaaaaaaaaaaaaaaw==
```

You can also create the `CustomerInfo.yml` using the `SecurityCsvFileSpec` parameter that points to the downloaded `security.csv` file. You must also specify the CustomerId.

```
New-CvadAcCustomerInfoFile -SecurityCsvFileSpec C:\Users\my_user_name\
    downloads/security.csv -CustomerId markhof123
```

Use `Set-CvadAcCustomerInfoFile` cmdlet to update the `CustomerInfo.yml` file. This cmdlet only changes the Client ID.

```
Set-CvadAcCustomerInfoFile -ClientId C80487EE-7113-49F8-85DD-2
    CFE30CC398E
```

The following is a sample CustomerInfo.yml file.

```
            # Created/Updated on 2020/01/29 16:46:47
            CustomerId: 'markhof123'
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            ClientId: '6713FEA6-46CC-4F8A-BC71-539F2DDK5384'
            Secret: 'TwBLaaabbbaaaaaaaaaaw=='
            Environment: Production
            AltRootUrl: ''
            StopOnError: False
            AlternateFolder: ''
            Locale: 'en-us'
            Editor: 'C:\Program Files\Notepad++\notepad++.exe'
            Confirm: True
            DisplayLog: True
```

Populate zone mapping file

An on-premises zone is the equivalent of the cloud resource location. Unlike other site components, you cannot import the on-premises zone to the cloud automatically. Instead, it must be manually mapped using the `ZoneMapping.yml` file. Import failures can occur if the zone name is not associated with an existing resource location name.

If the on-premises sites have only one zone and cloud sites have only one resource location, the Automated Configuration tool makes the correct association, eliminating the need to manually manage the `ZoneMapping.yml` file.

However, if the on-premises sites have multiple zones or cloud sites have multiple resource locations, then manually update the `ZoneMapping.yml` file to reflect the correct mapping of on-premises zones to cloud resource locations.

The `ZoneMapping.yml` file is located in `%HOMEPATH%\Documents\Citrix\AutoConfig`. The content of the `.yml` file is a dictionary with the zone name as the key and the resource location name as the value.

For example, an on-premises Citrix Virtual Apps and Desktops site with a primary zone called "Zone-1" and a secondary zone called "Zone-2"is migrated to a Citrix DaaS deployment with two newly created cloud resource locations called "Cloud-RL-1"and "Cloud-RL-2". In this instance, the ZoneMapping.yml would be configured as follows:

```
            Zone-1: Cloud-RL-1

            Zone-2: Cloud-RL-2
```

> **Note:**
>
> Add a space between the colon and resource location name. If spaces are used in the zone or resource location name, enclose the name with quotes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update the security file for host connections

Host connections and their associated hypervisors can be exported and imported using ACT.

Adding a hypervisor to a host connection requires security information specific to the type of hypervisor. This information cannot be exported from the on-premises site for security considerations. You must manually provide the information so that Automated Configuration can successfully import host connections and hypervisors to the cloud site.

The export process creates the `CvadAcSecurity.yml` file in `%HOMEPATH%\Documents\Citrix\AutoConfig` containing placeholders for each security item needed for the specific hypervisor type. You must update the `CvadAcSecurity.yml` file before importing into the cloud site. Administrator updates are retained over multiple exports with new security placeholders added as needed. Security items are never removed. For more information, see Manually update the CvadAcSecurity.yml file

```
HostConn1:
ConnectionType: XenServer®
UserName: root
PasswordKey: rootPassword
HostCon2:
ConnectionType: AWS
ApiKey: 78AB6083-EF60-4D26-B2L5-BZ35X00DA5CH
SecretKey: TwBLaaaaaaaaaaaaaaaaw==
Region: East
```

Per-hypervisor security information

The following lists the security information required for each hypervisor type.

- XenServer, Hyper-V, VMware
  - User Name
  - Clear-text Password
- Microsoft Azure
  - Subscription ID
  - Application ID
  - Application Secret
- AWS
  - Service Account ID
  - Application Secret
  - Region

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Special security considerations

All security information is entered as clear text. If clear text is not recommended, the host connections and associated hypervisors can be manually created using **Studio**. The host connections and hypervisor names must match their on-premises counterparts exactly so that machine catalogs that use the host connections can be successfully imported.

Export your Citrix Virtual Apps and Desktops on-premises configuration

Using an `export` PowerShell command, you can export your existing on-premises configuration and obtain the necessary `.yml` files. These files are used to import your desired configuration into Citrix Cloud.

Supported migration objects

Automated Configuration supports moving the configuration of the following components:

- Tags
- Delegated Admin
    - Scopes
    - Roles
- Host Connections
    - A Single Resource Pool
    - Admin Scopes
- Machine Catalogs
    - Admin Scopes
    - Machines
    - Remote PC Access, Physical, Pooled, Provisioned, MCS, Assigned
- StoreFront™
- Delivery Groups
    - Access Policy
    - Admin Scope Association
    - Application Access Policy
    - Assignment Policy
    - Entitlement/Desktop Policy
    - Power Schedules
    - Session Lingering

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Session Prelaunch
    - Reboot Schedules
    - Tags
- Application Groups
    - Admin Scope Association
    - Delivery Groups
    - Users and Groups
- Applications
    - Application Folders
    - Icons
    - Applications
    - Broker Configured FTAs
    - Tags
- Group Policies
- User Zone Preferences

Export on-premises configuration

1. Double-click the **Auto Config** icon. A PowerShell window appears.
2. Run the following command to export all components. Exporting your on-premises configuration does *not* change it in any way.

```
Export-CvadAcToFile
```

After you run any cmdlet for the first time, an export folder with the `.yml` configuration files and logs is created. The folder is at `%HOMEPATH%\Documents\Citrix\AutoConfig`. Each successive export creates a subfolder. The parent folder `%HOMEPATH%\Documents\Citrix\AutoConfig` always contains the exported files from the most recent export.

> **Note:**
>
> If Automated Configuration is not installed on the Delivery Controller, run `import-module Citrix.AutoConfig.Commands` before using the tool through PowerShell. This step is not needed if you open Automated Configuration using the **Auto Config** icon.

If you encounter any errors or exceptions, see the **Fixups** section in the log file.

Import your configuration to Citrix DaaS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> - When migrating an on-premises deployment to cloud, make sure that the domain and OU GPOs that contain the Citrix settings are migrated to cloud. Citrix Web Studio™ does not support GPMC and hence, the domain and OU GPOs are not visible in the Web Studio. The Citrix policy engine enforces the domain and OU GPOs on VDAs and users that are in the domains and OUs. Post log in to a VDA, a user might see that the policies from the domain and OU GPOs are applied to their session. However, administrators cannot see these policies and settings which might lead to confusions.

Component migration order

The components and their dependencies are listed here. A component's dependencies must be in place before it can be imported or merged. If a dependency is missing, it can cause the import or merge command to fail. The **Fixups** section of the log file shows missing dependencies if an import or merge fails.

1. Tags
    - No pre-dependencies
2. Delegated Admin
    - No pre-dependencies
3. Host Connections
    - Security Information in CvadAcSecurity.yml
4. Machine Catalogs
    - Machines present in Active Directory
    - Host Connections
    - Tags
5. StoreFront
6. Delivery Groups
    - Machines present in Active Directory
    - Users present in Active Directory
    - Machine Catalogs
    - Tags
7. Application Groups
    - Delivery Groups

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Tags

8. Applications
    - Delivery Groups
    - Application Groups
    - Tags
9. Group Policies
    - Delivery Groups
    - Tags
10. User Zone Preferences

Run an import

1. Double-click the **Auto Config** icon. A PowerShell window appears.
2. Run the following command to import all components.

```
Merge-CvadAcToSite
```

Verify the expected state with the new current state. Various import options control whether the import results are identical or a subset of the on-premises site.

After you run the cmdlet, an export folder with the `.yml` configuration files and logs is created. The folder is at `%HOMEPATH%\Documents\Citrix\AutoConfig`.

If you encounter any errors or exceptions, see the **Fixups** section in the log file.

> **Note:**
>
> If Automated Configuration is not installed on the Delivery Controller, run `import-module Citrix.AutoConfig.Commands` before using the tool through PowerShell. This step is not needed if you open Automated Configuration using the **Auto Config** icon.

To revert to your original Citrix DaaS configuration, see Backing up your Citrix DaaS configuration.

Understand import operation

The import process is designed to accurately perform updates, only perform needed updates and verify that all updates have been correctly made. The steps are followed in all import operations:

1. Read the exported .yml file (expected state).
2. Read the cloud (current state).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Back up the pre-import cloud state to .yml files (pre-backup can be restored if necessary).
4. Evaluate the differences between the expected and current state. This determines which updates to make.
5. Make the updates.
6. Reread the cloud (new current state).
7. Back up the post-import cloud state to .yml files (post-backup can be restored if necessary).
8. Compare the new current state with the expected state.
9. Report the results of the comparison.

Granular migration

> **Important:**
>
> For more information on component migration order, see Component migration order.

You can selectively migrate components only or even component names only.

- Component parameters supported include `MachineCatalogs`, `Tags`, and more.
- Component name parameters supported include `IncludeByName` and `ExcludeByName` parameters, and others.

For more information on parameters and how to use them, see Granular migration parameters.

Activate sites

The delivery controller in both on-premises and cloud sites controls resources such as brokering desktops, applications, and rebooting machines. Problems occur when a common set of resources is controlled by two or more sites. Such a situation can occur when migrating from an on-premises site to a cloud site. It is possible for both the on-premises and cloud delivery controllers to manage the same set of resources. Such dual management can lead to resources becoming unavailable and unmanageable, and can be difficult to diagnose.

Site activation allows you to control where the active site is controlled.

Site activation is managed using the delivery group maintenance mode. Delivery groups are placed in maintenance mode when the site is inactive. Maintenance mode is removed from delivery groups for sites that are active.

Site activation does not affect or manage VDA registration or machine catalogs.

- `Set-CvadAcSiteActiveStateCloud`
- `Set-CvadAcSiteActiveStateOnPrem`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

All cmdlets support the `IncludeByName` and `ExcludeByName` filtering. This parameter allows you to select which delivery groups can have their maintenance mode changed. Delivery groups can be selectively changed as needed.

Import and transferring control to the cloud

The following is a high-level description on how to import and transfer control from the on-prem site to the cloud site.

1. Export and import the on-premises site to the cloud. Make sure the `–SiteActive` parameter is not present on any of the import cmdlets. The on-premises site is active and the cloud site inactive. By default, cloud site delivery groups are in maintenance mode.
2. Verify the cloud content and configuration.
3. During off hours, set the on-premises site to inactive. The `–SiteActive` parameter must be absent. All on-premises site delivery groups are in maintenance mode.
    - `Set-CvadAcSiteActiveStateOnPrem`
4. Set the cloud site to active. The `–SiteActive` parameter must be present. No cloud site delivery groups are in maintenance mode.
    - `Set-CvadAcSiteActiveStateCloud –SiteActive`
5. Verify that the cloud site is active and the on-premises site is inactive.

Transfer control back to the on-premises site

To transfer control from the cloud site to the on-premises site:

1. During off hours, set the cloud site to inactive. All cloud site delivery groups are in maintenance mode.
    - `Set-CvadAcSiteActiveStateCloud`
2. Set the on-premises site to active. No on-prem site delivery groups are in maintenance mode.
    - `Set-CvadAcSiteActiveStateOnPrem -SiteActive`

Additional site activation information

- If no machines are power managed and there are no reboot schedules (which usually means there are no host connections either) all cloud delivery groups can be imported as active. Add `-SiteActive` to `Merge-CvadAcToSite`/`Import-CvadAcToSite` or run `Set-CvadAcSiteActiveStateCloud -SiteActive` after importing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If machines are power managed or there are reboot schedules, a different process is needed. For example, when switching from on-premises to cloud in this situation, set the on-premises site to inactive using `Set-CvadAcSiteActiveStateOnPrem`. Then, set the cloud site to active using `Set-CvadAcSiteActiveStateCloud -SiteActive`.
- The `Set-CvadAcSiteActiveStateCloud` and `Set-CvadAcSiteActiveStateOnPrem` cmdlets are also used to reverse the process. For example, run `Set-CvadAcSiteActiveStateCloud` without the `-SiteActive` parameter, then run `Set-CvadAcSiteActiveStateOnPrem` with the `-SiteActive` parameter.

Understand migrating Machine Creation Services provisioned catalogs

> **Note:**
>
> This feature is available only on versions 3.0 and later. Check your version by using `Get-CvadAcStatus` within Automated Configuration.

Machine Creation Services (MCS) catalogs create two different types of catalogs:

- When changes made to a machine are lost or reversed (Commonly Server OS, where applications are published) –this is a pooled VDI / multi-session use case
- When changes made to a machine are preserved across reboot (Commonly client OS with a dedicated user) –this is a static VDI use case

The type of catalog can be confirmed in the catalog node in Citrix Studio and looking at the "User data:"value of the catalog.

> **Note:**
>
> MCS cannot be backed up from the cloud using Automated Configuration.

Pooled VDI / multi-session catalogs

Catalogs with "User data: Discard"are pooled VDI catalogs and can only migrate the main image and configuration. Any virtual machines in these catalogs are not migrated. This is because the life cycle of the virtual machine is maintained by the site you are importing from, which means every time the machines are turned on, its state might change. This makes import impossible as the import data for the virtual machines quickly gets of out of sync.

When you are migrating these catalogs using the tool, it creates catalog metadata and initiates main image creation, but no machines are imported.

Since this process can take some time to be created based on the size of the main image, the import command within the tool only starts the MCS catalog creation and does not wait for it to finish. After

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the import has completed, monitor the catalog creation progress using Studio in the cloud deployment.

Once the main image is created, you can provision machines. Consider the capacity considerations because you would have capacity consumed from your on-premises usage.

All other objects (delivery groups, applications, policies, and so forth) that use that catalog can be imported and do not have to wait for the main image creation. When the catalog has finished creating, machines can be added to the imported catalog and then users can launch their resources.

> **Note:**
>
> Use the same commands available within the tool to migrate catalogs and all other objects.

Static VDI catalogs

> **Note:**
>
> Since this operation imports low-level details that are stored in the database, this process must be run from a machine with database access.

The static VDI catalogs migrate the main image, configurations, and all virtual machines. Unlike the pooled VDI use case, no images need to be created.

The VDAs must be pointed to the connector for them to register with the cloud.

Refer to the Activating sites section to make the cloud site active, so that the reboot schedule, power management, and other items are controlled by the cloud.

Once the migration is completed, if you want to delete this catalog from your on-premises site, you must select **leave VM and AD account**. Otherwise, they are deleted and the cloud site would be left pointing to the deleted VM.

Update MCS tags to detect orphaned resources after migration

After you migrate from on-premises configuration to a cloud site, or from your cloud configuration to another cloud site, you must update the MCS site id tags in case of persistent VMs so that orphaned resources can be detected correctly. To do this, use the PowerShell command `Set-ProvResourceTags`. Currently, this feature is applicable to Azure.

The detailed steps are as follows:

1. Update the MCS site id tags from the new Citrix site using the PowerShell command `Set-ProvResourceTags`. For example:

```
Set-ProvResourceTags -ProvisioningSchemeUid xxxxx  [-VMName <
    String>] [-VMBatchSize XX] [-ResourceType XX]
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Or,

```
Set-ProvResourceTags -ProvisioningSchemeName xxxxx  [-VMName <
    String>] [-VMBatchSize XX] [-ResourceType XX]
```

The parameter details are as follows:

- `ProvisioningSchemeUid` or `ProvisioningSchemeName` is a mandatory parameter.
- `VMName` is an optional parameter. If no `VMName` is specified, tags of all the VMs of this machine catalog are updated.
- `VMBatchSize` is an optional parameter to divide all VMs into batches. If no `VMBatchSize` is specified, the default value (10) is applied. The range is from 1 through 60.
- `ResourceType` can be one of the following:
  - `MachineCatalog`: For updating tags of machine catalog resources.
  - `VirtualMachine`: For updating tags of VM related resources.
  - `All`: (default ResourceType): For updating tags of both machine catalog and VM related resources.

Merging multiple sites into a single site

May 13, 2026

Multi-site support for Automated Configuration provides a method to merge multiple on-premises sites into a single cloud site.

Multi-site support adds unique prefixes and suffixes to component names on a per on-premises-site basis, ensuring name uniqueness after multiple on-premises sites are merged to a single cloud site.

Prefixes and suffixes can be assigned for each of the following components on a per-on-premises-site basis.

- `AdminScope`
- `AdminRole`
- `ApplicationAdmin`
- `ApplicationFolder`
- `ApplicationGroup`
- `ApplicationUser`
- `DeliveryGroup`
- `GroupPolicy`
- `HostConnection`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- MachineCatalog
- StoreFront™
- Tag

Application folders support prefixing, suffixing, and rerooting. Rerooting adds an extra top level folder to an application's existing folder structure.

Prefixing and suffixing rules

1. Prefixes and suffixes cannot contain any of the following special characters: `\ , / ; : # . * ? = < > | ( )"' { } [ ]`
2. Prefixes and suffixes can contain trailing spaces but not leading spaces.
3. Prefixes and suffixes must be double quoted to contain trailing spaces.
4. Prefixes and suffixes are applied at the time of import, merge, and add. The source .yml files are never modified.
5. The prefix and suffix process automatically prefixes or suffixes dependent component names when applicable. For example, if machine catalog names are prefixed with "East,"delivery groups referencing them are also prefixed with "East."
6. If a component name already begins with the prefix or suffix, no prefix or suffix is added. Component names cannot contain double identical prefixes or suffixes.
7. Prefixes and suffixes can be individually used or used in combination.
8. Use of a prefix or a suffix on a component is optional.

> **Note:**
>
> Studio displays components in alphabetical order.

Group components by site

Use prefixing to visually group components from a single site. Each site is listed in its own group with prefixing alphabetically controlling the ordering of different site groups.

Group components by name

Use suffixing to visually group like-named components from multiple sites. Like-named components from different sites visually alternate.

Prefix and suffix mapping file

Site prefixing begins with the SiteMerging.yml file that contains the site prefix and suffix mapping for one or more on-premises sites. You can manage the SiteMerging.yml file manually, or by using the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

available cmdlets listed at the Merging multiple on-premises sites cmdlets section.

Export on-premises site

Merging cannot begin until you have exported an on-premises site. To export an on-premises site, see Export on-premises configuration..

Central export target folder

The methods described in this section place multiple site exports into a central file share location. The `SiteMerging.yml` file, `CustomerInfo.yml` file, and all export files reside in that file share location, allowing you to do the import from one location independent of the on-premises sites.

Cloud-accessing operations never reference the on-premises sites or Active Directory, therefore allowing you to do cloud-accessing operations from anywhere.

Direct file share

There are two methods to do this:

- Direct file share: To import, merge, or add from the direct file share, you must decide from which machine you want to do the cloud accessing operation.
- File share reference using `SiteMerging.yml`: This method uses the `SiteRootFolder` member of the site's prefixes set and reduces the odds of targeting the wrong folder when exporting, importing, merging, or adding.

If you do not use a central file share method, then do the import, merge, or add from the individual Delivery Controllers. Create and replicate the `SiteMerging.yml` file on each Delivery Controller being migrated into the cloud. The default location is `%HOMEPATH%\Documents\Citrix\AutoConfig`. You must specify the `-SiteName` parameter to select the correct site prefixes.

Direct file share

The export, import, merge, and new/add operations provide a parameter to target or source a folder other than the default folder, *%HOMEPATH%\Documents\Citrix\AutoConfig*. The following examples use a central file share located at `\\share.central.net` that the admin already has access to, having provided credentials as needed.

To target the export to a site-specific folder, use the `-TargetFolder` parameter:

From the East Delivery Controller™::

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
mkdir \\share.central.net\AutoConfig\SiteEast

Export-CvadAcToFile –TargetFolder \\share.central.net\AutoConfig\
SiteEast
```

From the West Delivery Controller::

```
mkdir \\share.central.net\AutoConfig\SiteWest

Export-CvadAcToFile –TargetFolder \\share.central.net\AutoConfig\
SiteWest
```

After the exports are complete, create the `CustomerInfo.yml` and `SiteMerging.yml` files and place them in `\\share.central.net\AutoConfig`.

> **Note:**
>
> Do not use the `SiteRootFolder` parameter when creating the `SitePrefixes.yml` when using this direct file share reference method.

To import, merge, or add from the direct file share, you must decide from which machine you want to do the cloud accessing operation. Options include:

- One of the on-premises Delivery Controllers where the tool is already installed.
- The machine hosting the file share.
- A different machine.

Automated Configuration must be installed on the machine accessing the cloud. Neither the on-premises PowerShell SDK, Delivery Controllers, nor Active Directory are used, so the cloud accessing execution requirements are simpler than the export requirements.

To merge the East Delivery Controllers to the cloud:

```
Merge-CvadAcToSite –SiteName East –SourceFolder \\share.central.
net\AutoConfig\SiteEast -CustomerInfoFileSpec \\share.central.net\
AutoConfig\CustomerInfo.yml
```

To merge the West Delivery Controllers to the cloud:

```
Merge-CvadAcToSite –SiteName West –SourceFolder \\share.central.
net\AutoConfig\SiteWest -CustomerInfoFileSpec \\share.central.net\
AutoConfig\CustomerInfo.yml
```

The following is a sample `SitePrefixes.yml` file used in the previous example.

```
1         East:
2           SiteRootFolder: "" # Important: leave this empty
3           AdminScopePrefix: "East_"
4           AdminRolePrefix: "East_"
5           ApplicationAdminPrefix: "East_"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
6           ApplicationFolderPrefix: "" # Note that a new parent root
               folder is used instead
7           ApplicationFolderRoot: "East"
8           ApplicationGroupPrefix: "East_"
9           ApplicationUserPrefix: "East_"
10          DeliveryGroupPrefix: "East_"
11          GroupPolicyPrefix: "East_"
12          HostConnectionPrefix: "East_"
13          MachineCatalogPrefix: "East_"
14          StoreFrontPrefix: "East_"
15          TagPrefix: "East_"
16          AdminScopeSuffix: "_east"
17          AdminRoleSuffix: "_east"
18          ApplicationAdminSuffix: "_east"
19          ApplicationFolderSuffix: "_east"
20          ApplicationGroupSuffix: "_east"
21          ApplicationUserSuffix: "_east"
22          DeliveryGroupSuffix: "_east"
23          GroupPolicySuffix: "_east"
24          HostConnectionSuffix: "_east"
25          MachineCatalogSuffix: "_east"
26          StoreFrontSuffix: "_east"
27          TagSuffix: "_east"
28        West:
29          SiteRootFolder: "" # Important: leave this empty
30          AdminScopePrefix: "Western "
31          AdminRolePrefix: "Western "
32          ApplicationAdminPrefix: "Western "
33          ApplicationFolderPrefix: "" # Note that a new parent root
               folder is used instead
34          ApplicationFolderRoot: "Western"
35          ApplicationGroupPrefix: "Western "
36          ApplicationUserPrefix: "Western "
37          DeliveryGroupPrefix: "Western "
38          GroupPolicyPrefix: "Western "
39          HostConnectionPrefix: "Western "
40          MachineCatalogPrefix: "Western "
41          StoreFrontPrefix: "Western "
42          TagPrefix: "Western "
43          AdminScopeSuffix: ""
44          AdminRoleSuffix: ""
45          ApplicationAdminSuffix: ""
46          ApplicationFolderSuffix: ""
47          ApplicationGroupSuffix: ""
48          ApplicationUserSuffix: ""
49          DeliveryGroupSuffix: ""
50          GroupPolicySuffix: ""
51          HostConnectionSuffix: ""
52          MachineCatalogSuffix: ""
53          StoreFrontSuffix: ""
54          TagSuffix: ""
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

File share reference using SiteMerging.yml

This method uses the `SiteRootFolder` member of the site's prefixes set. While more involved than the direct file share method, this method reduces the odds of targeting the wrong folder when exporting, importing, merging, or adding.

First, set the `SiteRootFolder` for each site in the SiteMerging.yml file. You must do this on the shared location.

```
New-CvadAcSiteMergingInfo –SiteName East –SiteRootFolder \\share.
central.net\AutoConfig\SiteEast -SitePrefixesFolder \\share.central.
net\AutoConfig
```

```
New-CvadAcSiteMergingInfo –SiteName West –SiteRootFolder SiteWest -
SitePrefixesFolder \\share.central.net\AutoConfig
```

In this example, East is a fully qualified folder specification and West is a relative folder specification.

To target the export to a site-specific folder using the SiteMerging.yml file:

From the East Delivery Controller:

```
mkdir \\share.central.net\AutoConfig\SiteEast
```

```
Export-CvadAcToFile -SiteName East -CustomerInfoFileSpec \\share.
central.net\AutoConfig\CustomerInfo.yml
```

From the West Delivery Controller:

```
mkdir \\share.central.net\AutoConfig\SiteWest
```

```
Export-CvadAcToFile -SiteName West -CustomerInfoFileSpec \\share.
central.net\AutoConfig\CustomerInfo.yml
```

The export cmdlet uses the `CustomerInfo.yml` folder location to locate the `SiteMerging.yml` file. In the case of East, the `SiteRootFolder` is fully qualified. It is used as-is. In the case of West, the `SiteRootFolder` is not fully qualified. It is combined with the `CustomerInfo.yml` folder location to retrieve a fully qualified folder location for West.

To merge the East Delivery Controller to the cloud:

```
Merge-CvadAcToSite –SiteName East -CustomerInfoFileSpec \\share.
central.net\AutoConfig\CustomerInfo.yml
```

To merge the West Delivery Controller to the cloud:

```
Merge-CvadAcToSite –SiteName West -CustomerInfoFileSpec \\share.
central.net\AutoConfig\CustomerInfo.yml
```

The following is a sample `SitePrefixes.yml` file used in the previous example.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            East:
            SiteRootFolder: "\\\\share.central.net\\AutoConfig\\SiteEast"
            AdminScopePrefix: "East_"
            AdminRolePrefix: "East_"
            ApplicationAdminPrefix: "East_"
            ApplicationFolderPrefix: "" # Note that a new parent root
               folder is used instead
            ApplicationFolderRoot: "East"
            ApplicationGroupPrefix: "East_"
            ApplicationUserPrefix: "East_"
            DeliveryGroupPrefix: "East_"
            GroupPolicyPrefix: "East_"
            HostConnectionPrefix: "East_"
            MachineCatalogPrefix: "East_"
            StoreFrontPrefix: "East_"
            TagPrefix: "East_"
            AdminScopeSuffix: "_east"
            AdminRoleSuffix: "_east"
            ApplicationAdminSuffix: "_east"
            ApplicationFolderSuffix: "_east"
            ApplicationGroupSuffix: "_east"
            ApplicationUserSuffix: "_east"
            DeliveryGroupSuffix: "_east"
            GroupPolicySuffix: "_east"
            HostConnectionSuffix: "_east"
            MachineCatalogSuffix: "_east"
            StoreFrontSuffix: "_east"
            TagSuffix: "_east"
          West:
            SiteRootFolder: "\\\\share.central.net\\AutoConfig\\SiteWest"
            AdminScopePrefix: "Western "
            AdminRolePrefix: "Western "
            ApplicationAdminPrefix: "Western "
            ApplicationFolderPrefix: "" # Note that a new parent root
               folder is used instead
            ApplicationFolderRoot: "Western"
            ApplicationGroupPrefix: "Western "
            ApplicationUserPrefix: "Western "
            DeliveryGroupPrefix: "Western "
            GroupPolicyPrefix: "Western "
            HostConnectionPrefix: "Western "
            MachineCatalogPrefix: "Western "
            StoreFrontPrefix: "Western "
            TagPrefix: "Western "
            AdminScopeSuffix: ""
            AdminRoleSuffix: ""
            ApplicationAdminSuffix: ""
            ApplicationFolderSuffix: ""
            ApplicationGroupSuffix: ""
            ApplicationUserSuffix: ""
            DeliveryGroupSuffix: ""
            GroupPolicySuffix: ""
            HostConnectionSuffix: ""
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
52            MachineCatalogSuffix: ""
53            StoreFrontSuffix: ""
54            TagSuffix: ""
```

If a central file share method is not used and the import, merge, or add is done from the individual Delivery Controllers, then create and replicate the `SiteMerging.yml` file on each Delivery Controller being migrated into the cloud. The default location is *%HOMEPATH%\Documents\Citrix\AutoConfig*. You must specify the `–SiteName` parameter to select the correct site prefixes.

Merge the sites

Citrix® recommends performing the cloud operations in steps and to do a complete review of each result before doing the next cloud operation. For example, if merging three sites to a single cloud site:

1. Merge the initial site to the cloud using the appropriate `SiteName` value.
2. Review the results in Studio.
3. If the results are incorrect, determine the issue and its cause, correct it, and then rerun the merge. If necessary, remove the cloud components and start from scratch by using `Remove-CvadAcFromSite` for the selected component and members. If the results are correct, continue.
4. If the initial merge is correct, merge the second site to the single cloud site.
5. Repeat steps 2 and 3.
6. If the second merge is correct, merge the third site to the single cloud site.
7. Repeat steps 2 and 3.
8. Review the resources from the user's perspective and verify that the view is in the desired state.

Remove a component using the site prefix

You can selectively remove single site components by using the prefix on the `–IncludeByName` parameter of the `Remove-CvadAcFromSite` cmdlet. In the following example, the West Delivery Controller delivery groups are not correct. To remove the delivery groups for just the West site:

`Remove-CvadAcFromSite –DeliveryGroups –IncludeByName "Western *"`

To remove all West components, run the following cmdlets in order.

1. `Remove-CvadAcFromSite –GroupPolicies –IncludeByName "Western *"`
2. `Remove-CvadAcFromSite –Applications –IncludeByName "Western *"`
3. `Remove-CvadAcFromSite – ApplicationGroups –IncludeByName "Western *"`

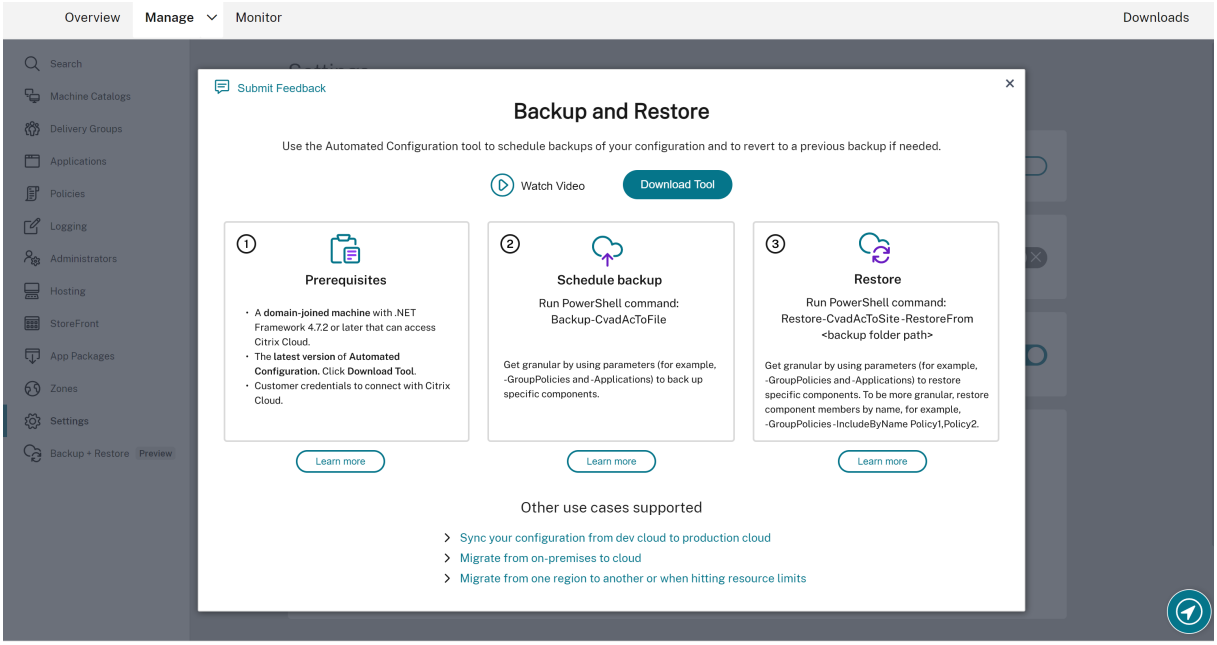
© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. `Remove-CvadAcFromSite –DeliveryGroups –IncludeByName “Western *”`
5. `Remove-CvadAcFromSite –MachineCatalogs –IncludeByName “Western *”`
6. `Remove-CvadAcFromSite –HostConnections –IncludeByName “Western *”`
7. `Remove-CvadAcFromSite –Tags –IncludeByName “Western *”`

To remove group policies of the East components, use the suffix:

```
Remove-CvadAcFromSite –GroupPolicies –IncludeByName “*_east”
```

Migrating from cloud to cloud



May 13, 2026

Automated Configuration allows you to automate moving your cloud configuration to another cloud site or allowing you to restore your own cloud site.

Using Automated Configuration can solve many use cases:

- Syncing your site from test or stage to production
- Backing up and restoring your configuration
- Reaching resource limits
- Migrating from one region to another

In Studio on Citrix Cloud™, see the Backup and Restore node for information about Automated Configuration and how it can be used to migrate your configuration from cloud to cloud.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prerequisites for migrating your configuration

For backing up and restoring your configuration, you need:

- Citrix DaaS™ provisioned.
- An active resource location with Connector installed.
- Connectivity to sites accessing Citrix Cloud must be allowed and available. For more information, see System and Connectivity Requirements.

> **Note:**
>
> MCS cannot be backed up from the cloud using Automated Configuration.

Back up your Citrix DaaS configuration

Requirements

Do the following before backing up your Citrix DaaS configuration:

1. Populate the `CustomerInfo.yml` file with your customer ID, client ID, and the secret key information included. For more information on how to retrieve your customer ID, client ID and secret key, see Generate the customer ID, client ID, and secret key. For information on how to add this information to the `CustomerInfo.yml` file, see Populate customer info file.

When you run the backup commands, the `CustomerInfo.yml` must have the details of the source site customer from where you are taking the backup.

When you run the restore commands, the `CustomerInfo.yml` must have the details of the destination site customer to where you are restoring the configurations.

1. Populate the `ZoneMapping.yml` file with information that maps your resource locations in the cloud. For more information on how to map your zones, see Populate zone mapping file.
2. If you have host connections, you must input the corresponding information in the `CvadAcSecurity.yml` file. See Update the security file for host connections

Steps to back up your Citrix DaaS configuration

1. Install Automated Configuration.

> **Note:**
>
> For cloud-to-cloud migration, Automated Configuration can be installed on a machine having access to the internet that the administrator has direct access to.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Double-click the **Auto Config** icon. A PowerShell window appears.
3. Run the following command to do a backup.

```
Backup-CvadAcToFile
```

After you run any cmdlet for the first time, an export folder with the `.yml` configuration files and logs is created. The folder is at `%HOMEPATH%\Documents\Citrix\AutoConfig`.

If you encounter any errors or exceptions, see the **Fixups** section in the log file.

Restore your configuration to Citrix DaaS

1. Double-click the **Auto Config** icon. A PowerShell window appears.
2. Run the following command to do a restore.

```
Restore-CvadAcToSite -RestoreFolder <folder path of the backup
    files>
```

Verify the expected state with the new current state.

After you run the cmdlet, an export folder with the `.yml` configuration files and logs is created. The folder is at *%HOMEPATH%\Documents\Citrix\AutoConfig*.

If you encounter any errors or exceptions, see the **Fixups** section in the log file.

The backup and restore process protects you from unintentional cloud site configuration changes or corruption. While Automated Configuration makes backups each time a change is made, this backup reflects the state of the cloud site configuration before the changes. Protecting yourself requires that you periodically back up your cloud site configuration and saving it in a safe place. If an undesirable change or corruption takes place, the backup can be used to fix the change or corruption at either a granular or full site configuration level.

Granular migration

> **Important:**
>
> For more information on component migration orders, see Component migration order.

Restore all components

Restoring one component involves selecting one or more component parameters.

To restore the:

- entire delivery group and machine catalog components

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- full cloud site configuration

follow this example:

```
Restore-CvadAcToSite   -RestoreFolder   %HOMEPATH%\Documents\Citrix\
   AutoConfig/Backup_yyyy_mm_dd_hh_mm_ss
```

Restore component members

Restoring one or more component members uses the `IncludeByName` feature. The `Restore` cmdlet is invoked with the `RestoreFolder` parameter along with the selected single component and the inclusion list.

To restore two group policies from a backup, follow this example:

```
Restore-CvadAcToSite   -RestoreFolder   %HOMEPATH%\Documents\Citrix\
   AutoConfig/Backup_yyyy_mm_dd_hh_mm_ss

-GroupPolicies -IncludeByName   Policy1,Policy2

-DeliveryGroups -MachineCatalogs
```

Activate sites

Site activation allows you to control which site is active and controls your resources. For more information, see Activate sites.

Migrate Cloud configurations to on-premises

May 15, 2026

This article describes backing up and migrating your Cloud configurations to on-premises sites.

Prerequisites for migrating your configuration

- Citrix Virtual Apps and Desktops™ on-premises environment with at least one registered VDA.
- Citrix Virtual Apps and Desktops™ on-premises environment running on one of the following versions:
  - The most recent Long-Term Service Release (LTSR) version - 2402.
  - Any of the Current Releases (CR) versions - 2308, 2311.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Run the Automated Configuration tool (ACT) commands on a domain-joined machine with .Net 4.7.2 version or higher.
- A machine with the Citrix PowerShell SDK. PowerShell SDK is available within the Citrix Delivery Controller™ installable.

> **Note:**
>
> - If you are running the ACT on a different machine, it must be domain-joined and Studio must have the correct PowerShell snap-ins installed. To get the installer, go to Citrix Virtual Apps and Desktopsdownloads website.
> - In the on-premises site, we recommend ACT be installed on the Delivery Controller. ACT can be started via the desktop icon.
> - If ACT is intended to be used from the standard Powershell window then the following command must be executed:
>
> ```
> Import-Module Citrix.AutoConfig.Commands
> ```

ACT is not part of the system PowerShell path so must be explicitly imported

Key steps

Follow the instructions to complete the migration of your Cloud configurations to on-premises:

1. Backup Cloud configuration
2. Modify YML files
3. Import configurations to on-premises

Backup Cloud configuration

1. Install the **Automated Configuration**.
2. Run `New-CvadAcCustomerInfoFile` to create a **CustomerInfo.yml** file. For more information, see Populate customer info file..
3. Run the command `Backup-CvadAcToFile` to take a backup of your Cloud configurations.

   > **Note:**
   >
   > - After you run any cmdlet for the first time, an export folder with the .yml configuration files and logs is created. The folder is at `%HOMEPATH%\Documents\Citrix\AutoConfig`.
   > - If you encounter any errors or exceptions, see the **Fixups** section in the log file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - Backup-CvadToFile does not support the parameters `IncludeByName` or `ExcludeByName`.

> **Important:**
>
> Citrix recommends backing up all the components together.

Modify YML files

Modify the `.yml` files located at `%HOMEPATH%\Documents\Citrix\AutoConfig` to include the on-premises details as described in the following table:

YML File	Parameter	Description	Examples
CustomerInfo.yml	Environment	Change Environment to OnPrem. The environment parameter value is case-sensitive.	
ZoneMapping.yml	DaaS:CVAD	Map your Cloud resource locations to your on-premises zones.	It has to be old:new zones
CvadAcSecurity.yml	Hypervisor: ConnectionType: “Username: “ Password: “	Add the hypervisor username and passwords.	If the hypervisor is XenServer,XenServer: ConnectionType: ‘XenServer’Username: ‘root’Password: “

Import configurations to on-premises

1. Run either of the following commands in your on-premises site based on your requirements:
   a) `Merge-CvadAcToSite` - if there is an on-premises site running and you want to merge the Cloud configurations to it.
   b) `Import-CvadAcToSite -Environment OnPrem` - If on-premises configurations are not available and you are importing the Cloud configurations to create one.

> **Important:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

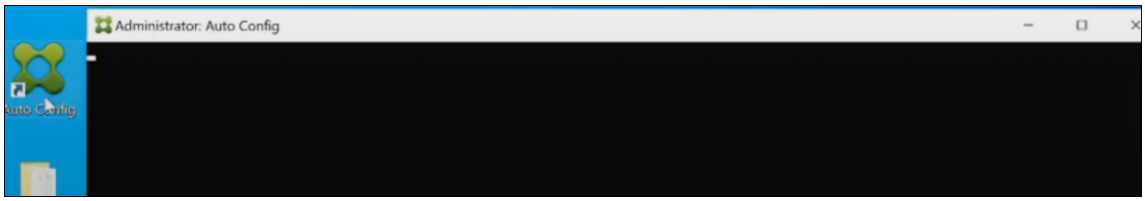
> Citrix recommends importing one component at a time to avoid conflicts.

Migrate on-premises configurations to on-premises site

May 13, 2026

This article describes the steps to migrate your on-premises configurations from one site to another on-premises site using Automated Configuration Tool (ACT).

Requirements



- Both on-premises sites must be domain joined to the same domain.
- Use Citrix Virtual Apps and Desktops™ version 2305 or later.

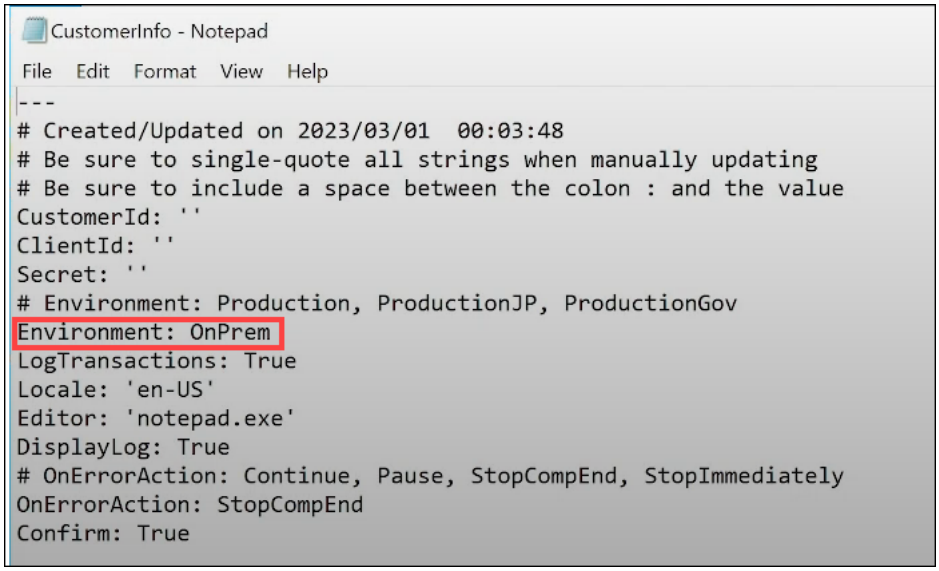
Steps

1. Download the Automated Configuration Tool and review the system requirements. See Download Automated Configuration.
2. Open ACT and export your on-premises site using the following the command.

   ```
   1 Export-CvadAcToFile
   ```

   See Supported migration objects for the list of components supported for migration. For information on the steps to export, see Export on-premises configuration. The parent folder %HOMEPATH%\\Documents\\Citrix\\AutoConfig always contains the exported files from the most recent export.
3. Launch the ACT on the target site. You must see an AutoConfig folder created in %HOMEPATH%\\Documents\\Citrix.

4. Copy the .yml files from the **Export** folder in the source site to the target site's %HOMEPATH%\\Documents\\Citrix\\AutoConfig folder.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Specify the environment that you are working in using the `Set-CvadAcCustomerInfoFile` command. For example:

```
Set-CvadAcCustomerInfoFile -Environment OnPrem
```

This command updates the **CustomerInfo** file with the environment.

6. Migrate the configuration files using the following command.

```
Import-CvadAcToFile
```

If you want to import from a different folder rather than the `AutoConfig` folder, run the following:

```
Import-CvadAcToFile -Sourcefolder PATH
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If you are migrating host connections, then update the `CvadAcSecurity.yml` file with the connection information for each host type. See Update the security file for host connections.

If you encounter any errors or exceptions, see the Fixups section in the log file.

7. Verify that your configurations are migrated on your target site using Web Studio.

Automated configuration tool cmdlets for migration

May 13, 2026

This page lists all the cmdlets and parameters supported by the tool for migration usecases.

All cmdlets take parameters having one of the following types.

- String
- List of strings
- Boolean: `$true` or `$false`
- SwitchParameter: presence of the parameter means `$true`; absence of the parameter means `$false`

> **Note:**
>
> SwitchParameter is the preferred method for true or false selections but booleans are still used in the tool due to legacy issues.

The following table is a summary of all cmdlets. See each individual section to find what parameters each cmdlet supports.

Category	Cmdlet	Description
On-premises to cloud migration	`Export-CvadAcToFile`	Export on-premises files to YAML files.
	`Import-CvadAcToSite`	Import YAML files to the cloud. Supports create, update, and delete operations.
	`Merge-CvadAcToSite`	Import YAML files to the cloud. Supports create and update operations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Cmdlet	Description
	`New-CvadAcToSite`	Import YAML files to the cloud. Supports create and update operations.
	`Sync-CvadAcToSite`	Export and import in one step.
	Granular migration For components, use parameters with commands above. Examples: `MachineCatalogs`, `Tags`. For component names, use parameters with commands above. Examples: `IncludeByName`, `ExcludeByName`.	Selectively migrate only components or component names
Cloud to cloud cmdlets	`Backup-CvadAcToFile`	Backs up all the configuration from your cloud site.
	`Restore-CvadAcToSite`	Restores backup YAML files to the cloud site. This cloud site can be the same or different than the source cloud site.
	`Remove-CvadAcFromSite`	Remove component members from cloud.
	Granular migration For components, use parameters with commands above. Examples: `MachineCatalogs`, `Tags`. For component names, use parameters with commands above. Examples: `IncludeByName`, `ExcludeByName`.	Selectively migrate only components or component names
Other basic cmdlets	`Compare-CvadAcToSite`	Compares the on-premises .yml files with the cloud configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Cmdlet	Description
Prerequisites-related cmdlets	New-CvadAcCustomerInfoFile	Create a customer info file.
	Set-CvadAcCustomerInfoFile	Update an existing customer info file.
Support and troubleshooting cmdlets	New-CvadAcZipInfoForSupport	Zips all log and .yml files in a single zip file to send to Citrix® for support.
	Get-CvadAcStatus	Use to test connectivity and to ensure that all prerequisites are met. Returns information about the tool like version number and connectivity with the cloud and connector status.
	Test-CvadAcConnectionWithSite	Test the connection with the cloud site.
	Find-CvadAcConnector	Locates existing connectors and determines their running state.
	Get-CvadAcCustomerSites	Returns the list of all the customer sites.
	New-CvadAcTemplateToFile	Creates a template file for selected components.
	Show-CvadAcDocument	Displays this documentation in the default browser.
	Find-CvadAcInFile	Find in file searches component YAML files looking for members matching one or more names that may contain wildcards.
Site activation cmdlets	Set-CvadAcSiteActiveStateOnPrem	Sets the on-premises site state to either active or inactive.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Cmdlet	Description
	`Set-CvadAcSiteActiveStateCloud`	Sets the cloud site state to either active or inactive.
Merging multiple on-premises sites cmdlets	`New-CvadAcSiteMergingInfo`	Creates a site merging prefix/suffix info set.
	`Set-CvadAcSiteMergingInfo`	Updates an existing site merging prefix/suffix info set.
	`Remove-CvadAcSiteMergingInfo`	Removes an existing site merging prefix/suffix info set.

For more information on parameters and how to use them, see Granular migration parameters.

Basic cmdlets

On-premises to cloud cmdlets

- `Export-CvadAcToFile` - Export on-premises files to YAML files.

  Exports configuration from your on-premises setup. This is the default export operation for Automated configuration. No modifications are made to the on-premises site configuration. Exported files are placed in the directory *%HOMEPATH%\Documents\Citrix\AutoConfig* in a uniquely named **Export** subfolder. The folder *%HOMEPATH%\Documents\Citrix\AutoConfig* always contains the latest exported on-premises site configuration.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components		SwitchParameters
Filtering by object names	See Filtering by object names		List of strings
`TargetFolder`	Specifies the export destination folder.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`Quiet`	Suppress logging to the console.		SwitchParameter

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
`AdminAddress`	Specifies the Delivery Controller's DNS or IP address when the export is not being run on the Delivery Controller.		String
`CheckUserAndMachines`	Verifies if users and machines are in Active Directory. Users and machines that are not in Active Directory might result in import failures.		`$true` or `$false`
`ZipResults`	Zips backup up YAML files into a single zip file. The file is in the same folder as the backed up YAML files and has the same name as the folder.		SwitchParameter

Returns:

- See Cmdlet return values

There are three ways of importing data into the cloud. Running specific cmdlets can result in one of the three combinations of actions on the cloud site:

- Add, Update, and Delete
- Add and Update only
- Add only

Cmdlet	Add	Update	Delete
Import	X	X	X
Merge	X	X	
New	X		

- `Import-CvadAcToSite` - Import YAML files to the cloud. Supports create, update and delete operations.

  Imports all the on-premises files to the cloud. This command ensures that the cloud end state is identical to the on-premises state. This option deletes any changes that exist in the cloud. Imported site configuration files are sourced from *%HOMEPATH%\Documents\Citrix\AutoConfig*. *Use with caution.*

  Parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
Migrate by components	See Migrate by components.		SwitchParameters
Filtering by object names	See Filtering by object names.		List of strings
Cloud-accessing parameters	See Cloud-accessing parameters.		SwitchParameters
`SourceFolder`	Identifies a substitute root folder for *%HOMEPATH%\Documents\Citrix\AutoConfig*.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`
`Merge`	When set to `$true`, only adds components to the cloud site. Components are not removed. Set to `$false` to remove components.		`$true` or `$false`
`AddOnly`	When set to `$true`, adds only new components, does not update or delete existing components. Set to `$false` to allow updates and deletions. `Merge` is ignored when this parameter is `$true`.		`$true` or `$false`
`MergePolicies`	Merge policy settings and filters. Merging occurs only when a policy being imported already exists in the cloud DDC. The result of merging policies is that the cloud DDC policies contain the settings and filters it already had in addition to any new settings and filters being imported. Note that when setting and filter collisions occur, the imported values take precedence.		SwitchParameter
`OnErrorAction`	See OnErrorAction parameter.		String

Returns:

- See Cmdlet return values

- `Merge-CvadAcToSite` - Import YAML files to the cloud. Supports create and update opera-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

tions.

Merges the on-premises files to the cloud, but does *not* delete any components in the cloud or the on-premises site. This preserves changes already made in the cloud. If a component exists in Citrix Cloud with the same name, this command can modify that component. This is the default import operation for Automated configuration. Merged site configuration files are sourced from *%HOMEPATH%\Documents\Citrix\AutoConfig*.

Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components.		SwitchParameters
Filtering by object names	See Filtering by object names.		List of strings
Cloud-accessing parameters	See Cloud-accessing parameters.		SwitchParameters
`SourceFolder`	Identifies a substitute root folder for *%HOMEPATH%\Documents\Citrix\AutoConfig*.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`
`Merge`	When set to `$true`, only adds components to the cloud site. Components are not removed. Set to `$false` to remove components.		`$true` or `$false`
`AddOnly`	When set to `$true`, adds only new components, does not update or delete existing components. Set to `$false` to allow updates and deletions. `Merge` is ignored when this parameter is `$true`.		`$true` or `$false`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
`MergePolicies`	Merge policy settings and filters. Merging occurs only when a policy being imported already exists in the cloud DDC. The result of merging policies is that the cloud DDC policies contain the settings and filters it already had in addition to any new settings and filters being imported. Note that when setting and filter collisions occur, the imported values take precedence.		SwitchParameter
`OnErrorAction`	See OnErrorAction parameter.		String

Returns:

- See Cmdlet return values

- `New-CvadAcToSite` - Import YAML files to the cloud. Supports create and update operations.

  Imports on-premises site configuration to the cloud but only adds new components. Existing cloud site components are neither updated nor deleted. Use this command if your existing cloud site components must remain unchanged.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components.		SwitchParameters
Filtering by object names	See Filtering by object names.		List of strings
Cloud-accessing parameters	See Cloud-accessing parameters.		SwitchParameters
`SourceFolder`	Identifies a substitute root folder for *%HOMEPATH%\Documents\Citrix\AutoConfig*.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`
`OnErrorAction`	See OnErrorAction parameter.		String

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type

Returns:

- See Cmdlet return values

- `Sync-CvadAcToSite` - Export and import in one step.

  Sync performs both an export and import in one step. Use the `SourceTargetFolder` parameter to specify the export/import destination folder.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components		SwitchParameters
Filtering by object names	See Filtering by object names		List of strings
Cloud-accessing parameters	See Cloud-accessing parameters		SwitchParameters
`SourceTargetFolder`	Specifies the export/import destination folder.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`AdminAddress`	Specifies the delivery controller's DNS or IP address when the export is not being executed on the delivery controller.		String
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`
`Merge`	When set to `$true`, only adds components to the cloud site. Components are not removed. Set to `$false` to remove components.		`$true` or `$false`
`AddOnly`	When set to `$true`, adds only new components, does not update or delete existing components. Set to `$false` to allow updates and deletions. `Merge` is ignored when this parameter is `$true`.		`$true` or `$false`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
`MergePolicies`	Merge policy settings and filters. Merging occurs only when a policy being imported already exists in the cloud DDC. The result of merging policies is that the cloud DDC policies contain the settings and filters it already had in addition to any new settings and filters being imported. Note that when setting and filter collisions occur, the imported values take precedence.		SwitchParameter

Returns:

- See Cmdlet return values

Cloud to cloud cmdlets

- `Backup-CvadAcToFile` - Backs up all the configuration from your cloud site.

  Exports your cloud configuration to .yml files. This backup can be used in a backup and restore process to restore lost components.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components		SwitchParameters
Cloud-accessing parameters	See Cloud-accessing parameters		SwitchParameters
`TargetFolder`	Specifies the export destination folder.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`
`ZipResults`	Zips backup up YAML files into a single zip file. The file is in the same folder as the backed up YAML files and has the same name as the folder.		SwitchParameter

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Returns:

- See Cmdlet return values

- `Restore-CvadAcToSite` - Restores backup YAML files to the cloud site. This cloud site can be the same or different than the source cloud site.

  Restores the cloud site to the previous configuration. Imported files are sourced from the folder specified using the `-RestoreFolder` parameter, which identifies the folder containing the .yml files to restore to the cloud site. This must be a fully qualified folder specification. This cmdlet can be used for reverting to your previous configuration or for backing up and restoring your cloud site. This command can add, delete, and update your cloud site.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components.		SwitchParameters
Filtering by object names	See Filtering by object names.		List of strings
Cloud-accessing parameters	See Cloud-accessing parameters.		SwitchParameters
`RestoreFolder`	Identifies the folder containing the .yml files to restore to the cloud site. This must be a fully qualified folder specification.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`
`Merge`	When set to `$true`, only adds components to the cloud site. Components are not removed. Set to `$false` to remove components.		`$true` or `$false`
`AddOnly`	When set to `$true`, adds only new components, does not update or delete existing components. Set to `$false` to allow updates and deletions. `Merge` is ignored when this parameter is `$true`.		`$true` or `$false`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
`MergePolicies`	Merge policy settings and filters. Merging occurs only when a policy being imported already exists in the cloud DDC. The result of merging policies is that the cloud DDC policies contain the settings and filters it already had in addition to any new settings and filters being imported. Note that when setting and filter collisions occur, the imported values take precedence.		SwitchParameter
`OnErrorAction`	See OnErrorAction parameter.		String

Returns:

- See Cmdlet return values

- `Remove-CvadAcFromSite` –Remove component members from cloud.

  Can reset the entire site or remove member items from a component (For example, removing one machine catalog from the list of catalogs). This can be used when coupled with the `IncludeByName` parameter to selectively remove specific members.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components		SwitchParameters
Filtering by object names	See Filtering by object names		List of strings
Cloud-accessing parameters	See Cloud-accessing parameters		SwitchParameters
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`

Returns:

- See Cmdlet return values

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Other basic cmdlets

- `Compare-CvadAcToSite` - Compares the on-premises .yml files with the cloud configuration, producing a report of changes that are made by an `Import`, `Merge`, or `Restore` cmdlet.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components.		SwitchParameters
Filtering by object names	See Filtering by object names.		List of strings
Cloud-accessing parameters	See Cloud-accessing parameters.		SwitchParameters
`SourceFolder`	Identifies a substitute root folder for *%HOMEPATH%\Documents\Citrix\AutoConfig*.		String
`Locale`	Specifies the language of human-readable text that can be exported.		String
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true` or `$false`
`Merge`	When set to `$true`, only adds components to the cloud site. Components are not removed. Set to `$false` to remove components.		`$true` or `$false`
`AddOnly`	When set to `$true`, adds only new components, does not update or delete existing components. Set to `$false` to allow updates and deletions. `Merge` is ignored when this parameter is `$true`.		`$true` or `$false`
`OnErrorAction`	See OnErrorAction parameter.		String

  Returns:

  - See Cmdlet return values

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Granular migration parameters

Migrate by components

The following components can be specified with cmdlets supporting them. The `All` option is automatically selected when no component parameters are specified. To avoid errors, we recommend that you migrate components in the following order:

- `All`
- `Tags`
- `AdminRoles`
- `AdminScopes`
- `HostConnections`
- `MachineCatalogs`
- `StoreFronts`
- `DeliveryGroups`
- `ApplicationGroups`
- `ApplicationFolders`
- `Applications`
- `GroupPolicies`
- `UserZonePreference`

Filtering by object names

Migrate by component names The `IncludeByName` and `ExcludeByName` parameters enable including and excluding component members in cmdlets by name. Only one component (for example, delivery groups) can be chosen at a time in any of the supported cmdlets. If a component member is in both areas, exclude overrides any other parameter and an entry is made in the log fixup list identifying the component and member name that was excluded.

`IncludeByName` and `ExcludeByName` take a list of component member names. Any name can contain one or more wildcards. Two types of wildcards are supported. The list of component member names must be enclosed in single-quotes when any member name contains special characters.

- * Matches any number of characters
- ? Matches a single character

`IncludeByName` and `ExcludeByName` can also take a file containing a list of members where each member can be explicit or contain wildcards. Each line in the file can contain one member. Leading and trailing spaces are trimmed from the member name. The file name must be preceded by the @ sign and be surrounded by single quotes (a PowerShell requirement so the @ is not reinterpreted). Multiple files can be listed in addition to being mixed with member names.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

One example of merging all delivery groups whose names begin with `DgSite1` and contain `Home2` would be written:

```
Merge-CvadAcToSite –DeliveryGroups –IncludeByName DgSite1*,*Home2*
```

By Delivery Group Name `ByDeliveryGroupName` filters by the delivery group name for applications and application groups. This parameter is always an inclusion list identifying members to include based on their delivery group association.

`ByDeliveryGroupName` takes a list of delivery group names. Any name can contain one or more wildcards. Two types of wildcards are supported.

- * matches any number of characters
- ? matches a single character

The following example merges all applications that reference all delivery group names beginning with `EastDg`.

```
Merge-CvadAcToSite –Applications –ByDeliveryGroupName EastDg*
```

Exclude Disabled `ExcludeDisabled` filters out from import operations all applications and application groups that are disabled. `ExcludeDisabled` defaults to **`false`**, meaning all applications and application groups are imported regardless of their enabled state.

By Machine Name `ByMachineName` filters by the machine name for machine catalogs and delivery groups. This parameter is always an inclusion list identifying members to include based on their machine name association.

`ByMachineName` takes a list of machine names where any name can contain one or more wildcards. Two types of wildcards are supported.

- * matches any number of characters
- ? matches a single character

When exporting or importing and using `ByMachineName` and a machine name filter results in no machines in the machine catalog or delivery group, the machine catalog or delivery group is excluded from the export or import.

> **Note:**
>
> Use of `ByMachineName` in any import type cmdlet results in `MergeMachines` being set to `$true`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Merge Machines `MergeMachines`, when set to `$true`, instructs the import operation to add machines only to the machine catalog or delivery group. Machines are not removed, allowing for incremental additive operations.

`MergeMachines` defaults to false meaning machines are removed if they are not present in the machine catalog or delivery group .yml file. `MergeMachines` is set to `$true` when `ByMachineName` is used but can be overridden by setting `MergeMachines` to false.

Prerequisites-related cmdlets

- `New-CvadAcCustomerInfoFile` - Create a customer info file. By default, the customer info file is located at *%HOMEPATH%\Documents\Citrix\AutoConfig*.

  Parameters:

Name	Description	Required?	Type
`CustomerId`	Customer's ID.	x	String
`ClientId`	Customer's client ID created on Citrix Cloud. The CustomerId and Secret must be specified when using this parameter.	Conditionally	String
`Secret`	Customer's secret key created on Citrix Cloud. The CustomerId and ClientId must be specified when using this parameter.	Conditionally	String
`Environment`	Production, ProductionGov, or ProductionJP environment.		Enumeration
`LogFileName`	Change the log file prefix from CitrixLog to something else.		String
`AltRootUrl`	Use only under the direction of Citrix.		String
`StopOnError`	Stops the operation upon first error.		`$true` or `$false`
`TargetFolder`	Use the specified folder as the root folder instead of *%HOMEPATH%\Documents\Citrix\AutoConfig*.		String
`Locale`	Use the specified local instead of the locale derived from the system the tool is run on.		String

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
`Editor`	Use the specified editor to display the log at the completion of each cmdlet. Notepad.exe is the default editor. This parameter must include the fully qualified file specification to the editor and the editor must take the log file spec as its only parameter.		String
`SecurityCsvFileSpec`	The fully qualified file specification pointing to the SecurityClient.csv file downloaded from Citrix Identity and Access Management. The CustomerId must be specified when using this parameter.		String

Returns:

- See Cmdlet return values

- `Set-CvadAcCustomerInfoFile` - Update an existing customer info file. Only cmdlet specified parameters are changed. All unspecified parameter values in the CustomerInfo.yml file are unchanged.

  Parameters:

Name	Description	Required?	Type
`CustomerId`	Customer's ID.		String
`ClientId`	Customer's client ID created on Citrix Cloud.		String
`Secret`	Customer's secret key created on Citrix Cloud.		String
`Environment`	Production, ProductionGov, or ProductionJP environment.		Enumeration
`LogFileName`	Change the log file prefix from CitrixLog to something else.		String
`StopOnError`	Stops the operation upon first error.		`$true` or `$false`
`TargetFolder`	Use the specified folder as the root folder instead of *%HOMEPATH%\Documents\Citrix\AutoConfig*.		String
`Locale`	Use the specified local instead of the locale derived from the system the tool is run on.		String

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
Editor	Use the specified editor to display the log at the completion of each cmdlet. Notepad.exe is the default editor. This parameter must include the fully qualified file specification to the editor and the editor must take the log file spec as its only parameter.		String
SecurityCsvFileSpec	The fully qualified file specification pointing to the SecurityClient.csv file downloaded from Citrix Identity and Access Management. The CustomerId must be specified when using this parameter.		String

Returns:

- See Cmdlet return values

Prerequisites-related parameters

Along with the cloud accessing parameters, the following parameters can be used with the prerequisites-related cmdlets:

- Environment –Production or ProductionGov environment.
- LogFileName –Change the log file prefix from CitrixLog to something else.
- StopOnError –Stops the operation upon first error.
- AlternateRootFolder –Use the specified folder as the root folder instead of *%HOMEPATH%\Documents\Citrix\AutoConfig*.
- Locale –use the specified local instead of the locale derived from the system the tool is run on.
- Editor –use the specified editor to display the log at the completion of each cmdlet. Notepad.exe is the default editor. This parameter must include the fully qualified file specification to the editor and the editor must take the log file spec as its only parameter.

Support and troubleshooting cmdlets

- New-CvadAcZipInfoForSupport - Zips all log and .yml files in a single zip file to send to Citrix for support. Customer sensitive information (CustomerInfo.yml and CvadAcSecurity.yml) is not included in the zip. The Icon.yml file is also excluded due to its size. The

© 1997–2026 Citrix Systems, Inc. All rights reserved.

zip file is placed in *%HOMEPATH%\Documents\Citrix\AutoConfig* and named *CvadAcSupport_yyyy_mm_dd_hh_mm_ss.zip*, based on the date and timestamp. This zip file can also act as a backup.

Parameters:

Name	Description	Required?	Type
`TargetFolder`	Specifies a target folder to create and save the zip file.		String
`Quiet`	Suppress logging to the console.		SwitchParameter

Returns:

- Zip file with zip file name and location is displayed on the command prompt.

- `Get-CvadAcStatus` - Use to test connectivity and to ensure all prerequisites are met. Returns information about the tool like version number and connectivity with the cloud and connector status.

  Parameters:

Name	Description	Required?	Type
Cloud-accessing parameters	See Cloud-accessing parameters		SwitchParameters
`SiteId`	Identifies the site to connect to.		String
`AdminAddress`	This is the DNS or IP address of the on-premises Delivery Controller used to verify the admins access level. This is required if the tool is not being run on a Delivery Controller.		String

  Returns:

  - Displays the results for each item.

- `Test-CvadAcConnectionWithSite` –Test the connection with the cloud site to verify that the communication connection is working. This cmdlet uses the cloud accessing parameters or the CustomerInfo.yml file to specify the customer connection information.

  Parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
Cloud-accessing parameters	See Cloud-accessing parameters		SwitchParameters
`Quiet`	Suppress logging to the console.		SwitchParameter

Returns:

- Test results are displayed on the command line.

- `Find-CvadAcConnector` - Locates existing connectors and determines their running state. This cmdlet uses information from the CustomerInfo.yml file or the customer ID parameter to locate the customer's connectors.

  Parameters:

Name	Description	Required?	Type
`CustomerInfoFileSpec`	The file specification pointing to a customer information file to override the default location and name. This parameter is ignored when the `CustomerId` parameter is provided.		String
`CustomerId`	The customer's ID. This parameter overrides the same value in the CustomerInfo.yml file.		String

  Returns:

  - Results are shown on the command line.

- `Get-CvadAcCustomerSites` - Returns the list of all the customer sites. This cmdlet uses the cloud accessing parameters or the CustomerInfo.yml file to specify the customer connection information.

  Parameters:

  - See Cloud-accessing parameters

  Returns:

  - Displays a list of found customer site IDs.

- `New-CvadAcTemplateToFile` –Creates a template file for selected components, allowing you to manually create an import file.

  Parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
Migrate by components	See Migrate by components		SwitchParameters
`TargetFolder`	Specifies the export destination folder.		String

Returns:

- See Cmdlet return values

- `Show-CvadAcDocument` - Displays this documentation in the default browser.

  Parameters:

  - None.

  Returns:

  - Display this webpage in the default web browser.

- `Find-CvadAcInFile` - Find in file searches component YAML files looking for members matching a one or more names that may contain wildcards. The result is a report of found members. Find in file can only search one component at a time. Find in file searches all YAML files in the current folder and all subfolders. Use `FindSourceFolder` to limit the number of files to search.

  Parameters:

Name	Description	Required?	Type
Migrate by components	See Migrate by components. Note: The `-All` value is not valid.		SwitchParameters
`IncludeByName`	A list specifying the names of delivery groups to include when setting the site active state to active. The '*'and '?'wildcards are supported in names.		List of strings
`Unique`	Report only unique-found members.		SwitchParameter
`IncludeYaml`	Include the member specific YAML.		SwitchParameter
`FindSourceFolder`	The folder find begins searching in.		String

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		SwitchParameter
`Quiet`	Suppress logging to the console.		SwitchParameter

Return:

- Creates a report containing found members for the specified component.

Site activation cmdlets

For more information on activating sites and the usage of these cmdlets, see Activating sites.

- `Set-CvadAcSiteActiveStateOnPrem` - Sets the on-premises site state to either active or inactive.

  Parameters:

Name	Description	Required?	Type
Cloud-accessing parameters	See Cloud-accessing parameters		SwitchParameters
`SiteActive`	When present, sets the on-premises site to active removing the maintenance mode from all delivery groups. When this parameter is not present, maintenance mode is set on all delivery groups.		SwitchParameter
`IncludeByName`	A list specifying the names of delivery groups to include when setting the site active state to active. The '*'and '?'wildcards are supported in names.		List of strings
`ExcludeByName`	A list specifying the names of delivery groups to exclude when setting the site active state to active. The '*'and '?'wildcards are supported in names.		List of strings
`Quiet`	Suppress logging to the console.		SwitchParameter

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true or $false`

Returns:

- See Cmdlet return values

- `Set-CvadAcSiteActiveStateCloud` - Sets the cloud site state to either active or inactive.

Parameters:

Name	Description	Required?	Type
Cloud-accessing parameters	See Cloud-accessing parameters		SwitchParameters
`SiteActive`	When present, sets the cloud site to active removing the maintenance mode from all delivery groups. When this parameter is not present, maintenance mode is set on all delivery groups.		SwitchParameter
`IncludeByName`	A list specifying the names of delivery groups to include when setting the site active state to active. The '*'and '?'wildcards are supported in names.		List of strings
`ExcludeByName`	A list specifying the names of delivery groups to exclude when setting the site active state to active. The '*'and '?'wildcards are supported in names.		List of strings
`Quiet`	Suppress logging to the console.		SwitchParameter
`DisplayLog`	Displays the log file at the completion of the cmdlet. Set to `$false` to suppress the log display.		`$true or $false`

Returns:

- See Cmdlet return values

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Merging multiple on-premises sites cmdlets

For more information on site merging and usage of these cmdlets, see Merge multiple sites into a single site.

- `New-CvadAcSiteMergingInfo` - Creates a site merging prefix/suffix info set. It is not necessary to know all prefixes or suffixes at the beginning. They can be updated with `Set-CvadAcSiteMergingInfo` or by manually editing the SiteMerging.yml file.
  Parameters:

Name	Description	Required?	Type
`SiteName`	The name used to identify the set of prefixes/suffixes for a specific site. It can match the name of the actual site but does not need to.	x	String
Site merging parameters	See Site merging parameters		SwitchParameters
`Quiet`	Suppress logging to the console.		SwitchParameter

  Returns:

  - None

- `Set-CvadAcSiteMergingInfo` - Updates an existing site merging prefix/suffix info set.

  Parameters:

Name	Description	Required?	Type
`SiteName`	The name used to identify the set of prefixes/suffixes for a specific site. It can match the name of the actual site but does not need to.	x	String
Site merging parameters	See Site merging parameters		SwitchParameters

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name	Description	Required?	Type
Quiet	Suppress logging to the console.		SwitchParameter

Returns:

- None

- Remove-CvadAcSiteMergingInfo - Removes an existing site merging prefix/suffix info set.

  Parameters:

  - SiteName –identifies the set of site prefixes and suffixes. This is a string and is required.

  Returns:

  - None

Site merging parameters

The following parameters can be used when running the site merging cmdlets. All listed parameters are strings.

- SiteName –the name used to identify the set of prefixes/suffixes for a specific site. It can match the name of the actual site but does not need to. SiteName is a required parameter.
- AdminScopedPrefix –the prefix to apply to administrator scopes.
- ApplicationPrefix - the prefix to apply to applications.
- ApplicationFolderPrefix –the prefix to apply to application folders; ApplicationFolderPrefi can be combined with ApplicationFolderRoot.
- ApplicationFolderRoot –the new root folder to application folders. This creates an extra folder hierarchy. ApplicationFolderRoot can be combined with ApplicationFolderPrefix.
- ApplicationGroupPrefix –the prefix for application groups.
- ApplicationUserPrefix –the prefix to apply to the application name the user sees.
- ApplicationAdminPrefix –the prefix to apply to the application name the administrator sees.
- DeliveryGroupPrefix –the prefix to apply to delivery groups.
- GroupPolicyPrefix –the prefix to apply to policy names.
- HostConnectionPrefix –the prefix to apply to host connections.
- MachineCatalogPrefix –the prefix to apply to machine catalogs.
- StoreFrontPrefix –the prefix to apply to StoreFront™ names.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `TagPrefix` –the prefix to apply to tags.
- `AdminScopedSuffix` –the suffix to apply to administrator scopes.
- `ApplicationSuffix` - the suffix to apply to applications.
- `ApplicationFolderSuffix` –the suffix to apply to application folders; `ApplicationFolderSuffi` can be combined with `ApplicationFolderRoot`.
- `ApplicationGroupSuffix` –the suffix for application groups.
- `ApplicationUserSuffix` –the suffix to apply to the application name the user sees.
- `ApplicationAdminSuffix` –the suffix to apply to the application name the administrator sees.
- `DeliveryGroupSuffix` –the suffix to apply to delivery groups.
- `GroupPolicySuffix` –the suffix to apply to policy names.
- `HostConnectionSuffix` –the suffix to apply to host connections.
- `MachineCatalogSuffix` –the suffix to apply to machine catalogs.
- `StoreFrontSuffix` –the suffix to apply to StoreFront names.
- `TagSuffix` –the suffix to apply to tags.
- `SiteRootFolder` –the fully qualified folder name to use for exports and imports; this can be a local folder or a file share.

Generic parameters

Cloud accessing parameters

All cmdlets accessing the cloud support the following extra parameters.

> **Note:**
>
> The CustomerId, ClientId, and Secret can be placed in the CustomerInfo.yml file or specified with the cmdlet using the following parameters. When they are specified in both places, the cmdlet parameters take precedence.

- `CustomerId` –The customer ID used in the Rest APIs and is required to access all Rest APIs. Your customer ID is found in Citrix Cloud.
- `ClientId` –The clientID created on the Citrix Cloud Identity and Access Management website. This is required to obtain the bearer token needed for authentication for all Rest APIs.
- `Secret` –The secret key created on the Citrix Cloud Identity and Access Management website. This is required to obtain the bearer token needed for authentication for all Rest APIs.
- `CustomerInfoFileSpec` –The file specification pointing to a customer information file to override the default location and name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Migration mode parameters

Cmdlets modifying the cloud site configuration (`Import`, `Restore`, `Merge`, `New`, and `Sync`) support the following extra parameters to provide further flexibility.

- `CheckMode` –Performs the import operation but makes *no* changes. All expected changes are reported before the import completes. You can use this command to test your import before it occurs.
- `BackupFirst` –Backs up the cloud contents to .yml files before modifying the cloud configuration. This is enabled by default.
- `Confirm` –When true, prompts users to confirm that they want to make changes to the cloud site configuration. The `Remove` cmdlet shows a prompt due to its destructive nature. Set to false if no prompt is desired, such as running inside automated scripts. `Confirm` defaults to true.
- `SecurityFileFolder` –This is the fully qualified folder containing the CustomerInfo.yml file which might point to a local folder or a network share folder that may be under authentication control. The tool will not prompt for credentials; access to the controlled resource must be obtained before running the tool.
- `SiteName` –Specifies the site merging prefix and suffix set to use when importing.
- `SiteActive` –Specifies whether the imported site is active or inactive. By default, this parameter is set to `$false` meaning the imported site is inactive.

Log display parameters

The `Export`, `Import`, `Sync`, `Restore`, `Backup`, `Compare`, and `Remove` cmdlets display the log file when the operation completes. You can suppress the display by setting the `-DisplayLog` parameter to `$false`. Notepad.exe is used by default to display the log file. You can specify a different editor in the CustomerInfo.yml file.

```
Editor: C:\Program Files\Notepad++\notepad++.exe
```

Cmdlet return values

ActionResult

All cmdlets return the following value.

```
1            public class ActionResult
2            {
3
4                public bool                          Overall_Success;
5                public Dictionary<string, string>   Individual_Success;
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
6                   public object                           CustomResult;
7               }
```

`Overall_Success` returns a single boolean showing the overall success of the cmdlet across all selected components: true meaning successful and false meaning unsuccessful.

`Individual_Success` returns one or three values for each main component. A component's result can be Success, Failure, or Skipped. Skipped indicates that the component was not selected for execution by the cmdlet.

`CustomResult` is cmdlet specific.

CustomResult

`Import`, `Merge`, `Restore`, `Sync`, `Compare`, `Compare File`, and `Remove` return the following custom result information to a single instance of `EvaluationResultData`.

> **Note:**
>
> `Export` and `Template` cmdlets do not return a custom result.

```
1                   public class EvaluationResultData
2                   {
3
4                       public Dictionary<string, Dictionary<string,
                           ActionResultValues >> EvaluationResults;
5                       public int                  Added;
6                       public int                  Updated;
7                       public int                  Deleted;
8                       public int                  NoChange;
9                       public int                  TotalChanged;
10                      public EvaluationResults     OverallResult;
11                      public string               CloudBackupFolder;
12                      public string               SourceBackupFolder;
13                   }
14
15                  Where:
16                  public enum ActionResultValues
17                 {
18
19                      Add,
20                      Update,
21                      Delete,
22                      Identical,
23                      DoNothing
24                   }
25
26                  public enum EvaluationResults
27                  {
28
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
29                      Success,
30                      Failure,
31                      Skipped
32                  }
```

`EvaluationResults` displays a list with one entry per selected component. The key is the component name and the value is a list of each component member and the action taken on that component member. Actions can be any one of the `ActionResultValues` values.

`Added`, `Updated`, `Deleted`, and `NoChange` indicate that the total number of component members added, updated, deleted, or no action taken, in that order.

`TotalChanged` is the sum of `Added`, `Updated`, and `Deleted`.

`OverallResult` is a single boolean indicating the result of the cmdlet. True indicates total success across all components and false indicates failure in processing one or more components.

`CloudBackupFolder` is the fully qualified file specification of the cloud site configuration backup before the cmdlet performing any cloud-modifying actions.

`SourceBackupFolder` is the fully qualified file specification of the source file backup made after completion of the cmdlet. By default, these files are at *%HOMEPATH%\Documents\Citrix\AutoConfig*.

PowerShell help

PowerShell help is available for each cmdlet. All parameters are documented with each cmdlet along with a brief explanation of the cmdlet. To access help for any cmdlet, type `Get-Help` in front of the cmdlet.

```
Get-Help Import-CvadAcToSite
```

Automated configuration tool cmdlets for backup and restore

May 13, 2026

This page lists all the cmdlets and parameters supported by the tool to trigger the backup and restore APIs that Web Studio uses.

Backup storage cmdlets

Get-BckRstrStorage

This cmdlet is applicable to only on-premises. Gets details for the storage where backups are saved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.

Set-BckRstrStorage

This cmdlet is applicable to only on-premises. Sets a new storage where backups are saved.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`MaximumBackups`	The maximum number of unpinned backups to be persisted until the backup cleanup process removes the oldest backups when new backups are created.
`MaximumPinnedBackups`	The maximum number of pinned backups to be persisted. These backups are not removed by the cleanup process.
`BlobStorageType`	The type of storage: `FileStorage` or `CustomerAzureStorage`.
`FileStoragefolder`	The fully qualified folder specification for the `BlobStorageType FileStorage` option.
`Info1`	For `FileStorage`, optional `UserName` For `CustomerAzureStorage`, the Azure SAS URL
`Info2`	For `FileStorage`, optional Password
`Info3` and `Info4`	Not used

Test-BckRstrStorage

This cmdlet is applicable to only on-premises. Tests to determine that the defined storage is valid.

For `FileStorage`, the test verifies that the folder exists and can be written to.

For `CustomerAzureStorage`, the test verifies that the SAS URL has the correct permissions and the current date is with the URL's start and end date.

Returns **`true`** if valid and **`false`** if invalid.

Parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.

Back up cmdlets

Get-BckRstrBackups

Enumerates backups stored in the Backup or Restore blob storage location. For Citrix Virtual Apps and Desktops™, this location is set up by the administrator through WebStudio. For DaaS, this is the pre-existing customer Azure storage. Use `Get-BckRstrBackupsWithDetiails` for complete information about each backup. Backup details include the following:

- Backup Name
- Notes
- Pinned (true or false)
- Date and time of backup
- History UID
- Related UID (UID of last Restore history record)
- Related Date and time
- Related if run in check-mode
- Duration in seconds
- Administrator name

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Details enumerating each component and count of members in each component.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.

Get-BckRstrBackupsMembers

Enumerates a single component's members stored in a selected backup. Member names are returned in a simple list.

The components are:

- Tags
- AdminScopes
- AdminRoles
- AdminAdministrators (on-premises only)
- HostConnections
- Icons
- AdminFolders
- MachineCatalogs
- StoreFronts
- DeliveryGroups

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- ApplicationGroups
- ApplicationFolders
- Applications
- AppVServers
- AppLibPackageDiscovery
- AppVIsolationGroups
- GroupPolicies
- UserZonePreferences
- SiteData
- Zones (on-premises only)

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`BackupName`	The name of backup. The `.zip` extension is optional.
`Component`	The components to be included in backup.

New-BckRstrBackup

Starts a new backup action on the Delivery Controller. This action is asynchronous to the `New-BckRstrBackup` cmdlet.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`Notes`	The notes about the backup.
`PollForCompletion`	The parameter to poll the action running on the Delivery Controller until the action completes. The polling logs progress and completion results to the console unless the `Quite` parameter is specified.

Pin backups cmdlets

Set-BckRstrPinBackups

Pins a backup so it is not removed as part of the Delivery Controller backup cleaning process.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`BackupName`	The name of backup. The `.zip` extension is optional.

Set-BckRstrUnpinBackups

Unpins a backup so it is available to be removed in the Delivery Controller backup cleaning process.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`BackupName`	The name of backup. The `.zip` extension is optional.

Remove backup cmdlet

Remove-BckRstrBackup

Removes one or more backups.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`Quiet`	The parameter to suppress output to the console.
`IncludeByName`	The filter to specify which component members to consider for restore. This is a comma separated list of filter values and can have the wildcard characters `*` and `?`.

Scheduled backups cmdlets

Get-BckRstrSchedules

Gets a list of backup schedules.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`BackupName`	The name of backup. The `.zip` extension is optional.
`Notes`	The notes to set or change.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

New-BckRstrSchedule

Creates a new backup schedule.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`Name`	The schedule name.
`Frequency`	The type of frequency: Daily, Weekly, or Monthly.
`Day`	If the frequency is daily.
`DaysInWeek`	If the frequency is weekly.
`DayInMonth`	If the frequency is monthly.
`WeekInMonth`	If the frequency is monthly.
`StartDate`	The format is `M/d/yy`
`StartTime`	The start time specified as a 24 hour clock.
`FrequencyFactor`	Run every n times such as every day (value = 1) or every other day (value = 2)
`Description`	The description of the scheduled backup
`Enabled`	The parameter to enable this backup schedule. `True` when enabled and **`false`** when disabled

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
TimeZoneId	The Windows Time Zone Id

Set-BckRstrSchedule

Modifies an existing backup schedule. Provide the name or Uid to select the schedule to modify.

Parameters:

Parameter	Description
CustomerId	The customer ID needed to obtain a bearer token.
CientId	The client ID needed to obtain a bearer token.
Secret	The secret needed to obtain a bearer token.
CustomerInforFileSpec	The fully qualified file specification of the customer info file containing security and environment information.
ProfileName	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
Environment	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
Quiet	The parameter to suppress output to the console.
Name	The schedule name.
Uid	If the schedule name is to be changed.
Frequency	The type of frequency: Daily, Weekly, or Monthly.
Day	If the frequency is daily.
DaysInWeek	If the frequency is weekly.
DayInMonth	If the frequency is monthly.
WeekInMonth	If the frequency is monthly.
StartDate	The format is M/d/yy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`StartTime`	The start time specified as a 24 hour clock.
`FrequencyFactor`	Run every n times such as every day (value = 1) or every other day (value = 2)
`Description`	The description of the scheduled backup
`Enabled`	The parameter to enable this backup schedule. `True` when enabled and **`false`** when disabled
`TimeZoneId`	The Windows Time Zone Id

Set-BckRstrScheduleEnabled

Enables an existing backup schedule. Provide the name or Uid to select the schedule to enable.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`Name`	The schedule name.
`Uid`	If the schedule name is to be changed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set-BckRstrScheduleDisabled

Disables an existing backup schedule. Provide the name or Uid to select the schedule to disable.

Parameters:

Parameter	Description
CustomerId	The customer ID needed to obtain a bearer token.
CientId	The client ID needed to obtain a bearer token.
Secret	The secret needed to obtain a bearer token.
CustomerInforFileSpec	The fully qualified file specification of the customer info file containing security and environment information.
ProfileName	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
Environment	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
Quiet	The parameter to suppress output to the console.
Name	The schedule name.
Uid	If the schedule name is to be changed.

Limit backups cmdlet

Set-BckRstrOptions

Limits scheduled backups to one per day to avoid identical backups.

Parameters:

Parameter	Description
CustomerId	The customer ID needed to obtain a bearer token.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`OneScheduledBackupPerDay`	The parameter to limit scheduled backups to one per day to avoid identical backups.

Restore cmdlet

Restore-BckRstrBackups

Restores members from a single component from an existing backup.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`BackupName`	The name of backup. The `.zip` extension is optional.
`Component`	The components to be included in backup.
`Notes`	The notes about the backup.
`CheckMode`	The parameter to identify component members that would be restored but does not perform the actual restore.
`RestoreType`	The restore type: MissingOnly or MissingUpdateExisting
`IncludeByName`	The filter to specify which component members to consider for restore. This is a comma separated list of filter values and can have the wildcard characters `*` and `?`.

History cmdlets

Get-BckRstrHistory

Gets a list history details for all actions.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.

Get-BckRstrSpecificBackupHistory

Gets a list of history details for a specific backup.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`BackupName`	The name of backup. The `.zip` extension is optional.

Set-BckRstrNotes

Sets or changes the notes in a history record.

Parameters:

Parameter	Description
`CustomerId`	The customer ID needed to obtain a bearer token.
`CientId`	The client ID needed to obtain a bearer token.
`Secret`	The secret needed to obtain a bearer token.
`CustomerInforFileSpec`	The fully qualified file specification of the customer info file containing security and environment information.
`ProfileName`	The parameter to identify an existing security profile used in place of the previous parameters. See XenApp & XenDesktop: Remote PowerShell SDK v2 for Citrix Cloud for how to set security profiles.
`Environment`	The type of production environment: Production, ProductionGov, ProductionJP, OnPrem.
`Quiet`	The parameter to suppress output to the console.
`BackupName`	The name of backup. The `.zip` extension is optional.
`Notes`	The notes to set or change.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshoot Automated configuration and additional information

May 13, 2026

> **Important:**
>
> For commonly occurring error messages for Automated configuration and corresponding solutions, see the *troubleshooting FAQ* at Knowledge Center article CTX277730.

Automated configuration tool errors

Automated configuration tool operations can sometimes produce errors. When this happens failures can occur when processing components like Machine Catalogs, Delivery Groups, or Group Policies, for example. Using `OnErrorAction` and continuation parameters allows you to catch errors mid-processing, resolve them, and pick up where you left off.

The default `OnErrorAction` value is `StopCompEnd`. When an error occurs, the tool finishes processing the current component. No additional components are processed, and errors do not carry forward to downstream, dependent components. After you resolve any errors, you can rerun your cmdlets with any continuation parameter applied.

OnErrorAction parameter

You can define `OnErrorAction` parameter values on migration commands to control how the tool responds to errors that it finds when processing components.

This table shows parameter values and their descriptions:

Value	Description
`Continue`	Attempts to process as many of all components as possible.
`Pause`	Pauses at the end of processing and prompts you to continue or stop.
`StopCompEnd`	Attempts to process as much of the component as possible. Stops after the component is finished. (Default)
`StopImmediately`	Processing stops when an error is found.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Migration cmdlets

You can apply the `OnErrorAction` parameter to the following migration commands:

- `Compare-CvadAcToSite`
- `Import-CvadAcToSite`
- `Merge-CvadAcToSite`
- `New-CvadAcToSite`
- `Restore-CvadAcToSite`

Example: `Merge-CvadAcToSite -OnErrorAction StopImmediately`

Resume parameters

These parameters define how the tool resumes after an operation pauses or stops because of an error.

You can apply resume parameters to migration cmdlets that include one of the following `OnErrorAction` parameter values:

- `Pause`
- `StopCompEnd`
- `StopImmediately`

This table shows parameter values and their descriptions:

Value	Description
`-AllRemaining`	Requires a starting component. Processing begins at the starting component and processes all remaining components. Multiple components are processed.
`-Resume`	Uses the component from `CurrentComponent.txt` as the starting point. All remaining is set to true. Multiple components are processed.
`-Repeat`	Uses the component from `CurrentComponent.txt` as the starting point. All remaining is set to false. Only one component is processed.

The last component processed is stored in the `CurrentComponent.txt` file in the AutoConfig folder. Editing this file is not recommended.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you specify -Resume or -Repeat, and CurrentComponent.txt is missing or invalid, processing stops, and you are prompted to select a component.

Setting the OnErrorAction in the CustomerInfo.yml file

You can also set OnErrorAction values in the CustomerInfo.yml file. Set the values using the following cmdlets:

- For a new file: New-CvadAcCustomerInfoFile -OnErrorAction Continue | Pause | StopCompEnd | StopImmediately
- For an existing file: Set-CvadAcCustomerInfoFile -OnErrorAction Continue | Pause | StopCompEnd | StopImmediately

Logs

Running any cmdlet results in a log file creation and an entry in the main history log file. All operation log files are placed in a backup folder. All log file names begin with CitrixLog, then show the autoconfig operation and the date and timestamp of the cmdlet execution. Logs do not auto-delete.

The main history log is located in *%HOMEPATH%\Documents\Citrix\AutoConfig*, in the file named **History.Log**. Each cmdlet execution results in a main log entry containing the date, operation, result, backup, and log file locations of the execution.

You can also use the New-CvadAcZipInfoForSupport cmdlet to collect logs to send to Citrix for support. This cmdlet zips all log and .yml files in a single zip file. Customer sensitive information (CustomerInfo.yml and CvadAcSecurity.yml) is not included in the zip. The Icon.yml file is also excluded due to its size. The zip file is placed in *%HOMEPATH%\Documents\Citrix\AutoConfig* and named *CvadAcSupport_yyyy_mm_dd_hh_mm_ss.zip*, based on the date and timestamp. This zip file can also act as a backup.

Each log file includes the following:

- The name of the operation and whether the check mode is enabled
- The start and end date and time
- Multiple entries for each component's actions and success/failure notifications
- Summary of actions taken including various counts of created objects
- Suggested fixes where applicable
- Backup folder location where applicable
- Main log location
- Duration

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Diagnostic files

Diagnostic files assist you in determining and resolving problems. The following files are created when their operation is run. They are located in the action-specific subfolder under *%HOMEPATH%\Documents\Citrix\AutoConfig*. Include these files when providing information for problem resolution support.

Export

`PoshSdk_yyyy_mm_dd_hh_mm_ss.ps1`

This file counts all Broker PowerShell SDK calls made to export the site configuration to files.

Import, Merge, Restore, Sync, Backup, Compare

`Transaction_yyyy_mm_dd_hh_mm_ss.txt`

This file documents each Rest API call and related information.

`RestApiContent_yyyy_mm_dd_hh_mm_ss.txt`

This file contains the all `Add`, `Update`, and `Delete` Rest API content.

Problems resulting from dependencies

Imports and merges might fail due to missing dependencies. Some common problems are:

1. Group Policies are missing delivery group filters. The usual causes are delivery groups that have not been imported.
2. Applications fail to import or merge. The usual cause is missing delivery groups or application groups that have not been imported.
3. Application groups are missing a RestrictToTag. The usual causes are tags that have not been imported.
4. Host connections fail. The usual cause is missing security information in the CvadAcSecurity.yml file.
5. Machine catalogs fail. The usual cause is host connections that were not imported.
6. Machines missing from machine catalogs and delivery groups. The usual cause is machines that were not found in Active Directory.
7. Users missing from delivery groups. The usual cause is users that were not found in Active Directory.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendations

- Do not run more than one instance of Automated configuration at a time. Running multiple concurrent instances produces unpredictable results in the cloud site. If this occurs, rerun one instance of Automated configuration to bring the site to the expected state.
- Do not work or change data in Studio while running Automated configuration.
- Always visually verify the merge or import or restore results in Studio to ensure that the cloud site meets expectations.

Folders

Default folder root location

All Automated configuration tool operations occur in the root folder or in subfolders inside it. The root folder is located in *%HOMEPATH%\Documents\Citrix\AutoConfig*.

Export

All exported files are placed in two folder locations, providing ease-of-use and a history of exports. Exports are always placed in the root folder. Copies are placed in a subfolder named **Export** with the date and time of the export.

The root folder always contains the most recent exported on-premises site configuration. Each **Export** subfolder contains the export done on the indicated date and time, which maintains a history of exports. You can use any **Export** subfolder to configure the cloud site. Automated configuration does not delete or modify existing export subfolders.

Import/Merge/Sync/Compare

`Import`, `Merge`, and `Compare` operations always sourced from files located in the root folder. Each operation results in the creation of a subfolder to which files in the root folder are copied, providing a history of cloud site changing source files.

Restore

The `Restore` operation uses an existing subfolder to configure the cloud site. The source folder is specified on the required `-RestoreFolder` parameter. Unlike with other commands, no new subfolder is created because the `Restore` operation uses an existing subfolder. The restore folder can be the root folder but still must be specified on the `-RestoreFolder` parameter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Backups

Automated Configuration initializes, updates, and backs up a cloud site configuration. When used over time, many different configurations can change on the cloud site. To facilitate long-term use and preserve history changes, Automated Configuration uses a preservation scheme to save this history of changes and provide a method to restore earlier states.

Cloud site configuration backups are always made to a subfolder named **Backup** with the data and time of the backup. Automated Configuration does not delete or modify existing export subfolders.

You can use the backups to restore specific components or your entire configuration. To restore the entire delivery group and machine catalog components, use the cmdlet:

```
Restore-CvadAcToSite -RestoreFolder %HOMEPATH%\Documents\Citrix\
AutoConfig/Backup_yyyy_mm_dd_hh_mm_ss -DeliveryGroups -MachineCatalogs
```

> **Note:**
>
> The backup file information in the preceding cmdlet is based on your own backups.

To restore the entire cloud site configuration, use the cmdlet:

```
Restore-CvadAcToSite -RestoreFolder %HOMEPATH%\Documents\Citrix\
AutoConfig/Backup_yyyy_mm_dd_hh_mm_ss
```

> **Note:**
>
> The backup file information in the preceding cmdlet is based on your own backups.

Changing the default root folder

The `Export`, `Import`, `Merge`, `Sync`, and `Compare` operations can change the default root folder by using the `–AlternateFolder` parameter. The creation and management of per-operation subfolders remains the same as previously described.

Files copied to subfolders

All files having an ".yml"extension are copied to operation subfolders except for the following:

- CustomerInfo.yml
- ZoneMapping.yml
- CvadAcSecurity.yml

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Automated fail-safe cloud site backups

A backup of the current cloud site configuration is made before running operations that change the configuration. This includes `Import`, `Merge`, `Sync`, and `Restore` parameters. The backup is always in a subfolder beneath the operational subfolder.

In the case of `Restore`, the backup folder is a subfolder of the folder specified on the `-RestoreFolder` parameter.

Automation

Automated configuration tool cmdlets can be run in automation scripts without administrator intervention by suppressing prompts and the display of the log results at cmdlet completion. You can also set parameters to do the same by using the CustomerInfo.yml file.

Add the following parameter to cloud modifying cmdlets to suppress the display of prompts.

```
-Confirm $false
```

Add the following parameter to cmdlets to suppress the display of log at the completion of the cmdlet.

```
-DisplayLog $false
```

Add the following parameter to cmdlets to suppress logging to the PowerShell command window.

```
-Quiet
```

As another method, the following parameters can be placed in the CustomerInfo.yml file.

```
Confirm: False
```

```
DisplayLog: False
```

Exporting from PCs other than the Delivery Controller™

The Automated configuration tool uses multiple Citrix PowerShell SDKs to export the on-premises site configuration to files. These SDKs are automatically installed on the Delivery Controller, enabling the tool to run on the Delivery Controller without extra actions. When running on non-Delivery Controller machines, it is necessary to install the set of Citrix PowerShell SDKs needed by the tool. This SDK set is part of Citrix Studio which can be installed from the Citrix Virtual Apps and Desktops™ installation media.

> **Note:**
>
> Automated configuration cannot be run on the Cloud Connector.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Moving to Citrix Cloud™ Government and Japan Control Plane

The Citrix Cloud Government and Japan Control Plane environments use different access points to authenticate and allocate access tokens. This unique requirement applies to any Automated configuration tool accessing the cloud. Perform the following steps to use Automated configuration in these environments.

1. In the *%HOMEPATH%\Documents\Citrix\AutoConfig* folder, edit CustomerInfo.yml.
2. Add one of the following lines, depending on the environment you want to connect to, to CustomerInfo.yml (or change it, if already present.)

   ```
   Environment: 'ProductionGov'
   ```

   or

   ```
   Environment: 'ProductionJP'
   ```

Automated Configuration is now able to be used on these environments.

Autoscale™

May 13, 2026

> **Note:**
>
> This feature is available only in Web Studio.

Autoscale is a feature that provides a consistent, high-performance solution to proactively power manage your machines. It aims to balance costs and user experience.

Autoscale enables proactive power management of all registered single-session and multi-session OS machines in a delivery group.

Autoscale features include:

- Schedule-based and load-based settings
- Dynamic session timeouts
- Autoscale tagged machines (cloud burst)
- User logoff notifications

Typical use cases

The following are the scenarios where AutoScale is commonly used.

- Scheduled-based machine powering on to handle expected workload

  Autoscale allows admins to vary the powered-on capacity with 30 min granularity and allows for different schedules on different days. If a volatile workload is expected, it is advised to configure the capacity buffer to avoid users having to wait for machines to power on.

- Cloud burst use case

  Autoscale provides the flexibility to power manage only a subset of machines in a delivery group. To achieve this, apply a tag to one or more machines and then configure Autoscale to power manage only tagged machines.

  This feature can be useful in cloud bursting use cases, where you want to use on-premises resources (or reserved public cloud instances) to handle workloads before cloud-based resources address additional demand (that is, burst workloads).

- Users ramping up slowly or seasonal users

  When an organization has users onboarding slowly and does not want to provision the entire capacity ahead of time, then the dynamic provisioning feature can help. The feature constantly

© 1997–2026 Citrix Systems, Inc. All rights reserved.

evaluates the load on the delivery group and dynamically scale up or down the number of machines in the delivery group based on the current load conditions. An admin must define the high and low watermark for the load on the delivery group to create machines. Admins can optionally define the maximum number of machines to be provisioned and tags to be applied to these machines.

Supported VDA hosting platforms

Autoscale supports all the platforms that Citrix Virtual Apps and Desktops supports. This includes various infrastructure platforms including XenServer, Amazon Web Services, Google Cloud Platform, Microsoft Azure Resource Manager, VMware vSphere, and many more. For a complete list of supported platforms, see System requirements for Citrix Virtual Apps and Desktops.

> **Note:**
>
> When adding public cloud host connections to your deployment, you need Hybrid Rights License. For information about Hybrid Rights License, see Transition and Trade-Up (TTU) with Hybrid Rights. For information about adding a license, see Create a site.

Supported workloads

Autoscale supports both multi-session OS and single-session OS delivery groups. There are three user interfaces to be aware of:

- Autoscale user interface for multi-session OS delivery groups (formerly RDS delivery groups)
- Autoscale user interface for single-session OS random (pooled) delivery groups (formerly pooled VDI delivery groups)
- Autoscale user interface for single-session OS static delivery groups (formerly static VDI delivery groups)

For more information about the user interfaces for different delivery groups, see Autoscale user interfaces.

Benefits

The Autoscale feature delivers the following benefits:

- Provide you with a single, consistent mechanism to power manage machines in a delivery group.
- Ensure availability and control costs by powering machines with load-based or schedule-based power management, or a combination of both.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To monitor metrics such as cost savings and capacity utilization, and to enable notifications, use Director.

Watch a 2-minute video

The following video provides a quick tour of Autoscale.

This is an embedded video. Click the link to watch the video

Get started with Autoscale™

May 13, 2026

Autoscale is a feature that provides a consistent, high-performance power management solution to proactively scale delivery groups based on a configured schedule or load demands.

Autoscale applies to all types of delivery groups:

- Single-session static OS
- Single-session random OS
- Multi-session random OS

This article describes basic Autoscale-related concepts and provides guidance on how to enable and configure Autoscale for a delivery group.

Basic concepts

Before you start, learn about the following basic concepts in Autoscale:

- Capacity and machine registration
- Scale across multiple machine catalogs
- Machine provisioning and session demand
- Instance size considerations
- Schedules
- Peak and Off-Peak times
- Power-Off delay
- Pool size
- Capacity buffer
- Load index
- Autoscale and maintenance mode

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Machine cost
- Scale up a delivery group
- Scale down a Delivery Group
- Drain state

Capacity and machine registration

Autoscale includes only machines that are registered with the site when determining the capacity. Powered-on machines that are unregistered can't accept session requests. As a result, they aren't included in the overall capacity of the delivery group.

Scale across multiple machine catalogs

In some sites, multiple machine catalogs might be associated with a single delivery group. Autoscale randomly powers on machines from each catalog to meet schedule or session demand requirements.

For example, a delivery group has two machine catalogs: Catalog A has three machines powered on and Catalog B has one machine powered on. If Autoscale needs to power on an extra machine, it might power on a machine from either Catalog A or Catalog B.

Machine provisioning and session demand

The machine catalog associated with the delivery group must have enough machines to power on and off as demand increases and decreases. If session demand exceeds the total number of registered machines in the delivery group, Autoscale ensures that all registered machines are powered on. However, **Autoscale does not provision additional machines**.

> **Note:**
>
> If a Delivery Group has 63 machines and a buffer capacity of 10% is set for off-business hours, then as per the Autoscale calculation, 6.3 machines must be turned on during off-business hours. To handle the decimal value, following are the rules:
>
> - Round to nearest: For example, if the value is 6.4, then 6 machines are turned on. If the value is 6.7, then 7 machines are turned on.
> - Round to 1 for any non-zero value less than 1. For example, if the value is 0.2 or 0.9, then 1 machine is turned on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Instance size considerations

You can optimize your costs if you appropriately size your instances in public clouds. We recommend that you provision smaller instances as long as they match your workload performance and capacity requirements.

Smaller instances host fewer user sessions than larger instances. Therefore, Autoscale puts machines into drain state faster because it takes less time for the last user session to be logged off. As a result, Autoscale powers off smaller instances sooner that reducing costs.

Schedules

Autoscale powers on and off machines in a delivery group based on a schedule that you set.

A schedule includes the number of active machines for each time slot, with peak and off-peak times defined.

Schedule settings vary with the type of delivery group. For more information, see:

- Multi-session OS delivery groups
- Single-session OS random delivery groups
- Single-session OS static delivery groups

Peak and off-peak times

Peak and off-peak times are used to indicate which of the capacity buffer values to use for specific periods of the day. You can define the peak times, leaving the remaining undefined times as off-peak times.

Power-Off delay

Power-off delay is the minimum number of minutes that must elapse after a machine is powered on before Autoscale can power off that machine. This keeps machines from flip-flopping on and off during volatile session demands. By default, the power-off delay is 30 minutes. You can set it in a range of 0-60 minutes.

Pool size

Pool size is the number of machines that must be kept powered-on for a particular period of a day.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Capacity buffer

Capacity buffer is used to add spare capacity to the current demand to account for dynamic load increases. There are two scenarios to be aware of:

- For multi-session OS delivery groups, the capacity buffer is defined as a percentage of the total capacity of the delivery group in terms of load index.
- For single-session OS delivery groups, the capacity buffer is defined as a percentage of the total number of machines in the delivery group.

The capacity buffer is a rolling buffer, given that it is calculated and applied based on the current usage rather than calculated and applied on top of the configured pool size.

For example, given a delivery group with 10 machines, a pool size of 1 machine for the current period and a capacity buffer of 10%. An additional machine is powered on when the 1 powered-on machine, as defined by the schedule, is loaded to the point where the 10% capacity buffer is no longer satisfied. If the load is reduced after powering on the second machine and there is more than enough free load capacity to satisfy the 10% capacity buffer, Autoscale prepares 1 machine for power off.

Load index

> **IMPORTANT:**
>
> The load index applies only to multi-session delivery groups.

The load index metric determines how likely a machine is to receive user logon requests. It's calculated using the **Citrix Load Management policy** settings configured for concurrent logon, session, CPU, disk, and memory use.

The load index ranges from 0 to 10,000. By default, a machine is considered at full load when it's hosting 250 sessions:

- The digit "0"indicates an unloaded machine. A machine with a load index value of 0 is at a baseline load.
- The digit "10,000"indicates a fully loaded machine that can't run any more sessions.

Autoscale and maintenance mode

Machines in maintenance mode, regardless of their availability status, are considered as part of the calculation of the overall pool size. Therefore, it's possible for all machines within the pool to be in maintenance mode. However, these machines are excluded from the capacity buffer calculations, ensuring their immediate availability. To guarantee a specific percentage of machines are accessible for user connections, adjust the pool size and buffer values accordingly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine cost

Machine instance cost per hour is the cost per hour, in US$, of the computing capacity being used. This setting is used to calculate the cost savings of the Autoscale settings. To view the savings, go to **Monitor > Trends > Machine usage**.

Scale up a delivery group

Autoscale powers on additional machines in an Autoscale-enabled delivery group when:

1. The Autoscale schedule for the delivery group indicates that more machines must be powered on for the current time period.
2. The current load on the delivery group has exceeded the capacity buffer.

Conditions for powering on machines:

1. Not in maintenance mode.
2. Hypervisor is not in maintenance mode.
3. Powered off and unregistered.
4. Belongs to the delivery group that requires scaling up
5. No pending power actions.

Scale down a delivery group

Autoscale powers off machines in an Autoscale-enabled delivery group when:

1. The Autoscale schedule specifies that machines must be powered off to meet the configured number of machines for the current time period.
2. The current load of the delivery group has decreased, resulting in more powered-on machines than required to meet the pool size and capacity buffer.

Autoscale scales down a delivery group by powering off the excess machines exceeding the number needed to meet the pool size and capacity buffer.

The scale-down process involves two steps:

1. Place the required number of machines into the drain state.
2. Select all drained machines for power off.

Machines eligible for power off must meet the following criteria:

1. Not in maintenance mode
2. Hypervisor not in maintenance mode
3. Currently powered-on

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Registered as available or is waiting to register after starting up
5. Drained and has no active sessions
6. No pending power actions
7. Satisfies the power-off delay

Drain state

Autoscale attempts to scale down the number of powered-on machines in the delivery group to the configured pool size and capacity buffer.

To achieve this goal, Autoscale puts the excess machines with the fewest sessions into "drain state" and powers them off when all sessions are logged off. This behavior occurs when session demand lessens and the schedule requires fewer machines than are powered on.

Conditions for the machines to drain:

1. Powered-on
2. Not be in maintenance mode
3. Hypervisor not in maintenance mode
4. Belongs to the delivery group that requires scaling down
5. Least number of current active sessions

> **Note:**
>
> - Machines that have been on for at least the time specified by the Power-Off delay are preferred for drain.
> - Machines in drain state no longer host new session launches and waits for the existing sessions to be logged off. A machine is shut down only when all sessions are logged off. However, if there are no machines immediately available for session launches, Autoscale prefers directing the session launches to a machine in drain state over powering on a machine.

Autoscale puts excess machines into "drain state"one by one:

- If two or more machines have the same number of active sessions, Autoscale drains the machine that has been powered on for the specified power-off delay.

  Doing so avoids putting recently powered-on machines into drain state because those machines are more likely to have the fewest sessions.

- If two or more machines have been powered on for the specified power-off delay, Autoscale drains those machines one by one at random.

Machines in drain state no longer host new session launches and are waiting for the existing sessions to be logged off. A machine becomes a candidate for shutdown only when all sessions are logged

© 1997–2026 Citrix Systems, Inc. All rights reserved.

off. However, if there are no machines immediately available for session launches, Autoscale prefers directing the session launches to a machine in drain state over powering on a machine.

A machine is taken out of drain state when one of the following conditions is met:

- The machine is powered off.
- Autoscale is disabled for the delivery group to which the machine belongs.
- Autoscale uses the machine to meet schedule or load demand requirements. This case occurs when the schedule (schedule-based scaling) or the current demand (load-based scaling) requires more machines than the number of machines that are currently powered on.

> **Important:**
>
> If no machines are immediately available for session launches, Autoscale prefers directing session launches to a machine in a drain state over powering on a machine. A machine in a drain state that hosts a session launch remains in drain state.

Display drain state You can determine which machines are in a drain state using PowerShell or Web Studio.

Use PowerShell Run the `Get-BrokerMachineV2` PowerShell cmdlet to view the **IsDraining** and **DrainingReason** properties for your machines.

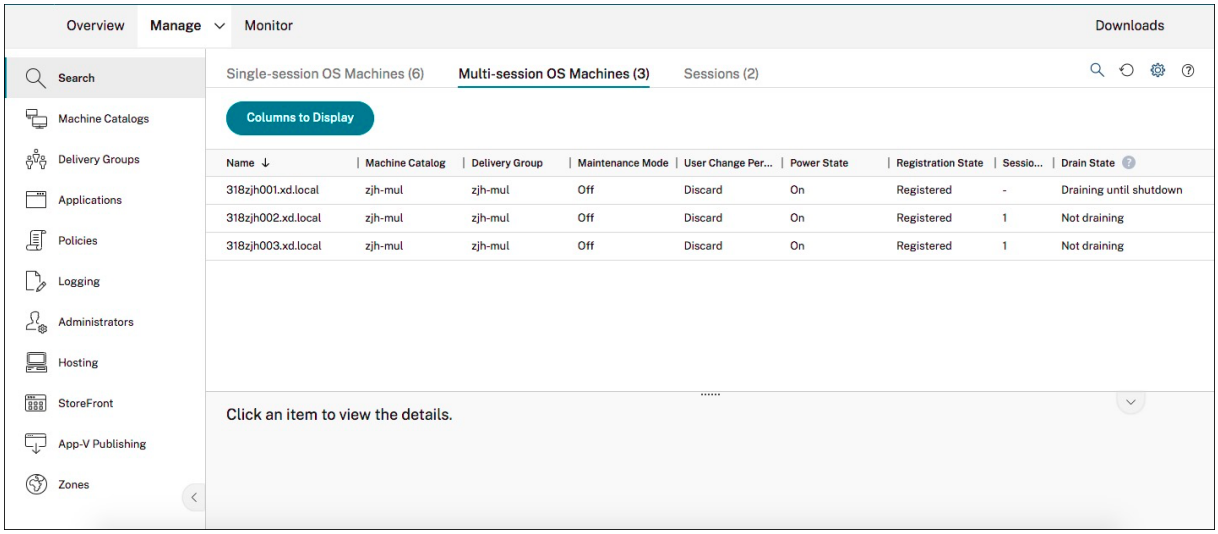
For example: `Get-BrokerMachineV2 -Property IsDraining,DrainingReason, MachineName | Format-Table MachineName,IsDraining,DrainingReason`

- **IsDraining:** This Boolean property is `True` when a machine is in a drain state and `False` when it is not.
- **DrainingReason:** This property provides a specific reason for the machine being in a drain state. Its default value is `NotDraining`. When a machine is draining, **DrainingReason** displays one of the following values:
  - **AutoscaleScaleDown:** Autoscale initiated the drain state to scale down the number of powered-on machines in a delivery group to meet configured pool size and capacity buffer requirements. This occurs when session demand lessens or the schedule requires fewer machines.
  - **NaturalRebootCycle:** The machine is draining as part of a scheduled reboot cycle with the "Wait for session to end"restart mode. The machine waits for active sessions to end before rebooting.
  - **RebootCycle:** The machine is draining as part of a scheduled reboot cycle with the "Force logoff"restart mode. Active sessions are forcibly logged off before the machine reboots.
  - **MaintenanceMode:** An administrator placed the machine in maintenance mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **HypervisorInMaintenanceMode:** The hypervisor connection hosting the machine is in maintenance mode.
- **MaintenanceCycle:** The machine is draining as part of VUS maintenance cycle operation, such as an OS disk reset.
- **GuestOSDraining:** The guest operating system explicitly sets itself into a drain mode (for example, through a registry setting). This reason applies only to multi-session machines.
- **GuestOSDrainingUntilRestart:** The guest operating system sets itself into a drain mode that will persist until the next restart. This reason applies only to multi-session machines.

Use Web Studio



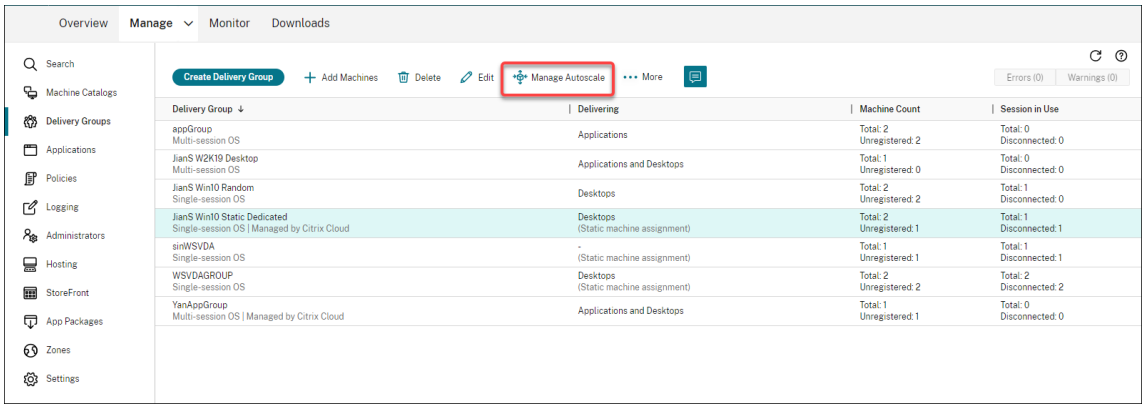
> **Note:**
>
> While the `IsDraining` and `DrainingReason` properties apply to both single-session and multi-session machines (with `GuestOSDraining` reasons being multi-session specific), the **Drain State** column in Web Studio historically applies only to multi-session machines for displaying these states.

To display machines that are in a drain state in Web Studio:

1. Navigate to the **Search** node and then click **Columns to Display**.
2. In the **Columns to Display** window, select the checkbox next to **Drain State**.
3. Click **Save** to exit the **Columns to Display** window.

The **Drain State** column can display the following information:

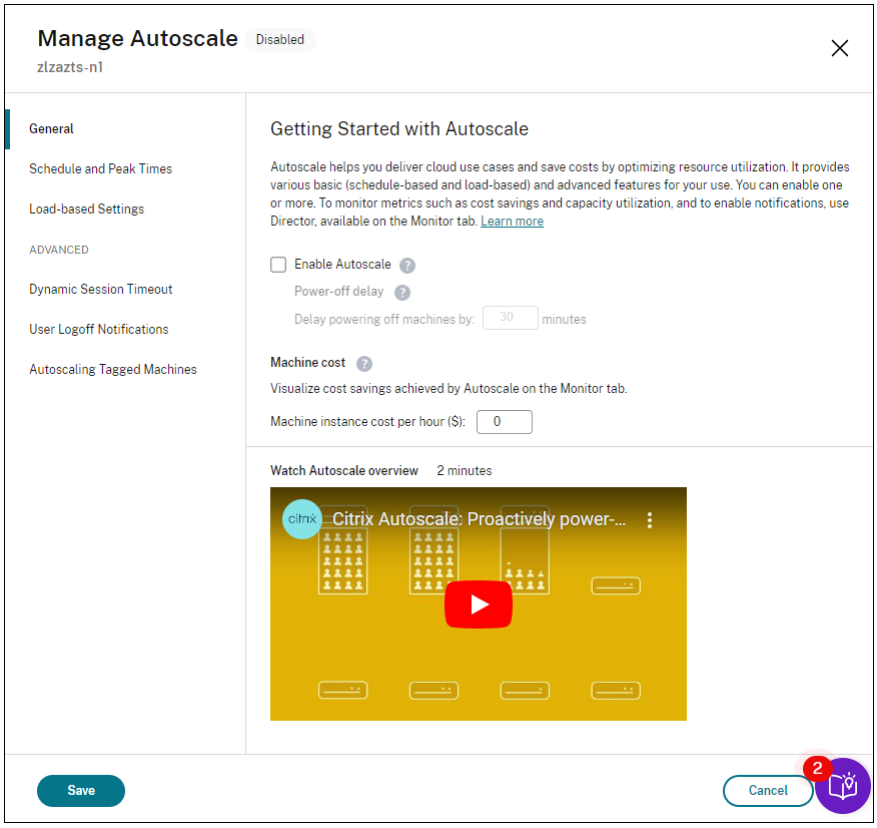
- **Draining until shutdown.** Appears when machines are in drain state until they're shut down.
- **Not draining.** Appears when machines aren't yet in a drain state.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable Autoscale for a delivery group

Autoscale is disabled by default when you create a delivery group. To enable and configure Autoscale for a delivery group using Web Studio, follow these steps:



You can also use PowerShell commands to enable and configure Autoscale for a delivery group. For more information, see Broker PowerShell SDK commands.

1. Select **Delivery Groups** in the left pane.
2. Select the delivery group that you want to manage and then click **Manage Autoscale**.

3. On the **Manage Autoscale** page, select the **Enable Autoscale** check box to enable Autoscale. After you enable Autoscale, the options on the page are enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. To change the default settings based on your organization's needs, complete the following settings:

    - Set up schedules
    - To power off inactive machines more efficiently, use Dynamic session timeouts and User logoff notifications
    - To power manage a subset of machines in the delivery group, use Autoscaling tagged machines

To disable Autoscale, clear the **Autoscale** check box. The options on the page turn gray to indicate that Autoscale is disabled for the selected delivery group.

> **Important:**
>
> - If you disable Autoscale, all machines managed by Autoscale remain in their states at the time of disabling.
> - After you disable Autoscale, the machines in drain state are taken out of drain state. For more information about drain state, see Drain state.
> - The **Power policies** actions for single-session OS static delivery groups and single-session OS random delivery groups on the **Load-based Settings** page is independent of the Autoscale setting (enabled or disabled).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Exclude draining machines from autoscale calculations

This feature allows you to prevent machines, which are draining due to reboot schedules, from counting towards Autoscale capacity targets. By excluding these machines, you optimize resource provisioning and avoid over-provisioning.

For example: You have a delivery group of multi-session OS machines configured with Autoscale and regular reboot schedules. When machines enter a draining state for reboot, Autoscale typically still counts them as available capacity. This might trigger the provisioning of additional machines unnecessarily. By enabling this feature, you instruct Autoscale to ignore these draining machines when calculating capacity. This ensures that only actively available machines contribute to the target, which leads to more efficient resource utilization and reduced operational costs.

Applicability

This feature applies to delivery groups containing **multi-session OS machines (RDS)**.

Limitations

- This feature does not apply to single-session OS machines.
- When you configure Autoscale based on the "Number of machines"(rather than "Percentage"), the system does not exclude machines in a draining state from Autoscale calculations.

Important considerations

- The property `ExcludeNaturalRebootDrainingFromAutoscale` is configured at the delivery group.
- The default value for the `ExcludeNaturalRebootDrainingFromAutoscale` property is `False`. This means draining machines are included in Autoscale calculations by default.

Prerequisites

- Configure a multi-session OS delivery group.
- Enable and configure Autoscale for the target delivery group. Preferably, you use "Percentage of machines"for scaling.
- Configure Restart Schedules for the delivery group to induce machines into a draining state.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How to configure

You configure this feature at the delivery group level using a PowerShell command.

1. Ensure the feature toggle `ExcludeNaturalRebootDrainingFromAutoscale` is enabled. You can verify this by running `Get-ConfigEnabledFeature` in PowerShell and checking for the toggle in the output list.

   > **Note:**
   >
   > If the toggle is disabled, you cannot modify the delivery group property.

2. Set the delivery group property to exclude draining machines.

   a) Open PowerShell with administrative privileges.

   b) Identify your multi-session OS delivery group.

   c) Set the `ExcludeNaturalRebootDrainingFromAutoscale` property to `$True` for your delivery group using the `Set-BrokerDesktopGroup` cmdlet:

   ```
   Set-BrokerDesktopGroup -Name "<YourDeliveryGroupName>" -
       ExcludeNaturalRebootDrainingFromAutoscale $True
   ```

   Replace <`YourDeliveryGroupName`> with the actual name of your delivery group.

   d) Verify the property is set to `True` by running:

   ```
   Get-BrokerDesktopGroup -Name "<YourDeliveryGroupName>" |
       Select Name, ExcludeNaturalRebootDrainingFromAutoscale
   ```

   The output should show `ExcludeNaturalRebootDrainingFromAutoscale : True`.

3. Configure Autoscale and restart schedules (if not already configured).

   Ensure your delivery group has Autoscale enabled and a Restart Schedule configured to cause machines to enter a draining state.

   a) In Web Studio, edit your delivery group.
   b) Go to **Manage Autoscale** and configure peak/off-peak schedules, ensuring Autoscale is enabled. If you intend for draining machines to be excluded, set your schedule based on "Percentage of machines".
   c) Go to **Restart Schedule** and create or edit a schedule that causes machines to enter a draining state (e.g., use **Graceful restart** for Cloud or **Re-start all machines after draining session** for on-premises deployments).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitoring and Troubleshooting

Problem: Sessions occasionally launch onto draining machines even when you enable the feature.

Cause: This is expected behavior. Machines in a draining state are still available for session launches as a "last resort" if no other suitable non-draining machines are available. The feature primarily affects Autoscale calculations for provisioning/deprovisioning. It does not affect the broker's session launch logic itself.

Solution: This is not an issue but an intended design. To minimize sessions going to draining machines, ensure your Autoscale buffer and capacity are sufficient to keep enough non-draining machines available to meet demand.

Autoscale options for VMs with user sessions

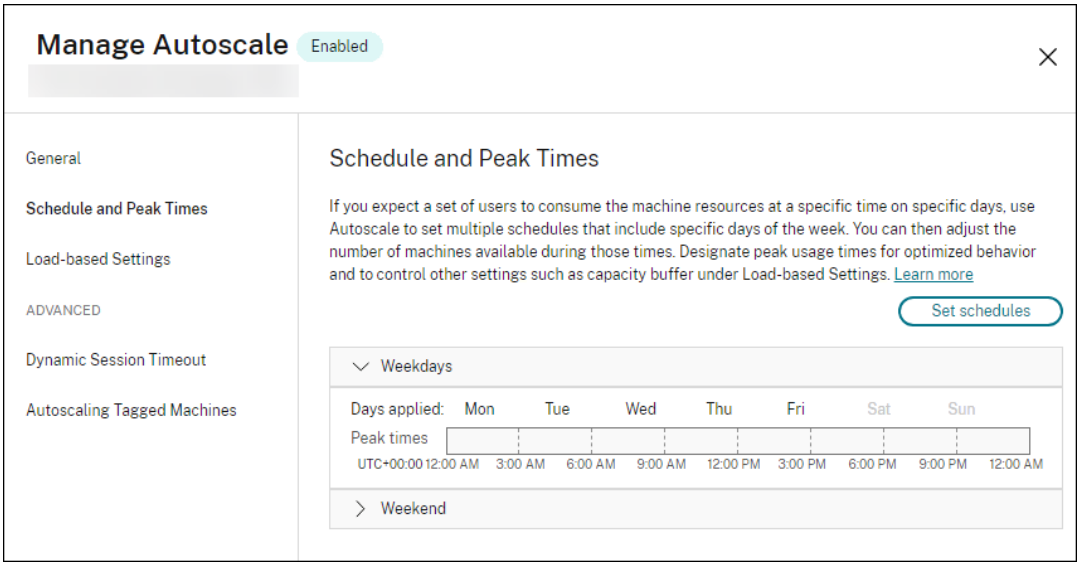
Autoscale can manage both assigned and pooled machines, optimizing their power and availability. The following content provides PowerShell commands and UI settings for controlling machine power states based on peak and off-peak times and user sessions for assigned and pooled machines.

Assigned machines are dedicated to a single user, while pooled machines are shared among multiple users.

> **Note:**
>
> - Session limit policies in Citrix Studio, particularly the *Disconnected session timer* and *Session idle timer*, are crucial for managing user sessions even when Citrix Autoscale is NOT enabled. These policies define how long a session can remain disconnected or idle before being terminated, ensuring resource utilization and preventing locked-out sessions. The policy setting can be used for both assigned and pooled machines, particularly those running multi-session VDAs. For detailed information, see Session limits policy settings.
> - The `Get-BrokerMachine` PowerShell command is deprecated. Use `Get-BrokerMachineV2` as an alternative.

For assigned machines

- To automatically power on assigned single-session machines in a static delivery group at the beginning of peak time use the PowerShell command:



```
Set-BrokerDesktopGroup "Desktop Group Name" -
    AutomaticPowerOnForAssigned $True
```

- To ensure any assigned machine that is found to be off during peak time is restarted, also enable `AutomaticPowerOnForAssignedDuringPeak`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-BrokerDesktopGroup "Desktop Group Name" -
    AutomaticPowerOnForAssigned $True -
    AutomaticPowerOnForAssignedDuringPeak $True
```

- If you want the VMs to turn on only when a user launches a session, then do either of the following:
  - Set `AutomaticPowerOnForAssigned` and `AutomaticPowerOnForAssignedDuringPeak` to `False`.
  - Define all hours as off-peak with no peak hours at all using the UI interface. See Schedule-based settings. During off peak times an Autoscale managed assigned machine is shut down if it has no user session on it.

- In cases where all the machines are turned on by Autoscale at peak times, use the UI interface to set the wait time in minutes and actions like, no action, suspend, or shut down if no user logs on after the machine is powered on by Autoscale. See Power policies.

For pooled machines

To automatically shut down pooled machines after session logoff, set the PowerShell command `ShutdownAfterUse` to `True` for a delivery group. For example:

```
Set-BrokerDesktopGroup -Name “DesktopGroupName” -
    ShutdownDesktopsAfterUse $true
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitor metrics

After you enable Autoscale for a delivery group, you can monitor the following metrics of Autoscale-managed machines from Director.

- Machine usage
- Estimated savings
- Alert notifications for machines and sessions
- Machine status
- Load evaluation trends

> **Note:**
>
> When you initially enable Autoscale for a delivery group, it might take a few minutes to display monitoring data for that delivery group.
> Monitoring data remains available if Autoscale is enabled and then disabled for the delivery group. Autoscale collects monitoring data at 5-minute intervals.

For more information about the metrics, see Monitor Autoscale-managed machines.

Autoscale on hibernated VMs

You can hibernate VMs through Autoscale configurable settings. Use the PowerShell commands `Get-BrokerDesktopGroups`, `New-BrokerDesktopGroups`, or `Set-BrokerDesktopGroups` to set the following positive value to the parameter `AutoscaleScaleDownActionDuringPeak` (during peak) or `AutoscaleScaleDownActionDuringOffPeak` (during off peak) to define the power actions:

- 0: Shut down the VMs when scaling down
- 1: Suspend (hibernate the VMs) when scaling down

VMs not capable of hibernation are shut down.

You can configure reboot schedules for hibernated VMs if the Delivery Group is hibernation enabled. In the reboot cycle, the VMs are resumed and, then shut down. The reboot schedule can be set as weekly, daily, monthly, and once. You can configure multiple schedules. However, the VMs resuming from hibernation can take few mins.

Autoscale can also power on hibernated multi-session Remote Desktop Services (RDS) and shared single session VMs with no sessions on it during peak time. The VMs can be of MCS and non-MCS machine catalogs.

More information

For more information on Autoscale, see Citrix Autoscale in Tech Zone.

Schedule-based and load-based settings

May 13, 2026

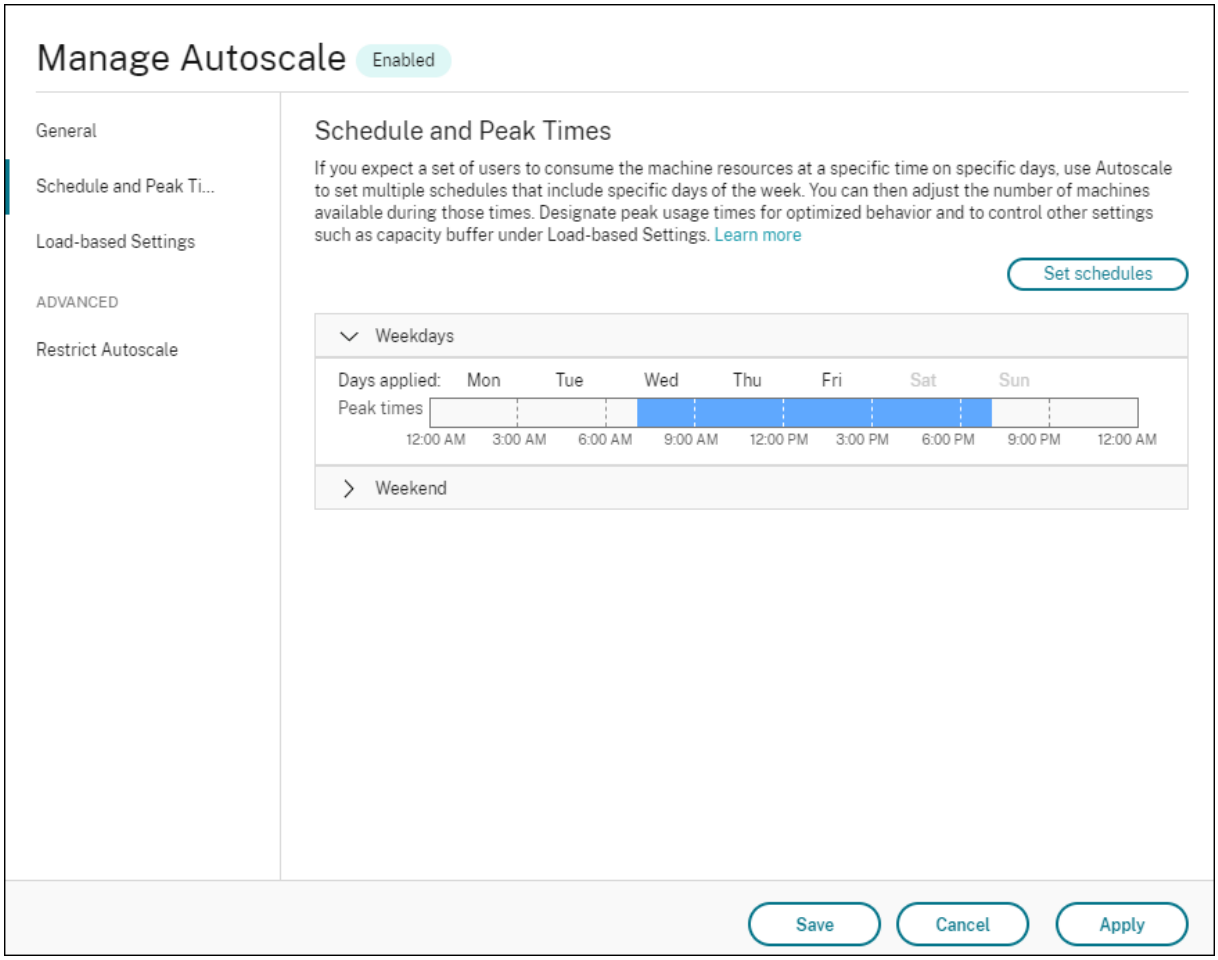
How Autoscale™ power manages machines

Autoscale powers machines on and off based on the selected schedule. Autoscale lets you set multiple schedules that include specific days of the week and adjust the number of machines available during those times. If you expect a set of users to consume the machine resources at a specific time on specific days, Autoscale helps provide an optimized experience. Note that those machines will be powered on during the schedule, whether or not there are sessions running on them.

> **Note:**
>
> Autoscale supports any power-managed machine.

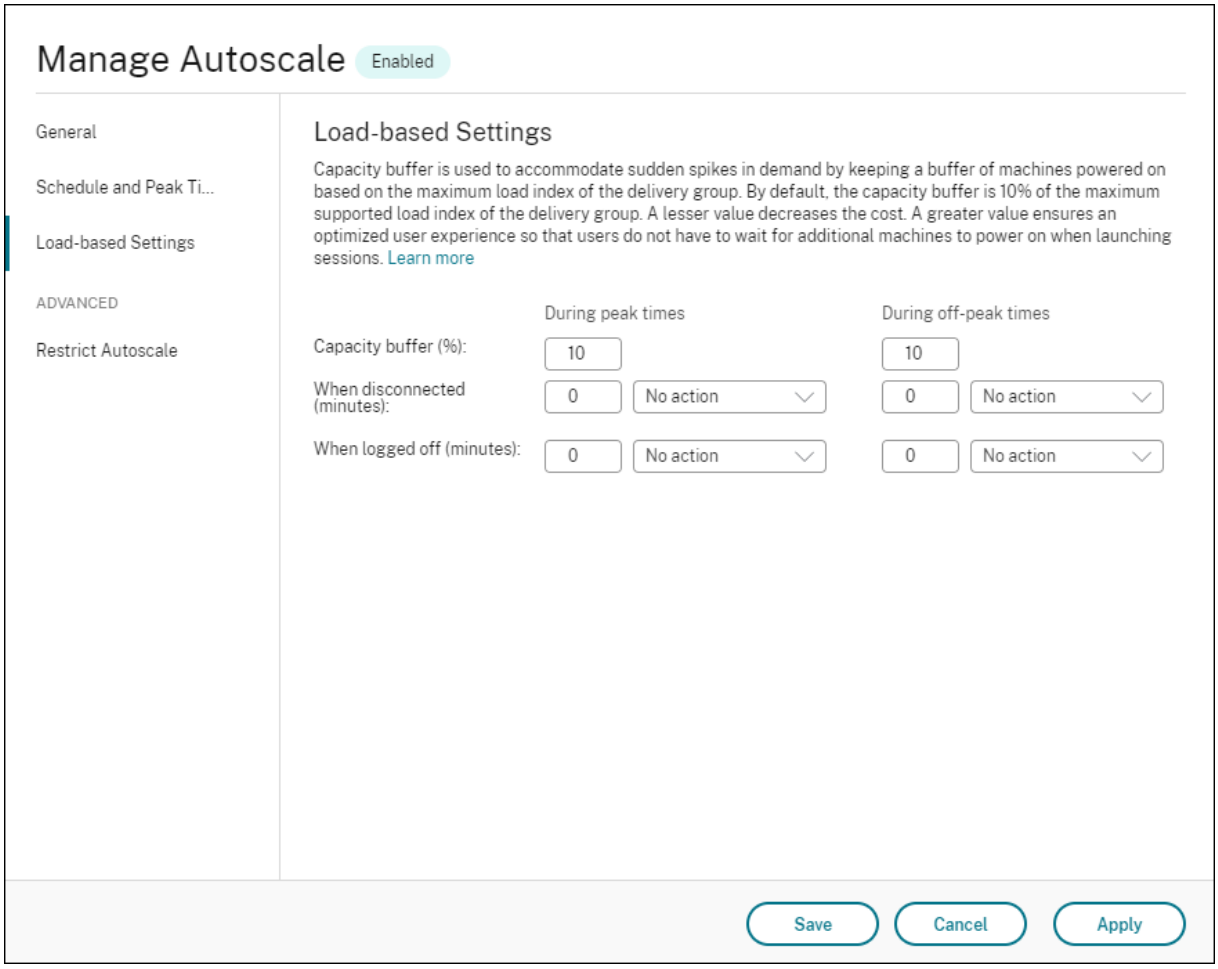
The schedule is based on the **time zone** of the delivery group. To change the time zone, you can change user settings in a delivery group. For more information, see Manage Delivery Groups.

Autoscale has two default schedules: *Weekdays* (Monday through Friday) and *Weekend* (Saturday and Sunday). By default, the **Weekdays** schedule keeps one machine powered on from 07:00 AM to 06:30 PM during peak times and none during off-peak times. The default capacity buffer is set to 10% during peak and off-peak times. By default, the **Weekend** schedule keeps no machines powered on.



> **Note:**
>
> Autoscale treats only those machines that are registered with the site as part of the available capacity in the calculations it makes. "Registered"means that the machine is available for use or already in use. Doing so ensures that only machines that can accept user sessions are included in the capacity for the delivery group.

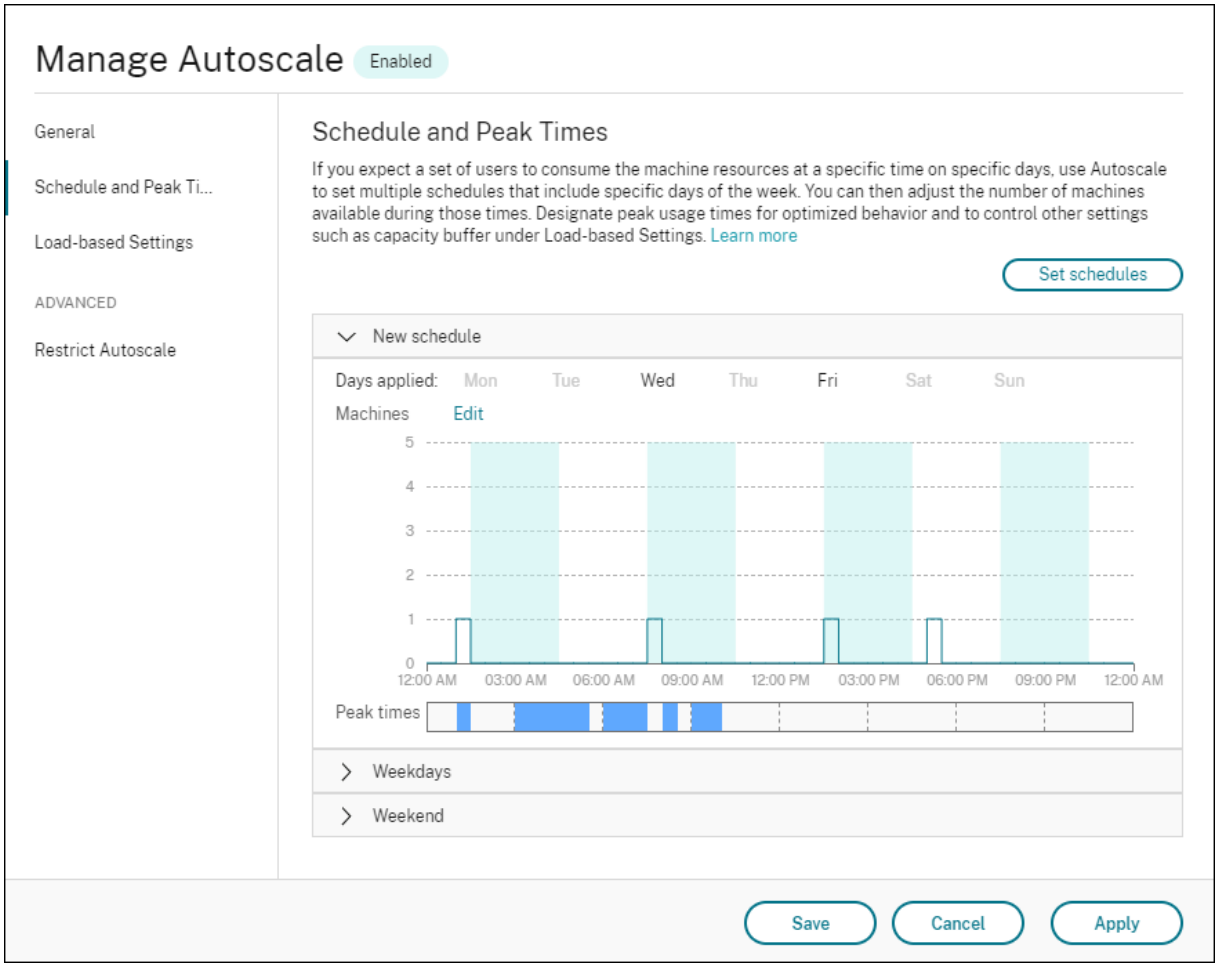
User interfaces



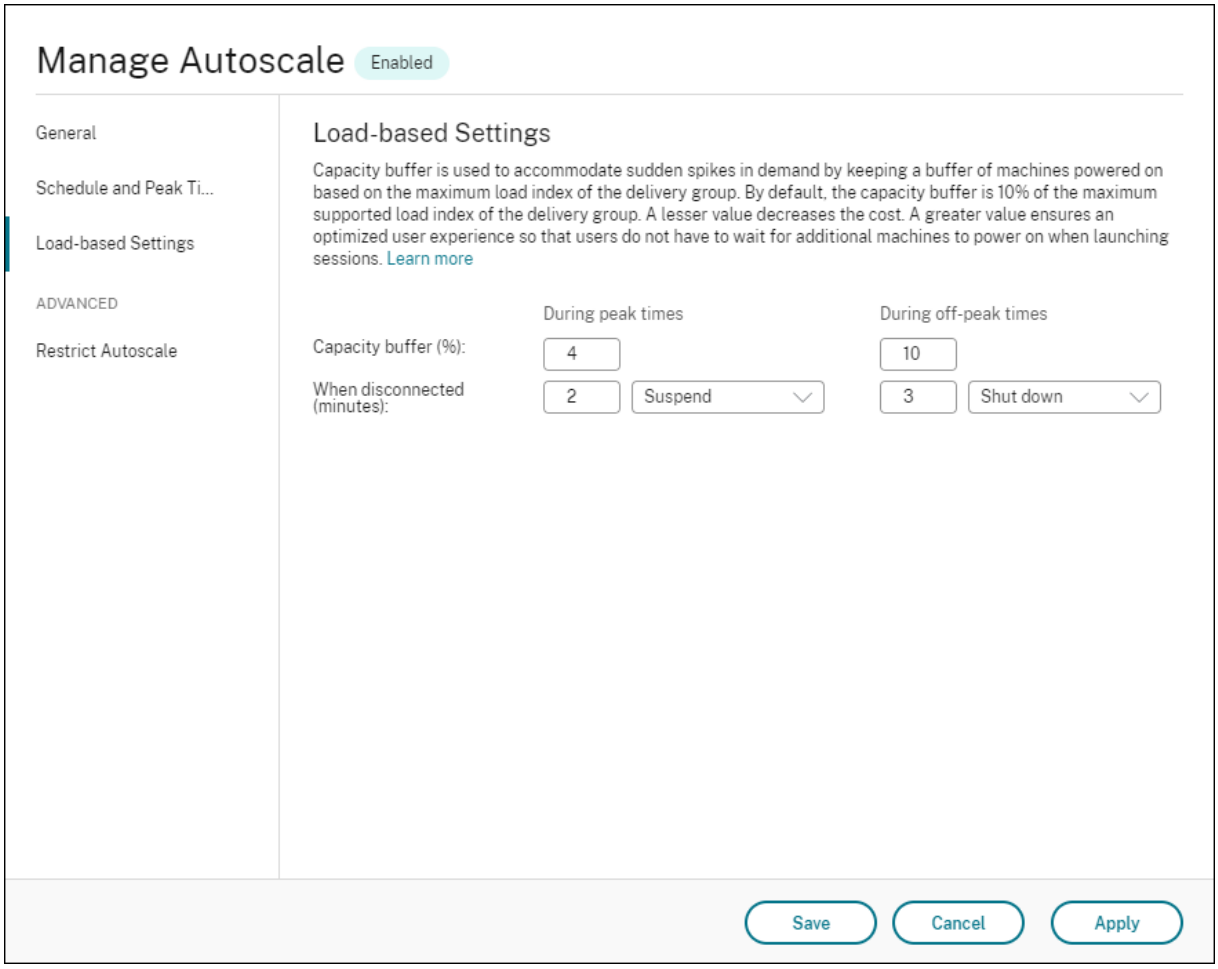
There are three types of user interfaces to be aware of.

User interface for *single-session OS static delivery groups*:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

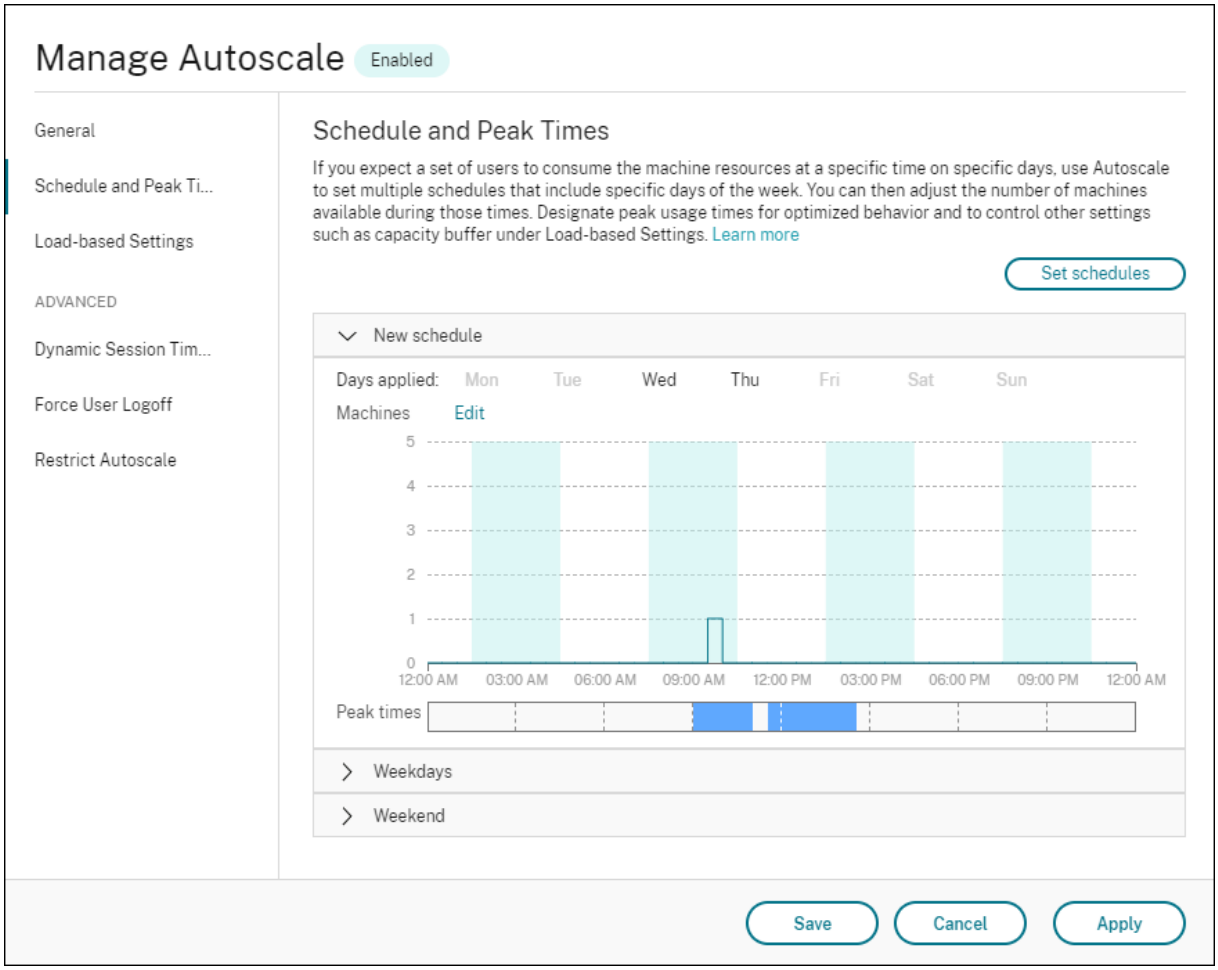


© 1997–2026 Citrix Systems, Inc. All rights reserved.

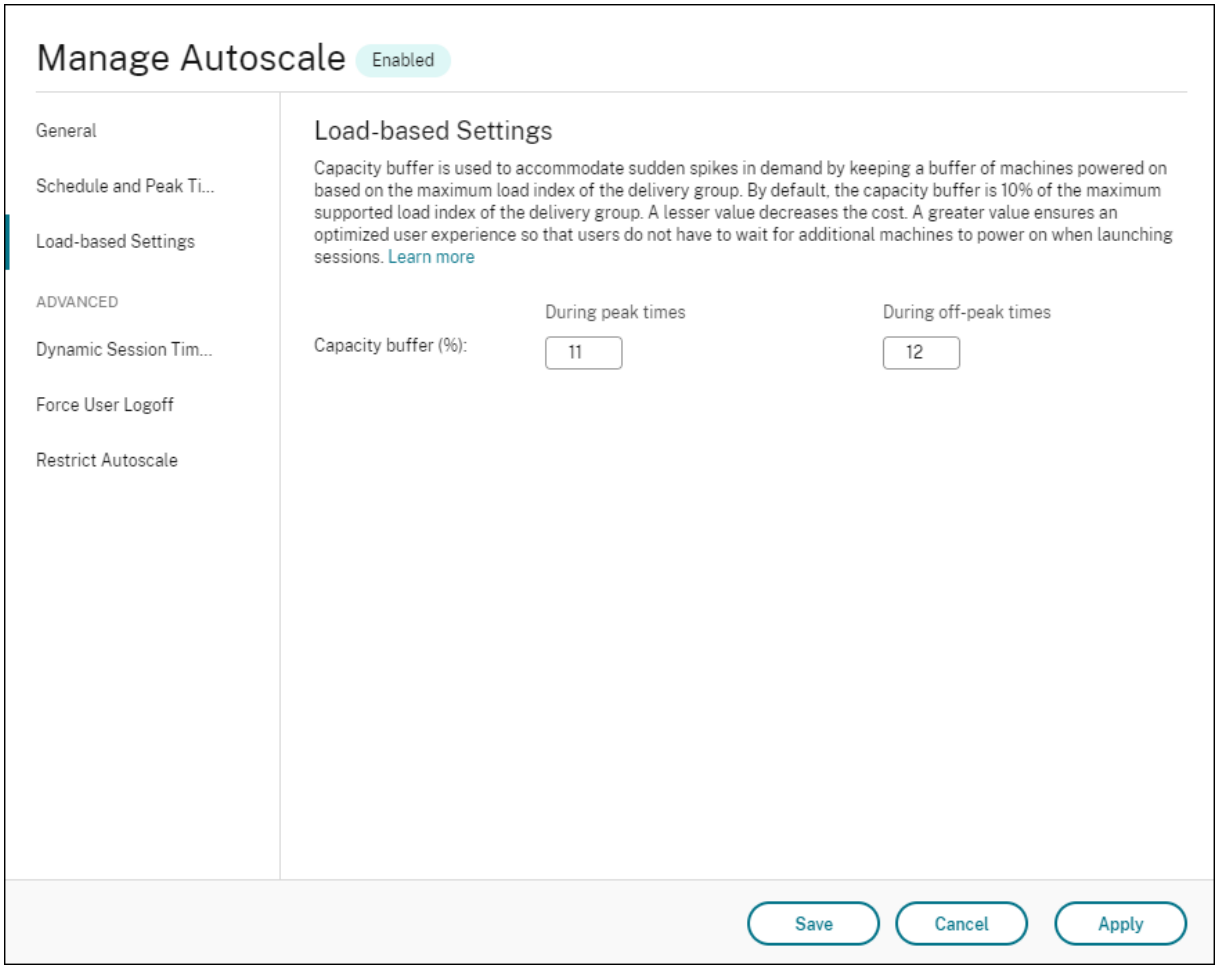


Autoscale user interface for *single-session OS random delivery groups*:

© 1997–2026 Citrix Systems, Inc. All rights reserved.



© 1997–2026 Citrix Systems, Inc. All rights reserved.



Autoscale user interface for *multi-session OS delivery groups*:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Schedule-based settings

Autoscale schedule. Lets you add, edit, select, and delete schedules.

Days applied. Highlights the days you applied to the selected schedule. The remaining days are grayed out.

Edit. Lets you assign the machines against each hour or each half hour. You can assign the machines by numbers and by percentages.

> **Note:**
>
> - This option is available only in the Autoscale user interfaces for multi-session OS and single-session OS random delivery groups.
> - The histogram next to **Edit** plots the number or percentage of machines that are running in different time slots.
> - You can **assign machines** against each time slot by clicking **Edit** above **Peak times**. Depending on the option you selected from the menu in the **Machines to start** window, you

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> can assign the machines by numbers or by percentages.
> - For multi-session OS delivery groups, you can set the minimum number of running machines separately in granular increments of 30 minutes during each day. For single-session OS random delivery groups, you can set the minimum number of running machines separately in granular increments of 60 minutes during each day.

To define your own schedules, follow these steps:

1. On the **Schedule and Peak Times** page of the **Manage Autoscale** window, click **Set schedules**.
2. In the **Edit Autoscale Schedules** window, select the days you want to apply to each schedule. You can also delete schedules as applicable.
3. Click **Done** to save the schedules and to return to the **Schedule and Peak Times** page.
4. Select the applicable schedule and configure it as needed.
5. Click **Apply** to exit the **Manage Autoscale** window or configure settings on other pages.

> **Important:**
>
> - Autoscale does not allow the same day to overlap in different schedules. For example, if you select Monday in schedule2 after selecting Monday in schedule1, Monday is automatically cleared in schedule1.
> - A schedule name is not case sensitive.
> - A schedule name must not be blank or contain only spaces.
> - Autoscale allows blank spaces between characters.
> - A schedule name must not contain the following characters: \ / ; : # . * ? = < > | [ ] ( ) { } ‘“‘.
> - Autoscale does not support duplicate schedule names. Enter a different name for each schedule.
> - Autoscale does not support empty schedules. This means that schedules without days selected are not saved.
>
> **Note:**
>
> The days included in the selected schedule are highlighted, while those not included are grayed out.

Load-based settings

Peak times. Lets you define the peak times for the days you applied in the selected schedule. You can do so by right-clicking the horizontal bar graph. After you define the peak times, the remaining, undefined times default to off-peak times. By **default**, the 7:00 AM to 7:00 PM time slot is defined as peak times for the days included in the selected schedule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> - For multi-session OS delivery groups, the peak times bar graph is used for the capacity buffer.
> - For single-session OS delivery groups, the peak times bar graph is used for the capacity buffer and controls the actions to be triggered after logoff and/or disconnection.
> - You can define the peak times for the days included in a schedule at a granular level of 30 minutes for both multi-session OS and single-session OS delivery groups. Alternatively, you can use the `New-BrokerPowerTimeScheme PowerShell` command instead. For more information, see Broker PowerShell SDK commands.

Capacity buffer. Lets you keep a buffer of powered-on machines. A lesser value decreases the cost. A greater value ensures an optimized user experience so that when launching sessions, users do not have to wait for additional machines to power on. By default, the capacity buffer is 10% for peak and off-peak times. If you set the capacity buffer to 0 (zero), users might have to wait for additional machines to power on when launching sessions. Autoscale lets you determine the capacity buffer separately for peak and off-peak times.

Miscellaneous settings

> **Tip:**
>
> - You can choose to configure the miscellaneous settings using the Broker PowerShell SDK. For more information, see Broker PowerShell SDK commands.
> - To understand the SDK commands associated with the when disconnected and when logged off settings, see https://citrix.github.io/delivery-controller-sdk/Broker/about_Broker_PowerManagement/#power-policy.

When disconnected. Lets you specify how long a disconnected, locked machine remains powered on after session disconnection before it is suspended or shut down. If a time value is specified, the machine is suspended or shut down when the specified disconnection time elapses, depending on the action you configured. By default, no action is assigned to disconnected machines. You can define actions separately for peak and off-peak times. To do so, click the down arrow and then select one of the following options from the menu:

- **No action**. If selected, the machine after session disconnection remains powered on. Autoscale does not act on it.
- **Suspend**. If selected, Autoscale pauses the machine without shutting it down when the specified disconnection time elapses. The following option becomes available after you select **Suspend**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **When no reconnection in (minutes)**. Suspended machines remain available to disconnected users when they reconnect but are not available for new users. To make the machines available again to handle all workloads, shut them down. Specify the timeout, in minutes, after which Autoscale shuts them down.

- **Shut down**. If selected, Autoscale shuts down the machine when the specified disconnection time elapses.

> **Note:**
>
> This option is available only in the Autoscale user interfaces for single-session OS random and static delivery groups.

When logged off. Lets you specify how long a machine remains powered on after session logoff before it is suspended or shut down. If a time value is specified, the machine is suspended or shut down when the specified logoff time elapses, depending on the actions you configured. By default, no action is assigned to logged-off machines. You can define actions separately for peak and off-peak times. To do so, click the down arrow and then select one of the following options from the menu:

- **No action**. If selected, the machine after session logoff remains powered on. Autoscale does not act on it.
- **Suspend**. If selected, Autoscale pauses the machine without shutting it down when the specified logoff time elapses.
- **Shut down**. If selected, Autoscale shuts down the machine when the specified logoff time elapses.

> **Note:**
>
> This option is available only in the Autoscale user interface for single-session OS static delivery groups.

Power manage single-session OS machines transitioning to a different time period with disconnected sessions

> **Important:**
>
> - This enhancement applies only to single-session OS machines with disconnected sessions. It does not apply to single-session OS machines with logged off sessions.
> - For this enhancement to take effect, you need to enable Autoscale for the applicable delivery group. Otherwise, disconnect power policy actions are not triggered on period transition.

In earlier releases, a single-session OS machine transitioning to a time period where an action (disconnect action=”**Suspend**”or “**Shutdown**”) was required remained powered on. This scenario occurred

© 1997–2026 Citrix Systems, Inc. All rights reserved.

if the machine disconnected during a time period (peak or off-peak times) where no action (disconnect action="**Nothing**") was required.

Starting with this release, Autoscale suspends or powers off the machine when the specified disconnection time elapses, depending on the disconnect action configured for the destination time period.

For example, you configure the following power policies for a single-session OS delivery group:

- Set `PeakDisconnectAction` to "Nothing"
- Set `OffPeakDisconnectAction` to "Shutdown"
- Set 'OffPeakDisconnectTimeout'to "10"

> **Note:**
>
> For more information about the disconnect action power policy, see https://developer-docs.citrix.com/projects/delivery-controller-sdk/en/latest/Broker/about_Broker_PowerManagement/#power-policy and https://developer-docs.citrix.com/projects/delivery-controller-sdk/en/latest/Broker/Get-BrokerDesktopGroup/.

In earlier releases, a single-session OS machine with a session disconnected during peak times remained powered on when it transitioned from peak to off-peak. Starting with this release, the `OffPeakDisconnectAction` and the `OffPeakDisconnectTimeout` policy actions are applied to the single-session OS machine on period transition. As a result, the machine is powered off 10 minutes after it transitions to off-peak.

In case you want to revert to the previous behavior (that is, take no action on machines that transition from peak to off-peak or off-peak to peak with disconnected sessions), do one of the following:

- Set the "LegacyPeakTransitionDisconnectedBehaviour"registry value to 1 (true; enables the previous behavior). By default, the value is 0 (false; triggers disconnect power policy actions on period transition).
  - Path: HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\DesktopServer
  - Name: LegacyPeakTransitionDisconnectedBehaviour
  - Type: REG_DWORD
  - Data: 0x00000001 (1)
- Configure the setting by using the `Set-BrokerServiceConfigurationData` PowerShell command. For example:
  - `PS C:\> Set-BrokerServiceConfigurationData HostingManagement.LegacyPeakTransitionDisconnectedBehaviour -SettingValue $true`

A machine must meet the following criteria before power policy actions can be applied to it on period transition:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Has a disconnected session.
- Has no pending power actions.
- Belongs to a single-session OS delivery group that transitions to a different time period.
- Has a session that disconnects during a certain time period (peak or off-peak times) and transitions to a period where a power action is assigned.

How capacity buffer works

Capacity buffer is used to add spare capacity to the current demand to account for dynamic load increases. There are two scenarios to be aware of:

- For multi-session OS delivery groups, the capacity buffer is defined as a percentage of the total capacity of the delivery group in terms of load index. For more information about load index, see Load index.
- For single-session OS delivery groups, the capacity buffer is defined as a percentage of the total capacity of the delivery group in terms of the number of machines.

> **Note:**
>
> In scenarios where you restrict Autoscale to tagged machines, the capacity buffer is defined as a percentage of the total capacity of the tagged machines in the delivery group in terms of load index.

Autoscale lets you set the capacity buffer separately for peak and off-peak times. A lesser value in the capacity buffer field decreases the cost because Autoscale powers on less spare capacity. A greater value ensures an optimized user experience so that users do not have to wait for additional machines to power on when launching sessions. By default, the capacity buffer is 10%.

> **Important:**
>
> The capacity buffer results in machines being powered on when the total spare capacity drops to a level below "X"percent of the total capacity of the delivery group. Doing so reserves the required percentage of spare capacity.

Multi-session OS delivery groups

When are machines powered on?

> **Important:**
>
> If a schedule is selected, Autoscale powers on all machines configured to be powered on in the schedule. Autoscale keeps this specified number of machines powered on during the schedule,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> regardless of the load.

When the number of powered-on machines in the delivery group can no longer meet the buffer needed for honoring the buffer capacity in terms of load index, Autoscale powers on extra machines. For example, let's say your delivery group has 20 machines and 3 machines are scheduled to be powered on as part of schedule-based scaling with a capacity buffer of 20%. Eventually, 4 machines will be powered on when there is no load. This is because a 4 x 10k load index is needed as a buffer; therefore at least 4 machines need to be powered on. This case might occur during peak times, increased load on machines, new session launches, and when you add new machines to the delivery group. Note that Autoscale powers on only the machines that meet the following criteria:

- The machines are not in maintenance mode.
- The hypervisor on which the machines are running is not in maintenance mode.
- The machines are currently powered off.
- The machines have no pending power actions.

When are machines powered off?

> **Important:**
>
> - If a schedule is selected, Autoscale powers off the machines based on the schedule.
> - Autoscale does not power off the machines configured in the schedule to be powered on during the schedule.

When there are more than enough machines to support the targeted number of powered-on machines (including the buffer) for the delivery group, Autoscale powers off extra machines. This case might occur during off-peak times, decreased load on machines, and session logoffs, and when you remove machines from the delivery group. Autoscale powers off only the machines that meet the following criteria:

- The machines and the hypervisor on which the machines are running are not in maintenance mode.
- The machines are currently powered on.
- The machines are registered as available or waiting to register after start-up.
- The machines have no active sessions.
- The machines have no pending power actions.
- The machines satisfy the specified power-off delay. This means that the machines have been powered on for at least "X"minutes, where "X"is the power-off delay specified for the delivery group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example scenario

Suppose you have the following scenario:

- **Delivery group configuration**. The delivery group that you want Autoscale to power manage contains 10 machines (M1 to M10).
- **Autoscale configuration**
  - Capacity buffer is set to 10%.
  - No machine is included in the selected schedule.

The scenario is executed in the following sequence:

1. No user logs on.
2. User sessions increase.
3. More user sessions start.
4. User session load decreases because of session termination.
5. User session load decreases further until the session load is handled only by on-premises resources.

See below for details about how Autoscale works in the scenario above.

- No user load (initial state)
  - One machine (for example, M1) is powered on. The machine is powered on because of the configured capacity buffer. In this case, 10 (number of machines) x 10,000 (load index) x 10% (configured capacity buffer) equals 10,000. Therefore, one machine is powered on.
  - The load index value of the powered-on machine (M1) is at a baseline load (load index equals 0).
- The first user logs on
  - The session is directed to be hosted on machine M1.
  - The load index of the powered-on machine M1 increases and machine M1 is no longer at a baseline load.
  - Autoscale starts to power on an additional machine (M2) to meet the demand because of the configured capacity buffer.
  - The load index value of machine M2 is at a baseline load.
- Users increase load
  - The sessions are load-balanced across machines M1 and M2. As a result, the load index of the powered-on machines (M1 and M2) increases.
  - The total spare capacity is still at a level above 10,000 in terms of load index.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - The load index value of machine M2 is no longer at a baseline load.

- More user sessions start

    - The sessions are load-balanced across machines (M1 and M2). As a result, the load index of the powered-on machines (M1 and M2) increases further.
    - When the total spare capacity drops to a level below 10,000 in terms of load index, Autoscale starts to power on an additional machine (M3) to meet the demand because of the configured capacity buffer.
    - The load index value of machine M3 is at a baseline load.

- Even more user sessions start

    - The sessions are load-balanced across machines (M1 to M3). As a result, the load index of the powered-on machines (M1 to M3) increases.
    - The total spare capacity is at a level above 10,000 in terms of load index.
    - The load index value of machine M3 is no longer at a baseline load.

- User session load decreases because of session termination

    - After users log off from their sessions or idle sessions time out, the freed-up capacity on machines M1 to M3 is reused to host sessions started by other users.
    - When the total spare capacity increases to a level above 10,000 in terms of load index, Autoscale puts one of the machines (for example, M3) into drain state. As a result, sessions started by other users are no longer directed to that machine unless new changes occur. For example, end-user load increases again or other machines become least loaded.

- User session load continues to decrease

    - After all sessions on machine M3 are terminated and the specified power-off delay times out, Autoscale powers off machine M3.
    - After more users terminate their sessions, the freed-up capacity on powered-on machines (M1 and M2) is reused to host sessions started by other users.
    - When the total spare capacity increases to a level above 10,000 in terms of load index, Autoscale puts one of the machines (for example, M2) into drain state. As a result, sessions started by other users are no longer directed to that machine.

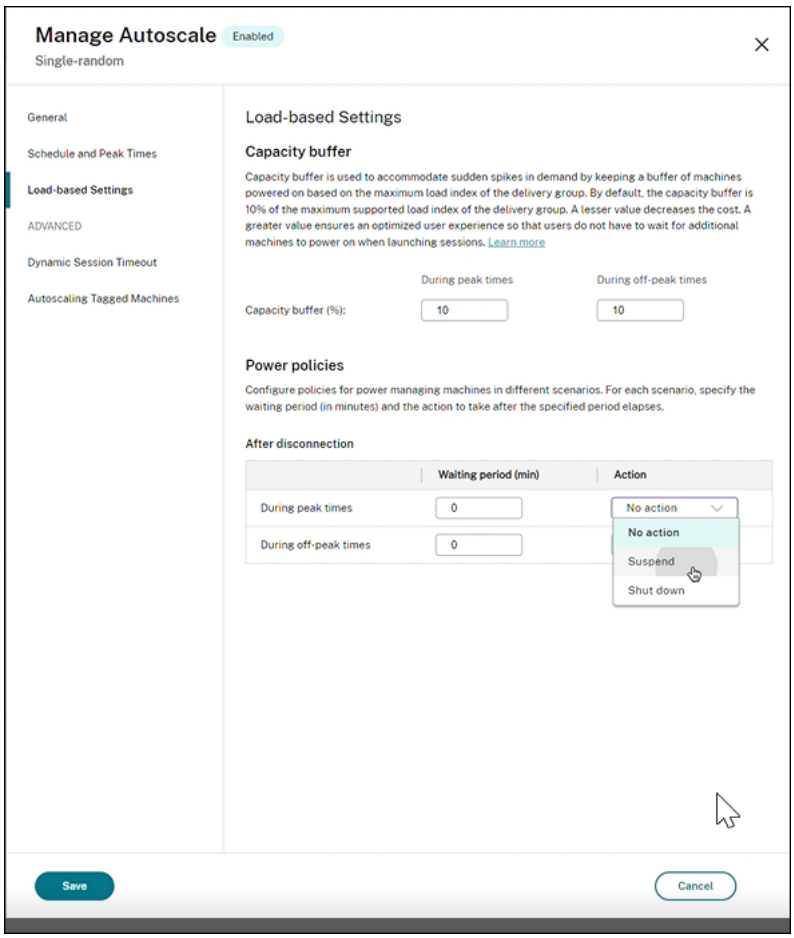
- User session load continues to decrease until there are no sessions

    - After all sessions on machine M2 are terminated and the specified power-off delay times out, Autoscale powers off machine M2.
    - The load index value of the powered-on machine (M1) is at a baseline load. Autoscale does not put machine M1 into drain state because of the configured capacity buffer.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> For multi-session OS delivery groups, all changes to the desktop are lost when users log off sessions. However, if configured, user-specific settings are roamed along with the user profile.

Single-session OS random delivery groups



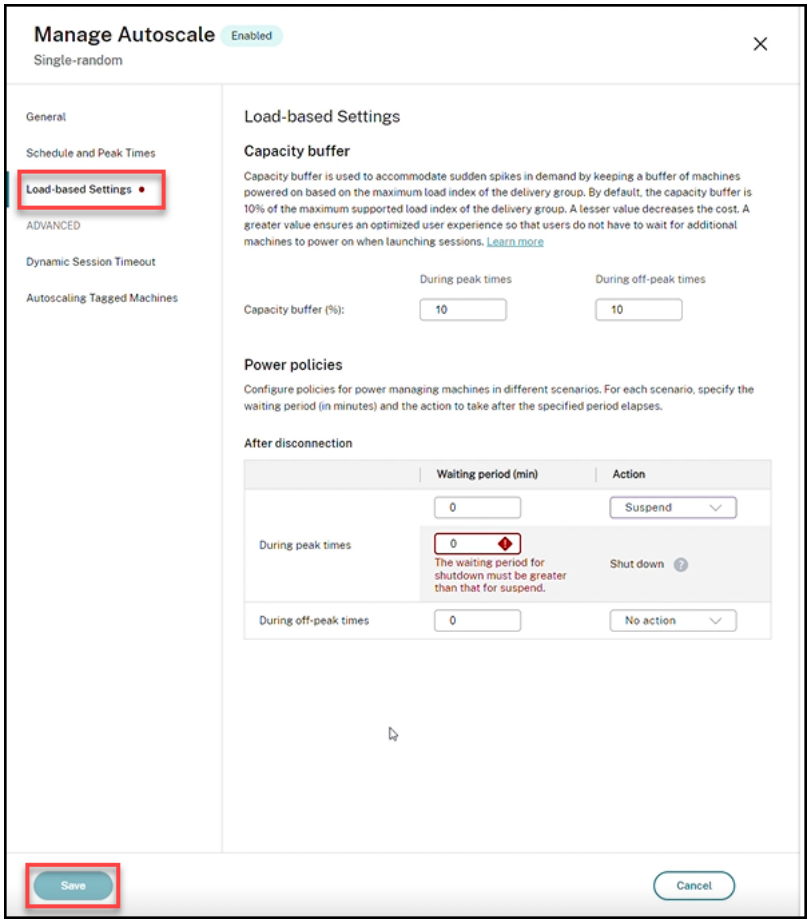
Capacity buffer is used to accommodate sudden spikes in demand by keeping a buffer of machines powered on based on the total number of machines in the delivery group. By default, the capacity buffer is 10% of the total number of machines in the delivery group.

If the number of machines (including the capacity buffer) exceeds the total number of currently powered-on machines, additional machines are powered on to meet the demand. If the number of machines (including the capacity buffer) is less than the total number of currently powered-on machines, the excess machines are shut down or suspended, depending on the actions you configured.

Power policies

Configure policies to manage the power of the machines for different scenarios. For each scenario, you can specify the wait time (in minutes) and the action to take after the specified time ends. Power policies are applicable for Single-session OS random delivery groups and Single-session OS static delivery groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



After disconnection, the following settings are applicable for both during peak times and during off-peak times:

- You can set the wait time in minutes and actions like, no action, suspend, or shut down from the drop down.
- If you select the suspend action, configure an additional wait time to shut down the machine.

> **Note:**
>
> - During peak and off-peak times, the wait time for shutdown action must be greater than the wait time of suspend.
> - Suspended machines are accessible only to disconnected users when they reconnect. To make the suspended machines available for new users, shut them down.
> - If the time settings are incorrectly configured for suspend and shut down fields, the **Save** option is disabled and a red dot also appears next to the navigation items indicating setting errors.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For example

- If you set the wait time to 12 minutes and choose the first action to be no action, then after the end of 12 minutes, the machine will continue to be in powered on state.
- If you set the wait time to 15 minutes and choose the first action to be suspend, and the second wait time to be 20 minutes, after the end of 15 minutes, the machine is suspended. After the end of the second wait time, the machine will shut down.
- If you set the wait time to 18 minutes and choose the first action to be shut down, then after the end of 18 minutes, the machine will shut down.

Example scenario

Suppose you have the following scenario:

- **Delivery group configuration**. The delivery group that you want Autoscale to power manage contains 10 machines (M1 to M10).
- **Autoscale configuration**
  - Capacity buffer is set to 10%.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- No machine is included in the selected schedule.

The scenario is executed in the following sequence:

1. No user logs on.
2. User sessions increase.
3. More user sessions start.
4. User session load decreases because of session termination.
5. User session load decreases further until the session load is handled only by on-premises resources.

See below for details about how Autoscale works in the scenario above.

- No user load (initial state)
  - One machine (M1) is powered on. The machine is powered on because of the configured capacity buffer. In this case, 10 (number of machines) x 10% (configured capacity buffer) equals 1. Therefore, one machine is powered on.
- A first user logs on
  - The first time a user logs on to use a desktop, the user is assigned a desktop from a pool of desktops hosted on powered-on machines. In this case, the user is assigned a desktop from machine M1.
  - Autoscale starts to power on an additional machine (M2) to meet the demand because of the configured capacity buffer.
- A second user logs on
  - The user is assigned a desktop from machine M2.
  - Autoscale starts to power on an additional machine (M3) to meet the demand because of the configured capacity buffer.
- A third user logs on
  - The user is assigned a desktop from machine M3.
  - Autoscale starts to power on an additional machine (M4) to meet the demand because of the configured capacity buffer.
- A user logs off
  - After a user logs off or the user's desktop times out, the freed-up capacity (for example, M3) is available as buffer. As a result, Autoscale starts to power off machine M4 because the capacity buffer is configured as 10%.
- More users log off until there are no users

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- After more users log off, Autoscale powers off machines (for example, M2 or M3).
- Even though there are no users left, Autoscale does not power off the remaining one machine (for example, M1) because that machine is reserved as a spare capacity.

> **Note:**
>
> For single-session OS random delivery groups, all changes to the desktop are lost when users log off sessions. However, if configured, user-specific settings are roamed along with the user profile.

Single-session OS static delivery groups

Capacity buffer is used to accommodate sudden spikes in demand by keeping a buffer of unassigned machines powered on based on the total number of unassigned machines in the delivery group. By default, the capacity buffer is 10% of the total number of unassigned machines in the delivery group.

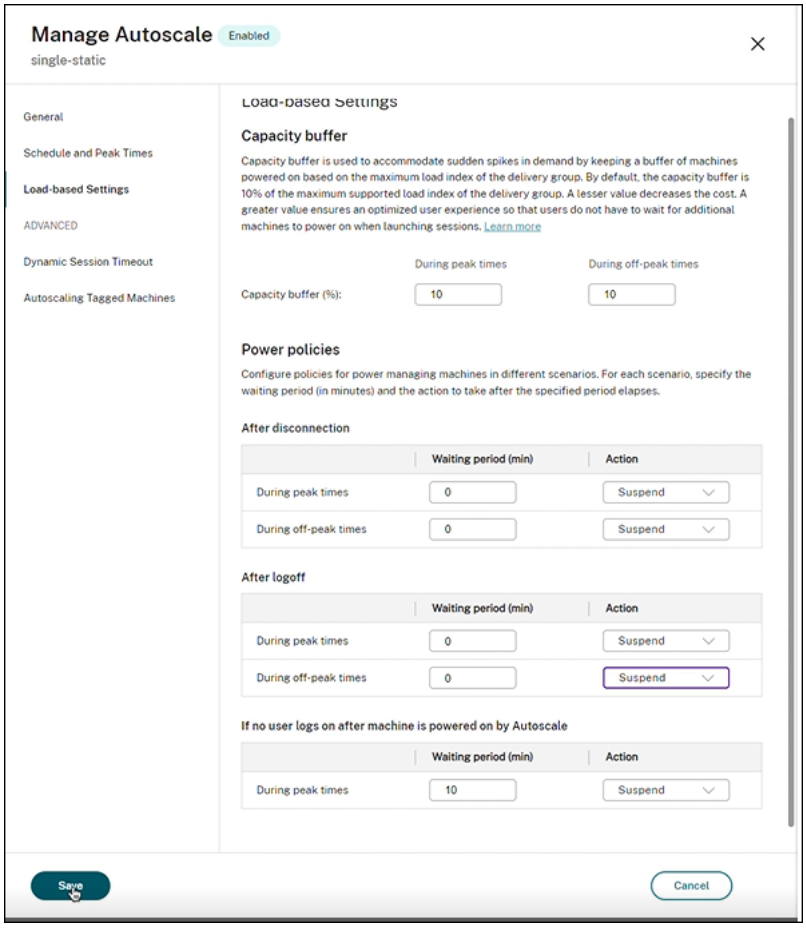
> **Important:**
>
> After all machines in the delivery group are assigned, the capacity buffer does not play a role in powering machines on or off.

If the number of machines (including the capacity buffer) exceeds the total number of currently powered-on machines, additional, unassigned machines are powered on to meet the demand. If the number of machines (including the capacity buffer) is less than the total number of currently powered-on machines, excess machines are powered off or suspended, depending on the actions you configured.

For single-session OS static delivery groups, Autoscale:

- Powers assigned machines on during peak times and off during off-peak times only when the `AutomaticPowerOnForAssigned` property of the applicable single-session OS delivery group is set to true.
- Automatically powers on a machine during peak times if it is powered off and the `AutomaticPowerOnForAssignedDuringPeak` property of the delivery group to which it belongs is set to true.

To understand how capacity buffer works with assigned machines, consider the following:



- The capacity buffer works only when the delivery group has one or more unassigned machines.
- If the delivery group has no unassigned machines (all machines in the delivery group are assigned), the capacity buffer does not play a role in powering machines on or off.
- The `AutomaticPowerOnForAssignedDuringPeak` property determines whether assigned machines are powered on during peak times. If it is set to true, Autoscale keeps the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

machines powered on during peak times. Autoscale will also power them on even if they are powered off.

Power policies

Configure policies to manage the power of the machines for different scenarios. For each scenario, you can specify the wait time (in minutes) and the action to take after the specified time ends. Power policies are applicable for Single-session OS random delivery groups and Single-session OS static delivery groups.

For **After disconnection** and **After logoff**, the following settings are applicable for both, during peak times and during off-peak times: You can set the wait time in minutes and actions like, no action, suspend, or shut down from the drop down.

If no user logs on after machine is powered on by Autoscale, the following settings are applicable only during peak times: You can set the wait time in minutes and actions like, no action, suspend, or shut down from the drop down during peak times.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example scenario

Suppose you have the following scenario:

- **Delivery group configuration**. The delivery group that you want Autoscale to power manage contains 10 machines (M1 to M10).
- **Autoscale configuration**
  - Machines M1 to M3 are assigned, and machines M4 to M10 are unassigned.
  - Capacity buffer set to 10% for peak and off-peak times.
  - According to the selected schedule, Autoscale power manages machines between 09:00 AM and 06:00 PM.

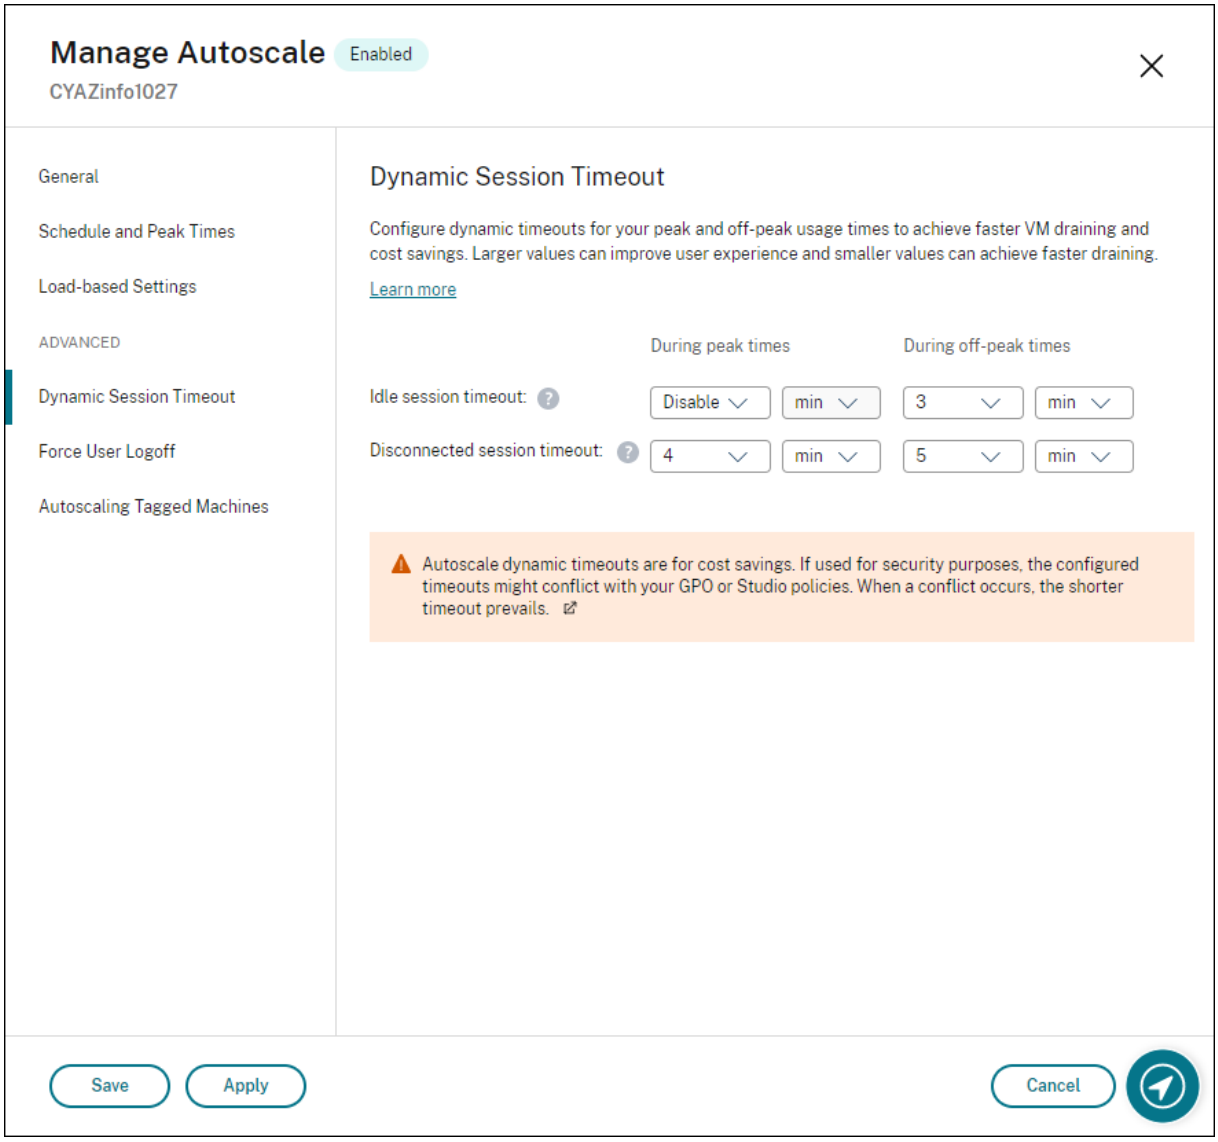
See below for details about how Autoscale works in the scenario above.

- Start of schedule –09:00 AM
  - Autoscale powers on machines M1 to M3.
  - Autoscale powers on an additional machine (for example, M4) because of the configured capacity buffer. Machine M4 is unassigned.
- A first user logs on
  - The first time a user logs on to use a desktop, the user is assigned a desktop from a pool of desktops hosted on unassigned powered-on machines. In this case, the user is assigned a desktop from machine M4. Subsequent logons from that user connect to the same desktop that was assigned on first use.
  - Autoscale starts to power on an additional machine (for example, M5) to meet the demand because of the configured capacity buffer.
- A second user logs on
  - The user is assigned a desktop from the unassigned powered-on machines. In this case, the user is assigned a desktop from machine M5. Subsequent logons from that user connect to the same desktop that was assigned on first use.
  - Autoscale starts to power on an additional machine (for example, M6) to meet the demand because of the configured capacity buffer.
- Users log off
  - As users log off from their desktops or the desktops time out, Autoscale keeps the machines M1 to M5 powered on during 09:00 AM –06:00 PM. When those users log on the next time, they connect to the same desktop that was assigned on first use.
  - The unassigned machine M6 is waiting to serve a desktop to an incoming, unassigned user.
- End of schedule –06:00 PM

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- At 06:00 PM, Autoscale powers off machines M1 to M5.
- Autoscale keeps the unassigned machine M6 powered on because of the configured capacity buffer. That machine is waiting to serve a desktop to an incoming, unassigned user.
- In the delivery group, machines M6 to M10 are unassigned machines.

Dynamic session timeouts

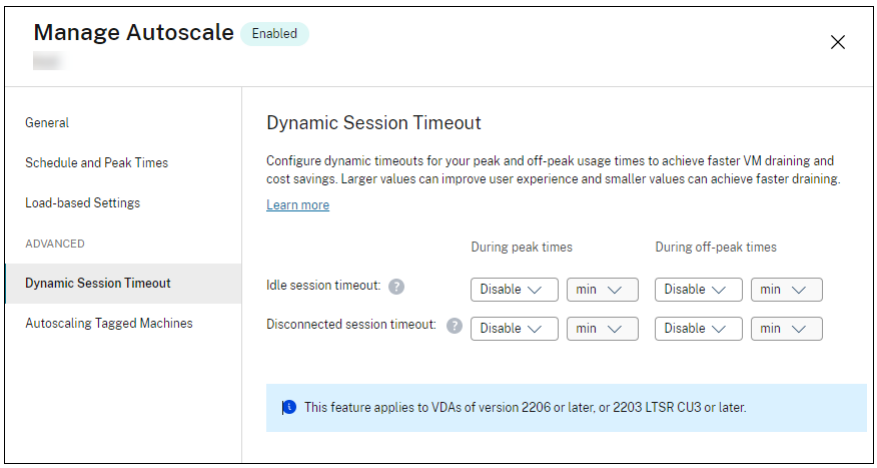


May 13, 2026

This feature lets you configure disconnected and idle session timeouts for your peak and off-peak usage times to achieve faster machine draining and cost savings. This feature applies to:

- Single-session and multi-session OS machines.
- All machines in the Delivery Group regardless of whether they are tagged for autoscaling.

A VDA reports idle times for sessions that have been idle for more than 10 minutes, so dynamic session timeouts are not able to disconnect idle sessions within 10 minutes of being idle. A lesser value removes lingering sessions sooner, thus reducing costs.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

- This feature is always available for multi-session OS delivery groups.
- For single-session OS delivery groups, this feature applies to VDAs of version 2206 CR or later, or 2203 LTSR CU3 or later. Ensure that those VDAs have registered with Citrix Cloud™ at least once. When unavailable, the following user interface appears:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Autoscale™ dynamic timeouts are for cost savings. If used for security purposes, the configured timeouts might conflict with your GPO or Manage console policies. When a conflict occurs, the shorter timeout prevails.

Idle session timeout. Enables or disables a timer that specifies how long an uninterrupted user connection is maintained if there is no user input. When the timer expires, the session is placed in the disconnected state and the **Disconnected session timeout** applies. If the **Disconnected session timeout** is disabled, the session is not logged off.

Important:

- If you specify a value less than or equal to 10 minutes (600 seconds), Autoscale disconnects the relevant sessions after they have been idle for 10 minutes. This is because Autoscale relies on session idle times that VDAs report. VDAs report idle times only for sessions that have been idle for more than 10 minutes.
- An idle session can still be placed into a disconnected state if the user interacts with it within the last 5 minutes of reaching the idle session timeout.

Disconnected session timeout. Enables or disables a timer that specifies how long a disconnected desktop remains locked before the session is logged off. If enabled, the disconnected session is logged off when the timer expires.

FAQ

Does the dynamic session timeout feature apply only to machines tagged for Autoscaling?

The dynamic session timeout feature applies to all the machines in the Delivery group, regardless of whether they are tagged for autoscaling.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When a session is logged off due to dynamic session timeout, are untagged machines also included in the Autoscale target of tagged machines?

The dynamic session timeout feature is not related to the Autoscale tagging feature. If dynamic session timeouts result in sessions being terminated, untagged machines might also be shut down during the process provided the machines are draining until shut down.

Autoscaling tagged machines (cloud burst)

May 13, 2026

> **Note:**
>
> This feature was formerly Restrict Autoscale.

Introduction

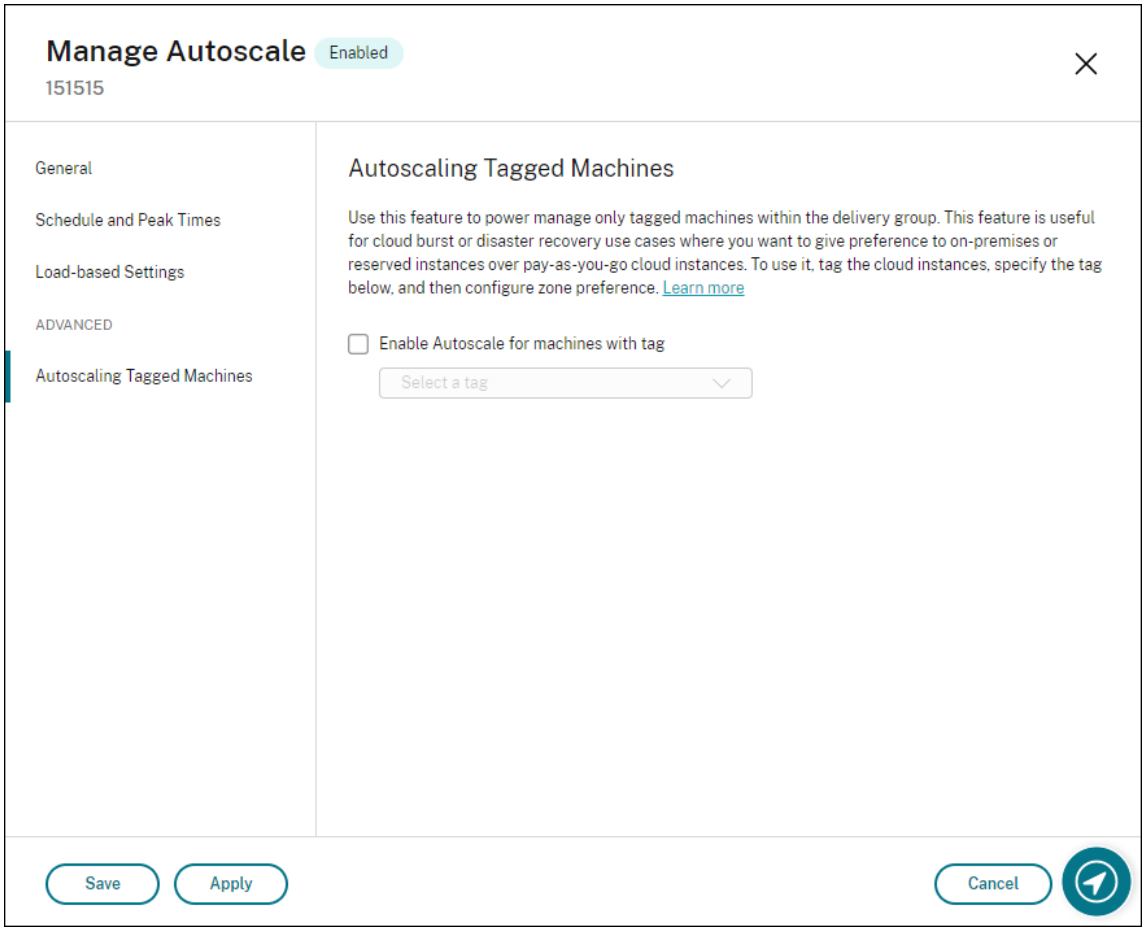
Autoscale provides the flexibility to power manage only a subset of machines in a delivery group. To achieve this, apply a tag to one or more machines and then configure Autoscale to power manage only tagged machines.

This feature can be useful in cloud bursting use cases, where you want to use on-premises resources (or reserved public cloud instances) to handle workloads before cloud-based resources address additional demand (that is, burst workloads). To let on-premises machines (or reserved instances) address workloads first, you must use tag restriction along with zone preference.

Tag restriction specifies machines to be power managed by Autoscale. Zone preference specifies machines in the preferred zone to handle user launch requests. For more information, see Tags and Zone preference.

To autoscale certain tagged machines, you can use the Manage console or PowerShell.

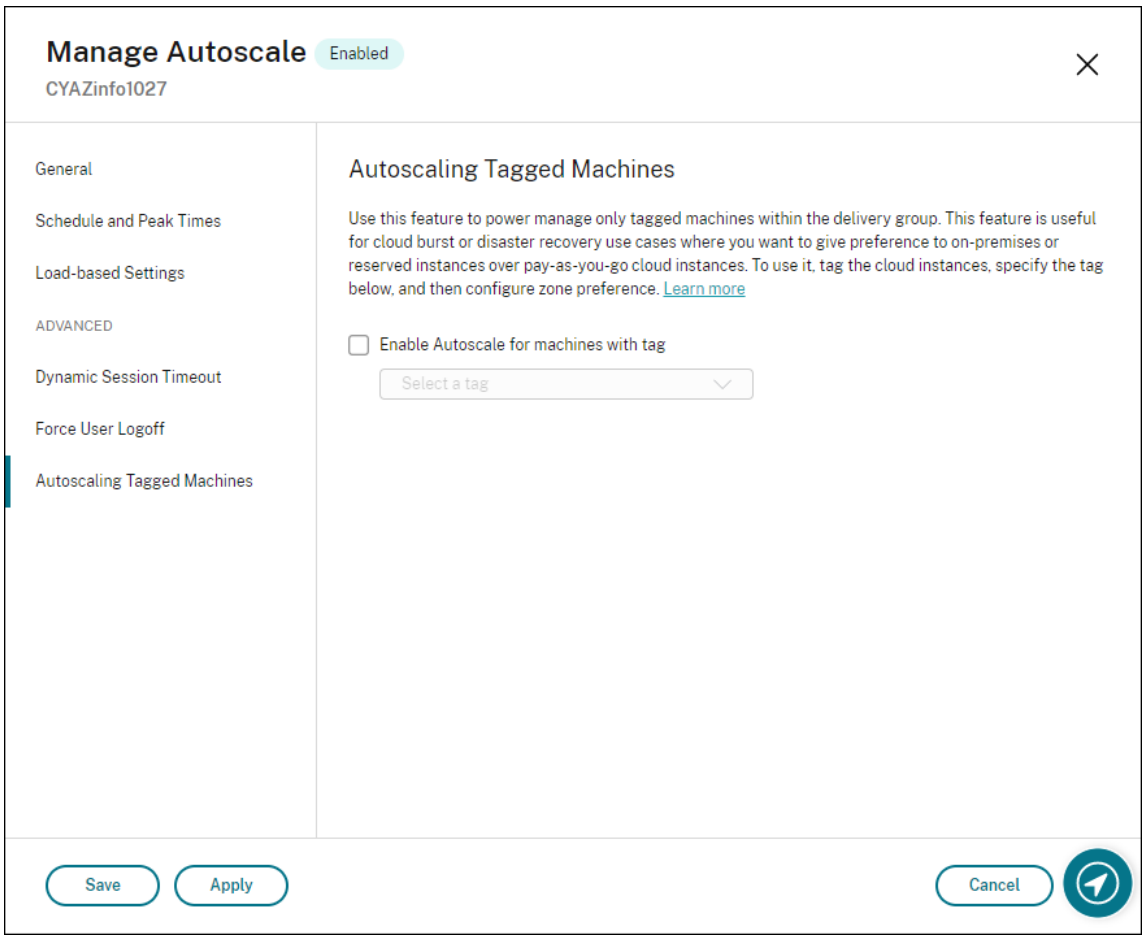
Use the Manage console to autoscale certain tagged machines



To autoscale certain tagged machines, complete the following steps:

1. Create a tag and apply that tag to the applicable machines in the delivery group. For more information, see Manage tags and tag restrictions.
2. Select the delivery group and then open the **Manage Autoscale** wizard.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



3. On the **Autoscaling Tagged Machines** page, select **Enable Autoscale for machines with tag**, select a tag from the list, and then click **Apply** to save your changes.

   User interface for single-session OS *static* and *random* delivery groups:

   User interface for *multi-session OS delivery groups*:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

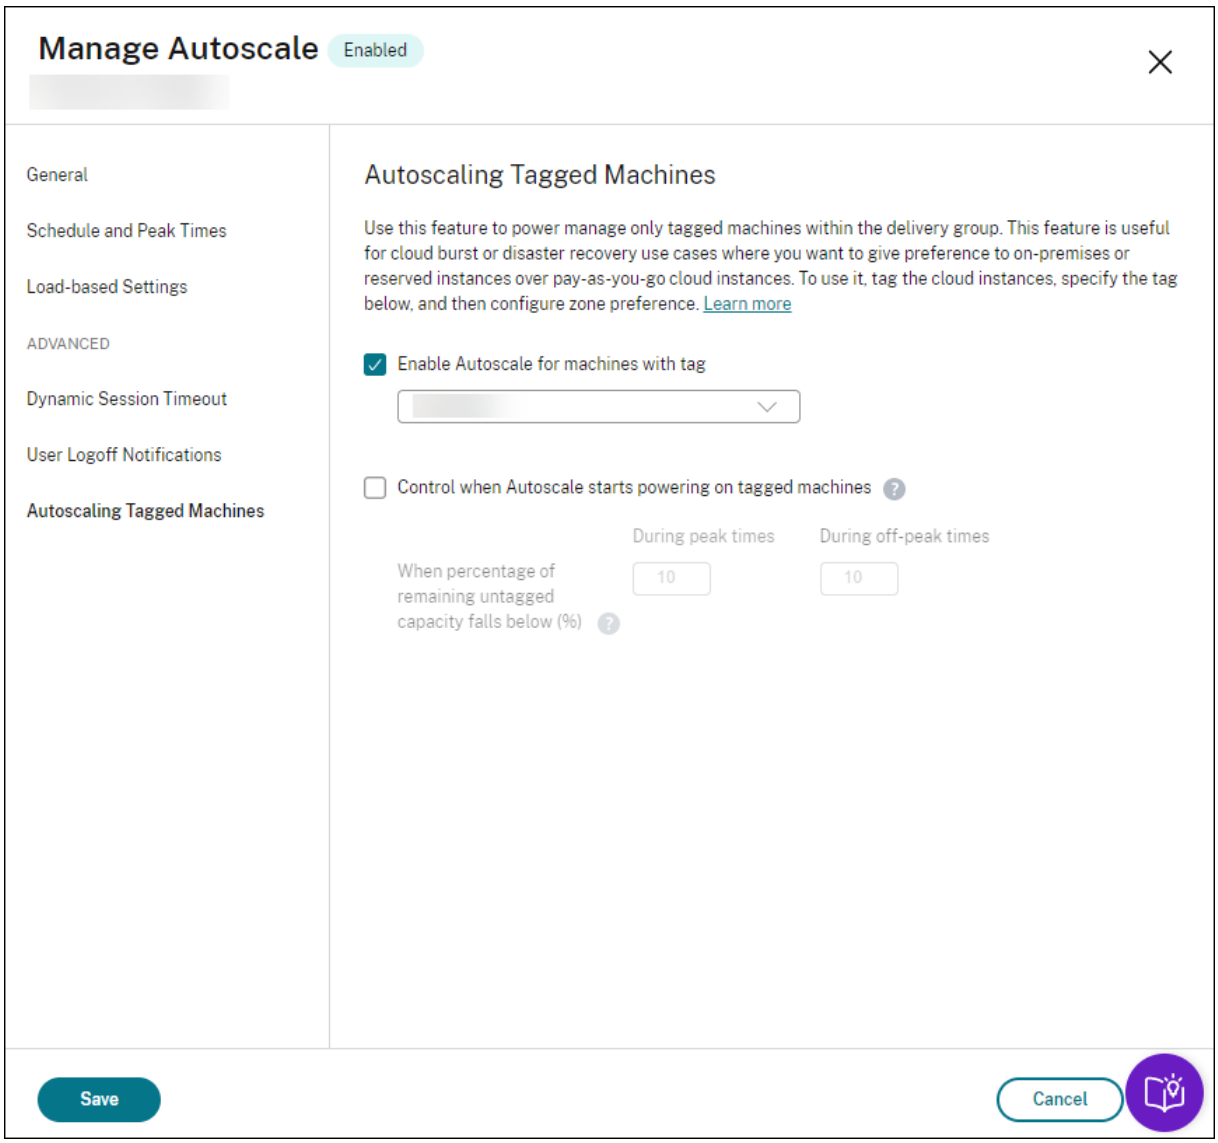
> **Warning:**
>
> - Autoscaling machines with a specific tag might cause the histogram to update automatically to reflect the number of machines per the tag. On the **Schedule and Peak Times** page, you can manually assign machines against each time slot if needed.
> - You cannot delete a tag that is being used on tagged machines. To delete the tag, you must first remove the tag restriction.

After you apply the tag restriction, you might want to remove it from the delivery group later. To do so, go to the **Manage Autoscale > Autoscaling Tagged Machines** page and then clear **Enable Autoscale for machines with tag**.

> **Warning:**
>
> - If you remove the tag from the applicable machines without clearing **Enable Autoscale for machines with tag**, you might receive a warning when you open the **Manage Autoscale** wizard. Removing the tag from the machines can leave no machines for Autoscale to manage because the tag you specified in Autoscale has become invalid. To resolve the warning,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> go to the **Autoscaling Tagged Machines** page, remove the invalid tag, and then click **Apply** to save your changes.



Control when Autoscale powers on resources

You can also control when Autoscale starts powering on tagged machines based on the usage of untagged machines. This helps you further optimize the consumption of your tagged or public cloud workloads.

To do this, complete the following steps:

1. On the **Autoscaling Tagged Machines** page, select **Control when Autoscale starts powering on tagged machines**.
2. Enter the percentage amount of untagged machine usage you want to reach for both peak times and off-peak times and then click **Apply**. Supported values: 0–100.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Tip:

The percentage controls when Autoscale starts powering on tagged machines. When the percentage falls below the threshold (default, 10%), Autoscale starts powering on tagged machines. When the percentage exceeds the threshold, Autoscale goes into power-off mode. When entering the percentage, consider two scenarios:

- For single-session OS delivery groups: The value is defined as a percentage of the total number of untagged machines in idle state. Example: You have 10 untagged single-session OS machines. When only one is left without a session, Autoscale starts powering on a tagged machine.
- For multi-session OS delivery groups: The value is defined as a percentage of the total capacity (in terms of load index) of available untagged machines. Example: You have 10 un-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> tagged multi-session OS machines. When they are 90% loaded, Autoscale starts powering on a tagged machine.

Use PowerShell to autoscale certain tagged machines

> **Note:**
>
> The `Get-BrokerMachine` PowerShell command is deprecated. Use `Get-BrokerMachineV2` as an alternative.

To use the PowerShell SDK directly, complete the following steps:

1. **Create a tag.** Use the New-Brokertag PowerShell command to create a tag.
   - For example: `$managed = New-BrokerTag Managed`. In this case, the tag is named "Managed."For more information about the New-Brokertag PowerShell command, see https://developer-docs.citrix.com/projects/delivery-controller-sdk/en/latest/Broker/New-BrokerTag/.
2. **Apply the tag to machines**. Use the Get-Brokermachine PowerShell command to apply the tag to machines in a catalog that you want Autoscale to power manage.
   - For example: `Get-BrokerMachine -CatalogName "cloud" | Add-BrokerTag $managed.Name`. In this case, the catalog is named "cloud."
   - For more information about the Get-Brokermachine PowerShell command, see https://developer-docs.citrix.com/projects/delivery-controller-sdk/en/latest/Broker/Get-BrokerMachine/.

   > **Note:**
   >
   > You might add new machines to the catalog after applying the tag. The tag is *NOT* automatically applied to those new machines.

3. **Add tagged machines to the delivery group that you want Autoscale to power manage.** Use the Get-BrokerDesktopGroup PowerShell command to add a tag restriction to the delivery group that contains the machines (in other words, "restrict launches to machines with tag X").
   - For example: `Get-BrokerDesktopGroup -Uid 1 | Set-BrokerDesktopGroup -RestrictAutoscaleTagUid $managed.Uid`. In this case, the UID of the Delivery Group is 1.
   - For more information about the Get-BrokerDesktopGroup PowerShell command, see https://developer-docs.citrix.com/projects/delivery-controller-sdk/en/latest/Broker/Get-BrokerDesktopGroup/.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After you apply the tag restriction, you might want to remove it from the delivery group later. To do so, use the Get-BrokerDesktopGroup PowerShell command.

Example: `Get-BrokerDesktopGroup -Uid 1 | Set-BrokerDesktopGroup -RestrictAutoscal $null`. In this case, the UID of the delivery group is 1.

> **Note:**
>
> Untagged machines restart automatically after users power them off. This behavior ensures that they become available to handle workloads sooner. This can be enabled or disabled on a per desktop group using the `Set-BrokerDesktopGroup`'s `AutomaticRestartForUntaggedMachines` property. For more information, see https://citrix.github.io/delivery-controller-sdk/Broker/Set-BrokerDesktopGroup/.

Example scenario

Suppose you have the following scenario:

- **Machine catalog configuration**. There are two machine catalogs (C1 and C2).
  - Catalog C1 contains 5 machines (M1 to M5) that are local in the on-premises deployments.
  - Catalog C2 contains 5 machines (M6 to M10) that are remote in the cloud deployments.
- **Tag restriction**. A tag named "Cloud"is created and applied to machines M6 to M10 in catalog C2.
- **Zone configuration**. Two zones (Z1 and Z2) are created.
  - Zone Z1 containing catalog C1 corresponds to the on-premises deployments.
  - Zone Z2 containing catalog C2 corresponds to the cloud deployments.
- **Delivery group configuration**
  - The delivery group contains 10 machines (M1 to M10), 5 machines from catalogs C1 (M1 to M5) and 5 from catalog C2 (M6 to M10).
  - Machines M1 to M5 are powered on manually and remain powered on throughout the schedule.
- **Autoscale configuration**
  - Capacity buffer is set to 10%.
  - Autoscale power manages only machines with the tag "Cloud."In this case, Autoscale power manages cloud machines M6 to M10.
- **Published application or desktop configuration**. Zone preferences are configured for the published desktops (for example), where Zone Z1 is preferred over Zone Z2 for a user launch request.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Zone Z1 is configured as the preferred zone (home zone) for the published desktops.

The scenario is executed in the following sequence:

1. No user logs on.
2. User sessions increase.
3. User sessions increase further until all available on-premises machines are consumed.
4. More user sessions start.
5. User session decreases because of session termination.
6. User session decreases further until the session load is handled only by on-premises machines.

See below for details about how Autoscale works in the scenario above.

- No user load (initial state)
  - The on-premises machines M1 to M5 are all powered on.
  - One machine in the cloud (for example, M6) is powered on. The machine is powered on because of the configured capacity buffer. In this case, 10 (number of machines) x 10,000 (load index) x 10% (configured capacity buffer) equals 10,000. Therefore, one machine is powered on.
  - The load index value of all the powered-on machines (M1 to M6) is at a baseline load (load index equals 0).
- Users log on
  - The sessions are directed to be hosted on machines M1 to M5 through the configured zone preference and are load-balanced across these on-premises machines.
  - The load index value of the powered-on machines (M1 to M5) increases.
  - The load index value of the powered-on machine M6 is at a baseline load.
- Users increase load, consuming all on-premises resources
  - The sessions are directed to be hosted on machine M1 to M5 through the configured zone preference and are load-balanced across these on-premises machines.
  - The load index value of all the powered-on machines (M1 to M5) has reached 10,000.
  - The load index value of the powered-on machine M6 remains at a baseline load.
- One more user logs on
  - The session overflows the zone preference and is directed to be hosted on cloud machine M6.
  - The load index value of all the powered-on machines (M1 to M5) has reached 10,000.
  - The load index value of the powered-on machine M6 increases and is no longer at a baseline load. When the total spare capacity drops to a level below 10,000 in terms of load

© 1997–2026 Citrix Systems, Inc. All rights reserved.

index, Autoscale starts to power on an additional machine (M7) to meet the demand because of the configured capacity buffer. Note that it might take some time to power on machine M7. So there might be a delay until machine M7 is ready.

- More users log on
  - The sessions are directed to be hosted on machine M6.
  - The load index value of all the powered-on machines (M1 to M5) has reached 10,000.
  - The load index value of the powered-on machine M6 increases further, but the total spare capacity is at a level above 10,000 in terms of load index.
  - The load index value of the powered-on machine M7 remains at a baseline load.
- Even more users log on
  - After machine M7 is ready, the sessions are directed to be hosted on machines M6 and M7 and are load-balanced across these machines.
  - The load index value of all the powered-on machines (M1 to M5) has reached 10,000.
  - The load index value of machine M7 is no longer at a baseline load.
  - The load index value of the powered-on machines (M6 and M7) increases.
  - The total spare capacity is still at a level above 10,000 in terms of load index.
- User session load decreases because of session termination
  - After users log off from their sessions or idle sessions time out, the freed-up capacity on machines M1 to M7 is reused to host sessions started by other users.
  - When the total spare capacity increases to a level above 10,000 in terms of load index, Autoscale puts one of the cloud machines (M6 to M7) into drain state. As a result, sessions started by other users are no longer directed to that machine (for example, M7) unless new changes occur; for example, user load increases again or other cloud machines become least loaded.
- User session load decreases further until one or more cloud machines are no longer needed
  - After all sessions on machine M7 are terminated and the specified power-off delay times out, Autoscale powers off machine M7.
  - The load index value of all the powered-on machines (M1 to M5) might drop to a level below 10,000.
  - The load index value of the powered-on machine (M6) decreases.
- User session decreases further until no cloud machines are needed.
  - Even though there are no user sessions on machine M6, Autoscale does not power it off because it is reserved as a spare capacity.
  - Autoscale keeps the remaining cloud machine M6 powered on because of the configured capacity buffer. That machine is waiting to serve a desktop to an incoming user.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Sessions are not directed to be hosted on machine M6 as long as the on-premises machines have available capacity.

Autoscale™ plug-in

May 13, 2026

Autoscale plug-in is a plug-in model where you can take direct action on the power management of VMs. You can deviate from the standard Autoscale settings related to the power management of VMs and instead have different settings for different scenarios. Currently, the plug-ins that you can use are:

- Autoscale holiday plug-in
- Intelligent Autoscale schedules plug-in

Autoscale holiday plug-in

You can use the Autoscale holiday plugin to handle different settings for holidays. For example, on weekdays, you want most of the VMs to be powered on. However, by default (without the plug-in), the weekday schedule is still applied on public holidays. To handle this scenario, the plug-in allows VMs to be powered off on specified holiday dates.

Create custom holiday schedules using Studio

Use Studio to create custom schedules to turn off unused VMs in a delivery group on specific days, like holidays, to reduce unnecessary resource consumption.

> **Note:**
>
> - The custom schedule takes effect one day after creation.
> - In case of tagged machines, this feature applies to only tagged machines within the delivery group.

To create custom schedules:

1. In Studio, go to **Delivery groups**. Right-click a delivery group and select **Manage Autoscale**.
2. On the **General** page, select **Enable Autoscale**.
3. On the **Schedule** page, click **Create schedule**.
4. Enter a name for the schedule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Select one or multiple dates on which you want the VMs in the delivery group to be turned off.

   If you want to save this schedule as a template for use with other delivery groups, click **Save as template**.

6. Click **Done** to create the custom schedule.

   You must now see the custom schedule created under **Custom** on the **Schedule** page.

To edit a custom schedule:

1. Click the pencil icon under **Actions** for the schedule you want to edit. You can do the following edits:

   - Disable the custom schedule: switch off the **Enable** toggle button.
   - Change or apply a template.
   - Change the name of the schedule.
   - Change the dates of the schedule.

2. Click **Done** to apply the changes.

You can also delete a custom schedule.

> **Note:**
>
> Deleting a delivery group also deletes its custom schedules. Saved templates are not deleted.

Configure holiday dates using PowerShell

Associate the Autoscale holiday plug-in with a delivery group and configure the holiday dates so that the plug-in can allow VMs to be powered off on the configured dates. To achieve this, run the following commands:

1. Run `Get-BrokerAutoscalePlugin` to get the UID of the holiday plug-in.

   ```
   (Get-BrokerAutoscalePlugin -Name Citrix.AutoscalePlugin.
      HolidaySchedule).Uid
   ```

   Note the UID value of the `HolidaySchedule` plug-in. Let's assume that the `HolidaySchedule` plug-in has UID 1.

2. Get the UID of the delivery group with which you want to associate the plug-in. For example:

   ```
   $dgUid = (Get-BrokerDesktopGroup 'My Group Name').Uid
   ```

3. Associate the `HolidaySchedule` plug-in with the delivery group (`-AutoscalePluginUid "<HolidaySchedule plugin UID>"`) and specify the required holiday dates. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-BrokerAutoscaleGroupPlugin -Name "Company Holidays" -
    DesktopGroupUid $dgUid -AutoscalePluginUid 1 -Configuration '{
 "Holidays":["2024-11-28","2024-11-29","2024-12-25"] }
 '
```

Note the UID of the `AutoscaleGroupPlugin` created (the association between the plug-in and the delivery group).

> **Note:**
>
> The name for the association must be unique among the associations for a given delivery group. For example, there can only be one association called "Company Holidays"for one delivery group, but one or more other delivery groups might also have associations called "Company Holidays".

Change the holiday dates You can change the specified holiday dates using the `Set-BrokerAutoscaleGroupPlugin` PowerShell commands and specifying the UID of the `AutoscaleGroupPlugin`. For example, let's assume that the `AutoscaleGroupPlugin` has UID 2.

```
Set-BrokerAutoscaleGroupPlugin 2 -Configuration '{
 "Holidays":["2024-11-28","2024-11-29"] }
 '
```

Important considerations Consider the following when working with the Autoscale holiday plug-in:

- When the Autoscale holiday plug-in is active, all VDAs are off, and the system doesn't operate at a reduced capacity. Any new launch requests are processed, however user might experience a delay due to the VDA being prepared for launch.
- The delivery group must have a timezone specified.
- The date format must be "yyyy-mm-dd".
- Schedule overrides (overrides a standard Autoscale setting) are generated a day in advance at 22:00 on the previous day. After 22:00 it's not possible to add, remove, or change any schedule override for the following day.
- The same Autoscale plug-in can be associated with multiple delivery groups. Run the `New-BrokerAutoscaleGroupPlugin` for each delivery group, and then configure the holidays required for that group.
- The latest `Set-BrokerAutoscalePlugin -Configuration` command overwrites all existing holidays with the new holidays specified.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Intelligent Autoscale schedules plug-in

Intelligent Autoscale is a data driven Autoscale feature with minimum administrative settings that allows you to configure the performance target of a delivery group. The performance target value ranges from 1 to 99 and the value specifies a target balance between user experience and cost:

- A low value prioritizes cost savings.
- A high value prioritizes user experience.

The performance target, combined with historical usage data, calculates an optimal buffer capacity (the number of VMs to be powered on) for each 30-minute block of a day. Therefore, 48 optimal buffer capacities are computed at the start of each day.

The optimal buffer capacity replaces peak/off-peak buffer capacity and pool size to manage available machines.

The historical usage data are used to calculate the optimal buffer capacity are:

- The customer's logon rate in users per minute
- The average VM power-on time, in minutes
- The average VM density, in users per VM.

Prerequisites

Following are the requirements for the Intelligent Autoscale to be enabled:

- The delivery group must be a shared delivery group.
- The delivery group must be Autoscale enabled.
- The delivery group must have at least 90 days worth of historical data before configuring the intelligent Autoscale for a desktop group. You can increase the `ConnectionLogLifetimeHours` from 48 hours to 90 days by using the command:

```
1  Set-BrokerServiceConfigurationData Logging.
       ConnectionLogLifetimeHours -SettingValue 2160.
```

Important considerations

- The delivery group must have a timezone specified.
- Schedule overrides are generated a day in advance at 22:00 on the previous day. After 22:00 it's not possible to add, remove, or change any schedule override for the following day.
- The same Autoscale plug-in can be associated with multiple delivery groups. Run the `New-BrokerAutoscaleGroupPlugin` for each delivery group, and then configure the performance target required for that group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The latest `Set-BrokerAutoscalePlugin -Configuration` command overwrites all existing holidays with the new holidays specified.

Configure performance target

Associate the `IntelligentAutoscaleSchedules` plug-in with a delivery group and configure performance target so that the performance target combined with historical usage data can calculate an optimal buffer capacity for each 30-minute block of a day. To achieve this, run the following commands:

1. Run `Get-BrokerAutoscalePlugin` to get the UID of the Intelligent Autoscale plug-in. Note the UID value of the `IntelligentAutoscaleSchedules` plug-in.

   ```
   (Get-BrokerAutoscalePlugin -Name Citrix.AutoscalePlugin.
      IntelligentAutoscaleSchedules).Uid
   ```

   Let's assume that the `IntelligentAutoscaleSchedules` plug-in has UID 2.

2. Get the UID of the delivery group with which you want to associate the plug-in. For example:

   ```
   $dgUid = (Get-BrokerDesktopGroup 'My Group Name').Uid
   ```

3. Associate the `IntelligentAutoscaleSchedules` plug-in with the delivery group (`-AutoscalePluginUid "<IntelligentAutoscaleSchedules value>"`) and specify the performance target value.

   ```
   New-BrokerAutoscaleGroupPlugin -DesktopGroupUid $dgUid -
      AutoscalePluginUid 2 -Configuration '{
    "PerformanceTarget":70 }
    '
   ```

4. Note the UID of the `AutoscaleGroupPlugin` created (the association between the plug-in and the delivery group).

Update performance target value

You can update the specified performance target value using the `Set-BrokerAutoscaleGroupPlugin` PowerShell command and specifying the UID of the `AutoscaleGroupPlugin`. For example, let's assume that the AutoscaleGroupPlugin has UID 2.

```
Set-BrokerAutoscaleGroupPlugin 2 -Configuration '{
 "PerformanceTarget":70 }
 '
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure Autoscale Group plug-in auto-approval

To allow schedule override (overrides a standard Autoscale setting) configure the following two properties in the `BrokerAutoscaleGroupPlugin`:

- `AutoApprove`
  - If `True`: Indicates that any schedule override produced by the plug-in is automatically accepted.
  - If `False`: The schedule is only accepted if the target date is on or before the date specified in ApprovedUntil properties.

  If `AutoApprove` is `False` and the `ApprovedUntil` date is not set, or is in the past, then any schedule override produced is discarded without being used.
- `ApprovedUntil`:
  - If `AutoApprove` is `False`, and you specify `ApprovedUntil` date, then the schedule override produced by the plug-in is automatically accepted as the schedule for the target date.

For example, let's assume that the `AutoscaleGroupPlugin` has UID 2.

- To enable auto-approval for that desktop group:

```
Set-BrokerAutoscaleGroupPlugin 2 -AutoApprove $true
```

- To enable auto approval until some date in the future:

```
Set-BrokerAutoscaleGroupPlugin 2 -ApprovedUntil "2025-01-01"
```

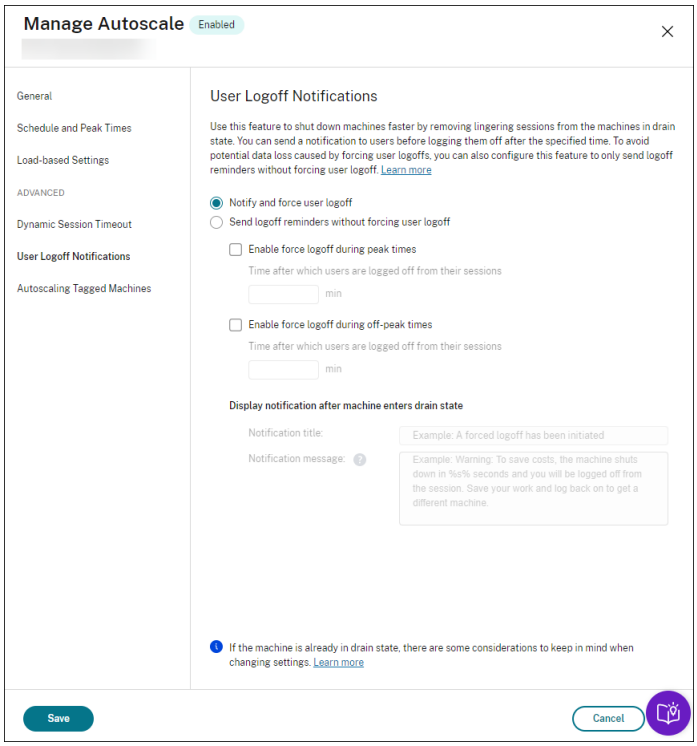
User logoff notifications (formerly force user logoff)

May 13, 2026

> **Important:**
>
> This feature is available only in the Autoscale™ user interface for multi-session app-based delivery groups.

To better achieve cost savings, Autoscale lets you force log off lingering sessions. It does so by letting you send a custom notification to the users and specify a grace period after which the sessions are force logged off. This is done only for machines in drain state and not for all powered-on machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



To avoid potential data loss caused by forcing user logoffs, you can instead configure this feature to only send logoff reminders without forcing user logoff.

You have the following two options:

- **Notify and force user logoff**
- **Send logoff reminders without forcing user logoff**

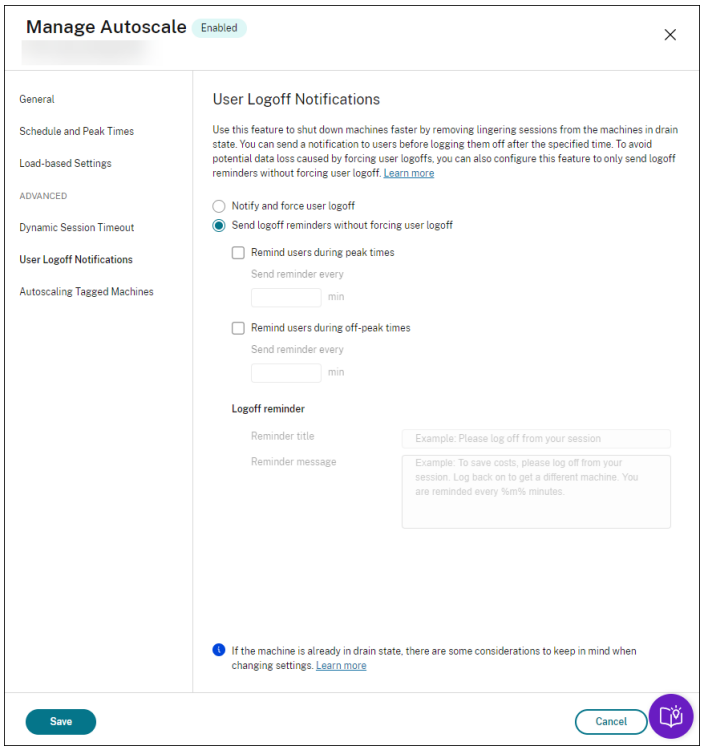
Notify and force user logoff

If selected, Autoscale logs off users from their sessions after the times specified below.

Enable force logoff during peak times. If selected, Autoscale logs off those users from their sessions during peak times when the specified time elapses.

Enable force logoff during off-peak times. If selected, Autoscale logs off those users from their sessions during off-peak times when the specified time elapses.

Display notification after machine enters drain state. Lets you send notifications to users after their machine enters drain state.



- **Notification title**. Lets you specify a title of the notification to be sent to users. Example: `A forced logoff has been initiated.`
- **Notification message**. Lets you specify the content of the notification to be sent to users. You can use %s% or %m% as variables to indicate the specified time in the message. To

© 1997–2026 Citrix Systems, Inc. All rights reserved.

express the time in seconds, use %s%. To express the time in minutes, use %m%. Example: `Warning: To save costs, the machine shuts down in %s% seconds and you will be logged off from the session. Save your work and log back on to get a different machine.`

Send logoff reminders without forcing user logoff

If selected, users will receive a reminder to log off from their machine after it has entered drain state. This reminder can be configured to be sent at the interval specified below.

Remind users during peak times. If selected, users receive a reminder to log off from their sessions during peak times every X minutes (X denotes the specified time).

Remind users during off-peak times. If selected, users receive a reminder to log off from their sessions during off-peak times every X minutes (X denotes the specified time).

Logoff reminder. Lets you configure the reminder sent to users after their machine enters drain state.

- **Reminder title**. Lets you specify a title for the reminder to be sent to users. Example: `Please log off from your session`.
- **Reminder message**. Lets you specify a message to be sent to users. Example: `Please log off from your session and log back on to save costs`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Considerations

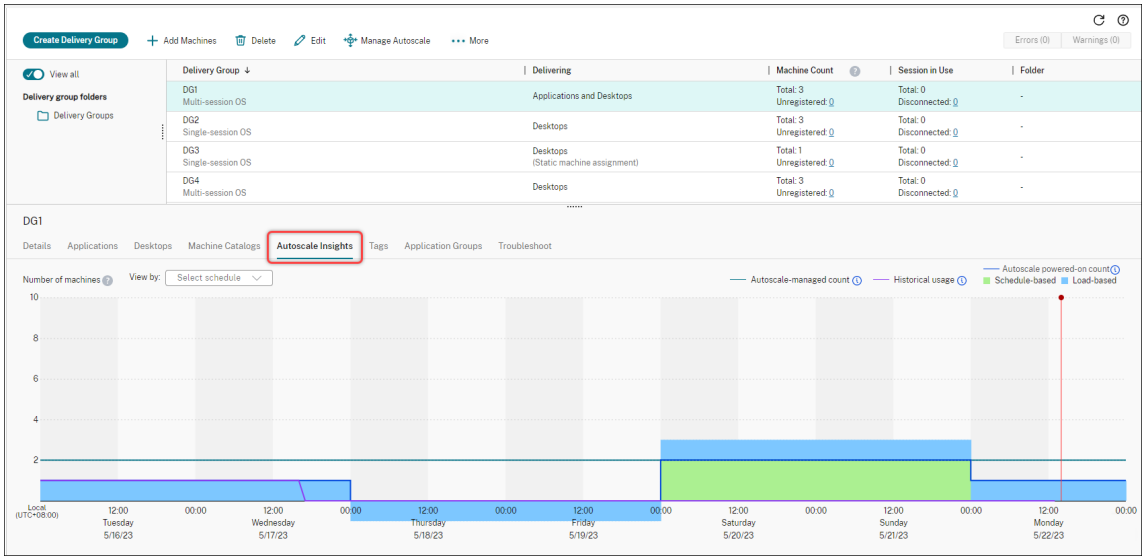
If the machine is already in drain state, consider the following when changing settings:

- If you change the setting from **Send logoff reminders without forcing user logoff** to **Notify and force user logoff**, the new setting takes effect immediately.
- If you change the setting from **Notify and force user logoff** to **Send logoff reminders without forcing user logoff**, the new setting does not take effect until the next time the machine enters drain state. The user is still forced to log off.

Analyze the effectiveness of Autoscale™ settings

May 13, 2026

This article describes how to analyze the effectiveness of the Autoscale settings based on machine usage from the previous week. Through the analysis, you can gain these insights into the effectiveness of Autoscale settings:



- Identify financial waste resulting from over-provisioning.
- Determine whether the user experience is negatively impacted due to under-provisioning.
- Ensure that the capacity provisioned is properly aligned with the machine usage.

To achieve this goal, follow these steps:

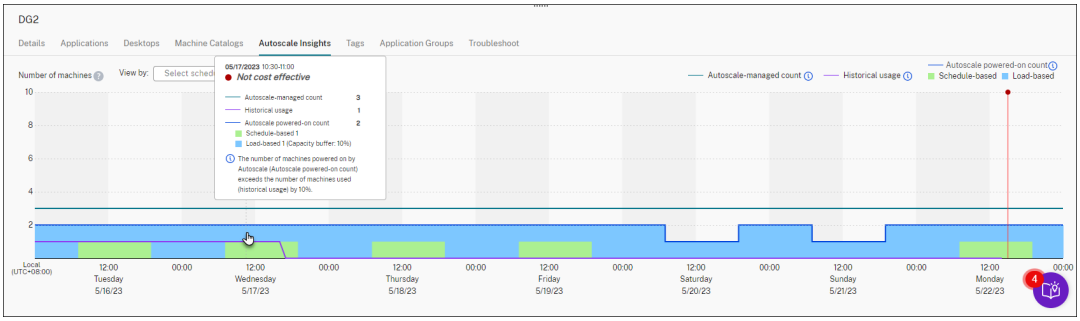
1. Select an Autoscale-enabled delivery group.
2. In the bottom pane, click the **Autoscale Insights** tab.

   The following graph appears, showing the comparison between machine usage data from the previous week and the number of machines to be powered on based on Autoscale settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

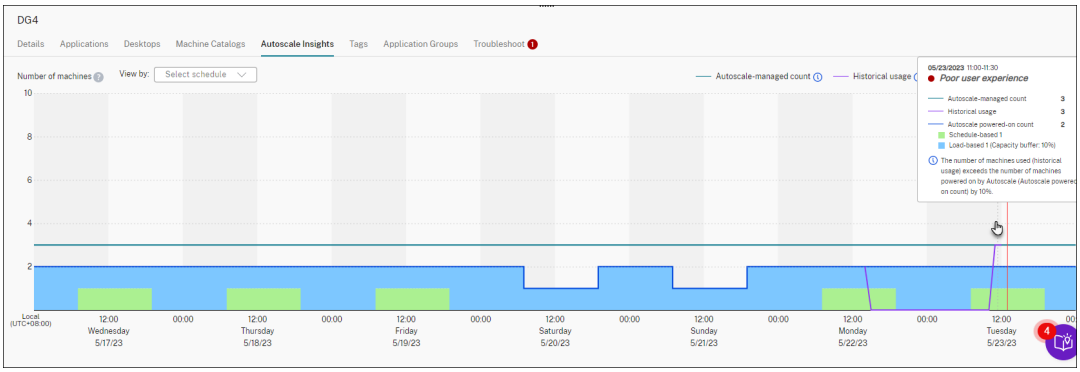
* The red vertical line identifies the current time.

The following table provides descriptions of the metrics shown in this graph.



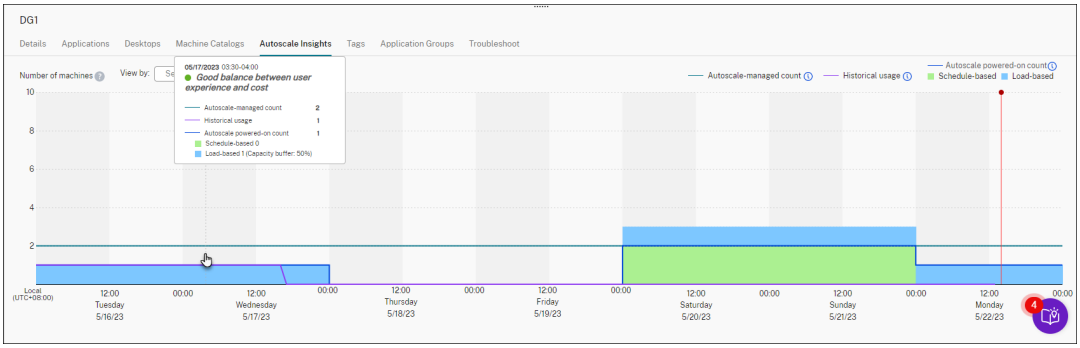
Metric	Description
Autoscale-managed count	Total number of machines managed by Autoscale. Autoscale-managed count = Total number of machines in the delivery group – Number of machines in maintenance mode – Number of machines not tagged for Autoscale (If tagged Autoscale feature is enabled).
Autoscale powered-on count	Total number of machines powered on by Autoscale. Autoscale powered-on count = Schedule-based machine count + Load-based machine count.
Historical usage	Number of machines that were delivered to users.
Schedule-based	Number of machines that are powered on based on the Autoscale schedule-based settings (**Note:** Schedule-based settings don't apply to delivery groups of the static single-session OS type).
Load-based	Number of machines that are powered on based on the Autoscale load-based settings.

3. To check the effectiveness of Autoscale settings at a specific time slot, hover your mouse over that slot on the graph. An information box appears, showing the comparison results and de-



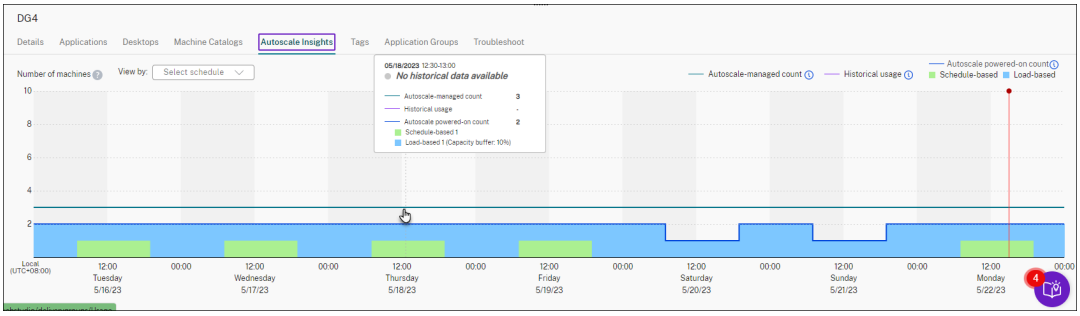
© 1997–2026 Citrix Systems, Inc. All rights reserved.

tailed machine counts:



- **Not cost effective**. The historical usage is less than 90% of the Autoscale settings (Autoscale powered-on count). As a result, wasted capacity might exist.

- **Poor user experience**. The historical usage is more than 110% of the Autoscale settings (Autoscale powered-on count). As a result, users might experience longer wait times for machines to power on.



- **Good balance between user experience and cost**. The difference between the historical usage and the Autoscale settings (Autoscale powered-on count) is less than 10%. The Autoscale settings are aligned with the historical usage.

- **No historical data available**. No historical data is available. Possible causes include that Autoscale was enabled for the delivery group less than a week ago.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. To highlight a date range based on an Autoscale schedule, select the schedule from the **View by** field.
5. Based on your analysis, adjust the Autoscale settings. For more information, see Schedule-based and load-based settings.

Broker PowerShell SDK commands

May 13, 2026

You can configure Autoscale for delivery groups using the Broker PowerShell SDK. To configure Autoscale using PowerShell commands, you must use PowerShell SDK version 7.21.0.12 or later. For more information about the PowerShell SDKs, see SDKs and APIs.

Set-BrokerDesktopGroup

Disables or enables an existing BrokerDesktopGroup or alters its settings. For more information about this cmdlet, see https://citrix.github.io/delivery-controller-sdk/Broker/Set-BrokerDesktopGroup/.

Examples

See the following examples for details about how to use the PowerShell cmdlets.

Enable Autoscale™

- Suppose you want to enable Autoscale for the delivery group whose name is “MyDesktop.”Use the `Set-BrokerDesktopGroup` PowerShell command. For example:
  - `PS C:\> Set-BrokerDesktopGroup "MyDesktop"-AutoscalingEnabled $true`

Configure the capacity buffer separately for peak and off-peak times

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Suppose you want to set the capacity buffer to 20% for peak times and 10% for off-peak times for a delivery group whose name is "MyDesktop."Use the `Set-BrokerDesktopGroup` PowerShell command. For example:
  - `PS C:\> Set-BrokerDesktopGroup "MyDesktop"-PeakBufferSizePercent 20 -OffPeakBufferSizePercent 10`

Configure the **when disconnected timeout** setting

- Suppose you want to set the **when disconnected timeout** value to 60 minutes for peak times and 30 minutes for off-peak times for a delivery group whose name is "MyDesktop."Use the `Set-BrokerDesktopGroup` PowerShell command. For example:
  - `PS C:\> Set-BrokerDesktopGroup "MyDesktop"-PeakDisconnectTimeout 60 -OffPeakDisconnectTimeout 30`

Configure the **when logged off timeout** setting

- Suppose you want to set the **when logged off timeout** value to 60 minutes for peak times and 30 minutes for off-peak times for a delivery group whose name is "MyDesktop."Use the `Set-BrokerDesktopGroup` PowerShell command. For example:
  - `PS C:\> Set-BrokerDesktopGroup "MyDesktop"-PeakLogOffTimeout 60 -OffPeakLogOffTimeout 30`

Configure the **power-off delay** setting

- Suppose you want to set the power-off delay to 15 minutes for a delivery group whose name is "MyDesktop."Use the `Set-BrokerDesktopGroup` PowerShell command. For example:
  - `PS C:\> Set-BrokerDesktopGroup "MyDesktop"-PowerOffDelay 15`

Configure a time period during which the power-off delay does not take effect

- Suppose you want the power-off delay to take effect until 30 minutes have elapsed for a delivery group whose name is "MyDesktop."Use the `Set-BrokerDesktopGroup` PowerShell command. For example:
  - `C:\PS> Set-BrokerDesktopGroup "MyDesktop"-SettlementPeriodBeforeAutoSh 30.`

Configure the **machine instance cost** setting

- Suppose you want to set the machine instance cost per hour to 0.2 dollars for a delivery group whose name is "MyDesktop."Use the `Set-BrokerDesktopGroup` PowerShell command. For example:
  - `PS C:\> Set-BrokerDesktopGroup "MyDesktop"-MachineCost 0.2`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Exclude maintenance mode VMs from the autoscale pool

- Consider a delivery group with 10 machines, out of which 2 machines are in maintenance mode. Autoscale buffer capacity is set to 50%. Suppose if you want to exclude the VMs in maintenance mode from the autoscale pool, then set `PoolSizeExcludesMaintenanceMode` to `True`. Autoscale then starts 4 machines as the 2 machines in maintenance mode are not included in the machine pool. Use the `Set-BrokerDesktopGroup` PowerShell command. For example:

  - `PS C:\> Set-BrokerDesktopGroup -PoolSizeExcludesMaintenanceMode $true`

  The default value for `PoolSizeExcludesMaintenanceMode` for the single-session delivery groups is `False`.

  The default value for `PoolSizeExcludesMaintenanceMode` for the multi-session delivery groups is `True`.

New-BrokerPowerTimeScheme

Creates a BrokerPowerTimeScheme for a delivery group. For more information, see https://citrix.github.io/delivery-controller-sdk/Broker/New-BrokerPowerTimeScheme/.

Example

Suppose you want to create a power time scheme for a delivery group whose UID value is 3. The new scheme covers the weekend, Monday, and Tuesday. The 8:00 AM to 6:30 PM time slot is defined as peak times for the days included in the scheme. For peak times, the pool size (the number of machines kept powered on) is 20. For off-peak times, it is 5. You can use the `Set-BrokerDesktopGroup` PowerShell command. For example:

- `PS C:\> $ps48=(0..47 | %{ if ($_ -lt 16 -or $_ -gt 37){ 5 } else { 20 } } )`
- `PS C:\> $pt48=(0..47 | %{ if ($_ -lt 16 -or $_ -gt 37){ $false } else { $true } } )`
- `PS C:\> New-BrokerPowerTimeScheme -Name 'First Half Week'-DaysOfWeek Weekend,Monday,Tuesday -DesktopGroupUid 3 -PeakHalfHours $pt48 -PoolSize $ps48`

Parameters for dynamic session timeouts

The following Broker PowerShell SDK cmdlets have been extended for dynamic session timeouts by supporting multiple new parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Get-BrokerDesktopGroup
- New-BrokerDesktopGroup
- Set-BrokerDesktopGroup

Those parameters include:

- **DisconnectPeakIdleSessionAfterSeconds** –Represents the time in seconds after which an idle session is disconnected during peak time. This property has a default value of 0, which indicates the disablement of its associated behavior during peak time. A value greater than 0 enables its behavior for the delivery group during peak time only.
- **DisconnectOffPeakIdleSessionAfterSeconds** - Represents the time in seconds after which an idle session is disconnected during off-peak hours. The default value of this property is 0, which indicates the disablement of its associated behavior during off-peak. A value greater than 0 enables its associated behavior for the delivery group during off-peak hours only.
- **LogoffPeakDisconnectedSessionAfterSeconds** - Represents the time in seconds after which a disconnected session is terminated during peak time. The default value of this property is 0, which indicates the disablement of its associated behavior during peak time. A value greater than 0 enables its associated behavior for the delivery group during peak time only.
- **LogoffOffPeakDisconnectedSessionAfterSeconds** - Represents the time in seconds after which a disconnected session is terminated during off-peak hours. The default value of this property is 0, which indicates the disablement of its associated behavior during off-peak. A value greater than 0 enables its associated behavior for the delivery group during off-peak hours only.

Example

Suppose you want to set the idle session timeout to 3,600 seconds during peak times for a delivery group whose name is "MyDesktop."Use the `Set-BrokerDesktopGroup` PowerShell command. For example:

- ```
  C:\PS> Set-BrokerDesktopGroup "MyDesktop"-DisconnectOffPeakIdleSessionAfte
    3600
  ```

Doing that disconnects sessions that have been idle for more than 1 hour in off-peak for the desktop group whose name is "MyDesktop."

Citrix Insight Services

September 1, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.
  ```

Citrix Insight Services (CIS) is a Citrix platform for instrumentation, telemetry, and business insight generation. Its instrumentation and telemetry capabilities enable technical users (customers, partners, and engineers) to self-diagnose and fix problems and optimize their environments. For details and the latest information about CIS and how it works, see https://cis.citrix.com (Citrix account credentials required).

All information uploaded to Citrix is used for troubleshooting and diagnostic purposes, and improving the quality, reliability, and performance of products, subject to:

- Citrix Insight Services Policy at https://cis.citrix.com/legal
- Citrix Privacy Policy at https://www.cloud.com/privacy-policy

This Citrix Virtual Apps and Desktops™ release supports the following technologies.

- Citrix Virtual Apps and Desktops™ install and upgrade analytics
- Citrix Customer Experience Improvement Program (CEIP)
- Citrix Call Home
- Citrix Scout

Install and upgrade analytics

When you use the full-product installer to deploy or upgrade Citrix Virtual Apps and Desktops components, anonymous information about the installation process is gathered and stored on the machine where you are installing/upgrading the component. This data is used to help Citrix improve its customers'installation experiences.

The information is stored locally under %ProgramData%\Citrix\CTQs.

Automatic upload of this data is enabled by default in both the graphical and command line interfaces of the full-product installer.

- You can change the default value in a registry setting. If you change the registry setting before installing/upgrading, that value is used when you use the full-product installer.
- You can override the default setting if you install/upgrade with the command line interface by specifying an option with the command.

Control automatic uploads:

- Registry setting that controls automatic upload of install/upgrade analytics (default = 1):
  - Location: HKLM:\Software\Citrix\MetaInstall
  - Name: SendExperienceMetrics
  - Value: 0 = disabled, 1 = enabled
- Using PowerShell, the following cmdlet disables automatic upload of install/upgrade analytics:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\MetaInstall -Name
    SendExperienceMetrics -PropertyType DWORD -Value 0
```

- To disable automatic uploads with the XenDesktopServerSetup.exe or XenDesktopVDASetup.exe command, include the `/disableexperiencemetrics` option.

  To enable automatic uploads with the XenDesktopServerSetup.exe or XenDesktopVDASetup.exe command, include the `/sendexperiencemetrics` option.

Citrix Customer Experience Improvement Program

When you participate in the Citrix Customer Experience Improvement Program (CEIP), anonymous statistics and usage information are sent to Citrix to help Citrix improve the quality and performance of Citrix products. For more information, see https://more.citrix.com/XD-CEIP.

Enrollment during Site creation or upgrade

You are automatically enrolled in CEIP when you create a Site (after you install the first Delivery Controller™). The first upload of data occurs approximately seven days after you create the Site.

You can stop your participation at any time after creating the Site. Select the **Settings** node in the Web Studio left pane and turn off the **Citrix Customer Experience Improvement Program** setting.

When you upgrade a Citrix Virtual Apps and Desktops deployment:

- If you upgrade from a version that did not support CEIP, you are asked if you want to participate.
- If you upgrade from a version that supported CEIP, and participation was enabled, CEIP is enabled in the upgraded Site.
- If you upgrade from a version that supported CEIP, and participation was disabled, CEIP is disabled in the upgraded Site.
- If you upgrade from a version that supported CEIP, and participation is unknown, you are asked if you want to participate.

The collected information is anonymous, so it cannot be viewed after it is uploaded to Citrix Insight Services.

Enrollment when installing a VDA

By default, you are automatically enrolled in CEIP when you install a Windows VDA. You can change this default in a registry setting. If you change the registry setting before installing the VDA, that value is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Registry setting that controls automatic enrolment in CEIP (default = 1):

Location: HKLM: \Software\Citrix\Telemetry\CEIP
Name: Enabled
Value: 0 = disabled, 1 = enabled

By default, the `Enabled` property is hidden in the registry. When it remains unspecified, the automatic upload feature is enabled.

Using PowerShell, the following cmdlet disables enrollment in CEIP:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\Telemetry\CEIP -Name
    Enabled -PropertyType DWORD -Value 0
```

The collected runtime datapoints are periodically written as files to an output folder (default %programdata%/Citrix/VdaCeip).

The first upload of data occurs approximately seven days after you install the VDA.

Enrollment when installing other products and components

You can also participate in CEIP when you install related Citrix products, components, and technologies, such as Citrix Provisioning™, AppDNA, Citrix License Server, Citrix Workspace™ app for Windows, Universal Print Server, and Session Recording. See their documentation for details about installation and participation default values.

Citrix Call Home

When you install certain components and features in Citrix Virtual Apps and Desktops, you are offered the opportunity to participate in Citrix Call Home. Call Home collects diagnostic data and then periodically uploads telemetry packages containing that data directly to Citrix Insight Services (via HTTPS on default port 443) for analysis and troubleshooting.

In Citrix Virtual Apps and Desktops, Call Home runs as a background service under the name Citrix Telemetry Service.

The Call Home scheduling functionality is also available in Citrix Scout. For details, see Citrix Scout.

What is collected

Citrix Diagnostic Facility (CDF) tracing logs information that can be useful for troubleshooting. Call Home collects a subset of CDF traces that can be helpful when troubleshooting common failures, for example, VDA registrations and application/desktop launches. This technology is known as always-on tracing (AOT). AOT logs are saved to disk at C:\ProgramData\Citrix\TelemetryService\CitrixAOT.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The `ProgramData` folder is hidden. To reveal it, click **View** > **Show** > **Hidden items**.

Call Home does not collect any other Event Tracing for Windows (ETW) information, nor can it be configured to do so.

Call Home also collects other information, such as:

- Registries created by Citrix Virtual Apps and Desktops under `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix`.
- Windows Management Instrumentation (WMI) information under the Citrix namespace.
- List of processes running.
- Crash dumps of Citrix processes that are stored in %PROGRAM DATA%\Citrix\CDF.
- Installation and upgrade information. This can include the full product metainstaller log, failing MSI logs, output from the MSI log analyzer, StoreFront™ logs, Licensing compatibility check logs, and results from preliminary site upgrade tests.

The trace information is compressed as it is collected. The Citrix Telemetry Service retains a maximum of 10 MB of compressed recent trace information, with a maximum time limit of eight days.

- Compressing data allows Call Home to maintain a small footprint on the VDA.
- Traces are held in memory to avoid IOPs on provisioned machines.
- The trace buffer uses a circular mechanism to retain traces in memory.

Call Home collects the key datapoints listed in Call Home key datapoints.

Configure and manage summary

You can enroll in Call Home when using the full-product installation wizard or later, using PowerShell cmdlets. When you enroll, by default, diagnostics are collected and uploaded to Citrix every Sunday at approximately 3:00 AM, local time. The upload is randomized with a two hour interval from the specified time. This means an upload using the default schedule occurs between 3:00 AM and 5:00 AM.

If you do not want to upload diagnostic information on a scheduled basis (or if you want to change a schedule), you can use PowerShell cmdlets to manually collect and upload diagnostics or store them locally.

When you enroll in scheduled Call Home uploads and when you manually upload diagnostic information to Citrix, you provide Citrix account or Citrix Cloud™ credentials. Citrix exchanges the credentials for an upload token that is used to identify the customer and upload the data. The credentials are not saved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When an upload occurs, a notification is emailed to the address associated with the Citrix account.

If you enable Call Home when you install a component, you can disable it later.

Prerequisites

- The machine must be running PowerShell 3.0 or later.
- The Citrix Telemetry Service must be running on the machine.
- The system variable `PSModulePath` must be set to Telemetry's install path, for example, C:\Program Files\Citrix\Telemetry Service\.

Enable Call Home during component installation

During VDA installation or upgrade: When you install or upgrade a Virtual Delivery Agent using the graphical interface in the full-product installer, you are asked if you want to participate in Call Home. There are two options:

- Participate in Call Home.
- Do not participate in Call Home.

If you're upgrading a VDA and previously enrolled in Call Home, that wizard page does not appear.

During Controller installation or upgrade: When you install or upgrade a Delivery Controller using the graphical interface, you are asked if you want to participate in Call Home. There are three options:

When you're installing a Controller, you cannot configure information on the Call Home page in the installation wizard if that server has an Active Directory GPO with the policy setting "Log on as a service" applied. For details, see CTX218094.

If you're upgrading a Controller and previously enrolled in Call Home, you're not asked about participating.

PowerShell cmdlets

The PowerShell help provides comprehensive syntax, including descriptions of cmdlets and parameters that are not used in these common use cases.

To use a proxy server for uploads, see Configure a proxy server.

- **Enable scheduled uploads:** Diagnostic collections are automatically uploaded to Citrix. If you do not enter additional cmdlets for a custom schedule, the default schedule is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$cred = Get-Credential
Enable-CitrixCallHome -Credential $cred
```

To confirm that scheduled uploads are enabled, enter `Get-CitrixCallHome`. If enabled, the return is `IsEnabled=True` and `IsMasterImage=False`.

- **Enable scheduled uploads for machines created from a master image:** Enabling scheduled uploads in a master image eliminates having to configure each machine that is created in the machine catalog.

  ```
  Enable-CitrixCallHome -Credential $cred -MasterImage
  ```

  To confirm that scheduled uploads are enabled, enter **Get-CitrixCallHome**. If enabled, the return is `IsEnabled=True` and `IsMasterImage=True`.

- **Create a custom schedule:** Create a daily or weekly schedule for diagnostic collections and uploads.

  ```
  $timespan = New-TimeSpan –Hours hours -Minutes minutes
  Set-CitrixCallHomeSchedule –TimeOfDay $timespan –DayOfWeek day
      -UploadFrequency {
  Daily|Weekly }
  ```

Examples:

The following cmdlet creates a schedule to bundle and upload data at 10:20 every evening. The Hours parameter uses a 24-hour clock. When the `UploadFrequency` parameter value is Daily, the `DayOfWeek` parameter is ignored, if specified.

```
$timespan – New-TimeSpan –Hours 22 –Minutes 20
Set-CitrixCallHomeSchedule –TimeOfDay $timespan -UploadFrequency Daily
```

To confirm the schedule, enter `Get-CitrixCallHomeSchedule`. In the preceding example, it returns `StartTime=22:20:00, DayOfWeek=Sunday (ignored), Upload Frequency =Daily`.

The following cmdlet creates a schedule to bundle and upload data at 10:20 every Wednesday evening.

```
$timespan – New-TimeSpan –Hours 22 –Minutes 20
Set-CitrixCallHomeSchedule –TimeOfDay $timespan –DayOfWeek Wed -
    UploadFrequency Weekly
```

To confirm the schedule, enter `Get-CitrixCallHomeSchedule`. In the preceding example, it returns `StartTime=22:20:00, DayOfWeek=Wednesday, Upload Frequency=Weekly` .

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Disable Call Home

You can disable Call Home using a PowerShell cmdlet or through Citrix Scout.

AOT logs are collected and saved to disk, even when Call Home scheduled uploads are disabled. (When scheduled uploads are disabled, AOT logs are not automatically uploaded to Citrix.) You can disable the collection and local storage of AOT logs.

Disable Call Home with PowerShell After running the following cmdlet, diagnostic data will not be uploaded to Citrix automatically. (You can still upload diagnostic data using Citrix Scout or telemetry PowerShell cmdlets.)

```
Disable-CitrixCallHome
```

To confirm that Call Home is disabled, enter `Get-CitrixCallHome`. If disabled, the return is `IsEnabled=False` and `IsMasterImage=False`.

Disable a collection schedule using Citrix Scout To disable a diagnostic collection schedule using Citrix Scout, follow the guidance in Schedule collections. In step 3, click **Off** to cancel the schedule for the selected machines.

Disable collection of AOT logs After running the following cmdlet (with the `Enabled` field set to **`false`**), AOT logs will not be collected.

```
Enable-CitrixTrace -Listen'{ "trace":{ "enabled":false,"persistDirectory
":"C:\Users\Public","maxSizeBytes":1000000, "sliceDurationSeconds
":300 } } '
```

The `Listen` parameter contains arguments in JSON format.

Configure a proxy server for Call Home uploads

Complete the following tasks on the machine where Call Home is enabled. Example diagrams in the following procedure contain server address and port 10.158.139.37:3128. Your information will differ.

1. Add proxy server information in your browser. In Internet Explorer, select **Internet Options > Connections > LAN settings**. Select **Use a proxy server for your LAN**”and enter the proxy server address and port number.
2. In PowerShell, run `netsh winhttp import proxy source=ie`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
PS C:\Users\administrator.JLGXH> netsh winhttp import proxy source=ie

Current WinHTTP proxy settings:

    Proxy Server(s) :  10.108.124.245:8080
    Bypass List     :  (none)
```

3. Using a text editor, edit the TelemetryService.exe config file, which is located in C:\Program Files\Citrix\Telemetry Service. Add the information shown in the red box.

4. Restart the Telemetry Service.

Run the Call Home cmdlets in PowerShell.

Manually collect and upload diagnostic information

You can use the CIS website to upload a diagnostic information bundle to CIS. You can also use PowerShell cmdlets to collect and upload diagnostic information to CIS.

To upload a bundle using the CIS website:

1. Log on to Citrix Insight Services using your Citrix account credentials.
2. Select **My Workspace**.
3. Select **Healthcheck** and then navigate to the location of your data.

CIS supports several PowerShell cmdlets that manage data uploads. This documentation covers the cmdlets for two common cases:

- Use the `Start-CitrixCallHomeUpload` cmdlet to manually collect and upload a diagnostic information bundle to CIS. (The bundle is not saved locally.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Use the `Start-CitrixCallHomeUpload` cmdlet to manually collect data and store a diagnostic information bundle locally. This allows you to preview the data. Later, use the `Send-CitrixCallHomeBundle` cmdlet to manually upload a copy of that bundle to CIS. (The data you originally saved remains locally.)

The PowerShell help provides comprehensive syntax, including descriptions of cmdlets and parameters that are not used in these common use cases.

When you enter a cmdlet to upload data to CIS, you are prompted to confirm the upload. If the cmdlet times out before the upload completes, check the status of the upload in the system event log. The upload request might be rejected if the service is already performing an upload.

Collect data and upload bundle to CIS:

```
Start-CitrixCallHomeUpload [-Credential] PSCredential [-InputPath
    string] [-Description string] [-IncidentTime string] [-SRNumber
    string] [-Name string] [-UploadHeader string] [-AppendHeaders string
    ] [-Collect string] [<CommonParameters>]
```

Collect data and save it locally:

```
Start-CitrixCallHomeUpload -OutputPath <String> [-InputPath string] [-
    Description string] [-IncidentTime string] [-SRNumber string] [-Name
     string] [-UploaderHeader string] [-AppendHeaders string] [-Collect
    strings] [<CommonParameters>]
```

The following parameters are valid:

- **Credential:** Directs the upload to CIS.
- **InputPath:** Location of zip file to include in the bundle. This might be an additional file that Citrix Support requests. Be sure to include the .zip extension.
- **OutputPath:** Location where the diagnostic information is saved. This parameter is required when saving Call Home data locally.
- **Description and Incident Time:** Free form information about the upload.
- **SRNumber:** Citrix Technical Support incident number.
- **Name:** Name that identifies the bundle.
- **UploadHeader:** JSON-formatted string specifying the upload headers uploaded to CIS.
- **AppendHeaders:** JSON-formatted string specifying the appended headers uploaded to CIS.
- **Collect:** JSON-formatted string specifying which data to collect or omit, in the form {'collector':{'enabled':Boolean}}, where Boolean is true or false.
  Valid collector values are:
  - 'wmi'

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- ‘process’
- ‘registry
- ‘crashreport’
- ‘trace’
- ‘file’
- ‘msi’
- ‘localdata’
- ‘sitedata’
- ‘sfb’

By default, all collectors except ‘sfb’are enabled.

The ‘sfb’collector is designed to be used on demand to diagnose Skype for Business issues. In addition to the ‘enabled’parameter, the ‘sfb’collector supports the ‘account’and ‘accounts’ parameters to specify target users. Use one of the forms:

- “-Collect “{‘sfb’:{‘account’:’domain\\user1’}}”
- “-Collect “{‘sfb’:{‘accounts’:[‘domain\\user1’, ‘domain\\user2’]}}”

- **Common Parameters:** See the PowerShell help.

Upload data that was previously saved locally:

```
Send-CitrixCallHomeBundle -Credential <PSCredentia\> -Path string [<
CommonParameters>]
```

The `Path` parameter specifies the location of the previously saved bundle.

Examples:

The following cmdlet requests an upload of Call Home data (excluding data from the WMI collector) to CIS. This data relates to registration failures of Citrix Provisioning VDAs, which were noted at 2:30 PM for Citrix Support case 123456. In addition to the Call Home data, the file “c:\Diagnostics\ExtraData.zip”is incorporated into the uploaded bundle.

```
C:\PS\>Start-CitrixCallHomeUpload -InputPath "c:\Diagnostics\ExtraData.
    zip" -Description "Registration failures with Citrix Provisioning
    VDAs" -IncidentTime "14:30" -SRNumber 123456 -Name "
    RegistrationFailure-021812016" -Collect "{
 'wmi':{
 'enabled':false }
  }
 " -UploadHeader "{
 'key1':'value1' }
 " -AppendHeaders "{
 'key2':'value2' }
 "
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following cmdlet saves Call Home data related to Citrix Support case 223344, noted at 8:15 AM. The data saved in the file mydata.zip on a network share. In addition to the Call Home data, the file "c:\Diagnostics\ExtraData.zip"will be incorporated into the saved bundle.

```
C:\PS\>Start-CitrixCallHomeUpload -OutputPath \\mynetwork\myshare\
    mydata.zip -InputPath "c:\Diagnostics\ExtraData.zip" -Description "
    Diagnostics for incident number 223344" -IncidentTime "8:15" -
    SRNumber 223344
```

The following cmdlet uploads the data bundle you saved earlier.

```
$cred=Get-Credential
C:\PS>Send-CitrixCallHomeBundle  – Credential $cred -Path \\mynetwork\
    myshare\mydata.zip
```

Citrix Scout

September 10, 2026

Introduction

Citrix Scout collects diagnostics and runs health checks. You can use the results to maintain your Citrix Virtual Apps and Desktops™ deployment. Citrix offers comprehensive, automated analysis of diagnostics collections through Citrix Insight Services. You can also use Scout to troubleshoot issues, on your own or with Citrix Support guidance.

You can upload collection files to Citrix for analysis and guidance from Citrix Support. Or, you can save a collection locally for your own review, and then later upload the collection file to Citrix for analysis.

Scout offers the following procedures:

- **Collect:** Runs a one-time diagnostics collection on machines that you select in a site. You can then either upload the file to Citrix or save it locally.
- **Trace & Reproduce:** Starts a manual trace on the machines that you select. Then you re-create issues on those machines. After re-creating the issue, the trace is stopped. Scout then collects other diagnostics and uploads the file to Citrix, or saves the file locally.
- **Schedule:** Schedules diagnostics collections to occur daily or weekly at a specified time on the machines you select. The file is automatically uploaded to Citrix.
- **Health Check:** Runs checks that gauge the health and availability of the site and its components. You can run health checks for Delivery Controllers, Virtual Delivery Agents (VDAs), StoreFront™ servers, and Citrix License Servers. If issues are found during the checks, Scout provides

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a detailed report. Each time Scout starts, it checks for updated health check scripts. If new versions are available, Scout downloads them automatically, for use the next time health checks are run.

> **Note:**
>
> The **Trace & Reproduce**, **Schedule**, and **Health Check** procedures are currently not available for Linux VDA.

The graphical interface described in this article is the primary way to use Scout. Alternatively, you can use PowerShell to configure one-time or scheduled diagnostic collections and uploads. See Call Home.

Where to run Scout:

- In an on-premises deployment, run Scout from a Delivery Controller™ to capture diagnostics or run checks on one or more Virtual Delivery Agents (VDAs), Delivery Controllers, StoreFront servers, Federated Authentication Service (FAS) servers, and License Servers. You can also run Scout from a VDA to collect local diagnostics.

  > **Note:**
  >
  > Currently, the *Health Check* for diagnosing FAS configuration issues isn't supported by Scout on the FAS server.

- In a Citrix Cloud environment that uses Citrix DaaS (formerly Citrix Virtual Apps and Desktops™ service), run Scout from a VDA to collect local diagnostics.

The log for the Scout application is stored in `C:\ProgramData\Citrix\TelemetryService\ScoutUI.log`. This file can be used for troubleshooting.

What is collected

The diagnostics collected by Scout include Citrix Diagnostic Facility (CDF) trace log files. A subset of CDF traces called Always-on Tracing (AOT) is also included. AOT information can be helpful when troubleshooting common issues such as VDA registrations and application/desktop launches. No other Event Tracing for Windows (ETW) information is collected.

The collection includes:

- Registry entries created by Citrix Virtual Apps and Desktops under `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix`.
- Windows Management Instrumentation (WMI) information under the **Citrix namespace**.
- Processes that are running.
- Crash dumps of Citrix processes that are stored in %PROGRAMDATA%\Citrix\CDF.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Citrix policy information, in CSV format.
- Installation and upgrade information. The collection can include the full product metainstaller log, failing MSI logs, output from the MSI log analyzer, StoreFront logs, Licensing compatibility check logs, and results from preliminary site upgrade tests.

About trace information:

- The trace information is compressed as it is collected, keeping a small footprint on the machine.
- On each machine, the Citrix Telemetry Service keeps compressed recent trace information for a maximum of eight days.
- Beginning with Citrix Virtual Apps and Desktops 7 1808, AOT traces are saved to the local disk by default. (In earlier versions, traces were held in memory.) Default path = `C:\ProgramData\Citrix\TelemetryService\CitrixAOT`.
- Beginning with Citrix Virtual Apps and Desktops 7 1811, AOT traces saved to network shares are collected with other diagnostics.
- You can modify the maximum size (default = 10 MB) and slice duration, using the `Enable-CitrixTrace` cmdlet or the `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Telemetry DefaultListen` registry string.
- Traces append to the file until the file reaches 10% of `MaxSize`.

For a list of the datapoints that Scout collects, see Call Home key datapoints.

Scout configuration

Scout can be configured to work on Linux VDAs. For more information on Linux VDA and telemetry, see Integrate with the Citrix Telemetry Service

The Linux VDA might automatically change the `ctxtelemetry` socket port or the port for telemetry service. If so, you must configure the port manually.

1. Navigate to C:\Program Files\Citrix\Telemetry Service
2. Open the ScoutUI.exe.config file.
3. Change the value for LinuxVDATelemetryServicePort or LinuxVDATelemetryWakeupPort to what was configured on the Linux VDA:

- `<add key="LinuxVDATelemetryServicePort"value="7502"/>`
- `<add key="LinuxVDATelemetryWakeupPort"value="7503"/>`

1. Save the changes and close the file.
2. Open Scout again to ensure it loads the latest configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

About health checks

Health check data is stored in folders under `C:\ProgramData\Citrix\TelemetryService\`.

Site health checks

Site health checks are included in the Environment Test Service, which provides a comprehensive evaluation of the FlexCast Management Architecture (FMA) services. In addition to checking for service availability, these checks look for other health indicators such as database connections.

Site health checks run on Delivery Controllers. Depending on your site's size, these checks can take up to an hour to complete.

Delivery Controller configuration checks As part of the site health checks. Delivery Controller configuration checks verify whether the following issues exist, based on Citrix recommendations for Virtual Apps and Desktops sites:

- One or more Delivery Controllers are in a failed state.
- There is only one Delivery Controller in the site.
- Delivery Controllers are of different versions.

In addition to meeting the permissions and requirements for health checks, Delivery Controller configuration checks require:

- At least one Controller powered on.
- The Broker Service running on a Controller.
- A working connection from the Controller to the site database.

VDA health checks

VDA health checks identify possible causes for common VDA registration, session launch, and time zone redirection issues.

For registration on the VDA, Scout checks:

- VDA software installation
- VDA machine domain membership
- VDA communication port availability
- VDA service status
- Windows firewall configuration
- Communication with Controller

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Time sync with Controller
- VDA registration status

For session launches on VDAs, Scout checks:

- Session launch communication port availability
- Session launch services status
- Session launch Windows firewall configuration
- VDA Remote Desktop Services Client Access Licenses
- VDA application launch path
- Session launch registry settings

For time zone redirection on VDAs, Scout checks:

- Windows hotfix installation
- Citrix hotfix installation
- Microsoft group policy settings
- Citrix group policy settings

For Profile Management on VDAs, Scout checks:

- Hypervisor detection
- Provisioning detection
- Citrix Virtual Apps and Desktops
- Personal vDisk configuration
- User store
- Profile Management Service status detection
- Winlogon.exe hooking test

To run checks on Profile Management, you must install and enable Profile Management on the VDA. For more information on Profile Management configuration checks, see Knowledge Center article CTX132805.

StoreFront health checks

StoreFront checks verify:

- Citrix Default Domain service is running
- Citrix Credential Wallet service is running
- Connection from the StoreFront server to Active Directory port 88
- Connection from the StoreFront server to Active Directory port 389
- Base URL has a valid FQDN
- Correct IP address from the base URL can be retrieved

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- IIS application pool is using .NET 4.0
- Whether the certificate is bound to the SSL port for the host URL
- Whether the certificate chain is complete
- Whether the certificates have expired
- Whether a certificate is expiring soon (within 30 days)

License Server checks

License Server checks verify:

- License Server connection from the Delivery Controller
- License Server firewall remote access status
- Citrix Licensing service status
- License Server License caching mode state
- License Server ports connection
- Whether the Citrix vendor daemon (CITRIX) is running
- Whether system clocks are synchronized
- Whether the Citrix Licensing service is running under the Local Service account
- Presence of the `CITRIX.opt` file
- Customer Success Services eligibility date
- Citrix License Server Update
- Whether the License Server certificate is in the Delivery Controller's trusted root store

In addition to meeting the permissions and requirements for health checks, the License Server must be joined to a domain. Otherwise, the License Server is not discovered.

Run health checks

The Health Check procedure comprises selecting machines, starting the checking, and then reviewing the results report.

1. Launch Scout. From the machine's **Start** menu, select **Citrix > Citrix Scout**. On the opening page, click **Health Check**.
2. Select machines. Click **Find machine** to discover machines. The **Select machines** page lists all the VDAs, Delivery Controllers, and License Servers discovered in the site. You can filter the display by machine name. Select the checkbox next to each machine that you want to collect diagnostics from, and then click **Continue**.

   To add other component types (such as StoreFront servers and VDA machines), see Add machines manually and Import VDA machines. You cannot manually add Citrix Provisioning™ Servers or License Servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Scout automatically launches verification tests on each selected machine, making sure it meets the criteria listed in Verification tests. If verification fails, a message is posted in the **Status** column, and that machine's checkbox is cleared. You can either:

- Resolve the issue and then select the machine's checkbox again. This triggers a retry of the verification tests.
- Skip that machine (leave its checkbox unselected). Health checks are not run for that machine.

When the verification tests complete, click **Continue**.

3. Run the health checks on the selected machines. The summary lists the machines where the tests run (the machines you selected that passed the verification tests). Click **Start Checking**.

   During and after checking:

   - The **Status** column indicates the current checking state for a machine.
   - To stop all in-progress checks, click **Stop Checking** in the lower right corner of the page. (You can't cancel a single machine's health check, only all selected machines. Information from machines that have completed the checks is kept.
   - When the checks complete for all selected machines, the **Stop Checking** button in the lower right corner changes to **Done**.
   - If a check fails, you can click **Retry** in the **Action** column.
   - If a check completes with no issues found, the **Action** column is empty.
   - If a check finds issues, click **View Details** to show the results.
   - After the check completes for all selected machines, don't click **Back**. (If you do, the check results are lost.)

4. When the checks complete, click **Done** to return to the Scout opening page.

Health check results

For report-generating Citrix checks, the reports contain:

- Time and date when the results report was generated
- Machines that were checked
- Conditions that the check looked for on the targeted machines

Permissions and requirements

Permissions:

- To collect diagnostics:

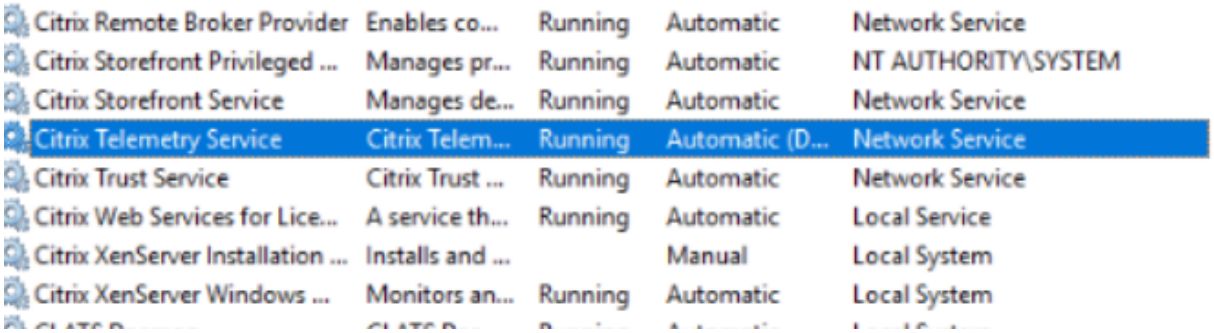
© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - You must be a local administrator and domain user for each machine from which you're collecting diagnostics.
    - You must have permission to write to the LocalAppData directory on each machine.

- To run health checks:

    - You must be a member of the domain users group.
    - You must be either a full administrator or have a custom role with read-only and **Run Environment Tests** permissions for the site.
    - Set the script execution policy to at least `RemoteSigned` to allow the scripts to run. For example: `Set-ExecutionPolicy RemoteSigned`. **Note:** other script execution privileges can work as well.

- Use **Run as administrator** when launching Scout.

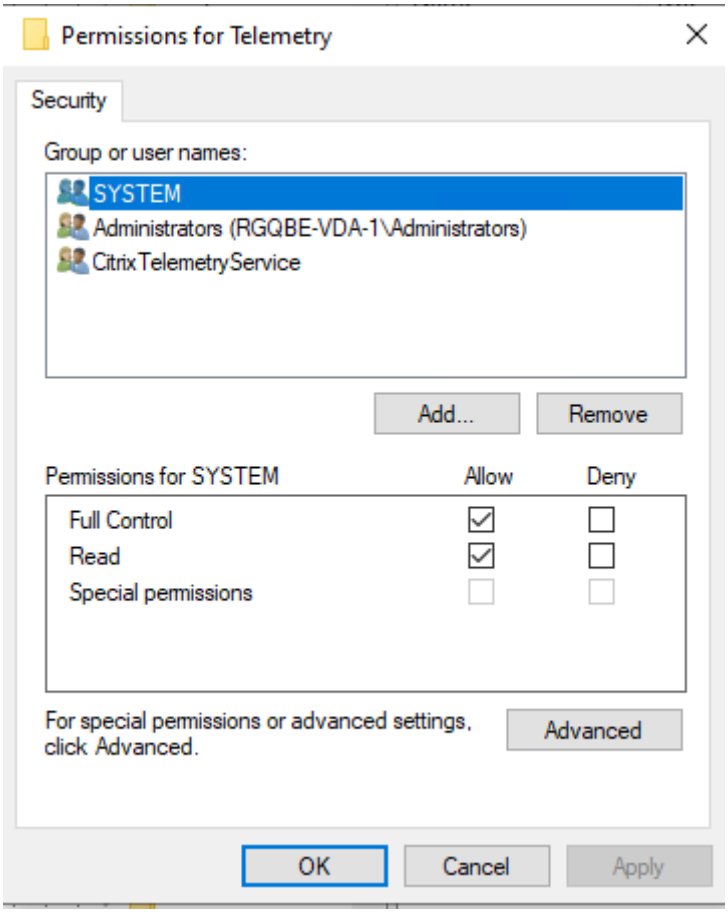


For each machine from which you collect diagnostics or run health checks:

- Scout must be able to communicate with the machine.
- File and printer sharing must be turned on.
- PSRemoting and WinRM must be enabled. The machine must also be running PowerShell 3.0 or later.
- The Citrix Telemetry Service must be running on the machine.
- Windows Management Infrastructure (WMI) access must be enabled on the machine.
- To set a schedule for diagnostic collection, the machine must be running a compatible Scout version.

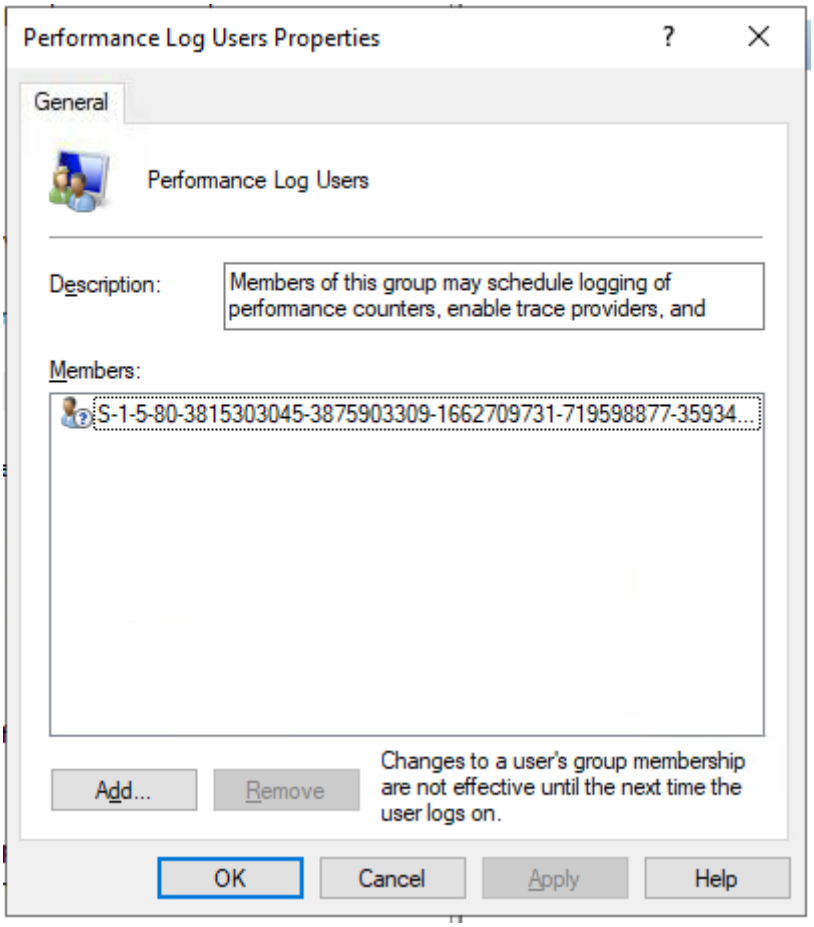
Do not use the dollar sign ($) in user names specified in pathnames. It prevents the collection of diagnostic information.

Scout runs verification tests on the machines that you select, to make sure these requirements are met.



The Telemetry Service for Windows runs on Network Service.

The AOT Trace Folder is saved in `C:\ProgramData\Citrix\TelemetryService\CitrixAOT`.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Only users in the Administrator group, System, and Telemetry Service SID have permission to access the `HKEYLOCALMACHINE:SOFTWARE\Citrix\Telemetry` registry.

The Telemetry Service SID remains in the Performance Log Users group after uninstalling the Telemetry Service, but you can remove it manually.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Verification tests

Before a diagnostic collection or health check starts, verification tests run automatically for each selected machine. These tests make sure that the requirements are met. If a test fails for a machine, Scout displays a message with suggested corrective actions.

- **Scout cannot reach this machine** - Ensure that:
  - The machine is powered-on.
  - The network connection is working properly. (This can include verifying that your firewall is properly configured.)
  - File and printer sharing is turned on. See the Microsoft documentation for instructions.
- **Enable PSRemoting and WinRM** - You can enable PowerShell remoting and WinRM at the same time. Using **Run as administrator**, run the `Enable-PSRemoting` cmdlet. For details, see the Microsoft help for the cmdlet.
- **Scout requires PowerShell 3.0 (minimum)** - Install PowerShell 3.0 (or later) on the machine, and then enable PowerShell remoting.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Unable to access LocalAppData directory on this machine** - Ensure that the account has permission to write to the LocalAppData directory on the machine.
- **Cannot locate Citrix Telemetry Service** - Ensure that the Citrix Telemetry Service is installed and started on the machine.
- **Cannot get schedule** - Upgrade the machine to (minimum) XenApp and XenDesktop 7.14.
- **WMI is not running on the machine** - Ensure that Windows Management Instrumentation (WMI) access is enabled.
- **WMI connections blocked** - Enable WMI in the Windows Firewall service.
- **Newer version of Citrix Telemetry Service required** - (Version is checked only for Collect and Trace & Reproduce.) Upgrade the Telemetry Service version on the machine (see Install and upgrade). If you do not upgrade the service, that machine is not included in the **Collect** or **Trace & Reproduce** actions.
- **Scout cannot connect to the systemd socket on this machine** - Ensure that:
  - Port 7503 is open. Verify that the `systemd ctxtelemetry.socket` is listening on port 7503 on the machine. The port might be different if the `ctxtelemetry.socket` port has been changed. See Scout configuration to adjust ports.
  - The network connection is working properly. (This might include verifying that your firewall is properly configured.)
- **The Linux VDA Telemetry Service is not started on this machine** - Ensure that:
  - Port 7502 is open. Verify that the Linux VDA Telemetry Service is installed and started on the machine. The port might be different if the telemetry service port has been changed. See Scout configuration to adjust ports.
  - The network connection is working properly. (This might include verifying that your firewall is properly configured.)

Version compatibility

This version of Scout (3.x) is intended to be run on Citrix Virtual Apps and Desktops (or minimum XenApp and XenDesktop 7.14) Controllers and VDAs.

Feature	Scout 2.23	Scout 3.0
Support Citrix Virtual Apps and Desktops (plus XenApp and XenDesktop 7.14 through 7.18)	Yes	Yes

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature	Scout 2.23	Scout 3.0
Support XenDesktop 5.x, 7.1–7.13	Yes	No
Support XenApp 6.x, 7.5 to 7.13	Yes	No
Delivered with product	7.1–7.13	Beginning with 7.14
Can be downloaded from CTX article	Yes	No
Capture CDF traces	Yes	Yes
Capture Always-on-Traces (AOT)	No	Yes
Allow collection of diagnostic data	Up to 10 machines at once (by default)	Unlimited (subject to resource availability)
Allow diagnostic data to be sent to Citrix	Yes	Yes
Allow diagnostic data to be saved locally	Yes	Yes
Support Citrix Cloud™ credentials	No	Yes
Support Citrix credentials	Yes	Yes
Support proxy server for uploads	Yes	Yes
Adjust schedules	N/A	Yes
Script support	Command line (local Controller only)	PowerShell using Call Home cmdlets (any machine with the Telemetry Service installed)
Health checks	No	Yes
Data Masking	No	Beginning with 3.17

Install and upgrade

By default, Scout is installed or upgraded automatically as part of the Citrix Telemetry Service when you install or upgrade a VDA or a Controller.

If you omit the Citrix Telemetry Service when you install a VDA, or remove the service later, run `TelemetryServiceInstaller_xx.msi` from the `x64\Virtual Desktop Components` or `x86\Virtual Desktop Components` folder on the Citrix Virtual Apps and Desktops installation media.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When you select the **Collect** or **Trace & Reproduce** action, you're notified if a machine is running an older version of the Citrix Telemetry Service. Citrix recommends using the latest supported version. If you don't upgrade the Telemetry Service on that machine, it is not included in the **Collect** or **Trace & Reproduce** actions. To upgrade the Telemetry Service, use the same procedure as installing it.

Upload authorization

If you plan to upload diagnostic collections to Citrix, you must have a Citrix or Citrix Cloud account. (These are the credentials that you use to access Citrix downloads or access the Citrix Cloud Control Center.) After your account credentials are validated, a token is issued.

If you authenticate with a Citrix account or a Citrix Cloud account, click a link to access Citrix Cloud using HTTPS with your default browser. After you enter your Citrix Cloud credentials, the token is displayed. Copy the token and then paste it into Scout. You can then continue in the Scout wizard.

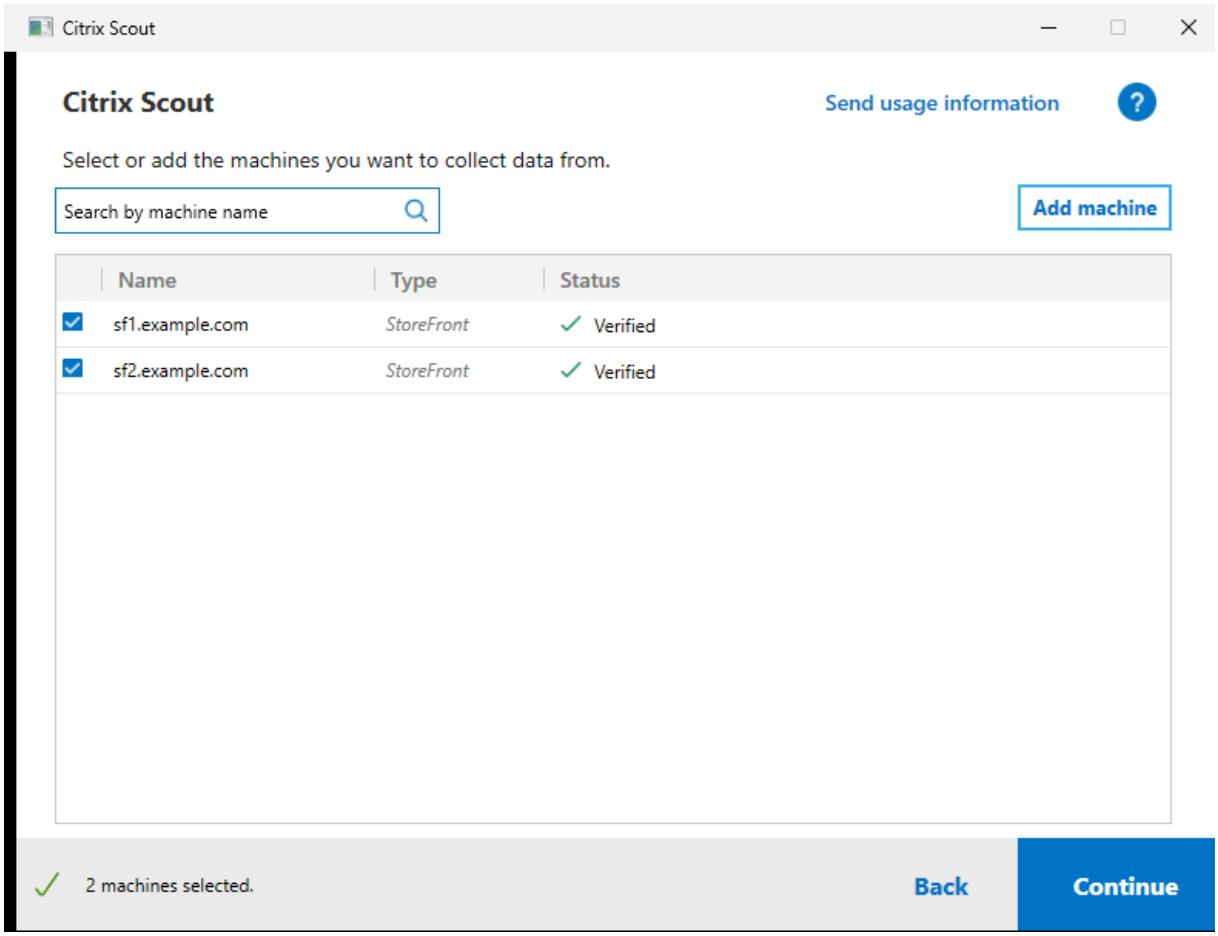
The token is stored locally on the machine where you're running Scout. To enable use of that token the next time you run **Collect** or **Trace & Reproduce**, select the **Store token and skip this step in the future** checkbox.

You must reauthorize each time you select **Schedule** on the Scout opening page. You cannot use a stored token when creating or changing a schedule.

Use a proxy for uploads

If you want to use a proxy server to upload collections to Citrix, you can instruct Scout to use the proxy settings configured for your browser's Internet Properties. Alternatively, you can specify the proxy server's IP address and port number.

Find machine



For the **Collect**, **Trace & Reproduce**, and **Schedule** procedures, Scout lists the Controllers and VDAs it discovers automatically.

Starting with Citrix Virtual Apps and Desktops LTSR 2607, when Scout runs on a StoreFront server, it also auto-discovers the other servers in the same StoreFront server group and lists them on the **Select machines** page for **Collect**, **Trace & Reproduce**, and **Schedule**. The following prerequisites must be met for auto-discovery to work:

- Scout must be running on the StoreFront machine itself. In the **Collect**, **Trace & Reproduce**, and **Schedule** procedures, running Scout on a Delivery Controller does not discover the members of a StoreFront server group.
- The `Citrix.StoreFront` PowerShell module must be present on that machine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Other StoreFront servers are discovered only if the server group contains more than one server. On a single-server deployment, only the local server is listed.

When you run Scout Health Check from the Delivery Controller, click **Find machine** to discover machines, including delivery controllers, VDAs, license servers, and StoreFront servers.

When you run Scout Health Check from a domain-joined machine which is not an Delivery Controller, Scout cannot discover machines automatically. You need to add machines manually or import VDA machines.

Add machines manually

After Scout lists the Controllers and VDAs it discovers, you can manually add other machines in the deployment, such as StoreFront servers, License Servers, and Citrix Provisioning servers.

When running health checks:

- Citrix License Servers in the domain are discovered automatically. You cannot add License Servers manually.
- Health checks do not currently support Citrix Provisioning servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

On any Scout page that lists the discovered machines, click **+ Add machine**. Type the FQDN of the machine that you want to add, and then click **Continue**. Repeat to add other machines, as needed. (Although entering a DNS alias instead of an FQDN can appear valid, the health checks might fail.)

Manually added machines always appear at the top of the machines list, above the discovered machines.

An easy way to identify a manually added machine is the red delete button on the right end of the row. Only manually added machines have that button. Discovered machines don't.

To remove a manually added machine, click the red button on the right end of the row. Confirm the deletion. Repeat to delete other manually added machines.

Scout remembers manually added machines until you remove them. When you close and then reopen Scout, the manually added machines are still listed at the top of the list.

CDF traces are not collected when using **Trace & Reproduce** on StoreFront servers. However, all other trace information is collected.

> **Note:**
>
> Starting with Citrix Virtual Apps and Desktops LTSR 2607, when Scout runs on a StoreFront server, servers in the same StoreFront server group are listed automatically (see Find machine). If you need to include StoreFront servers that are not part of the auto-discovered group, use the **+ Add machine** button. This button appears on the **Collect** page only (not on **Trace & Reproduce** or **Schedule**) when Scout is running on a StoreFront machine, starting with Citrix Virtual Apps and Desktops LTSR 2507. Older versions of *TelemetryService* do not support this feature.

Import VDA machines

You can import VDA machines in the deployment when running health checks.

1. On Delivery Controller or Connector, generate the machine list file with the PowerShell command. On Connector, you must input Citrix credentials and select the customer in the pop-up dialog.

   ```
   Get-BrokerMachine| foreach { $_.DnsName } | out-file C:\machineList
   .txt
   ```

2. Copy the machineList.txt file to the domain-joined machine that you want to launch Scout Health Check.
3. On the Scout Health Check page, click **Add Machine**.
4. Select the **Windows VDA** machine type.
5. Click **Import VDA machines**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Select the machineList.txt file.
7. Click **Open**.

The imported VDA machines are listed on the Scout Health Check page.

Collect diagnostics

The **Collect** procedure comprises selecting machines, starting the diagnostics collection, and then uploading the file containing the collection to Citrix or saving it locally.

1. Launch Scout. From the machine's **Start** menu, select **Citrix > Citrix Scout**. On the opening page, click **Collect**.
2. Select machines.

    - On a Controller, the **Select machines** page lists all the VDAs and Controllers in the site. You can filter the display by machine name. To add other machines manually (such as StoreFront or Citrix Provisioning servers), see Add machines manually.
    - On a StoreFront, the **Select machines** page lists the local machine and any other servers in the same StoreFront server group that are auto-discovered. To include servers outside the auto-discovered group, see Add machines manually.
    - On other components (such as VDA servers), the **Select machines** page lists only the local machine. Manually adding machines is not supported.

    Select the checkbox next to each machine you want to collect diagnostics from, and then click **Continue**.

    Scout automatically launches verification tests on each selected machine, ensuring it meets the criteria listed in Verification tests. If verification fails, a message is posted in the **Status** column, and that machine's checkbox is unselected. You can either:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Resolve the issue and then select the machine's checkbox again. This triggers a retry of the verification tests.
- Skip that machine (leave its checkbox unselected). Diagnostics won't be collected from that machine.

When the verification tests complete, click **Continue**.

3. Collect diagnostics. The summary lists all the machines from which diagnostics are collected (the machines you selected that passed the verification tests). Click **Start Collecting**.

   During collection:

   - The **Status** column indicates the current collection state for a machine.
   - To stop an in-progress collection on a single machine, click **Cancel** in the **Action** column for that machine.
   - To stop all in-progress collections, click **Stop Collection** in the lower right corner of the page. Diagnostics from machines that have completed collection are kept. To resume the collection, click **Retry** in the **Action** column for each machine.
   - When the collection completes for all selected machines, the **Stop Collection** button in the lower right corner changes to **Continue**.
   - To collect diagnostics again, click **Collect Again** in that machine's **Action** column. The newer collection overwrites the earlier.
   - If a collection fails, you can click **Retry** in the **Action** column. Only successful collections are uploaded or saved.
   - After the collection completes for all selected machines, don't click **Back**. (If you click it, the collection is lost.)

   When the collection completes, click **Continue**.

4. Save or upload the collection. Choose whether to upload the file to Citrix, or save it on the local machine.

   If you choose to upload the file now, continue with Step 5.

   If you choose to save the file locally:

   - A Windows **Save** dialog box appears. Navigate to the desired location.
   - When the local save completes, the pathname of the file is displayed and linked. You can view the file. You can upload the file later to Citrix. See CTX136396.

   Click **Done** to return to the Scout opening page. You don't need to complete any further steps in this procedure.

5. Authenticate for uploads and optionally specify a proxy. For details, see Upload authorization.

   - If you haven't authenticated through Scout, continue with this step.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you have authenticated through Scout, the stored authorization token is used by default. If this is what you want to do, select this option and click **Continue**. You aren't prompted for credentials for this collection. Continue with Step 6.
- If you authenticated previously, but want to reauthorize and get a new token, click **Change/Reauthorize** and continue with this step.

Choose whether you want to use Citrix credentials or Citrix Cloud credentials to authenticate the upload. Click **Continue**. The credentials page appears only if you're not using a stored token.

On the credentials page:

- If you want to use a proxy server for the file upload, click **Configure proxy**. You can instruct Scout to use the proxy settings configured for your browser's internet properties. Or, you can enter the proxy server's IP address and port number. Close the proxy dialog box.
- For a Citrix Cloud account, click **Generate token**. Your default browser launches to a Citrix Cloud page where a token is displayed. Copy the token, and then paste it on the Scout page.
- For a Citrix account, enter your credentials.

When you're done, click **Continue**.

6. Enter information about the upload.

   - The name field contains the default name for the file for the collected diagnostics. This suffices for most collections, although you can change the name. (If you delete the default name and leave the name field empty, the default name is used.)
   - Optionally, specify an 8-digit Citrix Support case number.
   - In the optional **Description** field, describe the issue and indicate when the issue occurred, if applicable.

   When you're done, click **Start Upload**.

   During the upload, the lower left portion of the page approximates the percentage of the upload that has completed. To cancel an in-progress upload, click **Stop Upload**.

   When the upload completes, the URL of its location is displayed and linked. You can follow the link to the Citrix location to view the analysis of the upload, or you can copy the link.

   Click **Done** to return to the Scout opening page.

Trace and reproduce

The **Trace and Reproduce** procedure comprises selecting machines, starting a trace, reproducing issues, completing the diagnostics collection, and then uploading the file to Citrix, or saving it locally.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This procedure is similar to the standard **Collect** procedure. However, it allows you to start a trace on machines and then re-create issues on those machines. All diagnostics collections include AOT trace information. This procedure adds CDF traces to help troubleshooting.

1. Launch Scout. From the machine's **Start** menu, select **Citrix > Citrix Scout**. On the opening page, click **Trace & Reproduce**.
2. Select machines. The **Select machines** page lists all the VDAs and Controllers in the site. You can filter the display by machine name. Select the checkbox next to each machine you want to collect traces and diagnostics from. Then click **Continue**.

   On a StoreFront, the **Select machines** page lists the local machine and any other servers in the same StoreFront server group that are auto-discovered. To include servers outside the auto-discovered group, see Add machines manually.

   To add other machines manually (such as StoreFront or Citrix Provisioning servers), see Add machines manually.

   Scout automatically launches verification tests on each selected machine, making sure it meets the criteria listed in Verification tests. If verification fails for a machine, a message is posted in the **Status** column, and that machine's checkbox is unselected. You can either:

   - Resolve the issue and then select the machine's checkbox again. This triggers a retry of the verification tests.
   - Skip that machine (leave its checkbox unselected). Diagnostics and traces are not collected from that machine.

   When the verification tests complete, click **Continue**.
3. Start the trace. The summary lists all the machines from which traces are collected. Click **Start Tracing**.

   On one or more of the selected machines, reproduce the issues you experienced. Trace collection continues while you're doing that. When you're done reproducing the issue, click **Continue** in Scout. That stops the trace.

   After you stop the trace, indicate whether you reproduced the issue during the trace.
4. Collect diagnostics from machines. Click **Start Collecting**. During collection:

   - The **Status** column indicates the current collection state for a machine.
   - To stop an in-progress collection on a single machine, click **Cancel** in the **Action** column for that machine.
   - To stop all in-progress collections, click **Stop Collection** in the lower right corner of the page. Diagnostics from machines that have completed collection are kept. To resume the collection, click **Retry** in the **Action** column for each machine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When the collection completes for all selected machines, the **Stop Collection** button in the lower right corner changes to **Continue**.
- To collect diagnostics again from a machine, click **Collect Again** in that machine's **Action** column. The newer collection overwrites the earlier.
- If a collection fails, you can click **Retry** in the **Action** column. Only successful collections are uploaded or saved.
- After the collection completes for all selected machines, don't click **Back**. (If you do, the collection is lost.)

When the collection completes, click **Continue**.

5. Save or upload the collection. Choose whether to upload the file to Citrix or save it locally.

   If you choose to upload the file now, continue with Step 6.

   If you choose to save the file locally:

   - A Windows Save dialog box appears. Select the desired location.
   - When the local save completes, the pathname of the file is displayed and linked. You can view the file. Remember: You can upload the file later from Citrix; see CTX136396 for Citrix Insight Services.

   Click **Done** to return to the Scout opening page. You don't need to complete any further steps in this procedure.

6. Authenticate for uploads and optionally specify a proxy. Review Upload authorization for details of this process.

   - If you haven't authenticated through Scout, continue with this step.
   - If you authenticated through Scout, the stored authorization token is used by default. If this what you want to do, choose this option and click **Continue**. You aren't prompted for credentials for this collection. Continue with Step 7.
   - If you previously authenticated, but want to reauthorize and get a new token, click **Change/Reauthorize** and continue with this step.

   Choose whether you want to use Citrix credentials or Citrix Cloud credentials to authenticate the upload. Click **Continue**. The credentials page appears only if you're not using a stored token.

   On the credentials page:

   - If you want to use a proxy server for the file upload, click **Configure proxy**. You can instruct Scout to use the proxy settings configured for your browser's Internet Properties. Or, you can enter the proxy server's IP address and port number. Close the proxy dialog box.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For a Citrix Cloud account, click **Generate token**. Your default browser launch to a Citrix Cloud page where a token is displayed. Copy the token, and then paste it on the Scout page.
- For a Citrix account, enter your credentials.

When you're done, click **Continue**.

7. Provide information about the upload.

   Enter upload details:

   - The name field contains the default name for the file for the collected diagnostics. This suffices for most collections, although you can change the name. (If you delete the default name and leave the name field empty, the default name is used.)
   - Optionally, specify an 8-digit Citrix Support case number.
   - In the optional Description field, describe the issue and indicate when the issue occurred, if applicable.

   When you're done, click **Start Upload**.

   During the upload, the lower left portion of the page approximates what percentage of the upload has completed. To cancel an in-progress upload, click **Stop Upload**.

   When the upload completes, the URL of its location is displayed and linked. You can follow the link to the Citrix location to view the analysis of the upload, or you can copy the link.

   Click **Done** to return to the Scout opening page.

Scout supports TraceLogging provider

Previously, Scout supported only the Windows performance provider, which required extra decoding files and traced only sessions and events from a single session for the same provider.

Starting with the Citrix Virtual Apps and Desktops version 2411, Scout supports the TraceLogging provider. This provider does not require extra decoding files and can enable and receive events from up to eight trace sessions for the same provider. This feature is enabled by default.

Enable additional log collection

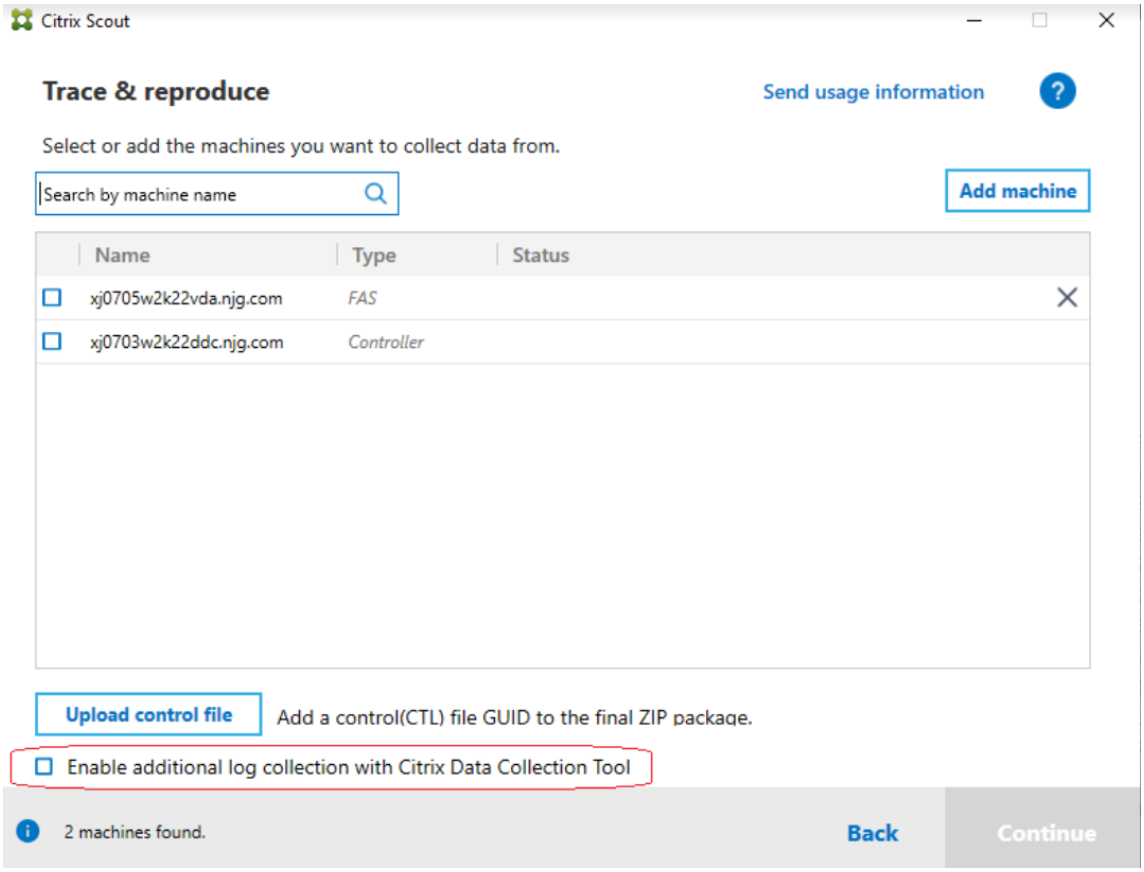
The **Enable additional log collection** function lets you use the trace and reproduce function with more tools, like perfmon, Netsh, DebugView, and Wireshark.

Starting with the 2407 release, when you enable additional log collection, Scout automatically detects the CDC-related tools installed on your machine and auto collects the CDC tool-related trace logs in the zip package. You can customize these zip files and attach them to Scout. With this automation, you can use Citrix Scout more effectively and this helps you to diagnose the issues quickly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> This only applies to local machines.

To enable additional log collection, ensure the following required tools are installed and their directories are created manually at the specified location.



Tool installation locations:

- **Procdump** logs: Download **Procdump** and place it at %ProgramData%\Citrix\TelemetryService\CDC\Lib\Re
- **StoreFront** logs: Download **DbgView** and place it at %ProgramData%\Citrix\TelemetryService\CDC\Lib\Res
- **Procmon** logs: Download **Process Monitor** and place it at %ProgramData%\Citrix\TelemetryService\CDC\Li
- **Wireshark** logs: Install **Wireshark** manually on your system.

To collect additional logs:

1. On the Scout home page, click **Trace & Reproduce**.
2. On the **Select or add machines** page to collect data from the page, check the box for local machine. The status must show as *Verified*.
3. Select the **Enable additional log collection with Citrix Data Collection Tool** checkbox to enable additional log collection.
4. Click the **Upload control file** button to load one CTL file. This button allows you to add additional GUIDs in the AOT collection list for AOT collection with Scout.
5. Click **Continue** and follow the Trace and Reproduce instructions.
6. After completion, check the logs in the zip file. The logs are zipped in the folder *CDCLogs*.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If the Procmon Tool is selected for tracing, Process Monitor logs can grow large quickly. Ensure you select only what tools are needed. You can also monitor the size of the logs under *%temp%\Scout-CDC-Log*.

Schedule collections

> **Note:**
>
> You can currently schedule collections, but not health checks.

The Schedule procedure comprises selecting machines and then setting or canceling the schedule. Scheduled collections are automatically uploaded to Citrix. (You can save scheduled collections locally using the PowerShell interface. See Citrix Call Home.)

1. Launch Scout. From the machine's Start menu, select **Citrix > Citrix Scout**. On the opening page, click **Schedule**.
2. Select machines. All the VDAs and Controllers in the site are listed. You can filter the display by machine name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

On a StoreFront, the **Select machines** page lists the local machine and any other servers in the same StoreFront server group that are auto-discovered. To include servers outside the auto-discovered group, see Add machines manually.

When you installed VDAs and Controllers using the graphical interface, if you set a Call Home schedule (see Citrix Call Home), Scout displays those settings, by default. You can use this version of Scout to start scheduled collections for the first time, or change a previously configured schedule.

Although you enabled/disabled Call Home on a per-machine basis during component installation, a schedule configured in Scout affects all the machines you select.

Select the checkbox next to each machine that you want to collect diagnostics from, and then click **Continue**.

To add other machines manually (such as StoreFront or Citrix Provisioning servers), see Add machines manually.

Scout automatically launches verification tests on each of the selected machines, making sure it meets the criteria in Verification tests. If verification fails for a machine, a message is posted in the **Status** column, and that machine's checkbox is unselected. You can either:

- Resolve the issue and then select the machine's checkbox again. This triggers a retry of the verification tests.
- Skip that machine (leave its checkbox unselected). Diagnostics (or traces) are not collected from that machine.

When the verification tests complete, click **Continue**.

The summary page lists the machines to which schedules are applied. Click **Continue**.

3. Set the schedule. Indicate when you want diagnostics to be collected. Remember: The schedule affects all selected machines.

   - To configure a weekly schedule for the selected machines, click **Weekly**. Choose the day of the week. Enter the time of day (24-hour clock) for the collection to begin.
   - To configure a daily schedule for the selected machines, click **Daily**. Enter the time of day (24-hour clock) for the collection to begin.
   - To cancel an existing schedule for the selected machines (and not replace it with another), click **Off**. This cancels any schedule that was previously configured for those machines.

   Click **Continue**.

4. Authenticate for uploads and optionally specify a proxy. Review Upload authorization for details of this process. Remember: You cannot use a stored token to authenticate when working with a Scout schedule.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Choose whether you want to use Citrix credentials or Citrix Cloud credentials to authenticate the upload. Click **Continue**.

On the credentials page:

- If you want to use a proxy server for the file upload, click **Configure proxy**. You can instruct Scout to use the proxy settings configured for your browser's Internet Properties. Or, you can enter the proxy server's IP address and port number. Close the proxy dialog box.
- For a Citrix Cloud account, click **Generate token**. Your default browser launches to a Citrix Cloud page where a token is displayed. Copy the token, and then paste it on the Scout page.
- For a Citrix account, enter your credentials.

When you're done, click **Continue**.

Review the configured schedule. Click **Done** to return to the Scout opening page.

During a collection, each selected machine's Windows application log contains entries about the collection and upload.

Data masking

The diagnostic information collected using Citrix Scout might contain security-sensitive information. The Citrix Scout data masking feature allows you to mask sensitive data in diagnostics files before uploading them to Citrix.

Scout data masking is configured to mask the IP address, machine names, domain names, user names, hypervisor names, Delivery Group names, catalog names, application names, and SIDs.

> **Note:**
>
> CDF traces are encrypted and cannot be masked.
>
> Linux VDA logs are compressed to `.tar.gz2` format and cannot be masked.

Collect new diagnostics and perform data masking

To use the Citrix Scout data masking feature, launch Scout from the command line.

1. In Windows, open the command prompt as an administrator.
2. Go to the directory where Scout is installed: `cd C:\Program Files\Citrix\Telemetry Service`.
3. Launch Scout: `ScoutUI.exe datamasking`.
4. Click **Collect** or **Trace & Reproduce** to collect diagnostics.
5. After the collection completes, select **Enable data masking**. This option is enabled by default.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Configure the data mask. You can use the default rules or customize the rules.
7. Select whether to upload or save the diagnostics collection.

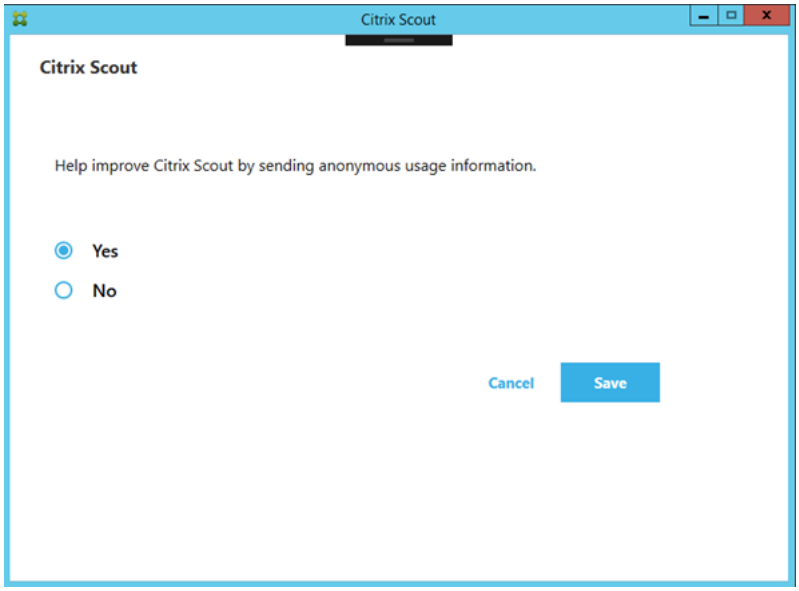
    - If you select **Upload the diagnostics collection to Citrix**, masked diagnostics files are uploaded to Citrix.
    - If you select **Save the diagnostics collection on your local machine**, both the original and masked diagnostics are saved to the specified location.

Perform data masking on existing diagnostics

1. In Windows, open the command prompt as an administrator.
2. Go to the directory where Scout is installed: `cd C:\Program Files\Citrix\Telemetry Service`.
3. Launch Scout directly in data masking mode: `ScoutUI.exe datamasking filePath`.
4. Select "Enable data masking"to continue. This option is enabled by default.
5. Configure the data mask. You can run data masking with the default rules or customize the rules.
6. Select whether to upload or save the diagnostics collection.

    - If you select **Upload the diagnostics collection to Citrix**, masked diagnostics files are uploaded to Citrix.
    - If you select **Save the diagnostics collection on your local machine**, both the original and masked diagnostics are saved to the specified location.

Masked data file and mapping file locations



After you have uploaded or saved the diagnostics collection, click the link to open the original and masked diagnostics, and open the mapping information file.

Usage data collection

When you use Scout, Citrix uses Google Analytics to collect anonymous usage data to be used for future product features and improvements. Data collection is enabled by default.

To change usage data collection and upload, click the **Settings** gear in the Scout UI. You can then choose whether to send the information by selecting **Yes** or **No** and then clicking **Save**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Command-line interfaces for Scout functionalities

You can now use command-line interfaces for Scout functionalities, enabling you to collect needed logs and data without opening the Scout UI. This feature provides convenience for advanced users to automate the log or trace process locally or remotely for target machines or sites. This feature is enabled by default.

Commands are added for the following functionalities:

- Help
- Collect diagnostics
- Start trace
- Stop trace
- List ongoing trace sessions
- Start and stop CDC

> **Note:**
>
> When running the remote trace session, the new telemetry version must be installed on both VDA and DDC. This installation is required because the Scout Command-line is supported starting from Citrix Virtual Apps and Desktops version 2411, and older versions of `TelemetryService` do not support this feature.

The following table describes the newly added commands:

Help

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Command-line interface	Description	Example
`ScoutCLI.exe -h`	Displays context-sensitive help.	`ScoutCLI.exe -h` `ScoutCLI.exe -help`

Command for collect diagnostics

Command-line interface	Description	Example
`ScoutCLI.exe Collect -exclude <collector>`	Excludes the diagnostics from the specified collectors (Windows Management Instrumentation (WMI) process, registry, crash report, header, trace, `msi`, `vcu`, tool telemetry, and local data).	`ScoutCLI.exe collect -exclude wmi, localdata -output "C:/Logs/mydata.zip"`
`ScoutCLI.exe Collect -output <filename>`	Specifies where to save the output log file with `.zip` as the suffix.	
`ScoutCLI.exe Collect -fqdn <hostname>`	Collects diagnostics on specified machines in a site.	`ScoutCLI.exe collect -fqdn hostname -exclude wmi, localdata -output "C:/Logs/mydata.zip"`

Start trace

Command-line interface	Description	Example
`ScoutCLI.exe StartTrace -guids <filename (xxx.ctl)>`	Collects target modules'logs for the specified GUIDs.	Example for local machine trace start - `ScoutCLI.exe StartTrace -guids C:\Logs\provider1.ctl -output C:\Logs\xxx.etl -name session1 -level 16 -max 50;` Example for remote machine trace start - `ScoutCLI.exe StartTrace -fqdn hostname -guids C:\Logs\provider1.ctl -output C:\Logs\xxx.etl -name session1 -level 16 -max 50`
`ScoutCLI.exe StartTrace -output <filename>`	Specifies where to save the output log file with .etl as the suffix.	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Command-line interface	Description	Example
`ScoutCLI.exe StartTrace -name <session name>`	Defines the name of the tracing session.	
`ScoutCLI.exe StartTrace -level <value>`	Selects the log level to log target diagnostic details. The default value is 16.	
`ScoutCLI.exe StartTrace -max <value>`	Specifies the maximum log file size in MB. The default value is 50.	
`ScoutCLI.exe StartTrace -fqdn <hostname>`	Starts tracing on specified machines in a site.	

Stop trace

Command-line interface	Description	Example
`ScoutCLI.exe StopTrace -name <session name>`	Stop the specified tracing session.	`ScoutCLI.exe StopTrace -name session1`
`ScoutCLI.exe StopTrace -fqdn <hostname>`	Stops tracing on specified machines in a site. -o option is needed to assign the local path where the remote `.etl` is copied to.	`ScoutCLI.exe StopTrace -fqdn hostname -name session1 -output C:\Logs\xxx.etl`
`ScoutCLI.exe StopTrace -output <filename>`	Specifies where to save the output log file with .etl as the suffix.	

List ongoing trace sessions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Command-line interface	Description	Example
`ScoutCLI.exe ListSession -name <session name>`	Shows details for the specified tracing session. If no name is specified, shows details for all running tracing sessions.	`ScoutCLI.exe ListSession -name session1`
`ScoutCLI.exe ListSession -fqdn <hostname>`	Shows tracing details on specified machines in a site.	`ScoutCLI.exe ListSession -fqdn hostname -name session1`

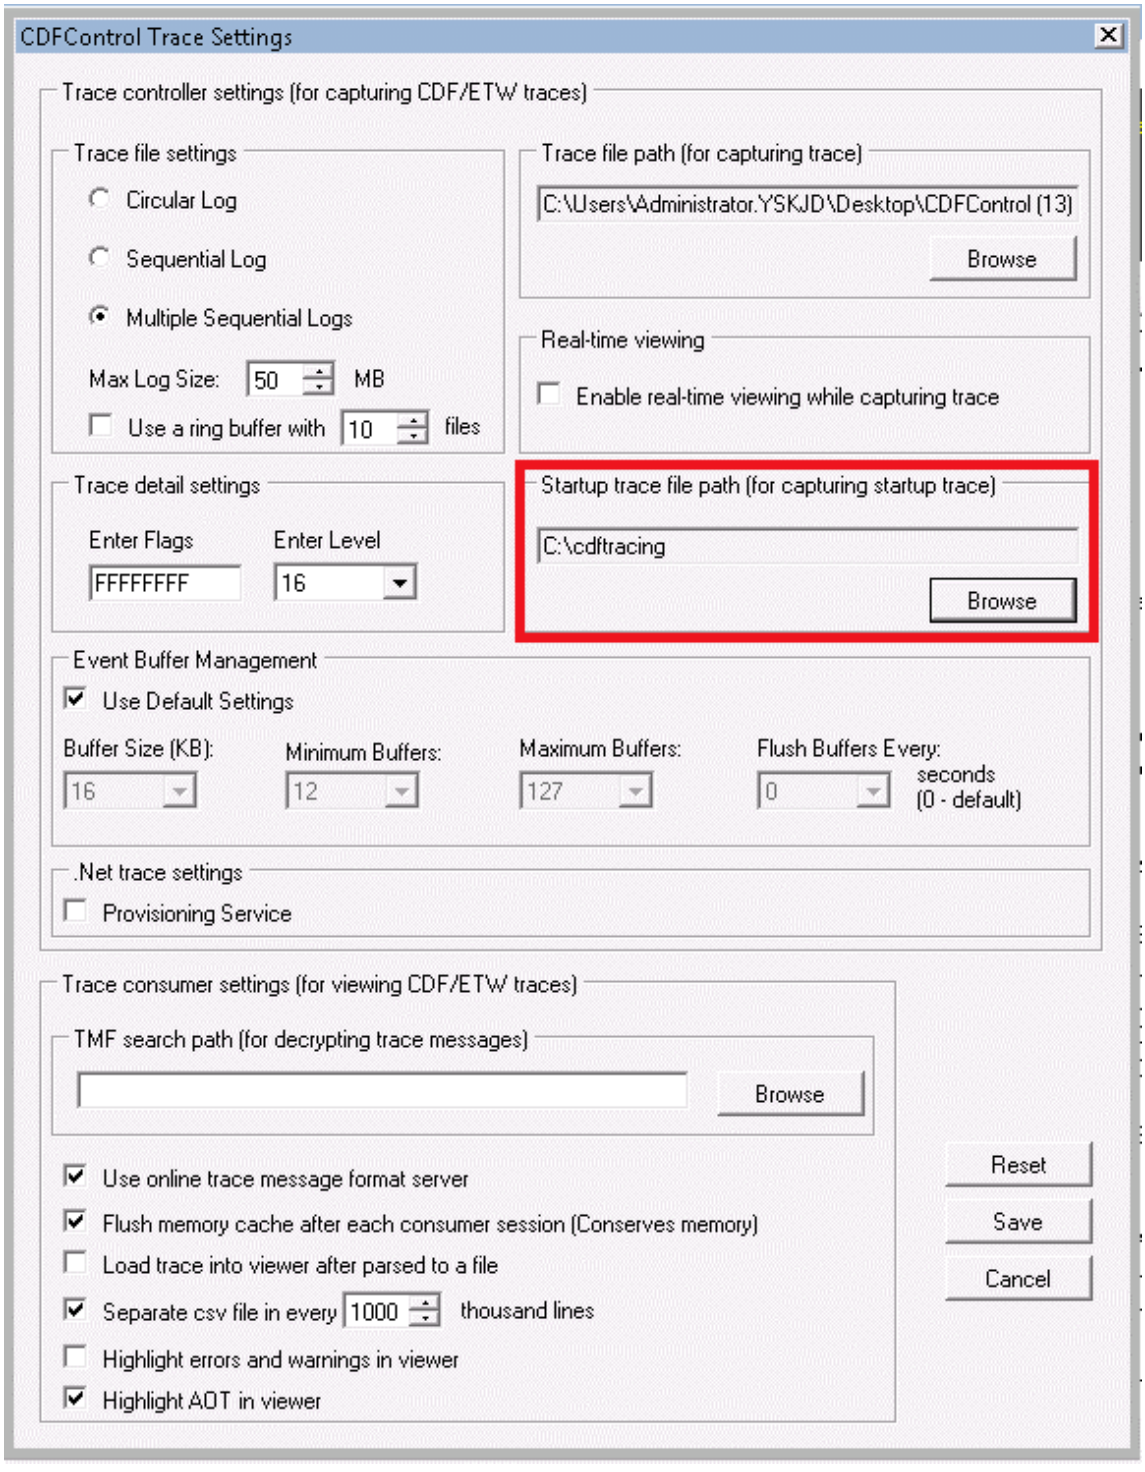
Start and stop CDC

Command-line interface	Description	Example
`ScoutCLI.exe StartCDC -config <filename>`	Specifies the JSON configuration file for the Citrix Diagnostic Collectors (CDC) tool parameters.	`ScoutCLI.exe StartCDC -config xxx.json -path C:\Logs`
`ScoutCLI.exe StartCDC -path <folder>`	Specifies where the output log files are saved.	
`ScoutCLI.exe StopCDC`	Stop the collection of CDC tools.	`ScoutCLI.exe StopCDC`

Collect a Citrix Diagnostic Facility (CDF) trace at system startup

May 13, 2026

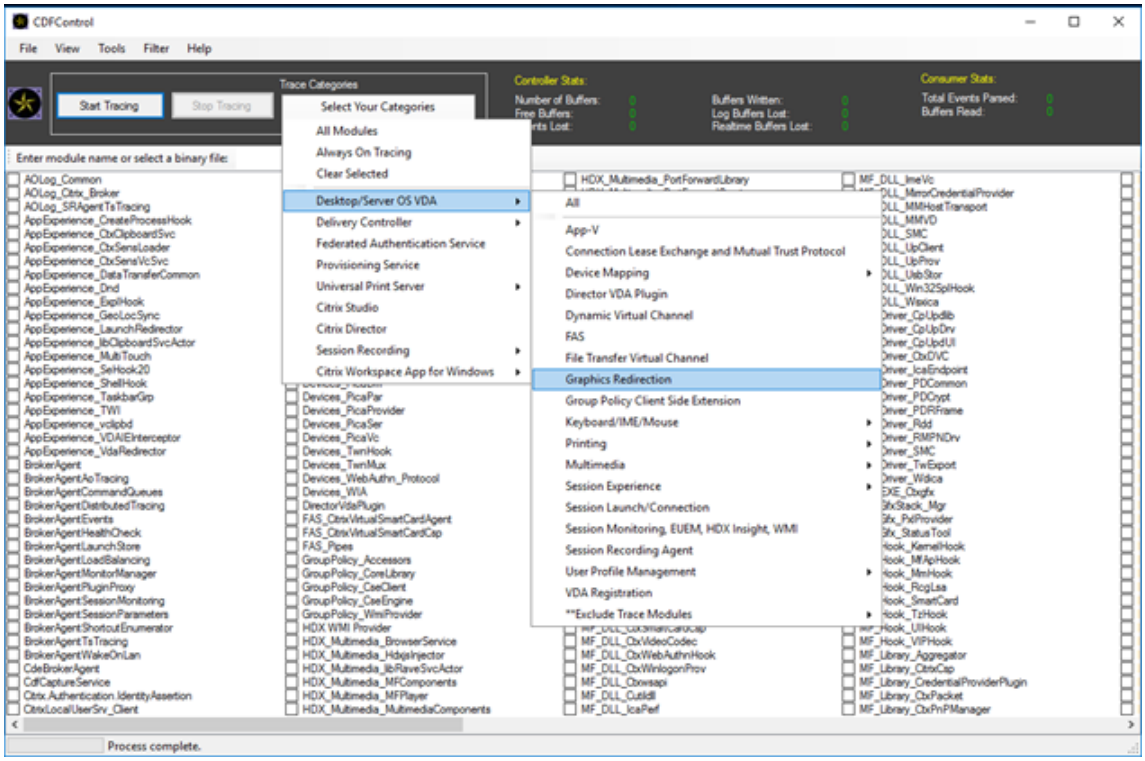
The CDFControl utility is an event tracing controller or consumer for capturing Citrix Diagnostic Facility (CDF) trace messages displayed from various Citrix tracing providers. It is intended to troubleshoot complex Citrix-related issues, parse filter support, and collect performance data. To download the CDFControl utility, see CTX111961.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Collect a trace at system startup

Use the following procedure to collect a CDF trace at system startup. You need administrator privileges.



1. Start **CDFControl** and select **Options** from the **Tools** menu.
2. Specify the trace file path in the **Startup trace file path for capturing startup trace** section. Then click **Save**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select the **Trace Categories** recommended by Citrix Support. (In the following example, **Graphics Redirection** is selected. That selection is only an example. We recommend that you enable the providers for the specific issue you are troubleshooting.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Select **Startup Tracing** and select **Enable** from the **Tools** menu.

   After selecting **Enable**, the animated bar starts scrolling. This activity does not affect the procedure. Continue to the next step.

5. After the **Startup Tracing** is enabled, close the **CDFControl utility** and restart the system.
6. Start the **CDFControl** utility. After the system restarts and the error appears, disable startup tracing by selecting **Startup Tracing** from the **Tools** menu, and clicking **Disable**.
7. Go to the trace file path specified in step 2 and collect the trace log file (.etl) for analysis.

Delegated administration

May 15, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The delegated administration model offers the flexibility to match how your organization wants to delegate administration activities, using role and object-based control. Delegated administration accommodates deployments of all sizes, and allows you to configure more permission granularity as your deployment grows in complexity. Delegated administration uses three concepts: administrators, roles, and scopes.

- **Administrators:** An administrator represents a person or a group of people identified by their Active Directory account. Each administrator is associated with one or more role and scope pairs.
- **Roles:** A role represents a job function, and has defined permissions associated with it. For example, the Delivery Group Administrator role has permissions such as 'Create Delivery Group' and 'Remove Desktop from Delivery Group.'An administrator can have multiple roles for a site, so a person can be a Delivery Group Administrator and a Machine Catalog Administrator. Roles can be built-in or custom.

  The built-in roles are:

Role	Permissions
Full Administrator	Can perform all tasks and operations. A Full Administrator is always combined with the All scope.
Read Only Administrator	Can see all objects in specified scopes in addition to global information, but cannot change anything. For example, a Read Only Administrator with Scope=London can see all global objects (such as Configuration Logging) and any London-scoped objects (for example, London Delivery Groups). However, that administrator cannot see objects in the New York scope (assuming that the London and New York scopes do not overlap).
Help Desk Administrator	Can view Delivery Groups, and manage the sessions and machines associated with those groups. Can see the Machine Catalog and host information for the Delivery Groups being monitored. Can also perform session management and machine power management operations for the machines in those Delivery Groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Role	Permissions
Machine Catalog Administrator	Can create and manage Machine Catalogs and provision the machines into them. Can build Machine Catalogs from the virtualization infrastructure, Provisioning Services, and physical machines. This role can manage base images and install software, but cannot assign applications or desktops to users.
Delivery Group Administrator	Can deliver applications, desktops, and machines; can also manage the associated sessions. Can also manage application and desktop configurations such as policies and power management settings.
Host Administrator	Can manage host connections and their associated resource settings. Cannot deliver machines, applications, or desktops to users.
Cost Administrator	Can monitor and view cost details for Azure MCS catalogs, specifically the total cost incurred over the past 30 days and a comparison between the current and previous 30-day periods.

In certain product editions, you can create custom roles to match the requirements of your organization and delegate permissions with more detail. You can use custom roles to allocate permissions at the granularity of an action or task in a console.

- **Scopes:** A scope represents a collection of objects. Scopes are used to group objects in a way that is relevant to your organization (for example, the set of Delivery Groups used by the Sales team). Objects can be in more than one scope; you can think of objects being labeled with one or more scopes. There is one built-in scope: 'All,' which contains all objects. The Full Administrator role is always paired with the **All** scope.

Example

Company XYZ decided to manage applications and desktops based on their department (Accounts, Sales, and Warehouse) and their desktop operating system (Windows 7 or Windows 8). The administrator created five scopes and then labeled each Delivery Group with two scopes: one for the department where they are used and one for the operating system they use.

The following administrators were created:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Administrator	Roles	Scopes
domain/fred	Full Administrator	All (the Full Administrator role always has the All scope)
domain/rob	Read Only Administrator	All
domain/heidi	Read Only Administrator, Help Desk Administrator	All Sales
domain/warehouseadmin	Help Desk Administrator	Warehouse
domain/peter	Delivery Group Administrator, Machine Catalog Administrator	Win7

- Fred is a Full Administrator and can view, edit, and delete all objects in the system.
- Rob can view all objects in the site but cannot edit or delete them.
- Heidi can view all objects and can perform help desk tasks on Delivery Groups in the Sales scope. This allows her to manage the sessions and machines associated with those groups; she cannot make changes to the Delivery Group, such as adding or removing machines.
- Anyone who is a member of the warehouseadmin Active Directory security group can view and perform help desk tasks on machines in the Warehouse scope.
- Peter is a Windows 7 specialist and can manage all Windows 7 Machine Catalogs and can deliver Windows 7 applications, desktops, and machines, regardless of which department scope they are in. The administrator considered making Peter a Full Administrator for the Win7 scope. However, she decided against this, because a Full Administrator also has full rights over all objects that are not scoped, such as 'Site' and 'Administrator.'

How to use delegated administration

Generally, the number of administrators and the granularity of their permissions depends on the size and complexity of the deployment.

- In small or proof-of-concept deployments, one or a few administrators do everything. There is no delegation. In this case, create each administrator with the built-in Full Administrator role, which has the All scope.
- In larger deployments with more machines, applications, and desktops, more delegation is needed. Several administrators might have more specific functional responsibilities (roles). For example, two are Full Administrators, and others are Help Desk Administrators. Also, an administrator might manage only certain groups of objects (scopes), such as machine catalogs. In this case, create new scopes, plus administrators with one of the built-in roles and the appropriate scopes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Even larger deployments might require more (or more specific) scopes, plus different administrators with unconventional roles. In this case, edit or create more scopes, create custom roles, and create each administrator with a built-in or custom role, plus existing and new scopes.

For flexibility and ease of configuration, you can create scopes when you create an administrator. You can also specify scopes when creating or editing Machine Catalogs or connections.

Create and manage administrators

When you create a site as a local administrator, your user account automatically becomes a Full Administrator with full permissions over all objects. After a site is created, local administrators have no special privileges.

The Full Administrator role always has the All scope; you cannot change this.

By default, an administrator is enabled. Disabling an administrator might be necessary if you are creating the administrator now, but that person won't start administration duties until later. For existing enabled administrators, you might want to disable several of them while you are reorganizing your object/scopes, then re-enable them when you are ready to go live with the updated configuration. You cannot disable a Full Administrator if it would result in there being no enabled Full Administrator. The enable/disable check box is available when you create, copy, or edit an administrator.

When you delete a role/scope pair while copying, editing, or deleting an administrator, it deletes only the relationship between the role and the scope for that administrator. It does not delete either the role or the scope. It also does not affect any other administrator who is configured with that role/scope pair.

To create and manage administrators, follow these steps:

1. Sign in to Web Studio, click **Administrators** in the left pane, and then click the **Administrators** tab.
2. Follow the instructions for the task you want to complete:
    - **Create an administrator:** Click **Create Administrator** in the action bar. Type or browse to the user account name, select or create a scope, and then select a role. The new administrator is enabled by default; you can change this.
    - **Copy an administrator:** Select the administrator and then click **Copy Administrator** in the action bar. Type or browse to the user account name. You can select and then edit or delete any of the role/scope pairs, and add new ones. The new administrator is enabled by default; you can change this.
    - **Edit an administrator:** Select the administrator and then click **Edit Administrator** in the action bar. You can edit or delete any of the role/scope pairs, and add new ones.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Delete an administrator:** Select the administrator and then click **Delete Administrator** in the action bar. You cannot delete a Full Administrator if it would result in there being no enabled Full Administrator.

The upper pane displays the administrators that you created. Select an administrator to view its details in the lower pane. The **Warnings** column indicates whether the role and scope pairs associated with the administrator contain unusable roles or scopes. The following warning message appears if an associated role and scope pair contains unusable roles or scopes:

- Associated role or scope not usable

> **Important:**
>
> A warning message appears only when an associated role and scope pair contains unusable roles or scopes or both.

To remove the role and scope pair from the administrator, complete one of the following steps:

- Delete the role and scope pair.
  1. In the action bar, click **Edit Administrator**.
  2. In the **Administrator Name and Details** window, select the role and scope pair and then click **Delete**.
  3. Click **Save** to exit.
- Delete the administrator.
  1. In the action bar, click **Delete Administrator**.
  2. In the confirmation window, Click **Delete**.

Create and manage roles

When administrators create or edit a role, they can enable only the permissions that they themselves have. This prevents administrators from creating a role with more permissions than they currently have and then assigning it to themselves (or editing a role that they are already assigned).

Role names can contain up to 64 Unicode characters; they cannot contain: backslash, forward slash, semicolon, colon, pound sign, comma, asterisk, question mark, equal sign, left or right arrow, pipe, left or right bracket, left or right parenthesis, quotation marks, or apostrophe. Descriptions can contain up to 256 Unicode characters.

You cannot edit or delete a built-in role. You cannot delete a custom role if any administrator is using it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Only certain product editions support custom roles. Only editions that support custom roles have related entries in the action bar.

To create and manage roles, follow these steps:

1. Sign in to Web Studio, click **Administrators** in the left pane, and then click the **Roles** tab.
2. Follow the instructions for the task you want to complete:
    - **View role details:** Select the role. The lower pane lists the object types and associated permissions for the role. Click the **Administrators** tab in the lower pane to view a list of administrators who currently have this role.
    - **Create a custom role:** Click **Create Role** in the action pane. Enter a name and description. Select the object types and permissions.
    - **Copy a role:** Select the role, and then click **Copy Role** in the action bar. Change the name, description, object types, and permissions, as needed.
    - **Edit a custom role:** Select the role, and then click **Edit Role** in the action bar. Change the name, description, object types, and permissions, as needed.
    - **Delete a custom role:** Select the role, and then click **Delete Role** in the action bar. When prompted, confirm the deletion.

Create and manage scopes

When you create a site, the only available scope is the 'All' scope, which cannot be deleted.

You can create scopes using the following procedure. You can also create scopes when you create an administrator; each administrator must be associated with at least one role and scope pair. When you are creating or editing desktops, machine catalogs, applications, or hosts, you can add them to an existing scope. If you do not add them to a scope, they remain part of the 'All' scope.

Site creation cannot be scoped, nor be delegated administration objects (scopes and roles). However, objects you cannot scope are included in the 'All' scope. (Full Administrators always have the All scope.) Machines, power actions, desktops, and sessions are not directly scoped. Administrators can be allocated permissions over these objects through the associated machine catalogs or delivery groups.

Rules for creating and managing scopes:

- Scope names can contain up to 64 Unicode characters. Scope names cannot include: backslash, forward slash, semicolon, colon, pound sign, comma, asterisk, question mark, equal sign, left arrow, right arrow, pipe, left or right bracket, left or right parenthesis, quotation marks, or apostrophe.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Scope descriptions can contain up to 256 Unicode characters.
- When you copy or edit a scope, keep in mind that removing objects from the scope can make those objects inaccessible to the administrator. If the edited scope is paired with one or more roles, ensure that the scope updates do not make any role/scope pair unusable.

To create and manage scopes, follow these steps:

1. Sign in to Web Studio, click **Administrators** in the left pane, and then click the **Scopes** tab.
2. Follow the instructions for the task you want to complete:
    - **Create a scope:** Click **Create new Scope** in the action bar. Enter a name and description. To include all objects of a particular type (for example, Delivery Groups), select the object type. To include specific objects, expand the type and then select individual objects (for example, Delivery Groups used by the Sales team).
    - **Copy a scope:** Select the scope and then click **Copy Scope** in the actions bar. Enter a name and description. Change the object types and objects, as needed.
    - **Edit a scope:** Select the scope and then click **Edit Scope** in the action bar. Change the name, description, object types, and objects, as needed.
    - **Delete a scope:** Select the scope and then click **Delete Scope** in the action bar. When prompted, confirm the deletion.

Set up tenant management

Set up tenant management to create management partitions within a single Citrix Virtual Apps and Desktops™ site. Each tenant has segregated resources and configurations such as machine catalogs and delivery groups. Administrators with access to a specific tenant can manage only resources and configurations associated with that tenant. Example use cases include corporates with different business silos (independent divisions or separate IT management teams) in a single site.

At a high level, the workflow for setting up tenant management includes:

1. Create tenants
2. Add administrators for tenants

Create tenants

Create a tenant by creating a tenant scope. Detailed steps are as follows:

1. Sign in to Web Studio, click **Administrators** in the left pane, and then click the **Scopes** tab.
2. Click *Create Scope** to start tenant creation.
3. Enter the following details for the tenant scope:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Type a descriptive name for the scope. This name also serves as the tenant's identifier.
b) (Optional) Enter a brief description.
c) Select **Tenant scope**.
d) If necessary, select the objects associated with the tenant. You can also add objects to tenant scopes when creating or managing objects.
e) Click **OK** to complete the creation.

After completion, you can see:

- The new tenant scope record appears in the Scope list, identified as a **Tenant** in the **Type** column.
- The scope name is shown in the **All Tenants** dropdown list located in the top right corner of Web Studio.

When working with a tenant scope, keep these considerations in mind:

- The tenant property follows a hierarchical assignment order: Hosting > Machine Catalogs > Delivery Groups > Applications. Lower-level objects inherit the tenant property from higher-level objects. For example, when selecting a delivery group for a tenant scope, ensure that you also select the associated hosting and machine catalog. Otherwise, the delivery group cannot inherit the tenant's property.
- After creating a tenant scope, you can edit tenant assignments by modifying objects. When a tenant assignment is changed, it is still subject to the constraint that it must be assigned to the same tenants or to a subset of those tenants. However, lower-level objects are not reevaluated when tenant assignments change. Make sure that objects are properly restricted when you change tenant assignments. For example, if a machine catalog is available for `TenantA` and `TenantB`, you can create a delivery group for `TenantA` and one for `TenantB`. (`TenantA` and `TenantB` are both associated with that machine catalog.) You can then change the machine catalog to be associated only with `TenantA`. As a result, the delivery group associated with `TenantB` becomes invalid.

Add administrators for tenants

Add administrators for a tenant by assigning user accounts with administrator roles and tenants.

To add an administrator for a tenant, follow these steps:

1. Sign in to Web Studio, click **Administrators** in the left pane, and then click the **Administrators** tab.
2. Click **Add Administrator**, and follow these steps to complete:

    a) Type or browse to the user account name and click **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) Select **Custom access** and then select one or more roles (for example, Machine Catalog Administrator) as necessary.
c) Click **Edit scopes** next to each role, change the scope from **All** to the desired tenant scope, and then click **Save**.

3. Click **Next**.
4. On the **Review and confirm** page, click **Send invitation**.

Create reports

You can create two types of delegated administration reports:

- An HTML report that lists the role/scope pairs associated with an administrator, plus the individual permissions for each type of object (for example, delivery groups and machine catalogs). You generate this report from Web Studio.

  To create this report, follow these steps:

  1. Sign in to Web Studio, click **Administrators** in the left pane
  2. Select an administrator and then click **Create Report** in the action bar.

  You can also request this report when creating, copying, or editing an administrator.

- An HTML or CSV report that maps all built-in and custom roles to permissions. You generate this report by running a PowerShell script named OutputPermissionMapping.ps1.

  To run this script, you must be a Full Administrator, a Read Only Administrator, or a custom administrator with permission to read roles. The script is located in: Program Files\Citrix\DelegatedAdmin\SnapIn\Citrix.DelegatedAdmin.Admin.V1\Scripts.

  Syntax:

  ```
  OutputPermissionMapping.ps1 [-Help] [-Csv] [-Path string] [-AdminAddress string] [-Show] [CommonParameters]
  ```

Parameter	Description
`-Help`	Displays script help.
`-Csv`	Specifies CSV output. Default = HTML
`-Path string`	Where to write the output. Default = stdout
`-AdminAddress string`	IP address or host name of the Delivery Controller™ to connect to. Default = localhost

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Description
-Show	(Valid only when the -Path parameter is also specified) When you write the output to a file, -Show causes the output to be opened in an appropriate program, such as a web browser.
CommonParameters	Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, and OutVariable. For details, see the Microsoft documentation.

The following example writes an HTML table to a file named Roles.html and opens the table in a web browser.

```
& "$env:ProgramFiles\Citrix\DelegatedAdmin\SnapIn\
Citrix.DelegatedAdmin.Admin.V1\Scripts\OutputPermissionMapping.ps1"
-Path Roles.html  – Show
```

The following example writes a CSV table to a file named Roles.csv. The table is not displayed.

```
& "$env:ProgramFiles\Citrix\DelegatedAdmin\SnapIn\
Citrix.DelegatedAdmin.Admin.V1\Scripts\OutputPermissionMapping.ps1"
 – CSV -Path Roles.csv
```

From a Windows command prompt, the preceding example command is:

```
powershell -command "& '%ProgramFiles%\Citrix\DelegatedAdmin\SnapIn\
Citrix.DelegatedAdmin.Admin.V1\Scripts\OutputPermissionMapping.ps1'
-CSV -Path Roles.csv"
```

Delivery Controllers

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The Delivery Controller is the server-side component that is responsible for managing user access, plus brokering and optimizing connections. Controllers also provide the Machine Creation Services™ that create desktop and server images.

A site must have at least one Controller. After you install the initial Controller, you can add more Controllers when you create a site, or later. There are two primary benefits from having more than one Controller in a site.

- **Redundancy:** As best practice, in a production site, always have at least two Controllers on different physical servers. If one Controller fails, the others can manage connections and administer the site.
- **Scalability:** As site activity grows, so does CPU utilization on the Controller and database activity. Additional Controllers enable you to handle more users and more applications and desktop requests, and can improve overall responsiveness.

Each Controller communicates directly with the site database. In a site with more than one zone, the Controllers in every zone communicate with the site database in the primary zone.

> **Important:**
>
> Do not change the computer name or the domain membership of a Controller after the site is configured.

How VDAs register with Controllers

Before a VDA can be used, it must register (establish communication) with a Delivery Controller in the site. For information about VDA registration, see VDA registration with Controllers.

Add, remove, or move Controllers

To add, remove, or move a Controller, you must have the server role and database role permissions listed in the Databases article.

Installing a Controller on a node in an SQL clustering or SQL mirroring installation is not supported.

When you add a Delivery Controller™ to a site, be sure to add logon credentials for that machine to any replica SQL Servers that you use for high availability.

If your deployment uses database mirroring:

- Before adding, removing, or moving a Controller, ensure that the principal and mirrored databases are both running. In addition, if you are using scripts with SQL Server Management Studio, enable SQLCMD mode before running the scripts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To verify mirroring after adding, removing, or moving a Controller, run the PowerShell `Get-configdbconnection` cmdlet. That cmdlet ensures that the Failover Partner has been set in the connection string to the mirror.

After you add, remove, or move a Controller:

- If auto-update is enabled, the VDAs receive an updated list of Controllers within 90 minutes.
- If auto-update is not enabled, ensure that the Controller policy setting or ListOfDDCs registry key are updated for all VDAs. After moving a Controller to another site, update the policy setting or registry key on both sites.

Add a Controller

You can add Controllers when you create a site and later. You cannot add Controllers installed with an earlier version of this software to a site that was created with this version.

1. Run the installer on a server containing a supported operating system. Install the Delivery Controller component and any other core components you want. Complete the installation wizard.
2. If you have not yet created a site, run Citrix Site Manager on this Controller to create a site. The IP address of this Controller is automatically added to the new site.

   If you plan to generate scripts that initialize the databases, add the Controllers before you generate the scripts.
3. If you have already created a site, follow these steps:

   a) Run Citrix Site Manager on this Controller, click **Join an existing site**, and type the address of a Controller in the site that you want to join.
   b) Run Studio configuration tool to add the Controller to the Web Studio.

Remove a Controller

Removing a Controller from a site does not uninstall the Citrix software or any other component. That action removes the Controller from the database so that it can no longer be used to broker connections and perform other tasks. If you remove a Controller, you can later add it back to the same site or to another site. A site requires at least one Controller, so you cannot remove the last one listed in Web Studio.

When you remove a Controller from a site, the Controller logon to the database server is not removed. This avoids potentially removing a logon that is used by other products' services on the same machine. The logon must be removed manually if it is no longer required. The `securityadmin` server role permission is needed to remove the logon.

After you remove a Controller:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- VDAs using auto-update reregister with other available Controllers. This reregistration occurs only if the auto-update mechanism is enabled and the VDAs can reach other controllers (in the same secondary zone as the removed Controller, or in the primary zone for on-premises deployments).
- Update Controller information in Citrix StoreFront. For more information, see Manage Controllers.
- In Citrix StoreFront, update Secure Ticket Authority (STA) URLs for remote access through Citrix Gateway. For more information, see Manage Secure Ticket Authorities.
- In Citrix Gateway, update any virtual server STA URLs. For more information, see Citrix Gateway.

> **Important:**
>
> Do not remove the Controller from Active Directory until after you remove it from the site.

1. Make sure that the Controller is powered on so that Web Studio loads can load and displays the Controller you want to remove.
2. After Web Studio has fully loaded the Controller, verify that all the services on the Controller are running and the Controller remains powered on.
3. Sign in to Web Studio, select **Settings** in the left pane.
4. Locate the **Delivery Controller** tile and click **Edit**.
5. On the **Manage Delivery Controller** page, select the Controller you want to remove.
6. Select **Remove Controller**. If you do not have the correct database roles and permissions, you are offered the option of generating a script that allows your database administrator to remove the Controller for you.

   Web Studio performs a pre-check before removing a Controller. A controller is safe to remove if it is powered off and not in the following service status:

   - Unknown
   - Pending failure
   - Older version
   - Newer version
   - Version change in progress
   - Missing mandatory features

   If the Controller is not powered off and is in any of the mentioned service status, Web Studio prompts you to power off the Controller.
7. You must remove the Controller's machine account from the database server. Before removing, check that another service is not using the account.

After using Web Studio to remove a Controller, traffic to that Controller might linger for a short amount of time to ensure proper completion of current tasks. If you want to force the removal of a Controller

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in a short time, Citrix recommends you shut down the server where it was installed, or remove that server from Active Directory. Then, restart the other Controllers on the site to ensure no further communication with the removed Controller.

Move a Controller to another zone

If your site contains more than one zone, you can move a Controller to a different zone. See the Zones for information about how this moving can affect VDA registration and other operations.

1. Select **Zone** in the left pane.
2. Select a zone in the middle pane, and then select a Controller.
3. Select **Move Items** in the action bar.
4. On the **Move Items** page that appears, select the zone where you want to move the Controller.
5. Click **Save**.

Move a VDA to another site

If a VDA was provisioned using Citrix Provisioning™ or is an existing image, you can move a VDA to another site (from site 1 to site 2) when upgrading, or when moving a VDA image that was created in a test site to a production site. VDAs provisioned using Machine Creation Services (MCS) cannot be moved from one site to another. MCS does not support changing the ListOfDDCs a VDA checks to register with a Controller. VDAs provisioned using MCS always check the ListOfDDCs associated with the site in which they were created.

There are two ways to move a VDA to another site: using the installer or Citrix policies.

Installer Run the installer and add a Controller, specifying the FQDN (DNS entry) of a Controller in site 2.

Specify Controllers in the installer only when the Controllers policy setting is not used.

Group Policy Editor The following example moves multiple VDAs between sites.

1. Create a policy in site 1 that contains the following settings, then filter the policy to the Delivery Group level to initiate a staged VDA migration between the sites.
    - Controllers: Containing FQDNs (DNS entries) of one or more Controllers in site 2.
    - Enable auto update of Controllers: set to disabled.
2. Each VDA in the Delivery Group is alerted within 90 minutes of the new policy. The VDA ignores the list of Controllers it receives (because auto-update is disabled); it selects one of the Controllers specified in the policy, which lists the Controllers in site 2.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. When the VDA successfully registers with a Controller in site 2, it receives the site 2 ListOfDDCs and policy information, which has auto-update enabled by default. The Controller with which the VDA was registered in site 1 is not on the list sent by the Controller in site 2. So, the VDA re-registers, choosing among the Controllers in the site 2 list. From then on, the VDA is automatically updated with information from site 2.

For information about how to use the Group Policy Editor, see the Citrix policies documentation.

Home page for Web Studio

May 13, 2026

The Web Studio's Home page provides an overview of your Citrix Virtual Apps and Desktops™ deployment and workloads along with information that helps you get the most from your subscription. This article introduces the available widgets on this page:

- Site details
- Resources
- Sessions
- Recent
- Errors and warnings
- Get started

You can customize this Home page by adding, removing, or repositioning widgets to suit your needs.

Site details

This widget provides an at-a-glance summary of your Citrix Virtual Apps and Desktops site. It displays key information such as your license type, Studio version, and the version and status of your Delivery Controllers.

To diagnose site issues, select **Test site** to run checks for database health, connectivity, delegated administration, VDA update readiness, registration state, and more. This action is especially useful during upgrades, helping ensure that your site is stable and ready before and after deployment.

Resources

This widget provides an overview of your Citrix Virtual Apps and Desktops deployment:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Resources**. Shows the numbers of deployed resources and their counts by category.

Resource	To view counts by category
Machines	Click **Machines**, select a state, and then hover over the donut chart for details. Available options: **Availability state** (Available, In use, Off, and Unavailable), **Registration state** (Registered and Unregistered), and **Maintenance state** (In maintenance and Not in maintenance). When viewing machine counts by availability state, you can click a state to view the corresponding machine details.
Applications	Click **Applications** and hover over the donut chart for details.
Delivery Groups	Click **Delivery Groups** and hover over the donut chart for details.
Machine Catalogs	Click **Machine Catalogs** and hover over the donut chart for details.

- **Sessions launched in last 7 days**. Shows the number of desktop and app sessions launched each day for the last seven days. To drill down for more details, click Go to Director.

Sessions

This widget provides an overview of your Citrix Virtual Apps and Desktops workloads in the last 7 days. Shows the number of desktop and app sessions launched daily over the previous seven days.

Recent

This widget displays a history of objects that you've recently accessed in Web Studio. It helps you quickly review your object access history. Clicking an object name in the list takes you directly to that object within its respective node.

Keep the following in mind:

- The list is stored locally in your browser's cache. Clearing your cache, switching browsers, or using incognito mode resets the list.
- The list is limited to the last 100 objects that you've accessed within the past 30 days.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- This list records only individual object views or operations. If you select *multiple* objects at once, they *aren't* recorded in the list.
- The following objects *aren't* tracked:
  - Objects within the **Settings**, **Licensing**, and **Logging** nodes.
  - Objects within the **Comparison** and **Modeling** tabs of the **Policies** node.
  - Objects within the **History** and **Settings** tabs of the **Backup and restore** node.

Get started

This widget guides you through a series of questions to help you set up your Citrix Virtual Apps and Desktops deployment. By answering these questions, you can quickly configure your deployment.

Errors and warnings

Centrally displays errors and warnings from your deployments:

- Lists the number of errors and the number of warnings present in the following configuration nodes: Zones, Machines, Machine Catalogs, Delivery Groups, Hosting, and Images. Clicking a number links you to the UI of the corresponding node.
- Lists the high-priority errors in your site, along with recommended actions.

Customize the Home page

To customize the Home page, follow these steps:

1. Sign in to Web Studio.

   The home page appears.
2. Click the **Edit** icon in the top right corner of the Home page.
3. To reposition a widget, drag it to a wanted position.
4. To remove a widget from the Home page, click the **Delete** icon in the top right of the widget.
5. To add a widget back to the Home page, click the **Add widget** icon in the top right corner of the Home page.
6. Click **Done** to save changes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

IPv4/IPv6 support

May 13, 2026

This release supports pure IPv4, pure IPv6, and dual-stack deployments that use overlapping IPv4 and IPv6 networks.

The following components support only IPv4. All others support IPv4 and IPv6.

- XenServer®
- Virtual Delivery Agents (VDAs) not controlled by the **Only use IPv6 Controller registration** policy setting

IPv6 communications are controlled with two VDA connection-related Citrix® policy settings.

- **Primary setting that enforces the use of IPv6:** Only use IPv6 Controller registration.

  This policy setting controls which form of address the VDA uses to register with the Delivery Controller.

  When enabled, the VDA registers and communicates with the Controller using a single IPv6 address chosen in the following precedence: global IP address, Unique Local Address (ULA), link-local address (only if no other IPv6 addresses are available).

  When disabled, the VDA registers and communicates with the Controller using the machine's IPv4 address. This is the default value.

  If a team frequently uses an IPv6 network, publish the desktops and applications for those users based on an image or Organizational Unit (OU) that has the **Only use IPv6 Controller registration** policy setting enabled.

  If a team frequently uses an IPv4 network, publish the desktops and applications for those users based on an image or OU that has the **Only use IPv6 Controller registration** policy setting disabled.

- **Dependent setting that defines an IPv6 netmask:** Controller registration IPv6 netmask.

  A machine can have multiple IPv6 addresses. This policy setting allows administrators to restrict the VDA to only a preferred subnet, rather than a global IP, if one is registered. This setting specifies the network where the VDA registers. The VDA registers only on the first address that matches the specified netmask.

  This setting is valid only when the **Only use IPv6 Controller registration policy** setting is enabled. Default = Empty string

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Deployment considerations

If your environment contains both IPv4 and IPv6 networks, create separate delivery group configurations for IPv4-only clients and for the clients who can access the IPv6 network. Consider using naming, manual Active Directory group assignment, or SmartAccess filters to differentiate users.
Session reconnection might fail if the connection starts on an IPv6 network, and then you try to connect again from a client that has only IPv4 access.

NOTE - These considerations do not apply if you have DNS resolution enabled

Licensing for Citrix Virtual Apps and Desktops™ using Web Studio

May 13, 2026

> **Note:**
>
> - Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.
> - The License Activation Service (LAS) is a new cloud-based licensing solution that provides an alternative to the traditional Citrix® legacy licensing. LAS introduces new modules for activation, ensuring a seamless and modern approach to license management. See License Activation Service for more information.

From Web Studio, you can manage and track licensing, if the license server is in the same domain as Web Studio or in a trusted domain. For information about licensing tasks, see the licensing documentation and Multi-type licensing.

The following table lists the supported editions and license models:

Products	Editions	License models
Citrix Virtual Apps	Premium, Advanced, Standard	Concurrent
Citrix Virtual Desktops	Premium, Advanced, Standard	User/Device and Concurrent

For more information, see Concurrent license and User/device license.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Supported Current Release (CRs) and Long Term Service Release (LTSRs) version

Citrix strongly recommends that you always use the latest available version of Citrix License Server to benefit from any functional or security improvements it may contain.

> **Note:**
>
> The License Server VPX is deprecated and won't receive any further maintenance or security fixes. Customers using 11.16.6 or previous versions of License Server VPX are advised to migrate to the latest version of License Server for Windows as soon as possible.

For more information about Citrix products' lifecycle dates, see Product Matrix.

For information on legacy products and product versions, refer to the Legacy Product Matrix.

You must be a full license administrator to complete the following tasks. To view license information in Web Studio, an administrator must have at least the Read Licensing delegated administration permission. The built-in Full Administrator and Read-Only Administrator roles have that permission.

Download and install a license from Citrix using Web Studio

1. Sign in to Web Studio and select **Licensing** in the left pane.
2. Select **Allocate Licenses** in the action bar.
3. Enter the License Access Code. You received in an email from Citrix after licenses are purchased or renewed.
4. Select a product and choose **Allocate Licenses**. Licenses available for that product are allocated and downloaded. After you allocate and download all the licenses for a specific License Access Code, you cannot reuse that License Access Code. To do other transactions with the same code, log on to My Account.

Add licenses that are stored on your local computer or on the network

1. Sign in to Web Studio and select **Licensing** in the left pane.
2. Select **Add Licenses** in the action bar.
3. Browse to a license file and add it to the license server.

Change the license server

1. Sign in to Web Studio and select **Licensing** in the left pane.
2. Select **Change License Server** in the action bar.
3. Type the address of the license server in the form *name:port*, where the name is a DNS, NetBIOS, or IP address. If you do not specify a port number, the default port (27000) is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Select the type of license to use

- When configuring the Site, after you specify the license server, you're prompted to select the type of license to use. If there are no licenses on the server, the option to use the product for a 30-day trial period without a license is automatically selected.
- If there are licenses on the server, their details are displayed and you can select one of them. Or, you can add a license file to the server and then select that one.

Change the product edition and licensing model

1. Sign in to Web Studio and select **Licensing** in the left pane.
2. Select **Edit Product Edition** in the action bar.
3. Update the appropriate options.

To access the License Administration Console, in the action bar, select **License Administration Console**. The console either appears immediately, or if the dashboard is configured as password-protected, you're prompted for License Administration Console credentials. For details about how to use the console, see the licensing documentation.

> **Note:**
>
> When you switch licenses in the Web Studio, the change takes up to 5 minutes to appear in the Citrix Director. For example, if you switch between Advanced and Premium.

Add a licensing administrator

1. Sign in to Web Studio and select **Licensing** in the left pane.
2. Select the **Licensing Administrators** tab.
3. Select **Add licensing administrator** in the action bar.
4. Browse to the user you want to add as an administrator and choose permissions.

Change a licensing administrator's permissions or delete a licensing administrator

1. Sign in to Web Studio and select **Licensing** in the left pane.
2. Select the **Licensing Administrators** tab and then select the administrator.
3. Select either **Edit licensing administrator** or **Delete licensing administrator** in the action bar.

Add a licensing administrator group

1. Sign in to Web Studio and select **Licensing** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select the **Licensing Administrators** tab.
3. Select **Add licensing administrator group** in the action bar.
4. Browse to the group you want to act as licensing administrators and choose permissions. Adding an Active Directory Group gives licensing administrator permissions to the users within that group.

Change a licensing administrator group's permissions or delete a licensing administrator group

1. Sign in to Web Studio and select **Licensing** in the left pane.
2. Select the **Licensing Administrators** tab and then select the administrator group.
3. Select either **Edit licensing administrator group** or **Delete licensing administrator group** in the action bar.

View license information

Sign in to Web Studio and select **Licensing** in the left pane. A summary of license usage and settings for the Site is displayed with a list of all the licenses currently installed on the specified license server.

Ensure that the licensing settings for the site, which include the product type, license edition, and licensing model, match the licenses your configured License Server uses. If not, you might have to download or allocate your exiting licenses to match the site's license settings.

Run the command `Get-Brokersite` to get the following licensing information:

- TotalUniqueLicenseUsers
- PeakConcurrentLicenseUsers
- PeakConcurrentLicensedDevice

> **Note:**
>
> Use the cloud licensing APIs to get the information in Citrix DaaS. For information on cloud licensing APIs, see APIs to manage Citrix Cloud licensing.

View license expiration alerts

Web Studio queries for license file expiration dates from the Citrix License Server. Web Studio alerts administrators on the Overview tab if license files are approaching expiration or already expired.

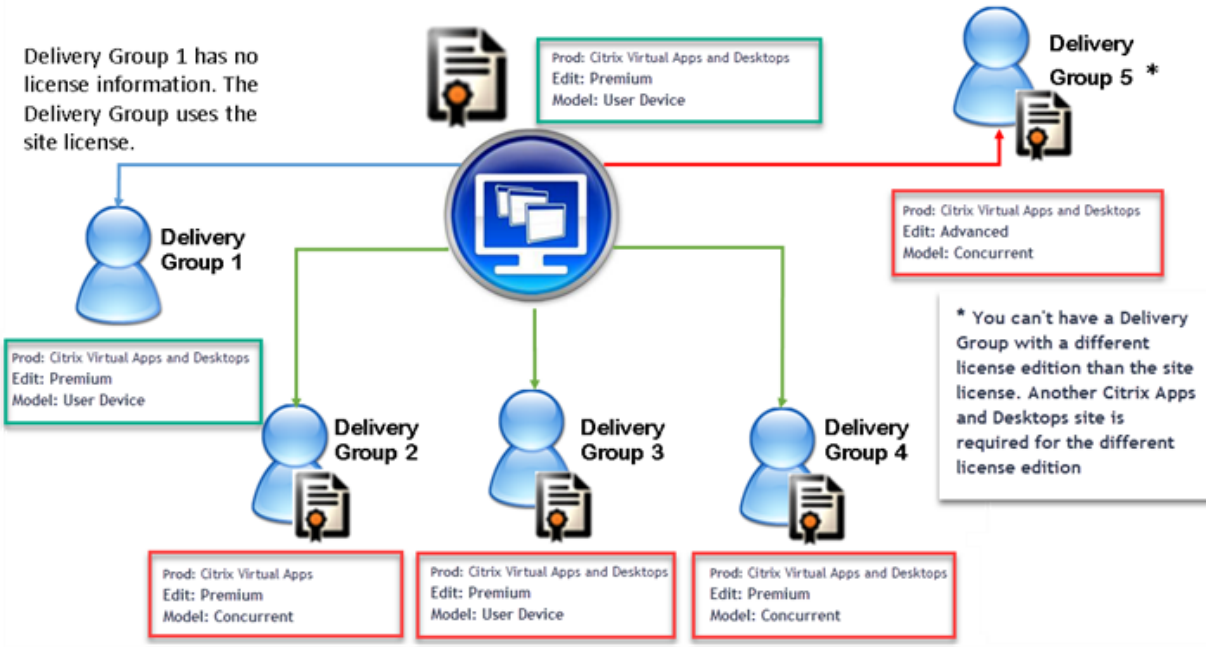
- See Transition and Trade-Up (TTU) with Hybrid Rights.



Multi-type licensing

May 13, 2026

> **Note:**
>
> - License Activation Service does not support multi-type licensing.
> - The delivery group-level license overrides is deprecated. Citrix Virtual Apps and Desktops now uses site-level license settings only.

Multi-type licensing supports consumption of different license types for delivery groups on a single Citrix Virtual Apps and Desktops site. **Type** is a single combination of Product ID (XDT or MPS) and Model (UserDevice or Concurrent). The delivery groups must use the same Product Edition (PLT/Premium or ENT/Advanced) as configured at the site level. Be aware of the special considerations at the end of this article when looking to configure multi-type licensing for your Citrix Virtual Apps and Desktops deployments.

If multi-type licensing is not configured, different license types can be used only when configured for separate sites. The delivery groups use the site license. For important notification limitations when multi-type licensing is configured, see Special considerations.

To determine the delivery groups that consume the different types of licenses, use these Broker PowerShell cmdlets:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- New-BrokerDesktopGroup
- Set-BrokerDesktopGroup
- Get-BrokerDesktopGroup

To install licenses, use:

- Citrix Studio
- Citrix Licensing Manager
- citrix.com

Customer Success Services dates are specific to each license file and to each product and model. Delivery groups set differently might have different Customer Success Services dates than each other.

Special considerations

Multi-type licensing has different functionality than regular Citrix Virtual Apps and Desktops™ licensing.

There are no alerts and notifications from Director or Studio for delivery groups configured to use a type that differs from the site configuration:

- No information when nearing license limits or the trigger or expiry of the License burst mode.
- No notification when a specific group has a problem.

Delivery groups configured for multi-type licenses consume ONLY that license type and don't fall back to the site configuration when fully consumed.

Though Citrix Virtual Apps Standard and Citrix Virtual Desktops™ Standard license edition names indicate that they are both Standard, they are not the same edition. Multi-type licensing is not available with Citrix Virtual Apps Standard and Citrix Virtual Desktop Standard licenses.

License compatibility matrix

This table details old product names, new product names, and the associated feature names. The four compatibility columns specify which product and license model combinations are compatible for multi-type licensing. CCU and CCS stand for concurrent licenses and UD is user/device licenses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Old Name	New Name	Feature	Multi-type licensing compatibility			
			STD	ADV	ENT	PLT
Citrix XenApp Standard	Citrix XenApp Standard	MPS_STD_CCU	X			
Citrix XenApp Advanced	Citrix Virtual Apps Standard	MPS_ADV_CCU		X		
Citrix XenApp Enterprise	Citrix Virtual Apps Advanced	MPS_ENT_CCU			X	
Citrix XenApp Platinum	Citrix Virtual Apps Premium	MPS_PLT_CCU				X
Citrix XenDesktop VDI Edition (XDT-U)	Citrix Virtual Desktops Standard- Per User/Device	XDT_STD_UD	X			
Citrix XenDesktop VDI Edition (XDT-C)	Citrix Virtual Desktops Standard - Concurrent	XDT_STD_CCS	X			
Citrix XenDesktop Enterprise Edition (XDT-C)	Citrix Virtual Apps and Desktops Advanced - Concurrent	XDT_ENT_CCS			X	
Citrix XenDesktop Enterprise Edition (XDT-U)	Citrix Virtual Apps and Desktops Advanced - Per User/Device	XDT_ENT_UD			X	
Citrix XenDesktop Platinum Edition (XDT-C)	Citrix Virtual Apps and Desktops Premium - Concurrent	XDT_PLT_CCS				X
Citrix XenDesktop Platinum Edition (XDT-U)	Citrix Virtual Apps and Desktops Premium - Per User/Device	XDT_PLT_UD				X

Broker PowerShell SDK

The **DesktopGroup** object has these two properties you can manipulate using the associated New-BrokerDesktopGroup and Set-BrokerDesktopGroup cmdlets.

Name	Value	Restriction
LicenseModel	A parameter (Concurrent or UserDevice) specifying the licensing model for the group. If none is specified, the site-wide license model is used.	If the feature toggle is disabled, attempting to set a property fails.
ProductCode	A text string of XDT (for Citrix Virtual Desktops) or MPS (for Citrix Virtual Apps™) specifying the licensing Product ID for the group. If none is specified, the site-wide product code is used.	If the feature toggle is disabled, attempting to set a property fails.

For more information about the LicenseModel and ProductCode, see about_Broker_Licensing.

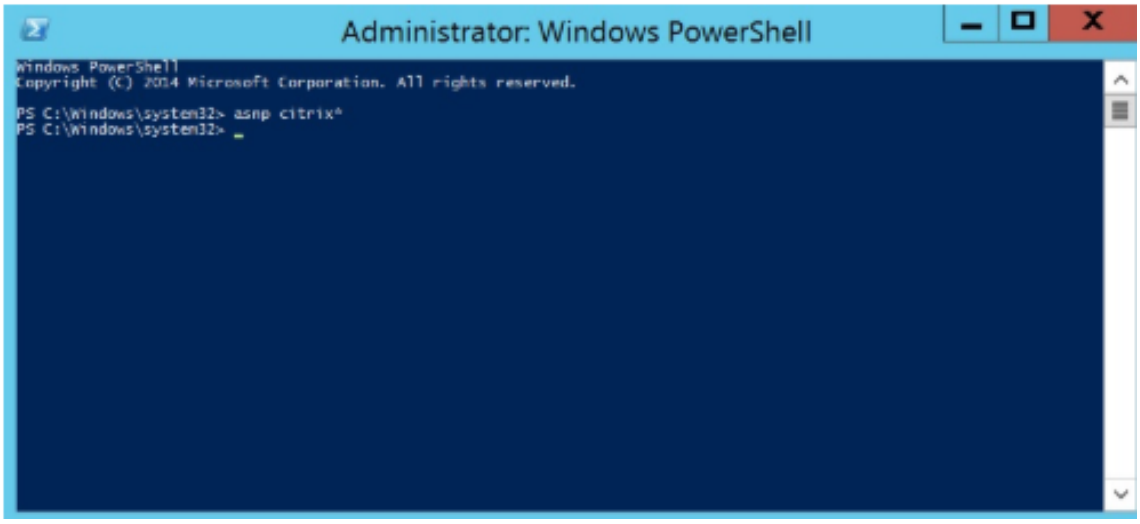
New-BrokerDesktopGroup

Creates a desktop group for managing the brokering of groups of desktops. For more information on this cmdlet, see https://citrix.github.io/delivery-controller-sdk/Broker/New-BrokerDesktopGroup/.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set-BrokerDesktopGroup

Disables or enables an existing broker desktop group or alters its settings. For more information on this cmdlet, see https://citrix.github.io/delivery-controller-sdk/Broker/Set-BrokerDesktopGroup/



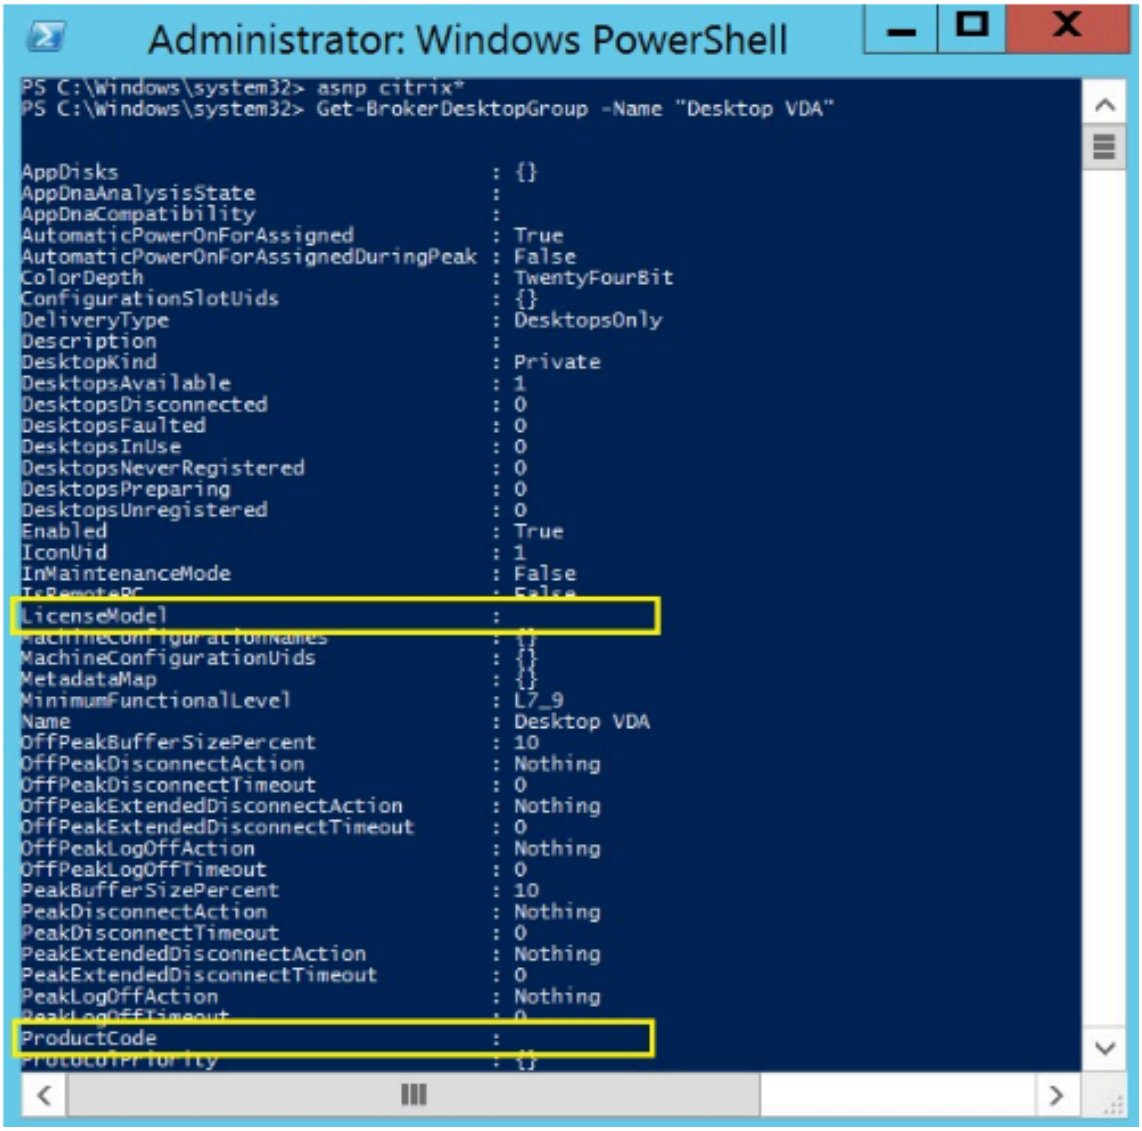
Get-BrokerDesktopGroup

Retrieves desktop groups matching the specified criteria. The output of the Get-BrokerDesktopGroup cmdlet includes the **ProductCode** and **LicenseModel** properties of the group. If the properties have not been set using New- BrokerDesktopGroup or Set-BrokerDesktopGroup, null values are returned. If null, the site-wide license model and product code are used. For more information on this cmdlet, see https://citrix.github.io/delivery-controller-sdk/Broker/Get-BrokerDesktopGroup/.

Configure different license products and models per delivery group

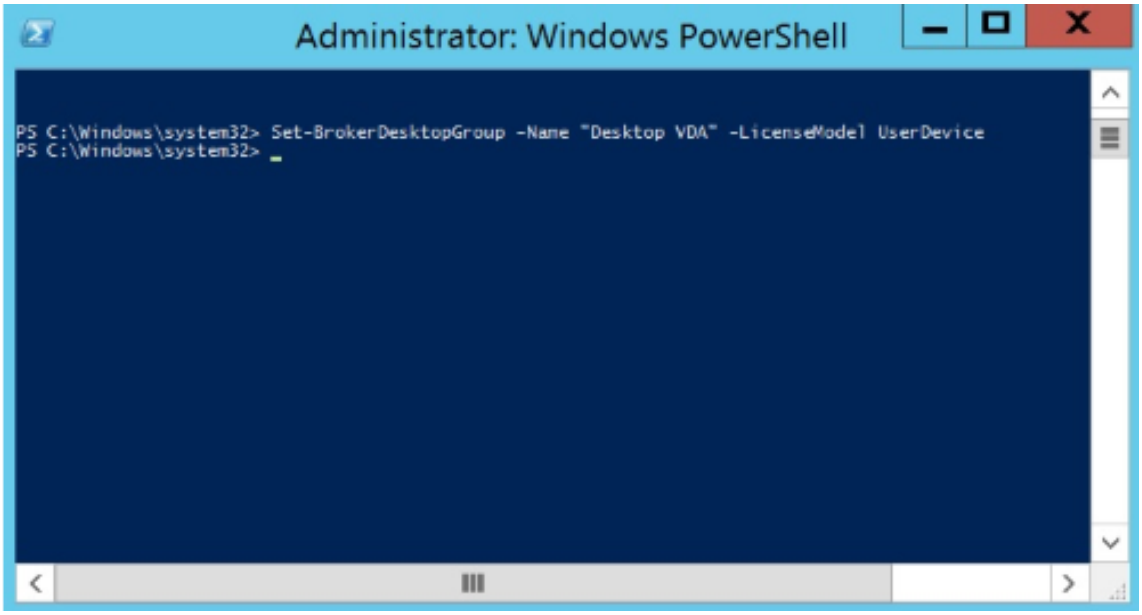
> **Note:**
>
> You can't configure two or more different types of products, editions, or license models configured on a single delivery group. In case you have different types of products, editions, or license models, configure them in separate delivery groups.

1. Open PowerShell with Administrative rights and add the Citrix snap-in.



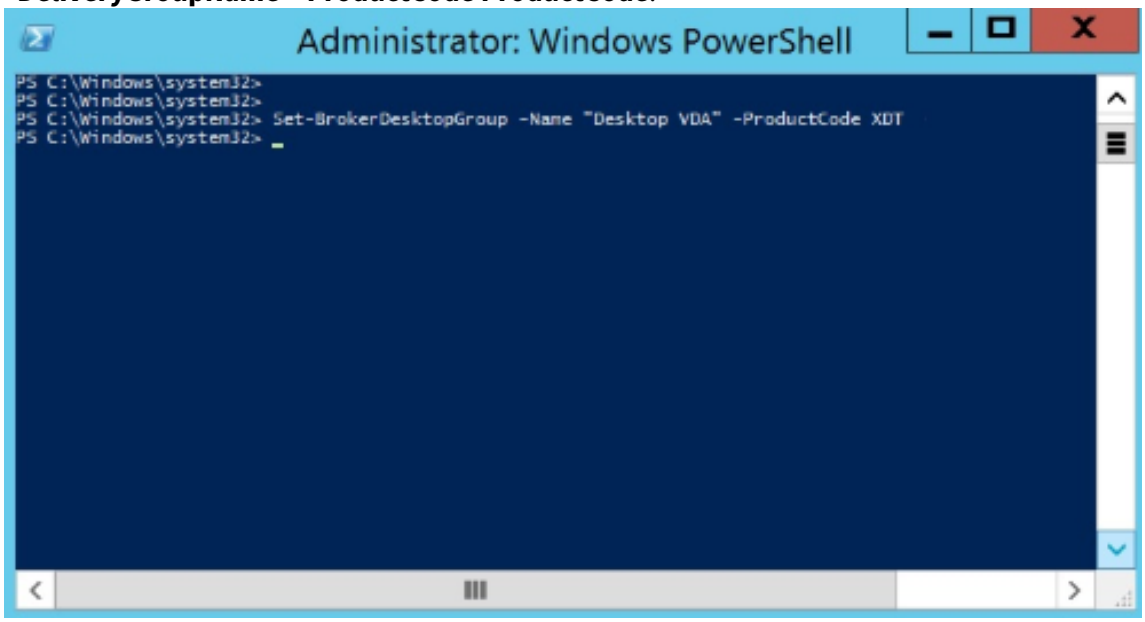
2. Run the command **Get-BrokerDesktopGroup –Name "DeliveryGroupName"** to view the current license configuration. Find the parameters **LicenseModel** and **ProductCode**. If you haven't configured these parameters before, they might be blank.

   > **Note:**
   >
   > If a delivery group does not have license information set, it defaults to **Site level Site li-**



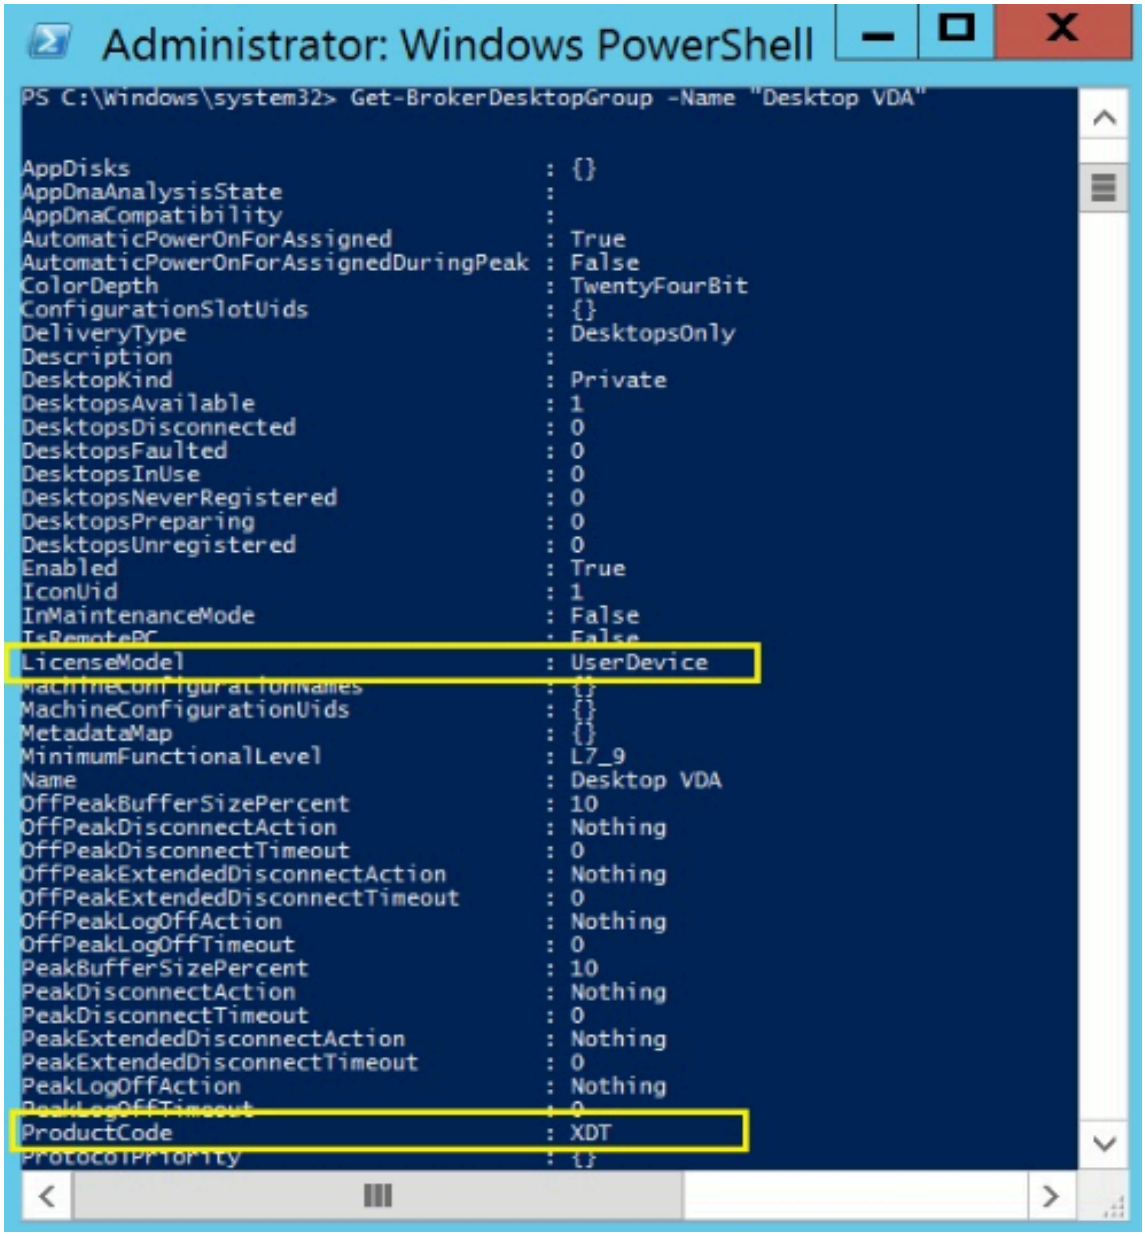
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **cense**.



3. Change the license model by running the command: **Set-BrokerDesktopGroup –Name "DeliveryGroupName"–LicenseModel LicenseModel**.

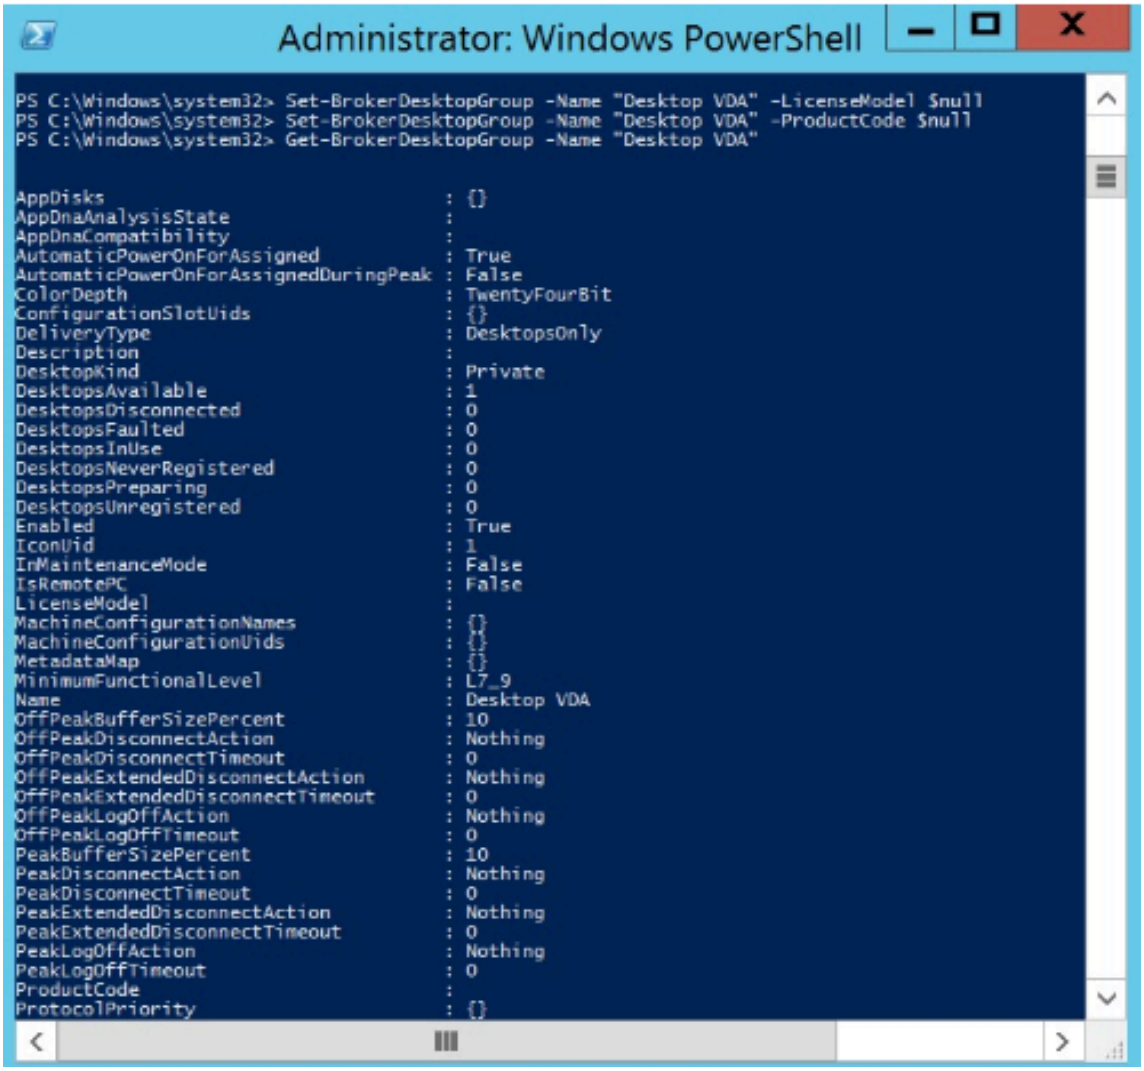
© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. Change the license product by running the command: **Set-BrokerDesktopGroup –Name "DeliveryGroupName"–ProductCode ProductCode**.

5. Enter the command **Get-BrokerDesktopGroup –Name "DeliveryGroupName"** to validate the changes.

> **Note:**
>
> You cannot mix and match editions in the same site. For example, Premium and Advanced licenses. Multiple sites are required if you have licenses with different editions.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Remove the license configuration by running the same **Set-BrokerDesktopGroup** commands as described in previous steps, and set the value to **$null**.

> **Note:**
>
> Studio doesn't display the license configuration for each delivery group. Use PowerShell to view the current configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example

This PowerShell cmdlet example illustrates setting multi-type licensing for two existing delivery groups and creates and sets a third delivery group.

To see the license product and license model associated with a delivery group, use the **Get-BrokerDesktopGroup** PowerShell cmdlet.

1. We set the first delivery group for XenApp® and Concurrent.

   Set-BrokerDesktopGroup -Name “Delivery group for Citrix Virtual Apps Premium Concurrent”-ProductCode MPS -LicenseModel Concurrent

2. We set the second delivery group for XenDesktop® and Concurrent.

   Set-BrokerDesktopGroup -Name “Delivery group for Citrix Virtual Desktops Premium Concurrent”-ProductCode XDT -LicenseModel Concurrent

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. We create and set the third delivery group for XenDesktop and UserDevice.

   New-BrokerDesktopGroup -Name “Delivery group for Citrix Virtual Desktops Premium UserDevice”-PublishedName “MyDesktop”-DesktopKind Private -ProductCode XDT -LicenseModel UserDevice

License Activation Service

September 1, 2026

The License Activation Service (LAS) is a new cloud-based licensing solution that provides an alternative to the traditional Citrix® legacy licensing. LAS introduces new modules for activation, ensuring a seamless and modern approach to license management.

The LAS simplifies the Citrix Licensing experience. There are no longer license access codes or files to generate, download, or install on the License Server. You only need to upgrade your License Server and register with Citrix Cloud. Once the compatible products are pointed to the License Server, they can be activated automatically.

After activation, the License Server regularly communicates with the License Activation Service to keep its activation up to date. The LAS is built with cloud technology, which improves performance and ensures that there is no downtime. If, for any reason, the License Server or LAS is unreachable, the system enters license caching mode, which is designed to protect the system from being unlicensed and avoid an outage. For more information, see License caching mode.

For more details on LAS, see the Licensing documentation License Activation Service.

For FAQs on Licensing, see FAQ for licensing.

Prerequisites

- Install or update the License Server to version 11.17.2 build 53100 or later.
- Reliable and continuous internet connection for the License Server.

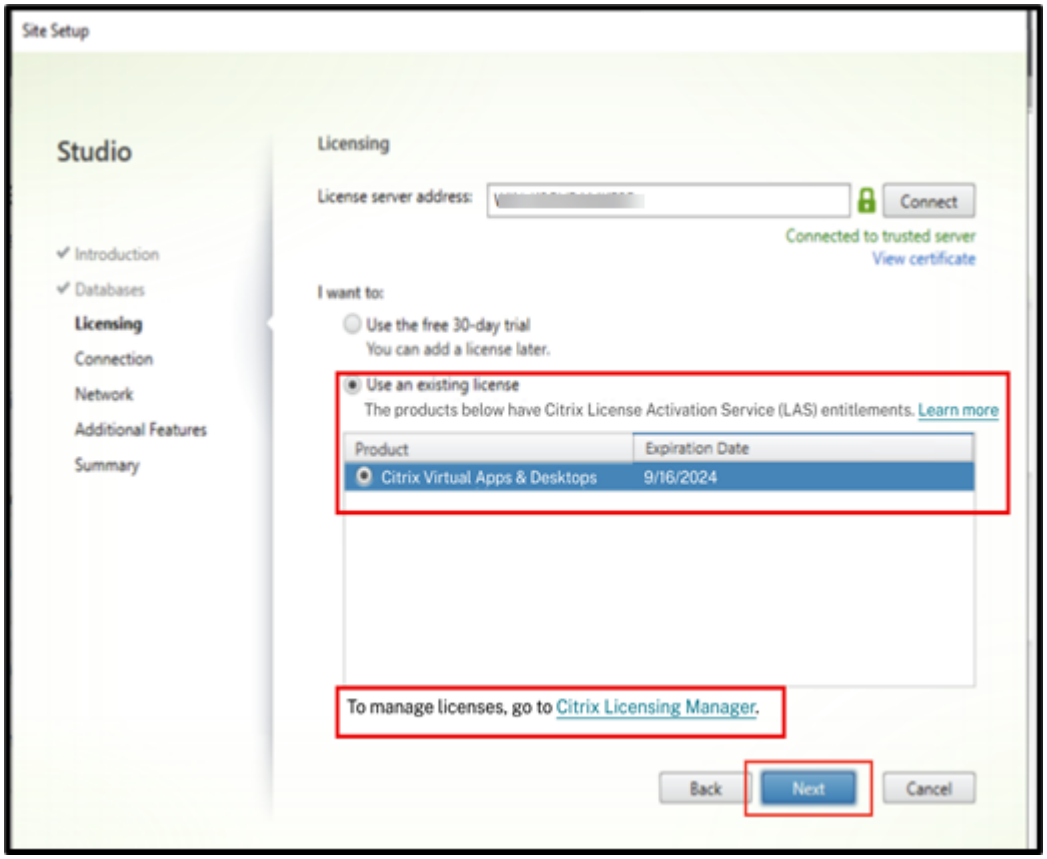
Considerations

- All Delivery Controllers must be compatible with LAS before the Web Studio prompts for activation. A single site can use either legacy licenses or LAS.
- You can have multiple License Servers registered with the same Citrix Cloud ID (CCID) or OrgID. However, a site can be configured to point to only one License Server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Limitations

- Migrating to LAS sets the Product Edition to **Premium** and the License Model to **Concurrent** but this might change in the future. Do not modify the license configuration using PowerShell as this might impact registration and session launch.
- You can migrate your Citrix Virtual Apps and Desktops™ site from the existing legacy license to LAS using only Web Studio.



Key steps

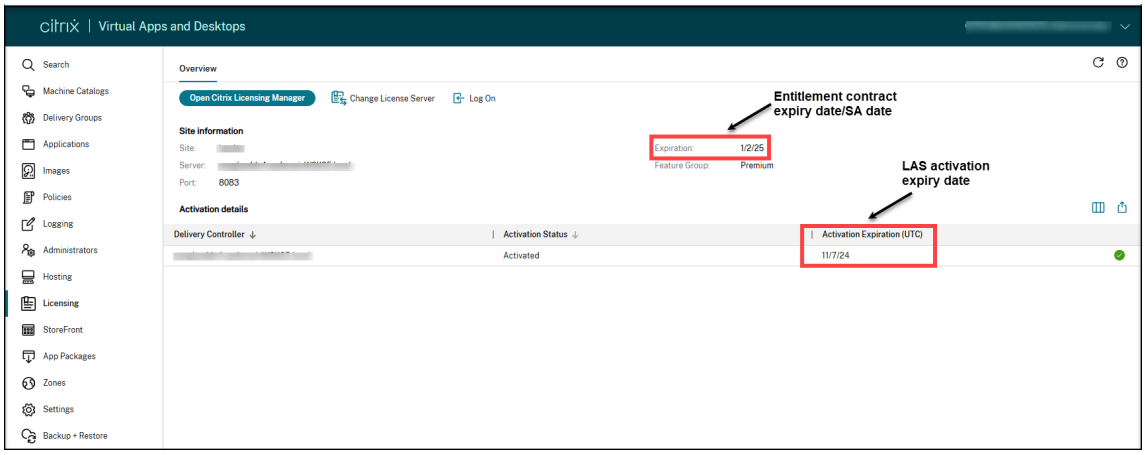
1. Install or upgrade the License Server to version 11.17.2 build 53100 or later and configure LAS as per the instructions mentioned in How to Configure License Server for License Activation Service.
2. Install Citrix Virtual Apps and Desktops™ version 2411 or later. Install the core components, such as Citrix Delivery Controller, Citrix Studio, Web Studio, and Citrix Director.

   > **Note:**
   >
   > All Delivery Controllers in the Citrix Virtual Apps and Desktops site must be compatible with LAS.

3. After you install the required components, use Citrix Site Manager to create a site. For information on creating a site, see Create a site. If the License Server is configured to use LAS, the Metainstaller displays the entitlements. The entitlements are provided along with their corresponding license expiration dates.

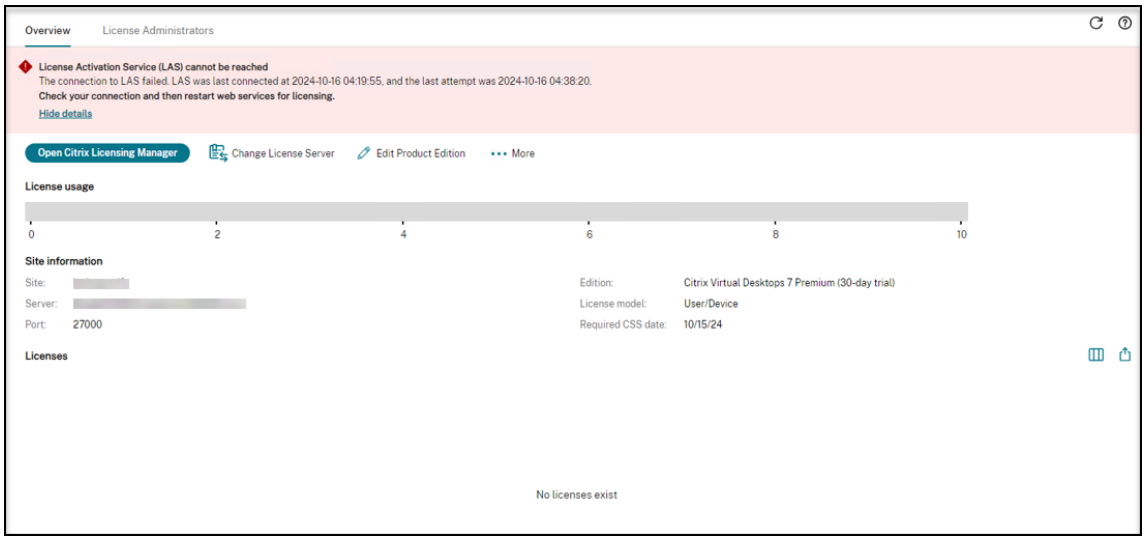
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If the License Server is not upgraded to the latest License Server version, you get an error message.



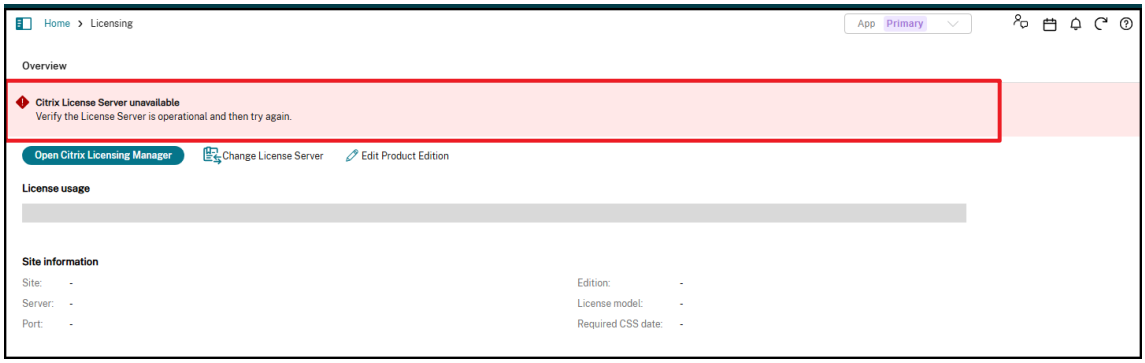
4. Check licensing details.
5. Migrate legacy licensing to LAS.

Check licensing details



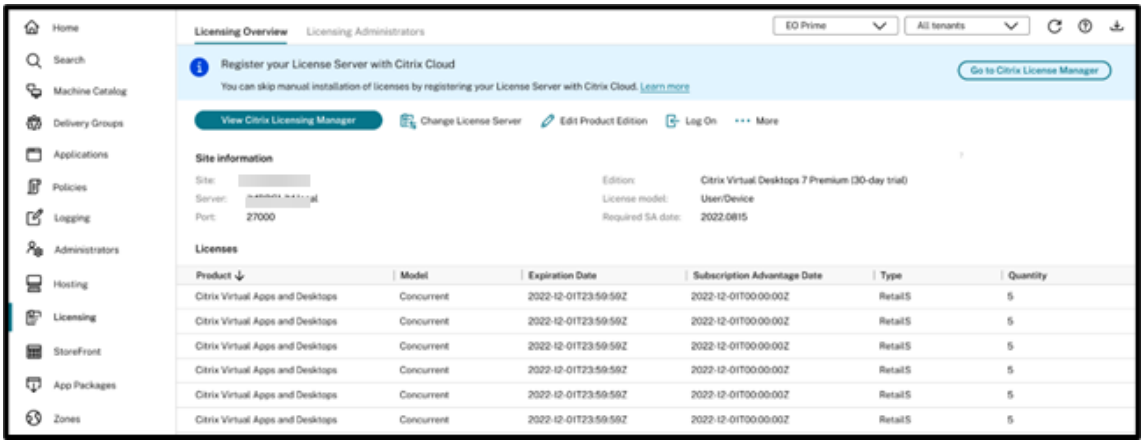
After creating the site, check the licensing details using Web Studio.

1. In Web Studio, select the **Licensing** node.
2. On the **Overview** tab, check if the Citrix Virtual Apps and Desktops site has the appropriate license or if the license has expired while using LAS features.



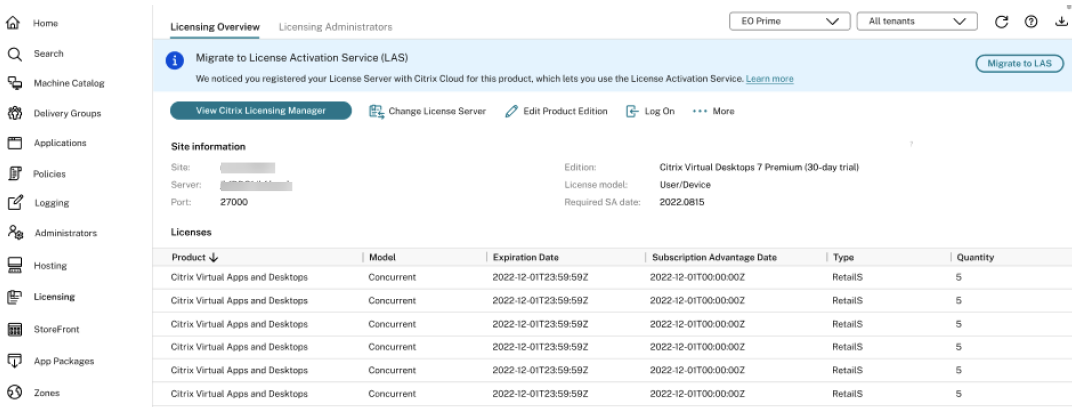
© 1997–2026 Citrix Systems, Inc. All rights reserved.

If the LAS is not reachable, you might see an error message:



If the License Server is not available, you might see an error message:

If your License Server is still using an old legacy license and the Citrix Virtual Apps and Desktops site is LAS-aware, then the Web Studio prompts you to register your License Server with Citrix Cloud.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Migrate legacy licensing to LAS

If you have already registered your License Server with Citrix Cloud and have the necessary entitlement, you must follow the specific sequence below to migrate your existing Citrix Virtual Apps and Desktops site from legacy licensing to LAS without impacting user sessions.

1. **Upgrade License Server:** Upgrade the License Server to the minimum supported version.
2. **Upgrade Delivery Controllers:** Upgrade all the Delivery Controllers in the site to a LAS-supported version.
3. **Remove Delivery Group License Assignments:**
   - Before clicking **Migrate to LAS**, manually remove any license assignments set below the Site level (that is, remove the license assignment in the delivery group level).
4. **Confirm Allocations:** Verify that the LAS allocations are accurate.
5. **Click Migrate to LAS:**
   - Once the previous steps are complete, click **Migrate to LAS**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The **License Edition** of the Citrix Virtual Apps and Desktops site is set to **Citrix Virtual Apps and Desktops Premium** and the **License Model** is configured to **Concurrent** once you migrate to LAS.

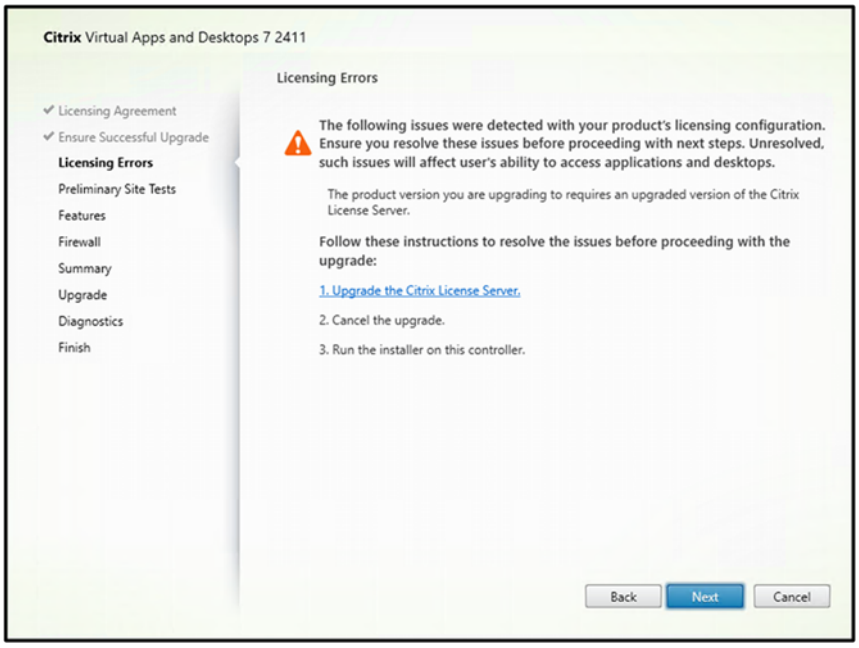
Roll back from LAS to legacy licensing

Do the following to roll back from LAS to legacy licensing:

1. Run the following PowerShell command.

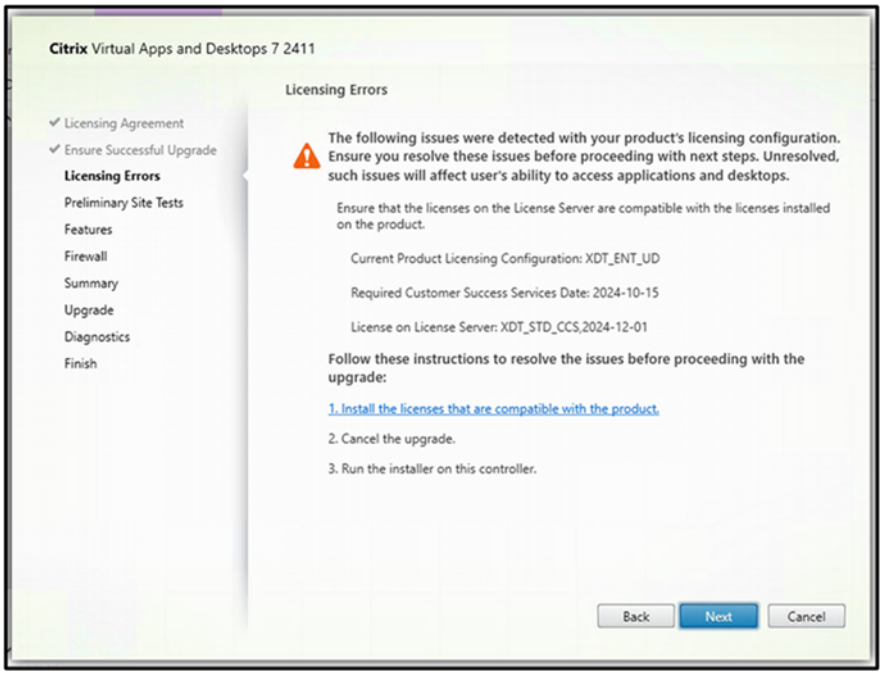
```
Set-ConfigSite -UseLicenseActivationService $false
```

2. Configure the legacy licenses in Web Studio.



> **Note:**
>
> These steps are provided for temporary troubleshooting only. Legacy license files are approaching End of Life (EOL) and will not function beyond April 15, 2026. To ensure uninterrupted service, we recommend migrating to the License Activation Service (LAS). For details, see the announcement.

Important considerations for upgrade



When you upgrade from any earlier Citrix Virtual Apps and Desktops version to 2411 and later, upgrade the License Server to the latest version (version 11.2.17 build 53100 or later).

- You get the following errors on the Licensing Errors page while upgrading using the metainstaller UI:
  - If you do not upgrade to the latest License Server version:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If there are any incompatibilities, such as an outdated License Server or unavailability of licenses:

- If you are upgrading using the command-line, run the following commands to avoid upgrade failure (assuming you are inside the \x64 folder in the mounted ISO):

1. Run the following:

```
\x64\Licensing\CitrixLicensing.exe /quiet
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you have copied the Licensing binaries to any of the local drives, then run the following command:

```
\x64\Licensing\CitrixLicensing.exe /quiet /l install.log
```

2. Run the following:

```
\x64\XenDesktop Setup\XenDesktopServerSetup.exe /components "
   CONTROLLER,WEBSTUDIO,DESKTOPDIRECTOR" /CONFIGURE_FIREWALL
```

Uninstall core components

During upgrade, if you have installed License Server first using the commands `\x64\Licensing\CitrixLicensing.exe /quiet` or `\x64\Licensing\CitrixLicensing.exe /quiet /l install.log` and then installed the core components, then follow the same order to uninstall:

1. Uninstall License Server using the command line:

```
CitrixLicensing.exe /quiet /uninstall /l uninstall.log
```

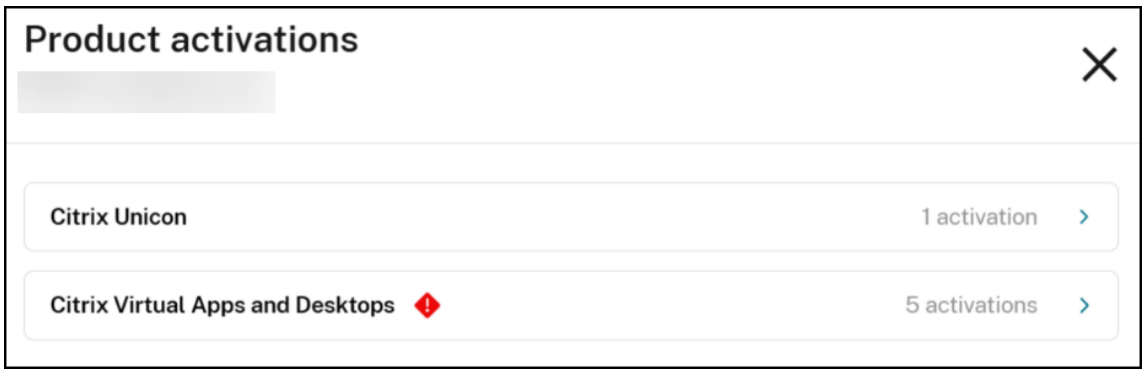
2. Uninstall components using the GUI or command line. For information, see Remove components.

If you uninstall the License Server and components using the command line `XenDesktopServerSetup.exe` or `removeall`, then clean up the registry entry and the remaining files.

To clean registry entries :

1. Search for the registry key `Citrix Licensing` and delete that entry. Mostly, you can find the entry in the following location:

```
"Computer\HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\
   Windows\CurrentVersion\Uninstall\
```

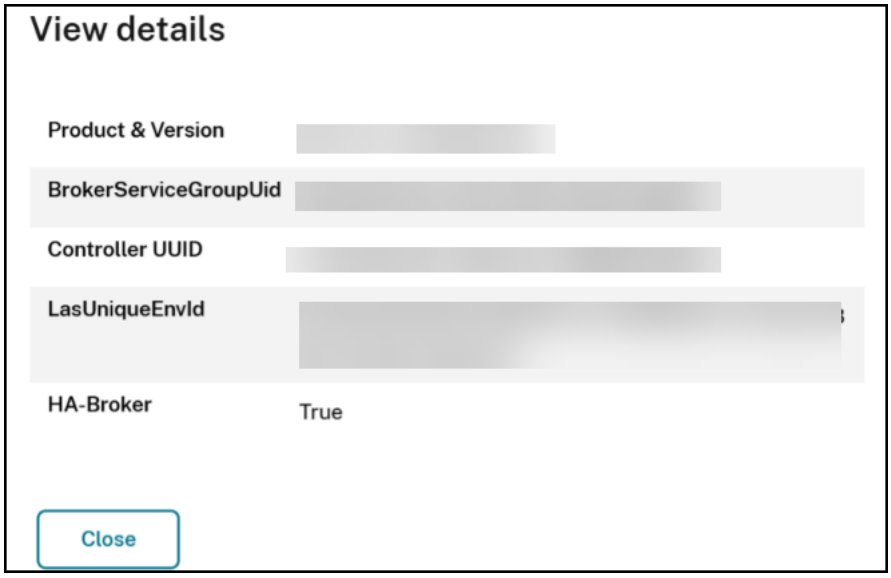


2. Delete the folder pointed by the **Uninstall String** in the registry key.

Troubleshooting

If the status of license server is showing anything other than green in Citrix Cloud, do the following to understand the granular details of the activations that could have issues:

1. In Citrix Cloud, navigate to **Licensing > Licensed deployments > License Servers**.
2. Click the expand button **>** across Citrix Virtual Apps and Desktops to see the list of Delivery Controllers that were activated.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **View details** across the activation to see the granular details.

   ID is the unique identifier to identify the activations.

   The following details are provided:

   - **Product & Version**: The Product_Edition_Model and the Burn In Date that the product is configured to use when activating with LAS. BurnInDate is usually the release date of the product.
   - **BrokerServiceGroupUid**: The UID for the Broker Service Group.
   - **Controller UUID**: The UUID of the Delivery Controller.
   - **LasUniqueEnvId**: The unique ID of the instance provided by LAS for activation.
   - **HA-Broker**: True or False indicating whether its a HA broker or main broker.

To map the activated host details with the actual host, run the following commands on the host.

- `Get-BrokerSite`: To compare the **BrokerServiceGroupUid** value displayed on the screen with the command's `BrokerServiceGroupId` output.
- `Get-BrokerController`: To compare the **Controller UUID** value displayed on the screen with the command's UUID output.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event viewer logs related to Licensing events

Event ID	Description
1112	The Citrix Broker Service failed to broker a connection for user to resource. The product and edition licensing configuration for the site does not allow this type of resource. Check that the correct license has been selected for this site.
1150	The Citrix Broker Service successfully contacted the license server.
1151	The Citrix Broker Service cannot contact the license server. Ensure that the license server is functioning correctly and that the details identifying the license server are correct in the XenDesktop configuration.
1152	This XenDesktop site does not have the required product licenses present on the license server. Use the License Administration Console to add the relevant product licenses to the license server.
1153	This XenDesktop site's license expired. The Citrix Broker service will request a new license from the license server.
1154	This controller has entered license caching mode because it could not contact the license server. You have 2 hour(s) remaining before this controller stops providing desktop and application sessions.
1155	The Citrix Broker Service will now stop providing desktop and application sessions. This controller is no longer in or could not enter a license caching mode due to sustained failure to communicate with the license server. Ensure that the license server is functioning and, if necessary, use the License Administration Console to add the relevant licenses to the license server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event ID	Description
1156	The Citrix Broker Service is successfully communicating with the license server. This controller is no longer in license caching mode.
1157	The version of the license server running on is older than the version of the Citrix Broker Service, and is therefore incompatible. Upgrade your license server or specify a license server location with the correct version in your XenDesktop configuration.
1158	The Citrix Broker Service detected that you have exceeded the number of licenses available for this site on the license server for this edition. The license server granted you an overdraft license.
1159	The Citrix Broker Service denied a desktop connection because the maximum number of installed licenses for this site has been exceeded. There are three licenses installed for edition but the maximum allowed number of licenses for this edition is two. Remove the relevant licenses from the license server to comply with the license limit.
1160	The Citrix Broker service encountered an internal error while managing licenses. Ensure that the license server is functioning correctly and that the details identifying the license server are correct in the XenDesktop configuration. Restarting the Citrix Broker service may also resolve the problem. If this problem persists, reinstall the Citrix XenDesktop Controller. See Citrix Knowledge Base article CTX126990.
1161	Error initializing licensing. Check license server connectivity.
1162	Error stopping licensing. Check license server connectivity.
1163	No connection license available. To resolve, free licenses by closing sessions that are not needed, or add more licenses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event ID	Description
1164	Error checking out a connection license. Check license server connectivity.
1165	Error checking in a connection license. Check license server connectivity.
1166	Error checking license availability. Check license server connectivity.
1167	Failed to start licensing. Check license server connectivity.
1168	Error reading licensing user notification settings. Check license server connectivity.
1169	This controller has entered the out-of-box license caching mode as no suitable licenses were found on the license server. You have 2 hour(s) remaining before this controller stops providing desktop and application sessions.
1170	The Citrix Broker Service has successfully detected suitable licenses on the license server. This controller is no longer in the out-of-box license caching mode.
1171	No license server has been specified. The Citrix Broker Service cannot provide desktops and applications to users until a valid license server is specified. You can specify a license server in Citrix Studio or with the Citrix PowerShell SDK cmdlet Set-ConfigSite.
1172	Error checking license server suitability. The Citrix broker service received an unexpected response when checking if a machine is suitable for use as a license server. Check that the machine can be contacted from the controller and that any firewall on the machine allows connections from the controller. If a license server is installed on the machine check that it is configured and operating correctly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event ID	Description
1173	This XenDesktop site does not have the required start up licenses present on the license server. Use the License Administration Console to add the relevant licenses to the license server.
1174	The configured product edition for this XenDesktop site does not support applications; application resources will not be available.
1176	The configured product edition does not support multi-session machines. The registration was rejected.
1177	The configured product edition does not support single-session machines. The registration was rejected.
1178	The configured product edition does not support RemotePC. The registration was rejected.
1179	The configured product edition does not support machines provisioned into a cloud system. The registration was rejected.
1180	The configured product edition for this XenDesktop site does not support applications on single session (workstation OS) machines. Application resource was refused launch.
1181	The configured product edition for this XenDesktop site does not support applications on multi session (server OS) machines. Application resource was refused launch.
1182	The configured product edition for this XenDesktop site does not support desktops on single session (workstation OS) machines. Desktop resource was refused launch.
1183	The configured product edition for this XenDesktop site does not support desktops on multi session (server OS) machine. Desktop resource was refused launch.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event ID	Description
1196	This controller has entered a license burst mode due to exhausting all usable licenses on the license server. Add more licenses to resolve this. You have 2 hour(s) remaining before this controller stops providing desktop and application sessions.
1197	The Citrix Broker Service will now stop providing desktop and application sessions. This controller is no longer in or could not enter a license burst mode due to insufficient licenses on the license server. Use the License Administration Console to add the relevant licenses to the license server.
1198	The Citrix Broker Service is successfully consuming licenses from the license server. There are sufficient licenses on the server to satisfy current demand. This controller is no longer in a license burst mode caused by license exhaustion.
1199	The Citrix Broker Service will now stop providing desktop and application sessions. This controller is no longer in or could not enter a license caching mode since no licenses are installed on the license server. Use the License Administration Console to add the relevant licenses to the license server.
1205	Your software maintenance has expired. Your Citrix environment is currently unsupported. Check your license server for expired licenses and remove them. There is a 30-day license caching mode before users start getting warning messages.
1206	License certificate hash is invalid. Your Citrix License certificate hash is invalid.
1300	The Citrix Broker Service will now stop providing desktop and application sessions. There is a problem with the system clock of the license server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event ID	Description
1301	Issues with the system clock of license server have been corrected. The Citrix Broker Service will now resume normal operation.
1302	This controller failed checking in or checking out a connection license again. Previously detected failures still exist. To avoid excessive event logging, the service is suppressing related messages (event ID 1163, 1164, 1165) until the problem is resolved. Licensing attempts will continue.
1303	This controller is no longer suppressing related messages (event ID 1163, 1164, 1165).
1304	The Citrix Broker Service successfully contacted LAS.
1305	The Citrix Broker Service cannot contact LAS. Ensure that the LAS is functioning correctly and that the details identifying LAS are correct in the XenDesktop configuration.

More information

For information on checking the LAS state of a site or verify if a site is in license caching mode, see:

- How can I check the LAS state of a site?
- How can I verify if a site is in license caching mode?

For detailed information on the commands, see:

- Get-BrokerController
- Get-ConfigSite

Citrix Virtual Apps and Desktops™ telemetry data elements

August 27, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Broker

Usage

Headers

Key	Description	Example
ver	Indicates the version of the telemetry event.	1
id	Indicates a unique identifier of the usage event.	d4ce7919-5d80-44de-a8fa-102923fe0ead
type	Indicates the event type used by Citrix Analytic Service to identify cloud usage events.	SendBrokerTelemetryData
st	Indicates the timestamp when the event is generated in Broker.	2011-08-12T20:17:46.384Z
prod	Identifies the originating product and deployment of the usage event.	XenDesktop.Broker (Cloud) OnPrem.Broker (OnPrem)
prodVer	Indicates the Citrix DaaS/Citrix Virtual Apps and Desktops product version.	7.25.0.0

Payload

Field	Description	Example
TotalPublishedApps	Indicates the total number of published Apps.	10
TotalPublishedDesktops	Indicates the total number of published Desktops.	10
VDAs.Total	Indicates the total number of VDAs.	10
VDAs.OSTypes	Indicates the total number of VDAs by OS types such as Windows, Linux, and Mac.	10

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
VDAs.OSVersions	Indicates the total number of by OS versions such as Windows 10, 11, 2022, 2019.	10
VDAs.HostingLocations.Azure VDAs.HostingLocations.AWS VDAs.HostingLocations.Nutanix VDAs.HostingLocations.VMWare VDAs.HostingLocations.XenServer VDAs.HostingLocations.HyperV	Indicates the number of VDAs for each supported hosting locations such as Azure, AWS, GCP, Nutanix, VMWare, XenServer, and HyperV.	10
VDAs.ProvisionedMethod.MCS	Indicates the number of machines provisioned by Machine Creation Service (MCS).	10
VDAs.ProvisionedMethod.ManualOr3P	Indicates the number of machines manually or 3P provisioned.	10
VDAs.SessionSupport.StaticSingle	Indicates the number of machines statically assigned single session.	10
VDAs.SessionSupport.DynamicSingle	Indicates the number of machines dynamically assigned single session.	10
VDAs.SessionSupport.Multi	Indicates the total number of multi-session machines.	10
VDAs.RemotePCAccess.Windows VDAs.RemotePCAccess.Linux VDAs.RemotePCAccess.MacOS	Indicates the number of Remote PC Access machines by OS type (Win, Mac, Linux).	10
VDAs.ActiveSessionRecordingAgents	Indicates the number of VDAs with active session recording agents.	5
VDAs.Subscriptions	Indicates the number of public cloud subscriptions of VDAs.	2
VDAs.LocationTypes	Indicates the number of location types of VDAs.	2

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
AutoScale.DGWithAutoscaleEnabled	Indicates the number of delivery groups with **Autoscale** Enabled.	2
AutoScale.TotalMachinesCtrlByAutoscale	Indicates the number of machines controlled by autoscale.	5
AutoScale.VerticalAutoscaleEnabledByDGandSite	Indicates the number of machines with **Vertical Autoscale** enabled by DG and Site.	2
AutoScale.TaggedBasedAutoscaledDG	Indicates the number of tagged-based autoscaled delivery groups.	2
DeliveryGroup.TotalRebootScheduleEnabled	Indicates the number of delivery groups with **Reboot Schedules** enabled.	2
DeliveryGroup.Total	Indicates the total number of delivery groups.	10
Policy.TotalPolicySets	Indicates the number of policy sets.	3
Policy.TotalPolicies	Indicates the number of group policies.	2
Policy.TotalPolicySettings	Indicates the number of group settings.	2
PublishedPackageApps.AppVSingleAdmin	Indicates the total number of packaged apps published in the AppV Single Admin mode.	2
PublishedPackageApps.AppVDualAdmin	Indicates the total number of packaged apps published in the AppV Dual Admin mode.	2
PublishedPackageApps.Msix	Indicates the total number of packaged apps published in the MSIX mode.	2
PublishedPackageApps.AppAttach	Indicates the total number of packaged apps published in the AppAttach mode.	2

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
PublishedPackageApps.FlexApp	Indicates the total number of packaged apps published in the FlexApp mode.	2

Session

Headers

Field	Description	Example
ver	Indicates the version of the license usage event.	1
id	Indicates a unique identifier of the usage event.	d4ce7919-5d80-44de-a8fa-102923fe0ead
type	Indicates the event type used by Citrix Analytic Service to identify cloud usage events.	Cloud.Licensing
st	Indicates the timestamp when the event is generated in Broker.	2011-08-12T20:17:46.384Z
prod	Identifies the originating product and deployment of the usage event.	XenDesktop.Broker (Cloud) OnPrem.Broker (OnPrem)
prodVer	Indicates Citrix DaaS or Citrix Virtual Apps and Desktops product version.	7.25.0.0
user	Identifies the User ID to uniquely identify a user initiating the session launch. **The value is scrambled.**	fullName: C648FE671A44B3F7 **(always scrambled)** samName:C758LH671A44B3F7 **(always scrambled)** upn: C7948FE671A44B3F7 **(always scrambled)** userLicenseId:C265FE671A44B3F7 **(always scrambled)** userSid: C097FE671A44B3F7 **(always scrambled)**
tenant -> id	Indicates the Customer ID of the Citrix Cloud™ account. For the on-premises deployment, this field is not applicable and has no value.	joj1mh0598tj

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
dvc -> dvcId	Indicates the device ID to uniquely identify a device from where the session launch is initiated.	AE18C4D5
dvc -> dvcName	Indicates the friendly name for the device. **The value is scrambled.**	C758LH671A44B3F7 **(always scrambled)**

Payload

Field	Description	Example
appProtectionKeyLoggingRequired	Indicates whether the session is launched with Key Logging Protection enabled.	False
appProtectionScreenCaptureRequired	Indicates whether the session is launched with Screen Capture Protection enabled.	False
cspTenantCustomerId	Indicates the Customer ID of a CSP tenant's Citrix Cloud account. For the on-premises deployment, this field is not applicable and has no value.	6c2vtxgxyftt
isAnonymousUser	Indicates whether an unauthenticated session is launched.	False
licenseActivityTimeStamp	Indicates the timestamp when the payload is generated.	2011-08-12T20:17:46.384Z
licenseActivityType	Indicates the licensing event type. This field indicates if the licensing event type is for assignment or release action.	Connect
licenseModel	Indicates the license model of the deployment.	UserDevice
productEdition	Indicates the product edition of the deployment.	Premium

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
productId	Indicates the product ID of the product in the deployment.	CAVDS
protocol	Indicates the protocol used to launch the session.	HDX™
sessionKey	Indicates a unique identifier for the session.	uq390c5fc3-86eb-4df3-bd9a-f4a8fed2c9e2
sessionSupport	Indicates the session support type.	SingleSession
sessionType	Indicates the session type.	Application
ver	Indicates the payload version.	1.3
workerSid	Indicates a unique identifier for the VDA used for the session.**The value is scrambled.**	1E5LH671A44B3F7 **(always scrambled)**
isWindows365	Denotes if the session is launched for Windows 365.	True
entitlementType	Indicates the Customer's license entitlement type.	Production
siteId	Indicates a unique identifier for the site.	a35647d0-901c-4477-87e0-dcd781d455f4
desktopGroupId	Indicates a unique identifier for the Desktop or Delivery Group.	e9d859dc-1bfc-4b3e-bad3-41806bb4e694
clientType	Indicates the Citrix Workspace™ app type.	Windows
clientVersion	Indicates the Citrix Workspace app version.	23.5.1.83
workerCloudType	Indicates the public cloud type used for VDA provisioning.	Azure
enabledFeatures	Indicates the features that are enabled for the session. For example, in a session where `AppProtectionScreenCaptureRequired` and `SessionRecording` are enabled, the value of this field is 66.	66
launchRequestSource	Records the product that is used to request the launch. It can be either On-prem StoreFront™ or Cloud StoreFront.	0 (StoreFront or 3P)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
		1 (Workspace)
isEvents	Indicates the critical failures in .	Unable to create ST Database.
heartBeatTime	Indicates the License server heart beat time to CIS or Citrix Analytic Service.	1689058813
vdaTelemetry	Indicates the payload that is captured for App Layering, User Personalization Layer, User Profile management, Workspace Environment Management™, and HDX features.	vdaTelemetry SessionTelemetry CPM_feature: 32 HDX1: 66 HDX2: 0 MachineTelemetry AL_productVersion: 23.12.0.1001 UPL_isEnabled: 1 CPM_version: 22.3.4000 wem_enableMethod: 1 wem_agentVersion: 2402.1

Studio

Usage

Headers

Field	Description	Example
ver	Indicates the version of the license usage event.	1
id	Indicates a unique identifier of the usage event.	8c2e20a5-ca3f-4401-ad69-d037933c40a0
type	Indicates the event type used by Citrix Analytic Service to identify cloud usage events	Studio.Usage

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
st	Indicates the timestamp when the event is generated in Studio.	2024-03-22T01:32:23.4056195Z
prod	Identifies the originating product and deployment of the usage event.	XenDesktop.Studio
prodVer	Indicates the Citrix DaaS/Citrix Virtual Apps and Desktops product version	7.42.0.0

Payload

Field	Description	Example
AdminLoginList	Indicates the list of unique admins SamAccountName. **The value is scrambled.**	{AdminLoginList: [UFMJ+JvXOTHO9mQDsOweiw==]}**(always scrambled)**
TotalApiRequests	Indicates the API requests of the Orchestration service.	{TotalApiRequests: 1000}
BackupCount	Indicates the count of backup which operated by Studio admin.	{BackupCount: 200}
RestoreCount	Indicates the count of restore which operated by Studio admin.	{RestoreCount: 20}

Director

Usage report

Headers

Field	Description	Example
ver	Indicates the version of the license usage event.	1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
id	Indicates a unique identifier of the usage event.	8c2e20a5-ca3f-4401-ad69-d037933c40a0
type	Indicates the event type used by Citrix Analytic Service to identify cloud usage events.	Telemetry
st	Indicates the timestamp when the event is generated in Studio.	2024-03-22T01:32:23.4056195Z
prod	Identifies the originating product and deployment of the usage event.	XenApp.Monitor
prodVer	Indicates the Director product version.	7.42.0.0
dvcName	Name of the server	C758LH671A44B3F7

Payload

Field	Description	Example
AdminLoginCount	This is a section of the payload which provides the count of admin logins.	type: AdminLogin stats 0: 1 1: 7
FeatureUsageCount	This section of the payload has the count of big rock features used in Director.	type: FeatureUsage stats 0: 15 1: 20 5: 10
OdataUsageCount	This section of the payload has the count of Odata API usage	type: OData_v3 stats 0: 1 2: 7 5: 9 type: OData_v4 stats 0: 1 2: 8 6: 7

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
AppUsage	Indicates the weekly usage metrics of the published applications.	type: AppUsage headers: application-Name,processName,totalDurationInMinutes period: 01/05/24-07/05/24 values: [Calc_AWTSVDA-1907R,calc.exe,0.13, Notepad_AWTSVDA-1907R,notepad.exe,4]
UniqueAppUsers	Indicates the count of unique users along with total app launches in a month for published applications.	type: UniqueAppUsers headers: application-Name,totalLaunches,totalUniqueUsers period: 04/24 values: [Calc_AWTSVDA-1907R,100,10, Notepad_AWTSVDA-1907R,200,20]
DesktopUsage	Indicates the weekly usage metrics of published desktops.	type: DesktopUsage headers: desktopGroup-Name,sessionSupport,totalDurationInMinute period: 01/05/24-07/05/24 values: [RdsDesktopAndApp-Group,1,10]
UniqueDesktopUsers	Indicates the count of unique users along with total launches in a month for published desktops.	type: UniqueDesktopUsers headers: desktopGroup-Name,totalLaunches,totalUniqueUsers period: 04/24 values: [RdsDesktopAndApp-Group,10,5]
AvgLogonDuration	Indicates the average logon duration.	type: AvgLogonDuration headers: totalUserLogons, avgLogonDurationInSeconds period: 01/05/24-07/05/24 values: [200,4]

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
CostSaved	Indicates the cost saved by the customer in a month.	type: CostSaved headers: hypervisor,costSaved,currency period: 04/24 values: [1,221.02,1 2,301.02,2]

Citrix Workspace App telemetry

Usage

Headers

Field	Description	Example
ver	The version of the payload being sent	1.0
id	The event identifier	d4ce7919-5d80-44de-a8fa-102923fe0ead
type	The telemetry event type	Configuration
st	Indicates the time the event was generated	2011-08-12T20:17:46.384Z
prod	The name of the product generating the event	OnPrem.StoreFront
prodVer	The CWA version generating the event	3.30.0.0

Payload

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
Device Id	Indicates an anonymised device ID to uniquely identify a device from where the session launch is initiated.	AE18C4D5
Client Device GUID	Indicates an anonymised device GUID to uniquely identify a device from where the session launch is initiated.	123e4567-e89b-12d3-a456-426614174000
Country Code	Country from where a user logs in to CWA	GB
Time Zone	Local time zone of end user	America/New_York

Storefront Configuration

Usage

Headers

Field	Description	Example
ver	Indicates the version of the license usage event	1.0
id	Indicates the unique identifier of the usage event	d4ce7919-5d80-44de-a8fa-102923fe0ead
type	Indicates the event type used by CAS to identify cloud usage events	Configuration
st	Indicates the timestamp when the event is generated in StoreFront	2011-08-12T20:17:46.384Z
prod	Identifies the originating product and deployment of the usage event	OnPrem.StoreFront
prodVer	Indicates the StoreFront version (internal)	3.30.0.0

Payload

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
serverName	Indicates the hostname of the service StoreFront is running on	storefront-01.storefront.local
deploymentId	Indicates the unique identifier of the deployment of StoreFront	f47ac10b-58cc-4372-a567-0e02b2c3d479
installedWithCVAD	Indicates whether the StoreFront was installed alongside CVAD	false
cpuCores	Indicates the total number of CPU cores	4
cpuModel	Indicates the CPU running StoreFront	12th Gen Intel(R) Core(TM) i7-1255U 1.70 GHz
ramGb	Indicates the total amount of RAM in GB	16
numServersInGroup	Indicates the number of servers in the server group	3
stores	Indicates the StoreFront Store configuration JSON blob. An array of Store objects. **Some values are scrambled**	Example
rfWebSites	Indicates the StoreFront RFWeb configuration JSON blob. An array of RFWeb Config objects	Example
gateways	Indicates the gateway configuration objects as JSON blob. An array of gateway objects	Example
authServices	Indicates the Auth service configuration objects as JSON blob. An array of auth services objects	Example
IsPiiScrambled		true

Example of field stores

```
[{

            "BaseUrl": "baseUrl",
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            "StorePath": "/",
            "EnabledFeatures": 21 bit bitmap,
            "ResourceTypeFilteringEnabled": "disabled|Citrix.MPS.
               Application;Citrix.MPS.Desktop",
            "DefaultRfWebSite": "/Citrix/StoreWeb",
            "GatewaysUsed": [
                "gatewayId"
            ],
            "VdaLogonDataProvider": "",
            "ResourceFeeds": [
                {

                    "FeedName": "<resourceFeedName>|scrambled",
                    "Type": "CVAD",
                    "LoadBalancingEnabled": true,
                 }

            ],
            "AdvancedAggregation": {

                 "Enabled": true,
                 "GroupingCount": 1,
                 "ControllersPushIdenticalResources": true,
                 "LoadBalanced": true,
                 "AnyPrimaryFarms": true,
                 "AnyBackupFarms": true,
             }

 }
 ]
```

If no Stores are found, it will be an empty array [].

Example of field rfWebSites

```
[{

    "SiteId": "siteId",
    "BaseUrl": "baseUrl",
    "StorePath": "storePath",
    "UiExperienced": 0,
    "EnabledFeatures": 9 bit,
    "AuthMethodsEnabled": [
        "ad"
    ],
    "CanUsersDownloadApps": {

        "Enabled": true,
        "Windows": "exe",
        "MacOS": "dmg"
     }
 ,
    "WorkspaceControl": {

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        "Enabled": true,
        "LogoffAction": 0,
        "AutoReconnectAtLogon": true,
        "ShowReconnectButton": true,
        "ShowDisconnectButton": true
     }
 ,
    "MultiClickTimeout": 1,
    "UiViews": [
        "apps",
        "desktops"
    ],
    "DefaultTab": 0,
 }
 ]
```

If no rfWebSites are found, it will be an empty array [].

Example of field gateways

```
[{

            "GatewayId": "gatewayId",
            "IsCloudGateway": true,
            "LoadBalancingSTAEnabled": true,
            "SessionReliabilityEnabled": true,
            "RequestTicketsFromTwoSTA": true,
            "Version": "1234",
            "LogonType": "domain",
            "SmartCardFallbackEnabled": true
 }
 ]
```

If no gateways are found, it will be an empty array [].

Example of field authServices

```
[{

    "SiteId": "SiteId",
    "Store": "StoreAuth",
    "AuthMethodsEnabled": [
        "ad"
    ],
    "PasswordChangeWhenExpired": 0,
    "PasswordRemindersForm": 1,
    "DelegateCredentialValidationToCitrix": true,
    "ValidatePasswordsOnDeliveryControllers": true
 }
 ]
```

If no auth services found, it will be an empty array [].

Storefront Login

Usage

Headers

Field	Description	Example
ver	Indicates the version of the license usage event	1.0
id	Indicates the unique identifier of the usage event	d4ce7919-5d80-44de-a8fa-102923fe0ead
type	Indicates the event type used by CAS to identify cloud usage events	Login
st	Indicates the timestamp when the event is generated in Broker	2011-08-12T20:17:46.384Z
prod	Identifies the originating product and deployment of the usage event	OnPrem.StoreFront
prodVer	StoreFront version (internal)	3.30.0.0

Payload

Field	Description	Example
user	The user that initiated the launch. **The value is scrambled**	fullName: C648FE671A44B3F7 **(always scrambled)** samName:C758LH671A44B3F7 **(always scrambled)** upn: C7948FE671A44B3F7 **(always scrambled)** userLicenseId:C265FE671A44B3F7 **(always scrambled)** userSid: C097FE671A44B3F7 **(always scrambled)**
serverName	Indicates the hostname of the service StoreFront is running on	storefront-01.storefront.local
loginMethodRfWeb	Indicates the method the user used to login to StoreFront from RFWeb	0

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
loginMethodAuth	Indicates the method the user used to login to StoreFront from the Auth service	0
gatewayURL	Indicates the Netscaler Gateway used during login	netscaler-gateway.com
enabledFeatures	Indicates a bitmask of enabled features	12
userAgent	Indicates the UserAgent of the client used to login	CitrixReceiver/22.11.0.19 Linux/5.17.15 X1Class CWACapable CWA/22.11.0.19
baseUrl	Indicates the store that the user login to	storefront-dev.storefront.dev
storePath	Indicates the store that the user login to	/Citirx/StoreWeb
apiUsed	Indicates if the client is using the Store or PNAgent API	0
deviceId	Indicates the device that is used to log into StoreFront. **The values is scrambled**	john-doe
transactionId	Indicates the transaction ID that is sent/generated during a single transaction	773aba9e-5b91-4ef9-8782-c4afb75698e7

Delegated Admin

Usage

Headers

Key	Description	Example
ver	Indicates the version of the license usage event.	1
id	Indicates a unique identifier of the usage event.	8c2e20a5-ca3f-4401-ad69-d037933c40a0

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Key	Description	Example
type	Indicates the event type used by Citrix Analytic Service to identify cloud usage events.	DelegatedAdmin.Usage
st	Indicates the timestamp when the event is generated in Delegated Admin.	2024-03-22T01:32:23.4056195Z
prod	Identifies the originating product and deployment of the usage event.	XenDesktop.DelegatedAdmin (Cloud) OnPrem.DelegatedAdmin (OnPrem)
prodVer	Indicates the Citrix DaaS or Citrix Virtual Apps and Desktops product version.	7.42.0.0

Payload

Key	Description	Example
TotalCustomScopes	Indicates the number of total custom scopes.	2
TotalCustomRoles	Indicates the number of total custom roles.	4

Scramble licensing telemetry data

Considering the sensitivity of information sent in the license telemetry, Citrix provides you an option to scramble the data.

The following table lists the data that can be scrambled:

Field	Description	Example
user	Identifies the User ID to uniquely identify a user initiating the session launch.	• fullName: C648FE671A44B3F7 • samName: C758LH671A44B3F7 • upn: C7948FE671A44B3F7 • userLicenseId: C265FE671A44B3F7 • userSid: C097FE671A44B3F7

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description	Example
dvc -> dvcName	Indicates the friendly name for the device.	`C758LH671A44B3F7`
workerSid	Indicates a Unique identifier for the VDA used for the session.	`1E5LH671A44B3F7`
AdminLoginList	Indicates the list of unique admins SamAccountName	`{ AdminLoginList: [ UFMJ+ JvXOTHO9mQDsOweiw= =] }`
stores	Indicates the StoreFront Store configuration JSON blob. An array of Store objects. **Some values are scrambled**	Example
deviceId	Indicates the device that is used to log into StoreFront.	john-doe

To enable or disable scrambling, run the following PowerShell commands on the Delivery Controller.

> **Note:**
>
> For a Citrix Service Provider™ (CSP) customer, scrambling is always disabled. CSP customers can't enable scrambling using PowerShell commands.

1. Open a PowerShell window from the Delivery Controller host.
2. Run the command `asnp citrix` to load Citrix-specific PowerShell modules.
3. Run the following command to enable or disable scrambling:

   By default, the value is 1, or **`true`**, which enables scrambling of license telemetry data.

   To disable:

   ```
   Set-BrokerServiceConfigurationData Core.ScrambleLicensingData -
       SettingValue $false
   ```

   After you disable scrambling, you can enable it using the following command:

   ```
   Set-BrokerServiceConfigurationData Core.ScrambleLicensingData -
       SettingValue $true
   ```

FAQ for licensing

May 13, 2026

> **Note:**
>
> - For business continuity resources related to the COVID-19 pandemic, see CTX27055.
> - For general information about maintaining business continuity, see Business continuity — on demand.
> - For more information about the current Citrix License Server, see Licensing.

Citrix® licensing

What is License Activation Service?

The License Activation Service (LAS) is a modern, cloud-based licensing solution for on-premises Citrix License Servers. It offers a streamlined alternative to the traditional, file-based licensing method.

Instead of manually uploading license files, you can connect your license server to the Citrix Cloud™ for online activation. Your entitlements are then delivered to the license server automatically, eliminating the need for license file lifecycle management.

For license servers that can't connect to the cloud, LAS also provides an offline activation option, ensuring flexibility for various network environments. This service introduces a seamless and modern approach to managing your Citrix product licenses.

For more information, see License Activation Service.

How can I get my license file?

We send the license access code in an email. There are three ways to generate license files using the license access code:

- The **Manage Licenses** from your MyAccount page on `citrix.com`. For more information, see Manage licenses on citrix.com.
- Web Studio to allocate your purchase and the license file automatically installs on your Citrix License Server.
- Citrix Licensing Manager within the Citrix License Server to allocate your purchase and install your license file. For more information, see Install licenses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How to allocate license on myaccount?

See Allocate licenses.

How to add allocated licenses to the license server?

See Modify licenses.

What TCP ports does Citrix licensing use?

- License Server port number is 27000.
- Vendor daemon port number is 7279.
- Web Service for Licensing port is 8083.

What is the Citrix License Server?

The Citrix License Server is a system that allows licenses to be shared across the network. For more information, see Licensing operations overview.

Can I virtualize or cluster the Citrix License Server?

Yes. You can virtualize or cluster the Citrix License Server. For more information, see Clustered License Servers.

What benefits are available to me if I virtualize the Citrix License Server?

Virtualizing the Citrix License Server provides a redundant solution. That solution allows for mobility between multiple physical servers without the need for downtime.

Are there any limitations to consider if I virtualize the Citrix License Server?

No.

Does the Citrix License Server manage all the licenses for my Citrix Virtual Apps and Desktops™ deployment?

The Citrix License Server manages all licenses you receive for Citrix Virtual Apps™ and Desktop, except licenses in the Premium Edition used with Citrix Gateway. License servers built in to the network appliances as required for those security-oriented network devices manage those licenses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

What is the Citrix Licensing Manager?

The Citrix Licensing Manager enables downloading and allocation of license files from the License Server on which you installed the Citrix Licensing Manager. The Citrix Licensing Manager is the recommended License Server management method, which enables the following:

- Short code registration of the License Server to Citrix Cloud and easy removal of registration.
- Configure user and group accounts.
- Use the dashboard to display installed, in-use, expired and available licenses, and Customer Success Services dates.
- Export license use data for use in reporting.
- Configure the historical use data retention period. Default data retention period is 180 days.
- Simplified installation of license files on the License Server using a license access code or downloaded file.
- Enable and disable the License burst mode.
- Configure Customer Experience Improvement Program (CEIP) and Call Home.
- Automatically or manually checks for Customer Success Services renewal licenses and notifies you or installs the licenses if found.
- Notifies you of the License Server state - Missing startup license, time issues, uploader failures.
- Modify these ports:
    - License Server (default 27000)
    - Vendor Daemon (default 7279)
    - Web Services for Licensing (default 8083)

For more information, see Citrix Licensing Manager.

Where is the Citrix License Administration Console?

The License Administration Console is no longer supported and was removed from the License Server version 11.16.6. We recommend you use the Citrix Licensing Manager.

You can use Studio to manage and track licensing, provided the License Server is in the same domain as Studio, or in a trusted domain.

For more information, see Citrix Licensing Manager.

What is the license assignment period?

The license assignment period is the term that a Citrix Virtual Apps and Desktops license is assigned to a user or device. The default license assignment period is 90 days.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How do I know how many licenses my organization has purchased?

All purchased licenses are available to review and access at any time (24x7) from your secure **Manage Licenses** toolbox on your **My Account** page on https://www.citrix.com.

How do I know how many licenses are in use at any time?

The Citrix Licensing Manager and Studio provide details on real time license use.

License Server disaster recovery and maintenance

For information about disaster recovery and maintenance of your License Server, see Disaster recovery and maintenance in the Citrix Licensing documentation.

Citrix Virtual Apps and Desktops licensing

How is Citrix Virtual Apps and Desktops licensed?

The Citrix Virtual Apps and Desktops licensing offers user/device and concurrent license models.

User/device:

The flexible user/device model aligns with:

- Enterprise-wide desktop usage.
- Underlying Microsoft desktop virtualization licensing.
- Concurrent licensing for customers with users needing only occasional access to their virtual desktops and apps.

User/device licensing gives users access to their virtual desktops and apps from an unlimited number of devices. Device licenses give an unlimited number of user's access to their virtual desktops and apps from a single device. This approach provides you with maximum flexibility and improves alignment with Microsoft desktop virtualization licensing.

> **Important:**
>
> You can't manually allocate licenses to a user or device. The License Server or cloud service assigns licenses. With user/device licensing, once a license is assigned it can't be assigned to another user until after 90 days of inactivity.

Concurrent:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Concurrent licenses allow one connection to an unlimited number of virtual apps and desktops for any user and any device. A license is consumed only during an active session. If the session disconnects or is terminated, the license is checked back into the pool.

For more information about user/device licensing, see User/device license and concurrent licenses see, Concurrent license.

Is it possible to try Citrix Virtual Apps and Desktops before purchasing licenses?

Yes. You can download the Citrix Virtual Apps and Desktops software and run it in trial mode. Trial mode lets you use Citrix Virtual Apps and Desktops on-premises for 30 days, for 10 connections, without a license. For more information, see Evaluation licenses.

Citrix DaaS™ (formerly Citrix Virtual Apps and Desktops service) for Citrix Cloud is available for trial service based on approval. Check with your Citrix representative for further details.

How does Citrix define concurrency for Citrix Virtual Apps and Desktops?

The Citrix Virtual Apps and Desktops concurrent model allows one connection to an unlimited number of virtual apps and desktops for any user and any device. A license is consumed only during an active session. If the session disconnects or is terminated, the license is checked back into the pool for reissue. For more information, see Concurrent license.

Can I deploy multiple editions of Citrix Virtual Apps and Desktops licenses on a common License Server?

Yes. The License Server manages licenses for both Citrix Virtual Apps and Desktops simultaneously. We recommend that you install the latest License Server version. If you are unsure if your License Server version is current, verify it by comparing your version with the number on the Citrix downloads site.

Can a single site use both Citrix Virtual Apps and Citrix Virtual Apps and Desktops licenses?

Depending on the version, a single Citrix Virtual Apps or Citrix Virtual Apps and Desktops site can support both licensing models - user/device or concurrent. A single Citrix Virtual Apps or Citrix Virtual Apps and Desktops site can support only one edition. For more information, see Multi-type licensing.

The minimum versions that support multi-type licensing are XenApp and XenDesktop 7.15 Long Term Service Release (LTSR) and Citrix Virtual Apps and Desktops 7 1808.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Can I select Citrix Virtual Apps concurrent as a product model if I have Citrix Virtual Apps and Desktops user/device or Citrix Virtual Apps and Desktops concurrent licenses installed on the License Server?

If you use Citrix Virtual Apps as a feature of Citrix Virtual Apps and Desktops Advanced or Premium Edition, your Citrix Virtual Apps license model is the same as your Advanced or Premium Edition of Citrix Virtual Apps and Desktops. If you have purchased Citrix Virtual Apps and Desktops, configure your licensing as Citrix Virtual Apps and Desktops even if you plan to use only the Citrix Virtual Apps functionality. Select Citrix Virtual Apps as a product model only if you have Citrix Virtual Apps concurrent standalone licenses installed on the License Server.

What product components are included with each Citrix Virtual Apps and Citrix Virtual Apps and Desktops edition?

For a full feature matrix by edition, see Citrix Virtual Apps and Desktops features.

How do I license Citrix Virtual Desktops™ environments in compliance with the Citrix Virtual Apps and Desktops EULA?

To deploy Citrix Virtual Apps and Desktops under the user/device or the concurrent license model in compliance with the Citrix Virtual Apps and Desktops EULA, apply the license files to your License Server. The License Server then controls and monitors license compliance. We recommend that you configure your product based on what you purchased. For example, if you purchase Citrix Virtual Apps and Desktops Premium but only want to use the Citrix Virtual Apps feature, configure the product to Citrix Virtual Apps and Desktops to meet compliance. For more information, see the Product License Compliance Center.

How do I license Citrix Virtual Apps environments in compliance with the Citrix Virtual Apps EULA?

To deploy Citrix Virtual Apps under the concurrent license model in compliance with the Citrix Virtual Apps EULA, apply the license files to your License Server. The License Server then controls and monitors license compliance.

Is there a licensing requirement for Citrix Virtual Apps and Desktops Servicing Options: Long Term Service Release (LTSR) or Current Release (CR)?

Citrix Virtual Apps and Desktops Servicing Options, such as Long-Term Service Release, are a benefit of the Customer Success Services program. You must have active Customer Success Services to qualify

© 1997–2026 Citrix Systems, Inc. All rights reserved.

for the benefits of LTSR. For more information, see [Citrix Virtual Apps, Citrix Virtual Apps and Desktops, and XenServer Servicing Options.

How do the Remote Browser Isolation (RBI) Service pooled hours work?

When you purchase a minimum of 25 users of the service, you receive 5000 of hours of rights to use the service, pooled across all users. Subsequent purchases of user rights don't increase the pooled hours entitlement. To increase the entitlement of service hours, buy add-on packs.

Can I use Remote PC Access with CCU licenses?

Yes.

For information about Remote PC Access, see Remote PC Access.

What happens when software maintenance expires for my Citrix environment?

When your Software Maintenance (SWM) or subscription expires, access to software upgrades and technical support is paused. Also, depending on your license type and product version, end users and administrators will receive specific warning notifications indicating that the environment is unsupported.

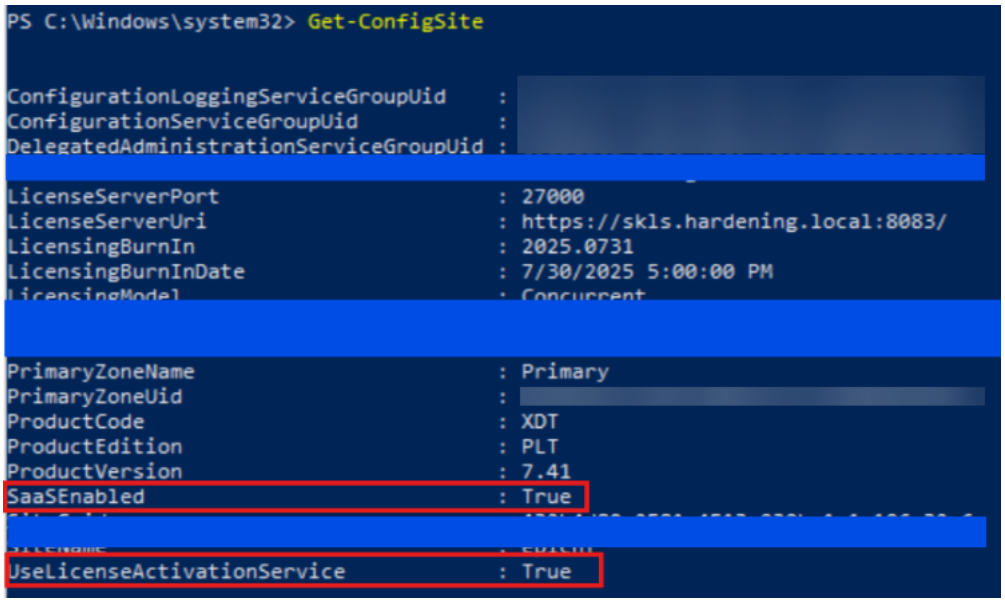
These notifications are triggered only when all licenses on the server have expired.

End user experience Users will receive a warning message after launching a session. The message states:

```
Citrix Virtual Apps and Desktops warning: Your corporate Citrix
    environment is currently unsupported. Please contact your IT
    department to resolve.
```

Administrator experience Administrators will see warning alerts within the Citrix Studio console alerting them of the upcoming or active expiration.

Expiration behavior by license type The timing of these messages depends on the license type and the version of Citrix Virtual Apps and Desktops installed.



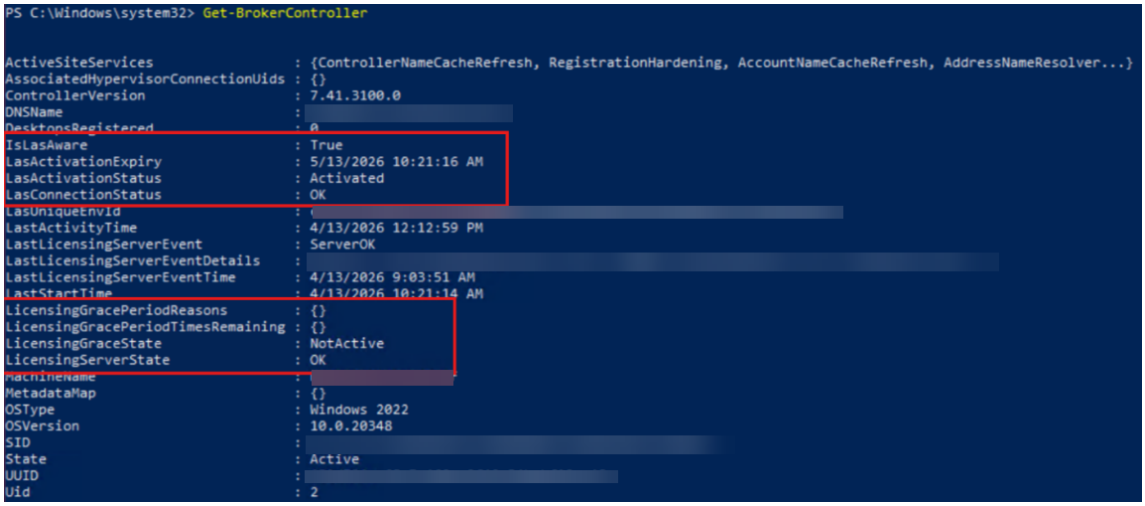
© 1997–2026 Citrix Systems, Inc. All rights reserved.

On-premises subscription licenses

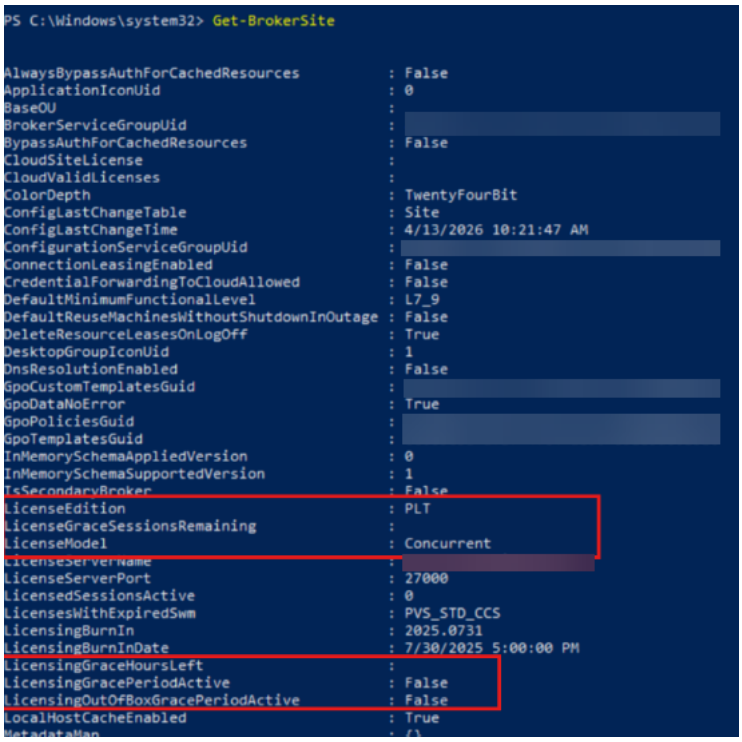
- End User Warning: Appears after the subscription expires, during the grace period.
- Administrator Warning: Appears in Studio 30 days before the subscription expires.
- Supported Versions:
  - Current Release: Citrix Virtual Apps and Desktops 2411 and higher.
  - LTSR: 2203 CU6, and 2402 CU1 and later LTSR releases

How can I check the LAS state of a site?

Run `Get-configsite` to check the LAS activation state and SaaS bit status.



How can I verify if a site is in license caching mode?



Run `Get-Brokercontroller` and `Get-brokersite` to get details on caching mode and remaining time.

- `Get-Brokercontroller` output:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `Get-brokersite` output:

For detailed information on the commands, see:

- Get-BrokerController
- Get-ConfigSite

For information on Delivery Controller event viewer logs regarding licensing, see Event viewer logs related to Licensing events.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

User or device licenses

How does Citrix allocate licenses to users in the user/device licensing model?

With the user/device license model, the License Server assigns the license to a unique user ID. It allows that single user unlimited connections from unlimited devices. If a user connects to a desktop or device, the user requires one license assigned to that user to access a virtual desktop or application. The License Server or cloud service assigns the license. You can't assign these licenses manually. The license is assigned to the user, not the shared device. Once a license is assigned, it can't be assigned to another user until after 90 days of inactivity. For more information, see User/Device license.

How does Citrix define a licensed device in the user/device licensing model?

A licensed device requires a unique endpoint device ID. Under the user/device model, a device is any piece of equipment that you authorized for use by any individuals to access instances of Citrix Virtual Apps and Desktops. For a shared device, a single Citrix Virtual Apps and Desktops user/device license can support multiple users that share the device. For example, a shared device can be a classroom workstation or a clinical workstation in a hospital.

Can I convert my Citrix Virtual Desktops Standard Edition concurrent licenses to the user/device model?

You cannot convert Citrix Virtual Desktops Standard Edition concurrent licenses to Citrix Virtual Desktops Standard Edition user/device licenses. Similarly, you cannot convert Citrix Virtual Desktops Standard Edition user/device licenses to Citrix Virtual Desktops Standard Edition concurrent licenses.

If you have Citrix Virtual Desktops Standard Edition concurrent licenses and you want the user/device license model, upgrade to either Citrix Virtual Apps and Desktops Advanced or Premium Edition.

From	To Standard concurrent	To Standard user/device	To Advanced user/device	To Premium user/device
Citrix Virtual Desktops Standard Edition concurrent licenses	N/A	Concurrent to user/device conversion NOT allowed	You cannot convert license models, but you can upgrade to Citrix Virtual Apps and Desktops Advanced or Premium Edition.	You cannot convert license models, but you can upgrade to Citrix Virtual Apps and Desktops Advanced or Premium Edition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

From	To Standard concurrent	To Standard user/device	To Advanced user/device	To Premium user/device
Citrix Virtual Desktops Standard Edition user/device licenses	User/device to concurrent conversion NOT allowed	N/A	N/A	N/A

How does concurrent licensing work differently from user/device licensing?

We base concurrent licensing on concurrent device connections. A concurrent license is in use only when a device has established an active connection. Once the connection ends, the concurrent license returns to the license pool for immediate use. We recommend this licensing model for occasional usage. User/device licenses are leased for a period and are not available for other users until the lease expires.

Under the user/device model, can we allocate licenses to both users and devices in the same enterprise?

Yes. Both types can be present in the same enterprise. The License Server optimally assigns licenses to users or devices based on usage. You can't assign these licenses manually.

How do I decide how many users or devices to license?

Assess the use case requirements to determine the appropriate number of licenses. User/device licensing enables unlimited access to unlimited virtual desktops and virtual apps from an unlimited number of devices. Concurrent licensing enables unlimited access to unlimited virtual desktops and virtual apps from a single device that an unlimited number of users can use. Consider the following formula:

```
(Number of total users) – (number of users that only access exclusively
 with shared devices) + (number shared devices) = total number of licenses to buy.

For example, there are 1000 total users at the hospital. If 700 of them access only
Citrix Virtual Desktops from 300 shared devices in the hospital, the number of
licenses to purchase is 1000 – 700 + 300 = 600 licenses.
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Under the user/device model, what is the maximum number of devices a licensed user can use to connect to my environment?

Each licensed user is entitled to use an unlimited number of connected or offline devices.

Under the user/device model, what is the maximum number of users who can access a licensed device?

Each licensed device can service an unlimited number of users within an organization.

Under the user/device model, what is the maximum number of virtual desktops or RBI web applications a licensed user can consume at any given time?

Each licensed user can connect to an unlimited number of virtual desktops or web applications.

Can I purchase Citrix Virtual Apps and Desktops licenses to increase the number of licensed users/devices in my existing Citrix Virtual Apps and Desktops environment?

Yes. You can purchase Citrix Virtual Apps and Desktops licenses to increase the number of licensed users/devices in your existing Citrix Virtual Apps and Desktops environment.

How do I release an authorized user/device license?

To release the assignment of an authorized user/device, use the `udadmin` utility in accordance with the EULA terms. The License Server then assigns the license to the next appropriate user/device. For more information, see Display or release licenses for users or devices.

What happens if I exceed my purchased user/device license count?

User/device licenses include a 10% overdraft, which is included when licenses are generated. The overdraft is also included in the installed license count. If the usage spike exceeds the installed count including overdraft, access for more users is denied. Purchase and deploy a new license to enable access for more users.

If all licenses are in use, including the license overdraft, the License burst mode enables unlimited connections to a product. The License burst mode gives you time to determine why you exceeded the maximum license count and to purchase more licenses without disrupting your users. This period lasts until 15 days elapses or you install more retail licenses, whichever comes first. For more information, see License burst mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The Director displays the License caching mode states. For more information, see Panels on the Director Dashboard.

What is the maximum number of virtual applications a licensed user can consume at any given time?

Each licensed user can connect to an unlimited number of virtual applications.

What happens if a licensed user leaves my organization?

When an existing licensed user leaves your organization, you can release the departing user's license without notifying Citrix. Use the `udadmin` utility to release the license. If you don't release the license, the License Server automatically releases any license after 90 days of inactivity. This information is subject to the terms specified in the EULA.

What happens if a licensed user is absent for a protracted period?

If an existing licensed user is absent for a protracted period, you can release the license without notifying Citrix, so that it becomes available for reassignment. Use the `udadmin` utility to release the license.

What happens if we replace a licensed device in my organization?

If you replace an existing licensed device, you can release the license without notifying Citrix so that it becomes available for reassignment. Use the `udadmin` utility to release the license.

What happens if a licensed device is out of service for an extended period?

When an existing licensed device is out of service for an extended period, you can release the license without notifying Citrix, so that it becomes available for reassignment. Use the `udadmin` utility to release the licenses. If you don't release the license, the License Server automatically releases any license after 90 days of inactivity. This information is subject to the terms specified in the EULA.

Can I switch user licenses to device licenses and conversely after I've assigned the licenses to a device or user?

Yes. This change happens automatically. The License Server assigns licenses to either users or devices based on usage patterns. If usage patterns change, the License Server might switch the assignment

© 1997–2026 Citrix Systems, Inc. All rights reserved.

based on the new usage. The License Server always assigns licenses in the most economical fashion for the customer. Also, the License Server monitors licenses to identify **unused** licenses after their 90-day assignment period. You can reassign licenses identified as unused after the 90-day assignment period to other users or devices.

Concurrent licenses

Under the concurrent model, what is the maximum number of virtual desktops a Citrix Virtual Apps and Desktops licensed user can consume at any given time?

An endpoint can service many users and allows for unlimited connections.

Can I deploy concurrent licenses from a previous version of Citrix Virtual Apps and Desktops and new user/device or concurrent licenses to a single License Server?

Yes. You can continue to use the same License Server to support user/device or concurrent licensed deployments.

Can I deploy concurrent licenses and user/device or concurrent licenses to a single License Server?

Yes. You can continue to use the same License Server to support concurrent and user/device or concurrent licensed deployments.

Do Citrix Virtual Apps and Desktops Advanced and Premium editions include Citrix Virtual Apps concurrent licenses?

Citrix Virtual Apps and Desktops Advanced and Premium user/device licenses include concurrent Citrix Virtual Apps licenses for compatibility only. These concurrent licenses are for use only with earlier product versions that are incompatible with user/device licenses. Use of the concurrent compatibility licenses included with user/device licenses is permissible only with these versions - XenApp versions earlier than 6.5 and XenDesktop versions earlier than 5.0 Service Pack 1.

What happens if I exceed my purchased concurrent license count?

If all licenses are in use, the License burst mode enables unlimited connections to a product. The License burst mode gives you time to determine why you exceeded the maximum license count and to purchase more licenses without disrupting your users. This period lasts until 15 days elapses or you install more retail licenses, whichever comes first. For more information, see License burst mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director displays the grace period states. For more information, see Panels on the Director Dashboard.

Overdraft licenses

How do I get overdraft licenses?

Products (excluding Citrix Cloud) that support user/device, user, or device license models include a license overdraft feature that enables you to use a limited number of extra licenses to prevent access denial. We offer any overdraft feature as a convenience, not as a license entitlement. Concurrent and server licenses do not contain overdraft. Any overdraft licenses used must be purchased within 30 days of first use, but use is not limited to 30 days. Citrix reserves the right to remove any overdraft feature in new product releases. For more information, see License overdraft.

How can I identify a license overdraft?

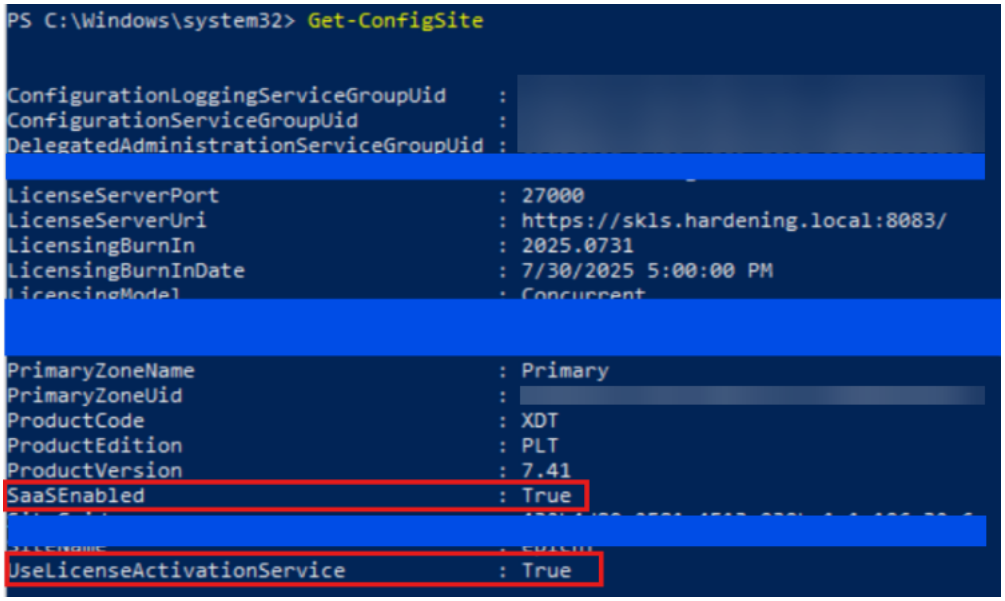
You can view usage information, including the number of licenses in overdraft in the Citrix Licensing Manager. The Studio also contains overdraft usage information.

What happens when an overdraft license is consumed?

A license is assigned from your installed licenses to enable access to your Citrix Virtual Apps and Desktops environment. This overdraft license provides as much access and functionality as your other licenses.

Can I get an alert when my overdraft licenses are consumed?

Currently, there are no specific alerts provided when overdraft licenses are consumed.

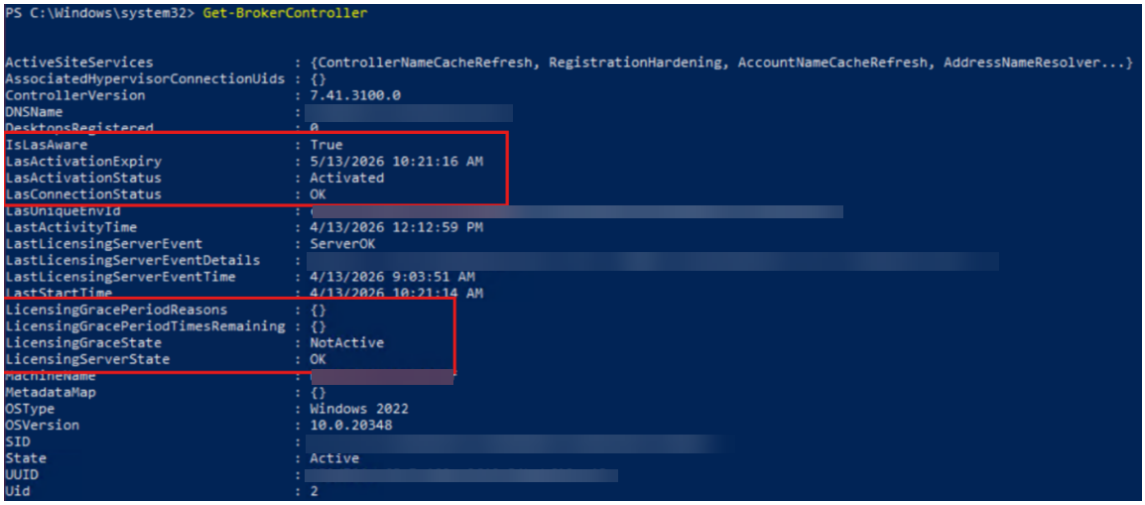


How long can an overdraft license be consumed?

Purchase any overdraft licenses used within 30 days of the first use.

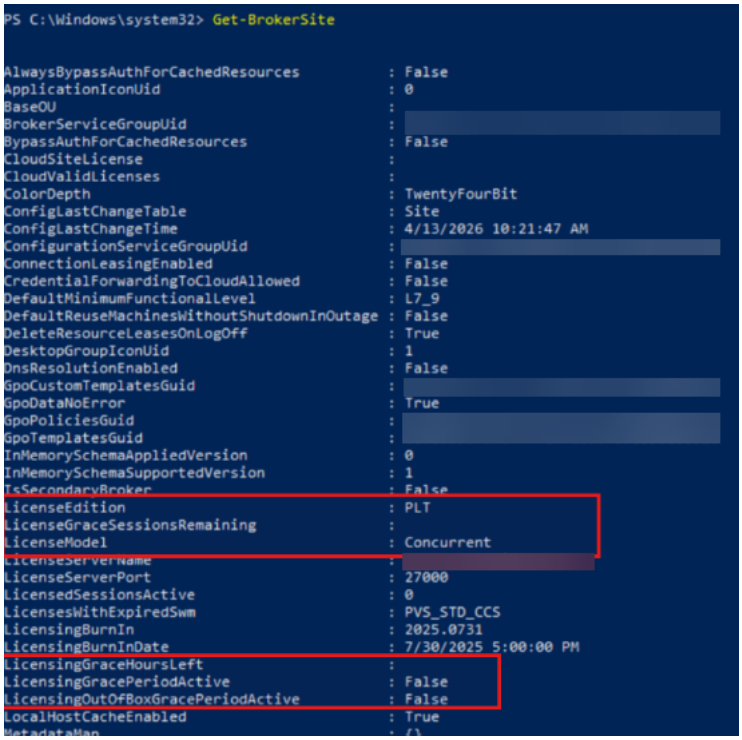
How can I check the LAS state of a site?

Run `Get-configsite` to check the LAS activation state and SaaS bit status.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

How can I verify if a site is in emergency license caching mode?



Run `Get-Brokercontroller` and `Get-brokersite` to get details on emergency caching mode and remaining time.

- `Get-Brokercontroller` output:

- `Get-brokersite` output:

Local Host Cache

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To ensure that the Citrix Virtual Apps and Desktops site database is always available, Citrix recommends starting with a fault-tolerant SQL Server deployment, by following high availability best practices from Microsoft. (For supported SQL Server high availability features, see Databases.) However, network issues and interruptions can result in users not being able to connect to their applications or desktops.

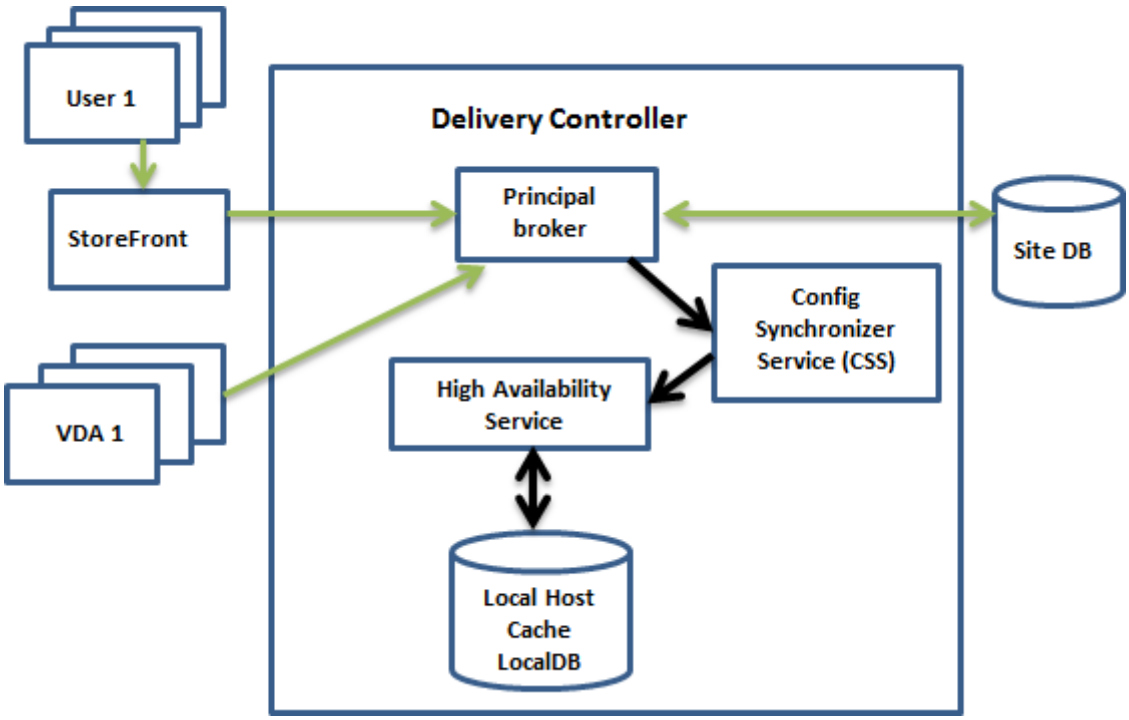
The Local Host Cache feature allows connection brokering operations in a site to continue when an outage occurs. An outage occurs when the connection between a Delivery Controller™ and the site database fails in an on-premises Citrix® environment. Local Host Cache engages when the site database is inaccessible for 90 seconds.

As of XenApp and XenDesktop 7.16, the connection leasing feature (a predecessor high availability feature in earlier releases) was removed from the product, and is no longer available.

Data content

Local Host Cache includes the following information, which is a subset of the information in the main database:

- Identities of users and groups who are assigned rights to resources published from the site.
- Identities of users who are currently using, or who have recently used, published resources from the site.
- Identities of VDA machines (including Remote PC Access machines) configured in the site.
- Identities (names and IP addresses) of client Citrix Receiver™ machines being actively used to connect to published resources.



It also contains information for currently active connections that were established while the main database was unavailable:

- Results of any client machine endpoint analysis performed by Citrix Receiver.
- Identities of infrastructure machines (such as NetScaler Gateway and StoreFront™ servers) involved with the site.
- Dates and times and types of recent activity by users.

How it works

The following graphic illustrates the Local Host Cache components and communication paths during normal operations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

During normal operations

- The *principal broker* (Citrix Broker Service) on a Controller accepts connection requests from StoreFront. The broker communicates with the site database to connect users with VDAs that are registered with the Controller.
- The Citrix Config Synchronizer Service (CSS) checks with the broker approximately every 5 minutes to see if any changes were made. Those changes can be administrator-initiated (such as changing a delivery group property) or system actions (such as machine assignments).
- If a configuration change occurred since the previous check, the CSS synchronizes (copies) information to a secondary broker on the Controller. (The secondary broker is also known as the High Availability Service.)

  All configuration data is copied, not just items that changed since the previous check. The CSS imports the configuration data into a Microsoft SQL Server Express LocalDB database on the Controller. This database is referred to as the Local Host Cache database. The CSS ensures that the information in the Local Host Cache database matches the information in the site database. The Local Host Cache database is re-created each time synchronization occurs.

  Microsoft SQL Server Express LocalDB (used by the Local Host Cache database) is installed automatically when you install a Controller. (You can prohibit this installed when installing a Controller from the command line.) The Local Host Cache database cannot be shared across Controllers. You do not need to back up the Local Host Cache database. It is recreated every time a

© 1997–2026 Citrix Systems, Inc. All rights reserved.

configuration change is detected.

- If no changes have occurred since the last check, no data is copied.

The following graphic illustrates the changes in communications paths if the principal broker loses contact with the site database (an outage begins).

During an outage

When an outage begins:

- The secondary broker starts listening for and processing connection requests.
- When the outage begins, the secondary broker does not have current VDA registration data, but when a VDA communicates with it, a registration process is triggered. During that process, the secondary broker also gets current session information about that VDA.
- While the secondary broker is handling connections, the Brokering Principal continues to monitor the connection. When the connection is restored, the Brokering Principal instructs the secondary broker to stop listening for connection information, and the Brokering Principal resumes brokering operations. The next time a VDA communicates with the Brokering Principal, a registration process is triggered. The secondary broker removes any remaining VDA registrations from the previous outage. The CSS resumes synchronizing information when it learns that configuration changes have occurred in the deployment.

In the unlikely event that an outage begins during a synchronization, the current import is discarded and the last known configuration is used.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The event log provides information about synchronizations and outages.

There is no time limit imposed for operating in outage mode.

The transition between normal and outage mode does not affect existing sessions. It affects only the launching of new sessions.

You can also intentionally trigger an outage. See Force an outage for details about why and how to do this.

Sites with multiple Controllers

Among its other tasks, the CSS routinely provides the secondary broker with information about all Controllers in the zone. (If your deployment does not contain multiple zones, this action affects all Controllers in the site.) Having that information, each secondary broker knows about all peer secondary brokers running on other Controllers in the zone.

The secondary brokers communicate with each other on a separate channel. Those brokers use an alphabetical list of FQDN names of the machines they're running on to determine (elect) which secondary broker will be broker operations in the zone if an outage occurs. During the outage, all VDAs register with the elected secondary broker. The non-elected secondary brokers in the zone actively reject incoming connection and VDA registration requests.

If an elected secondary broker fails during an outage, another secondary broker is elected to take over, and VDAs register with the newly elected secondary broker.

During an outage, if a Controller is restarted:

- If that Controller is not the elected broker, the restart has no impact.
- If that Controller is the elected broker, a different Controller is elected, causing VDAs to register. After the restarted Controller powers on, it automatically takes over brokering, which causes VDAs to register again. In this scenario, performance can be affected during the registrations.

If you power off a Controller during normal operations and then power it on during an outage, Local Host Cache cannot be used on that Controller if it is elected as the broker.

The event logs provide information about elections.

What is unavailable during an outage, and other differences

There is no time limit imposed for operating in outage mode. However, Citrix recommends restoring connectivity as quickly as possible.

During an outage:

- You cannot use Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You have limited access to the PowerShell SDK.
  - You must first:
    - Add a registry key `EnableCssTestMode` with a value of 1: `New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\DesktopServer\LHC -Name EnableCssTestMode -PropertyType DWORD -Value 1`
    - Use port 89: `Get-BrokerMachine -AdminAddress localhost:89 | Select MachineName, ControllerDNSName, DesktopGroupName, RegistrationState`
  - After running those commands, you can access:
    - All `Get-Broker*` cmdlets.
- Hypervisor credentials cannot be obtained from the Host Service. All machines are in the unknown power state, and no power operations can be issued. However, VMs on the host that are powered-on can be used for connection requests.
- An assigned machine can be used only if the assignment occurred during normal operations. New assignments cannot be made during an outage.
- Automatic enrollment and configuration of Remote PC Access machines is not possible. However, machines that were enrolled and configured during normal operation are usable.
- Server-hosted applications and desktop users might use more sessions than their configured session limits, if the resources are in different zones.
- Users can launch applications and desktops only from registered VDAs in the zone containing the currently active/elected secondary broker. Launches across zones (from a secondary broker in one zone to a VDA in a different zone) are not supported during an outage.
- If a site database outage occurs before a scheduled restart begins for VDAs in a delivery group, the restarts begin when the outage ends. This can have unintended results. For more information, see Scheduled restarts delayed due to database outage.
- Zone preference cannot be configured. If configured, preferences are not considered for session launch.
- Tag restrictions where tags are used to designate zones are not supported for session launches. When such tag restrictions are configured, and a StoreFront store's advanced health check option is enabled, sessions might intermittently fail to launch.

Application and desktop support

LHC supports the following types of VDAs and delivery models:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VDA type	Delivery model	VDA availability during LHC events
Multi-session OS	Applications and desktops	Always available.
Single-session OS static (assigned)	Desktops	Always available.
Power-managed single-session OS random (pooled)	Desktops	Not available by default. All session launch attempts to power-managed VDAs in pooled delivery groups will fail by default.

> **Note:**
>
> Enabling access to power-managed desktop VDAs in pooled delivery groups doesn't affect how the configured `ShutdownDesktopsAfterUse` property works during normal operations. When access to these desktops during LHC is enabled, VDAs don't automatically restart after the LHC event is complete. Power-managed desktop VDAs in pooled delivery groups can retain data from previous sessions until the VDAs restart. A VDA restart can occur when a user logs off the VDA during non-LHC operations or when administrators restart the VDA.

pooled machines can cause data and changes from previous user sessions being present in subsequent sessions.

Enable LHC for power-managed single-session OS pooled VDAs using Web Studio

Using Web Studio, you can make those machines available for new connections during LHC events on a per-delivery group basis:

- To enable this feature during delivery group creation, see Create delivery groups.
- To enable this feature for an existing delivery group, see Manage delivery groups.

> **Note:**
>
> This setting is available in Web Studio only for pooled desktop delivery groups that deliver power-managed VDAs.

Enable LHC for power-managed single-session OS pooled VDAs using PowerShell

To enable LHC for VDAs in a specific delivery group, follow these steps:

1. Enable this feature at the site level by running this command:

   ```
   Set-BrokerSite -ReuseMachinesWithoutShutdownInOutageAllowed $true
   ```

2. Enable LHC for a delivery group by running this command with the delivery group name specified:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-BrokerDesktopGroup -Name "name"-ReuseMachinesWithoutShutdownInOutage
 $true
```

To change the default LHC availability for newly created pooled delivery groups with power managed VDAs, run the following command:

```
Set-BrokerSite -DefaultReuseMachinesWithoutShutdownInOutage $true
```

RAM size considerations

The LocalDB service can use approximately 1.2 GB of RAM (up to 1 GB for the database cache, plus 200 MB for running SQL Server Express LocalDB). The secondary broker can use up to 1 GB of RAM if an outage lasts for an extended interval with many logons occurring (for example, 12 hours with 10K users). These memory requirements are in addition to the normal RAM requirements for the Controller, so you might need to increase the total amount of RAM capacity.

If you use a SQL Server Express installation for the site database, the server will have two sqlserver.exe processes.

CPU core and socket configuration considerations

A Controller's CPU configuration, particularly the number of cores available to the SQL Server Express LocalDB, directly affects Local Host Cache performance, even more than memory allocation. This CPU overhead is observed only during the outage period when the database is unreachable and the secondary broker is active.

While LocalDB can use multiple cores (up to 4), it's limited to only a single socket. Adding more sockets will not improve the performance (for example, having 4 sockets with 1 core each). Instead, Citrix recommends using multiple sockets with multiple cores. In Citrix testing, a 2x3 (2 sockets, 3 cores) configuration provided better performance than 4x1 and 6x1 configurations.

Storage considerations

As users access resources during an outage, the LocalDB grows. For example, during a logon/logoff test running at 10 logons per second, the database grew by 1 MB every 2-3 minutes. When normal operation resumes, the local database is recreated and the space is returned. However, sufficient space must be available on the drive where the LocalDB is installed to allow for the database growth during an outage. Local Host Cache also incurs more I/O during an outage: approximately 3 MB of writes per second, with several hundred thousand reads.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Performance considerations

During an outage, one secondary broker handles all the connections, so in sites (or zones) that load balance among multiple Controllers during normal operations, the elected secondary broker might need to handle many more requests than normal during an outage. Therefore, CPU demands will be higher. Every secondary broker in the site (zone) must be able to handle the additional load imposed by the Local Host Cache database and all the affected VDAs, because the secondary broker elected during an outage can change.

VDI limits:

- In a single-zone VDI deployment, up to 10,000 VDAs can be handled effectively during an outage.
- In a multi-zone VDI deployment, up to 10,000 VDAs in each zone can be handled effectively during an outage, to a maximum of 40,000 VDAs in the site. For example, each of the following sites can be handled effectively during an outage:
  - A site with four zones, each containing 10,000 VDAs.
  - A site with seven zones, one containing 10,000 VDAs, and six containing 5,000 VDAs each.

During an outage, load management within the site can be affected. Load evaluators (and especially, session count rules) can be exceeded.

During the time it takes all VDAs to register with a secondary broker, that service might not have complete information about current sessions. So, a user connection request during that interval can result in a new session being launched, even though reconnection to an existing session was possible. This interval (while the "new"secondary broker acquires session information from all VDAs during re-registration) is unavoidable. Sessions that are connected when an outage starts are not impacted during the transition interval, but new sessions and session reconnections might be.

This interval occurs whenever VDAs must register:

- An outage starts: When migrating from a principal broker to a secondary broker.
- Secondary broker failure during an outage: When migrating from a secondary broker that failed to a newly elected secondary broker.
- Recovery from an outage: When normal operations resume, and the principal broker resumes control.

You can decrease the interval by lowering the Citrix Broker Protocol's `HeartbeatPeriodMs` registry value (default = 600000 ms, which is 10 minutes). This heartbeat value is double the interval the VDA uses for pings, so the default value results in a ping every 5 minutes.

For example, the following command changes the heartbeat to five minutes (300000 milliseconds), which results in a ping every 2.5 minutes:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\DesktopServer -Name
HeartbeatPeriodMs -PropertyType DWORD –Value 300000
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use caution when changing the heartbeat value. Increasing the frequency results in greater load on the Controllers during both normal and outage modes.

The interval cannot be eliminated entirely, no matter how quickly the VDAs register.

The time it takes to synchronize between secondary brokers increases with the number of objects (such as VDAs, applications, groups). For example, synchronizing 5000 VDAs might take 10 minutes or more to complete.

Differences from XenApp 6.x releases

Although this Local Host Cache implementation shares the name of the Local Host Cache feature in XenApp 6.x and earlier XenApp releases, there are significant improvements. This implementation is more robust and immune to corruption. Maintenance requirements are minimized, such as eliminating the need for periodic `dsmaint` commands. This Local Host Cache is an entirely different implementation technically.

Manage Local Host Cache

For Local Host Cache to work correctly, the PowerShell execution policy on each Controller must be set to RemoteSigned, Unrestricted, or Bypass.

SQL Server Express LocalDB

The Microsoft SQL Server Express LocalDB software that Local Host Cache uses is installed automatically when you install a Controller or upgrade a Controller from a version earlier than 7.9. Only the secondary broker communicates with this database. You cannot use PowerShell cmdlets to change anything about this database. The LocalDB cannot be shared across Controllers.

The SQL Server Express LocalDB database software is installed regardless of whether Local Host Cache is enabled.

To prevent its installation, install or upgrade the Controller using the `XenDesktopServerSetup.exe` command, and include the `/exclude "Local Host Cache Storage (LocalDB)"` option. However, keep in mind that the Local Host Cache feature will not work without the database, and you cannot use a different database with the secondary broker.

Installation of this LocalDB database has no effect on whether you install SQL Server Express for use as the site database.

For information about replacing an earlier SQL Server Express LocalDB version with a newer version, see Replace SQL Server Express LocalDB.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Default settings after product installation and upgrade

During a new installation of Citrix Virtual Apps and Desktops (minimum version 7.16), Local Host Cache is enabled.

After an upgrade (to version 7.16 or later), Local Host Cache is enabled if there are fewer than 10,000 VDAs in the entire deployment.

Enable and disable Local Host Cache

- To enable Local Host Cache, enter:

  ```
  Set-BrokerSite -LocalHostCacheEnabled $true
  ```

  To determine whether Local Host Cache is enabled, enter `Get-BrokerSite`. Check that the `LocalHostCacheEnabled` property is `True`.

- To disable Local Host Cache, enter:

  ```
  Set-BrokerSite -LocalHostCacheEnabled $false
  ```

Remember: As of XenApp and XenDesktop 7.16, connection leasing (the feature that preceded Local Host Cache beginning with version 7.6) was removed from the product, and is no longer available.

Verify that Local Host Cache is working

To verify that Local Host Cache is set up and working correctly:

- Ensure that synchronization imports complete successfully. Check the event logs.
- Ensure that the SQL Server Express LocalDB database was created on each Delivery Controller. This confirms that the secondary broker can take over, if needed.
  - On the Delivery Controller server, browse to `C:\Windows\ServiceProfiles\NetworkService`.
  - Verify that `HaDatabaseName.mdf` and `HaDatabaseName_log.ldf` are created.
- Force an outage on the Delivery Controllers. After you've verified that Local Host Cache works, remember to place all the Controllers back into normal mode. This can take approximately 15 minutes.

Event logs

Event logs indicate when synchronizations and outages occur. In event viewer logs, outage mode is referred to as *HA mode*.*

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Config Synchronizer Service:

During normal operations, the following events can occur when the CSS imports the configuration data into the Local Host Cache database using the Local Host Cache broker.

- 503: The Citrix Config Sync Service received an updated configuration. This event indicates the start of the synchronization process.
- 504: The Citrix Config Sync Service imported an updated configuration. The configuration import completed successfully.
- 505: The Citrix Config Sync Service failed an import. The configuration import did not complete successfully. If a previous successful configuration is available, it is used if an outage occurs. However, it will be out-of-date from the current configuration. If there is no previous configuration available, the service cannot participate in session brokering during an outage. In this case, see the Troubleshoot section, and contact Citrix Support.
- 507: The Citrix Config Sync Service abandoned an import because the system is in outage mode and the Local Host Cache broker is being used for brokering. The service received a new configuration, but the import was abandoned because an outage occurred. This is expected behavior.
- 510: No Configuration Service configuration data received from primary Configuration Service.
- 517: There was a problem communicating with the primary Broker.
- 518: Config Sync script aborted because the secondary Broker (High Availability Service) is not running.

High Availability Service:

This service is also known as the Local Host Cache broker.

- 3502: An outage occurred and the Local Host Cache broker is performing brokering operations.
- 3503: An outage was resolved and normal operations have resumed.
- 3504: Indicates which Local Host Cache broker is elected, plus other Local Host Cache brokers involved in the election.
- 3507: Provides a status update of Local Host Cache every 2 minutes which indicates that Local Host Cache mode is active on the elected broker. Contains a summary of the outage including outage duration, VDA registration, and session information.
- 3508: Announces Local Host Cache is no longer active on the elected broker and normal operations have been restored. Contains a summary of the outage including outage duration, number of machines that registered during the Local Host Cache event, and number of successful launches during the LHC event.
- 3509: Notifies that Local Host Cache is active on the non-elected broker(s). Contains an outage duration every 2 minutes and indicates the elected broker.
- 3510: Announces Local Host Cache is no longer active on the non-elected broker(s). Contains the outage duration and indicates the elected broker.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Force an outage

You might want to deliberately force an outage.

- If your network is going up and down repeatedly. Forcing an outage until the network issues are resolved prevents continuous transition between normal and outage modes (and the resulting frequent VDA registration storms).
- To test a disaster recovery plan.
- To help ensure that Local Host Cache is working correctly.
- While replacing or servicing the site database server.

To force an outage, edit the registry of each server containing a Delivery Controller. In `HKLM\Software\Citrix\DesktopServer\LHC`, create and set `OutageModeForced` as `REG_DWORD` to `1`. This setting instructs the Local Host Cache broker to enter outage mode, regardless of the state of the database. Setting the value to `0` takes the Local Host Cache broker out of outage mode.

To verify events, monitor the `Current_HighAvailabilityService` log file in `C:\ProgramData\Citrix\WorkspaceCloud\Logs\Plugins\HighAvailabilityService`.

Troubleshoot

Several troubleshooting tools are available when a synchronization import to the Local Host Cache database fails and a 505 event is posted.

CDF tracing: Contains options for the `ConfigSyncServer` and `BrokerLHC` modules. Those options, along with other broker modules, will likely identify the problem.

Report: If a synchronization import fails, you can generate a report. This report stops at the object causing the error. This report feature affects synchronization speed, so Citrix recommends disabling it when not in use.

To enable and produce a CSS trace report, enter the following command:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\DesktopServer\LHC -Name EnableCssTraceMode -PropertyType DWORD -Value 1
```

The HTML report is posted at `C:\Windows\ServiceProfiles\NetworkService\AppData\Local\Temp\CitrixBrokerConfigSyncReport.html`.

After the report is generated, enter the following command to disable the reporting feature:

```
Set-ItemProperty -Path HKLM:\SOFTWARE\Citrix\DesktopServer\LHC -Name EnableCssTraceMode -Value 0
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Export the broker configuration: Provides the exact configuration for debugging purposes.

```
Export-BrokerConfiguration | Out-File <file-pathname>
```

For example, `Export-BrokerConfiguration | Out-File C:\\BrokerConfig.xml`.

Local Host Cache PowerShell commands

You can manage Local Host Cache(LHC) on your Delivery Controllers using PowerShell commands.

The PowerShell module is located at the following location on the Delivery Controllers:

```
C:\Program Files\Citrix\Broker\Service\ControlScripts
```

> **Important:**
>
> Run this module only on the Delivery Controllers.

Import PowerShell module To import the module, run the following on your Delivery Controller.

```
cd C:\Program Files\Citrix\Broker\Service\ControlScripts Import-
Module .\HighAvailabilityServiceControl.psm1
```

PowerShell commands to manage LHC The following commands help you to activate and manage the LHC mode on the Delivery Controllers.

Cmdlets	Function
`Enable-LhcForcedOutageMode`	Place the Broker in LHC mode. LHC database files must have been successfully created by the ConfigSync Service for `Enable-LhcForcedOutageMode` to function properly. This cmdlet only forces LHC on the Delivery Controller that it was run on. For LHC to become active, this command must be run on all the Delivery Controllers within the zone.
`Disable-LhcForcedOutageMode`	Takes the Broker out of the LHC mode. This cmdlet only disables LHC mode on the Delivery Controller that it was run on. `Disable-LhcForcedOutageMode` must be run on all the Delivery Controllers within the zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cmdlets	Function
`Set-LhcConfigSyncIntervalOverride`	Sets the interval at which the Citrix Config Synchronizer Service (CSS) checks for configuration changes within the site. The time interval can range from 60 seconds(one minute) to 3600 seconds (one hour). This setting only applies to the Delivery Controller on which it was run. For consistency across Delivery Controllers, consider running this cmdlet on each Delivery Controller. For example: `Set-LhcConfigSyncIntervalOverride -Seconds 1200`
`Clear-LhcConfigSyncIntervalOverride`	Sets the interval at which the Citrix Config Synchronizer Service (CSS) checks for configuration changes within the site to the default value of 300 seconds (five minutes). This setting only applies to the Delivery Controller on which it was run. For consistency across Delivery Controllers, consider running this cmdlet on each Delivery Controller.
`Enable-LhcHighAvailabilitySDK`	Enables access to all the `Get-Broker*` cmdlets within the Delivery Controller that it was run on.
`Disable-LhcHighAvailabilitySDK`	Disables access to the Broker cmdlets within the Delivery Controller that it was run on.

> **Note:**
>
> - Use port 89 when running the `Get-Broker*` cmdlets on the Delivery Controller. For example:
>   - `Get-BrokerMachine -AdminAddress localhost:89`
> - When not in LHC mode, the LHC Broker on the Delivery Controller only holds configuration information.
> - During LHC mode, the LHC Broker on the elected Delivery Controller holds the following information:
>   - Resource states
>   - Session details

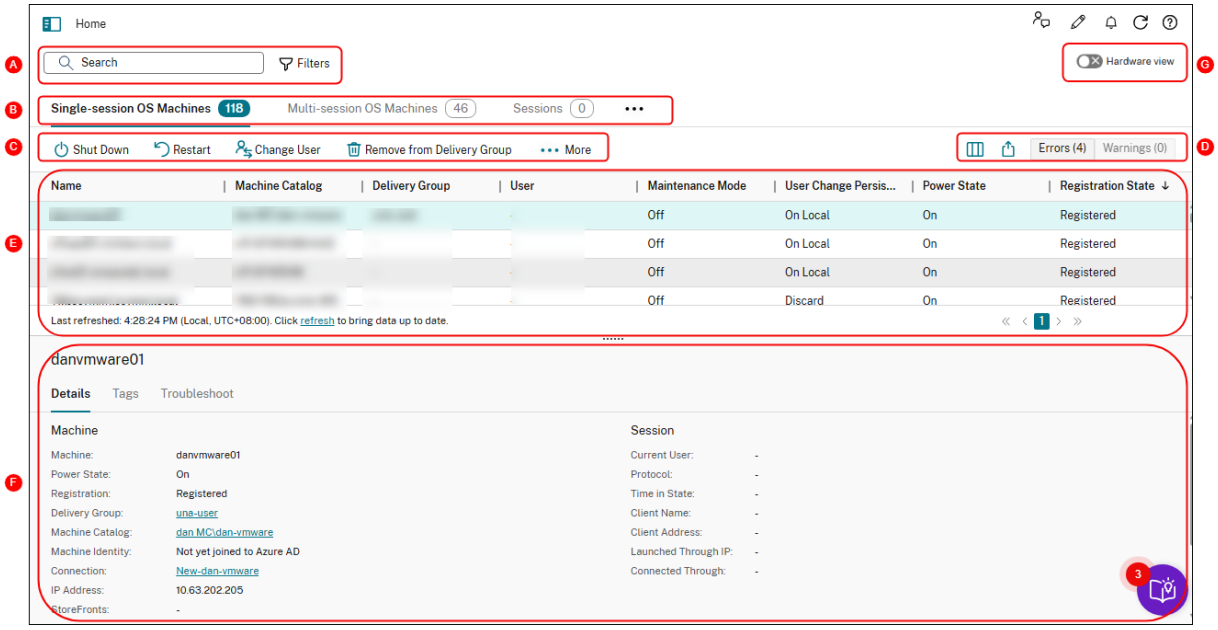
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- VDA registrations
- Configuration information

Monitor and manage machines and sessions in Search > Default view

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.



This article guides you through how to monitor and manage machines and sessions using Default view within the **Search** node. It includes the following topics:

- Learn about Default view
- Search for machines and sessions
- Customize cloumns to display
- Manage machines and sessions
- Export machine or session data to CSV files

Learn about Default view

Defaut view within the **Search** node provides a central place for monitoring and managing machines and user sessions.

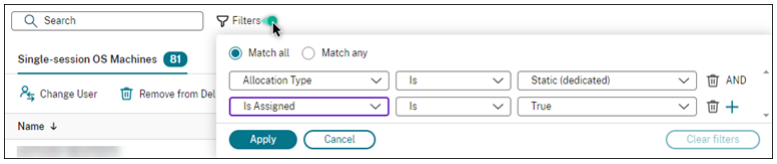
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Callout	Area	Description
A	Search bar	Provides a quick search and a filter-based search that allows you to define complex search criteria. For more information, see Search for instances.
B	Type tabs	Displays tabs to list machines by type or list all sessions. Instance counts appear in the tab names.
C	Instance-level actions	Displays actions that you can perform on the *selected instances* (machines or sessions). For more information, see Machine actions and Session actions.
D	List-level actions	Displays actions that you can perform on the current *list*: **Export** icon: Export the list of instances displayed in the main view to a CSV file. **Column to display** icon: Customize the main view for the list. **Errors** label: Enable this label to display only unregistered machines with errors in the main view. To view issue details, go to the **Troubleshoot** tab in the **Details** pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Callout	Area	Description
E	Main view	Displays the instances and their properties. You can customize the main view by selecting the **Column to display** icon. For more information about available columns, see Machine columns and Session columns.
F	Details pane	Displays the following details: Details of the selected instance (machine or session) Tags applied to the selected machine Details of errors or warnings with the selected machine, including problems, possible causes, and suggested solutions
G	Switch to Hardware view	Click to switch from Default view to Hardware view.

Search for instances

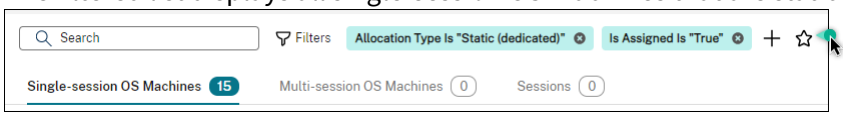


Use the search function to locate specific machines and sessions:

- Search using filters
- Save the current filter set for a quick search
- Pin a filter field in the Search bar
- Search using the quick search box
- Tips to enhance a search

Search using filters

For example, to locate all single-session OS machines that are *static* and *assigned to users*, follow these steps:

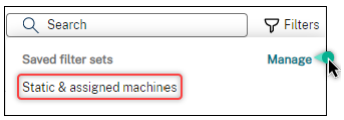


1. On the **Single-session OS machines** tab, click the **Filters** icon. The Filters panel appears.
2. Add the necessary filter criteria.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select **Match all** (AND operator) if you want the search to return results that match all filter criteria. Select **Match any** (OR operator) if you want the search to return results that match any of the filter criteria.
4. Click **Apply**.

   The filtered list displays all single-session OS machines that are static and assigned to users.

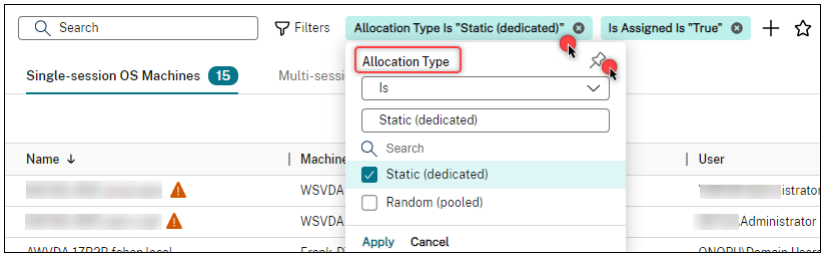


Save the current filter set for a quick search

For example, to save the filter set for single-session OS machines that are static and assigned to users for future use, follow these steps:

1. After you conduct a filter-based search, click the **Star** icon in the search bar, as shown in the preceding figure.
2. On the page that appears, enter a name for this filter set (for example, *Static & assigned machines*).
3. Click **Save**.

   The saved filter set appears in the search history list when you click the search box.



> **Note:**
>
> Filter sets are saved on a per user account basis. To manage saved filter sets, select **Manage**.

Pin a filter field in the Search bar

Pin frequently used filter *fields* in the search bar for easy access. For example, after conducting a filter-based search, you want to pin **Allocate Type** in the search bar. Follow these steps:

1. Click the *filter setting* in the search bar.
2. In the panel that appears, click the **Pin** icon to pin the filter field (*Allocation Type* for this example) in the search bar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Search using the quick search box

The quick search box provides a convenient way to search for instances based on name-related properties or saved filter sets. Detailed steps are as follows:

1. Click the search box. Your recent searches and saved filter sets appear in the drop-down list. You can click a previous search or filter set for a quick search.
2. To start a new search, enter a complete or partial name from the following options:
    - Machine name or DNS name
    - Machine catalog name
    - Delivery group name
    - Session user name
    - Session client name
    - Friendly name of the VM hosting the session, as used by its hypervisor
    - Hosting server name

Tips to enhance a search

Consider the following tips when using the Search feature:

- On the **Search** node, select any column to sort items.
- To show more characteristics to include in the display where you can search and sort, select **Columns to Display** or click any column and select **Columns to Display**. In the **Columns to Display** window, select the checkbox next to the items you want to display and select **Save** to exit.

    > **Note:**
    >
    > Columns that degrade performance are marked with the **Degrades performance** label.

- To locate a user device connected to a machine, use **Client (IP)** and **Is**, and enter the device IP address.
- To locate active sessions, use **Session State**, **Is**, and **Connected**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To list all machines in a delivery group, select **Delivery Groups** in the left pane. Select the group, and then select **View Machines** from the action bar or the context menu.
- To quickly narrow down MCS-provisioned machines by specific properties, use the **Search** bar available in Hardware view.

Keep the following considerations in mind when performing sorting operations:

- As long as the number of items does not exceed 5,000, you can click any column to sort the items in it. When the number exceeds 5,000, you can sort only by name or by current user (depending on which tab you are on). To enable sorting, use filters to reduce the number of items to 5,000 or fewer.
- When the number of items is greater than 500 but no more than 5,000:
  - We cache all data locally to improve sort performance. On the **Single-session OS Machines** and **Multi-session OS Machines** tabs, we cache the data the first time you click a column (any column except the **Name** column) to sort. On the **Sessions** tab, we cache the data the first time you click a column (any column except the **Current User** column) to sort. As a result, the sort takes longer to complete. For faster performance, sort by name or current user, or use filters to reduce the number of items.
  - The following message under the table indicates that the data is cached: Last refreshed: <the time when you refreshed the table>. In that case, sort operations are based on items that were loaded previously. Those items might not be up to date. To bring them up to date, click the refresh icon.

Customize columns to display

Create a personalized main view to display the properties and statuses crucial for your daily operations. Detailed steps are as follows:

1. In the **Search** node, select the **Multi-session OS Machines**, **Single-session OS Machines**, or **Sessions** tab as necessary.
2. Click the **Columns to display** icon in the action bar and select the columns.

   For more information about the available columns and their descriptions, see Machine columns and Session columns.

When choosing columns, you can see columns marked with the **Degrades performance** label. Selecting those columns might degrade the performance of the console. Keep these considerations in mind:

- After you complete your customization, the table refreshes to display the columns you select. Their presence might result in delays when you refresh the table.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- After you refresh the browser or sign out of the console and then sign in, a message appears asking whether to preserve those columns. If you choose to preserve them, you're restricted to refreshing the table more than once a minute for optimal console performance. For more frequent refreshes, remove any columns that degrade performance.

Manage machines and sessions

Use actions in the Search node to troubleshoot machines and session issues or process user requests.

Good to know

You can manage machines at different levels:

- At the individual machine level. Use the **Search** node to locate target machines and perform actions.
- At the machine catalog level, such as changing master images for a catalog, deleting machines from a catalog, and adding machines to a catalog. For more information, see Manage machine catalogs.
- At the delivery group level, such as turning on or off maintenance mode for machines in a group. For more information, see Manage delivery groups.

In addition to the individual session level, You can also manage sessions at the delivery group level, such as configuring session prelaunch and linger for a delivery group. For more information, see Manage Delivery Groups.

Perform actions on machines or sessions

To manage machines or sessions at the individual instance level, follow these steps:

1. In the **Search** node, select the **Multi-session OS Machines**, **Single-session OS Machines**, or **Sessions** tab.
2. Select one or more instances as necessary.
3. From the action bar or right-click menu, select an action based on the issues that you encounter with those instances or user requests.

   For more information about the available actions and their descriptions, see Machine actions and Session actions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If you select two or more instances, only actions that apply to all of them are available.

Export machine or session data to CSV files

Export the list of instances (machines or sessions) displayed on a tab (up to 30,000 items) to a CSV file. Detailed steps are as follows:

1. In the **Search** node, select the **Multi-session OS Machines**, **Single-session OS Machines**, or **Sessions** tab as necessary.
2. Click the **Export** icon in the upper right corner.
3. In the dialog box that appears, click **Continue**.

   The export might take several minutes to complete. You can find the file in the default download folder of your browser.

> **Note:**
>
> On each tab of the **Search** node, you cannot perform another export while an export is in progress.

Machine actions and columns

May 13, 2026

This article lists machine actions and columns with descriptions for your reference.

Actions

View the actions you can perform on machines and their descriptions.

Action	Description	Applies to
Remove from Delivery Group	Remove a machine from the delivery group.	Single-session and multi-session
Add to Delivery Group	Add a machine to a delivery group.	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Description	Applies to
View Sessions	View the sessions running on a machine	Single-session and multi-session
Manage Tags	Add and manage tags for a machine. For more information about typical use cases of tags, see Tags.	Single-session and multi-session
Turn On Maintenance Mode	Place a machine in maintenance mode before applying patches, or for troubleshooting. This mode prevents new connections from being made to that machine. Users can connect to existing sessions on that machine, but they can't start new sessions on that machine.	Single-session and multi-session
Turn Off Maintenance Mode	Turn off maintenance mode for a machine.	Single-session and multi-session
Upgrade VDA	Upgrade VDA for a machine.	Single- or multi-session OS machines that meet certain requirements: Learn more.
Log Off	Force log off a machine	Single-session and multi-session
Delete	Delete a VM from a machine catalog while leaving it intact on the hypervisor or cloud service.	Single-session and multi-session
Change User	Assign a machine to a specific user.	single-session *static* machines.
Start	Start a machine.	Single-session and multi-session
Shut Down	Shut down a machine.	Single-session and multi-session
Restart	Restart a machine	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Description	Applies to
Suspend	Place a machine in a hibernation or suspension state. When you suspend a machine, Delivery Controllers store the memory contents of the machine in a file and then shuts down the machine.	Single-session OS machines
Resume	Resume a suspended machine. When you resume a suspended machine, Delivery Controllers start the machine and restores it to the previous state.	Single-session OS machines
Force Restart	Force restart a machine.	Single-session OS machines
Force Shut Down	Force shut down a machine.	Single-session OS machines

Columns

View all machine columns and their descriptions by type:

- Machine
- Machine details
- Applications
- Hosting
- Connection
- Registration
- Session Details
- Session

Machine

Columns in the **Machine** category.

Column	Description	Applies to
Name	The DNS host name of the machine.	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
Machine Catalog	The name of the catalog the machine belongs to.	Single-session and multi-session
Delivery Group	The name of the delivery group the machine belongs to.	Single-session and multi-session
User Display Name	The full names of the users associated with the machine (usually in the form `Firstname Lastname`). Associated users are the current users for shared machines and the assigned users for dedicated machines.	Single-session and multi-session
User	The user names of the users associated with the machine (in the form "domain\user"). Associated users are the current users for shared machines and the assigned users for dedicated machines.	Single-session and multi-session
User Principal Name	The User Principal Names of the users associated with the machine (in the form "user@domain"). Associated users are the current users for shared machines and the assigned users for dedicated machines.	Single-session and multi-session
Desktop Display Name	The published name of the machine originally used to launch the session. It's the name displayed on the Citrix Workspace™ app or StoreFront.	Single-session only

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
	Note: To change a desktop's display, you need the **Perform Machine Update** permission because changing the display name involves updating the machine property.	
Desktop Conditions	The list of outstanding desktop conditions for the machine. Possible values: Unknown, CPU, ICALatency, and UPMLogonTime.	Single-session and multi-session
Allocation Type	The allocation type of the machine: **Permanent**, when allocated to a user permanently. **Random**, when allocated randomly.	Single-session and multi-session
Maintenance Mode	Indicates whether the machine is in maintenance mode.	Single-session and multi-session
Windows Connection Setting	Logon mode reported by Windows. Possible values: LogonEnabled, Draining, DrainingUntilRestart, and LogonDisabled.	Multi-session only
Is Assigned	Indicates whether a dedicated desktop has been assigned to a user or a client (name/address). Users can be assigned explicitly or by assigning-on-first-use-of-the-machine.	Single-session and multi-session
Is Physical	Indicates whether the machine is physical or not. `True` indicates that the machine is physical, meaning it isn't power-managed by Delivery Controllers. `False` indicates otherwise.	Single-session and multi-session
Provisioning Type	How the machine was provisioned. Possible values: Manual: Not provisioned using PVS or MCS. PVS: Provisioned using PVS (physical, blade, and virtual machines) MCS: Provisioned using MCS	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
Scheduled Restart	The state of any scheduled reboot operation for the machine. Possible values: None: No reboot is scheduled. Pending: Awaiting reboot but is available for use. Draining: Awaiting reboot and is unavailable for new sessions.	Single-session and multi-session
Zone	The name of the zone where the machine is located.	Single-session and multi-session
State	The overall state of the desktop associated with the machine, derived from various specific states, such as session state, registration state, and power state. Possible states: Off, Unregistered, Available, Disconnected, InUse, and Preparing.	Single-session and multi-session
Tags	The list of tags associated with the machine.	Single-session and multi-session
VDA Upgrade	The machine state for VDA package upgrade actions. Possible values: MissingUpgradeType, UpgradeScheduled, UpgradeAvailable, UpToDate, and Unknown.	Single-session and multi-session
Suspend Capable	Indicates whether the machine supports power actions (Suspend and Resume).	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
Load Evaluator Index	The overall effective load index (percentage) for the machine. For more information, see CTX202150.	Multi-session only
Load Index	The current load index. For more information, see Learn more.	Multi-session only
Drain State	Indicates whether the machine is draining and will shut down after all sessions on the machine end. True appears only for power-managed, multi-session machines. **Note:** The machine doesn't shut down if it's in maintenance mode. It shuts down only after it's off maintenance mode.	Multi-session only

Machine details

Columns in the **Machine details** category.

Column	Description	Applies to
Agent Version	The version of the Citrix Virtual Delivery Agent (VDA) installed on the machine.	Single-session and multi-session
IP Address	The IP address of the machine.	Single-session and multi-session
Is Assigned	Indicates whether a dedicated desktop has been assigned to a user or a client (name/address). Users can be assigned explicitly or by assigning-on-first-use-of-the-machine.	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
OS Type	The type of the operating system running on the machine.	Single-session only

Applications

Columns in the **Applications** category.

Column	Description	Applies to
Application in Use	The list of applications in use on the machine (displayed as browser names).	Single-session and multi-session
Published Applications	The list of applications published by the machine (displayed as browser names).	Single-session and multi-session

Connections

Columns in the **Connections** category.

Column	Description	Applies to
Client (IP)	The IP address of the client connected to the machine.	Single-session only
Client	The host name of the client connected to the machine.	Single-session only
Plug-In Version	The version of the Citrix Workspace app on the connected client.	Single-session only
Connected Through	The host name of the incoming connection, typically a gateway, router, or client.	Single-session only
Connected Through (IP)	The IP address of the incoming connection, typically a gateway, router, or client.	Single-session only

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
Connection Type	The protocol used for the session. Possible values: HDX, RDP, and Console. Note: The field is left blank for console sessions on XenDesktop® 5 VDAs.	Single-session only
Last Connection Time (UTC)	The time of the last detected connection attempt that either failed or succeeded.	Single-session and multi-session
Last Connection User	The SAM name (in the form "DOMAIN\user") of the user that last attempted a connection with the machine. If the SAM name is not available, the SID is used.	Single-session and multi-session
Secure ICA® Active	Indicates whether SecureICA is active on the current session. Always null for multi-session machines.	Single-session and multi-session

Hosting

Columns in the **Hosting** category.

Column	Description	Applies to
VM	The friendly name of a hosted machine running the session, as used by its hypervisor. It doesn't necessarily match either the DNS or AD name of the machine.	Single-session and multi-session
Hosting Server Name	The DNS name of the hypervisor that is hosting the machine if managed.	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
Connection	The name of the host connection assigned to the machine hosting the session.	Single-session and multi-session
Pending Update	Indicates whether the VM image for a hosted machine is out of date and due to be updated to a new image at the machine's next reboot.	Single-session and multi-session
User Change Persistence	How user changes are handled, indicating whether the changes are persistent: OnLocal: Persistent. User changes are saved locally. Discard: Non-persistent. User changes are discarded.	Single-session and multi-session
Pending Power Action	Indicates whether there are any pending power actions for the machine.	Single-session and multi-session
Power State	The power state of the machine. Possible values: Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.	Single-session and multi-session
Will Shut Down After Use	Applicable only to power-managed, single-session machines. Indicates whether the machine is tainted and will shut down after all sessions end. **Note:** The machine won't shut down if it's in maintenance mode. It will shut down only after it is taken out of maintenance mode.	Single-session only

Registration

Columns in the **Registration** category.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
Last Registration Failure	The reason for the last deregistration of the machine with the broker. Possible values are: AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError, and BrokerRegistrationLimitReached.	Single-session and multi-session
Last Registration Failure Time (UTC)	The time of the last deregistration of the machine.	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description	Applies to
Registration State	The registration state of the machine. Possible values: Unregistered, Initializing, Registered, and AgentError.	Single-session and multi-session
Fault State	The summary state of any current fault state of the machine. Possible values: None: No fault. The machine is healthy. FailedToStart: The last power-on operation for the machine failed. StuckOnBoot: The machine failed to start after being powered on. Unregistered. The machine failed to register within the expected period or its registration has been rejected. MaxCapacity. The machine is reporting itself at maximum capacity.	Single-session and multi-session

Session details

Columns in the **Session details** category.

Column	Description	Applies to
Launched Over	The host name of the StoreFront server used to launch the current brokered session. Always null for multi-session machines.	Single-session and multi-session
Launched Over (IP)	The IP address of the StoreFront server used to launch the current brokered session. Always null for multi-session machines.	Single-session and multi-session
Session Change Time (UTC)	The time of the last state change of the current session.	Single-session only
SmartAccess Filters	Smart Access tags for the current session. Always null for multi-session machines.	Single-session and multi-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session

Columns in the **Session** category.

Column	Description	Applies to
Session State	The state of the current session. Possible values: Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.	Single-session only
Current User	The name of the current session's user (in the form "DOMAIN\user").	Single-session only
Start Time (UTC)	The start time of the current session.	Single-session only
Session Count	The number of sessions on the machine.	Multi-session only

Session actions and columns

May 13, 2026

This article lists machine actions and columns with descriptions for your reference.

Actions

View the actions you can perform on sessions and their descriptions.

Action	Description	Applies to sessions on
Log off	Log a user off a session.	Single-session OS machines or multi-session OS machines
Send Message	Send a message to the user of a session.	Single-session OS machines or multi-session OS machines

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Description	Applies to sessions on
View machines	View the hosting machine for a session.	Single-session OS machines or multi-session OS machines
Disconnect	Disconnect a session. If a session becomes disconnected, it is still active and its applications continue to run, but the user device is no longer communicating with Delivery Controllers.	Single-session OS machines or multi-session OS machines
Shut Down Machine	Shut down the machine associated with a session.	Single-session OS machines
Restart Machine	Restart the machine associated with a session.	Single-session OS machines

Columns

View session columns and their descriptions.

Column	Description
Current user	The name of the user; the User Principal Name (UPN) of the user.
Name	The DNS host name of the machine hosting the session.
Delivery Group	The name of the delivery group containing the session's hosting machine.
Machine Catalog	The name of the machine catalog containing the session's hosting machine.
Agent Version	The version of the Citrix Virtual Delivery Agent (VDA) installed on the machine hosting the session.
Application in Use	The list of applications in use in the session, identified by their administrative names.
Autonomously Brokered	Whether this is an HDX™ session established by a direct connection without being brokered.
Brokering Time (UTC)	The time at which the session was brokered.
Brokering User Name	The name of the brokering user.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description
Client (IP)	The IP address of the client connected to the session.
Client	The host name of the client connected to the session.
Plug-In Version	The version of Citrix Workspace™ app running on the client connected to the session.
Connected Through	The host name of the incoming connections, typically a gateway, router, or client.
Connected Through (IP)	The IP address of the incoming connection, typically a gateway, router, or client.
Allocation Type	Whether the session is shared or dedicated.
Hidden	Whether the session is hidden from the user and not to be reconnected to.
VM	The friendly name of the VM hosting the session, as used by its hypervisor. It doesn't necessarily match either the DNS or AD name of the machine.
Hosting Server Name	The DNS name of the hypervisor that is hosting the session's hosting machine.
Connection	The name of the host connection assigned to the machine hosting the session.
Pending Update	Whether the VM image for a hosted machine is out of date and due to be updated to a new image at the machine's next reboot.
Maintenance Mode	Whether the machine hosting the session is in maintenance mode.
IP Address	The IP address of the machine hosting the session.
Is Physical	Whether the machine hosting the session is physical or not. `True` indicates that the machine is physical, meaning it isn't power-managed by Delivery Controllers. `False` indicates otherwise.
Launched Over	The host name of the StoreFront™ server used to launch the session. Blank if the session was launched via Workspace.

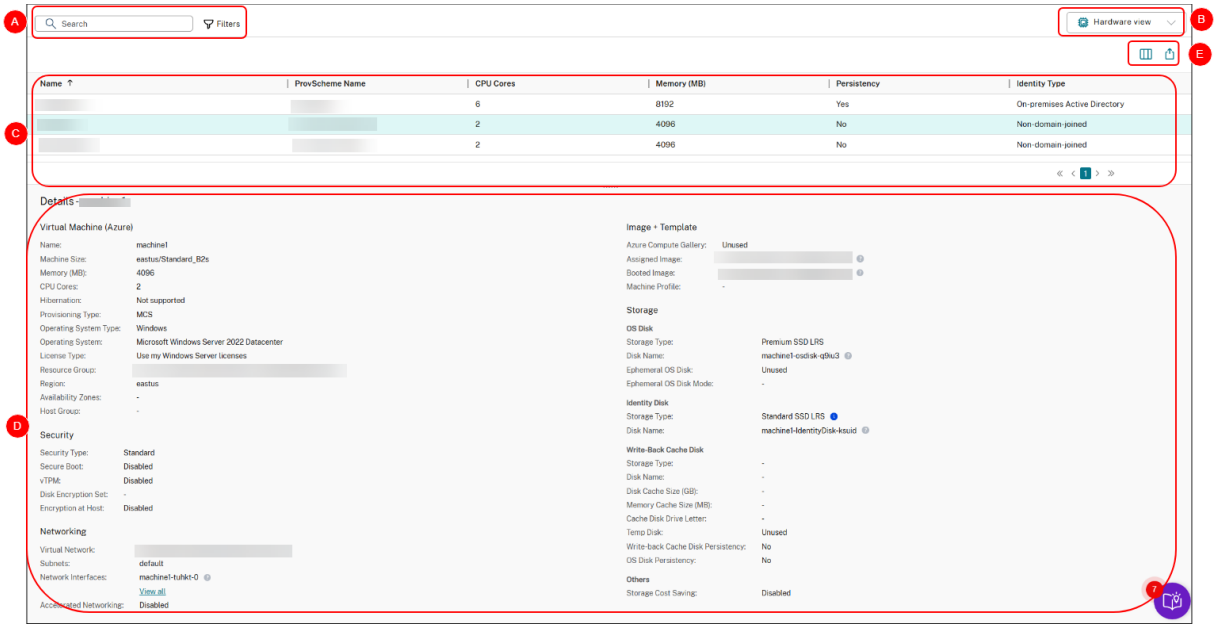
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description
Launched Over (IP)	The IP address of the StoreFront server used to launch the session. Blank if the session was launched via Workspace.
OS Type	The identification string of the operating system hosting the session.
User Change Persistence	How user changes are handled, indicating whether the changes are persistent: OnLocal: Persistent. User changes are saved locally. Discard: Non-persistent. User changes are discarded.
Connection Type	The protocol used for the session, such as HDX, RDP, or Console. **Note:** The field is blank for console sessions on XenDesktop® 5 VDAs.
Provisioning Type	How the machine hosting the session was provisioned: Manual: Not provisioned using PVS or MCS. PVS: Provisioned by PVS (Physical, blade, and virtual machines). MCS: Provisioned by MCS (VMs only).
Secure ICA® Active	Whether SecureICA is active on the session.
Session State	The state of the session. Possible values: Connected, Active, or Disconnected. Other states might occur for sessions on machines with functional levels earlier than L7, such as PreparingSession, Reconnecting, NonBrokeredSession, Other, and Unknown.
Session Change Time	The time of the most recent state change for the session.
Application State	The state of applications in the session. Possible values: PreLogon, PreLaunched, Active, Desktop, Lingering, and NoApps.
Session Support	Whether the machine hosting the session supports multiple or single sessions.
Zone	Name of the zone where the machine hosting the session is located.
SmartAccess Filters	Smart Access tags for the session.
Start Time (UTC)	When the session was started.
State	The summary state of the machine. Possible values: Unregistered, Disconnected, or InUse.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description
Time in State (UTC)	How long the session has been in its current state.
Delivery Controller™	The DNS host name of the controller that the session's hosting machine is registered with.
User Display Name	The full name of the user.
Desktop Display Name	The published name of the machine originally used to launch the session. It's the name displayed on the Citrix Workspace app or StoreFront. For application sessions, it's the name of the first application launched into the session even if that application has since ended. The name keeps unchanged even if the resource is later renamed or removed.

Monitor MCS-provisioned machines in Search > Hardware view



May 13, 2026

This article guides you through how to view MCS-provisioned machines and their properties using the **Hardware view** within the **Search** node.

Learn about the hardware view

Hardware view within the **Search** node displays your MCS-provisioned machines and their critical properties, including machine security settings, network details, images, and machine profile details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Callout	Area	Description
A	Search bar	Provides a quick search and a filter-based search that allows you to define complex search criteria. For more information, see Search for machines. **Tip:** Use filters to quickly narrow down machines by specific properties. For example, combine **Pending Image Update = Yes** and **Identity Type = ActiveDirectory** to view all Active Directory machines that are pending image updates.
B	Switch to Default view	Switch from Hardware view to Default view.
C	Main view	Displays your MCS-provisioned machines and their critical properties. You can customize the view by selecting the **Column to display** icon. For more information about available columns, see Machine columns.
D	Details pane	Displays details information for the selected machine.
E	List-level actions	Displays actions that you can perform on the the entire displayed list: **Export** icon: Export the list of machines displayed in the main view to a CSV file. **Column to display** icon: Customize the main view for the list.

Reference: Machine columns

This table lists all columns in Hardware view and their descriptions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description
Name	The DNS host name of the machine.
Provisioning Scheme Name	The name of the provisioning scheme used to provision the machine.
CPU Cores	The number of CPU cores allocated to the machine.
Memory (MB)	The amount of memory (in MB) allocated to the machine.
Persistency	Indicates whether the machine's disk and data persist across restarts.
Identity Type	The identity type of the machine.
Pending Image Update	Indicates whether the VM image for the machine is outdated and due to be updated to a new image at the machine's next reboot.
Last Boot Time (UTC)	The date and time (in UTC) when the machine was last started.
Use WBC	Indicates whether the machine is configured with WBC (aka MCSIO).
WBC Disk Size (GB)	The MCSIO disk-cache size of the machine.
WBC Memory Size (MB)	The MCSIO memory-cache size of the machine.
Identity Provider	The identity provider of the machine.
Activation Type	Valid only for Windows VDAs. The Windows license activation type of the machine. Values include: Unsupported VDA, Key Management Service, Multiple Activation Key, and Not valid.

Manage security keys

May 15, 2026

> **Important:**
>
> - You must use this feature in combination with StoreFront™ 1912 LTSR CU2 or later.
> - The Secure XML feature is only supported on Citrix ADC and Citrix Gateway release 12.1 and later.

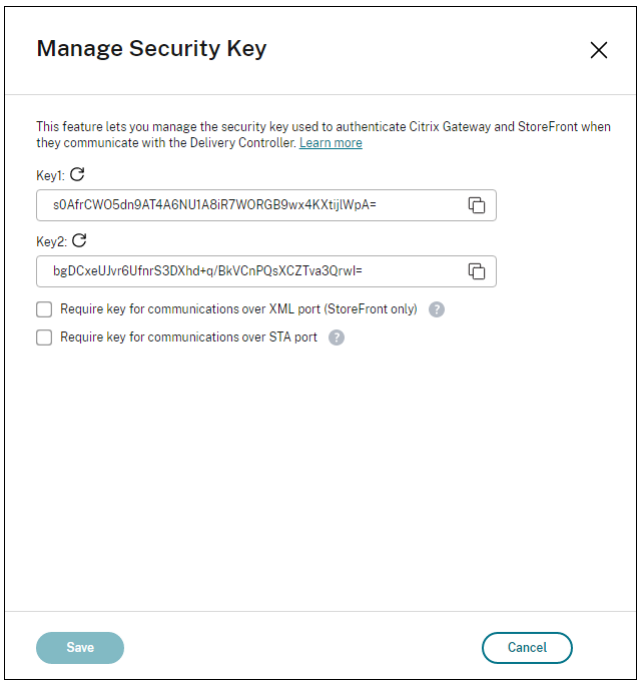
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

This feature lets you allow only approved StoreFront and Citrix Gateway machines to communicate with Delivery Controllers. After you enable this feature, any requests that do not contain the key are blocked. Use this feature to add an extra layer of security to protect against attacks originating from the internal network.

A general workflow to use this feature is as follows:

1. Enable Web Studio to show the feature settings.
2. Configure settings for your site.
3. Configure settings for StoreFront.
4. Configure settings for Citrix ADC.



Configure settings for the site

You can use Web Studio or PowerShell to configure security key settings for your site.

Use Web Studio

1. Sign in to Web Studio, select **Settings** in the left pane.
2. Locate the **Manage security key** tile and click **Edit**. The **Manage Security Key** page appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click the refresh icon to generate the keys.

   > **Important:**
   >
   > - There are two keys available for use. You can use the same key or different keys for communications over the XML and STA ports. We recommend that you use only one key at a time. The unused key is used only for key rotation.
   > - Do not click the refresh icon to update the key already in use. If you do, service interruption will occur.

4. Select where a key is required for communications:

   - **Require key for communications over XML port (StoreFront only)**. If selected, require a key to authenticate communications over the XML port. StoreFront communicates with Citrix Cloud over this port. For information about changing the XML port, see Knowledge Center article CTX127945.
   - **Require key for communications over STA port**. If selected, require a key to authenticate communications over the STA port. Citrix Gateway and StoreFront communicate with Citrix Cloud over this port. For information about changing the STA port, see Knowledge Center article CTX101988.

5. Click **Save** to apply your changes and close the window.

Use PowerShell

The following are PowerShell steps equivalent to Web Studio operations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Run the Citrix Virtual Apps and Desktops™ Remote PowerShell SDK.
2. In a command window, run the following command:
   - `Add-PSSnapIn Citrix*`
3. Run the following commands to generate a key and set up Key1:
   - `New-BrokerXmlServiceKey`
   - `Set-BrokerSite -XmlServiceKey1 <the key you generated>`
4. Run the following commands to generate a key and set up Key2:
   - `New-BrokerXmlServiceKey`
   - `Set-BrokerSite -XmlServiceKey2 <the key you generated>`
5. Run one or both of the following commands to enable the use of a key in authenticating communications:
   - To authenticate communications over the XML port:
     - `Set-BrokerSite -RequireXmlServiceKeyForNFuse $true`
   - To authenticate communications over the STA port:
     - `Set-BrokerSite -RequireXmlServiceKeyForSta $true`

See the PowerShell command help for guidance and syntax.

Configure settings for StoreFront

After completing the configuration for your site, you need to configure relevant settings for StoreFront by using PowerShell.

On the StoreFront server, run the following PowerShell commands:

To configure the key for communications over the XML port, use command [Set-STFStoreFarm	https://developer-docs.citrix.com/en-us/storefront-powershell-sdk/current-release/Set-STFStoreFarm.html]. For example

```
$store = Get-STFStoreService -VirtualPath [Path to store]
$farm = Get-STFStoreFarm -StoreService $store -FarmName [Resource feed
    name]
Set-STFStoreFarm -Farm $farm -XMLValidationEnabled $true -
    XMLValidationSecret [secret]
```

Enter the appropriate values for the following parameters:

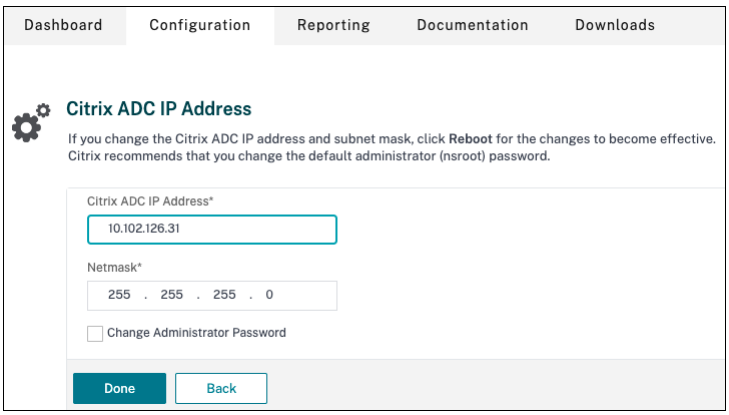
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Path to store
- Resource feed name
- secret

To configure the key for communications over the STA port, use the New-STFSecureTicketAuthority and Set-STFRoamingGateway commands. For example:

```
$gateway = Get-STFRoamingGateway -Name [Gateway name]
$sta1 = New-STFSecureTicketAuthority -StaUrl [STA1 URL] -
    StaValidationEnabled $true -StaValidationSecret [secret]
$sta2 = New-STFSecureTicketAuthority -StaUrl [STA2 URL] -
    StaValidationEnabled $true -StaValidationSecret [secret]
Set-STFRoamingGateway -Gateway $gateway -SecureTicketAuthorityObjs
    $sta1,$sta2
```

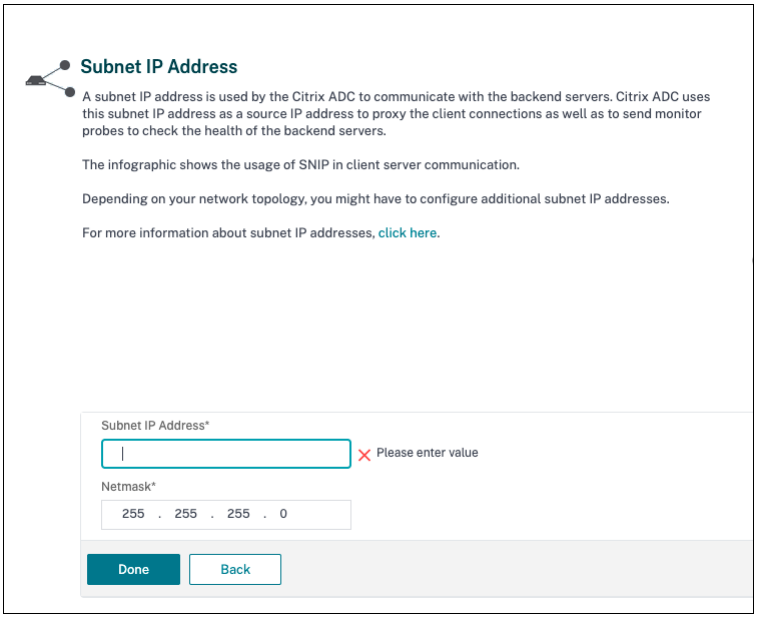
Enter the appropriate values for the following parameters:



- Gateway name
- STA URL
- Secret

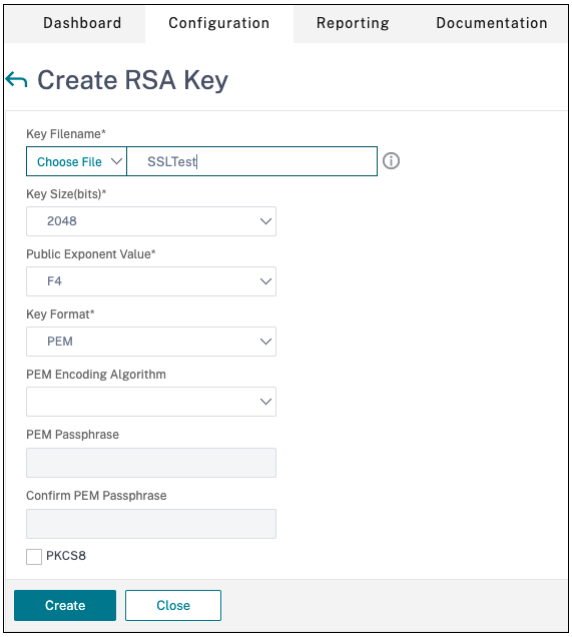
See the PowerShell command help for guidance and syntax.

Configure settings for Citrix ADC



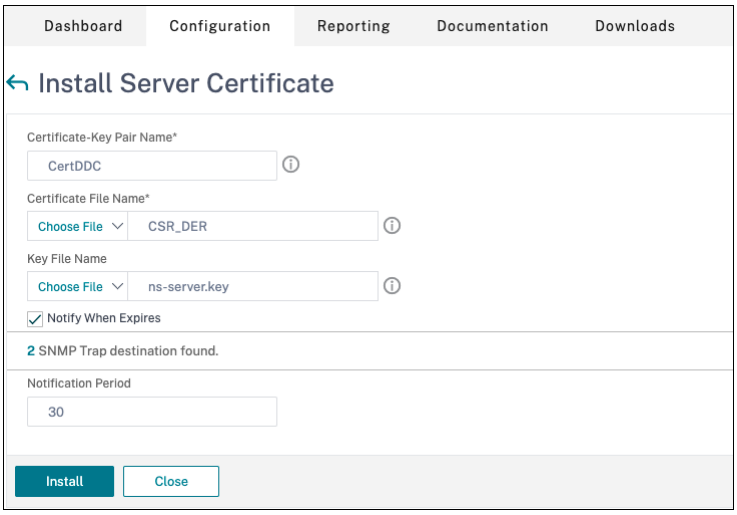
> **Note:**
>
> Configuring this feature for Citrix ADC is not required unless you use Citrix ADC as your gateway. If you use Citrix ADC, follow these steps:

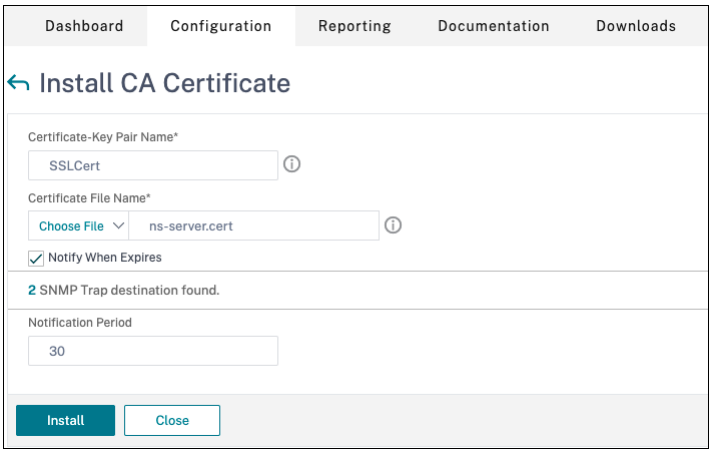
1. Ensure that the following prerequisite configuration is already in place:
    - The following Citrix ADC related IP addresses are configured.
        - Citrix ADC Management IP (NSIP) address for accessing the Citrix ADC console. For details, see Configuring the NSIP address.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

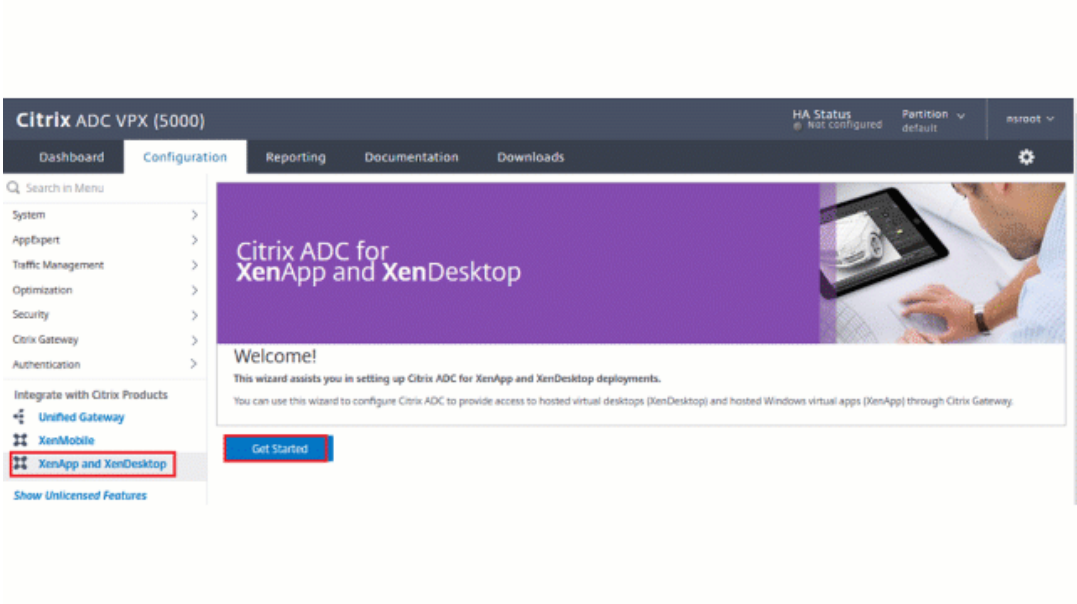
- Subnet IP (SNIP) address for enabling communication between the Citrix ADC appliance and the back-end servers. For details, see Configuring Subnet IP Addresses.
- Citrix Gateway virtual IP address and load balancer virtual IP address to log in to the ADC appliance for session launch. For details, see Create a virtual server.



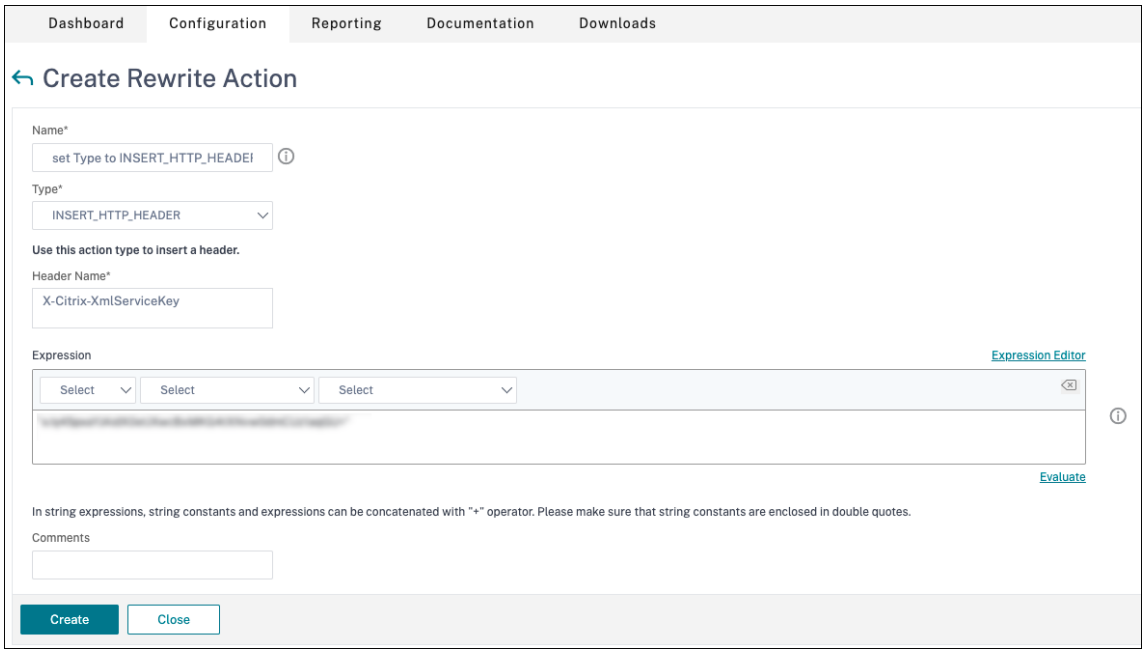


- The required modes and features in the Citrix ADC appliance are enabled.
  - To enable the modes, in the Citrix ADC GUI go to **System > Settings > Configure Mode**.
  - To enable the features, in the Citrix ADC GUI go to **System > Settings > Configure Basic Features**.
- Certificates related configurations are complete.
  - The Certificate Signing Request (CSR) is created. For details, see Create a certificate.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- The server and CA certificates and root certificates are installed. For details, see Install, link, and updates.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A Citrix Gateway has been created for Citrix Virtual Desktops. Test the connectivity by clicking the **Test STA Connectivity** button to confirm that the virtual servers are online. For details, see Setting up Citrix ADC for Citrix Virtual Apps and Desktops.

2. Add a rewrite action. For details, see Configuring a Rewrite Action.

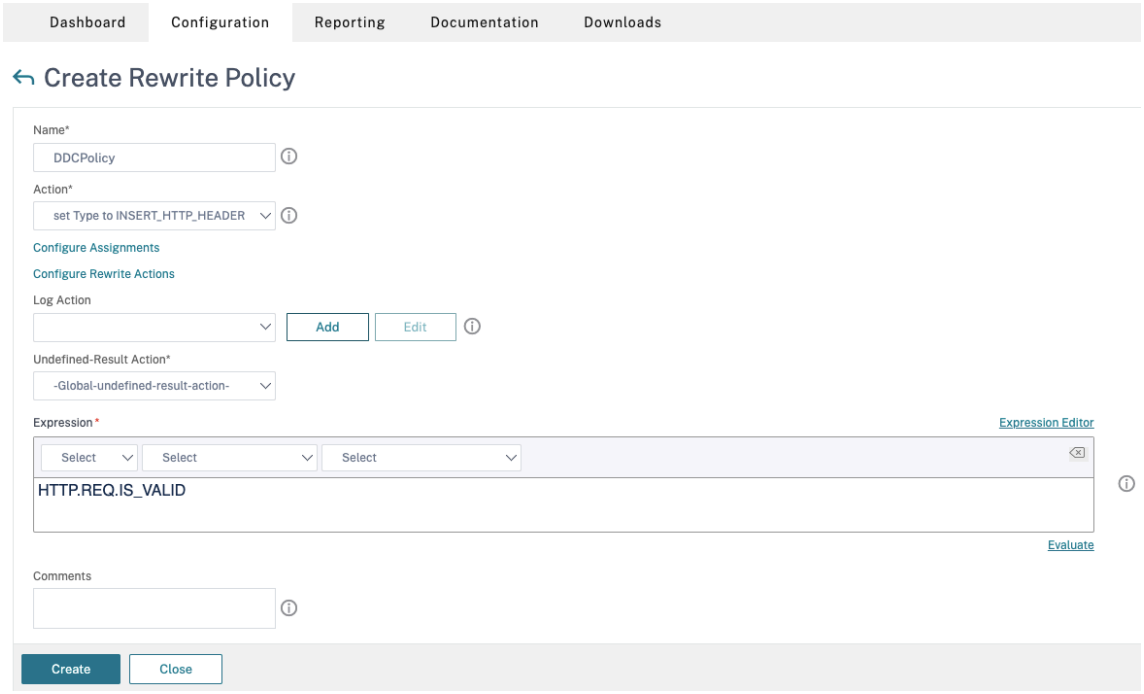
   a) Go to **AppExpert > Rewrite > Actions**.
   b) Click **Add** to add a new rewrite action. You can name the action as "set Type to INSERT_HTTP_HEADER".

   a) In **Type**, select **INSERT_HTTP_HEADER**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) In **Header Name**, enter X-Citrix-XmlServiceKey.

c) In **Expression**, add <XmlServiceKey1 value> with the quotes. You can copy the XmlServiceKey1 value from your Desktop Delivery Controller™ configuration.



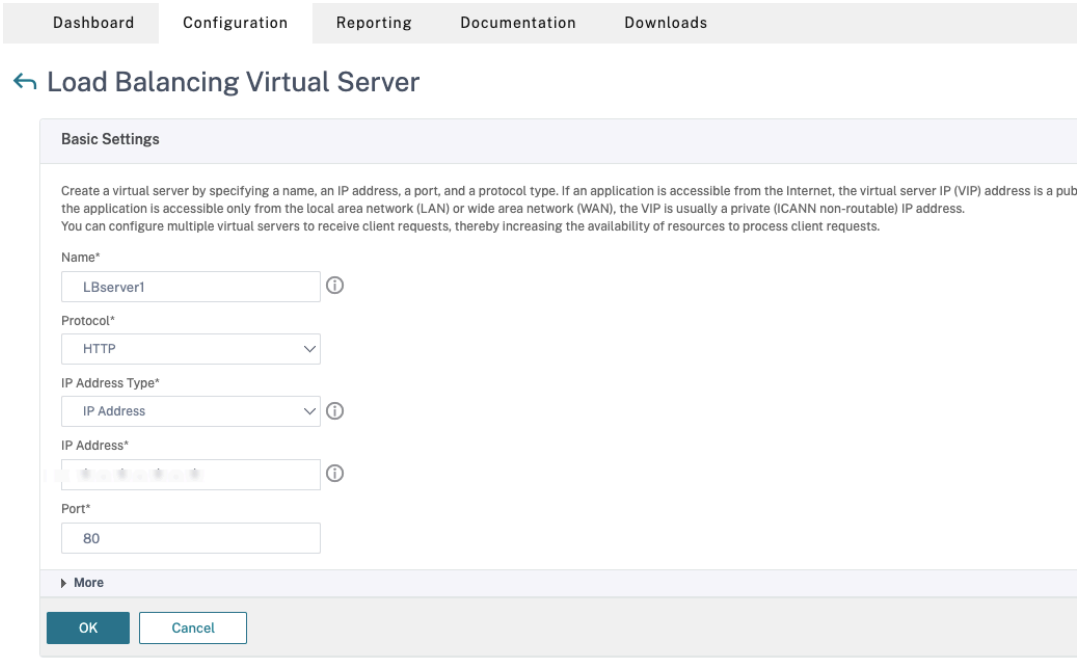
3. Add a rewrite policy. For details, see Configuring a Rewrite Policy.

a) Go to **AppExpert > Rewrite > Policies**.

b) Click **Add** to add a new policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) In **Action**, select the action created in the earlier step.
b) In **Expression**, add HTTP.REQ.IS_VALID.
c) Click **OK**.

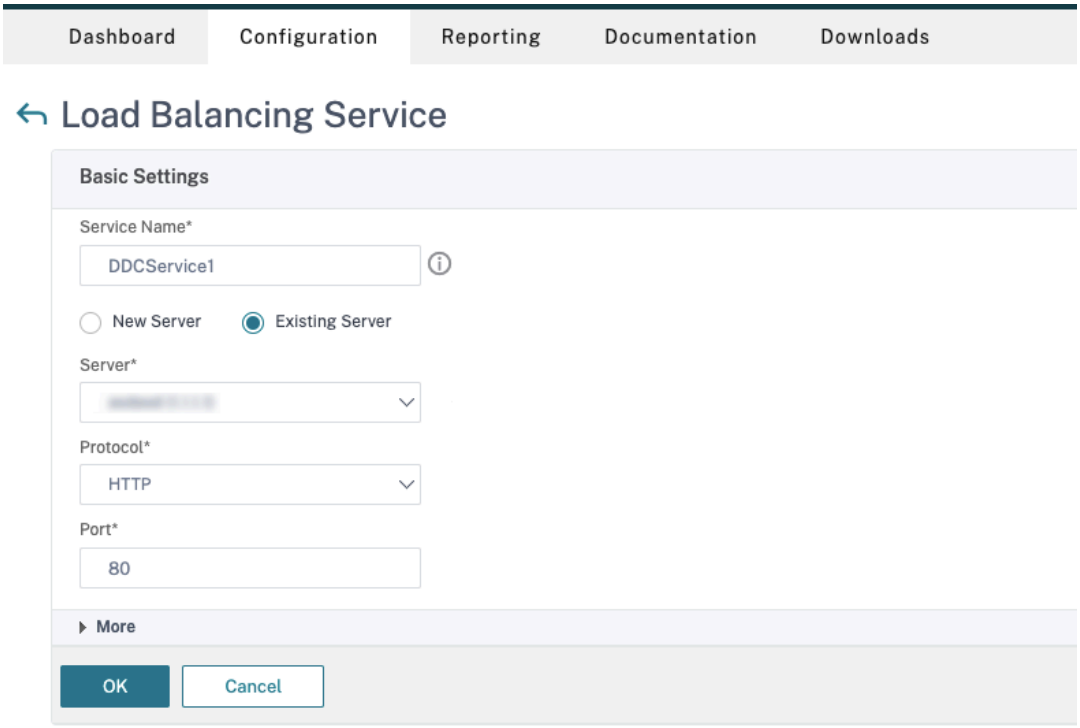


4. Set up load balancing. You must configure one load balancing virtual server per STA server. If not the sessions fail to launch.

   For details, see Set up basic load balancing.

   a) Create a load balancing virtual server.

      - Go to **Traffic Management > Load Balancing > Servers**.
      - In **Virtual Servers** page, click **Add**.

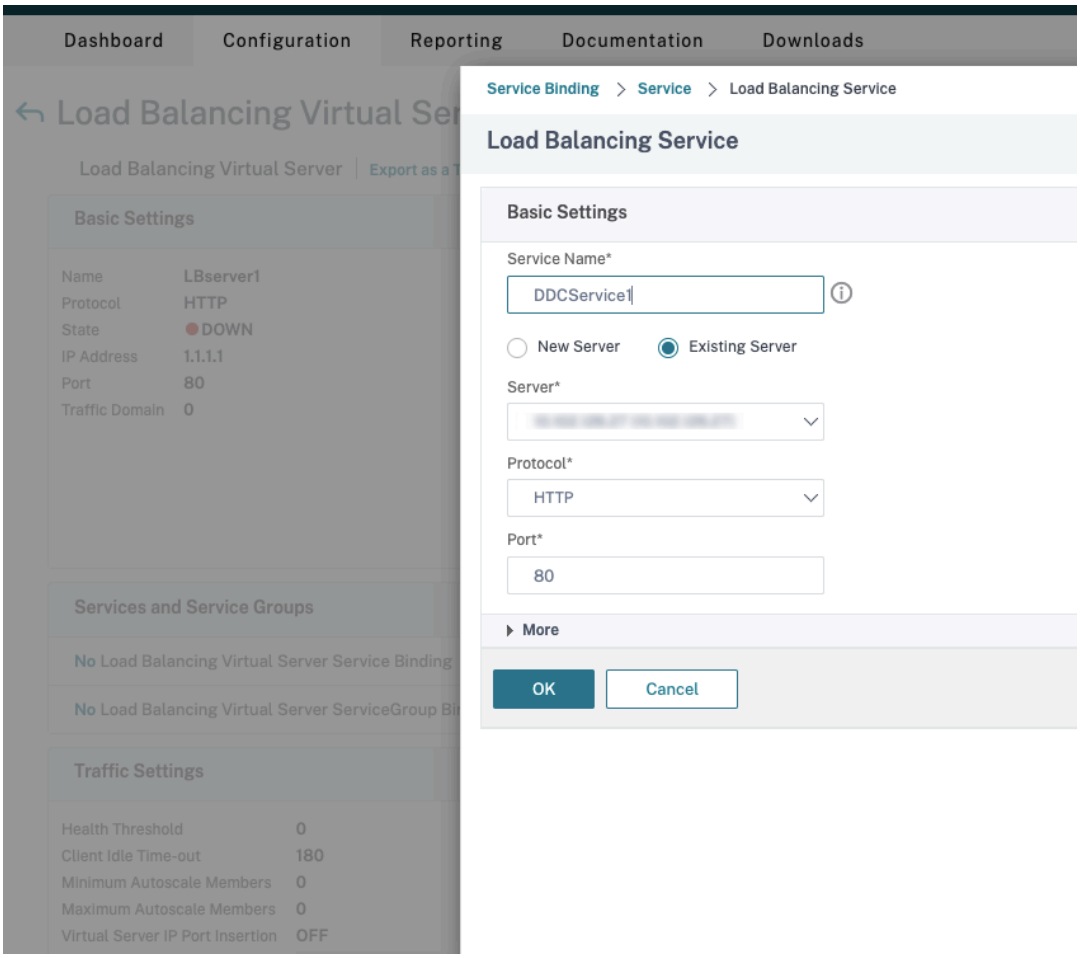


© 1997–2026 Citrix Systems, Inc. All rights reserved.

- In **Protocol**, select **HTTP**.
- Add the load balancing virtual IP address and in **Port** select **80**.
- Click **OK**.

b) Create a load balancing service.

- Go to **Traffic Management > Load Balancing > Services**.

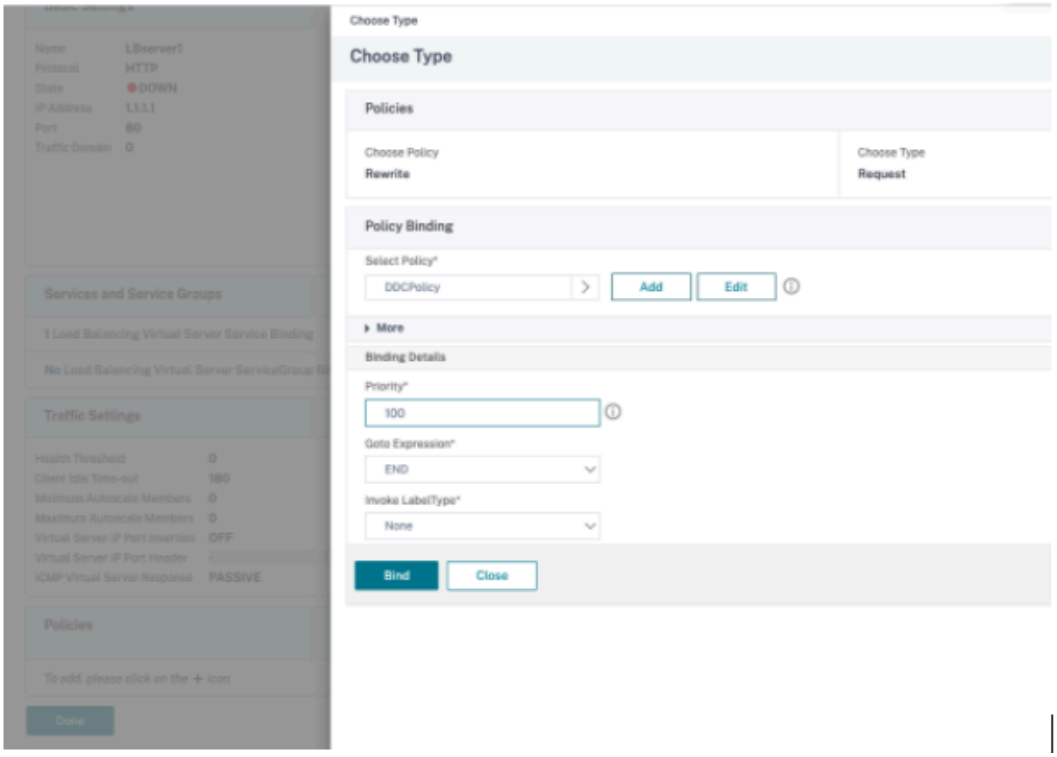


© 1997–2026 Citrix Systems, Inc. All rights reserved.

- In **Existing Server**, select the virtual server created in the previous step.
- In **Protocol**, select **HTTP** and in **Port** select **80**.
- Click **OK,** and then click **Done**.

c) Bind the service to the virtual server.

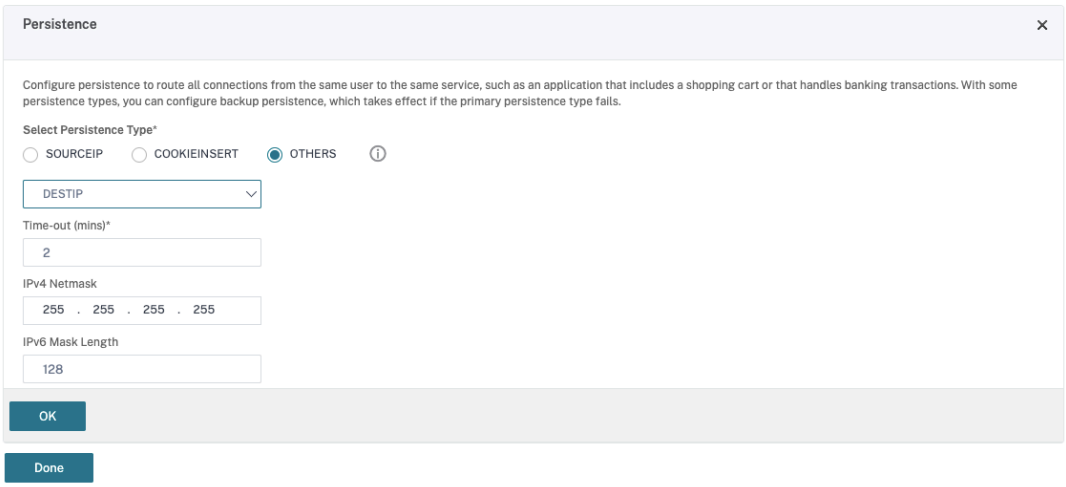
- Select the virtual server created earlier and click **Edit**.
- In **Services and Service Groups**, click **No Load Balancing Virtual Server Service Binding**.



- In **Service Binding**, select the service created earlier.
- Click **Bind**.

d) Bind the rewrite policy created earlier to the virtual server.

- Select the virtual server created earlier and click **Edit**.
- In **Advanced Settings**, click **Policies,** and then in **Policies** section click **+**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- In **Choose Policy**, select **Rewrite** and in **Choose Type**, select **Request**.
- Click **Continue**.
- In **Select Policy**, select the rewrite policy created earlier.
- Click **Bind**.
- Click **Done**.

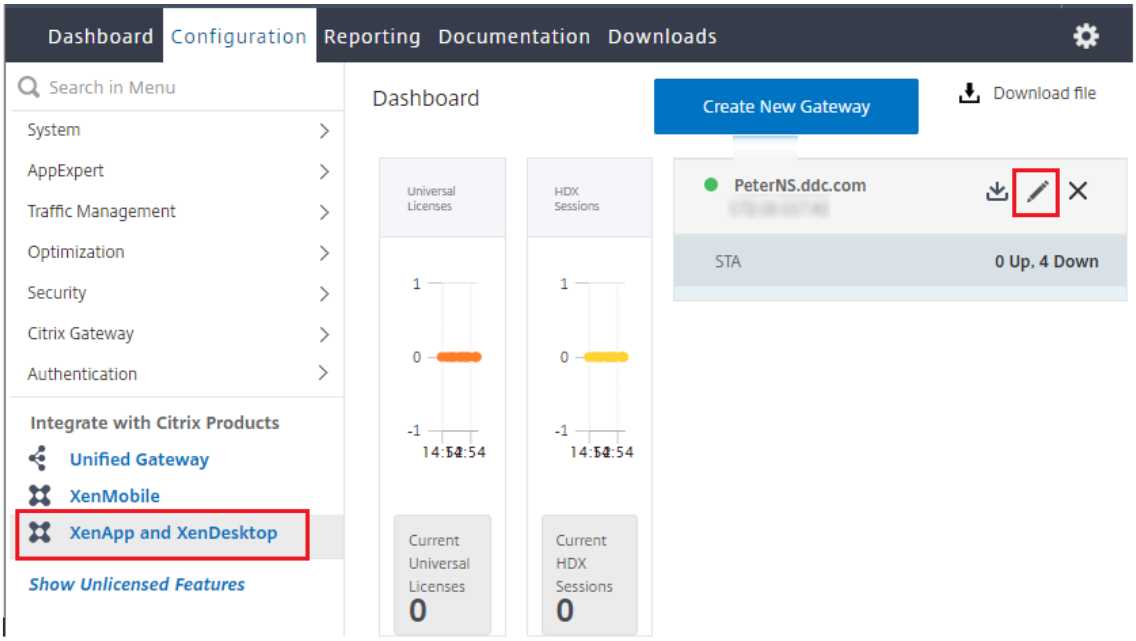
e) Set up persistence for the virtual server, if necessary.

- Select the virtual server created earlier and click **Edit**.
- In **Advanced Settings**, click **Persistence**.

- Select persistence type as **Others**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

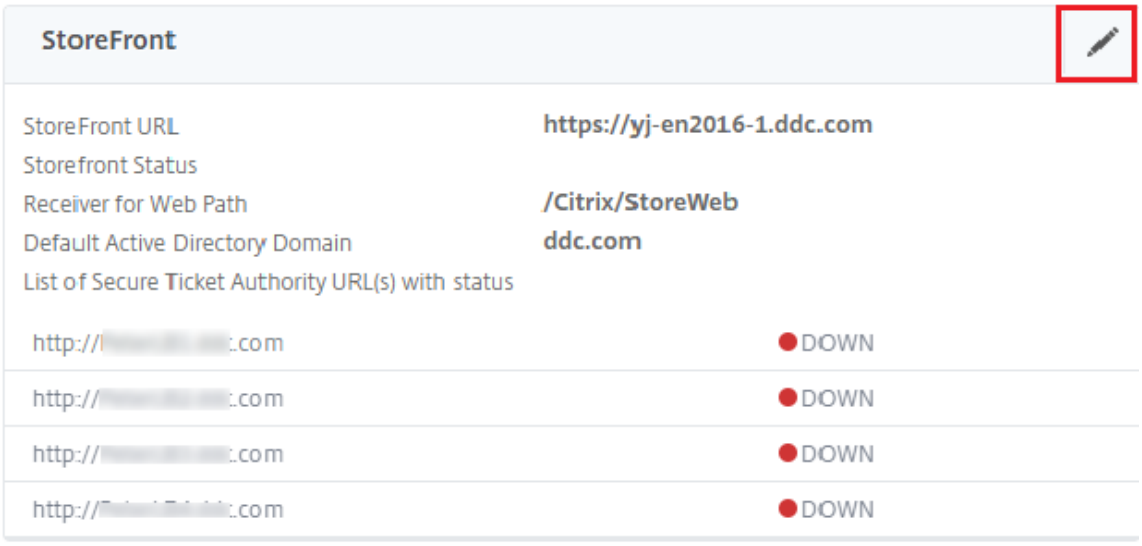
- Select **DESTIP** to create persistence sessions based on the IP address of the service selected by the virtual server (the destination IP address)
- In **IPv4 Netmask**, add network mask same as that of the DDC.
- Click **OK**.



f) Repeat these steps for the other virtual server as well.

Configuration changes if the Citrix ADC appliance is already configured with Citrix Virtual Desktops™

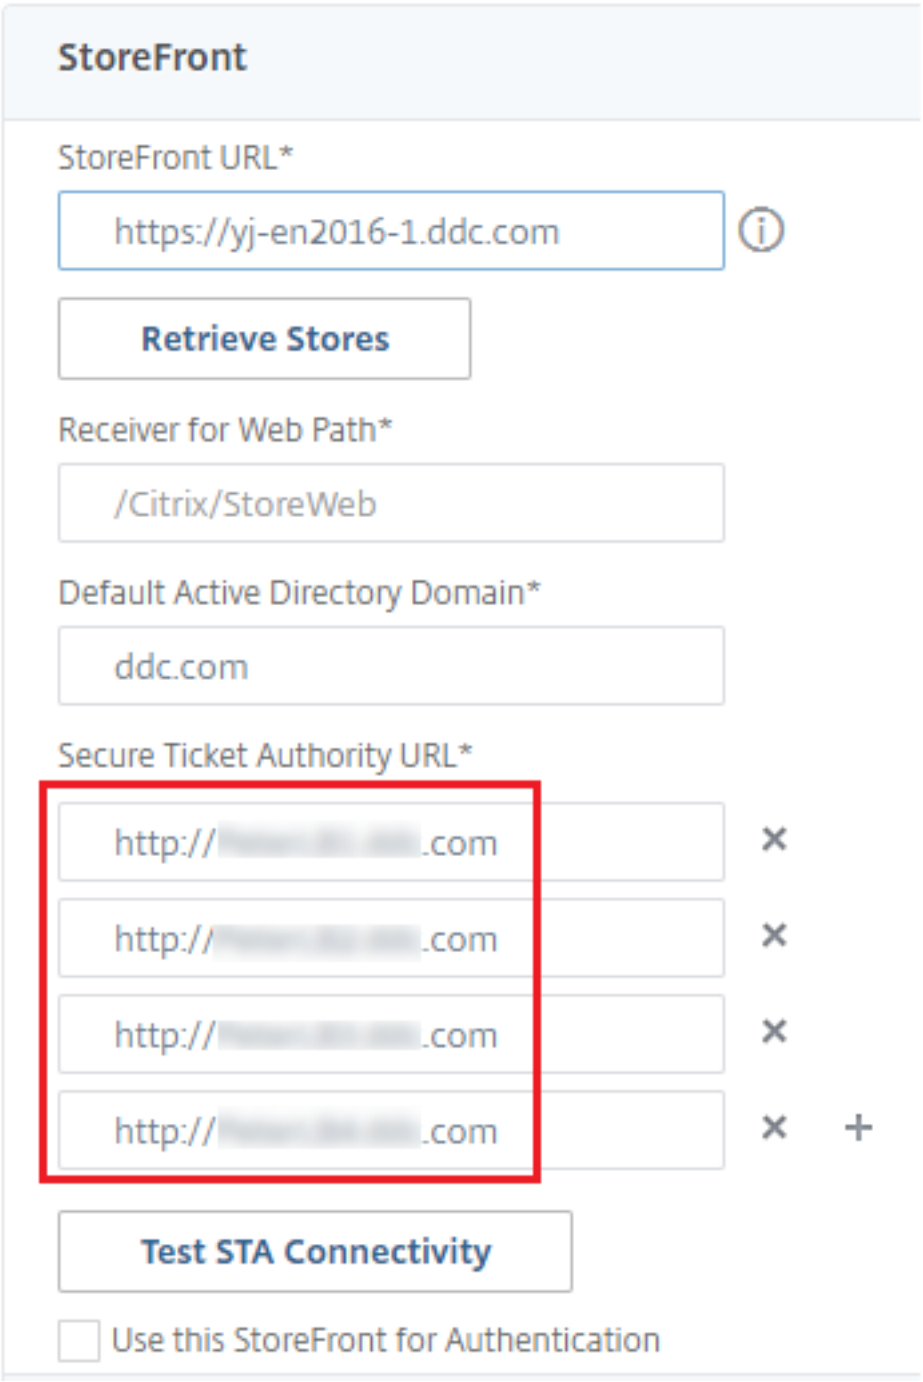
If you have already configured the Citrix ADC appliance with Citrix Virtual Desktops, then to use the Secure XML feature, you must make the following configuration changes.



- Before the session launch, change the **Security Ticket Authority URL** of the gateway to use the FQDNs of the load balancing virtual servers.
- Ensure that the `TrustRequestsSentToTheXmlServicePort` parameter is set to False. By default, `TrustRequestsSentToTheXmlServicePort` parameter is set to False. However, if the customer has already configured the Citrix ADC for Citrix Virtual Desktops, then the `TrustRequestsSentToTheXmlServicePort` is set to True.

1. In the Citrix ADC GUI, go to **Configuration > Integrate with Citrix Products** and click **XenApp and XenDesktop®**.
2. Select the gateway instance and click the edit icon.

3. In the StoreFront pane, click the edit icon.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Add the **Secure Ticket Authority URL**.

   - If the Secure XML feature is enabled, then the STA URL must be the URL of the load balancing service.
   - If the Secure XML feature is disabled, then the STA URL must be the URL of STA (DDC's address) and the `TrustRequestsSentToTheXmlServicePort` parameter on the DDC must be set to True.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session resilience settings

May 13, 2026

Maintaining session activity is critical to providing the best user experience. Losing connectivity due

© 1997–2026 Citrix Systems, Inc. All rights reserved.

to unreliable networks, highly variable network latency, and range limitations of wireless devices can lead to user frustration. Moving quickly between devices and accessing the same applications at each logon is a priority for many mobile workers such as healthcare workers.

The features described in this article optimize the reliability of sessions, reduce inconvenience, downtime, and loss of productivity; using these features, mobile users can roam quickly and easily between devices.

Session reliability

Session Reliability keeps sessions active and on the user's screen when network connectivity is interrupted. Users continue to see the application they are using until network connectivity resumes.

This feature is especially useful for mobile users with wireless connections. For example, a user with a wireless connection enters a railroad tunnel and momentarily loses connectivity. Ordinarily, the session is disconnected and disappears from the user's screen, and the user has to reconnect to the disconnected session. With Session Reliability, the session remains active on the machine. To indicate lost connectivity, the user's display freezes and the cursor changes to a spinning hourglass until connectivity resumes on the other side of the tunnel. The user continues to access the display during the interruption and can resume interacting with the application when the network connection is restored. Session Reliability reconnects users without reauthentication prompts.

Citrix Workspace™ app users cannot override the Controller setting.

You can use Session Reliability with Transport Layer Security (TLS). TLS encrypts only the data sent between the user device and Citrix Gateway.

Enable and configure Session Reliability with the following policy settings:

- The Session reliability connections policy setting allows or prevents session reliability.
- The Session reliability timeout policy setting has a default of 180 seconds, or three minutes. Although you can extend the amount of time session reliability keeps a session open, this feature is designed for user convenience. Therefore, it does not prompt the user for reauthentication. As you extend the amount of time a session is kept open, the chances increase that a user might get distracted and walk away from the user device. Those actions can potentially leave the session accessible to unauthorized users.
- Incoming session reliability connections use port 2598, unless you change the port number in the Session reliability port number policy setting.
- To prevent users from reconnecting to interrupted sessions without having to reauthenticate, use the Auto Client Reconnect feature. You can configure the Auto Client Reconnect authentication policy setting to prompt users to reauthenticate when reconnecting to interrupted sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you use both Session Reliability and Auto Client Reconnect, the two features work in sequence. Session Reliability closes, or disconnects, the user session after the amount of time you specify in the Session reliability timeout policy setting. After that, the Auto Client Reconnect policy settings take effect, attempting to reconnect the user to the disconnected session.

Auto Client Reconnect

With the Auto Client Reconnect feature, Citrix Workspace app can detect unintended disconnections of ICA® sessions and reconnect users to the affected sessions automatically. When this feature is enabled on the server, users do not have to reconnect manually to continue working.

For application sessions, Citrix Workspace app attempts to reconnect to the session until there is a successful reconnection or the user cancels the reconnection attempts.

For desktop sessions, Citrix Workspace app attempts to reconnect to the session for a specified period, unless there is a successful reconnection or the user cancels the reconnection attempts. By default, this period is five minutes. To change this period, edit the following registry setting on the user device (where `seconds` is the number of seconds after which no more attempts are made to reconnect the session).

```
HKLM\Software\Citrix\ICA Client\TransportReconnectRetryMaxTimeSeconds
; DWORD;<seconds>
```

Enable and configure Auto Client Reconnect with the following policy settings:

- **Auto Client Reconnect:** Enables or disables automatic reconnection by Citrix Workspace app after a connection has been interrupted.
- **Auto Client Reconnect authentication:** Enables or disables the requirement for user authentication after automatic reconnection.
- **Auto Client Reconnect logging:** Enables or disables logging of reconnection events in the event log. Logging is disabled by default. When enabled, the server's system log captures information about successful and failed automatic reconnection events. Each server stores information about reconnection events in its own system log. The site does not provide a combined log of reconnection events for all servers.

> **Note:**
>
> Auto Client Reconnect without reauthentication is supported only for password authentication. If you use Federated Authentication Service or smart card authentication, Auto Client Reconnect without reauthentication is not supported. In such cases, users are redirected to the login screen.

Auto Client Reconnect incorporates an authentication mechanism based on encrypted user credentials. When a user initially logs on, the server encrypts and stores the user credentials in memory. The

© 1997–2026 Citrix Systems, Inc. All rights reserved.

server also creates and sends a cookie containing the encryption key to Citrix Workspace app. Citrix Workspace app submits the key to the server for reconnection. The server decrypts the credentials and submits them to Windows logon for authentication. When cookies expire, users must reauthenticate to reconnect to sessions.

Cookies are not used if you enable the Auto Client Reconnect authentication setting. Instead, users are presented with a dialog box to users requesting credentials when Citrix Workspace app attempts to reconnect automatically.

For maximum protection of user credentials and sessions, use encryption for all communication between clients and the site.

Disable Auto Client Reconnect on Citrix Workspace app for Windows by using the icaclient.adm file. For more information, see the documentation for your Citrix Workspace app for Windows version.

Settings for connections also affect Auto Client Reconnect:

- By default, Auto Client Reconnect is enabled through policy settings at the site level, as described earlier. User reauthentication is not required. However, if a server's ICA TCP connection is configured to reset sessions with a broken communication link, automatic reconnection does not occur. Auto Client Reconnect works only if the server disconnects sessions when there is a broken or timed out connection. In this context, the ICA TCP connection refers to a server's virtual port (rather than an actual network connection) that is used for sessions on TCP/IP networks.
- By default, the ICA TCP connection on a server is set to disconnect sessions with broken or timed out connections. Disconnected sessions remain intact in system memory and are available for reconnection by Citrix Workspace app.
- The connection can be configured to reset or log off sessions with broken or timed-out connections. When a session is reset, attempting to reconnect initiates a new session. Rather than restoring a user to the same place in the application in use, the application is restarted.
- If the server is configured to reset sessions, Auto Client Reconnect creates a new session. This process requires users to enter their credentials to log on to the server.
- Automatic reconnection can fail if Citrix Workspace app or the plug-in submits incorrect authentication information, which might occur during an attack or the server determines that too much time has elapsed since it detected the broken connection.

ICA Keep-Alive

Enabling the ICA Keep-Alive feature prevents broken connections from being disconnected. When enabled, if the server detects no activity, this feature prevents Remote Desktop Services from disconnecting that session. Examples of no activity include no clock change, no mouse movement, no screen updates. The server sends keep-alive packets every few seconds to detect if the session is active. If the session is no longer active, the server marks the session as disconnected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> ICA Keep-Alive works only if you are not using Session Reliability. Session Reliability has its own mechanisms to prevent broken connections from being disconnected. Configure ICA Keep-Alive only for connections that do not use Session Reliability.

ICA Keep-Alive settings override keep-alive settings that are configured in Windows Group Policy.

Enable and configure ICA Keep-Alive with the following policy settings:

- **ICA keep alive timeout:** Specifies the interval (1-3600 seconds) used to send ICA keep-alive messages. Do not configure this option if you want your network monitoring software to close inactive connections in environments where broken connections are so infrequent that allowing users to reconnect to sessions is not a concern.

  The default interval is 60 seconds: ICA Keep-Alive packets are sent to user devices every 60 seconds. If a user device does not respond in 60 seconds, the status of the ICA sessions changes to disconnected.
- **ICA keep alives:** Sends or prevents sending ICA keep-alive messages.

Workspace control

Workspace control lets desktops and applications follow a user from one device to another. This ability to roam enables a user to access all desktops or open applications from anywhere simply by logging on, without having to restart the desktops or applications on each device. For example, workspace control can assist healthcare workers in a hospital who need to move quickly among different workstations and access the same set of applications each time they log on. If you configure workspace control options to allow it, these workers can disconnect from multiple applications at one client device and then reconnect to open the same applications at a different client device.

Workspace control affects the following activities:

- **Logging on:** By default, workspace control enables users to reconnect automatically to all running desktops and applications when logging on, bypassing the need to reopen them manually. Through workspace control, users can open disconnected desktops or applications, plus any that are active on another client device. Disconnecting from a desktop or application leaves it running on the server. If you have roaming users who must keep some desktops or applications running on one client device while they reconnect to a subset of their desktops or applications on another client device, you can configure the logon reconnection behavior to open only the desktops or applications that the user disconnected from previously.
- **Reconnecting:** After logging on to the server, users can reconnect to all of their desktops or applications at any time by clicking Reconnect. By default, Reconnect opens desktops or applications that are disconnected, plus any that are currently running on another client device.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can configure Reconnect to open only those desktops or applications that the user disconnected from previously.

- **Logging off:** For users opening desktops or applications through StoreFront™, you can configure the **Log Off** command to log the user off from StoreFront and all active sessions, or from StoreFront only.
- **Disconnecting:** Users can disconnect from all running desktops and applications at once, without needing to disconnect from each individually.

Workspace control is available only for Citrix Workspace app users who access desktops and applications through a Citrix StoreFront connection. By default, workspace control is disabled for virtual desktop sessions, but is enabled for hosted applications. Session sharing does not occur by default between published desktops and any published applications running inside those desktops.

User policies, client drive mappings, and printer configurations change appropriately when a user moves to a new client device. Policies and mappings are applied according to the client device where the user is logged on to the session. For example, a healthcare worker logs off from a device in the emergency room and then logs on to a workstation in the x-ray laboratory. The policies, printer mappings, and client drive mappings appropriate for the session in the x-ray laboratory go into effect at the session startup.

You can customize which printers appear to users when they change locations. You can also control whether users can print to local printers, how much bandwidth is consumed when users connect remotely, and other aspects of their printing experiences.

For information about enabling and configuring workspace control for users, see the StoreFront documentation.

Session roaming

> **Note:**
>
> The following information guides you to configure session roaming using PowerShell. You can use Web Studio instead. For more information, see Manage delivery groups.

By default, sessions roam between client devices with the user. When the user launches a session and then moves to another device, the same session is used and applications are available on both devices. The applications follow, regardless of the device or whether current sessions exist. Often, printers and other resources assigned to the application also follow.

While this default behavior offers many advantages, it might not be ideal in all cases. You can prevent session roaming using the PowerShell SDK.

Example 1: A medical professional is using two devices, completing an insurance form on a desktop PC, and looking at patient information on a tablet.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If session roaming is enabled, both applications appear on both devices (an application launched on one device is visible on all devices in use). This might not meet security requirements.
- If session roaming is disabled, the patient record does not appear on the desktop PC, and the insurance form does not appear on the tablet.

Example 2: A production manager launches an application on the PC in his office. The device name and location determine which printers and other resources are available for that session. Later in the day, he goes to an office in the next building for a meeting that will require use of a printer.

- When session roaming is enabled, the production manager would probably be unable to access the printers near the meeting room, because the applications he launched earlier in his office resulted in the assignment of printers and other resources near that location.
- When session roaming is disabled, when he logs on to a different machine (using the same credentials), a new session is started, and nearby printers and resources will be available.

Configure session roaming

To configure session roaming, use the following entitlement policy rule cmdlets with the "SessionReconnection"property. Optionally, you can also specify the "LeasingBehavior"property.

For desktop sessions:

```
Set-BrokerEntitlementPolicyRule <Delivery-Group-name> -SessionReconnection
 <value> -LeasingBehavior Allowed|Disallowed
```

For application sessions:

```
Set-BrokerAppEntitlementPolicyRule <Delivery-Group-name> -SessionReconnection
 <value> -LeasingBehavior Allowed|Disallowed
```

Where `value` can be one of the following:

- **Always:** Sessions always roam, regardless of the client device and whether the session is connected or disconnected. This is the default value.
- **DisconnectedOnly:** Reconnect only to sessions that are already disconnected; otherwise, launch a new session. (Sessions can roam between client devices by first disconnecting them, or using Workspace Control to explicitly roam them.) An active connected session from another client device is never used. Instead, a new session is launched.
- **SameEndpointOnly:** A user gets a unique session for each client device they use. This completely disables roaming. Users can reconnect only to the same device that was previously used in the session.

The "LeasingBehavior"property is described below.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Effects from other setting:

Disabling session roaming is affected by the application limit **Allow only one instance of the application per user** in the application's properties in the delivery group.

- If you disable session roaming, then disable the "Allow only one instance …"application limit.
- If you enable the "Allow only one instance …"application limit, do not configure either of the two values that allow new sessions on new devices.

Logon interval

If a virtual machine containing a desktop VDA closes before the logon process completes, you can allocate more time to the process. The default for 7.6 and later versions is 180 seconds (the default for 7.0-7.5 is 90 seconds).

On the machine (or the master image used in a machine catalog), set the following registry key:

Key:`HKLM\SOFTWARE\Citrix\PortICA`

- Value: `AutoLogonTimeout`
- Type: `DWORD`
- Specify a decimal time in seconds, in the range 0-3600.

If you change a master image, update the catalog.

This setting applies only to VMs with desktop VDAs. Microsoft controls the logon timeout on machines with server VDAs.

Settings

June 4, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Use Web Studio to manage authentication, domain settings, personal preferences, and other site-level configurations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage authentication

By default, users log on to Web Studio using their domain username and password. You can also choose a different authentication method for users, such as the smart card authenticaiton or integrated Windows authentication.

Manage using Studio

To choose an authentication method for users, follow these steps:

1. Sign in to Web Studio and select **Settings** in the left pane.
2. Locate the **Authentication** tile and click **Edit** to select an option:
   - **Domain credentials**
   - **Domain credentials or integrated Windows authentication**

     With integrated Windows authentication enabled, users can access Web Studio using their Windows credentials (Kerberos/NTLM) or a client certificate.

     When the Web Studio and the Delivery Controller™ are installed on different machines, for integrated Windows authentication to work, enable Allow cross-origin access and add the URL of the Web Studio server to the allow list.

     > **Important**
     >
     > Integrated Windows authentication does not work when Web Studio is configured as a proxy for Delivery Controllers.

   - **Smart card authentication**
   - **Domain credentials or smart card authentication**

     Enable smart card authentication requires additional configuration. For more information, see Set up smart card authentication for Web Studio.

Manage using the PowerShell script

The authentication method is configured in the Delivery Controller database. You can use the following PowerShell script to set the authentication method:

1. Get the current site ID by running the following command on the Delivery Controller:

   ```
   Get-ConfigSite | Select SiteGuid
   ```

2. Set the authentication method by running the following script:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
# Generate a new bearer token
$bearerData = New-TrustBearerToken
# Define the Delivery Controller DNS name and Site ID
$ddc = "ddc.dc.com" # replace this with the Delivery Controller's
    DNS name
$siteid = "c68a8f89-42af-4bea-a6e9-c8c936353f49" # replace this
    with the site ID you get from step #1
# Define the URL and headers
$url = "https://$ddc/citrix/orchestration/api/CitrixOnPremises/
    Sites/$siteid/Settings"
$headers = @{

"Content-Type" = "application/json"
"Authorization" = "Bearer $($bearerData.Token)"
 }

# Define the JSON body
$body = @{

SupportedAuthenticators = "BasicAndSmartCard" # replace this with
    a required authentication method: "Basic" for "Domain
    credentials"; "BasicAndIntegratedWindowsAuthentication" for "
    Domain credentials or integrated Windows authentication"; "
    BasicAndSmartCard" for "Domain credentials or smart card
    authentication"; "SmartCard" for "Smart card authentication"
 }
  | ConvertTo-Json -Depth 10
# Send the PATCH request
Invoke-RestMethod -Uri $url -Method Patch -Headers $headers -Body
    $body
```

Configure the browsers for Integrated Windows authentication

If you enable *Integrated Windows authentication* using **Domain credentials or Integrated Windows authentication**, the next time your users sign in, they are automatically signed in. As a user, if you are unable to sign in automatically, follow these steps to configure your web browser to allow integrated Windows authentication.

For Google Chrome:

1. From the Control Panel, select **Internet Options**.
2. Select the **Advanced** tab.
3. Select **Enable Integrated Windows Authentication**.
4. Select the **Security** tab.
5. Select **Local Intranet > Sites > Advanced**.
6. In the **Add this website to the zone** box:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the Web Studio and the Delivery Controller reside on the same server, type the URL of the host running the Web Studio.
- If not, type a wildcard domain. Example: if the Delivery Controller is at `ddc.domain.com`, type `*.domain.com`.

7. Click **Add > Close**

For Mozilla Firefox:

1. From the browser, type `about:config` in the URL box.
2. In the **Search** box, type `network negotiate`.
3. Right-click **network.negotiate-auth.trusted-uris** and select **Modify**.
4. In the **Enter string value** box:

   - If the Web Studio and the Delivery Controller reside on the same server, add a comma-separated list of URLs and/or aliases referencing the name of the server hosting the Web Studio.
   - If not, add the URLs this way. Example: if the Delivery Controller is at `ddc.domain.com`, type `*.domain.com`.

After you configure your browser, you can click **Windows integrated sign-in** on the sign-in page to try again.

When the Web Studio and the Delivery Controller are installed on different machines, for integrated Windows authentication to work, you need to enable **Allow cross-origin access**.

Follow these steps to enable **Allow cross-origin access**:

1. Select the **Allow cross-origin access** checkbox.
2. Add the URL of the Web Studio server to the allow list.
3. In the **Enter URL** field, enter the URL. Click **Add** to add more if necessary.

   > **Note**
   >
   > - The URL must follow the correct format:`<scheme>://<hostname>`. Make sure that it does not include any paths or trailing slashes.
   > - IP addresses and FQDNS are supported. When adding a URL, ensure that it corresponds to how you access the Web Studio. For example, if accessing the Web Studio using an IP address, add the IP address-based URL to the list.
   > - If you use a non-default port, be sure to include the port number.

4. Click **Add** to add more if necessary.
5. After you have finished, click **Done** to save and exit.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set a default domain name for the Studio login page

To auto-populate the **Domain** field on the Studio login page with a domain name, follow these steps:

1. Sign in to Web Studio and select **Settings** in the left pane.
2. On the **Configure domain name** tile, type a domain name as needed.
3. Click **Apply**.

   When an administrator accesses the Studio login page, the *Domain* field is automatically populated with the domain name you set.

Configure the domain exclusion list

Improve domain lookup performance by adding unreachable or unnecessary domains to a domain exclusion list in **Settings > Site settings**. Web Studio automatically skips excluded domains across all domain and OU lookups, making domain lookups more responsive.

To speed up domain queries, add unreachable or unneeded domains to an exclusion list. Web Studio then skips those domains automatically across all domain and OU lookups.

To add domains to the exclusion list, follow these steps:

1. Sign in to Web Studio and select **Settings** in the left pane.
2. Under **Site settings**, locate **Add domains to exclusion list**.
3. Turn on **Enable domain exclusions**.
4. Select **Add domain**, enter a domain name in the **Domain name** field, and select **Confirm**. Repeat for each domain you want to exclude.
5. Select **Save**.

The status indicator below the section title shows how many domains are currently excluded.

> **Note:**
>
> - Domain names on the exclusion list must be unique and follow a valid domain name format.
> - To temporarily disable all exclusions without removing the domains from the list, turn off **Enable domain exclusions**.
> - If you search for an excluded domain in the **Location (domain)** dropdown, **Web Studio** notifies you that the domain is excluded and provides a link to this page so you can review or remove it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage personal preferences in Studio

Use the **My preferences** tab under the **Settings** node to manage your personal view and interaction preferences in Studio. These settings apply only to your account and do not affect other administrators. Available options include:

- **Date and time**: Set your default time zone, date format, and time format. These settings are used throughout Studio for time-related displays, such as scheduled restarts and autoscaling.
- **Folder view**: Choose whether to show or hide the folder view in the **Machine Catalogs**, **Delivery Groups**, and **Applications** nodes.
- **Tab order in Search**: Customize the tab order within the **Search** node.

To set your preferred view in Studio, follow these steps:

1. In Studio, go to **Settings > My preferences**.
2. Click **Edit**.
3. In the **Date and time** tile, configure the following format settings:
    - **Date format**: Select how to display the date (for example, yyyy/MM/dd). To use the date format associated with the language you chose for Studio, select **Match console language**.
    - **Time format:** Select a 12-hour format (09:00 PM, for example) or a 24-hour clock (21:00, for example). To use the time format associated with the language you chose for Studio, select **Match console language**.
    - **Time zone:** Select your preferred time zone. To use your computer's time zone, select **Match console language**.

      > **Note:**
      >
      > - To use your computer's regional settings for date, time, or time zone, select **Match console language**.
      > - Int Studio, you can hover over any displayed time to view its equivalent in your local time zone.

4. In the **Folder view** tile, select whether to show or hide the folder view in the **Machine Catalogs**, **Delivery Groups**, and **Applications** nodes.
5. In the **Tab order in Search** tile, drag and reorder the tabs within the **Search** node.
6. Click **Apply** to save and apply the changes immediately.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable DNS resolution

To present DNS names instead of IP addresses in the ICA® file, follow these steps:

1. Sign in to Web Studio and select **Settings** in the left pane.
2. Turn on the **Enable DNS resolution** setting.

Set the inactivity timeout for the Studio console

You can set the inactivity duration after which administrators are automatically signed out of the Studio console.

1. Sign in to Web Studio and select **Settings** in the left pane.
2. Type a duration ranging from 10 minutes to 24 hours.
3. To apply this setting, refresh the page or sign out and then sign back in.

Centralize site management

This feature lets you use one Web Studio console to manage multiple Citrix Virtual Apps and Desktops sites. For more information, see Enable multiple site management.

Set a custom notice on the Studio login page

To set a sign-in page notice, follow these steps:

1. Sign in to Web Studio and select **Settings** in the left pane.
2. Locate the **Login page notice** tile and select the **Show notice on login page** checkbox.
3. Click **Edit** to open the **Login page notice** page and type a login page notice as needed.
4. Click **Save**.

Display the FQDN of active DDC on the Studio login page

To display the FQDN of DDC used for the current session on the Studio sign-in page, follow these steps:

1. Sign in to Web Studio and select **Settings** in the left pane.
2. Turn on **Show connected Delivery Controller**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure the log server

Configure the AOT (Always-on Tracing) log server and define the logging scope. **Director** connects to the log server to retrieve logs for monitoring and troubleshooting.

To configure the log server and define the logging scope, follow these steps:

1. Sign in to **Web Studio** and select **Settings** in the left pane.
2. If no log server is configured, click **Add** in the **Log server** tile.
3. On the **Log server** page that appears, select **Enable log forwarding to log server**.
4. Select which components forward logs to the log server:
    - **Include Delivery Controllers:** Forwards logs from all Delivery Controllers to the log server.
    - **Select delivery groups:** Forwards logs from VDAs within specific delivery groups to the log server. By default, **All delivery groups** is selected, which forwards logs from VDAs in all delivery groups. To forward logs only from VDAs in specific delivery groups, select **Select specific delivery groups**, and then choose the groups you want to include.
5. Enter the **Authkey** generated by the log server. **Director** uses this key to access the log server.
6. Click **Save** to apply the configuration.

To update the log server or modify the logging scope, click **Edit** in the **Settings > Log server** tile.

Configure Microsoft Entra single sign-on (SSO)

Set up Microsoft Entra single sign-on (SSO). After you configure SSO, users can sign in to their virtual apps and desktops using their Microsoft Entra ID credentials on Microsoft Entra–joined or Microsoft Entra hybrid–joined session hosts.

> **Note:**
>
> Microsoft Entra SSO is currently supported only for Microsoft Entra hybrid–joined session hosts.

Before you begin

Before you configure SSO:

- Register the required resource application.
- Create the client application in your Microsoft Entra tenant.

For more information about requirements, see Microsoft Entra single sign-on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Workflow

1. Sign in to **Web Studio** and select **Settings** in the left pane.
2. Click **Configure** in the **Microsoft Entra single sign-on (SSO)** tile. The configuration page appears.
3. In **Application (client) ID**, enter a valid GUID.
   Example: `12345678-1234-1234-1234-123456789abc`
4. In **Redirect URI (reply URL)**, enter a valid redirect URI.
   Example: `https://ctx-ws-assets.cloud.com/assets/workspace/html/static/aad_sso_msal_redirect.html`
5. In **Authentication URL**, enter the authentication endpoint.
   Example: `https://login.microsoftonline.com`
6. In **Resource application ID URI**, select one of the following options:
   - **Commercial**, **Government**, or **Japan**. The resource application ID URI is automatically populated with the Citrix-provided value.
   - **Custom**. Enter your custom Application ID URI.
7. Select **Save**.

After you save the configuration, Microsoft Entra single sign-on (SSO) is enabled for your site.

Introduction

Tags are strings that identify items such as machines, applications, desktops, delivery groups, application groups, and policies. After creating a tag and adding it to an item, you can tailor certain operations to apply to only items that have a specified tag.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Tailor search displays in Web Studio.

  For example, to display only applications that have been optimized for testers, create a tag named "test"and then add (apply) it to those applications. You can now filter the Web Studio search with the tag "test".

- Publish applications from an application group or specific desktops from a delivery group, considering only a subset of the machines in selected delivery groups. This is called a *tag restriction*.

  With tag restrictions, you can use your existing machines for more than one publishing task, saving the costs associated with deploying and managing more machines. A tag restriction can be thought of as subdividing (or partitioning) the machines in a delivery group. Its functionality is similar, but not identical, to worker groups in XenApp releases earlier than 7.x.

  Using an application group or desktops with a tag restriction or can be helpful when isolating and troubleshooting a subset of machines in a delivery group.

- Schedule periodic restarts for a subset of machines in a delivery group.

  Using a tag restriction for machines enables you to use new PowerShell cmdlets to configure multiple restart schedules for subsets of machines in a delivery group. For examples and details, see Manage delivery groups.

- Tailor the application (assignment) of Citrix policies to a subset of machines in delivery groups, delivery group types, or OUs that have (or do not have) a specified tag.

  For example, if you want to apply a Citrix policy only to the more powerful workstations, add a tag named "high power"to those machines. Then, on the **Assign Policy** page of the Create Policy wizard, select that tag and the **Enable** check box. You can also add a tag to a delivery group and then apply a Citrix policy to that group. For details, see Create policies.

You can apply tags to:

- Machines
- Applications
- Machine catalogs (PowerShell only; see Tags on machine catalogs)
- Delivery groups
- Application groups

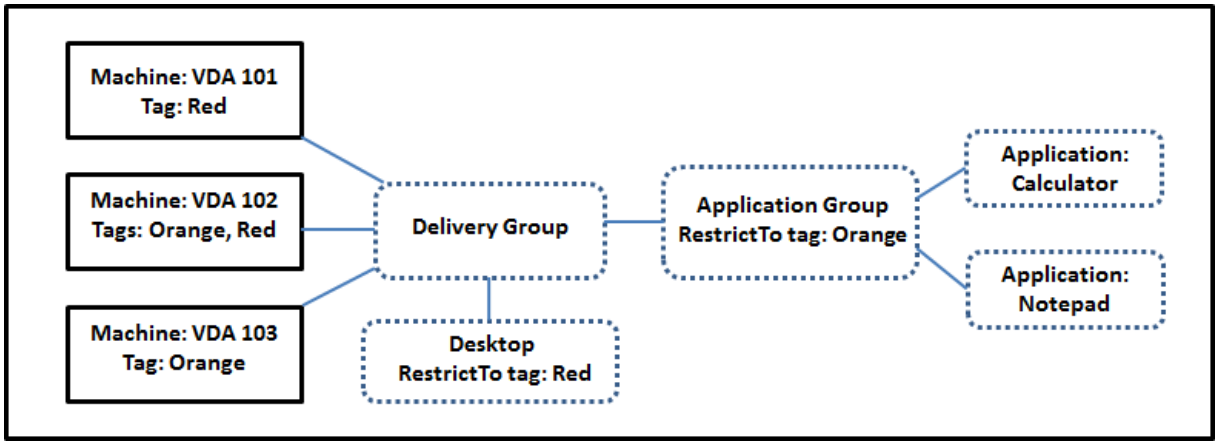
You can configure a tag restriction can be configured when creating or editing the following in Web Studio:

- A desktop in a shared delivery group
- An application group

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> A tag can be explicitly applied to a machine or can be explicitly applied at the machine catalog or delivery group level. When a tag is applied at the machine catalog or delivery group level, all machines within that catalog or delivery group implicitly inherit the tag. These inherited tags cannot be removed at the machine level. To remove the tag effect, the tag must be removed from the machine catalog or delivery group level.

Tag restrictions for a desktop or an application group



A tag restriction involves several steps:

- Create the tag and then add (apply) it to machines.
- Create or edit a group with the tag restriction (in other words, "restrict launches to machines with tag x").

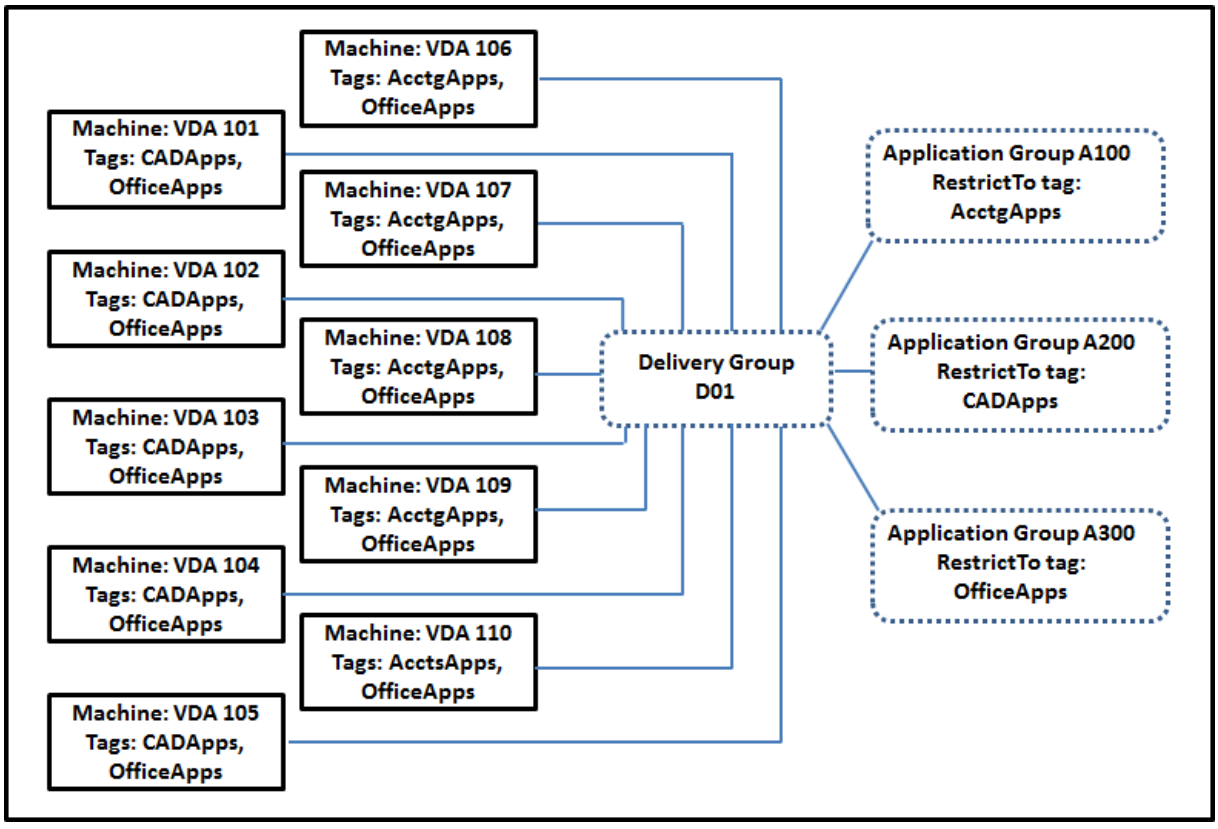
A tag restriction extends the broker's machine selection process. The broker selects a machine from an associated delivery group subject to access policy, configured user lists, zone preference, and launch readiness, plus the tag restriction (if present). For applications, the broker falls back to other delivery groups in priority order, applying the same machine selection rules for each considered delivery group.

Example 1: Simple layout

This example introduces a simple layout that uses tag restrictions to limit which machines are considered for certain desktop and application launches. The site has one shared delivery group, one published desktop, and one application group configured with two applications.

- Tags have been added to each of the three machines (VDA 101–103).

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- The desktop in the shared delivery group was created with a tag restriction named "Red". A desktop can be launched only on machines in that delivery group that have the tag "Red": VDA 101 and 102.
- The application group was created with the "Orange"tag restriction, so each of its applications (Calculator and Notepad) can be launched only on machines in that delivery group that have the tag "Orange": VDA 102 and 103.

Machine VDA 102 has both tags (Red and Orange), so it can be considered for launching the applications and the desktop.

Example 2: More complex layout

This example contains several application groups that were created with tag restrictions. This results in the ability to deliver more applications with fewer machines than would otherwise be needed if you used only delivery groups.

How to configure example 2 shows the steps used to create and apply the tags, and then configure the tag restrictions in this example.

This example uses 10 machines (VDA 101–110), one delivery group (D01), and three application groups (A100, A200, A300). By applying tags to each machine and then specifying tag restrictions when creating each application group:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

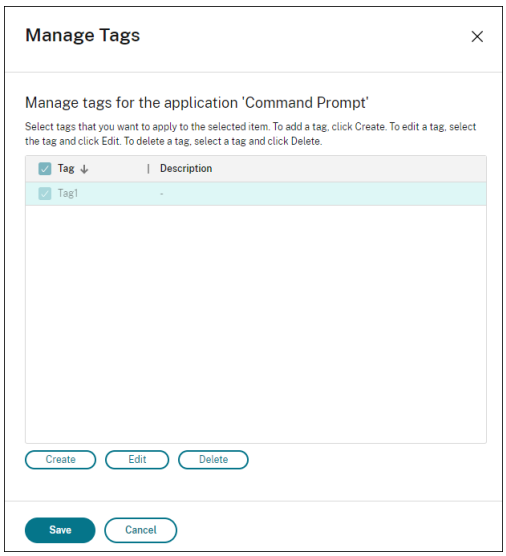
- Accounting users in the group can access the apps they need on five machines (VDA 101–105)
- CAD designers in the group can access the apps they need on five machines (VDA 106-110)
- Users in the group who need Office applications can access the Office apps on 10 machines (VDA 101–110)

Only 10 machines are used, with only one delivery group. Using delivery groups alone (without application groups) would require twice as many machines, because a machine can belong to only one delivery group.

Manage tags and tag restrictions

Tags are created, added (applied), edited, and deleted from selected items through the **Manage Tags** action in Web Studio.

(Exception: Tags used for policy assignments are created, edited, and deleted through the **Manage Tags** action in Web Studio. However, tags are applied (assigned) when you create the policy. See Create policies for details.)



Tag restrictions are configured when you create or edit desktops in delivery groups, and when you create and edit application groups.

Use the Manage Tags dialogs in Web Studio

In Web Studio, select the items you want to apply a tag to (one or more machines, applications, a desktop, a delivery group, or an application group) and then select **Manage Tags** in the action bar. The dialog box lists all the tags that have been created in the Site, not just for the items you selected.

- A check box containing a check mark indicates that the tag has already been added to the selected items. (In the screen capture below, the selected machine has the tag named "Tag1" applied.)
- If you selected more than one item, a check box containing a hyphen indicates that some, but not all selected items have that tag added.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following actions are available from the **Manage Tags** dialog box. Be sure to review Cautions when working with tags.

- **To create a tag:**

  Click **Create.** Enter a name and description. Tag names must be unique and are not case-sensitive. Then click **OK**. (Creating a tag does not automatically apply it to any items you have selected. Use the check boxes to apply the tag.)

- **To add (apply) one or more tags:**

  Enable the check box next to the tag name. If you selected multiple items and the check box next to a tag contains a hyphen (indicating that some, but not all selected items already have the tag applied), changing it to a check mark affects all selected machines.

  If you attempt to add a tag to one or more machines, and that tag is being used as a restriction in an application group, you are warned that the action can result in making those machines available for launch. If that's what you intended, proceed.

- **To remove one or more tags:**

  Clear the check box next to the tag name. If you selected multiple items and the check box next to a tag contains a hyphen (indicating that some, but not all selected items already have the tag applied), clearing the check box removes the tag from all selected machines.

  If you attempt to remove a tag from a machine that is using that tag as a restriction, you are warned that the action can affect which machines are considered for launch. If that's what you intended, proceed.

- **To edit a tag:**

  Select a tag and then click **Edit**. Enter a new name, description, or both. You can edit only one tag at a time.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **To delete one or more tags:**

  Select the tags and then click **Delete**. The Delete Tag dialog box indicates how many items currently use the selected tags (for example "2 machines"). Click an item to display more information. For example, clicking a "2 machines"item displays the names of the two machines that have that tag applied. Confirm whether you want to delete the tags.

  You cannot use Web Studio to delete a tag that is used as a restriction. First, edit the application group and remove the tag restriction or select a different tag.

When you're done in the **Manage Tags** dialog box, click **Save**.

To see if a machine has any tags applied: Select **Delivery Groups** in the left pane. Select a delivery group in the middle pane and then select **View Machines** in the action bar. Select a machine in the middle pane and then select the **Tags** tab on the **Details** pane.

Manage tag restrictions

Configuring a tag restriction is a multi-step process: You first create the tag and add/apply it to machines. Then, you add the restriction to the application group or the desktop.

- **Create and apply the tag:**

  Create the tag and then add (apply) it to the machines affected by the tag restriction, using the **Manage Tags** actions described earlier.

- **To add a tag restriction to an application group:**

  Create or edit the application group. On the **Delivery Groups** page, select **Restrict launches to machines with the tag** and then select the tag from the list.

- **To change or remove the tag restriction on an application group:**

  Edit the group. On the **Delivery Groups** page, either select a different tag from the list or remove the tag restriction entirely by clearing **Restrict launches to machines with the tag**.

- **To add a tag restriction to a desktop:**

  Create or edit a delivery group. Click **Add** or **Edit** on the **Desktops** page. In the Add Desktop dialog box, select **Restrict launches to machines with the tag** and then select the tag from the menu.

- **To change or remove the tag restriction on a delivery group:**

  Edit the group. On the Desktops page, click **Edit**. In the dialog box, either select a different tag from the lists or remove the tag restriction entirely by clearing **Restrict launches to machines with the tag**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cautions when working with tags

A tag applied to an item can be used for different purposes, so keep in mind that adding, removing, and deleting a tag can have unintended effects. You can use a tag to sort machine displays in the Web Studio search field. You can use the same tag as a restriction when configuring an application group or a desktop. The tag limits launch consideration to only machines in specified delivery groups that have that tag.

When you try to add a tag to machines after that tag has been configured as a tag restriction for a desktop or an application group, a warning appears. Adding that tag might make the machines available for launching additional applications or desktops. If that is what you intended, proceed. If not, you can cancel the operation.

For example, let's say you create an application group with the "Red"tag restriction. Later, you add several other machines in the same delivery groups used by that application group. If you then attempt to add the "Red"tag to those machines, Web Studio displays a message similar to: "The tag "Red"is used as a restriction on the following application groups. Adding this tag might make the selected machines available to launch applications in this application group."You can then confirm or cancel adding that tag to those additional machines.

Similarly, if an application group uses a tag to restrict launches, Web Studio warns that you cannot delete the tag until you edit the group to remove it as a restriction. (If you were allowed to delete a tag that's used as a restriction in an application group, that might result in allowing applications to launch on all machines in the delivery groups associated with the application group.) The same prohibition against deleting a tag applies if the tag is being used as a restriction for desktop launches. After you edit the application group or desktops in the delivery group to remove that tag restriction, you can delete the tag.

All machines might not have the same sets of applications. A user can belong to more than one application group, each with a different tag restriction and different or overlapping sets of machines from delivery groups. The following table lists how machine considerations are decided.

When an application has been added to	These machines in the selected delivery groups are considered for launch
One application group with no tag restriction	Any machine.
One application group with tag restriction A	Machines that have tag A applied.
Two application groups, one with tag restriction A and the other with tag restriction B	Machines that have tag A and tag B. If none are available, then machines that have tag A or tag B.
Two application groups, one with tag restriction A and the other with no tag restriction	Machines that have tag A. If none are available, then any machine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you used a tag restriction in a machine restart schedule, any changes you make that affect tag applications or restrictions affect the next machine restart cycle. It does not affect any restart cycles that are in progress while the changes are being made.

How to configure example 2

The following sequence shows the steps to create and apply tags, and then configure tag restrictions for the application groups illustrated in the second example.

VDAs and applications have already been installed on the machines and the delivery group has been created.

Create and apply tags to the machines:

1. In Web Studio, select delivery group D01 and then select **View Machines** in the action bar.
2. Select machines VDA 101–105 and then select **Manage Tags** in the action bar.
3. In the Manage Tags dialog box, click **Create** and then create a tag named `CADApps`. Click **OK**.
4. Click **Create** again and create a tag named OfficeApps. Click **OK**.
5. While still in the **Manage Tags** dialog box, add (apply) the newly created tags to the selected machines by enabling the check boxes next to each tag's name (`CADApps` and `OfficeApps`). When you're done, close the dialog box.
6. Select delivery group D01, select **View Machines** in the action bar.
7. Select machines VDA 106–110 and then select **Manage Tags** in the action bar.
8. In the **Manage Tags** dialog box, click **Create**. Create a tag named `AcctgApps`. Click **OK**.
9. Apply the newly created `AcctgApps` tag and the `OfficeApps` tag to the selected machines by clicking the check boxes next to each tag's name, and then close the dialog box.

Create the application groups with tag restrictions.

1. In Web Studio, select **Applications** in the left pane, select the **Application Groups** tab, and then select **Create Application Group** in the action bar. The Create Application Group wizard launches.
2. On the **Delivery Groups** page of the wizard, select delivery group D01. Select **Restrict launches to machines with tag** and then select the `AcctgApps` tag from the list.
3. Complete the wizard, specifying the accounting users and the accounting applications. (When adding the application, choose the **From Start menu** source, which searches for the application on the machines that have the `AcctgApps` tag.) On the **Summary** page, name the group `A100`.
4. Repeat the preceding steps to create application group `A200`, specifying machines that have the `CADApps` tag, plus the appropriate users and applications.
5. Repeat steps to create application group `A300`, specifying machines that have the `OfficeApps` tag, plus the appropriate users and applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Tags on machine catalogs

You can use tags on machine catalogs. The overall sequence of creating a tag and then applying it to a catalog is the same as described previously. However, applying tags to catalogs is supported only through the PowerShell interface. You cannot use Web Studio to apply a tag to a catalog or remove a tag from a catalog. Catalog displays in Web Studio do not indicate if a tag is applied.

Summary: You can use Web Studio or PowerShell to create or delete a tag for use on a catalog. Use PowerShell to apply the tag to the catalog.

Here are some examples of using tags with catalogs:

- A delivery group has machines from several catalogs, but you want an operation (such as a restart schedule) to affect only the machines in a specific catalog. Applying a tag to that catalog accomplishes that.
- In an application group, you want to limit application sessions to machines in a specific catalog. Applying a tag to that catalog accomplishes that.

Affected PowerShell cmdlets:

- You can pass catalog objects to cmdlets such as `Add-BrokerTag` and `Remove-BrokerTag`.
- `Get-BrokerTagUsage` shows how many catalogs contain tags.
- `Get-BrokerCatalog` has a property named `Tags`.

For example, the following cmdlets add a tag named `fy2018` to the catalog named `acctg`: `Get-BrokerCatalog -Name acctg | Add-BrokerTag fy2018`. (The tag was previously created using either Web Studio or PowerShell.)

See the PowerShell cmdlet help for more guidance and syntax.

Auto tags

Using auto tags, you can define rules for automatic addition and removal of tags on machines, application groups, applications, desktop groups, or desktops. The tags are also automatically removed if they do not meet the defined rules. This enhancement eliminates the need to maintain different scripts that run periodically for environment optimization.

Use cases

With auto-tagging, you can implement rules relevant to your business drivers, such as reducing costs, optimizing the infrastructure, and driving consumption. The following are some of the use cases:

- **Reclaim unused VDIs** - To release the dedicated workloads that have not been used for more than a pre-configured number of days to the available pool.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Remove App clutter** - To reduce application clutter by identifying the applications that have not been used for more than a pre-configured number of days.
- **DGs with less than X functional level** - To find delivery groups with less than a specific functional level.
- **Inactive users** - To reclaim resources of users who have not logged on for more than a pre-configured number of days.

> **Note:**
>
> The tag attached to a machine that has not been used for more than 30 days is removed from that machine the next time it runs if a user logs in that machine after 30 days.

PowerShell commands

You can create autotags using PowerShell commands. After an autotag rule is created, it is evaluated at a frequency of 3600 seconds. For more information, see New-BrokerAutoTagRule.

The parameters of `New-BrokerAutoTagRule` are:

- Name: Generic name for the rule
- Object type: Machine
- Rule text : The filter to define the rule.
- Tag Uid: The tag id that you want to associate with.

Examples

1. To tag dedicated VDIs that have not been used for more than 30 days:

```
New-BrokerAutoTagRule -Name ‘UnusedVdi’ -ObjectType ‘Machine’
    -RuleText “ -AllocationType Static -IsAssigned $true -Filter {
  SummaryState -ne `”InUse`” -and ( LastConnectionTime -lt ‘-30
      ’ -or LastConnectionTime -eq `$null ) }
  ” -TagUid 123
```

   After the rule is configured, the machines with the tag **unused-VDI** are released.

2. To tag delivery groups with less than X functional level (using **L7_20** as the threshold functional level):

```
New-BrokerAutoTagRule -Name 'LowFL' -ObjectType 'DesktopGroup' -
    RuleText " -Filter {
  MinimumFunctionalLevel -lt 'L7_20' }
  " -TagUid 143
```

3. To tag user visible apps published without a folder:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-BrokerAutoTagRule -Name 'NoFolder' -ObjectType 'Application' -
    RuleText "-Enabled $true -Filter {
  ClientFolder -eq $null  }
  " -TagUid 153`
```

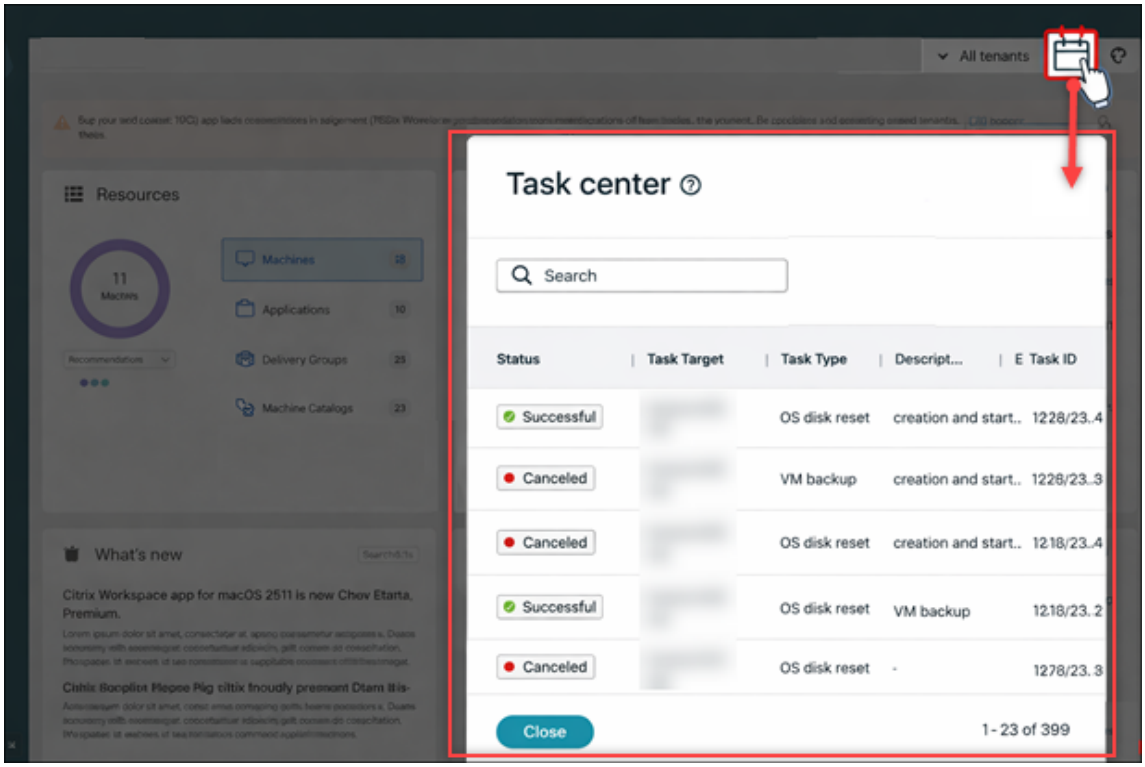
Blog post: How to assign desktops to specific servers.

Monitor and manage tasks in Task Center

June 4, 2026

Task Center provides a centralized view of scheduled and recurring tasks in Citrix Virtual Apps and Desktops™. You can track task status in real time and manage tasks from a single location in Studio.



> **Note:**
>
> In this release, Task Center supports Machine Creation Services (MCS) tasks. Support for additional task types will be introduced in future releases.

Access Task Center

1. Open the Studio console.
2. In the upper-right corner, select the **Calendar** icon.

   The Task Center panel opens, displaying task activity.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

View and manage tasks

In Task Center, you can:

- Search and filter tasks using the search bar.
- Track real-time task status.
- Perform actions on tasks, such as cancel or rerun.

Each task entry displays the following details:

Field	Description
Status	Current state of the task: Successful, Canceled, In progress, or Failed
Task Target	Resource the task applies to
Task Type	Type of operation (for example, OS disk reset, VM backup)
Description	Summary of the operation
Task ID	Unique identifier for tracking

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Supported task types

- Hardware update
- OS disk reset

User profiles

May 15, 2026

By default, Citrix Profile Management is installed silently on master images when you install the Virtual Delivery Agent, but you do not have to use Profile Management as a profile solution.

To suit your users' varying needs, you can use Citrix Virtual Apps and Desktops™ policies to apply different profile behavior to the machines in each Delivery Group. For example, one Delivery Group might require Citrix mandatory profiles, whose template is stored in one network location, while another Delivery Group requires Citrix roaming profiles stored in another location with several redirected folders.

- If other administrators in your organization are responsible for Citrix Virtual Apps and Desktops™ policies, work with them to ensure that they set any profile-related policies across your Delivery Groups.
- Profile Management policies can also be set in Group Policy, in the Profile Management .ini file, and locally on individual virtual machines. These multiple ways of defining profile behavior are read in the following order:

  1. Group Policy (.adm or .admx files)
  2. Citrix Virtual Apps and Desktops policies in the Policy node
  3. Local policies on the virtual machine that the user connects to
  4. Profile Management .ini file

  For example, if you configure the same policy in both Group Policy and the Policy node, the system reads the policy setting in Group Policy and ignores the Citrix Virtual Apps and Desktops policy setting.

Whichever profile solution you choose, Director administrators can access diagnostic information and troubleshoot user profiles. For more information, see the Director documentation.

Automatic configuration

The desktop type is automatically detected, based on the Virtual Delivery Agent installation and, in addition to the configuration choices you make in Studio, sets Profile Management defaults accord-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ingly.

The policies that Profile Management adjusts are shown in the following table. Any non-default policy settings are preserved and are not overwritten by this feature. Consult the Profile Management documentation for information about each policy. The types of machines that create profiles affect the policies that are adjusted. The primary factors are whether machines are persistent or provisioned, and whether they are shared by multiple users or dedicated to just one user.

Persistent systems have some type of local storage, the contents of which can be expected to persist when the system turns off. Persistent systems might employ storage technology such as SANs to provide local disk mimicking. In contrast, provisioned systems are created "on the fly" from a base disk and some type of identity disk. Local storage is usually mimicked by a RAM disk or network disk, the latter often provided by a SAN with a high speed link. The provisioning technology is generally Citrix Provisioning or Machine Creation Services™ (or a third-party equivalent). Sometimes provisioned systems have persistent local storage. These are classed as persistent.

Together, these two factors define the following machine types:

- **Both persistent and dedicated**. Examples are single-session OS machines with a static assignment and persistent local storage that are created with Machine Creation Services, physical workstations, and laptops.
- **Both persistent and shared**. Examples are multi-session OS machines that are created with Machine Creation Services, and Citrix Virtual Apps servers.
- **Both provisioned and dedicated**. Examples are single-session OS machines with a static assignment but without persistent storage that are created with Citrix Provisioning Service (in Citrix Virtual Desktops™).
- **Both provisioned and shared**. Examples are single-session OS machines with a random assignment that are created with Citrix Provisioning™ Service (in Citrix Virtual Desktops) and Citrix Virtual Apps servers.

The following Profile Management policy settings are suggested guidelines for the different machine types. They work well in most cases, but you might want to deviate from them as your deployment requires.

> **Important:**
>
> **Delete locally cached profiles on logoff**, **Profile streaming**, and **Always cache** are enforced by the auto-configuration feature. Adjust the other policies manually.

Persistent machines

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy	Both persistent and dedicated	Both persistent and shared
Delete locally cached profiles on logoff	Disabled	Enabled
Profile streaming	Disabled	Enabled
Always cache	Enabled (note 1)	Disabled (note 2)
Active write back	Disabled	Disabled (note 3)
Process logons of local administrators	Enabled	Disabled (note 4)

Provisioned machines

Policy	Both provisioned and dedicated	Both provisioned and shared
Delete locally cached profiles on logoff	Disabled (note 5)	Enabled
Profile streaming	Enabled	Enabled
Always cache	Disabled (note 6)	Disabled
Active write back	Enabled	Enabled
Process logons of local administrators	Enabled	Enabled (note 7)

1. Because **Profile streaming** is disabled for this machine type, the **Always cache** setting is always ignored.
2. Disable **Always cache**. However, you can ensure that large files are loaded into profiles as soon as possible after logon by enabling this policy and using it to define a file size limit (in MB). Any file this size or larger is cached locally as soon as possible.
3. Disable **Active write back** except to save changes in profiles of users who roam between Citrix Virtual Apps servers. In this case, enable this policy.
4. Disable **Process logons of local administrators** except for Hosted Shared Desktops. In this case, enable this policy.
5. Disable **Delete locally cached profiles on logoff**. This setting retains locally cached profiles. Because the machines are reset at logoff but are assigned to individual users, logons are faster if their profiles are cached.
6. Disable **Always cache**. However, you can ensure that large files are loaded into profiles as soon as possible after logon by enabling this policy and using it to define a file size limit (in MB). Any file this size or larger is cached locally as soon as possible.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Enable **Process logons of local administrators** except for profiles of users who roam between Citrix Virtual Apps and Desktops servers. In this case, disable this policy.

Folder redirection

Folder redirection lets you store user data on network shares other than the location where the profiles are stored. Folder redirection reduces profile size and load time but it might impact network bandwidth. Folder redirection does not require that Citrix user profiles are employed. You can choose to manage user profiles on your own, and still redirect folders.

Configure folder redirection using Citrix policies in Studio.

- Ensure that the network locations used to store the contents of redirected folders are available and have the correct permissions. The location properties are validated.
- Redirected folders are set up on the network and their contents populated from users' virtual desktops at logon.

Configure folder redirection using only Citrix Policies or Active Directory Group Policy Objects, not both. Configuring folder redirection using both policy engines might result in unpredictable behavior.

Advanced folder redirection

In deployments with multiple operating systems (OSs), you might want some of a user's profile to be shared by each OS. The rest of the profile is not shared and is used only by one OS. To ensure a consistent user experience across the OSs, you need a different configuration for each OS, that is, advanced folder redirection. For example, different versions of an application running on two OSs might need to read or edit a shared file, so you decide to redirect it to a single network location where both versions can access it. Alternatively, because the **Start Menu** folder contents are structured differently in two OSs, you decide to redirect only one folder, not both. This approach separates the **Start Menu** folder and its contents on each OS, ensuring a consistent experience for users.

If your deployment requires advanced folder redirection, you must understand the structure of your users' profile data and determine which parts of it can be shared between OSs. Unpredictable behavior can result unless folder redirection is used correctly.

To redirect folders in advanced deployments:

- Use a separate Delivery Group for each OS.
- Understand where your virtual applications, including those on virtual desktops, store user data and settings, and understand how the data is structured.
- For shared profile data that can safely roam (because it is structured identically in each OS), redirect the containing folders in each Delivery Group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For non-shared profile data that cannot roam, redirect the containing folder in only one of the Desktop Groups, typically the one with the most used OS or the one where the data is most relevant. Alternatively, for non-shared data that cannot roam between OSs, redirect the containing folders on both systems to separate network locations.

Example advanced deployment

The deployment has applications, including versions of Microsoft Outlook and Internet Explorer, running on Windows 10 desktops and applications, including other versions of Outlook and Internet Explorer, delivered by Windows Server 2019. You have already set up two Delivery Groups for the two OSs. Users want to access the same set of **Contacts** and **Favorites** in both versions of the two applications.

Important: The following decisions and advice are valid for the OSs and deployment described. In your organization, the folders you choose to redirect and whether your decide to share them depend on various factors that are unique to your specific deployment.

- Using policies applied to the Delivery Groups, you choose the following folders to redirect.

Folder	Redirected in Windows 10?	Redirected in Windows Server 2019?
My Documents	Yes	Yes
Application Data	No	No
Contacts	Yes	Yes
Desktop	Yes	No
Downloads	No	No
Favorites	Yes	Yes
Links	Yes	No
My Music	Yes	Yes
My Pictures	Yes	Yes
My Videos	Yes	Yes
Searches	Yes	No
Saved Games	No	No
Start Menu	Yes	No

- For the shared, redirected folders:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - After analyzing the structure of the data saved by the different versions of Outlook and Internet Explorer, you decide it is safe to share the **Contacts** and **Favorites** folders.
    - You know the structure of the **My Documents**, **My Music**, **My Pictures**, and **My Videos** folders is standard across OSs. So it is safe to store these folders in the same network location for each Delivery Group.

- For the non-shared, redirected folders:

    - You do not redirect the Desktop, Links, Searches, or **Start Menu** folder in the Windows Server Delivery Group because data in these folders is organized differently in the two OSs. It therefore cannot be shared.
    - To ensure predictable behavior of this non-shared data, you redirect it only in the Windows 10 Delivery Group. Windows 10 are used more often by users in their day-to-day work. Users only occasionally access the applications delivered by the Windows Server. Also, in this case the non-shared data is more relevant to a desktop environment rather than an application environment. For example, desktop shortcuts are stored in the **Desktop** folder and might be useful if they originate from a Windows 10 machine but not from a Windows Server machine.

- For the non-redirected folders:

    - You do not want to clutter your servers with users'downloaded files, so you choose not to redirect the Downloads folder
    - Data from individual applications can cause compatibility and performance issues, so you decide not to redirect the Application Data folder

For more information on folder redirection, see Folder Redirection, Offline Files, and Roaming User Profiles overview.

Folder redirection and exclusions

In Citrix Profile Management (but not in Studio), a performance enhancement allows you to prevent folders from being processed using exclusions. If you use this feature, do not exclude any redirected folders. The folder redirection and exclusion features work together. Ensuring no redirected folders are excluded allows Profile Management to move them back into the profile folder structure and preserves data integrity if you later decide not to redirect them. For more information on exclusions, see Include and exclude items.

VDA registration

May 13, 2026

Introduction

> **Note:**
>
> In an on-premises environment, VDAs register with a Delivery Controller. In a Citrix Cloud service environment, VDAs register with a Cloud Connector. In a hybrid environment, some VDAs register with a Delivery Controller while others register with a Cloud Connector.

Before a VDA can be used, it must register (establish communication) with one or more Controllers or Cloud Connectors on the site. The VDA finds a Controller or Connector by checking a list called the `ListofDDCs`. The `ListOfDDCs` on a VDA contains DNS entries that point that VDA to Controllers or Cloud Connectors on the site. For load balancing, the VDA automatically distributes connections across all Controllers or Cloud Connectors in the list.

Why is VDA registration so important?

- From a security perspective, registration is a sensitive operation. You're establishing a connection between the Controller or Cloud Connector and the VDA. For such a sensitive operation, the expected behavior is to reject the connection if everything is not in perfect shape. You are effectively establishing two separate communication channels: VDA to Controller or Cloud Connector, and Controller or Cloud Connector to VDA. The connection uses Kerberos, so time synchronization and domain membership issues are unforgiving. Kerberos uses Service Principal Names (SPNs), so you cannot use load-balanced IP\hostname.
- If a VDA does not have accurate and current Controller or Cloud Connector information as you add and remove Controllers (or Cloud Connectors), the VDA might reject session launches that are brokered by an unlisted Controller or Cloud Connector. Invalid entries can delay the startup of the virtual desktop system software. A VDA won't accept a connection from an unknown and untrusted Controller or Cloud Connector.

In addition to the `ListofDDCs`, the `ListOfSIDs` (Security IDs) indicates which machines in the `ListofDDCs` are trusted. The `ListofSIDs` can be used to decrease the load on Active Directory or to avoid possible security threats from a compromised DNS server. For more information, see ListOfSIDs.

If a `ListofDDCs` specifies more than one Controller or Cloud Connector, the VDA attempts to connect to them in random order. In an on-premises deployment, the `ListofDDCs` can also contain Controller groups. The VDA attempts to connect to each Controller in a group before moving to other entries in the `ListofDDCs`.

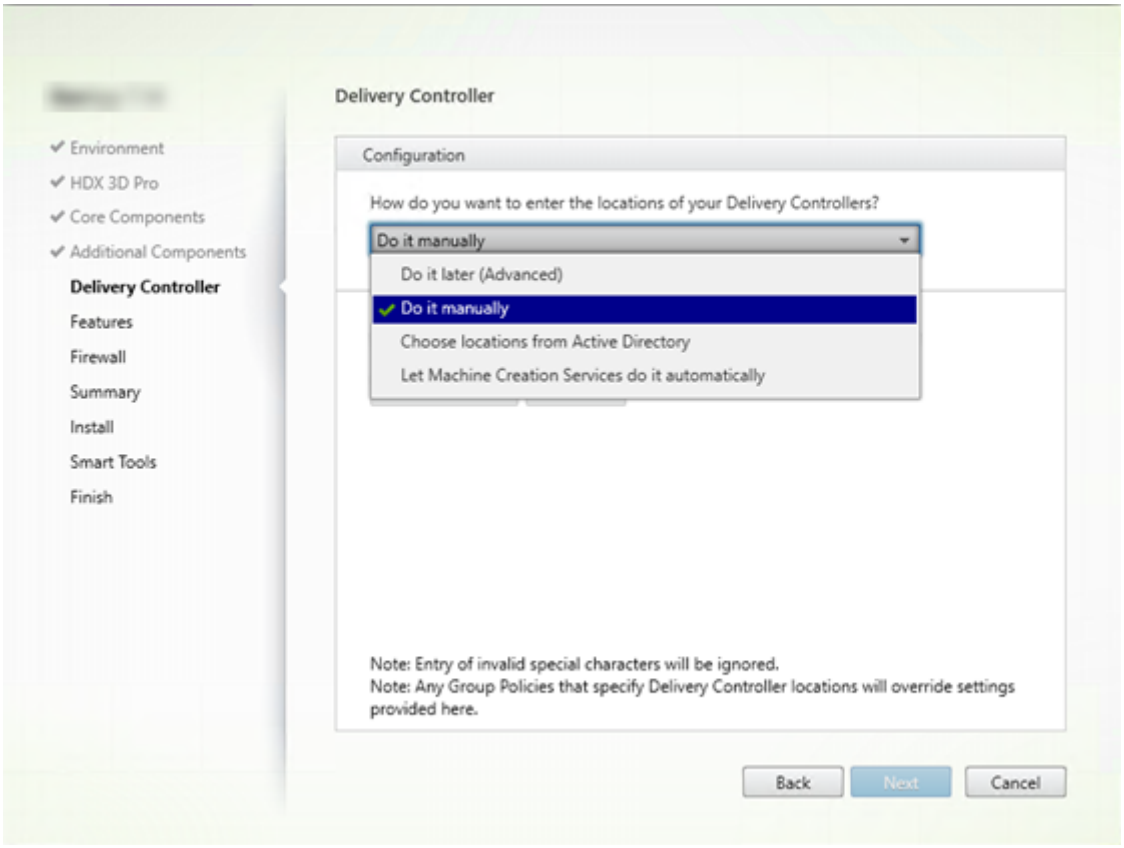
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops™ automatically tests the connectivity to configured Controllers or Cloud Connectors during VDA installation. Errors are displayed if a Controller or Cloud Connector cannot be reached. If you ignore a warning that a Controller or Cloud Connector cannot be contacted (or when you do not specify Controller or Cloud Connector addresses during VDA installation), messages remind you.

Methods for configuring Controller or Cloud Connector addresses

The administrator chooses the configuration method to use when the VDA registers for the first time (the initial registration). During the initial registration, a persistent cache is created on the VDA. During subsequent registrations, the VDA retrieves the list of Controllers or Cloud Connectors from this local cache, unless a configuration change is detected.

The easiest way to retrieve that list during subsequent registrations is by using the auto-update feature. Auto-update is enabled by default. For more information, see Auto-update.



There are several methods for configuring Controller or Cloud Connector addresses on a VDA.

- Policy-based (LGPO or GPO)
- Registry-based (manual, Group Policy Preferences (GPP), specified during VDA installation)
- Active Directory OU-based (legacy OU discovery)
- MCS-based (personality.ini)

You specify the initial registration method when you install a VDA. (If you disable auto-update, the method you select during VDA installation is used for subsequent registrations.)

The following graphic shows the **Delivery Controller** page of the VDA installation wizard.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy-based (LGPO\GPO)

Citrix® recommends using GPO for initial VDA registration. It has the highest priority. (Although auto-update is listed as the highest priority, auto-update is used only after the initial registration.) Policy-based registration offers the centralizing advantages of using Group Policy for configuration.

To specify this method, complete both of the following steps:

- On the **Delivery Controller** page in the VDA installation wizard, select **Do it later (advanced)**. The wizard reminds you several times to specify Controller addresses, even though you're not specifying them during VDA installation. (VDA registration is that important.)
- Enable or disable policy-based VDA registration through Citrix policy with the `Virtual Delivery Agent Settings > Controllers` setting. (If security is your top priority, use the `Virtual Delivery Agent Settings > Controller SIDs` setting.)

This setting is stored under `HKLM\Software\Policies\Citrix\VirtualDesktopAgent (ListOfDDCs)`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Registry-based

To specify this method, complete one of the following steps:

- On the **Delivery Controller** page in the VDA installation wizard, select **Do it manually**. Then, enter the FQDN of an installed Controller and then click **Add**. If you've installed more Controllers, add their addresses.
- For a command-line VDA installation, use the /controllers option and specify the FQDNs of the installed Controllers or Cloud Connectors.

This information is stored in registry value `ListOfDDCs` under registry key `HKLM\Software\Citrix\VirtualDesktopAgent` or `HKLM\Software\Wow6432Node\Citrix\VirtualDesktopAge`
.

You can also configure this registry key manually or use Group Policy Preferences (GPP). This method might be preferable to the policy-based method (for example, if you want conditional processing of different Controllers or Cloud Connectors, such as: use XDC-001 for computer names that begin with XDW-001-).

Update the `ListOfDDCs` registry key, which lists the FQDNs of all the Controllers or Cloud Connectors in the site. (This key is the equivalent of the Active Directory site OU.)

`HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\ListOfDDCs` (`REG_SZ`)

If the `HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent` registry location contains both the `ListOfDDCs` and `FarmGUID` keys, `ListOfDDCs` is used for Controller or Cloud Connector discovery. The `FarmGUID` is present if a site OU was specified during VDA installation. (This might be used in legacy deployments.)

Optionally, update the `ListOfSIDs` registry key (for more information, see ListOfSIDs:

`HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\ListOfSIDs` (`REG_SZ`)

Remember: If you also enable policy-based VDA registration through Citrix policy that overrides settings you specify during VDA installation, because it is a higher-priority method.

Active Directory OU-based (legacy)

This method is supported primarily for backward compatibility and is not recommended. If you're still using it, Citrix suggests changing to another method.

To specify this method, complete both of the following steps:

- On the **Delivery Controller** page in the VDA installation wizard, select **Choose locations from Active Directory.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Use the `Set-ADControllerDiscovery.ps1` script (available on every Controller). Also, configure the `FarmGuid` registry entry on each VDA to point to the right OU. This setting can be configured using Group Policy.

MCS-based

If you use MCS to provision VMs, MCS sets up the list of Controllers or Cloud Connectors. This feature works with auto-update. When creating the catalog, MCS injects the list of Controllers or Cloud Connectors into the `Personality.ini` file during initial provisioning. Auto-update keeps the list current.

To specify this method, on the **Delivery Controller** page in the VDA installation wizard, select **Let Machine Creation Services™ do it**.

Review and recommendations

As best practice:

- Use the Group Policy registration method for initial registration.
- Use auto-update (enabled by default) to keep your list of Controllers up-to-date.
- In a multi-zone deployment, use Group Policy for initial configuration (with at least two Controllers or Cloud Connectors). Point VDAs to Controllers or Cloud Connectors local to (in) their zone. Use auto-update to keep them up-to-date. Auto-update automatically optimizes the `ListofDDCs` for VDAs in satellite zones.
- List more than one controller on the `ListOfDDCs` registry key, separated by a space, to prevent registration issues if a Controller is not available. For example:

```
DDC7x.xd.local DDC7xHA.xd.local

32-bit: HKEY_LOCAL_MACHINE \Software\Citrix\VirtualDesktopAgent\
    ListOfDDCs

HKEY_LOCAL_MACHINE \Software\Citrix\VirtualDesktopAgent\
    ListOfDDCs (REG_SZ)
```

- Ensure all values listed under `ListofDDCs` map to a valid fully qualified domain name to prevent startup registration delays.

Auto-update

Auto-update (introduced in XenApp and XenDesktop 7.6) is enabled by default. It is the most efficient method for keeping your VDA registrations up-to-date. Although not used for initial registration, the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

auto-update software downloads and stores the `ListofDDCs` in a persistent cache on the VDA when initial registration occurs. This process is done for each VDA. The cache also holds machine policy information, which ensures that policy settings are retained across restarts.

Auto-update is supported when using MCS or Citrix Provisioning™ to provision machines, except for Citrix Provisioning server-side cache. Server-side cache is not a common scenario because there is no persistent storage for auto-update cache.

To specify this method:

- Enable or disable auto-update through a Citrix policy containing the setting `Virtual Delivery Agent Settings` > `Enable auto update of Controllers`. This setting is enabled by default.

How it works:

- Each time a VDA re-registers (for example, after a machine restart), the cache is updated. Each Controller or Cloud Connector also checks the site database every 90 minutes. If a Controller or Cloud Connector has been added or removed since the last check, or if a policy change occurred that affects VDA registration, the Controller or Cloud Connector sends an updated list to its registered VDAs and the cache is updated. The VDA accepts connections from all the Controllers or Cloud Connectors in its most recently cached list.
- If a VDA receives a list that does not include the Controller or Cloud Connector it is registered with (in other words, that Controller or Cloud Connector was removed from the site), the VDA re-registers, choosing among the Controllers or Cloud Connectors in the `ListofDDCs`.

Example:

- A deployment has three Controllers: A, B, and C. A VDA registers with Controller B (which was specified during VDA installation).
- Later, two Controllers (D and E) are added to the site. Within 90 minutes, VDAs receive updated lists and then accept connections from Controllers A, B, C, D, and E. (The load is not spread equally to all Controllers until the VDAs are restarted.)
- Later still, Controller B is moved to another site. Within 90 minutes, VDAs in the original site receive updated lists because there has been a Controller change since the last check. The VDA that originally registered with Controller B (which is no longer on the list) re-registers, choosing among the Controllers in the current list (A, C, D, and E).

In a multi-zone deployment, auto-update in a satellite zone automatically caches all local Controllers first. All Controllers in the primary zone are cached in a backup group. If no local Controllers in the satellite zone are available, registration is attempted with Controllers in the primary zone.

As shown in the following example, the cache file contains host names and a list of Security IDs (`ListofSIDs`). The VDA does not query SIDs and thus, reduces the Active Directory load.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can retrieve the cache file with a WMI call. However, it is stored in a location that's readable only by the SYSTEM account.

> **Important:**
>
> This information is provided only for information purposes. DO NOT MODIFY THIS FILE. Any modification to this file or folder results in an unsupported configuration.

```
Get-WmiObject -Namespace "Root\Citrix\DesktopInformation"-Class "
Citrix_VirtualDesktopInfo"-Property "PersistentDataLocation"
```

If you need to manually configure the `ListofSIDs` for security reasons (as distinct from reducing Active Directory load), you cannot use the auto-update feature. For details, see ListOfSIDs.

Exception to auto-update priority

Although auto-update usually has the highest priority of all VDA registration methods and overrides settings for other methods, there is an exception. The `NonAutoListOfDDCs` elements in the cache specify the initial VDA configuration method. Auto-update monitors this information. If the initial registration method changes, the registration process skips auto-update, and uses the next-highest configured priority method. This process can be helpful when you move a VDA to another site (for example, during disaster recovery).

Configuration considerations

View a common VDA registration configuration.

View VDA registration steps.

This is an embedded video. Click the link to watch the video

Consider the following when configuring items that can affect VDA registration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Controller or Cloud Connector addresses

Regardless of which method you use to specify Controllers or Cloud Connectors, Citrix recommends using an FQDN address. An IP address is not considered a trusted configuration, because it's easier to compromise an IP than a DNS record. If you populate the `ListofSIDs` manually, you can use an IP in a `ListofDDCs`. However, FQDN is still recommended.

Load balancing

As noted earlier, the VDA automatically distributes connections across all Controllers or Cloud Connectors in the `ListofDDCs`. Failover and load balancing functionality is built into the Citrix Brokering Protocol (CBP). If you specify multiple Controllers or Cloud Connectors in your configuration, registration automatically fails over between them, if needed. With auto-update, automatic failover occurs automatically for all VDAs.

For security reasons, you cannot use a network load balancer, such as Citrix ADC. VDA registration uses Kerberos mutual authentication, where the client (VDA) must prove its identity to the service (Controller). However, the Controller or Cloud Connector must prove its identity to the VDA. This means that the VDA and the Controller or Cloud Connector are acting as server and client at the same time. As noted at the beginning of this article, there are two communications channels: VDA to Controller/-Cloud Connector and Controller/Cloud Connector to VDA.

A component in this process is called Service Principal Name (SPN), which stored as a property in an Active Directory computer object. When your VDA connects to a Controller or Cloud Connector, it must specify who it wants to communicate with. This address is an SPN. If you use a load-balanced IP, mutual Kerberos authentication correctly recognizes that the IP does not belong to the expected Controller or Cloud Connector.

For more information, see:

- Introduction to Kerberos
- Mutual authentication using Kerberos

Auto-update replaces CNAME

The auto-update feature replaces the CNAME (DNS alias) function from XenApp and XenDesktop versions earlier than 7.x. CNAME functionality is disabled, beginning with XenApp and XenDesktop 7. Use auto-update instead of CNAME. (If you must use CNAME, see CTX137960. For DNS aliasing to work consistently, do not use both auto-update and CNAME at the same time.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Controller/Cloud Connector groups

In certain scenarios, you might want to process Controllers or Cloud Connectors in groups, with one group being preferred and the other group used for a failover if all Controllers/Cloud Connectors fail. Remember that Controllers or Cloud Connectors are randomly selected from the list, so grouping can help enforce preferential use.

These groups are intended for use within a single site (not multiple sites).

Use parentheses to specify groups of Controllers/Cloud Connectors. For example, with four Controllers (two primary and two backups), a grouping might be:

```
(XDC-001.cdz.lan XDC-002.cdz.lan)(XDC-003.cdz.lan XDC-004.cdz.lan)
```

In this example, the Controllers in the first group (001 and 002) are processed first. If both fail, Controllers in the second group (003 and 004) are processed.

For XenDesktop 7.0 or higher, there is an extra step you need to perform to use **Registration Groups** feature. You need to **Prohibit** the **Enable Auto Update of Controller** policy from Studio.

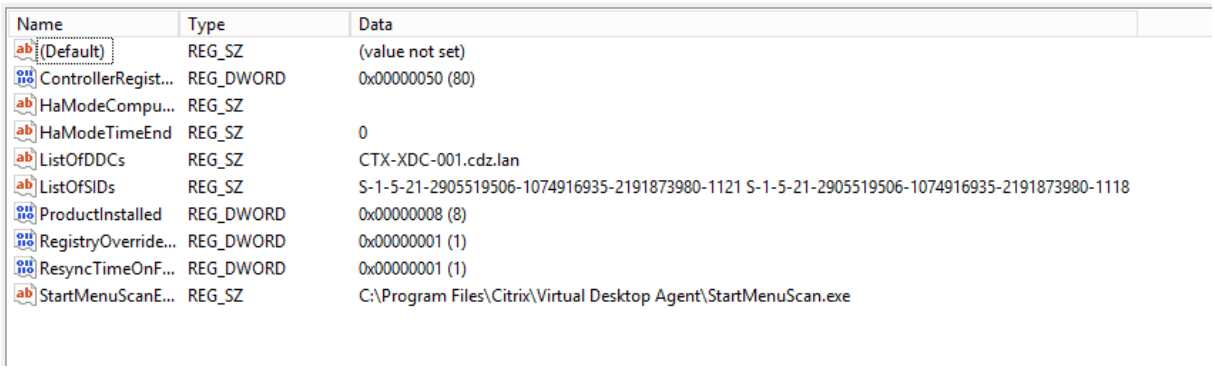
ListOfSIDs

The list of Controllers that a VDA can contact for registration is the `ListofDDCs`. A VDA must also know which Controllers to trust because VDAs do not automatically trust the Controllers in the `ListofDDCs`. The `ListofSIDs` (Security IDs) identify the trusted Controllers. VDAs attempt to register only with trusted Controllers.

In most environments, the `ListofSIDs` is generated automatically from the `ListofDDCs`. You can use a CDF trace to read the `ListofSIDs`.

Generally, there is no need to manually modify the `ListofSIDs`. There are several exceptions. The first two exceptions are no longer valid because newer technologies are available.

- **Separate roles for Controllers:** Before zones were introduced in XenApp and XenDesktop 7.7, the `ListofSIDs` was manually configured when only a subset of Controllers was used for registration. For example, if you were using XDC-001 and XDC-002 as XML brokers, and XDC-003 and XDC-004 for VDA registration, you specified all Controllers in the `ListofSIDs`, and XDC-003 and XDC-004 in the `ListofDDCs`. This is not a typical or recommended configuration. Do not use it in newer environments. Instead, use zones.
- **Reducing Active Directory load:** Before the auto-update feature was introduced in XenApp and XenDesktop 7.6, the `ListofSIDs` was used to reduce the load on domain controllers. By pre-populating the `ListofSIDs`, the resolution from DNS names to SIDs can be skipped. However, the auto-update feature removes the need for this work, because this persistent cache contains SIDs. Citrix recommends keeping the auto-update feature enabled.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Security:** In some highly secured environments, the SIDs of trusted Controllers were manually configured to avoid possible security threats from a compromised DNS server. However, if you do this, you must also disable the auto-update feature. Otherwise, the configuration from a persistent cache is used.

So, unless you have a specific reason, do not modify the `ListofSIDs`.

If you must modify the `ListofSIDs`, create a registry key named `ListOfSIDs` (`REG_SZ`) under `HKLM\Software\Citrix\VirtualDesktopAgent`. The value is a list of trusted SIDs, separated by spaces if you have more than one.

In the following example, one Controller is used for VDA registration (`ListofDDCs`), but two Controllers are used for brokering (List OfSIDs).

Name	Type	Data
(Default)	REG_SZ	(value not set)
ControllerRegist...	REG_DWORD	0x00000050 (80)
HaModeCompu...	REG_SZ	
HaModeTimeEnd	REG_SZ	0
ListOfDDCs	REG_SZ	CTX-XDC-001.cdz.lan
ListOfSIDs	REG_SZ	S-1-5-21-2905519506-1074916935-2191873980-1121 S-1-5-21-2905519506-1074916935-2191873980-1118
ProductInstalled	REG_DWORD	0x00000008 (8)
RegistryOverride...	REG_DWORD	0x00000001 (1)
ResyncTimeOnF...	REG_DWORD	0x00000001 (1)
StartMenuScanE...	REG_SZ	C:\Program Files\Citrix\Virtual Desktop Agent\StartMenuScan.exe

Controller search during VDA registration

When a VDA tries to register, the Broker Agent first performs a DNS lookup in the local domain to ensure that the specified Controller can be reached.

If that initial lookup doesn't find the Controller, the Broker Agent can start a fallback top-down query in AD. That query searches all domains, and repeats frequently. If the Controller address is invalid (for example, the administrator entered an incorrect FQDN when installing the VDA), that query's activity can potentially lead to a distributed denial of service (DDoS) condition on the domain controller.

The following registry key controls whether the Broker Agent uses the fallback top-down query when it cannot locate a Controller during the initial search.

`HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent`

- Name: `DisableDdcWildcardNameLookup`
- Type: `DWORD`
- Value: `0` (default) or any non-zero value

When set to `0`, the fallback search is enabled. If the initial search for the Controller fails, the fallback top-down search is started. This is the default behavior. However, if set to any non-zero value, the fallback search is disabled. If the initial search for the Controller fails, the Broker Agent stops looking.

LDAP binding sequencing during VDA registration using a read-only domain controller

When a VDA registers with a read-only domain controller (RODC), the Broker Agent must select which Light Directory Access Protocol (LDAP) binding or bindings to ignore. To make this selection, the Broker Agent requires a suitable registry key.

If a registry key is not provided, or the registry key field is empty, VDA registration with the RODC takes longer because it is required to go through the original LDAP binding sequence.

To modify the LDAP binding sequence, the registry key `ListofIgnoredBindings` has been added to `HKEY_LOCAL_MACHINE\Software\Policies\Citrix\VirtualDesktopAgent`. Use of `ListofIgnoredBindings` lets you modify the LDAP binding sequence as necessary, and thereby speed up VDA registration with a RODC.

- Name: `ListofIgnoredBindings`
- Type: `REG_SZ`
- Values: `DefaultPath`, `DomainPath`, `PDCPath`

The value is a list of binding path options, each separated by a comma. The registry key ignores values that it does not recognize as valid.

Troubleshoot VDA registration issues

As noted previously, a VDA must be registered with a Delivery Controller or Cloud Connector to be considered when launching brokered sessions. Unregistered VDAs can result in underutilization of otherwise available resources. There are various reasons a VDA might not be registered, many of which an administrator can troubleshoot. Studio provides troubleshooting information in the catalog creation wizard, and after you create a Delivery Group.

- **Identifying issues during machine catalog creation:** In the catalog creation wizard, after you add existing machines, the list of computer account names indicates whether each machine is suitable for adding to the catalog. Hover over the icon next to each machine to display an informative message about that machine.

  If the message identifies a problematic machine, you can either remove that machine (using the **Remove** button), or add the machine. For example, if a message indicates that information was not obtained about a machine (perhaps because it had never registered), you might choose to add the machine anyway.

  A catalog's functional level controls which product features are available to machines in the catalog. Using features introduced in new product versions might require a new VDA. Setting a functional level makes all features introduced in that version (and later, if the functional level does not change) available to machines in the catalog. However, machines in that catalog with an earlier VDA version will not be able to register.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Identifying issues after creating Delivery Groups:** After you create a Delivery Group, Studio displays details about machines associated with that group.

  The details pane for a Delivery Group indicates the number of machines that must be registered but are not. In other words, there might be one or more machines that are powered on and not in maintenance mode, but are not currently registered with a Controller. When viewing a "not registered, but must be"machine, review the **Troubleshoot** tab in the details pane for possible causes and recommended corrective actions.

More information about troubleshooting VDA registration

- For more information about functional levels, see VDA versions and functional levels.
- For more information about VDA registration troubleshooting, see CTX136668.
- You can also use Citrix Scout health checks to troubleshoot VDA registration and session launch. For details, see About health checks.

Virtual IP and virtual loopback

May 13, 2026

> **Important:**
>
> - Windows 10 Enterprise multi-session doesn't support Remote Desktop IP Virtualization (Virtual IP) and we don't support Remote Desktop IP Virtualization or virtual loopback on Windows 10 Enterprise multi-session.
> - Remote Desktop IP Virtualization (Virtual IP) isn't supported on cloud-hosted machines. For more information, see Microsoft documentation.

Remote Desktop IP Virtualization and virtual loopback features are supported on Windows Server 2016, Windows Server 2019, and Windows Server 2022 machines. These features do not apply to Windows desktop OS machines.

The Microsoft Remote Desktop IP Virtualization address feature provides a published application with a unique dynamically assigned IP address for each session. With the Citrix virtual loopback feature, you can configure applications that depend on communications with localhost (127.0.0.1 by default) to use a unique virtual loopback address in the localhost range (127.*).

Certain applications, such as CRM and Computer Telephony Integration (CTI), use an IP address for addressing, licensing, identification, or other purposes that require a unique IP address or loopback address. Other applications might bind to a static port, so attempts to launch additional instances

© 1997–2026 Citrix Systems, Inc. All rights reserved.

of an application in a multiuser environment fail because the port is in use. For such applications to function correctly in a Citrix Virtual Apps™ environment, a unique IP address is required for each device.

Remote Desktop IP Virtualization and virtual loopback are features independent of each other. You can use either or both.

Administrator action synopsis:

- To use Microsoft Remote Desktop IP Virtualization, enable and configure it on the Windows server. (Citrix® policy settings aren't needed.)
- To use Citrix virtual loopback, configure two settings in a Citrix policy.

Remote Desktop IP Virtualization (Virtual IP)

When Remote Desktop IP Virtualization is enabled and configured on the Windows server, each configured application running in a session appears to have a unique address. Users access these applications on a Citrix Virtual Apps server in the same way that they access any other published application. A process requires Remote Desktop IP Virtualization in either of the following cases:

- The process uses a hard-coded TCP port number
- The process uses Windows sockets and requires a unique IP address or a specified TCP port number

To determine if an application needs to use Remote Desktop IP Virtualization addresses:

1. Obtain the **TCPView** tool from Microsoft. This tool lists all applications that bind specific IP addresses and ports. For more information on TCPView, see Microsoft documentation.
2. Disable the **Resolve IP Addresses** feature so that you see the addresses instead of host names.
3. Launch the application and use **TCPView** to see which IP addresses and ports the application opens and which process names are opening these ports.
4. Configure any processes that open the IP address of the server, 0.0.0.0, or 127.0.0.1.
5. To ensure that an application does not open the same IP address on a different port, launch another instance of the application.

How Microsoft Remote Desktop (RD) IP virtualization works

- Virtual IP addressing must be enabled on the Microsoft server.

  For example, in a Windows Server 2016 environment, from Server Manager, expand **Remote Desktop Services > RD Session Host Connections** to enable the RD IP Virtualization feature and configure the settings to dynamically assign IP addresses using the Dynamic Host Configuration Protocol (DHCP) server on a per-session or per-program basis. For more information on configuring Remote Desktop IP Virtualization, see Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- After enabling the feature, at session startup, the server requests dynamically assigned IP addresses from the DHCP server.
- The **RD IP Virtualization** feature assigns IP addresses to remote desktop connections per-session or per-program. If you assign IP addresses for multiple programs, they share a per-session IP address.
- After an address is assigned to a session, the session uses the virtual address rather than the primary IP address for the system whenever the following calls are made: `bind`, `closesocket`, `connect`, `WSAConnect`, `WSAAccept`, `getpeername`, `getsockname`, `sendto`, `WSASendTo`, `WSASocketW`, `gethostbyaddr`, `getnameinfo`, `getaddrinfo`.

When using the Microsoft IP virtualization feature within the Remote Desktop session hosting configuration, applications are bound to specific IP addresses by inserting a "filter"component between the application and Winsock function calls. The application then sees only the correct IP address to use. Any attempt by the application to listen for TCP or UDP communications is bound to its allocated virtual IP address (or loopback address) automatically. Any originating connections opened by the application originate from the IP address bound to the application.

In functions that return an address (such as `GetAddrInfo()`, which a Windows policy controls), if the local host IP address is requested, Remote Desktop IP Virtualization looks at the returned IP address and changes it to the Remote Desktop IP Virtualization address of the session. Applications that attempt to get the IP address of the local server through such name functions see only the unique Remote Desktop IP Virtualization address assigned to that session. This IP address is often used in subsequent socket calls, such as bind or connect. For more information about Windows policies, see RDS IP Virtualization in Windows Server.

Often, an application requests to bind to a port for listening on the address 0.0.0.0. When an application does this and uses a static port, you can't launch more than one instance of the application. The Remote Desktop IP Virtualization address feature also looks for 0.0.0.0 in these call types. It changes the call to listen on the specific Remote Desktop IP Virtualization address, which enables more than one application to listen on the same port on the same computer because they're all listening on different addresses. The call is changed only if it is in an ICA session and the Remote Desktop IP Virtualization address feature is enabled. For example, if two instances of an application running in different sessions both try to bind to all interfaces (0.0.0.0) and a specific port (such as 9000), they're bound to VIPAddress1:9000 and VIPAddress2:9000 and there's no conflict.

Virtual loopback

Enabling the **Citrix Remote Desktop IP Virtualization loopback policy** settings allows each session to have its own loopback address for communication. When an application uses the localhost address (default = 127.0.0.1) in a Winsock call, the virtual loopback feature simply replaces 127.0.0.1

© 1997–2026 Citrix Systems, Inc. All rights reserved.

with 127.X.X.X, where X.X.X is a representation of the session ID + 1. For example, a session ID of 7 is 127.0.0.8. In the unlikely event that the session ID exceeds the fourth octet (more than 255), the address rolls over to the next octet (127.0.1.0), to the maximum of 127.255.255.255.

A process requires virtual loopback in either of the following cases:

- The process uses the Windows socket loopback (localhost) address (127.0.0.1)
- The process uses a hard-coded TCP port number

Use the virtual loopback policy settings for applications that use a loopback address for interprocess communication. No additional configuration is required. Virtual loopback has no dependency on Virtual IP, so you do not have to configure the Microsoft server.

- Virtual IP loopback support. When enabled, this policy setting allows each session to have its own virtual loopback address. This setting is disabled by default. The feature applies only to applications specified with the Virtual IP virtual loopback programs list policy setting.
- Virtual IP virtual loopback programs list. This policy setting specifies the applications that use the virtual IP loopback feature. This setting applies only when the Virtual IP loopback support policy setting is enabled.
- Virtual IP loopback port exclusion. When an application calls the loopback address on the ports specified in this setting, virtual loopback does not change the call to the session-specific loopback address.

Related feature

You can use the following registry settings to ensure that virtual loopback is given preference over virtual IP. This feature is called preferred loopback. However, proceed with caution:

- Use preferred loopback only if both Virtual IP and virtual loopback are enabled. Otherwise, you might have unintended results.
- Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix can't guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Run regedit on the servers where the applications reside.

- HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\VIP
- Name: PreferLoopback, Type: REG_DWORD, Data: 1
- Name: PreferLoopbackProcesses, Type: REG_MULTI_SZ, Data: <list of processes>

Zones

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Deployments that span widely dispersed locations connected by a WAN can face challenges due to network latency and reliability. There are two options that mitigate those challenges:

- Deploy multiple sites, each with their own SQL Server site database.

  This option is recommended for large enterprise deployments. Multiple sites are managed separately, and each requires its own SQL Server site database. Each site is a separate Citrix Virtual Apps™ deployment.

- Configure multiple zones within a single site.

  Configuring zones can help users in remote regions connect to resources without necessarily forcing their connections to traverse large segments of the WAN. Using zones allows effective site management from a single Web Studio console, Citrix Director, and the site database. This saves the costs of deploying, staffing, licensing, and operating more sites containing separate databases in remote locations.

  Zones can be helpful in deployments of all sizes. You can use zones to keep applications and desktops closer to end users, which improves performance. A zone can have one or more Controllers installed locally for redundancy and resiliency, but it is not required.

  The number of Controllers configured in the site can affect the performance of some operations, such as adding new Controllers to the site itself. To avoid this, we recommend that you limit the number of zones in your Citrix Virtual Apps or Citrix Virtual Desktops™ site to no more than 50.

  When the network latency of your zones is more than 250 ms RTT, we recommend that you deploy multiple sites instead of zones.

Throughout this article the term local refers to the zone being discussed. For example, "A VDA registers with a local Controller"means that a VDA registers with a Controller in the zone where the VDA is located.

Zones in this release are similar, but not identical to zones in XenApp version 6.5 and earlier. For example, in this implementation of zones, there are no data collectors. All Controllers in the site communi-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

cate with one site database in the primary zone. Also, failover and preferred zones work differently in this release.

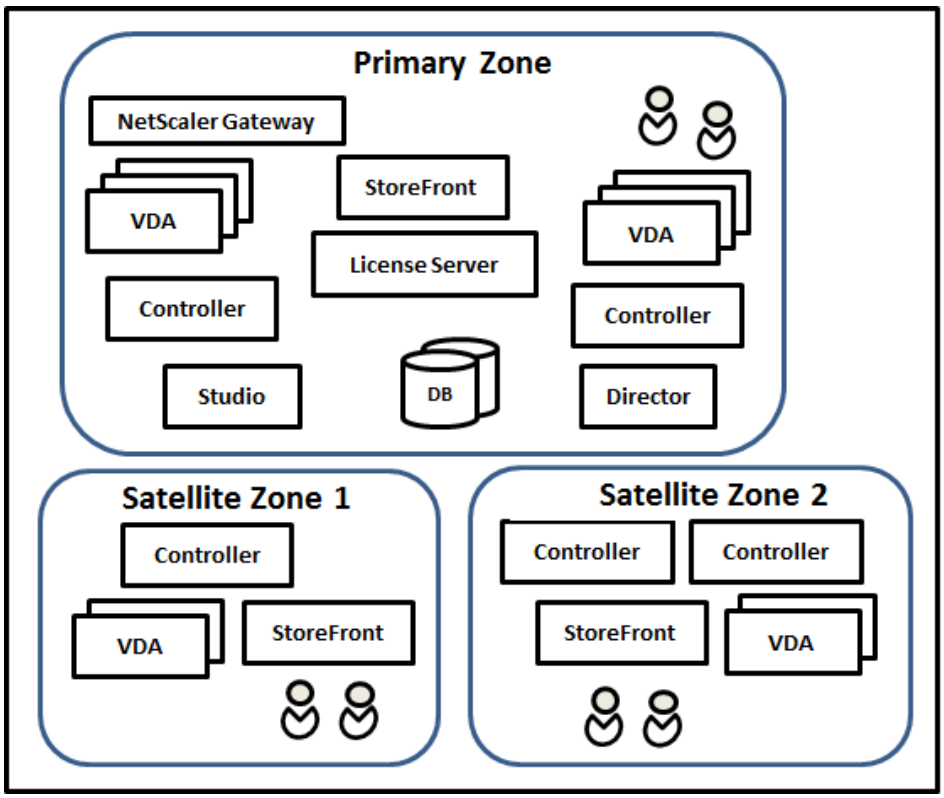
Zone types

A site always has one primary zone. It can also optionally have one or more satellite zones. Satellite zones can be used for disaster recovery, geographically distant data centers, branch offices, a cloud, or an availability zone in a cloud.

Primary zone:

The primary zone has the default name "Primary". This zone contains the SQL Server site database (and high availability SQL servers, if used), Web Studio, Director, Citrix StoreFront™, Citrix License Server, and Citrix Gateway. Always keep the site database in the primary zone.

The primary zone should have at least two Controllers for redundancy. The primary zone can have VDAs with applications that are tightly coupled with the database and infrastructure.



Satellite zone:

A satellite zone contains one or more VDAs, Controllers, StoreFront servers, and Citrix Gateway servers. Under normal operations, Controllers in a satellite zone communicate directly with the database in the primary zone.

A satellite zone, particularly a large one, might also contain a hypervisor that is used to provision and store machines for that zone. When you configure a satellite zone, you can associate a hypervisor or other service connection with it. (Be sure any catalogs that use that connection are in the same zone.)

A site can have satellite zones of different configurations, based on your unique needs and environment. The following figure illustrates a primary zone and examples of satellite zones.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the illustration:

- **Primary zone:** Contains two Controllers, Web Studio, Director, StoreFront, License Server, and the site database (plus high availability SQL Server deployments). The Primary zone also contains several VDAs and a Citrix Gateway.
- **Satellite zone 1: VDAs with Controller:** Satellite zone 1 contains a Controller, VDAs, and a StoreFront server. VDAs in this satellite zone register with the local Controller. The local Controller communicates with the site database and license server in the primary zone.

  If the WAN fails, the Local Host Cache feature allows the Controller in the satellite zone to continue brokering connections to VDAs in that zone. Such a deployment can be effective in an office where workers use a local StoreFront site and the local Controller to access their local resources.
- **Satellite zone 2: VDAs with redundant Controllers:** Satellite zone 2 contains two Controllers, VDAs, and a StoreFront server. This is the most resilient zone type, offering protection against a simultaneous failure of the WAN and one of the local Controllers.

Where VDAs register and where Controllers fail over

In a site containing primary and satellite zones, with VDAs at minimum version 7.7:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- A VDA in the primary zone registers with a Controller in the primary zone. A VDA in the primary zone never attempts to register with a Controller in a satellite zone.
- A VDA in a satellite zone registers with a local Controller, if possible. (This is considered the preferred Controller.) If no local Controllers are available (for example, because they cannot accept more VDA registrations or they have failed), the VDA will attempt to register with a Controller in the primary zone. In this case, the VDA stays registered in the primary zone, even if a Controller in a satellite zone becomes available again. A VDA in a satellite zone never attempts to register with a Controller in another satellite zone.
- When auto-update is enabled for VDA discovery of Controllers, and you specify a list of Controller addresses during VDA installation, a Controller is randomly selected from that list for initial registration (regardless of which zone the Controller resides in). After the machine with that VDA is restarted, the VDA will start to prefer registering with a Controller in its local zone.
- If a Controller in a satellite zone fails, it fails over to another local Controller, if possible. If no local Controllers are available, it fails over to a Controller in the primary zone.
- If you move a Controller in or out of a zone, and auto-update is enabled, VDAs in both zones receive updated lists indicating which Controllers are local and which are in the primary zone, so they know with whom they can register and accept connections from.
- If you move a catalog to another zone, the VDAs in that catalog re-register with Controllers in the zone where you moved the catalog. (When you move a catalog to another zone, make sure this zone and the zone with the associated host connection are well connected. If there is limited bandwidth or high-latency, move the host connection to the same zone containing the associated machine catalog.)

If all Controllers in the primary zone fail:

- Web Studio cannot connect to the site.
- Connections to VDAs in the primary zone cannot be made.
- Site performance degrades until the Controllers in the primary zone become available.

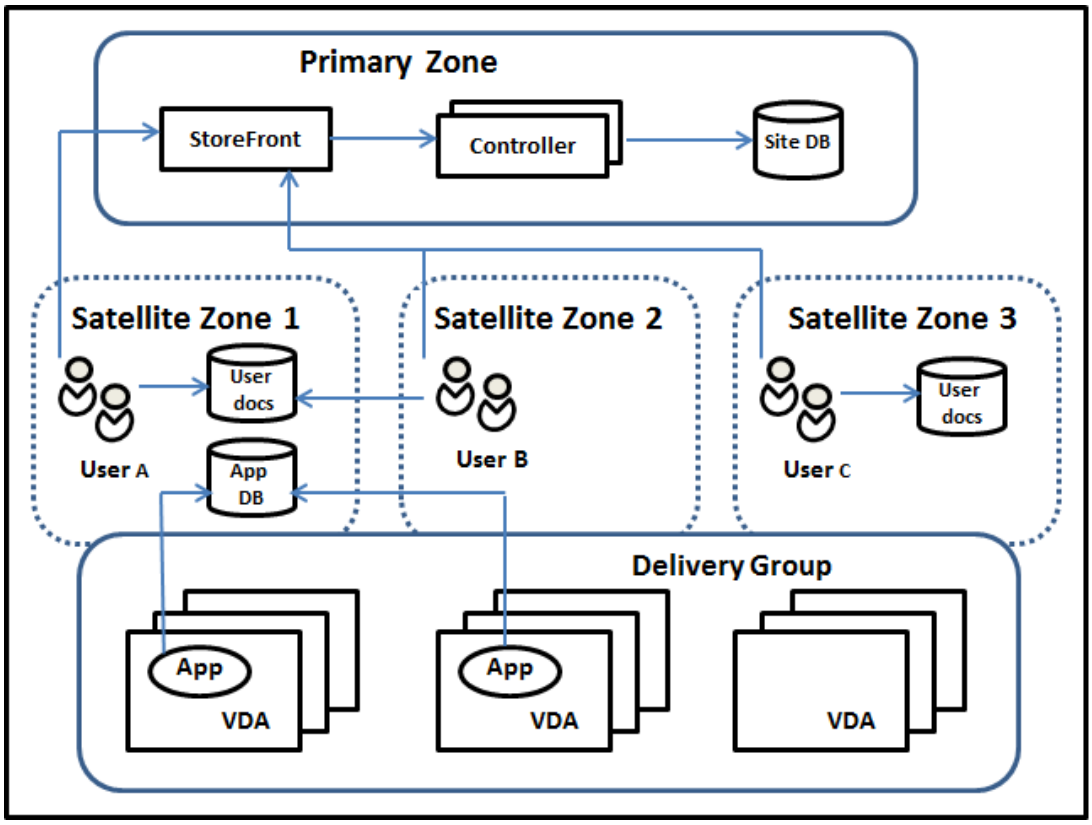
For sites containing VDA versions earlier than 7.7:

- A VDA in a satellite zone accepts requests from Controllers in their local zone and the primary zone. (VDAs at minimum version 7.7 can accept Controller requests from other satellite zones.)
- A VDA in a satellite zone registers with a Controller in the primary zone or the local zone at random. (VDAs at minimum version 7.7 prefer the local zone.)

Zone preference

To use the zone preference feature, you must be using minimum StoreFront 3.7 and Citrix Gateway 11.0-65.x.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



In a multi-zone site, the zone preference feature offers the administrator more flexibility to control which VDA is used to launch an application or desktop.

How zone preference works

There are three forms of zone preference. You might prefer to use a VDA in a particular zone, based on:

- Where the application's data is stored. This is referred to as the application home.
- The location of the user's home data, such as a profile or home share. This is referred to as the user home.
- The user's current location (where the Citrix Workspace™ app is running). This is referred to as the user location.

The following graphic shows an example multi-zone configuration.

In this example, VDAs are spread among three satellite zones, but they are all in the same Delivery Group. Therefore, the broker might have a choice which VDA to use for a user launch request. This example indicates there are several locations where users can be running their Citrix Workspace app endpoints:

- User A is using a device with Citrix Workspace app in satellite zone 1.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- User B is using a device in satellite zone 2.
- A user's documents can be stored in various locations.
    - Users A and B use a share based in satellite zone 1.
    - User C uses a share from satellite zone C.
    - One of the published applications uses a database located in satellite zone 1.

You associate a user or application with a zone by configuring a home zone for the user or application. The broker in the Delivery Controller™ then uses those associations to help select the zone where a session will be launched, if resources are available. You can:

- Configure the home zone for a user by adding a user to a zone.
- Configure the home zone for an application by editing the application properties.

A user or an application can have only one home zone at a time. (An exception for users can occur when multiple zone memberships occur because of user group membership; see the "Other considerations" section. However, even in this case, the broker uses only one home zone.)

Although zone preferences for users and applications can be configured, the broker selects only one preferred zone for a launch. The default priority order for selecting the preferred zone is application home > user home > user location. You can restrict the sequence; see Tailoring zone preference. When a user launches an application:

- If that application has a configured zone association (an application home), then the preferred zone is the home zone for that application.
- If the application does not have a configured zone association, but the user has a configured zone association (a user home), then the preferred zone is the home zone for that user.
- If neither the application nor the user has a configured zone association, then the preferred zone is the zone where the user is running a Citrix Workspace app instance (the user location). If that zone is not defined, a random VDA and zone selection is used. Load balancing is applied to all VDAs in the preferred zone. If there is no preferred zone, load balancing is applied to all VDAs in the Delivery Group.

Tailoring zone preference

When you configure (or remove) a home zone for a user or an application, you can also further restrict how zone preference is used.

- **Mandatory user home zone use:** In a Delivery Group, you can specify that a sessions launch in the user's home zone (if configured), with no failover to another zone if the home zone doesn't have available resources. This restriction is helpful when you must avoid the risk of copying large profiles or data files between zones. In other words, you would rather deny a session launch than to launch the session in a different zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Mandatory application home zone use:** Similarly, when you configure a home zone for an application, you can indicate that the application be launched only in that zone, with no failover to a different zone if resources are not available in the application's home zone.
- **No application home zone, and ignore configured user home zone:** If you do not specify a home zone for an application, you can also indicate that no configured user zones be considered when launching that application. For example, you might prefer that users run an application on a VDA near their device, using the user location zone preference, even though some users might have a different home zone.

How preferred zones affect session use

When a user launches an application or desktop, the broker prefers using the preferred zone rather than using an existing session.

If the user launching an application or desktop already has a session that is suitable for the resource being launched (for example, that can use session sharing for an application, or a session that is already running the resource being launched), but that session is running on a VDA in a zone other than the preferred zone for the user/application, then the system might create a new session. This satisfies launching in the correct zone (if it has available capacity), ahead of reconnecting to a session in a less-preferred zone for that user's session requirements.

To prevent an orphan session that can no longer be reached, reconnection is allowed to existing disconnected sessions, even if they are in a non-preferred zone.

The order of desirability for sessions to satisfy a launch is:

1. Reconnect to an existing session in the preferred zone.
2. Reconnect to an existing disconnected session in a zone other than the preferred zone.
3. Start a new session in the preferred zone.
4. Reconnect to a connected existing session in a zone other than the preferred zone.
5. Start a new session in a zone other than the preferred zone.

Other zone preference considerations

- If you configure a home zone for a user group (such as a security group), that group's users (through direct or indirect membership) are associated with the specified zone. However, a user can be a member of multiple security groups, and therefore might have a different home zone configured through other group membership. In such cases, determination of that user's home zone can be ambiguous.

If a user has a configured home zone that was not acquired through group membership, that zone is used for zone preference. Any zone associations acquired through group membership are ignored.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If the user has multiple different zone associations acquired solely through group membership, the broker chooses among the zones randomly. Once the broker makes this choice, that zone is used for subsequent session launches, until the user's group membership changes.

- The user location zone preference requires detection of Citrix Workspace app on the endpoint device by the Citrix Gateway through which that device is connecting. The Citrix Gateway must be configured to associate ranges of IP addresses with particular zones, and discovered zone identity must be passed through StoreFront to the Controller.

For more information about zone preference, see Zone preference internals.

Considerations, requirements, and best practice

- You can place the following items in a zone: Controllers, machine catalogs, host connections, users, and applications. If a catalog uses a host connection, be sure the catalog and the connection are in the same zone. (However, with a low-latency high-bandwidth connection available, they can be in different zones.)
- When you place items in a satellite zone it affects how the site interacts with them and with other objects related to them.
    - When Controllers are placed into a satellite zone, it is assumed that those machines have good (local) connectivity to hypervisors and VDAs in the same zone. Controllers in that satellite zone are then used in preference to Controllers in the primary zone for handling those hypervisors and VDA machines.
    - When a hypervisor connection is placed into a satellite zone, it is assumed that all the hypervisors managed via that hypervisor connection also reside in that satellite zone. Controllers in that satellite zone are then used in preference to Controllers in the primary zone when communicating with that hypervisor connection.
    - When a machine catalog is placed into a satellite zone, it is assumed that all the VDA machines in that catalog are in the satellite zone. Local Controllers are used in preference to Controllers in the primary zone when attempting to register with the site, after the Controller list auto-update mechanism has activated after the first registration of each VDA.
    - Citrix Gateway instances can also be associated with zones. This is done as part of the StoreFront Optimal HDX™ Routing configuration rather than, as for the other elements described here, as part of the site configuration. When a Citrix Gateway is associated with a zone, it is preferred to be used when HDX connections to VDA machines in that zone are used.
- When you create a production site and then create the first catalog and Delivery Group, all items are in the primary zone –you cannot create satellite zones until after you complete that initial

© 1997–2026 Citrix Systems, Inc. All rights reserved.

setup. (If you create an empty site, the primary zone will initially contain only a Controller. You can create satellite zones before or after creating a catalog and Delivery Group.)

- When you create the first satellite zone containing one or more items, all other items in your site remain in the primary zone.
- The primary zone is named 'Primary' by default; you can change that name. Although Web Studio indicates which zone is the primary zone, it is best practice to use an easily identifiable name for the primary zone. You can reassign the primary zone (that is, make another zone the primary zone), but it should always contain the site database and any high availability servers.
- Always keep the site database in the primary zone.
- After you create a zone, you can later move items from one zone to another. This flexibility allows you to potentially separate items that work best in close proximity. For example, moving a catalog to a different zone than the connection (host) that creates the machines in the catalog, can affect performance. Consider potential unintended effects before moving items between zones. Keep a catalog and the host connection it uses in the same zone, or in zones which are well connected (for example, via a low-latency and high-bandwidth network).
- For optimal performance, install Web Studio and Director only in the primary zone. You can access Web Studio and Director from a satellite zone (for example, a satellite zone containing Controllers to use as failover if the primary zone becomes inaccessible) because they are web application.
- Ideally, Citrix Gateway in a satellite zone is used for user connections coming into that zone from other zones or external locations, although you can use it for connections within the zone.
- Remember: To use the zone preference feature, you must be using minimum StoreFront 3.7 and Citrix Gateway 11.0-65.x.

Connection quality limits

The Controllers in the satellite zone perform SQL interactions directly with the site database. This imposes some limits on the quality of the link between the satellite zone and the primary zone containing the site database. The specific limits are relative to the number of VDAs and user sessions on those VDAs that are deployed in the satellite zone. So satellite zones with only a few VDAs and sessions can function with a poorer-quality connection to the database than satellite zones with large numbers of VDAs and sessions.

For more information, see Latency and SQL Blocking Query Improvements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The impact of latency on brokering performance

Although zones allow users to be on higher-latency links, providing that there is a local broker, the additional latency inevitably impacts end-user experience. For most work that users do, they experience slowness caused by round trips between Controllers in the satellite zone and the site database.

For launching applications, extra delays occur while the session brokering process identifies suitable VDAs to send session launch requests to.

Create and manage zones

A Full Administrator can perform all zone creation and management tasks. However, you can also create a custom role that allows you to create, edit, or delete a zone. Moving items between zones does not require zone-related permissions (except zone read permission); however, you must have edit permission for the items you are moving. For example, to move a catalog from one zone to another, you must have edit permission for that catalog. For more information, see Delegated administration.

If you use Citrix Provisioning™: The Citrix Provisioning console is not aware of zones, so we recommend using Web Studio to create catalogs for satellite zones. Create the catalog in Web Studio, specifying the correct satellite zone. Then use the Citrix Provisioning console to provision machines in that catalog. (If you create the catalog using the Citrix Provisioning wizard, the catalog is placed in the primary zone. You must use Web Studio to move it to the satellite zone later.)

Create a zone

1. Sign in to Web Studio.
2. Select **Zones** in the left pane.
3. Select **Create Zone** in the action bar.
4. Enter a name for the zone, and a description (optional). The name must be unique within the site.
5. Select the items to place in the new zone. You can filter or search the list of items from which you can select. You can also create an empty zone; simply do not select any items.
6. Click **Save**.

As an alternative to this method, you can select one or more items in Web Studio and then select **Create Zone** in the action bar.

Change a zone name or description

1. Sign in to Web Studio.
2. Select **Zones** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select a zone in the middle pane and then select **Edit Zone** in the action bar.
4. Change the zone name, description, or both. If you change the name of the primary zone, make sure the zone remains easily identifiable as the primary zone.
5. Click **Save** or **Apply**.

Move items from one zone to another zone

1. Sign in to Web Studio.
2. Select **Zones** in the left pane.
3. Select a zone in the middle pane, and then select one or more items.
4. Drag the items to the destination zone or select **Move Items** in the action bar and then specify which zone to move them to.

A confirmation message lists the items you selected and asks if you are sure you want to move all of them.

Remember: When a catalog uses a host connection to a hypervisor or other service, place both the catalog and the connection in the same zone. Otherwise, performance can be affected. If you move one, move the other, too.

Delete a zone

A zone must be empty before it can be deleted. You cannot delete the primary zone.

1. Sign in to Web Studio.
2. Select **Zones** in the left pane.
3. Select a zone in the middle pane.
4. Select **Delete Zone** from the action bar. If the zone is not empty (it contains items), you are asked to choose the zone where those items will be moved.
5. Confirm the deletion.

Add a home zone for a user

Configuring a home zone for a user is also known as *adding a user to a zone*.

1. Sign in to Web Studio.
2. Select **Zones** in the left pane, and then select a zone in the middle pane.
3. Select **Add Users to Zone** in the action bar.
4. In the **Add Users to Zone** dialog box, click **Add** and then select the users and user groups to add to the zone. If you specify users who already have a home zone, a message offers two choices:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Yes = add only those users you specified who do not have a home zone; **No** = return to the user selection dialog.

5. Click **OK**.

For users with a configured home zone, you can require that sessions launch only from their home zone:

1. Create or edit a delivery group.
2. On the **Users** page, select the **Require sessions to launch in a user's home zone (if configured)** check box.

All sessions launched by a user in that delivery group must launch from machines in that user's home zone. If a user in the delivery group does not have a configured home zone, this setting has no effect.

Remove a home zone for a user

This procedure is also known as removing a user from a zone.

1. Sign in to Web Studio.
2. Select **Zones** in the left pane, and then select a zone in the middle pane.
3. Select **Remove Users from Zone** in the action bar.
4. In the **Add Users to Zone** dialog box, click **Remove** and then select the users and groups to remove from the zone. This action removes the users only from the zone; those users remain in the delivery groups and application groups to which they belong.
5. Confirm the removal when prompted.

Manage home zones for applications

Configuring a home zone for an application is also known as adding an application to a zone. By default, in a multi-zone environment, an application does not have a home zone.

An application's home zone is specified in the application's properties. You can configure application properties when you add the application to a group or later.

- When creating a Delivery Group, creating an Application Group, or adding applications to existing groups, select **Properties** on the **Applications** page of the wizard.
- To change an application's properties after the application is added, select **Applications** in the left pane. Select an application and then select **Edit Application Properties** in the action bar.

On the **Zones** page of the application's properties/settings:

- If you want the application to have a home zone:
  - Select **Use the selected zone to decide** radio button and then select the zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - If you want the application to launch only from the selected zone (and not from any other zone), select the check box under the zone selection.

- If you do not want the application to have a home zone:
    - Select the **Do not configure a home zone** radio button.
    - If you do not want the broker to consider any configured user zones when launching this application, select the check box under the radio button. In this case, neither application or user home zones are used to determine where to launch this application.

Other actions that include specifying zones

After you create at least one satellite zone, you can specify a zone when you add a host connection or create a catalog.

Usually, the primary zone is the default. When using Machine Creation Services™ to create a catalog, the zone that is configured for the host connection is automatically selected.

If the site contains no satellite zones, the primary zone is assumed and the zone selection box does not appear.

Remove broker user from the cache

May 13, 2026

There are cases when administrators are unable to remove a broker user from the cache or sometimes when running `Get-BrokerUser`, the user displays the incorrect SID from AD.

This happens when the user is deleted from AD and recreated but the broker cache still has the previous user SID.

To resolve this, do the following:

1. Remove the users from Active Directory.
2. Run `Get-BrokerUser` for each removed account. Accounts that are not referenced anywhere, do not return any results. For users that are referenced, you get a value after you run `Get-BrokerUser`. Now, you must find out what resources the user is assigned to and manually remove the users from those resources.

   For example:

    - Find if the user is assigned to an application: `Get-BrokerApplication`
    - Find if the user is assigned to an application group: `Get-BrokerApplicationGroup`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Find if the user is assigned to an access policy: `Get-BrokerAccessPolicyRule`
- Find if the user is assigned to an application entitlement policy: `Get-BrokerAppEntitlementPol`
- Find if the user is assigned to a desktop entitlement policy: `Get-BrokerEntitlementPolicyRul`
- Find if the user is assigned to a desktop group session linger: `Get-BrokerSessionLinger`
- Find if the user is running any sessions on a VDA: `Get-BrokerSession`
- Find if the user is assigned to a resource in the merged group: `Get-BrokerMergedResource`
- Find if the user is assigned to a group of resources: `Get-BrokerMergeGroup`
- Find if a command is queued for a user: `Get-BrokerMachineCommand`
- Find if the user is assigned to a private desktop: `Get-BrokerMachineV2`
- Find if the user is assigned to a zone preference: `Get-BrokerUserZonePreference`

3. Manually remove the users from the resources.
4. Run `Get-BrokerUser` command to confirm the user has been removed from all resources.
5. Once the user has been removed from all resources, run the following to remove the user from the cache.

```
Update-BrokerNameCache -Users -Purge -UnusedFor 0
```

Citrix Virtual Desktop Assistant application

July 24, 2026

Citrix Virtual Desktop Assistant app is a GUI tool designed to enable end-users to optimize their sessions across CPU, memory, networking, HDX™, and other performance factors. It offers a simple and convenient experience, often requiring just a single click to significantly improve session performance or do the troubleshooting.

Sessions can currently be optimized in the following areas:

- System Resources: CPU and memory optimization.
- Network: Network status checks and personalized recommendations.
- Applications: Display unresponsive applications and option to terminate them.
- Storage: Clean temporary files and identify files larger than 100 MB for deletion directly from the user interface.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Hardware diagnostics and troubleshooting:
  - Audio diagnostic and troubleshooting.
  - Camera device testing.
  - Keyboard diagnostic
  - USB diagnostic

  You can also use Always On Tracing (AOT) feature if there are issues with the VDA.

Installation and execution

For Workstation and Server VDA: The Citrix Virtual Desktop Assistant app is downloaded by default and runs in minimal operation mode. After installation, restart the VDA to display the Citrix Virtual Desktop Assistant app icon in the system tray. Then, click the Citrix Virtual Desktop Assistant app icon in the system tray to launch the graphical user interface (GUI).

You can disable the application through the Citrix Virtual Desktop Assistant Studio Policy Setting. When disabled, the icon is removed from the system tray and users cannot launch the application. To do this:

1. From Studio, go to **Policies**.
2. Right-click the Assistant app, and select **Edit Setting** and click **Disabled**.

Log files

The log files for the Citrix Virtual Desktop Assistant app are stored in `USERPROFILE%\AppData\Local\Temp\citrix\AssistantApp\ctxasst.log`. Use the log file for troubleshooting.

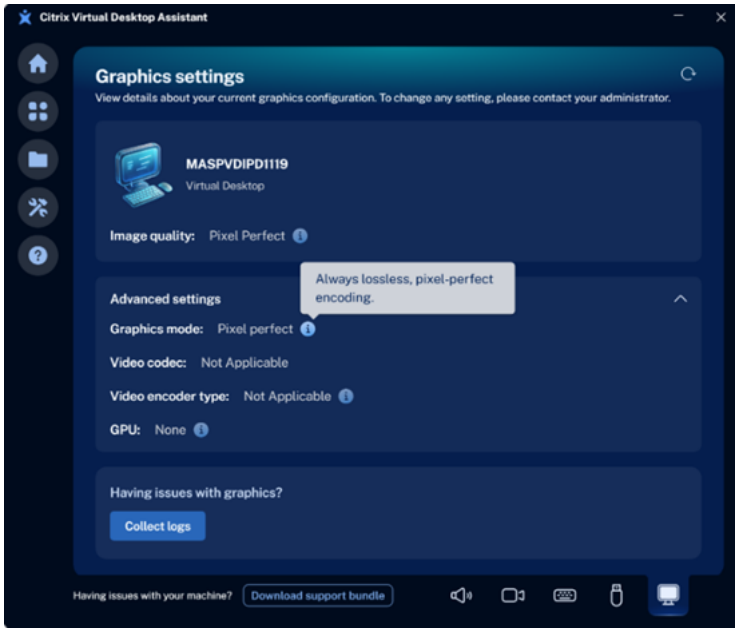
You can attach these logs manually and email to `CitrixVDAssistantFeedback@citrix.com` to help us improve the Citrix Virtual Desktop Assistant application.

Explore the UI

The app automatically detects your operating system's language variant and displays the app in that language.

The app features three main pages, accessible through the left pane:

- Home
- Apps
- Files
- Tools



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- About

Camera, Sound, Keyboard, and USB settings are available in the bottom-right corner.

Graphics page

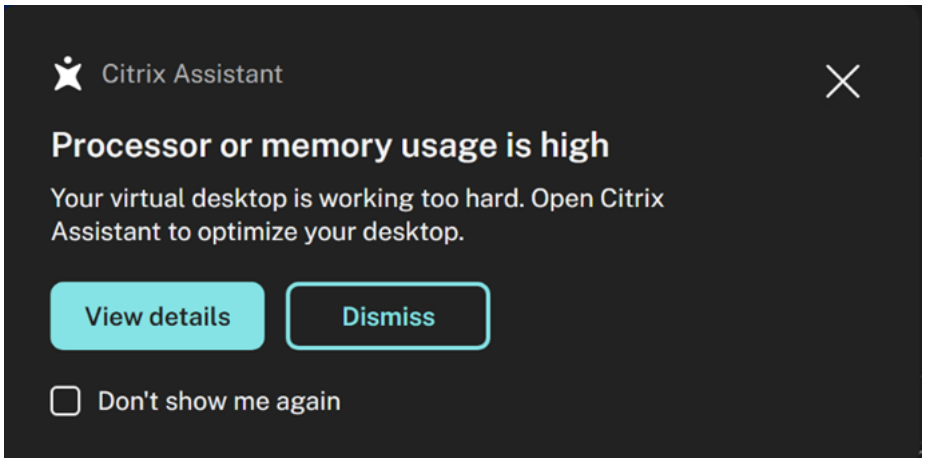
The Citrix Virtual Desktop Assistant app's graphics page helps you view HDX graphics configuration details for the current Virtual Delivery Agent (VDA) session.

- **Image quality:** Displays the current HDX image quality setting for the session.
- **Advanced settings:** Click to expand and view additional graphics details, including:
  - **Graphics mode:** The active HDX graphics rendering mode.
  - **Video codec:** Shows whether video codec is disabled, active for the full screen, or active only for screen regions that are actively changing.
  - **Video encoder type:** The hardware or software encoder currently in use.
  - **GPU:** The GPU model used for the session.

Hover over the info icon next to each setting to learn more about the value.

To troubleshoot graphics issues in a VDA session, click **Collect logs** and share the exported log file with your IT administrator.

To refresh the graphics data, click the **Refresh** icon in the top-right corner.



> **Note:**
>
> The Graphics page is available only in Citrix Virtual Desktop sessions. It is not displayed on phys-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> ical machines.

Proactive notifications

The Citrix Virtual Desktop Assistant app now proactively notifies you when your session is under sustained high load or when your profile storage is running low, so you can take action before performance is affected.

A notification popup appears at the bottom-right corner of the screen in the following situations:

- **High CPU or memory usage:** CPU or memory usage has been above 70% for 30 seconds or more.
- **High profile storage usage:** Your container profile storage has reached 70% or above capacity.

The notification popup provides the following options:

- **View details:** Opens the Citrix Virtual Desktop Assistant app and navigates to the relevant page.
- **Dismiss:** Closes the notification. The notification may appear again after the cooldown period.
- **Don't show me again:** Select this checkbox to permanently disable proactive notifications. This setting persists across sessions.

> **Note:**
>
> Storage notifications apply only to users with a container-type user profile (CitrixContainer or FSLogix).
>
> Notifications are not shown more than once per hour to avoid repeated interruptions during sustained workloads.

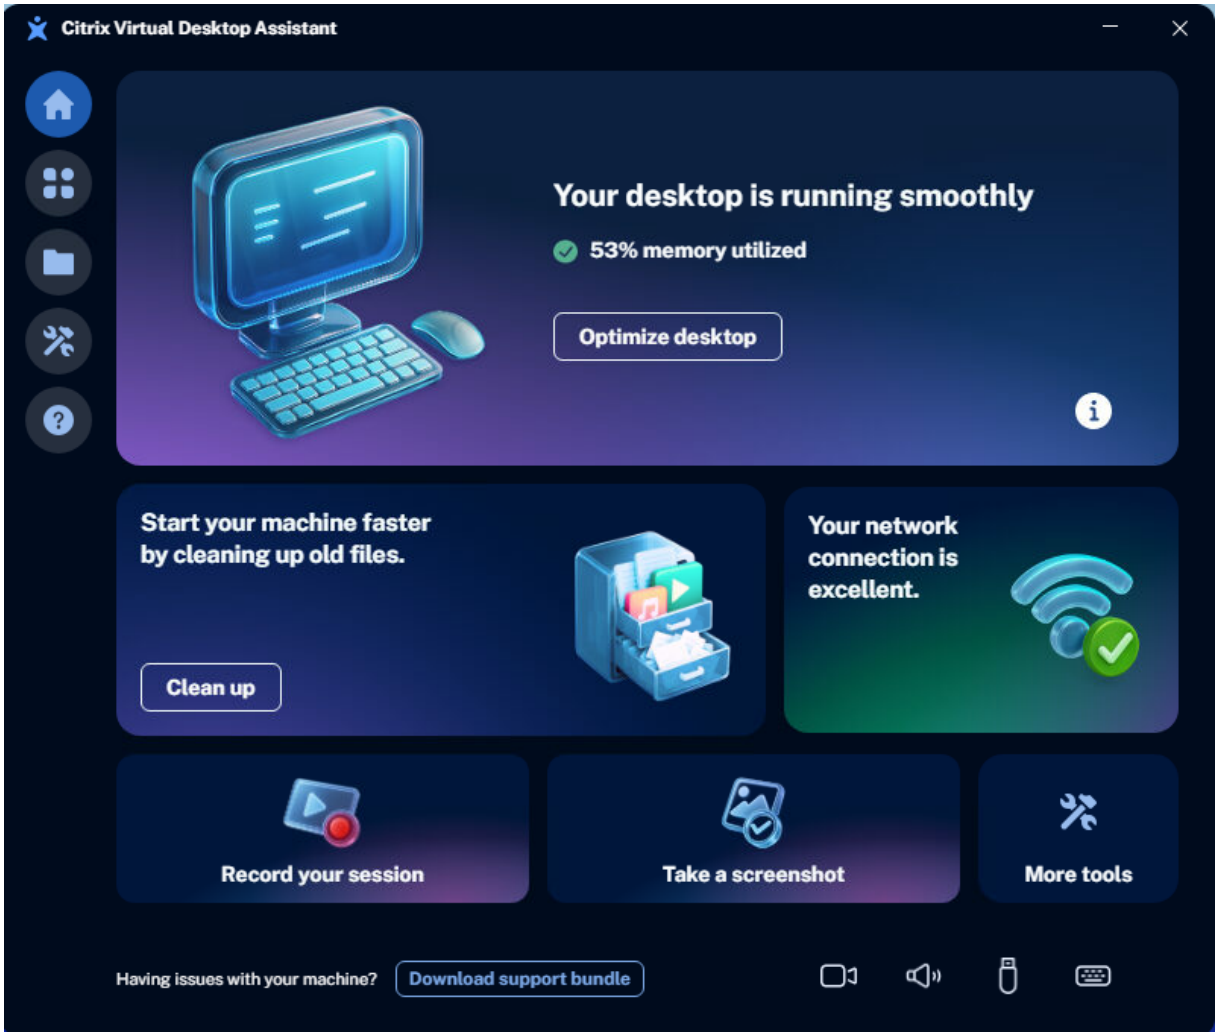
To re-enable notifications after selecting Don't show me again:

Right-click the Citrix Virtual Desktop Assistant icon in the system tray and click Enable Notifications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The Enable Notifications option in the system tray is only available when the administrator policy permits notifications, and the user has previously selected Don't show me again.

DDC Policy control for Proactive notifications You can disable proactive notifications through the **EnableAssistantAppNotificationDialog** Studio Policy Setting under the **AssistantApp** category.



1. From Studio, go to Policies.
2. Search for or locate the EnableAssistantAppNotificationDialog setting under the AssistantApp category.
3. Right-click the setting, select **Edit Setting**, and click **Disabled**.

   > **Note:**
   >
   > This is a machine-level policy. The default value is Enabled.

Home page

The **Home** page provides the following functionalities:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- *Optimize Desktop*: The Optimize feature enhances overall system performance by adjusting CPU priority for resource-intensive applications during periods of high CPU usage. It also reclaims memory from inactive applications to ensure efficient use of system resources. After you click **Optimize Desktop**, you might notice improved system performance, and the applications that have been optimized through memory reclamation.
- *Network Status*: This tile displays VDA network connection status. The network connection result is displayed, based on bandwidth and latency data. The connection status is categorized as excellent, fair, or poor. If the status is fair or poor, clicking **What can I do?** provides recommendations for improvement.

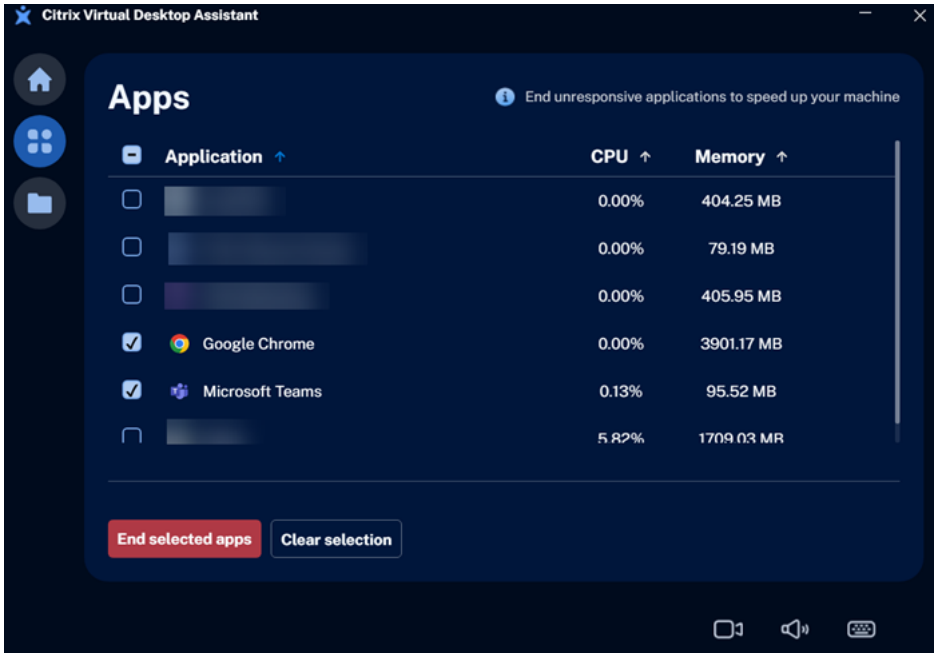
  > **Note:**
  >
  > The option to clean up files is unavailable when the connection is poor.

- *Clean Up*: This option provides information about your user profile and helps in cleaning up temporary or large files (larger than 100 MB). This action can significantly improve your machine'

© 1997–2026 Citrix Systems, Inc. All rights reserved.

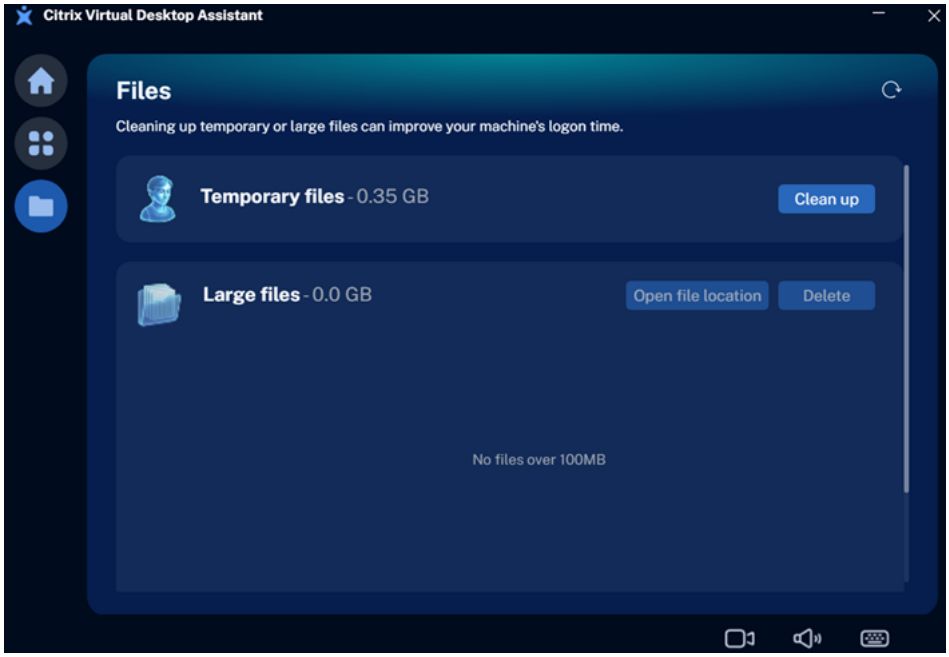
s log-on time. Temporary files include crashed dump reports, application caches, and hidden files that contribute to a bulky profile. You can also access the Files page on the left pane to clean up files. For more information, see Files page.

- *Record your session*: This option helps you to record your active virtual desktop session as MP4 video clips for troubleshooting, collaboration and session review. For information, see Tools page.
- *Take a screenshot*: This option helps you to capture your entire session, including areas that Windows Snipping tool might miss or black out. For information, see Tools page.
- *More tools*: This option takes you to the **Tools** page where you get a variety of tools to enhance your virtual desktop experience. For information, see Tools page.



Apps page

The **Apps** page displays all the unresponsive applications within the VDA session and options to terminate them. You can terminate single or multiple applications from this interface. You also see the **Optimized** tag beside the application name if that application is in the optimized list.

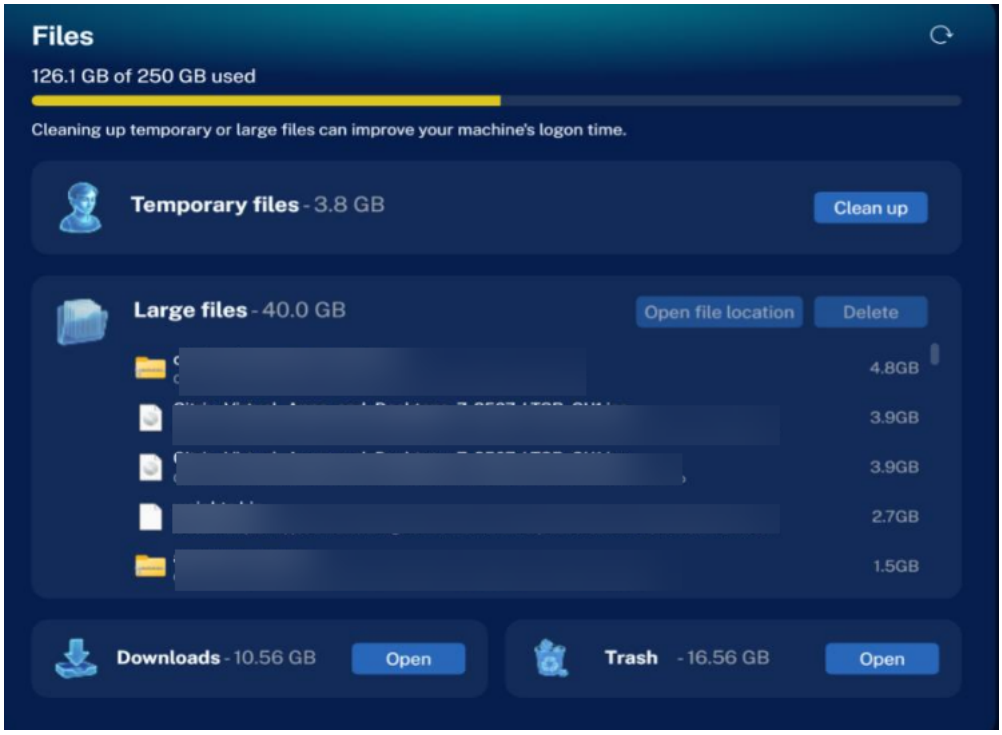


- Terminate a single app: You can either hover over an app row to display the **End** button or select a check box and click **End selected apps**. Confirm the action when prompted.
- Terminate multiple apps: Select multiple applications at a time and click **End selected apps**. Confirm the action when prompted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Files page

The **Files** page provides information about your user profile and helps in cleaning up temporary or large files (larger than 100 MB). This action can significantly improve your machine's log-on time. Temporary files include crashed dump reports, application caches, and hidden files that contribute to a bulky profile.

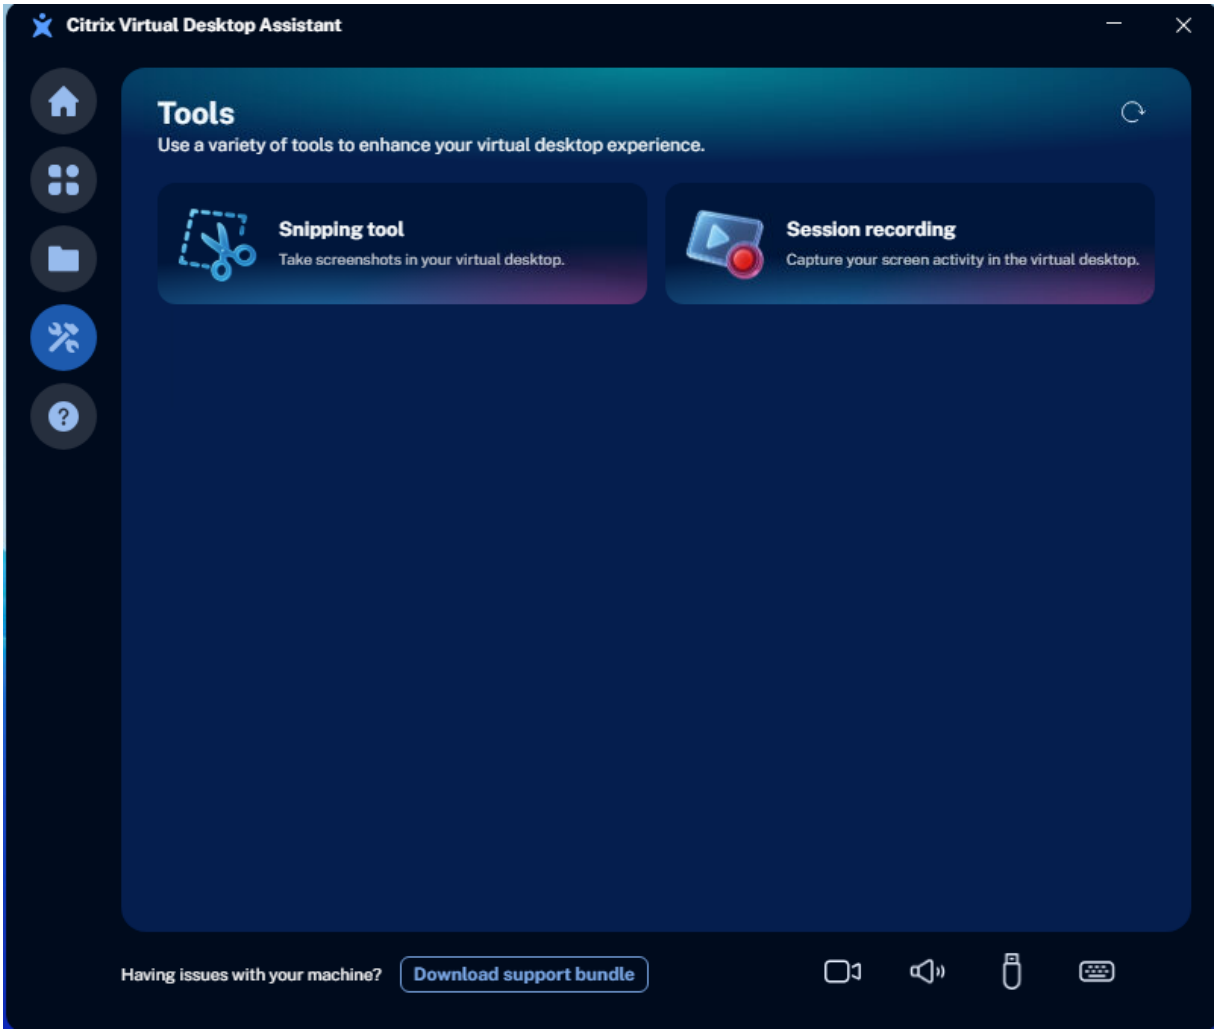


- Temporary files: Click **Clean up** to clean temporary files.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Large files: You can either click **Delete** to remove the large files or click **Open file location** to go to their location and then decide on the appropriate action. You can use **Ctrl** key to select multiple files simultaneously.
- Downloads and Trash folder: Click **Open** to go to their location and then decide on the appropriate action.

For container-type profile, you can also see capacity usage.



To recalculate the data on the **Files** page, click the **Refresh** icon in the top-right corner of the app.

Tools page

The **Tools** page displays the following tools to enhance your virtual desktop experience.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Snipping tool: The Citrix Snipping Tool allows users to seamlessly capture screenshots of overlay and redirected content within their Citrix Virtual Apps and Desktops sessions. This includes optimized media such as Browser Content Redirection (BCR), Microsoft Teams Optimization, and other Unified Communications platforms. For more information, see the Citrix Snipping Tool documentation

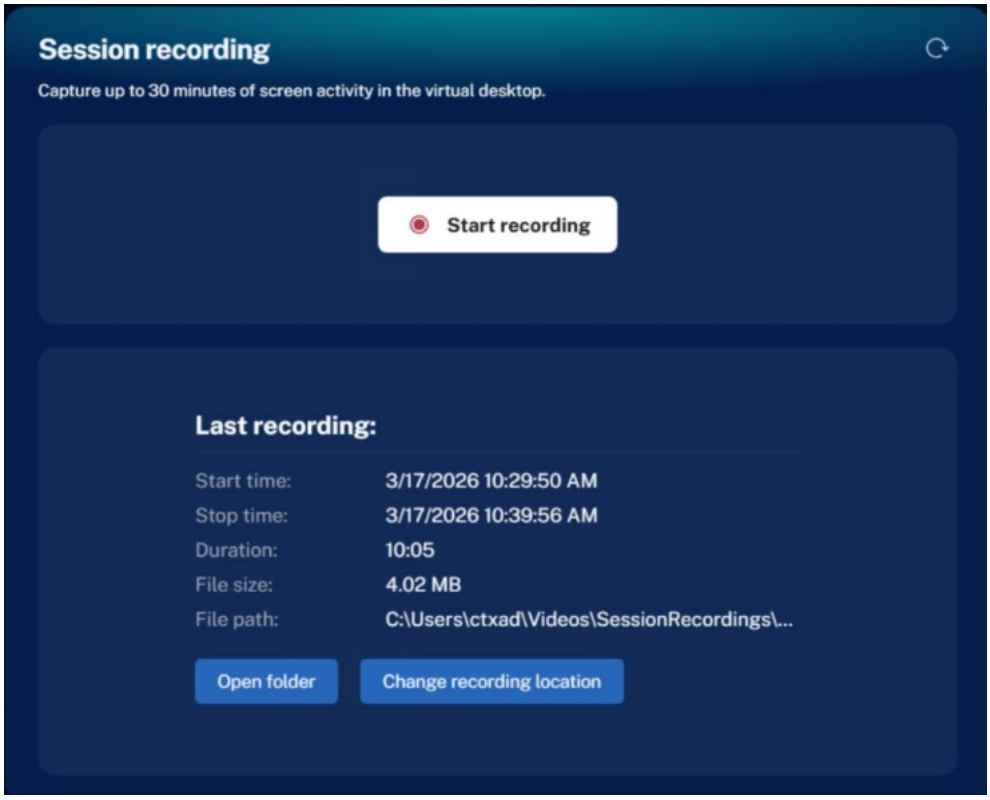
  To capture in-session screenshots:

  1. Click **Snipping tool**.
  2. Click **New** to start a new snip and select the area you want to capture.
  3. Once the snip has been captured, save the snip to file in a `.PNG` or `.BMP` file format, or save to the clipboard.

  > **Note:**
  >
  > - By default, the snipping tool can capture a user-defined region of the VDA session. Alternatively, the snipping tool can also be used to capture a full in-session screenshot

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> of the entire screen (Single screen), or when multiple screens are used (All screens).
> - The snipping tool can also be used with a delayed screenshot. Use the delay button to select the desired delay. After the set delay time is over, the screenshot is taken.



If overlay content is not captured, then check the following:

- Confirm the **Screenshot Redirected Content** policy is enabled in Web Studio.
- Ensure VDA and Citrix Workspace App versions meet minimum requirements.
  - VDA: 2607 LTSR or later
  - Citrix Workspace App (CWA) for Windows : 2607 LTSR or later
  - Supported Clients: Windows only
- Check if App Protection is blocking screenshot functionality.

- Session recording: Records your active virtual desktop session as MP4 video clips for troubleshooting, collaboration and session review.

  On the **Session recording** page, you can manage the capture using the following options:

  - **Start recording**: Begins capturing the current desktop session. A recording indicator is displayed to confirm that the recording is currently in progress.
  - **Stop recording**: Ends the capture and automatically saves the video as an MP4 file.

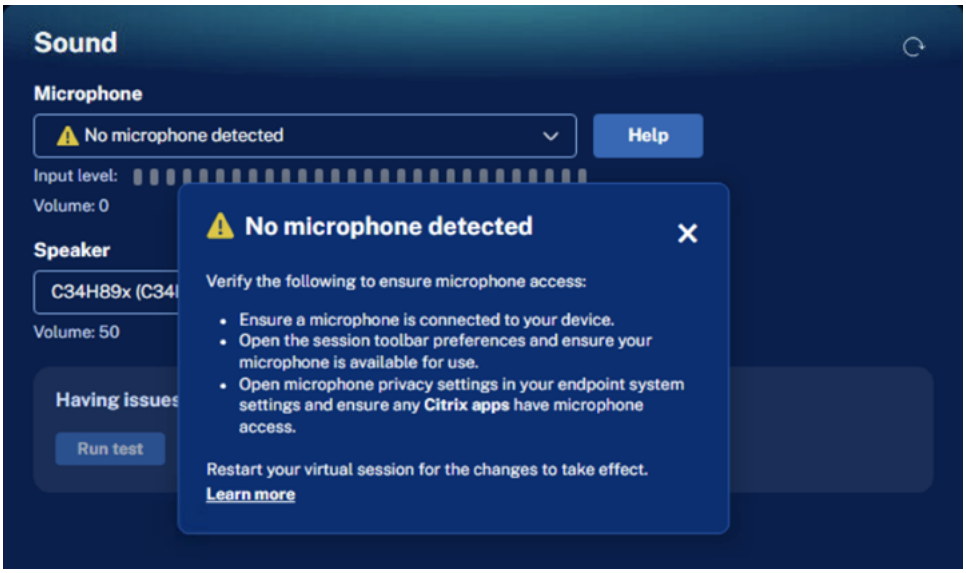
  The **Session recording** page provides the following options to manage captured content:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Open folder**: Opens the configured directory where the recorded MP4 files are stored. By default, recordings are saved to: %userprofile%\Videos\SessionRecordings.
- **Change recording location**: Allows you to modify the storage path for session recordings. Supported locations include:
  - Local Storage: Folders on the virtual machine's local drives.
  - Network Paths: Accessible mapped network drives or UNC paths (for example, \\Server\Share\Recordings), provided you have write permissions.

Sound page

The Citrix Virtual Desktop Assistant app's sound page helps to diagnose and troubleshoot audio settings within a VDA session.

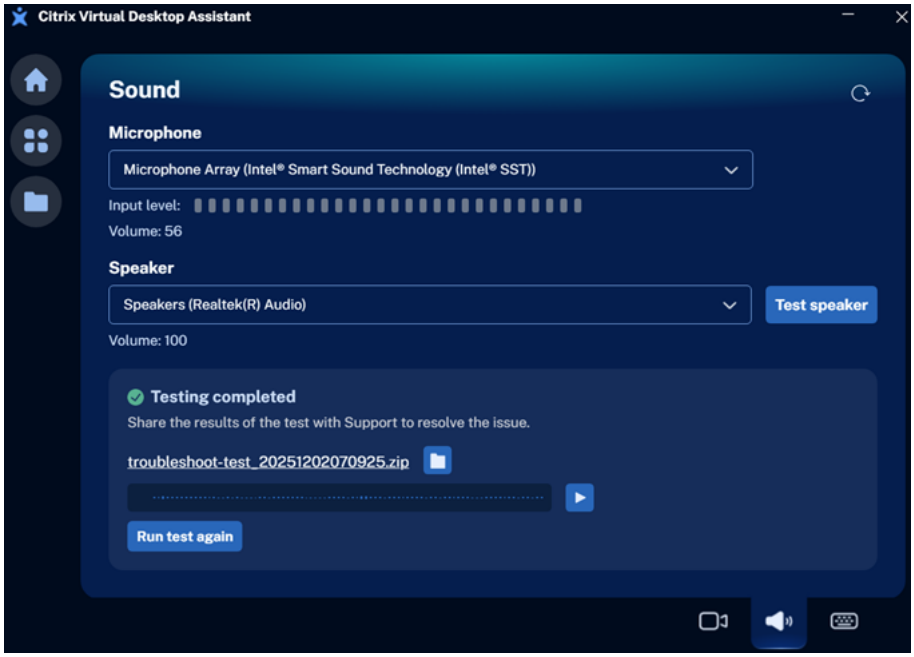


- You can select a Microphone and Speaker from the dropdown list if you have multiple audio devices connected.

  If Citrix Virtual Desktop Assistant cannot use your microphone, you might see one of the following warning messages:

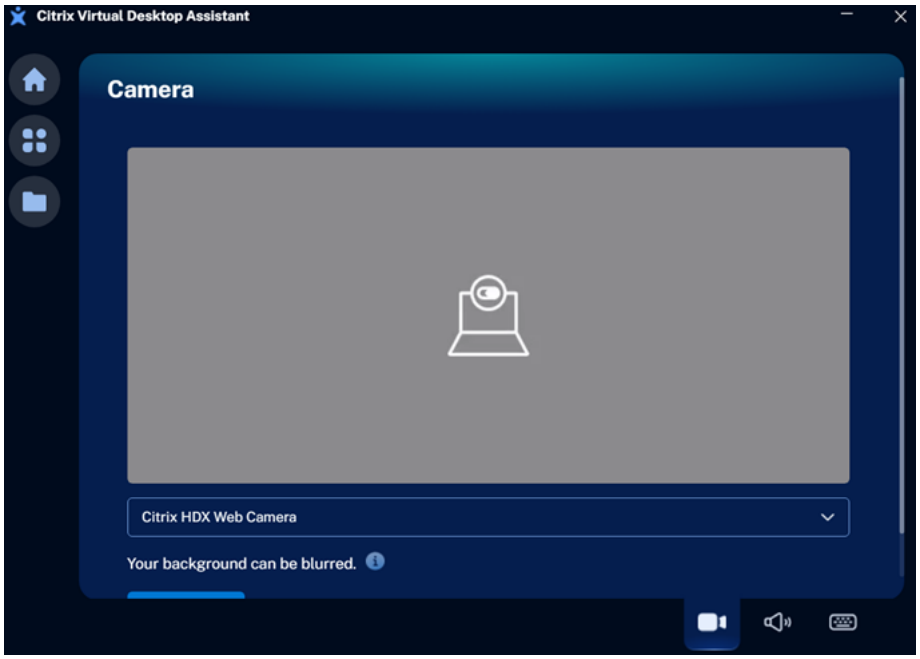
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **No microphone detected**: It is most likely caused by microphone privacy settings being disabled for the the Citrix Workspace app. Check your microphone privacy settings and enable access for the Citrix Workspace app, following the tips shown in the dialog.



- **Allow microphone access**: It happens when Citrix Virtual Desktop Assistant does not have microphone access in the current Citrix virtual desktop. Resolve this issue by following the tips shown in the dialog.

- Click **Test speaker** to test the selected speaker device by playing a demo audio.
- When troubleshooting audio device issues within a VDA session, click **Run test** and then the application records the sound input. This recording is then exported into a zip file. You can



© 1997–2026 Citrix Systems, Inc. All rights reserved.

share the zip file with your IT or Citrix Admin team for assistance. You can also replay the audio to verify sound playback.

Camera page

The Citrix Virtual Desktop Assistant app's camera page helps to configure video settings within a VDA session.

- You can select a camera from the dropdown list if you have multiple cameras connected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

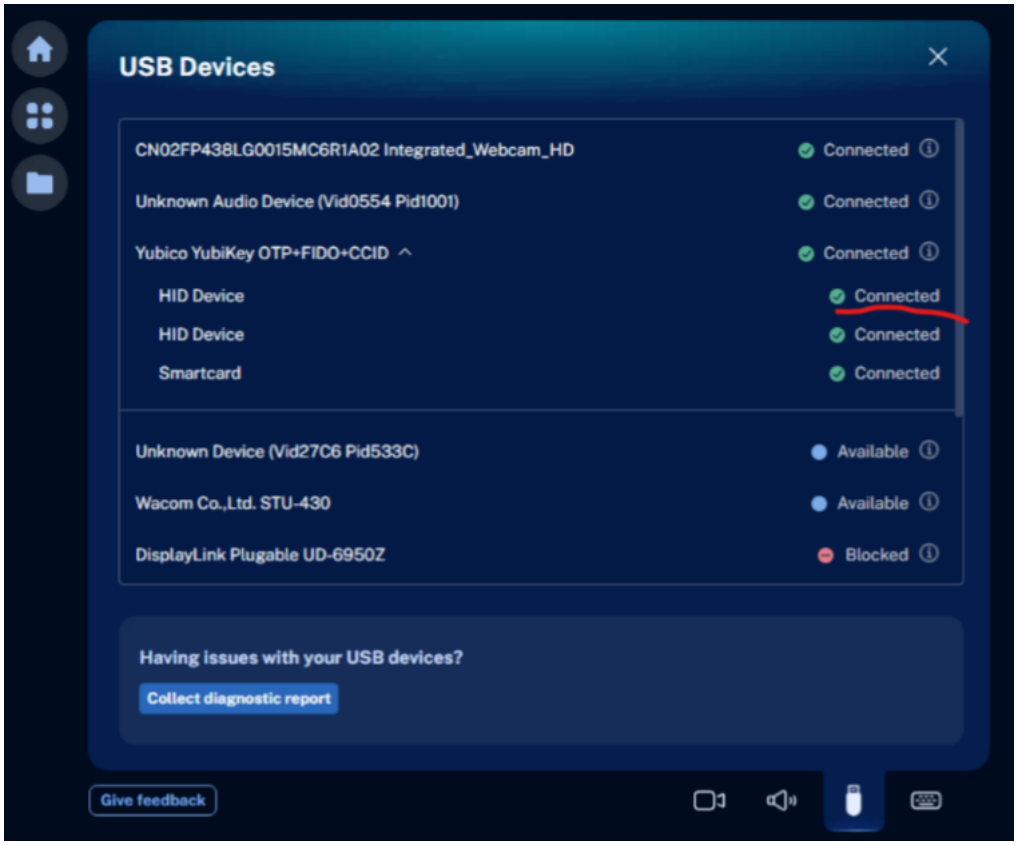
> **Note:**
>
> If only **Citrix HDX Web Camera** is displayed and you have multiple camera devices connected on the CWA client, then reboot the VDA machine to see the list of all connected camera devices. Make sure to reboot only after you install the Citrix Virtual Desktop Assistant App.

- You can blur your background. To blur your background, navigate to **Citrix Workspace™ app > Preferences > Default webcam > Enable background blur**.
- To adjust your camera settings, click **Retry Camera**. However, make sure that the camera is not in use by other video conferencing tools.

Keyboard page

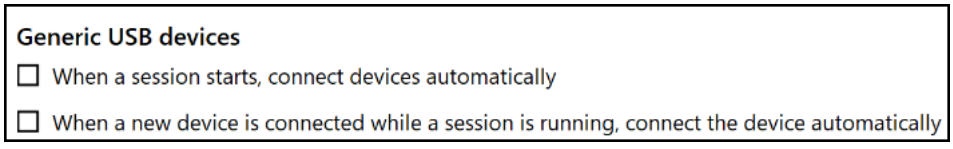
The **Keyboard** page displays your local device keyboard layout, Virtual desktop keyboard layout, sync setting, and keyboard shortcut settings in a single view. You can update these settings from your Citrix Workspace app (CWA) preferences toolbar, and the changes reflect in your Assistant app.

For troubleshooting keyboard or IME issues within a VDA session, click **Collect Diagnostic Report** at the bottom of the page.



> **Note:**
>
> Hover over the info icon to learn about the keyboard setting values.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



USB page

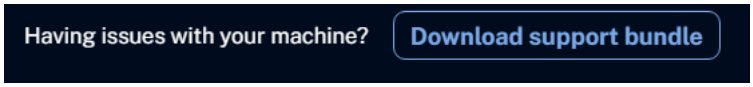
The **USB** page lets you view your USB devices.

If you don't see the USB screen in Citrix Assistant, ensure the following:

- Your Citrix Workspace app (CWA) version is 2511 or later.
- The USB Redirection Policy is disabled.
- The following checkboxes are selected in your Preferences toolbar.

USB devices can have five different status values:

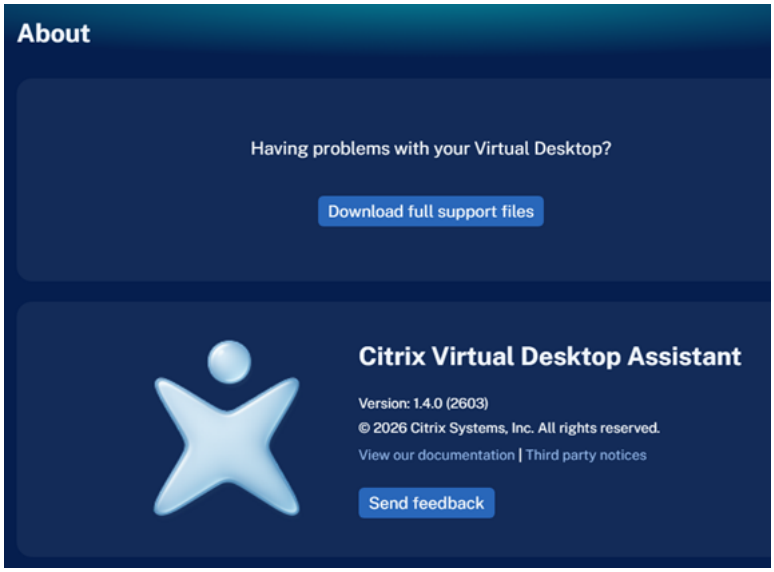
- **Connected**: These devices have redirected successfully, use a virtual channel, and are available for use on both your client and VDA.
- **Connected with info**: These USB devices have been redirected successfully and are available for use on the VDA. You can disable them by accessing the **Devices** toolbar from the Citrix Workspace app (CWA) toolbar.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Driver missing**: These devices require a driver to be installed on the VDA, and that driver is currently missing.
- **Blocked**: These devices are blocked by your administrator through device rules. To use these devices, contact your administrator.
- **Available**: Enable these devices from the **Devices** toolbar. Once enabled, they connect and become ready for use on the VDA.

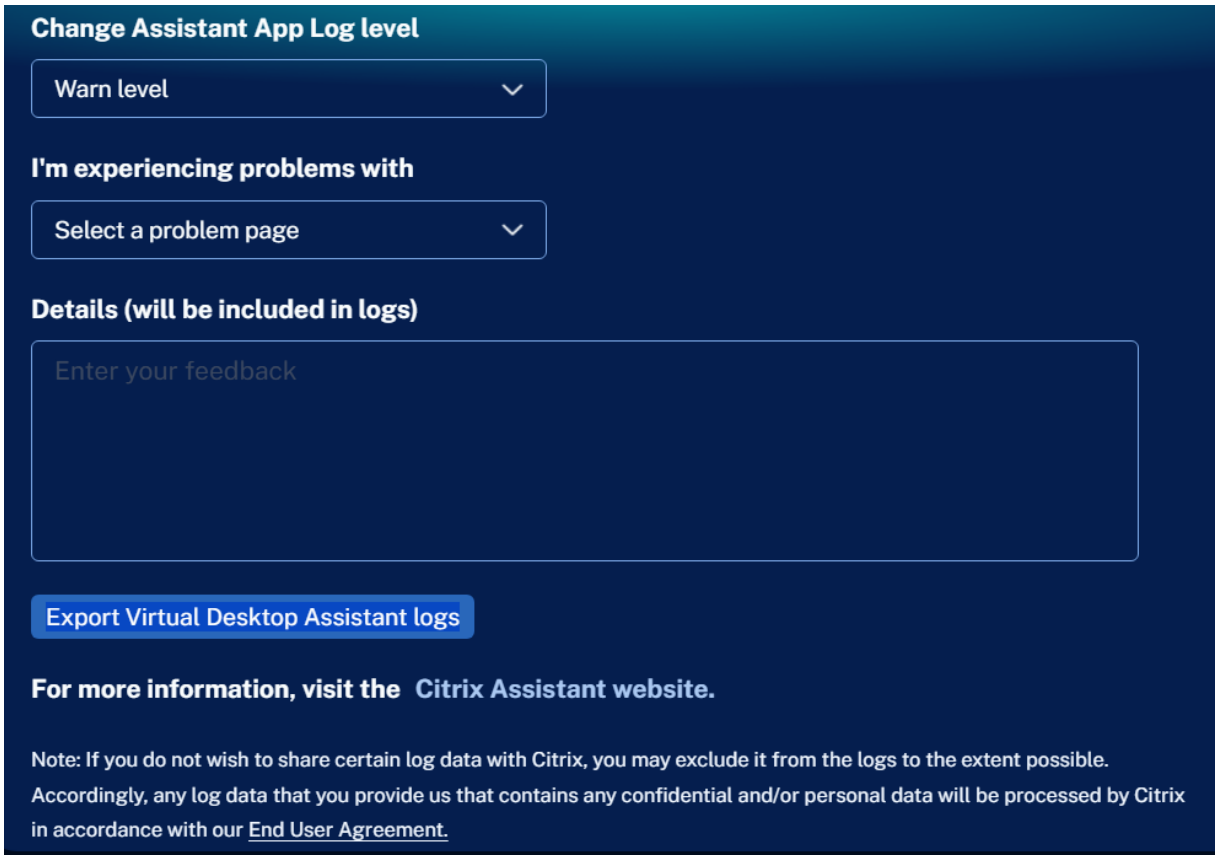
For troubleshooting USB issues within a VDA session, click **Collect Diagnostic Report** at the bottom of the page.



AOT logs

If your administrator has setup the Always On Tracing (AOT) feature and you are facing issues on your VDA, click **Download support bundle** to export logs for your session and share the logs with your administrator. The logs also capture the software versions of your Citrix software for the administrator or support to isolate issues based on versions.

About page



From the left pane, right-click the **About** icon to open the **About** page.

The version information and the third-party license entry of the Citrix Virtual Desktop Assistant app are displayed on the **About** page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can also download support files and send feedback along with the Citrix Virtual Desktop Assistant logs.

Limitations

- **Temporary file cleanup limitation**: The temporary files that are read-only, corrupted, or actively in use, can't be cleaned.
- **Large file rendering time**: The **Large files** section might take a significant amount of time to display files. Efforts are underway to reduce the listing time for these files.
- **Recording location limitation**: The session recording storage path currently supports only English characters.

Monitor

May 15, 2026

Administrators and help desk personnel can monitor Citrix Virtual Apps and Desktops™ Sites using a variety of features and tools. Using these tools, you can monitor:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- User sessions and session use
- Logon performance
- Connections and machines, including failures
- Load evaluation
- Historical trends
- Infrastructure

Citrix Director

Director is a real-time web tool that you can use to monitor and troubleshoot, and to perform support tasks for end users.

For details, see the Director articles.

Configuration Logging

Configuration Logging allows administrators to keep track of administrative changes to a Site. Configuration Logging can help administrators diagnose and troubleshoot problems after configuration changes are made, assist change management and track configurations, and report administration activity.

You can view and generate reports about logged information from Studio. You can also view logged items in Director with the Trend View to provide notifications of configuration changes. This feature is useful for administrators who don't have access to Studio.

The Trends View gives historical data of configuration changes over a period of time so administrators can assess what changes were made to the Site, when they were made, and who made them to find the cause of an issue. This view sorts configuration information into three categories:

- Connection Failures
- Failed Single-session Machines
- Failed Multi-session Machines

For details about how to enable and configure Configuration Logging, see Configuration Logging. The Director articles describe how to view logged information from that tool.

Event logs

Services within Citrix Virtual Apps and Desktops™ log events that occur. Event logs are used to monitor and troubleshoot operations.

For details, see Event logs. Individual feature articles might also contain event information.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration logging

May 13, 2026

Configuration logging is a feature that captures site configuration changes and administrative activities to the database. The feature is enabled by default. You can use the logged content to:

- Diagnose and troubleshoot problems after configuration changes are made. The log provides a breadcrumb trail.
- Assist change management and track configurations.
- Report administration activity.

You set configuration logging preferences, display configuration logs, and generate HTML and CSV reports from Citrix Studio. You can filter configuration log displays by date ranges and full text search results. Mandatory logging, when enabled, prevents configuration changes from being made unless they can be logged. With appropriate permission, you can delete entries from the configuration log. You cannot use the configuration logging feature to edit log content.

Configuration logging uses a PowerShell SDK and the Configuration Logging Service. The Configuration Logging Service runs on every Controller in the site. If one Controller fails, the service on another Controller automatically handles logging requests.

By default, the configuration logging feature is enabled, and uses the database that is created when you create the site (the site configuration database). You can specify a different location for the database. The configuration logging Database supports the same high availability features as the site configuration Database.

Access to configuration logging is controlled through delegated administration, with the Edit Logging Preferences and View Configuration Logs permissions.

Configuration logs are localized when they are created. For example, a log created in English is read in English, regardless of the locale of the reader.

What is logged

Configuration changes and administrative activities initiated from Studio, Director, and PowerShell scripts are logged. Examples of logged configuration changes include working with (creating, editing, deleting assigning):

- Machine catalogs
- Delivery groups (including changing power management settings)
- Administrator roles and scopes
- Host resources and connections

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Citrix policies through Studio

Examples of logged administrative changes include:

- Power management of a virtual machine or a user desktop
- Studio or Director sending a message to a user

The following operations are not logged:

- Autonomic operations such as pool management power-on of virtual machines.
- Policy actions implemented through the Group Policy Management Console (GPMC); use Microsoft tools to view logs of those actions.
- Changes made through the registry, direct access of the database, or from sources other than Studio, Director, or PowerShell.
- When the deployment is initialized, configuration logging becomes available when the first Configuration Logging Service instance registers with the Configuration Service. Therefore, the early stages of configuration are not logged (for example, when the database schema is obtained and applied, when a hypervisor is initialized).

Manage configuration logging

By default, configuration logging uses the database that is created when you create a site (also known as the site configuration database). Citrix recommends that you use a separate location for the configuration logging database (and the monitoring database) for the following reasons:

- The backup strategy for the configuration logging database is likely to differ from the backup strategy for the site configuration database.
- The volume of data collected for configuration logging (and the Monitoring Service) might adversely affect the space available to the site configuration database.
- It splits the single point of failure for the three databases.

Product editions that do not support configuration logging do not have a Logging node in Studio.

Enable and disable configuration logging and mandatory logging

By default, configuration logging is enabled, and mandatory logging is disabled.

1. Sign in to Web Studio and select **Logging** in the left pane.
2. Select **Preferences** in the action bar. The configuration logging dialog box contains database information and indicates whether configuration logging and mandatory logging are enabled or disabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select the desired action:

   To enable configuration logging, select **Enable**. This is the default setting. If the database cannot be written to, the logging information is discarded, but the operation continues.

   To disable configuration logging, select **Disable**. If logging was previously enabled, existing logs remain readable with the PowerShell SDK.

   To enable mandatory logging, select **Prevent changes to the site configuration when the database is not available**. No configuration change or administrative activity that is normally logged is allowed unless it can be written in the configuration logging database. You can enable mandatory logging only when configuration logging is enabled (when **Enable** is selected). If the Configuration Logging Service fails, and high availability is not in use, mandatory logging is assumed. In such cases, operations that would normally be logged are not performed.

   To disable mandatory logging, select **Allow changes when to the site configuration when the database is not available**. Configuration changes and administrative activities are allowed, even if the configuration logging database cannot be accessed. This is the default setting.

Change the configuration logging database location

You cannot change the database location when mandatory logging is enabled, because the location change includes a brief disconnect interval that cannot be logged.

1. Create a database server, using a supported SQL Server version.
2. Sign in to Web Studio and select **Logging** in the left pane.
3. Select **Preferences** in the action bar.
4. In the Logging Preferences dialog box, select **Change logging database**.
5. In the Change Logging Database dialog box, specify the location of the server containing the new database server. See Database address formats for valid formats.
6. To allow Studio to create the database, click **OK**. When prompted, click **OK**, and the database is created automatically. Studio attempts to access the database using the current Studio user's credentials. If that fails, you are prompted for the database user's credentials. Studio then uploads the database schema to the database. (The credentials are retained only during database creation.)
7. To create the database manually, click **Generate database script**. The generated script includes instructions for manually creating the database. Ensure that the database is empty and that at least one user has permission to access and change the database before uploading the schema.

The configuration logging data in the previous database is not imported to the new database. Logs cannot be aggregated from both databases when retrieving logs. The first log entry in the new configuration logging database indicates that a database change occurred, but it does not identify the previous database.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

View configuration log content

To view configuration log content, select **Logging** in the left pane, and then select the **Events** tab.

By default, event logs are listed by administrator names. You can perform the following tasks as needed:

- **View log details.** A high-level operation results in one or more service and SDK calls, which are low level operations. When you select a high-level operation in the upper pane, the lower pane displays the low-level operations.
- **Sort the display.** Sort the display by clicking a column header.
- **Filter logs.** Refine the display by setting filter conditions such as day intervals or custom periods or by entering complete or partial Main Task names in the Search box. To return to the standard display after using search, clear the text in the Search box.
- **Export logs.** Export selected or all logs to a CSV file for archiving or further analysis.
- **Customize columns.** Tailor the display to your needs by adding non-default columns such as Client IP and Labels.
- **Manage labels.** Add, edit, and remove labels for event logs to enhance log organization and tracking.

Display characteristics:

- If an operation fails before completion, the log operation might not be completed in the database. For example, a start record has no corresponding stop record. In such cases, the log indicates that there is missing information. When you display logs based on time ranges, incomplete logs are shown if the data matches the criteria.

  For example, if you request logs for the last five days, and a log with a start time in the last five days has no end time, it's included.

- When using a script that calls PowerShell cmdlets, if you create a low-level operation without specifying a parent high-level operation, configuration logging creates a surrogate high-level operation.

Generate reports

You can generate CSV and HTML reports containing configuration log data.

- The CSV report contains all the logging data from a specified time interval. The hierarchical data in the database is flattened into a single CSV table. No aspect of the data has precedence in the file. No formatting is used and no human readability is assumed. The file (named MyReport) contains the data in a universally consumable format. CSV files are often used for archiving data or as a data source for a reporting or data manipulation tool such as Microsoft Excel.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The HTML report provides a human-readable form of the logging data for a specified time interval. It provides a structured, navigable view for reviewing changes. An HTML report comprises two files, named Summary and Details. Summary lists high level operations: when each operation occurred, by whom, and the outcome. Clicking a **Details** link next to each operation takes you to the low level operations in the Details file, which provides additional information.

To generate a configuration log report, select **Logging** in the Studio navigation pane, and then select **Create custom report** in the action bar.

- Select the date range for the report.
- Select the report format: CSV, HTML, or both.
- Browse to the location where you want to save the report.

Delete configuration log content

To delete the configuration log, you must have certain delegated administration and SQL Server database permissions.

- **Delegated administration:** You must have a delegated administration role that allows the deployment configuration to be read. The Full administrator role has this permission. A custom role must have Read Only or Manage selected in the Other permissions category.

  To create a backup of the configuration logging data before deleting it, the custom role must also have Read Only or Manage selected in the Logging Permissions category.

- **SQL Server database:** You must have a SQL server login with permission to delete records from the database. There are two ways to do this:

  - Use a SQL Server database login with a sysadmin server role, which allows you to perform any activity on the database server. Alternatively, the `serveradmin` or `setupadmin` server roles allow you to perform deletion operations.
  - If your deployment requires more security, use a non-sysadmin database login mapped to a database user who has permission to delete records from the database.

    1. In SQL Server Management Studio, create a SQL Server login with a server role other than 'sysadmin.'
    2. Map the login to a user in the database. SQL Server automatically creates a user in the database with the same name as the login.
    3. In Database role membership, specify at least one of the role members for the database user: `ConfigurationLoggingSchema_ROLE` or `dbowner`.

    For more information, see the SQL Server Management Studio documentation.

To delete the configuration logs:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Sign in to Web Studio and select **Logging** in the left pane.
2. Select **Delete logs** in the action bar.
3. You are asked if you want to create a backup of the logs before they are deleted. If you choose to create a backup, browse to the location where the backup archive is saved. The backup is created as a CSV file.

After the configuration logs are cleared, the log deletion is the first activity posted to the empty log. That entry provides details about who deleted the logs, and when.

View API and PowerShell logs

To monitor API requests made during your current session, click the **APIs** tab. API logs are cleared after you sign out of Web Studio.

To view PowerShell commands corresponding to UI actions you've taken during the day, click the **PowerShell** tab.

Associate metadata with configuration logs

You can attach metadata to configuration logs by associating a `name-value` pair called `MetadataMap` with the log records.

> **Note:**
>
> - You can only attach metadata to high-level operation objects.
> - Metadata is associated with the existing records at the time of execution.

Set the metadata

Run the PowerShell command `Set-LogHighLevelOperationMetadata` to associate a log record with the `MetadataMap`.
`Set-LogHighLevelOperationMetadata` takes the following parameters:

- **Id**: ID of the high-level operation.
- **InputObject**: The high-level operations to which you add the metadata. This is an alternative to the `Id` parameter where a high-level operation object or list of objects is passed to the PowerShell command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Name: Property name of the metadata to be added. The property must be unique for the high-level operation specified. The property cannot contain any of the following characters ()\/;:#.*?=<>	[]'".

-
- **Value**: Value for the property.
- **Map**: Dictionary of (name, value) pairs for the properties. This is an alternative to setting the metadata using the `-Name` and `-Value` parameters.

For example, to attach the metadata to all the high-level log records with Id 40, run the following PowerShell command:

```
Get-LogHighLevelOperation – Id 40 | Set-LogHighLevelOperationMetadata
 -Name A -Value B
```

To attach the metadata to the high-level record with the user `abc@example.com`, run the following PowerShell command:

```
Get-LogHighLevelOperation – User `abc@example.com` | Set-LogHighLevelOperation
 -Name C -Value D
```

Retrieve using the metadata

Run the following PowerShell commands to use the associated metadata to retrieve the log records:

- Search by key and value:

  ```
  Get-LogHighLevelOperation -Metadata "Key:Value"
  ```

- Search by value any key:

  ```
  Get-LogHighLevelOperation -Metadata "*:Value"
  ```

- Search by key and any value:

  ```
  Get-LogHighLevelOperation -Metadata "Key:*"
  ```

Remove the metadata

Run the PowerShell command `Remove-LogHighLevelOperationMetadata` to remove the associated metadata.
`Remove-LogHighLevelOperationMetadata` takes the following parameters:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Id**: ID of the high-level operation.
- **InputObject**: The high-level operations to which you add the metadata. This is an alternative to the `Id‘` parameter where a high-level operation object or list of objects is passed to the PowerShell command.
- **Name**: Property name of the metadata to be removed. Set to $null to remove all the metadata for the specified object.
- **Map**: Dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{“name1”= “val1”; “name2”= “val2”}) or a string dictionary (created with new-object “System.Collections.Generic.Dictionary[String, String]”). The properties whose names match the keys in the map are removed.

Best practices

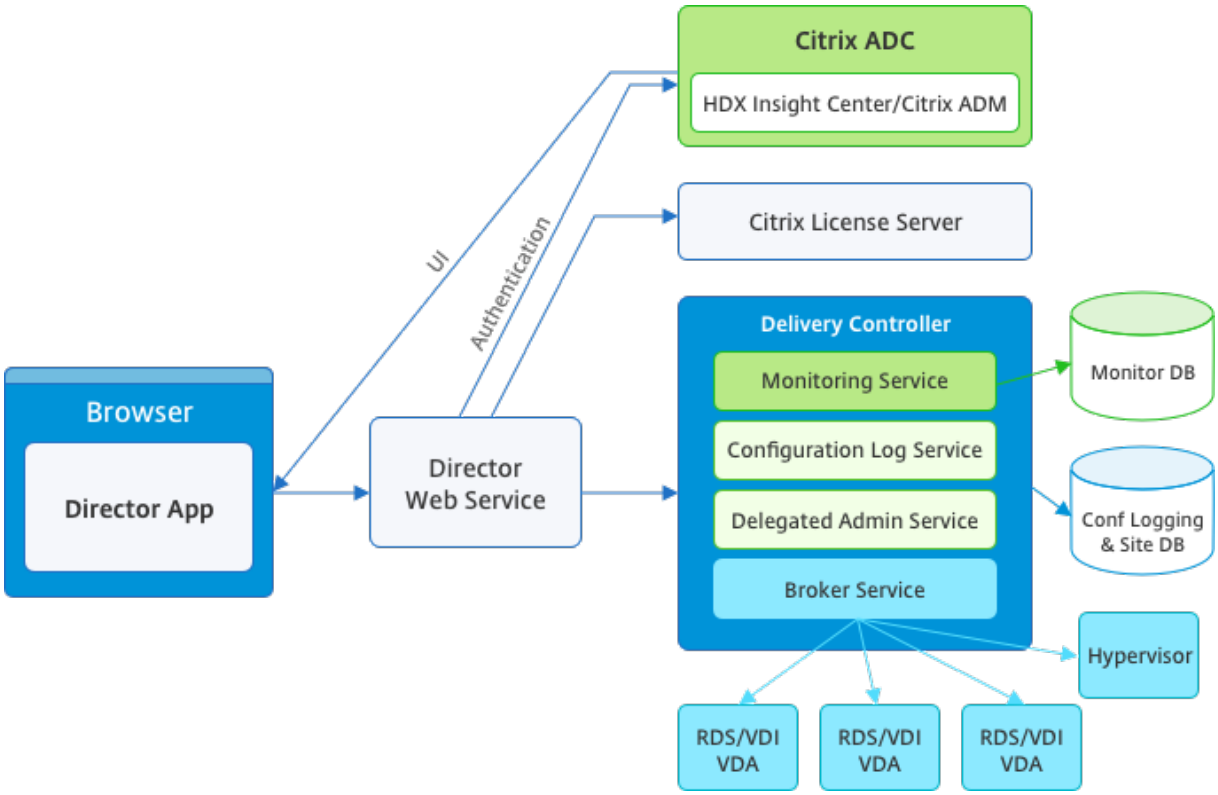
1. **Use direct parameters first**. Match what is known about an action to its corresponding parameter: `-User`, `-OperationType`, `-TargetType`, `-Source`, or `-IsSuccessful`.
2. **Always include a time range**. `-StartTime` and `-EndTime` are the most effective first filter on any query.
3. **Drill down from high-level to low-level**. When investigating a specific action, retrieve the high-level operation first, then use its ID with `-HighLevelOperationId`.
4. **Scope exports to the period of interest**. Use `-StartDateRange` and `-EndDateRange` to target the relevant time window.
5. **Use `-RawReport` on exports when display names are not needed**. This reduces processing time and output size.

Event logs

May 13, 2026

The following articles list and describe events that can be logged by services within Citrix Virtual Apps and Desktops.

This information is not comprehensive. Readers should check individual feature articles for additional event information.



- Citrix Broker Service events
- Citrix FMA Service SDK events
- Citrix Configuration Service events
- Citrix Delegated Administration Service events

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director

May 15, 2026

Director is a monitoring and troubleshooting console for Citrix Virtual Apps and Desktops.

Director can access:

- Real-time data from the Broker Agent using a unified console integrated with Analytics, Performance Manager, and Network Inspector. The following analytics are powered by Citrix ADM to identify bottlenecks due to the network in your Citrix Virtual Apps™ or Desktops environment:
  - Performance management for health and capacity assurance
  - Historical trending and network analysis
- Historical data stored in the Monitor database to access the Configuration Logging database.
- ICA® data from the Citrix Gateway using Citrix ADM.
  - Gain visibility into the end-user experience for virtual applications, desktops, and users for Citrix Virtual Apps or Desktops.
  - Correlate network data with application data and real-time metrics for effective troubleshooting.
  - Integrate with Citrix Virtual Desktop 7 Director monitoring tool.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director uses a troubleshooting dashboard that provides real-time and historical health monitoring of the Citrix Virtual Apps or Desktops Site. This feature allows you to see failures in real time, providing a better idea of what the end users are experiencing.

For more information regarding the compatibility of Director features with Delivery Controller (DC), VDA and any other dependent components, see Feature compatibility matrix.

> **Note:**
>
> With the disclosure of the Meltdown and Spectre speculative execution side-channel vulnerabilities, Citrix recommends that you install relevant mitigation patches. These patches might impact SQL Server performance. For more information, see the Microsoft support article, Protect SQL Server from attacks on Spectre and Meltdown side-channel vulnerabilities. Citrix recommends that you test the scale and plan your workloads before rolling out the patches in your production environments.

Director is installed by default as a website on the Delivery Controller. For prerequisites and other details, see the System requirements documentation for this release. For specific information on the installation and configuration of Director, see Install and configure Director.

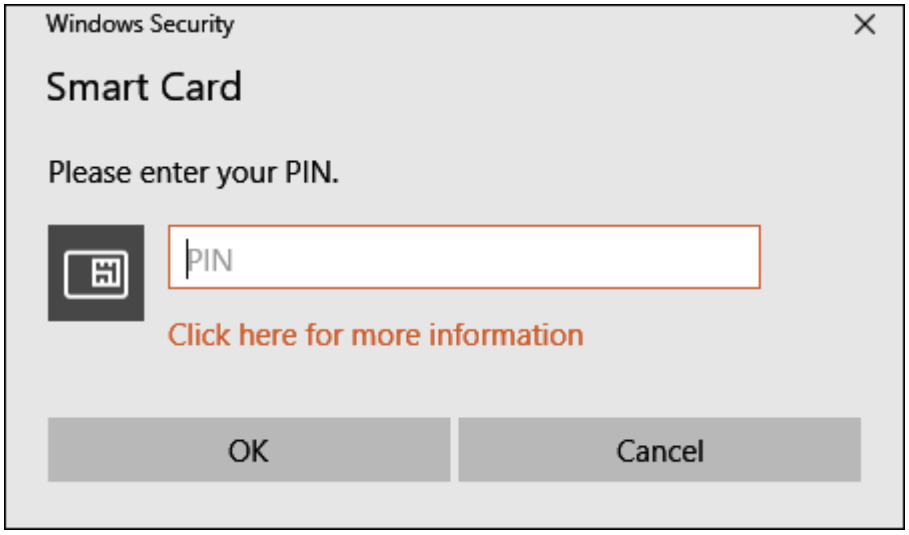
Log on to Director

The Director website is at https or `http://<Server FQDN>/Director`.

If one of the Sites in a multi-site deployment is down, the logon takes a little longer while it attempts to connect to the Site that is down.

Use Director with PIV smart card authentication

Director now supports Personal Identity Verification (PIV) based smart card authentication to log on. This feature is useful for organizations and government agencies that use smart card based authentication for access control.
Smart card authentication requires specific configuration on the Director server and in the Active Directory. The configuration steps are detailed in Configure PIV smart card authentication.



> **Note:**
>
> Smart card authentication is supported only for users from the same Active Directory domain.

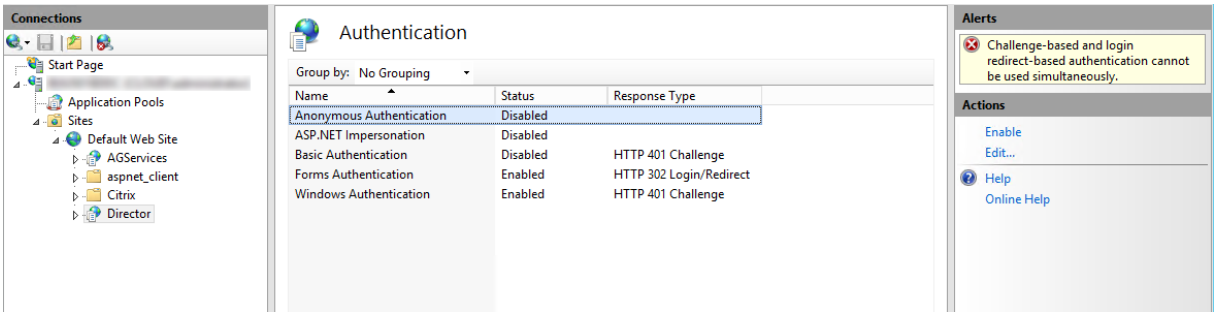
After performing the required configuration, you can log on to Director using a smart card:

1. Insert your smart card into the smart card reader.
2. Open a browser and go to the Director URL, `https://<directorfqdn>/Director`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select a valid user certificate from the displayed list.
4. Enter your smart card token.

5. After you are authenticated, you can access Director without keying extra credentials on the Director logon page.



Use Director with Integrated Windows Authentication

With Integrated Windows Authentication(IWA), domain-joined users gain direct access to Director without rekeying their credentials on the Director logon page. The prerequisites for working with Integrated Windows Authentication and Director are:

- Enable Integrated Windows Authentication on the IIS website that hosts Director. When you install Director, Anonymous and Forms Authentications are enabled. To support Integrated Windows Authentication and Director, disable Anonymous Authentication and enable Windows Authentication. Forms Authentication must remain set to Enabled for authentication of non-domain users.

  1. Start IIS manager.
  2. Go to **Sites** > **Default Web Site** > **Director**.
  3. Select **Authentication**.
  4. Right-click **Anonymous Authentication**, and select **Disable**.
  5. Right-click **Windows Authentication**, and select **Enable**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Configure Active Directory delegation permission for the Director machine. Configuration is only required if Director and the Delivery Controller™ are installed on separate machines.

    1. On the Active Directory machine, open the Active Directory Management Console.
    2. In the Active Directory Management Console navigate to **Domain Name** > **Computers.** Select the Director machine.
    3. Right-click and select **Properties**.
    4. In Properties, select the **Delegation** tab.
    5. Select the option, **Trust this computer for delegation to any service (Kerberos only)**.

- The browser that is used to access Director must support Integrated Windows Authentication. Additional configuration steps might be required in Firefox and Chrome. For more information, refer to the browser documentation.
- The Monitoring Service must be running Microsoft .NET Framework 4.5.1 or a later supported version listed in the System Requirements for Director. For more information, see System Requirements.

When a user logs off Director or if the session times out, the logon page is displayed. From the logon page, the user can set the Authentication type to **Automatic logon** or **User credentials**.

Interface views

Director provides different views of the interface tailored to particular administrators. Product permissions determine what is displayed and the commands available.

For example, help desk administrators see an interface tailored to help desk tasks. Director allows help desk administrators to search for the user reporting an issue and display activity associated with that user. For example, status of the user's applications and processes. They can resolve issues quickly by performing actions such as ending an unresponsive application or process, shadowing operations on the user's machine, restarting the machine, or resetting the user profile.

In contrast, full administrators see and manage the entire Site and can perform commands for multiple users and machines. The Dashboard provides an overview of the key aspects of a deployment, such as the status of sessions, user logons, and the Site infrastructure. Information is updated every

© 1997–2026 Citrix Systems, Inc. All rights reserved.

minute. If issues occur, details appear automatically about the number and type of failures that have occurred.

For more information about the various roles and their permissions in Director, see Delegated Administration and Director

Usage data collection by Pendo

The Director Service starts using Pendo to collect usage data after Director is installed. Statistics regarding the usage of the Trends pages and OData API call analytics are collected. Analytics collection complies with the Citrix Privacy Policy. Data collection is enabled by default when you install Director.

To opt out of the Pendo data collection, edit the registry key on the machine where Director is installed. If the registry key doesn't exist, create and set it to the desired value. Refresh the Director instance after changing the registry key value.

Caution: Using the Registry Editor incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Citrix recommends that you back up Windows Registry before changing it.

Location: HKEY_LOCAL_MACHINE\Software\Citrix\Director

Name: DisableGoogleAnalytics

> **Note:**
>
> Previously, Director Service used Google Analytics to collect the data. The same registry key is now used for Pendo.

Value: 0 = enabled(default), 1 = disabled

You can use the following PowerShell cmdlet to disable data collection by Pendo:

```
1 New-Item HKLM:\SOFTWARE\Citrix -Name Director
2
3 New-ItemProperty HKLM:\SOFTWARE\Citrix\Director -Name
     DisableGoogleAnalytics -PropertyType DWORD -Value 1
```

New features guide

Director has an in-product guide that uses Pendo to give an insight into the new features released in the current version of Director. The quick overview coupled with appropriate in-product messages helps you understand what's new in the product.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To opt out of this feature, edit the registry key, as described below on the machine where Director is installed. If the registry key doesn't exist, create and set it to the desired value. Refresh the Director instance after changing the registry key value.

> **Caution:**
>
> Using the Registry Editor incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Citrix recommends that you back up Windows Registry before changing it.

Location: HKEY_LOCAL_MACHINE\Software\Citrix\Director

Name: DisableGuidedHelp

Value: 0 = enabled(default), 1 = disabled

You can use the following PowerShell cmdlet to disable the in-product guide:

```
New-Item HKLM:\SOFTWARE\Citrix -Name Director

New-ItemProperty HKLM:\SOFTWARE\Citrix\Director -Name DisableGuidedHelp
    -PropertyType DWORD -Value 1
```

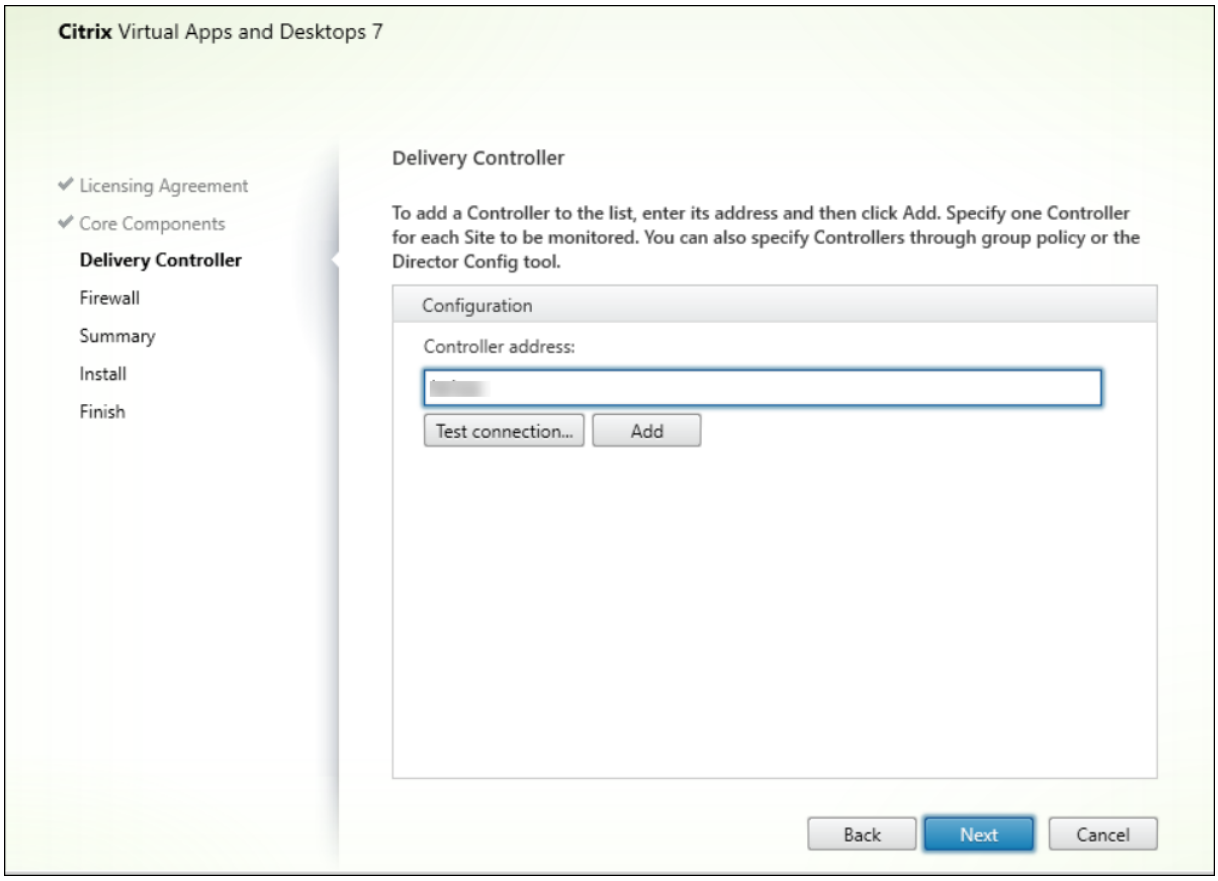
Install and configure



May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Install Director

Install Director using the full product ISO Installer for Citrix Virtual Apps and Desktops, which checks for prerequisites, installs any missing components, sets up the Director website, and performs basic configuration. For prerequisites and other details, see the System requirements documentation for this release. This release of Director is not compatible with Virtual Apps deployments earlier than 6.5 or Virtual Desktops deployments earlier than 7.
The default configuration provided by the ISO installer handles typical deployments. If Director was not included during installation, use the ISO installer to add Director. To add any additional components, rerun the ISO installer and select the components to install. For information on using the ISO installer, see Install core components in the installation documentation. Citrix recommends that you install using the full product ISO installer only, not the .MSI file.

When Director is installed on the Controller, it is automatically configured with localhost as the server address, and Director communicates with the local Controller by default. To install Director on a dedicated server that is remote from a Controller, you are prompted to enter the FQDN or IP address of a Controller.

> **Note:**
>
> Click **Add** to add the Controller to be monitored.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director communicates with that specified Controller by default. Specify only one Controller address for each site that you monitor. Director automatically discovers all other Controllers in the same site and falls back to those other Controllers if the Controller you specified fails.

> **Note:**
>
> Director does not load balance among Controllers.

To secure the communications between the browser and the Web server, Citrix® recommends that you implement TLS on the IIS website hosting Director. Refer to the Microsoft IIS documentation for instructions. Director configuration is not required to enable TLS.

Deploy and configure Director

When Director is used in an environment containing more than one site, be sure to synchronize the system clocks on all the servers where Controllers, Director, and other core components are installed. Otherwise, the sites might not display correctly in Director.

> **Important:**
>
> To protect the security of user names and passwords sent using plain text through the network, allow Director connections using only HTTPS, and not HTTP. Certain tools are able to read plain text user names and passwords in HTTP (unencrypted) network packets, which can create a potential security risk for users.

Configure permissions

To log on to Director, administrators with permissions for Director must be Active Directory domain users and must have the following rights:

- Read rights in all Active Directory forests to be searched (see Advanced configuration).
- Configured Delegated Administrator roles (see delegated administration and Director).
- To shadow users, administrators must be configured using a Microsoft group policy for Windows Remote Assistance. In addition:
  - When installing VDAs, ensure that the Windows Remote Assistance feature is enabled on all user devices (selected by default).
  - When you install Director on a server, ensure that Windows Remote Assistance is installed (selected by default). However, it is disabled on the server by default. The feature does not need to be enabled for Director to provide assistance to end users. Citrix recommends leaving the feature disabled to improve security on the server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To enable administrators to initiate Windows Remote Assistance, grant them the required permissions by using the appropriate Microsoft Group Policy settings for Remote Assistance. For information, see CTX239706: How to configure Shadow feature in latest Director versions.

Citrix uberAgent® integration with Director

Citrix uberAgent is now included by default with the Citrix Virtual Apps and Desktops™ installation, providing enhanced monitoring capabilities and seamless integration with Citrix Director. Administrators can exclude it from installation by deselecting it on the **Optional Software** screen during Virtual Delivery Agent setup.

For more information on installing uberAgent as part of the Citrix Virtual Apps and Desktops installation, see the uberAgent documentation.

Key feature:

Local application usage monitoring: With Citrix uberAgent, you can monitor the usage of applications launched within virtual desktop sessions (also known as local applications) and through the Director integration, the data is available directly on the Director dashboard (available with a Platinum license).

Configuring Citrix uberAgent integration with Director

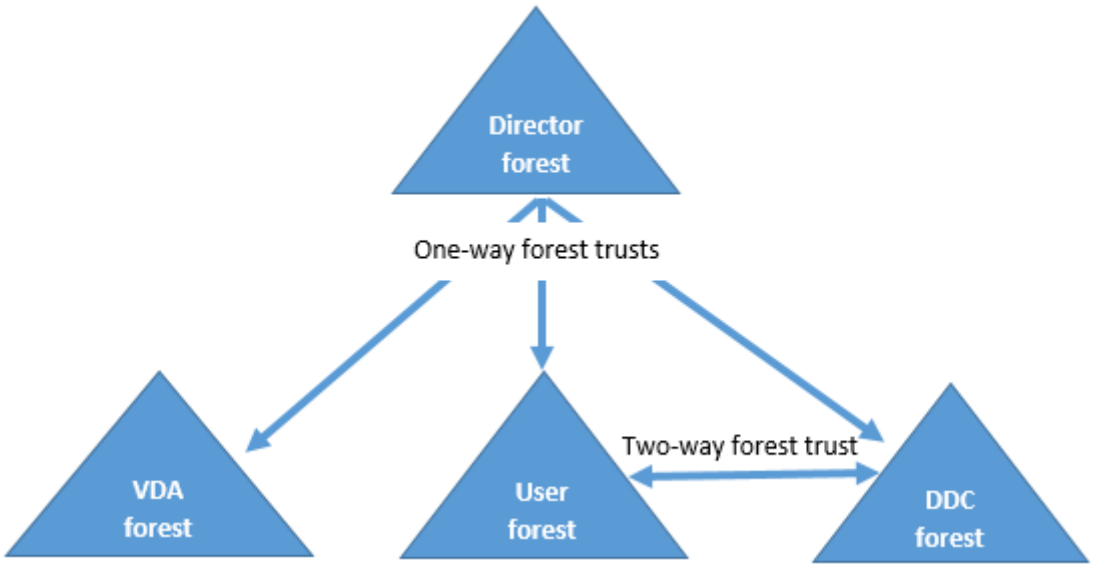
After installing Citrix uberAgent, configure the following policies in Citrix Web Studio™ to fully integrate and use uberAgent with Director:

- **Enable uberAgent Data Collection Policy**: When enabled, uberAgent provides insights into application usage and performance, system health, network metrics, and security analysis. This policy is disabled by default.
- **Enhance Director with uberAgent Data Policy**: This policy enables the integration of Director with uberAgent. It allows Director to process data provided by uberAgent to enhance monitoring capabilities, including monitoring of local application usage. This policy is enabled by default.

Once configured, the data becomes available in the Application Usage Monitoring section of Citrix Director.

> **Note:**
>
> It takes at least one day for uberAgent data on local application usage to be aggregated and displayed in Director..

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Advanced configuration

May 13, 2026

Director can support multi-forest environments spanning a forest configuration where users, Delivery Controllers (DCs), VDAs, and Directors are located in different forests. This requires proper setup of trust relationships among the forests and configuration settings.

Recommended configuration in a multi-forest environment

The recommended configuration requires creation of outgoing and incoming forest trust relationships among the forests with domain-wide authentication.

The trust relationship from the Director enables you to troubleshoot issues in user sessions, VDAs, and Delivery Controllers located in different forests.

Advanced configuration required for Director to support multiple forests is controlled through settings defined in Internet Information Services (IIS) Manager.

> **Important:**
>
> When you change a setting in IIS, the Director service automatically restarts and logs off users.

To configure advanced settings using IIS:

1. Open the Internet Information Services (IIS) Manager console.
2. Go to the Director website under the Default website.
3. Double-click **Application Settings**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Double-click a setting to edit it.
5. Click **Add** to add a new setting.

Director uses Active Directory to search for users and to look up more user and machine information. By default, Director searches the domain or forest in which:

- The administrator's account is a member.
- The Director web server is a member (if different).

Director attempts to perform searches at the forest level using the Active Directory global catalog. If you do not have permissions to search at the forest level, only the domain is searched.

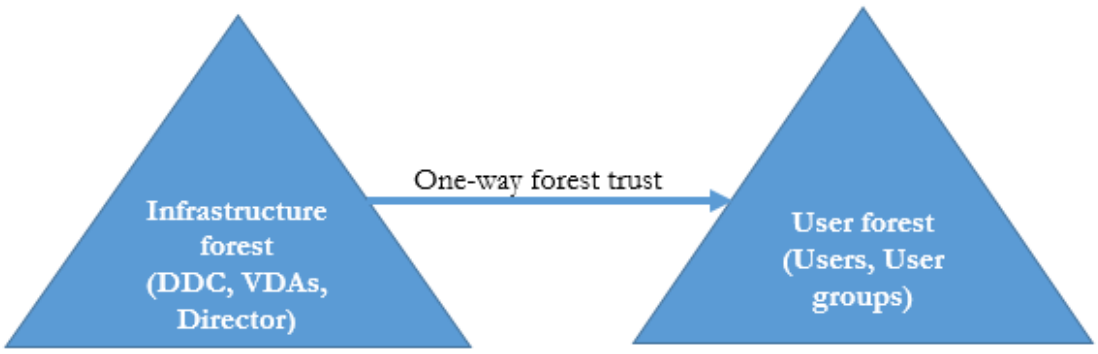
Searching or looking up data from another Active Directory domain or forest requires that you explicitly set the domains or forests to be searched. Configure the following Applications setting to the Director website in the IIS Manager:

```
Connector.ActiveDirectory.Domains = (user),(server)
```

The value attributes user and server represent the domains of the Director user (the administrator) and Director server, respectively.

To enable searches from an extra domain or forest, add the name of the domain to the list, as shown in this example:

```
Connector.ActiveDirectory.Domains = (user),(server),\<domain1\>,\<
    domain2\>
```



For each domain in the list, Director attempts to perform searches at the forest level. If you do not have permissions to search at the forest level, only the domain is searched.

Domain local group configuration

Most Citrix Service Providers (CSPs) have similar environment set-ups consisting of the VDAs, DCs, and Director in the Infrastructure forest. The users or user-group records belong to the Customer forest. A one-way outgoing trust exists from the Infrastructure forest to the Customer forest.

CSP administrators typically create a domain local group in the Infrastructure forest and add the users or user groups in the Customer forest to this domain local group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director can support a multi-forest set-up like this and monitor the sessions of users configured using domain local groups.

1. Add the following Applications settings to the Director website in IIS Manager:

```
Connector.ActiveDirectory.DomainLocalGroupSearch= true

DomainLocalGroupSearchDomains= \<domain1\>,\<domain2\>
```

   <domain1><domain2> are names of the forests in which the domain local group exists.

2. Assign the domain local group to delivery groups in Web Studio.
3. Restart IIS and log on to Director again for the changes to take effect. Now, Director can monitor and show the sessions of these users.

Add sites to Director

If Director is already installed, configure it to work with multiple sites. To configure, use the IIS Manager Console on each Director server to update the list of server addresses in the application settings.

Add an address of a Controller from each site to the following setting:

```
Service.AutoDiscoveryAddresses = SiteAController,SiteBController
```

SiteAController and SiteBController are the addresses of Delivery Controllers from two different sites.

Disable the visibility of running applications in the Activity Manager

By default, the Activity Manager in Director displays a list of all running applications for a user's session. This information is viewed by all administrators that have access to the Activity Manager feature

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in Director. For Delegated Administrator roles, this includes Full Administrator, delivery group Administrator, and Help Desk Administrator.

To protect the privacy of users and the applications they are running, you can disable the **Applications** tab to list running applications.

> **Warning:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® does not guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back up the registry before you edit it.

1. On the VDA, modify the registry key at HKEY_LOCAL_MACHINE\Software\Citrix\Director\TaskManagerDataDis
   By default, the key is set to 1. Change the value to 0, which means the information is not collected from the VDA and hence not displayed in the Activity Manager.
2. On the server with Director installed, modify the setting that controls the visibility of running applications. By default, the value is "true"which allows visibility of running applications in the Applications tab. Change the value to "false"which disables visibility. This option affects only the Activity Manager in Director, not the VDA.
   Modify the value of the following setting:
   UI.TaskManager.EnableApplications = false

> **Important:**
>
> To disable the view of running applications, make both changes to ensure that the data is not displayed in the Activity Manager.

Configure PIV smart card authentication

May 13, 2026

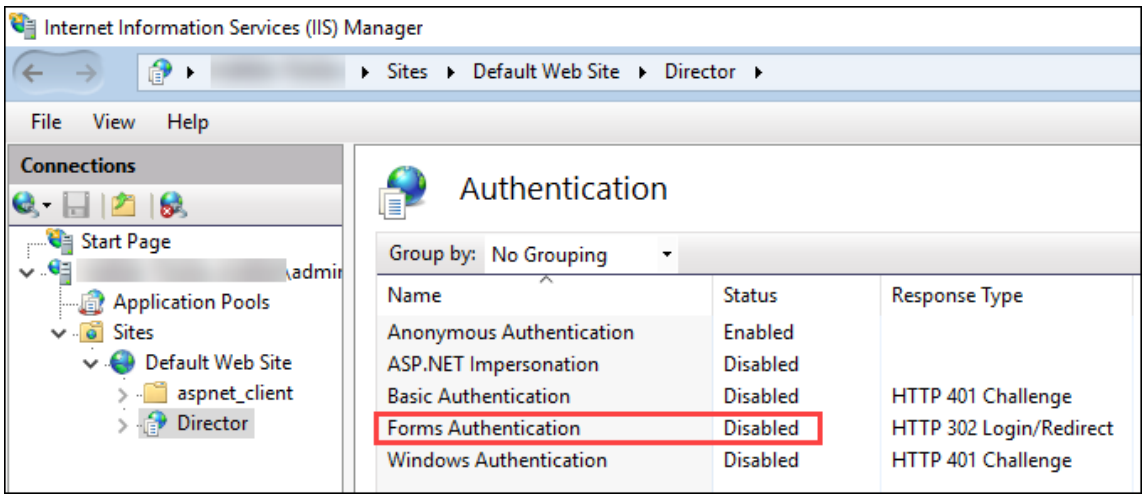
This article lists the configuration required on the Director Server and in the Active Directory to enable the smart card authentication feature.

> **Note:**
>
> Smart card authentication is supported only for users from the same Active Directory domain.

Director server configuration

Perform the following configuration steps on the Director server:

© 1997–2026 Citrix Systems, Inc. All rights reserved.



1. Install and enable the Client Certificate Mapping Authentication. Follow the **Client Certificate Mapping authentication using Active Directory** instructions in the Microsoft document, Client Certificate Mapping Authentication.
2. Disable Forms Authentication on the Director site.

   Start IIS Manager.

   Go to **Sites** > **Default Web Site** > **Director**.

   Select **Authentication**.

   Right-click **Forms Authentication**, and select **Disable.**

3. Configure the Director URL for the more secure https protocol (instead of HTTP) for client certificate authentication.

   a) Start IIS Manager.

   b) Go to **Sites** > **Default Web Site** > **Director**.

   c) Select **SSL Settings.**

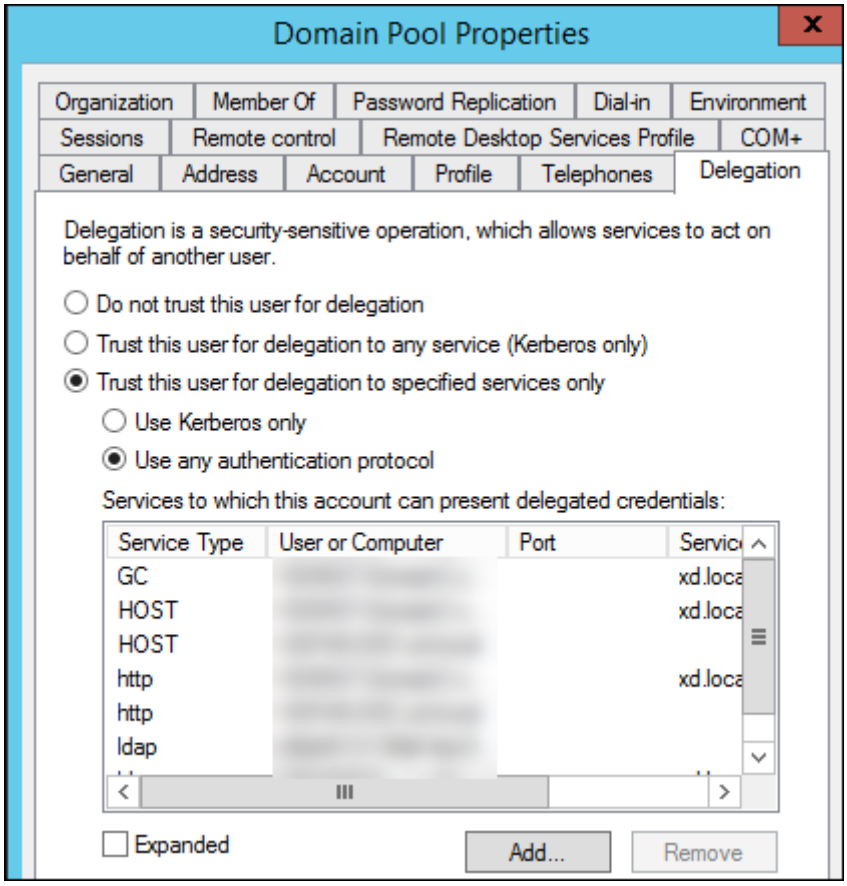
   d) Select **Require SSL** and **Client certificates** > **Require.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Update web.config. Open the web.config file (available in c:\inetpub\wwwroot\Director) using a text editor.

Under the <system.webServer> parent element, add the following snippet as the first child element:

```
<defaultDocument>
   <files>
       <add value="LogOn.aspx"/>
   </files>
</defaultDocument>
```



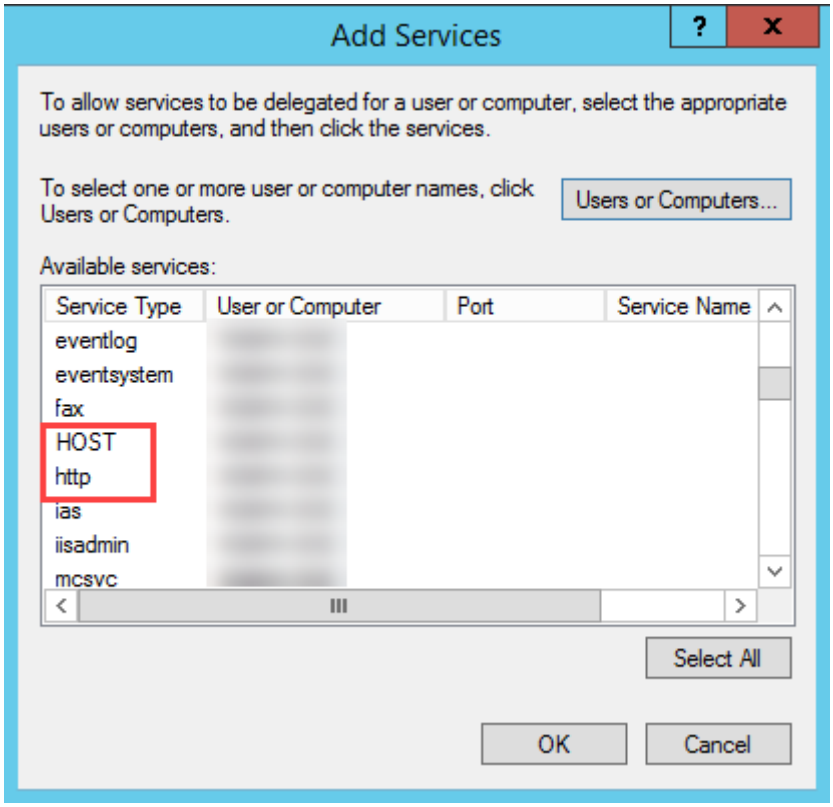
Active Directory configuration

By default the Director application runs with the **Application Pool** identity property. Smart card authentication requires delegation for which the Director application identity must have Trusted Computing Base (TCB) privileges on the service host.

Citrix recommends that you create a separate service account for Application Pool identity. Create the service account and assign TCB privileges as per the instructions in the Microsoft MSDN article, Protocol Transition with Constrained Delegation Technical Supplement.

Assign the newly created service account to the Director application pool. The following figure shows the properties dialog of a sample service account, Domain Pool.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Configure the following services for this account:

- Delivery Controller™: HOST, HTTP
- Director: HOST, HTTP
- Active Directory: GC, LDAP

To configure,

1. In the user account properties dialog, click **Add.**
2. In the **Add Services** dialog, click Users or Computers.
3. Select the Delivery Controller host name.
4. From the **Available services** list, select HOST and HTTP **Service Type**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

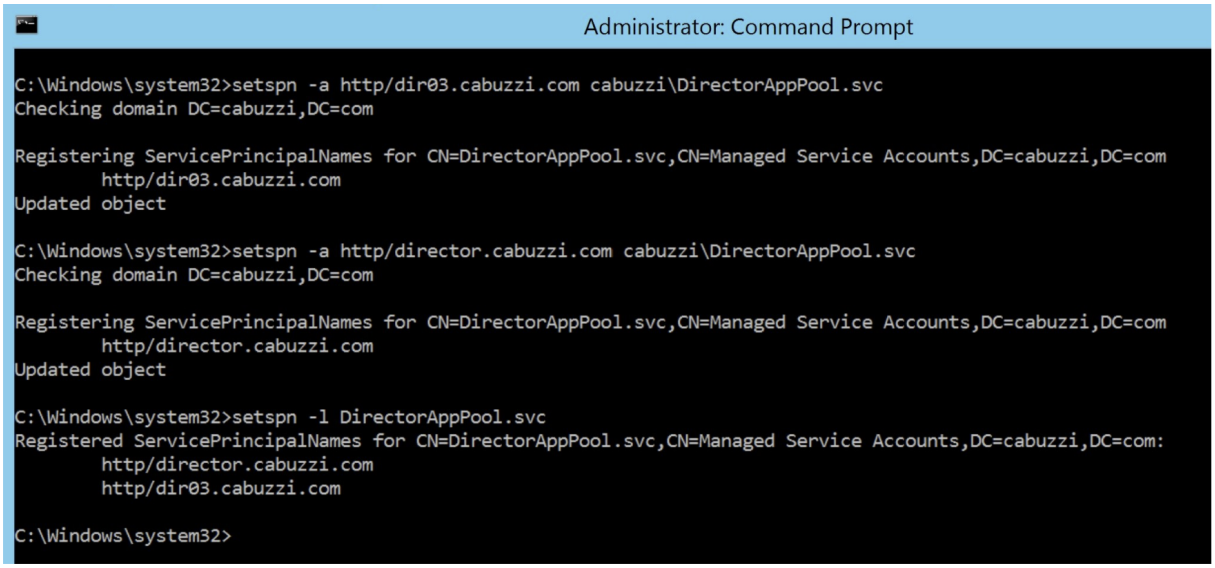
Similarly, add Service Types for **Director** and **Active Directory** hosts.

Create Service Principal Name records

You must create a service account for each Director server and load-balanced Virtual IPs (VIP) used to access a pool of Director servers. You must create service principal name (SPN) records to configure a delegation to the newly created service account.

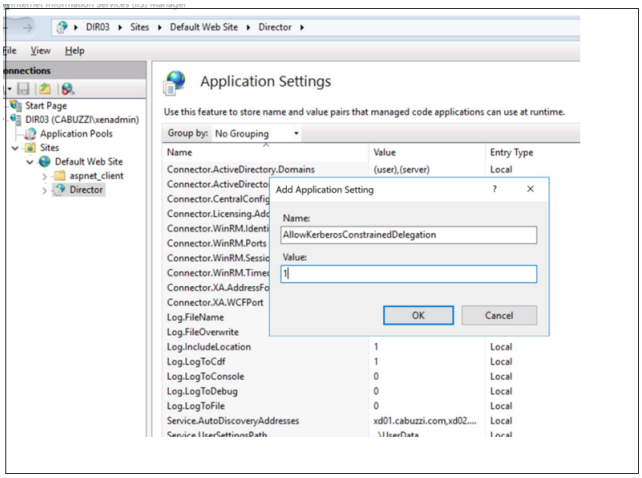
- Use the following command to create an SPN record for a Director server:

```
setspn -a http/<directorServer>.<domain_fqdn> <domain>\<
   DirectorAppPoolServiceAcct>
```



- Use the following command to create an SPN record for a load-balanced VIP:

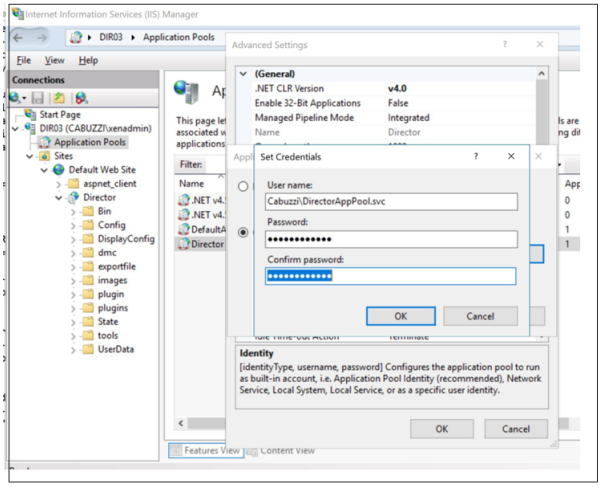
```
setspn -S http/<DirectorFQDN> <domain>\<
   DirectorAppPoolServiceAcct>
```



- Use the following command to view or test the created SPNs:

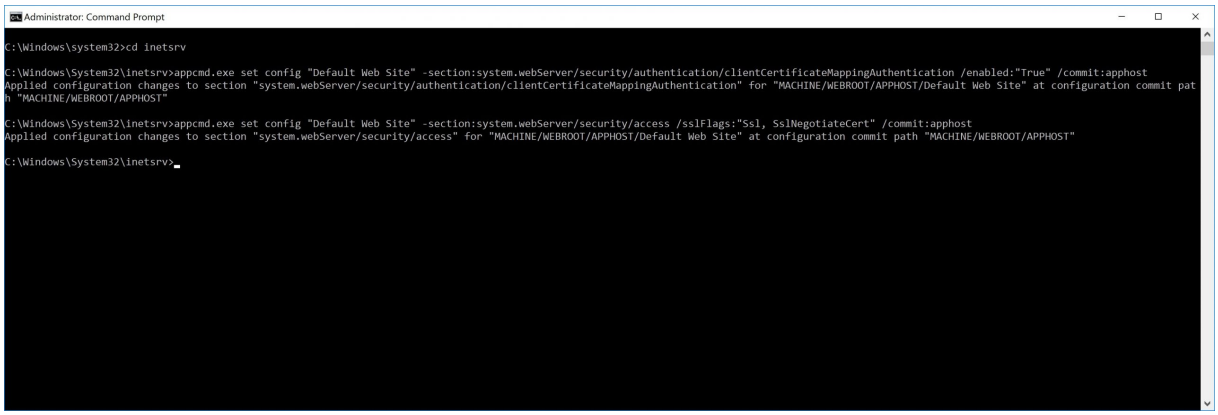
```
setspn –l <DirectorAppPoolServiceAcct>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- Select the Director virtual directory in the left pane and double click **Application Settings**. Inside the Application Settings window, click **Add** and ensure **AllowKerberosConstrainedDelegation** is set to 1.

- Select **Application Pools** in the left-hand pane, then right-click the Director application pool and select **Advanced Settings**.
- Select **Identity**, click the ellipses ("…") to enter the service account domain\logon and password credentials. Close the IIS console.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- From an elevated command prompt, change the directory to C:\Windows\System32\inetsrv and enter the following commands:

```
appcmd.exe set config "Default Web Site" -section:system.webServer/security/authentication/clientCertificateMappingAuthentication /enabled:"True" /commit:apphost
```

```
appcmd.exe set config "Default Web Site" -section:system.webServer/security/access /sslFlags:"Ssl, SslNegotiateCert" /commit:apphost
```

Firefox browser configuration

To use the Firefox browser, install the PIV driver available at OpenSC 0.17.0. For installation and configuration instructions, see Installing OpenSC PKCS#11 Module in Firefox, Step by Step.
For information on the usage of the smart card authentication feature in Director, see the Use Director with PIV based smart card authentication section in the Director article.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure network analysis

May 13, 2026

> **Note:**
>
> The availability of this feature depends on your organization's license and your administrator permissions.

Director integrates with Citrix ADM to provide network analysis and performance management:

- Network analysis uses HDX™ Insight reports from Citrix ADM to provide an application and desktop contextual view of the network. With this feature, Director provides advanced analytics of ICA traffic in your deployment.
- Performance management provides historical retention and trend reporting. With historical retention of data versus the real-time assessment, you can create Trend reports, including capacity and health trending.

After you enable this feature in Director, HDX Insight reports provide Director with additional information:

- The Network tab in the Trends page shows latency and bandwidth effects for applications, desktops, and users across your entire deployment.
- The User Details page shows latency and bandwidth information specific to a particular user session.

Limitations:

- In the Trends view, HDX connection logon data isn't collected for VDAs earlier than 7. For earlier VDAs, the chart data is displayed as 0.

To enable network analysis, you must install and configure Citrix ADM in Director. Director requires Citrix ADM Version 11.1 Build 49.16 or later. MAS is a virtual appliance that run on the XenServer. Using network analysis, Director communicates and gathers the information that is related to your deployment.

For more information, see the Citrix ADM documentation.

> **Note:**
>
> Citrix NetScaler Insight Center has reached its End of Maintenance date as of 15 May 2018. See the Citrix Product Matrix. Integrate Director with Citrix ADM for network analysis. To migrate your NetScaler Insight Center to Citrix ADM, see Migrate from NetScaler Insight Center to Citrix ADM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. On the server where Director is installed, locate the DirectorConfig command line tool in C:\inetpub\wwwroot\Director\tools, and run it with parameter /configNetScaler from a command prompt.
2. When prompted, enter the Citrix ADM machine name (FQDN or IP address), the user name, password, HTTPS connection type (preferred over HTTP), and choose Citrix ADM integration.
3. To verify the changes, log off and log back on.

> **Note:**
>
> For security reasons, it is recommended to create a custom role for ADM integration with Director with sufficient permission to access HDX Insight only.
>
> For more information, see Configure access policies.

Delegated administration and Director

May 13, 2026

Delegated administration uses three concepts: administrators, roles, and scopes. Permissions are based on an administrator's role and the scope of this role. For example, an administrator might be assigned a Help Desk administrator role where the scope involves responsibility for end-users at one site only.

For information about creating delegated administrators, see the main delegated administration article.

Administrative permissions determine the Director interface presented to administrators and the tasks they can perform. Permissions determine:

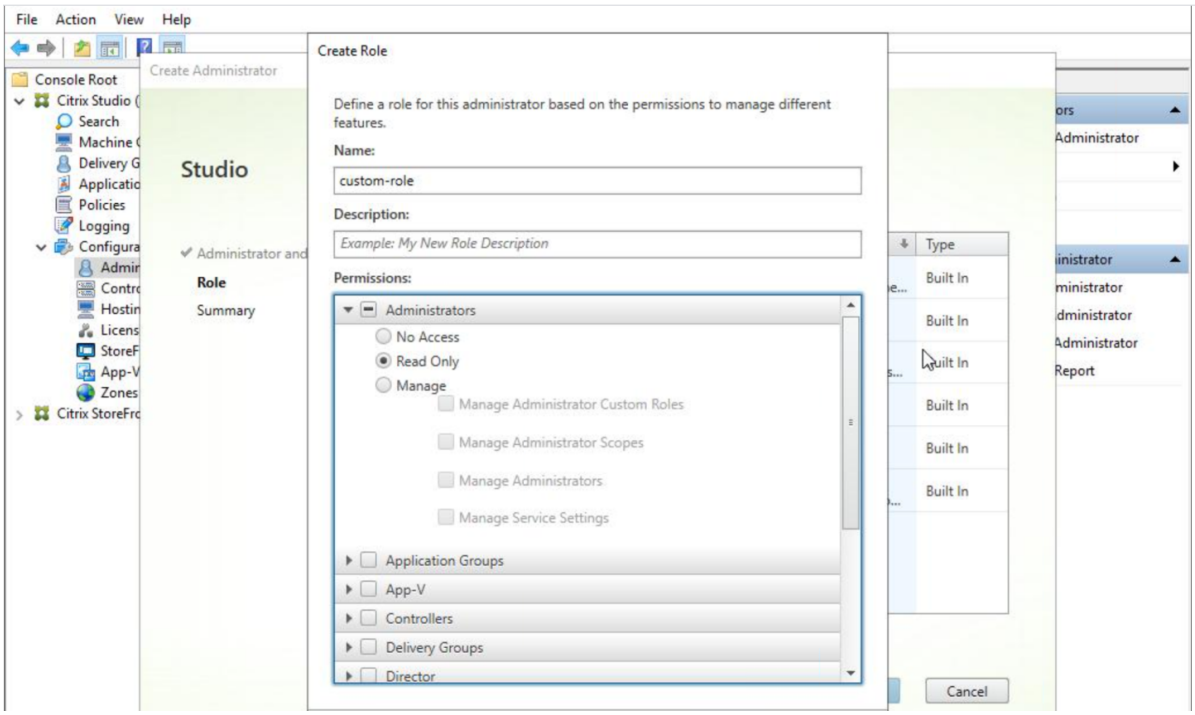
- The views the administrator can access, collectively referred to as a view.
- The desktops, machines, and sessions that the administrator can view and interact with.
- The commands the administrator can perform, such as shadowing a user's session or enabling maintenance mode.

The built-in roles and permissions also determine how administrators use Director:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Administrator Role	Permissions in Director
Full Administrator	Full access to all views and can perform all commands, including shadowing a user's session, enabling maintenance mode, and exporting trends data.
Delivery group Administrator	Full access to all views and can perform all commands, including shadowing a user's session, power management and session management, enabling maintenance mode, and exporting trends data.
Read Only Administrator	Can access all views and see all objects in specified scopes and global information. Can download reports from HDX™ channels and can export Trends data using the Export option in the Trends view. Cannot perform any other commands or change anything in the views.
Help Desk Administrator	Can access only the Help Desk and User Details views and can view only objects that the administrator is delegated to manage. Can shadow a user's session and perform commands for that user. Can perform maintenance mode operations. Can use power control options for Single-session OS Machines. Cannot access the Dashboard, Trends, Alerts, or Filters views. Cannot use power control options for Multi-session OS machines.
Machine catalog administrator	Can access only the Machine Details page (Machine-based search).
Host Administrator	No access. This administrator is not supported for Director and cannot view data.

Configure custom roles for Director administrators



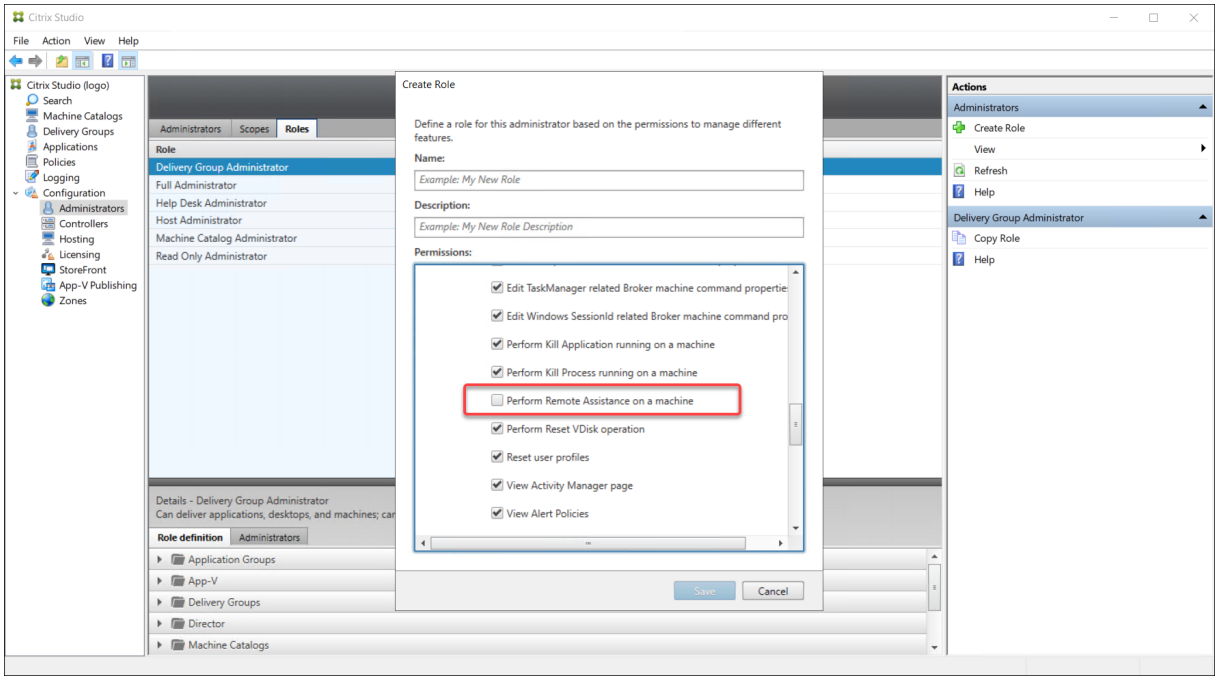
In Studio, you can also configure Director-specific, custom roles to more closely match the requirements of your organization and delegate permissions more flexibly. For example, you can restrict the built-in Help Desk administrator role so that this administrator cannot log off sessions.

If you create a custom role with Director permissions, you must also give that role other generic per-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

missions:

- Delivery Controller™ permission to log on to Director - at least read only access in Administrator node
- Permissions to delivery groups to view the data related to those delivery groups in Director - at least read only access



Alternatively, you can create a custom role by copying an existing role and include extra permissions for different views. For example, you can copy the Help Desk role and include permissions to view the Dashboard or Filters pages.

Select the Director permissions for the custom role, which include:

- Perform Kill Application running on a machine
- Perform Kill Process running on a machine
- Perform Remote Assistance on a machine
- Reset user profiles
- View Client Details page
- View Dashboard page
- View Filters page
- View Machine Details page
- View Trends page
- View User Details page

In this example, Shadowing (Perform Remote Assistance on a machine) is turned off.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A permission can have dependencies on other permissions to become applicable on the UI. For example, selecting the **Perform Kill Application running on a machine** permission enables the **End Application** functionality only in those panels to which the role has permission. You can select the following panel permissions:

- View Filters page
- View User Details page
- View Machine Details page
- View Client Details page

In addition, from the list of permissions for other components, consider these permissions from delivery groups:

- Enable/disable maintenance mode of a machine using delivery group membership.
- Perform power operations on Windows Desktop machines using delivery group membership.
- Perform session management on machines using delivery group membership.

Secure Director deployment

May 13, 2026

This article highlights areas that might have an impact on system security when deploying and configuring Director.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director communications

In a production environment, use the HTTPS protocols to secure the data passing between Director and your servers. HTTPS uses Transport Layer Security (TLS) protocols to provide strong data encryption.

> **Note:**
>
> - Citrix® strongly recommends that you restrict access to Director console within the intranet network.
> - Citrix strongly recommends that you do not enable unsecured connections to Director in a production environment.
> - Use TLS 1.2 or higher. Do not use legacy TLS or SSL.

To secure communications between users' web browsers and Director, refer to Enable TLS on Web Studio and Director

To secure communications between Director and Citrix Virtual Apps and Desktops servers (for monitoring and reports), refer to Securing On-Premises Monitor OData API Access.

To secure communications between Director and Citrix ADC (for Citrix Insight), when you Configure network analysis, choose a connection type of HTTPS.

Configure Microsoft Internet Information Services (IIS)

You can configure Director with a restricted IIS configuration.

Application Pool recycling limits

Director uses an application pool called **Director**. You can set the following Application Pool recycling limits on the application pool:

- Virtual Memory Limit: 4,294,967,295
- Private Memory Limit: The size of the physical memory of the StoreFront™ server
- Request Limit: 4,000,000,000

File name extensions

During installation, Director configures request filtering to only allow the following extensions:

- .
- .aspx

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- .css
- .eot
- .html
- .ico
- .js
- .png
- .svc
- .svg
- .png
- .json
- .woff
- .woff2
- .ttf

HTTP Verbs

During installation, Director configures request filtering to only allow the following verbs:

- GET
- POST
- HEAD

IIS features

Director does not require the following IIS components:

- ISAPI extensions
- CGI programs
- FastCGI programs

You can remove these components.

.NET trust level

Director requires **.NET Trust Level** to be set to **Full Trust**. Do not set the .NET trust level to any other value.

Configure user rights

When Director is installed, its application pool is granted the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Log on as a service** logon right
- **Adjust memory quotas for a process**, **Generate security audits**, and **Replace a process level token** privileges

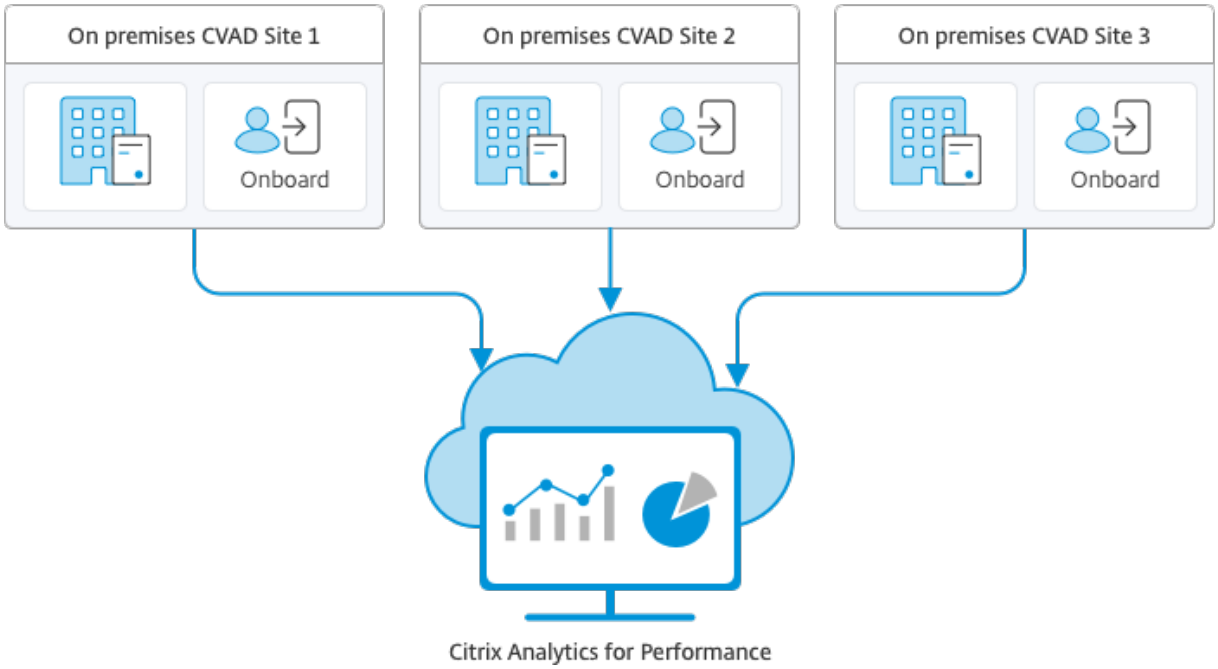
The rights and privileges mentioned are normal installation behavior when application pools are created.

You do not need to change these user rights. These privileges are not used by Director and are automatically disabled.

Director security separation

You can deploy any web applications in the same web domain (domain name and port) as Director. However, any security risks in those web applications can potentially reduce the security of your Director deployment. Where a greater degree of security separation is required, Citrix recommends that you deploy Director in a separate web domain.

Configuring on-premises sites with Citrix Analytics for Performance™



May 13, 2026

Citrix Analytics for Performance (Performance Analytics) is the comprehensive performance monitoring solution from the Citrix Analytics Cloud Service. Performance analytics provides advanced insights and analytics built on performance metrics. Performance Analytics helps you monitor and view the usage and performance metrics of one or more Citrix Virtual Apps and Desktops™ sites in your organization.

For more information about Performance Analytics, see the Performance Analytics article.

You can send performance data from your site to Citrix Analytics for Performance on Citrix Cloud™ to leverage its advanced performance analytics capabilities. To view and use Performance Analytics, you must first configure your on-premises sites with Citrix Analytics for Performance from the **Analytics** tab in **Director**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Performance Analytics accesses data in a secure manner and no data is transferred from Citrix Cloud to the on-premises environment.

Prerequisites

To configure Citrix Analytics for Performance from Director, no new components need to be installed. Ensure that the following requirements are met:

- Your Delivery Controller and Director are on version 1912 CU2 or later. For more information, see Feature compatibility matrix.

> **Note:**
>
> - Configuring your on-premises site with Citrix Analytics for Performance from Director might fail if the Delivery Controller is running a Microsoft .NET Framework version earlier than 4.8. As a workaround, upgrade the .NET Framework in your Delivery Controller to version 4.8. LCM-9255.
> - When you configure your on-premises site running Citrix Virtual Apps and Desktops version 2012 with Citrix Analytics for Performance from Director, the configuration might fail after a couple of hours or after a restart of the Citrix Monitor Service in the Delivery Controller. The Analytics tab displays a Not Connected status in this case. As a workaround, create an Encryption folder in the registry on the Delivery Controller, Location: HKEY_LOCAL_MACHINE\Software\Citrix\XDservices\Monitor, Folder Name: Encryption. Ensure that the CitrixMonitor account has Full Control Access on the Encryption

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> folder. Restart the Citrix Monitor Service.DIR-14324.

- Access to the **Analytics** tab to perform this configuration is available for full administrators only.
- For Performance Analytics to access performance metrics, outbound internet access is available on all Delivery Controllers and the machines on which Director is installed. Specifically, ensure accessibility to the following URLs:
  - Citrix Key Registration: `https://*.citrixnetworkapi.net/`
  - Citrix Cloud: `https://*.citrixworkspacesapi.net/`
  - Citrix Analytics: `https://*.cloud.com/`
  - Microsoft Azure: `https://*.windows.net/`

  In case, Delivery Controllers and Director machines are within an intranet and outbound internet access is via a proxy server, ensure the following:
- The proxy server must allow the preceding list of URLs.
- Add the following configuration in the Director web.config and citrix.monitor.exe.config files. Ensure that you add this configuration within the **configuration** tags:

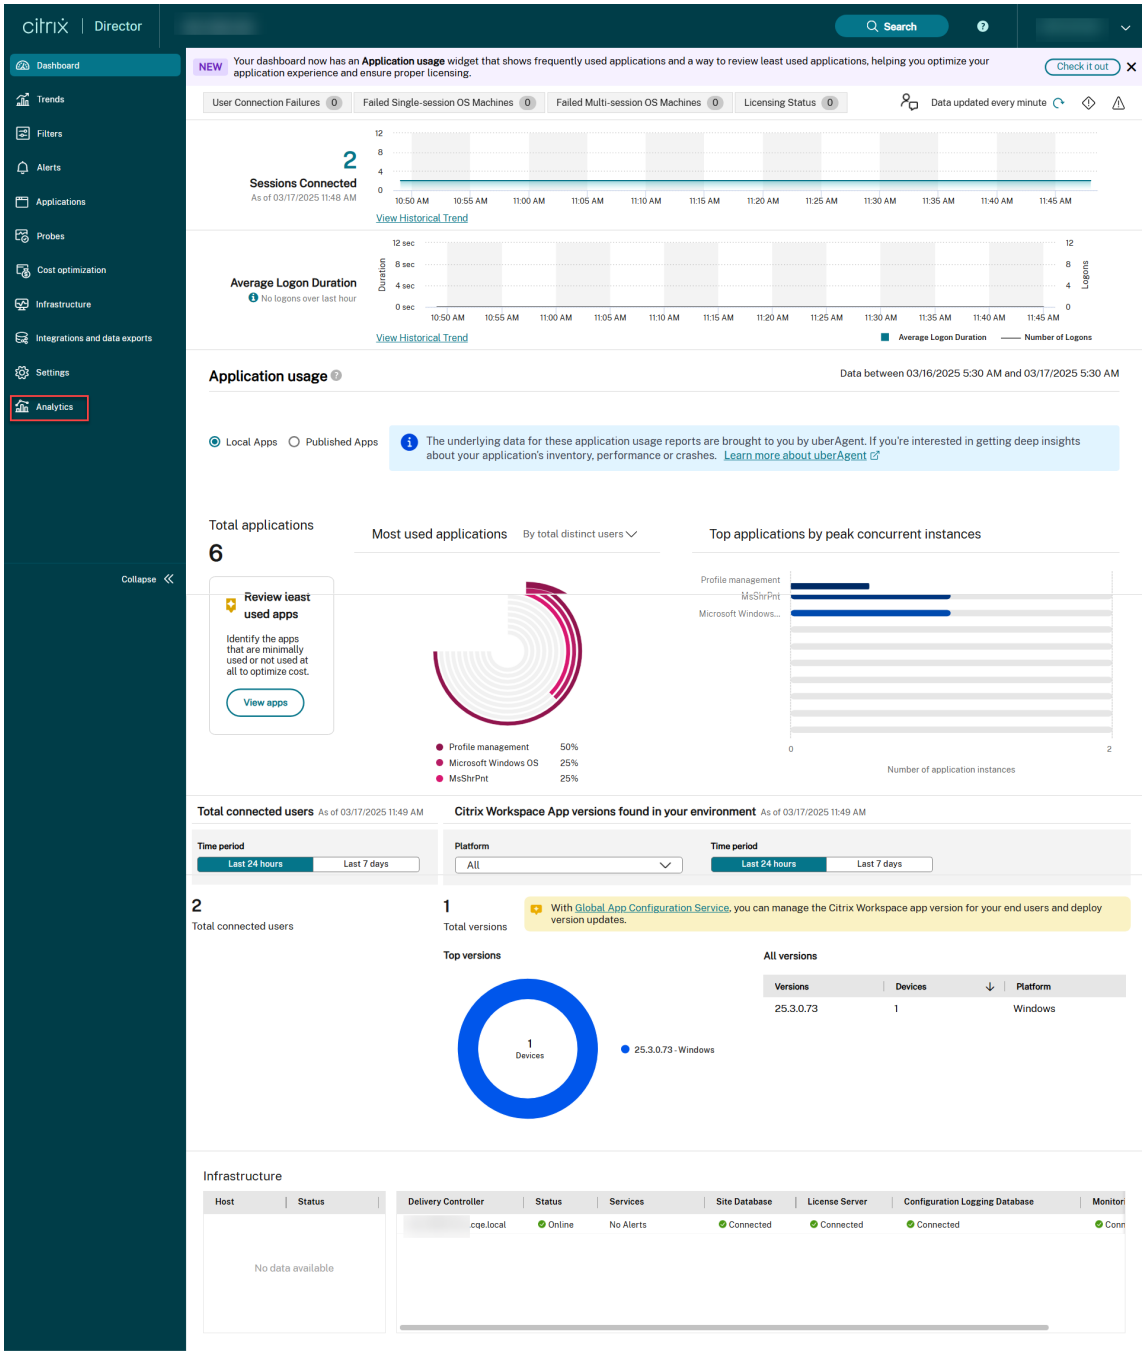
```
<system.net>
    <defaultProxy>
        <proxy  usesystemdefault = "false"  proxyaddress = "http
            ://<your_proxyserver_address>:80" bypassonlocal = "
            true"  />
    </defaultProxy>
</system.net>
```

  - The Director web.config is located at `C:\inetpub\wwwroot\Director\web.config` on the machine where Director is installed.
  - The citrix.monitor.exe.config is located at `C:\Program Files\Citrix\Monitor\Service\Citrix.Monitor.exe.Config` on the machine where the Delivery Controller is installed.

  This setting is provided by Microsoft on IIS. For more information, see `https://docs.microsoft.com/en-us/dotnet/framework/network-programming/proxy-configuration`.

  The **defaultproxy** field in the config file controls the outbound access of Director and Monitor Service. Configuration and communication with Performance Analytics requires the **defaultproxy** field to be set to **true**. It is possible that the policies in effect set this field to false. In this case, you must manually set the field to true. Take a backup of the config files before you make the changes. Restart the Monitoring service on the Delivery Controller™ for the changes to be affected.
- You have an active Citrix Cloud entitlement for Citrix Analytics for Performance.

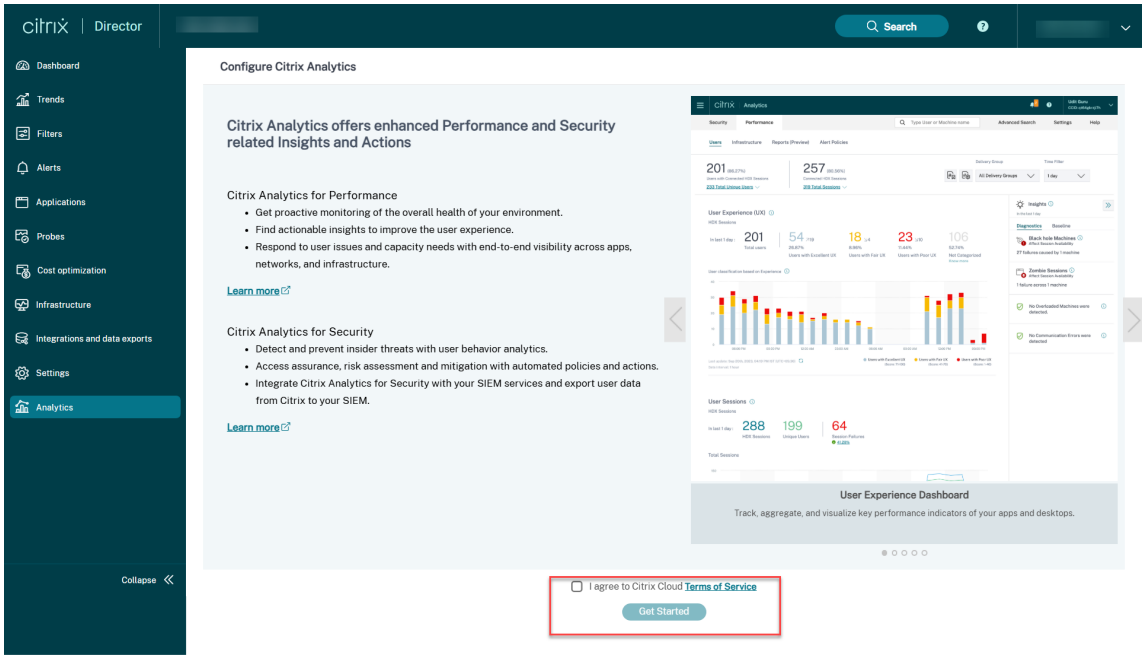
© 1997–2026 Citrix Systems, Inc. All rights reserved.



- Your Citrix Cloud account is an Administrator account with rights to the Product Registration Experience. For more information about administrator permissions, see Modify Administrator Permissions.

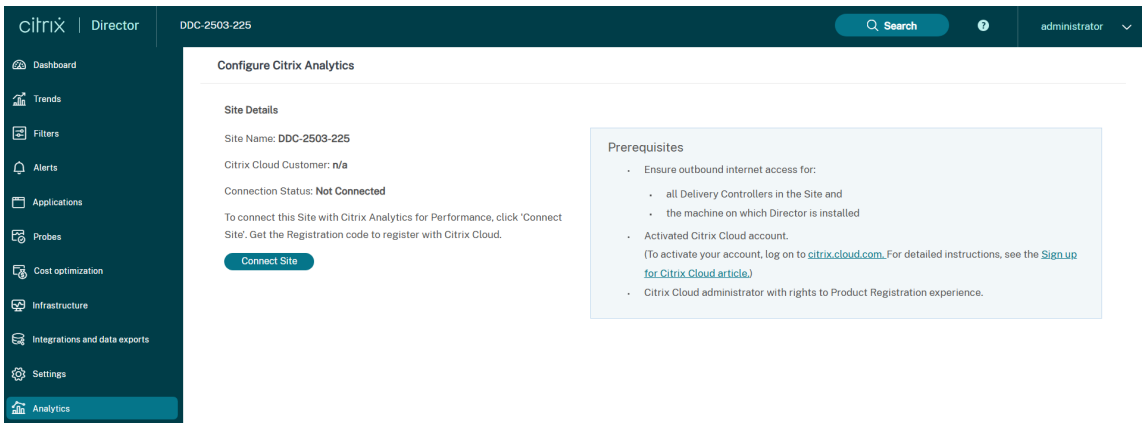
Configuration steps

After you have verified the prerequisites, do the following:



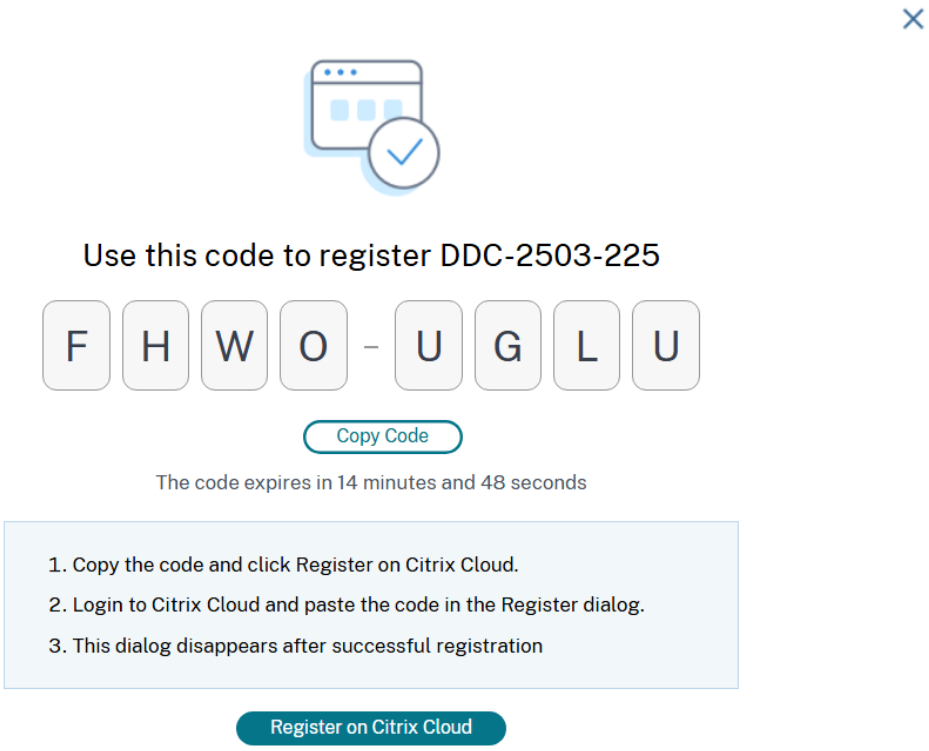
1. Sign in to Director as a full administrator and select the site which you want to configure with Performance Analytics. The Director Dashoard page appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. Click the **Analytics** tab. The **Configure Citrix Analytics** page appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

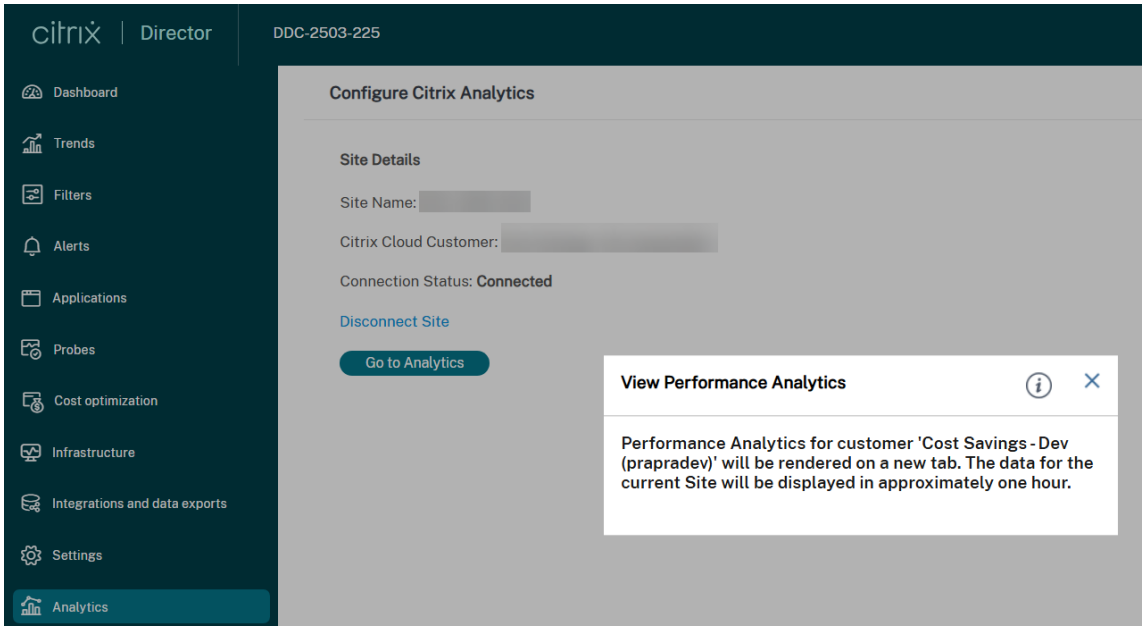


3. Review the steps, select the terms of service, and then click **Get Started**. The **Site Details** page appears.

4. Review the prerequisites and ensure that they are met. Review the site details.
5. Click **Connect Site** to start the configuration process.

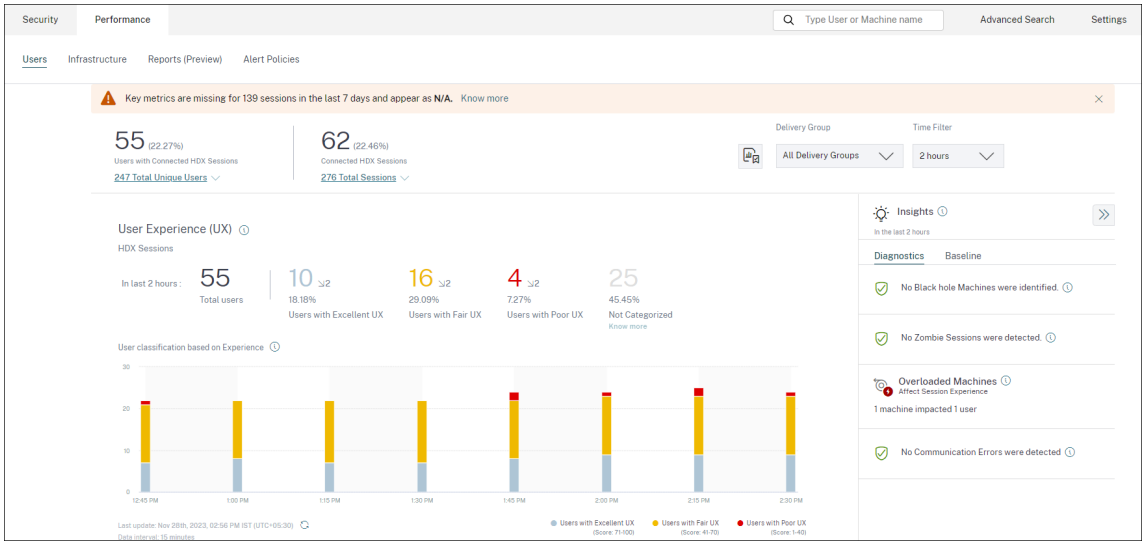
   A unique 8-digit registration code is generated to be used to register this site with Citrix Cloud.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



6. Click **Copy Code** to copy the code and then click **Register on Citrix Cloud**. You are redirected to the registration URL in Citrix Cloud.
7. Sign in with your Citrix Cloud credentials and select your customer.
8. Paste the copied registration code in the Product Registrations page in Citrix Cloud. Click **Continue** to register. Review the registration details and click **Register**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Your on-premises site registers with Citrix Cloud.

9. From **Director**, click **Go to Analytics** on the **Analytics** tab.

Performance Analytics opens on a new tab on your browser.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If your Citrix Cloud session has expired, you might be redirected to the Citrix.com or My Citrix account logon page.

10. To register multiple sites with Performance Analytics, repeat the preceding configuration steps for each site from Director. Metrics for all configured sites are displayed on the Performance Analytics dashboard.

    In case you have more than one Director instance running per site, configure from any one Director instance. All other Director instances connected to the site are updated at the next refresh after the configuration process.

11. To disconnect your site from Citrix Cloud, click **Disconnect Site**. This option deletes the existing configuration.

    > **Notes:**
    >
    > The first time you configure a site, events from the site might take some time (approximately an hour) to be processed; causing a delay in the display of metrics on the Performance Analytics dashboard. Thereafter, events refresh at regular intervals.
    >
    > Upon disconnect, data transmission from the old account continues for some time until the events from the new account are transmitted. For approximately one hour after data transmission stops, analytics related to the old account remain displayed on the Performance Analytics Dashboard.
    >
    > Upon expiry of entitlement to the Citrix Analytics service, it takes up to a day to stop sending the site metrics to Performance Analytics.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Independent release of Director for LTSR deployments

May 15, 2026

The independent release of Director for LTSR deployments now provides an option to access the latest Director features for enhanced troubleshooting and monitoring in Citrix® environments to compatible LTSR environments. This feature allows you to use the latest Director version on your 2402 LTSR deployments. Also, provides access to features released after the LTSR announcement without impacting the application delivery infrastructure.

The standalone installer includes the latest .msi for Monitor service, Director service, and the Monitor Snap-in. Using these new .msi files, you can upgrade your 2402 LTSR CU1 with current release features.

For information on the Director features that are part of current releases after the 2402 LTSR release, see the following:

- Citrix Virtual Apps and Desktops 2407 release
- Citrix Virtual Apps and Desktops 2411 release

To learn more about specific features on Director with the minimum version of VDA, see Director Version Matrix.

Benefits

- **Access to new features**: Get access to Director features released after the 2402 LTSR announcement, including those in Citrix Virtual Apps and Desktops™ 2407 and 2411 Cumulative Release (CR).
- **Targeted upgrades:** Upgrade only the Director and Monitoring Service components without impacting the rest of your LTSR infrastructure.
- **LTSR compatibility**: Maintain your LTSR environment while benefiting from the latest Director enhancements.
- **Rollback option:** You have the flexibility to roll back to the previous Director version if needed.

Key consideration

The upgraded Director component is LTSR compatible, but is not covered by LTSR core component support. However, the rest of your LTSR infrastructure retains its existing support.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prerequisites

1. Download the `Director2411.zip` file from the Citrix downloads page.
2. Unzip the installer file, and can find the following installers:
    - DesktopDirector.msi
    - Monitor_PowerShellSnapIn.msi
    - Monitor_Service_x64.msi
3. Ensure you are using a Citrix Virtual Apps and Desktops™ 2402 LTSR or 2402 LTSR CU1 site.

High-level overview

To upgrade a Citrix Virtual Apps and Desktops 2402 LTSR CU1 site with the latest features of the Current Release, follow these steps:

1. **Backup your database**: Before upgrading, ensure you back up the Monitoring database. This procedure is crucial as the upgrade process also updates the database.
2. **Upgrade your site**: Proceed with upgrading your site to incorporate the new features of the current release.
3. **Rollback option**: If you decide not to continue with the upgraded site, you can revert to your previous site using the rollback steps.

Upgrade steps

1. Take a back up of the Monitoring database.
2. Download the `Director2411.zip` file from the Citrix downloads page.
3. Unzip the installer file, and can find the following installers:
    - DesktopDirector.msi
    - Monitor_PowerShellSnapIn.msi
    - Monitor_Service_x64.msi
4. Navigate to the location of the .msi files.
5. Install the Monitor service using the command line:

```
msiexec /i Monitor_service_x64 REINSTALLMODE=amus /l*v <logfile
    path and name>
```

6. Follow the onscreen instructions and complete the wizard.
7. Install Director service using the command line:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
msiexec /i DesktopDirector /l*v <logfile path and name>
```

8. Follow the onscreen instructions and complete the wizard.
9. Run the following command using the command line.

```
DirectorConfig.exe /UPGRADE
```

10. Install Monitor Snap-in using the command line

```
msiexec /i Monitor_PowershellSnapin_x64.msi
```

11. Once all the .msi installation is complete, navigate to the Monitor service in Program Files and run the command:

```
Citrix.Monitor.exe /upgrade /enablefeatures
```

12. Open Citrix Site Manager and select the **Automatic Site Upgrade** option and complete the upgrade workflow.
13. Sign in to the Director to verify the new features are available.

Rollback steps

1. Make sure to take the backup of the Monitoring database.
2. Download and run the database rollback script named dbollback.zip.
3. Uninstall the following from the Control Panel:
   - Select **Citrix Monitor Service PowerShell Snap-in- x64** and click **Uninstall**.
   - Select **Citrix Monitor Service - x64** and click **Uninstall**.
   - Select **Citrix Director** and click **Uninstall**.
4. Restore the monitoring database from the backup that you have taken already. For more information, see the knowledge-sharing article CTX135207.
5. Reinstall the Delivery Controller and Director using the Citrix Virtual Apps and Desktops installer. For more information, see install core components

   Or,

You can also reinstall the components using the following command:

```
XenDesktopServerSetup.exe /components controller,director /
   configure_firewall /quiet
```

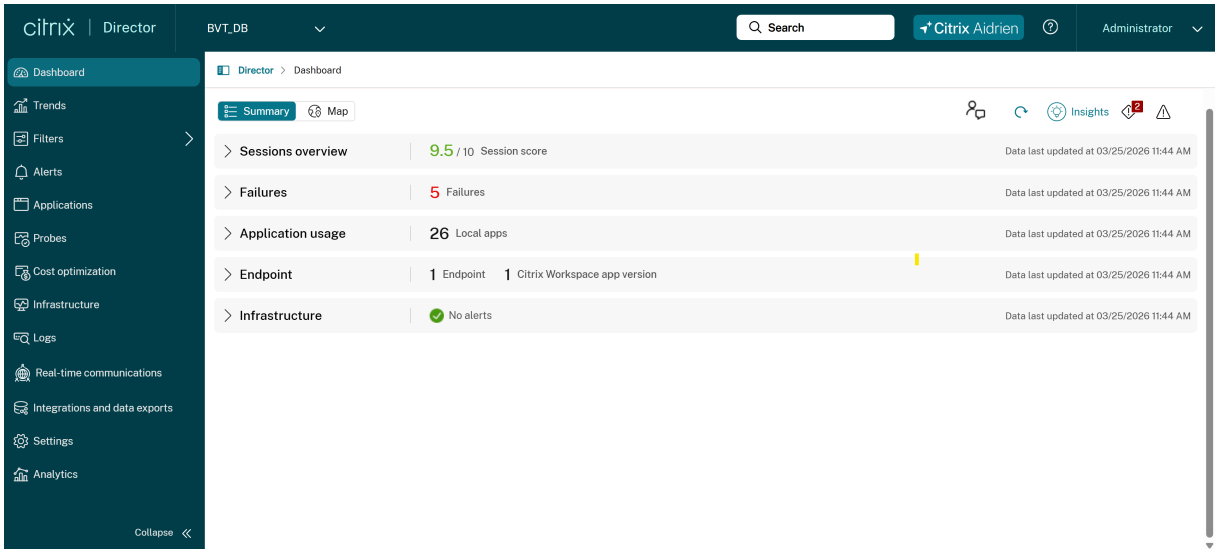
1. Once the installation is complete, select the **Open Citrix Site Manager** checkbox.
2. Perform a site upgrade if suggested in the Citrix Site Manager.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Support and compliance

Support

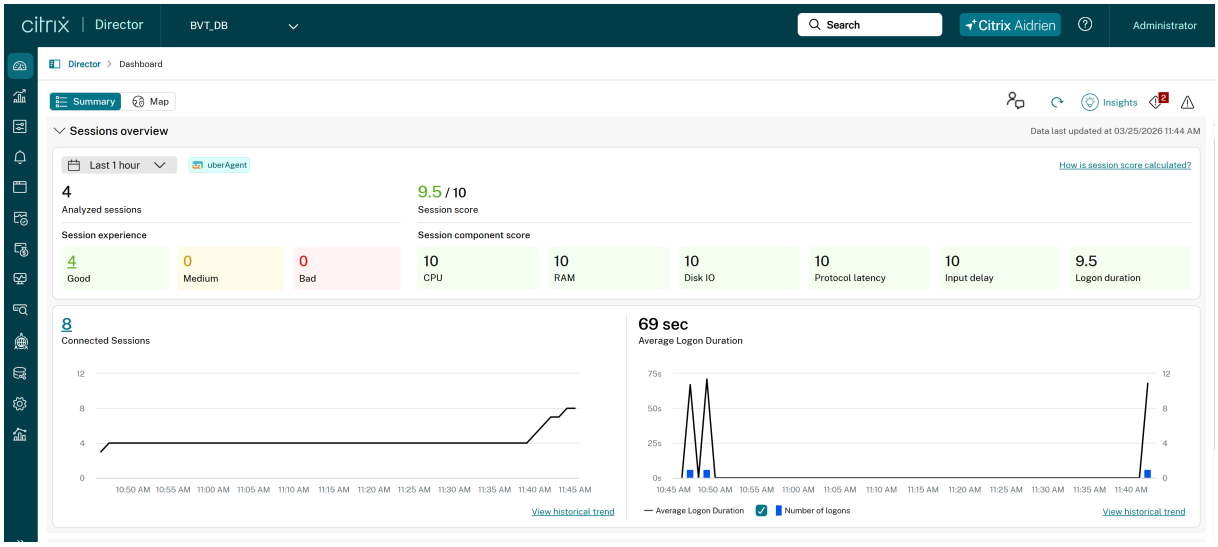
- The Cumulative Release (CR) versions of Director are LTSR compatible, but not LTSR compliant.
- Once upgraded, all support tickets, and bug fixes required are added to the following Cumulative Release (CR) for Director.
- The CR with the changes or fixes are made available in the following Cumulative Updates (CU).



508/WCAG 2.1

- For customers with the 508/wcag 2.1 compliance mandate, it is recommended to continue to use the LTSR version of all core components.

Site Analytics



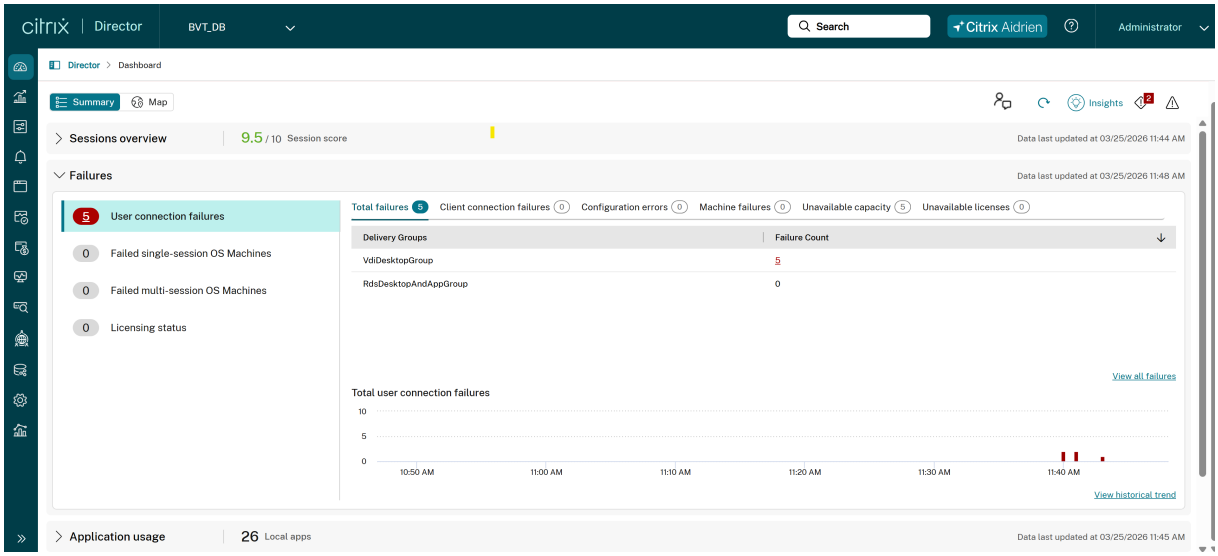
May 13, 2026

Using Director, you can monitor the health your deployments. You can troubleshoot performance issues by searching for a user, endpoint, or machine across all onboarded sites.

With full administrator permission, when you open Director, the Dashboard provides a centralized location to monitor the health and usage of a site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If there are currently no failures and no failures have occurred in the past 60 minutes, the panels stay collapsed. When there are failures, the specific failure panel automatically appears.



> **Note:**
>
> Depending on your organization's license and your Administrator privileges, some options or features might not be available.

Panels on the Director Dashboard

User Connection Failures

Connection failures over the last 60 minutes. Click the categories next to the total number to view metrics for that type of failure. In the adjacent table that number is broken out by delivery groups. Connection failures include failures caused by application limits being reached. For more information on application limits, see Applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Failed Single-session OS Machines or Failed Multi-session OS Machines

Total failures in the last 60 minutes broken out by delivery groups. Failures broken out by types, including failed to start, stuck on boot, and unregistered. For Multi-session OS machines, failures also include machines reaching maximum load.

Licensing Status

License Server alerts display alerts sent by the License Server and the actions required to resolve the alerts. Requires License Server Version 11.12.1 or later. Delivery Controller alerts display the details of the licensing state as seen by the Controller and are sent by the Controller. Requires Controller for XenApp 7.6 or XenDesktop 7.6 or later. You can set the threshold for alerts in Studio. Licensing status displayed in **Delivery Controllers** > **Details** > **Product Editions** > **PLT** indicates **Premium** and not **Platinum**.

Grace State

Director displays one of the following grace states. This information is fetched from the Delivery Controller.

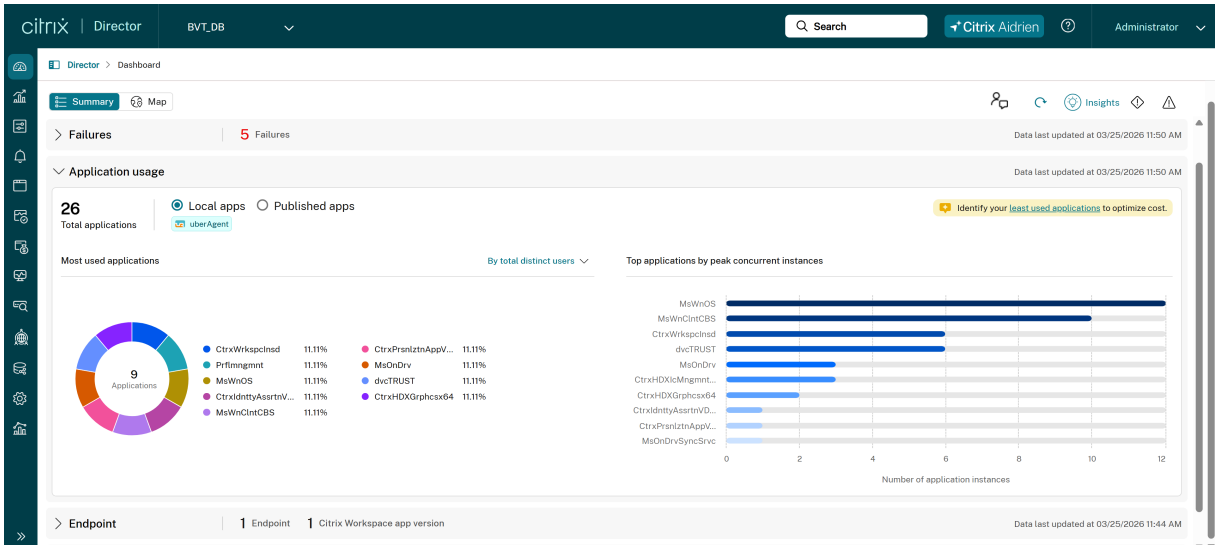
1. **Not Active:** Not in any type of License caching mode. Normal licensing limits apply.
2. **Emergency Grace:** Comes into effect when the license server is unreachable or the license information cannot be fetched while brokering a connection. Users are not affected. Errors shown in Director cannot be dismissed until the license server is reachable.
3. **Grace Expired:** Emergency License caching mode has expired.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information, see License overdraft and License burst mode.

Sessions Connected

Connected sessions across all delivery groups for the last 60 minutes.



Average Logon Duration

Logon data for the last 60 minutes. The large number on the left is the average logon duration across the hour. Logon data for VDAs earlier than XenDesktop 7.0 is not included in this average. For more information, see Diagnose user logon issues.

Infrastructure

Lists your site's infrastructure - hosts and Controllers. For infrastructure from XenServer or VMware, you can view performance alerts. For example, you can configure XenCenter to generate performance alerts when CPU, network I/O, or disk I/O usage go over a specified threshold on a managed server or virtual machine. By default, the alert repeat interval is 60 minutes, but you can configure this as well. For details, see the XenCenter Performance Alerts section in the XenServer product documentation.

> **Note:**
>
> If no icon appears for a particular metric, this indicates that this metric is not supported by the type of host you are using. For example, no health information is available for System Center Virtual Machine Manager (SCVMM) hosts, AWS and CloudStack.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Continue to troubleshoot issues using these options (which are documented in the following sections):

- Control user machine power
- Prevent connections to machines

Total connected users

Shows the number of users who had at least one connection in the last 24 hours or last 7 days. This panel helps the admins to showcase adoption trends to their executives.

Citrix Workspace™ app versions found in your environment

Provides an overview of the Citrix Workspace app versions used across the organization. It helps in unifying the versions by showing how many devices are using different versions. By default, Citrix Workspace app version data for all OS platforms is displayed. You can view the version data for a specific OS platform by selecting the corresponding OS from the **Platform drop-down** list.

Monitor sessions

If a session becomes disconnected, it is still active and its applications continue to run, but the user device is no longer communicating with the server.

Action	Description
View a user's currently connected machine or session	From the Activity Manager and User Details views, view the user's currently connected machine or session and a list of all machines and sessions to which this user has access. To access this list, click the session switcher icon in the user title bar. For more information, see Restore sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Description
View the total number of connected sessions across all delivery groups	From the Dashboard, in the **Sessions Connected** pane, view the total number of connected sessions across all delivery groups for the last 60 minutes. Then click the large total number, which opens the Filters view, where you can display graphical session data based on selected delivery groups and ranges and usage across delivery groups.
End idle sessions	The Sessions Filters view displays data related to all active sessions. Filter the sessions based on Associated User, delivery group, Session State, and Idle Time greater than a threshold time period. From the filtered list, select sessions to log off or disconnect. For more information, see Troubleshoot applications.
View data over a longer period of time	On the Trends view, select the **Sessions** tab to drill down to more specific usage data for connected and disconnected sessions over a longer period of time (that is, session totals from earlier than the last 60 minutes). To view this information, click **View historical trends**.

> **Note:**
>
> If the user device is running a legacy Virtual Delivery Agent (VDA), such as a VDA earlier than version 7, or a Linux VDA, Director cannot display complete information about the session. Instead, it displays a message that the information is not available.

Desktop Assignment Rules limitation:

Web Studio allows assignment of multiple Desktop Assignment Rules (DAR) for different users or user groups to a single VDA in the delivery group. StoreFront™ displays the assigned desktop with the corresponding **Display Name** as per the DAR for the logged in user. However, Director does not support DARs and displays the assigned desktop using the delivery group name regardless of the logged in user. As a result, you cannot map a specific desktop to a machine in Director.

You can map the assigned desktop displayed in StoreFront to the delivery group name displayed in Director using the following PowerShell command:

```
Get-BrokerDesktopGroup | Where-Object {
  \$\_.Uid -eq \(Get-BrokerAssignmentPolicyRule | Where-Object {
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
  \$\_.PublishedName -eq \"\<Name on StoreFront\>\"  }
).DesktopGroupUid  }
 | Select-Object -Property Name, Uid
```

Session transport protocol

View the transport protocol in use for the HDX connection type for the current session in the **Session Details** panel. This information is available for sessions launched on VDAs Version 7.13 or later.

- For **HDX™** Connection type,
  - The Protocol is displayed as **UDP**, if EDT is used for the HDX connection.
  - The Protocol is displayed as **TCP**, if TCP is used for the HDX connection.
- For **RDP** Connection type, the Protocol is displayed as **n/a**.

When adaptive transport is configured, the session transport protocol dynamically switches between EDT (over UDP) and TCP, based on the network conditions. If the HDX session cannot be established using EDT, it falls back to the TCP protocol.

For more information about adaptive transport configuration, see Adaptive Transport.

Export reports

You can export trends data to generate regular usage and capacity management reports. Export supports PDF, Excel, and CSV report formats. Reports in PDF and Excel formats contain trends represented as graphs and tables. CSV format reports contain tabular data that can be processed to generate views or can be archived.

To export a report:

1. Go to the **Trends** tab.
2. Set filter criteria and time period and click **Apply**. The trend graph and table are populated with data.
3. Click **Export** and enter name and format of the report.

Director generates the report based on the filter criteria you select. If you change the filter criteria, click **Apply** before you click **Export**.

> **Note:**
>
> Export of a large amount of data causes a significant increase in memory and CPU consumption on the Director server, the Delivery Controller, and the SQL servers. The supported number of

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> concurrent export operations and the amount of data that can be exported is set to default limits to achieve optimal export performance.

Supported export limits

Exported PDF and Excel reports contain complete graphical charts for the selected filter criteria. However, tabular data in all report formats is truncated beyond the default limits on the number of rows or records in the table. The default number of records supported is defined based on the report format.

You can change the default limit by configuring the Director Application Settings in Internet Information Services (IIS).

Report format	Default number of records supported	Fields in Director Application Settings	Max number of records supported
PDF	500	UI.ExportPdfDrilldownLimit	5000
Excel	100,000	UI.ExportExcelDrilldownLimit	1000,000
CSV	100,000 (10,000,000 in **Sessions** tab)	UI.ExportCsvDrilldownLimit	10,000,000

To change the limit of the number of records you can export:

1. Open the IIS Manager console.
2. Go to the Director website under the Default website.
3. Double-click **Application Settings**.
4. Edit or add a setting for the fields UI.ExportPdfDrilldownLimit, UI.ExportExcelDrilldownLimit, or UI.ExportCsvDrilldownLimit as required.

Adding these field values in Application Settings overrides the default values.

> **Warning:**
>
> Setting field values greater than the max number of records supported can impact the performance of Export and is not supported.

Error Handling

This section gives you information on dealing with errors that you might encounter during Export operation.

- **Director has timed out**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This error can occur due to network issues or high resource usage on the Director server or with the Monitor Service.

The default timeout duration is 100 seconds. To increase the timeout duration of the Director Service, set the value of **Connector.DataServiceContext.Timeout field in** Director Application Settings in Internet Information Services (IIS):

1. Open the IIS Manager console.
2. Go to the Director website under the Default website.
3. Double-click **Application Settings**.
4. Edit the value **Connector.DataServiceContext.Timeout**.

- **Monitor has timed out**

This error can occur due to network issues or high resource usage with the Monitor Service or on the SQL server.

To increase the timeout duration of the Monitor Service, run the following PowerShell commands on the Delivery Controller:

```
asnp Citrix.*
Get-MonitorConfiguration
Set-MonitorConfiguration -MonitorQueryTimeoutSeconds <timeout value>
```

- **Max concurrent Export or Preview operations ongoing**

Director supports one instance of Export or Preview. If you get the **Max concurrent Export or Preview operations ongoing** error, try the next Export operation again later.

It is possible to increase the number of concurrent Export or Preview operations, however this can impact the performance of Director and is not supported:

1. Open the IIS Manager console.
2. Go to the Director website under the Default website.
3. Double-click **Application Settings**.
4. Edit the value **UI.ConcurrentExportLimit**.

- **Insufficient disk space in Director**

Each Export operation requires a maximum of 2 GB hard disk space in the Windows Temp folder. Retry Export after clearing space or adding more hard disk space on the Director server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitor hotfixes

To view the hotfixes installed on a specific machine VDA (physical or VM), choose the **Machine Details** view.

Control user machine power states

To control the state of the machines that you select in Director, use the Power Control options. These options are available for Single-session OS machines, but might not be available for Multi-session OS machines.

> **Note:**
>
> This functionality is not available for physical machines or machines using Remote PC Access.

Command	Function
Restart	Performs an orderly (soft) shutdown of the VM and all running processes are halted individually before restarting the VM. For example, select machines that appear in Director as "failed to start,"and use this command to restart them.
Force Restart	Restarts the VM without first performing any shut-down procedure. This command works in the same way as unplugging a physical server and then plugging it back in and turning it back on.
Shut Down	Performs an orderly (soft) shutdown of the VM. All running processes are halted individually.
Force Shutdown	Shuts down the VM without first performing any shut-down procedure. This command works in the same way as unplugging a physical server. It might not always shut down all running processes, and you risk losing data if you shut down a VM in this way.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Command	Function
Suspend	Suspends a running VM in its current state and stores that state in a file on the default storage repository. This option allows you to shut down the VM's host server and later, after rebooting it, resume the VM, returning it to its original running state.
Resume	Resumes a suspended VM and restores its original running state.
Start	Starts a VM when it is off (also called a cold start).

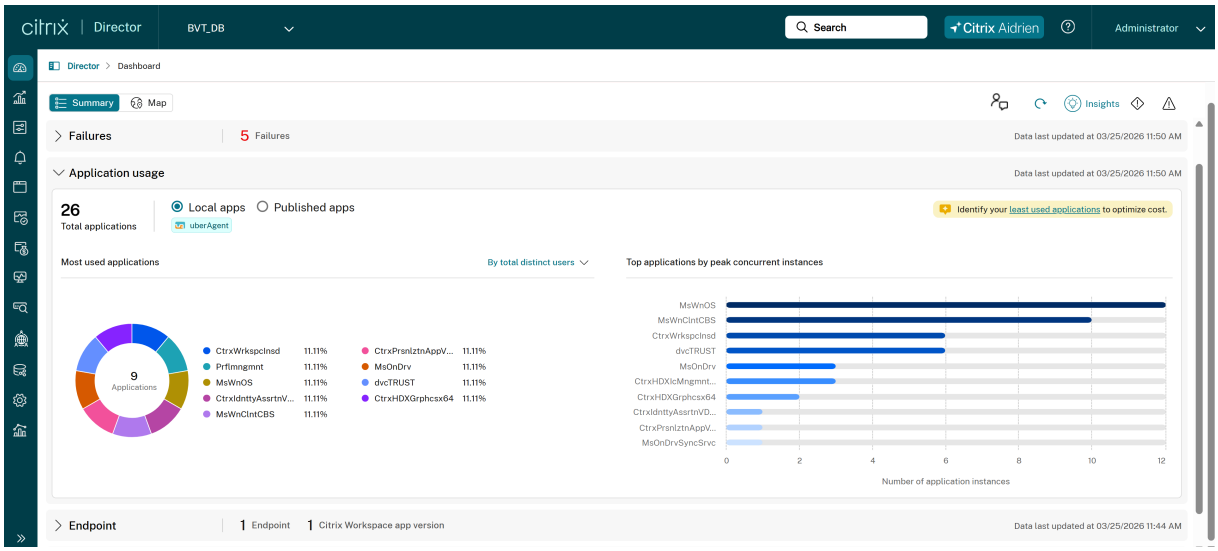
If power control actions fail, hover the mouse over the alert, and a pop-up message appears with details about the failure.

Prevent connections to machines

Use maintenance mode to prevent new connections temporarily while the appropriate administrator performs maintenance tasks on the image.

When you enable maintenance mode on machines, no new connections are allowed until you disable it. If users are currently logged on, maintenance mode takes effect as soon as all users are logged off. For users who do not log off, send a message informing them that machines will be shut down at a certain time, and use the power controls to force the machines to shut down.

1. Select the machine, such as from the User Details view, or a group of machines in the Filters view.
2. Select **Maintenance Mode**, and turn on the option.

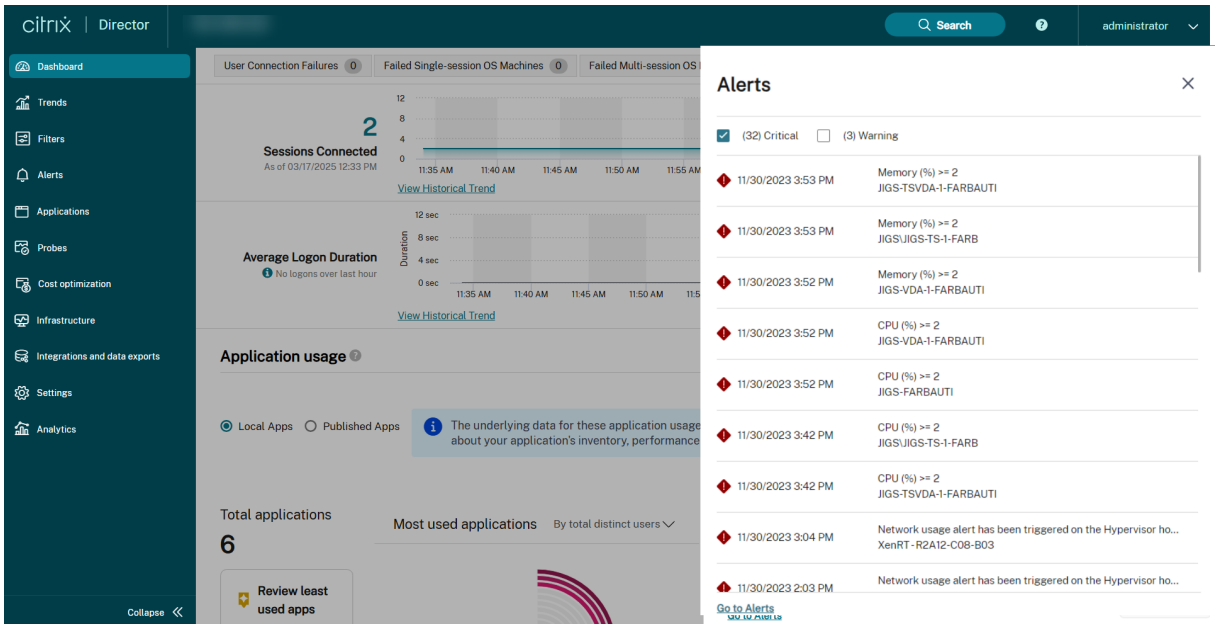


If a user tries to connect to an assigned desktop while it is in maintenance mode, a message appears indicating that the desktop is unavailable. No new connections can be made until you disable maintenance mode.

Application Analytics

The **Applications** tab displays application-based analytics in a single, consolidated view to help analyze and manage application performance efficiently. You can gain valuable insight into the health and usage information of all applications published on the site. It shows metrics such as the probe

© 1997–2026 Citrix Systems, Inc. All rights reserved.

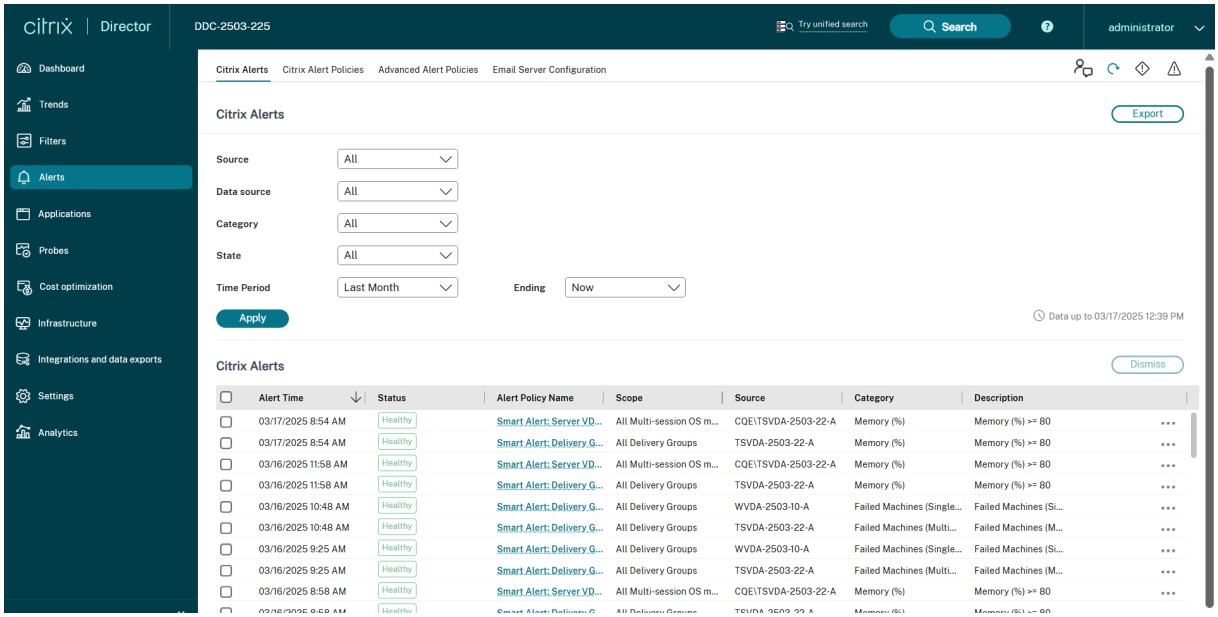


results, number of instances per application, and faults and errors associated with the published applications. For more information, see the Application Analytics section in **Troubleshooting Applications**.

Alerts and notifications

May 13, 2026

Alerts are displayed in Director on the dashboard and other high-level views with warning and critical alert symbols. Alerts are available for **Premium** licensed sites. Alerts update automatically every minute; you can also update alerts on demand.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

A warning alert (amber triangle) indicates that the warning threshold of a condition has been reached or exceeded.

A critical alert (red circle) shows that the critical threshold of a condition has been reached or exceeded.

You can view more detailed information on alerts by selecting an alert from the sidebar, clicking the **Go to Alerts** link at the bottom of the sidebar or by selecting **Alerts** from the top of the Director page.

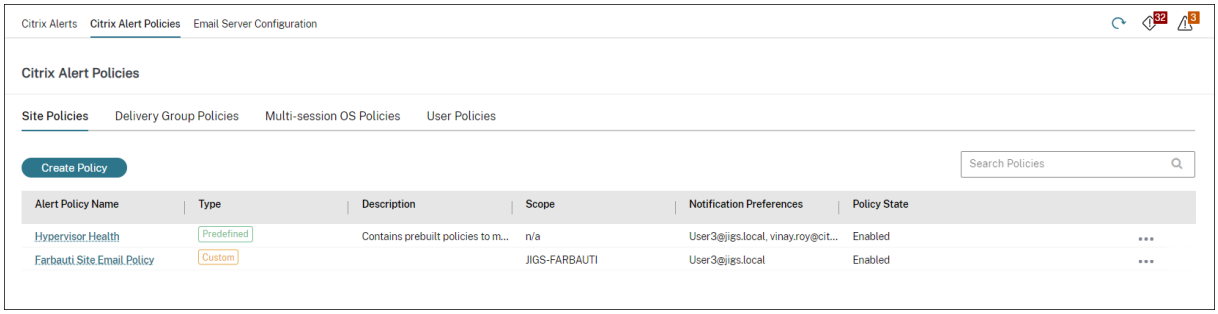
In the Alerts view, you can filter and export alerts. For example, Failed Multi-session OS machines for a specific Delivery Group over the last month, or all alerts for a specific user. For more information, see Export reports.

Citrix® alerts

Citrix alerts are alerts monitored in Director that originate from Citrix components. You can configure Citrix alerts within Director in **Alerts** > **Citrix Alerts Policy**. As part of the configuration, you can set notifications to be sent by email to individuals and groups when alerts exceed the thresholds you have set up. For more information on setting up Citrix Alerts, see Create alerts policies.

> **Note:**
>
> Ensure that your firewall, proxy, or Microsoft Exchange Server do not block the email alerts.

Smart alert policies



A set of built-in alert policies with predefined threshold values is available for Delivery Groups and Multi-session OS VDA scope. This feature requires Delivery Controller(s) version 7.18 or later. You can

© 1997–2026 Citrix Systems, Inc. All rights reserved.

modify the threshold parameters of the built-in alert policies in **Alerts** > **Citrix Alerts Policy**. These policies are created when there is at least one alert target -a Delivery Group or a Multi-session OS VDA defined in your site. Additionally, these built-in alerts are automatically added to a new delivery group or a Multi-session OS VDA.

In case you upgrade Director and your site, the alert policies from your previous Director instance are carried over. Built-in alert policies are created only if no corresponding alert rules exist in the Monitor database.

For the threshold values of the built-in alert policies, see the Alerts policies conditions section.

Advanced alert policies

The Proactive Notification and Alerting feature of the Director is enhanced to include a new alerting framework named **Advanced Alert Policies**. With this feature, you can create alerts by including granular details for each element or condition, thereby enhancing the control over the alerts scope. Currently, these policies include alerts for cost savings and infrastructure.

With the introduction of Advanced alert policies, which is a data source-driven alert you can use multi-condition scope filtering.

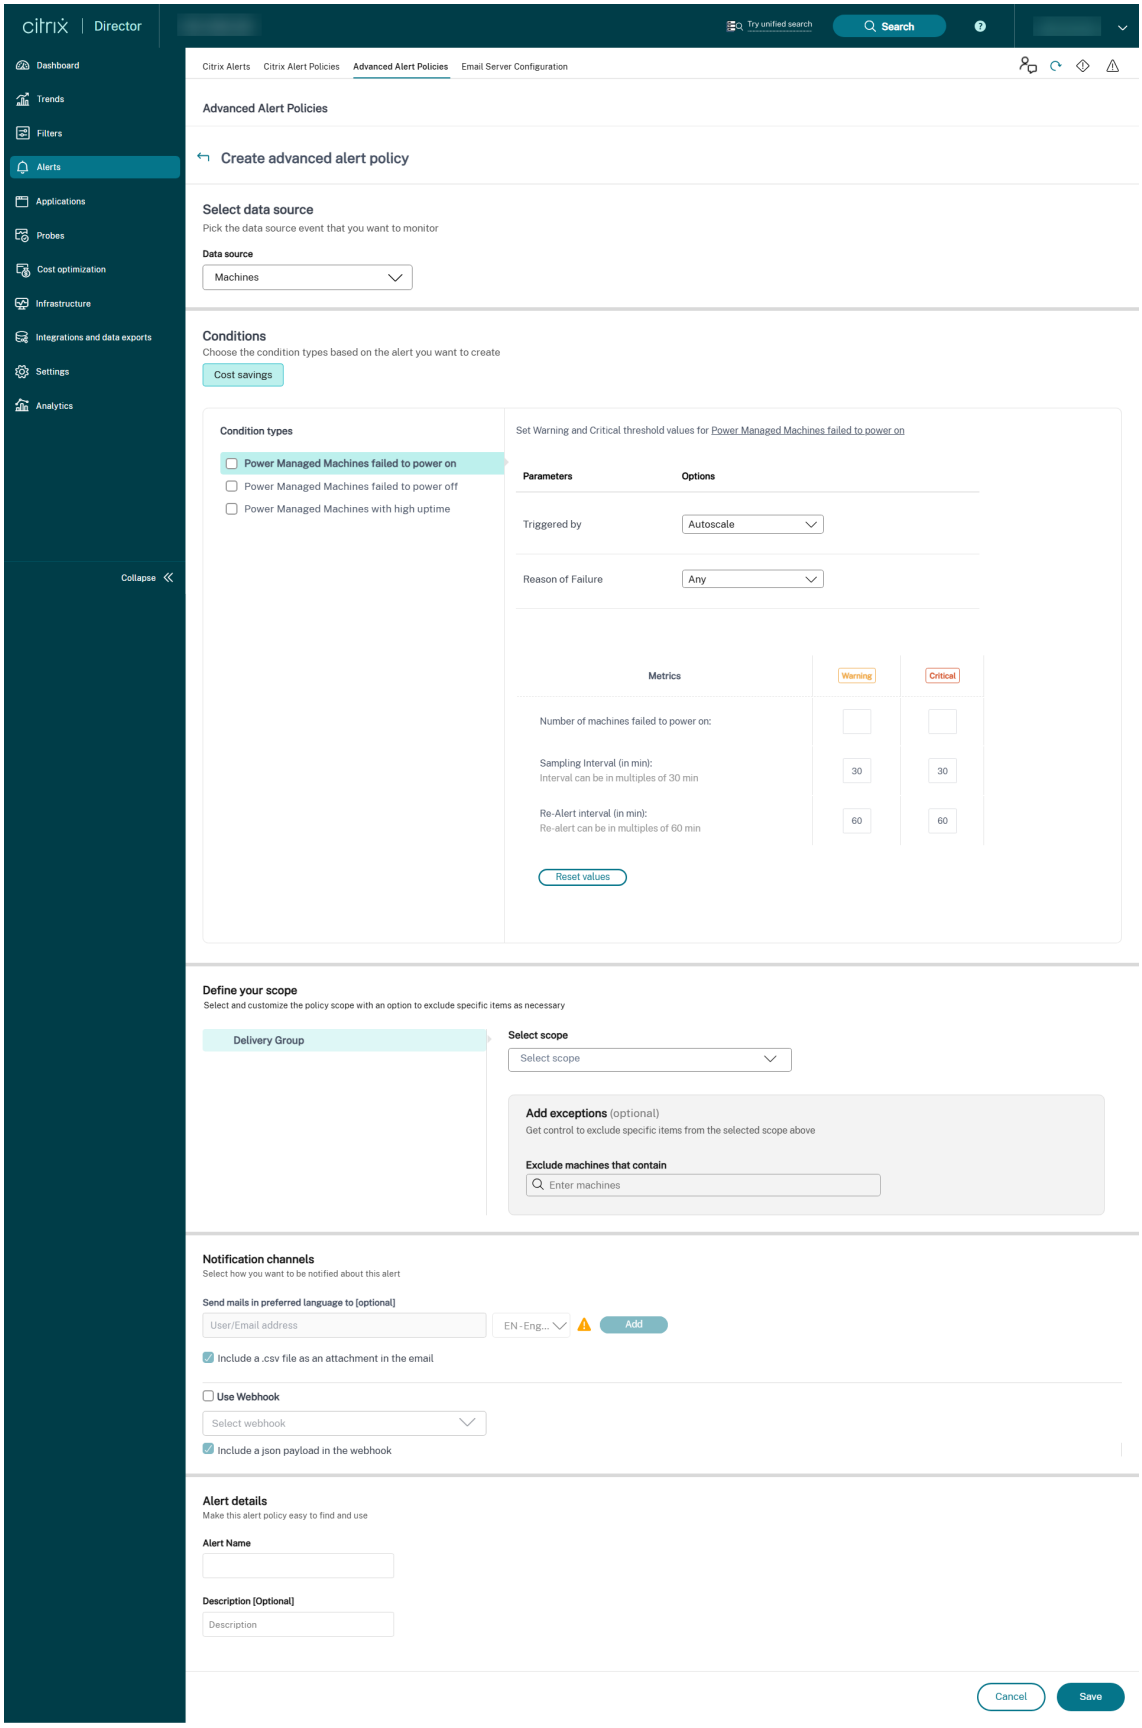
This feature helps you to reduce excessive alerts which might lead to reduced responsiveness or effectiveness in addressing important issues. This policy helps to measure effectiveness of alert policies and engagement from admins.

You can create an Advanced alert policy from the **Alerts** > **Advanced alert policy** > **Create Policy** section.

You can select the one of the following Data source:

- Machines
- Provisioning Service
- StoreFront™
- Delivery Controller™

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Alerts for cost savings

You can create alerts for cost savings which help you optimize costs. Currently, you can create alerts for machines.

To create alerts on Machines, do the following:

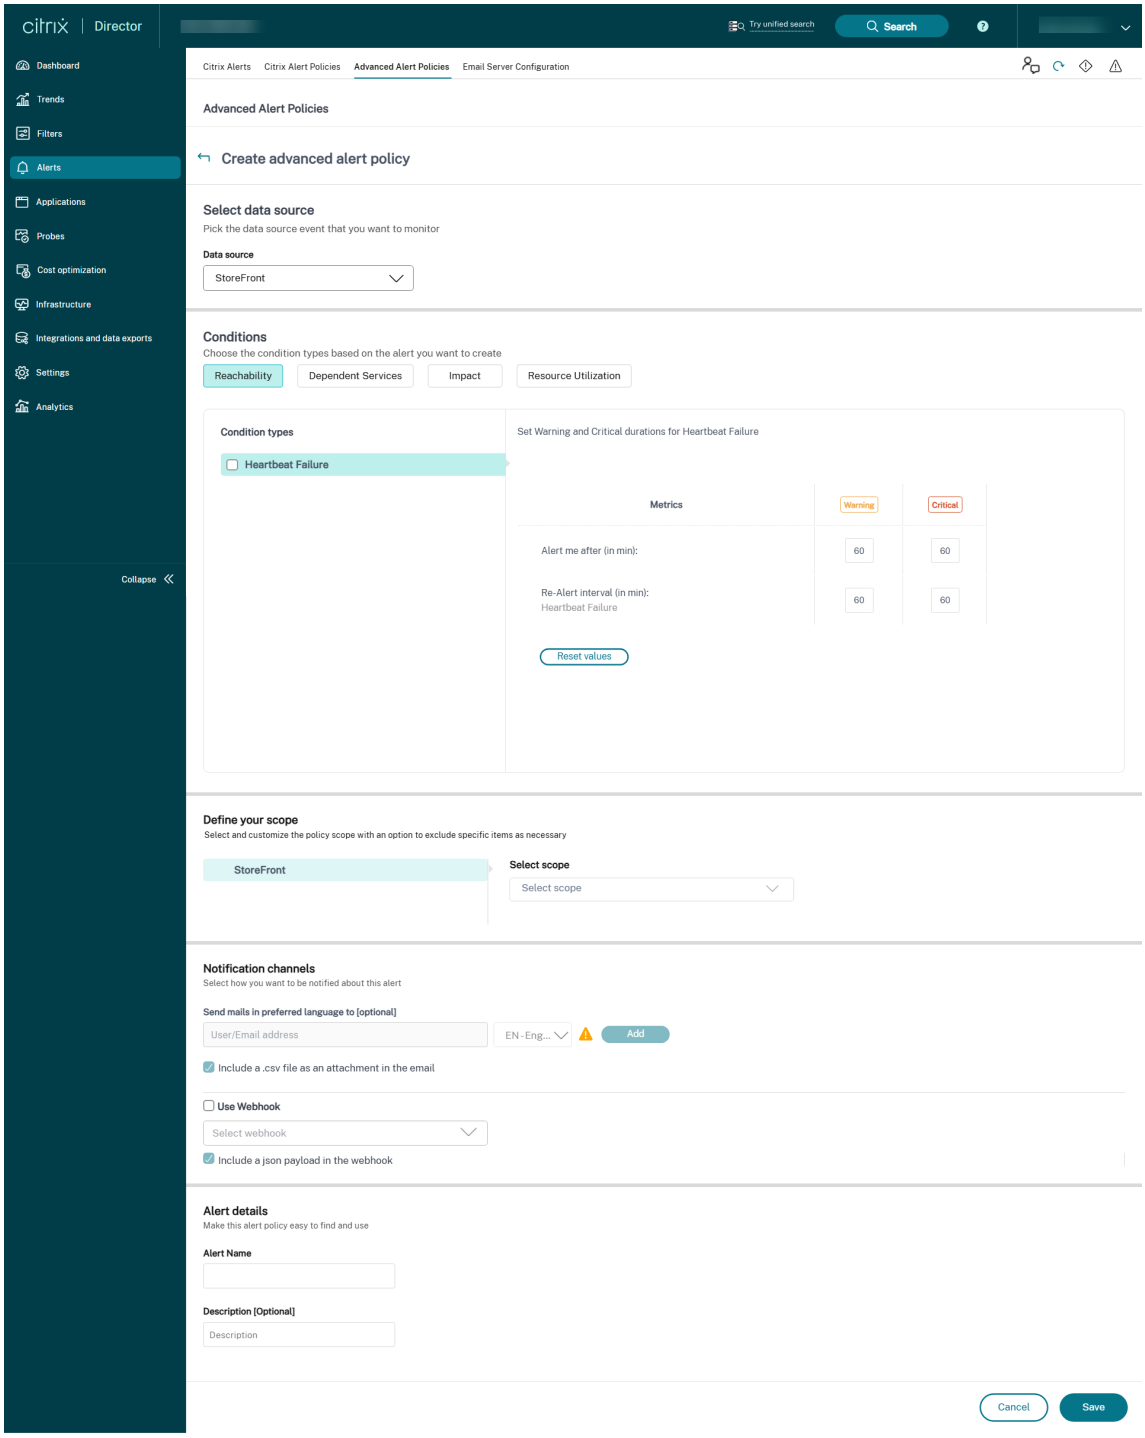
1. Click the **Alerts** tab > **Advanced Alert Policies**. The **Advanced Alert Policies** page appears.
2. Click **Create Policy**. The **Create Advanced Alert Policies** section appears.
3. Select **Machines** from the Data source drop-down list. The Cost savings condition and corresponding condition types are displayed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Select the following condition types as required:
    - Power Managed Machines failed to power on
    - Power Managed Machines failed to power off
    - Power Managed Machines with high uptime
5. Select the specific parameters and the corresponding options for each of the selected conditions.
6. Set the Warning and Critical metrics for the selected condition type:
    - For Power Managed Machines with high uptime:
        - Number of machines crossing uptime threshold
        - Re-alert interval (in min) interval can be a minimum of 60 min
    - For Power Managed Machines failed to power on and Power Managed Machines failed to power off:
        - Number of machines crossing uptime threshold
        - Sampling interval (in min) intervals can be multiples of 30 min
        - Re-alert interval (in min) re-alert can be multiples of 60 min
7. Schedule re-alert intervals for the selected alerts as needed.
8. Define the scope of the alert.
9. Set the notification channels. This can be email or Webhook.
    a) You can select the following checkboxes:
        - Include a json payload as an attachment in the webhook
        - Include a csv file as an attachment in the email

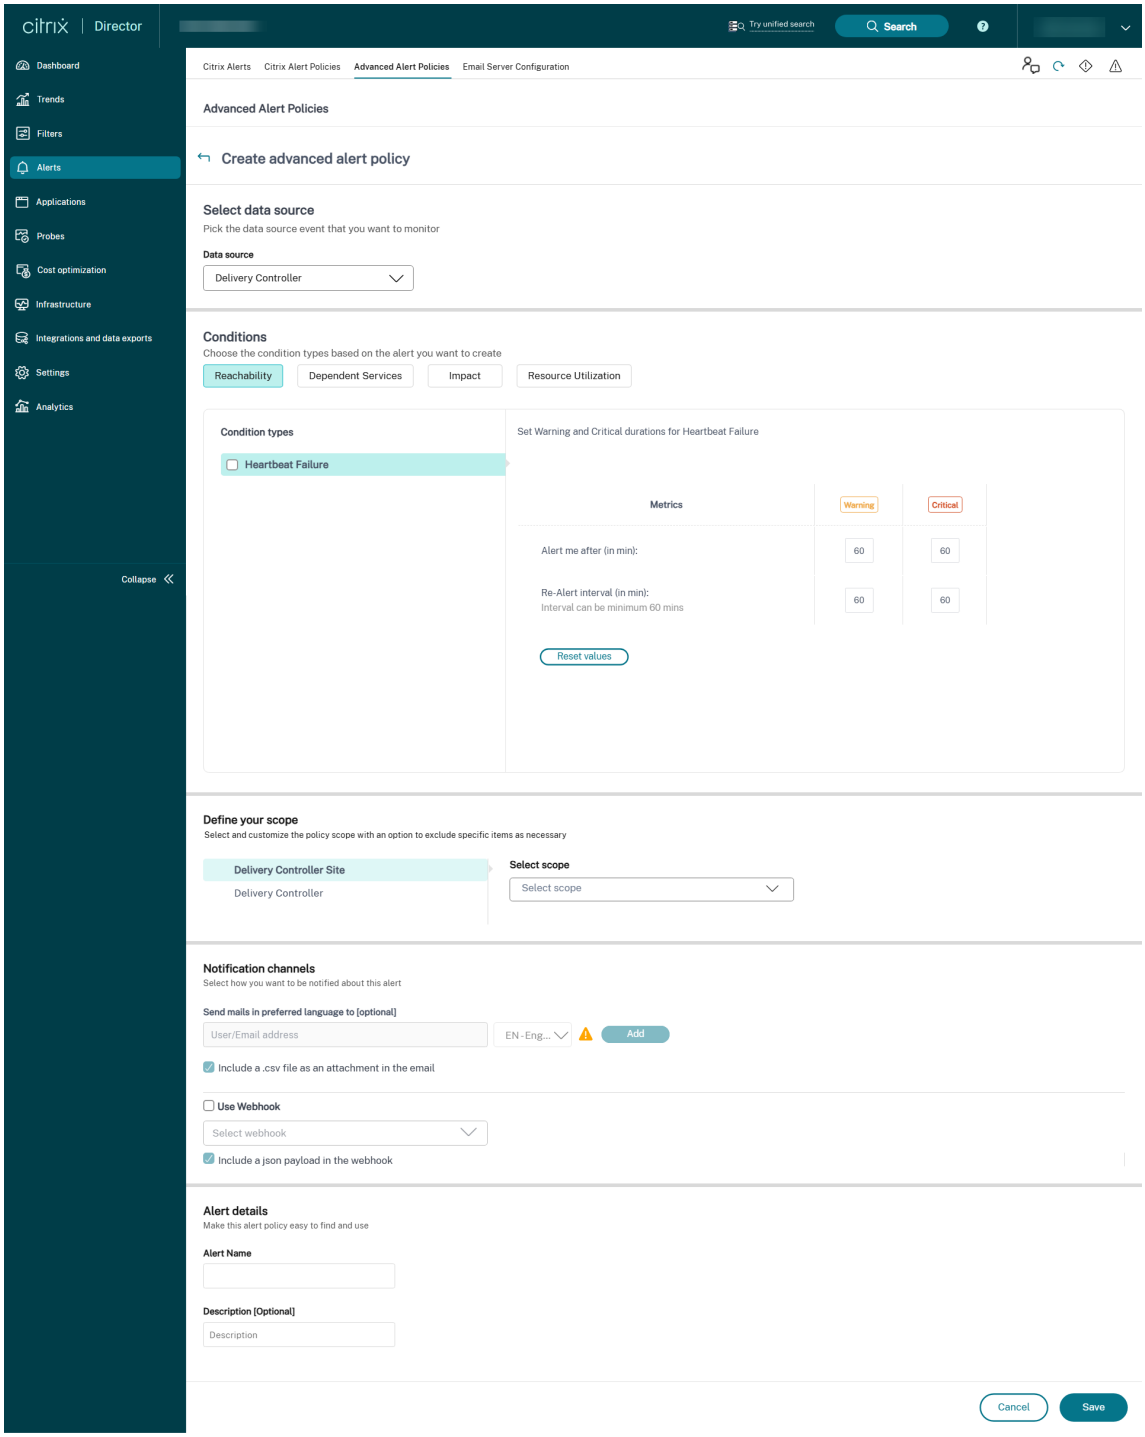
    For more information, see Enhancements on alert content.
10. Enter the **Alert details** such as **Alert Name** and **Description** (optional).
11. Click **Save**. The alert is created.



Alerts for infrastructure monitoring

You can create alerts to monitor the health of the following supported Citrix Virtual Apps and Desktops™ components:

- Provisioning Service



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- StoreFront

- Delivery Controller

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Once the Infrastructure monitoring setup is completed, you can use the health data available in Director to configure alerts for any required component. Admins can set conditions, scopes, and notification mediums to receive important alerts through emails or a json payload through webhooks. For Provisioning Service and Delivery Controller, you can select the scope of alerts as either site level or individual server level. For example, in the case of Provisioning Service, if you select "All Provisioning Service,"you will receive only a single alert for the entire site, even if the site has two servers. This is

© 1997–2026 Citrix Systems, Inc. All rights reserved.

considered a site-level alert. The alerts raised are also available in the **Citrix Alerts** section for analysis and management.

As a part of the newly introduced Infrastructure policy, alert conditions are categorized into four sections as follows:

- Reachability
- Dependent services
- Impact
- Resource utilization

Conditions within each category can be set with the severity of **Critical** and **Warning** based on your organizational priorities. You can also schedule re-alert intervals for these alerts.

You can create an infrastructure policy from the **Alerts** > **Citrix Alert Policies** section. You can select the required category and then select the required conditions for the policy. For more information on how to create a policy, see Create alert policies. After the policy is created, you can edit, delete, or disable the policy on the Citrix Alerts page.

For more details on the conditions supported in each category and component, see the following:

- Provisioning Service health metrics
- StoreFront health metrics
- Delivery Controller health metrics

The following data is received as an alert over email or on the Citrix Alert page:

Field	Description
Customer ID	The customer ID of the site.
Alert level	The possible values are Critical and Warning.
Target	The name of the machine for which the alert is triggered.
Time	The time when the alert is triggered.
Scope	The scope of the policy.
Policy	The name of the policy.
Description	The description of the issue for which the alert is triggered.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Define the scope of the policy

You can define the scope of your alert and add exceptions. The alert is generated only for the selected scope and the subscope excluded using add exceptions aren't included in alert generation. This feature helps you to create alerts on a granular level.

You can create notifications through emails or through webhook URLs. You can also select your preferred language in which you would like to receive alerts. You can also select an option to receive the alert parameters in a .CSV file attachment for email or in a json payload through a webhook URL. The attachment includes details of the required parameters. For more information, see Enhancements on alert content.

The following data is received as an alert over email or on the **Citrix Alerts** page:

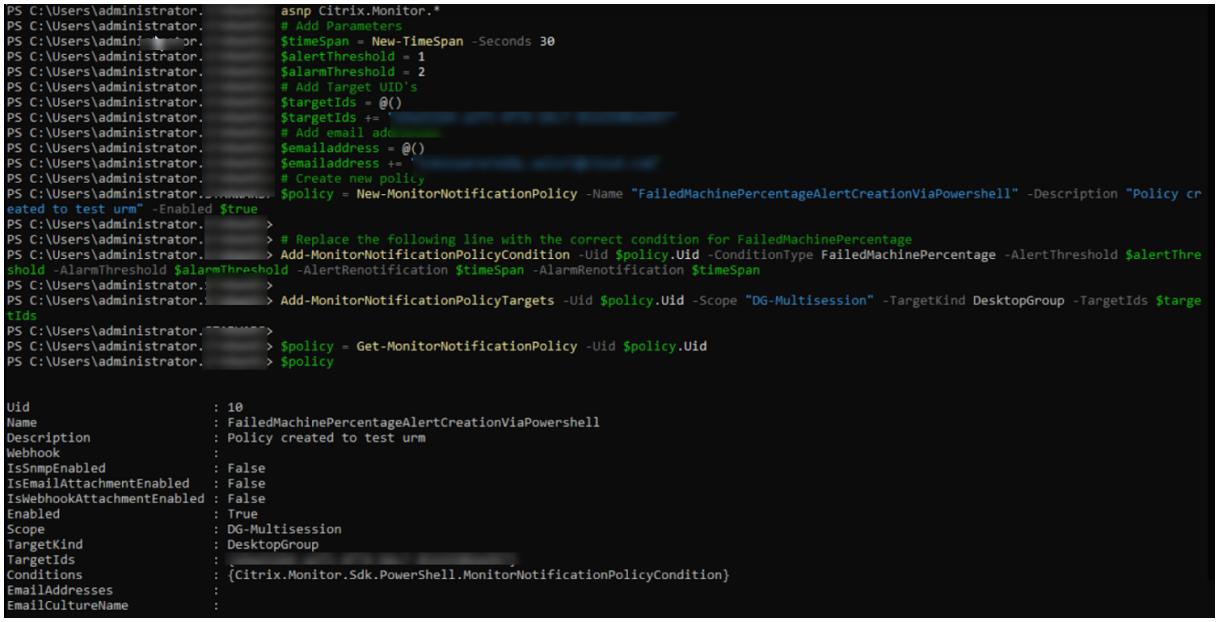
Field	Description
Customer ID	The customer ID of the site.
Alert level	This value is the predefined value set for each alert condition. The possible values are Critical and Warning.
Condition	This value is the condition set while creating the policy. For example, the number of unregistered machines is equal to or more than 20.
Target	The name of the delivery group or site for which the alert is triggered.
Site	The name of the site.
Scope	The scope of the policy. This value includes subscope also.
Policy	The name of the policy.
Description	The description of the issue for which the alert is triggered.

How to create an Advanced alert policy using a PowerShell script?

PowerShell script to create an alert policy:

```
asnp Citrix.Monitor.*
# Add Parameters
$timeSpan = New-TimeSpan -Seconds 30
$alertThreshold = 1
$alarmThreshold = 2
# Add Target UID's
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.



```
$targetIds = @()
$targetIds += "e9a211b4-a1f3-4f74-b6c7-85225902e997"
# Add email addresses
$emailaddress = @()
$emailaddress += "loki@abc.com"
# Create new policy
$policy = New-MonitorNotificationPolicy -Name "
    FailedMachinePercentageAlertCreationViaPowershell" -Description "
    Policy created to test urm" -Enabled $true
```

Replace the following line with the correct condition for FailedMachinePercentage

```
Add-MonitorNotificationPolicyCondition -Uid $policy.Uid -ConditionType
    FailedMachinePercentage -AlertThreshold $alertThreshold -
    AlarmThreshold $alarmThreshold -AlertRenotification $timeSpan -
    AlarmRenotification $timeSpan

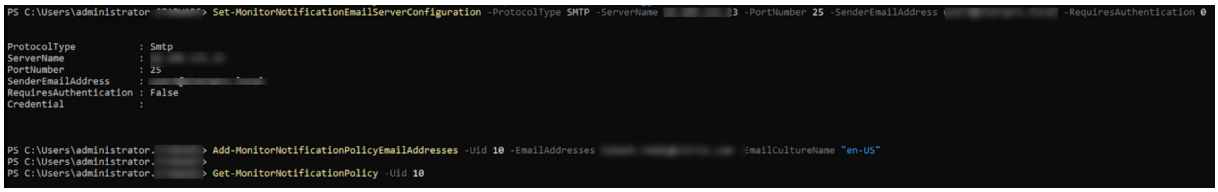
Add-MonitorNotificationPolicyTargets -Uid $policy.Uid -Scope "DG-
    Multisession" -TargetKind DesktopGroup -TargetIds $targetIds

$policy = Get-MonitorNotificationPolicy -Uid $policy.Uid
$policy
```

From the preceding image, you can see that the policy is created and Uid is 10.

To add email to configuration

```
Set-MonitorNotificationEmailServerConfiguration -ProtocolType SMTP -
    ServerName NameOfTheSMTPServerOrIPAddress -PortNumber 80 -
    SenderEmailAddress loki@abc.com -RequiresAuthentication 0
```



To add email to policy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

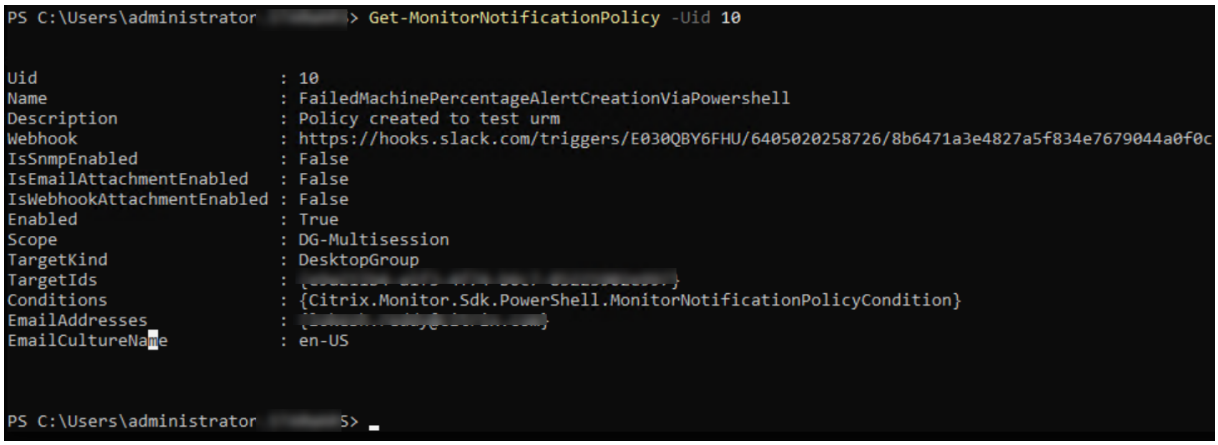
```
Add-MonitorNotificationPolicyEmailAddresses -Uid $policy.Uid -
    EmailAddresses $emailaddress -EmailCultureName "en-US"
```

Sample script to add email:

```
Add-MonitorNotificationPolicyEmailAddresses -Uid 10 -EmailAddresses
    $emailaddress -EmailCultureName "en-US"
```

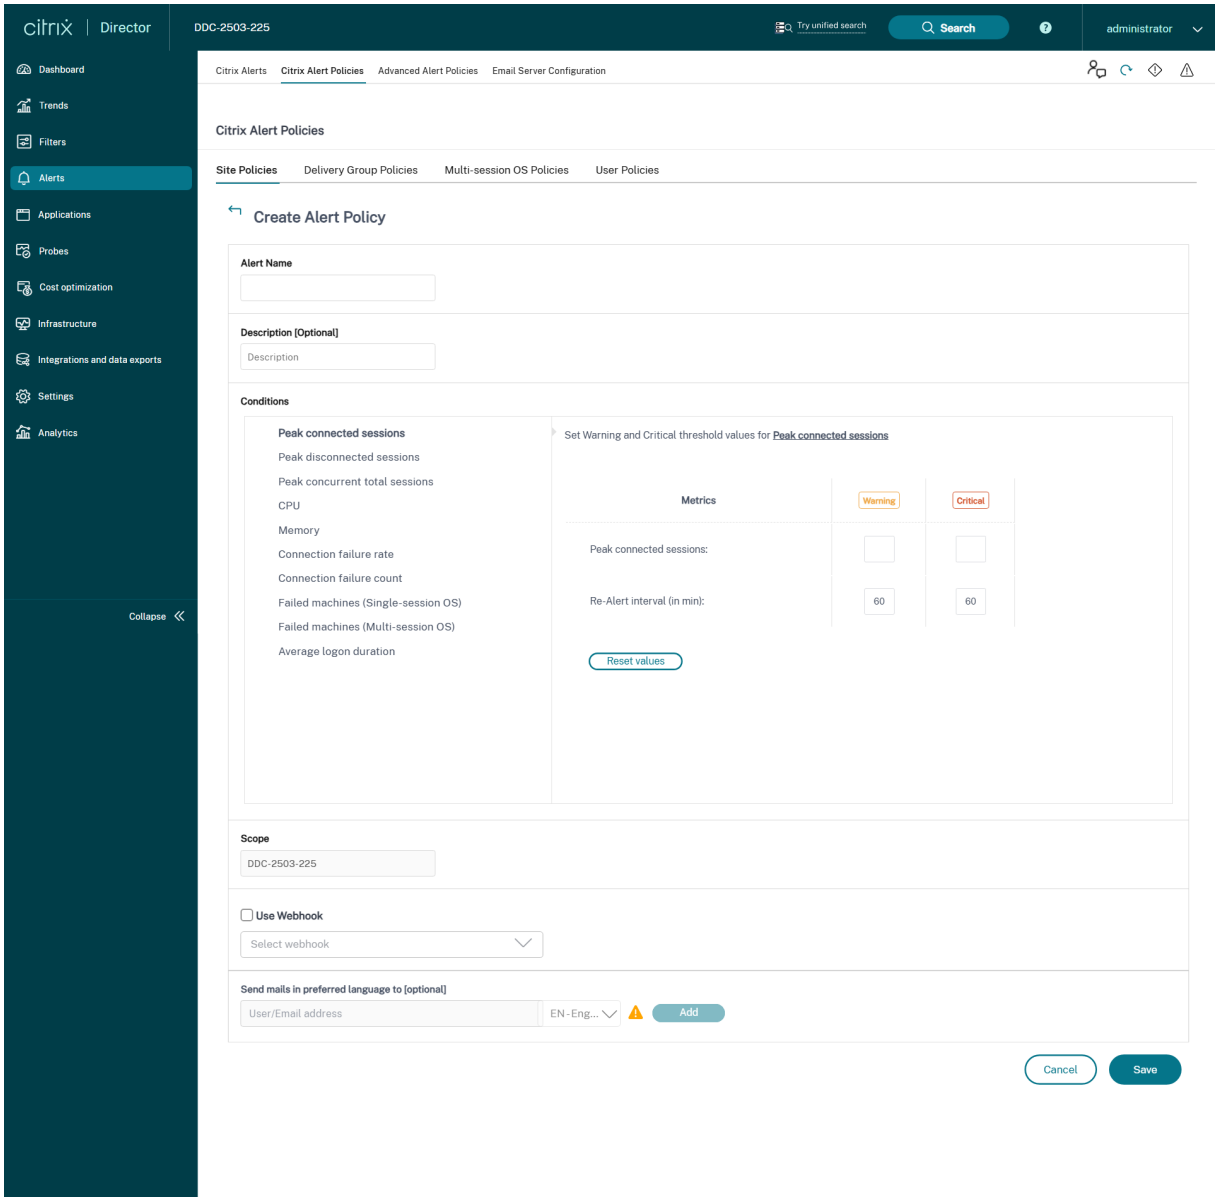
To add Webhook URL to policy

```
Set-MonitorNotificationPolicy  – Uid $polcy.Uid  – Webhook 'URL'
```



Sample scipt to add webhook URL:

```
Set-MonitorNotificationPolicy  – Uid 10   – Webhook  'https://hooks.slack
    .com/triggers/E030QBY6FHU/6405020258726/8
    b6471a3e4827a5f834e7679022a1f1c'
```



Get Created Policy details

```
Get-MonitorNotificationPolicy -Uid 10
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create alert policies

To create an alert policy, for example, to generate an alert when a specific set of session count criteria is met:

1. Go to **Alerts** > **Citrix Alerts Policy** and select, for example, Multi-session OS Policy.
2. Click **Create**.
3. Name and describe the policy, then set the conditions that have to be met for the alert to be triggered. For example, specify Warning and Critical counts for Peak Connected Sessions, Peak Disconnected Sessions, and Peak Concurrent Total Sessions. Warning values must not be greater than Critical values. For more information, see Alerts policies conditions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Set the Re-alert interval. If the conditions for the alert are still met, the alert is triggered again at this time interval and, if set up in the alert policy, an email notification is generated. A dismissed alert does not generate an email notification at the re-alert interval.
5. Set the Scope. For example, set for a specific Delivery Group.
6. In Notification preferences, specify who must be notified by email when the alert is triggered. You have to specify an email server on the **Email Server Configuration** tab to set email Notification preferences in Alerts Policies.

    a) You can also receive the alert content in a .CSV attachment or through the json payload. For this, select the following checkboxes:

    - **Include a json payload as an attachment in the webhook**
    - **Include a csv file as an attachment in the email**

    > **Note:**
    >
    > To receive alert content through .CSV attachment and json payload options are available only for a few alerts currently. For more information, see Enhancements on alert content

7. Click **Save**.

Creating a policy with 20 or more Delivery Groups defined in the Scope might take approximately 30 seconds to complete the configuration. A spinner is displayed during this time.

Creating more than 50 policies for up to 20 unique Delivery Groups (1000 Delivery Group targets in total) might result in an increase in response time (over 5 seconds).

Moving a machine containing active sessions from one Delivery Group to another might trigger erroneous Delivery Group alerts that are defined using machine parameters.

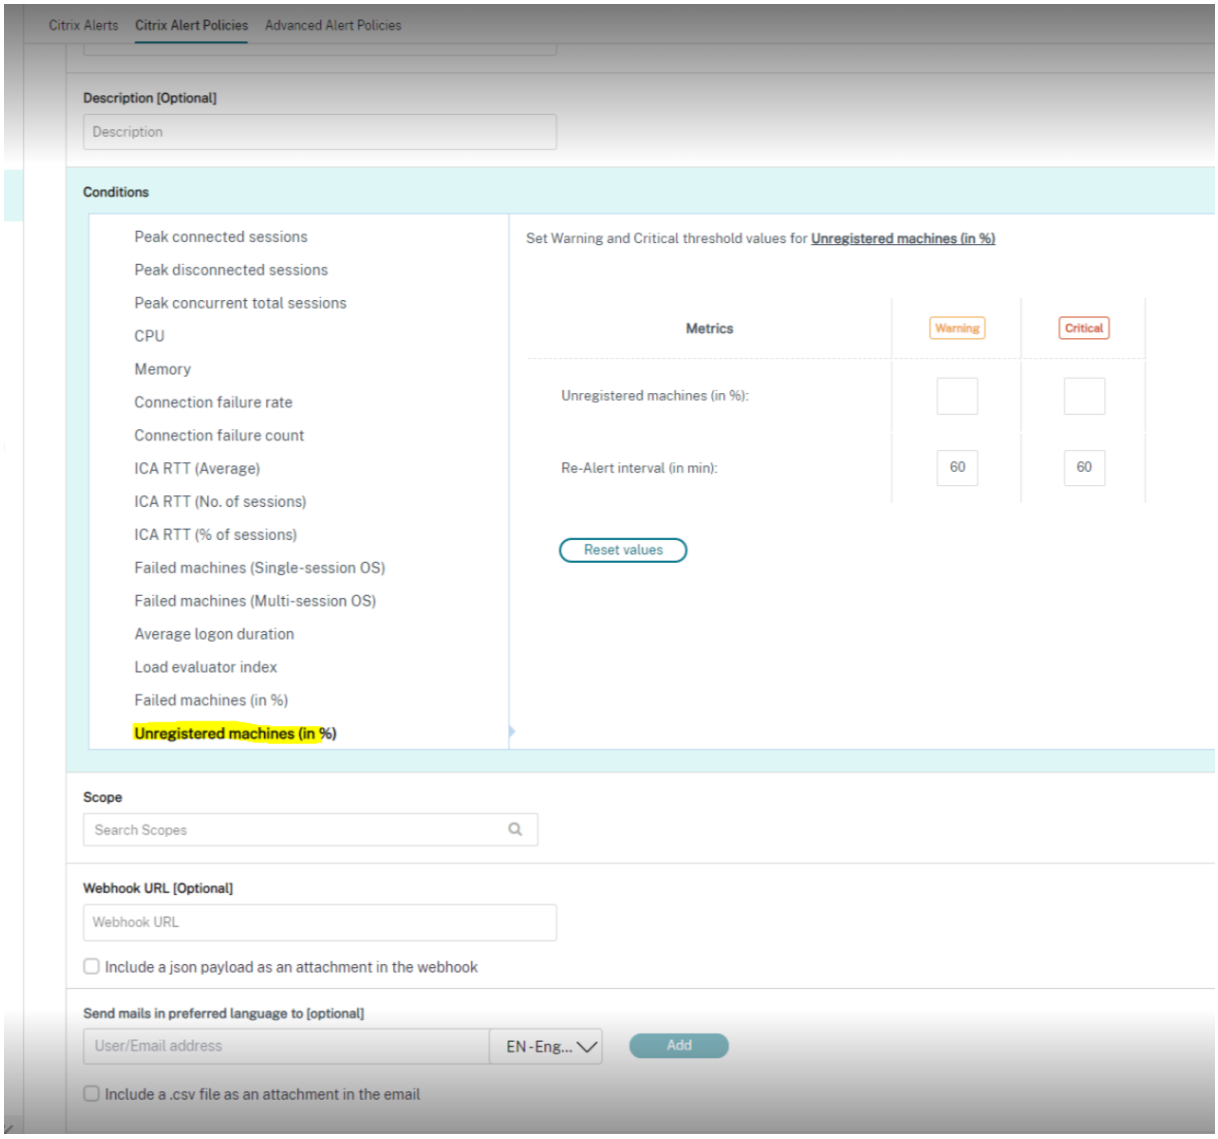
> **Note:**
>
> After you delete an alert policy, it might take up to 30 minutes for the alert notifications generated by the policy to stop.

Enhancements on alert content

The alerting feature of the Director is enhanced to include a CSV attachment and a JSON payload. With this enhancement, you can get alert details in a CSV attachment over email or as a JSON payload if there is a webhook. Using this CSV attachment or JSON payload, you can receive enriched content at a detailed level, aiding in the quick identification and resolution of issues.

Currently, this enhancement is available only on the following alerts:

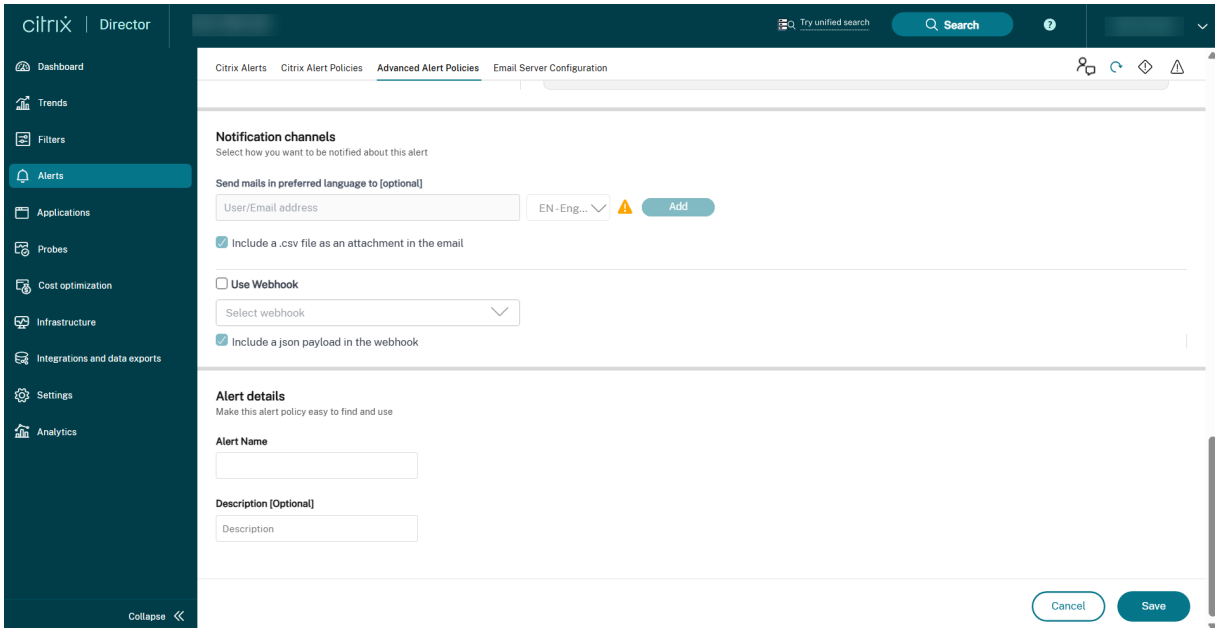
- Machine uptime



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Failed power on actions
- Failed power off actions
- Unregistered machines (%)

To use this feature, navigate to the alert and select the following checkboxes:



- **Include a json payload as an attachment in the webhook**
- **Include a csv file as an attachment in the email**

The following is a screenshot from the **Citrix Alert Policies** section:

Here is a screenshot from **Advanced Alert Policies** section:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CSV attachment The following table provides columns of the .CSV attachment for all supported alerts:

Column	Applicable alert
Machine Name, IP Address, and Delivery Group Name	Machine uptime, Failed power off action and Failed power on action, and Unregistered machines (%)
Current Registration State, Failure Date, Fault State, and Lifecycle State	Unregistered machine (%)
Last Power Action Failure Reason, Last Power Action Triggered By, Last Power Action Type, and Last Power Action Completed Date	Failed power off action and Failed power on action
Power State, Powered On Date, and Total Uptime In Minutes	Machine uptime

Webhook payload

Unregistered Machine Percentage Alert

Alerts policies conditions

Find below the alert categories, recommended actions to mitigate the alert, and built-in policy conditions if defined. The built-in alert policies are defined for alert and realert intervals of 60 minutes.

Peak Connected Sessions

- Check the Director Session Trends view for peak connected sessions.
- Check to ensure that there is enough capacity to accommodate the session load.
- Add new machines if needed

Peak Disconnected Sessions

- Check the Director Session Trends view for peak disconnected sessions.
- Check to ensure that there is enough capacity to accommodate session load.
- Add new machines if needed.
- Log off disconnected sessions if needed

Peak Concurrent Total Sessions

- Check the Director Session Trends view in Director for peak concurrent sessions.
- Check to ensure that there is enough capacity to accommodate session load.
- Add new machines if needed.
- Log off disconnected sessions if needed

CPU

Percentage of CPU usage indicates the overall CPU consumption on the VDA, including that of the processes. You can get more insight into the CPU utilization by individual processes from the **Machine details** page of the corresponding VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Go to **Machine Details > View Historical Utilization > Top 10 Processes**, identify the processes consuming the CPU. Ensure that the process monitoring policy is enabled to initiate collection of process level resource usage statistics.
- End the process if necessary.
- Ending the process causes unsaved data to be lost.
- If all is working as expected, add additional CPU resources in the future.

> **Note:**
>
> The **Enable resource monitoring** policy setting is allowed by default for the monitoring of CPU and memory performance counters on machines with VDAs. If this policy setting is disabled, alerts with CPU and memory conditions are not triggered. For more information, see Monitoring policy settings

Smart policy conditions:

- **Scope:** Delivery Group, Multi-session OS scope
- **Threshold values:** Warning - 80%, Critical - 90%

Memory

Percentage of Memory usage indicates the overall memory consumption on the VDA, including that of the processes. You can get more insight into the memory usage by individual processes from the **Machine details** page of the corresponding VDA.

- Go to **Machine Details > View Historical Utilization > Top 10 Processes**, identify the processes consuming memory. Ensure that process monitoring policy is enabled to initiate collection of process level resource usage statistics.
- End the process if necessary.
- Ending the process causes unsaved data to be lost.
- If all is working as expected, add additional memory in the future.

> **Note:**
>
> The **Enable resource monitoring** policy setting is allowed by default for the monitoring of CPU and memory performance counters on machines with VDAs. If this policy setting is disabled, alerts with CPU and memory conditions are not triggered. For more information, see Monitoring policy settings

Smart policy conditions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Scope:** Delivery Group, Multi-session OS scope
- **Threshold values:** Warning - 80%, Critical - 90%

Connection Failure Rate

Percentage of connection failures over the last hour.

- Calculated based on the total failures to total connections attempted.
- Check Director Connection Failures Trends view for events logged from the Configuration log.
- Determine if applications or desktops are reachable.

Connection Failure Count

Number of connection failures over the last hour.

- Check Director Connection Failures Trends view for events logged from the Configuration log.
- Determine if applications or desktops are reachable.

ICA® RTT (Average)

Average ICA round-trip time.

- Check Citrix ADM for a breakdown of the ICA RTT to determine the root cause. For more information, see Citrix ADM documentation.
- If Citrix ADM is not available, check the Director User Details view for the ICA RTT and Latency, and determine if it is a network problem or an issue with applications or desktops.

ICA RTT (No. of Sessions)

Number of sessions that exceed the threshold ICA round-trip time.

- Check Citrix ADM for the number of sessions with high ICA RTT. For more information, see Citrix ADM documentation.
- If Citrix ADM is not available, work with the network team to determine the root cause.

  Smart policy conditions:

  - **Scope:** Delivery Group, Multi-session OS scope
  - **Threshold values:** Warning - 300 ms for 5 or more sessions, Critical - 400ms for 10 or more sessions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ICA RTT (% of Sessions)

Percentage of sessions that exceed the average ICA round-trip time.

- Check Citrix ADM for the number of sessions with high ICA RTT. For more information, see Citrix ADM documentation.
- If Citrix ADM is not available, work with the network team to determine the root cause.

ICA RTT (User)

ICA round-trip time that is applied to sessions launched by the specified user. The alert is triggered if ICA RTT is greater than the threshold in at least one session.

Failed Machines (Single-session OS)

Number of failed Single-session OS machines. Failures can occur for various reasons as shown in the Director Dashboard and Filters views.

- Run Citrix Scout diagnostics to determine the root cause.

  Smart policy conditions:

  - **Scope:** Delivery Group, Multi-session OS scope
  - **Threshold values:** Warning - 1, Critical - 2

Failed Machines (Multi-session OS)

Number of failed Multi-session OS machines. Failures can occur for various reasons as shown in the Director Dashboard and Filters views.

- Run Citrix Scout diagnostics to determine the root cause.

  Smart policy conditions:

  - **Scope:** Delivery Group, Multi-session OS scope
  - **Threshold values:** Warning - 1, Critical - 2

Failed Machines (in %)

The percentage of failed single-session and multi-session OS machines in a delivery group calculated based on the number of failed machines. This alert condition allows you to configure alert thresholds as a percentage of failed machines in a delivery group and is calculated every 30 seconds.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Failures can occur for various reasons as shown in the Director Dashboard and Filters views. Run Citrix Scout diagnostics to determine the root cause. For more information, see Troubleshoot user issues.

Failed power on action and Failed Power off action

Number of failed power on actions and number of failed power off actions in a delivery group calculated based on the number of **Power Managed Machines** that failed to power on or off. This alert condition allows you to configure alert thresholds as the number of **Power Managed Machines** that failed to power on or off in a delivery group and is calculated every 30 minutes.

Admin can configure the following parameters for these alerts in the Advanced alert policy:

- Triggered By: What triggered the power action
- Reason Of failure: Why the action failed
- Threshold: Threshold number of machines that failed power action to trigger the policy
- Sampling interval: The interval In which the failed power action has to be checked
- Re-alert interval: After how much time the alert must be re-sent

Failures can occur for various reasons as shown in the Director Dashboard and Filters views. Run Citrix Scout diagnostics to determine the root cause. For more information, see Troubleshoot user issues.

Unregistered machines (in %)

A machine is considered unregistered, when a machine becomes unstable due to a restart or when there is a communication problem between the delivery controller and the virtual machines. The **Unregistered machines (in %)** is the percentage of unregistered single-session and multi-session OS machines in a delivery group calculated based on the number of unregistered machines. This alert condition allows you to configure warning and critical threshold values as a percentage of unregistered machines in a delivery group. You can set an interval for re-alert. You can also add an email to get a notification when the conditions are met for **Unregistered Machines (in %)**. When the critical or warning threshold value is exceeded, alerts and emails are generated. You can view alerts under **Citrix Alerts**. You can filter it by **Unregistered Machines (in %)** category and for the required state and time.

You can also receive alert details in a CSV attachment if there is an email or through a JSON payload if there is a webhook.

> **Note:**
>
> The critical value must be greater than the warning value.

Policy conditions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Scope**: Single-session OS, and Multi-session OS Delivery group
- **Threshold values**: Warning and Critical

Machine uptime alert

Machine uptime in a delivery group is calculated based on the number of hours per day, hours per week, or hours per month for a machine that is turned on in a delivery group. This alert condition allows you to configure alert thresholds as the hours a machine is turned on in a delivery group. The machine uptime alerts works as follows in case of:

- Hours per day - You can specify the number of hours a machine is turned on for a day and is calculated every 30 minutes. The maximum number of hours per day that you can set is 24 hours.
- Hours per week - You can specify the number of hours a machine is turned on for a week and is calculated every six hours. The maximum number of hours per week that you can set is 168 hours.
- Hours per month - You can specify the number of hours a machine is turned on for a month and is calculated once every day. The maximum number of hours per month is 720 hours.
  The minimum re-alert interval value that you can set is 60 minutes. You can enter the number of machines that cross the machine uptime threshold value under the Warning and Critical alerts section. You can also add exceptions for any machines.

For example, if there are five delivery groups added for this alert and if in the first delivery group and fourth delivery group, the number of machines crosses the warning or critical threshold values, the alert is triggered separately for the first delivery group and for the fourth delivery group.

This alert helps the admins to analyze the uptime of the machines and based on this analysis the admins can help in optimizing the cost. You can also receive alert details in a CSV attachment if there is an email or through a JSON payload if there is a webhook.

Average Logon Duration

Average logon duration for logons that occurred over the last hour.

- Check the Director Dashboard to get up-to-date metrics regarding the logon duration. Many users logging in during a short timeframe can increase the logon duration.
- Check the baseline and break down of the logons to narrow down the cause. For more information, see Diagnose user logon issues

  Smart policy conditions:

  - **Scope:** Delivery Group, Multi-session OS scope
  - **Threshold values:** Warning - 45 seconds, Critical - 60 seconds

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Logon Duration (User)

Logon duration for logons for the specified user that occurred over the last hour.

Load Evaluator Index

Value of the Load Evaluator Index over the last 5 minutes.

- Check Director for Multi-session OS Machines that might have a peak load (Max load). View both Dashboard (failures) and Trends Load Evaluator Index report.

  Smart policy conditions:

  - **Scope:** Delivery Group, Multi-session OS scope
  - **Threshold values:** Warning - 80%, Critical - 90%

Configure alerts policies with webhooks

Apart from email notifications, you can configure alerts policies with webhooks.

Note: This feature requires Delivery Controller(s) version 7.11 or later.

You can configure an alert policy with an HTTP callback or an HTTP POST using PowerShell cmdlets. They are extended to support webhooks.

For information on the creation of a new Octoblu workflow and obtaining the corresponding webhook URL, see the Octoblu Developer Hub.

To configure a webhook URL for a new alert policy or for an existing policy, use the following PowerShell cmdlets.

Create a new alerts policy with a webhook URL:

```
$policy = New-MonitorNotificationPolicy -Name <Policy name> -
    Description <Policy description> -Enabled $true -Webhook <Webhook
    URL>
```

Add a webhook URL to an existing alerts policy:

```
Set-MonitorNotificationPolicy - Uid <Policy id> -Webhook <Webhook URL>
```

For help on the PowerShell commands, use the PowerShell help, for example:

```
Get-Help  <Set-MonitorNotificationPolicy>
```

Notifications generated from the alert policy trigger the webhook with a POST call to the webhook URL. The POST message contains the notification information in JSON format:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
{
 "NotificationId" : \<Notification Id\>,

"Target" : \<Notification Target Id\>,

"Condition" : \<Condition that was violated\>,

"Value" : \<Threshold value for the Condition\>,

"Timestamp": \<Time in UTC when notification was generated\>,

"PolicyName": \<Name of the Alert policy\>,

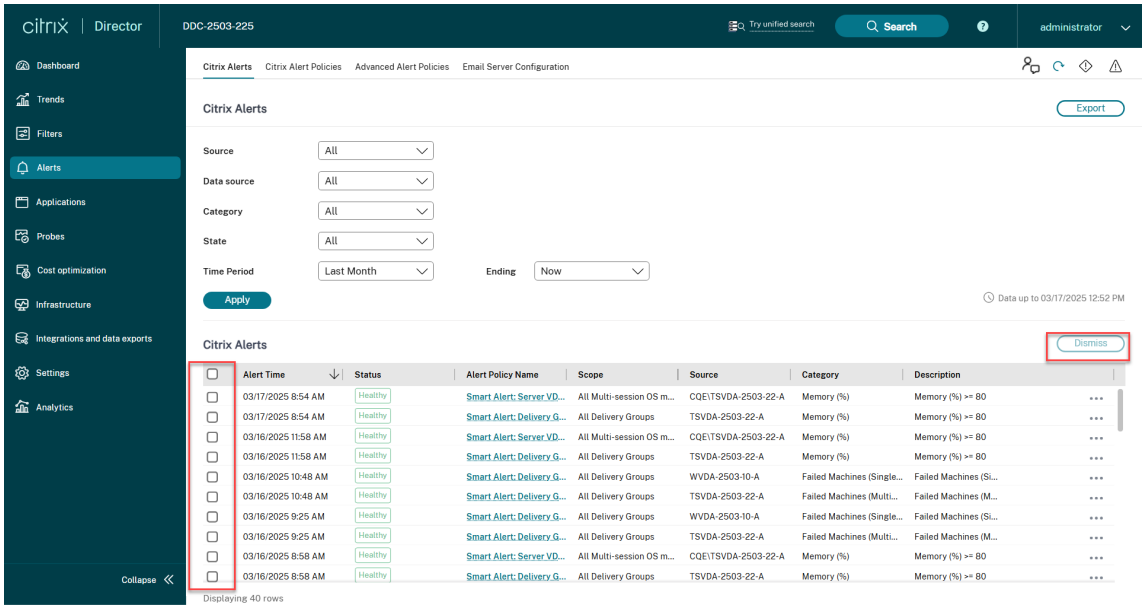
"Description": \<Description of the Alert policy\>,

"Scope" : \<Scope of the Alert policy\>,

"NotificationState": \<Notification state critical, warning, healthy or
    dismissed\>,

"Site" : \<Site name\> }
```

Bulk alert dismissal



This feature optimizes the alert management process for administrators, providing flexibility and reducing alert fatigue. Administrators can bulk dismiss alerts based on time, type, or category, simplifying alert management during maintenance or when dealing with hypervisors and other environments.

Bulk dismissal of alerts helps administrators manage their workload efficiently and prevents them from being overwhelmed by a high volume of alerts.

Steps to bulk dismiss alerts

1. Navigate to the **Alerts** > **Citrix Alerts** tab. The alerts are displayed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select an option from the **Source**, **Category**, **State**, or **Time Period** to filter the alerts that you want to dismiss. The specific alerts are displayed.
3. Select the checkbox next to a specific alert or at the top to select all alerts.
4. Click **Dismiss**. A notification appears to confirm the dismissal of alerts.
5. Click **Yes**. The selected alerts are marked as *dismissed*, and the status of the alert is updated accordingly.

Webhook configuration using PowerShell SDK

The webhook configuration feature using PowerShell SDK allows administrators to create, modify, delete, and list webhook profiles. This feature provides flexibility in configuring webhooks by allowing the specification of headers, authentication types, content types, payloads, and webhook URLs.

> **Note:**
>
> The supported payload format is text and the end user must enable text in their webhook.

The latest payload format is:

```
{
 "text": "This is a message from a Webex incoming webhook." }
```

Create a webhook

You can use the following sample PowerShell command to create a webhook profile:

To create a webhook without authorization header:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$headers = [System.Collections.Generic.Dictionary[string,string]]::new
    ()

$headers.Add("Content-Type", "application/json")

$payloads = '{
  "text": "$PAYLOAD"  }
 '

$url = "<Fill this field with the required URL>"

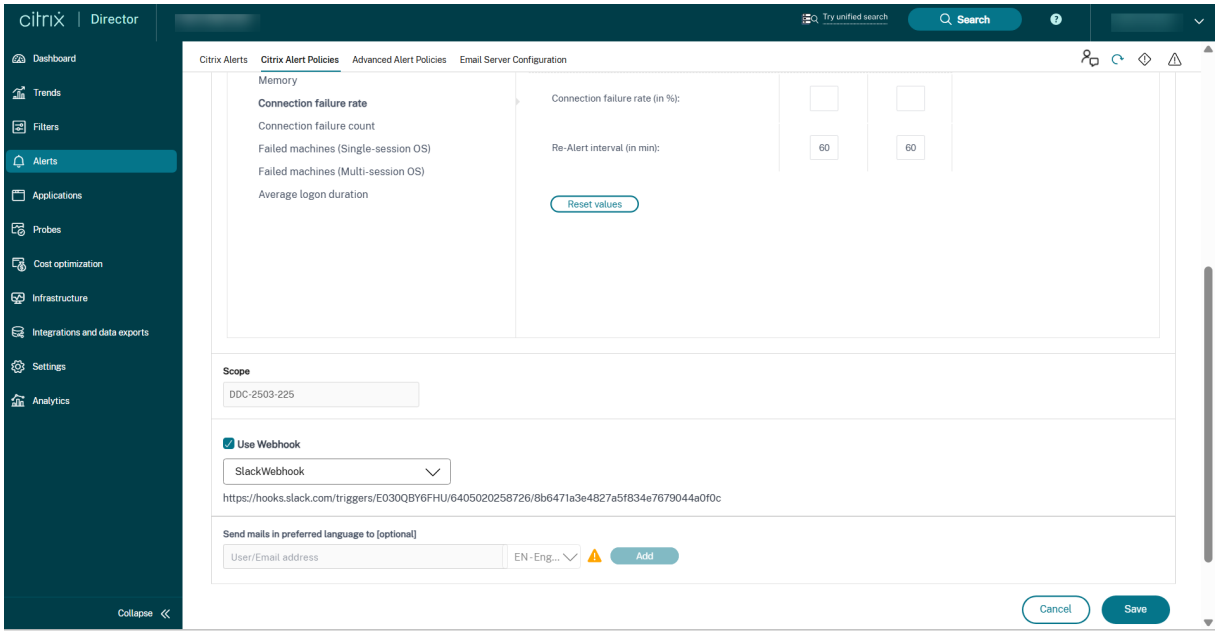
Add-MonitorWebhookProfile -Name "profile_slack" -Description "webhook
    profile for slack" -Url $url -Headers $headers -PayloadFormat
    $payloads
```

To create a webhook with authorization header:

```
$headers = [System.Collections.Generic.Dictionary[string,string]]::new
    ()

$headers.Add("Content-Type", "application/json")

$headers.Add("Authorization", "Basic <Fill this field with the
    authorization token>")



$payloads = '{
  "text": "$PAYLOAD"  }
 '

$url = "<Fill this field with the required URL>"

Add-MonitorWebhookProfile -Name "profile_azure" -Description "webhook
    profile for azure function with Authentication" -Url $url -Headers
    $headers -PayloadFormat $payloads
```

Once the profile is created, you can check it in the database. Also, you can find the newly created webhook profile in the **Citrix Alerts** page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update a webhook profile

You can use the following sample PowerShell command to update a webhook profile:

```
$headers = [System.Collections.Generic.Dictionary[string,string]]::new
    ()

$headers.Add("Content-Type", "application/json")

$payloads = '{
  "text": "$PAYLOAD"  }
 '

$url =  "<Fill this field with the required URL>"

Set-MonitorWebhookProfile -Uid 1  -Name "profile_slack_citrix" -
    Description "webhook profile for citrix slack" -Url $url -Headers
    $headers -PayloadFormat $payloads
```

Get a list of all webhook profiles

You can use the following sample PowerShell command to get a list of all available webhook profiles:

```
Get-MonitorWebhookProfile

Get-MonitorWebhookProfile -Name 'profile_msteams'

Get-MonitorWebhookProfile -Uid 1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove a webhook profile

You can use the following sample PowerShell command to remove a webhook profile:

```
Remove-MonitorWebhookProfile -Uid 1
```

> **Note:**
>
> If a webhook profile is mapped to any policy, it cannot be removed. As a workaround, you must first remove the webhook mapping from the policy.

Create a policy with webhook profile

You can use the following sample PowerShell command to create a policy with webhook profile:

```
New-MonitorNotificationPolicy -Name "Policy1" -Description "Policy
    Description" -Enabled $true -WebhookProfileId 1
```

Update a policy with webhook profile

You can use the following sample PowerShell command to update a policy with webhook profile:

```
$Policy = Set-MonitorNotificationPolicy -Uid 1 -WebhookProfileId 1
```

Remove webhook mapping from a policy

You can use the following sample PowerShell command to remove webhook profile from a policy:

```
$Policy = Set-MonitorNotificationPolicy -Uid 1 -WebhookProfileId 0
```

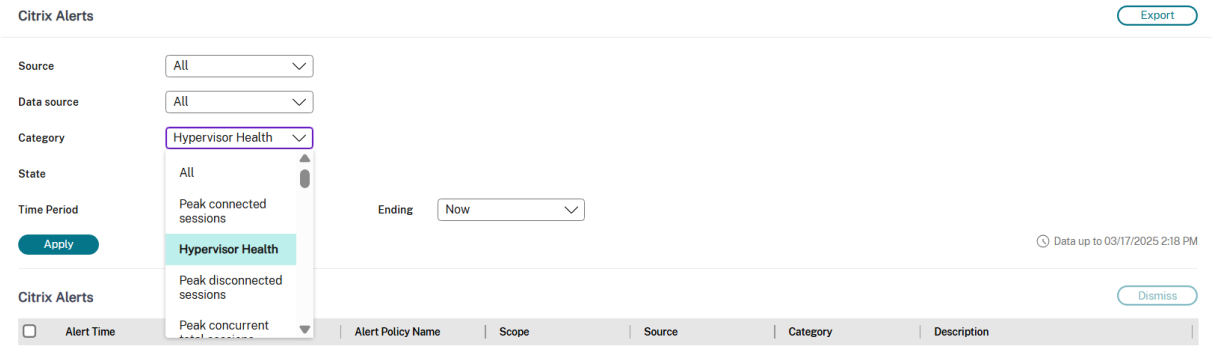
Test webhook profile

You can use the following sample PowerShell command to test the webhook profile:

```
$headers = [System.Collections.Generic.Dictionary[string,string]]::new
    ()

$headers.Add("Content-Type", "application/json")

$headers.Add("Authorization", "Basic <Fill this with authorization
    token>")

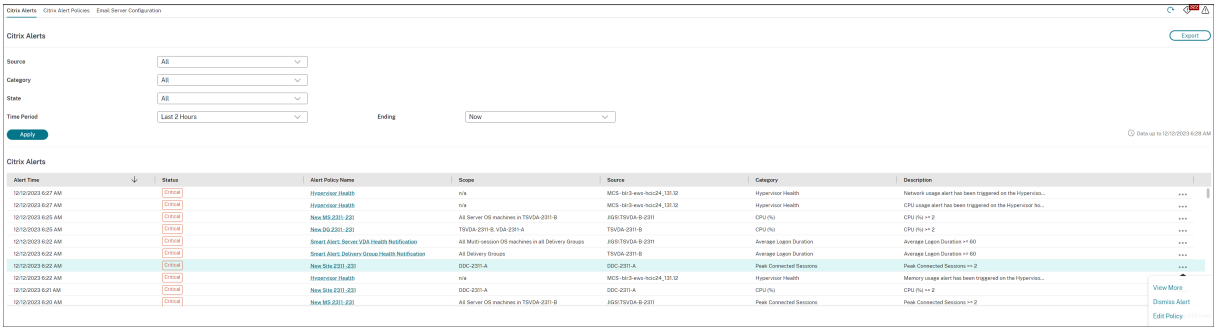


$payloads = '{
  "text": "$PAYLOAD"  }
 '
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
10
11 $url ="<Fill this field with the required URL>"
12
13 Test-MonitorWebhookProfile -Url $url -Headers $headers -PayloadFormat
      $payloads
```

Hypervisor Alerts Monitoring



Director displays alerts to monitor hypervisor health. Alerts from XenServer® and VMware vSphere help monitor hypervisor parameters and states. The connection status to the hypervisor is also monitored to provide an alert if the cluster or pool of hosts is rebooted or unavailable.

To receive hypervisor alerts, ensure that a hosting connection is created in Web Studio. For more information, see Connections and resources. Only these connections are monitored for hypervisor alerts.

These alerts are displayed once the thresholds are reached or exceeded. Hypervisor alerts can be:

- Critical—critical threshold of the hypervisor alarm policy reached or exceeded
- Warning—warning threshold of the hypervisor alarm policy reached or exceeded
- Dismissed—alert no longer displayed as an active alert

This feature requires Delivery Controller version 7 1811 or later. If you are using an older version of Director with sites 7 1811 or later, only the hypervisor alert count is displayed. To view the alerts, you must upgrade Director.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following table describes the various parameters and states of Hypervisor alerts.

Alert	Supported Hypervisors	Triggered by	Condition	Configuration
CPU usage	XenServer, VMware vSphere	Hypervisor	CPU usage alert threshold is reached or exceeded	Alert thresholds must be configured in the Hypervisor.
Memory usage	XenServer, VMware vSphere	Hypervisor	Memory usage alert threshold is reached or exceeded	Alert thresholds must be configured in the Hypervisor.
Network usage	XenServer, VMware vSphere	Hypervisor	Network usage alert threshold is reached or exceeded	Alert thresholds must be configured in the Hypervisor.
Disk usage	VMware vSphere	Hypervisor	Disk usage alert threshold is reached or exceeded	Alert thresholds must be configured in the Hypervisor.
Host connection or power state	VMware vSphere	Hypervisor	Hypervisor Host has been rebooted or is unavailable	Alerts are prebuilt in VMware vSphere. No additional configurations are needed.
Hypervisor connection unavailable	XenServer, VMware vSphere	Delivery Controller	Connection to the hypervisor (pool or cluster) is lost or powered down or rebooted. This alert is generated every hour as long as the connection is unavailable.	Alerts are prebuilt with the Delivery Controller. No additional configurations are needed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> For more information about configuring alerts, see Citrix XenCenter Alerts or check the VMware vCenter Alerts documentation.

Email notification preference can be configured under **Citrix Alerts Policy > Site Policy > Hypervisor Health**. The threshold conditions for Hypervisor alert policies can be configured, edited, disabled, or deleted from the hypervisor only and not from Director. However, modifying email preferences and dismissing an alert can be done in Director. You can disable the alert if your role does not involve infrastructure monitoring.

> **Important:**
>
> - Alerts triggered by the Hypervisor are fetched and displayed in Director. However, changes in the life cycle/state of the Hypervisor alerts are not reflected in Director.
> - Alerts that are healthy or dismissed or disabled in the Hypervisor console continues to appear in Director and have to be dismissed explicitly.
> - Alerts that are dismissed in Director are not dismissed automatically in the Hypervisor console.

Improved handling of vertical and horizontal load balancing alerts

Previously, when you set `UseVerticalScalingForRdsLaunches` to true and configured the "Maximum number of sessions"policy in Studio, machines moved to the "Maximum capacity"state. Director triggered alerts for "Maximum capacity"whether the limit was reached due to vertical or horizontal load balancing. There was no way to distinguish between vertical and horizontal load balancing when encountering specific errors, such as "Max Load Reached."This caused unnecessary alerts for expected behavior in vertical scaling scenarios, wasting your time and creating confusion.

Now, when vertical load balancing is active and a machine reaches its session limit, it moves to a new state: "Maximum capacity for vertical scaling."Director no longer generates alerts for this new state. Alerts only trigger for "Maximum capacity"in horizontal scaling scenarios. You can view the new state in the Filters and Custom reports pages, making it easier to distinguish between expected and exceptional conditions. This enhancement helps you avoid unnecessary alerts and focus on real issues, streamlining monitoring and troubleshooting. It applies when you configure `UseVerticalScalingForRdsLaunches` using Set-BrokerSite and set the "Maximum number of sessions"policy in Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

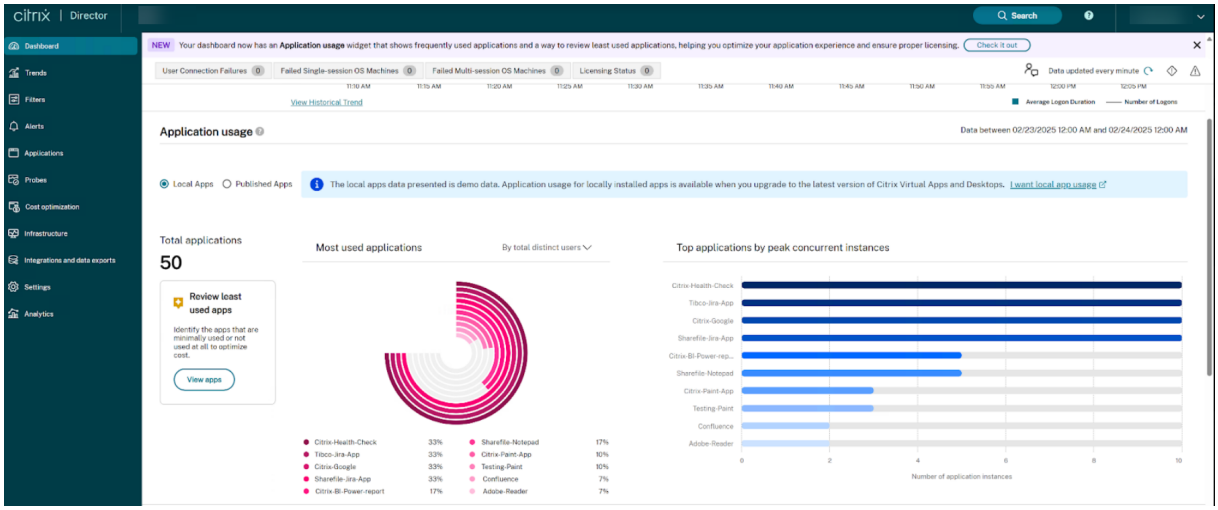
Application usage monitoring

May 15, 2026

Citrix Director helps you to monitor the usage of following:

- Applications launched within virtual desktop sessions (also known as local applications)
- Applications launched from the Citrix Workspace™ app session directly (also know as published applications)

The application usage reporting provides visibility into the most, least, and not used applications. The most used applications are presented on the Dashboard and contains curated charts. These charts help the IT admins or application admins to gain insight into which applications are heavily used and the extent of their usage.



> **Note:**
>
> - This feature is available only for the platinum-licensed sites.
> - uberAgent must be integrated with Director for monitoring usage of local applications. For more information, see Citrix uberAgent integration with Director.
> - If your environment delivers the same application as both a published app and an installed app within the desktop (local app), you might see the app listed in both the published apps and local apps reports.

With this feature, an admin can view which local and published applications are used the most. Using this data, admins can dive deeper into the extent of usage. Admin can analyze the details of the popular apps in the last 24 hours by the following data points:

- Total number of applications - Identifies the total number of applications in use by all the - users in the enterprise's site.
- Most used applications by total number of distinct users - Identifies the top 10 apps by the total number of unique users.
- Most used applications by total number of application launches - Identifies the top 10 apps based on the total number of application launches.
- Top peak concurrent app instances - Identifies the top 10 apps based on the highest number of simultaneous instances of each application's usage. This information provides you the maximum demand for the applications listed.

This chart is present at the bottom of the Dashboard page. However, you can click **Check it out** on top of the screen to reach the chart directly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can also click **View all app usage** to view the details of a single app. This link opens the **Trends** > **Capacity Management** > **Hosted Application Usage** page.

The chart provides a visual representation of the app usage. Also, when you hover on the graph, you get the respective absolute counts of the selected data points. When you click any data point on the chart, the **Trends** > **Capacity Management** > **Hosted Application Usage** page opens with the specific app name selected. This data is to depict a comparative value against all the apps present in the enterprise's system. The absolute value of the data point is also mentioned separately in the same hover.

Least used and not used apps report

In a large Citrix Virtual Apps and Desktops™ environment, it's common to have many underutilized applications. To optimize your environment, the **Applications** page now offers extra metrics to help you understand application usage patterns within the organization and make data-driven decisions to improve resource allocation and cost savings.

Key features

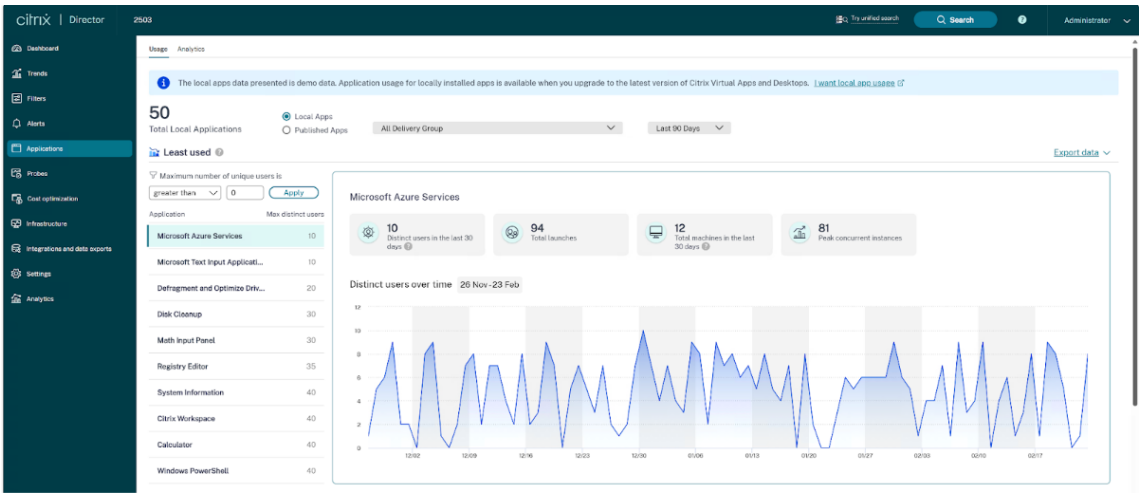
- **Detailed usage information:** View distinct users (last 30 days), total launches, peak concurrent instances, and a trend chart of distinct users over time for each application.
- **Data focus:** Analyze application usage patterns over the last seven days, 30 days, or 90 days to assess application necessity. Viewing data for 90 days is recommended as it provides a quarter's worth of data, allowing you to observe whether application usage fluctuates or remains consistent. The dates on the X-axis help correlate organizational events with usage trends to determine if a drop was expected. This data empowers administrators to maintain efficient environments by eliminating unnecessary applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Optimization:** Identify total published apps, least used apps, and unused apps to optimize your Citrix deployment.
- **Actionable data:** Make data-driven decisions aiding application management to optimize resource allocation and license management.
- **Export data:** Export data in PDF or CSV format for further analysis. You can also export the data using Power BI integration or ODATA queries using application usage.

Requirements

- Delivery Controllers Version 7.16 or later
- VDAs version 7.15 or later



Viewing Application usage details

1. Click the **View apps** link in the **Review least used apps** section on the Dashboard.

   Or,

   Click the **Applications** tab. The following page appears:

   When the **Local apps** option is selected:

   When the **Published apps** option is selected:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select the desired delivery group.
3. Select the required time period. (Note: For optimal analysis, the default is the last 90 days.)

   The following information is displayed:

   - **Total Local and published applications:** Displays the total number of local and published applications.
   - **Least used:** Displays the apps with the fewest unique users over the selected time. The calculation is done as follows:

     a) **Daily user count:** The number of unique users for each app is counted daily.
     b) **Peak daily usage:** The highest daily user count for each app is identified.
     c) **Highest overall Usage:** The highest user count for each app across the selected time-frame is determined.
     d) **Ascending order:** The apps are listed in ascending order based on their highest overall user count, starting with the app with the lowest user count.

     > **Note:**
     >
     > It is recommended to select the last 90 days as the period for analysis. This range of days provides a quarter's worth of data and offers a comprehensive view of app usage patterns. However, options for filtering by seven days and one month are also available.

   - **Not used:** Displays the applications that you have not been launched a single time in the last 90 days are listed. The delivery group that they were delivered through, the version of the app, and the exact timestamp of its last usage are provided. This information helps admins make informed decisions before removing an application from a virtual desktop.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Select an app from the **Least used** category to view detailed usage information, including:

   - **Distinct users in the last 30 days:** Displays the number of distinct users who accessed the app in the last 30 days. If you filter for seven days, this metric shows the distinct number of users for the selected app over those seven days.

   > **Note:**
   >
   > Even when you select 90 days, this metric still displays data for the last 30 days only.

   - **Total launches:** Shows the number of times the app was launched.
   - **Total machines in the last 30 days**: Shows the number of machines installed in the last 30 days. This metric is present only when you view the Local apps details.
   - **Peak concurrent instances:** Displays the highest number of instances running simultaneously.
   - **Trend chart:** View a trend chart showing the number of distinct users over time for the selected app. Click **View details** to see more information in the **Capacity Management > Hosted Application Usage** section.

Usage of the trend chart

The trend chart illustrates the usage patterns, helping to identify trends and periods of low or high usage over the selected period. The X-axis represents the period in days, and the Y-axis represents the number of distinct users over time. By analyzing these metrics and the usage pattern graph, administrators can confidently optimize their Citrix Virtual Apps and Desktops™ environment.

You can use the trend chart in the following ways:

- **Hover over data points:** View the number of distinct users for the selected period.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **View trends:** Identify usage patterns and determine whether app usage is consistent or just a temporary spike. This chart is useful for admins to monitor employee activity and identify potential issues or areas for improvement. For example, if an employee goes on vacation, there might be no application usage during that period. Once the employee returns, the application usage increases. The default filter for the period is 90 days which assists admins in making these calculations.
- **View details:** See the date and the corresponding number of distinct users.
- **Filter options:** Select different Time Period filter options to view the corresponding data.

Filter data to troubleshoot failures

May 13, 2026

When you click numbers on the Dashboard or select a predefined filter from the Filters menu, the Filters view opens to display data based on the selected machine or failure type.

Predefined filters cannot be edited, but you can save a predefined filter as a custom filter and then modify it. Also, you can create custom filtered views of machines, connections, sessions, and application instances across all delivery groups.

1. Select a view:

    - **Machines**. Select Single-session OS Machines or Multi-session OS Machines. These views show the number of configured machines. The Multi-session OS Machines tab also includes the load evaluator index, which indicates the distribution of performance counters and tool tips of the session count if you hover over the link.
    - **Sessions**. Filter sessions by different time periods, including last 60 minutes, last 24 hours, last 7 days, or custom time period. You can also see the session count from the Sessions view. Use the idle time measurements to identify sessions that are idle beyond a threshold time period. Click the **Associated User** to open the Activity Manager for the user. Clicking the **Endpoint** name opens the Activity Manager for the Endpoint. Clicking **View Details** opens the **User Details** or **Endpoint Details** page respectively. For more information, see User Details.
    - **Connections**. Filter connections by different time periods, including last 60 minutes, last 24 hours, last 7 days, or custom time period.
    - **Application Instances**. Filter application instances by different time periods, including last 60 minutes, last 24 hours, last 7 days, or custom time period. This view displays the properties of all application instances on VDAs of Server and Single-session OS. The session idle time measurements are available for Application instances on VDAs of Multi-session OS.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If you have launched Desktop sessions on VDAs installed on a Windows 10 1809 computer, the Activity Manager in Director might sometimes display Microsoft Edge and Office as actively running applications while they are actually running only in the background.

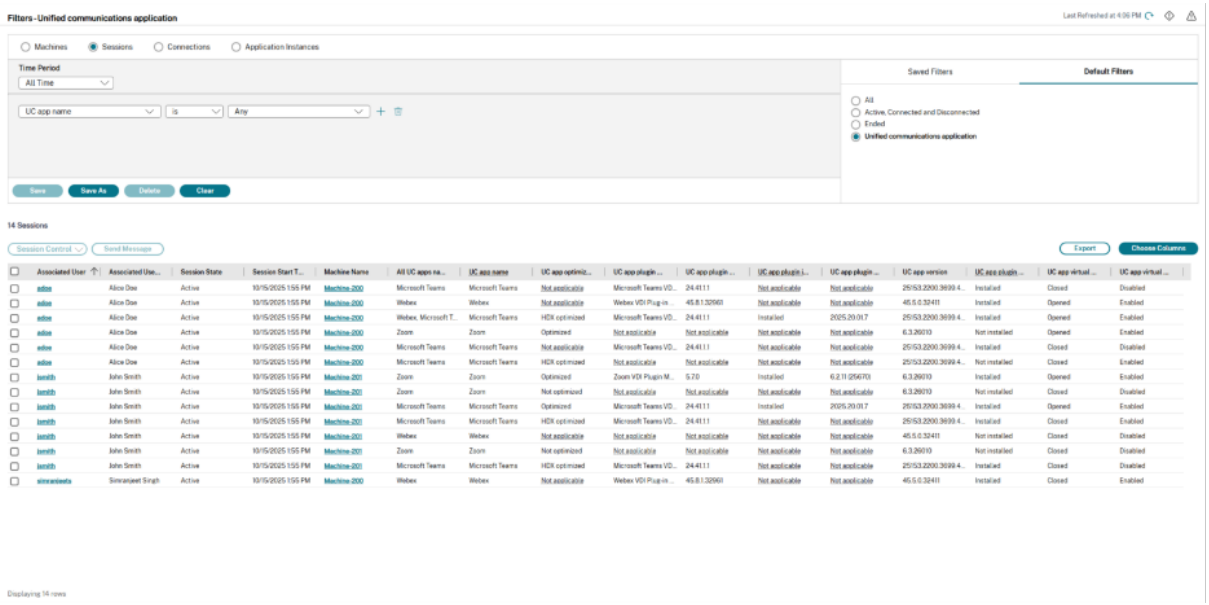
2. For **Filter by**, select the criteria.
3. Use the additional tabs for each view, as needed, to complete the filter.
4. Select extra columns, as needed, to troubleshoot further.
5. Save and name your filter.
6. To access filters from multiple Director servers, store the filters on a shared folder accessible from those servers:
   - The shared folder must have modifying permissions for accounts on the Director server.
   - The Director servers must be configured to access the shared folder. To configure, run **IIS Manager**. In **Sites > Default Web Site > Director > Application Settings**, modify the **Service.UserSettingsPath** setting to reflect the UNC path of the shared folder.
7. To open the filter later, from the **Filters** menu, select the filter type (Machines, Sessions, Connections, or Application Instances), and then select the saved filter.
8. Click **Export** to export the data to CSV format files. Data of up to 100,000 records can be exported. This feature is available in Delivery Controller™ version 1808 and later.
9. If needed, for **Machines** or **Connections** views, use power controls for all the machines you select in the filtered list. For the Sessions view, use the session controls or option to send messages.
10. If needed, you can use multiple actions. You get a progress bar on the progress of the action. Also, get a message when the action is complete.
11. In the **Machines** and **Connections** views, click the **Failure Reason** of a failed machine or connection to get a detailed description of the failure and actions recommended to troubleshoot the failure. The failure reasons and the recommended actions for Machine and Connection failures are available in Citrix Director failure reasons and troubleshooting.
12. In the **Machines** view, click a machine name link to go to the corresponding **Machine Details** page. This page displays the details of the machine, provides power controls, displays the CPU, memory, disk monitoring, and GPU monitoring graphs. Also, click **View Historical Utilization** to see the resource utilization trends for the machine. For more information, see Troubleshoot machines.
13. In the **Application Instances** view, sort or filter based on **Idle Time** greater than a threshold time period. Select the idle application instance to end. Log off or Disconnect of an application

© 1997–2026 Citrix Systems, Inc. All rights reserved.

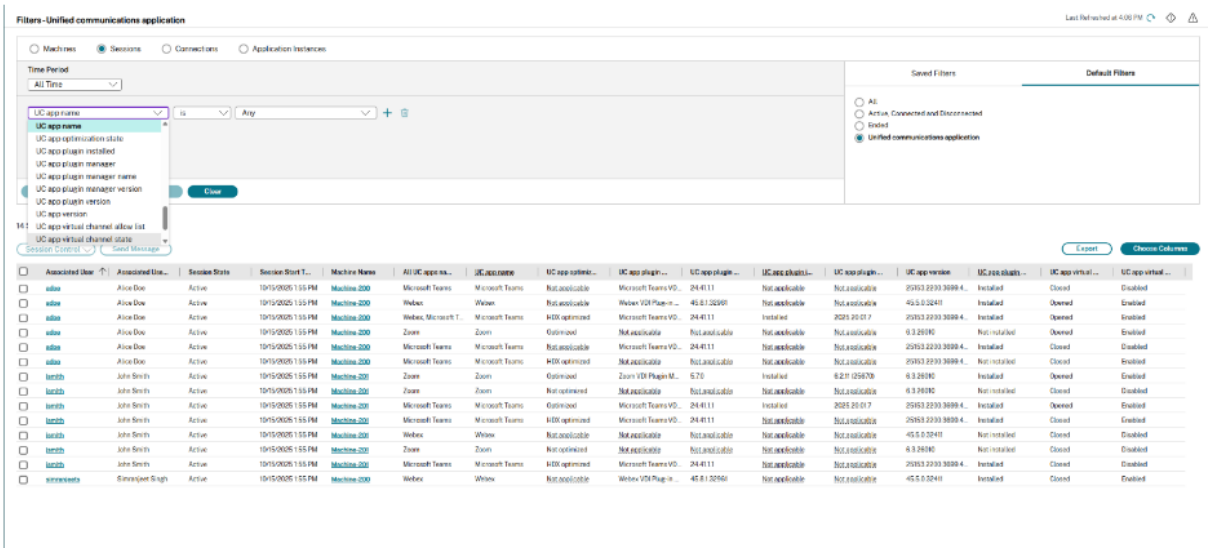
instance ends all active application instances in the same session. For more information, see Troubleshoot applications. The Application Instances filter page and idle time measurements in the Sessions filter pages are available if Director, Delivery Controllers, and VDAs are version 7.13 or later.

> **Note:**
>
> Web Studio allows assignment of multiple Desktop Assignment Rules (DAR) for different users or user groups to a single VDA in the delivery group. StoreFront™ displays the assigned desktop with the corresponding Display Name as per the DAR for the logged in user. However, Director does not support DARs and displays the assigned desktop using the delivery group name regardless of the logged in user. As a result, you cannot map a specific desktop to a machine in Director. To map the assigned desktop displayed in StoreFront to the delivery group name displayed in Director, use the following PowerShell command:

```
Get-BrokerDesktopGroup | Where-Object {
  $_.Uid -eq (Get-BrokerAssignmentPolicyRule | Where-Object {
  $_.PublishedName -eq "<Name on StoreFront>"  }
 ).DesktopGroupUid  }
  | Select-Object -Property Name, Uid
```

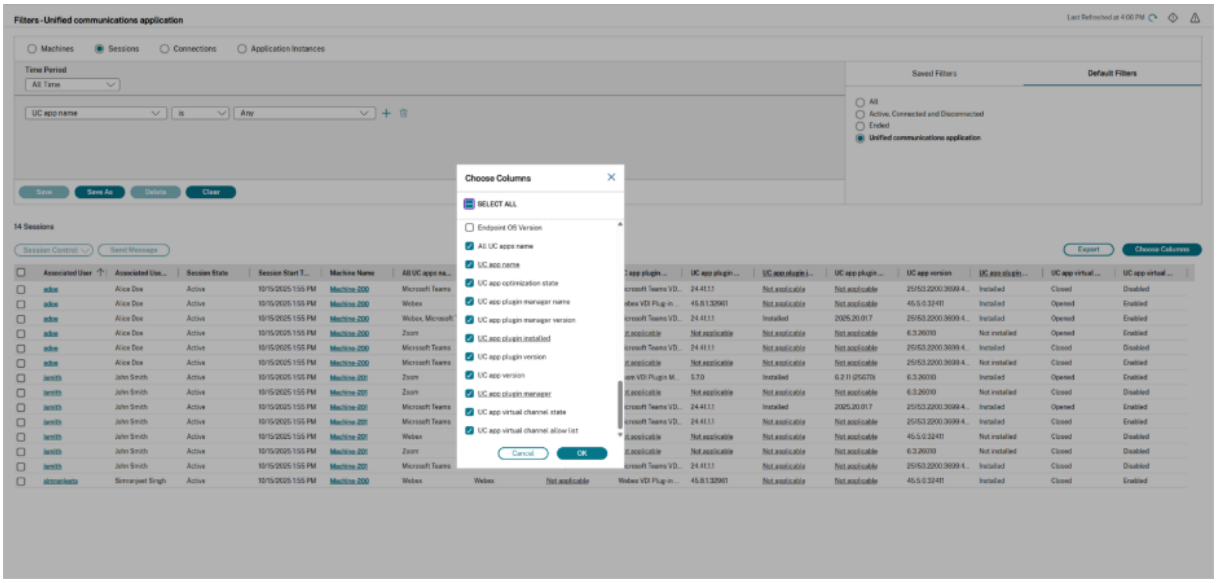


Unified Communication app metrics



The Sessions view now includes several new display columns that provide detailed insights into Unified Communications (UC) application usage for a user session. These metrics are available in the filter to refine the list of sessions, and they can also be selected via the **"Choose Columns"** option to be displayed in the main session table view.

- **All UC apps name (Column Only):** Contains data listing for all multiple UC applications that were running in the session simultaneously. This is a display column and not a filter option.
- **UC app name:** The name of the specific Unified Communications application (e.g., Microsoft Teams, Webex, Zoom).
- **UC app optimization state:** The optimization status of the UC application within the session (e.g., Optimized, HDX optimized, not optimized, not applicable).
- **UC app plugin manager name:** The name of the plugin manager used for the UC application.
- **UC app plugin manager version:** The version of the plugin manager being used.
- **UC app plugin installed:** Indicates whether the necessary application plugin is Installed or Not installed for the UC application.
- **UC app plugin version:** The version of the specific UC application plugin.
- **UC app version:** The overall version of the Unified Communications application.
- **UC app plugin manager:** Indicates whether the necessary application plugin manager is Installed or Not installed on the endpoint for the UC application



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **UC app virtual channel state:** The status of the virtual channel established for the UC application (e.g., Opened, Closed).
- **UC app virtual channel allow list:** Indicates if the application's virtual channel is on the allowed list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitor historical trends across a site

May 13, 2026

The Trends view accesses historical trend information of each site for the following parameters:

- sessions
- connection failures
- machine failures
- logon performance
- load evaluation
- capacity management
- machine usage
- resource utilization
- network analysis for each site.

To locate this information, click the **Trends** menu.

The zoom-in drill down feature lets you navigate through trend charts by zooming in on a time period (clicking a data point in the graph) and drilling down to see the details associated with the trend. This feature enables you to better understand the details of who or what is affected.

To change the default scope of each graph, apply a different filter to the data.

Choose a time period for which you require the historical trend information. Time period availability depends on your Director deployment as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Trend reports of up to Last year (365 days) are available in Premium licensed sites.
- Trend reports of up to Last month (31 days) are available in Advanced licensed sites.
- Trend reports of up to Last 7 days in non-Premium and non-Advanced licensed sites.

> **Note:**
>
> - In all Director deployments, sessions, failures, and logon performance trend information are available as graphs and tables when the time period is set to Last month (**Ending now**) or shorter. For the time period chosen as Last month with a custom ending date or as Last year, the trend information is available as graphs and not as tables.
> - Grooming retention values of the Monitor Service control the trends data availability. The default values are available in Data granularity and retention. Customers on Premium licensed sites can change the grooming retention to their desired number of retention days.
> - The following parameters in IIS Manager control the range of custom ending dates available for selection. However, the data availability for selected dates depends on the grooming retention setting for the specific metric being measured.

Parameter	Default values
UI.TrendsLast2HoursRange	3
UI.TrendsLast24HoursRange	32
UI.TrendsLast7DaysRange	32
UI.TrendsLastMonthRange	365

Available trends

View trends for sessions: From the **Sessions** tab, select the Delivery Group and time period to view more detailed information about the concurrent session count.

The **Session Auto Reconnect** column displays the number of auto reconnects in a session. Auto reconnect is enabled when the Session Reliability or the Auto Client Reconnect policies are in effect. When there is a network interruption on the endpoint, the following policies come into effect:

- Session reliability comes into effect (by default for 3 minutes) where the Citrix Receiver™ or Citrix Workspace™ app tries to connect to the VDA.
- Auto client reconnect comes into effect between 3 and 5 minutes where the client tries to connect to the VDA.

Both reconnects are captured and displayed to the user. This information can take a maximum time of 5 minutes to appear on the Director UI after the reconnect has occurred.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The auto reconnect information helps you view and troubleshoot network connections having interruptions. It also analyzes networks having a seamless experience. You can view the number of reconnects for a specific Delivery Group or time period selected in the Filters. A drilldown provides additional information like Session Reliability or Auto Client Reconnect, time stamps, Endpoint IP, and Endpoint Name of the machine where Workspace app is installed.

By default, logs are sorted by the event time stamps in descending order. This feature is available for Citrix Workspace app for Windows, Citrix Workspace app for Mac, Citrix Receiver for Windows, and Citrix Receiver for Mac. This feature requires Delivery Controller™ version 7 1906 or later, and VDAs 1906 or later.

For more information about session reconnections, see Sessions.

For more information about policies, see Auto client reconnect policy settings and Session reliability policy settings.

Sometimes, the auto reconnect data might not appear in Director for the following reasons:

- Workspace app is not sending auto reconnect data to VDA.
- VDA is not sending data to the monitor service.
- Delivery Controllers discard VDA payloads as they might not have the corresponding sessions.

> **Note:**
>
> Sometimes, the client IP address might not be obtained correctly if certain Citrix Gateway policies are set.

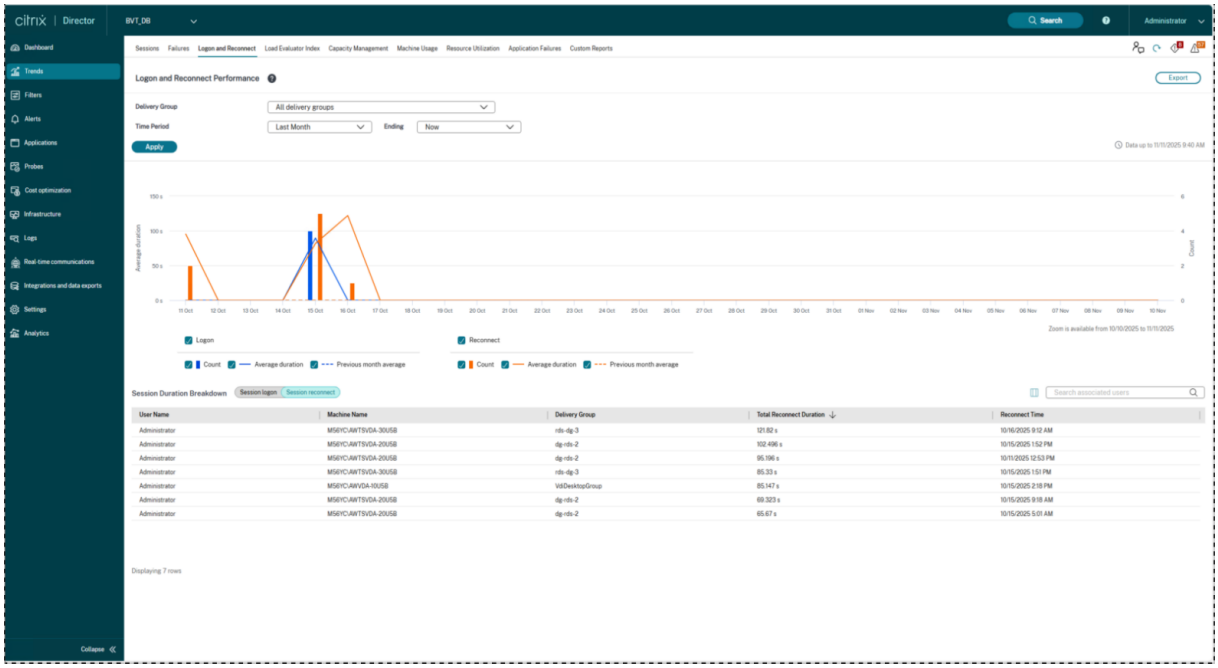
View trends for connection failures: From the Failures tab, select the connection, machine type, failure type, Delivery Group, and time period to view a graph containing more detailed information about the user connection failures across your site.

View trends for machine failures: From the **Single-session OS Machine Failures** tab or Multi-session OS Machines tab, select the failure type, Delivery Group, and time period to view a graph containing more detailed information about the machine failures across your site.

View trends for logon and reconnect performance: From the Logon and Reconnect Performance tab, select the delivery group and time period to view a graph with detailed information about user logon and reconnect durations across your site. This view helps you understand the number of logons or reconnects and the overall performance.

The graph includes:

- **Logon events, logon duration and phases** (such as brokering, Interactive session, etc.), providing insights into user experience when launching a new session.
- **Reconnect events and reconnect duration**, providing insights into user experience when reconnecting from disconnected sessions.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use the legend to select required metrics based on the trends being analyzed.

- Count
- Average Duration
- Previous (time range) Average

The table below the graph displays **Session Logon** and **Session Reconnect** details by user session or connection. You can toggle between metrics using the selection above the table, choose columns to display, sort by any column, and export reports to PDF, Excel or CSV format.

> **Note:**
>
> Session reconnect duration is supported on **Director and VDAs version 2511 CR or later**.

View trends for load evaluation: From the **Load Evaluator Index** tab, view a graph containing more detailed information about the load that is distributed among Multi-session OS machines. The filter options for this graph include the Delivery Group or Multi-session OS machine in a Delivery Group, Multi-session OS machine (available only if the Multi-session OS machine in a Delivery Group was selected), and range.

View hosted applications usage: The availability of this feature depends on your organization's license.

From the **Capacity Management** tab, select the **Hosted Applications Usage** tab. Select the Delivery Group and time period to view a graph displaying peak concurrent usage and a table displaying application based usage. From the Application Based Usage table, you can choose a specific application to see details and a list of users who are using, or have used, the application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

View Single-session and Multi-session OS usage: The Trends view shows the usage of Single-session OS by site and by Delivery Group. When you select **Site**, usage is shown per Delivery Group. When you select Delivery Group, usage is shown per User.
The Trends view also shows the usage of Multi-session OS by site, by Delivery Group, and by Machine. When you select **Site**, usage is shown per Delivery Group. When you select Delivery Group, usage is shown per Machine and per User. When Machine is selected usage is shown per User.

View virtual machine usage: From the **Machine Usage** tab, select **Single-session OS Machines or Multi-session OS Machines** to obtain a real-time view of your VM usage, enabling you to quickly assess your site's capacity needs.
Single-session OS availability - displays the current state of Single-session OS machines (VDIs) by availability for the entire site or a specific Delivery Group.
Multi-session OS availability - displays the current state of Multi-session OS machines by availability for the entire site or a specific Delivery Group.

You can click the following links on the banner displayed to gain better visibility into machine usage with **Cost optimization**:

- Estimated savings - This link directs you to the **Estimated savings** section on the **Cost optimization** page, displaying details of all delivery groups.
- Savings report - This link directs you to the **Savings report** section on the **Cost optimization** page, displaying details of all delivery groups.

> **Note:**
>
> The number of machines displayed in Available Counter includes machines in maintenance mode.

View resource utilization: From the **Resource Utilization** tab, select **Single-session OS Machines or Multi-session OS Machines** to obtain insight into historical trends data for CPU and memory usage, and IOPS and disk latency for each VDI machine for better capacity planning.
This feature requires Delivery Controllers and VDAs **version 7.11** or later.
Graphs show data for average CPU, average memory, average IOPS, disk latency, and peak concurrent sessions. You can drill down to the machine, and view data and charts for the top 10 processes consuming CPU.

Filter by Delivery Group and Time period. CPU, memory usage, and peak concurrent sessions graphs are available for the last 2 hours, 24 hours, 7 days, month, and year. The average IOPS and disk latency graphs are available for the last 24 hours, month, and year. You can click the **Check out** link on the banner to gain better visibility into machine usage with Cost optimization. This link takes you to the **Workload rightsizing** tab in the **Cost optimization** page, displaying details of the selected delivery group from the **Resource Utilization** tab.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - The Monitoring policy setting, **Enable Process Monitoring**, must be set to **Allowed** to collect and display data in the Top 10 Processes table on the Historic Machine Utilization page. The policy is set to **Prohibited** by default. All resource utilization data is collected by default. This can be disabled using the **Enable Resource Monitoring** policy setting. The table below the graphs shows the resource utilization data per machine. For more information, see Monitoring policy settings.
> - Average IOPS shows the daily averages. Peak IOPS is calculated as the highest of the IOPS averages for the selected time range. (An IOPS average is the hourly average of IOPS collected during the hour on the VDA).
> - The machine drilldown lists processes with average CPU or average memory usage more than 1%, this could mean that sometimes fewer than 10 processes are listed.

View network analysis data: The availability of this feature depends on your organization's license and your administrator permissions. This feature requires Delivery Controllers **version 7.11** or later.

From the **Network** tab, monitor your network analysis, which provides a user, application, and desktop contextual view of the network. With this feature, Director provides advanced analytics of ICA traffic in your deployment through HDX Insight reports from Citrix ADM. For more information, see Configure network analysis

View application failures: The **Application Failures** tab displays failures associated with the published applications on the VDAs.

This feature requires Delivery Controllers and VDAs **version 7.15** or later. Single-session OS VDAs running Windows Vista and later, and Multi-session OS VDAs running Windows Server 2008 and later are supported.
For more information, see Historical application failure monitoring.

By default, only application faults from Multi-session OS VDAs are displayed. You can set the monitoring of application failures by using Monitoring policies. For more information, see Monitoring policy settings.

View probe results: The **Probe Results** tab displays the results of probe for applications and desktops that have been configured for probing in the Configuration page. Here, the stage of launch during which the failure occurred is recorded.

For more information see Application and Desktop Probing.

Create customized reports: The Custom Reports tab provides a user interface for generating Custom Reports containing real-time and historical data from the Monitoring database in tabular format.

This feature requires Delivery Controllers **version 7.12** or later.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

From the list of previously saved Custom Report queries, you can click **Run and download** to export the report in CSV format, click **Copy OData** to copy and share the corresponding OData query, or click **Edit** to edit the query.
You can create a Custom Report query based on machines, connections, sessions, or application instances. Specify filter conditions based on fields such as machine, Delivery Group, or time period. Specify additional columns required in your Custom Report. Preview displays a sample of the report data. Saving the Custom Report query adds it to the list of saved queries.

You can create a Custom Report query based on a copied OData query. To do this, select the OData Query option and paste the copied OData query. You can save the resultant query for execution later.

> **Note:**
>
> The column names in Preview and Export report generated using OData queries are not localized, but appear in English.

The flag icons on the graph indicate significant events or actions for that specific time range. Hover the mouse over the flag and click to list events or actions.

> **Note:**
>
> - HDX™ connection logon data is not collected for VDAs earlier than 7. For earlier VDAs, the chart data is displayed as 0.
> - Delivery Groups deleted in Citrix Studio are available for selection in the Director Trends filters until data related to them are groomed out. Selecting a deleted Delivery Group displays graphs for available data until retention. However, the tables don't show data.
> - Moving a machine containing active sessions from one Delivery Group to another causes the **Resource Utilization and Load Evaluator Index** tables of the new Delivery Group to display metrics consolidated from the old and new Delivery Groups.

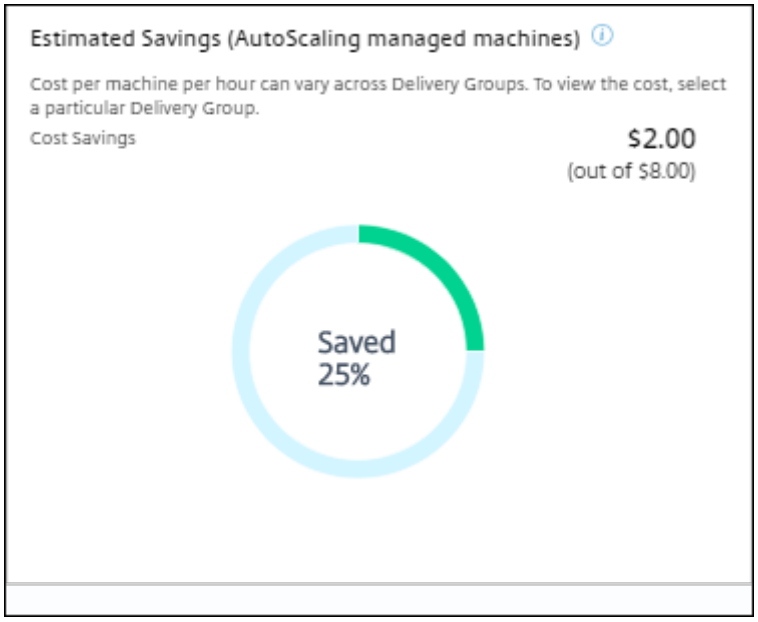
Monitor Autoscale-managed machines

May 13, 2026

Autoscale is a power management feature that enables proactive power management of all registered Multi-session and Single session OS machines in a delivery group. You can configure Autoscale for a selected delivery group in Web Studio. For more information, see Autoscale.
You can monitor the key metrics of Autoscale enabled machines using Director.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine Usage



The **Machine Usage** page displays the total number of Autoscale enabled multi-session and single-session OS machines that are powered on for a selected delivery group and time period. This metric indicates the actual usage of machines in the delivery group.
From the **Single session OS Machines** or the **Multi-session OS Machines** tab, select the Delivery group and the time period.

The chart plots the following metrics:

- **Machines On** - the number of Autoscale enabled machines that are powered on
- **Machines Registered** - the number of registered Multi-session or Single session OS machines
- **Machines under Maintenance** - the number of Multi-session or Single session OS machines with maintenance mode switched on

Estimated Savings

The **Machine Usage** page also displays the estimated cost savings achieved by enabling Autoscale in the selected delivery group.

Estimated Savings is calculated as the percentage of savings per machine per hour (in US $) as configured in **Edit Delivery Group** > **Autoscale**. For more information about configuring the savings per machine, see Autoscale.

When you select all Delivery groups, the average value of Estimated Savings across all the delivery groups is displayed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The estimated savings help administrators consolidate the existing infrastructure and plan the capacity to achieve maximum savings and utilization.

Alert notifications for machines and sessions

The Director Dashboard displays alert notifications that can be further drilled down. Alert details are displayed on the **Alerts** page.

- To create an alert policy in a delivery group, go to **Alerts** > **Citrix Alerts Policy** > **Delivery Group Policy**.
- Here, you can set the following Warning and Critical thresholds:
  - Failed Machines (Single-session OS) and Failed Machines (Multi-session OS),
  - Peak Connected Sessions, Peak Disconnected Sessions and Peak Concurrent Total Sessions in the delivery group.
- Alerts are generated when the corresponding metric in the delivery group reaches the threshold.

For more details regarding the alert policy conditions and creation of new alert policies, see Alerts and notifications.

Machine status

- **Filters** > **Machines** displays the power state of all machines in a tabular format. You can filter by a specific delivery group.
- **Filters** > **Sessions** displays filter by the Machine name to see the associated sessions and their real-time status.
- In **Trends** > **Sessions**, select your delivery group and time period to see the trend of the sessions and their associated metrics.

For more information, see Filter data to troubleshoot failures.

Load Evaluation trends

The **Trends** > **Load Evaluator Index** page displays a graph with detailed information about the load that is distributed among the Multi-session OS machines. The filter options for this graph include the delivery group or Multi-session OS machine in a delivery group, Multi-session OS machine (available only if Multi-session OS machine in a delivery group was selected), and range. The Load Evaluator Index is displayed as percentages of Total CPU, Memory, Disk, or Sessions and is shown in comparison with the number of connected users in the last interval.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshoot deployments

May 13, 2026

As a help desk administrator, you can search for the user reporting an issue and display details of sessions or applications associated with that user. Similarly, search for machines or endpoints where issues are reported. Resolve issues quickly by monitoring the relevant metrics and performing suitable actions.

Available actions include:

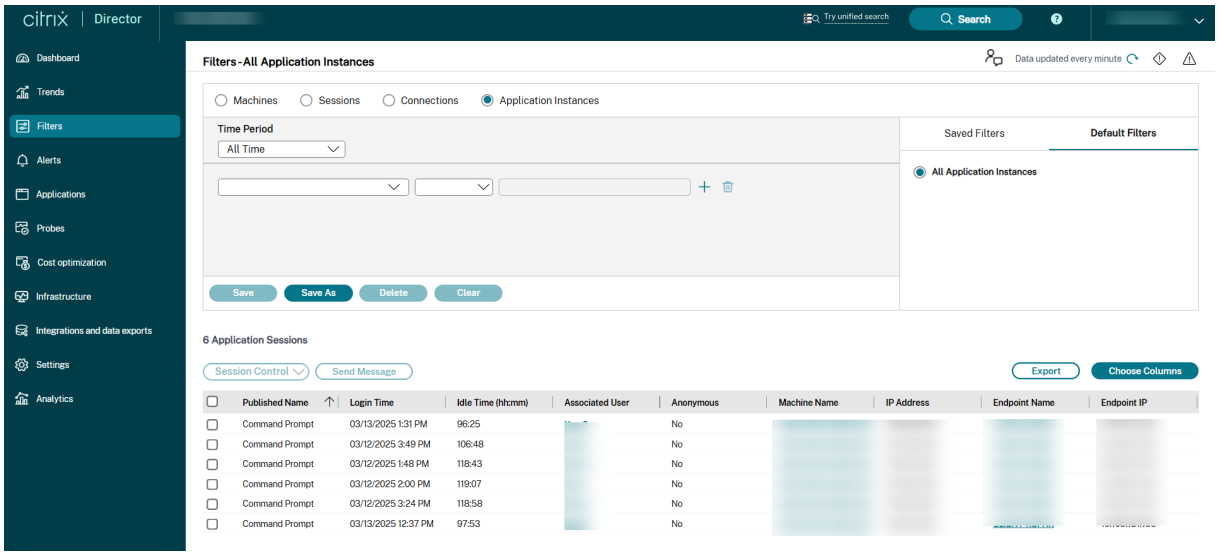
- Ending an unresponsive application or process
- Shadowing operations on the user's machine
- Logging off an unresponsive session
- Restarting the machine
- Putting a machine into maintenance mode
- Resetting the user profile

Troubleshoot applications

May 13, 2026

Real-time application monitoring

You can troubleshoot applications and sessions by using the idle time metric to identify instances that are idle beyond a specific time limit.



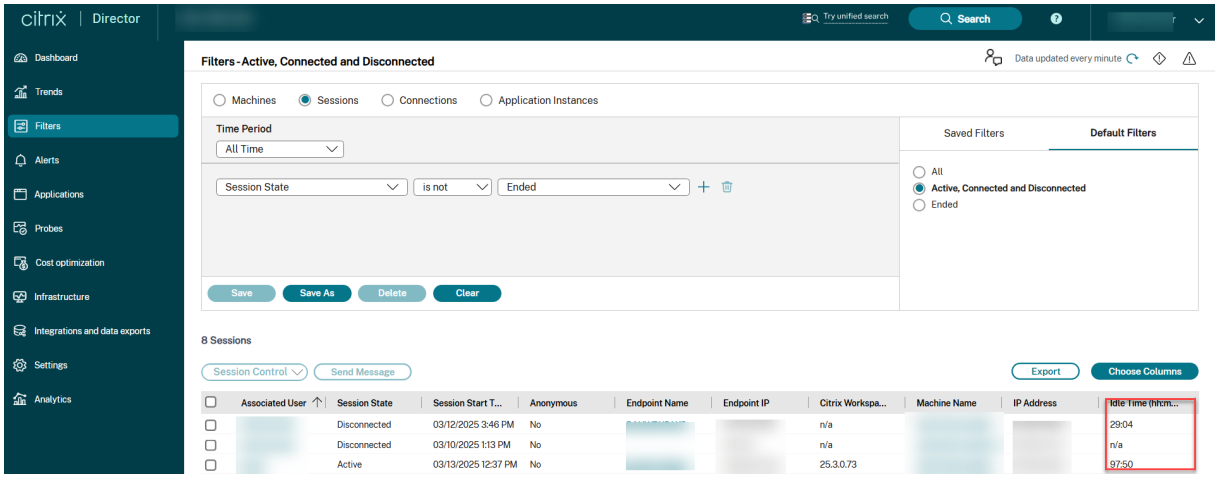
Typical use cases for application-based troubleshooting are in the healthcare sector, where employees share application licenses. There, you must end idle sessions and application instances to purge the Citrix Virtual Apps and Desktops™ environment, to reconfigure poorly performing servers, or to maintain and upgrade applications.

The **Application Instances** filter page lists all application instances on VDAs of Server and Single-session OS. The associated idle time measurements are displayed for application instances on VDAs of Multi-session OS that have been idle for at least 10 minutes.

> **Note:**
>
> The Application Instances metrics are available on sites of all license editions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use this information to identify the application instances that are idle beyond a specific time period and log off or disconnect them as appropriate. To do this, select **Filters > Application Instances** and select a pre-saved filter or choose **All Application Instances** and create your own filter.



An example of a filter would be as follows. As **Filter by** criteria, choose **Published Name** (of the application) and **Idle Time**. Then, set **Idle Time** to **greater than or equal to** a specific time limit and save the filter for reuse. From the filtered list, select the application instances. Select option to send messages or from the **Session Control** drop-down, choose **Logoff** or **Disconnect** to end the instances.

> **Note:**
>
> Logging off or disconnecting an application instance logs off or disconnects the current session, thereby ending all application instances that belong to the same session.

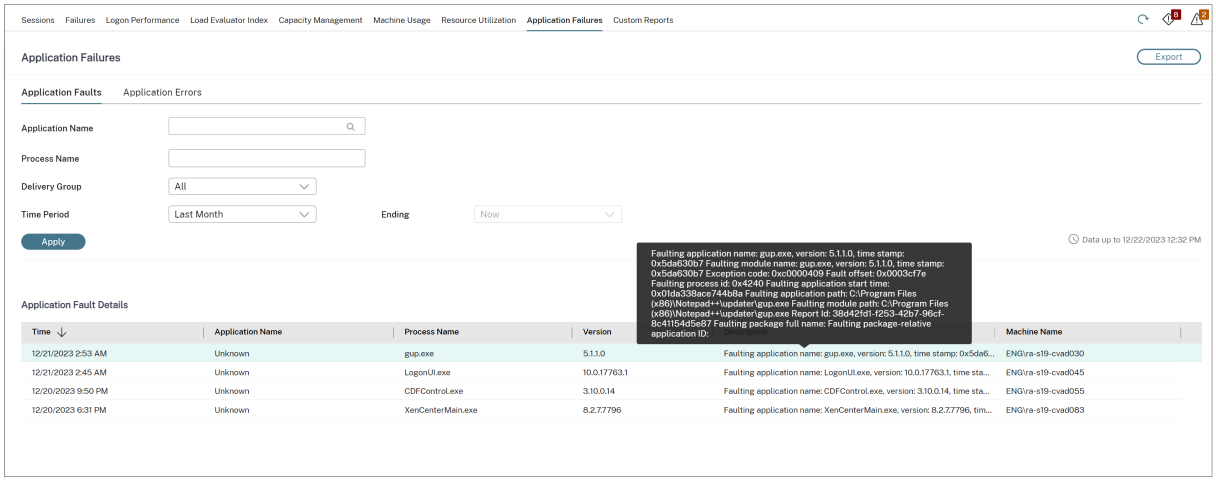
You can identify idle sessions from the **Sessions** filter page using the session state and the session idle time metric. Sort by the **Idle Time** column or define a filter to identify sessions that are idle beyond a specific time limit. Idle time is listed for sessions on VDAs of Multi-session OS that have been idle for at least 10 minutes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The **Idle time** is displayed as **N/A** when the session or application instance

- has not been idle for more than 10 minutes,
- is launched on a VDA of Single-session OS, or
- is launched on a VDA running Version 7.12 or earlier.

Historical application failure monitoring



The **Trends** -> **Application Failures** tab displays failures associated with the published applications on the VDAs.

Application failure trends are available for the last 2 hours, 24 hours, 7 days, and month for Premium and Advanced licensed sites. They are available for the last 2 hours, 24 hours, and 7 days for other license types. The application failures that are logged to the Event Viewer with source "Application Errors"are monitored. Click **Export** to generate reports in CSV, Excel, or PDF formats

The grooming retention settings for application failure monitoring, GroomApplicationErrorsRetentionDays and GroomApplicationFaultsRetentionDays are set to one day by default for both Premium and non-Premium licensed sites. You can change this setting using the PowerShell command:

```
PowerShell command Set-MonitorConfiguration -\<setting name\> \<value
\>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The failures are displayed as **Application Faults** or **Application Errors** based on their severity. The Application Faults tab displays failures associated with loss of functionality or data. Application Errors indicate problems that are not immediately relevant; they signify conditions that might cause future problems.

You can filter the failures based on **Published Application Name**, **Process Name** or **Delivery Group,** and **Time Period.** The table displays the fault or error code and a brief description of the failure. The detailed failure description is displayed as a tooltip.

> **Note:**
>
> The published application name is displayed as "Unknown"when the corresponding application name cannot be derived. This typically occurs when a launched application fails in a desktop session or when it fails due to an unhandled exception caused by a dependent executable.

By default, only faults of applications hosted on Multi-session OS VDAs are monitored. You can modify the monitoring settings through the Monitoring Group Policies: Enable monitoring of application failures, Enable monitoring of application failures on Single-session OS VDAs, and List of applications excluded from failure monitoring. For more information, see Policies for application failure monitoring in Monitoring policy settings.

The **Trends > Application Probe Results** page displays the results of application probing run in the site for the last 24 hours and 7 days. For more details on how to configure application probes, see Application Probing.

Troubleshoot machines

May 15, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> **Citrix Health Assistant** is a tool to troubleshoot configuration issues in unregistered VDAs. The tool automates several health checks to identify possible root causes for VDA registration failures and issues in session launch and time zone redirection configuration. The Knowledge Center article, Citrix Health Assistant - Troubleshoot VDA Registration and Session Launch contains the **Citrix Health Assistant** tool download and usage instructions.

The **Filters > Machines** view in the Director console displays the machines configured in the site. The Multi-session OS Machines tab includes the load evaluator index, which indicates the distribution of performance counters and tooltips of the session count if you hover over the link.

Click the **Failure Reason** column of a failed machine to get a detailed description of the failure and actions recommended to troubleshoot the failure. The failure reasons and the recommended actions for machine and connection failures are available in Citrix Director failure reasons and troubleshooting.

Click the machine name link to go to the **Machine Details** page.

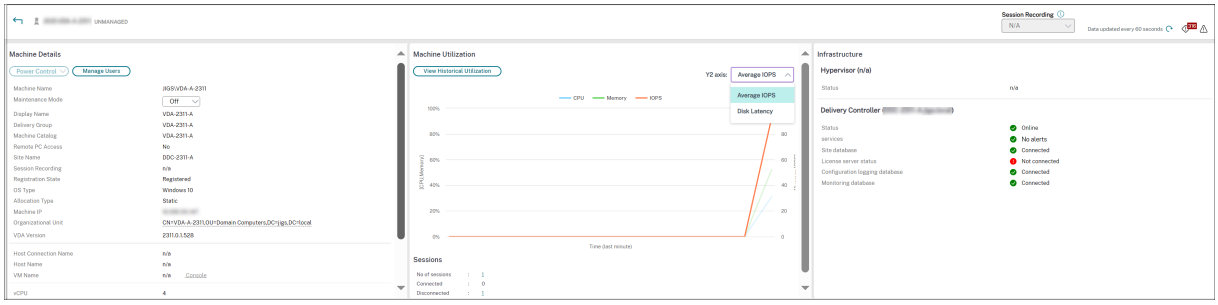
The Machine Details page lists the machine details, infrastructure details, and details of the hotfixes applied on the machine.

Prerequisite

- uberAgent must be installed on the VDAs
- **Windows VDA version**: 2511 or later

Metrics

Metrics	Description
Average CPU Usage (%)	
Average RAM Usage (%)	
Average Disk IOPS	
Average Disk Latency (ms)	
Average GPU Usage (%)	
Average Network Utilization (%)	
Average Load Index	
Average Disk Usage (%)	



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Metrics	Description
Average Profile Disk Usage (%)	
Average CPU Idleness (%)	
Average Pagefile Usage (%)	
Average CPU Relative Frequency (%)	

Machine-based real-time resource utilization

The **Machine Utilization** panel displays graphs showing real-time utilization of CPU and memory. In addition, disk and GPU monitoring graphs are available for sites with Delivery Controllers and VDA versions **7.14** or later.

Disk monitoring graphs, average IOPS, and disk latency are important performance measurements that help you monitor and troubleshoot issues related to VDA disks. The Average IOPS graph displays the average number of reads and writes to a disk. Select **Disk Latency** to see a graph of the delay between a request for data and its return from the disk, measured in milliseconds.

GPU Utilization

Select **GPU Utilization** to see the percentage utilization of the GPU, the GPU memory, and of the Encoder and the Decoder to troubleshoot GPU-related issues on multi-session and single-session OS VDAs.

Supported GPU versions:

- NVIDIA Tesla M60 GPUs running Display Driver version 369.17 or later. For more information, see NVIDIA vGPU Software.
- AMD Radeon Instinct MI25 GPUs and AMD EPYC 7V12(Rome) CPUs. For more information, see AMD Drivers and Support.

Drivers:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The appropriate drivers or extensions must be installed on the VDAs.

- For NVIDIA GPUs, install GRID drivers manually or via extensions. For more information, see NVIDIA vGPU Software.
    - For NVIDIA, only GRID drivers are supported. CUDA drivers do not work with the NVadsA10 v5-series and aren't supported.
    - For a sample process to install NVIDIA Grid GPU drivers via extensions on Azure based machines, see NVIDIA GRID drivers. NVIDIA GPU Driver Extension - Azure Windows VMs - Azure Virtual Machines.
    - For a sample process to install NVIDIA Grid GPU drivers manually, see Azure N-series NVIDIA GPU driver setup for Windows - Azure Virtual Machines.
- For AMD GPUs, install AMD graphics drivers manually or via extensions. For more information, see AMD Drivers and Support.
    - For a sample process to install AMD GPU drivers via extensions on Azure based machines, see AMD GPU Driver Extension - Azure Windows VMs - Azure Virtual Machines.
    - For a sample process to install AMD GPU drivers manually on Azure machines, see Install AMD GPU drivers on N-series VMs running Windows.

Usage Notes:

- The GPU Utilization graphs are available only for VDAs running 64-bit Windows.
- The VDAs must have HDX 3D Pro enabled to provide GPU acceleration. For more information, see GPU acceleration for Windows Single-session OS and GPU acceleration for Windows Multi-session OS.
- When a VDA accesses more than one GPU, the utilization graph displays the average of the GPU metrics collected from the individual GPUs. The GPU metrics are collected for the entire VDA and not for individual processes.
- For AMD, encoder and decoder usage are not supported separately. Any encoding/ decoding workload using the GPU will be reported as the general 3D load on GPU usage.
- Ensure that you install the NVIDIA WMI during installation. This window is available only during manual installation.
- If drivers are installed but Director does not detect the GPU
    - Check Task Manager. If drivers are installed properly, the GPU must show up in Task Manager.
    - Check if the machine is registered. Sometimes machines might take some time to be detected as online.
- If the GPU usage shows no activity in Director, make sure that the workload you are running is using the GPU. For graphics workloads, this can be enabled from Settings > System > Display > Graphics Settings > Choose the app to set preference. Make sure to turn on High Performance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sometimes, Windows defaults to using the CPU for graphics workloads when this is set to system default or power saving, based on other settings.

- The data is updated every minute and the data visualization starts within a minute of selecting **GPU Utilization**.

Machine-based historical resource utilization

In the **Machine Utilization** panel, click **View Historical Utilization** to view the historical usage of resources on the selected machine.
The utilization graphs include critical performance counters of CPU, memory, peak concurrent sessions, average IOPS, and disk latency.

> **Note:**
>
> The Monitoring policy setting, **Enable Process Monitoring**, must be set to Allowed to collect, and display data in the Top 10 Processes table on the Historic Machine Utilization page. The collection is prohibited by default.

The CPU and memory utilization, average IOPS, and disk latency data are collected by default. You can disable the collection by using the **Enable Resource Monitoring** policy setting.

1. From the **Machine Utilization** panel in the **Machine Details** view, select **View Historical Utilization**.
2. In the **Historical Machine Utilization** page, set **Time Period** to view usage for the last 2 hours, 24 hours, 7 days, month, or year.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

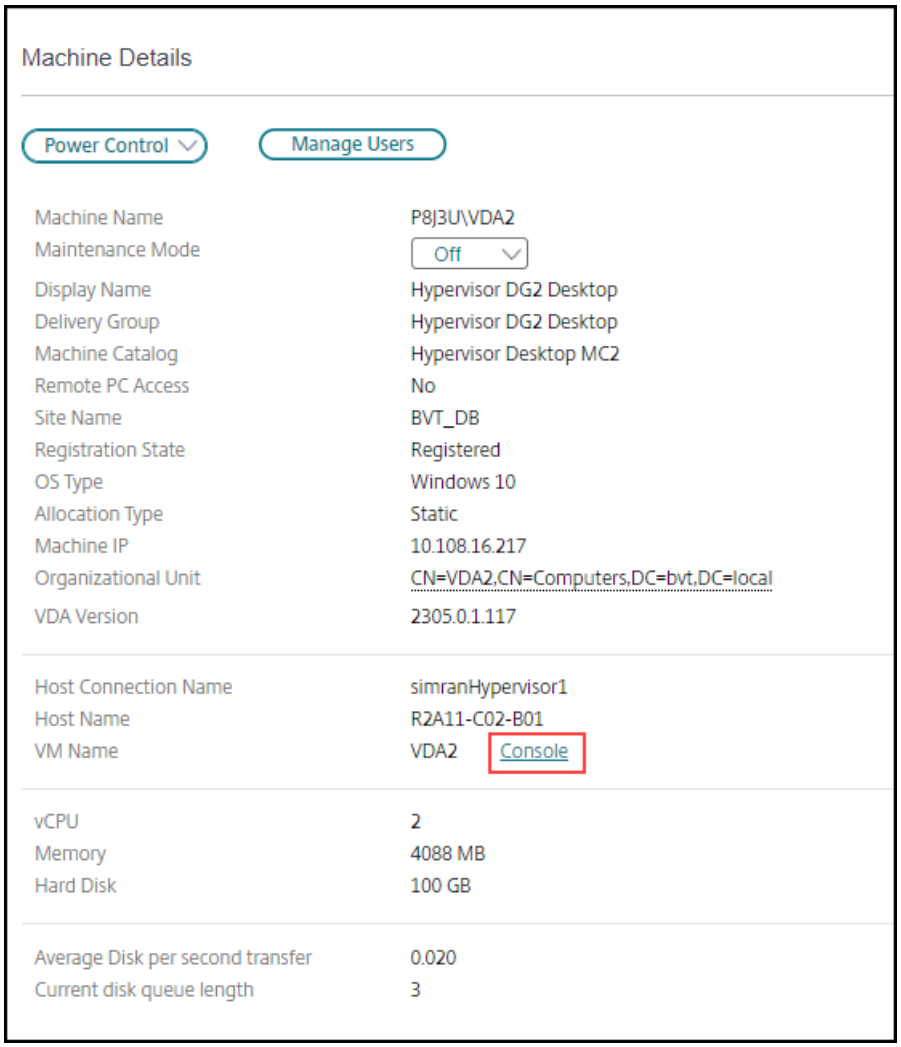
> **Note:**
>
> Average IOPS and disk latency usage data are available only for the last 24 hours, month, and year ending now. Custom end time is not supported.

3. Click **Apply** and select the required graphs.
4. Hover over different sections of the graph to view more information for the selected time period.

For example, if you select **Last 2 hours**, the baseline period is the 2 hours before the selected time range. View the CPU, memory, and session trend over the last 2 hours and the baseline time. If you select **Last month**, the baseline period is the previous month. Select to view the Average IOPS and disk latency over the last month and the baseline time.

1. Click **Export** to export the resource utilization data for the selected period. For more information, see the Export reports section in Monitor Deployments.
2. Below the graphs, the table lists the top 10 processes based on CPU or memory utilization. You can sort by any of the columns, which show Application Name, User Name, Session ID, Average CPU, Peak CPU, Average Memory, and Peak Memory over the selected time range. The IOPS and Disk Latency columns cannot be sorted.

> **Note:**
>
> The session ID for system processes is displayed as “0000”.



3. To view the historical trend on the resource consumption of a particular process, drill into any of the Top 10 processes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine Console access

You can access the consoles of Single-session and Multi-session OS machines hosted on XenServer Version 7.3 and later directly from Director. This way, you don't require XenCenter to troubleshoot issues on XenServer hosted VDAs. For this feature to be available:

- Delivery Controller of Version 7.16 or later is required.
- The XenServer hosting the machine must be of Version 7.3 or later and must be accessible from the Director UI.

To troubleshoot a machine, click the **Console** link in the corresponding Machine Details panel. After authentication of the host credentials you provide, the machine console opens in a separate tab using noVNC, a web-based VNC client. You now have keyboard and mouse access the console.

> **Note:**
>
> - This feature is not supported on Internet Explorer 11.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the mouse pointer on the machine console is misaligned, see CTX230727 for steps to fix the issue.
- Director launches console access in a new tab, ensure that your browser settings allow pop-ups.
- For security reasons, Citrix® recommends that you install SSL certificates on your browser.

Inspect machines with recent power actions

You can now inspect machines with the status of the success and failed power actions. This feature helps you to analyze the following:

- Power on failure which causes user issues
- Power off failure which increases cost

Note:

Data is available only for the power-managed machine. Data isn't available for the power actions taken before the feature was supported.

You can view the power action status of the machines using the following ways:

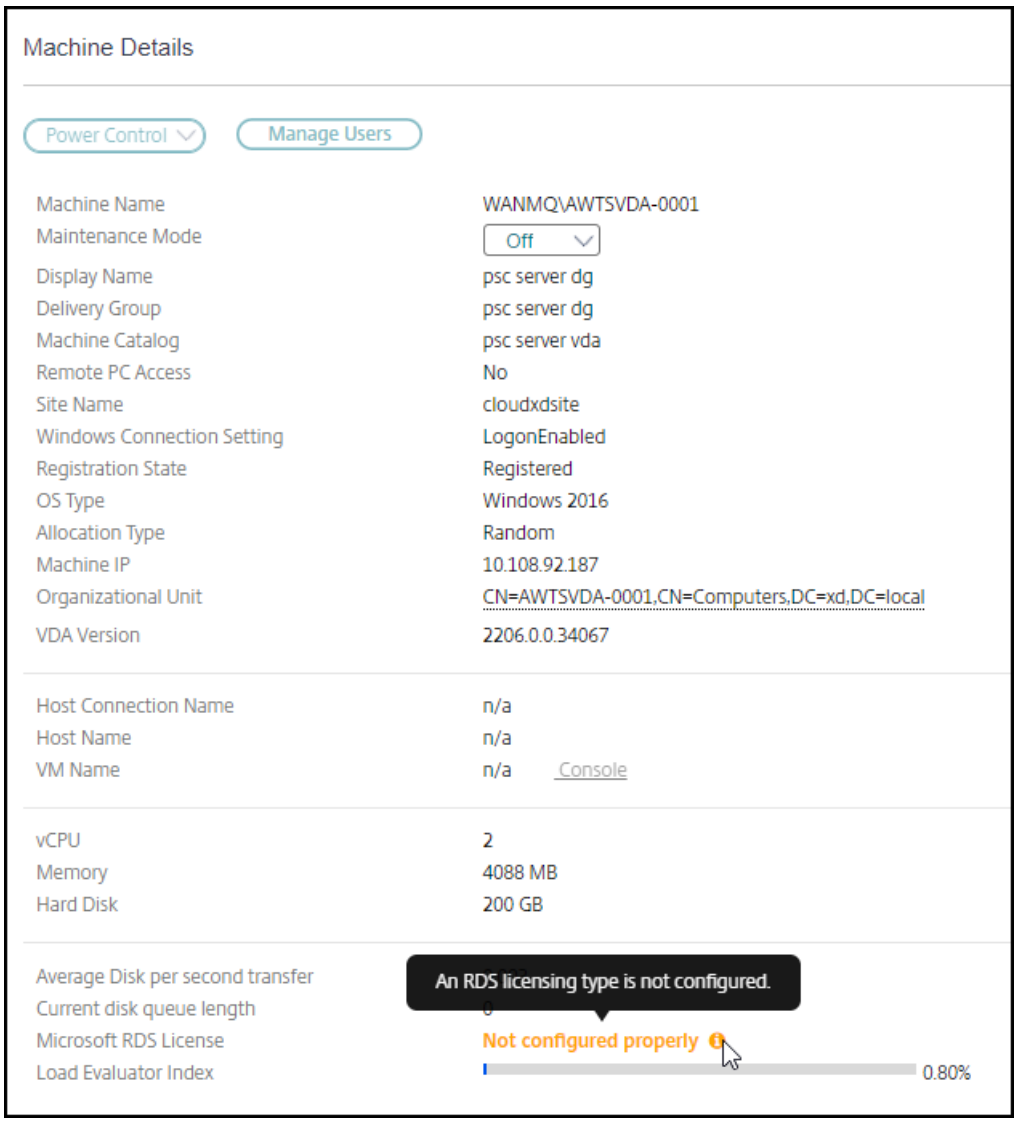
From **Filters** -> **Machines** tab. In this case, by default the **Power Action Time** and the **Power Action Result** columns are visible. You can also select the columns that you want to visible.

From **Cost Optimization** tab. In this case, the default filter is **Power Action Triggered By** is set to *Autoscale™* and the **Power Action Result** is set to *Failed*.

With this feature, you can view the details of the power action controls. For example, you can view who triggered the action, which action changed the power state, the reason for failure, and the time when the action is completed. You can also export these details.

The following filters are added to view the power action status:

Filter	Description
Power Action Result	Displays the result of the power action. The possible filter values are success and failed.
Power Action Triggered By	Displays who or what triggered the power action. The possible filter values are the following • Autoscale - This value appears when a power action is triggered by the following • When admin shut down a VM to clean the VM's OS disk back to its initial state



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Filter	Description
	• When a VM is shut down or suspended based on the set policies • When a VM is made available based on the pool size or buffer size configuration • Admin - This value appears when a power action is triggered by an admin. The possible examples are when admin requests for turn off, turn on, suspend, resume, restart, or reboot a VM. • User - This value appears when a power action is triggered by a user. The examples are when a user resets, turn on, or resume work on the VM. • Others - This value appears when power action is triggered by scheduled and by unknown reasons.
Last Power Action	Displays the exact power action happened on the machine such as power-on, power off, shut down, restart, reset, resume
Power Action Time	The time when the power action is completed. The possible filter values are last minute, last 5 minutes, last 30 minutes, last hour, today, last 24 hours, and yesterday.
Power Action Failure Reason	Displays the reason for failure. The possible filter values are hypervisor reported failure, hypervisor rate limit exceeded, unknown error, and none. If there is a successful action, it shows "None".

Microsoft RDS license health

You can view the status of the Microsoft RDS license in the **Machine Details** panel in the **Machine Details** and the **User Details** page for Multi-session OS machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

One of the following messages is displayed:

- License available
- Not configured properly (warning)
- License error (error)
- Incompatible VDA version (error)

> **Note:**
>
> The Microsoft RDS license health status for machines under grace period with valid license displays a **License available** message in green. Renew your licenses before they expire.

For warning and error messages, hover over the info icon to view additional information as given in the following table.

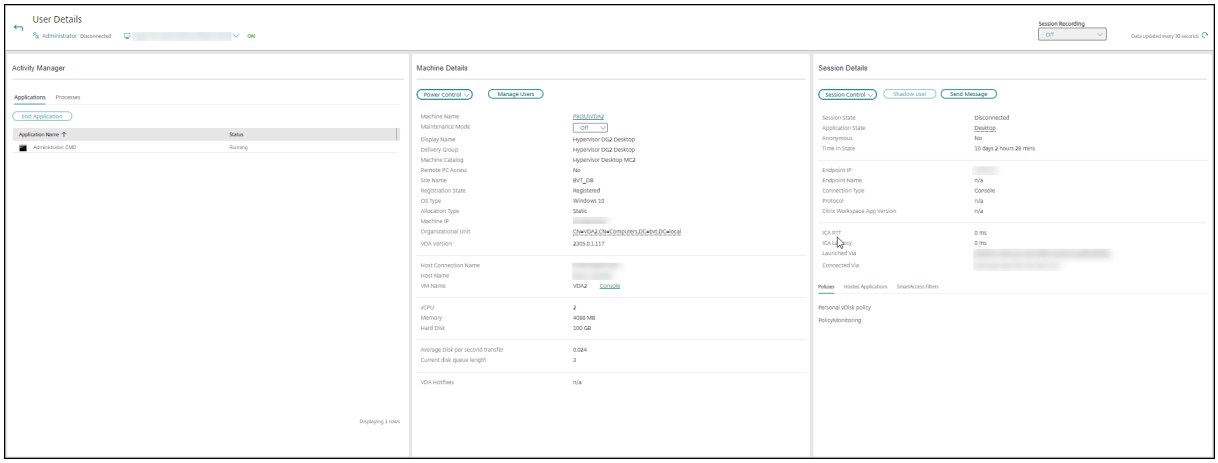
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Message Type	Messages in Director
Error	Available for VDAs version 7.16 and later.
Error	New RDS connections aren't allowed.
Error	Microsoft RDS license has exceeded its grace period.
Error	A License Server is not configured for the required OS level with the Per Device Client Access licensing type.
Error	The configured License Server is incompatible with the RDS Host OS level with the Per Device Client Access licensing type.
Warning	Personal Terminal Server is not a valid RDS licensing type in a Citrix Virtual Apps and Desktops™ deployment.
Warning	Remote Desktop for Administration is not a valid licensing type in a Citrix Virtual Apps and Desktops™ deployment.
Warning	An RDS licensing type is not configured.
Warning	The Domain Controller or License Server is unreachable with the Per User Client Access RDS licensing type.
Warning	With the Per Device Client Access licensing type, the Client Device license cannot be determined since the license server for the required OS level is unreachable.

> **Note:**
>
> This feature is applicable only for Microsoft RDS CAL (Client Access License).

Troubleshoot user issues

May 13, 2026



Use the Director's **Help Desk** view (**Activity Manager** page) to view information about the user or session:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Clicking **View Details** from the Activity Manager for a user opens the **User Details** page.

Clicking **View Details** from the Activity Manager for an endpoint opens the **Endpoint Details** page.

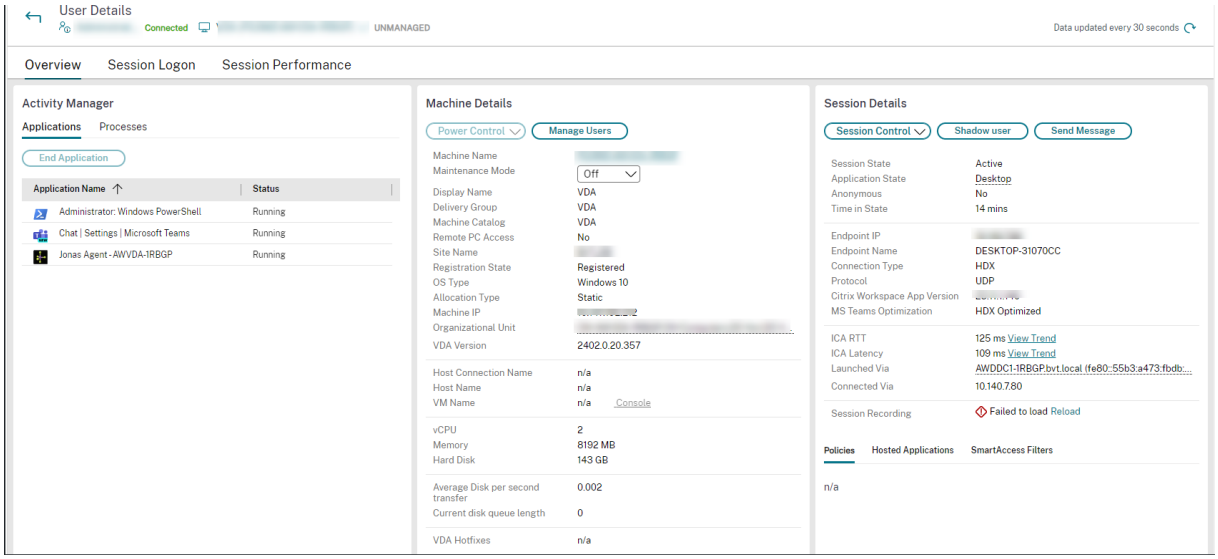
Session Selector

If the user has started several sessions, the session selector helps select a session.

Choose a session to view the details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

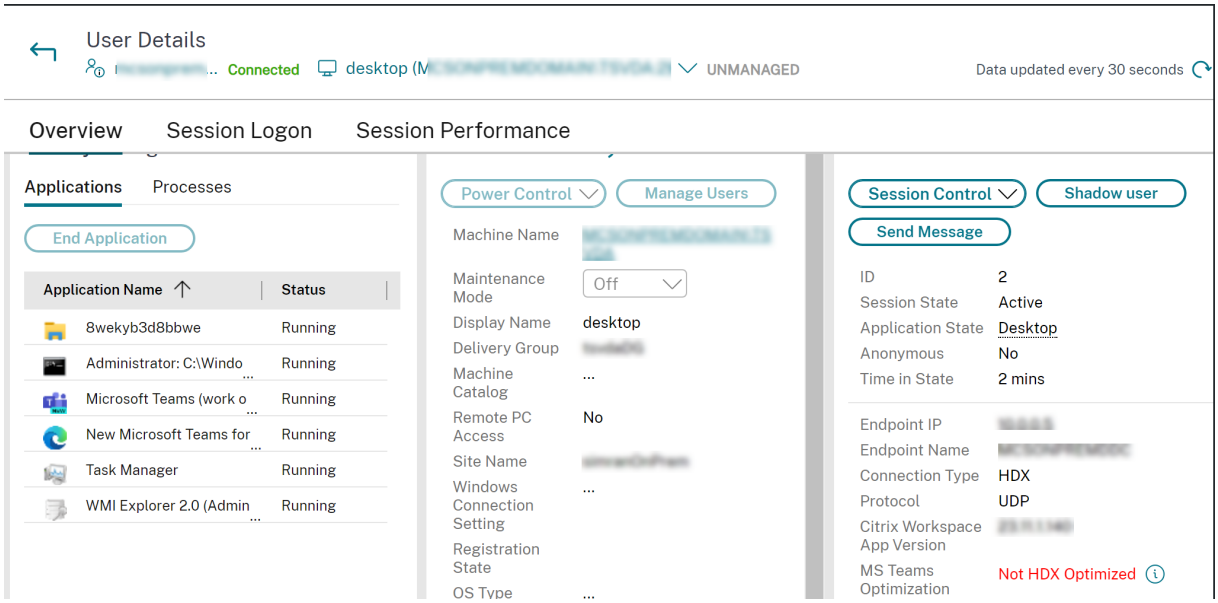
- Check details about the session, user's sign in experience, session startup, connection, and applications.
- you can Shadow the user's machine.
- Record the ICA® session.



Microsoft Teams optimization status

Director displays the Microsoft Teams optimization status for HDX™ sessions in the **User Details** page > **Session Details** panel > **MS Teams Optimization** field. Microsoft Teams being optimized is critical for the better user experience such as clear audio and video. Visibility of the Microsoft Teams optimization status is useful in reducing the time required to resolve tickets and helps administrators identify important metrics during troubleshooting.

> **Note:**
>
> Citrix Director supports Microsoft Teams version 2.1 or earlier.



Prerequisites:

- VDA are running version 2311 and later.
- Citrix Workspace app versions supported are listed in Optimization for Microsoft Teams.
- Microsoft Teams runs as a published app or inside a published desktop.
- Crucial services such as the Citrix HDX HTML5 Video Redirection Service, are running.

If the Microsoft Teams isn't optimized, the tooltip provides a link to an external troubleshooting live article from HDX containing tips to optimize Microsoft Teams. Troubleshooting HDX Optimization.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting tips

Troubleshoot the issue with the recommended actions in the following table, and, if needed, escalate the issue to the appropriate administrator.

User issue	Suggestions
Logon takes a long time or fails intermittently or repeatedly	Diagnose user logon issues
Session startup takes a long time or fails intermittently or repeatedly	Diagnose session startup issues
Session response is slow or not responding	Diagnose session performance issues
Application is slow or does not respond	Resolve application failures
Connection failed	Restore desktop connections
Session is slow or not responding	Restore sessions
Record sessions	Record sessions
Video is slow or poor quality	Run HDX channel system reports

> **Note:**
>
> To make sure that the machine isn't in maintenance mode, from the User Details view, review the Machine Details panel.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session Logon

The **User Details** view > **Session Logon** tab displays a comprehensive view of the session logon process. This tab shows the total logon duration, client and controller duration, and VDA duration. The **Session Logon** tab contains the Logon Duration phases chart with the various logon phases plotted. Use this data to troubleshoot user logon issues. For more information, see Diagnose user logon issues.

Session Performance

The **Session Performance** tab has enhanced troubleshooting workflows starting with the ability to correlate real-time metrics in identifying issues within user sessions. The **Session Topology** panel provides a visual representation of the in-session path for connected HDX sessions. The **Performance Metrics** panel provides trends for the session metrics like ICARTT, ICA Latency, Frames Per Second, Output Bandwidth Available, and Output Bandwidth Consumed help indicate how these metrics have performed over time. For more information, see Diagnose session performance issues.

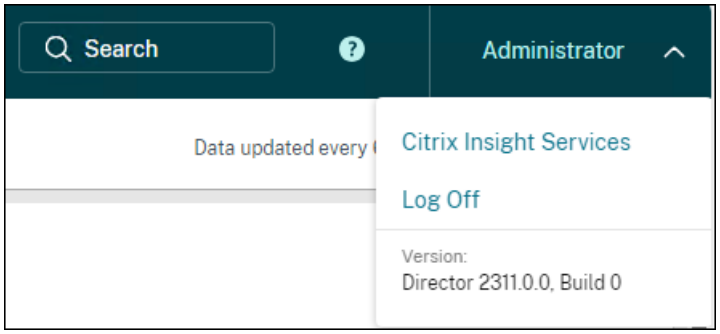
Search tips

When you type the user's name in a Search field, Director searches for users in the Active Directory for users across all sites that are configured to support Director.

When you type a multiuser machine name in a Search field, Director displays the Machine Details for the specified machine.

When you type an endpoint name in a Search field, Director uses the unauthenticated (anonymous) and authenticated sessions that are connected to a specific endpoint. This search enables troubleshooting unauthenticated sessions. Ensure that endpoint names are unique to enable troubleshooting of unauthenticated sessions.

The search results also include users who are not currently using or assigned to a machine.



- Searches aren't case-sensitive.
- Partial entries produce a list of possible matches.
- After you type a few letters of a two-part name, separated by a space, the results include matches for both strings. The examples for two-part names are user name, family name and first name, or display name. For example, if you type jo rob, the results might include strings such as "John Robertson" or "Robert Jones".

To return to the landing page, click the **Director logo**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Access Citrix Insight Services

You can access Citrix Insight Services (CIS) from the **User** drop-down list in Director to access extra diagnostic insights. The data available in the CIS comes from sources including Call Home and Citrix Scout.

Upload troubleshooting information to Citrix Technical Support

Run Citrix Scout from a single Delivery Controller™ or VDA to capture key data points and Citrix Diagnostics Facility (CDF) traces to troubleshoot selected computers. Scout offers the ability to securely upload the data to the CIS platform to assist Citrix Technical Support on troubleshooting. Citrix Technical Support uses the CIS platform to reduce the time to resolve customer-reported issues.

Scout is installed with Citrix Virtual Apps and Desktops™ components. Depending on the version of Windows, Scout appears in the **Windows Start** menu or Start Screen when you install or upgrade to Citrix Virtual Apps and Desktops.

To start Scout, from the Start menu or Start Screen, select **Citrix > Citrix Scout**.

For information on using and configuring the Scout, and for an FAQ, see CTX130147.

Diagnose session startup issues

May 13, 2026

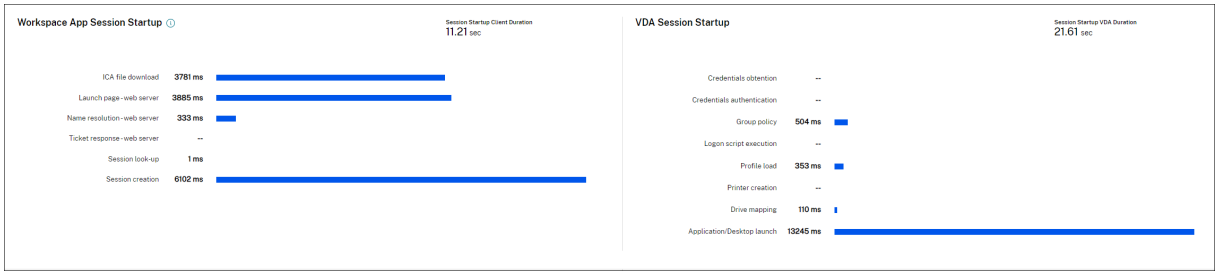
In addition to the logon process phases mentioned in the Diagnose user logon issues section, Director displays the session startup duration. This is divided into Workspace App Session Startup and VDA Session Startup duration on the **User Details** page and **Machine Details** pages. These two durations further contain individual phases whose startup durations are also displayed. This data helps you to understand and troubleshoot high session startup duration. Further, the time duration for each phase involved in the session startup helps in troubleshooting issues associated with individual

© 1997–2026 Citrix Systems, Inc. All rights reserved.

phases. For example, if the Drive Mapping time is high, you can check to see whether all the valid drives are mapped correctly in the GPO or script. This feature is available on Delivery Controller version 7 1906 and later and VDAs 1903 and later.

Prerequisites

Ensure that the following prerequisites are met for session startup duration data to be displayed:



- Delivery Controller™ 7 1906 or later.
- VDA 1903 or later.
- Citrix End User Experience Monitoring (EUEM) service must be running on the VDA.

Limitations

The following limitations apply when Director displays the session startup duration data.

- Session startup duration is available only for HDX™ sessions.
- For session launches from iOS and Android OS, only VDA Startup Duration is available.
- ICA® File Download Duration (IFDCD) is available only when Workspace App is detected while launching from a browser.
- For session launches from Mac OS, IFDCD is available for Workspace App 1902 or later only.
- For session launches from Windows OS, IFDCD is available for Workspace app 1902 and later. For earlier versions, IFDCD is displayed for only app launches from browser with Workspace app detected.

> **Notes:**
>
> - If you face issues in the sessions startup duration display after the prerequisites are met, view the Director server and VDA logs as described in CTX130320.
>   For shared sessions (multiple applications launched in the same session), the Workspace App Startup metrics are displayed for the latest connection or the latest application launch.
> - Some metrics in VDA Session Startup are not applicable on reconnects. In such cases, a message is displayed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Workspace App session startup phases

Session Startup Client Duration (SSCD)

When this metric is high, it indicates a client-side issue that is causing long start times. Review subsequent metrics to determine the probable root cause of the issue. SSCD starts as close as possible to the time of the request (mouse click). It ends when the ICA connection between the client device and VDA has been established. In the case of a shared session, this duration is much smaller, as much of the setup costs associated with the creation of a new connection to the server are not incurred. At the following level down, there are several detailed metrics available.

ICA File Download Duration

This is the time taken for the client to download the ICA file from the server. The overall process is as follows:

1. The user clicks a resource (application or desktop) in the Workspace Application.
2. A request from the user is sent to the StoreFront™ through the Citrix Gateway (if configured), which sends the request to the Delivery Controller.
3. The Delivery Controller finds an available machine for the request and sends the machine information and other details to StoreFront. Also, StoreFront requests and receives a one-time ticket from the Secure Ticket Authority.
4. StoreFront generates an ICA File and sends it to the user via Citrix Gateway (if configured).

IFDCD represents the time it takes for the complete process (steps 1–4). The IFDCD duration stops counting when the client receives the ICA file.

LPWD is the StoreFront component of the process.

If IFDCD is high (but LPWD is normal), the server-side processing of the launch was successful, but there were communication issues between the client device and the StoreFront. This results from network issues between the two machines. So you can troubleshoot potential network issues first.

Launch Page Web Server Duration (LPWD)

This is the time taken to process the launch page (launch.aspx) on the StoreFront. If LPWD is high, there might be a bottleneck on the StoreFront.

Possible causes include:

- High load on the StoreFront. Try to identify the cause of the slowdown by checking the Internet Information Services (IIS) logs and monitoring tools, Task Manager, Performance Monitor and so on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- StoreFront is having issues communicating with other components such as the Delivery Controller. Check if the network connection between StoreFront and Delivery Controller is slow or some Delivery Controllers are down or overloaded.

Name Resolution Web Server Duration (NRWD)

This is the time taken by the Delivery Controller to resolve the name of a published application/desktop to a VDA Machine IP Address.

When this metric is high, it indicates that the Delivery Controller is taking a long time to resolve the name of a published application to an IP address.

Possible causes include a problem on the client, issues with the Delivery Controller, such as the Delivery Controller being overloaded, or a problem with the network link between them.

Ticket Response Web Server Duration (TRWD)

This duration indicates the time it takes to get a ticket (if necessary) from the Secure Ticket Authority (STA) Server or Delivery Controller. When this duration is high, it indicates that the STA server or the Delivery Controller are overloaded.

Session Look-up Client Duration (SLCD)

This duration represents the time taken to query every session to host the requested published application. The check is performed on the client to determine whether an existing session can handle the application launch request. The method used depends on whether the session is new or shared.

Session Creation Client Duration (SCCD)

This duration represents the time taken to create a session, from the moment wfica32.exe (or a similar equivalent file) is launched to the time when the connection is established.

VDA session startup phases

Session Startup VDA Duration (SSVD)

This duration is the high-level server-side connection start-up metric that encompasses the time VDA takes to perform the entire start-up operation. When this metric is high, it indicates that there is a VDA issue increasing session start times. This includes the time spent on the VDA performing the entire start-up operation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Credentials Obtention VDA Duration (COVD)

The time taken for the VDA to obtain the user credentials.

This duration can increase artificially if a user fails to provide credentials in a timely manner. So, it is not included in the VDA Startup Duration. This time is likely to be a significant only if manual login is being used and the server side credentials dialog is displayed (or if a legal notice is displayed before login commences).

Credentials Authentication VDA Duration (CAVD)

This is the time taken by the VDA to authenticate the user's credentials against the authentication provider. They can be Kerberos, Active Directory, or a Security Support Provider Interface (SSPI).

Group Policy VDA Duration (GPVD)

This duration is the time taken to apply group policy objects during logon.

Login Script Execution VDA Duration (LSVD)

This is the time taken by the VDA to run the user's login scripts.

Consider making asynchronous the user or group's login scripts. Consider optimizing any application compatibility scripts or use environment variables instead.

Profile Load VDA Duration (PLVD)

This is the time taken by the VDA to load the user's profile.

If this duration is high, consider your User Profile configuration. Roaming profile size and location contribute to slow session starts. When a user logs on to a session where Terminal Services roaming profiles and home folders are enabled, the roaming profile contents and access to that folder are mapped during the logon. This takes extra resources. Sometimes, this can consume significant amount of the CPU usage. Consider using the **Terminal Services home** folders with redirected personal folders to mitigate this problem. In general, consider using Citrix Profile Management to manage user profiles in Citrix environments. If you are using Citrix Profile Management and have slow logon times, check if your antivirus software is blocking the Citrix Profile Management tool.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Printer Creation VDA Duration (PCVD)

This is the time taken for the VDA to map the user's client printers synchronously. If the configuration is set for printer creation to be performed asynchronously, the value is not recorded for PCVD as it does not impact completion of the session startup.

Excessive time spent in mapping printers is often the result of the printer auto creation policy settings. The number of printers added locally on the users' client devices and your printing configuration can directly affect your session start times. When a session starts, Citrix Virtual Apps and Desktops™ has to create every locally mapped printer on the client device. Consider reconfiguring your printing policies to reduce the number of printers that get created, specifically when users have many local printers. To do this, edit the Printer Auto creation policy in Delivery Controller and Citrix Virtual Apps and Desktops.

Drive Mapping VDA Duration (DMVD)

This is the time taken by the VDA to map the user's client drives, devices, and ports.

Ensure that your base policies include settings to disable unused virtual channels. For example, audio or COM port mapping, to optimize the ICA protocol and improve overall session performance.

Application/Desktop Launch VDA Duration (ALVD/DLVD)

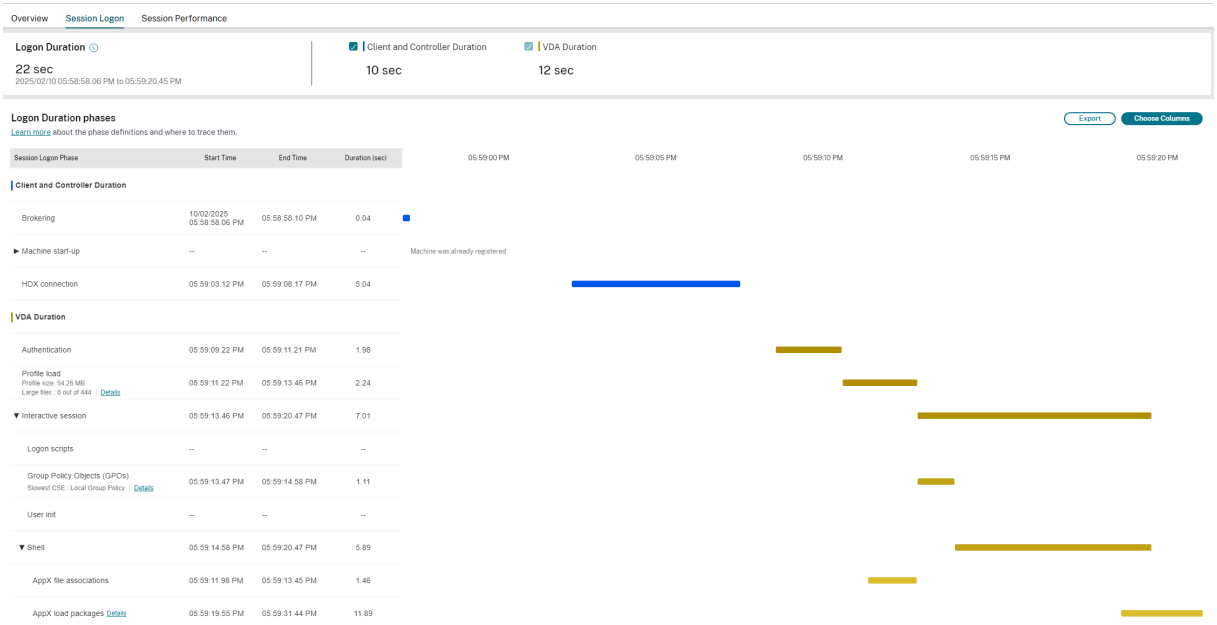
This phase is a combination of Userinit and Shell duration. When a user logs on to a Windows machine, winlogon runs userinit.exe. Usernit.exe runs logon scripts, re-establishes network connections, and then starts Explorer.exe. Userinit represents the duration between the start of userinit.exe to the start of the user interface for the virtual desktop or application. The Shell duration is the time between the initialization of the user interface to the time the user receives keyboard and mouse control.

Session Creation VDA Duration (SCVD)

This time includes any miscellaneous delay in session creation time on VDA.

Diagnose user logon issues

May 13, 2026



The **User Details** view > **Session Logon** tab displays a comprehensive view of the session logon process. This tab shows the total logon duration, client and controller duration, and VDA duration. Use this data to troubleshoot user logon issues.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Logon duration is measured only for initial connections to a desktop or app using HDX. This data does not include users trying to connect with Remote Desktop Protocol or reconnect from disconnected sessions. Specifically, logon duration is not measured when a user initially connects using a non-HDX protocol and reconnects using HDX.

As users log on to Citrix Virtual Apps and Desktops™, the Monitor Service tracks the phases of the logon process. The phases begin from the time the user connects from Citrix Workspace™ app to the time when the app or desktop is ready to use.

The **Session Logon** tab contains the Logon Duration phases chart with the various logon phases plotted. The Logon Duration represents the time spent establishing the connection and obtaining an app or a desktop from Delivery Controller™ and the time spent to authenticate and log on to a virtual app or desktop. The duration information is presented in seconds (or fractions of seconds).

The Logon Duration phases chart provides a clear view of different logon phases and their start and end times. The chart shows the overlapping of the individual logon phases. The total logon time might not be the sum of the individual logon phase durations. This is because the individual phases might overlap and not all logon phases are a part of this representation. Also, certain phases might extend even after the user starts interacting with the virtual app or desktop, and this duration is not measured as part of the overall logon duration.

Use this view to identify specific logon phases causing a delayed session launch. The definition for each logon phase and the event source from where you can trace information helps further troubleshooting. Hovering on the chart gives a tooltip containing the phase duration for the current session as well as the user's 7-day average and the delivery group's 7-day average. This information helps compare the current session logon duration with the 7-day average values. You can further drilldown into subphase measurements in the case of GPO and Profile Details. This visualization helps

© 1997–2026 Citrix Systems, Inc. All rights reserved.

understand and troubleshoot logon duration-related issues easily.

Prerequisites

Ensure that the following prerequisites are met for logon duration data and drilldowns to appear:

1. Install **Citrix User Profile Manager** and **Citrix User Profile Manager WMI Plugin** on the VDA.
2. Ensure that the Citrix Profile Management Service is running.
3. For XenApp and XenDesktop sites 7.15 and earlier, disable the GPO setting, **Do not process the legacy run list**.
4. Audit process tracking must be enabled for Interactive Session drilldown.
5. For GPO drilldown, increase the size of Group Policy operational logs.

> **Notes:**
>
> - Logon duration is supported only on the default Windows shell (explorer.exe) and not on custom shells.
> - Logon duration for Remote PC Access is available only when **Citrix User Profile Manager** and the **Citrix User Profile Manager WMI Plugin** are installed as extra components during Remote PC Access installation. For more information, see Step 4 in Remote PC Access configuration and sequence considerations.

Steps to troubleshoot user logon issues

1. From the **User Details** view > **Session Logon** tab, troubleshoot the logon state using the Logon Duration chart.
    - If the user is logging on, the view reflects the process of logging on.
    - If the user is logged on, the Logon Duration panel displays the time it took for the user to log on to the current session.
2. Examine the phases of the logon process.

Logon process phases

Client and Controller duration

Time taken since the user clicked on the app or desktop icon until the keyboard and mouse controls are handed over to the end user to interact with the session.

Brokering Time taken to decide which desktop to assign to the user.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

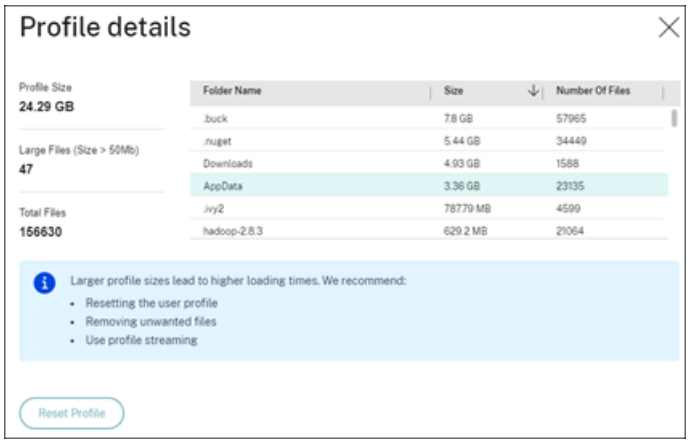
Machine Start-up If the session required a machine start, this is the time taken to start the virtual machine. The following sub-section provides breakdown of the time taken to start a virtual machine during different phases:

- **Power On** - Displays the time taken to power on a virtual machine
- **Boot-up and registration** - Displays the time taken to boot up and register a virtual machine

You can use the collapsible button to collapse or expand the options under the **Machine Start-up**.

HDX connection Time taken to complete the steps required in setting up the HDX connection from the client to the virtual machine.

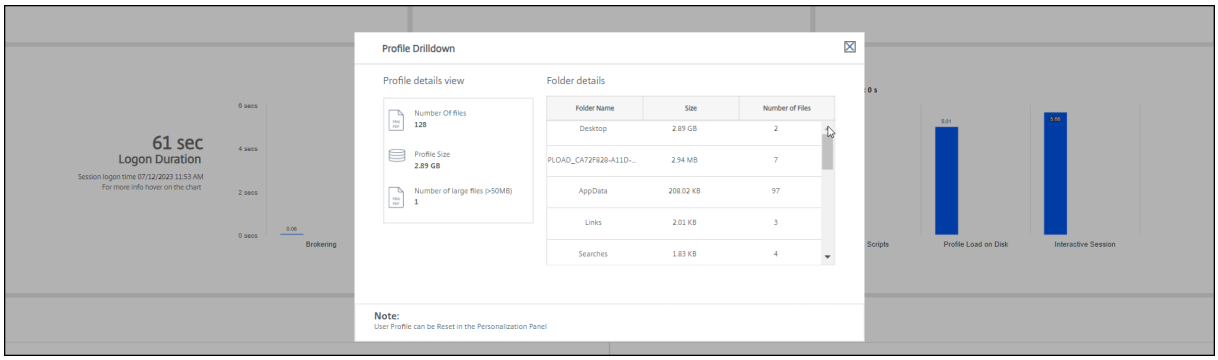
VDA duration



Time taken on the VDA to create a session.

Authentication Time taken to complete authentication to the remote session.

Profile load If profile settings are configured for the user or the virtual machine, this is the time taken for the profile to load.



If Citrix Profile Management and FSLogix are configured, the Profile Load bar includes the time taken by Citrix Profile Management and FSLogix to process user profiles. This information helps administrators to troubleshoot high profile processing duration issues. When Profile Management and FSLogix are configured, the Profile Load bar displays an increased duration. This increase is caused by this enhancement and does not reflect a performance degradation. This enhancement is available on VDA versions 2407 or later.

Hovering over the Profile Load bar displays a tooltip showing the user profile details for the current session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Click **Details** to drilldown further into each individual folder in the profile root folder (for instance, C:/Users/username), its size, and the number of files (including files inside nested folders).

Profile drilldown is available on Delivery Controller version 7 1811 or later and VDAs 1811 or later. Using the profile drilldown information, you can resolve issues involving a high profile load time. You can:

- Reset the user profile
- Optimize the profile by removing unwanted large files
- Reduce the number of files to reduce the network load
- Use profile streaming

By default, all folders in the profile root are displayed in the drilldown. To hide folder visibility, edit the following registry value on the VDA machine:

> **Warning:**
>
> Adding and editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix does not guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

1. On the VDA, add a new registry value **ProfileFoldersNameHidden** at HKEY_LOCAL_MACHINE\Software\Citrix
2. Set the value to 1. This value must be a DWORD (32-bit) value. Folder names visibility is now disabled.
3. To make the folder names visible again, set the value to 0.

> **Note:**
>
> You can use GPO or PowerShell commands to apply the registry value change on multiple machines. For more information about using GPO to deploy registry changes, see the blog.

Additional information

- Profile drilldown does not consider redirected folders.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

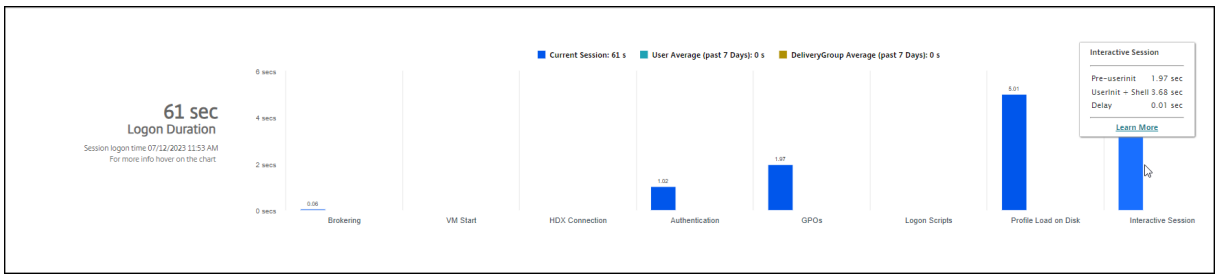
- The NTUser.dat files in the root folder might not be visible to end users. However, they are included in the profile drilldown and displayed in the list of files in **Root Folder**.
- Certain hidden files in the AppData folder are not included in the Profile drilldown.
- The number of files and profile size data might not match with the data in the Personalization panel due to certain Windows limitations.

Interactive Session

Interactive Session is the time taken to "hand off"keyboard and mouse control to the user after the user profile has been loaded. It is normally the longest duration out of all the phases of the logon process and is calculated as **Interactive Session duration = Desktop Ready Event Timestamp (EventId 1000 on VDA) - User Profile Loaded Event Timestamp (EventId 2 on VDA)**. Interactive Session has three subphases: Pre-userinit, Userinit, and Shell. Hover over Interactive Session to see a tooltip showing the following:

- subphases
- time taken for each subphase
- total cumulative time delay between these subphases

You can use the collapsible button to collapse or expand the options under the **Interactive Session**.



> **Note:**
>
> This feature is available on VDAs 1811 and later. If you have launched sessions on sites earlier than 7.18 and then upgraded to 7.18 or later, a 'Drilldown unavailable due to server error'message is displayed. However, if you have launched sessions after upgrading, no error message is displayed.

To view the time duration of each subphase, enable Audit process tracking on the VM (VDA). When the Audit process tracking is disabled (default), the time duration of Pre-userinit and the combined time duration of Userinit and Shell are displayed. You can enable Audit process tracking through a Group Policy Object (GPO) as follows:

1. Create a GPO and edit it using the GPO editor.
2. Go to **Computer Configuration > Windows Settings > Security Settings > Local Policies > Audit Policy**.
3. On the right pane, double-click **Audit process tracking**.
4. Select **Success** and click OK.
5. Apply this GPO to the required VDAs or Group.

For more information about Audit process tracking and enabling or disabling it, see Audit process tracking in the Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Logon Duration panel in the User Details view.

- **Interactive Session –Pre-userinit:** The segment of Interactive Session which overlaps with Group Policy Objects and scripts. This subphase can be reduced by optimizing the GPOs and scripts.
- **Interactive Session –Userinit:** When a user logs on to a Windows machine, Winlogon runs userinit.exe. Userinit.exe runs logon scripts, re-establishes network connections, and then starts Explorer.exe, the Windows user interface. This subphase of Interactive Session represents the duration between the start of Userinit.exe to the start of the user interface for the virtual desktop or application.
- **Interactive Session –Shell:** In the previous phase, Userinit starts the initialization of Windows user interface. The Shell subphase captures the duration between the initialization of the user interface to the time the user receives keyboard and mouse control.
- **Delay:** This is the cumulative time delay between the **Pre-userinit and Userinit** subphases and the **Userinit and Shell** subphases.

The total logon time is not an exact sum of these phases. For example, some phases occur in parallel, and in some phases, more processing occurs that can result in a longer logon duration than the sum. The total logon time does not include the ICA® idle time that is the time between the ICA file download and the ICA file launch for an application.
To enable the automatic opening of the ICA file upon application launch, configure your browser for automatic ICA file launch upon download of an ICA file. For more information, see CTX804493.

> **Note:**
>
> The Logon Duration graph shows the logon phases in seconds. Any duration values below one second are displayed as subsecond values. The values above one second are rounded to the nearest 0.5 second. The graph has been designed to show the highest y-axis value as 200 seconds. Any value greater than 200 seconds is shown with the actual value displayed above the bar.

Logon scripts If logon scripts are configured for the session, this is the time taken for the logon scripts to be run.

GPOs If Group Policy settings are enabled on the virtual machines, this is the time taken to apply group policy objects during logon. The drill-down of the time taken to apply each policy as per the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CSEs (Clients-Side Extension) is available as a tooltip when you hover on the GPO bar.

Click **Details** to see a table with the policy status, and the corresponding GPO name. The time durations in the drilldown represent the CSE processing time only and do not add up to the total GPO time. You can copy the drill-down table for further troubleshooting or use in reports. The GPO time for the policies is retrieved from Event Viewer logs. The logs can get overwritten depending on the memory allocated for the operational logs (default size is 4 MB). For more information about increasing the log size for the operational logs, see the Microsoft TechNet article Configuring the Event Logs.

User init When a user logs on to a Windows machine, Winlogon runs userinit.exe. Userinit.exe runs logon scripts, re-establishes network connections, and then starts Explorer.exe, the Windows user interface. This subphase of Interactive Session represents the duration between the start of Userinit.exe to the start of the user interface for the virtual desktop or application

Shell

The Shell subphase captures the duration between the initialization of the user interface to the time the user receives keyboard and mouse control.

AppX file associations The time taken to associate AppX files during the new VDA session.

AppX load packages The time taken to load the AppX packages during the new VDA session.

> **Note:**
>
> uberAgent must be integrated with Director for collecting AppX packages loading duration during the new VDA session. For more information, see Citrix uberAgent integration with Director.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Export data

Along with the default Logon Duration Phases table options, which is Session Logon Phase and Duration, you can also choose the following columns on the Session Logon page:

- Start time
- End time
- Delivery Group - 7d Avg (sec)
- User - 7d Avg (sec)

You can also export the preceding data to a .CSV file.

Troubleshooting tips

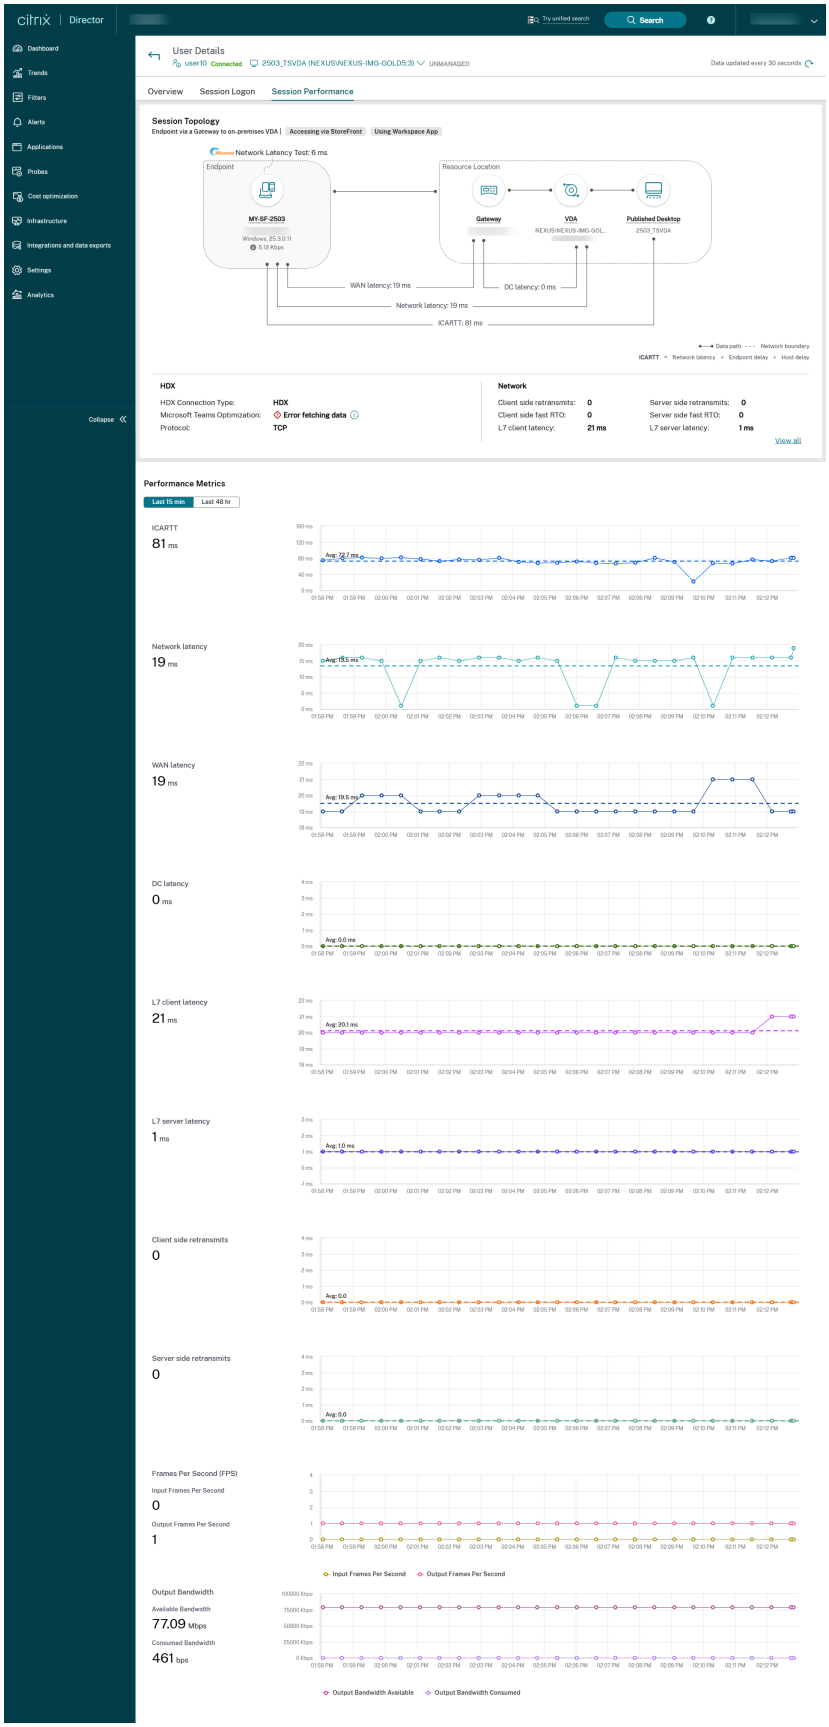
To identify unusual or unexpected values in the graph, compare the amount of time taken in each phase of the current session with the average duration for this user for the last seven days, and the average duration for all users in this delivery group for the last seven days.

Escalate as needed. For example, if the **Machine Start-up** is slow, the issue might be in the hypervisor, so you can escalate it to the hypervisor administrator.

Examine unusual differences, including:

- Missing (current) logon bars
- Major discrepancy between the current duration and this user's average duration. Causes include:
  - A new application was installed.
  - An operating system update occurred.
  - Configuration changes were made.
  - Profile size of the user is high. In this case, the Profile Load is high.
- Major discrepancy between the user's logon numbers (current and average duration) and the delivery group average duration.

If needed, click **Restart** to observe the user's logon process to troubleshoot issues, such as **Machine Start-up** or **Brokering**.



Diagnose Session Performance issues

September 30, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The **Session Performance** tab on the User Details Page has enhanced troubleshooting workflows to help identify issues within HDX™ user sessions. The **Session Topology and Performance Metrics** panels help correlate the component view and multiple performance metrics of a session in a single view and reduces the mean time for resolution of session experience issues.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

End-to-end Network Hop view

The end-to-end network hop view offers a visual representation of the complete session path, significantly aiding in troubleshooting. You can access this view from **User Details** > **Session Performance** > **Session Topology**. The end-to-end network hop view displays components, metadata, links, and published applications for connected HDX sessions.

This view helps administrators to:

- Understand session data flow.
- Identify performance bottlenecks at specific hops.

Session Performance metrics

The following metrics are available contextually to help administrators understand the performance of the given session. The metrics presented in the end-to-end network hop view are available in near real-time and refresh periodically based on the intervals shown in the UI.

Endpoint metrics Endpoint metrics are vital for troubleshooting Citrix® session performance as they provide insights into the "last mile"of the user experience and reveal details about the user's immediate environment. These metrics help identify local bottlenecks, such as poor Wi-Fi, low network throughput, endpoint device limitations, distinguishing between server-side and client-side problems. By offering a holistic view when combined with metrics in the session topology, endpoint data enables faster root cause identification and quicker resolution of performance issues, improving the user experience.

Use the policies in Citrix Studio to enable or disable collection of listed endpoint metrics based on your requirements. The policies provide Citrix administrators granular controls to report metrics in adherence to your compliance requirements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy name	Policy Description	UI metrics	Default value	Value options	VDA Windows version	VDA Mac version	VDA Linux version
Endpoint statistics interval	Allows the collection of endpoint network details from the user endpoint. Enabling this policy is a prerequisite for other endpoint related policies to take effect.	Wi-Fi signal strength, Network interface type, Throughput incoming or outgoing, Link speed, Workspace type, Endpoint CPU, Endpoint memory, Endpoint GPU	Enabled	Enabled or Disabled. Option to modify the frequency between 60s - 3600s. 60s is suggested value	2407 or later	2607	2607

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Policy name	Policy Description	UI metrics	Default value	Value options	VDA Windows version	VDA Mac version	VDA Linux version
Endpoint location data collection	Allows the collection of endpoint location and ISP details from the user endpoint using the Locus service - https://locus.analytics.cloud.com	Public IP address, Country, City, and Internet Service Provider.	Disabled	Enabled or Disabled	2411 or later	2607	2607
Endpoint network latency measurement interval	Allows the measurement and collection of network latency between the endpoint and the beacon host - https://downloadplugins.citrix.com	Network latency (under Endpoint network details)	Disabled	Enabled or Disabled. Option to modify the frequency between 60s - 3600s. 60s is suggested value	2411 or later	2607	2607

> **Note:**
>
> From Citrix Virtual Apps and Desktops™ 2507 or later, **Endpoint location data collection** policy and **Endpoint network latency measurement interval** policy are disabled by default. Consequently, the related data is unavailable in Director unless these policies are manually enabled in

> Studio.

Endpoint metrics that are readily available are listed below:

- Endpoint name
- Endpoint IP
- Endpoint OS
- Citrix Workspace™ app version

The following table lists metrics dependent on supported product versions:

Feature name	UI parameters	VDA Windows version	VDA Mac version	VDA Linux version	Citrix Workspace app for Windows version	Citrix Workspace app for Mac version	Citrix Workspace app for Linux version	Citrix Workspace app for HTML5 version	Citrix Workspace app for ChromeOS version
Endpoint network details	Network interface type	2407 or later	NA	NA	2405.10 or later	2409 or later	2408 or later	2411 or later	2411 or later
	Signal strength	2407 or later	NA	NA	2405.10 or later	2409 or later	2408 or later	Not applicable	Not applicable
	Endpoint throughput (incoming, outgoing)	2407 or later	NA	NA	2405.10 or later	2409 or later	2408 or later	Not applicable	Not applicable
	Link speed	2407 or later	NA	NA	2405.10 or later	2409 or later	2408 or later	2411 or later	2411 or later
	Endpoint public IP address	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	2411 or later	2411 or later

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature name	UI parameters	VDA Windows version	VDA Mac version	VDA Linux version	Citrix Workspace app for Windows version	Citrix Workspace app for Mac version	Citrix Workspace app for Linux version	Citrix Workspace app for HTML5 version	Citrix Workspace app for ChromeOS version
	Endpoint City, Endpoint country	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	2411 or later	2411 or later
	Internet service provider	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	2411 or later	2411 or later
	Workspace type	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	2411 or later	2411 or later
	Access type (via Workspace / StoreFront)	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	2411 or later	2411 or later
	Endpoint CPU	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	Not applicable	2411 or later
	Endpoint memory	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	Not applicable	2411 or later
	Endpoint GPU	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	Not applicable	Not applicable
	Network latency	2411 or later	NA	NA	2409 or later	2409 or later	2408 or later	2411 or later	2411 or later

Data definitions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UI parameter	Description
Endpoint name	Name of the user's endpoint device used for the session.
Endpoint IP	IP address of the endpoint as available to the Virtual Delivery Agent (VDA). It might contain private or public IP addresses of the endpoint device.
Endpoint OS	Operating system of the endpoint device
Citrix Workspace App version	Installed Citrix Workspace app version
Signal strength	Displays the quality and strength of the wireless signal.
Endpoint throughput (incoming, outgoing)	Indicates the rate of data transfer into and out of the network interface. Analogous to the upload and download internet speed observed on the endpoint.
Link speed	Specifies the type of network connection, such as Ethernet, Wi-Fi, or cellular.
Network interface type	Represents the maximum data transfer rate of the network connection.
Endpoint public IP address	The external IP address assigned to your device by your internet service provider.
Endpoint City, Endpoint country	The geographical location, including country and city, of the device.
Internet service provider	The name of the company that provides internet access to the end user device.
Workspace type	The type of workspace being used, either Citrix Workspace app or a web browser.
Access type (via Workspace / StoreFront)	The method of accessing resources, either through Citrix Workspace or StoreFront.
Endpoint CPU	The percentage of CPU resources currently being used.
Endpoint memory	The percentage of memory resources currently being used.
Endpoint GPU	The percentage of GPU resources currently being used.
Network latency test	The time delay experienced in the network, measured in milliseconds.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Network metrics Network metrics are critical for Citrix session troubleshooting because the performance and stability of a Citrix session are heavily dependent on the underlying network conditions. Unlike a local application, a Citrix session involves streaming an interactive desktop or application experience over a network, meaning any network instability or bottleneck will directly impact the user's perception of performance.

Use the policies in Citrix Studio to enable or disable collection of listed network metrics based on your requirements. The policies provide Citrix administrators granular controls to report metrics in adherence to your compliance requirements.

Policy name	Policy Description	UI metrics	Default value	Value options	Virtual Delivery Agent version
Network telemetry	Allows the collection of network details between the user endpoint and the backend components.	All HDX insights metrics for Citrix Gateway and Citrix Gateway service	Disabled	Enabled or Disabled. Option to modify the frequency between 60s - 3600s. 60s is suggested value	2411 or later for Gateway service. 2503 or later for Citrix Gateway

Citrix Gateway Service The following table lists metrics dependent on supported product versions:

Feature name	UI parameters	Windows VDA version	Mac VDA version	Linux VDA version	Citrix Workspace app for Windows version	Citrix Workspace app for Mac version	Citrix Workspace app for Linux version	Citrix Workspace app for HTML5 version	Citrix Workspace app for ChromeOS version
Network metrics	L7 Server latency	2411 or above	2507 or later	2507 or later	2409 or later	2505 or later	2505 or later	NA	NA

Data definitions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UI parameter	Description
WAN latency	Latency caused by the client side of the network, from NetScaler® to the end user.
DC latency	Latency caused by the server side of the network, from NetScaler to backend servers.
L7 Client latency	The average L7 latency observed between the ICA® client and the NetScaler instance. This metric is useful in non-Citrix devices that are present in the delivery path.
L7 Server latency	The average L7 latency observed between the NetScaler device and the Citrix Virtual App. This metric is useful when non-Citrix devices are present in the delivery path.
Client retransmits	The number of packets retransmitted on the connection between NetScaler and the end user. A high value of this metric indicates high bandwidth utilization due to retransmits but does not necessarily mean a poor user experience. Note: For sessions using Gateway service, Client retransmits are only available for TCP sessions.
Server side retransmits	The number of packets retransmitted on the connection between NetScaler and the back-end server.
Client side zero window count	The number of times the client advertised a zero TCP window.
Server side zero window count	The number of times the server advertised a zero TCP window.

VDA metrics

	VDA disk latency	2511 or later	NA	NA	2503 or later	2503 or later	2503 or later	NA	NA

HDX metrics HDX metrics are fundamental to understanding and troubleshooting the quality of the user's virtual experience. These metrics directly measure the performance of the ICA/HDX protocol that delivers the virtual session.

> **Note:**
>
> ICA metrics are available starting with Citrix Workspace app for Windows version 2405.10 or later, and Citrix Virtual Apps and Desktops 2407 or later. However, updates and fixes to the data are available in recent versions. Refer to the following table for the recommended versions for each data point:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature name	UI parameters	Windows VDA version	Mac VDA version	Linux VDA version	Citrix Workspace app for Windows version	Citrix Workspace app for Mac version	Citrix Workspace app for Linux version	Citrix Workspace app for HTML5 version
ICA metrics	ICA RTT	2507 or later	NA	NA	2503 or later	2503 or later	2503 or later	2503 or later
	Network latency	2507 or later	NA	NA	2503 or later	2503 or later	2503 or later	2503 or later
	HDX connection type	2411 or later	NA	NA	2411 or later	2411 or later	2411 or later	2411 or later
	Protocol	2411 or later	NA	NA	2411 or later	2411 or later	2411 or later	2411 or later
	EDT MTU	2411 or later	NA	NA	2411 or later	2411 or later	2411 or later	2411 or later

Data definitions:

UI parameter	Description
ICA RTT	Measures the time between user action and screen response. Thinwire RTT counter represents this metric starting with Citrix Virtual Apps and Desktops version 2507. Previous versions continue to use the EUEM RTT.
Network latency	Indicates network latency and potential slowness. Defined as the sum of client and server side latency starting with Citrix Virtual Apps and Desktops version 2503. Previous versions continue to use HDX latency reported on the VDA.
HDX Connection type	Type of HDX connection for the user session.
Protocol	Underlying protocol used for the user session. Values can be *TCP* or *EDT*.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UI parameter	Description
EDT MTU	MTU, referred to as Maximum Transmission Unit, is the largest size of a packet (in bytes) that a network interface can send without needing to fragment it. EDT MTU represents the MTU established for the EDT session of the user.

Real-time communications optimization visibility The session topology provides comprehensive visibility into the optimization status of real-time communication (RTC) applications like Microsoft Teams, Zoom, and WebEx within Citrix sessions. It pinpoints whether an application is optimized, and identifies any missing components (such as necessary plugins, plugin management, or platform-specific limitations) that prevent optimal performance.

Benefits:

- Customers get clear assurance regarding RTC application optimization, eliminating guesswork about whether a session is truly optimized.
- Direct insight into missing components to proactively address issues and achieve full optimization.
- Faster troubleshooting improves the user experience for important communication tools.

Use the **Real time communications** field in the **Session Topology** to view optimization details for each application.

Third-party optimized applications create a virtual channel using Citrix technology, but the application vendor manages other configurations and settings. The optimization relies on solutions owned by the vendor.

Click the **View details** link next to the **Real time communications** field in the **Session Topology** screen. The following screen appears:

HDX-optimized applications use the Citrix virtual channel and are directly impacted by Citrix configurations and settings.

Click the **HDX optimization** section on the **Real time communications** screen. The following image appears:

The real time communications details are updated every 5 minutes. The following table lists available details for an application that relies on third-party optimization. Ensure you are using supported product versions to get full visibility.

Note:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - Microsoft Teams Slimcore Optimization is available only for published desktops and for New Teams as per vendor support.
> - For Zoom, the vendor changes to fetch plug-in details and optimization states are available from version 6.3.10 onwards. For more information, see Zoom documentation.

The following table lists available details for an application that relies on Citrix HDX optimization. Ensure that you are using supported product versions to get full visibility.

Feature name	UI parameters	Virtual Delivery Agent version	Citrix Workspace app for Windows version	Citrix Workspace app for Mac version	Citrix Workspace app for Linux version

Microsoft Teams	State	1906.2	2112	2203	2203

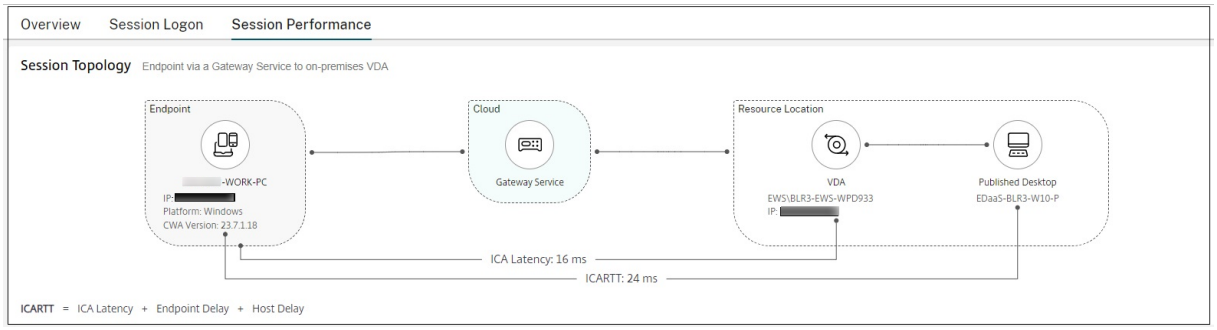
Data definitions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UI parameter	Description
Plugin manager	Shows whether the plugin manager is installed or not. The plug-in manager is a small management component that opens the Virtual channel and downloads the necessary media engine (plugin) for optimization. Note: Functionality might vary by vendor.
Plugin manager name	Name of the installed plugin manager.
Plugin manager version	Version of the installed plugin manager.
Plugin	Shows whether the plugin is installed or not. Plugin is the necessary media engine for optimization. Note: Functionality might vary by vendor.
Plugin version	Version of the installed plugin on the endpoint.
App version	Represents the version of the application on the virtual delivery agent (VDA).
Virtual channel	Represents if the virtual channel is open or closed for the real time communications app.
Virtual channel allow list	Shows the status of virtual channels. Values are *Enabled* or *Disabled*.
State	Shows the optimization state for the application for the specific user session

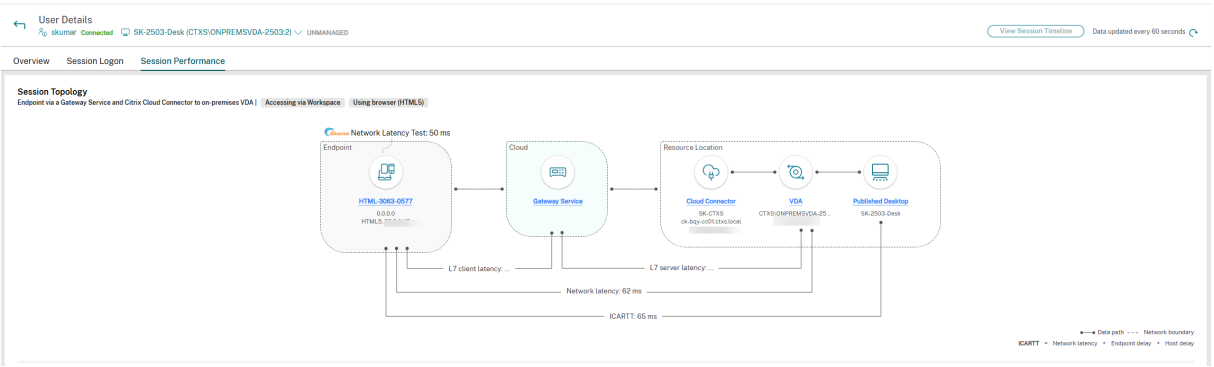
Session Topology scenarios

Session topology is available for active sessions, updating in real-time. Disconnected and ended sessions, display the topology of the last known state for comprehensive post-session analysis.



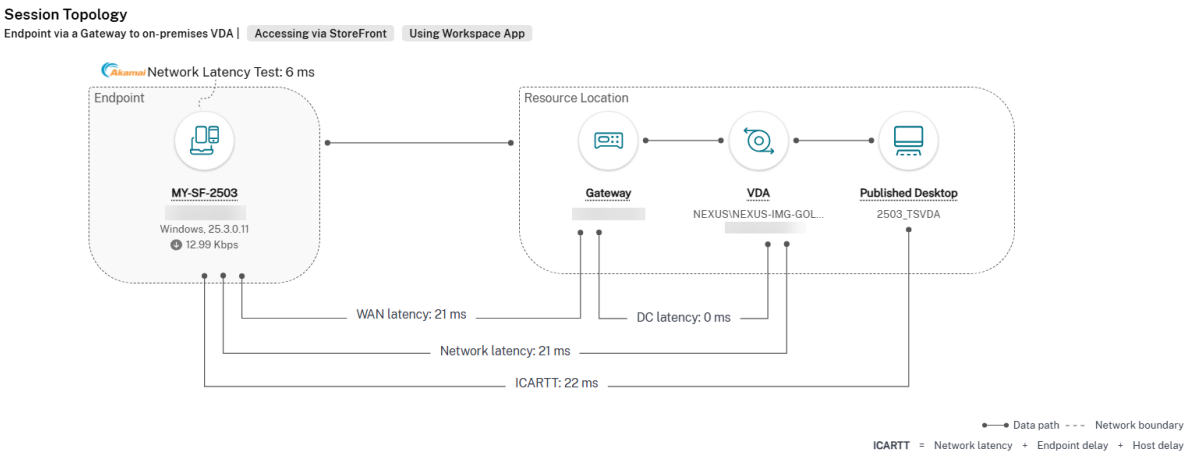
Depending on the deployment scenario of the site, the components involved in a session are all or any of the following:

- Citrix Workspace app on Endpoint
- Gateway service/ on-premises Gateway
- Cloud Connector –Gateway is connected to DaaS via a Cloud Connector in the case of hybrid connections.
- VDAs



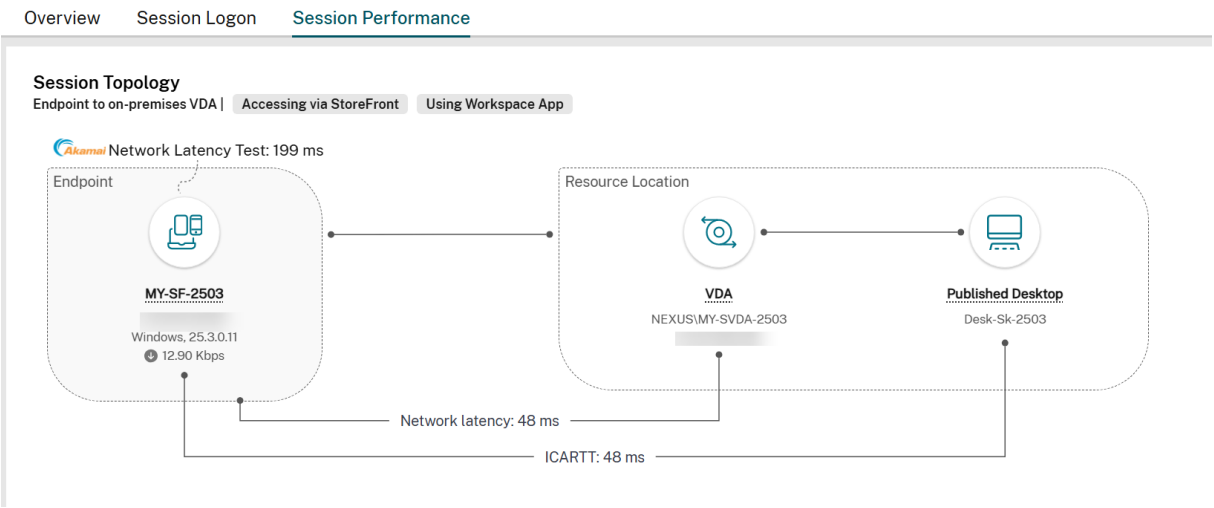
Accordingly, the possible network topologies are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.



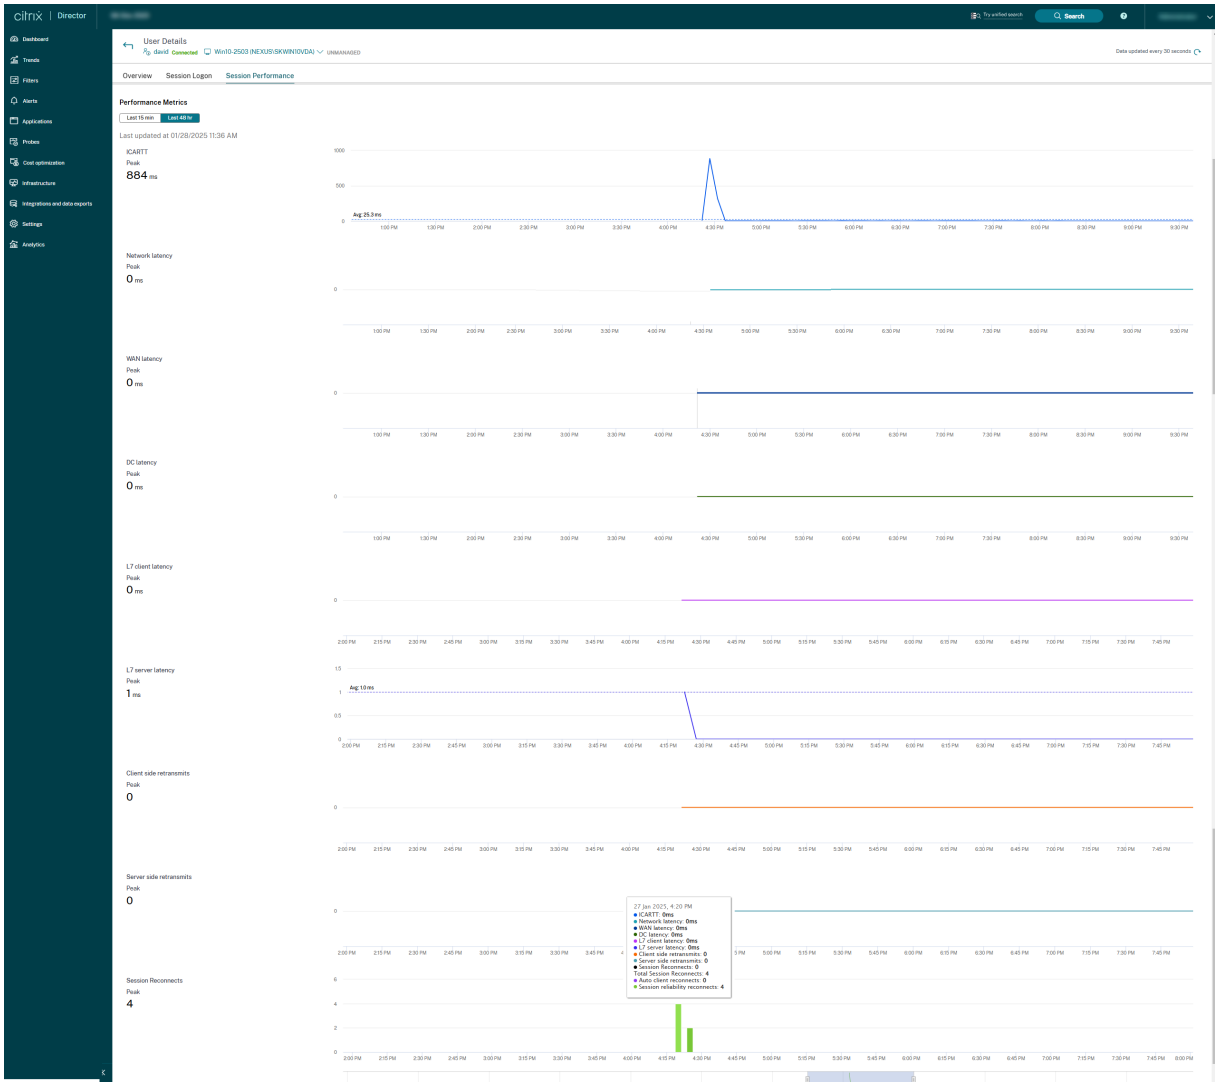
- Citrix Workspace app on the endpoint connects via Citrix Workspace and Gateway Service to an on-premises VDA. No Cloud Connector is used to connect to VDA.

- Citrix Workspace app on the endpoint connects via Citrix Workspace and Gateway Service to an on-premises VDA via Cloud Connector.



- Citrix Workspace app on the endpoint connects via StoreFront™ and on-premises Gateway to on-premises VDA.

- Citrix Workspace app on the endpoint connects via StoreFront to on-premises VDA.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Performance Metrics

The **Performance Metrics** panel offers the ability to correlate real-time metrics in identifying issues within user sessions. Trends for the session metrics help indicate how these metrics have performed over time. When you click the **Session Performance** tab, along with the real-time data, you can view the last 15 minutes and 48 hours data. The plots help to correlate multiple component performance metrics in a single view.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Note:

- With the trailing 15-minutes metrics support, the graph is plotted for the duration for which the session is connected and disconnected. The disconnected session's metric is displayed with the value zero.
- With the trailing last 48 hours metrics support, the ICARTT, ICA Latency, and Session Reconnects plots are updated with the historical data metrics. The session reconnect information helps you to view and troubleshoot network connections having interruptions. It also analyzes networks having a seamless experience. The graph to see the number of Session Reconnects, Total Session Reconnects, Auto client reconnect, and Session reliability reconnects.

Apart from ICARTT and ICA Latency, the following metrics are available for real-time and last 15-minutes metrics:

- Frames Per Second - Frames Per Second is an important metric that indicates the session re-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

sponsiveness.

- Output Bandwidth Available - Output Bandwidth Available is a measure of the total bandwidth available to transmit data from the VDA to the endpoint.
- Output Bandwidth Consumed - Output Bandwidth Consumed indicates the actual amount of data transmitted from the VDA to the endpoint to display sessions to users.

Analyzing Output Bandwidth Available and the Output Bandwidth Consumed helps check if sufficient bandwidth is available to serve sessions and to detect if a session is affected by insufficient bandwidth.

Troubleshoot when ICA RTT or Session Logon Duration data fails to populate

Previously, when EUEM service or Profile Management service failed to run, the reason for failure in getting the data related to ICA RTT or Session Logon Duration wasn't displayed. With this new feature, you can get the reason for failure and the corresponding solution for that failure. The **Learn more** links provides the ICA RTT and Session Logon Duration errors, the reason for failure, and the solution as mentioned in the following table:

Error type	Error	Error message	Solution
ICA RTT error	ICA RTT value is not displayed.	**Citrix End User Experience Monitoring is not running.**	1. Open the Services console. To open this console, click **Start** and then type **Services**. 2. Make sure that the Citrix End User Experience Monitoring Service is running. 3. Reopen the desktop session and try. The ICA RTT value must be displayed. 4. If the issue persists, contact the Citrix administrator.
ICA RTT error	ICA RTT value is not displayed.	**Citrix End User Experience Monitoring is not installed.**	1. Re-install the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error type	Error	Error message	Solution
			2. Open the Services console. To open this console, click **Start** and then type Services 3. Make sure that the Citrix End User Experience Monitoring Service is running. 4. Reopen the desktop session and try. The ICA RTT value must be displayed now. 5. If the issue persists, contact the Citrix administrator.
ICA RTT error	ICA RTT value is not displayed.	**Error fetching data.**	1. Open the Services console. To open this console, click **Start** and then type Services. 2. Ensure that the **Windows Management Instrumentation Service** is running. 3. Also, ensure that the Wf-Shell.exe/PicaShell.exe process is running under **Activity Manager** > **Process** tab. If it is not running, reopen the desktop session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error type	Error	Error message	Solution
			4. If the preceding steps are not working, run the following command to ensure that the Citrix_Euem_RoundTrip instance is present: `Get-CimInstance -Namespace 'ROOT\Citrix\Euem'-Query "select * from Citrix_Euem_RoundTrip"` 5. If the Citrix_Euem_RoundTrip instance is present, reopen the desktop session. 6. If the issue persists, contact the Citrix administrator.
Session Logon Duration error	The graph is not loaded.	**Citrix Profile Management is not running**	1. Open the Services console. To open this console, click **Start** and then type Services. 2. Ensure that the **Citrix Profile Management Service** is running. 3. Reopen the desktop session and try. The graph must be displayed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error type	Error	Error message	Solution
			4. If the issue persists, contact the Citrix administrator.
Session Logon Duration error	The graph is not loaded.	**Citrix Profile Management is not installed.**	1. Install the Citrix Profile Management Service. 2. Open the Services console. To open this console, click **Start** and then type Services. 3. Ensure that the **Citrix Profile Management Service** is running. 4. Reopen the desktop session and try. The graph must be displayed. 5. If the issue persists, contact the Citrix administrator.
Session Logon Duration error	The graph is not loaded.	**Error fetching data.**	1. Open the **Services** console. To open this console, click **Start** and then type Services. 2. Ensure that the **Windows Management Instrumentation Service** is running.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error type	Error	Error message	Solution
			3. If the preceding service is already running, run the following command to ensure that the `LogonTimings instance is present`: `Get-CimInstance -Namespace 'ROOT\Citrix\Profile\Metrics' -Query "select * from LogonTimings"` 4. If the issue persists, contact the Citrix administrator.
ICA RTT error	ICA RTT value is not displayed.	Console isn't supported.	Start a session using HDX.
ICA RTT error	ICA RTT value is not displayed.	Remote Desktop Protocol (RDP) isn't supported.	Start a session using HDX.
ICA RTT error	ICA RTT value is not displayed.	Upgrade VDA to version 2402 or higher to get detailed error detection and access all the features.	Upgrade VDA to 2402 or higher.
Session Logon Duration error	The graph is not loaded.	Citrix Profile Management WMI plug-in isn't installed.	Install Citrix Profile Management WMI plug-in.

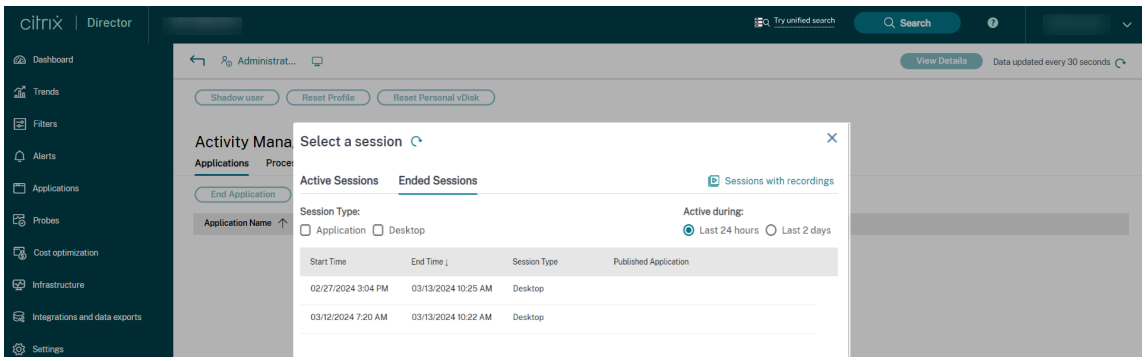
Diagnose ended user sessions

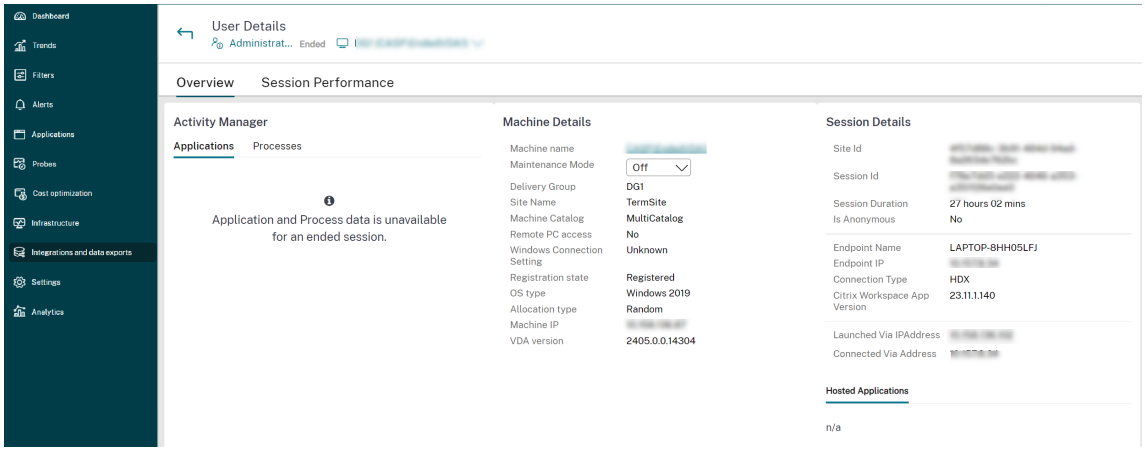


May 13, 2026

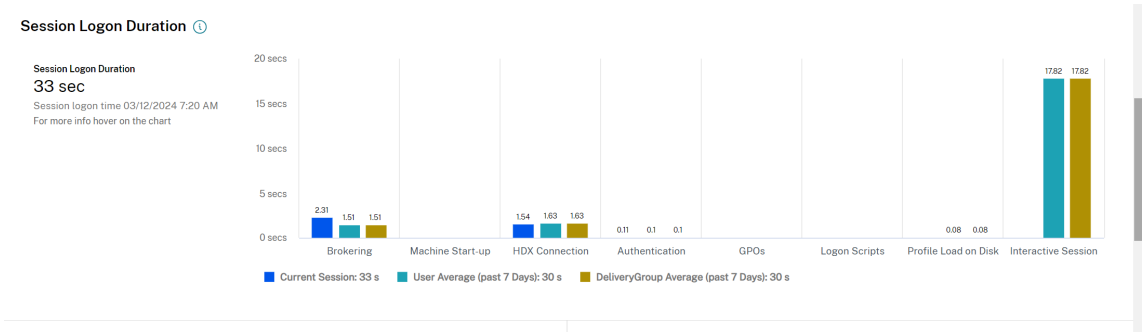
Citrix Director now displays the details of sessions in active, disconnected, or in terminated state. Previously, you could see the details of active sessions only. With this feature, help desk admins can troubleshoot issues with a session that was ended or in a terminated state. The details for ended sessions are available for the last 24 hours and last 2 days. You can view the following details of an ended or terminated session:

- Machine Details panel - Displays the available details of the machine where the selected session was launched
- Session Details panel - Displays the available details of the selected session.
- Session logon duration - Displays the information on the logon duration taken for the selected session. You can view the chart on time taken for the following:
  - Brokering
  - Machine start-up
  - HDX™ connection
  - Authentication
  - GPOs
  - Logon scripts
  - Profile load on disk
  - Interactive session

To view the historical user sessions, do the following:

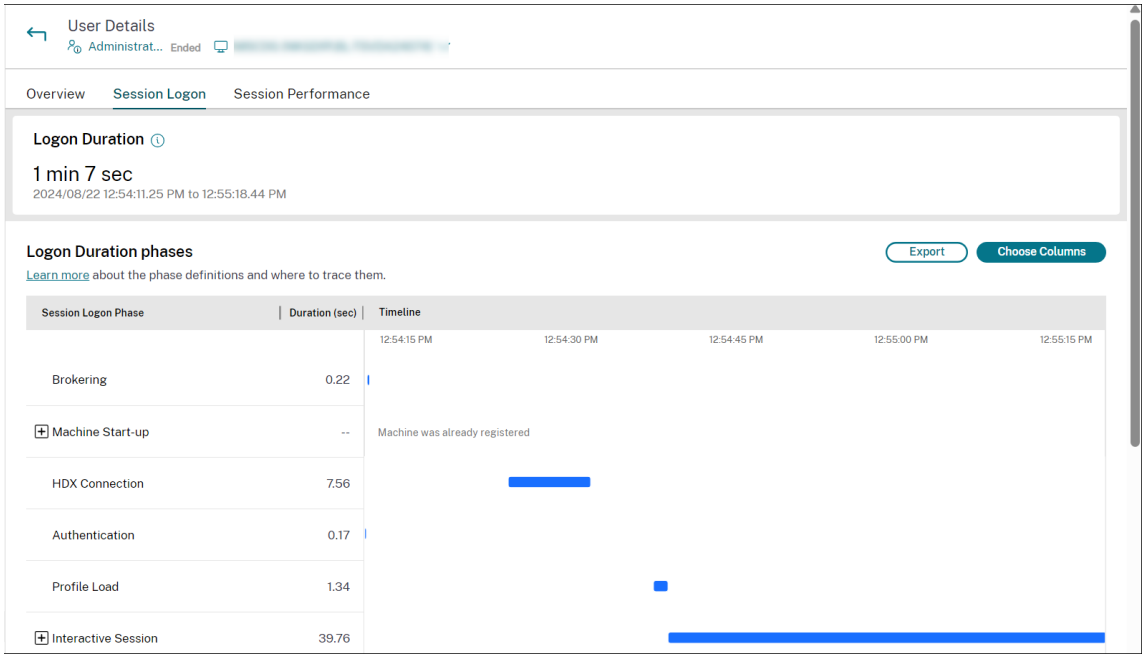


1. Click **Filter** > **Session** view.
2. Click the **Associated User** to open the Activity Manager for the user.



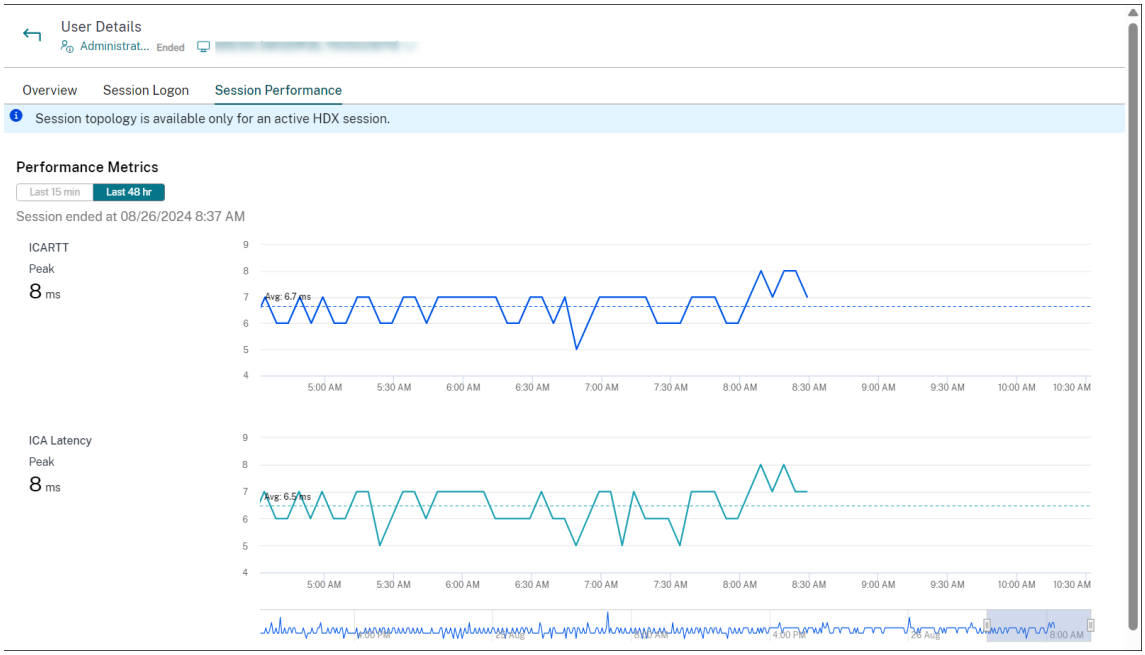
3. Select the required session from the **Ended Sessions** section.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. View the **Machine Details** and **Session Details** panels.

5. Scroll down and view the **Session logon duration** for the ended session.



6. Click the **Session Logon** tab and view the details.

7. Click the **Session Performance** tab and view the details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Shadow users

May 15, 2026

From Director, use the shadow user feature to view or work directly on a user's virtual machine or session. You can shadow both Windows or and Linux VDAs. The user must be connected to the machine that you want to shadow. Verify this by checking the machine name listed in the user title bar.

Director launches shadowing in a new tab, update your browser settings to allow pop-ups from the Director URL.

Access the shadowing feature from the **User Details** view. Select the user session, and click **Shadow** in the Activity Manager view or the Session Details panel.

Using Remote Assist

Shadowing Linux VDAs

Shadowing is available for Linux VDAs Version 7.16 or and later running the RHEL7.3 or Ubuntu Version 16.04 Linux distributions.

> **Note:**
>
> - The VDA must be accessible from the Director UI for shadowing to work. Hence, shadowing

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> is possible only for Linux VDAs in the same intranet as the Director client.
> - Director uses FQDN to connect to the target Linux VDA. Ensure that the Director client can resolve the FQDN of the Linux VDA.
> - The VDA must have the python websockify and x11vnc packages installed.
> - noVNC connection to the VDA uses the WebSocket protocol. By default, **ws://** WebSocket protocol is used. For security reasons, Citrix recommends that you use the secure **wss://** protocol. Install SSL certificates on each Director client and Linux VDA.

Follow the instructions in Session Shadowing to configure your VDA for shadowing.

1. After you click **Shadow**, the shadowing connection initializes and a confirmation prompt appears on the user device.
2. Instruct the user to click **Yes** to start the machine or session sharing.
3. The administrator can only view the shadowed session.

Shadowing Windows VDAs

Windows VDA sessions are shadowed using Windows Remote Assistance. Enable the **User Windows Remote Assistance** feature while installing the VDA. For more information, see Enable or Disable features.

1. After you click **Shadow**, the shadowing connection initializes and a dialog box prompts you to open or save the .msrc incident file.
2. Open the incident file with the Remote Assistance Viewer, if not already selected by default. A confirmation prompt appears on the user device.
3. Instruct the user to click **Yes** to start the machine or session sharing.
4. For more control, ask the user to share keyboard and mouse control.

Streamline Microsoft Internet Explorer browsers for shadowing

Configure your Microsoft Internet Explorer browser to automatically open the downloaded Microsoft Remote Assistance (.msra) file with the Remote Assistance client.

To do this, you must enable the Automatic prompting for file downloads setting in the Group Policy editor:

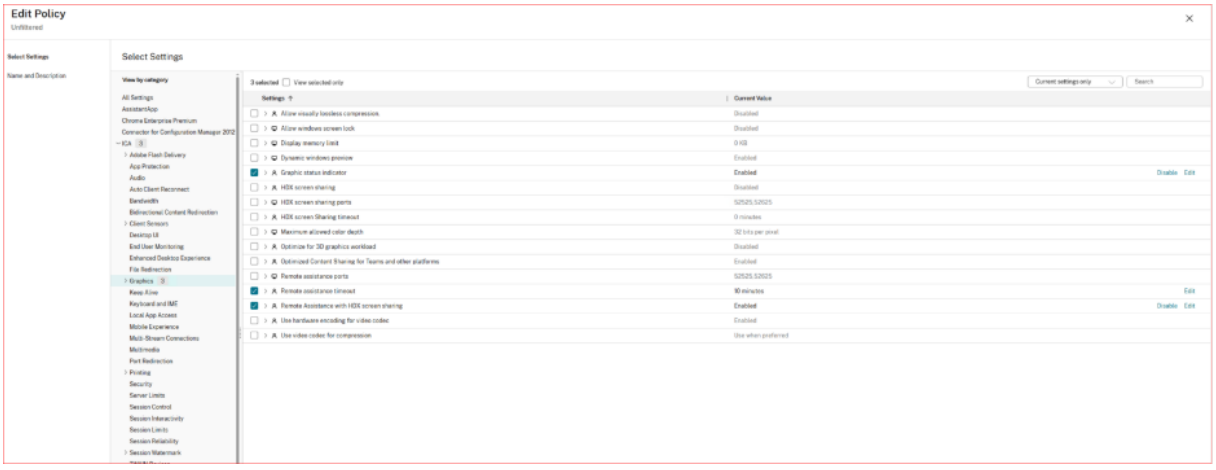
Computer Configuration > Administrative Templates > Windows Components > Internet Explorer > Internet Control Panel > Security Page > Internet Zone > Automatic prompting for file downloads.

By default, this option is enabled for sites in the Local intranet zone. If the Director site is not in the Local intranet zone, consider manually adding the site to this zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using HDX Screen Share

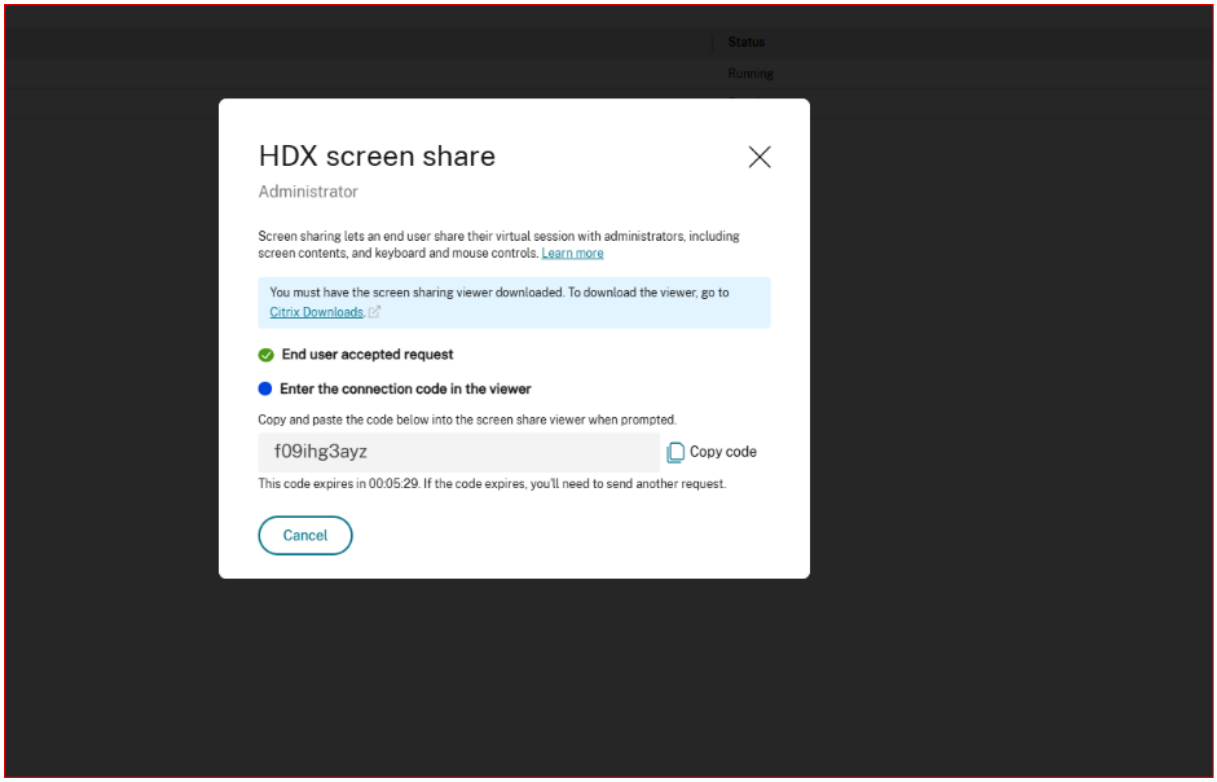
Director supports remote assistance that enables IT administrators and helpdesk personnel to provide remote support to end users through HDX screen sharing technology. This feature leverages Citrix's native HDX protocol to deliver secure, high-performance screen sharing capabilities for troubleshooting and user assistance scenarios.



Prerequisites

Component	Supported Environments or Versions
Operating Systems	Windows, Linux for Single Session OS **or Multi Session OS**
Virtual Delivery Agent (VDA)	CR 2511 or above
Director	CR 2511 or above
Delivery Controller	CR 2511 or above
TWPlayer (ThinWire Player)	A link to download the player is available on the Director UI when initiating a shadow session

Group Policy Configuration



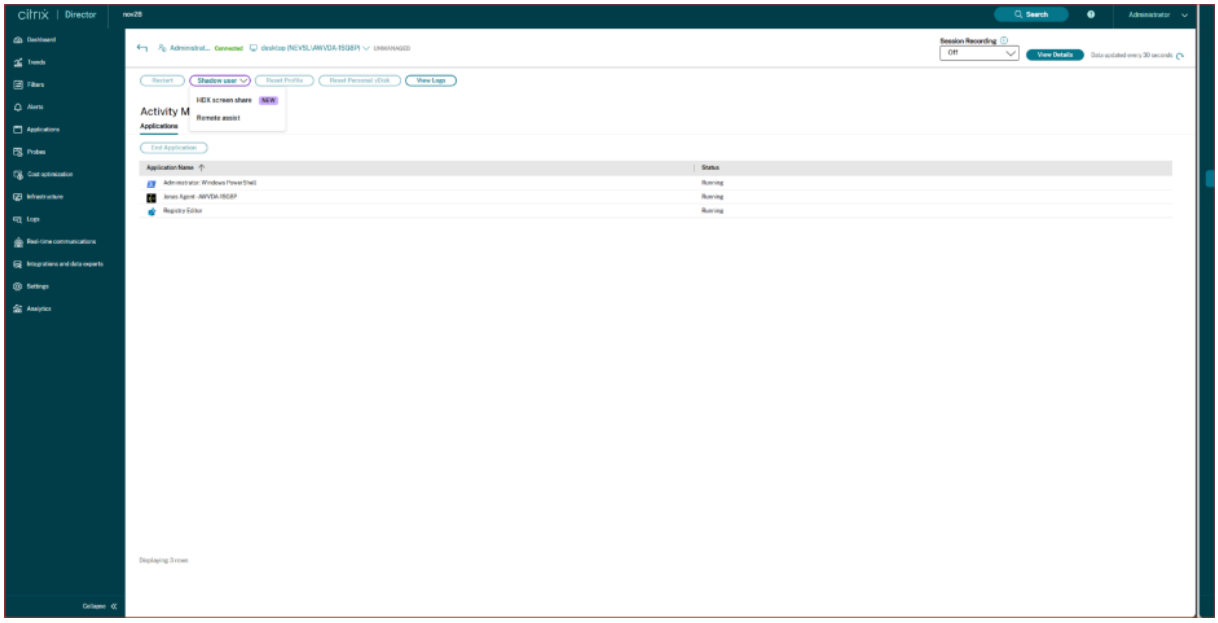
To enable Remote Assistance using Director and HDX Screen Share, configure the following Group Policies on the VDA:

- Remote Assistance with HDX screen sharing
- Remote assistance timeout
- Graphics Status Indicator

© 1997–2026 Citrix Systems, Inc. All rights reserved.

TWPlayer (ThinWire Player) is a required component that must be downloaded once to enable HDX screen sharing functionality. A link to download the player is available on the Director UI when initiating a shadow session.

Limitations



- Published applications (app sessions) cannot be shadowed –desktop sessions only.

Workflow using Director and HDX Screen Share The steps below outline the process for an administrator to initiate an HDX screen share session:

1. **Initiate Shadow Session**
    a) Log in to Citrix Director
    b) Navigate to user session requiring assistance
    c) Click the "Shadow "button
    d) Choose HDX Screen share
2. **Launch Viewer**
    a) Open the generated incident file with TWPlayer/Remote Assistance Viewer
    b) Wait for user to accept the connection request
3. **View Session**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Session screen appears in the viewer window
b) Administrator can observe user actions in real-time

Send messages to users

May 13, 2026

From Director, send a message to a user who is connected to one or more machines. Use this feature to send immediate notices about administrative actions such as impending desktop maintenance, machine logoffs and restarts, and profile resets.

1. In the Activity Manager view, select the user and click Details.
2. In the User Details view, locate the Session Details panel and click Send Message.
3. Type your message information in the Subject and Message fields, and click Send.

If the message is sent successfully, a confirmation message appears in Director. The message appears in the user's machine.

If the message is not sent successfully, an error message appears in Director. Troubleshoot the problem according to the error message. When you have finished, type the subject and message text again and click **Try** again.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Resolve application failures

May 13, 2026

In the **Activity Manager** view, click the Applications tab. You can view all the applications on all machines to which this user has access, including local and hosted applications for the currently connected machine, and the status of each.

> **Note:**
>
> If the Applications tab is grayed out, contact an administrator with the permission to enable the tab.

The list includes only those applications that were launched within the session.

For Multi-session OS machines and Single-session OS machines, applications are listed for each disconnected session. If the user is not connected, no applications are displayed.

Action	Description
End the application that is not responding	Choose the application that is not responding and click End Application. Once the application is terminated, ask the user to launch it again.
End processes that are not responding	If you have the required permission, click the Processes tab. Select a process that is related to the application or using a high amount of CPU resources or memory, and click End Process. However, if you do not have the required permission to terminate the process, attempting to end a process fails.
Restart the user's machine	For Single-session OS machines only, for the selected session, click Restart. Alternatively, from the Machine Details view, use the power controls to restart or shut down the machine. Instruct the user to log on again so that you can recheck the application. For Multi-session OS machines, the restart option is not available. Instead, log off from the user and let the user log on again.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Description
Put the machine into maintenance mode	If the machine's image needs maintenance, such as a patch or other updates, put the machine into maintenance mode. From the Machine Details view, click Details and turn on the maintenance mode option. Escalate to the appropriate administrator.

Restore desktop connections

May 13, 2026

From Director, check the user's connection status for the current machine in the user title bar.

If the desktop connection failed, the error that caused failure is displayed and can help you decide how to troubleshoot.

Action	Description
Ensure that the machine is not in maintenance mode	On the User Details page, make sure maintenance mode is turned off.
Restart the user's machine	Select the machine and click **Restart**. Use this option if the user's machine is unresponsive or unable to connect. For example, when the machine is using an unusually high amount of CPU resources, which can make the CPU unusable.

Restore sessions

May 13, 2026

If a session becomes disconnected, it is still active and its applications continue to run, but the user device is no longer communicating with the server.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the User Details view, troubleshoot session failures in the **Session Details** panel. You can view the details of the current session, indicated by the session ID.

Action	Description
End applications or processes that are not responding	Click the **Applications** tab. Select any application that is not responding and click **End Application**. Similarly, select any corresponding process that is not responding and click **End Process**. Also, end processes that are consuming an unusually high amount of memory or CPU resources, which can make the CPU unusable.
Disconnect the Windows session	Click **Session Control** and then select **Disconnect**. This option is available only for brokered Multi-session OS machines. For non-brokered sessions, the option is disabled.
Log off from the user's session	Click **Session Control** and then select **Log Off**.

To test the session, the user can attempt to log back on to it. You can also shadow the user to more closely monitor this session.

Run HDX™ channel system reports

May 13, 2026

In the **User Details** view, check the status of the HDX channels on the user's machine in the **HDX** panel. This panel is available only if the user machine is connected using HDX.

If a message appears indicating that the information is not currently available, wait for one minute for the page to refresh, or select the **Refresh** button. HDX data takes a little longer to update than other data.

Click an error or warning icon for more information.

> Tip:
>
> You can view information about other channels in the same dialog box by clicking the left and right arrows in the left corner of the title bar.

HDX channel system reports are used mainly by Citrix Support to troubleshoot further.

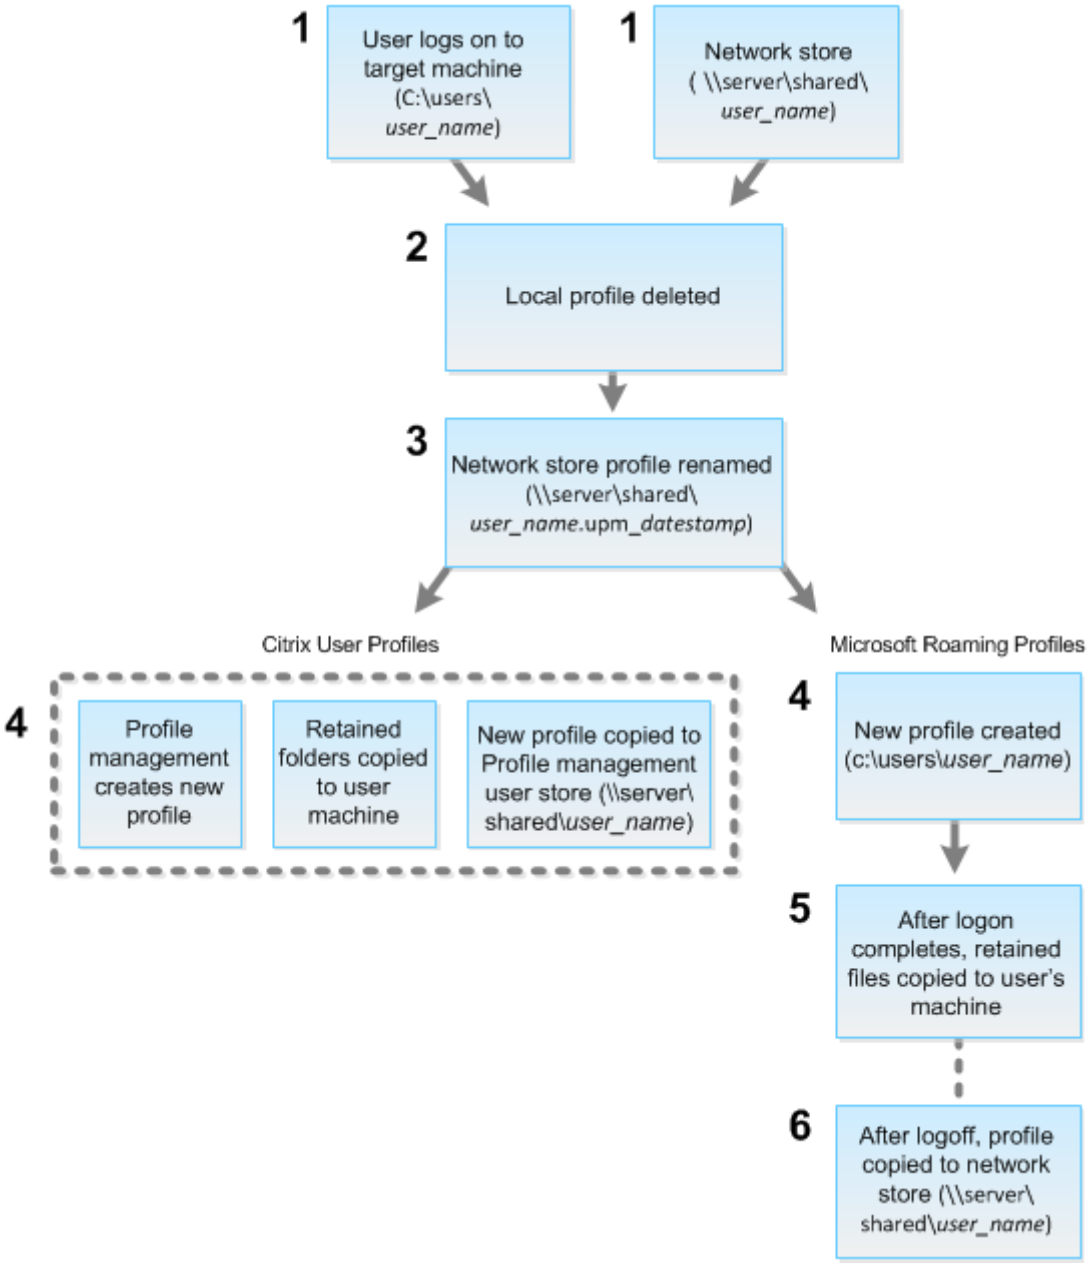
© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. In the HDX panel, click Download System Report.
2. You can view or save the .xml report file.
    - To view the .xml file, click Open. The .xml file appears in the same window as the Director application.
    - To save the .xml file, click Save. The Save As window appears, prompting you for a location on the Director machine to download the file to.

Reset a user profile

May 13, 2026

> **CAUTION:**
>
> When a profile is reset, the user's folders and files are saved and copied to the new profile. However, most user profile data is missing (for example, the registry is reset and application settings might be deleted).



The reset function applies to both file-based and container–based profile solutions.

How reset profiles are processed

Any Citrix® user profile or Microsoft roaming profile can be reset. After the user logs off and you select the reset command (either in Director or using the PowerShell SDK), Director first identifies the user profile in use and issues an appropriate reset command. Director receives the information through Profile Management, including information about the profile size, type, and logon timings.

This diagram illustrates the process following the user logon, when a user profile is reset.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The reset command issued by Director specifies the profile type. The Profile Management service then attempts to reset a profile of that type and looks for the appropriate network share (user store). If the user is processed by Profile Management, but receives a roaming profile command, it is rejected (or the opposite way).

1. If a local profile is present, it is deleted.
2. The network profile is renamed.
3. The next action depends on whether the profile being reset is a Citrix user profile or a Microsoft roaming profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For Citrix user profiles, the new profile is created using the Profile Management import rules. The folders are copied back to the network profile, and the user can log on normally. If a roaming profile is used for the reset, any registry settings in the roaming profile are preserved in the reset profile. You can configure Profile Management so that a template profile overrides the roaming profile, if necessary.

For Microsoft roaming profiles, Windows creates a profile, and when the user logs on, the folders are copied back to the user device. When the user logs off again, the new profile is copied to the network store.

To reset a user profile in Director

If you are using the Citrix Virtual Desktops™ (Desktop VDA), do the following:

1. From **Director**, search for the user whose profile you want to reset, and then select this user's session.
2. Click **Reset Profile**.
3. Instruct the user to log off from all sessions.
4. Instruct the user to log back on.
   The folders and files that were saved from the user's profile are copied to the new profile.

If you are using Citrix Virtual Desktops (Server VDA), you need to be logged on to perform the profile reset. The user then needs to log off, and log back on to complete the profile reset.

> **Important:**
>
> If the user has profiles on multiple platforms (such as Windows 8 and Windows 7), instruct the user to log back on first to the same desktop or app that the user reported as a problem. This logon action ensures that the correct profile is reset. If the profile is a Citrix user profile, the profile is already reset by the time the user's desktop appears. If the profile is a Microsoft roaming profile, the folder restoration might still be in progress for a brief time. The user must stay logged on until the restoration is complete.

If the profile is not successfully reset (for example, the user cannot successfully log back on to the machine or some of the files are missing), you must manually restore the original profile.

Note the following:

- If the user store is enabled as the user profile solution, the new profile contains the following personal folders from the original user profile:
  - Desktop
  - Cookies
  - Favorites

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - Documents
  - Pictures
  - Music
  - Videos

- Starting with Citrix Profile Management version 2407, if the profile container is enabled as the entire user profile solution, the new profile retains the preceding personal folders.
- In Windows 8 and later, cookies are not copied to the new profile when profiles are reset.

To manually restore a profile after a failed reset

1. Instruct the user to log off from all sessions.
2. Delete the local profile if one exists.
3. Locate the archived folder on the network share that contains the date and time appended to the folder name, the folder with a .upm_datestamp extension.
4. Delete the current profile name. That is, the one without the upm_datestamp extension.
5. Rename the archived folder using the original profile name. That is, remove the date and time extension. You have returned the profile to its original, pre-reset state.

To reset a profile using PowerShell SDK

You can reset a profile using the Broker PowerShell SDK.

New-BrokerMachineCommand

Creates a command queued for delivery to a specific user, session, or machine. For more information about this cmdlet, see https://citrix.github.io/delivery-controller-sdk/Broker/New-BrokerMachineCommand/.

Examples

See the following examples for details about how to use the PowerShell cmdlets to reset a profile:

Reset a Profile Management profile

- Suppose you want to reset the profile for user1. Use the New-BrokerMachineCommand PowerShell command. For example:
  - `New-BrokerMachineCommand -Category UserProfileManager -CommandName "ResetUpmProfile"-DesktopGroups 1 -CommandData $byteArray -SendTrigger logon -user domain1\user1`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> The `CommandData $byteArray` must be in the following format: `<SID>[,<backup path>]`. If you do not provide the backup path, Profile Management generates a backup folder named by current date and time.

Reset a Windows roaming profile

- Suppose you want to reset the roaming profile for user1. Use the New-BrokerMachineCommand PowerShell command. For example:
  - `New-BrokerMachineCommand -Category UserProfileManager -CommandName "ResetRoamingProfile"-DesktopGroups 1 -CommandData $byteArray -SendTrigger logon -user domain1\user1`

Record sessions

May 15, 2026

You can record ICA® sessions using the Session Recording controls from the **User Details** and **Machine Details** screen in Director. This feature is available for customers on **Premium** sites.

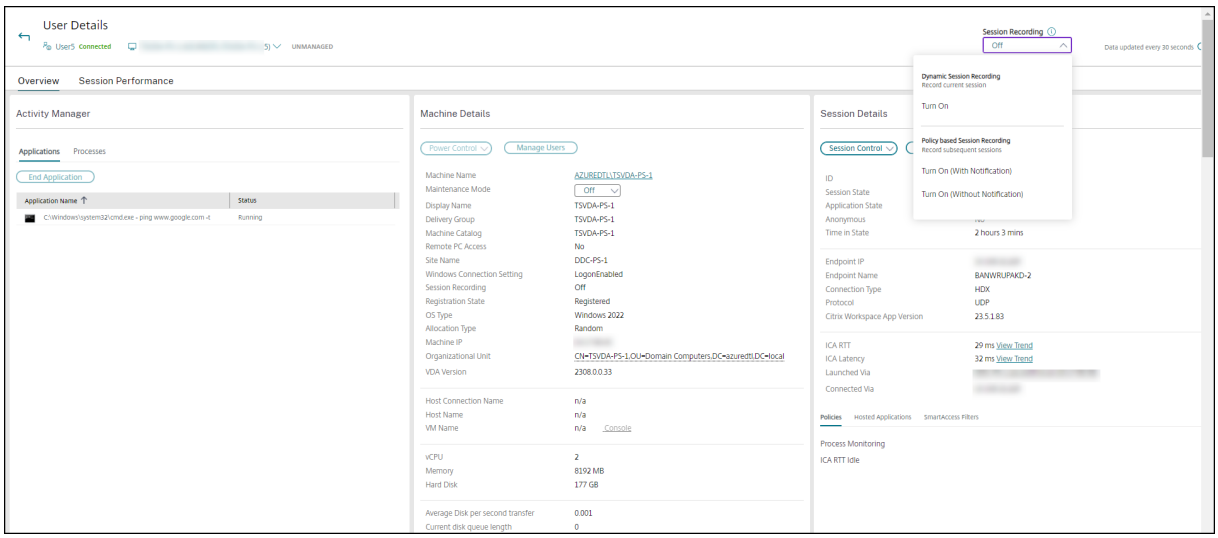
Dynamic Session Recording

You can record the current active session using the Session Recording controls from the **User Details** screen. For more information about Dynamic Session Recording, see the Session Recording service article.

Policy based Session Recording

To configure Policy-based Session Recording on Director using the DirectorConfig tool, see the **Configure Director to use the Session Recording Server** section in Configure session recording policies. The Session Recording controls are available in Director only if the logged-in user has the permission to modify the Session Recording policies. This permission can be set on the Session Recording Authorization console as described in Authorize users.

> **Note:**
>
> Changes made to the Session Recording settings through Director or the Session Recording Policy console take effect starting from the subsequent ICA session.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session Recording controls in Director

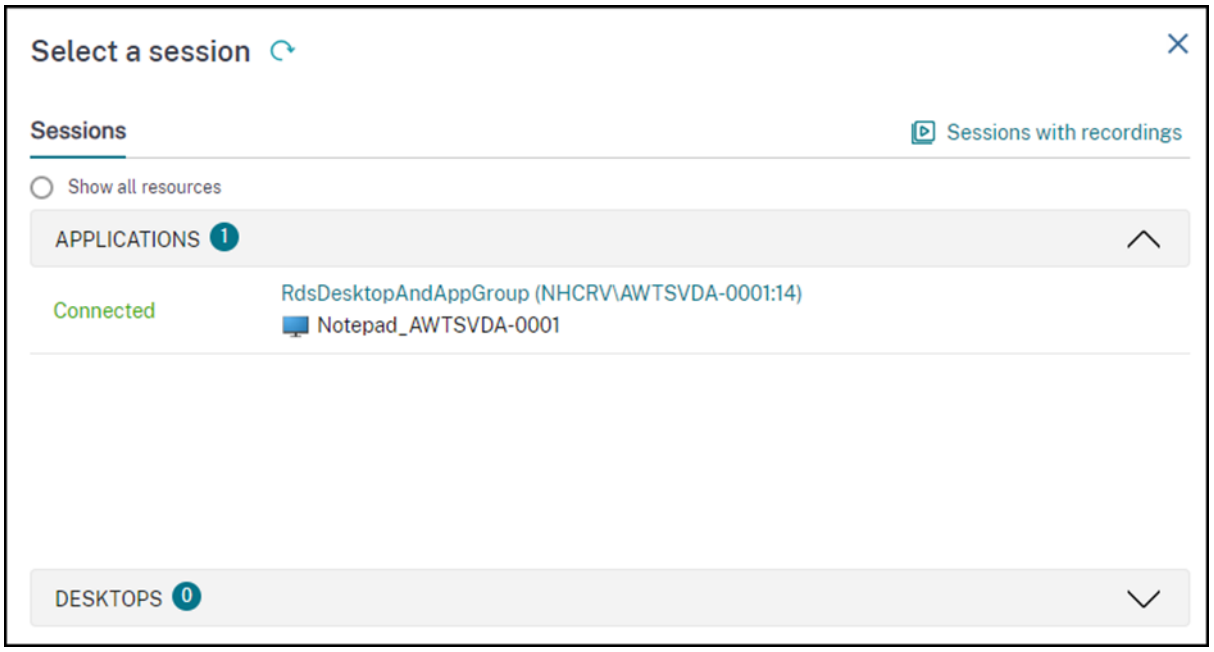
You can use the **User Details** > **Session Recording** actions to record the current or subsequent sessions.

- Turn ON Dynamic Session Recording - the current session is recorded.
- Turn ON (with notification) - the subsequent sessions are recorded and the user is notified about the session being recorded on logging on to the ICA session.
- Turn ON (without notification) - the subsequent sessions are recorded and the session is recorded silently without notifying the user.
- Turn OFF - disable recording of sessions for the user.

The **Policies** Panel displays the name of the active Session Recording policy.

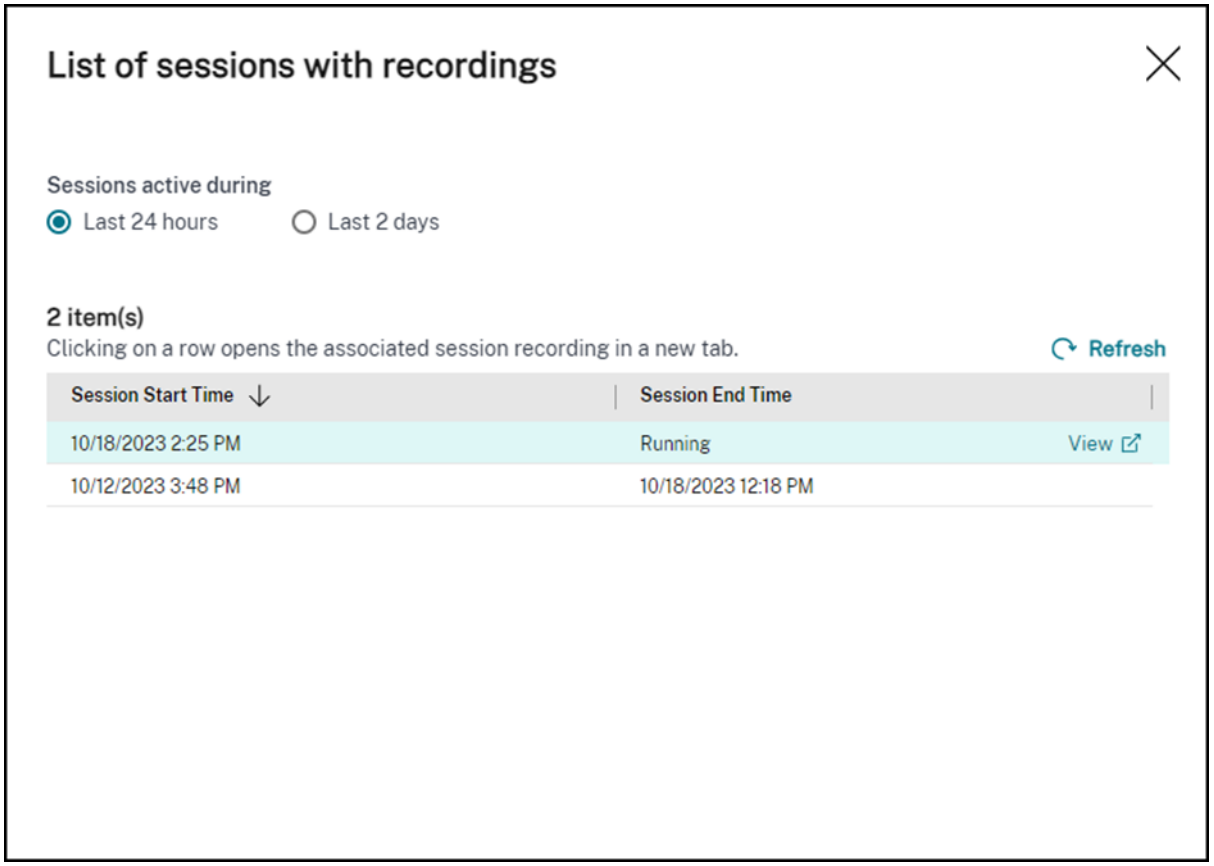
The **Machine Details** panel displays the status of the Session Recording policy for the machine.

Play back live and recorded sessions



You can play back recorded and live user sessions to understand the issues encountered by the user. Ready access to recordings and session related metrics within the Director console eliminates the requirement of searching for the recordings across multiple session recording servers or looking for third-party apps to view the recordings. It helps corelate the issues discovered in the recordings with the performance metrics.

This feature requires the following:



- VDA and the Session Recording servers are on version 2308 or later.
- Delivery Controller™ and Director are on version 2311 or later.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director stores session recordings in a centralized repository. The list of recordings belonging to the user are displayed on clicking the **Session Selector** modal > **Sessions with recordings** link.

You can choose to view recordings of sessions that were active during the last 24 hours or the last 2 days. Live recordings of currently active sessions are marked with **Session End Time** as **Running**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Click the **View** link to play back the recording on a new tab using the Citrix Session Recording playback server.

Unified search for Hybrid multi-cloud deployments

May 13, 2026

Previously, during triage when you search for a user in Director, you get the user details only if the user is from an on-premises site. If the user is from a cloud site, you had to go to Monitor and search again.

With this enhanced search functionality, you can search for users from cloud sites or on-premises sites using the **Search** option in Director. You can use this feature when you use hybrid deployments (both cloud and on-premises sites) and when you use Director for triage purposes. You can get the details of users irrespective of on-premises or cloud sites. If the site is present on Director, you can directly navigate to the selected session's Activity Manager in Director. If the site isn't present in Director, you can directly navigate to the selected session's Activity Manager in Monitor. And, then continue with triage.

> **Note:**
>
> You can use the unified search console through Citrix Director.

This feature reduces the mean time to resolve issues and provides a seamless experience with a single console for both cloud and on-premises users. The additional benefit is that there is no rapid growth in the size of the database since only the cloud site details are added to Director. User details are saved in the cloud itself.

> **Note:**
>
> You can get search results within three seconds for up to six or lesser cloud sites.

To enable this feature, you need to connect the cloud site to Director.

Connecting cloud site to Director

Prerequisites

To configure Unified Search in Citrix Director, no new components need to be installed. Ensure that the following requirements are met:

- For Unified Search, outbound internet access is available on all Delivery Controllers and the machines on which Director is installed. Specifically, ensure accessibility to the following URLs:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - Citrix Key Registration: https://*.citrixnetworkapi.net/
  - Citrix Cloud: https://*.citrixworkspacesapi.net/
  - Citrix DaaS: https://*.cloud.com/
  - Microsoft Azure: https://*.windows.net/

- In case, Delivery Controllers and Director machines are within an intranet and outbound internet access is through a proxy server, ensure the following:

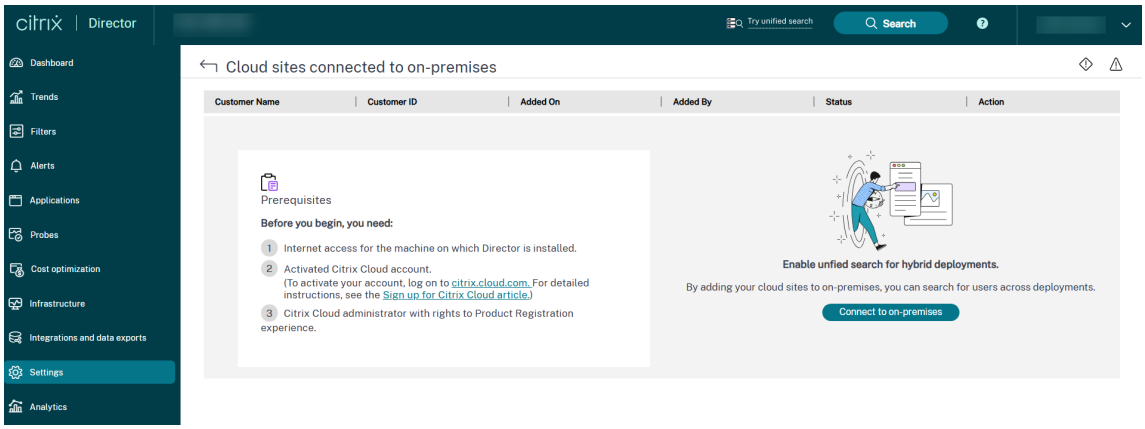
  - The proxy server must allow the preceding list of URLs.
  - Add the following configuration in the Director **web.config** and **citrix.monitor.exe.config** files. Ensure that you add this configuration within the **configuration** tags:

```
<system.net>
    <defaultProxy>
        <proxy usesystemdefault="false" proxyaddress="http://<
           your_proxyserver_address>:80" bypassonlocal="true" />
    </defaultProxy>
</system.net>
```

  - The Director **web.config** is located at `C:\inetpub\wwwroot\Director\web.config` on the machine where the Director is installed.
  - The **citrix.monitor.exe.config** is located at `C:\Program Files\Citrix\Monitor\Service\Citrix.Monitor.exe.Config` on the machine where the Delivery Controller is installed.

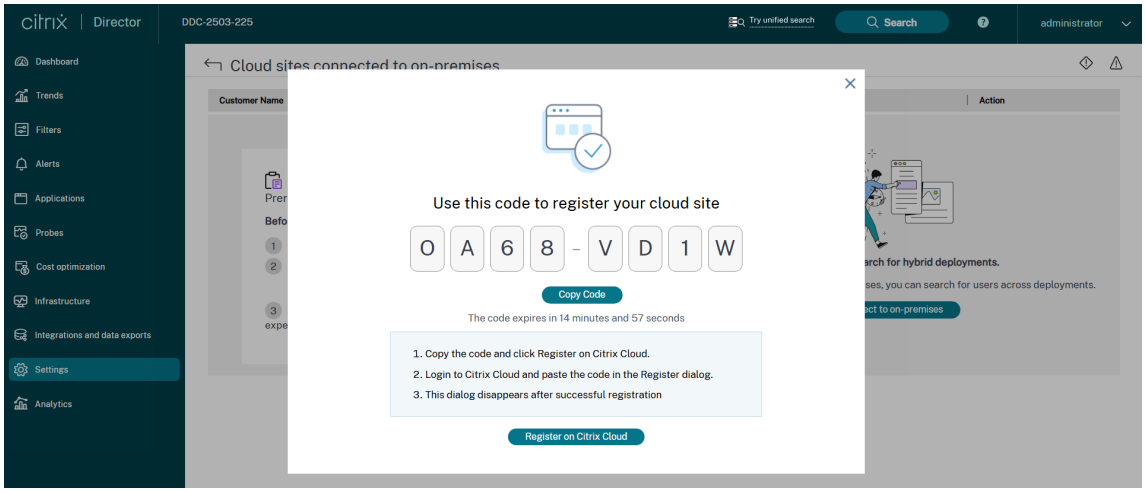
  This setting is provided by Microsoft on IIS. For more information, see Proxy Configuration. The **defaultproxy** field in the config file controls the outbound access of Director and Monitor Service. Configuration and communication with Citrix DaaS requires the **defaultproxy** field to be set to true. It is possible that the policies in effect set this field to false. In this case, you must manually set the field to true. Take a backup of the config files before you make the changes. Restart the Monitoring service on the Delivery Controller for the changes to be affected.

- You have an active Citrix Cloud™ entitlement for DaaS.
- Your Citrix Cloud account is an Administrator account with rights to the Product Registration Experience. For more information about administrator permissions, see Modify Administrator Permissions.
- Ensure that there's internet access for the machine on which Citrix Director is installed.
- To use the Citrix Cloud services, you must be able to connect to the required Citrix addresses through the HTTPS port 443. For more information, see Internet Connectivity requirements.
- Ensure that you have full admin access for performing product registration.



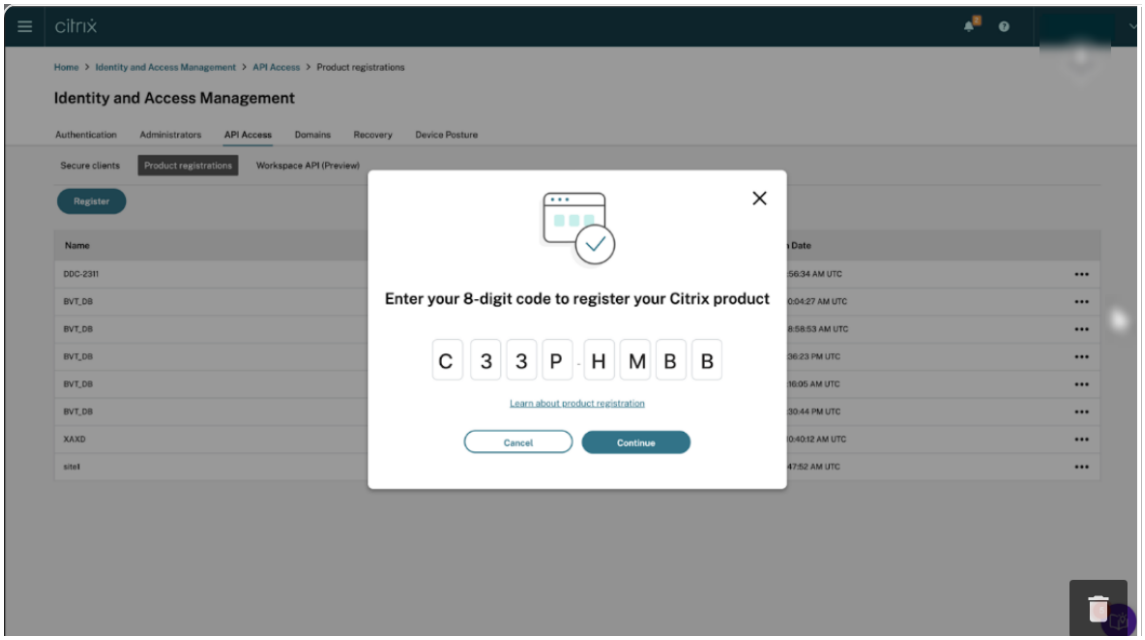
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration steps

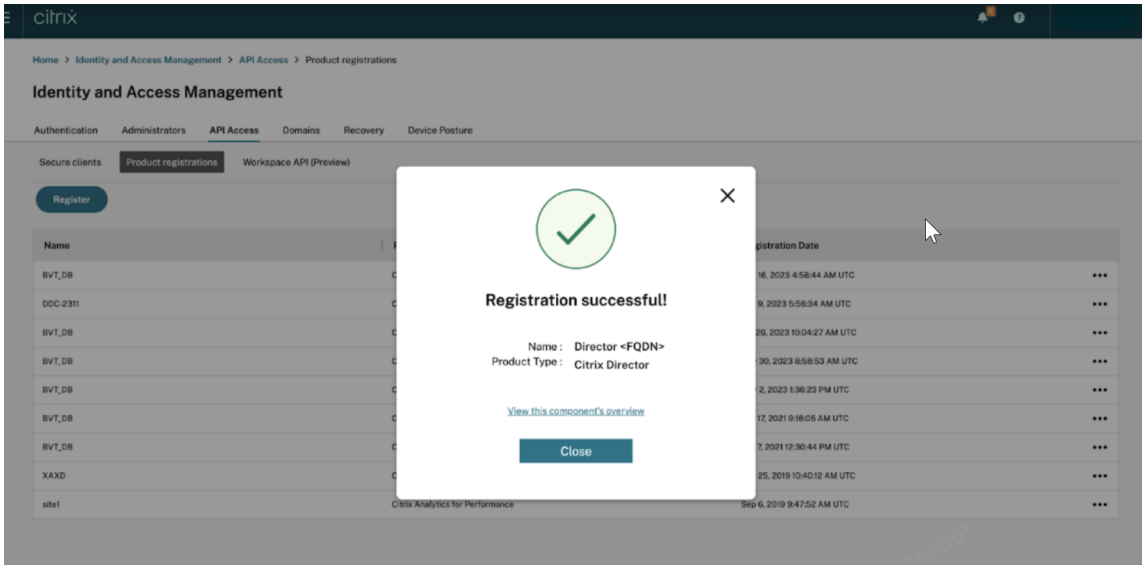


1. Sign in to Director as a full administrator. The Director Dashboard page appears.
2. Click the **Settings** tab. The **Settings** page appears.

3. Click **Add Cloud Site**. The following page appears:

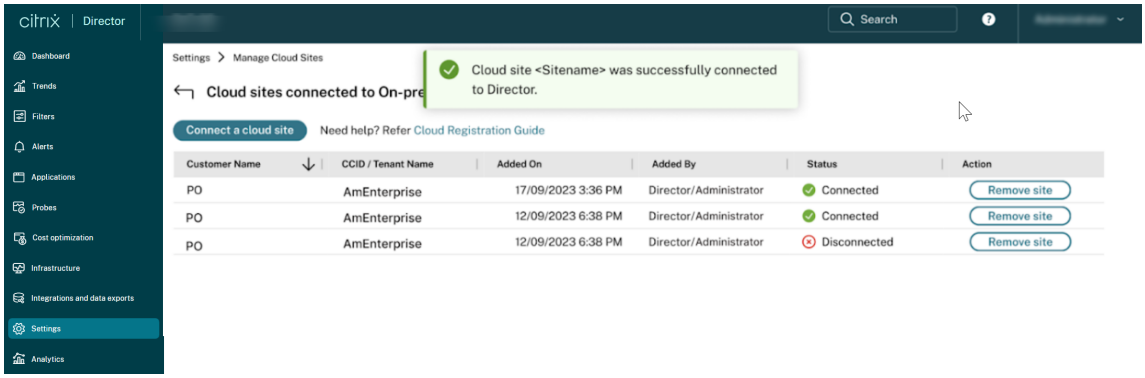


4. Review the prerequisites and then click **Connect cloud sites** to start the configuration process. A unique 8-digit registration code is generated to be used to register this site with Citrix Cloud.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Click **Copy Code** to copy the code and then click **Register on Citrix Cloud**. You are redirected to the registration URL in Citrix Cloud.
6. Sign in with your Citrix Cloud credentials and select your customer.
7. Paste the copied registration code in the **Product Registrations** page in Citrix Cloud. Click **Continue** to register the site.



8. Click **Continue**. Your cloud site registers with Citrix Director and you get the following message:

9. Click **Close**. The following screen appears:

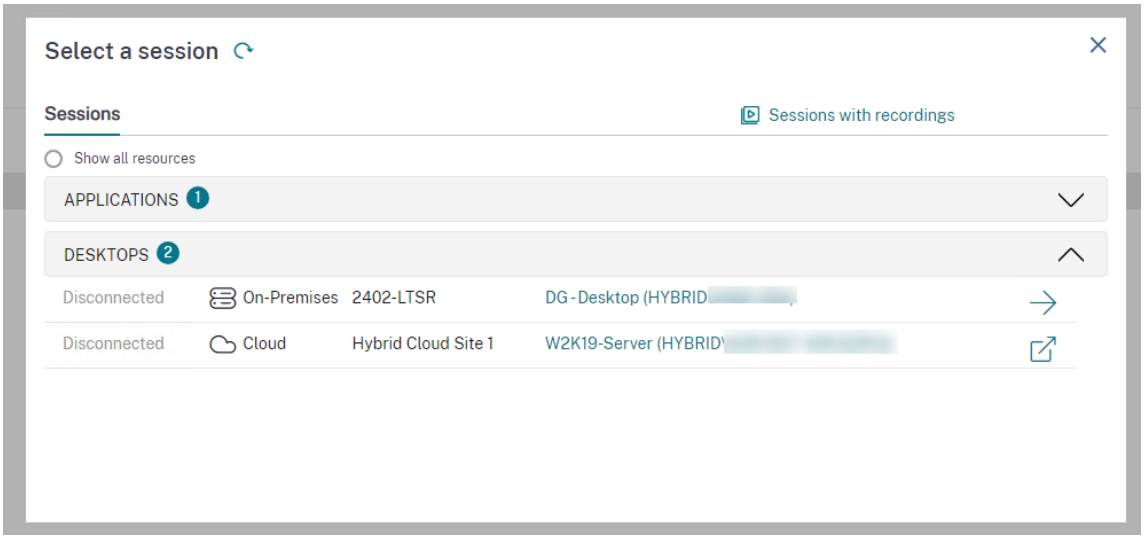
© 1997–2026 Citrix Systems, Inc. All rights reserved.

10. To configure multiple cloud sites with Director, repeat the preceding configuration steps for each site from Director.

    In case you have more than one Director instance running per site, configure from any one Director instance. All other Director instances connected to the site are updated at the next refresh after the configuration process.

> **Note:**
>
> To disconnect your site from Citrix Director, click **Remove site**. This option deletes the existing configuration.

Searching for a user from hybrid deployments



To search for a user, do the following:

1. Click **Search** at the top navigation bar. The **Monitor and troubleshoot deployments** page appears:

2. Select **User** from the drop-down list and enter the user name. A list of active and failed sessions from on-premises and cloud deployments appears:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select a session to inspect:

- If it's a session using cloud deployment, the relevant DaaS Monitor URL with the user context is opened to the **Activity Manager** page to quickly begin troubleshooting.
- If it's a session using on-premises deployment, the Activity Manager page opens quickly to begin troubleshooting.

Infrastructure monitoring

May 15, 2026

Director now offers visibility into the operational health of Citrix Virtual Apps and Desktops™ components. This feature helps you to easily identify, troubleshoot, and resolve issues related to your infrastructure. Currently, the health of the following components is monitored:

- Delivery Controller™
- Citrix Provisioning™ Service
- StoreFront™

To support this feature, a new Windows executable named `citrixinframonitor.msi` is introduced for Citrix components. This helps with the collection and transmission of relevant health metrics from Provisioning Service or StoreFront servers to Director. However, `CitrixInfraMonitor.msi` is not required for monitoring Delivery Controller. The Delivery Controller component is automatically onboarded for monitoring when connected to the Citrix Virtual Apps and Desktops site.

This feature helps you to get critical monitoring data sets and proactive alerts regarding the Delivery Controller, Provisioning Service, and StoreFront servers on a single dashboard in Director. Data is collected every five minutes from the monitored components to ensure the latest information.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This feature aims to enhance operational efficiency by offering proactive monitoring, detailed metrics, and automated alerts, ensuring your Citrix® infrastructure runs smoothly and efficiently.

Key features

Real-time monitoring:

- Continuous monitoring of Citrix infrastructure components such as Delivery Controller, Citrix Provisioning (Provisioning Service) servers, and StoreFront.
- Dashboard views presenting system health, resource utilization, and relevant performance metrics.

Detailed analysis:

- Provides detailed analysis on the system health metrics such as connectivity status, and service or process status for each component.
- Details on the resource utilization metrics such as CPU, memory, and disk utilization.

Automated alerts and notifications:

- Customizable alert thresholds for various metrics and states with granular scopes.
- Real-time notifications through email and webhooks.

Use-cases

Operational efficiency:

Ensures that Citrix admin teams can maintain high availability and performance of their Citrix servers and services. This feature also helps in minimizing downtime by proactively identifying and alerting admins on issues before they impact significant user groups.

Faster ticket resolution:

Monitors key metrics on server health and performance to evaluate the optimal delivery of virtual applications and desktops to users. Use these metrics to diagnose and resolve user complaints related to performance by analyzing associated components.

Prerequisites

- Citrix Virtual Apps and Desktops™ version 2407 or later
- Enusre the prerequisites for Provisioning Service or the prerequisites for StoreFront are met.
- For monitoring Citrix Provisioning:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Minimum required version to monitor **DB Connectivity** and **License Server Reachability** is Citrix Provisioning 2407
    - Minimum required version to monitor **PXE Service**, **TFTP Service**, and **Total Reconnect Count** is Citrix Infra Monitor 2411

- User accounts or permissions required to run Citrix Infrastructure Monitor:
    - User accounts with Windows administrator permissions to install the Citrix Infrastructure Monitor on the endpoint machines.
    - A full administrator user account or a custom role with the following Director permissions:
        - Create\Edit\Enable\Delete Alert Policies
        - Create\Edit\Remove Alert Email Server Configuration
        - Create\Edit\Manage Connections to Citrix components (Infra Monitoring)
        - Dismiss Alerts
        - View Alert Policies
        - View Alerts
        - View Dashboard page
        - View Infrastructure Monitor page

> **Note:**
>
> - The preceding prerequisite is valid only for Provisioning Service and StoreFront components monitoring.
> - If you don't have permission to access the **Alerts** page, the **Manage Alerts** option is disabled on the **Infrastructure Monitoring** page.

For more information, see the following:

- Getting started with Infrastructure Monitoring
- Manage connections
- Infrastructure dashboard
- Advanced alert policies
- Infrastructure policies

Getting started with Infrastructure Monitoring

May 13, 2026

You can connect to Citrix Infrastructure Monitor using:

- Manual connection - Download and install the Citrix Infrastructure Monitor service manually.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Automatic connection - The UI handles the download and installation automatically.

You can optionally configure HTTPS for Citrix Infrastructure Monitor after both manual and automatic connections.

For more information, see the following:

- Manual connection
- Automatic connection
- Configure HTTPS for Citrix Infrastructure Monitor

Manage connections

May 13, 2026

You can view, remove, or edit the connections on the **Connect Citrix Components** page.

View connections

You can view details of all the connected and disconnected components available in this view. The following table describes the different columns of the **Create connection** page:

Column	Description
Host name	The name of the server.
Type	The type of the connection. This can be Delivery Controller™, Provisioning Service, and StoreFront.
Version	The version of the `CitrixInfraMonitor.msi` installed on the component. This field isn't applicable to Delivery Controller.
Created by	The name of the person who created the connection.
Creation date	The date on which the connection is established.
Last updated	The date on which the connection was last updated.
State	The different states are Connecting, Connected, and Disconnected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description
	Connecting: This state indicates that it can take approximately five minutes for data to appear for the new component and approximately 10 minutes for the resource utilization data to be available. **Connected:** This state indicates that the connection between the components and the site is up and running. **Disconnected:** This state indicates that the connection between the components and the site is disconnected. Possible reasons for the Disconnected state include server downtime or the site being unable to connect to Citrix Infrastructure Monitor.

> **Note:**
>
> The Delivery Controller connections are automatically populated in this view when connected to on-premises Citrix Virtual Apps and Desktops™ sites.

Edit the connection

Editing the connection might be required to update the administrator credentials used to establish the Provisioning Service or StoreFront™ connection.

To edit an existing connection, do the following:

1. Navigate to the **Connect Citrix Components** page from the **Settings** or **Infrastructure** tab.
2. On the list of connections table, click the three dots at the end of the row on the component of interest.
3. Click **Edit** and update the details as required.

Remove a component

You can remove a component from the Director UI or using the PowerShell command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using Director UI

Removing a component is a process of deregistering a Provisioning Service or StoreFront connection from Director. Once the deregistration process is complete, new data collection is stopped for the selected component. To remove an existing connection:

1. Navigate to the **Connect Citrix Components** page from the **Settings** or **Infrastructure** tab.
2. On the list of connections table, click the three dots at the end of the row on the component of interest.
3. Click **Remove**. The connection is deregistered and removed from Director.

Using PowerShell SDK

In the event you need to deregister a given component, run the following PowerShell command on the Delivery Controller:

```
Remove-MonitorDirectorAgent -Fqdn <FQDN of component> -Component <
    component>
```

A sample command to remove registration of the Citrix Infrastructure Monitor is as follows:

```
Remove-MonitorDirectorAgent -Component PVS -Fqdn [redacted]
```

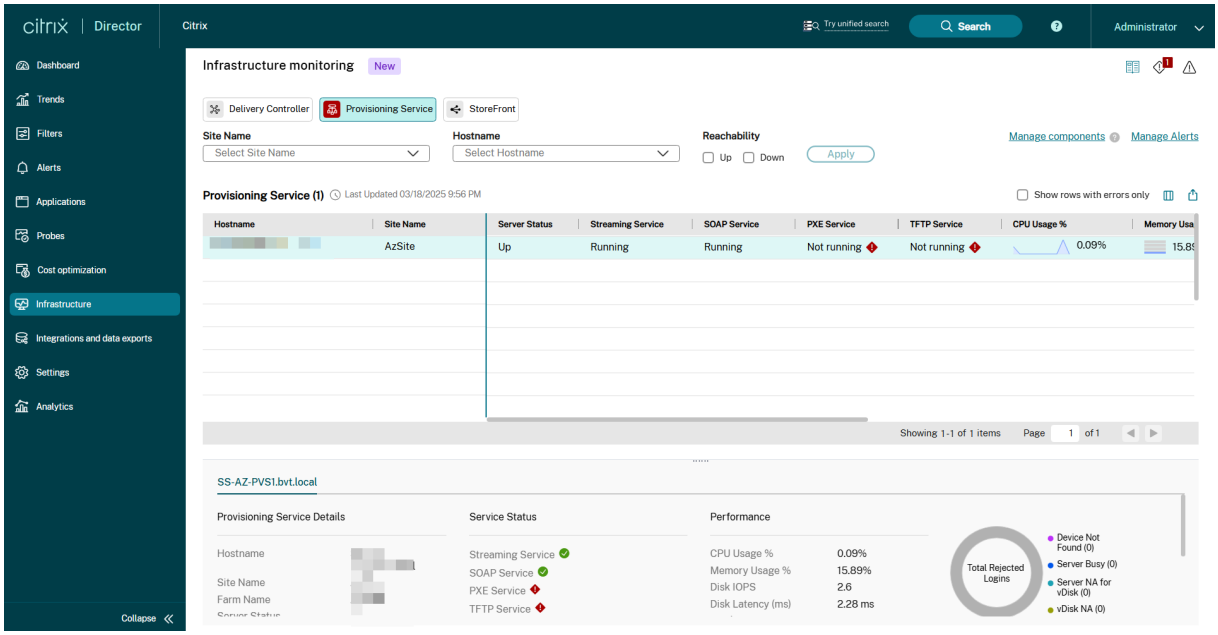
> **Note:**
>
> Deregistering a component only stops the data flow from the specific component to Director. If you need to uninstall Citrix Infrastructure Monitor, uninstall it from the **Control Panel**.

Infrastructure dashboard

May 13, 2026

You can see the health values for your components in the **Infrastructure Monitoring** page. These results help to analyze and troubleshoot issues proactively regarding your infrastructure.

You can filter the **Infrastructure Monitoring** page by:



- Host name - Select the host name
- Reachability - Select **Up** (server is reachable) or **Down** (Server isn't reachable) checkbox
- Errors - Select Show rows with errors only checkbox.

Use the **Manage columns** option to choose the data to be seen in your dashboard.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Provisioning Service health metrics

Click the **Infrastructure** tab and then select **Provisioning Service**. The Infrastructure dashboard for Provisioning Service appears:

The following details are monitored for Provisioning Service servers:

Category	Metrics	Description
Reachability	Host name	The name of the Provisioning Service machine where Citrix Infrastructure Monitor is installed. This metric is a string value.
	Provisioning Service Site Name	The name of the Provisioning Service site. This metric is a string value.
	Provisioning Service Farm Name	The name of the Provisioning Service farm. This metric is a string value.
	Provisioning Service Site ID	Displays the site ID of the Provisioning Service server. This metric is a string value.
	Provisioning Service Farm ID	Displays the farm ID of the Provisioning Service server. This metric is a string value.

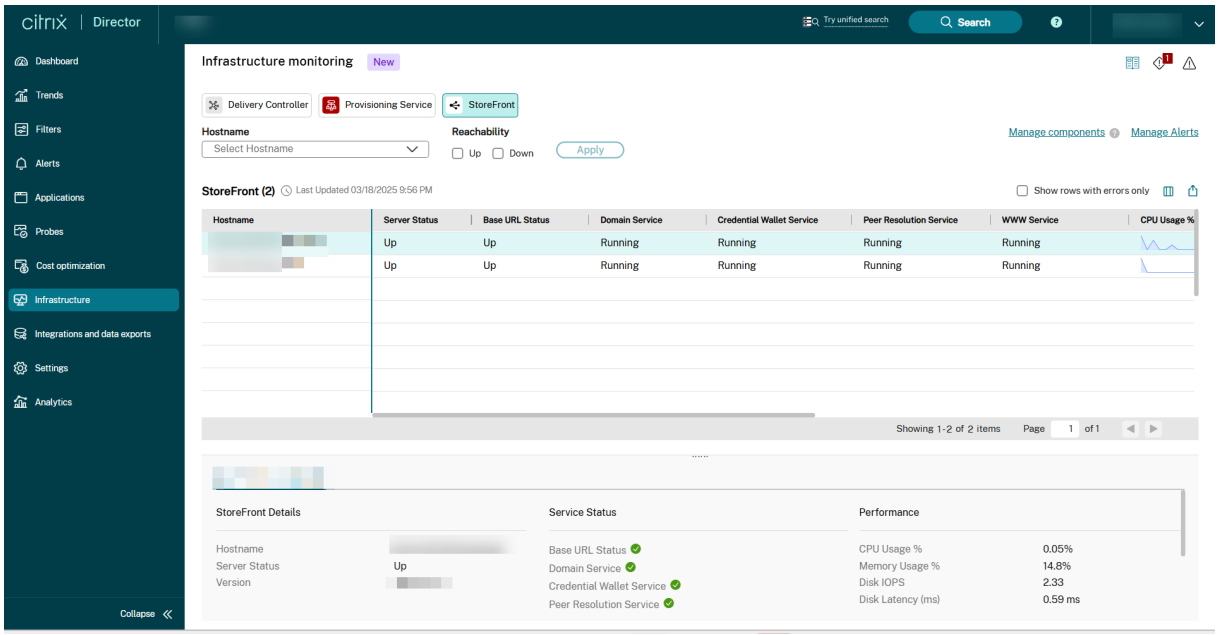
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
Dependent Services	Server Status	Shows the reachability state of the given server. Possible values are *Up*, *Down*, and *Unknown*.
	Last Boot Time	Displays the time when the Provisioning Service server was last booted.
	Last updated	Displays the time when the data was collected from the Provisioning Service server.
	Streaming Service	Displays the status of the streaming service. This metric shows the Windows services status. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
	SOAP Service	Displays the status of the Simple Object Access Protocol (SOAP) service. This metric shows the Windows services status. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
	DB Connectivity	Displays the status of the database connectivity. If you are using a Citrix Provisioning server version 2402 or earlier, you might get an unknown error. The possible values are *Not Connected*, *Connected*, *Unknown*, and *n/a* (with help icon).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
	License Server Reachability	Displays whether the license server is reachable or not. If you're using the Citrix Provisioning server version 2402 or earlier, you might get an unknown error. The possible values are *Not Connected*, *Connected*, *Unknown*, and *n/a* (with help icon).
	Total Reconnect Count	Displays how many times the session got reconnected.
	PXE Service	Displays the status of the Preboot Execution Environment service. This metric shows the Windows services status. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
	TFTP Service	Displays the status of the Trivial File Transfer Protocol service. This metric shows the Windows services status. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
Resource Utilization	CPU Usage %	Displays the usage of CPU in percentage using a line chart. The value displayed is the latest one at the end of the last 5 mins.
	Average CPU %	Displays the average CPU percentage of the Provisioning Service server aggregated over the last 10 mins.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Category	Metrics	Description
	Peak CPU %	Displays the peak CPU percentage of the Provisioning Service server in the last 5 mins.
	Memory Usage %	Displays the usage of memory in percentage using a stack chart. The value displayed is the latest one at the end of the last 5 mins.
	Average Memory %	Displays the average memory percentage of the Provisioning Service server aggregated over the last 10 mins.
	Peak Memory %	Displays the peak memory percentage of the Provisioning Service server in the last 5 mins.
	Disk IOPS	Displays the input and output value of the disk using a line chart.
	Average Disk IOPS %	Displays the average disk IOPS of the Provisioning Service server aggregated over the last 10 mins.
	Peak Disk IOPS %	Displays the peak disk IOPS percentage of the Provisioning Service server in the last 10 mins.
	Disk Latency (Ms)	Displays the latency value of the disk using a line chart.
	Average Disk Latency %	Displays the average disk latency of the Provisioning Service server aggregated over the last 10 mins.
	Peak Disk Latency %	Displays the peak disk latency percentage of the Provisioning Service server in the last 5 mins.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
Impact	Total Rejected Logins	Number of total failure logins divided by the number of total logins trials.
	Device Count Active	Displays the total number of active devices in the Provisioning Service server. This metric is an integer value.

StoreFront™ health metrics

Click the **Infrastructure** tab and then select **StoreFront**. The Infrastructure dashboard for StoreFront appears:

The following details are monitored for StoreFront servers:

Category	Metrics	Description
Reachability	Host name	Displays the name of the StoreFront server. This metric is a string value.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
	Server Status	Displays the status of the StoreFront server. This metric shows the Windows services status. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
	Base URL Status	Displays the health of the base URL. If the HTTP status code is 200, the status is UP. Else, the value is Down.
	Last Boot Time	Displays the time when the StoreFront server was last booted.
	Last updated	Displays the time when the data was collected from the StoreFront server.
Dependent Services	Domain Service	Health of windows service named as domain service. This metric shows the Windows services status. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
	Credential Wallet Service	This service is a windows service that is used for storing encrypted passwords. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
	Peer Resolution Service	This service is a windows service which is responsible for inter-server group network communication forming a peer mesh of StoreFront servers. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
Resource Utilization	WWW Service	This metric is the web service of the StoreFront server. This metric shows the Windows services status. The possible values are: *Not running*, *Running*, *Not Installed*, and *n/a* (with help icon).
	CPU Usage %	Displays the usage of CPU in percentage using a line chart. The value displayed is the latest one at the end of the last five mins.
	Average CPU %	Displays the average CPU percentage of the StoreFront server aggregated over the last 10 mins.
	Peak CPU %	Displays the peak CPU percentage of the StoreFront server in the last five mins. This value helps to decide on the maximum required capacity for a CPU.
	Memory Usage %	Displays the usage of memory in percentage using a stack chart. The value displayed is the latest one at the end of the last 5 mins.
	Average Memory %	Displays the average memory percentage of the StoreFront server aggregated over the last 10 mins.
	Peak Memory %	Displays the peak memory percentage of the StoreFront server in the last 5 mins.
	Disk IOPS	Displays the input and output value of the disk using a line chart.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

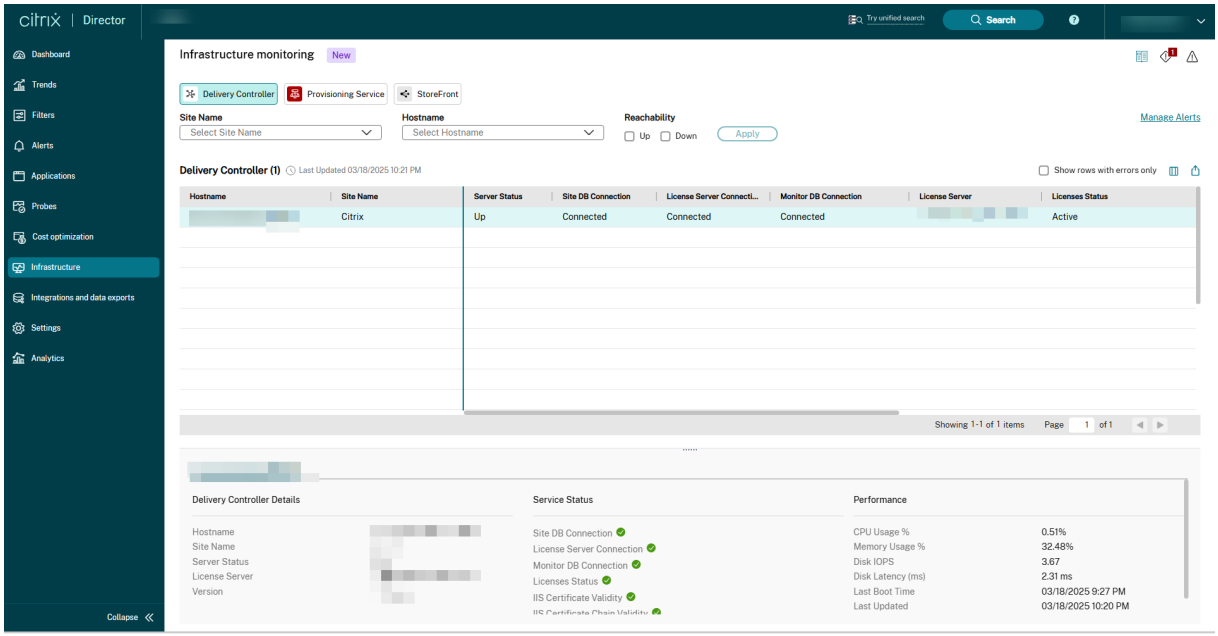
Category	Metrics	Description
	Average Disk IOPS %	Displays the average disk IOPS of the StoreFront server using a float.
	Peak Disk IOPS %	Displays the peak disk IOPS percentage of the StoreFront server aggregated over the last 10 mins.
	Disk Latency (Ms)	Displays the latency value of the disk using a line chart.
	Average Disk Latency %	Displays the average disk latency of the StoreFront server aggregated over the last 10 mins.
	Peak Disk Latency %	Displays the peak disk latency percentage of the StoreFront server in the last five mins.
Impact	ICA® Certificate Validity	Displays the validity of the ICA certificate. The possible values are *Expired*, *Expiring*, *Valid*, and *Not Found*.
	ICA Certificate Chain Validity	Displays StoreFront ICA Certificate Chain is valid or not. The possible value is *Yes* or *No*.
	IIS Certificate Validity	Displays the validity of the IIS certificate. The possible values are *Expired*, *Expiring*, *Valid*, and *Not Found*.
	IIS Certificate Chain Validity	Displays StoreFront IIS Certificate Chain is valid or not. The possible value is *Yes* or *No*.

Delivery Controller™ health metrics

The Delivery Controller component is added by default as part of Infrastructure monitoring. The Delivery Controller component that is connected to the Citrix Virtual Apps and Desktops™ site is auto onboarded for monitoring.

This feature enables customers to monitor controllers' health under the infrastructure monitoring

© 1997–2026 Citrix Systems, Inc. All rights reserved.



dashboard and configure alerts for it. The alerting functionality enables customer admins to get alerted if any of the policies created for delivery controllers are in the critical or warning stage.

You can select the required Site Name and the details are displayed according to the selected site name. You can also select the **Reachability Status** such as *Up* or *Down*.

Note: The `CitrixInfraMonitor.msi` file is not required for monitoring Delivery Controllers.

You can monitor both single-site and multi-site details for the infrastructure details.

Click the **Infrastructure** tab and then select **Delivery Controller**. The infrastructure dashboard for the Delivery Controller appears:

The following details are monitored for the Delivery Controller:

Category	Metrics	Description
Reachability	Server Status	Shows the reachability state of the given Delivery Controller. Possible values are *Up* and *Down*.
	Version	The version of the Delivery Controller.
	Last Boot Time	Displays the time when the Delivery Controller was last booted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
Dependent Services	Last updated	Displays the time when the data was collected from the Delivery Controller.
	Site DB Connection	Displays the status of the site database connection. The possible values are *Not Connected*, *Connected*, *Unknown*, and *n/a* (with help icon). **Unknown:** This value appears when no metrics are collected or available. **n/a:** Not applicable. This value appears when the server status is down.
	License Server Connection	Displays the status of the license server connection. The possible values are *Not Connected*, *Connected*, *Unknown*, and *n/a* (with help icon).
	Monitor DB Connection	Displays the status of the monitor database connectivity. The possible values are *Not Connected*, *Connected*, *Unknown*, and *n/a* (with help icon).
	License Server	Displays whether the license server is reachable or not.
	License Status	Displays the status of the license.
Resource Utilization	CPU Usage %	Displays the usage of CPU in percentage using a line chart. The value displayed is the latest one at the end of the last 5 mins.
	Average CPU %	Displays the average CPU percentage of the Delivery Controller server aggregated over the last 10 mins.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
	Peak CPU %	Displays the peak CPU percentage of the Delivery Controller server in the last 5 mins.
	Memory Usage %	Displays the usage of memory in percentage using a stack chart. The value displayed is the latest one at the end of the last 5 mins.
	Average Memory %	Displays the average memory percentage of the Delivery Controller server aggregated over the last 10 mins.
	Peak Memory %	Displays the peak memory percentage of the Delivery Controller server in the last 5 mins.
	Disk IOPS	Displays the input and output value of the disk using a line chart.
	Average Disk IOPS %	Displays the average disk IOPS of the Delivery Controller server aggregated over the last 10 mins.
	Peak Disk IOPS %	Displays the peak disk IOPS percentage of the Delivery Controller server in the last 10 mins.
	Disk Latency (Ms)	Displays the latency value of the disk using a line chart.
	Average Disk Latency %	Displays the average disk latency of the Delivery Controller server aggregated over the last 10 mins.
	Peak Disk Latency %	Displays the peak disk latency percentage of the Delivery Controller server in the last 5 mins.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Metrics	Description
Impact	IIS Certificate Validity	Displays the validity of the IIS certificate. The possible values are *Expired*, *Expiring*, *Valid*, and *Not Found*.
	IIS Certificate Chain Validity	Displays whether the StoreFront IIS Certificate Chain is valid or not. The possible value is *Yes* or *No*.

Create and manage alerts

You can set up alerts for proactively monitoring conditions and scopes of interest to you and reduce alert fatigue. Alerts can be configured with severity, re-alert intervals, notification mediums, and follow the alert lifecycle supported in the product. You can create the alerts related to infrastructure from the **Advanced Alert Policies** section.

For more information, see the Advanced alert policies page.

Application and Desktop Probing

May 13, 2026

Application and desktop probing automates the process of checking the health of the apps and desktops that are published in a site by test launching them serially using StoreFront. The results of probing are available in Director.

Requirements

- Delivery Controller runs version 7.18 or later for application probing and version 1906 or later for desktop probing.
- Endpoint machines running probe agents are Windows machines with Citrix Workspace™ app for Windows version 1808 or later for application probing and version 1906 or later for desktop probing. Workspace app for Unified Windows Platform (UWP) is not supported.
- Citrix Probe Agent supports authentication via StoreFront and Citrix Workspace using Active Directory credentials. In cases where the endpoint device is connected to StoreFront / Workspace

© 1997–2026 Citrix Systems, Inc. All rights reserved.

via Citrix Gateway, you can authenticate using the Citrix Gateway domain credentials or Multi-factor authentication (MFA). Citrix Probe Agent doesn't support other authentication methods like Single Sign-On (SSO).

> **Note:**
>
> - If user enabled the sign-in policy or conditional authentication on Citrix Cloud™, probe agent fails to sign in to Storefront or Citrix Workspace app.
> - Probe Agent supports only the Active Directory authentication to authenticate to Citrix Workspace app.

- Citrix Probe Agent works only when there is no proxy server or load balancer like Citrix Gateway or Citrix ADC deployed.
- Ensure that Microsoft .NET Framework version 4.7.2 or later is installed on the endpoint machine where you want to install the Probe Agent.

User accounts or permissions required to run Probing:

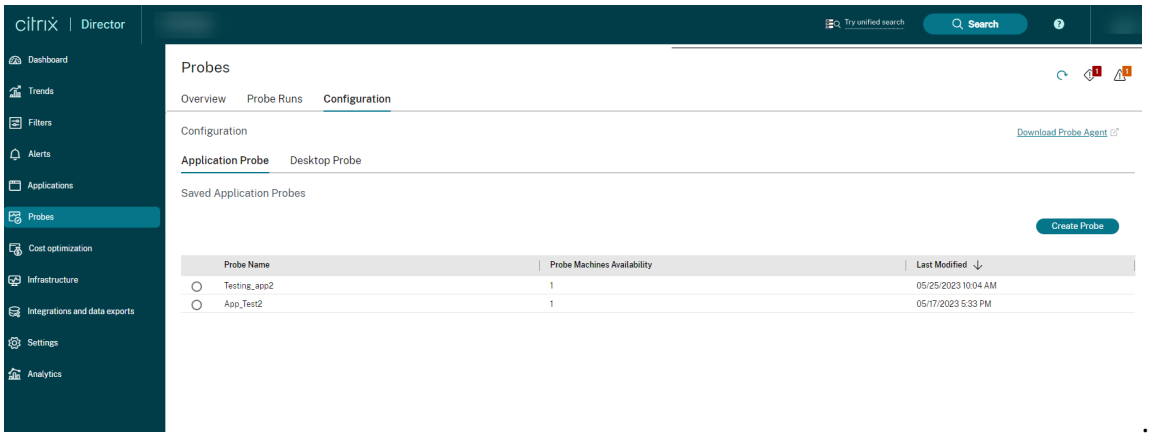
- A unique StoreFront user to probe on each endpoint machine. The StoreFront user need not be an administrator; the probes can run in a non-administrator context.
- User accounts with Windows administrator permissions to install and configure the Citrix Probe Agent on the endpoint machines.
- User must be a member of the same domain as the VDAs used for application or desktop launch. Probe Agent currently doesn't support multiple domains.
- Reusing existing user accounts for probing might log off from the users' active sessions. A full administrator user account or a custom role with the following permissions:
  - Delivery group permissions:
    - Read-only
  - Director permissions:
    - Create\Edit\Remove Alert Email Server Configuration - if the email server is not already configured
    - Create\Edit\Remove Probe Configurations
    - View Configurations page
    - View Trends page

Configuration

You can schedule your probes to run during off-peak hours across multiple geographies. The comprehensive probe results can help to troubleshoot issues related to the applications, hosting machine or connection before the users experience them.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Probe Agent version 2103 and later supports site aggregation. When you configure Citrix Probe Agent, select the Workspace (StoreFront) Site Aggregation Enabled option to enable enumeration of applications and desktops from aggregated sites. The following combinations of sites are supported:



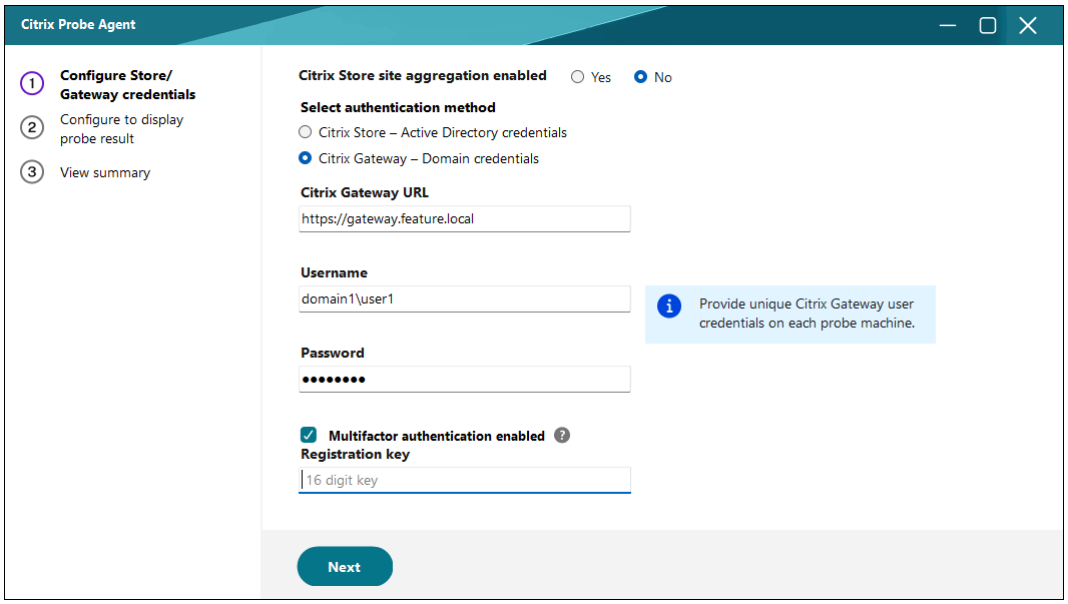
- Multiple on-premises sites having one StoreFront URL.
- On-premises and cloud sites having either a StoreFront or Workspace URL.
- Multiple cloud sites having one Workspace URL.
- On-premises sites connected to StoreFront or Workspace via Citrix Gateway.

> **Note:**
>
> You must create separate administrators or users to configure probes that have access to only one site.

Step 1: Install and configure the Citrix Probe Agent

The Citrix Probe Agent is a Windows executable that simulates the actual application or desktop launch by the user through StoreFront. It tests launches as configured in Director and reports back the results to Director.

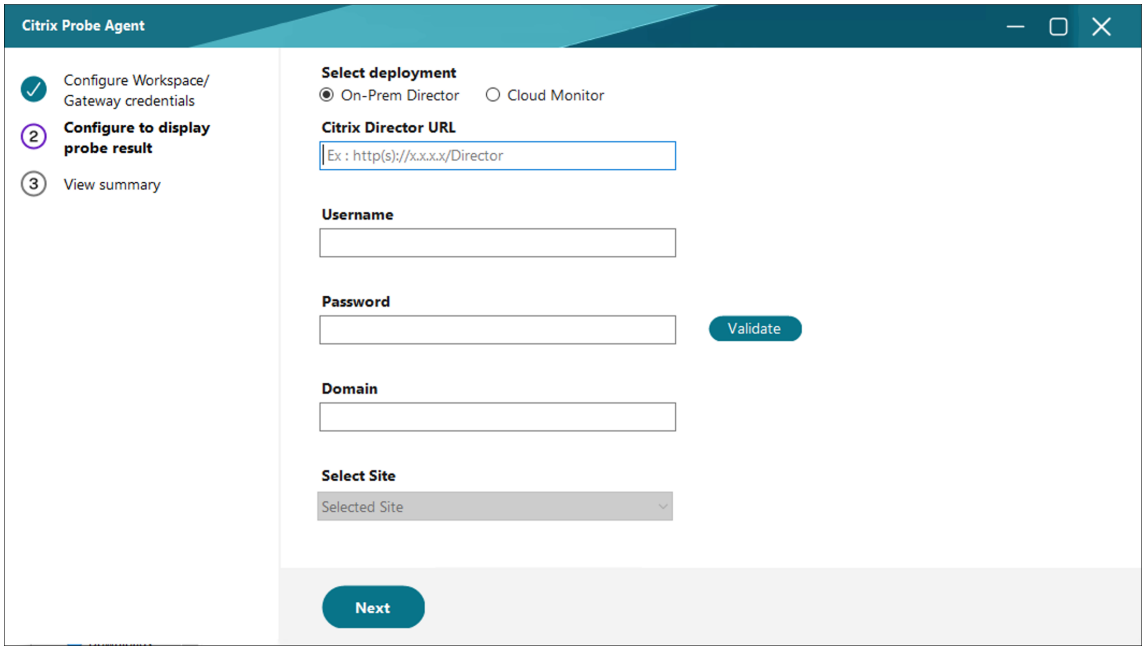
1. Identify endpoint machines from where you want to run probing.
2. Users with administrative privileges can install and configure the Citrix Probe Agent on the endpoint machine. Download the Citrix Probe Agent executable available in the Citrix downloads page. The download link is also available in the **Probes** tab in Director.



3. If you have aggregated sites, select the Workspace (StoreFront) Site Aggregation Enabled option to enable enumeration of applications and desktops from aggregated sites.
4. Select an authentication method and enter the relevant credentials. Credentials are encrypted and stored securely.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Configure with your StoreFront Active Directory credentials. Configure a unique Workspace (StoreFront) user on each endpoint machine.



6. Choose the Citrix Gateway option if your endpoint is connected to StoreFront via Citrix Gateway and configure with your Citrix Gateway Domain credentials.

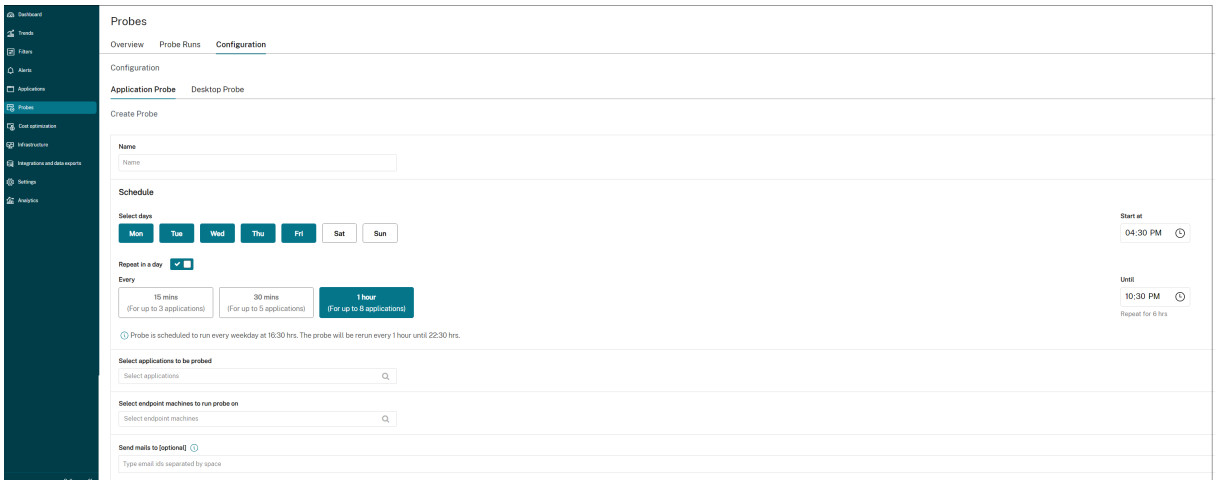
7. Choose Multi-factor Authentication option if your Gateway supports it and enter the 16-digit authentication key. This is available only for Citrix Gateway that is configured with LDAP and Native OTP using Single Login Schema.

8. In the **Configure To Display Probe Result** tab, enter your Director credentials, and click **Validate**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. Select your site and click **Next**.
10. In the **View Summary** tab, ensure that the configured details are accurate. If you need to make changes, go to the respective tab and make the updates.

> **Note:**
>
> You can use the PowerShell script contained in Automating Citrix Probe Agent Installation and Configuration to automate the installation and configuration of Citrix Probe Agent.



Step 2: Configure Probing in Director

> **Limitation:**
>
> Probing fails if applications or desktops are test launched from Windows VDAs that have the interactive logon message banner enabled. This is because a timeout occurs due to waiting to accept the interactive logon message.
> To disable the logon message on a Server VDA. Go to Computer Configuration > Windows Settings > Security Settings > Local Policies > Security options.
>
> Remove the text in the following fields and update the Microsoft policy.
>
> - Interactive Logon: Message Text for users attempting to logon
> - Interactive Logon: Message Title for users attempting to logon
>
> Assign the probe user to this specific Server VDA with the interactive logon message banner disabled to ensure that the probe can get past the Application or Desktop Launch state.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> For more information, see https://learn.microsoft.com/en-us/windows/security/threat-protection/security-policy-settings/interactive-logon-message-text-for-users-attempting-to-log-on.

1. Go to **Probes** > **Application Probe** or **Desktop Probe** and click **Create Probe**.
2. In the **Create Probe** page, enter the name of the probe.
3. Select the schedule:
    a) Choose the days of the week on which you want the probe to run.
    b) Enter the start time at which you want the probe to run.
    c) In addition, you can choose the **Repeat in a day** option. Enter the end time and the interval in which you want the probe to repeat within a day. For example, the configuration below helps run application probes from 12:08 hours until 16:34 hours repeating every 30 minutes every Monday, Wednesday, Thursday, and Sunday.
4. Select the recommended number of applications or desktops to be probed depending on the interval.
5. Select the endpoint machines on which the probe must run.
6. Enter the email addresses of admins to send the results of failed probes. Configure your email server in **Alerts** > **Email Server Configuration**.

In this configuration, the application sessions launch at 12:08 hours, 12:38 hours, 13:08 hours, and so on until 16:08 hours every Monday, Wednesday, Thursday, and Sunday.

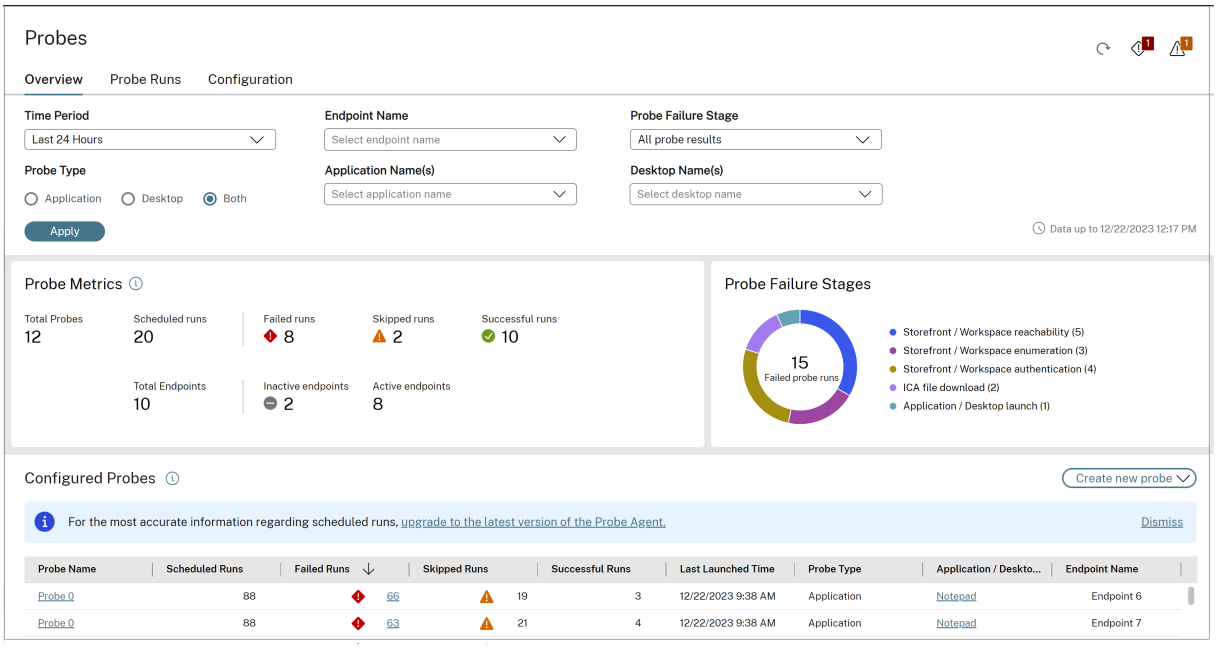
> **Note:**
>
> - After configuration, the agent runs the configured probes starting the next hour.
> - The probes that were set up before the **Repeat in a day** option was introduced, continue to run at their scheduled time. They have the **Repeat in a day** option disabled by default.
> - It is recommended that you configure probes such that each run has a period of 5 minutes

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> to prevent overlaps.

Step 3: Probe execution

The agent runs probing as per the probe configuration that it fetches from Director periodically.



It launches selected applications serially using StoreFront. The agent reports the results back to Director via the Monitor database. Failures are reported in five specific stages:

- **StoreFront Reachability** - configured StoreFront URL is not reachable.
- **StoreFront Authentication** - configured StoreFront credentials are invalid.
- **StoreFront Enumeration** - StoreFront Enumerate applications list does not contain the application or desktop to be probed.
- **ICA® download** - the ICA file is not available.
- **Application / Desktop launch** –the application or desktop could not be launched.

Step 4: View probe results

You can see the probe results in **Probes**. The Probes view gives a comprehensive glimpse of the probe results. These results help analyze and troubleshoot issues proactively, enabling a smoother session launch experience for users.

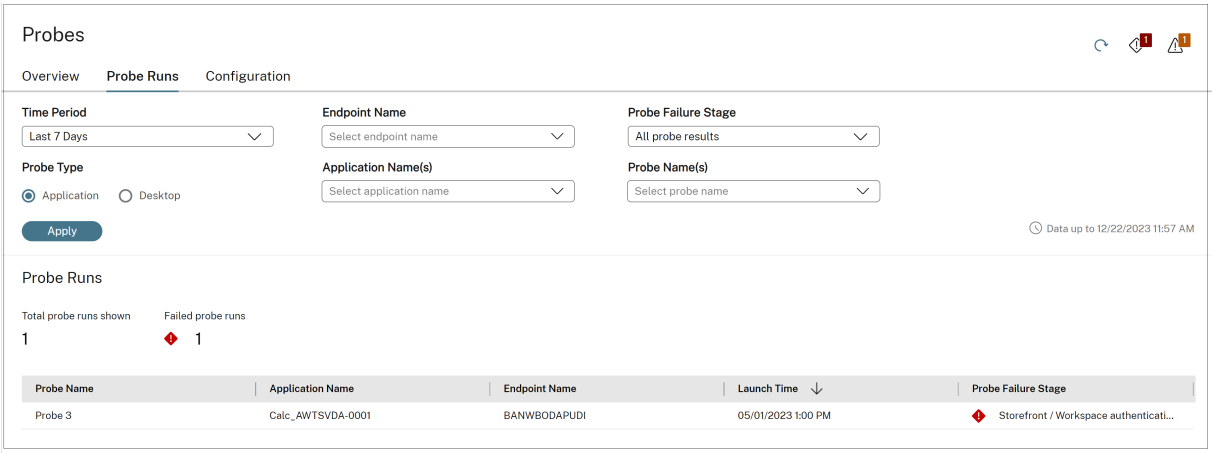
The **Overview** tab provides a summary of all the configured probes in a single view.

You can filter probes based on Time Period, Probe Type, Endpoint name, Application Name, Desktop Name and Probe Result Type. Probes that match the filter criteria are shown with the following details per probe, application/desktop and endpoint.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Probe Metrics shows the count of Scheduled, Planned, Skipped, Successful, and Failed runs.

- Completed Runs –the number of probe runs that ran to completion.
- Failed Runs –the number of probe runs that failed.
- Skipped Runs –the number of runs that did not run to completion due to either the endpoint being inactive, or services being unavailable.
- Successful Runs –the number of probes that completed successfully with no failures in any stage during the app/desktop launch.



The total number of endpoint machines is also displayed, with the count of active and inactive machines.

Probe Failure Stages presents a visual breakdown of the failure distribution for each failure group. By analyzing the stages in which most failures have occurred, it becomes easier to interpret the probe results and troubleshoot issues. The graphical representation shows the number of failed probe runs for application/desktop launch, ICA file downloads, Storefront/Workspace enumeration, Storefront/-Workspace reachability, and Storefront/Workspace authentication.

It helps analyze the stages in which most failures have occurred. This information helps quickly understand the probe results and troubleshoot.

Some probe runs might not run to completion due to either the endpoint being inactive, or services being unavailable.

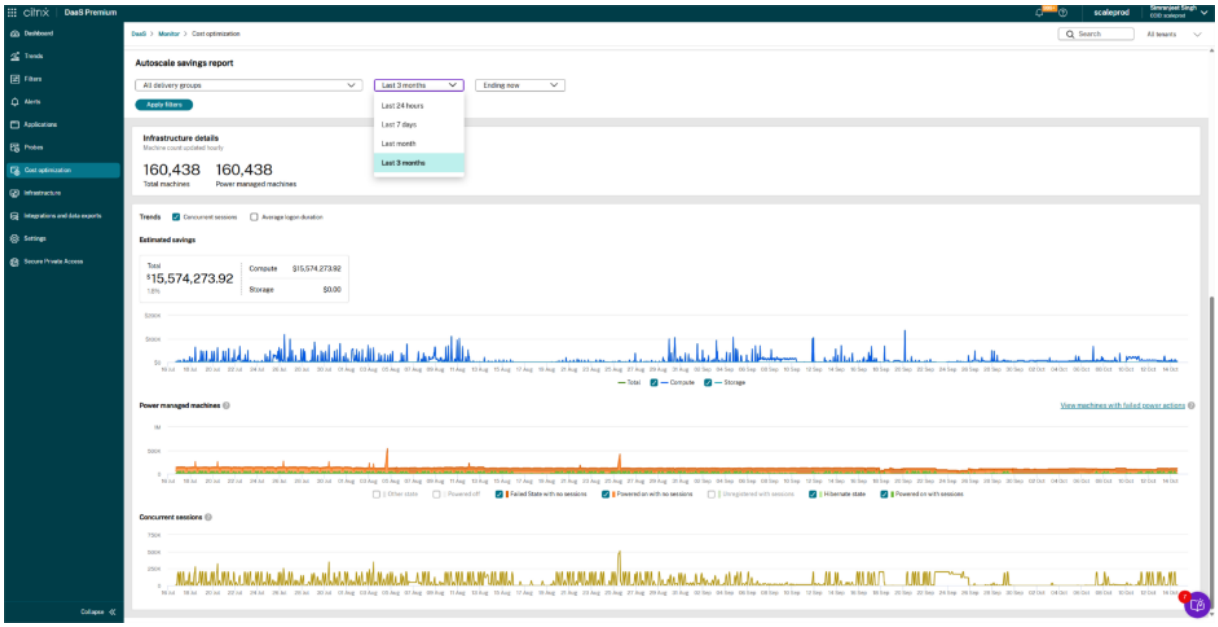
The **Probe Runs** tab provides the results of the completed probe runs in detail. You can drilldown to see the details of each individual run of a selected probe. You can filter and analyze further based on important pivot points.

You can filter the probes runs based on Time Period, Probe Type, Endpoint name, Application Name, Desktop Name and Probe Failure Stage. Probe Failure Stage displays the stage in which the probe failed. Clicking on the Probe Name, Scheduled Runs, Failed Runs, Application/ Desktop name links also takes you to the Probe Runs page with the list of Probe runs matching the filter criteria.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cost optimization

May 13, 2026



Citrix Director now introduces a new feature called Cost Optimization, which helps you to analyze the usage of virtual machines and sessions effectively. This feature provides insightful visual representations on how to optimize the cost. It also helps you to eliminate unnecessary machines and thereby reducing costs.

To support the cost optimization, the following alerts are also introduced:

- Failed power on action and Failed Power off action
- Machine uptime alert

You can also inspect machines with recent power actions to analyze power on failure which causes user issues and power off failure which increase costs. For more information, see the Inspect machines with recent power actions section.

Click the **Cost Optimization** tab from the left menu on the **Home** page to access the **Cost Optimization** page.

On the **Cost Optimization** home page, you can do the following:

- Get started link - Access this link to learn more about the cost optimization feature.
- Review the cost optimization page - You can provide feedback on the **Cost Optimization** page
- Refresh the data.
- View the alerts - You can view both critical and warning alerts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

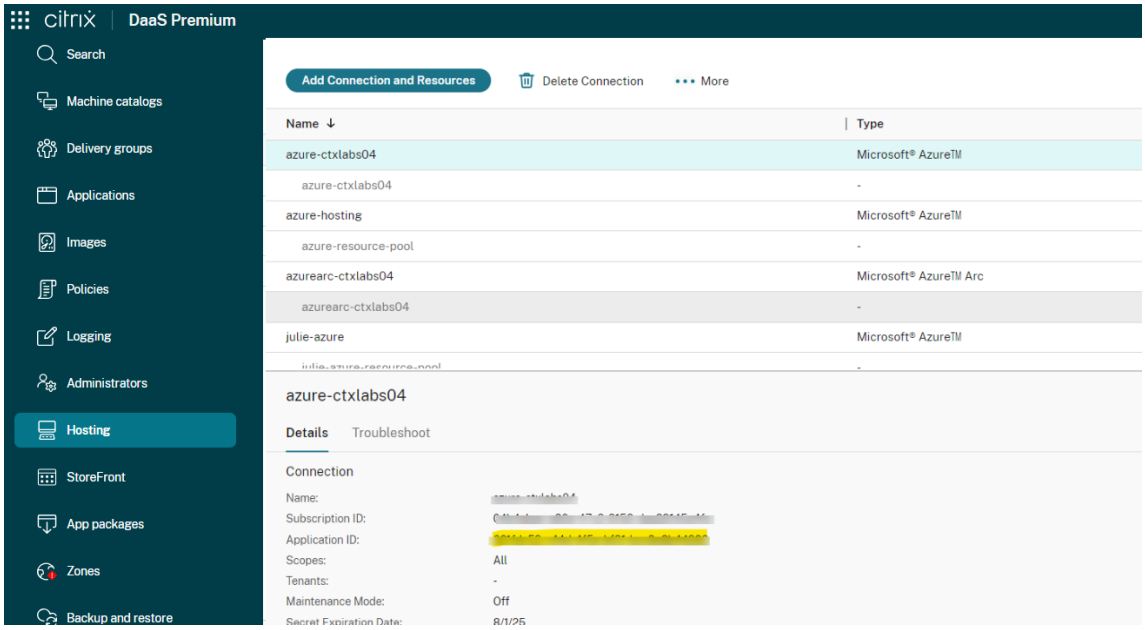
The **Cost Optimization** page includes the following features:

- Cost savings
- Infrastructure rightsizing

How is the cost calculated for optimizing the cost?

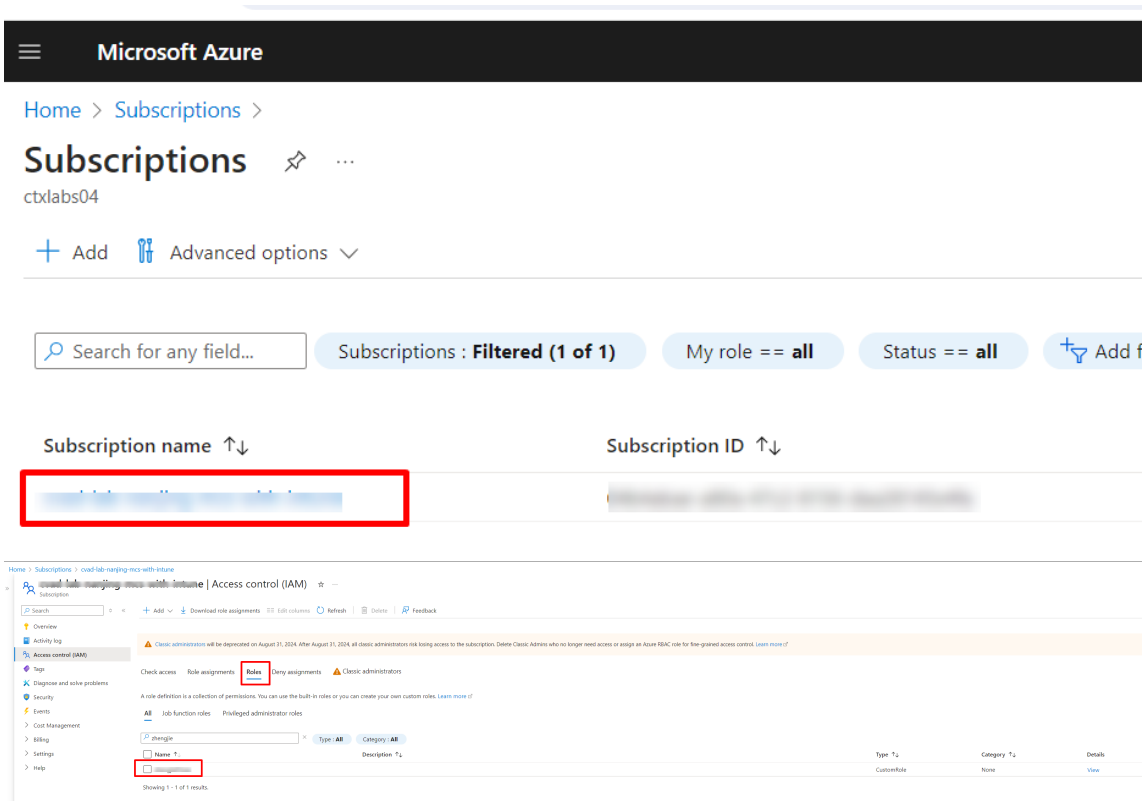
The cost per machine per hour is displayed in the currency that the hypervisor supports. This section describes how cost is calculated for Azure machines and for other machines.

Cost for Azure machines



The order of priority for calculating the cost is as follows:

1. When the 'Microsoft.Consumption/pricesheets/read permission is available, the effective price is displayed in the currency that is configured in the Azure subscription.
2. If permissions aren't available, the Azure retail price is displayed. For more information, see Azure Retail Prices overview.
3. When the effective price or retail price isn't available, the cost is displayed based on the cost entered by admins in the Web Studio.
4. If there is no cost mentioned in the Web Studio, the default cost of $1 is considered.



To find the account details of Azure and add the required permission to find the effective price, do the following:

1. Navigate to Citrix DaaS.
2. Click the **Hosting** tab to find the hosting connection account.
3. Look for the **Application ID** mentioned in the **Hosting** tab.

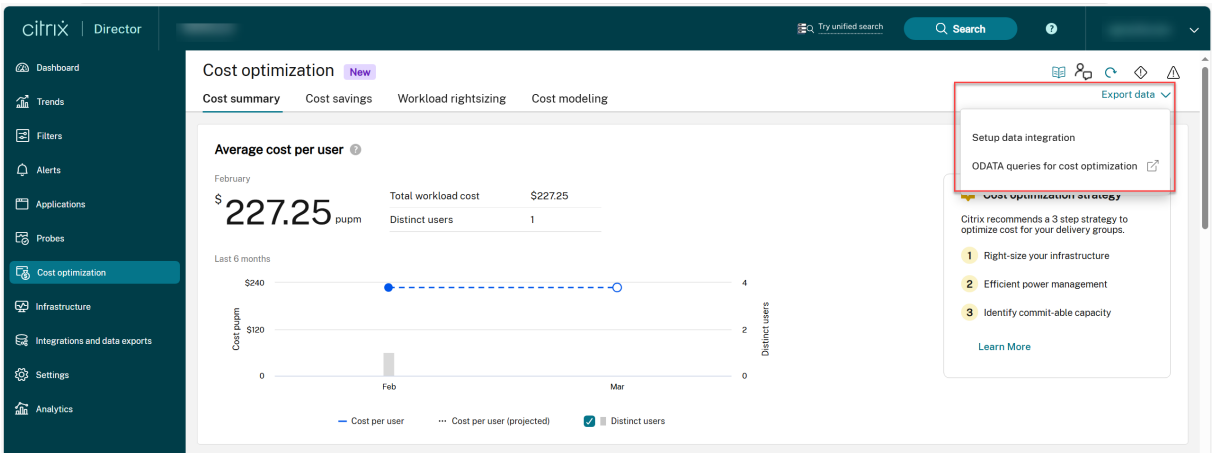
© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Go to the Microsoft Entra ID and look for the **Application ID** noted in step 3.
5. Go to **Subscription** > **Access control (IAM)** > choose a customized role configured for the hosting connection SPN.

6. Add the *Microsoft.Consumption/pricesheets/read* permission to the role.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How to verify the Azure retail price? If the `Microsoft.Consumption/pricesheets/read` isn't available, the Azure retail price is displayed. Now you can use the Retail Rates Prices API to get retail prices for all Azure services. Previously, the only way that you can retrieve prices for Azure services was to either use the Azure Pricing Calculator or use the Azure portal. For more information, see Azure Retail Prices overview.



Calculating costs for machines other than Azure

For other machines, cost is displayed based on the cost entered by admins in the Web Studio. If there is no cost mentioned in the Web Studio, the default cost of $1 is considered.

Export data

You can export the data on the **Cost optimization** page using data integration and ODATA queries. To export data, click **Export data** on the **Cost optimization** page, the following options are displayed:

- Setup data integration
- ODATA queries for cost optimization

Setup data integration

You can integrate Cost optimization data with the Monitor Service API using which you can collect the data for troubleshooting and triaging the issues. For more information, see Integrations and data exports page.

ODATA queries for cost optimization

You can use the available sample ODATA queries on the **Cost optimization** page to export data.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Get started with ODATA The following links help you to start using ODATA:

- Overview on ODATA
- Different methods to access Citrix Monitor Service data using the OData v4 endpoint in Citrix Cloud
- Use OData V4 aggregation queries in Citrix Monitor Service data
- How to connect PowerBI with DaaS Monitor using OData and API clients
- Get details of users with high logon duration using Postman
- How to Access the Monitor Service Data
- Data Access Protocol
- Monitor model
- Monitor notifications

Sample ODATA queries

Find out unused VDA To find out an unused VDA, you must provide a desktop group ID, start date, and end date of the VDA.

For more information to reduce spending on the unused resources, see Workload rightsizing.

Sample query:

```
https://<DDC URL>/monitorodata/ResourceUtilizationSummary?$apply=filter
    (DesktopGroupId eq desktop-group-id and granularity eq 1440 and
    SummaryDate ge startdate and SummaryDate lt enddate)/groupby((
    MachineId), aggregate(cast(TotalSessionCount, Edm.Int32) with
    average as AvgTotalSessionCount))/filter(AvgTotalSessionCount eq
    0.0)/aggregate($count as UnusedVDACount)
```

Find out the daily average uptime in minutes To find out the daily average uptime in minutes, you must provide the following:

- Desktop group ID
- Start date
- End date
- Day difference between the end date and start date.

For more information to reduce spending on the unused resources, see Workload rightsizing.

Sample query:

```
https://[<DDC URL>|https://api-us.cloud.com/monitorodata/
    ResourceUtilizationSummary?$apply=filter(DesktopGroupId] /
    monitorodata/ResourceUtilizationSummary?$apply=filter(desktopGroupId
     eq desktop-group-id and granularity eq 1440 and SummaryDate ge
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        startdate and SummaryDate lt enddate)/groupby((MachineId), aggregate
        (cast(UptimeInMinutes, Edm.Int32) div day-difference with sum as
        TotalUptimeInMinutes))/aggregate(TotalUptimeInMinutes with average
        as DailyAverageUptimeInMinutes)
```

Find out failed machine power action For more information on failed machine power action, see Failed power on action and Failed Power off action.

Sample query:

```
1  https:// <DDC URL> /monitorodata/Machines?$filter=LifecycleState eq 0
       and DesktopGroup/SessionSupport eq 1 and (cast(LastPowerActionReason
       ,'Edm.Int32') eq 6 or cast(LastPowerActionReason,'Edm.Int32') eq 7
       or cast(LastPowerActionReason,'Edm.Int32') eq 8) and (cast(
       LastPowerActionFailureReason,'Edm.Int32') eq 300 or cast(
       LastPowerActionFailureReason,'Edm.Int32') eq 402 or cast(
       LastPowerActionFailureReason,'Edm.Int32') eq 401) and MachineRole eq
        0&$orderby=Name&$skip=0&$top=50&$expand=DesktopGroup($select=Name)&
       $select=Sid,Id,Name,IsAssigned,IPAddress,FaultState,
       LastDeregisteredCode,FailureDate,CurrentPowerState,
       CurrentSessionCount,IsInMaintenanceMode,LastPowerActionFailureReason
       ,LastPowerActionCompletedDate
```

Find out total savings For more information on cost savings, see the Cost savings page.

Sample query:

```
1  https://[<DDC URL>|https://api-us.cloud.com/monitorodata/
       ResourceUtilizationSummary?$apply=filter(DesktopGroupId] /
       monitorodata/MachineCostSavingsSummaries?$apply=aggregate(
       TotalAmountSaved with sum as TotalAmountSavedSum)
```

Find out the machine state For more information on cost savings, see the Cost savings page.

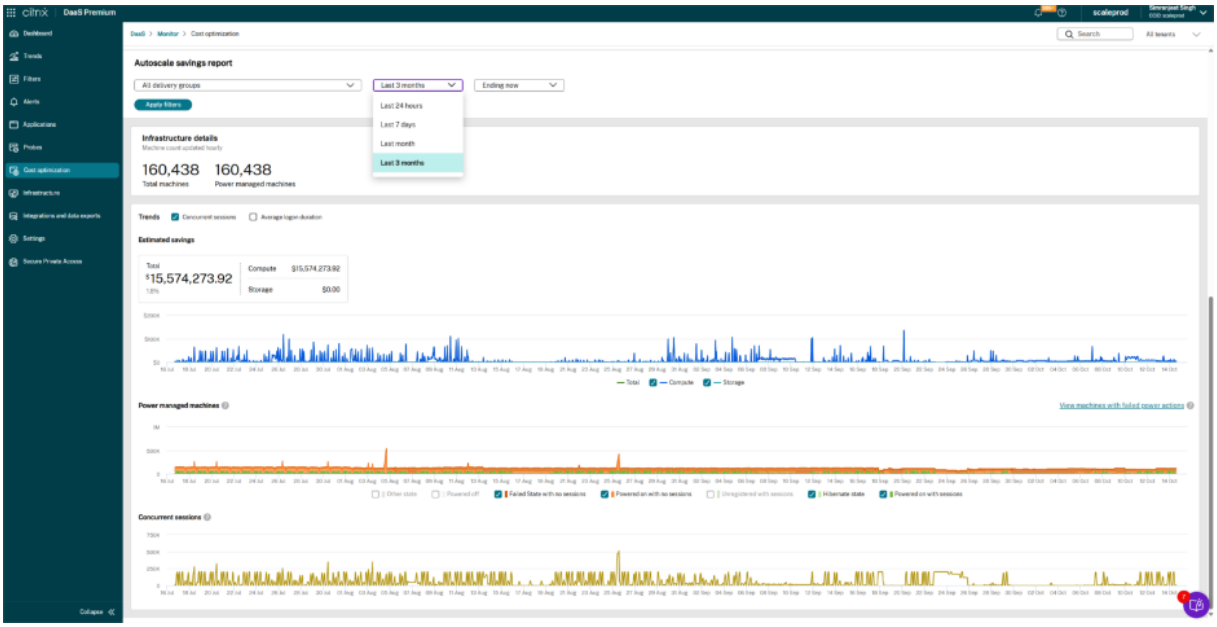
Sample query:

```
1  https:// <DDC URL> /monitorodata/MachineCostSavingsSummaries?$filter=
       SummaryDate eq 2024-08-09T06:00:00Z&$select=TotalMachinesCount,
       PowerManagedMachinesOff,PowerManagedMachinesInHibernate,
       PowerManagedMachinesOnWithSessions,
       PowerManagedMachinesOnWithoutSessions
```

Cost savings

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.



The **Cost savings** page provides a visual representation of infrastructure savings accrued over a selected period and forecasts expected savings for the remaining days. By analyzing machine usage and sessions, this page helps you to identify achieved savings and opportunities for cost reduction. This page offers:

- Insight into the optimization of infrastructure costs
- The amount saved
- Information on a range of scenarios that might result in exceeding projected costs
- Potential opportunities for identification and strategic planning to realize infrastructure cost savings

The machine usage typically increases during peak hours, demanding increased resources. The Autoscale™ feature helps you to reduce cost by automatically powering off unused machines during the low demand period. The projected savings depend on this usage pattern. However, costs might exceed expectations under specific circumstances, such as when unused machines are present or when there are failures in Autoscale power actions. Identifying the reasons behind these occurrences was previously challenging.

The **Cost optimization** page provides you detailed information on different scenarios that might cause you to exceed the expected cost. Similarly, for example, if there are machines with no sessions, it shows you further opportunities for cost savings.

Click the **Cost optimization** tab from the left menu on the **Home** page to access the **Cost optimization** page.

From the drop-down list on the top, if a site has both cloud and on-premises providers, you can now filter by all cloud providers, all on-premises providers, or individual providers.

Note:

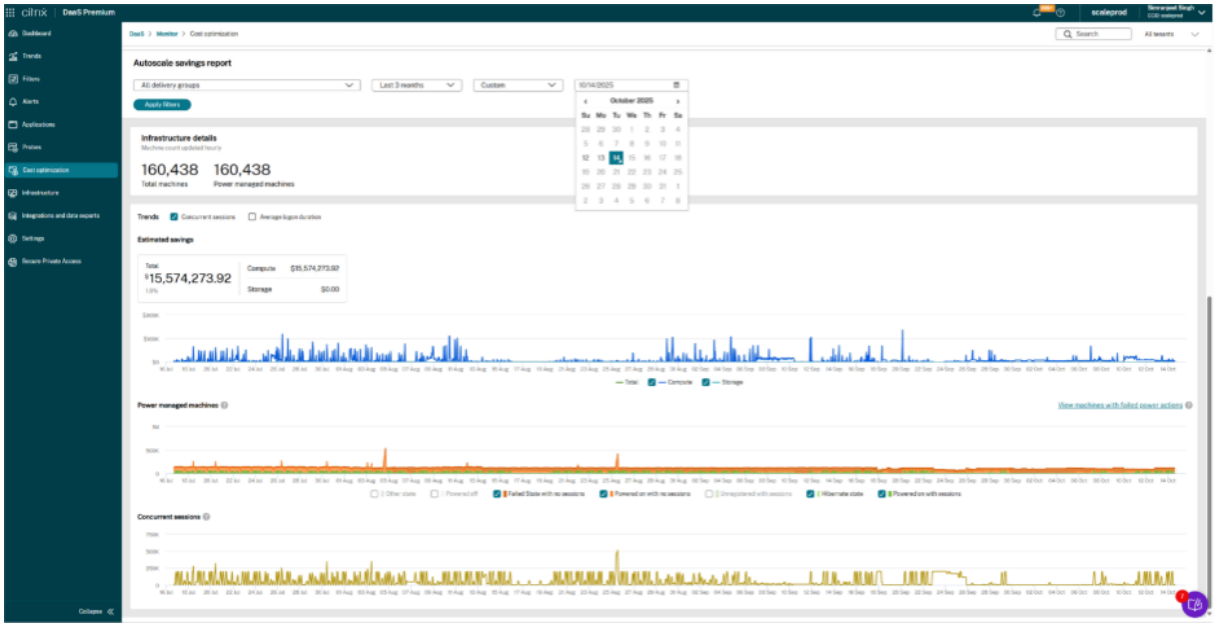
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> The filter is applied immediately upon selection without an apply button.

The **Cost optimization** page includes **Estimated savings** and **Autoscale savings report**. You can view cost savings in the currency of the hypervisor or as a percentage of the incurred cost.

Estimated savings: This graphical representation helps to evaluate the efficient utilization of infrastructure resources. The cost savings are displayed in the currency of the hypervisor or as a percentage of the cost incurred. This graph shows the savings achieved from the compute-related savings and storage savings.

Note:



> To view the savings from storage:
>
> - Autoscale must be enabled to optimize compute costs. For more information, see Get started with Autoscale.
> - Change the storage type to a lower tier when a VM is shut down to optimize storage costs. For more information, see Change the storage type to a lower tier when a VM is shut down documentation.
> - This feature is currently applicable only to Azure machines.

You can view the results for last:

- Seven days
- Thirty days
- Three months
- Six months
- Twelve months

The following picture shows the Estimated infrastructure savings section:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following table lists the elements of the Estimated infrastructure savings graph:

Element	Description
Total savings	Displays the total savings achieved in infrastructure for the selected duration. The savings are further categorized into storage and compute costs and are available in a tabular format.
Estimated savings	Displays the amount of savings achieved in infrastructure for the selected duration.
Power-managed machines	Displays the total number of power-managed machines.
Projected savings	Displays how much infrastructure savings can be done for the remaining duration.
Compute - Total	Displays total savings achieved from the compute-related savings.
Compute - Autoscale	Displays total savings achieved from the compute-related savings that are using the Autoscale feature.
Compute - User actions	Displays total savings achieved from the compute-related savings that are from user actions.
Storage - Total	Displays the total savings achieved from the storage savings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Element	Description
Storage - Autoscale	Displays total savings achieved from the storage savings that are using the Autoscale feature.
Storage - User action	Displays total savings achieved from the storage savings that are from user actions.

Autoscale Savings report: This graphical representation provides the savings report for the delivery groups for which the Autoscale feature is configured and enabled. This report is applicable only for the power-managed machines. You can select a delivery group and then select data for today, last day, last week, next week, this month, or next month. You can hover over any graphs to retrieve specific chart values.

> **Note:**
>
> If the delivery group is deleted, you can't get any data in the Autoscale savings report.

You can drill down to the following options from the delivery groups drop-down list :

- **All delivery groups**: Infrastructure details display all the delivery group information.
- **All single-session**: Infrastructure details for all delivery groups which are single-session machines along with the graphical representation of the machine power state, successful Autoscale power actions, and sessions when you hover over the chart.
- **All multi-session**: Infrastructure details for all delivery groups which are multi-session machines along with the graphical representation.
- **Select up to 15** - Infrastructure details display all the selected delivery groups, up to 15, along with a graphical representation.
- **Exclude up to 15** - Infrastructure details display all delivery groups, excluding the selected delivery groups, up to 15, with a graphical representation.

The data displays for the selected duration. The graphical representation of the **Estimated savings** is the actual savings of the selection made from the drop-down menu. When you hover over the peak points, the information about machine power state, successful Autoscale power actions, and sessions are shown.

Based on the delivery group selected, you can view the following details:

- **Infrastructure details**
    - Total machines and Power managed machines - Displays the total number of machines and out of that how many machines are power-managed. This data provides you a further opportunity to consider converting the remaining non-power managed machines to

© 1997–2026 Citrix Systems, Inc. All rights reserved.

power-managed machines, thereby enabling the Autoscale feature for a more comprehensive coverage. The data in the Infrastructure details section shows the last known information updated every hour.

- **Catalog details**

  Displays the name of the hypervisors (service providers). For more information, see Supported VDA hosting platforms. The data in the Catalog details shows the most recent data (live data) available at the current time.

  You can get the following details:

  - **Hypervisor name** - Displays the name of the hypervisor to which the site is connected. Displays all available hypervisors when multiple hypervisors are present.
  - **Instance** - Displays the name of the instance.
  - **Total Cost per hour** - Displays the cost per machine per hour in the currency that the hypervisor supports. For Azure machines, when the Microsoft.Consumption/pricesheets/read permission is available, the effective price is displayed in the currency that is configured in the Azure subscription. If permissions aren't available, the Azure retail price is displayed. For more information, see Azure Retail Prices overview. For other machines, cost is displayed based on the cost entered by admins in the Web Studio. The default cost is $1 if the cost is not mentioned in Web Studio. For more information, see [How is the cost calculated for optimizing the cost?
  - **Compute Cost Per Hour** - Displays the cost savings from the compute-related savings.
  - **Storage Cost Per Hour** - Displays the cost savings from the storage savings.
  - **Machines** - Displays the count of the machines for the selected instance.

- **Autoscale configuration (last known)**

  Tag in use - Displays the tag of the machines that is configured in the Autoscale settings in a WebStudio. You can also filter the data based on the tagged machines. In this case, you get only the tagged machines summary.

  Capacity buffer (peak) and **Capacity buffer (off peak)**

  Displays the percentage of buffer for machines that are powered on based on the maximum requirement of the delivery group during peak and off-peak times.

- **Estimated savings**

  Displays the amount of savings achieved in infrastructure for the selected duration. You can view the savings from compute-related savings and storage-related savings for the Azure machines with Autoscale feature enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Power managed machines**

  With Autoscale enabled, the power-managed machines are turned off when not in use to optimize costs. You can get the following details:

  - Number of machines powered off - This data helps you to analyze the number of machines that were powered off and thus helped to reduce cost.
  - Hibernate state - This data helps you to analyze how many machines are in the hibernated state.
  - Machines on with no sessions - This data provides you the opportunity to analyze why machines were active without any sessions. This data provides you the opportunity to plan for a more effective infrastructure savings strategy.
  - Machines on with sessions - This data helps you to analyze the number of machines that were powered on and with active sessions.
  - Power off - This data helps you to analyze the number of machines that were powered off or suspended and when this action was done. You can verify this data and make further modifications, contributing cost reduction.
  - Power on - This data helps you to analyze how many machines were powered on and when this action was done. You can verify this data and make further modifications and thus help to reduce cost.
  - Failed state with no sessions: This field displays the count of machines that are in a failed state and have no active sessions.
  - Unregistered with sessions: This field displays the count of machines that are in an unregistered state but are still serving sessions.

  > **Note:**
  >
  > You can see the count of machines in the Failed state with no sessions and Machines with failed power actions states and take actions based on the failure reason, time, and delivery group. The counts are clickable links that navigate to the Filters page for further actions. The count includes both single session and multi-session machines.

- **Concurrent sessions**

  Displays the total number of sessions at the selected time. This data helps you to determine when to power off machines for cost optimization.

- **Average logon duration**

Displays the average time for a user to log on over the selected time duration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Workload rightsizing

May 13, 2026

The enhanced workload rightsizing page helps you analyze the usage and sizing aspects of your delivery groups. Hereby, delivery groups can be analyzed based on machine or user activity.

The machine-based analysis enables you to:

- Categorize virtual desktops based on usage to identify machines with no or low activity and reduce spending on unused resources.Usage Analysis
- Analyze resource utilization on virtual desktops to identify machines that needs to be right sized to reduce cost or improve user experience.Sizing Analysis

The user-based analysis enables you to:

- Categorize the users based on their activity. Consider removing the access entitlement of users with no activity for IT hygiene reasons. Users with low usage could be moved to shared resources for a more efficient use of resources.
- Analyze the resource consumption of users to identify cohorts with higher or lower than average resource consumption, and to distribute users more effectively.

Click the **Cost Optimization** tab from the left menu on the Home page. And then, click the **Workload rightsizing** tab to access the **Workload rightsizing** page.

> **Note:**
>
> At the top of the page, you can toggle between machine and user-based analysis.

You can also click the **Rightsize this delivery group link** from the **Infrastructure details** section in the **Cost Optimization tab > Cost savings** to access the **Workload rightsizing** page.

Machine analysis is ideal for scenarios with virtual desktops statically assigned to users, such as Windows 365 Enterprise or Frontline dedicated. User analysis is useful for the analysis of delivery groups with randomly assigned virtual desktops. Both analyses are currently limited to single session machines.

> **Note:**
>
> The classic rightsizing analysis, accessible through the “All Workloads”button at the top of the page, will be deprecated in an upcoming release.

Usage analysis

Usage analysis enables you to categorize virtual desktops based on their activity levels as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Low or no usage machines (Dedicated machines)**: Machines in this category might no longer be necessary and can potentially be removed to save costs.
- **High usage machines (Dedicated machines)**: This category is critical for daily operations and might require additional service continuity measures.
- **Low or no-usage users (Pooled machines)**: Users with no activity within the selected timeframe may no longer need to be assigned to the delivery group. Removing them can help reduce the costs of your environment. Low-activity users may benefit from reassignment. To consolidate usage and reduce costs, consider moving low-activity users who have a dedicated desktop to a pooled desktop.

To perform usage analysis:

1. Select machines based on Delivery Groups or Tags
2. Choose the timeframe for analysis.
3. Review and configure thresholds that define low and high usage patterns.
4. Examine the summary section showing virtual desktop categorization based on configured thresholds.
5. Review the net active usage section displaying usage details for each machine. Idle and disconnected time can be included or excluded in net active usage analysis.
6. Use the drop-down to focus on specific categories.
7. Export machine names and associated users using the export function to review the names of the machines and their associated users.

> **Note:**
>
> The example provided illustrates machine-based usage analysis; however, the steps for user-based analysis are equivalent and are not discussed separately.

Sizing analysis

Sizing analysis categorizes virtual desktops or users based on resource utilization as follows:

- Oversized machines: Have more resources than necessary; reducing resource allocation can lower costs without impacting user experience
- Undersized machines: Lack sufficient resources; user experience can be improved by allocating more resources
- Right-sized machines: Fall between the oversized and undersized thresholds
- Light users: These users may benefit from reassignment. To consolidate and reduce costs, consider moving light users with a dedicated desktop to a shared pooled desktop.
- Moderate users: Moderate users are properly assigned to machines in a delivery group and should expect an optimal user experience.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Power users: Power users consume significant resources, and when they share a pooled desktop, their high usage can negatively impact the overall experience for other users on that machine. To enhance the experience for all users and ensure that power users have consistent access to a desktop, consider moving these users to a dedicated desktop or assigning them to individual delivery groups.

To perform Sizing Analysis:

1. Select machines based on Delivery Groups or Tags
2. Choose the timeframe for analysis.
3. Configure separate thresholds for CPU and Memory utilization.
4. Review the summary section showing virtual desktop categorization
5. Analyze the machine resource utilization chart showing CPU and Memory distribution
6. Fine-tune machine configurations based on resource type and identify outliers
7. Export machine names and associated users using the export function to review the names of the machines and their associated users

> **Note:**
>
> The example provided illustrates machine-based resource consumption analysis; however, the steps for user-based analysis are equivalent and are not discussed separately.

> **Note:**
>
> The utilization analysis uses 95th-percentile utilization for delivery groups in the selected timeframe, indicating that 95% of CPU or Memory utilization is at or below the set value.

Best practices

- Use usage analysis to identify cost-saving opportunities by removing underutilized machines.
- Apply sizing analysis to optimize resource allocation and improve user experience.
- Use machine analysis for statically assigned virtual desktop scenarios for accurate analysis.
- Use user activity for pooled virtual desktop scenarios for accurate analysis.
- Consider roaming patterns when analyzing randomly assigned virtual desktops.
- Export detailed reports for further analysis and documentation.

Key terms and charts

Machine net active usage: Net active usage is calculated by deducting the total uptime waste from the average machine uptime. All times are in minutes.

Percentage of Net Active Usage: The actual time users actively used the machine. This is the duration when at least one session was active while the machine was powered on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Average Machine Uptime: The total time the machine was powered on.

No Session: The wasted uptime due to no active sessions.

Idle Time: Wasted uptime due to idle sessions. This is the time when all sessions on the machine are idle.

Disconnected Time: Wasted uptime due to disconnected sessions. This is the time when all sessions on the machine are disconnected.

Total machine - Displays the total number of machines. This includes all the machines which were powered on during the selected period.

Average session density - This is an average across the number of machines and across the selected time period. Refers to the amount of session load on a machine which affects the resource available for sessions.

Unused machines - Displays the number of machines which had no sessions over the selected time period but which were still powered on.

CPU utilization:

Machine cohort - Provides information about the machine groups categorized into top, middle, and bottom based on its CPU utilization. Thresholds limit can be configured by the admins.

Range of CPU Peaks - Displays the CPU peaks range based on its utilization corresponding to the machine cohort.

Machines - Displays the number of machines corresponding to the machine cohort.

Session density - Displays the session density corresponding to the machine cohort.

Resource utilization trends:

Range of CPU peaks - Displays the range of CPU peaks in a band. When you hover on any point in the band, the top and bottom value of the band is displayed.

Peak memory utilization - Displays the highest memory utilization for the selected machines and for the selected time over a graph.

Average Session density - Displays the average session density for the selected machines and for the selected time over a graph.

Average ICA RTT - Displays the average round trip time for the session. This chart shows breaks when there are no active sessions or when sessions are disconnected.

Average logon duration - Displays the average logon duration for the selected machines and for the selected time period over a graph. This chart shows data when a new logon starts during the selected time.

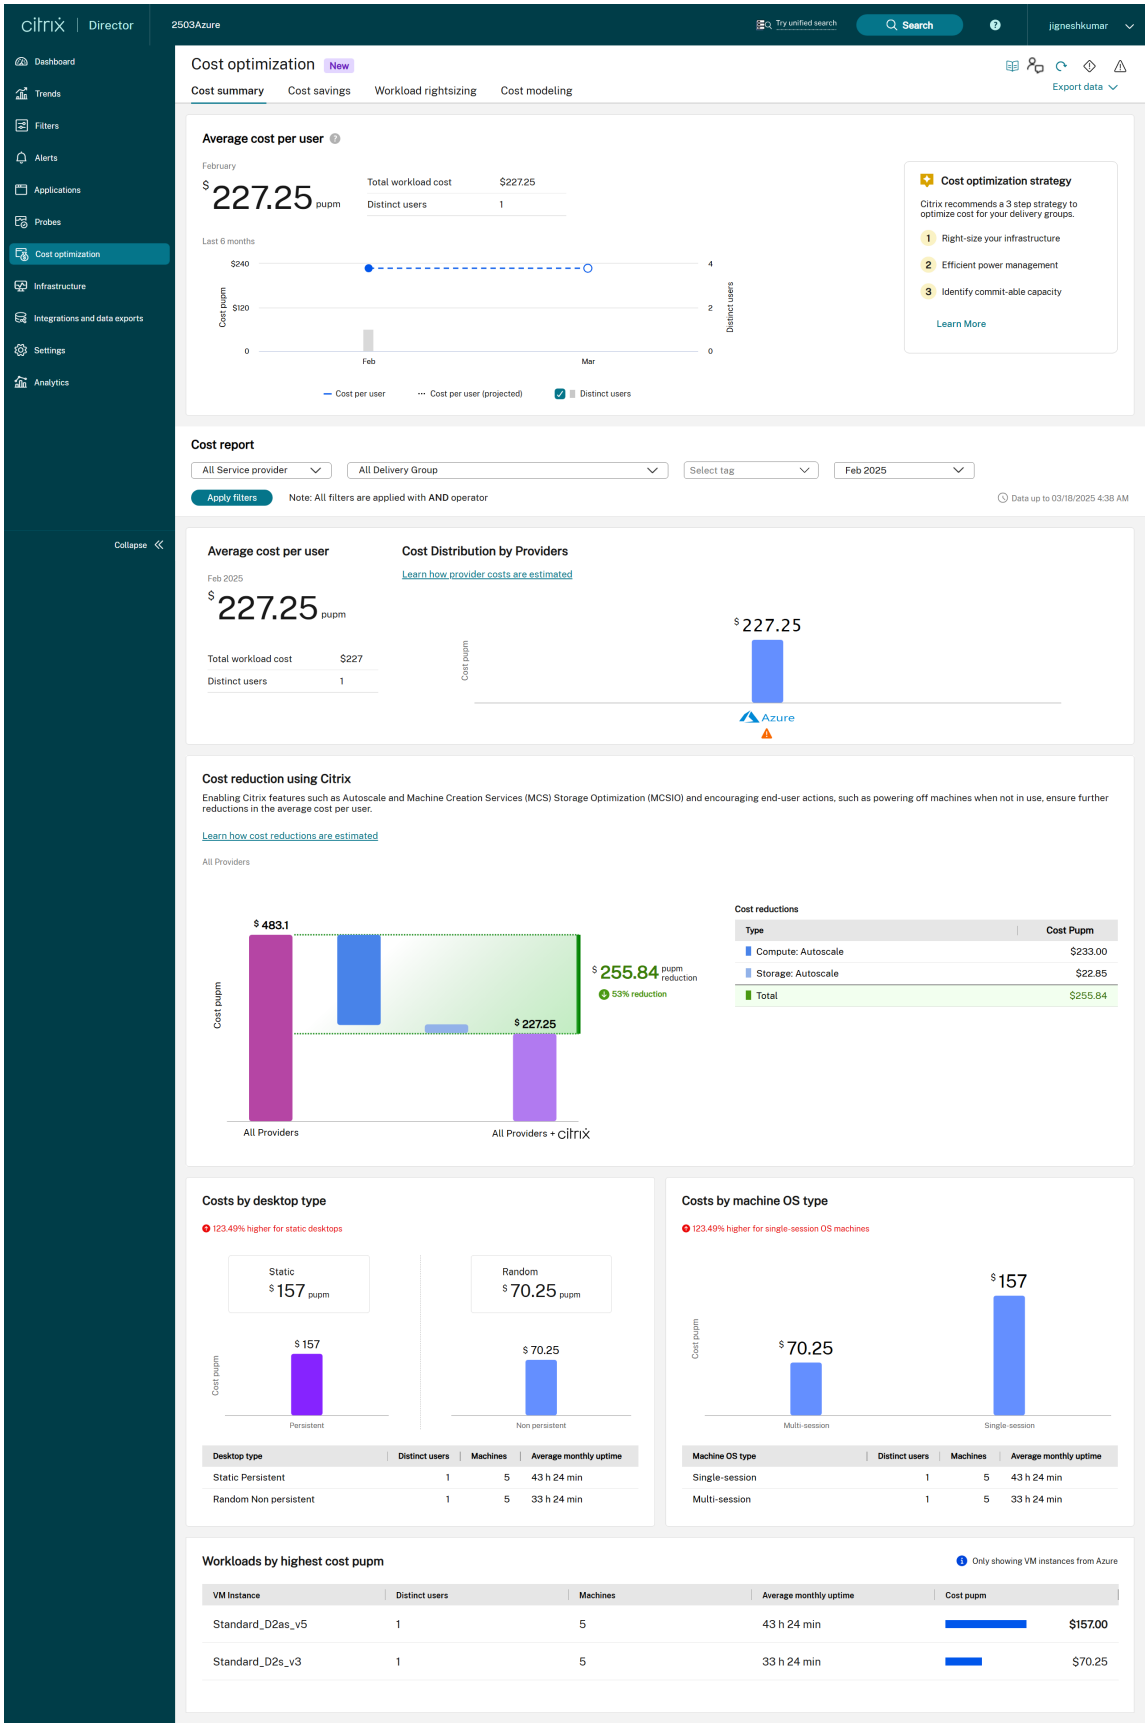
Cost summary

May 13, 2026

The **Cost summary** page provides a comprehensive summary of the expenses associated with running the Citrix® environment. With this enhancement, you gain visibility into:

- The overall cost per user
- Cost of delivering virtualization by the chosen Workload providers, desktop types, and VM series sets



This page offers:

- Insight into the cost of delivering a virtualized app or desktop to a user
- The amount saved
- Information on costs and savings categorized by:
  - Platform provider
  - OS type
  - Desktop type
  - VM series

> **Note:**
>
> The **Cost summary** page is available only if the site has been running for at least 15 days in a month.

To access the **Cost summary** page, click **Director** > **Cost optimization** > **Cost summary**. The **Cost summary** page appears:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The **Cost summary** page includes:

- **Average cost per user**

  You can view the actual cost per user per month for the last six months and also the projected cost for the current month. In addition, you can see the total cost of workloads and the number of distinct users on the site. When multiple currencies are involved, costs are displayed in USD if USD is one of them. Otherwise, the cost is shown in a randomly selected currency from the list. The cost savings compared to the last and last to the last months are provided in percentage. Also, the changes in the number of distinct users are also presented. The graphical representation shows the trend for every month.

  You can use the average cost per user and optimize the usage.

- **Cost report**

  You can view the cost report of the selected service providers, for the selected delivery group, and for the selected tag. You can view the report for the last three months separately or a consolidated view of the last three months' data.

- **Cost reduction using Citrix**

  You can further reduce the average cost per user by enabling Citrix features such as Autoscale and Machine Creation Services™ (MCS), Storage Optimization (MCSIO). Also, encourage end-user actions, such as powering off machines when not in use.

  This data displays the total savings when Citrix features are applied. It also displays the savings from the end-user actions.

- **Cost by desktop type**

  You can view the costs of the following types of desktops:

  - **Static persistent:** The user signs on to the same virtual desktop each time and the changes made to the desktop are saved.
  - **Static non-persistent:** The user signs on to the same virtual desktop each time and the changes made to the desktop are not saved.
  - **Random persistent:** The user is assigned a virtual desktop from the pool of desktops and the changes made to the desktop are saved.
  - **Random non-persistent:** The user is assigned a virtual desktop from the pool of desktops and the changes made to the desktop are not saved.

  You can view the number of distinct users, machines, and average monthly uptime for each type of machine.

  You can use this data and plan for saving costs by moving users to different types of desktops. For example, static persistent desktop types require more resource usage compared to random

© 1997–2026 Citrix Systems, Inc. All rights reserved.

non-persistent desktops. So, you can plan to move some users from static persistent desktop types to random non-persistent desktop types.

- **Cost by OS type**

  You can view the costs of single-session and multi-session OS types. You can view the machine OS type, distinct users, machines, and average monthly uptime. You can use this data and plan for saving costs by moving users to different types of OS.

- **Workloads by highest cost per user per month**

  You can view the details of the highest cost per user per month, including the virtual machine instance, number of distinct users, and average uptime of the machine. Also, you can see the number of machines and the cost per user.

  Use this data to view the cost for each VM configuration type and decide which configurations to assign to users.

Feature compatibility matrix

May 15, 2026

Citrix Director 7 2503 is compatible with:

- Citrix Virtual Apps and Desktops™ 7 2112 and later
- Citrix Virtual Apps and Desktops™ 7 1912 LTSR

Within each site, although you can use Director with earlier versions of Delivery Controller™, all the features in the latest version of Director might not be available. Citrix recommends having Director, Delivery Controller, and the VDAs at the same version.

> **Note:**
>
> After you upgrade a Delivery Controller, you are prompted to upgrade the site when you open Studio. For more information, see the **Upgrade Sequence** section in Upgrade a deployment.

The first time you log in after a Director upgrade, a version check is performed on the configured sites. If any site is running a version of the Controller earlier than that of Director, a message appears on the Director console, recommending a site upgrade. Additionally, as long as the version of the site is older than that of Director, a note remains displayed on the Director Dashboard indicating this mismatch.

> **Note:**
>
> Earlier versions of Citrix Director do not display policies applied to user sessions running on recent VDA versions. Citrix Director 1912 and earlier versions do not display policies applied to user

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> sessions running on VDA versions 2003 and later. Use Citrix Director versions 2003 and later to view those policies.

Specific Director features with the minimum version of Delivery Controller (DC), VDA and other dependent components required along with License Edition are listed below.

Director Version	Feature	Dependencies - min version required	Edition
2507	Microsoft call quality dashboard for monitoring and troubleshooting	None	All
2507	Improved handling of vertical and horizontal load balancing alerts	None	All
2507	Change in default policy behavior of the endpoint data collection used in Session topology	None	All
2507	Enhanced definitions of ICA RTT and Network latency measurements in Director	None	All
2507	Enhanced visibility of plug-in manager and optimization state for real-time communication applications	None	All
2503	Cost modeling for Azure workloads	None	All
2503	Enhancements to Cost savings page	None	All
2503	Director integration with uberAgent	VDA 2503 (uberAgent installed)	All

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director Version	Feature	Dependencies - min version required	Edition
2503	Local application usage reporting	VDA 2503	Platinum-licensed sites
2503	Monitoring VDA logon duration details	VDA 2503	All
2503	Additional metrics collection for Provisioning Service	VDA 2503	All
2503	Option to extend monitoring of HDX optimization beyond Microsoft Teams	VDA 2503	All
2503	Session auto reconnect details in Filters view and Session Performance tab	VDA 2503	All
2503	Unified platform experience for Citrix Director	None	All
2503	Custom role to limit bulk action option for user actions	None	All
2503	Provision to set site level alerts for Provisioning Service and Delivery Controller	VDA 2503	All
2503	Integration with Webhook	None	All
2411	Least used and unused published apps report on the Applications page	DDC 7.16, VDAs 7.15	Platinum-licensed sites

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director Version	Feature	Dependencies - min version required	Edition
2411	Enumerated application details for TCP or UDP apps on the Activity Manager	VDA 2411 and DDC 2411	All
2411	Webhook configuration using PowerShell SDK	VDA 2411 and DDC 2411	All
2411	Bulk alert dismissal	VDA 2411 and DDC 2411	All
2411	Machine net active usage in Workload rightsizing page	None	All
2411	Cost savings by optimizing storage usage (Preview)	None	All
2411	Cost summary (Preview)	None	All
2411	Delivery Controller monitoring (Preview)	VDA 2411	All
2411	Connecting Citrix components from the UI (Preview)	VDA 2411	All
2407	Cost optimization	None	All
2407	Integrations and data exports	VDA 2407	All
2407	Diagnose historical user sessions (Preview)	VDA 2407	All
2407	Activity Manager for Secure Private Access session (Preview)	VDA 2407	All

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director Version	Feature	Dependencies - min version required	Edition
2407	Secure Private Access integration for TCP and UDP apps with Director (Preview)	VDA 2407	All
2407	Infrastructure monitoring (Preview)	VDA 2407	All
2407	Unregistered machines alert	VDA 2407 and DDC 2407	All
2407	Machine uptime alert	VDA 2407 and DDC 2407	All
2407	Failed power on action and Failed Power off action alert	VDA 2407 and DDC 2407	All
2407	Capability to include CSV attachment in alert emails and JSON payload in alert Webhook	VDA 2407 and DDC 2407	All
2407	Inspect machines with recent power actions	VDA 2407	All
2407	Advanced alert policies	VDA 2407 and DDC 2407	All
2407	Unified search for cloud and on-premises users	DDC 2407	All
2407	Published application usage monitoring charts on Dashboard	VDA 2407 and DDC 2407	Platinum-licensed sites
2402 LTSR	Secure Private Access integration for web and SaaS apps with Director (Preview)	VDA 2402 LTSR	All

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director Version	Feature	Dependencies - min version required	Edition
2402 LTSR	Support for Microsoft Teams version 2.1 or earlier	VDA 2402 LTSR	All
2311	Play Back live and recorded sessions	VDA 2308 and DDC 2311	All
2311	Session topology and performance metrics	Multiple versions - link	All
2311	Optimal screen resolution	None	All
2311	MS Teams Optimization	VDA 2311 and DDC latest	All
2311	Probes Overview enhancements	None	All
2311	Revamped Session Logon Duration view	None	All
2308	Probes summary and drilldown	None	All
2308	Citrix Probe Agent support for Citrix Gateway Multi-factor authentication	Citrix Gateway	All
2308	Disable Hypervisor Alerts	None	All
2308	Trends for Session Experience metrics	None	All
2305	Support authentication via Citrix Gateway	None	All
2305	Autoscale management in Director	None	All
2303	Failed Machines Alert	DC 7 2303	Premium

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director Version	Feature	Dependencies - min version required	Edition
2203	TLS 1.3 support	-	All
2212	Real-time GPU Utilization available for AMD GPUs	DC 7.14 and VDA 7.14 running 64-bit Windows and HDX 3D Pro enabled	All
2212	Advanced Probe Scheduling	DC 7 1906 and Citrix Probe Agent 2209	Premium
1909	Configure on-prem sites with Citrix Analytics for Performance	DC 7 1906 and VDA 1906	All
1906	Session Auto Reconnect	DC 7 1906 and VDA 1906	All
1906	Session startup duration	DC 7 1906 and VDA 1903	All
1906	Desktop probing	DC 7 1906 and Citrix Probe Agent 1903	Premium
7.9 and later	Citrix Profile Management Duration in Profile Load	VDA 1903	All
1811	Profile Drilldown	DC 7 1811 and VDA 1811	All
1811	Hypervisor Alerts Monitoring	DC 7 1811	Premium
1811	Application probing	DC 7 1811 and Citrix Application Probe Agent 1811	Premium
1811	Microsoft RDS license health	DC 7 1811 and VDA 7.16	All
1811	Key RTOP Data display	DC 7 1811 and VDA 1808	Premium
1808	Export of Filters data	DC 7 1808	All
1808	Interactive Session drill down	DC 7 1808 and VDA 1808	All

7.14	GPU Monitoring	DC 7.14 and VDA 7.14	All
7.13	Transport protocol on Session Details panel	DC 7.x and VDA 7.13	All

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director Version	Feature	Dependencies - min version required	Edition
7.12	User-friendly Connection and Machine failure descriptions	DC 7.12 and VDA 7.x	All
7.12	Increased historical data availability in Enterprise edition	DC 7.12 and VDA 7.x	Enterprise
7.12	Custom Reporting	DC 7.12 and VDA 7.x	Premium (formerly Platinum)
7.11	Resource utilization reporting	DC 7.11 and VDA 7.11	All
7.11	Alerting extended for CPU, memory and ICA RTT conditions	DC 7.11 and VDA 7.11	Premium (formerly Platinum)
7.11	Export report improvements	DC 7.11 and VDA 7.x	All
7.11	Integration with Citrix ADM	DC 7.11, VDA 7.x, and MAS version 11.1 Build 49.16	Premium (formerly Platinum)
7.9	Logon Duration breakdown	DC 7.9 and VDA 7.x	All
7.7	Proactive monitoring and alerting	DC 7.7 and VDA 7.x	Premium (formerly Platinum)
7.7	Windows Authentication Integration	DC 7.x and VDA 7.x	All
7.7	Single-session and Multi-session OS Usage	DC 7.7 and VDA 7.x	Premium (formerly Platinum)
7.6.300	Support for Framehawk virtual channel	DC 7.6 and VDA 7.6	All
7.6.200	Session recording integration	DC 7.6 and VDA 7.x	Premium (formerly Platinum)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Director Version	Feature	Dependencies - min version required	Edition
7	HDX Insight integration	DC 7.6, VDA 7.x, and Citrix ADM	Premium (formerly Platinum)

Data granularity and retention

May 13, 2026

Aggregation of data values

The Monitor Service collects various data, including user session usage, user logon performance details, session load balancing details, and connection and machine failure information. Data is aggregated differently depending on its category. Understanding the aggregation of data values presented using the OData Method APIs is critical to interpreting the data. For example:

- Connected Sessions and Machine Failures occur over a period. Therefore, they are exposed as maximums over a time period.
- LogOn Duration is a measure of the length of time, therefore is exposed as an average over a time period.
- LogOn Count and Connection Failures are counts of occurrences over a period, therefore are exposed as sums over a time period.

Concurrent data evaluation

Sessions must be overlapping to be considered concurrent. However, when the time interval is 1 minute, all sessions in that minute (whether they overlap) are considered concurrent. The size of the interval is so small that the performance overhead involved in calculating the precision is not worth the value added. If the sessions occur in the same hour, but not in the same minute, they are not considered to overlap.

Correlation of summary tables with raw data

The data model represents metrics in two different ways:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The summary tables represent aggregate views of the metrics in per minute, hour, and day time granularities.
- The raw data represents individual events or current state tracked in the session, connection, application, and other objects.

When attempting to correlate data across API calls or within the data model itself, it is important to understand the following concepts and limitations:

- **No summary data for partial intervals.** Metrics summaries are designed to meet the needs of historical trends over long periods of time. These metrics are aggregated into the summary table for complete intervals. There are no summary data for a partial interval at the beginning (oldest available data) of the data collection nor at the end. When viewing aggregations of a day (Interval=1440), this means that the first and most recent incomplete days do not have any data. Although raw data might exist for those partial intervals, it is never summarized. You can determine the earliest and latest aggregate interval for a particular data granularity by pulling the min and max SummaryDate from a particular summary table. The SummaryDate column represents the start of the interval. The Granularity column represents the length of the interval for the aggregate data.
- **Correlating by time.** Metrics are aggregated into the summary table for complete intervals as described in the preceding section. They can be used for historical trends, but raw events might be more current in the state than what has been summarized for trend analysis. Any time-based comparison of summary to raw data must consider that there are no summary data for partial intervals that might occur or for the beginning and ending of the time period.
- **Missed and latent events.** Metrics that are aggregated into the summary table might be slightly inaccurate if events are missed or latent to the aggregation period. Although the Monitor Service attempts to maintain an accurate current state, it does not go back in time to recompute aggregation in the summary tables for missed or latent events.
- **Connection High Availability.** During connection high availability, there will be gaps in the summary data counts of current connections, but the session instances will still be running in the raw data.
- **Data retention periods.** Data in the summary tables is retained on a different grooming schedule from the schedule for raw event data. Data might be missing because it has been groomed away from summary or raw tables. Retention periods might also differ for different granularities of summary data. Lower granularity data (minutes) is groomed more quickly than higher granularity data (days). If data is missing from one granularity due to grooming, it might be found in a higher granularity. Since the API calls only return the specific granularity requested, receiving no data for one granularity does not mean that the data doesn't exist for a higher granularity for the same time period.
- **Time zones.** Metrics are stored with UTC time stamps. Summary tables are aggregated on hourly time zone boundaries. For time zones that don't fall on hourly boundaries, there might be some discrepancy as to where data is aggregated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Granularity and retention

The granularity of aggregated data retrieved by Director is a function of the time (T) span requested. The rules are as follows:

- 0 < T <= 1 hour - uses per-minute granularity
- 0 < T <= 30 days - uses per-hour granularity
- T > 31 days - uses per-day granularity

Requested data that does not come from aggregated data comes from the raw Session and Connection information. This data tends to grow fast, and therefore has its own grooming setting. Grooming ensures that only relevant data is kept long term. Grooming ensures better performance while maintaining the granularity required for reporting. Customers on Premium licensed sites can change the grooming retention to their desired number of retention days, otherwise the default is used. In case there was a connectivity loss with the Site database, Monitor Service will use the default retention days for Premium entitlement as specified in the table below.

To access the settings, run the following PowerShell commands on the Delivery Controller™:

```
asnp Citrix.*
 Get-MonitorConfiguration
 Set-MonitorConfiguration -<setting name> <value>
```

#	Setting name	Schema table impacted	Tables and Chart impacted in Monitor pages	Retention days for Premium	Retention days for Advanced
1	GroomSessionsRetentionDays	MonitorData.Session and MonitorData.Connection tables	This setting impacts session details, Logon Duration by User Session, Application Based Usage tables on the Trends page.	90	31

#	Setting name	Schema table impacted	Tables and Chart impacted in Monitor pages	Retention days for Premium	Retention days for Advanced
22	GroomApplicationErrorsRetentionDays	MonitorData.ApplicationError	Daily error impacts error details shown in the "Application Errors" column on the Applications page.	1	1
23	GroomApplicationFaultsRetentionDays	MonitorData.ApplicationFault	Daily failure impacts the "Application Faults" column on the Applications page.	1	1

> **Caution:**
>
> Modifying values on the Monitor Service database requires restarting the service for the new values to take effect. You are advised to make changes to the Monitor Service database only under the direction of Citrix Support.

The settings GroomProcessUsageRawDataRetentionDays, GroomResourceUsageRawDataRetentionDays, and GroomSessionMetricsDataRetentionDays are limited to their default values of 1, while GroomProcessUsageMinuteDataRetentionDays is limited to its default value of 3. The PowerShell commands to set these values have been disabled, as the process usage data tends to grow quickly. Also, license based retention settings are as follows:

- **Premium licensed sites -** the grooming retention for all settings is limited to 1000 days (Citrix recommends 365 days).
- **Advanced licensed sites -** the grooming retention for all settings is limited to 31 days.
- **All other sites -** the grooming retention for all settings is limited to 7 days.

Exceptions:

- GroomApplicationInstanceRetentionDays can be set only in Premium licensed sites.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- GroomApplicationErrorsRetentionDays and GroomApplicationFaultsRetentionDays are limited to 31 days in Premium licensed sites.

Retaining data for long periods have the following implications on table sizes:

- **Hourly data.** If hourly data is allowed to stay in the database for up to two years, a site of 1000 delivery groups can cause the database to grow as follows:

  1000 delivery groups x 24 hours/day x 365 days/year x 2 years = 17,520,000 rows of data. The performance impact of such a large amount of data in the aggregation tables is significant. Given that the dashboard data is drawn from this table, the requirements on the database server might be large. Excessively large amounts of data might have a dramatic impact on performance.

- **Session and event data.** Data collected every time a session is started and a connection/reconnection is made. For a large site (100 K users), this data grows fast. For example, two years' worth of these tables would gather more than a TB of data, requiring a high-end enterprise-level database.

Citrix Director failure reasons and troubleshooting

May 15, 2026

The following tables describe the various failure categories, the reasons, and the action you need to take to resolve the issues. For more information, see Enums, error codes, and descriptions.

Connection failure errors

Category	Reason	Issue	Action
N/A	[0] Unknown. This error code is not mapped.	The Monitoring service cannot determine the reason for the reported launch or connection failure from information shared by the Brokering service.	Collect CDF logs on the controller and contact Citrix support.
[0] None	[1] None	None	N/A

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[2] MachineFailure	[2] SessionPreparation	Session preparation request from the delivery controller to the VDA failed. Possible causes: Communication issues between the controller and the VDA, issues experienced by the Broker Service while creating a prepare request, or network issues resulting in the VDA not accepting the request.	Refer to troubleshooting steps listed in Knowledge center article, Troubleshooting Virtual Delivery Agent Registration with delivery controllers in Citrix Virtual Apps and Desktops for common problems that cause communication issues between the controller and the VDA.
[2] MachineFailure	[3] RegistrationTimeout	The VDA was powered on, but a time-out occurred while it was attempting to register with the delivery controller.	Verify that the Citrix Broker Service is running on the delivery controller and that the Desktop service is running on the VDA. Start each if stopped.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[1] ClientConnection-Failure	[4] ConnectionTimeout	The client did not connect to the VDA after the VDA was prepared for session launch. The session was successfully brokered, but a time-out occurred while waiting for the client to connect to the VDA. Possible causes: Firewall settings, network interruptions, or settings that prevent remote connections.	Check the Director console to see if the client currently has an active connection, which means no user is impacted. If no session exists, review the event logs on the client and on the VDA for any errors. Resolve any issues with network connectivity between the client and the VDA.
[4] NoLicensesAvailable	[5] Licensing	The licensing request failed. Possible causes: Insufficient number of licenses, or the license server has been down for more than 30 days.	Verify that the license server is online and reachable. Resolve any network connectivity issues to the license server or reboot the license server if it appears to be malfunctioning. Verify that there are sufficient licenses in the environment and allocate more if necessary.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[1] ClientConnection-Failure	[6] Ticketing	A failure occurred during ticketing, indicating that the client connection to the VDA does not match the brokered request. A launch request ticket is prepared by the Broker and delivered in the ICA® file. When the user attempts to launch a session, the VDA validates the launch ticket in the ICA file with the Broker. Possible causes: ICA file is corrupt or the user is attempting to make an unauthorized connection.	Verify that the user has access to the application or desktop based on user groups defined in the delivery groups. Instruct the user to relaunch the application or desktop to determine whether this is a one off issue. If the issue occurs again, review the client device event logs for errors. Verify that the VDA to which the user is attempting to connect is registered. If unregistered, review the event logs on the VDA and resolve any registration issues.
[1] ClientConnection-Failure	[7] Other	A session has been reported as terminated from the VDA after the client has initially contacted the VDA but before it completed the connection sequence.	Verify if the session was not terminated by the user before launch. Try relaunching the session, if the problem persists, collect CDF logs and contact Citrix support.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[1] ClientConnection-Failure	[8] GeneralFail	The session failed to launch. Possible causes: A brokered launch was requested while the broker was still starting up or initializing, or internal error during the brokering phase of a launch.	Verify that the Citrix Broker Service is running and retry launching the session.
[5] Configuration	[9] MaintenanceMode	The VDA, or the delivery group to which the VDA belongs, is set in maintenance mode.	Determine whether maintenance mode is required. Disable maintenance mode on the delivery group or machine in question if it is not needed and instruct the user to attempt to reconnect.
[5] Configuration	[10] ApplicationDisabled	The application cannot be accessed by end users because it has been disabled by the administrator.	If the application is intended to be available for production use, enable the application and instruct the user to reconnect.
[4] NoLicensesAvailable	[11] LicenseFeature Refused	The feature being used is not covered by the existing licenses.	Contact a Citrix sales representative to confirm the features that are covered by the existing Citrix Virtual Apps and Desktops™ license edition and type.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[3] NoCapacityAvailable	[13] SessionLimitReached	All VDAs are in use and there is no capacity to host more sessions. Possible causes: All VDAs are in use (for single-session OS VDAs), or all VDAs have reached the configured maximum concurrent sessions allowed (for multi-session OS VDAs).	Verify if there are any VDAs in maintenance mode. Disable maintenance mode if it is not needed to free up more capacity. Consider increasing the value of **Maximum Number of Sessions** in the Citrix policy setting to allow more sessions per server VDA. Consider adding more multi-session OS VDAs. Consider adding more single-session OS VDAs.
[5] Configuration	[14] DisallowedProtocol	The ICA and RDP protocols are not allowed.	Run the **Get-BrokerAccessPolicyRule** PowerShell command on the delivery controller and verify that the **AllowedProtocols** value has all the desired protocols listed. This issue occurs only if there is a misconfiguration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[5] Configuration	[15] ResourceUnavailable	The application or desktop to which the user is attempting to connect is not available. This application or desktop might not exist, or there are no VDAs available to run it. Possible causes: The application or desktop has been unpublished, or the VDAs hosting the application or desktop have reached maximum load, or the application or desktop is set in maintenance mode.	Verify that the application or desktop is still published and the VDAs are not in maintenance mode. Determine whether the multi-session OS VDAs are at full load. If so, provision more multi-session OS VDAs. Verify that there are single-session OS VDAs available for connections. Provision more single-session OS VDAs if necessary.
[5] Configuration	[16] ActiveSessionReconnectDisabled	The ICA session is active and connected to a different endpoint. However, because the **Active Session Reconnection** is disabled, the client cannot connect to the active session.	On the delivery controller, verify that **Active Session Reconnection** is enabled. Verify that the value of **DisableActiveSessionReconnect** in the registry, under **HKEY_LOCAL_MACHINE\Software** is set to 0.
[2] MachineFailure	[17] NoSessionToReconnect	The client attempted to reconnect to a specific session but the session was terminated.	Retry the workspace control reconnection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[2] MachineFailure	[18] SpinUpFailed	The VDA cannot be powered on for session launch. This is a hypervisor reported issue.	If the machine is still powered off, attempt to start the machine from Citrix Studio. If this fails, review the hypervisor connectivity and permissions. If the VDA is a PVS-provisioned machine, verify in the PVS console that the machine is running. If not, verify that the machine is assigned a Personal vDisk, log in to the hypervisor to reset the VM.
[2] MachineFailure	[19] Refused	The delivery controller sends a request to the VDA to prepare for a connection from an end user, but the VDA actively refuses this request.	Verify via ping, that the delivery controller and the VDA can successfully communicate. If not, resolve any firewall or network routing issues.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[2] MachineFailure	[20] ConfigurationSet Failure	The delivery controller did not send required configuration data, such as policy settings and session information, to the VDA during session launch. Possible causes: Communication issues between the controller and the VDA, issues experienced by the Broker Service while creating a configuration set request, or network issues resulting in the VDA not accepting the request.	-
[3] NoCapacityAvailable	[21] MaxTotalInstance-sExceeded	The maximum number of instances of an application has been reached. No additional instances of the application can be opened on the VDA. This issue is related to the application limits feature.	Consider increasing the application setting, **Limit the number of instances running at the same time** to a higher value if licensing permits.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[3] NoCapacityAvailable	[22] MaxPerUserInstancesExceeded	The user is attempting to open more than one instance of an application but the application is configured to allow only a single instance of the application per user. This issue is related to the application limits feature.	Only one instance of the application is allowed per user by default. If multiple instances per user are required, consider clearing the **Limit to one instance per user** setting in the application setting.
[1] ClientConnectionFailure	[23] Communication error	The delivery controller attempted to send information to the VDA, such as a request to prepare for a connection, but an error occurred during the communication attempt. This can be caused due to network disruptions.	If already started, restart the Desktop service on the VDA to restart the registration process and verify that the VDA registers successfully. Confirm that the delivery controllers configured for the VDA are accurate via the details in the application event log.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Category	Reason	Issue	Action
[3] NoCapacityAvailable	[100] NoMachineAvailable Monitoring service converts [12] NoDesktopAvailable to this error code.	The VDA assigned to launch the session is in an invalid state or is unavailable. Possible causes: Power state of the VDA is unknown or unavailable, the VDA did not reboot since the last user's session, session sharing is disabled while the current session requires it to be enabled, or the VDA was removed from the delivery group or from the site.	Verify that the VDA is in a delivery group. If not, add it to the appropriate delivery group. Verify that there are sufficient VDAs registered and in ready state to be able to launch the published shared desktop or application requested by the user. Verify that the hypervisor hosting the VDA is not in maintenance mode.
[2] MachineFailure	[101] MachineNotFunctional. Monitoring service converts [12] NoDesktopAvailable to this error code.	The VDA is not operational. Possible causes: The VDA was removed from the delivery group, the VDA is unregistered, the VDA power state is unavailable, or the VDA is experiencing internal issues.	Verify that the VDA is in a delivery group. If not, add it to the appropriate delivery group. Verify that the VDA shows as powered on in Citrix Studio. If the power state is unknown for several machines, resolve any issues with connectivity to the hypervisor or host failures. Verify that the hypervisor hosting the VDA is not in maintenance mode. Restart the VDA once these issues have been addressed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine failure type

Error Code	Error Code ID	Issue	Action
Unknown	-	-	-
Unregistered	3	-	-
MaxCapacity (represented as Max Load on Director)	4	Machine is reporting itself at maximum capacity i.e. Max Load Index	Ensure that all hypervisors are powered on. Add more machines to the affected Delivery Groups by adding more capacity to the hypervisor or by adding more hypervisors.
StuckOnBoot	2	The VM did not complete its boot sequence and is not communicating with the hypervisor.	Ensure that the VM booted successfully on the hypervisor. Check for other messages on the VM, such as OS issues. Ensure that the hypervisor tools are installed on the VM. Ensure that the VDA is installed on the VM.
FailedToStart	1	The VM experienced issues when trying to start on the hypervisor.	Check the hypervisor logs.
None	0	-	-

Machine deregistration reason (applicable when failure type is Unregistered or Unknown)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
AgentShutdown	0	The VDA experienced a graceful shutdown.	Power on the VDA if you do not expect it to be off based on existing power management policies. Review any errors in the event logs.
AgentSuspended	1	The VDA is in hibernation or sleep mode.	Take the VDA out of hibernation mode. Consider disabling hibernation for Citrix Virtual Apps and Desktops™ VDAs via power settings.
IncompatibleVersion	100	The VDA cannot communicate with the delivery controller due to a mismatch in the Citrix protocol versions.	Align the VDA and delivery controller versions.
AgentAddressResolutionFailed	101	The delivery controller was not able to resolve the VDA's IP address.	Verify that the VDA machine account exists in AD. If not, create it. Verify that the name and the IP address of the VDA in DNS are accurate. If not, correct them. If widespread, validate the DNS settings on the delivery controllers. Verify DNS resolution from the controller by running the `nslookup` command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
	101	The delivery controller was not able to resolve the VDA's IP address.	Verify that the VDA machine account exists in AD. If not, create it. Verify that the name and the IP address of the VDA in DNS are accurate. If not, correct them.
AgentNotContactable	102	A communication issue occurred between the delivery controller and the VDA.	Use a ping to verify that the delivery controller and the VDA can successfully communicate. If not, resolve any firewall or network issues. Refer to the troubleshooting steps listed in Knowledge Center article, Troubleshooting Virtual Delivery Agent Registration with delivery controllers in Citrix Virtual Apps and Desktops (CTX136668), for common problems that cause communication issues between the controller and the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
	102	A communication issue occurred between the delivery controller and the VDA.	Refer to troubleshooting steps listed in Knowledge Center article, Troubleshooting Virtual Delivery Agent Registration with delivery controllers in Citrix Virtual Apps and Desktops (CTX136668), for common problems that cause communication issues between the controller and the VDA. Contact Citrix support.
AgentWrongActiveDirectoryOU	103	An Active Directory discovery misconfiguration occurred. The site-specific OU (where the site controller info is stored in AD) configured in the VDA registry is for a different Site.	Ensure the active directory configuration is correct, or check registry settings.
EmptyRegistrationRequest	104	The registration request sent from the VDA to the delivery controller was empty. This can be due to a corrupt VDA software installation.	Restart the Desktop service on the VDA to restart the registration process and verify that the VDA registers correctly via the application event log.
MissingRegistrationCapabilities	105	The VDA version is not compatible with the delivery controller.	Upgrade the VDA or remove the VDA and then reinstall it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
MissingAgentVersion	106	The VDA version is not compatible with the delivery controller.	Reinstall the VDA software if the issue is impacting all machines.
InconsistentRegistrationCapabilities	107	The VDA cannot communicate its capabilities to the Broker. This can be due to incompatibility between the VDA and delivery controller versions. The registration capabilities, which change with each version, are expressed in a form that does not match the registration request.	Align the VDA and delivery controller versions.
NotLicensedForFeature	108	The feature you are attempting to use is not licensed.	Check your Citrix licensing edition, or remove the VDA and then reinstall it.
	108	The feature you are attempting to use is not licensed.	Contact Citrix support.
UnsupportedCredentialSecurityversion	109	The VDA and the delivery controller are not using the same encryption mechanism.	Align the VDA and delivery controller versions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
InvalidRegistrationRequest	110	The VDA made a registration request to the Broker but the content of the request is corrupt or invalid.	Refer to the troubleshooting steps listed in Knowledge Center article, Troubleshooting Virtual Delivery Agent Registration with delivery controllers in Citrix Virtual Apps and Desktops (CTX136668), for common problems that cause communication issues between the controller and the VDA.
SingleMultiSessionMismatch	111	The VDA's operating system type is not compatible with the machine catalog or delivery group.	Add the VDA to the correct machine catalog type or delivery group containing machines with the same operating system.
FunctionalLevelTooLowForCatalog	112	The machine catalog is set to a higher VDA functional level than the installed VDA version.	Verify that the VDA's machine catalog functional level matches that of the VDA. Upgrade or downgrade the machine catalog to match that of the VDA.
FunctionalLevelTooLowForDesktopGroup	113	The delivery group is set to a higher VDA functional level than the installed VDA version.	Verify that the VDA's delivery group functional level matches that of the VDA. Upgrade or downgrade the machine catalog to match that of the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
PowerOff	200	The VDA did not shut down gracefully.	If the VDA is supposed to be powered on, attempt to start the VDA from Citrix Studio and verify that it boots up and registers correctly. Troubleshoot any boot or registration issues. Review the event logs on the VDA once it is back up to help determine the root cause of the shutdown.
AgentRejectedSettingsUpdate	203	Settings such as Citrix policies were changed or updated but there was an error in sending the updates to the VDA. This can occur if the updates are incompatible with the installed VDA version.	Upgrade the VDA if necessary. Review whether the updates that were applied are supported with the VDA version.
SessionPrepareFailure	206	The Broker did not complete an audit of the sessions that are running on the VDA.	If widespread, restart the Citrix Broker Service on the delivery controller.
	206	The Broker did not complete an audit of the sessions that are running on the VDA.	Contact Citrix support.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
ContactLost	207	The delivery controller lost connection with the VDA. This can be caused by network disruptions.	Verify that the Citrix Broker Service is running on the delivery controller and the Desktop service is running on the VDA. Start each if stopped. If already started, restart the Desktop service on the VDA to restart the registration process and verify that the VDA registers successfully. Confirm that the delivery controllers configured for the VDA are accurate via the details in the Application event log. Use a ping to verify that the delivery controller and the VDA can successfully communicate. If not, resolve any firewall or network issues.
	207	The delivery controller lost connection with the VDA. This can be caused by network disruptions.	Verify that the Desktop service is running on the VDA. Start if stopped.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
BrokerRegistrationLimitReached	201	The delivery controller has reached the configured maximum number of VDAs that are allowed to concurrently register with it. By default, the delivery controller allows 10,000 concurrent VDA registrations.	Consider adding delivery controllers to the Site or creating a Site. You can also increase the number of VDAs allowed to concurrently register with the delivery controller via the **HKEY_LOCAL_MACHINE\Software** registry key. See Knowledge Center article, Registry Key Entries Used by Citrix Virtual Apps and Desktops (CTX117446) for more information. Increasing this number might require more CPU and memory resources for the controller.
SettingsCreationFailure	208	The Broker did not construct a set of settings and configurations to send to the VDA. If the Broker is unable to gather the data, registration fails and the VDA becomes unregistered.	Check the event logs on the delivery controller for any errors. Restart the Broker Service if a specific issue is not evident in the logs. Once the Broker Service is restarted, restart the Desktop service on the affected VDAs and verify that they successfully register.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Error Code	Error Code ID	Issue	Action
	208	The Broker did not construct a set of settings and configurations to send to the VDA. If the Broker is unable to gather the data, registration fails and the VDA becomes unregistered.	Restart the Desktop service on the affected VDAs and verify that they successfully register. Contact Citrix support.
SendSettingsFailure	204	The Broker did not send settings and configuration data to the VDA. If the Broker can gather the data but is unable to send it, registration fails.	If limited to a single VDA, restart the Desktop service on the VDA to force reregistration and validate that the VDA registers successfully via the application event log. Troubleshoot any errors seen. Refer to the troubleshooting steps listed in Knowledge center article, Troubleshooting Virtual Delivery Agent Registration with delivery controllers in Citrix Virtual Apps and Desktops (CTX136668), for common problems that cause communication issues between the controller and the VDA.

Secure Private Access integration with Director (Preview)

May 13, 2026

The Secure Private Access integration with Director allows help desk admin or full admin to monitor and troubleshoot all Secure Private Access sessions in Director. To support this feature, you must use the 2402 or later versions of Director, Secure Private Access, Citrix Workspace™ app, and VDA.

Available actions include viewing the details of the following:

- Secure Private Access active sessions for a user under the **Select a Session** popup > **Sessions** tab > **Web SaaS and Client/Server Apps**
- Secure Private Access failed or blocked enumerations and failed app launches under the **Select a Session** popup > **Denied Access** tab
- Session and application details view for active and failed app launches
- Session and application details view for failed and blocked enumerations

> **Note:**
>
> The Secure Private Access integration with Director is only supported for Director Forms-based authentication and not supported for Integrated Windows Authentication or Smart Card-based authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prerequisites

1. To support this feature, you must use the following:
    - Director 2402 or later version
    - Secure Private Access 2402 or later version
    - Citrix Workspace app 2402 or later version
2. Ensure that at least one Citrix Virtual Apps and Desktops™ site is configured on Director.
3. Set up Secure Private Access.
4. Make sure that the Director server has network connectivity to the Secure Private Access server.

    > **Note:**
    >
    > A trusted certificate must be installed on the Secure Private Access server to successfully establish a connection to Citrix Director.

5. Ensure that the Director admin user has the following permissions:
    a) Secure Private Access Full Admin or ReadOnly Admin in the Secure Private Access Admin console.
    b) Citrix Virtual Apps™ or Desktops help desk or Full Admin or ReadOnly Admin in the Citrix Studio console.

Configure Director with Secure Private Access

1. Open a command prompt as admin on the machine where Director is installed.
2. Go to the path of the `DirectorConfig` tool by running the following command:

    ```
    cd c:\inetpub\wwwroot\Director\tools
    ```

3. Run the following command to configure Secure Private Access:

    ```
    DirectorConfig.exe /configspa
    ```

4. Enter the FQDN of the machine where Secure Private Access is installed along with the port number.
5. Make sure that the connection to the Secure Private Access (server or load balancer) is secure and has a trusted certificate applied to it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
PS C:\inetpub\wwwroot\Director\tools> .\DirectorConfig.exe /configspa

 Make sure the SPA server or load balancer is reachable from this Director machine
 Enter SPA server or load balancer FQDN including port [https://spa-server.mydomain.com:4[redacted]3] : https://[redacted]

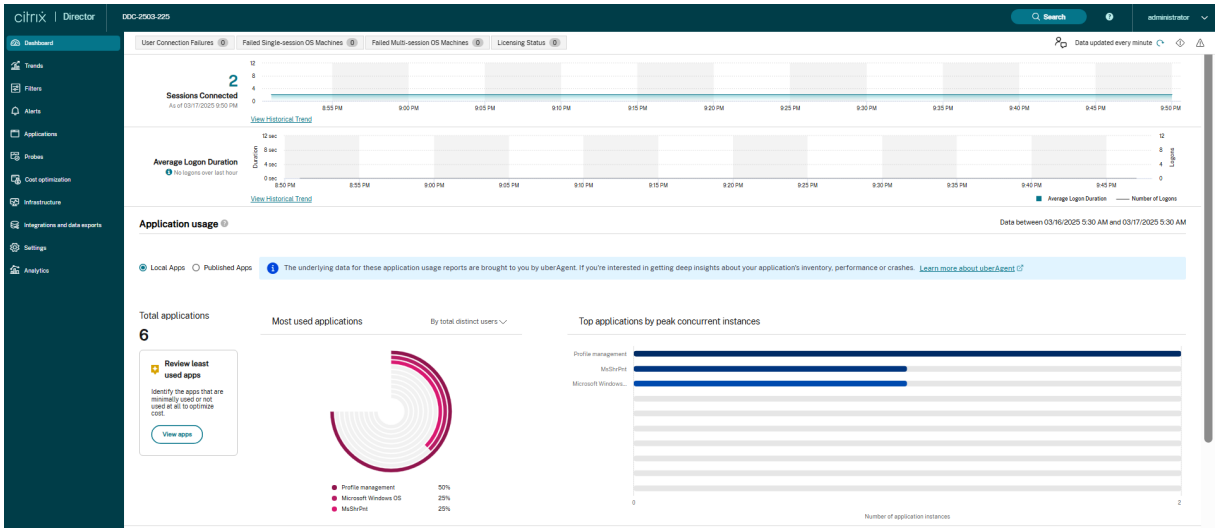
 Checking connectivity to https://spa1.gwonprem.corp[redacted]

 Spa Server or load balancer: https://s[redacted] is reachable.

 Checking Spa Server or load balancer is valid

 Retry with correct Spa Server FQDN which is reachable

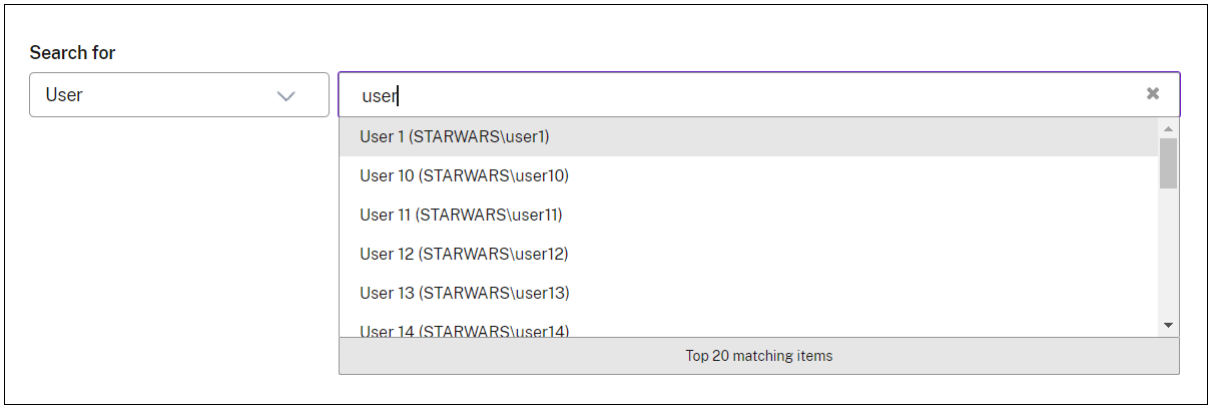
 Director configuration encountered an error



=====================================================
Spa Server or load balancer FQDN https://[redacted] is either invalid or Spa server/load balancer is down
=====================================================
```

> **Note:**
>
> The admins must be added to the Secure Private Access console to view the Secure Private Access session details in Director. For more information, see Manage administrators.

View a Secure Private Access session by user



On the Director dashboard, click **Search** and enter the user name. The **Select a session** screen appears.

Full admin:

Help desk admin:

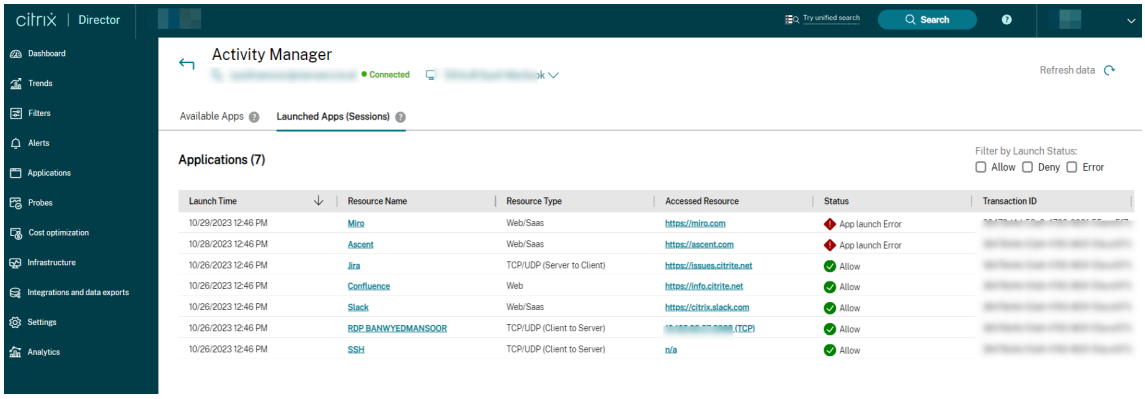
© 1997–2026 Citrix Systems, Inc. All rights reserved.

View the Activity Manager for Secure Private Access session

Citrix Director offers the Activity Manager view for Secure Private Access sessions which gives you an overall view of the session activities. The Activity Manager provides a comprehensive view of all apps and desktops that are successfully opened, failed to open, and the outcome of the policies set in the Secure Private Access app. This feature is available from Citrix Virtual Apps and Desktops version 2407 or later.

Prerequisites:

- Director 2407 or later version
- Secure Private Access 2407 or later version



The Activity Manager is displayed with the **Available Apps** and **Launched Apps** details. You can find the following session details:

- Launch time
- Resource name
- Resource type
- Accessed resource
- Status
- Transaction ID

To view the Activity Manager, do the following:

1. On the Director dashboard, click **Search** and enter the user name. The **Select a session** screen appears.
2. Select a session that is opened using the Secure Private Access session. The Activity Manager for the selected session appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **Available Apps** to view apps that are available in the Citrix Workspace app.

Or,

Click **Launched Apps (sessions)** to view the apps that are opened in the Citrix Workspace app.

You can filter the resources with the status of the resource set in the Secure Private Access app:

- Allow - Resources that are allowed for a user to access. This status is set using a policy under the Secure Private Access app. This resource is present for the user in the Citrix Workspace app.
- Deny - Resources that are denied for a user to access. This status is set using a policy under the Secure Private Access app. This resource is present for the user in the Citrix Workspace app.
- Error - Resources that are allowed to access for a user under the Secure Private Access app. However, because of some error, the resource isn't available in the Citrix Workspace app. There are two types of errors such as enumeration error and session error.

View available apps

The Web and SaaS apps that are available in the Citrix Workspace app are displayed under the **Available Apps** section. This section shows the last enumeration attempt of the apps and the status of the enumeration attempt.

You can view the following details:

- Resource name
- Status
- Transaction ID

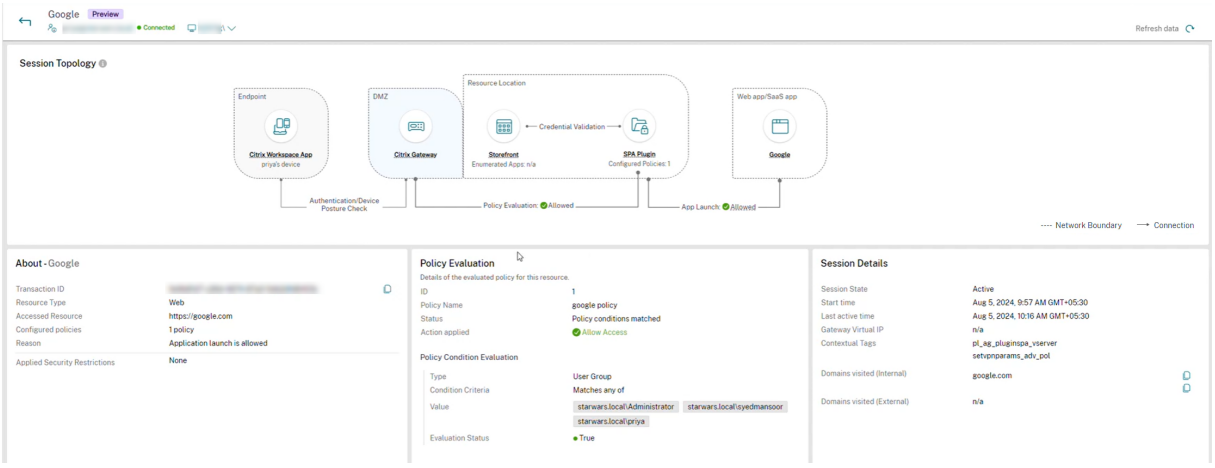
You can also filter the preceding details with the application status such as **Allow**, **Deny**, and **Error**. You also sort the details using the up and down arrow.

> **Note:**
>
> TCP/UDP apps aren't present in the **Available Apps** section.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

View launched apps

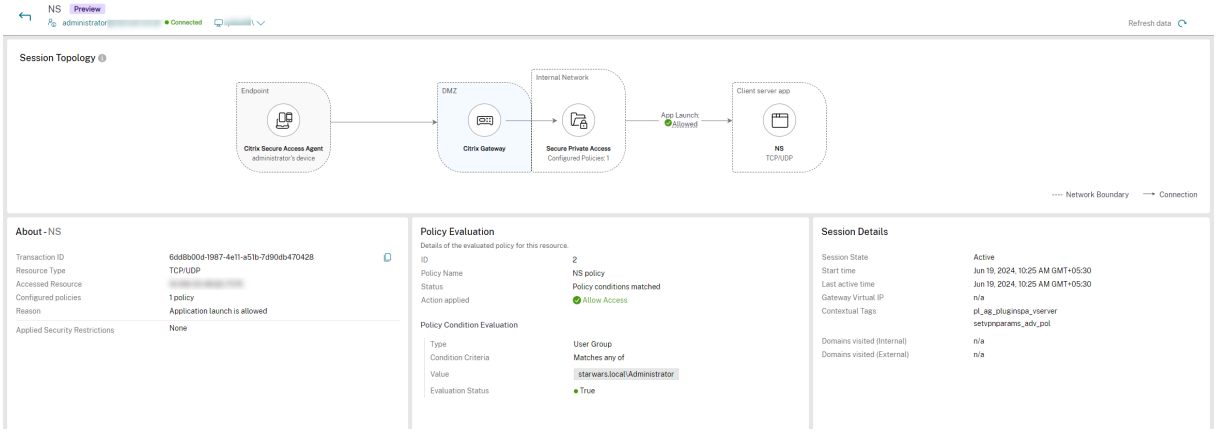
The apps that are opened in the Citrix Workspace app are displayed under the **Launched Apps (sessions)** section. You can view the following details:



- Launch time
- Resource name
- Resource type
- Accessed resource
- Status
- Transaction ID

You can also filter the preceding details with the application status such as **Allow**, **Deny**, and **Error**. You can also sort the details using the up and down arrow.

Session topology view for Secure Private Access apps



You can view the session topology for the apps opened using Secure Private Access. Click the required app from the **Activity Manager** to view the Session Topology of the selected app.

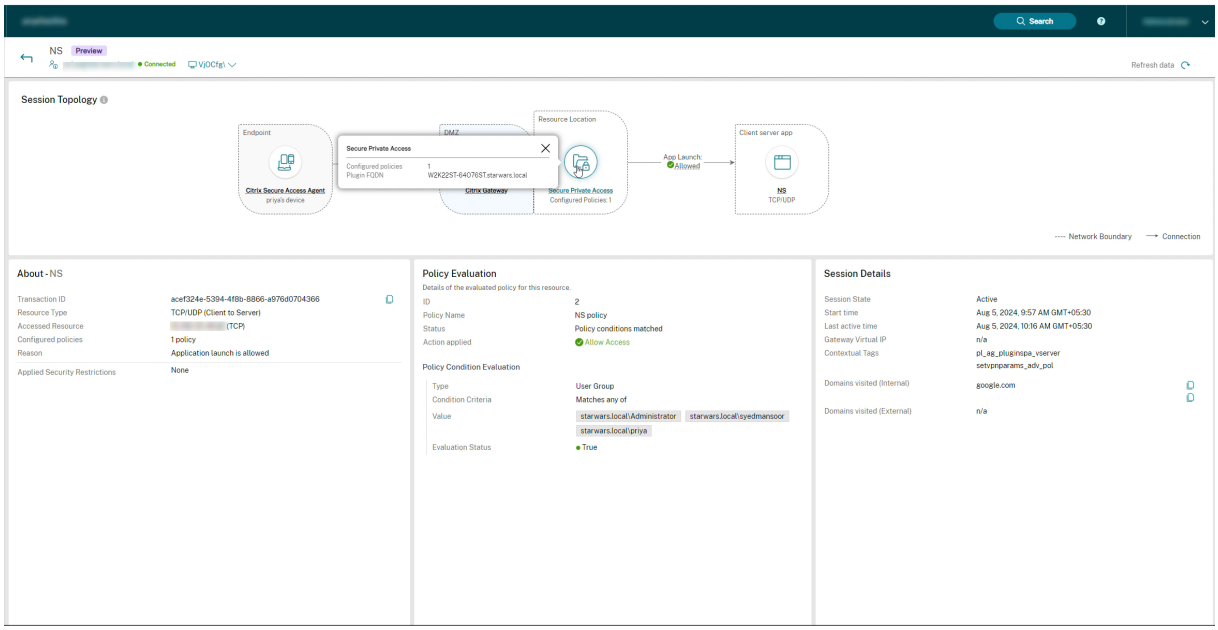
Web/SaaS apps:

TCP/UDP apps:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session Topology view provides the flow of the app launch process. The endpoint connects to the Citrix Gateway and Citrix Gateway connects to the Secure Private Access plug-in. Using the information from the Secure Private Access plug-in, the app is launched. This feature is available from Citrix Virtual Apps and Desktops version 2407 or later.

Prerequisites:



- Director 2407 or later version
- Secure Private Access 2407 or later version
- Citrix Secure Access 24.8.1.x or later version

You can view the following:

- Endpoint - Displays the endpoint where the app is opened. The possible options are Citrix Workspace app and Citrix Secure Agent. The device ID is displayed.
- Internal network - Displays the number of enumerated apps and the number of configured policies.
- Policy evaluation - Displays the result of the policy that is set on the Secure Private Access app. The different values are **Allowed**, **Denied**, **Access allowed with restrictions**, and **Error**. This is applicable only for Web or SaaS apps.
- App launched - Displays the type of apps and the status of app launch. The possible values for app types are Web/SaaS app or TCP/UDP app. Similarly, the possible values for app launch statuses are **Allowed**, **Denied**, **Access allowed with restrictions**, and **Error**.

You can now view the following extra details in the **Session Topology** view for Secure Private Access apps. This change applies to both Web and SaaS apps, in addition to TCP/UDP apps.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Endpoint:

Click the link within **Endpoint** to view the following:

- **Endpoint type:** This can be either the Secure Access Agent or Citrix Workspace app.
- **Access details:** View how the endpoint is accessed, whether through StoreFront™ or Citrix Workspace app.
- **Endpoint OS:** For example, Windows.
- **Location type:** Indicates whether the location is internal or external.

Resource Location:

Click the link within **Resource Location** to view the following:

> **Note:** This is applicable only for Web and SaaS apps.

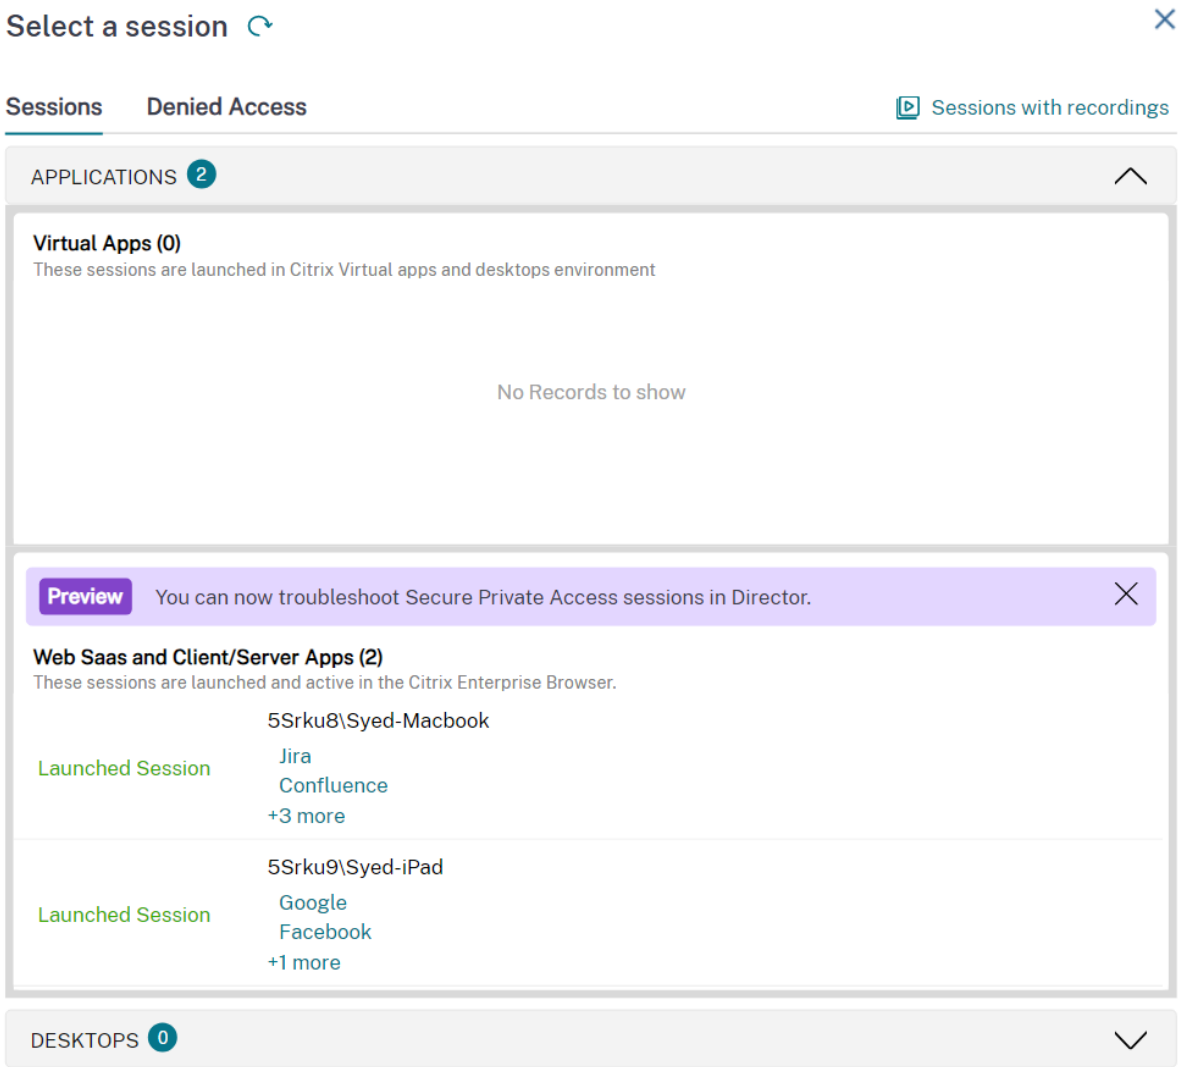
- **Number of enumerated applications:** Displays the number of enumerated applications and the store URL.
- **Access method:** Indicates whether the endpoint is accessed through StoreFront or Citrix Workspace app.

Secure Private Access:

- **Configured policies:** Displays the number of configured policies.
- **FQDN plug-in:** Shows the FQDN of the agent that served the request.

Web and SaaS App / Client-Server App (TCP/UDP):

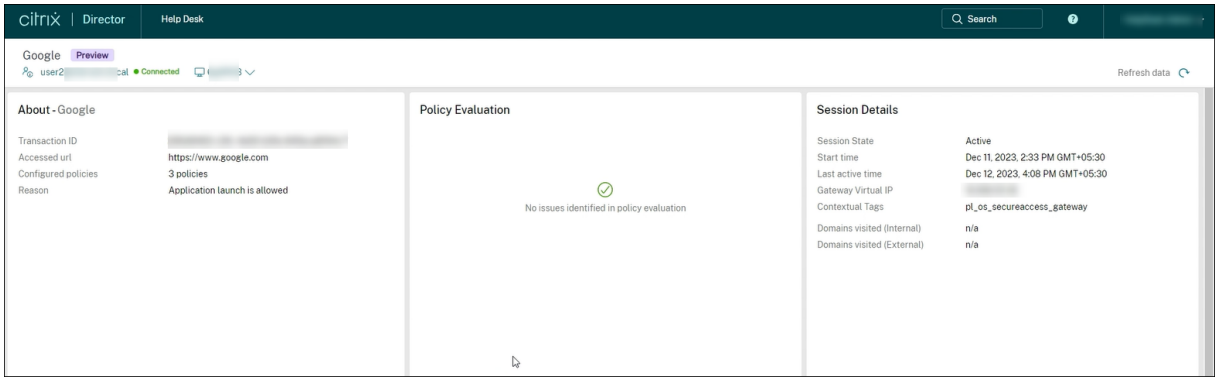
Click the link within **Web and SaaS App / Client-Server App** to view the following:



- **App name:** The name of the app.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

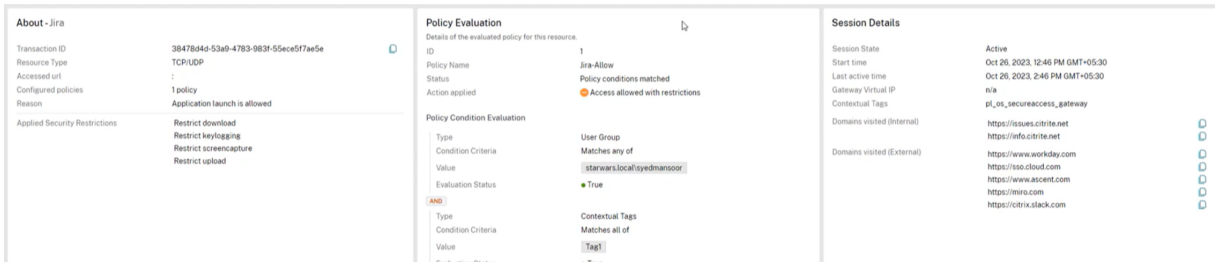
- **Top level URL:** For Web or SaaS apps, the URL of the published app is displayed. For TCP/UDP apps, the protocol IP address of the app is displayed.
- **App type:** Indicates whether the app is a Web or SaaS app, or a TCP/UDP app.
- **App publishing type:** Indicates whether the app is published externally or internally.



View successfully launched Web apps and SaaS apps

The successfully launched apps are displayed on the **Web SaaS and Client/Server Apps** section.

Click an app from the **Web SaaS and Client/Server Apps** section to view the details.

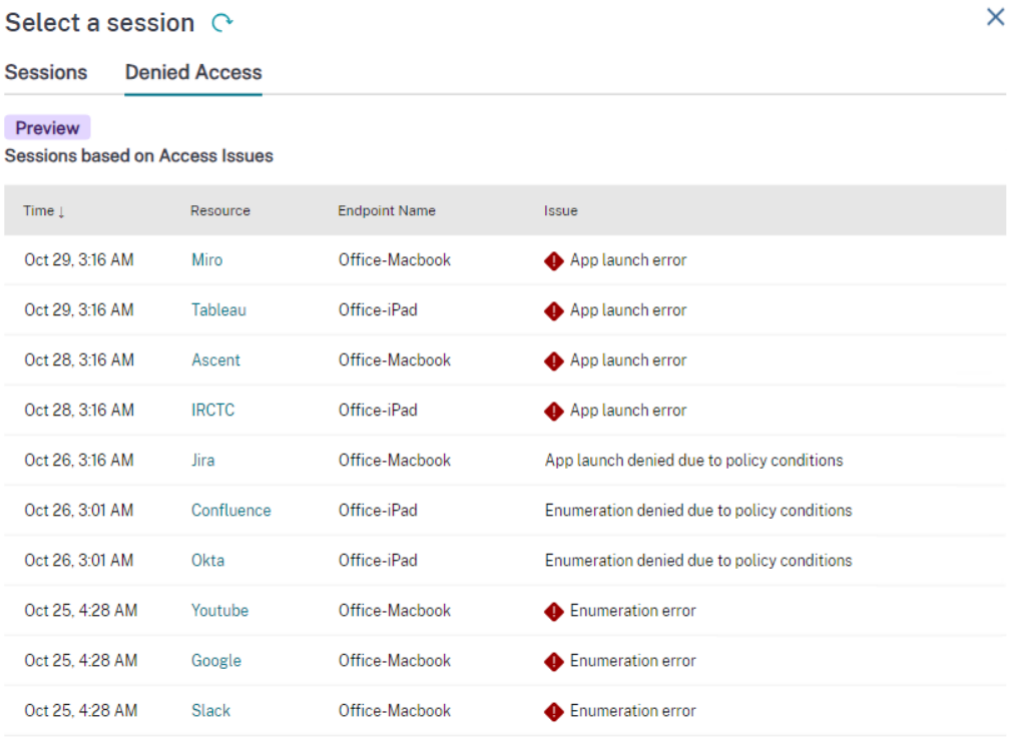


© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information on success codes, see Citrix Director related codes.

View details about the access denied apps

Click **Check Access Details** on the **Select a session** screen.



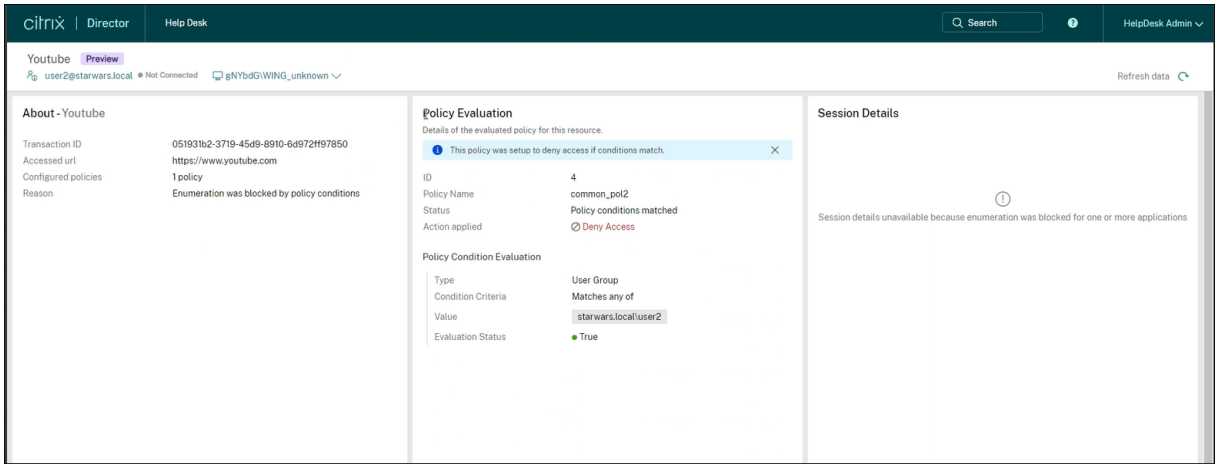
> **Note:**
>
> The **Check Access Details** button appears when there is no active session.

Or,

Click the **Denied Access** tab to view the apps for which the access is denied.

The **Denied Access** tab opens.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



The session details such as time, resource, endpoint name, and reason for failure are displayed. For more information on error codes, see Citrix Director related codes.

Currently, the following issues are identified:

- Enumeration denied due to policy conditions
- App launch error
- Enumeration errors
- App launch denied due to policy conditions

Select an app from the **Denied Access** tab > **Resource** column to view the details:

The following details are displayed for the successful or failed sessions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- About the app
- Policy evaluation
- Session details

About the app

The name of the successful, failed, or denied app is displayed. Along with it, the following details of the app for the success or failure are displayed:

Field	Description
Transaction ID	Citrix Transaction ID during the session or enumeration.
Resource Type	Displays the type of the resource. The possible values are Web, SaaS, TCP/UDP (Server to Client), and TCP/UDP (Client to Server).
Accessed Resource	The URL of the accessed resource during the session or enumeration. In the case of a TCP or UDP app, it shows whether the type of accessed resource is TCP or UDP.
Configured policies	The number of policies that are used within a session or enumeration.
Reason	The analysis of the session or enumeration activity.
Applied Security Restrictions	Displays the applied security restrictions which are applied in the Secure Private Access app.

Policy evaluation

Displays that no issues found during evaluation for a successful session. For a failed session or enumeration, the following details of the policies evaluated are displayed:

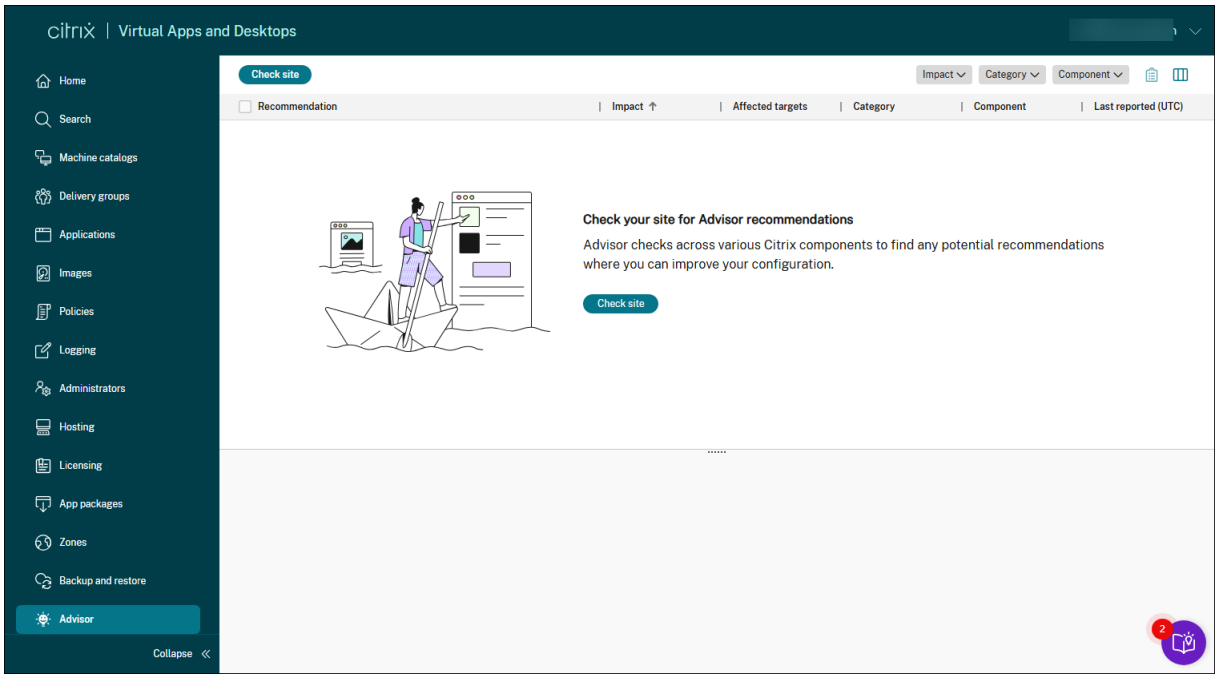
Field	Description
ID	Citrix Transaction ID.
Policy Name	The name of the policy. If there are multiple policies, the first policy that is matched with the set condition appears.
Status	The status of the policy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Description
Action applied	The action applied on the policy. For example, deny access.
Policy Condition Evaluation	
Type	The type of the policy condition.
Condition Criteria	The condition criteria of the policy applied in the failed session or enumeration.
Value	The value of the policy.
Evaluation Status	The evaluation status of the policy. The different values are **Allowed**, **Denied**, **Access allowed with restrictions**, and **Error**.

Session details

For a failed session, the reason for session failure is displayed. For a successful session, the following details are displayed:



Field	Description
Session State	Displays the state of the session whether it is active or inactive.
Start time	Displays the session start time.
Last active time	Displays the last active time of the successful session.
Gateway Virtual IP	Displays the virtual IP address of the gateway to which the successful session is connected.
Contextual Tags	Displays the contextual tags. The contextual tag on the Secure Private Access plug-in is the name of a NetScaler® Gateway policy (session, preauthentication, EPA) that is applied to the sessions of the authenticated users.
Domains visited (Internal)	Displays the internal domains accessed using the successful session.
Domains visited (External)	Displays the external domains accessed using the successful session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Advisor

August 31, 2026

Citrix Advisor is a service that helps you optimize Citrix Virtual Apps and Desktops deployment and enhance its overall health and readiness. It automates environment checks and delivers actionable recommendations, empowering you to proactively identify configuration issues, inefficiencies, resource wastes, deviations from best practices, and more.

Note:

- This service is available exclusively to **Full Administrators**.
- We recommend submitting your feedback using the feedback icon in the top-right corner of the page.

Benefits

With Advisor, you can:

- **Proactively identify and resolve issues**: Detect potential problems, configuration drift, and deviations from best practices before they impact users, disrupt business operations, or compromise security.
- **Optimize environment performance and stability**: Fine-tune configurations, optimize resource allocation, and implement best practices to enhance the stability, security, and performance of your Citrix deployments.

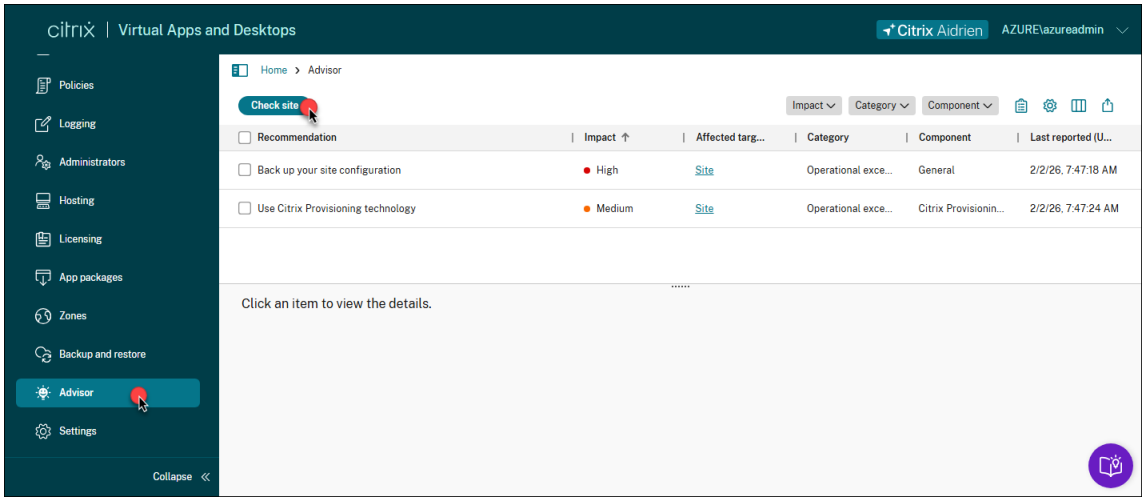
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Streamline operations and reduce overhead**: Automate routine checks, simplify complex remediation tasks, and receive guided assistance, thereby reducing operational overhead and freeing up administrative resources.
- **Optimize costs and resource utilization**: Identify areas of overspending, uncover opportunities for resource optimization, and ensure efficient utilization of Citrix technologies to minimize the total cost of ownership.
- **Maintain compliance and adherence to best practices**: Ensure that your Citrix deployments adhere to Citrix best practices, security standards, and industry regulations, reducing risk and improving overall governance.
- **Simplify complex tasks**: Simplify administrative tasks to support a healthy, optimized environment.

Check for recommendations

To check your site for Advisor recommendations, follow these steps:

1. Sign in to Web Studio using an account with the **Full Administrator** role.
2. In the left pane, select **Advisor**.
3. Click **Check site**.
4. On the **Check site** page, select the categories you want Advisor to check.



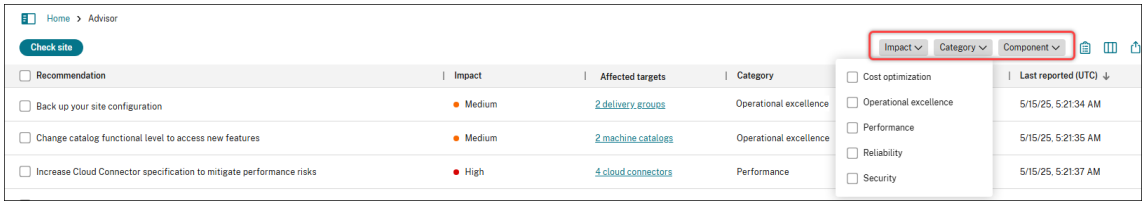
Category	Description	Reference
Security	Recommendations for detecting threats and vulnerabilities that might lead to security breaches.	Security recommendations
Reliability	Recommendations for ensuring and improving the continuity of your business-critical applications.	Reliability recommendations
Performance	Recommendations for enhancing performance across applications and desktops to deliver faster, more responsive experiences for end users.	Performance recommendations

© 1997–2026 Citrix Systems, Inc. All rights reserved.

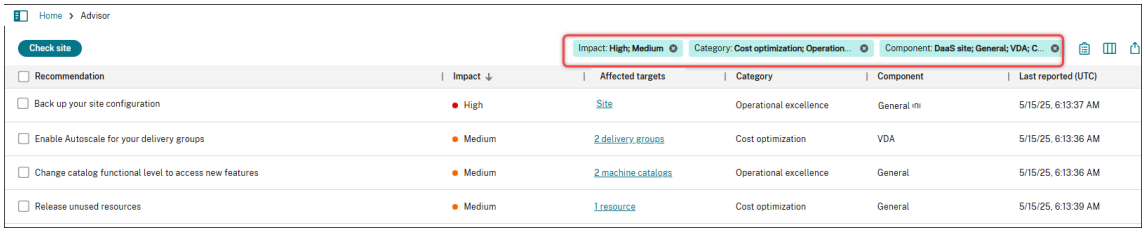
Category	Description	Reference
Operational excellence	Recommendations for helping you achieve process and workflow efficiency, resource manageability, and deployment best practices.	Operational excellence recommendations
Cost optimization	Recommendations for reducing overall spending by right-sizing resources, minimizing waste, and aligning capacity with actual usage needs.	Cost optimization recommendations

5. Click **Run check** to run a site check and generate updated recommendations based on the current configuration.

   All recommendations appear in the list.



Filter recommendations



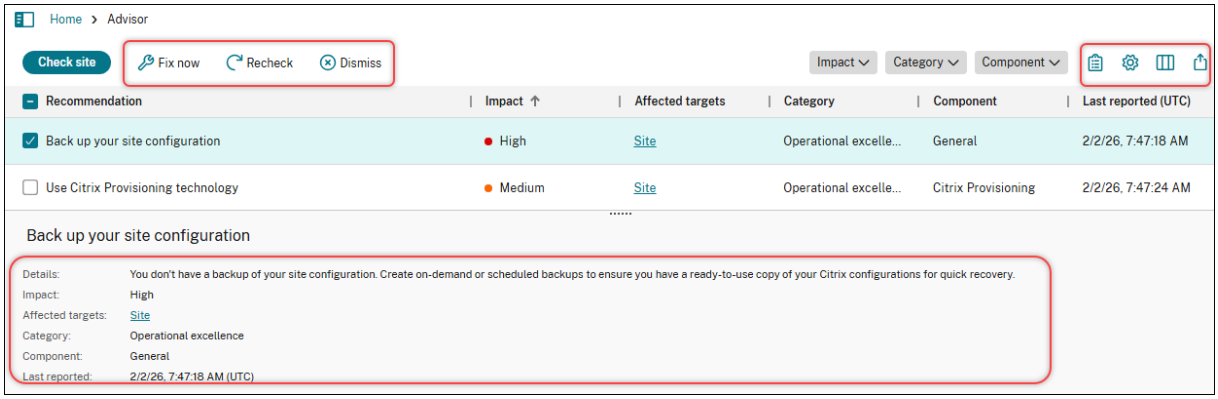
You can filter recommendations by **Impact**, **Category**, or **Component** to focus on the information most relevant to your deployment.

1. In **Advisor**, locate the filters at the top right of the recommendation list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Click a filter (for example, **Category**) to view available options.
3. Select one or more checkboxes to apply the filter. The list updates automatically to display only the recommendations that match your selections.
4. Use multiple filters together to narrow down the list.

Review and act on recommendations



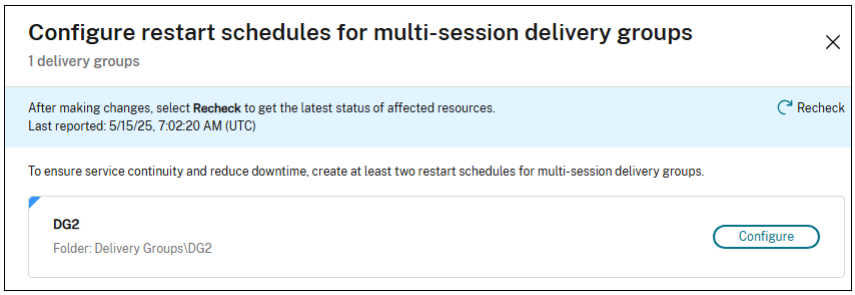
Use the recommendations list to understand configuration issues and improvement opportunities in your deployment. You can take the following actions on recommendations:

- View recommendation details
- Implement recommended actions
- Dismiss recommendations
- Dismiss specific affected targets in a recommendation
- Customize check rules
- View the full site check report

View recommendation details

To review a recommendation, select a recommendation to view its details in the lower pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Implement recommended actions

To implement the recommended actions for a recommendation, follow these steps:

1. Select a recommendation.
2. Click **Fix now** in the action bar.
3. Follow the recommended steps to make the necessary updates.

   Sometimes, you're directed to supporting documentation when automated configuration isn't supported or feasible. We want to make sure that Advisor is designed to provide automated actions directly within the UI wherever possible, minimizing the need for manual setup.
4. After making updates, click **Recheck** to update the status of the affected targets.

> **Note:**
>
> The UI and steps vary depending on the recommendation. The screenshot shown is for illustration purposes only.

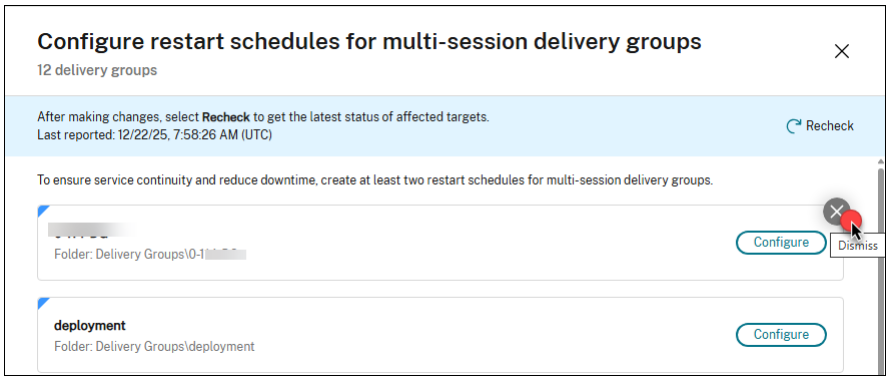
Dismiss recommendations

If a recommendation isn't relevant to your deployment or doesn't require action, you can remove it from the current list and future check results:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Select the recommendation.
2. Click **Dismiss** in the action bar.

> **Tip:**
>
> To restore a recommendation, click the **Gear** icon in the upper-right corner above the recommendation list, and select **Manage dismissed items**



Dismiss specific affected targets in a recommendation

If a recommendation includes affected targets that are intentionally non-compliant with best practices (*for example*, test, validation, or temporary resources), you can remove them from this recommendation (also known as `granular dismissal`).

> **Note:**
>
> Granular dismissal is supported only for the following targets: machine catalogs, delivery groups, application groups, and zones.

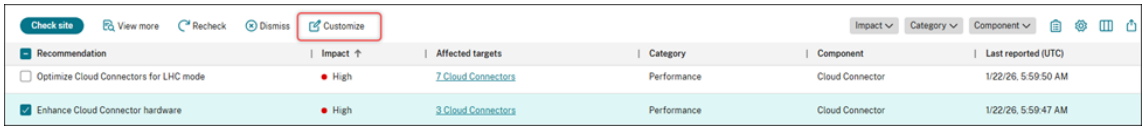
Detailed steps are as follows:

1. Select the recommendation.
2. Click the **Affected targets** field of the recommendation. The recommendation page displays all affected targets.
3. Hover over the affected target that you want to dismiss. A **Dismiss** icon appears in the top-right corner of the target.

4. Click the **Dismiss** icon. A dismissal confirmation dialog box appears.
5. Enter a note for the dismissal if needed, and then click **Dismiss**. The affected target is removed from the recommendation page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Tip:**
>
> To restore a dismissed target in a recommendation, click the Gear icon in the upper-right corner above the recommendation list, and select **Manage dismissed items**.



Customize check rules

You can customize Advisor check rules for the following recommendations:

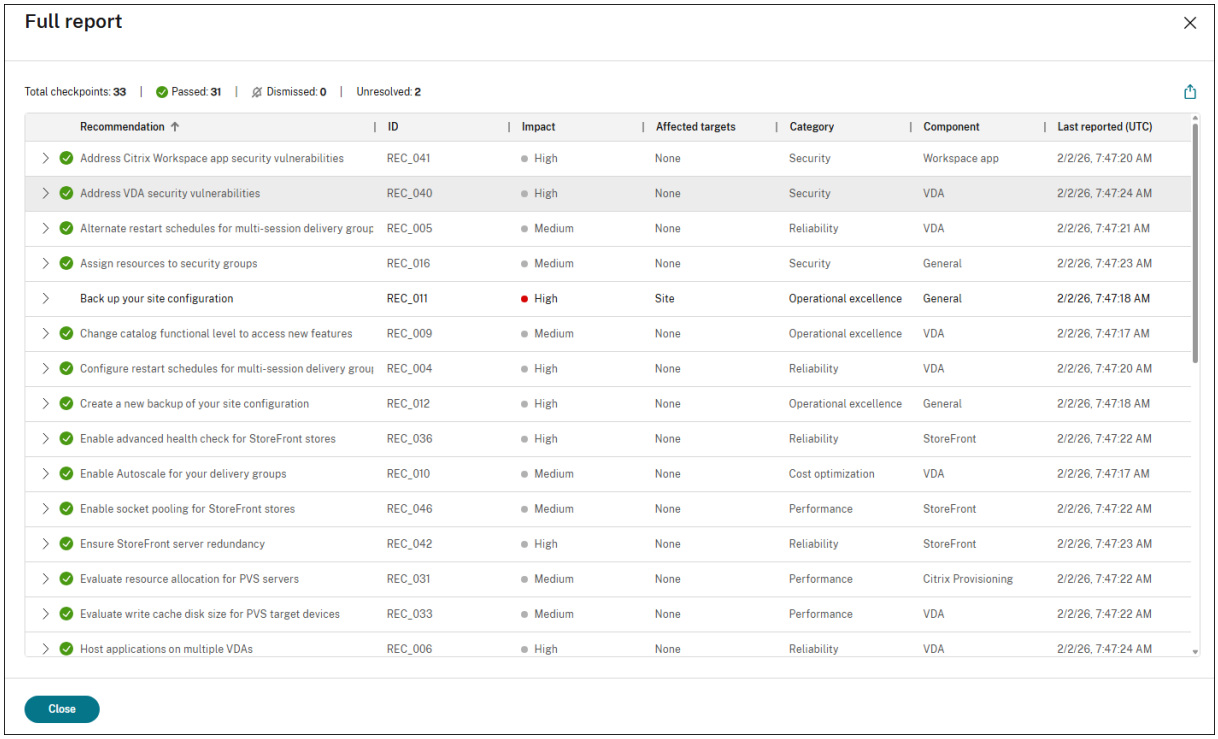
- **Enhance Cloud Connector hardware:** Adjust thresholds for CPU, memory, and disk usage, and exclude specific disks.
- **Release unused resources:** Define custom unused time thresholds for machines and applications.
- **Optimize GPO configuration for VDAs:** Modify the GPO processing time threshold.

To customize the check rule for a single recommendation, follow these steps:

1. Select a recommendation and click **Customize** in the action bar.

2. On the **Customize** page, update the check settings as needed.
3. Click **Save**. Changes take effect the next time you run the check.

To customize check rules for all three recommendations from a central location, follow these steps:



1. Click the **Gear** icon in the upper-right corner above the recommendation list, and select **Customize rules**. The three recommendations appear.
2. Click the **Edit** icon next to a recommendation.
3. Update the check settings as needed.
4. To update check rules for the remaining recommendations, repeat steps 2–3.
5. Click **Save**. Changes take effect the next time you run the check.

View the full site check report

The **full report** provides a summary of all Advisor recommendations from the latest site check. It includes passed, dismissed, and unresolved checkpoints, helping you assess the overall health and optimization opportunities in your DaaS site.

To view the full report, click the **View full report** icon at the top right of the recommendation list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set up StoreFront™ for Advisor checks

StoreFront-related recommendations in Citrix Advisor require additional setup. To set up StoreFront for Advisor checks, complete the following steps:

1. Add your StoreFront servers to Infrastructure Monitoring by creating corresponding connections. For more information, see Infrastructure monitoring.
2. If you configure a StoreFront connection in **Manual connection** mode, ensure that Citrix Infrastructure Monitoring version 2603 or later is downloaded and installed. To verify a required version is installed:
    a) Go to **Director > Settings**.
    b) Locate the connection where **Type** equals `StoreFront`.
    c) Confirm that the **Version** field displays `7.47` or greater.

> **Important:**
>
> After you apply changes to your StoreFront deployment based on Advisor recommendations, wait at least 6 hours before rechecking the same recommendations. This delay allows Infrastructure Monitoring to collect and process updated telemetry and ensures that Advisor evaluates the most current data.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

References

This section lists all Citrix Advisor recommendations by category to help you understand their purpose and impact.

Security recommendations

Recommendation	ID	Impact	Component	Description
Upgrade VDAs that reached End of Life	REC_001	High	VDA	Some machines are using VDA versions that have reached End of Life and are no longer supported by Citrix. Upgrade affected machines to the latest LTSR or CR VDA version.
Assign resources to security groups	REC_016	Medium	General	Some resources are assigned to individual users. It is a Citrix best practice only to assign user access through security groups to streamline management and enhance security. Reconfigure the user assignment for delivery and application groups to include only security groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Upgrade Citrix Workspace app versions that reached End of Life	REC_017	High	Workspace app	Some endpoint devices use a Citrix Workspace app version that reached End of Life. Upgrade devices to the latest Workspace app version to reduce supportability and security risks. For simplified version management and automatic update control, use Global App Configuration Service. Additionally, consider using endpoint analysis solutions to enforce a minimum Workspace app version to access the store.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Use HTTPS for host connections	REC_039	Medium	General	Some host connections are currently configured with HTTP instead of HTTPS. To ensure secure communication with your hypervisor, update these connections to use HTTPS. This requires enabling HTTPS on your hypervisor and ensuring valid TLS certificates are in place.
Upgrade StoreFront server versions that reached End of Life	REC_043	High	StoreFront	Some StoreFront servers are running versions that have reached End of Life and are no longer supported by Citrix. To maintain a secure, supportable environment, upgrade all affected StoreFront servers to the latest LTSR or CR version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Use HTTPS for StoreFront base URL	REC_044	High	StoreFront	Some StoreFront base URLs are currently configured with HTTP instead of HTTPS. To protect user credentials and sensitive data, configure your StoreFront servers and associated load balancers to use HTTPS. Make sure the base URL begins with 'https://'. This ensures all communications are encrypted and helps prevent security threats such as man-in-the-middle attacks.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Use HTTPS for communication between StoreFront and Delivery Controllers	REC_045	High	StoreFront	Traffic between StoreFront and Delivery Controllers is currently transmitted over unencrypted HTTP, which can expose user credentials to security threats. To protect your environment, enable HTTPS on Delivery Controllers and configure StoreFront to use secure connections.

> **Note:**
>
> StoreFront-related recommendations require additional setup. See Set up StoreFront for Advisor check for details.

Reliability recommendations

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Configure restart schedules for multi-session delivery groups	REC_004	High	VDA	Some multi-session delivery groups do not have restart schedules configured. Scheduled restarts help maintain optimal performance, stability, and resource availability across multi-session OS VDAs. To ensure service continuity and reduce downtime, create at least two restart schedules. Alternate restart schedules with tag restrictions by tagging VDAs into groups, such as ‘Even’and ‘Odd.’

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Host applications on multiple VDAs	REC_006	High	VDA	Some published applications are hosted on only a single VDA, which can impact service continuity and lead to downtime risks. Ensure that each application is hosted on multiple VDAs in a delivery group to help maintain availability and reliability.
Upgrade VDAs to match the catalog functional level	REC_008	High	VDA	Some machines use an earlier VDA version not supported by the minimum catalog functional level, which can prevent them from registering. To avoid registration issues, upgrade earlier VDA versions to match the catalog functional level.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Enable advanced health check for StoreFront stores	REC_036	Medium	StoreFront	One or more stores on some StoreFront servers do not have advanced health check enabled. StoreFront uses the additional information from the advanced health check results to ensure launch requests are sent to the appropriate resource location (zone) in Local Host Cache (LHC) mode. Without advanced health check, launches may fail when in LHC mode. To improve the resiliency of your Citrix environment, enable advanced health check for all stores on the StoreFront servers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Ensure StoreFront server redundancy	REC_042	High	StoreFront	Some StoreFront server groups contain only one server, creating a single point of failure and a lack of redundancy in the event of an outage. For better resiliency, deploy at least two StoreFront servers in a server group and front them with a load balancer to ensure seamless failover and uninterrupted access.

> **Note:**
>
> StoreFront-related recommendations require additional setup. See Set up StoreFront for Advisor check for details.

Performance recommendations

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Rightsize high resource-consuming machines	REC_023	Medium	VDA	Some machines show signs of performance strain, such as high CPU or memory utilization, or a high session count. This indicates machines are undersized to handle the workloads they support, which can lead to a poor user experience and reduced performance. Consider changing the machine size to increase the allocated resources for the machine or relocating power users to a delivery group that has high-performance machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Evaluate resource allocation for PVS servers	REC_031	Medium	Provisioning	Some Citrix Provisioning (PVS) servers show signs of performance strain, such as high CPU or memory utilization. Insufficient server resource allocation may result in poor performance and extended boot times. Consider increasing the CPU and memory allocation for these PVS servers as needed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Increase resource allocation for PVS servers	REC_032	High	Provisioning	Some Citrix Provisioning (PVS) servers show signs of performance strain, such as critical CPU or memory utilization. Insufficient server resource allocation may result in poor performance and extended boot times. Consider increasing the CPU and memory allocation for these PVS servers as needed.
Evaluate write cache disk size for PVS target devices	REC_033	Medium	VDA	The write cache disk usage on some Citrix Provisioning (PVS) target devices is nearing the threshold. To avoid performance issues and user session failures, evaluate the current write cache disk size and increase it as needed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Optimize GPO configuration for VDAs	REC_035	Medium	VDA	Some user sessions experienced prolonged GPO processing during logon, impacting performance. To increase control over environment settings, block Group Policy inheritance for your VDA organizational units and apply only relevant policies and security configurations. Additionally, consider leveraging Citrix Workspace Environment Management to process settings asynchronously for faster session logons.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Enable socket pooling for StoreFront stores	REC_046	Medium	StoreFront	Some StoreFront stores don't have socket pooling enabled. Socket pooling enhances efficiency by maintaining a pool of readily available network connections (sockets) for communication with Delivery Controllers or Cloud Connectors. Instead of creating a new socket for every request and then closing it (a high-overhead process), StoreFront reuses an existing connection from the pool. To enhance overall environment performance and efficiency, enable socket pooling on all stores, particularly for Transport Layer Security (TLS) connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> StoreFront-related recommendations require additional setup. See Set up StoreFront for Advisor check for details.

Operational excellence recommendations

Recommendation	ID	Impact	Component	Description
Upgrade VDAs to the latest version	REC_002	Low	VDA	Some machines are using older VDA versions. Upgrade to the latest LTSR or CR VDA version to access new features, improvements, and security enhancements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Use Citrix provisioning technology	REC_003	Medium	Provisioning	All machines in the site are manually provisioned and do not use Citrix provisioning technologies such as Machine Creation Services (MCS) or Citrix Provisioning Services (PVS). Use MCS or PVS to ensure VDA consistency, minimize manual tasks, and streamline environment scaling operations.
Back up your site configuration	REC_011	High	General	You don't have a backup of your site configuration. Create on-demand or scheduled backups to ensure you have a ready-to-use copy of your Citrix configurations for quick recovery.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Reset tainted Active Directory accounts	REC_049	Medium	Provisioning	Some machine catalogs contain AD accounts marked as 'tainted' in the AD Identity Service. These accounts must be reset to be available for subsequent provisioning operations.

> **Note:**
>
> StoreFront-related recommendations require additional setup. See Set up StoreFront for Advisor check for details.

Cost optimization recommendations

Recommendation	ID	Impact	Component	Description
Enable Autoscale for your delivery groups	REC_010	Medium	VDA	Some eligible delivery groups aren't using Autoscale. Enable Autoscale for consistent machine power management, maintaining availability while effectively balancing costs and user experience.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendation	ID	Impact	Component	Description
Release unused resources	REC_013	Medium	General	Some dedicated workloads, such as machines or applications, have not been used for over 30 days. To reduce unnecessary spending and optimize costs, release unused machines back to the available pool and manage unused applications.

Citrix VDA Upgrade Service (VUS)

May 13, 2026

Features in Technical Preview

Features in Technical Preview are available to use in non-production or limited production environments, and to give customers an opportunity to share feedback. Citrix does not accept support cases for features in technical preview but welcomes feedback for improving them. Citrix might act on feedback based on its severity, criticality, and importance.

It isn't a commitment, promise, or legal obligation to deliver any material, code, or functionality and must not be relied upon in making Citrix product purchase decisions. The development, release, and timing of any features or functionality remain at our sole discretion and are subject to change without notice or consultation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix VDA Upgrade Service Overview

The Citrix VDA Upgrade Service (VUS) is a component of Citrix Virtual Apps and Desktops™ (CVAD) that facilitates a streamlined upgrade process for persistent Virtual Delivery Agents (VDAs) within your Citrix environment. The service helps keep your environments up to date with the latest VDA versions, enhancing performance and security, and enabling new Citrix DaaS features.

Administrators can leverage VUS to check for updates, schedule upgrades, and monitor upgrade progress. Upgrades can be initiated immediately or scheduled for a specific date and time, enabling you to choose the best time for your upgrades.

Upgrading VDAs has never been easier. Install the VDA Upgrade Agent on your VDAs or images, right-click on the machine or machine catalog in Web Studio, select "Upgrade VDAs," and select the options that best fit your environment.

Before upgrading, review the upgrade cycle options. Two upgrade tracks are available for your VDAs: Long-Term Service Release (LTSR) and Current Release (CR). LTSR has a longer support lifecycle, providing more stability and less frequent upgrades. CR versions are released more frequently, providing the latest and greatest features. For more information, refer to
Lifecycle Milestones.

Pre-requisites for Upgrading VDAs Using VUS

May 13, 2026

To perform VDA upgrades using VUS, the following prerequisites must be met.

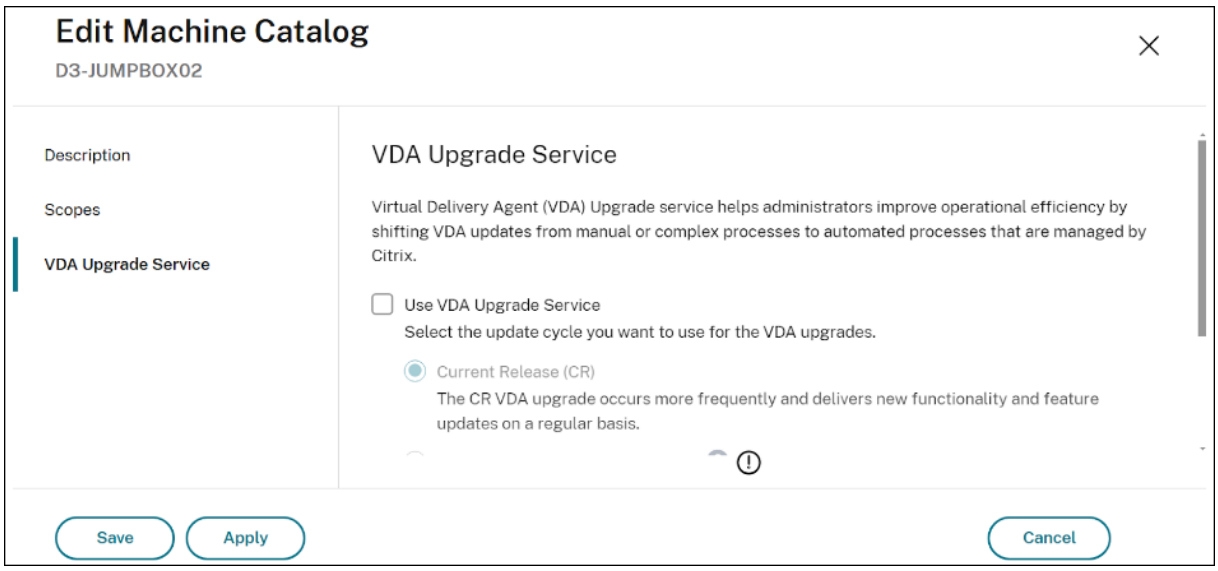
Enable the VDA Upgrade Service for your Site

To enable VUS for your 2503 Site, run the following PowerShell cmdlet:

```
Set-VusSite -Enabled $true
```

Once enabled, import the latest VDA versions to your CVAD Site by running the following PowerShell cmdlet:

```
Import-VusVdaReleasesMetadata -Path '[<CVAD-2503-ISO>\Support\VdaUpdateServiceM
\vda_releases.xml]'
```



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable the VDA Upgrade Service

To enable the VDA Upgrade Service feature, use the VDA Upgrade option when creating or editing a Machine Catalog. Admins must choose from the following upgrade cycles when enabling the VUS:

- LTSR
- CR
- LTSR Early Access Release (EAR)
- CR EAR

To enable the VDA Upgrade Service for a machine catalog from Web Studio, right-click on a catalog, click "Edit Catalog", select the "VDA Upgrade Service"tab, check the "Use VDA Upgrade Service"box, and select an upgrade track.

To enable the VDA Upgrade Service for a machine catalog using PowerShell, use the `Set-VusCatalogUpgradeType` cmdlet.

The upgrade type can be set as "LTSR", "CR", "EAR_CR", or "EAR_LTSR".

Example: `Set-VusCatalogUpgradeType -CatalogName "Workstation catalog" -UpgradeType LTSR`

> **Note:**
>
> Enabling the VDA Upgrade option will not result in the automatic upgrade of VDAs. All VDA upgrades through VUS must be initiated as a separate task explicitly performed by administrators.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VDA Requirements

VDA Version

- For machines created using MCS:
  - 2311 or later
- For machines added using Websocket VDA Enrollment
  - 2311 or later
- For manually provisioned machines
  - 2411 or later

Provisioning Type

- Single or multi-session persistent machines provisioned using non-Citrix provisioning™ services or .
- Single-session MCS-provisioned persistent machines (AD joined, Microsoft Entra joined, and non-domain-joined).
- Remote PC Access machines.

VDA Upgrade Agent

- The VDA Upgrade Agent version 7.44 or later must be installed and active on the VDA. The agent can be installed:
  - As an additional component, when upgrading your VDA or modifying the VDA installation.
  - Using the standalone MSI that is available in the Citrix Virtual Apps and Desktops™ iso.
    - MSI name: CitrixUpgradeAgent_x64.msi
    - Path: x64\Virtual Desktop Components

Permissions

You must have the Full Administrator or Machine Catalog Administrator role in CVAD.

VDA State

For upgrades scheduled through VUS to proceed as intended, the VDAs targeted for upgrade must meet the following prerequisites:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The VDA must not be manually put in maintenance mode.
- For a VDA upgrade to occur successfully, no users can be logged on.
  - VDAs are placed in maintenance mode when the upgrade process begins draining user sessions throughout the upgrade window. They are removed from maintenance mode once the upgrade is completed successfully.
  - If a user has an active or disconnected session throughout the duration of the upgrade window, the upgrade will be canceled at the end of the Upgrade Window.

    > **Note:**
    >
    > Active and disconnected sessions can be terminated using the forced logoff option in VUS.

- VDAs not provisioned through MCS (manually provisioned) must be added to a Delivery Group before performing an upgrade through VUS.
- VDAs must be powered on.

  > **Note:**
  >
  > AutoScale™ does not cease power managing machines when VDA upgrades are scheduled. Consider disabling AutoScale schedules on the Delivery Group when upgrades are in progress.

Connectivity

- VDAs must be able to communicate with Delivery Controllers over HTTPS for VDA upgrades.
  - To verify that the VDA installer is signed by a valid certificate, VDAs must communicate with the following URLs.
    - http://crl3.digicert.com/*
    - http://crl4.digicert.com/*
    - http://ocsp.digicert.com/*
    - http://cacerts.digicert.com/*
- If VDAs do not have access to the internet, configure the VDAs to bypass the certificate revocation list (CRL).
  - Disable the "VDA upgrade certificate revocation list check"Citrix® policy setting, and assign it to the delivery group.
    - Policy description:
      - When enabled, the VDA Upgrade Agent performs certificate revocation list checks during component upgrades.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When disabled, the VDA Upgrade Agent skips these checks. Disable this setting for VDAs without access to the internet.

VDAs with Proxy configurations

- Only proxies in the form of Hostname: Port (IP:Port) and PAC file are supported. SOCKS5 proxies are not supported.
- The VDA Upgrade Agent must be configured to use a proxy using Web Studio or the registry.
  - VDA Upgrade Agent proxy configuration using Web Studio.
    - Enable the VDA upgrade proxy configuration Citrix Policy setting for the VDAs that use a proxy.
    - Input the proxy address or the path to the PAC file in the settings.
  - VDA Upgrade Agent proxy configuration using the registry
    - **Key:** `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\VirtualDesktopAgent`
      - **Value type:** `String`
      - **Value name:** `ProxySettings`
      - **Value data:** Proxy address or path to pac file.
        - For example:
          - **Proxy address:** `http://\<URL or IP>:\<port>`
          - **Pac file:** `http://\<URL or IP>/\<path/\<filename>.pac`

VDAs installed using the VDAWorkstationCoreSetup.exe

If the VDA was originally installed using VDAWorkstationCoreSetup.exe, it can still be upgraded using VUS, which utilizes `VDAWorkstationSetup.exe`.

When upgrading VDAs that were installed with `VDAWorkstationCoreSetup.exe` using VUS, you should review the installation options to ensure only the desired features are enabled, especially if migrating from a minimal core installation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Upgrade VDAs using the VDA Upgrade Service

May 13, 2026

You can initiate VDA upgrades through the VDA upgrade service by selecting the target machine catalog, individual machine, or group of machines and then selecting "Upgrade VDAs".

> **Note:**
>
> Citrix® recommends backing up VDAs before performing upgrades when possible.

Scheduling Upgrades

The VDA upgrade process in Citrix can be carried out on a catalog level, a group of machines level, or an individual machine level, depending on the requirements. Upgrades can be set to start immediately or can be scheduled at a date and time up to 7 days in advance.

Considerations

- **Catalog vs. Group of Machine vs. Machine Scope:** Catalog upgrades are ideal for bulk updates while upgrading machines individually or by groups allows more granular control.
- **Scheduling:** Upgrades can be scheduled for up to 7 days in advance. If using machine catalog level upgrades, machines added to the catalog after the upgrade is scheduled are not included as part of the existing scheduled upgrade.

Key Differences

Feature	Per-Catalog Upgrade	Per-Machine Upgrade	Group of Machines
Scope of upgrades	Entire catalog	Individual machine	Group of machines from a Machine Catalog
Schedule control	A single schedule applies to all VDAs in the machine catalog, best for large-scale upgrade operations	VDAs are scheduled individually, which is mostly used for testing and one-off upgrades	VDAs are scheduled in groups, giving you the flexibility to upgrade different groups of VDAs at different times

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Feature	Per-Catalog Upgrade	Per-Machine Upgrade	Group of Machines
Management	Managed through the machine catalogs node in Web Studio or the `New-VusCatalogSchedule` cmdlet	Managed through the Search node in Web Studio or the `New-VusMachineUpgrade` cmdlet	Managed through the Search node in Web Studio, or by passing a list of machines to the `New-VusMachineUpgrade` cmdlet
Use Case	Bulk upgrades for an entire Machine Catalog	Granular control for targeted upgrades and test scenarios	Targeted control of a subset of VDAs. Can be used to stagger the upgrades within a catalog
VDA versions available	For CR and all currently supported LTSR VDA versions, the latest version as well as 2 previous (N-2) versions are available to upgrade to. See VDA versions available for more information	For CR and all currently supported LTSR VDA versions, the latest version as well as 2 previous (N-2) versions are available to upgrade to. See VDA versions available for more information	Only the latest LTSR or CR VDA version is available to be upgraded
Additional Components	Installs or upgrades VDA components on each VDA. Leaving a component unchecked will not uninstall the feature, but the component will not be upgraded	Installs or upgrades the VDA component on the VDA. Leaving a component unchecked will not uninstall the feature, but the component will not be upgraded	Additional components cannot be managed by the VDA upgrade service when upgrading a group of machines. Note: Additional features, like “Enable Restore Cleanup”is available for group of machine upgrades
Additional Features	Additional features can be enabled or upgraded	Additional features can be enabled or upgraded	Additional features can be enabled or upgraded

Feature	Per-Catalog Upgrade	Per-Machine Upgrade	Group of Machines
Concurrency	Controlled as a setting when scheduling the upgrade. See Concurrency for more information	A single VDA is upgraded	Automatically load balanced based on the number of VDAs selected as part of the upgrade schedule
Failure Threshold	A failure threshold can be set to prevent future upgrades if a provided number of VDAs fail upgrades. See Failure Threshold for more information	Failure thresholds are not applicable for a per-machine upgrade	Failure thresholds are not available for group of machine upgrades. Consider setting the size of the group of machines to be upgraded to be the maximum number of VDAs that would be an acceptable failure amount

How scheduled upgrades work

The VDA Upgrade Agent on the VDAs communicates with Delivery Controllers periodically to determine if the VDA should be upgraded.
VDAs can be scheduled to upgrade immediately or up to 7 days in advance. When scheduling an upgrade in advance, you can set the date and time (in UTC) that the upgrade begins.

The upgrade duration sets the length of time after the scheduled upgrade start time during which upgrades occur. By default, for machine catalog and group of machine upgrades, Citrix load balances VDA upgrades throughout the upgrade duration to improve performance and avoid bottlenecks.

Once an upgrade begins, the VDA is placed into maintenance mode until the upgrade is complete. If a session is present on the VDA, the VDA will not upgrade until no sessions are present. No new sessions can be brokered to the VDA when it is in maintenance mode. If a user disconnects from a session during an upgrade window, the user will not be able to reconnect until the upgrade is complete.

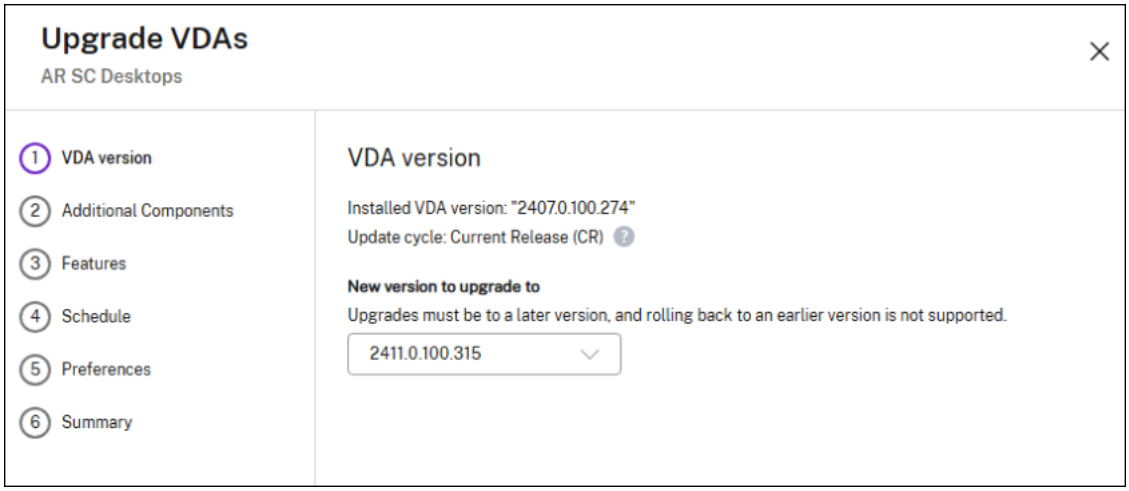
The VDA will continue to attempt an upgrade until the scheduled upgrade duration is complete. If a session is present throughout the upgrade duration, the upgrade will be canceled, and maintenance mode will be turned off for the VDA. Consider a longer upgrade duration to improve the VDA upgrade success rate.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> VDAs manually placed into maintenance mode before a scheduled upgrade will fail to upgrade.

VDA Versions Available

The VDA upgrade service maintains N-2 versions of the VDA for CR versions and N-2 CU versions for all LTSR versions that are currently supported.



When a new CVAD version is released, you can update VUS to include more recent VDA versions without updating your whole Site. VUS uses a **vda_releases.xml** file to populate the available VDA versions. The **vda_releases.xmld** file is available in the CVAD metainstaller at the following location:

<CVAD-ISO>\Support\VdaUpdateServiceMetadata\vda_releases.xml

To import the newer vda_releases.xml file to VUS, run the following cmdlet:

```
Import-VusVdaReleasesMetadata -Path '[Path to vda_releases.xml]'
```

In Web Studio, when upgrading either a catalog or an individual machine, the UI prompts you for which version you want to upgrade your VDAs to.

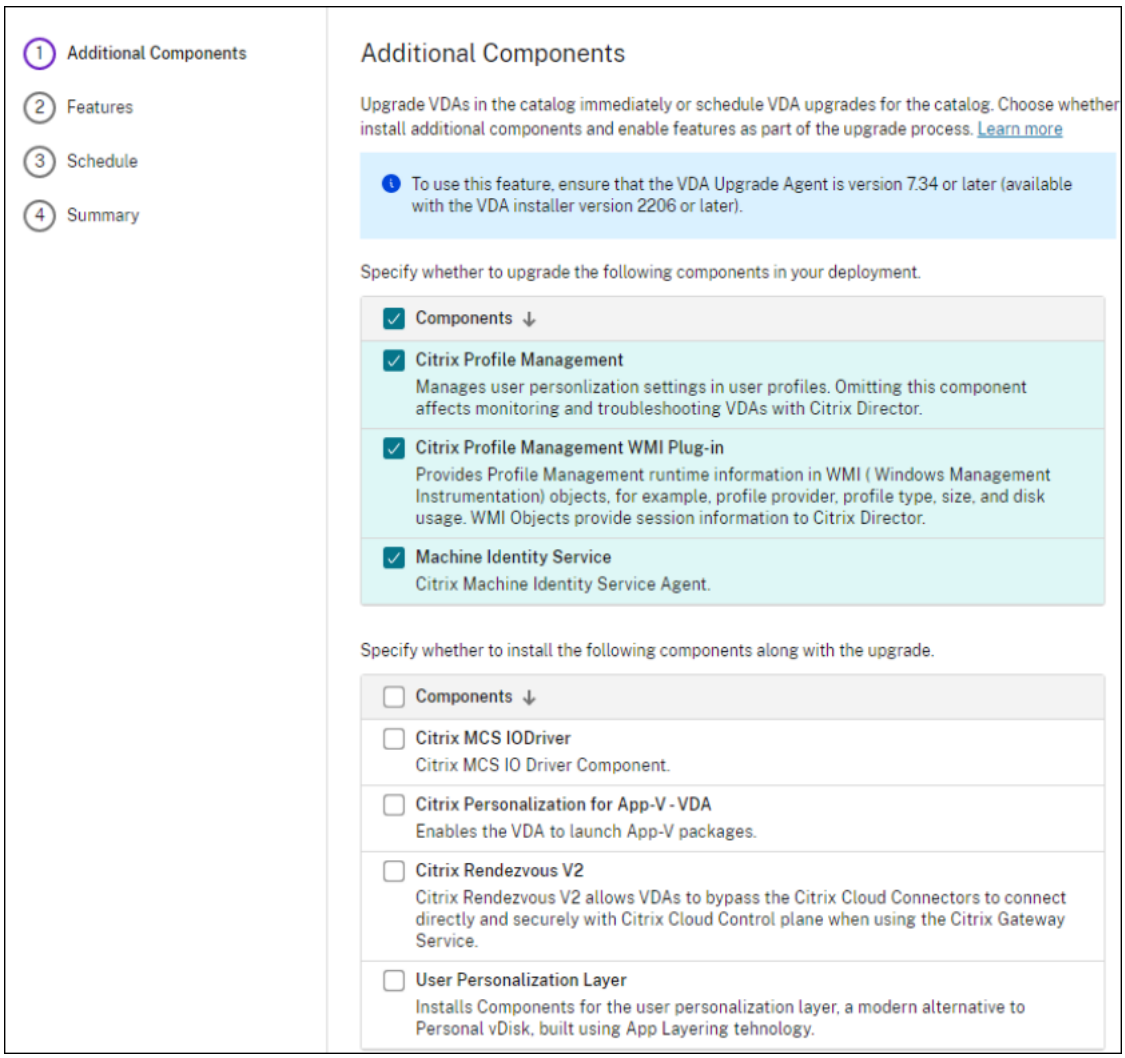
To determine the available VDA versions using PowerShell, use the `Get-VusAvailableVdaVersion` cmdlet.

Without passing a machine or a catalog with the cmdlet, the cmdlet will return the latest available version for all upgrade tracks.

To get the specific versions available for a resource, pass a VDA (-MachineName, -MachineUid or -MachineUuid) or catalog (-CatalogName, -CatalogUid, or -CatalogUuid) with the `Get-VusAvailableVdaVersion` cmdlet.

For example:

```
Get-VusAvailableVdaVersion -CatalogName '[Name of your Machine Catalog ]'
```



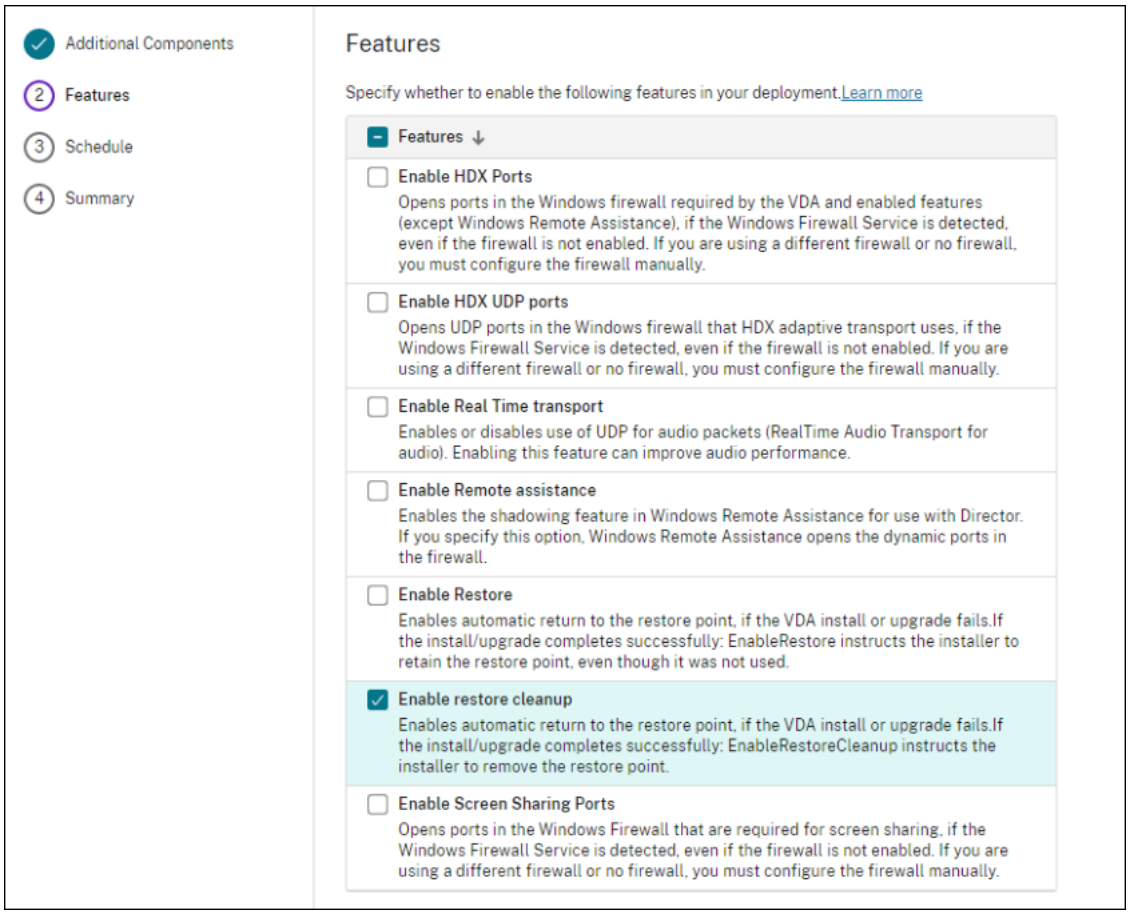
© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
PS V:\> Get-VusAvailableVdaVersion -CatalogName 'CR-2303'

UpgradeType Version
----------- -------
         CR 2411.0.100.315
         CR 2407.0.100.274
         CR 2402.0.100.629
```

Additional Components

Additional components can be installed or upgraded when upgrading VDAs by machine catalog or by individual machine. If you do not check a component, it will not uninstall the component, but the component will not be upgraded as part of the overall VDA upgrade.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Features

Features can be enabled or upgraded on VDAs through the VDA upgrade service. If you do not check a feature, it will not disable the feature, but the feature will not be upgraded as part of the overall VDA upgrade.

By default, the **Enable restore cleanup** checkbox is selected. Citrix recommends enabling the restore cleanup feature to ease management and improve recovery of failed upgrades. With the feature enabled, a system restore point is created before the upgrade starts. If an upgrade fails, the VDA is restored to the system restore point. The restore point is deleted after the successful installation of the VDA. For more information, see Restore on install or upgrade failure.

> **Note:**
>
> Windows System Restore is only supported on single-session operating systems (e.g., Windows 10 and 11). The Windows System Restore feature must be enabled on the VDA for the "Enable restore cleanup"feature to work. Upgrades may fail if "Enable restore"or "Enable restore cleanup" is selected, but Windows System Restore is not configured on the VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Concurrency

When upgrading machine catalogs, VUS enables you to define a maximum number of VDAs that will upgrade simultaneously. This can help reduce the load on your internet connection or file server and, when used in conjunction with failure thresholds, enables you to stop upgrades if a number of VDAs fail to upgrade.

As soon as the scheduled upgrade starts, all VDAs in the catalog are placed in maintenance mode. An upgrade will start on a quantity of VDAs that matches the defined maximum concurrency setting. As soon as a VDA upgrade is completed, another VDA will begin to upgrade to maintain the concurrent number of VDAs upgrading simultaneously.

If no concurrency is specified for a machine catalog scheduled upgrade, Citrix uses a default concurrency value based on the total number of VDAs in the Catalog and the upgrade duration.

Upgrades take an average of around 30 minutes to complete, but this can vary greatly based on environmental conditions. Consider setting your concurrency to a quantity where all VDAs can upgrade in the provided upgrade duration. For example, if you have 20 VDAs that are set to upgrade over 4 hours, you need 5 VDAs to upgrade an hour. Using the average upgrade duration of 30 minutes, you can set the concurrency value to 3 to meet the 5 VDA upgrades per hour requirement (3 upgrades per 30 minutes results in 6 updates per hour).

Failure Threshold

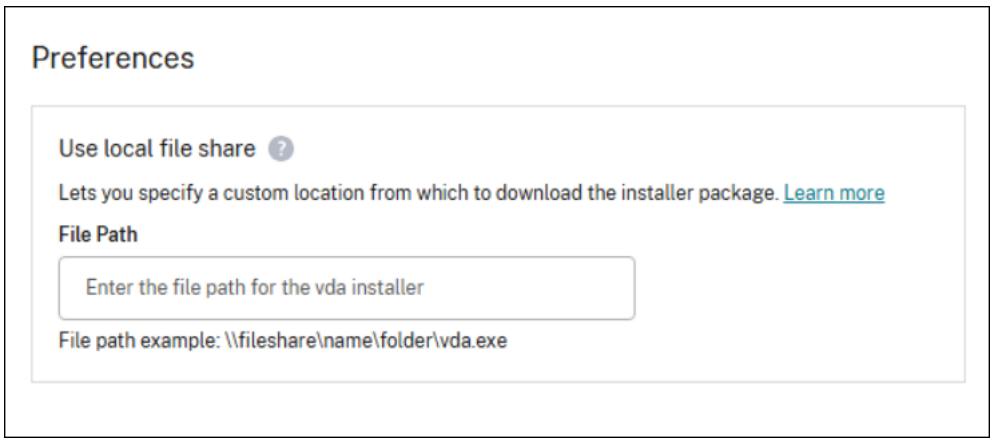
When upgrading machine catalogs, use a failure threshold to prevent further VDAs from being upgraded if a given number of VDAs have failed. Failure thresholds can reduce the impact radius of issues that cause upgrade failures, reducing troubleshooting efforts for administrators.

Failure thresholds prevent any future VDAs from starting upgrades, but do not stop VDAs that have already started the upgrade. For example, if a machine catalog has 100 VDAs, concurrency is set to 10 VDAs, and the failure threshold is set to 3, if all VDA upgrades fail, at least 13 VDAs will have attempted to upgrade, and the remaining 87 will have never started, and the upgrade will be cancelled.

10 concurrent VDAs start to upgrade at the beginning of the scheduled upgrade, if the first upgrade fails, another VDA will start the upgrade to maintain the 10 concurrent simultaneous upgrades. If the second upgrade fails, another VDA will begin the upgrade. If the third upgrade fails, all VDAs that are currently in the upgrade process will continue, and the rest of the VDAs in the upgrade schedule will have their upgrade cancelled.

VDA Installer Location

The VDA installer must be hosted on a local file share in your environment. Requirements for the file share and VDA installer are listed below:



© 1997–2026 Citrix Systems, Inc. All rights reserved.

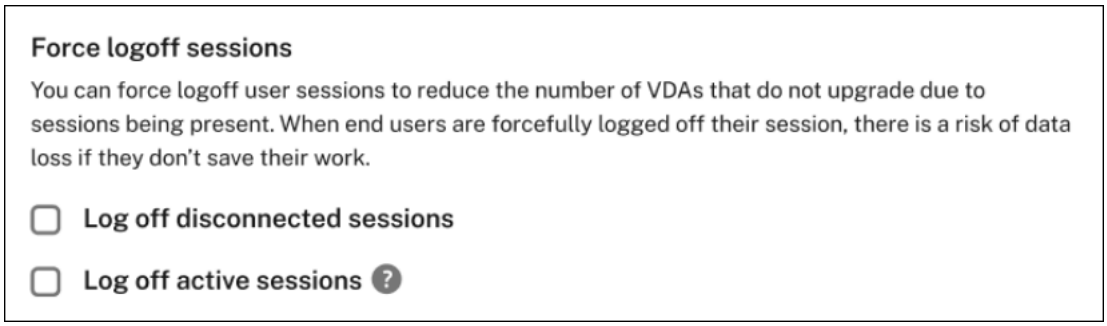
The file share must have the following prerequisites.

- File Share Permissions
  - The network shares containing VDA installer packages must have read access for the VDA Upgrade Agent service which runs as Local System (NT AUTHORITY\SYSTEM principal).
  - Domain-Joined VDAs:
    - The Local System account (VUA runs as Local System), uses computer credentials when accessing network shares.
    - The file share must be given read access to Domain Computers.
    - In Advanced Share Settings, **File and Printer Sharing** must be enabled.
  - Non Domain-Joined VDAs:
    - The Local System account (VUA runs as Local System), uses **ANONYMOUS LOGON** when accessing network shares.
    - In the **Network and Sharing Center, Password Protected Sharing** must be disabled.
    - In the folder permissions **Security** tab, read access permissions must be granted to **ANONYMOUS LOGON**.
    - In Advanced Share Settings, **File and Printer Sharing** must be enabled.
    - The shared folder name must be added to the **Network Access Security Policy**.
- VDA installer
  - The VDA installer must be downloaded from the Citrix Downloads website and placed in the file share.
  - The relevant VDA installer for the machine catalog must be downloaded.
    - Use the **Multi-session OS VDA installer** if the catalog type is multi-session.
    - Use the **Single-session OS VDA installer** if the catalog type is single-session.
  - For a given upgrade, the version of the installer on the file share must be an excat match of a version published by VUS. Use the `Get-VusAvailableVersion` PowerShell cmdlet to determine the available versions.

The path to the installer should be a file path that includes the executable. For example, `\\hostname\VDA-Packages\VDAWorkstationSetup_2308.exe`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When using VUS through PowerShell, use the `-VdaWorkstationPackageUri` (single-session OS) or `-VdaServerPackageUri` (multi-session OS) parameter when scheduling your upgrade.



Force Logoff Sessions

To increase the number of VDAs that are available for upgrade during a scheduled upgrade, consider forcefully logging off user sessions during the upgrade. The forceful logoff occurs when the upgrade begins for each individual VDA, not at the start of the overall scheduled upgrade window.

Since different VDAs start upgrading at different times within the scheduled period, users will only be logged off when their specific VDA starts its upgrade.

To forcefully log off disconnected sessions during scheduled upgrades using Web Studio, select the **Log off disconnected sessions** option.

To forcefully log off active sessions during scheduled upgrades using Web Studio, select the **Log off active sessions** option. If logging off active sessions, users will receive a notification in their session 10 minutes before the upgrade starts, reminding them to save their work before being logged off automatically.

To forcesfully log off disconnected sessions during scheduled upgrades using PowerShell, use the `-LogoffOption` parameter when scheduling your upgrade. The available options for `-LogoffOption` are listed below:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **ActiveSessionsOnly:** If an active session is on the VDA during the scheduled upgrade window, the user will be logged off. A banner will display 10 minutes before the user is logged off to provide a warning. VDAs with disconnected sessions will not be logged off during the upgrade window. If the disconnected session remains throughout the upgrade window, that VDA upgrade will be cancelled.
- **DisconnectedSessionsOnly:** If a disconnected session is present on the VDA during the scheduled upgrade window, the user will be logged off. Users are not notified that their disconnected session will be logged off. VDAs with active sessions will not be logged off during the upgrade window. If the active session remains throughout the upgrade window, that VDA upgrade will be cancelled.
- **ActiveAndDisconnectedSessions:** If a disconnected or active session is on the VDA during the scheduled upgrade window, the user will be logged off. For active sessions, a banner will display 10 minutes before the user is logged off to provide a warning.
- **DoNotLogoff:** Active and disconnected sessions are not logged off. If a session is present on the VDA throughout the duration of the upgrade schedule, the upgrade is cancelled at the end of the scheduled upgrade window.

When possible, Citrix recommends forcefully logging off sessions to increase the number of VDAs that upgrade successfully.

> **Important:**
>
> Forcefully logging off sessions can result in users losing unsaved work from their sessions.

Edit or Cancel the VDA workflow

After you schedule the upgrades for a catalog, you can edit the start time and duration of the upgrade or cancel it altogether.

To edit or cancel an upgrade using the UI at the machine catalog level, right-click on a machine catalog with an existing scheduled upgrade and click **Edit Scheduled VDA Upgrade**. To edit an existing machine catalog level upgrade using PowerShell, use the `Set-VusCatalogUpgrade` and `Remove-VusCatalogUpgrade` cmdlets.

To edit or cancel an upgrade at the machine level, in the search node, right-click on a machine with an existing scheduled upgrade and click **Edit Scheduled VDA Upgrade**. You cannot edit the scheduled VDA upgrade for multiple machines simultaneously. To edit an existing machine-level upgrade using PowerShell, use the `Set-VusMachineUpgrade` and `Remove-VusMachineUpgrade` cmdlets.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Monitoring and Troubleshooting

August 17, 2026

Monitoring Scheduled VDA Upgrades

VDAs and machine catalogs have two attributes to help monitor the readiness and current status of VDA upgrades that are visible as columns that can be used to filter in Studio or in the details pane of the VDAs or catalogs.

- VDA Upgrade
- VDA Upgrade State

VDA Upgrade

VDA Upgrade provides information on whether the VDA or machine catalog has the VDA upgrade agent configured and if VDAs are up to date or if an upgrade is available. The available statuses are as follows:

VDA Upgrade (Studio)	VDA Upgrade (Powershell)	Description
Catalog Level		
Not configured	MissingUpgradeType	An upgrade track (CR, LTSR, CR EAR, or LTSR EAR) has not been selected for the machine catalog.
Scheduled	UpgradeScheduled	An upgrade is scheduled for the machine catalog.
Available	UpgradeAvailable	VDAs in the catalog are not on the latest version of the upgrade track. An upgrade is recommended.
Up to date	UpToDate	VDAs in the catalog are on the latest version of the upgrade track. No action is required.
Unknown	Unknown	Retrieving the latest VDA Upgrade state.
Machine Level		

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VDA Upgrade (Studio)	VDA Upgrade (Powershell)	Description
Not configured	MissingUpgradeType	An upgrade track (CR, LTSR, CR EAR, or LTSR EAR) has not been selected for the machine catalog of the VDA.
Scheduled	UpgradeScheduled	An upgrade is scheduled for the VDA.
Available	UpgradeAvailable	The VDA is not on the latest version of the upgrade track. An upgrade is recommended.
Up to date	UpToDate	The VDA is on the latest version of the upgrade track. No action is required.
Checking state	Unknown	Retrieving the latest VDA Upgrade state.

> **Note:**
>
> For VDAs using the LTSR track, a catalog will only show as Up to date if the VDAs are on the latest cumulative update (CU) of the latest long term service (LTSR) version. If the VDA is on the latest CU of a previous LTSR version, VDA Upgrade will still show as **Available**.

VDA Upgrade State

VDA Upgrade State provides information on the status of a scheduled upgrade. The VDA Upgrade State statuses are as follows:

VDA Upgrade State (Studio)	VDA Upgrade State (PowerShell)	Description
Catalog Level		
Not scheduled	NotScheduled	No upgrade is scheduled for the catalog.
Scheduled	UpgradeScheduled	An upgrade is scheduled for the catalog.
In progress	UpgradeInProgress	An upgrade is in progress for the catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VDA Upgrade State (Studio)	VDA Upgrade State (PowerShell)	Description
Canceled	UpgradeCancelled	An upgrade was cancelled for the catalog. This can be due to a manual cancellation or the failure threshold being reached.
Failed	UpgradeFailed	A scheduled upgrade for the catalog failed.
Successful	UpgradeSuccessful	A scheduled upgrade for the catalog completed successfully. Note: A successful upgrade does not mean all VDAs in the catalog upgraded successfully.
-	Empty	No upgrade scheduled for the catalog.
Machine Level		
Scheduled	UpgradeScheduled	An upgrade is scheduled for the VDA.
Awaiting upgrade	UpgradeInUpgradeWindow	A scheduled upgrade is active, but the VDA has not started to upgrade yet. See "Concurrency" for more information on how VDA upgrades are load-balanced.
In progress	UpgradeInProgress	The VDA is currently upgrading.
Canceled	UpgradeCancelled	A scheduled upgrade has been cancelled for the VDA before the upgrade began.
Upgrade failed	UpgradeFailed	The VDA began to upgrade but the upgrade failed to complete successfully. See "troubleshooting" for more information.
Succesful	UpgradeSuccess	The VDA upgraded successfully.
Validation failed	UpgradeValidationFailed	Certificate validation failed while downloading the metadata for the VDA installer.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VDA Upgrade State (Studio)	VDA Upgrade State (PowerShell)	Description
-	Empty	No upgrade is scheduled for the VDA.

Troubleshooting Scheduled VDA Upgrades

If you encounter upgrade failures, the following logs can help you identify and troubleshoot the issues. You can also share these logs with Citrix Technical Support to expedite the assistance process.

VDA Installation Logs

When troubleshooting upgrade failures, gather and review the logs for both the initial installation of the VDA and the failed upgrade. Logs for installation and upgrades can be found in the following locations.

- Installation logs for VDA installations are placed in:
  - %temp%/Citrix/XenDesktop Installer
- Upgrade logs for VDA installations are placed either in:
  - C:\Windows\Temp\Citrix\XenDesktop Installer **or**
  - C:\Windows\SystemTemp\Citrix\XenDesktop Installer

VDA Upgrade Agent Version

When gathering data to troubleshoot upgrade failures through VUS, it is important to know the version of the upgrade agent on the VDAs. To check VDA Upgrade Agent versions, use the following cmdlet: `Get-VusComponentVersion -ComponentType VUS`. It lists all VDAs and their VDA Upgrade Agent versions.

To check VDA Upgrade Agent versions at a catalog level, you can use the following script:

> **Note:**
>
> The script is intended as an example and might need to be adapted to suit your specific environment. We recommend that you test the script thoroughly before using it in a production environment.

```
Param( [Parameter (Mandatory=$true)]
[string] $CatalogName )
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
try { $Uuids = Get-BrokerMachine -CatalogName $CatalogName |
Select-Object -Property UUID

if($Uuids -eq $null)
{
throw "Cannot find CatalogName "+$CatalogName
}
Write-Output("Catalog Name passed is "+$CatalogName)

foreach($Uuid in $Uuids){ $compVersion = Get-VusComponentVersion
 -MachineId $machine.UUID -ComponentType VUS $Machine = Get-
BrokerMachine -UUID $compVersion.MachineId Write-Output("MachineName
: "+$Machine.MachineName+", Machine UUID:"+$machine.MachineId+"
, VUA Version:"+$compVersion.Version)} } catch { Write-Output("
Exception Occured")Write-Host $_ }
```

Logs related to the VDA Upgrade Agent

VDA Upgrade Agent (VUA) logs can provide essential information for troubleshooting upgrade failures and issues with the VUA communicating with the VDA upgrade service. Logs you can collect include:

- Citrix Diagnostic Facility (CDF) traces. The CDF module name is `VdaUpgradeAgent`.
- Windows event logs. View logs in the **Event Viewer > Windows Logs > Applications > Citrix VDA Upgrade Agent Service**.

A registry setting is available that allows administrators to enable a rotating log file that captures critical information for troubleshooting while preventing the log files from growing too large. The total size of log files is capped at 20 MB. Create the following registry key to enable logging to a file:

- **Key:** `HKLM:\SOFTWARE\Citrix\UpdateServices\UpdateAgent`
- **Value name:** `LogToFile`
- **Value type:** `REG_DWORD`
- **Value data:**
  - `0` - file tracing disabled
  - `1` - file tracing enabled

To create the LogToFile registry key on a VDA using PowerShell, use the following cmdlet:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\UpdateServices\UpdateAgent
 -Name LogToFile -Value 1 -PropertyType DWord -Force
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To enable LogToFile for groups of machines at scale, consider creating the LogToFile registry on all VDA organizational units (OUs) through Group Policy Preference.

> **Note:**
>
> - When `LogToFile=1` is set, logs are written only to the file. They will not appear in the CDF traces.
> - The VDA Upgrade Agent service restart is required for the registry change to take effect
> - The log file is created in C:\ProgramData\Citrix\Update Services\Logs folder

Troubleshoot VDA upgrade download failures

Follow the steps below to troubleshoot and resolve download failures related to the VDA upgrade feature:

1. Make sure that relevant URLs have been added to the allow list if URL filtering is in place. See Connectivity.
2. After adding the necessary URLs to the allow list, try rescheduling the VDA upgrade.

You can enable CDF tracing or set `LogToFile` to 1 to capture detailed logs for analysis. If the download failure issue persists, check the errors. If you see the following error message "Download Failed: This access control list is not in canonical form and therefore cannot be modified,"it indicates that the permissions on the folder `C:\ProgramData\Citrix\UpgradeServices\Downloads\VDA` are incorrect.

To address the issue, do either of the following:

- **Option 1:** Reset access control lists (ACLs) on the folder using the following command. (The command reset the ACLs with default inherited ACLs for all matching files.)
  - icacls.exe "C:\ProgramData\Citrix\UpgradeServices\Downloads\VDA"/reset /T /C /L /Q
- **Option 2:** Delete the VDA folder under Downloads and then schedule the VDA upgrade.

Troubleshoot VDA upgrade validation failures

Follow the steps below to troubleshoot and resolve download failures related to the VDA upgrade feature:

1. Make sure that relevant URLs have been added to the allow list if URL filtering is in place, especially the Certificate Revocation List (CRL) or Online Certificate Status Protocol (OCSP) URLs needed for the revocation check. See VDA upgrade requirement.
2. After adding the necessary URLs to the allow list, try rescheduling the VDA upgrade.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

We suggest enabling CDF tracing or setting `LogToFile` to 1 to capture detailed logs for analysis. The logs can include the following errors:

- RevocationStatusUnknown
- The revocation function was unable to check the revocation status for the certificate.
- The revocation function was unable to check revocation because the revocation server was offline.

The VDA Upgrade Agent relies on Windows system calls to validate certificates and perform revocation checks. The errors above indicate that the agent is unable to establish a connection to the CRL or OCSP URLs.

The Windows CryptoAPI does not currently support proxy settings. Review the VDAs with Proxy configurations section for configuring your VDA proxies to facilitate outbound CRL calls.

Introduction

August 18, 2026

Always On Tracing (AOT) is a modern diagnostic framework from Citrix designed to continuously capture relevant log data across the Citrix Virtual Apps and Desktops (CVAD) environment. AOT is a subset of Citrix Diagnostic Facility (CDF) traces, with additional logs from other components, that can be helpful when troubleshooting common failures (for example, VDA registrations and application/desktop launches etc..).

Unlike traditional tools that require manual intervention, AOT runs in the background by default, ensuring that critical information is available when issues occur, even if the problem cannot be reproduced.

AOT is built to simplify troubleshooting for IT administrators and Citrix support teams to improve the mean-time-to-resolution by:

- Automatically capturing log data for user sessions and system events.
- Eliminating the need to reproduce issues.
- Making logs easily accessible and readable without engineering-level expertise.
- Enabling self-service log data to reduce dependency on Citrix Support.

Key Benefits

- Faster MTTR (Mean Time to Resolution)
- Always-on, no manual trace initiation needed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Self-diagnosis for common issues
- Streamlined escalation to Citrix Support with full context
- Secure, compliant log handling with sensitive data redaction

For more information, see Always On Tracing

Third party notices

August 12, 2026

This release of Citrix Virtual Apps and Desktops™ may include third-party software licensed under the terms defined in the following documents:

- Citrix Virtual Apps and Desktops Third Party Notices (PDF Download)
- Citrix Assistant App Third Party Notices - Preview (PDF Download)
- Non-Commercial Software Disclosures For FlexNet Publisher 2017 (11.15.0.0) (PDF Download)
- FlexNet Publisher Documentation Supplement Third Party and Open Source Software used in FlexNet Publisher 11.15.0 (PDF Download)

SDKs and APIs

May 15, 2026

Several SDKs and APIs are available with this release. To access the SDKs and APIs, go to Build anything with Citrix. From there, select **Citrix Workspace** to access programming information for Citrix Virtual Apps and Desktops and its related components.

> **Note:**
>
> The Citrix Virtual Apps and Desktops™ SDK and the Citrix Group Policy SDK can be installed as a module or a snap-in. Several component SDKs (such as Citrix Licensing, Citrix Provisioning, and StoreFront) install using only a snap-in.

This product supports PowerShell versions 3 through 5.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops™ SDK

This SDK installs automatically as a PowerShell module when you install a Delivery Controller™ or Studio. This enables you to use this SDK's cmdlets without having to add snap-ins. (Instructions are provided below if you choose to install this SDK as a snap-in.)

Permissions

You must run the shell or script using an identity that has Citrix administration rights. Although members of the local administrators group on the Controller automatically have full administrative privileges to allow Citrix Virtual Apps or Citrix Virtual Desktops™ to be installed, Citrix recommends that for normal operation, you create Citrix administrators with the appropriate rights, rather than use the local administrators account.

Access and run the cmdlets

1. Start a shell in PowerShell: Open Studio, select the **PowerShell** tab, and then click **Launch PowerShell**.
2. To use SDK cmdlets within scripts, set the execution policy in PowerShell. For information about PowerShell execution policy, see the Microsoft documentation.
3. If you want to use the snap-in (rather than the module), add the snap-in using the `Add-PSSnapin` (or `asnp`) cmdlet.

   V1 and V2 denote the version of the snap-in. XenDesktop 5 snap-ins are version 1. Citrix Virtual Apps and Desktops, and earlier XenDesktop 7 version snap-ins are version 2. For example, to install Citrix Virtual Apps and Desktops snap-in, type `Add-PSSnapin Citrix.ADIdentity.Admin.V2`. To import all the cmdlets, type: `Add-PSSnapin Citrix.*.Admin.V*`

You can now use the cmdlets and help files.

- To access the help files for this SDK, select the product or component in the Categories list, and then select **Citrix Virtual Apps and Desktops SDK**.
- For PowerShell guidance, see Windows PowerShell Integrated Scripting Environment (ISE).

Group Policy SDK

The Citrix Group Policy SDK enables you to display and configure Group Policy settings and filters. This SDK uses a PowerShell provider to create a virtual drive that corresponds to the machine and user settings and filters. The provider appears as an extension to `New-PSDrive`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To use the Group Policy SDK, either Studio or the Citrix Virtual Apps and Desktops SDK must be installed.

The Citrix Group Policy PowerShell provider is available as a module or a snap-in.

- To use the module, no additional work is needed.
- To add the snap-in, type `Add-PSSnapin citrix.common.grouppolicy`.

To access help, type: `help New-PSDrive -path localgpo:/`.

To create a virtual drive and load it with settings, type `New-PSDrive <Standard Parameters> [-PSProvider] CitrixGroupPolicy -Controller <string>` where the Controller string is the fully qualified domain name of a Controller in the site you want to connect to and load settings from.

Citrix Virtual Apps and Desktops REST APIs

With Citrix Virtual Apps and Desktops REST APIs, you can automate the management of resources within a Citrix Virtual Apps and Desktops deployment.

The Citrix Virtual Apps and Desktops REST APIs are available at https://developer.cloud.com/citrixworkspace/citrix-daas-rest-apis/docs/citrix-virtual-apps-and-desktops-apis. APIs not applicable to Citrix Virtual Apps and Desktops are marked accordingly. Follow the guidance there to configure access to the API service and use the APIs to manage and optimize your resources.

Monitor Service OData

The Monitor API allows access to the Monitor Service data using Version 3 or 4 of the OData API. You can create customized monitoring and reporting dashboards based on data queried from the Monitor Service data. OData V.4 is based on the ASP.NET Web API and supports aggregation queries.

For more information, see the Monitor Service OData API.

OEM Guides

July 21, 2026

This section provides guidance from Citrix on deploying and optimizing products from select OEM vendors within Citrix Virtual Apps and Desktops HDX sessions. The documentation covers supported configurations, design considerations, and troubleshooting best practices to help administrators successfully integrate third-party hardware and software in virtualized environments. Note that while

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix validates interoperability at the HDX transport layer, device and application-specific behavior remains the responsibility of the respective OEM vendor.

Introduction

August 24, 2026

Citrix Virtual Apps and Desktops supports Nuance PowerMic and Philips SpeechMike dictation microphones for use within HDX sessions, enabling voice dictation and microphone control in published applications and virtual desktops.

These devices are commonly used in environments that rely on speech recognition workflows. In Citrix sessions, dictation microphones present as composite USB devices that expose audio and HID interfaces. Citrix HDX supports these devices by handling audio input through the HDX audio virtual channel while redirecting required device interfaces to the session to ensure application compatibility and button functionality.

This page describes supported scenarios and provides guidance for enabling Nuance PowerMic and Philips SpeechMike devices in Citrix Virtual Apps and Desktops environments.

Configuration

Design Considerations

> **Important —Third-Party Statement**
>
> Nuance PowerMic and Philips SpeechMike devices, along with associated speech recognition software, are third-party products. Citrix Virtual Apps and Desktops supports these devices at the virtualization and HDX transport layer only.
>
> Citrix does not develop, certify, or provide support for third-party device drivers, firmware, speech recognition engines, or application-specific functionality. Device behavior such as transcription accuracy, button mappings, and application responsiveness is determined by the third-party software and underlying environmental conditions.
>
> For issues related to device hardware, firmware, drivers, or speech-recognition application behavior, contact the respective device or application vendor. Customers should validate third-party compatibility and supported configurations directly with the vendor before deploying these devices in production Citrix environments.

Requirements and Configuration

August 24, 2026

Requirements

Citrix® Control Plane

- Citrix Virtual Apps and Desktops™ 2402 or later
- Citrix DaaS

Session Host

- Operating system
  - Windows 11
  - Windows Server 2019 or later
- VDA
  - Windows: version 2402 or later

> **Note:**
>
> When the session host is a Windows Server, microphone access must be enabled on the server as it is disabled by default.

Client Device

- Operating system
  - Windows 11
  - Linux
- Workspace app
  - Windows: version 2402 or later
  - Linux: version 2601 or later

> **Note:**
>
> - Older versions of Citrix Workspace App for Linux might require additional configuration on the client endpoint and might have some feature gaps.
> - Nuance PowerMic and Philips SpeechMike devices are supported in single-hop Citrix Virtual

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> Apps and Desktops sessions. Multi-hop or nested virtualization scenarios may result in degraded performance and are not recommended for latency-sensitive dictation workflows.

Configuration

Dictation microphones are composite USB devices that expose both audio and HID interfaces. The HID interfaces are redirected using USB redirection, while audio traffic flows through the HDX audio channel. The steps below configure split-device USB redirection for each supported device model.

PowerMic 4

The PowerMic 4 is a composite device with 8 interfaces. The HID interfaces (04, 05, 06, 07) are redirected via USB redirection; audio flows through the HDX audio channel.

1. In Citrix Web Studio, enable the **Client USB device redirection** policy setting.
2. Edit the **Client USB device redirection rules (Version 2)** policy setting and add the following rule, then click **Save**:

```
Connect: VID=0554 PID=0064 split=1 intf=04,05,06,07 #Nuance PowerMic4 HID controls
Deny: VID=0554 PID=0064 split=1 intf=00,01,02 #Nuance PowerMic4 audio
Deny: VID=0554 PID=0064 split=1 intf=03 #Nuance PowerMic4 mouse
```

1. Edit the **Allow existing USB devices to be automatically connected** policy setting. Clear the **Use default value** checkbox, select **Automatically redirect available USB devices**, and click **Save**.
2. Edit the **Allow newly arrived USB devices to be automatically connected** policy setting. Clear the **Use default value** checkbox, select **Automatically redirect available USB devices**, and click **Save**.

Once these settings are configured, the PowerMic 4 device will automatically be presented in subsequent HDX sessions and will not require any additional end-user action.

PowerMic 3

The PowerMic 3 is a composite device with 4 interfaces. The HID interface (03) is redirected via USB redirection; audio flows through the HDX audio channel.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. In Citrix Web Studio, enable the **Client USB device redirection** policy setting.
2. Edit the **Client USB device redirection rules (Version 2)** policy setting and add the following rule, then click **Save**:

```
Connect: VID=0554 PID=1001 split=01 intf=03 #Nuance PowerMic3
 Deny: VID=0554 PID=1001 split=01 intf=00,01,02 #Nuance PowerMic3
    audio
```

1. Edit the **Allow existing USB devices to be automatically connected** policy setting. Clear the **Use default value** checkbox, select **Automatically redirect available USB devices**, and click **Save**.
2. Edit the **Allow newly arrived USB devices to be automatically connected** policy setting. Clear the **Use default value** checkbox, select **Automatically redirect available USB devices**, and click **Save**.

Once these settings are configured, the PowerMic 3 device will automatically be presented in subsequent HDX sessions and will not require any additional end-user action.

Philips SpeechMike

The Philips SpeechMike is a composite device with 7 interfaces. The HID interfaces (03, 04, 05, 06) are redirected via USB redirection; audio flows through the HDX audio channel.

1. In Citrix Web Studio, enable the **Client USB device redirection** policy setting.
2. Edit the **Client USB device redirection rules (Version 2)** policy setting and add the following rule, then click **Save**:

```
Connect: VID=0911 PID=0c1c split=1 intf=03,04,05,06 #Philips
   SpeechMike
 Deny: VID=0911 PID=0c1c split=1 intf=00,01,02 #Philips SpeechMike
    audio
```

1. Edit the **Allow existing USB devices to be automatically connected** policy setting. Clear the **Use default value** checkbox, select **Automatically redirect available USB devices**, and click **Save**.
2. Edit the **Allow newly arrived USB devices to be automatically connected** policy setting. Clear the **Use default value** checkbox, select **Automatically redirect available USB devices**, and click **Save**.

Once these settings are configured, the Philips SpeechMike device will automatically be presented in subsequent HDX sessions and will not require any additional end-user action.

Design Considerations and Client Considerations

July 21, 2026

Design Considerations

When planning to use Nuance PowerMic or Philips SpeechMike devices in Citrix Virtual Apps and Desktops environments, consider the following design factors that can affect device behavior and user experience.

Audio policy settings in Studio

Citrix recommends using default audio policy settings in Studio. Modifying the default options may result in inconsistent audio performance.

Network Latency and Session Topology

Dictation workflows are sensitive to latency. High network latency or jitter can result in delayed audio delivery, reduced transcription accuracy, or perceptible lag between speaking and text appearing in the application.

Environments that introduce double-hop scenarios —for example, accessing a virtual desktop through another virtualized layer or remote access solution —can further compound latency and may negatively impact real-time dictation and button responsiveness.

For best results, ensure that network conditions support low-latency audio streaming between the user endpoint and the session host.

Audio and Device Redirection Behavior

Dictation microphones depend on a combination of HDX audio channels and redirected device interfaces. Poor network conditions, competing real-time workloads, or constrained client resources can affect how audio and control signals are delivered into the session, potentially leading to inconsistent behavior.

Citrix recommends validating microphone behavior under expected production conditions before broad deployment, especially in environments with variable network quality.

Application-Specific Dependencies

The end-user experience is heavily dependent on the speech recognition application running inside the session. Some applications may introduce their own buffering, processing latency, or compatibility constraints that are outside the control of Citrix Virtual Apps and Desktops.

Citrix does not control or validate application-level speech recognition accuracy, transcription performance, or button mappings. Customers should verify application compatibility and supported device models with the application vendor.

User Expectations and Workflow Validation

Dictation workflows require near real-time feedback. If environmental conditions do not meet performance expectations, users may experience delays in transcription or inconsistent device response.

Citrix recommends validating end-to-end workflows —including network path, client endpoint, virtualization layers, and application behavior —to ensure that the solution meets user productivity requirements before production rollout.

Client Device Considerations

The client endpoint plays a critical role in the overall dictation experience when using Nuance PowerMic or Philips SpeechMike devices in HDX sessions. Administrators should consider the following factors when designing and validating client-side deployments.

Client Platform and Workspace App Version

Citrix recommends using current, supported versions of Citrix Workspace app on client devices. Older client versions may lack optimizations for audio redirection or composite USB device handling, which can result in degraded microphone performance or inconsistent button behavior.

Differences in implementation between Windows, macOS, and Linux Workspace app clients may also affect how dictation devices are enumerated and redirected into the session.

Client Hardware and Resource Availability

Dictation workflows rely on real-time audio capture and delivery. Client devices with limited CPU, memory, or audio subsystem capabilities may introduce additional delay or distortion before audio is sent to the VDA, even in low-latency network environments.

To ensure consistent results, validate device behavior on the same class of endpoints that will be used in production.

USB Connectivity and Device Topology

Nuance PowerMic and Philips SpeechMike devices may expose multiple USB interfaces. USB hubs, docking stations, or virtualized USB controllers on the endpoint can affect how these interfaces are presented to the Citrix session.

Citrix recommends testing dictation devices using the planned endpoint connection topology, especially in environments that rely on shared workstations, hot-desking, or docking solutions.

Local Audio and Peripheral Usage

Other local applications using audio input devices on the client endpoint can compete for system resources and may affect dictation performance. Administrators should account for concurrent local audio usage, such as conferencing or recording tools, when validating user workflows.
