Citrix Virtual Apps and Desktops™ 7 2607 LTSR

August 7, 2026

About the release

This Citrix Virtual Apps and Desktops™ release includes new versions of the Windows Virtual Delivery Agents (VDAs) and new versions of several core components. You can:

- **Install or upgrade a site**: Use the ISO for this release to install or upgrade core components and VDAs. Installing or upgrading to the latest version allows you to use the latest features.
- **Install or upgrade VDAs in an existing site**: If you already have a deployment and aren't ready to upgrade your core components, you can still use several of the latest HDX™ features by installing (or upgrading to) a new VDA. Upgrading only the VDAs can be helpful when you want to test enhancements in a non-production environment.

  After upgrading your VDAs to this version, you do not need to update the machine catalog's functional level. For more information, see VDA versions and functional levels.

For installation and upgrade instructions:

- If you are building a new site, follow the sequence in Install and configure.
- If you are upgrading a site, see Upgrade a deployment.

Documentation for supported and legacy versions

Documentation for supported versions is available in Citrix Virtual Apps and Desktops.

The End of Life (EOL) version documentation PDFs are archived in Legacy Documentation.

What's new

September 3, 2026

This article lists new and enhanced features for Citrix Virtual Apps and Desktops 7 2607 LTSR. Updates are organized by component.

Citrix Virtual Desktop Assistant

The following updates are added to the Citrix Virtual Desktop Assistant app in the 2607 LTSR release. The sessions can now also be optimized or monitored in the following areas:

- **Graphics:** View current HDX graphics configuration details for the VDA session. For more information, see Graphics page.
- **Proactive notifications:** Receive alerts when session resource usage is high or when your profile storage is nearing capacity. For more information, see Proactive notifications.

HDX

Devices

PDF printing enhancements The PDF based universal printer driver now provides a printer driver UI on the VDA that allows users to configure various print settings for auto-created printers. Additionally, print preferences are sent to and honored by the printer without leaving the document behind on the client endpoint. For more information, see PDF printing.

FIDO2 diagnostics tool A new command-line tool **CtxFido2Diagnostics.exe** is now available on the VDA to help users and administrators troubleshoot FIDO2 redirection configuration issues. For more information, see FIDO2 diagnostics tool.

HDX connectivity

EDT MTU Rediscovery A new machine policy setting, **MTU Rediscovery**, is now available. Use this setting to configure EDT MTU Rediscovery. See Enlightened Data Transport for details.

Microsoft Entra single sign-on Microsoft Entra single sign-on for Entra hybrid joined session hosts is now generally available.

You can also use the Microsoft Entra single sign-on machine policy setting to enable or disable this capability on your session hosts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Web sign-in (Preview) You can enable web-based sign-in to log in or unlock your Entra hybrid joined virtual desktop. See Web sign-in for details.

Published applications

Disconnect session after closing published application It is now possible to change the application close behavior from logging off the user to disconnecting the session. See Session management configuration for details.

Web Studio

Faster domain selection with search and an exclusion list

Finding Active Directory domains and organizational units (OUs) is now faster in Web Studio. During machine catalog creation, when you select **Create new Active Directory accounts**, you can search for a specific domain directly from the **Location (domain)** dropdown instead of browsing the full list of trusted domains.

You can also improve domain lookup performance by adding unreachable or unnecessary domains to a domain exclusion list in **Settings > Site settings**. Web Studio automatically skips excluded domains during future queries, making the Location (domain) dropdown and other domain lookups more responsive. For more information, see Configure the domain exclusion list.

Flexible billing for Amazon WorkSpaces Core Managed Instances

You can now choose between Monthly (flat-rate) and Hourly (pay-as-you-go) billing models when provisioning Amazon WorkSpaces Core Managed instances using Citrix MCS.

This flexibility allows you to optimize compute costs based on your specific workload requirements and usage patterns.

Use the Monthly billing mode for persistent desktops to benefit from predictable, flat-rate pricing, or use Hourly billing for on-demand or intermittent workloads.

This feature requires your AWS account to be configured for the Amazon WorkSpaces billing service.

For more information, see Flexible billing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Amulet Hotkey CoreStation

Power Management GA for Amulet Hotkey CoreStation HX2000

General availability of power management for Amulet Hotkey CoreStation HX2000. With this feature, Citrix manages your Amulet Hotkey CoreStation workloads through an Amulet Hotkey CoreStation plug-in. With this plug-in, you can create hosting connections to your Amulet Hotkey CoreStation device, create machine catalogs, and power manage machines using PowerShell commands and Studio.

For more information, see:

- Amulet Hotkey CoreStation virtualization environments
- Connection to Amulet Hotkey CoreStation
- Power manage Amulet Hotkey CoreStation VMs
- Create an Amulet Hotkey CoreStation machine catalog
- Enroll WebSocket Amulet Hotkey CoreStation VDAs using tokens

Fixed issues

August 19, 2026

> **Note:**
>
> Fixes to issues in previous versions of Citrix Virtual Apps and Desktops™ are included in this and subsequent releases.

General

- When using Browser Content Redirection in Server Fetch Client Render mode, manual form-based login might fail even when the login page loads successfully. [HDX-99152]
- When using Browser Content Redirection with Google Chrome's experimental AI bar enabled in the address bar, the top center section of the redirected page might appear clipped and become non-interactable. [HDX-103167]
- When using Browser Content Redirection with Integrated Windows Authentication (IWA) Single Sign-On, the WebSocketAgent process might crash when navigating to an HTTP URL included in the BCR ACL policy. [HDX-104393]

Machine Creation Services™

- Updating a vTPM-enabled master image for an MCS non-persistent machine catalog through a Nutanix AHV Prism Central connection triggers a VM recreation that might invalidate DNS reservations, and necessitate re-enrollment for software utilizing MAC addresses for licensing. [PMCS-60382]
- When you prepare a master image using Azure Local VM with Azure Connected Machine agent version 1.61 or later installed and onboarded, catalog creation in MCS fails in the image preparation process due to access denial when deleting the agent configuration file. As a workaround, do the following while creating a master image: Navigate to `C:\ProgramData\AzureConnectedMachineAgent\Config\agentconfig.json`, right-click the file, select **Properties**, and clear the **Read-only** attribute check box. [PMCS-59003]
- Adding a large batch of VMs to an MCS catalog using a Nutanix AHV Prism Central host connection might fail with an `OutOfMemory` error. To avoid this, reduce the number of VMs created in a single batch. We recommend adding a maximum of 10 VMs at a time. [PMCS-58254]
- After upgrading an existing VDA to version 2511, the `MachineGuid` changes to a unique value for the machine. Any software that relies on the `MachineGuid` for licensing might need to be reenrolled. [PMCS-58288]

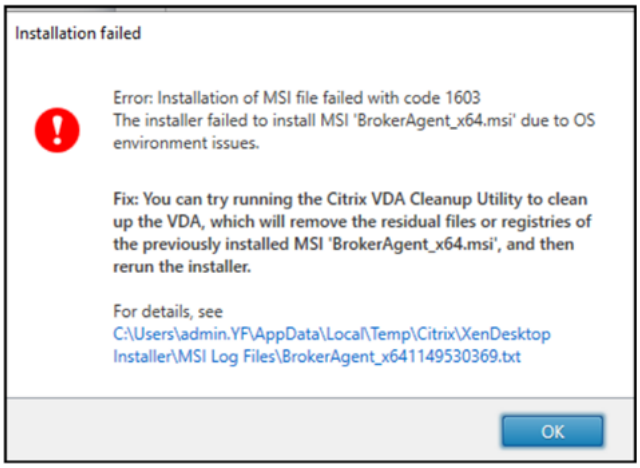
Known issues

August 19, 2026

Citrix Virtual Apps and Desktops™ 7 2607 LTSR includes the following known issues:

Notes



- If a known issue has a workaround, it is provided after the description of the issue.
- The following warning applies to any workaround that suggests changing a registry entry:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Warning:**
>
> Editing the registry incorrectly can cause serious problems that might require you to re-install your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back up the registry before you edit it.

General

- You might encounter the following error during Citrix VDA installation on Windows 10 (22H2) and Windows Server 2022 platforms.

  Also, in the broker agent msi logs, you might see the following error message:

```
MSI (s) (04:D8) [09:46:08:426]: Note: 1: 1722 2:
    CA_RunInstallAgent 3: C:\Program Files\Citrix\Virtual Desktop
    Agent\BrokerAgent.exe 4: -install
CustomAction CA_RunInstallAgent returned actual error code 1701 (
    note this may not be 100% accurate if translation happened
    inside sandbox)
MSI (s) (04:D8) [09:46:08:427]: Product: Citrix Virtual Desktop
    Agent - x64 -- Error 1722. There is a problem with this
    Windows Installer package. A program run as part of the setup
    did not finish as expected. Contact your support personnel or
    package vendor. Action CA_RunInstallAgent, location: C:\
    Program Files\Citrix\Virtual Desktop Agent\BrokerAgent.exe,
    command: -install
```

  To resolve this issue, close the installer, rebuild Windows Performance Counters, restart the machine, and do the installation again. See the Microsoft document Manually rebuild performance counters for Windows Server 2008 64 bit or Windows Server 2008 R2 systems for information. [LCM-23228]

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you launch the app bar and then open the Connection Center menu in Citrix Workspace™ app for Windows, the app bar doesn't appear under the server that hosts it. [HDX-27504]
- The **Session limits** settings for multi-session VDAs are declined in session hosts running Windows Server 2022, Windows 10 Enterprise multi-session, and Windows 11 Enterprise multi-session. [HDX-47001]
- Microsoft confirms there is an issue retaining print settings between print jobs when using the Modern Print Dialog, which they are working to address. Their current projection is the first half of 2025. The Modern Print Dialog is enabled by default in newer OS versions such as Windows 11 and Windows Server 2025. The OS can be configured to use the legacy print dialog by taking the following action:

  1. Open the Registry Editor.
  2. Go to `HKEY_CURRENT_USER\Software\Microsoft\Print\UnifiedPrintDialog`
  3. Right-click and select **New > DWORD (32-bit) Value**
  4. Rename the value as **PreferLegacyPrintDialog**.
  5. Right-click **PreferLegacyPrintDialog** and select **Modify**.
  6. Set the value data to 1 and click **OK**.

  [HDX-66953] [HDX-66904]

- Client printers are not cleaned up when reconnecting to a single-session VDA via RDP.

  On single-session machines, redirected client printers from a prior ICA session are not removed when a user reconnects to the same machine using RDP. As a result, stale client printers remain visible in the session but are no longer functional. This does not impact multi-session VDAs. [HDX-101630]

- During a Citrix Virtual Apps and Desktops session, if a client monitor supporting audio playback is power cycled (turned off and then on), the name of the monitor's audio playback device within the VDA's Sound Control Panel (mmsys.cpl) changes from its correct, specific name to "Citrix HDX Audio". This is an intermittent issue. As a workaround, close the VDA's Sound Control Panel (mmsys.cpl) window and then re-launch it. [HDX-87080]
- When attempting to add a new printer from within certain applications published on a Windows Server 2019 Virtual Delivery Agent (VDA), an error occurs preventing the printer from being listed or added. Specifically, an error message indicating that `rundll32.exe` cannot be accessed appears.

  As a workaround, use a printer that is already visible in the application or add the printer so that it is available in the current session. [HDX-86440]

- If the device name is changed on the client machine while a session is active, the new name is not immediately reflected inside the session settings. This behavior affects both playback and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

recording devices.

As a workaround, to view the updated device name, you must disconnect from the session and then reconnect. Alternatively, logging out of the session and logging back in also resolves the issue. [HDX-86327]

- When multiple Chrome browser tabs, including those configured for Browser Content Redirection (BCR), are dragged and dropped simultaneously from one Chrome window to another, the redirected content might exhibit unexpected behavior. [HDX-81501]
- If you move a tab with video content to a new window, playback might stop or the video might not appear. [HDX-92343]
- When using Browser Content redirection with Browser Profile Sharing, SSO persistence with multiple profiles is not supported. [HDX-85325]
- Windows 11 has a new UI feature to snap the windows on the desktop. A special toolbar appears on top of the desktop while the user drags the window. So multimedia overlay clipping logic is cutting the top/center area out, probably because of the new invisible/transparent window for this functionality.

  As a workaround, see:

  - Snap your windows section.
  - How to disable "Snap your windows"feature

  [HDX-91532]

- **[3rd Party] Printing might fail after an in place Windows upgrade on machines with the Citrix VDA already installed**
  After an in place Windows upgrade, Citrix print providers might no longer be invoked, which can result in printing failures. This issue occurs because the Windows upgrade process resets the print provider execution order and does not preserve Citrix registered providers. Microsoft has confirmed this is a Windows behavior and does not currently preserve provider registrations in the execution order during upgrades. [HDX-85359]

The workaround is to add the print providers back into the appropriate registry location.

```
1. Open the Registry Editor.
1. Go to `HKEY_LOCAL_MACHINE\CurrentControlSet\Control\Print\Providers
   `
1. Right-click **order** and select **Modify**.
1. Add the values `Universal Printer` and `Client Printer` above any
   other providers.
1. Reboot the VDA.
```

- Any catalogs using MCSIO write cache for storage optimization, please make sure to install the Citrix MCS I/O driver as part of the VDA install and upgrades. For more information, see Storage

© 1997–2026 Citrix Systems, Inc. All rights reserved.

shared by hypervisors and Configure cache for temporary data. The MCS I/O driver missing on the VDA may create issue when you are updating the catalog. [HDX-101001]

- When you attempt to sign out from a locked Windows session using the Citrix Toolbar, the operation fails. This issue occurs on both Citrix Workspace app (CWA) for Linux and CWA for Windows.

As a workaround, ensure that the Windows session is unlocked before attempting to disconnect or sign out. If the session is unlocked, the disconnect and sign-out functions work correctly. [HDX-103985]

Audio

- When an audio device, such as a headset, is generically redirected using USB redirection to a Windows Server Virtual Delivery Agent (VDA) (for example, Windows Server 2019 or 2022), and multiple user sessions are simultaneously active on the same VDA, clicking the volume icon in the lower-right corner of the taskbar to adjust the settings can cause an unexpected crash of the Windows `ShellExperienceHost.exe` process. This issue primarily occurs in a session where the audio device is not actively redirected, but another session on the same VDA is utilizing generic USB audio redirection.

  As a workaround, restart the Windows Explorer process (explorer.exe) in the affected session through the Task Manager. This might allow the volume icon to function without crashing. [HDX-80937]

Machine Creation Services™

- When using a machine profile that has multiple network interfaces (NICs) with Accelerated Networking enabled, ensure that the selected VM size supports Accelerated Networking on all NICs. Some Azure VM sizes (for example, Standard_D2ads_v5) restrict Accelerated Networking to a single NIC. If the machine profile enables Accelerated Networking on more NICs than the VM size allows, machines fail to power on with the error `VmSizeRestrictedToSingleNicWithAcceleratedNetworkingEnable`. To resolve this, either select a VM size that supports Accelerated Networking on multiple NICs, or update the machine profile to enable Accelerated Networking on only one NIC. [PMCS-59817]
- The TLS encryption on VDA version 2511 breaks if the environment relies on wildcard certificates inherited from the master image.

  As a workaround for single-session machines, a per-machine certificate can be used instead. See Enable TLS / DTLS on VDAs for details. [PMCS-58287]
- The VMs created using `InstanceType` are not supported as a master image in Red Hat OpenShift environments. [PMCS-54272]

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When creating an MCS machine catalog in a Red Hat OpenShift virtualization environment, you can't use a master image and a machine profile that have different operating system types. This is due to how Red Hat OpenShift manages each OS type. Therefore, using a Windows VM as the master image with a non-Windows (example, Linux) VM as the machine profile, or the other way around, is not supported. [PMCS-54009]
- In a VMware environment hosted on AWS, the MCS machine catalog creation fails if the master image is vTPM enabled. This issue affects all Citrix Virtual Apps and Desktops versions and is due to a problem in the VMware environment. For assistance, contact VMware support. [PMCS-38514]
- When using Machine Creation Services I/O (MCSIO) with Windows Server 2019 VDAs running VDA 2607 , the write-cache disk is successfully attached to the provisioned virtual machine but remains empty and is not utilized as expected.

  This issue has been observed only under the following conditions:

  - The VDA operating system is Windows Server 2019
  - VDA 2607 is installed
  - The machine catalog is provisioned using MCSIO

  Workaround

  Configure the required CVhdFilter registry setting on the master image before provisioning machines.
  Registry location: `HKLM\SYSTEM\CurrentControlSet\Services\CVhdFilter`

  Resolution Steps

  1. On the Windows Server 2019 master image, open Registry Editor (regedit.exe) .
  2. Navigate to: HKLM\SYSTEM\CurrentControlSet\Services\CVhdFilter
  3. Right click on CVhdFilter and create a new empty key 'Parameters'.
  4. Reseal or shut down the master image.
  5. Create a new snapshot of the master image.
  6. Update the MCSIO machine catalog to use the new snapshot.
  7. Reboot the provisioned virtual machines.
  8. Verify that the write-back cache (WBC) disk is populated during normal user session activity.

  Affected Versions

  - Citrix Virtual Delivery Agent (VDA) 2607
  - Windows Server 2019
  - Machine Creation Services I/O (MCSIO) [PMCS-63379]

Deprecations and removals

August 31, 2026

The announcements in this article are intended to give you advanced notice of platforms, Citrix® products, and features that are being phased out so that you can make timely business decisions. Citrix monitors customer use and feedback to determine when they are withdrawn. Announcements can change in subsequent releases and might not include every deprecated feature or functionality.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For details about product lifecycle support, see the Product Lifecycle Support Policy article. For information about the Long Term Service Release (LTSR) servicing option, see https://support.citrix.com/support-home/kbsearch/article?articleNumber=CTX205549.

The following table shows the platforms, Citrix products, and features that are deprecated or removed. Dates in **bold** face indicate changes at this release.

Deprecations

Deprecation means we intend to remove the feature or capability from a future release. The feature or capability will continue to work and is fully supported until it is officially removed. This deprecation notification can span a few months or years. After removal, the feature or capability will no longer work. This notice is to allow you sufficient time to plan and update your code before the feature or capability is removed. Alternatives for deprecated items are suggested where possible.

Item	Deprecation announced in version	Alternative
VDA support on Windows 10	2607	Upgrade to the latest Windows version.
VDA support on Windows Server 2019	2607	Upgrade to the latest Windows Server version.
The **Last Boot Time (UTC)** column in Studio and the **LastBootTime** field in **Get-ProvVM** and **Get-ProvVMDetails** responses	2607	-
Per-delivery group license overrides (multi-type licensing)	2603	Citrix Virtual Apps and Desktops uses site-level license settings only. Delivery group overrides are ignored and the License Assignment step in the Create and Edit Delivery Group wizards is removed. For more information, see Multi-type licensing.
Studio UI option for App-V full infrastructure	2603	Migrate to the App-V Single Admin model
Zero latency text also known as local text echo	2603	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Alternative
Support for Audio over UDP (Audio over UDP Real-time Transport and Audio UDP port range)	2511	Use Adaptive audio with EDT Loss Tolerant Mode for Audio. Requires the below minimum versions. Virtual delivery agent Windows 2308 Linux 2411 Mac 2411 Citrix Workspace app Windows 2309 Linux 2402 Mac 2402
Audio Quality setting (and support for legacy audio codecs)	2511	Use Adaptive audio. Requires the below minimum versions. Virtual delivery agent Windows 2109 Linux 2112 Mac 2411 Citrix Workspace app Windows 2109 Linux 2109 Mac 2109
Local App Access (LAA)	2511	There is no direct alternative to LAA. Customers are advised to install the locally installed applications from the endpoint on the VDA instead. LAA will be supported on 2402 LTSR or 2507 LTSR until their maintenance ends. With this deprecation, the Local App Access extension for Microsoft Internet Explorer and Firefox is also deprecated.
HTML5 multimedia redirection	2511	Browser Content Redirection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Alternative
File based licensing	2507	License Activation Service (LAS) is the next generation technology for product activations across the suite of Citrix products. Customers using file based licensing are required to upgrade to a compatible release and perform this technology transition before April 15, 2026. LAS will be the only way to activate and license Citrix on-premises components after April 15, 2026.
Support for `Get-BrokerMachine`	2507	Use `Get-BrokerMachineV2`
Support for **Enable heavyweight compression** option under the Image compression section of **Universal printing optimization defaults** policy setting	2507	
Support for `Repair-AcctADAccount` PowerShell command	2503	Use the following commands `Repair-AcctIdentity`: To repair identity accounts without changing the current state of them. This can repair existing in used identity accounts for existing provisioned VMs. For example, `repair-userCertificate` attributes for Microsoft Entra hybrid joined identity accounts. The `Repair identity info` (including machine password/trust key pair) for AD joined identity accounts. `Reset-AcctIdentity`: To reset identity accounts to initial states (For example, from
Optimize for 3D HDX Graphics policy	2411	Use Use a video codec for compression set to For the Entire Screen. see https://docs.citrix.com/en-us/citrix-virtual-apps-desktops/2607-ltsr/policies/reference/ica-policy-settings/graphics-policy-settings.html#use-video-codec-for-compression

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Alternative
NVIDIA GPU hardware encoding (NVENC) with: vGPU 15 and older, and driver version 529.19 and older.	2411	Use currently supported NVIDIA drivers: vGPU 16 or newer, and driver version 536.22 or newer. See https://docs.nvidia.com/vgpu/index.html#driver-versions on NVIDIA supported vGPU and driver versions for more information.
Support for the following `-AcctADAccount` PowerShell commands New-AcctADAccount Add-AcctADAccount Update-AcctADAccount Remove-AcctADAccount Unlock-AcctADAccount Get-AcctADAccount	2411	Use the -AcctIdentity PowerShell commands New-AcctIdentity Add-AcctIdentity Update-AcctIdentity Remove-AcctIdentity Unlock-AcctIdentity Get-AcctIdentity
Support for `-ResetIdentityInfo` PowerShell command	2411	Use `-Recreate` to recreate the identity disk. For information, see Repair the identity information of active computer accounts.
MMC-based Studio	2411	MMC Studio was removed in 2511 and use Web Studio instead.
Multiple monitor hooks	2407	-
Domain pass-through authentication	2407	Use enhanced domain pass-through for single sign-on.
Rendezvous V1	2402	Use Rendezvous V2.
Secure ICA®	2402	Use Secure HDX.
VDA support on Windows Server 2016	2402	Upgrade to the latest Windows Server versions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Alternative
Support for Delivery Controller™, Web Studio, Citrix Director, Citrix License Server, Citrix StoreFront, Server VDI for single-session OS, VDA for multi-session OS, Active Directory forest and domain, and Universal Print Server on Windows Server 2016	2402	Upgrade to the latest version of Windows Server.
Support for Microsoft SQL Server versions 2016 and 2017 for the site configuration, configuration logging, and monitoring databases	2402	Upgrade to the latest version of Microsoft SQL Server.
Support for Azure catalogs created before on-demand provisioning feature (“legacy” catalogs)	2402	Recreate Azure legacy catalog VMs. The catalogs are provisioned as on-demand and thereby, save storage cost.
The **Target Minimum Frame Rate** policy	2311	Use **Graphics Status Indicator** to modify the target minimum frame rate.
Support for using a master image in a region different from the region where the catalog is created	2311	Use Azure Compute Gallery to replicate the master image to the desired region.
HDX™ Graphics Display Memory Limit setting	2311	The minimum amount of memory required is allocated to ensure the client’s display layout is fully accommodated.
Progressive mode support in HDX Graphics	2311	Use Thinwire. See Progressive mode.
Support for browser content redirection in Internet Explorer 11	2311	Use Google Chrome-based browser content redirection.
Support for SQL Server 2016 in Broker	2308	Use the latest versions. For more information, see System Requirements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Alternative
Support for XenApp 5.x in Director	2308	—
Support for XenApp 6.x in Director	2308	—
SCOM Pack for alerts in Director	2308	—
Support for plug-in in Director	2308	—
Support for WebRTC SDP format (Plan B)	2308	Upgrade the Citrix Workspace™ App to a supported version.
Support for Single Window mode in Microsoft Teams Optimization	2308	Upgrade the Citrix Workspace App to a version that supports MultiWindow mode. For more information, see Feature matrix and version support.
Support for `AwsCaptureInstanceProperties` used in AWS environments	2308	Use a machine profile. See Create a catalog using a machine profile.
`Schedule-ProvVMUpdate` PowerShell command	2305	Use `Set-ProvVMUpdateTimeWindow`.
`Request-ProvVMUpdate` PowerShell command	2305	Use `Set-ProvVMUpdateTimeWindow` with `-StartsNow` and `-DurationInMinutes -1` parameters.
`Cancel-ProvVMUpdate` PowerShell command	2305	Use `Clear-ProvVMUpdateTimeWindow`.
`DedicatedTenancy` parameter used in `New-ProvScheme` command	2303	Use `TenancyType` parameter.
License Server VPX	2206	—
Unmanaged disk to provision VMs in Azure environments.	2206	Use managed disks.
Host to Client (URL) redirection	2203	Bidirectional content redirection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Alternative
Support for four AWS specific commands: `Revoke-HypSecurityGroupIngress`, `Revoke-HypSecurityGroupEgress`, `Grant-HypSecuritygroupegress`, and `Grant-HypSecurityGroupIngress` used in Cloud and on-premises environment.	2203	—
Citrix Files for Windows and Citrix Files for Outlook from the VDA metainstaller.	2203	Use the standalone installers.
WEM Agent component from the VDA metainstaller.	2203	—
Citrix SCOM Management Packs for XenApp and XenDesktop, Provisioning Services, and StoreFront. For the product versions that can be monitored, see Citrix SCOM Management Packs documentation.	1912	Use Director for monitoring and managing your deployment. For more information on SCOM EOL and alternatives, see https://support.citrix.com/support-home/kbsearch/article?articleNumber=CTX266943.
Mobility SDK / Mobile SDK (from the former Citrix Labs)	7.16	Superseded by mobile experience policy settings, and native experiences for hosted desktops/apps.

Removals

Removed items are either removed, or are no longer supported, in Citrix Virtual Apps and Desktops.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
Remove the support for Citrix Backup and Restore on server VDA	2603	2603	Back up manually before installing or upgrading a server VDA
SCCM-integrated Wake on LAN option for Remote PC Access.	2012	2511	Use the standalone Wake on LAN feature.
Support for Citrix Connector 3.1 for System Center Configuration Manager	2311	2507	Do image or application update manually.
Removed the support for AWS volume worker	2311	2503	Use Direct disk upload and download. See Direct disk upload and download.
Support for SQL Server 2016 and 2017	2402 and 2308	2411	Use SQL Server 2019 and 2022
Support for configuring the MCS I/O write-back cache to include only a disk cache and no memory cache	2402	2411	When creating machines with write-back cache enabled, select the **Memory cache size (MB)** option and give it a non-zero size.
Support for PVS Import wizard in Citrix Studio	1912 LTSR	2311	Provision Citrix Provisioning™ machines using either of the following ways Provision machines using Citrix Provisioning Console and export them to Citrix Virtual Apps and Desktops using Citrix Provisioning Devices Export Wizard. See Export Devices Wizard for more details. Create Citrix Provisioning catalogs using Web Studio. See Create Citrix Provisioning catalogs in Citrix Studio for
Citrix Workspace app for Windows 1912	—	2402	Use the latest versions.
HDX Graphics FullScreen + Text optimization	2311	2311	Use Desktop Duplication API (DXGI).
Support for NVIDIA Frame Buffer Capture (NVFBC) with HDX 3D Pro	2308	2311	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
VDA support for policy setting "Automatic installation of in-box printer drivers".	7.16	2311	None. Policy setting supported with VDAs on earlier OSs only (Windows 7, Windows Server 2012 R2 and earlier).
NVIDIA GPU hardware encoding (NVENC) with: vGPU 11 and older, and driver version 466.77 and older.	2305	2305	Use currently supported NVIDIA drivers: vGPU 13 or newer, version 471.41 or newer.
Citrix Supportability Tools (Supportability-Tool_x64 .msi) from the VDA Meta-Installer.	—	2212	—
Citrix License Administration Console (last included in the Windows License Server 11.16.3 build 30000 and removed in the Windows License Server v11.16.6 build 31000).	2003	2006	Use the Citrix Licensing Manager.
Citrix Indirect Display Driver (IDD) graphics adapter support on Windows 10 version 1709 and earlier.	2003	2003	Use Citrix Virtual Apps and Desktops™ 7 1912 LTSR VDAs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
Hardware encoding with NVIDIA GPUs (NVENC) using GRID 9 or earlier display drivers.	2003	2003	Use GRID 10 display drivers with Citrix Virtual Apps and Desktops 7 2003 or later VDAs, or use Citrix Virtual Apps and Desktops 7 1912 LTSR VDAs.
Self-Service Password Reset (SSPR) feature.	2003	2006	—
Support for Microsoft .NET Framework versions prior to version 4.8 for VDAs and core server components. Includes Delivery Controller, Studio, Director.	1912	2003	Upgrade to .NET Framework version 4.8.
VDAs on Windows Server 2012 R2.	1912	2003	Install VDAs on a supported operating system.
AppDNA® application migration component of Citrix Virtual Apps and Desktops Premium edition.	1909	2003	—
Installing Studio on 32-bit (x86) machines.	1909	2003	Install on a supported x64 operating system.
Support for the Excel hook in seamless applications. This was used for creating separate taskbar icons for each Microsoft Excel 2010 workbook.	1909	1909	—

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
Core server components on Windows Server 2012 R2 (including Service Packs). Includes: Delivery Controller, Studio, and Director.	1906	2003	Install on a newer supported operating system.
Support for Site Configuration, Configuration Logging, and Monitoring databases on Microsoft SQL Server versions 2008 R2, 2012, and 2014 (including all Service Packs and editions).	1906	2003	Install databases on a supported Microsoft SQL Server version.
Support for VDAs on Windows 10 on x86 platforms.	1906	1909*	Install VDAs on a supported x64 operating system. *This feature is still supported in Citrix Virtual Apps and Desktops 7 1912 LTSR.
Removal of Citrix Smart Tools Agent from Citrix Virtual Apps and Desktops installation media.	1903	1906	—
Support for Linux VDA on Red Hat Enterprise Linux/CentOS 7.5.	1903	1903	Install Linux VDA on a later version of Red Hat Enterprise Linux.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
StoreFront support for TLS 1.0, and TLS 1.1 protocols between Citrix Virtual Apps and Desktops (formerly XenApp and XenDesktop) and Citrix Receiver, and Workspace Hub.	7.17	2203	Upgrade Citrix Receivers to a Citrix Workspace app that supports the TLS 1.2 protocol. For more information on Citrix Workspace app, see https://docs.citrix.com/en-us/citrix-workspace-app.
VDA support for policy setting "Automatic installation of in-box printer drivers".	7.16	2311	None. Policy setting supported with VDAs on earlier OSs only (Windows 7, Windows Server 2012 R2 and earlier).
Support for Framehawk display remoting technology	1811	1903	Use Thinwire with adaptive transport enabled.
Support for Citrix Smart Scale in all Citrix Virtual Apps and Desktops (and XenApp and XenDesktop) versions. This functionality will reach End of Life on 31 May 2019.	1808	1906	Consider using the Virtual Apps and Desktops Service on Citrix Cloud for improved power management functionality.
Support for Microsoft .NET Framework versions 4.5.1, 4.5.2, 4.6, 4.6.1, 4.6.2, and 4.7 by Citrix StoreFront, Citrix VDAs, Citrix Studio, Citrix Director, and Citrix Delivery Controller.	7.18	1808	Upgrade to .NET Framework version 4.7.1 or later. (The installer automatically installs .NET Framework 4.7.1 if it is not already installed.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
Support for Linux VDA on Red Hat Enterprise Linux 7.3.	7.18	1808	Install Linux VDA on a later version of Red Hat Enterprise Linux.
Support for the Linux VDA on SUSE Linux Enterprise Server 11 Service Pack 4.	7.16	7.16	Install Linux VDA on supported SUSE version.
Support for Citrix WDDM driver on VDAs	7.16	7.16	The Citrix WDDM driver is no longer installed with VDAs.
VDAs on Windows 10 version 1511 (Threshold 2) and earlier Windows Single-session OS releases, including Windows 8.x and Windows 7 (see https://www.citrix.com/blogs/2018/01/08/the-citrix-strategy-for-windows-7-virtual-desktop-users/).	7.15 LTSR (and 7.12)	7.16	Install Single-session OS VDAs on Windows 10 minimum version 1607 (Redstone 1) or newer Semi-Annual Channels. If using 1607 LTSB, we recommend a 7.15 VDA. See CTX224843.
VDAs on Windows Server 2008 R2 and Windows Server 2012 (including Service Packs)	7.15 LTSR (and 7.12)	7.16	Install VDAs on a supported operating system.
Desktop Composition Redirection (previously known as DirectX Command Remoting) (DCR)	7.15 LTSR	7.16	Use Thinwire.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
Core components on Windows Server 2012 and Windows Server 2008 R2 (including Service Packs). Includes: Delivery Controller, Studio, Director, StoreFront, License Server, and Universal Print Server.	7.15 LTSR	7.18	Install components on a supported operating system.
Self-Service Password Reset (SSPR) feature on Windows Server 2012 and Windows Server 2008 R2 (including Service Packs)	7.15 LTSR	7.18	Install on a newer supported operating system.
Studio on Windows 7, Windows 8, and Windows 8.1 (including Service Packs)	7.15 LTSR	7.18	Install Studio on a supported operating system.
Flash Redirection	7.15 LTSR	1912	Create video content as HTML5 Video. Use HTML5 Video Redirection for managed content, and Browser Content Redirection for public websites. For more information, see the Flash Redirection End of Life note.
Citrix Online Integration (Goto product) with StoreFront	7.14 (and StoreFront 3.11)	StoreFront 3.12	—

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
The user account, CtxAppVCOMAdmin, which was created during VDA installation and added to the Local Administrators Group on the VDA machine, is no longer created. The underlying "COM" mechanism is also removed.	7.14	7.14	The Windows service CtxAppVService performs the same function. It is automatically installed and configured and requires no user interaction.
Universal Print Server UpsServer component support on Windows Server 2008 32-bit	7.14	7.14	Install on a newer supported operating system.
StoreFront and Receiver for Web on Internet Explorer 8	7.13	7.13	—
VDA command line installation option /no_appv to prevent installation of the Citrix App-V components	7.13	7.13	Use the command line installation option /exclude "Citrix Personalization for App-V –VDA".
The full-product installer no longer installs the Citrix.Common.Commands snap-in on new installations and automatically removes it when upgrading existing installations.	7.13	7.13	Some PowerShell commands that were provided by the Citrix.Common.Commands snap-in are still available in the XenApp 6.5 SDK.
Partial functionality to manipulate icon data that was provided by *-CtxIcon cmdlets.	7.13	7.13	Now provided by *-BrokerIcon cmdlets in the Broker Service.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
Legacy Thinwire mode	7.12	7.16	Use Thinwire. If you are using Legacy Thinwire mode on Windows Server 2008 R2, migrate to Windows Server 2012 R2 or Windows Server 2016, and use Thinwire.
In-place upgrades from StoreFront 2.0, 2.1, 2.5, and 2.5.2	7.13	7.16	Upgrade from one of these versions to a later supported version and then to XenApp and XenDesktop 7.16.
In-place upgrades from XenDesktop 5.6 or 5.6 FP1	7.12	7.16	Migrate your XenDesktop 5.6 or 5.6 FP1 deployment to the current XenDesktop version. To do this, first upgrade to XenDesktop 7.6 LTSR (with the latest CU), then upgrade to the latest Citrix Virtual Desktops (formerly XenDesktop) release or LTSR version.
Installing Delivery Controller, Director, StoreFront, or License Server on 32-bit (x86) machines.	7.12	7.16	Install on a supported x64 operating system.
Connection leasing	7.12	7.16	Use Local Host Cache.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Item	Deprecation announced in version	Removed in version	Alternative
XenDesktop 5.6 used on Windows XP. VDA installations on Windows XP are not supported.	7.12	7.16	Install VDAs on a supported operating system.
Support for CloudPlatform connections	7.12	2003	Use a different supported hypervisor or cloud service.
Support for Azure Classic (also known as Azure Service Management) connections	7.12	2003	Consider using the Virtual Apps and Desktops Service on Citrix Cloud.
AppDisks functionality (and the AppDNA integration into Studio, which supports it)	7.13	2003	Use Citrix App Layering.
Personal vDisk functionality	7.15	2006†	Use Citrix App Layering user layer or user personalization layer technology.

† At Citrix Virtual Apps and Desktops 7 2003, the Personal vDisk driver was removed from the VDA installer. At Citrix Virtual Apps and Desktops 7 2006, the Personal vDisk driver workflow was removed from Studio.

System requirements

May 15, 2026

Introduction

The system requirements in this document were valid when this product version was released. Updates are made periodically. System requirements for components not covered here (such as host

© 1997–2026 Citrix Systems, Inc. All rights reserved.

systems, Citrix Workspace™ app, and Citrix Provisioning™) are described in their respective documentation.

Review Prepare to install before beginning an installation.

Except where noted, the component installer deploys software prerequisites automatically (such as .NET and C++ packages) if the required versions are not detected on the machine. The Citrix® installation media also contains some of this prerequisite software.

The installation media contains several third-party components. Before using the Citrix software, check for security updates from the third party, and install them.

For globalization information, see Knowledge Center article CTX119253.

For components and features that can be installed on Windows Servers, Nano Server installations are not supported, unless noted. Server Core is supported only for Delivery Controllers and Director.

Hardware requirements

RAM and disk space values are in addition to requirements for the product image, operating system, and other software on the machine. Your performance varies, depending on your configuration. Your configuration includes the features that you use, plus the number of users, and other factors. Using only the minimum can result in slow performance.

The following table lists the minimum requirements for core components.

Component	Minimum
All core components and StoreFront™ on one server, for an evaluation only, not a production deployment	5 GB RAM
All core components and StoreFront on one server, for a test deployment or a small production environment	12 GB RAM
Delivery Controller™ (more disk space required for Local Host Cache)	5 GB RAM, 800 MB hard disk
Studio	1 GB RAM, 100 MB hard disk
Director	2 GB RAM, 200 MB hard disk
StoreFront	2 GB RAM, see the StoreFront documentation for disk recommendations
License Server	8 GB RAM; see the Licensing documentation for disk recommendatio

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Sizing of VMs that deliver desktops and applications

Specific recommendations cannot be provided because of the complex and dynamic nature of hardware offerings, and every deployment has unique needs. Generally, sizing a Citrix Virtual Apps™ VM is based on the hardware and not the user workloads. The exception is RAM. You need more RAM for applications that consume more.

For more information:

- Citrix Tech Zone contains guidance on sizing.
- Citrix Virtual Apps and Desktops Single Server Scalability discusses how many users or VMs can be supported on a single physical host.

Microsoft Visual C++

When installing a Delivery Controller, Virtual Delivery Agent (VDA), or Universal Print Server, the Citrix installer automatically installs the Microsoft Visual C++ 2015–2022 Redistributable.

- If the machine contains an earlier version of that runtime (such as 2015-2019), the Citrix installer upgrades it.
- If the machine contains a version earlier than 2015, Citrix installs the newer version in parallel.

Delivery Controller

> **Note:**
>
> **License Server version compatibility:** Ensure that the License Server is running a minimum of version 11.17.2 build 53100. Failure to meet this prerequisite will block the Citrix Virtual Apps and Desktops (CVAD) site upgrades and site creation

Supported operating systems:

- Windows Server 2025
- Windows Server Core 2022
- Windows Server 2022
- Windows Server 2019, Standard and Datacenter Editions, and with the Server Core option

Requirements:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.
- Windows PowerShell 3.0, 4.0, or 5.0.
- Microsoft Visual C++ 2015–2022 Redistributable.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you upgrade from Citrix Virtual Apps and Desktops version 2407 to 2411 or later, or perform a fresh installation of version 2411 or later, update the License Server to the latest version (version 11.2.17 build 53100 or later) as the first step. Then, upgrade the Delivery Controller. Failing to do so results in a warning message on the UI and failure of command-line installations.

> **Note:**
>
> Citrix Virtual Apps and Desktops™ Delivery Controllers do not support the read-only domain controller (RODC).

Databases

> **Note:**
>
> Starting with version 2411, you can use Azure SQL Managed Instance for databases.

Supported Microsoft SQL Server versions for the site configuration, configuration logging, and monitoring databases:

- SQL Server 2022, Express, Standard, and Enterprise Editions.
  - For new installations: By default, SQL Server Express 2022 with Cumulative Update 14 is installed when installing the Controller, if an existing supported SQL Server installation is not detected.
- SQL Server 2019, Express, Standard, and Enterprise Editions.
- SQL Server 2025, Express, Standard, and Enterprise Editions.

The following database high availability solutions are supported (except for SQL Server Express, which supports only standalone mode):

- SQL Server AlwaysOn Failover Cluster Instances
- SQL Server AlwaysOn Availability Groups (including Basic Availability Groups)
- SQL Server Database Mirroring

Windows authentication is required for connections between the Controller and the SQL Server site database.

Local Host Cache considerations: Microsoft SQL Server Express LocalDB is a feature of SQL Server Express that Local Host Cache uses on a standalone basis. Local Host Cache does not require any components of SQL Server Express other than SQL Server Express LocalDB.

- When installing a Controller, Microsoft SQL Server Express LocalDB 2022 with Cumulative Update 15 is installed for use with the Local Host Cache feature. (This installation is separate from the default SQL Server Express installation for the site database.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When upgrading a Controller, the existing Microsoft SQL Server Express LocalDB version is not automatically upgraded. For replacement requirements and procedures, see Replace SQL Server Express LocalDB.

More database information:

- Databases
- CTX114501 lists the most currently supported databases
- Database sizing guidance
- Local Host Cache

Web Studio

> **Note:**
>
> - Web Studio is a web-based management console that lets you configure and manage your on-premises Citrix Virtual Apps and Desktops deployment. It's designed for an improved user experience and generally responds faster than Citrix Studio. See Install Web Studio for the installation steps.
> - Starting with version 2511, Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops. Citrix Studio (MMC-based) has been removed from the installer.

For information about supported operating systems, browsers, display settings, and hardware requirements for installing and using Web Studio, see System requirements in the Web Studio article.

Citrix Director

Supported operating systems:

- Windows Server 2025
- Windows Server Core 2022
- Windows Server 2022
- Windows Server 2019, Standard and Datacenter Editions, and with the Server Core option

Requirements:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.
- Microsoft Internet Information Services (IIS) 7.0 and ASP.NET 2.0. Ensure that the IIS server role has the Static Content role service installed. If this software is not already installed, you are prompted for the Windows Server installation media. Then, that software is installed for you.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To view the event logs on machines where Citrix Director is installed, you must install Microsoft .NET Framework 2.0.

Citrix Profile Management:

- Ensure that the Citrix Profile Management and Citrix Profile Management WMI Plug-in are installed on the VDA (**Additional Components** page in the installation wizard) and that the Citrix Profile Management Service is running to view the user profile details in Director.

System Center Operations Manager (SCOM) integration requirements:

- System Center 2012 R2 Operations Manager

Supported browsers for viewing Director:

- Microsoft Edge.
- Firefox ESR (Extended Support Release).
- Chrome.

The recommended optimal screen resolution for viewing Director is 1440 x 1024.

Virtual Delivery Agent (VDA) for single-session OS

Supported operating systems:

- Windows 11
- Windows 10 (x64 only), any version that is currently in mainstream support.
    - For edition support, see Knowledge Center article CTX224843.

Requirements:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.
- Microsoft Visual C++ 2015–2022 Redistributable.

Remote PC Access uses this VDA, which you install on physical office PCs. This VDA supports Secure Boot for Citrix Virtual Desktops™ Remote PC Access on Windows 11 and Windows 10.

Several multimedia acceleration features (such as HDX MediaStream Windows Media Redirection) require that Microsoft Media Foundation be installed on the machine on which you install the VDA. If the machine does not have Media Foundation installed, the multimedia acceleration features are not installed and do not work. Do not remove Media Foundation from the machine after installing the Citrix software. Otherwise, users cannot log on to the machine. On most supported Windows single-session

© 1997–2026 Citrix Systems, Inc. All rights reserved.

OS editions, Media Foundation support is already installed and cannot be removed. However, N editions do not include certain media-related technologies; you can obtain that software from Microsoft or a third party. For more information, see Prepare to install.

For Linux VDA information, see the Linux Virtual Delivery Agent articles.

To use the Server VDI feature, you can use the command-line interface to install a VDA for Windows single-session OS on a supported Windows Server machine. See Server VDI for guidance.

For information about installing a VDA on a Windows 7 machine, see Earlier operating systems.

Virtual Delivery Agent (VDA) for multi-session OS

Supported operating systems:

- Windows Server 2025
- Windows 11 (supported only with Citrix DaaS™)
- Windows 10 (x64 only; supported only with Citrix DaaS), any version that is currently in mainstream support.
- Windows Server 2022
- Windows Server 2019, Standard, and Datacenter Editions

The installer automatically deploys the following requirements, which are also available on the Citrix installation media in the **Support** folders:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.
- Microsoft Visual C++ 2015–2022 Redistributable.

The installer automatically installs and enables Remote Desktop Services role services, if they are not already installed and enabled.

Several multimedia acceleration features (such as HDX MediaStream Windows Media Redirection) require that the Microsoft Media Foundation be installed on the machine on which you install the VDA. If the machine does not have Media Foundation installed, the multimedia acceleration features are not installed and do not work. Do not remove Media Foundation from the machine after installing the Citrix software; otherwise, users will not be able to log on to the machine. On most Windows Server versions, the Media Foundation feature is installed through the Server Manager. For more information, see Prepare to install.

If the Media Foundation is not present on the VDA, these multimedia features do not work:

- Windows Media Redirection
- HTML5 Video Redirection
- HDX™ RealTime Webcam Redirection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For Linux VDA information, see the Linux Virtual Delivery Agent articles.

For information about installing a VDA on a Windows Server 2008 R2 machine, see Earlier operating systems.

VDAs in Amazon WorkSpaces Core Managed Instances

Supported operating systems:

- Windows 11 single-session
- Windows 10 single-session
- Windows Server 2025
- Windows Server 2022
- Windows Server 2019
- Windows Server 2016
- Ubuntu Server 24.04 LTS
- Debian 12

Hosts / virtualization resources

The following host/virtualization resources (listed alphabetically) are supported. Where applicable, the *major.minor* versions are supported, including updates to those versions. Knowledge Center article CTX131239 contains current version information, plus links to known issues.

Some features might not be supported on all host platforms or all platform versions. See the feature documentation for details.

The Remote PC Access Wake on LAN feature requires Microsoft System Center Configuration Manager minimum 2012.

Supported hypervisors:

- **Azure Local**

  For more information, see Azure Local environments.

- **XenServer (formerly Citrix Hypervisor™)**

  CTX131239 contains current version information, plus links to known issues.

  For more information, see XenServer virtualization environments.

- **Microsoft System Center Virtual Machine Manager**

  Includes any version of Hyper-V that can register with the supported System Center Virtual Machine Manager versions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CTX131239 contains current version information, plus links to known issues.

For more information, see Microsoft System Center Virtual Machine Manager virtualization environments.

- **Nutanix Acropolis**

  CTX131239 contains current version information, plus links to known issues.

  For more information, see Nutanix virtualization environments.

- **VMware vSphere (vCenter + ESXi)**

  No support is provided for vSphere vCenter Linked Mode operation.

  CTX131239 contains current version information, plus links to known issues.

  For more information, see VMware virtualization environments.

Supported public cloud hosts:

- **Amazon Web Services (AWS)**

  For information about using AWS to provision virtual machines, see Amazon Web Services virtualization environments.

- **Google Cloud Platform**
  For more information, see Google Cloud Platform virtualization environments and Getting Started with Citrix DaaS on Google Cloud.

- **Microsoft Azure Resource Manager**

  For information about using Microsoft Azure Resource Manager to provision virtual machines, see Microsoft Azure Resource Manager virtualization environments.

- **Red Hat OpenShift**

  For information about using Red Hat OpenShift to provision virtual machines, see Red Hat OpenShift virtualization environments.

- **Nutanix cloud and partner solutions**

  For information about using Nutanix cloud and partner solutions, see Nutanix cloud and partner solutions.

- **VMware cloud and partner solutions**

  For information about using VMware cloud and partner solutions, see VMware cloud and partner solutions.

When adding public cloud host connections to your deployment, consider the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You need a Hybrid Rights License. For information about Hybrid Rights License, see Transition and Trade-Up (TTU) with Hybrid Rights. For information about adding a license, see Create a site.
- The information sources direct you to the Citrix DaaS documentation. If you are familiar with the public cloud hosts in the Citrix DaaS product, the on-premises version has several differences.
    - Updates are rolled out to Citrix DaaS approximately every four weeks. So, you might find that certain features available with Citrix DaaS are not available with the on-premises version.

Active Directory functional levels

The following functional levels for the Active Directory forest and domain are supported:

- Windows Server 2025
- Windows Server 2016
- Windows Server 2012 R2
- Windows Server 2012
- Windows Server 2008 R2
- Windows Server 2008

> **Note:**
>
> Before upgrading the Citrix Virtual Apps and Desktops site, review the requirements for individual features, as newer features and VDAs might need specific minimum Active Directory functional levels.

HDX

Audio

UDP audio for Multi-Stream ICA® is supported on Citrix Workspace app for Windows and Citrix Workspace app for Linux 13.

Echo cancellation is supported on Citrix Workspace app for Windows.

See the specific HDX feature support and requirements. For more information on HDX features and Citrix Workspace apps, see the Feature matrix.

HDX Windows Media delivery

The following clients are supported for Windows Media client-side content fetching, Windows Media redirection, and real-time Windows Media multimedia transcoding: Citrix Workspace app for Win-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

dows, Citrix Workspace app for iOS, and Citrix Workspace app for Linux.

To use Windows Media client-side content fetching on Windows 8 devices, set the Citrix Multimedia Redirector as a default program: in **Control Panel > Programs > Default Programs > Set your default programs**, select **Citrix Multimedia Redirector** and click either **Set this program as default** or **Choose defaults for this program**. GPU transcoding requires an NVIDIA CUDA-enabled GPU with Compute Capability 1.1 or higher; see https://developer.nvidia.com/cuda/cuda-gpus.

HDX 3D Pro

The VDA for Windows single-session OS detects the presence of GPU hardware at runtime.

The physical or virtual machine hosting the application can use GPU Passthrough or Virtual GPU (vGPU):

- GPU Passthrough is available with:
  - XenServer®
  - Nutanix AHV
  - VMware vSphere and VMware ESX, where it is referred to as virtual Direct Graphics Acceleration (vDGA)
- vGPU is available with:
  - XenServer
  - Nutanix AHV
  - VMware vSphere

See https://docs.citrix.com/en-us/citrix-virtual-apps-desktops/2607-ltsr/graphics/hdx-3d-pro.

Citrix recommends that the host computer has at least 4 GB of RAM and four virtual CPUs with a clock speed of 2.3 GHz or higher.

Graphical Processing Unit (GPU):

- For virtualized graphics acceleration using the NVIDIA GRID API, you can use HDX 3D Pro with all the NVIDIA GRID GPUs supported by the NVIDIA Virtual GPU (vGPU) software version 13 and up, see https://docs.nvidia.com/grid/index.html.
  For a detailed list of supported Hypervisors and supported hardware, see the NVIDIA vGPU software documentation.
- Virtualized graphics acceleration is supported on the Intel Xeon Processor E3 Family of data center graphics platforms and the Intel data center GPU Flex series. For more information, see GPU Flex series.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- AMD GPUs are supported with AMD's mxGPU virtualization. For more information on supported hardware, see AMD documentation.

User device:

- Citrix supports up to 8 4k monitors, depending on the hardware resources. Depending on the GPU used, there can be other hardware restrictions on this maximum.
- Citrix recommends that user devices have at least 4 GB of RAM and a CPU with a clock speed of 1.6 GHz or higher. For optimum performance, we recommend that user devices have at least 8 GB of RAM and a dual-core CPU with a clock speed of 3 GHz or higher.
- For multi-monitor access, Citrix recommends user devices with quad-core CPUs.
- Citrix Workspace app must be installed.

For more information, see the HDX 3D Pro articles and www.citrix.com/xenapp/3d.

Universal Print Server

The Universal Print Server comprises client and server components. The UpsClient component is included in the VDA installation. You install the UpsServer component on each print server where shared printers reside that you want to provision with the Citrix Universal™ Print Driver in user sessions.

The UpsServer component is supported on:

- Windows Server 2025
- Windows Server 2022
- Windows Server 2019

Requirements:

- Microsoft Visual C++ 2015–2022 Redistributable
- Microsoft .NET Framework 4.8 (minimum)

For VDAs for Multi-session OS, user authentication during printing operations requires the Universal Print Server to be joined to the same domain as the VDA.

Standalone client and server component packages are also available for download.

For more information, see Provision printers.

Other

Only Citrix License Server 11.17.2 and later are supported. For more information, see Licensing.

See the Product Matrix for more information about version compatibility.

For supported StoreFront versions, see the StoreFront system requirements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For information about system requirements for Workspace Environment Management (WEM), see System requirements in the WEM document.

The Microsoft Group Policy Management Console (GPMC) is required if you store Citrix policy information in Active Directory rather than the site configuration database. If you install `CitrixGroupPolicyManagement_x64.msi` separately (for example, on a machine that does not have a Citrix Virtual Apps and Desktops core component installed), that machine must have Visual Studio 2015 runtime installed. For more information, see the Microsoft documentation.

If you want to edit domain GPOs using GPMC, enable the Group Policy Management feature (in the Windows Server Manager) on all machines containing Delivery Controllers.

Multiple NICs are supported.

By default, the Citrix Workspace app for Windows is not installed when you install a current VDA. For more information, see the Citrix Workspace app for Windows documentation.

See Local App Access for supported browser information for that feature.

This version of Citrix Virtual Apps and Desktops requires a minimum of HDX RealTime Connector 2.9 LTSR. For more information, see the HDX RealTime Optimization Pack documentation.

This product supports PowerShell versions 3 through 5.

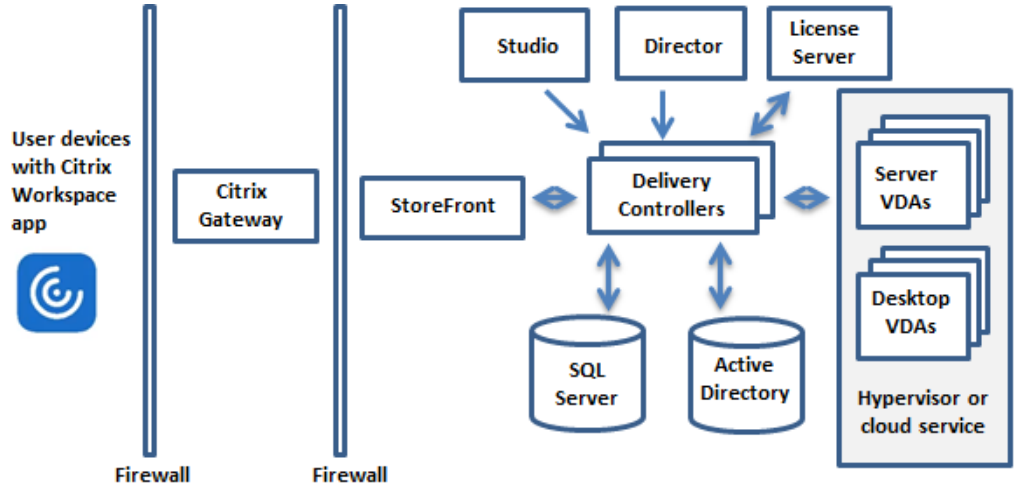
Technical overview

May 15, 2026

Citrix Virtual Apps and Desktops™ are virtualization solutions that give IT control of virtual machines, applications, licensing, and security while providing anywhere access for any device.

Citrix Virtual Apps and Desktops™ allow:

- End users to run applications and desktops independently of the device's operating system and interface.
- Administrators to manage the network and control access from selected devices or from all devices.
- Administrators to manage an entire network from a single data center.



Citrix Virtual Apps and Desktops share a unified architecture called FlexCast Management Architecture (FMA). FMA's key features are the ability to run multiple versions of Citrix Virtual Apps or Citrix Virtual Desktops™ from a single site and integrated provisioning.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Key components

This article is most helpful if you're new to Citrix Virtual Apps and Desktops.

This illustration shows the key components in a typical deployment, which is called a site.

Delivery Controller™

The Delivery Controller is the central management component of a site. Each site has one or more Delivery Controllers. It is installed on at least one server in the data center. For site reliability and availability, install Controllers on more than one server. If your deployment includes a hypervisor or other service, the Controller services communicate with it to:

- Distribute applications and desktops
- Authenticate and manage user access
- Broker connections between users and their desktops and applications
- Optimize user connections
- Load balance the connections

The Controller's Broker Service tracks which users are logged on and where, what session resources the users have, and if users need to reconnect to existing applications. The Broker Service runs PowerShell cmdlets and communicates with a broker agent on the VDAs over TCP port 80. It does not have the option to use TCP port 443.

The Monitor Service collects historical data and places it in the monitoring database. This service uses TCP port 80 or 443.

Data from the Controller services is stored in the site database.

The Controller manages the state of desktops, starting and stopping them based on demand and administrative configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Database

At least one Microsoft SQL Server database is required for every site to store configuration and session information. This database stores the data collected and managed by the services that make up the Controller. Install the database within your data center, and ensure it has a persistent connection to the Controller.

The site also uses a configuration logging database and a monitoring database. By default, those databases are installed in the same location as the site database, but you can change this.

Virtual Delivery Agent (VDA)

The VDA is installed on each physical or virtual machine in your site that you make available to users. Those machines deliver applications or desktops. The VDA enables the machine to register with the Controller, which in turn allows the machine and the resources it is hosting to be made available to users. VDAs establish and manage the connection between the machine and the user device. VDAs also verify that a Citrix® license is available for the user or session, and apply policies that are configured for the session.

The VDA communicates session information to the Broker Service in the Controller through the broker agent in the VDA. The broker agent hosts multiple plug-ins and collects real-time data. It communicates with the Controller over TCP port 80.

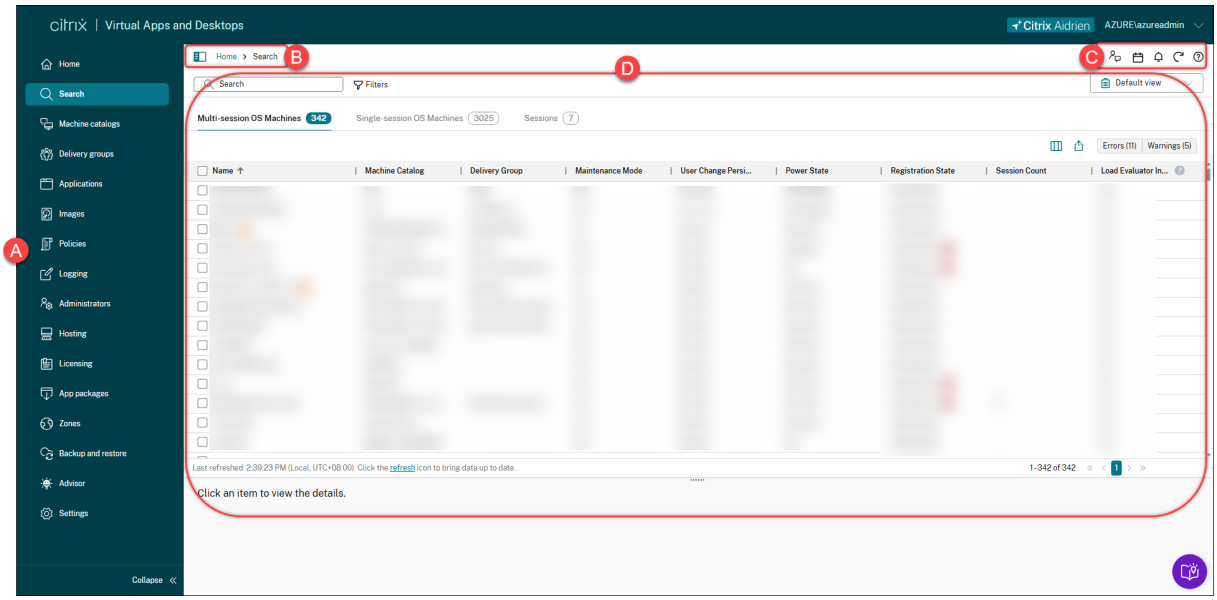
The word "VDA"is often used to refer to the agent and the machine on which it is installed.

VDAs are available for single-session and multi-session Windows operating systems. VDAs for multi-session Windows operating systems allow multiple users to connect to the server at a time. VDAs for single-session Windows operating systems allow only one user to connect to the desktop at a time. Linux VDAs are also available.

Citrix StoreFront™

StoreFront authenticates users and manages stores of desktops and applications that users access. It can host your enterprise application store, which gives users self-service access to the desktops and applications that you make available to them. It also keeps track of users'application subscriptions, shortcut names, and other data. This helps ensure that users have a consistent experience across multiple devices.

Citrix Workspace™ app



Installed on user devices and other endpoints (such as virtual desktops), Citrix Workspace app provides users with quick, secure, self-service access to documents, applications, and desktops. Citrix

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Workspace app provides on-demand access to Windows, web, and Software as a Service (SaaS) applications. For devices that can't install the device-specific Citrix Workspace app software, Citrix Workspace app for HTML5 provides a connection through an HTML5-compatible web browser.

Studio

Web Studio is a web-based management console that lets you configure and manage your on-premises Citrix Virtual Apps and Desktops deployment.

Callout	Area	Description
A	Navigation menu	Let you configure and manage your DaaS deployments for delivering virtual apps and desktops. Examples include: Search, Machine Catalogs, Delivery Groups, and more. For more information, see Plan and build a deployment and Manage deployments.
B	Breadcrumb trail	Provides context and enables quick navigation back to higher-level pages.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Callout	Area	Description
C	Common actions	Displays common actions such as Submit feedback, Customize the Home page, access the Notification Center, and more. • Notification Center provides real-time updates and a 48-hour history of long-running operations. While an operation is running, a status notification appears below the common actions area to indicate its progress. • Task Center displays a comprehensive list of all tasks, organized by category. The UI provides Filter, Search, and other controls consistent with the main view. You can perform actions on any listed task, including common actions like **Delete** and **View details**, and task-specific actions such as Rerun task and Export sub-task status. Currently, Task Center supports Hardware update and OS disk reset tasks.
F	Working pane	Displays actions and details of a selected node in the navigation menu.

For more information, see Install Web Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Secure Private Access

Citrix Secure Private Access on-premises solution enhances an organization's overall security and compliance posture with the ability to easily deliver Zero Trust Network Access to browser-based apps (internal web apps and SaaS apps) using StoreFront as a unified access portal to web and SaaS apps, along with virtual apps and desktops as an integrated part of Citrix Workspace. The solution is compatible with existing releases of NetScaler and StoreFront without any changes to the versions. For details, see Secure Private Access for on-premises.

Citrix Director

Director is a web-based tool that enables IT support and help desk teams to monitor an environment, troubleshoot issues before they become system-critical, and perform support tasks for end users. You can use one Director deployment to connect to and monitor multiple Citrix Virtual Apps or Citrix Virtual Desktops sites.

Director displays:

- Real-time session data from the Broker Service in the Controller, which includes data the Broker Service gets from the broker agent in the VDA.
- Historical site data from the Monitor Service in the Controller.

Director uses the ICA® performance and heuristics data captured by the Citrix Gateway device to build analytics from the data and then presents it to the administrators.

You can also view and interact with a user's sessions through Director, using Windows Remote Assistance.

Citrix License Server

The License Server manages your Citrix product licenses. It communicates with the Controller to manage licensing for each user's session and with Studio to allocate license files. A site must have at least one license server to store and manage your license files.

Hypervisor or other service

The hypervisor or other service hosts the virtual machines in your site. These can be the VMs you use to host applications and desktops, and VMs you use to host the Citrix Virtual Apps and Desktops components. A hypervisor is installed on a host computer dedicated entirely to running the hypervisor and hosting virtual machines.

Citrix Virtual Apps and Desktops support various hypervisors and other services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Although many deployments require a hypervisor, you don't need one to provide Remote PC Access. A hypervisor is also not required when you are using Provisioning Services (PVS) to provision VMs.

Additional components

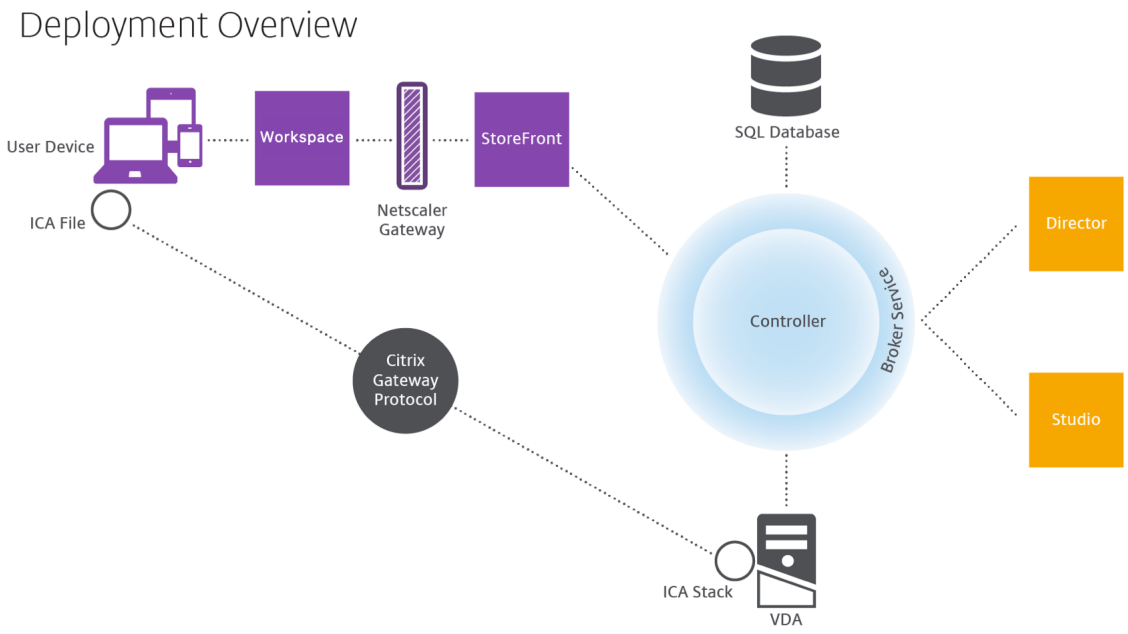
The following components can also be included in Citrix Virtual Apps and Desktops deployments. For more information, see their documentation.

Citrix Provisioning™

Citrix Provisioning (formerly Provisioning Services) is an optional component that is available with some editions. It provides an alternative to MCS for provisioning virtual machines. Whereas MCS creates copies of a master image, PVS streams the master image to user devices. PVS doesn't require a hypervisor to do this, so you can use it to host physical machines. PVS communicates with the Controller to provide users with resources.

Citrix Gateway

When users connect from outside the corporate firewall, Citrix Virtual Apps and Desktops can use Citrix Gateway (formerly Access Gateway and NetScaler® Gateway) technology to secure these connections with TLS. The Citrix Gateway or VPX virtual appliance is an SSL VPN appliance that is deployed in the demilitarized zone (DMZ). It provides a single secure point of access through the corporate firewall.



Citrix SD-WAN™

In deployments where virtual desktops are delivered to users at remote locations such as branch offices, Citrix SD-WAN technology can be employed to optimize performance. Repeaters accelerate performance across WANs. With repeaters in the network, users in the branch office experience LAN-like performance over the WAN. Citrix SD-WAN can prioritize different parts of the user experience so that, for example, the user experience does not degrade in the branch location when a large file or print job is sent over the network. HDX™ WAN optimization provides tokenized compression and data deduplication, dramatically reducing bandwidth requirements and improving performance.

How typical deployments work

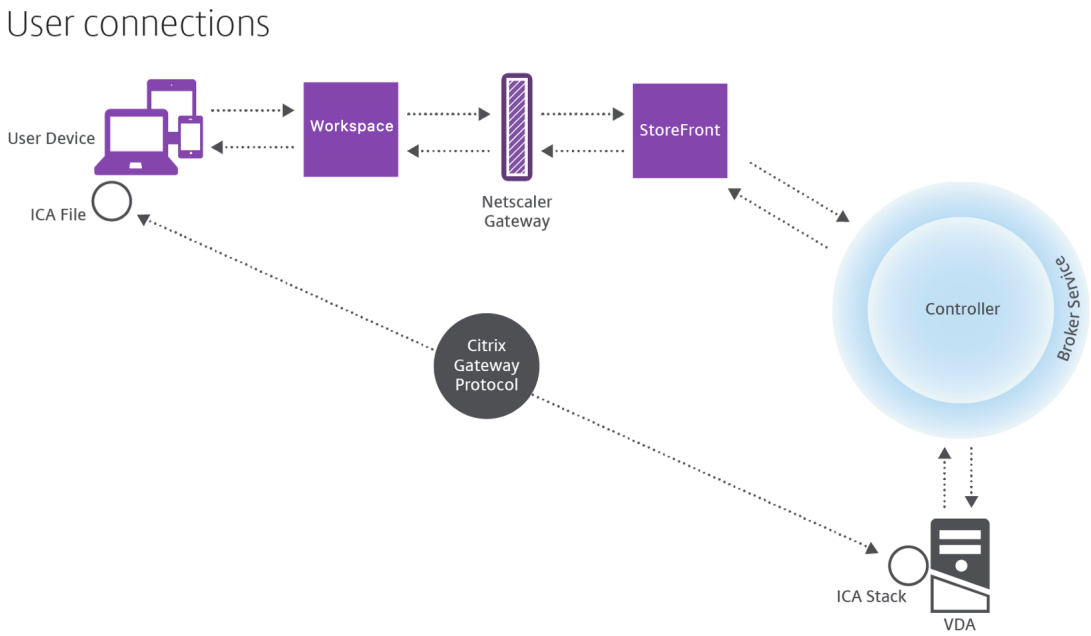
A site is made up of machines with dedicated roles that allow for scalability, high availability, and failover, and provide a solution that is secure by design. A site consists of VDA-installed servers and desktop machines, and the Delivery Controller, which manages access.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The VDA enables users to connect to desktops and applications. It is installed on virtual machines in the data center for most delivery methods, but it can also be installed on physical PCs for Remote PC Access.

The Controller is made up of independent Windows services that manage resources, applications, and desktops, and optimize and balance user connections. Each site has one or more Controllers. Because sessions are affected by latency, bandwidth, and network reliability, place all Controllers on the same LAN, if possible.

Users never directly access the Controller. The VDA serves as an intermediary between users and the Controller. When users log on using StoreFront, their credentials pass through to the Broker Service on the Controller. The Broker Service then obtains profiles and available resources based on the policies set for them.



How user connections are handled

To start a session, the user connects either through Citrix Workspace app installed on the user's device, or a StoreFront website.

The user selects the physical or virtual desktop or virtual application that is needed.

The user's credentials move through this pathway to access the Controller, which determines which resources are needed by communicating with a Broker Service. Citrix recommends that administrators place an SSL certificate on StoreFront to encrypt the credentials coming from Citrix Workspace app.

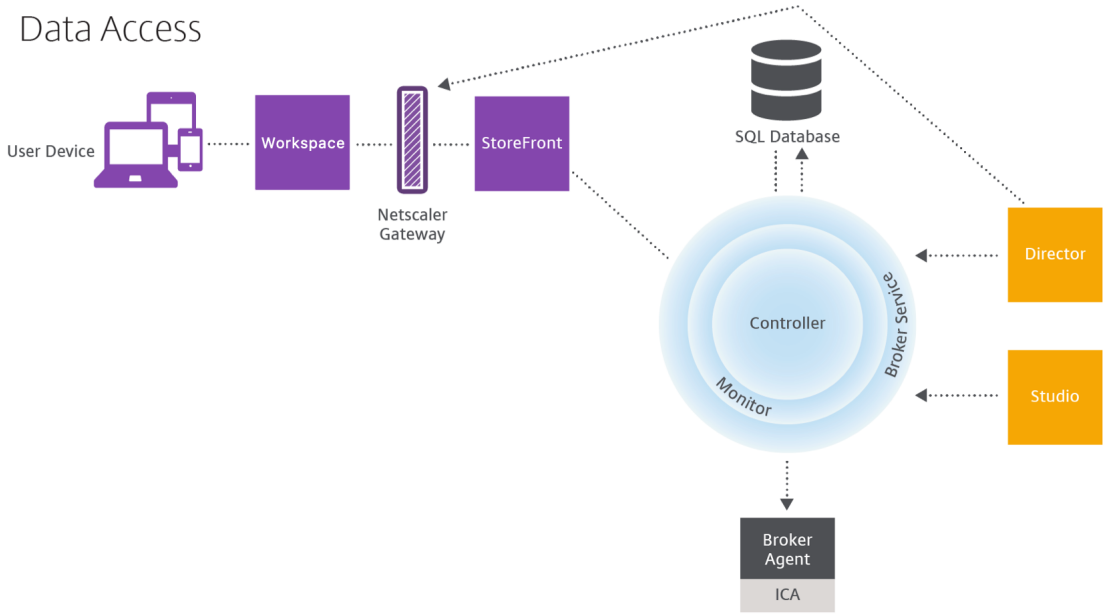
© 1997–2026 Citrix Systems, Inc. All rights reserved.

The Broker Service determines which desktops and applications the user is allowed to access.

After the credentials are verified, information about available applications or desktops is sent back to the user through the StoreFront-Citrix Workspace app pathway. When the user selects applications or desktops from this list, that information goes back down the pathway to the Controller. The Controller then determines the proper VDA to host the specific applications or desktop.

The Controller sends a message to the VDA with the user's credentials, and then sends all the data about the user and the connection to the VDA. The VDA accepts the connection and sends the information back through the same pathways to Citrix Workspace app. A set of required parameters is collected on StoreFront. These parameters are then sent to Citrix Workspace app either as part of the Citrix-Workspace-app-StoreFront protocol conversation, or converted to an Independent Computing Architecture (ICA) file and downloaded. As long as the site was properly set up, the credentials remain encrypted throughout this process.

The ICA file is copied to the user's device and establishes a direct connection between the device and the ICA stack running on the VDA. This connection bypasses the management infrastructure (Citrix Workspace app, StoreFront, and Controller).



The connection between Citrix Workspace app and the VDA uses the Citrix Gateway Protocol (CGP). If a connection is lost, the Session Reliability feature enables the user to reconnect to the VDA rather than having to relaunch through the management infrastructure. Session Reliability can be enabled or disabled in Citrix policies.

After the client connects to the VDA, the VDA notifies the Controller that the user is logged on. The Controller then sends this information to the site database and starts logging data in the monitoring database.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How data access works

Every Citrix Virtual Apps and Desktops session produces data that IT can access through Studio or Director. Using Studio, administrators can access real-time data from the Broker Agent to manage sites. Director accesses the same data plus historical data stored in the monitoring database. It also accesses HDX data from NetScaler Gateway for help desk support and troubleshooting.

Within the Controller, the Broker Service reports session data for every session on the machine providing real-time data. The Monitor Service also tracks the real-time data and stores it as historical data in the monitoring database.

Studio communicates only with the Broker Service. It accesses only real-time data. Director communicates with the Broker Service (through a plug-in in the Broker Agent) to access the site database.

Director can also access Citrix Gateway to get information on the HDX data.

Deliver desktops and applications

You set up the machines that deliver applications and desktops with machine catalogs. Then, you create delivery groups that specify the applications and desktops that will be available (using machines in the catalogs), and which users can access them. Optionally, you can then create application groups to manage collections of applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine catalogs

Machine catalogs are collections of virtual or physical machines that you manage as a single entity. These machines, and the application or virtual desktops on them, are the resources you provide to your users. All the machines in a catalog have the same operating system and the same VDA installed. They also have the same applications or virtual desktops.

Typically, you create a master image and use it to create identical VMs in the catalog. For VMs you can specify the provisioning method for the machines in that catalog: Citrix tools (Citrix Provisioning or MCS) or other tools. Alternatively, you can use your own existing images. In that case, you must manage target devices on an individual basis or collectively using third-party electronic software distribution (ESD) tools.

Valid machine types are:

- **Multi-session OS:** Virtual or physical machines with a multi-session operating system. Used for delivering Citrix Virtual Apps published apps (also known as server-based hosted applications) and Citrix Virtual Apps published desktops (also known as server-hosted desktops). These machines allow multiple users to connect to them at one time.
- **Single-session OS:** Virtual or physical machines with a single-session operating system. Used for delivering VDI desktops (desktops running single-session OSs that can optionally be personalized), VM hosted apps (applications from single-session OSs), and hosted physical desktops. Only one user at a time can connect to each of these desktops.
- **Remote PC Access:** Enables remote users to access their physical office PCs from any device running Citrix Workspace app. The office PCs are managed through the Citrix Virtual Desktops deployment, and require user devices to be specified in an allow list.

For more information, see Citrix Virtual Apps and Desktops Image Management and Create machine catalogs.

Delivery groups

Delivery groups specify which users can access which applications, desktops, or both on which machines. Delivery groups contain machines from your machine catalogs, and Active Directory users who have access to your site. You might assign users to your delivery groups by their Active Directory group, because Active Directory groups and delivery groups are ways to group users with similar requirements.

Each delivery group can contain machines from more than one catalog, and each catalog can contribute machines to more than one delivery group. However, each individual machine can only belong to one delivery group at a time.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You define which resources users in the delivery group can access. For example, to deliver different applications to different users, you might install all the applications on the master image for one catalog and create enough machines in that catalog to distribute among several delivery groups. You can then configure each delivery group to deliver a different subset of applications that are installed on the machines.

For more information, see Create delivery groups.

Application groups

Application groups provide application management and resource control advantages over using more delivery groups. Using the tag restriction feature, you can use your existing machines for more than one publishing task, saving the costs associated with deployment and managing more machines. A tag restriction can be thought of as subdividing (or partitioning) the machines in a delivery group. Application groups can also be helpful when isolating and troubleshooting a subset of machines in a delivery group.

For more information, see Create application groups.

Databases

July 17, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

A Citrix Virtual Apps or Citrix Virtual Desktops™ site uses three SQL Server databases:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Site:** (also known as site configuration) stores the running site configuration, plus the current session state and connection information.
- **Logging:** (also known as Configuration Logging) stores information about site configuration changes and administrative activities. This database is used when the configuring logging feature is enabled (default = enabled).
- **Monitoring:** stores data used by Director, such as session and connection information.

Each Delivery Controller communicates with the site database. Windows authentication is required between the Controller and the databases. A Controller can be unplugged or turned off without affecting other Controllers in the site. This means, however, that the site database forms a single point of failure. If the database server fails, existing connections continue to function until a user either logs off or disconnects. For information about connection behavior when the site database becomes unavailable, see Local Host Cache.

Citrix recommends the following regarding databases:

- **Back up regularly.** Back up the databases regularly so that you can restore from the backup if the database server fails. The backup strategy for each database can differ. For more information, see CTX135207; note, however, that it refers to CitrixXenDesktopDB, which is no longer supported or available to customers.
- **Back up and restore the Site, Monitoring and Logging SQL Server databases regularly.** For specific information about SQL Server databases, see Creating Full and Differential Backups of a SQL Server Database.

If your site contains more than one zone, ensure that the primary zone always contains the site database. Controllers in every zone communicate with that database.

High availability

There are several high availability solutions to consider for ensuring automatic failover:

- **AlwaysOn Availability Groups (including Basic Availability Groups):** This enterprise-level high availability and disaster recovery solution introduced in SQL Server 2012 enables you to maximize availability for one or more databases. AlwaysOn Availability Groups requires that the SQL Server instances reside on Windows Server Failover Clustering (WSFC) nodes. For more information, see Windows Server Failover Clustering with SQL Server.
- **SQL Server database mirroring:** Mirroring the database ensures that, if you lose the active database server, an automatic failover process happens in a matter of seconds, so that users are generally unaffected. This method is more expensive than other solutions because full SQL Server licenses are required on each database server. You cannot use SQL Server Express edition in a mirrored environment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **SQL clustering:** The Microsoft SQL clustering technology can be used to automatically allow one server to take over the tasks and responsibilities of another server that has failed. However, setting up this solution is more complicated, and the automatic failover process is typically slower than alternatives such as SQL mirroring.
- **Using the hypervisor's high availability features:** With this method, you deploy the database as a virtual machine and use your hypervisor's high availability features. This solution is less expensive than mirroring because it uses your existing hypervisor software and you can also use SQL Server Express edition. However, the automatic failover process is slower, as it can take time for a new machine to start for the database, which might interrupt the service to users.

The Local Host Cache feature supplements the SQL Server high availability best practices. Local Host Cache enables users to connect and reconnect to applications and desktops even when the site database is not available. For more information, see Local Host Cache.

If all Controllers in a site fail, you can configure the VDAs to operate in high availability mode, which allows users to continue to access their desktops and applications. In high availability mode, the VDA accepts direct ICA connections from users, rather than connections brokered by the Controller. Use this feature only on the rare occasion when communication with all Controllers fails. The feature is not an alternative to other high availability solutions. For more information, see CTX 127564.

Installing a Controller on a node in an SQL clustering or SQL mirroring installation is not supported.

Install database software

> **Note:**
>
> Starting with version 2411, you can use Azure SQL Managed Instance for databases.

By default, SQL Server Express edition is installed when you install the first Delivery Controller™ if another SQL Server instance is not detected on that server. That default action is usually sufficient for proof of concept or pilot deployments. However, SQL Server Express does not support Microsoft high availability features.

The default installation uses the default Windows service accounts and permissions. See the Microsoft documentation for details of these defaults, including the addition of Windows service accounts to the sysadmin role. The Controller uses the Network Service account in this configuration. The Controller does not require any additional SQL Server roles or permissions.

If necessary, you can select **Hide instance** for the database instance. When configuring the address of the database in Web Studio, enter the instance's static port number, rather than its name. See the Microsoft documentation for details about hiding an instance of SQL Server Database Engine.

For most production deployments, and any deployment that uses Microsoft high availability features, we recommend using only supported non-Express editions of SQL Server. Install SQL Server on ma-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

chines other than the server where the first Controller is installed. System requirements lists the supported SQL Server versions. The databases can reside on one or more machines.

Ensure the SQL Server software is installed before creating a site. You don't have to create the database, but if you do, it must be empty. Configuring Microsoft high availability technologies is also recommended.

Use Windows Update to keep SQL Server up-to-date.

Set up the databases from the site creation wizard

Specify the database names and addresses (location) on the **Databases** page in the site creation wizard. (See Database address formats.) To avoid potential errors when Director queries the Monitor Service, do not use whitespace in the name of the monitoring database.

The **Databases** page offers two options for setting up the databases: automatic and using scripts. Generally, you can use the automatic option if you (the Web Studio user and Citrix administrator) have the required database privileges. (See Permissions required to set up databases.)

You can change the location of the configuration logging and monitoring database later, after you create the site. See Change database locations.

To configure a site to use a mirror database, complete the following and then proceed with the automatic or scripted setup procedures.

1. Install the SQL Server software on two servers, A and B.
2. On Server A, create the database intended to be used as the principal. Back up the database on Server A and then copy it to server B.
3. On Server B, restore the backup file.
4. Start mirroring on server A.

To verify mirroring after creating the site, run the PowerShell cmdlet `get-configdbconnection` to ensure that the Failover Partner has been set in the connection string to the mirror.

If you later add, move, or remove a Delivery Controller in a mirrored database environment, see Delivery Controllers.

Automatic setup

If you have the required database privileges, set up the database by completing these steps:

1. Select **Create and set up databases from Studio** on the **Databases** page of the site creation wizard.
2. Provide the names and addresses of the principal databases.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Configure the following SQL Server connection options to improve the security and flexibility of your database connectivity setup:

   - **Encryption**: Specify the encryption level for the connection.
   - **Trust Server Certificate**: Select to bypass server certificate validation.
   - **Host Name In Certificate**: Enter the host name that the server's certificate must match. This setting ensures stricter certificate validation.

   For more information, see this Microsoft article.

If a database exists at an address you specify, it must be empty. If databases don't exist at a specified address, you are informed that a database cannot be found, and then asked if you want the database to be created for you. When you confirm that action, Web Studio automatically creates the databases, and then applies the initialization scripts for the principal and replica databases.

Scripted setup

If you do not have the required database rights, request assistance from someone who does, such as a database administrator. Here is the sequence:

1. On the **Databases** page in the site creation wizard, select **Generate scripts to manually set up**. This action generates the following three types of scripts for each of the following principal and the replica databases: site, monitoring, and logging databases.

   - *Script containing "SysAdmin" in its name*. A script that creates the databases and the Delivery Controller login. These tasks require securityadmin rights.
   - *Script containing "DbOwner" in its name*. A script that creates the user roles in the database, adds the logins, and then creates the database schemas. These tasks require `db_owner` rights.
   - *Script containing "Mixed" in its name*. All tasks in one script, regardless of required rights.

   You can indicate where to store the scripts.

   > **Note:**
   >
   > In enterprise environments, database setup includes scripts that might be handled by different teams with different roles (rights): `securityadmin` or `db_owner`. If applicable, you first have "SysAdmin" scripts run by administrators with the `securityadmin` role and then "DbOwner" scripts run by administrators with `db_owner` rights. To generate those scripts, you can also use PowerShell. For details, see Preferred database rights scripts.

2. Give those scripts to your database administrator. The site creation wizard stops automatically at this point. You are prompted when you return later to continue the site creation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The database administrator then creates the databases. Each database must have the following characteristics:

- Use a collation that ends with `_CI_AS_KS`. We recommend using a collation that ends with `_100_CI_AS_KS`.
- For optimum performance, enable the SQL Server Read-Committed Snapshot. For details, see CTX 137161.
- Configured high availability features, if applicable.
- To configure mirroring, first set the database to use the full recovery model (simple model is the default). Back up the principal database to a file and copy it to the mirror server. Then, restore the backup file on the mirror server. Finally, start mirroring on the principal server.

The database administrator uses the SQLCMD command-line utility or SQL Server Management Studio in SQLCMD mode to:

- Run each of the `xxx_Replica.sql` scripts on the high availability SQL Server database instances (if high availability is configured)
- Run each of the `xxx\\_Principal.sql` scripts on the principal SQL Server database instances.

See the Microsoft documentation for SQLCMD details.

When all the scripts complete successfully, the database administrator gives the Citrix administrator the three principal database addresses.

Web Studio prompts you to continue the site creation. You are returned to the **Databases** page, complete the following steps:

1. Enter the addresses.
2. Configure the following SQL Server connection options to improve the security and flexibility of your database connectivity setup:

    - **Encryption**: Specify the encryption level for the connection.
    - **Trust Server Certificate**: Select to bypass server certificate validation.
    - **Host Name In Certificate**: Enter the host name that the server's certificate must match. This setting ensures stricter certificate validation.

    For more information, see this Microsoft article.

If any of the servers hosting a database cannot be contacted, an error message appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Permissions required to set up databases

You must be a local administrator and a domain user to create and initialize the databases (or change the database location). You must also have certain SQL Server permissions. The following permissions can be explicitly configured or acquired by Active Directory group membership. If your Web Studio user credentials do not include these permissions, you are prompted for SQL Server user credentials.

Operation	Purpose	Server role	Database role
Create a database	Create a suitable empty database	`dbcreator`	
Create a schema	Create all service-specific schemas and add the first Controller to the site	`securityadmin`*	`db_owner`
Add a Controller	Add a Controller (other than the first) to the site	`securityadmin`*	`db_owner`
Add a Controller (mirror server)	Add a Controller login to the database server currently in the mirror role of a mirrored database	`securityadmin`*	
Remove Controller	Remove controller from site	**	`db_owner`
Update a schema	Apply schema updates or hotfixes		`db_owner`

* While technically more restrictive, in practice, you can treat the `securityadmin` server role as equivalent to the `sysadmin` server role.

** When a Controller is removed from a site, the Controller logon to the database server is not removed. This is to avoid potentially removing a logon being used by services other than this Citrix product on the same machine. The logon must be removed manually if it is no longer required. This action requires `securityadmin` server role membership.

When using Web Studio to perform these operations, the Web Studio user must either have a database server account that is explicitly a member of the appropriate server roles, or be able to provide credentials of an account that is.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Preferred database rights scripts

In enterprise environments, database setup includes scripts that must be handled by different teams with different roles (rights): `securityadmin` or `db_owner`.

Using PowerShell, you can specify the preferred database rights. Specifying a nondefault value results in the creation of separate scripts. One script contains tasks that need the `securityadmin` role. The other script requires only `db_owner` rights and can be run by a Citrix administrator, without having to contact a database administrator.

In the `get-*DBSchema` cmdlets, the `-DatabaseRights` option has the following valid values:

- `SA`: Generates a script that creates the databases and the Delivery Controller login. These tasks require `securityadmin` rights.
- `DBO`: Generates a script that creates the user roles in the database, adds the logins, and then creates the database schemas. These tasks require `db_owner` rights.
- `Mixed`: (Default) All tasks in one script, regardless of required rights.

For more information, see the cmdlet help.

Database address formats

You can specify a database address in one of the following forms:

- `ServerName`
- `ServerName\InstanceName`
- `ServerName,PortNumber`

For an AlwaysOn Availability Group, specify the group's listener in the location field.

For database mirroring, specify only the principal server address. Citrix Site Manager locates the mirror server based on the principal server.

For more information about how to configure standalone SQL server, Database Mirroring, and Always on High Availability, see this CTX article.

Change database locations

After you create a site, you can change the location of the *configuration logging* and *monitoring* databases. However, you cannot change the location of the *site* database. When you change the location of a database, keep the following notes in mind:

- The data in the previous database is not imported to the new database.
- Logs cannot be aggregated from both databases when retrieving logs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The first log entry in the new database indicates that a database change occurred, but it does not identify the previous database.
- You cannot change the location of the configuration logging database when mandatory logging is enabled.
- Changing database locations between SQL Server and Azure SQL isn't supported.

To change the location of a database:

1. If you use Microsoft SQL Server, ensure that a supported version is installed on the server where you want the database to reside. Set up high-availability features as needed.
2. Sign in to Web Studio, and then select **Settings** in the left pane.
3. Locate the **Database** tile and select **Edit**.
4. On the **Manage Database** page, select the database for which you want to specify a new location and then select **Change Database** in the action bar.
5. Specify the new location and the database name. If the database is hosted on Azure SQL, type the credentials of a service principal with permission to manage the database.
6. If you want Web Studio to create the database and you have the appropriate permissions, click **Done**. When prompted, click **Done**, and then Web Studio creates the database automatically. Web Studio attempts to access the database using your credentials. If that fails, you are prompted for the database user's credentials. Web Studio then uploads the database schema to the database. The credentials are retained only for the database creation time frame.
7. If you do not want Web Studio to create the database, or you do not have sufficient permissions, click **Generate database script**. The generated scripts include instructions for manually creating the database and a mirror database, if needed. Before uploading the schema, ensure that the database is empty and that at least one user has permission to access and change the database.

- Sizing the site database and configuring connection strings when using SQL Server high availability solutions.

Delivery methods

May 13, 2026

Citrix Virtual Apps and Desktops™ offers various delivery methods. A single delivery method will likely not meet all of your requirements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Introduction

Choosing the appropriate application delivery method helps improve scalability, management, and user experience.

- **Installed app:** The application is part of the base desktop image. The install process involves dll, exe, and other files copied to the image drive, in addition to registry modifications. For details, see Create machine catalogs.
- **Streamed app (Microsoft App-V):** The application is profiled and delivered to the desktops across the network on demand. Application files and registry settings are placed in a container on the virtual desktop and isolated from the base operating system and each other. This isolation helps address compatibility issues. For details, see Deploy and deliver App-V applications.
- **Layered app (Citrix App Layering):** Each layer contains a single application, agent, or operating system. By integrating one OS layer, one platform layer (VDA, Citrix Provisioning agent) and many application layers, an administrator can easily create new, deployable images. Layering simplifies ongoing maintenance, as an OS, agent, and application exists in a single layer. When you update the layer, all deployed images containing that layer are updated. For details, see Citrix App Layering.
- **Hosted Windows app:** An application installed on a multi-user Citrix Virtual Apps host and deployed as an application and not a desktop. A user accesses the hosted Windows app seamlessly from the VDI desktop or endpoint device, hiding the fact that the app is executing remotely. For details, see Create delivery groups.
- **Local app:** An application deployed on the endpoint device. The application interface appears within the user's hosted VDI session, even though it executes on the endpoint. For details, see Local App Access and URL redirection.

For desktops, consider published desktops or VDI desktops.

Citrix Virtual Apps™ published apps and desktops

Use multi-session OS machines to deliver Citrix Virtual Apps and Desktops published apps and published desktops.

Use case:

- You want inexpensive server-based delivery to minimize the cost of delivering applications to many users, while providing a secure, high-definition user experience.
- Your users perform well-defined tasks and do not require personalization or offline access to applications. Users can include task workers such as call center operators and retail workers, or users that share workstations.
- Application types: any application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Benefits and considerations:

- Manageable and scalable solution within your data center.
- Most cost effective application delivery solution.
- Hosted applications are managed centrally and users cannot modify the application. This provides a user experience that is consistent, safe, and reliable.
- Users must be online to access their applications.

User experience:

- User requests one or more applications from StoreFront™, their **Start** menu, or a URL you provide.
- Applications are delivered virtually and display seamlessly in high definition on user devices.
- Depending on profile settings, user changes are saved when the user's application session ends. Otherwise, the changes are deleted.

Process, host, and deliver applications:

- Application processing takes place on hosting machines, rather than on the user devices. The hosting machine can be a physical or a virtual machine.
- Applications and desktops reside on a multi-session OS machine.
- Machines become available through machine catalogs.
- Machines from machine catalogs are organized into delivery groups that deliver the same set of applications to groups of users.
- Multi-session OS machines support delivery groups that host either desktops or applications, or both.

Session management and assignment:

- Multi-session OS machines run multiple sessions from a single machine to deliver multiple applications and desktops to multiple, simultaneously connected users. Each user requires a single session from which they can run all their hosted applications.

  For example, a user logs on and requests an application. One session on that machine becomes unavailable to other users. A second user logs on and requests an application which that machine hosts. A second session on the same machine is now unavailable. If both users request more applications, no additional sessions are required because a user can run multiple applications using the same session. If two more users log on and request desktops, and two sessions are available on that same machine, that single machine is now using four sessions to host four different users.

- Within the delivery group to which a user is assigned, a machine on the least loaded server is selected. A machine with session availability is randomly assigned to deliver applications to a user when that user logs on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

VM hosted apps

Use single-session OS machines to deliver VM hosted applications

Use case:

- You want a client-based application delivery solution that is secure, provides centralized management, and supports many users per host server. You want to provide those users with applications that display seamlessly in high definition.
- Your users are internal, external contractors, third-party collaborators, and other provisional team members. Your users do not require offline access to hosted applications.
- Application types: Applications that might not work well with other applications or might interact with the operation system, such as Microsoft .NET Framework. These types of applications are ideal for hosting on virtual machines.

Benefits and considerations:

- Applications and desktops on the master image are securely managed, hosted, and run on machines within your data center, providing a more cost-effective application delivery solution.
- On logon, users can be randomly assigned to a machine within a delivery group that is configured to host the same application. You can also statically assign a single machine to deliver an application to a single user each time that user logs on. Statically assigned machines allow users to install and manage their own applications on the virtual machine.
- Running multiple sessions is not supported on single-session OS machines. Therefore, each user consumes a single machine within a delivery group when they log on, and users must be online to access their applications.
- This method can increase the amount of server resources for processing applications and increase the amount of storage for users' data.

User experience:

- The same seamless application experience as hosting shared applications on multi-session OS machines.

Process, host, and deliver applications:

- The same as multi-session OS machines except they are virtual single-session OS machines.

Session management and assignment:

- Single-session OS machines run a single desktop session from a single machine. When accessing applications only, a single user can use multiple applications (and is not limited to a single application) because the operating system sees each application as a new session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Within a delivery group, when users log on they can access either a statically assigned machine (each time the user logs on to the same machine), or a randomly assigned machine that is selected based on session availability.

VDI desktops

Use single-session OS machines to deliver Citrix Virtual Apps and Desktops VDI desktops.

VDI desktops are hosted on virtual machines and provide each user with a desktop operating system.

VDI desktops require more resources than published desktops, but do not require that applications installed on them support server-based operating systems. Also, depending on the type of VDI desktop you choose, these desktops can be assigned to individual users. This allows users a high level of personalization.

When you create a machine catalog for VDI desktops, you create one of these types of desktops:

- **Random non-persistent desktop, also known as pooled VDI desktop:** Each time a user logs on to one of these desktops, that user connects to a desktop selected from a pool of desktops. That pool is based on a single master image. All changes to the desktop are lost when the machine restarts.
- **Static non-persistent desktop:** During the first logon, a user is assigned a desktop from a pool of desktops. (Each machine in the pool is based on a single master image.) After the first use, each time a user logs on to use a desktop, that user connects to the same desktop that was assigned on first use. All changes to the desktop are lost when the machine restarts.
- **Static persistent desktop:** Unlike other types of VDI desktops, users can fully personalize these desktops. During the first logon, a user is assigned a desktop from a pool of desktops. Subsequent logons from that user connect to the same desktop that was assigned on first use. Changes to the desktop are retained when the machine restarts.

Remote PC Access

Remote PC Access is a feature of Citrix Virtual Apps and Desktops that enables organizations to easily allow their employees to access corporate resources remotely in a secure manner. The Citrix platform makes this secure access possible by giving users access to their physical office PCs. If users can access their office PCs, they can access all the applications, data, and resources they need to do their work. Remote PC Access eliminates the need to introduce and provide other tools to accommodate teleworking. For example, virtual desktops or applications and their associated infrastructure.

Remote PC Access uses the same Citrix Virtual Apps and Desktops components that deliver virtual desktops and applications. As a result, the requirements and process of deploying and configuring

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remote PC Access are the same as those required for deploying Citrix Virtual Apps and Desktops for the delivery of virtual resources. This uniformity provides a consistent and unified administrative experience. Users receive the best user experience by using Citrix HDX™ to deliver their office PC session.

For more information, Remote PC Access.

Network ports

May 13, 2026

Complete network port information is provided in Communication Ports Used by Citrix Technologies.

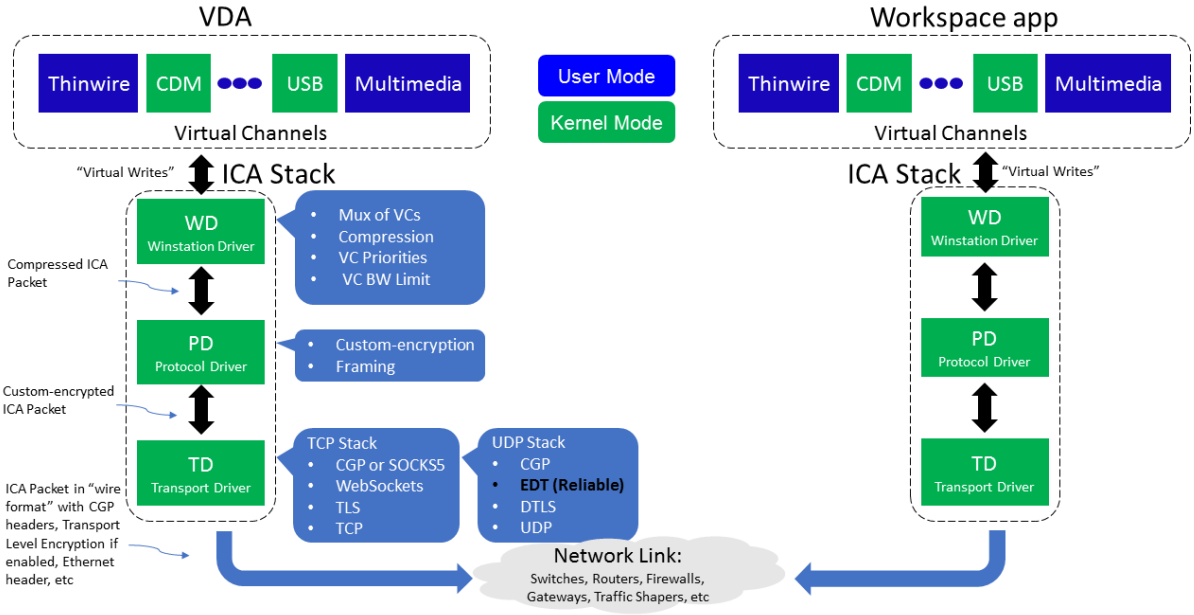
When Citrix® components are installed, the operating system's host firewall is also updated, by default, to match the default network ports.

You might need port information:

- For regulatory compliance.
- If there is a network firewall between the Citrix Virtual Apps and Desktops™ components and other Citrix products or components, so you can configure that firewall appropriately.
- If you use a third-party host firewall, such as one provided with an anti-malware package, rather than the operating system's host firewall.
- If you alter the configuration of the host firewall on these components (usually Windows Firewall Service).
- If you reconfigure component features to use a different port or port range, and then want to disable or block ports that aren't used in your configuration.

Some of the ports are registered with the Internet Assigned Numbers Authority (IANA). Details about these assignments are available at http://www.iana.org/assignments/port-numbers. However, the descriptive information held by IANA does not always reflect today's usage.

Also, the operating systems on the VDA and Delivery Controller™ require incoming ports for their own use. See the Microsoft Windows documentation for details.



HDX™

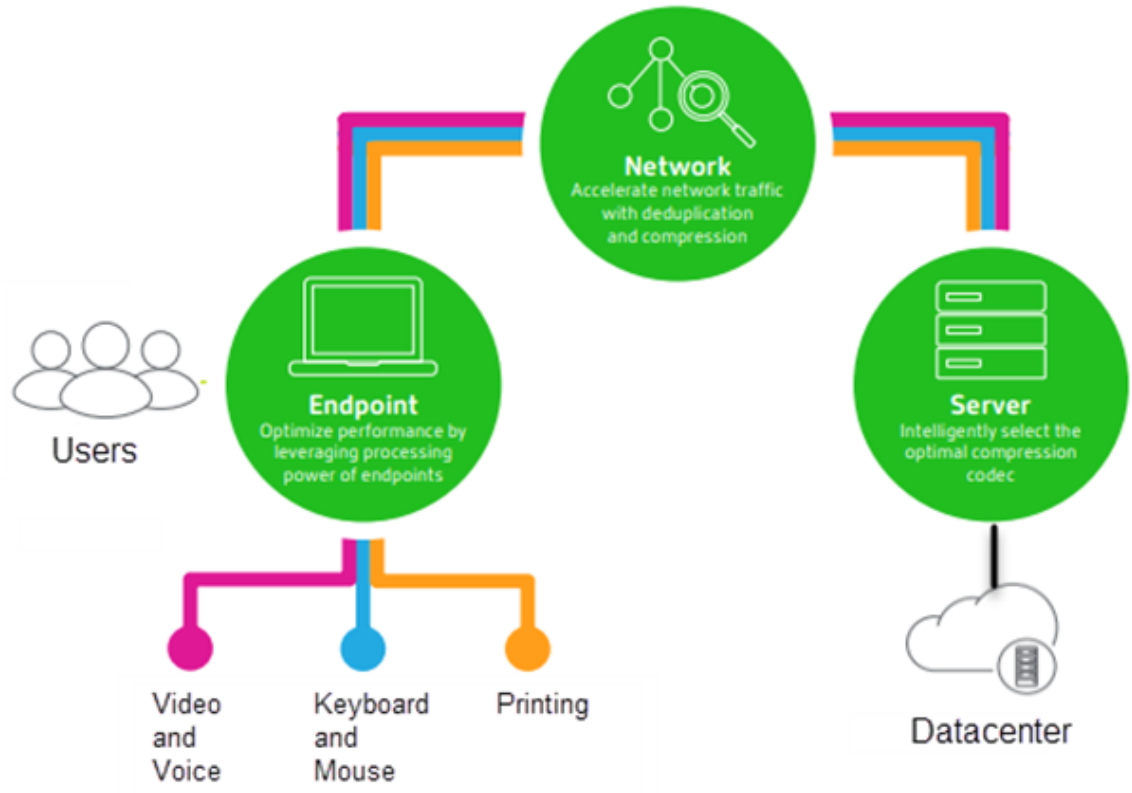
May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Warning:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Citrix HDX represents a broad set of technologies that deliver a high-definition experience to users of centralized applications and desktops, on any device and over any network.

HDX is designed around three technical principles:



- Intelligent redirection
- Adaptive compression
- Data de-duplication

Applied in different combinations, they optimize the IT and user experience, decrease bandwidth consumption, and increase user density per hosting server.

- **Intelligent redirection** - Intelligent redirection examines screen activity, application commands, endpoint device, and network and server capabilities to instantly determine how and where to render an application or desktop activity. Rendering can occur on either the endpoint device or hosting server.
- **Adaptive compression** - Adaptive compression allows rich multimedia displays to be delivered on thin network connections. HDX first evaluates several variables, such as the type of input, device, and display (text, video, voice, and multimedia). It chooses the optimal compression

© 1997–2026 Citrix Systems, Inc. All rights reserved.

codec and the best proportion of CPU and GPU usage. It then intelligently adapts based on each unique user and basis. This intelligent adaptation is per user, or even per session.

- **Data de-duplication** - De-duplication of network traffic reduces the aggregate data sent between client and server. It does so by taking advantage of repeated patterns in commonly accessed data such as bitmap graphics, documents, print jobs, and streamed media. Caching these patterns allows only the changes to be transmitted across the network, eliminating duplicate traffic. HDX also supports multicasting of multimedia streams, where a single transmission from the source is viewed by multiple subscribers at one location, rather than a one-to-one connection for each user.

For more information, see Boost productivity with a high-definition user workspace.

At the device

HDX uses the computing capacity of user devices to enhance and optimize the user experience. HDX technology ensures that users receive a smooth, seamless experience with multimedia content in their virtual desktops or applications. Workspace control enables users to pause virtual desktops and applications and resume working from a different device at the point where they left off.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

On the network

HDX incorporates advanced optimization and acceleration capabilities to deliver the best performance over any network, including low-bandwidth and high-latency WAN connections.

HDX features adapt to changes in the environment. The features balance performance and bandwidth. They apply the best technologies for each user scenario, whether the desktop or application is accessed locally on the corporate network or remotely from outside the corporate firewall.

In the data center

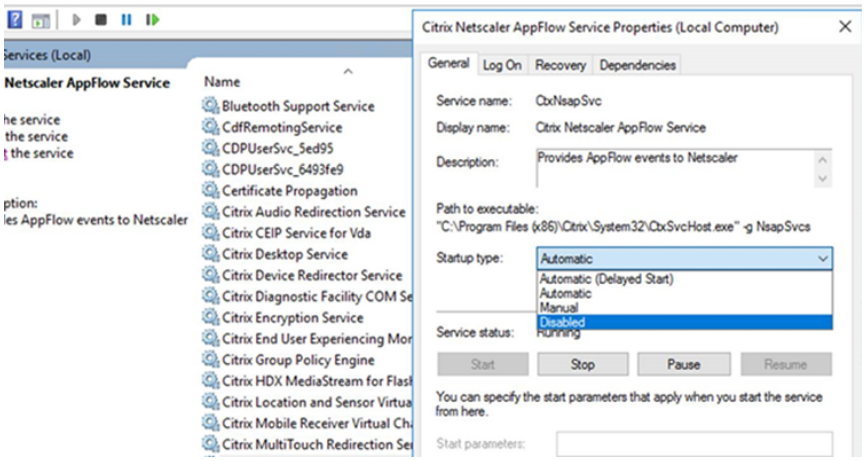
HDX uses the processing power and scalability of servers to deliver advanced graphical performance, regardless of the client device capabilities.

HDX channel monitoring provided by Citrix Director displays the status of connected HDX channels on user devices.

HDX Insight

HDX Insight is the integration of NetScaler® Network Inspector and Performance Manager with Director. It captures data about ICA traffic and provides a dashboard view of real-time and historical details. This data includes client-side and server-side ICA session latency, bandwidth use of ICA channels, and the ICA round-trip time value of each session.

You can enable NetScaler to use the HDX Insight virtual channel to move all the required data points in an uncompressed format. If you disable this feature, the NetScaler device decrypts and decompresses the ICA® traffic spread across various virtual channels. Using the single virtual channel lessens complexity, enhances scalability, and is more cost effective.



Minimum requirements:

- NetScaler version 12.0 Build 57.x
- Citrix Workspace™ app for Windows 1808
- Citrix Receiver for Windows 4.10
- Citrix Workspace app for Mac 1808
- Citrix Receiver for Mac 12.8

Enable or disable HDX Insight virtual channel

To disable this feature, set the Citrix NetScaler Application Flow service properties to Disabled. To enable, set the service to Automatic. In either case, we recommend that you restart the server machine after changing these properties. By default, this service is enabled (Automatic).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Experience HDX capabilities from your virtual desktop

- To see how browser content redirection, one of four HDX multimedia redirection technologies, accelerates delivery of HTML5 and WebRTC multimedia content:

  1. Download the Chrome browser extension and install it on the virtual desktop.
  2. To experience how browser content redirection accelerates the delivery of multimedia content to virtual desktops, view a video on your desktop from a website containing HTML5 videos, such as YouTube. Users don't know when browser content redirection is running. To see whether browser content redirection is being used, drag the browser window quickly. You'll see a delay or out of frame between the viewport and the user interface. You can also right-click on the webpage and look for **About HDX Browser Redirection** in the menu.

- To see how HDX delivers high definition audio:

  1. Configure your Citrix client for maximum audio quality; see the Citrix Workspace app documentation for details.
  2. Play music files by using a digital audio player (such as iTunes) on your desktop.

HDX provides a superior graphics and video experience for most users by default, and configuration isn't required. Citrix policy settings that provide the best experience for most use cases are enabled by default.

- HDX automatically selects the best delivery method based on the client, platform, application, and network bandwidth, and then self-tunes based on changing conditions.
- HDX optimizes the performance of 2D and 3D graphics and video.
- HDX enables user devices to stream multimedia files directly from the source provider on the internet or intranet, rather than through the host server. If the requirements for this client-side

© 1997–2026 Citrix Systems, Inc. All rights reserved.

content fetching are not met, media delivery falls back to server-side content fetching and multimedia redirection. Usually, adjustments to the multimedia redirection feature policies aren't needed.
- HDX delivers rich server-rendered video content to virtual desktops when multimedia redirection is not available: View a video on a website containing high definition videos, such as http://www.microsoft.com/silverlight/iis-smooth-streaming/demo/.

Good to know:

- For support and requirements information for HDX features, see the System requirements article. Except where otherwise noted, HDX features are available for supported Windows Multi-session OS and Windows Single-session OS machines, plus Remote PC Access desktops.
- This content describes how to optimize the user experience, improve server scalability, or reduce bandwidth requirements. For information about using Citrix policies and policy settings, see the Citrix policies documentation for this release.
- For instructions that include editing the registry, use caution: editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Auto client reconnect and session reliability

When accessing hosted applications or desktops, network interruption might occur. To experience a smoother reconnection, we offer auto client reconnect and session reliability. In a default configuration, session reliability starts and then auto client reconnect follows.

Auto client reconnect:

Auto client reconnect relaunches the client engine to reconnect to a disconnected session. Auto client reconnect closes (or disconnects) the user session after the time specified in the setting. If auto client reconnect is in progress, the system sends an application and desktops network interruption notification to the user as follows:

- **Desktops.** The session window is grayed out and a countdown timer displays the time until the reconnections occur.
- **Applications.** The session window closes and a dialog appears to the user containing a countdown timer showing the time until the reconnections are attempted.

During auto client reconnect, sessions relaunch expecting network connectivity. The user cannot interact with sessions while an auto client reconnect is in progress.

On reconnection, the disconnected sessions reconnect using saved connection information. The user can interact with the applications and desktops normally.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Default auto client reconnect settings:

- Auto client reconnect timeout: 120 seconds
- Auto client reconnect: Enabled
- Auto client reconnect authentication: Disabled
- Auto client reconnect Logging: Disabled

For more information, see Auto client reconnect policy settings.

Session reliability:

Session reliability reconnects ICA sessions seamlessly across network interruptions. Session reliability closes (or disconnects) the user session after the time specified in the setting. After the session reliability timeout, the auto client reconnect settings take effect, attempting to reconnect the user to the disconnected session. When session reliability is in progress, application and desktops network interruption notification are sent to the user as follows:

- **Desktops.** The session window becomes translucent and a countdown timer displays the time until the reconnections occur.
- **Applications.** The window becomes translucent along with connection interrupted pop-ups from the notification area.

While session reliability is active, the user cannot interact with the ICA sessions. However, user actions like keystrokes are buffered for a few seconds immediately after the network interruption and retransmitted when the network is available.

On reconnection, the client and the server resume at the same point where they were in their exchange of protocol. The session windows lose translucency and appropriate notification area pop-ups are shown for applications.

Default session reliability settings

- Session reliability timeout: 180 seconds
- Reconnection UI opacity level: 80%
- Session reliability connection: Enabled
- Session reliability port number: 2598

For more information, see Session reliability policy settings.

NetScaler with auto client reconnect and session reliability:

If Multistream and Multiport policies are enabled on the server and any or all these conditions are true, auto client reconnect does not work:

- Session reliability is disabled on NetScaler Gateway.
- A failover occurs on the NetScaler appliance.
- NetScaler SD-WAN is used with NetScaler Gateway.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

HDX adaptive throughput

HDX adaptive throughput intelligently fine-tunes the peak throughput of the ICA session by adjusting output buffers. The number of output buffers is initially set at a high value. This high value allows data to be transmitted to the client more quickly and efficiently, especially in high latency networks. Providing better interactivity, faster file transfers, smoother video playback, higher framerate, and resolution results in an enhanced user experience.

Session interactivity is constantly measured to determine whether any data streams within the ICA session are adversely affecting interactivity. If that occurs, the throughput is decreased to reduce the impact of the large data stream on the session and allow interactivity to recover.

> **Important:**
>
> HDX adaptive throughput changes the way that output buffers are set by moving this mechanism from the client to the VDA, and no manual configuration is necessary.

This feature has the following requirements:

- VDA version 1811 or later
- Workspace app for Windows 1811 or later

Improve the image quality sent to user devices

The following visual display policy settings control the quality of images sent from virtual desktops to user devices.

- Visual quality. Controls the visual quality of images displayed on the user device: medium, high, always lossless, build to lossless (default = medium). The actual video quality using the default setting of medium depends on available bandwidth.
- Target frame rate. Specifies the maximum number of frames per second that are sent from the virtual desktop to the user device (default = 30). For devices that have slower CPUs, specifying a lower value can improve the user experience. The maximum supported frame rate per second is 60.
- Display memory limit. Specifies the maximum video buffer size for the session in kilobytes (default = 65536 KB). For connections requiring more color depth and higher resolution, increase the limit. You can calculate the maximum memory required.

> **Note:**
>
> The **Display Memory Limit** setting has been deprecated. With this change, Citrix now no longer limits the display memory. Instead, the minimum amount of memory required is allocated to ensure the client's display layout is fully accommodated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Improve video conference performance

Several popular video conferencing applications are optimized for delivery from Citrix Virtual Apps and Desktops through multimedia redirection (see, for example, HDX RealTime Optimization Pack). For applications that are not optimized, HDX webcam video compression improves bandwidth efficiency and latency tolerance for webcams during video conferencing in a session. This technology streams webcam traffic over a dedicated multimedia virtual channel. This technology uses less bandwidth compared to the isochronous HDX Plug-n-Play USB redirection support, and works well over WAN connections.

Citrix Workspace app users can override the default behavior by choosing the Desktop Viewer Mic & Webcam setting **Don't use my microphone or webcam**. To prevent users from switching from HDX webcam video compression, disable USB device redirection by using the policy settings under ICA policy settings > USB Devices policy settings.

HDX webcam video compression requires that the following policy settings be enabled (all are enabled by default).

- Client audio redirection
- Client microphone redirection
- Multimedia conferencing

If a webcam supports hardware encoding, HDX video compression uses the hardware encoding by default. Hardware encoding might consume more bandwidth than software encoding. To force software compression, add the following DWORD key value to the registry key: HKCU\Software\Citrix\HdxRealTime: DeepCompress_ForceSWEncode=1.

Network traffic priorities

Priorities are assigned to network traffic across multiple connections for a session using Quality of Service supported routers. Four TCP streams and two User Datagram Protocol (UDP) streams are available to carry ICA traffic between the user device and the server:

- TCP streams - real time, interactive, background, and bulk
- UDP streams - voice and Framehawk display remoting

Each virtual channel is associated with a specific priority and transported in the corresponding connection. You can set the channels independently, based on the TCP port number used for the connection.

Multiple channel streaming connections are supported for Virtual Delivery Agents (VDAs) installed on Windows 10, Windows 8, and Windows 7 machines. Work with your network administrator to ensure the Common Gateway Protocol (CGP) ports configured in the **Multi-Port Policy** setting are assigned correctly on the network routers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Quality of Service is supported only when multiple session reliability ports, or the CGP ports, are configured.

> **Warning:**
>
> Use transport security when using this feature. Citrix recommends using Internet Protocol Security (IPsec) or Transport Layer Security (TLS). TLS connections are supported only when the connections traverse a NetScaler Gateway that supports multi-stream ICA. On an internal corporate network, multi-stream connections with TLS are not supported.

To set Quality of Service for multiple streaming connections, add the following Citrix policy settings to a policy (see Multi-stream connections policy settings for details):

- Multi-Port policy - This setting specifies ports for ICA traffic across multiple connections, and establishes network priorities.
  - Select a priority from the CGP default port priority list. By default, the primary port (2598) has a High priority.
  - Type more CGP ports in CGP port1, CGP port2, and CGP port3 as needed, and identify priorities for each. Each port must have a unique priority.

  Explicitly configure the firewalls on VDAs to allow the additional TCP traffic.
- Multi-Stream computer setting - This setting is disabled by default. If you use Citrix NetScaler SD-WAN with Multi-Stream support in your environment, you do not need to configure this setting. Configure this policy setting when using third-party routers or legacy NetScaler SD-WAN to achieve the desired Quality of Service.
- Multi-Stream user setting - This setting is disabled by default.

For policies containing these settings to take effect, users must log off and then log on to the network.

Show or hide the remote language bar

The language bar displays the preferred input language in an application session. If this feature is enabled (default), you can show or hide the language bar from the **Advanced Preferences > Language bar** UI in Citrix Workspace app for Windows. By using a registry setting on the VDA side, you can disable client control of the language bar feature. If this feature is disabled, the client UI setting doesn't take effect, and the per user current setting determines the language bar state. For more information, see Improve the user experience.

To disable client control of the language bar feature from the VDA:

1. In the registry editor, navigate to HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell
2. Create a DWORD value key, SeamlessFlags, and set it to 0x40000.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unicode keyboard mapping

Non-Windows Citrix Receivers use the local keyboard layout (Unicode). If a user changes the local keyboard layout and the server keyboard layout (scan code), they might not be in sync and the output is incorrect. For example, User1 changes the local keyboard layout from English to German. User1 then changes the server-side keyboard to German. Even though both keyboard layouts are German, they might not be in sync causing incorrect character output.

Enable or disable Unicode keyboard layout mapping

By default, the feature is disabled on the VDA side. To enable the feature, toggle on the feature by using the registry editor regedit on the VDA. Add the following registry key:

KEY_LOCAL_MACHINE/SOFTWARE/Citrix/CtxKlMap

Name: EnableKlMap

Type: DWORD

Value: 1

To disable this feature, set **EnableKlMap** to 0 or delete the **CtxKlMap** key.

Enable Unicode keyboard layout mapping compatible mode

By default, Unicode keyboard layout mapping automatically hooks some windows API to reload the new Unicode keyboard layout map when you change the keyboard layout on the server side. A few applications cannot be hooked. To keep compatibility, you can change the feature to compatible mode to support these non-hooked applications. Add the following registry key:

HKEY_LOCAL_MACHINE/SOFTWARE/Citrix/CtxKlMap

Name: DisableWindowHook

Type: DWORD

Value: 1

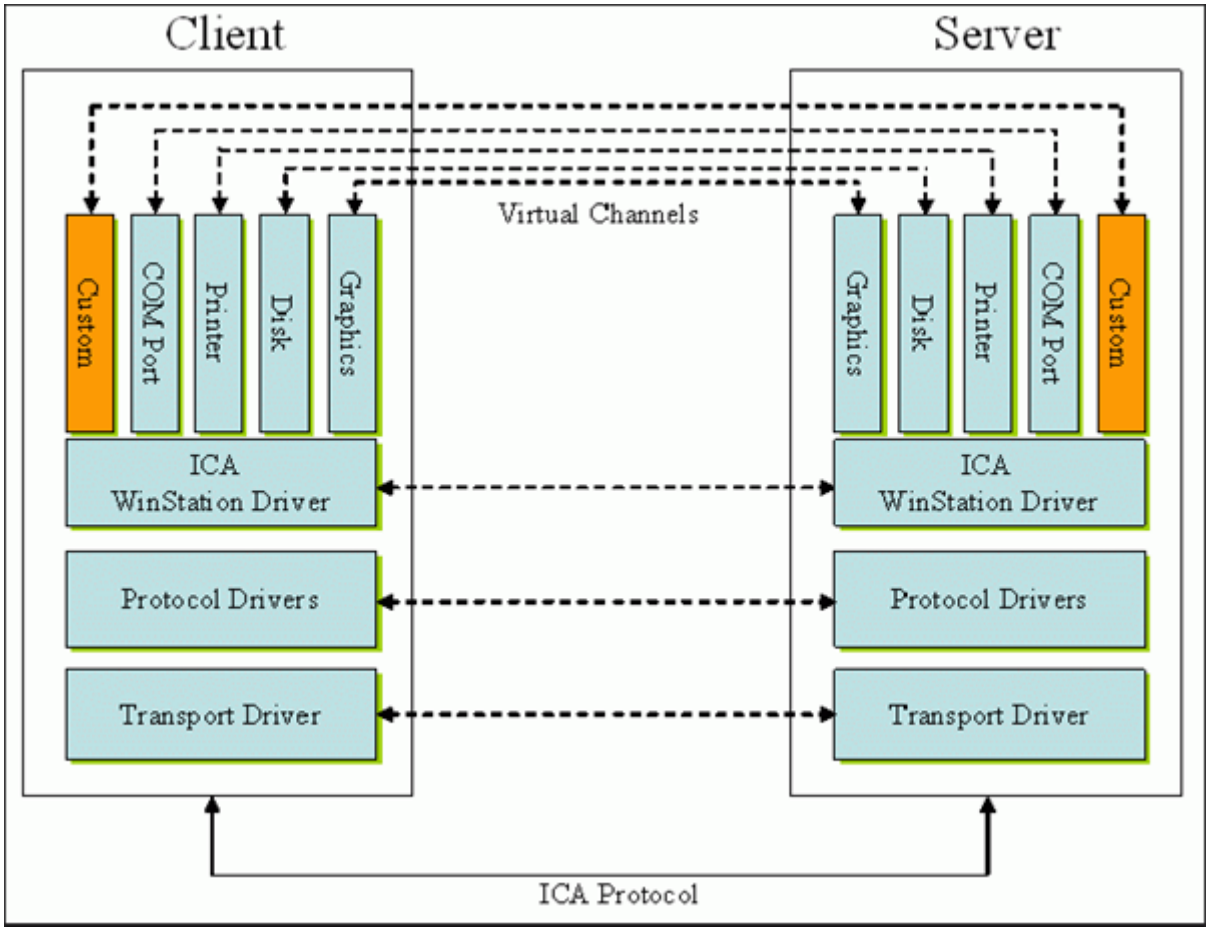
To use normal Unicode keyboard layout mapping, set **DisableWindowHook** to 0.

Citrix ICA® virtual channels

May 15, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Warning:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.



What are ICA virtual channels?

A large portion of the functionality and communication between the Citrix Workspace™ app and the Citrix Virtual Apps and Desktops™ servers occurs over virtual channels. Virtual channels are a necessary part of the remote computing experience with the Citrix Virtual Apps and Desktops servers. Virtual channels are used for:

- Audio
- COM ports
- Disks
- Graphics
- LPT ports
- Printers
- Smart cards
- Third-party custom virtual channels
- Video

New virtual channels are sometimes released with new versions of the Citrix Virtual Apps and Desktops™ servers and Citrix Workspace app products to provide more functionality.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A virtual channel consists of a client-side virtual driver that communicates with a server-side application. Citrix Virtual Apps and Desktops ship with various virtual channels included. They're designed to allow customers and third-party vendors to create their own virtual channels by using one of the provided Software Development Kits (SDKs).

Virtual channels provide a secure way to accomplish various tasks. For example, an application that is running on a Citrix Virtual Apps server that is communicating with a client-side device or an application that is communicating with the client-side environment.

On the client side, virtual channels correspond to virtual drivers. Each virtual driver provides a specific function. Some are required for normal operation, and others are optional. Virtual drivers operate at the presentation layer protocol level. There can be several protocols active at any time by multiplexing channels that are provided by the Windows Station (WinStation) protocol layer.

The following functions are contained in the VirtualDriver registry value under this registry path:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\Engine\Configuration\
Advanced\Modules\ICA 3.0
```

Or

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\ICA 3.0` (for 64-bit)

- Thinwire3.0 (Required)
- ClientDrive
- ClentPrinterQueue
- ClentPrinterPort
- Clipboard
- ClientComm
- ClientAudio
- LicenseHandler (Required)
- TWI (Required)
- SmartCard
- ICACTL (Required)
- SSPI
- TwainRdr
- UserEXperience
- Vd3d

> **Note:**
>
> You can disable specific client functionality by removing one or more of these values from the registry key. For example, if you wanted to remove the Client Clipboard, remove the word **Clipboard**.

This list contains the client virtual driver files and their respective functions. Citrix Virtual Apps and Citrix Workspace app for Windows use these files. They are in the form of Dynamic Link Libraries (user mode), and not Windows drivers (kernel mode) except for Generic USB as described in the Generic USB virtual channel.

- vd3dn.dll –Direct3D virtual channel used for desktop composition redirection
- vdcamN.dll –Bidirectional audio
- vdcdm30n.dll –Client drive mapping
- vdcom30N.dll - Client COM port mapping
- vdcpm30N.dll –Client printer mapping
- vdctln.dll –ICA controls channel
- vddvc0n.dll –Dynamic virtual channel
- vdeuemn.dll - End user experience monitoring
- vdgusbn.dll –Generic USB virtual channel
- vdkbhook.dll –Transparent key pass-through
- vdlfpn.dll –Framehawk display channel over UDP like transport
- vdmmn.dll –Multimedia support

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- vdmrvc.dll –Mobile Receiver virtual channel
- vdmtchn.dll - Multi-touch support
- vdscardn.dll –Smartcard support
- vdsens.dll –Sensors virtual channel
- vdspl30n.dll –Client UPD
- vdsspin.dll –Kerberos
- vdtuin.dll –Transparent UI
- vdtw30n.dll –Client Thinwire
- vdtwin.dll –Seamless
- vdtwn.dll –Twain

Some virtual channels are compiled into other files. For example Clipboard Mapping is available in wfica32.exe

64-bit compatibility

Citrix Workspace app for Windows is 64-bit compatible. As with most of the binaries compiled for 32 bit, these client files have 64-bit compiled equivalents:

- brapi64.dll
- confmgr.dll
- ctxlogging.dll
- ctxmui.dll
- icaconf.exe
- icaconfs.dll
- icafile.dll
- pnipcn64.dll
- pnsson.dll
- ssoncom.exe
- ssonstub.dll
- vdkbhook64.dll

Generic USB virtual channel

Generic USB virtual channel implementation uses two kernel mode drivers along with the virtual channel driver vdgusbn.dll:

- ctxusbm.sys
- ctxusbr.sys

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How ICA virtual channels work

Virtual channels are loaded in multiple ways. The Shell (WfShell for the server and PicaShell for the workstation) load some virtual channels. Some virtual channels are hosted as windows services.

Virtual channel modules loaded by the Shell, for example:

- EUEM
- Twain
- Clipboard
- Multimedia
- Seamless session sharing
- Time Zone

Some are loaded as kernel mode, for example:

- CtxDvcs.sys –Dynamic virtual channel
- Icausbb.sys –Generic USB redirection
- Picadm.sys –Client drive mapping
- Picaser.sys –COM port redirection
- Picapar.sys –LPT port redirection

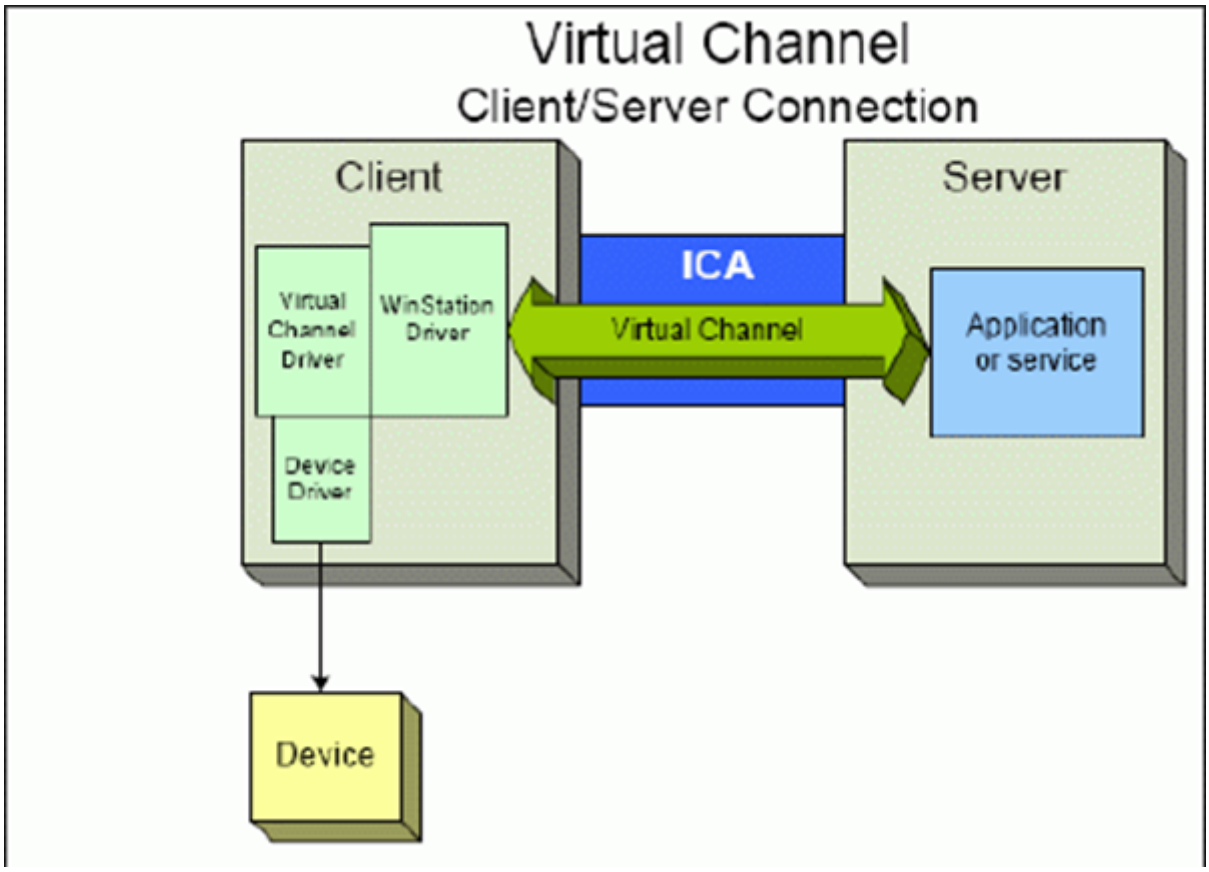
Graphics virtual channel on the server side

The `ctxgfx.exe` hosts the graphics virtual channel for both workstation and terminal server based sessions. `Ctxgfx` hosts platform specific modules that interact with the corresponding driver (`Icardd.dll` for RDSH and `vdod.dll` and `vidd.dll` for workstation).

For XenDesktop® 3D Pro deployments an OEM graphics driver is installed for the corresponding GPU on the VDA. `Ctxgfx` loads specialized adaptor modules to interact with the OEM graphics driver.

Hosting specialized channels in windows services

On Citrix Virtual Apps and Desktops servers, various channels are hosted as windows services. Such hosting provides one-to-many semantics for multiple applications in a session and multiple sessions on the server. Examples of such services include:



- Citrix Device Redirector Service
- Citrix Dynamic Virtual Channel Service
- Citrix End User Experience Monitoring Service
- Citrix Location and Sensor Virtual Channel Service
- Citrix MultiTouch Redirection Service

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Citrix Print Manager Service
- Citrix Smartcard Service
- Citrix Audio Redirection Service (Citrix Virtual Desktops™ only)
- Citrix ICA Status Channel Service

The audio virtual channel on Citrix Virtual Apps is hosted using Windows Audio service.

On the server side, all client virtual channels are routed through the WinStation driver, Wdica.sys. On the client side, the corresponding WinStation driver, built into wfica32.exe, polls the client virtual channels. This image illustrates the virtual channel client-server connection.

This overview contains a client-server data exchange using a virtual channel.

1. The client connects to the Citrix Virtual Apps and Desktops server. The client passes information about the virtual channels it supports to the server.
2. The server-side application starts, obtains a handle to the virtual channel, and optionally queries for additional information about the channel.
3. The client virtual driver and server-side application pass data using the following two methods:
    - If the server application has data to send to the client, the data is sent to the client immediately. When the client receives the data, the WinStation driver de-multiplexes the virtual channel data from the ICA stream and immediately passes it to the client virtual driver.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the client virtual driver has data to send to the server, the data is sent the next time the WinStation driver polls it. When the server receives the data, it is queued until the virtual channel application reads it. There is no way to alert the server virtual channel application that data was received.

4. When the server virtual channel application is completed, it closes the virtual channel and frees any allocated resources.

Creating your own virtual channel using the Virtual Channel SDK

> **Note:**
>
> Citrix SDKs are available in the Citrix Developer portal at https://developer.cloud.com.

Creating a virtual channel using the Virtual Channel SDK requires intermediate programming knowledge. Use this method to provide a major communication path between the client and the server. For example, if you are implementing usage of a device on the client side, such as a scanner, to be used with a process in the session.

> **Note:**
>
> - The Virtual Channel SDK requires the WFAPI SDK to write the server side of the virtual channel.
> - Because of enhanced security for Citrix Virtual Apps and Desktops, you must specify which virtual channels are allowed to be opened in an ICA session. For more information, see Virtual channel allow list policy settings.

Creating your own virtual channel using the ICA Client Object SDK

Creating a virtual channel using the ICA Client Object (ICO) is easier than using the Virtual Channel SDK. Use the ICO by creating a named object in your program using the **CreateChannels** method.

> **Important:**
>
> Because of enhanced security starting with the 10.00 version of the Citrix Receiver for Windows and later (and Citrix Workspace apps for Windows), you must take an extra step when creating an ICO virtual channel.

Pass-through functionality of virtual channels

Most virtual channels that Citrix provides operate unmodified when you use the Citrix Workspace app for Windows within an ICA session (also known as a pass-through session). There are considerations when using the client in extra hops.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following functions operate the same way in single or multiple hops:

- Client COM port mapping
- Client drive mapping
- Client printer mapping
- Client UPD
- End user experience monitoring
- Generic USB
- Kerberos
- Multimedia support
- Smartcard support
- Transparent key pass-through
- Twain

As the inherent nature of latency and factors such as compression and decompression and rendering being performed at each hop, performance might be affected with each additional hop that the client undergoes. The affected areas are:

- Bidirectional audio
- File transfers
- Generic USB redirection
- Seamless
- Thinwire

> **Important:**
>
> By default, the client drives mapped by an instance of the client running in a pass-through session are restricted to the client drives of the connecting client.

Pass-through functionality of virtual channels between a Citrix Virtual Desktop session and a Citrix Virtual App session

Most virtual channels provided by Citrix operate unmodified when you use Citrix Workspace app for Windows within an ICA session on a Citrix Virtual Desktops server (also known as a pass-through session).

Specifically, on the Citrix Virtual Desktops server, there is a VDA hook that runs **picaPassthruHook**. This hook makes the client think it's running on a CPS server, and placing the client into its traditional pass-through mode.

We support the following traditional virtual channels and their functionality:

- Client
- Client COM port mapping

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Client drive mapping
- Client printer mapping
- Generic USB (limited due to performance)
- Multimedia support
- Smartcard support
- SSON
- Transparent key pass-through

Security and ICA virtual channels

Securing usage is an important part of planning, developing, and implementing virtual channels. There are several references to specific areas of security located throughout this document.

Best practices

Open virtual channels when you **Connect** and **Reconnect**. Close virtual channels when you log off and **Disconnect**.

Keep the following guidelines in mind when you create scripts that use virtual channel functions.

Naming the Virtual Channels:

You can create a maximum of 32 virtual channels. Seventeen of the 32 channels are reserved for special purposes.

- Virtual channel names must not be more than seven characters in length.
- The first three characters are reserved for the vendor name, and the next four for the channel type. For example, **CTXAUD** represents the Citrix audio virtual channel.

Virtual channels are referred to by a seven-character (or shorter) ASCII name. In some previous versions of the ICA protocol, virtual channels were numbered. The numbers are now assigned dynamically based on the ASCII name, making implementation easier. Users who are developing virtual channel code for internal use only can use any seven-character name that does not conflict with existing virtual channels. Use only numbers and upper and lowercase ASCII. Follow the existing naming convention when adding your own virtual channels. There are several predefined channels. The predefined channels begin with the OEM identifier CTX and are for use only by Citrix.

Double-Hop Support:

Virtual Channel	Is double hop supported?
Audio	No

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual Channel	Is double hop supported?
Browser Content Redirection	No
CDM	Yes
CEIP	No
Clipboard	Yes
Continuum (MRVC)	No
Control VC	Yes
HTML5 Video Redirection (v1)	Yes
Keyboard, Mouse	Yes
MultiTouch	No
NSAPVC	No
Printing	Yes
SensVC	No
Smartcard	Yes
Twain	Yes
USB VC	Yes
WAYCOM devices -K2M using USB VC	Yes
Webcam Video Compression	Yes
Windows Media Redirection	Yes

Double hop in Citrix Virtual Apps and Desktops™

June 19, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the context of a Citrix client session, the term "double hop" refers to a Citrix Virtual App session that is running within a Citrix Virtual Desktop session. The following diagram illustrates a double hop.

In a double hop scenario, when the user connects to a Citrix Virtual Desktop running on a single-session OS VDA (known as VDI) or a multi-session OS VDA (known as a published desktop), that is considered the first hop. After the user connects to the virtual desktop, the user can launch a Citrix Virtual Apps™ session. That is considered the second hop.

You can use a double hop deployment model to support various use cases. The case where the Citrix Virtual Desktop and the Citrix Virtual Apps environments are managed by different entities is one common example. This method can also be effective in resolving application compatibility issues.

System requirements

All Citrix Virtual Apps and Desktops editions including the Citrix Cloud™ service support double hop.

The first hop must use a supported version of the single-session or multi-session OS VDA and the Citrix Workspace App. The second hop must use a supported version of the multi-session OS VDA. See the Product Matrix page for supported versions.

For best performance and compatibility, Citrix recommends using a Citrix client of the same version or newer than the VDA versions in use.

In environments where the first hop involves a third-party (non-Citrix) virtual desktop solution in combination with a Citrix Virtual Apps session, support is limited to the Citrix Virtual Apps environment. In the event of any issues related to the third-party virtual desktop, including - but not limited to - Citrix Workspace™ app compatibility, redirection of hardware devices, and session performance, Citrix can provide technical support in a limited capacity. A Citrix Virtual Desktop at the first hop might be required as part of troubleshooting.

Deployment considerations for HDX™ in double hop

In general, each session in a double hop is unique and client-server functions are isolated to a given hop. This section includes areas that require special consideration by Citrix administrators. Citrix

© 1997–2026 Citrix Systems, Inc. All rights reserved.

recommends that customers conduct thorough testing of required HDX capabilities to ensure user experience and performance is adequate for a given environment configuration.

Graphics

Use default graphics settings (selective encoding) on the first and second hops. In the case of HDX 3D Pro, Citrix highly recommends that all applications that require graphics acceleration run locally in the first hop with the appropriate GPU resources available to the VDA.

Latency

End-to-end latency can impact the overall user experience. Consider the added latency between the first and second hops. This is especially important with redirection of hardware devices.

Multimedia

Server-side (in session) rendering of audio and video content performs best in the first hop. Video playback in the second hop requires decoding and re-encoding at the first hop, increasing bandwidth and hardware resource utilization as a result. Audio and video content must be limited to the first hop whenever possible.

USB device redirection

HDX includes generic and optimized redirection modes to support a wide array of USB device types. Pay special attention to the mode in use at each hop and use the following table as reference for best results. For more information about generic and optimized redirection modes, see Generic USB devices.

First hop (VDI or published desktop)	Second hop (Virtual apps)	Support notes
Optimized	Optimized	Recommended (based on device support). For example, USB mass storage, TWAIN scanners, Webcam, Audio.
Generic	Generic	For devices where the optimized option is not available.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

First hop (VDI or published desktop)	Second hop (Virtual apps)	Support notes
Generic	Optimized	While technically possible, it is recommended to use the optimized mode across both hops when device support is available.
Optimized	Generic	Not supported

> **Note:**
>
> Due to the inherent chattiness of USB protocols, performance may decrease across hops. Functionality and results vary depending on specific device and application requirements. Validation testing is highly recommended in all cases of device redirection and especially important in double hop scenarios.

FIDO2 redirection

FIDO2 redirection is supported in double-hop scenarios as long as the Citrix Workspace App for Windows installed on the intermediate hop VDA is version 2503 or later. Additionally, this is only supported when the 2nd hop connection is over ICA.

Support exceptions

Double hop sessions support most HDX features and capabilities except for the following:

- Browser content redirection
- Local App Access
- RealTime Optimization Pack for Skype for Business
- Optimization for Microsoft Teams

Install and configure

May 15, 2026

Review the referenced articles before starting each deployment step, to learn about what you see and specify during the deployment.

Use the following sequence to deploy Citrix Virtual Apps and Desktops.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prepare

Review Prepare to install and complete any necessary tasks.

- Where to find information about concepts, features, differences from earlier releases, system requirements, and databases.
- Considerations when deciding where to install core components.
- Permission and Active Directory requirements.
- Information about the available installers, tools, and interfaces.

Install core components

Install the Delivery Controller, Web Studio, Citrix Director, and Citrix License Server. You can also install Citrix StoreFront. For details, see Install core components or Install using the command line.

Create a site

After you install the core components and launch Studio, you are prompted to create a site.

Install one or more Virtual Delivery Agents (VDAs)

Install a VDA on a machine running a Windows operating system, either on a master image or directly on each machine. See Install VDAs or Install using the command line. Sample scripts are provided if you want to install VDAs through Active Directory.

For machines with a Linux operating system, follow the guidance in Linux Virtual Delivery Agent.

For a Remote PC Access deployment, install a VDA for a single-session OS on each office PC. If you need only the core VDA services, use the standalone `VDAWorkstationCoreSetup.exe` installer and your existing Electronic Software Distribution (ESD) methods. (Prepare to install describes the available VDA installers.)

Install optional components

If you plan to use the Citrix Universal Print Server, install its server component on your print servers. See Install core components or Install using the command line.

To allow StoreFront to use authentication options such as SAML assertions, install the Citrix Federated Authentication Service.

To enable end users to have greater control over their user accounts, install Self-Service Password Reset.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Optionally, integrate more Citrix components into your Citrix Virtual Apps and Desktops™ deployment.

- Citrix Provisioning is an optional component that provisions machines by streaming a master image to target devices.
- Citrix Gateway is a secure application access solution that provides administrators with granular application-level policy and action controls to secure access to applications and data.
- Citrix SD-WAN is a set of appliances that optimize WAN performance.

Create a machine catalog

After you create a site in Studio, you are guided to create a machine catalog.

A catalog can contain physical or virtual machines (VMs). Virtual machines can be created from a master image. When using a hypervisor or other service to provide VMs, you first create a master image on that host. Then, when you create the catalog, you specify that image, which is used when creating VMs.

Create a delivery group

After you create your first machine catalog in Web Studio, you are guided to create a delivery group.

A delivery group specifies which users can access machines in a selected catalog and the applications available to those users.

Create an application group (optional)

After you create a delivery group, you can optionally create an application group. You can create application groups for applications that are shared across different delivery groups or used by a subset of users within delivery groups.

Known limitation

When you use Citrix Workspace™ app for Windows version 1912 or earlier, the session drops after a while. This issue is fixed in the newer LTSR and CR versions of Citrix Workspace app.
For more information on the supported release versions, see Citrix Workspace app for Windows / Citrix Receiver for Windows Long Term Service Releases.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine identities

May 13, 2026

Each machine must have a unique machine identity, also known as computer account. Machine identities can be created and managed in the machines locally or in a directory. Citrix® supports hosting virtual applications and desktops on machines that are Active Directory joined, Microsoft Entra hybrid joined, or non-domain joined.

Machine identity types

The following machine identity types are supported.

Machine identity type	Description
AD joined	Identities are created and managed in on-premises Active Directory. Provisioned machines are joined to on-premises Active Directory using the assigned machine identities.
Microsoft Entra hybrid joined	Identities are created in on-premises Active Directory and are synced with Microsoft Entra ID through Microsoft Entra Connect. Provisioned machines are joined to on-premises Active Directory. The machines are then Microsoft Entra hybrid joined. For importing a Microsoft Entra hybrid joined VM, the VM is treated as an Active Directory joined VM by Citrix Virtual Apps and Desktops.
Non-domain-joined	Identities are created and managed in the machines locally. Importing VMs to Citrix Virtual Apps and Desktops is not supported.

Supported Configurations

The following are details of the supported configurations for each scenario.

Supported infrastructure

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine identity	Citrix Virtual Apps and Desktops™	Citrix Workspace™	Citrix StoreFront	Citrix Gateway Service	Citrix Gateway
AD joined	Yes	Yes	Yes	Yes	Yes
Microsoft Entra joined	No	Yes	No	Yes	No
Microsoft Entra hybrid joined	Yes	Yes	Yes	Yes	Yes
Non-domain-joined	Yes	Yes	No	Yes	No

Supported workspace authentication identity providers

Machine identity	Microsoft Entra ID	Active Directory	Active Directory and Token	Okta	SAML	Citrix Gateway	Adaptive Authentication
AD joined	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Microsoft Entra hybrid joined	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Non-domain-joined	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Active Directory joined

May 13, 2026

Active Directory is required for authentication and authorization. The Kerberos infrastructure in Active Directory is used to guarantee the authenticity and confidentiality of communications with the Delivery Controllers. For information about Kerberos, see the Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The System requirements article lists the supported functional levels for the forest and domain. To use Policy Modeling, the domain controller must be running on all supported Server OSs. This does not affect the domain functional level.

This product supports:

- **Deployments in which the user accounts and computer accounts exist in domains in a single Active Directory forest.** User and computer accounts can exist in arbitrary domains within a single forest. All domain functional levels and forest functional levels are supported in this type of deployment.
- **Deployments in which user accounts exist in an Active Directory forest that is different from the Active Directory forest containing the computer accounts of the Controllers and virtual desktops.** In this type of deployment, the domains containing the Controller and virtual desktop computer accounts must trust the domains containing user accounts. Forest trusts or external trusts can be used. All domain functional levels and forest functional levels are supported in this type of deployment.
- **Deployments in which the computer accounts for Controllers exist in an Active Directory forest that is different from one or more additional Active Directory forests that contain the computer accounts of the virtual desktops.** In this type of deployment a bi-directional trust must exist between the domains containing the Controller computer accounts and all domains containing the virtual desktop computer accounts. In this type of deployment, all domains containing Controller or virtual desktop computer accounts must be at "Windows 2000 native"functional level or higher. All forest functional levels are supported.
- **Writable domain controllers.** Read-only domain controllers are not supported.

Optionally, Virtual Delivery Agents (VDAs) can use information published in Active Directory to determine which Controllers they can register with (discovery). This method is supported primarily for backward compatibility, and is available only if the VDAs are in the same Active Directory forest as the Controllers. For information about this discovery method see Active Directory OU-based discovery and CTX118976.

> **Note:**
>
> Do not change the computer name or the domain membership of a Delivery Controller™ after the site is configured.

Deploy in a multiple Active Directory forest environment

In an Active Directory environment with multiple forests, if one-way or two-way trusts are in place you can use DNS forwarders or conditional forwarders for name lookup and registration. To allow the appropriate Active Directory users to create computer accounts, use the Delegation of Control wizard. See the Microsoft documentation for details about this wizard.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

No reverse DNS zones are necessary in the DNS infrastructure if appropriate DNS forwarders are in place between forests.

The `SupportMultipleForest` key is necessary if the VDA and Controller are in separate forests, regardless of whether the Active Directory and NetBIOS names are different. Use the following information to add the registry key to the VDA and the Delivery Controllers:

> **Caution:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix® cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Back up the registry before you edit it.

On the VDA, configure: `HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\SupportMultipleForest`.

- Name: `SupportMultipleForest`
- Type: `REG_DWORD`
- Data: `0x00000001 (1)`

On all Delivery Controllers, configure: `HKEY_LOCAL_MACHINE\Software\Citrix\DesktopServer\SupportMultipleForest`.

- Name: `SupportMultipleForest`
- Type: `REG_DWORD`
- Data: `0x00000001 (1)`

You might need reverse DNS configuration if your DNS namespace is different than that of Active Directory.

A registry entry has been added to avoid unwanted enabling of NTLM authentication in VDAs, which is less secure than Kerberos. This entry can be used instead of the `SupportMultipleForest` entry, which can still be used for backwards compatibility.

On the VDA, configure: `HKEY_LOCAL_MACHINE\Software\Policies\Citrix\VirtualDesktopAgent`.

- Name: `SupportMultipleForestDdcLookup`
- Type: `REG_DWORD`
- Data: `0x00000001 (1)`

This registry key performs a DDC lookup in a two-way trust multiple forest environment that allows you to remove NTLM-based authentication during the initial registration process.

If external trusts are in place during setup, the `ListOfSIDs` registry key is required. The `ListOfSIDs` registry key is also necessary if the Active Directory FQDN is different than the DNS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

FQDN, or if the domain containing the Domain Controller has a different NetBIOS name than the Active Directory FQDN. To add the registry key, use the following information:

For the VDA, locate the registry key `HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\ListOfSIDs`.

- Name: `ListOfSIDs`
- Type: `REG_SZ`
- Data: Security Identifier (SID) of the Controllers. (SIDs are included in the results of the `Get-BrokerController` cmdlet.)

When external trusts are in place, make the following change on the VDA:

1. Locate the file `Program Files\Citrix\Virtual Desktop Agent\brokeragent.exe.config`.
2. Make a backup copy of the file.
3. Open the file in a text editing program such as Notepad.
4. Locate the text `allowNtlm="false"` and change the text to `allowNtlm="true"`.
5. Save the file.

After adding the `ListOfSIDs` registry key and editing the `brokeragent.exe.config` file, restart the Citrix Desktop Service to apply the changes.

The following table lists the supported trust types:

Trust type	Transitivity	Direction	Supported in this release
Parent and child	Transitive	Two-way	Yes
Tree-root	Transitive	Two-way	Yes
External	Nontransitive	One-way or two-way	Yes
Forest	Transitive	One-way or two-way	Yes
Shortcut	Transitive	One-way or two-way	Yes
Realm	Transitive or nontransitive	One-way or two-way	No

For more information about complex Active Directory environments, see CTX134971.

Where to go next

For information on how to create identity pool of on-premises Active Directory (AD) joined machine identity, see Identity pool of on-premises Active Directory joined machine identity.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Microsoft Entra hybrid joined

August 21, 2026

This article describes the requirements to create identity pool of Microsoft Entra hybrid joined catalogs and Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune in addition to the requirements outlined in the system requirements section.

Microsoft Entra hybrid joined machines use on-premises AD as the authentication provider. You can assign them to domain users or groups in on-premises AD. To enable Microsoft Entra ID seamless SSO experience, you need to have the domain users synced to Microsoft Entra ID.

> **Note:**
>
> Microsoft Entra hybrid joined VMs are supported in both federated and managed identity infrastructures.

Requirements for Microsoft Entra hybrid joined

- VDA type: Single-session (desktops only) or multi-session (apps and desktops)
- VDA version: 2212 or later
- Provisioning type: Machine Creation Services™ (MCS), Persistent and Non-persistent
- Assignment type: Dedicated and pooled
- Hosting platform: Any hypervisor or cloud service

Limitations for Microsoft Entra hybrid joined

- If Citrix Federated Authentication Service (FAS) is used, single sign-on is directed to on-premises AD rather than Microsoft Entra ID. In this case, it is recommended to configure Microsoft Entra certificate-based authentication so that the primary refresh token (PRT) is generated upon user logon, which facilitates single sign-on to Microsoft Entra resources within the session. Otherwise, the PRT will not be present and SSO to Microsoft Entra resources will not work. For information on achieving Microsoft Entra single sign-on (SSO) to hybrid joined VDAs using Citrix Federated Authentication Service (FAS), see Hybrid-joined VDAs.
- Do not skip image preparation while creating or updating machine catalogs. If you want to skip image preparation, make sure the master VMs are not Microsoft Entra or Microsoft Entra hybrid joined.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Considerations for Microsoft Entra hybrid joined

- Creating Microsoft Entra hybrid joined machines requires the `Write userCertificate` permission in the target domain. Make sure that you enter credentials of an administrator with that permission during catalog creation.
- The Microsoft Entra hybrid joining process is managed by Citrix. You need to disable `autoWorkplaceJoin` controlled by Windows in the master VMs as follows. The task of manually disabling `autoWorkplaceJoin` is only required for VDA version 2212 or earlier.

  1. Run `gpedit.msc`.
  2. Navigate to **Computer Configuration > Administrative Templates > Windows Components > Device Registration**.
  3. Set **Register domain joined computers as devices** to **Disabled**.

- Select the Organizational Unit (OU) that is configured to be synced with Microsoft Entra ID when you create the machine identities.
- For Windows 11 22H2 based master VM, create a scheduled task in the master VM that executes the following commands at system startup using SYSTEM account. This task of scheduling a task in the master VM is only required for VDA version 2212 or earlier.

```
$VirtualDesktopKeyPath = 'HKLM:\Software\AzureAD\VirtualDesktop'
$WorkplaceJoinKeyPath = 'HKLM:\SOFTWARE\Policies\Microsoft\
   Windows\WorkplaceJoin'
$MaxCount = 60

for ($count = 1; $count -le $MaxCount; $count++)
{

  if ((Test-Path -Path $VirtualDesktopKeyPath) -eq $true)
  {

    $provider = (Get-Item -Path $VirtualDesktopKeyPath).GetValue(
       "Provider", $null)
    if ($provider -eq 'Citrix')
    {

        break;
     }

    if ($provider -eq 1)
    {

        Set-ItemProperty -Path $VirtualDesktopKeyPath -Name "
           Provider" -Value "Citrix" -Force
        Set-ItemProperty -Path $WorkplaceJoinKeyPath -Name "
           autoWorkplaceJoin" -Value 1 -Force
        Start-Sleep 5
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
25            dsregcmd /join
26            break
27          }
28
29        }
30
31
32      Start-Sleep 1
33    }
```

- By default, Microsoft Entra Connect synchronizes every 30 minutes. The provisioned machines can take up to 30 minutes to be Microsoft Entra hybrid joined during the first boot.

Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune

Microsoft Entra hybrid joined catalogs, persistent single and multi-session VMs, enrolled in Microsoft Intune use the device credentials with co-management capability.

Co-management enables you to concurrently manage Windows 10 or later devices by using both Configuration Manager and Microsoft Intune. For more information, see Co-management.

Prerequisites for Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune

Before enabling this feature, verify that:

- Your Azure environment meets the licensing requirements to use Microsoft Intune. For more information, see the Microsoft documentation.
- You have a valid Configuration Manager deployment with co-management enabled. For more information, see the Microsoft documentation.

Requirements for Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune

- VDA type: Single-session or multi-session
- VDA version: 2407 or later
- Provisioning type: Machine Creation Service (MCS), Persistent. Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune for non-persistent single and multi-session VMs is currently under Preview. See Enrollment of Hybrid Entra ID joined non-persistent VMs into Microsoft Intune.
- Assignment type: Dedicated and pooled
- Hosting platform: Any hypervisor or cloud service

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Limitations for Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune

- Do not skip image preparation while creating or updating machine catalogs.
- Internet-based client management (IBCM) of Configuration Manager is not supported.

Considerations for Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune

- Intune enrollment might be delayed if too many machines in the catalog are powered on simultaneously.

  Microsoft imposes a per-tenant Intune enrollment restriction that limits the number of devices that can be enrolled within a specific time frame. The allowable number of devices varies depending on the number of Microsoft Intune licenses associated with the tenant. Consult your Microsoft account team to find out the allowable limit for your tenant. This approach helps Microsoft Intune enrollment scale better for large environments.

  For persistent machines, there might be an initial wait time required for all devices to complete Intune enrollment.

  For non-persistent machines, consider limiting the concurrent power actions in either Autoscale™ or manual power actions.

- Configure Cloud Attach of Configuration Manager. For more information, see the Microsoft documentation.

- Manually install Configuration Manager client on the master VM without assigning the site code with `.\CCMSetup.exe /mp:SCCMServer /logon FSP=SCCMServer`. The SCCMServer is the SCCM server name in your environment. For more information, see the Microsoft documentation.

- MCS created machines use the automatic site assignment mechanism to find site boundary groups that are published to Active Directory Domain Services. Ensure that the boundaries and boundary groups of **Configuration Manager** are configured in your environment. If automatic site assignment is not available, a static Configuration Manager site code can be configured in the master VM through the following registry setting:

  Key:

  ```
  HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\MachineIdentityServiceAgent\
     DeviceManagement
  ```

  Value name: `MdmSccmSiteCode`

  Value type: **String**

  Value data: `the site code to be assigned`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Configure Microsoft Intune to delete the stale devices. This ensures that your device records stay current. For information on deleting the stale devices, see Automatically delete devices with cleanup rules.

Where to go next

For more information on creating identity pool of Microsoft Entra hybrid joined catalogs, see Identity pool of Microsoft Entra hybrid joined machine identity.

Non-domain-joined

May 13, 2026

This article describes the requirements to create non-domain-joined catalogs using using Citrix Virtual Apps and Desktops in addition to the requirements outlined in the System Requirements section.

Requirements

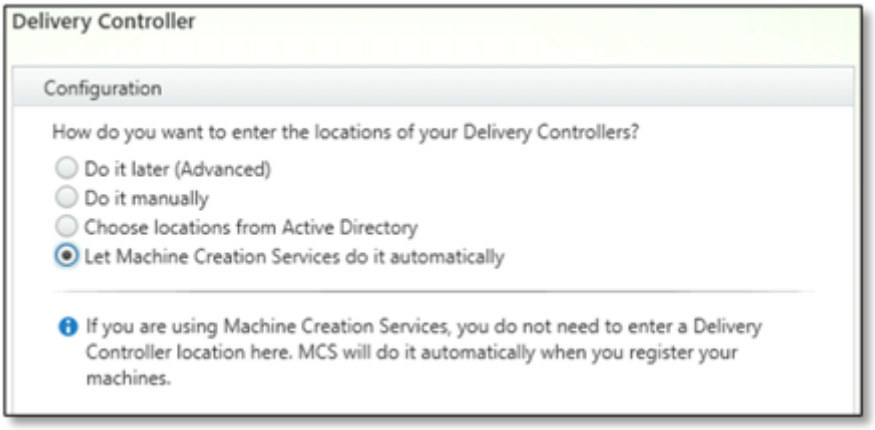
- Control plane: See Supported Configurations
- VDA type: Single-session (desktops only) or multi-session (apps and desktops)
- VDA version: 2311 or later
- Provisioning type: Machine Creation Services™ (MCS), Persistent and Non-persistent
- Assignment type: Dedicated and pooled
- Hosting platform: All platforms supported by MCS
- Rendezvous V2 must be enabled

Limitations

- Service continuity is not supported.
- Whenever we use a multi session non domain joined VDA, the local user's profile data is not retained and is deleted on logoff.

VDA installation and configuration

Follow the steps for installing the VDA:



1. Make sure to select the following options in the installation wizard:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- In the Environment page, select **Create a master MCS image**.

- In the Delivery Controller™ page, select **Let Machine Creation Services do it automatically**.

Where to go next

Once the resource location and hosting connection are available, proceed to create the identity pool. For more information on creating identity pool of non-domain-joined machine identity, see Identity pool of non-domain-joined machine identity.

Session authentication

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix supports multiple methods for authenticating users into virtual desktop and application sessions. The available options depend on how your environment is configured; specifically, the directory service where user accounts reside (e.g. Active Directory or Microsoft Entra ID), the directory service where the session host machines are joined, and the identity provider used for initial logon into the Citrix environment. These factors determine whether authentication can be handled through traditional credentials, smart cards, federated assertions, or certificate-based mechanisms. This section outlines the available authentication methods and how they align with different deployment scenarios.

Microsoft Entra single sign-on

August 25, 2026

You can leverage single sign-on (SSO) when using Microsoft Entra ID credentials to access virtual applications and desktops on Microsoft Entra hybrid joined session hosts.

For DaaS, see Microsoft Entra single sign-on.

Supported infrastructure

The following is an overview of the infrastructure components supported for Microsoft Entra single sign-on:

Machine identity	Citrix DaaS	CVAD On-prem	Citrix Storefront Cloud	Citrix Storefront	Citrix Gateway Service	NetScaler Gateway
Microsoft Entra joined	Yes	No	Yes	No	Yes	Yes
Microsoft Entra hybrid joined	Yes	Yes	Yes	Yes	Yes	Yes

> **Note:**
>
> In StoreFront, Microsoft Entra single sign-on is supported with the Modern UI experience only, not with the Classic UI experience.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Supported access methods

The following are the access methods available in a Citrix environment:

- **Native access**: You use the native Citrix Workspace app client to access Citrix Storefront and establish the session connection.
- **Browser access**: You access Citrix Storefront through a browser and connect to the virtual app or desktop session using the Citrix Workspace app for HTML5 client.
- **Hybrid access**: You access Citrix Storefront through a browser and connect to the virtual app or desktop session using the native Workspace app client.

The following is an overview of the access methods supported for Microsoft Entra single sign-on:

Access Method	Windows	Linux	Mac	Chrome OS	Android	iOS
Native	Yes	Yes	Yes	Yes	Yes	Yes
Browser	Yes	Yes	Yes	Yes	Yes	Yes
Hybrid	Yes	Yes	Yes	No	No	No

> **Note:**
>
> You must allow pop-ups for single sign-on to work with browser and hybrid access.

System requirements

The following are the system requirements for using Microsoft Entra single sign-on:

- Control plane: Citrix Virtual Apps and Desktops™ 2607 LTSR or later
- Access Tier: StoreFront 2607 LTSR or later
- Virtual Delivery Agent (VDA)
    - Windows: version 2507 or later
- Citrix Workspace app
    - Windows: version 2508 or later
    - Linux: version 2604.10 or later
    - Mac: version 2607 or later
    - HTML5: version 2603.10 or later
    - Chrome OS: version 2603 or later
    - Android: version 2511 or later
    - iOS: version 2607 or later

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Web browsers with native launch:
  - Microsoft Edge with Citrix Web Extension
  - Google Chrome with Citrix Web Extension
- Web browsers with browser launch: Any supported web browser.
- Session host OS:
  - Windows 11, version 24H2 with 2025-09 Cumulative Updates for Windows 11 (KB5065789) or later installed (build 26100.6725)
  - Windows Server 2025 with 2026-01 Cumulative Updates for Windows Server 2025 (KB5073379) or later installed (build 26100.32230)

> **Note:**
>
> The Citrix Web Extension is only needed if your users will be leveraging hybrid access in **Windows** or **Mac** devices. If your users leverage native or browser access, the Citrix Web Extension is not needed.

Considerations

- If your users will be leveraging hybrid access, they must use either Microsoft Edge or Google Chrome, and install the Citrix Web Extension. Microsoft Entra single sign-on with hybrid access is not supported with other browsers.
- Auto Client Reconnect is not supported when Microsoft Entra single sign-on is used to log into the session. This feature is automatically disabled when this logon method is used. Session Reliability is still available for automatic reconnection in case of network disruptions.
- When a virtual desktop is locked, the default behavior is to display the Windows lock screen. Depending on your authentication requirements, you might need to change the session lock behavior. See Session lock behavior for more details.
- With Microsoft Entra hybrid joined session hosts, single sign-on does not work by default for members of privileged groups like Domain Admins. To enable it, add the group or user to the Read-Only Domain Controller (RODC) allowlist for Microsoft Entra Kerberos access. See Microsoft Entra Kerberos TGT and Active Directory access control for details.
- Microsoft Entra single sign-on requires the Windows setting **Allow Custom SSPs and APs to be loaded into LSASS** to be enabled (default). Note that if you deploy the **Security Baseline for Windows 10 and later** template via Microsoft Intune, this setting is automatically disabled and will block SSO, so you must update your Intune device configuration policy to keep it enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How to configure Microsoft Entra single sign-on

Overview

The configuration of Microsoft Entra single sign-on consists of the following steps:

1. Azure and Microsoft Entra ID configuration.
    a) Register the Citrix resource and client applications.
    b) Enable the Microsoft Entra ID Remote Desktop Services authentication protocol for the Citrix resource application.
    c) Hide the user consent prompt.
    d) Approve the client application.
    e) Create a Kerberos server object (Microsoft Entra hybrid joined environments only).
    f) Review Microsoft Entra Conditional Access policies.
2. Citrix configuration.
    a) Provision session hosts with the required OS version, identity type, and VDA version.
    b) Configure StoreFront.
    c) Enable Microsoft Entra single sign-on in your site.
    d) Enable Microsoft Entra single sign-on in your delivery groups.

Azure and Microsoft Entra ID configuration

In order to leverage Microsoft Entra single sign-on, you must first allow Microsoft Entra authentication for Windows in your Microsoft Entra ID tenant, which enables issuing the required authentication tokens that allow users to sign in to the Microsoft Entra joined and Microsoft Entra hybrid joined session hosts.

The person making the Azure configuration must be assigned one of the following Microsoft Entra built-in roles or equivalent at a minimum:

- Application Administrator
- Cloud Application Administrator

The configuration can be completed through Azure Portal, using Microsoft Graph PowerShell SDK, or Microsoft Graph API. The following sections provide details for completing the configuration through Azure Portal. If you prefer to use Microsoft Graph PowerShell SDK or Microsoft Graph API, refer to Microsoft Entra single sign-on Azure configuration.

Register Citrix applications You must register the multi-tenant Citrix Resource application in your Azure tenant and create a single-tenant Client application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

First, you must register the Citrix Resource application. To do so, use one of the following consent URLs:

- US, EU, APS: `https://login.microsoftonline.com/common/adminconsent?client_id=3a510bb1-e334-4298-831e-3eac97f8b26c`
- Japan: `https://login.microsoftonline.com/common/adminconsent?client_id=0027603f-364b-40f2-98be-8ca4bb79bf8b`

Once the Resource application is registered, you need to create your single-tenant Client application.

Create a single-tenant Client application

1. Go to the Azure Portal.
2. Navigate to **Microsoft Entra ID > Enterprise Applications**.
3. Select **New application**.
4. Select **Create your own application**.
5. Enter a name for the application, select **Register an application to integrate with Microsoft Entra ID**, and click **Create**.
6. Under **Supported account types**, select **Single tenant only**, and click **Register**.
7. Navigate to **Microsoft Entra ID > App registrations**, and select **All applications**.
8. Search for and click on the application you just created.
9. Click on **Add a Redirect URI**.
10. You will need to add three redirect URIs: **Web**, **Single-page application**, and **Mobile and desktop applications**.
    a) For each URI, select **Add Redirect URI**.
    b) Enter the Redirect URI. Refer to the table below for details on what to add.

Platform type	Redirect URI	Notes
Web	Customer-specific NetScaler login URI	The URI string is calculated based on your specific NetScaler URL.
Mobile and Desktop Applications	`ctxaadsso://citrix.aad.redirect`	Enter this URI exactly as is.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Platform type	Redirect URI	Notes
SPA App (Single Page Application)	StoreFront Store Web URL	Enter your StoreFront Store's Web URL. For example, if the URL used to access your Store via a browser is `https://finance.acme.com/Citrix/MyStoreWeb`, the SPA Redirect URI must be `https://finance.acme.com/Citrix/MyStoreWeb`. If you have multiple Stores in your environment, you must enter all the Stores' Web URLs as SPA Redirect URIs.

c) Select **Configure**.

11. After all Redirect URIs have been added, you will need to add an API permission to the Client application.
    a) Select **API permissions** on the left pane under Manage.
    b) Select **Add permission**.
    c) Select **APIs my organization uses**.
    d) Select the Citrix Resource application (**Citrix-Workspace-Resource**).
    e) In the list of permissions, check **user_impersonation**.
    f) Select **Add permissions**.
12. Select **Overview** on the left pane and take note of the assigned Application ID.

Register the Client application Once the application has been created and configured, you must consent to the application permissions.

You can consent to the application's permission within Azure portal:

1. Navigate to **Microsoft Entra ID > Enterprise Applications**.
2. Search for and select the Client application.
3. Select **Permissions** on the left pane under Security.
4. Click on **Grant admin consent for <tenantName>**
5. Consent to the permissions.

Alternatively, you can use an admin consent URL: `https://login.microsoftonline.com/<EntraTenantID>/adminconsent?client_id=<clientAppID>`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

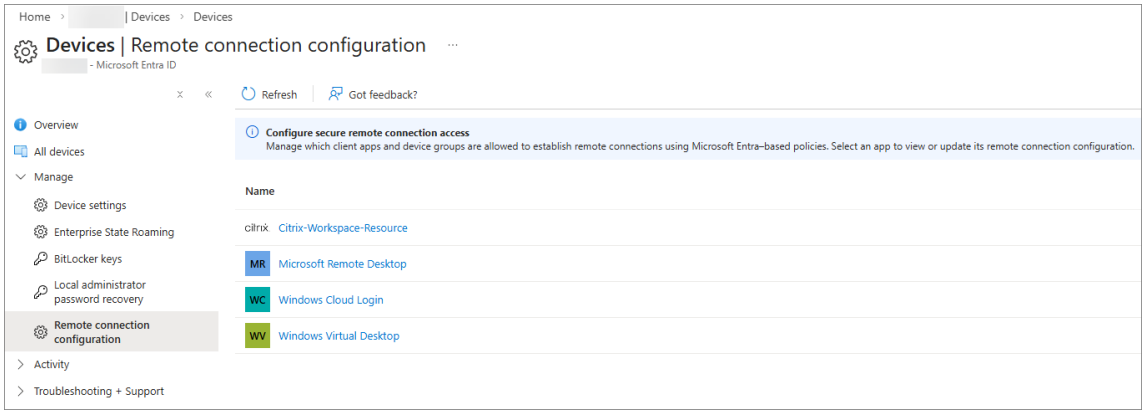
> **NOTE:**
>
> You must replace <EntraTenantID> with your Entra tenant's ID, and <clientAppID> with the Client application's Application ID.

Citrix Resource application permissions The following are the application's permissions:

API name	Claim value	Permission	Type
Microsoft Graph	User.Read	Sign in and read user profile	Delegated

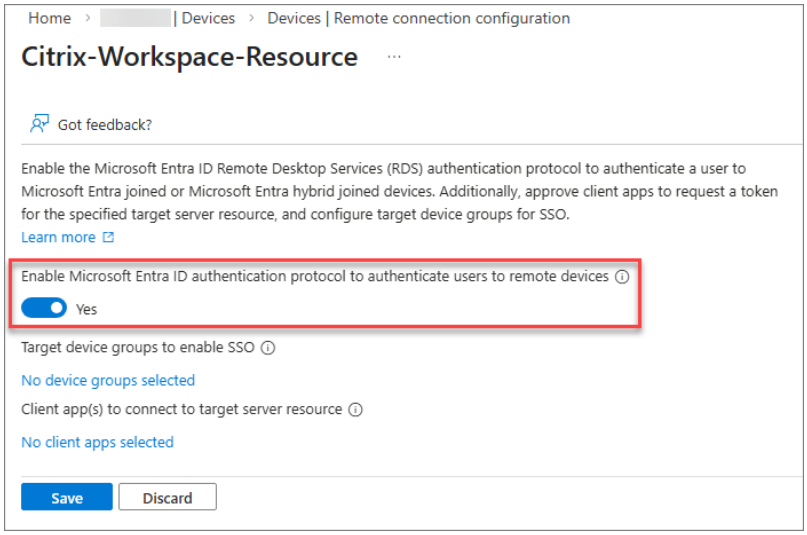
For US, EU, and APS, the application is called **Citrix-Workspace-Resource** (application ID 3a510bb1-e334-4298-831e-3eac97f8b26c).

For Japan, the application is called **Citrix-Workspace-Resource-JP** (application ID 0027603f-364b-40f2-98be-8ca4bb79bf8b).



Citrix Client application permissions The following are the application's permissions:

API name	Claim value	Permission	Type
Citrix-Workspace-Resource	user_impersonation	Citrix Entra ID SSO	Delegated
Citrix-Workspace-Resource-JP	User.Read Microsoft Graph	Sign in and read user profile	Delegated



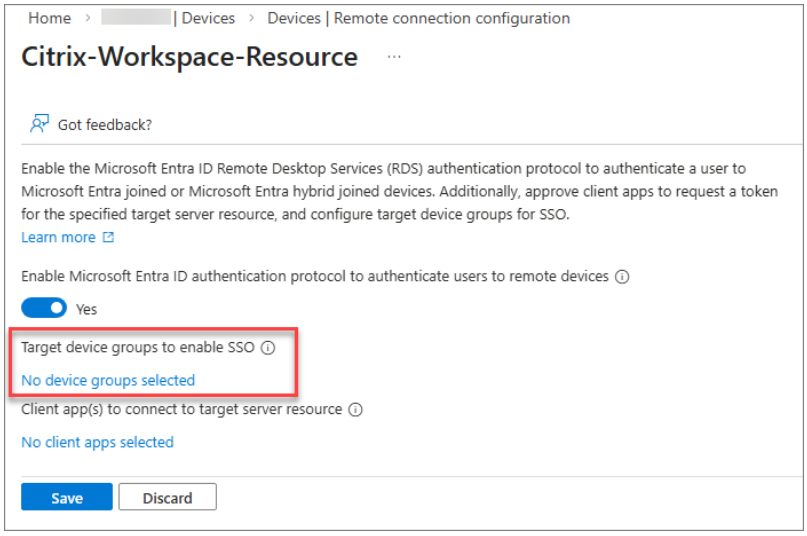
Enable Microsoft Entra ID Remote Desktop Services authentication protocol You must enable the Microsoft Entra ID Remote Desktop Services authentication protocol in the Citrix Resource application. To do so:

1. In Azure Portal, navigate to Microsoft Entra ID > Devices > Manage > Remote connection configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select **Citrix-Workspace-Resource**.
3. Enable **Microsoft Entra ID Remote Desktop Services authentication protocol**.

4. Proceed to hide the user consent prompt.



Hide the user consent prompt dialog By default, users are prompted to allow the Remote Desktop connection when connecting to a Microsoft Entra joined or Microsoft Entra hybrid joined session host with Microsoft Entra single sign-on enabled, in which they must select **Yes** to allow single sign-on. Microsoft Entra will remember up to 15 unique session hosts for 30 days before prompting again.

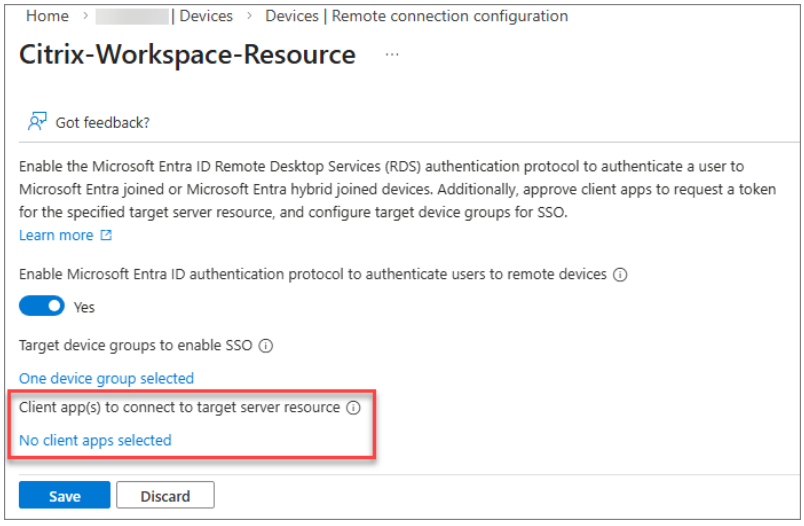
You can hide this dialog by configuring a list of target devices. To configure the list of devices, you must create one or more groups in Microsoft Entra ID that contain the Microsoft Entra joined and/or Microsoft Entra hybrid joined session hosts and then authorize the groups in the resource application, up to a maximum of 10 groups.

Once you have enabled the Microsoft Entra ID Remote Desktop Services authentication protocol and the groups have been created:

1. Click on the link to add the target device groups and select the appropriate groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

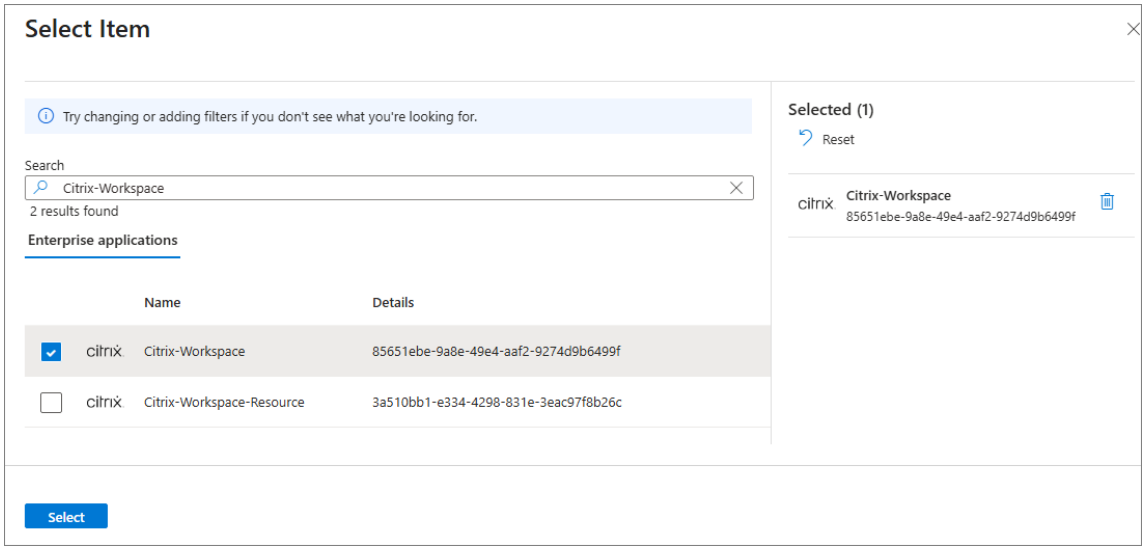
NOTE



It is highly recommended to create a dynamic group to simplify the membership management for the group. While dynamic groups normally update within 5-10 minutes, large tenants can take up to 24 hours.

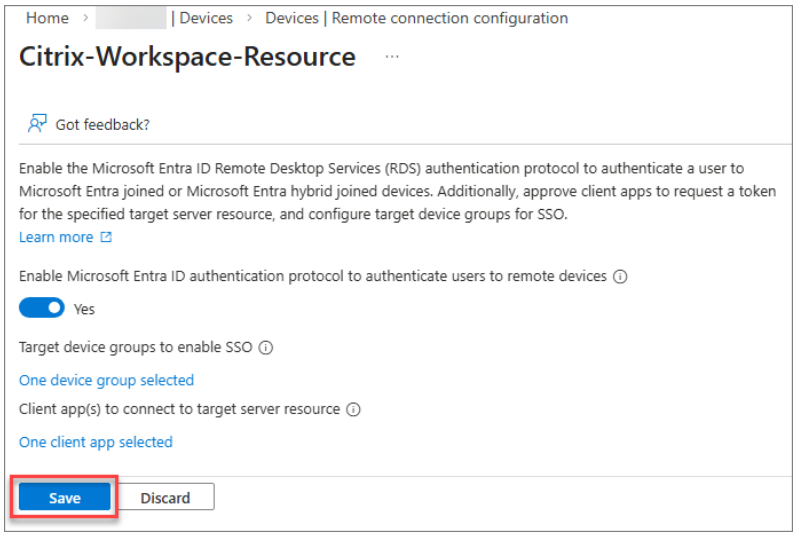
Dynamic groups requires the Microsoft Entra ID P1 license or Intune for Education license. For more information, see Dynamic membership rules for groups.

1. Proceed to approve the client application.



Approve the client application You must explicitly add the Citrix Client application as an approved client in the Citrix Resource application:

1. Click on the link to add your trusted client applications.



2. Select the Citrix Client application.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select **Save** to apply the configuration changes to the Citrix Resource application.

4. Proceed to create a Kerberos server object.

Create a Kerberos server object If your session hosts are Microsoft Entra hybrid joined, you must configure a Kerberos server object in the Active Directory domain where the user and computer accounts reside. See Create a Kerberos Server object for details.

Review Microsoft Entra Conditional Access policies If you use or plan to use Microsoft Entra Conditional Access policies, review the configuration applied to the Citrix Resource application to ensure users have the intended sign-in experience.

For detailed guidance on configuring Conditional Access when using Microsoft Entra single sign-on, refer to the Microsoft documentation. Remember that the required Conditional Access settings must

© 1997–2026 Citrix Systems, Inc. All rights reserved.

be applied to the **Citrix Resource application**, not the Citrix Client application or Microsoft applications.

Citrix Session Hosts

Ensure the system requirements for the session hosts are met:

1. Ensure the session hosts are Microsoft Entra hybrid joined.
2. Install the required operating system version and build as specified in the system requirements.
3. Install the required VDA version as specified in the system requirements.

Microsoft Entra hybrid joined session hosts When deploying Microsoft Entra hybrid joined session hosts with Citrix Machines Creation Services, Citrix Provisioning, or Windows 365, proceed to the next section. If you are provisioning Microsoft Entra hybrid joined hosts using any other tool or method, you must add the following registry value to your session hosts:

- Key: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix`
- Value type: **DWORD**
- Value name: `AzureADJoinType`
- Data: 1

Session lock behavior When a virtual desktop is locked, the default behavior is to display the Windows lock screen. At this point, the supported authentication methods for unlocking the desktop are **username and password** or **smart card**.

> **NOTE**
>
> Citrix web sign-in (preview) allows you to unlock your desktop using web-based Entra authentication. See Web sign-in for details.

If you have a passwordless deployment where users don't know their passwords, it's recommended to configure the session lock behavior to disconnect the session instead of showing the lock screen.

You can configure this behavior by enabling the **Disconnect remote session on lock for Microsoft identity platform authentication** setting through Intune or Group Policy. For detailed steps, see Configure the session lock behavior for Azure Virtual Desktop.

Citrix Access and Control Plane

StoreFront configuration To enable Microsoft Entra single sign-on with StoreFront, please refer to Entra ID single-on in the StoreFront documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable Microsoft Entra single sign-on in Web Studio To enable Microsoft Entra single sign-on on your site, you must add your Client and Resource application details and Redirect URI. Refer to the Settings documentation for details.

Enabling Microsoft Entra single sign-on for delivery group

Using Web Studio

1. Go to delivery groups on Web Studio and click **Create Delivery Group**.
2. On the **Users** page, select **Microsoft Entra hybrid joined** as the identity type.
3. Complete the configuration on the following pages. For reference, see Create delivery groups.

Using PowerShell

1. Create a new delivery group and add the VDA to the delivery group. Assign the user (AD account) to the VDA.
2. Set the delivery group `MachineLogonType` to `HybridAzureAd`. For example:

```
Get-BrokerDesktopGroup -Name <dgName> | Set-BrokerDesktopGroup -
    MachineLogOnType "HybridAzureAd"
```

3. Trust the Xml Service.

```
Add-PSSnapin Citrix.Broker.Admin.V2
Set-BrokerSite -TrustRequestsSentToTheXmlServicePort $true
```

4. Set the SSO parameters (see table below for guidance).

```
Set-BrokerSite -AzureGlobalCloudId "B16898C6-A148-4967-9171-64
    D755DA8520" -AzureSSOnAuthorizeUrl "<URL>" -AzureSSOnClientId "
    <clientAppID>" -AzureSSOnRedirectUrl "<URL>" -
    AzureSSOnResourceAppId "<resourceAppID>"
```

The following table provides details of the parameters and their default values:

Parameter	Default value	Description
AzureGlobalCloudId	B16898C6-A148-4967-9171-64D755DA8520	Identifies the Entra CloudAP in Windows.
AzureSSOnAuthorizeUrl	`https://login.microsoftonline.com/common/`	Initial login URL. This is determined by which Azure cloud the Entra tenant is in (e.g. Azure Commercial vs. Azure Gov)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter	Default value	Description
AzureSSOnClientId	No default	Application ID of the Client application.
AzureSSOnRedirectUrl	No default	Post-authentication redirect URI. It must be a URL that is configured as a redirect URI in the client application.
AzureSSOnResourceAppId	3a510bb1-e334-4298-831e-3eac97f8b26c	Application ID of the Citrix Resource application.

Configuring Microsoft Entra single sign-on on the VDA By default, Microsoft Entra single sign-on is enabled on the VDA. To enable or disable this capability for a subset of session hosts, use the Microsoft Entra single sign-on policy setting.

Client Device

Ensure the system requirements for the client devices are met:

1. Install the required Citrix Workspace app version as specified in the system requirements.
2. If your users will be leveraging hybrid access, make sure the Citrix Web Extension is installed. If your users will be using native or browser access, the Citrix Web Extension is not needed.

Troubleshooting

> **NOTE**
>
> For troubleshooting StoreFront issues, see Diagnostics logs.

Known issues

- If Storefront shows the error `There was a failure with the mapped account`, it's likely due to the user being an Entra ID user without a matching user in Active Directory.
- If the session launch fails before an ICA file is issued, ensure that XML trust is enabled.
- If the VDA status is stuck at Initializing, ensure the computer object in Active Directory is in an OU that has is being synchronized with Entra ID.
- If **Keep me signed in (KMSI)** is disabled in Entra ID, single sign-on fails on Linux and macOS client devices.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When single sign-on fails If single sign-on fails when accessing virtual desktops or applications, proceed as follows:

1. Confirm that Microsoft Entra single sign-on is enabled in StoreFront.
2. Confirm that Microsoft Entra single sign-on is enabled in your site.
3. Confirm that Microsoft Entra single sign-on is enabled in the delivery groups.
4. Confirm that the access method leveraged by the user is supported.
5. If the user is leveraging hybrid access, confirm that the Citrix Web Extension is installed.
6. Confirm that the client device is running the required Citrix Workspace app version.
7. Confirm that your session hosts are running the required Windows build.
8. Confirm that your session hosts are running the required VDA version.
9. Ensure that the Windows setting `Always prompt for password upon connection` is not enabled on the session hosts. This setting is disabled by default, and can be configured through Group Policy or Intune under `Computer Configuration\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Security`. You can check in the registry if the setting is enabled by looking for the value `fPromptForPassword` under `HKLM\SOFTWARE\Policies\Microsoft\Windows NT\Terminal Services`. If the value is set to `1`, the setting is enabled and single sign-on will not be available. If the value is missing or set to `0`, the setting is disabled.
10. Confirm that the `AzureADJoinType` setting is configured correctly in the session hosts:
    - Key: `HKLM\SYSTEM\CurrentControlSet\Control\Citrix`
    - Value type: **DWORD**
    - Value name: `AzureADJoinType`
    - Value data: `1` (Microsoft Entra hybrid joined)
11. Ensure that the virtual desktops or applications are assigned to Active Directory identities and not Entra ID identities in Citrix Studio.
12. Confirm that the Delivery Groups' logon type is configured correctly by running the following PowerShell command:

    ```
    1 Get-BrokerDesktopGroup -Name <deliveryGroupName>
    ```

    For Microsoft Entra hybrid joined session hosts, `MachineLogOnType` must be set to `HybridAzureAd`.
13. Confirm that the Citrix Resource application and the single tenant Client application are registered in the Microsoft Entra tenant.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

14. Confirm that the Microsoft Entra ID RDS authentication protocol is enabled on the Citrix Resource application.
15. Confirm that the Client application was added as an approved client application in the Citrix Resource application.
16. If your session hosts are Microsoft Entra hybrid joined, confirm that a Kerberos server object was created in the Active Directory domain where the user and computer accounts reside.
17. Review your Microsoft Entra Conditional Access policies. Ensure no policies are being applied to the Citrix Client application and that any policies applied to the Citrix Resource application or the session hosts are configured properly so they don't affect the single sign-on experience.

Federated Authentication Service

May 13, 2026

Citrix Federated Authentication Service (FAS) enables single sign-on (SSO) to Citrix virtual desktops and applications in environments where users authenticate through modern identity providers such as SAML or OpenID Connect (OIDC) that don't supply a Windows password, ensuring seamless access to session hosts joined to an Active Directory domain.

See the Federated Authentication Service documentation for more details.

Smart cards

May 13, 2026

Citrix Virtual Apps and Desktops and Citrix DaaS support smart cards both for logging into virtual desktops and applications and for use within active sessions. Smart cards provide certificate-based, two-factor authentication that strengthens security by requiring both the physical card and a PIN. This allows organizations to meet compliance requirements, protect sensitive data, and streamline access for users who already rely on smart cards for Windows logon or secure applications. Once authenticated, users can also use their smart cards inside the session to digitally sign documents, encrypt email, or access other smart card–enabled applications, ensuring a consistent and secure experience across both local and virtual environments.

See the smart cards documentation for more details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Web sign-in (Preview)

August 18, 2026

You can use the Citrix web sign-in credential provider to enable the use of Entra ID based Windows authentication. This allows users to log into or unlock their virtual desktops using any authentication method that is enabled in Entra ID.

> **IMPORTANT**
>
> Web sign-in is currently in preview. This feature is provided without support and is not yet recommended for use in production environments.

System requirements

The following are the system requirements for using web sign-in:

- Virtual Delivery Agent
  - Windows: **single session** version 2607 or later
- Citrix Workspace app
  - Windows: version 2607 or later
- Session host identity: Entra hybrid joined
- Session host OS:
  - Windows 11, version 24H2 with 2025-09 Cumulative Updates for Windows 11 (KB5065789) or later installed (build 26100.6725)

How to configure web sign-in

Citrix web sign-in is disabled by default. To enable it, follow these steps:

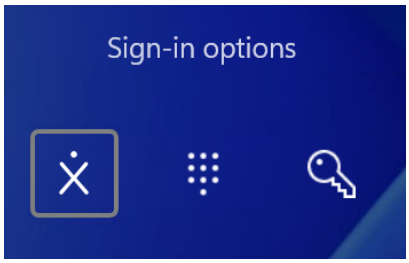
1. Complete the **Azure and Microsoft Entra ID configuration** described in the Microsoft Entra single sign-on documentation. If you have Microsoft Entra single sign-on enabled in your environment, you can continue to the next step.

   The relevant steps are:

   a) Register the Citrix resource and client applications.
   b) Enable the Microsoft Entra ID Remote Desktop Services authentication protocol for the Citrix resource application.
   c) Hide the user consent prompt.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

d) Approve the client application.
e) Create a Kerberos server object (Microsoft Entra hybrid joined environments only).
f) Review Microsoft Entra Conditional Access policies.



2. Enable the **Web sign-in** setting in a Citrix policy and apply the policy to the appropriate delivery groups.

> **NOTE**
>
> - It is not necessary to use Microsoft Entra single sign-on to use web sign-in.
> - If the policy setting is not available in your environment, you can enable web sign-in via the registry:
>   - Key: HKLM\SOFTWARE\Policies\Citrix\ICAPolicies
>   - Value type: DWORD
>   - Value name: AllowWebSignIn
>   - Value data: 1

How to use web sign-in

To use Citrix web sign-in to log in or unlock your virtual desktop:

1. Select the Citrix tile from the logon methods available.

2. Click on **Citrix Web Sign-in**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Once the authentication prompt pops up, authenticate with the required authentication method.

> **NOTE**
>
> The authentication methods available to the user are determined by what is enabled in Microsoft Entra ID.

Prepare to install

September 10, 2026

Deploying Citrix Virtual Apps and Desktops™ begins with installing the following components. This process prepares for the delivery of applications and desktops to users inside your firewall.

- One or more Delivery Controllers
- Citrix Director
- Citrix StoreFront™
- Citrix License Server
- One or more Citrix Virtual Delivery Agents (VDAs)
- Optional components and technologies such as the Universal Print Server, the Federated Authentication Service, and Self-Service Password Reset

For users outside your firewall, install and configure an extra component, such as Citrix Gateway. For an introduction, see Integrate Citrix Virtual Apps and Desktops with Citrix Gateway.

> **Note:**
>
> Make sure that the following Microsoft prerequisites are met on the server OS and the workstation OS:
>
> - Microsoft **Volume Shadow Copy** and **Microsoft Software Shadow Copy Provider** services are running. For more information, see Volume Shadow Copy Service.
> - The **MS-Defender** version must be higher than 4.18.2105.5. For more information, see Microsoft Defender Antivirus security intelligence and product updates.

If your deployment includes Windows Server workloads, configure a Microsoft RDS License Server.

You can use the full-product installer on the product ISO to deploy many components and technologies. You can use a standalone VDA installer to install VDAs. The standalone VDA installers are available on the Citrix download site. All installers offer graphical and command line interfaces. See Installers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The product ISO contains sample scripts that install, upgrade, or remove VDAs for machines in an Active Directory. You can also use the scripts to manage images used by Machine Creation Services (MCS) and Citrix Provisioning (formerly Provisioning Services). For details, see Install VDAs using scripts.

Information to review before installation

- Technical overview: To familiarize yourself with the product and its components.
- Security: When planning your deployment environment.
- Known issues: Issues you might come across in this version.
- Databases: Learn about the system databases and how to configure them. During Controller installation, you can install SQL Server Express for use as the site database. You configure most database information when you create a site, after you install the core components.
- Remote PC Access: If you're deploying an environment that enables your users to access their physical machines in the office remotely.
- Connections and resources: If you're using a hypervisor or other service to host or provision VMs for applications and desktops. You can configure the first connection when you create a site (after you install the core components). Set up your virtualization environment before then.
- Microsoft System Center Configuration Manager: If you're using ConfigMgr to manage access to applications and desktops, or if you're using the Wake on LAN feature with Remote PC Access.
- **Public Cloud host connections:** If you have a Hybrid Rights License, you can create host connections to the public cloud. For information related to the Hybrid Rights License, see Hybrid Rights Renewals. For information related to public cloud entitlement and the reasons for this change, see CTX270373.

Where to install components

Review the System requirements for supported platforms, operating systems, and versions. Component prerequisites are installed automatically, except as noted. See the Citrix StoreFront and the Citrix License Server documentation for their supported platforms and prerequisites.

You can install the core components on the same server or on different servers.

- Installing all the core components on one server can work for evaluation, test, or small production deployments.
- To accommodate future expansion, consider installing components on different servers. For example, installing Studio on a different machine than the server where you installed the Controller allows you to manage the site remotely.
- For most production deployments, installing core components on separate servers is recommended.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Install the Citrix License Server and licenses before installing other components on other servers.

- To install a supported component on a Server CoreOS (such as a Delivery Controller), you must use the command line. That OS type does not offer a graphical interface, so install Studio and other tools elsewhere, and then point them to the Controller server.

You can install both a Delivery Controller™ and a VDA for multi-session OS on the same server. Launch the installer and select the Delivery Controller (plus any other core components you want on that machine). Then launch the installer again and select the **Virtual Delivery Agent** for multi-session OS.

Make sure that each operating system has the latest updates.

Make sure that all machines have synchronized system clocks. The Kerberos infrastructure that secures communication between the machines requires synchronization.

With XenServers, the virtual machine's power state might appear as unknown even if it appears registered. To resolve this issue, edit the registry key `HostTime` value to disable time synchronization with the host:

```
HKEY_LOCAL_MACHINE\Software\Citrix\XenTools\HostTime="Local"
```

```
HKEY_LOCAL_MACHINE\Software\Wow6432Node\Citrix\XenTools\HostTime="
Local"
```

> **Tip:**
>
> The default value is `HostTime="UTC"`. Change this value to something other than UTC, for example, `Local`. This change effectively disables time synchronization with the host.

Optimization guidance for Windows 10 single-session machines is available in CTX216252.

Where NOT to install components:

- Do not install any components on an Active Directory domain controller.
- Installing a Controller on a node in a SQL Server clustering installation, SQL Server mirroring installation, or on a server running Hyper-V is not supported.

If you try to install or upgrade a VDA on a Windows OS that this product version doesn't support, a message guides you to an article describing options.

Permission and Active Directory requirements

You must be a domain user and a local administrator on the machines where you are installing components.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To use a standalone VDA installer, you must have elevated administrative privileges or use **Run as administrator**.

Configure your Active Directory domain before starting an installation.

- System requirements lists the supported Active Directory functional levels. Active Directory joined contains more information.
- You must have at least one domain controller running Active Directory Domain Services.
- Do not install any Citrix Virtual Apps and Desktops™ components on a domain controller.
- Do not use a forward slash (/) when specifying Organizational Unit names in Studio.

The Windows user account used to install the Citrix License Server is automatically configured as a delegated administration full administrator.

For more information:

- Security best practices
- Delegated administration
- Microsoft documentation for Active Directory configuration

Installation guidance, considerations, and best practice

During installation of any component

- When installing or upgrading a Delivery Controller, Studio, License Server, or Director from the full-product media, if the Citrix installer detects that a restart is pending from a previous Windows installation on the machine, the installer stops with exit/return code 9. You are prompted to restart the machine.

  This is not a Citrix forced restart. It is due to other components installed earlier on the machine. If this occurs, restart the machine and then launch the Citrix installer again.

  When using the command-line interface, you can prevent the check for the pending restart by including the `/no_pending_reboot_check` option in the command.

- Usually, if a component has prerequisites, the installer deploys them if they are not present. Some prerequisites might require a machine restart.

- When you create objects before, during, and after installation, specify unique names for each object. For example, provide unique names for networks, groups, catalogs, and resources.

- If a component does not install successfully, the installation stops with an error message. Components that installed successfully are retained. You do not need to reinstall them.

- Citrix Analytics are collected automatically when you install (or upgrade) components. By default, that data is uploaded to Citrix automatically when the installation completes. Also, when

© 1997–2026 Citrix Systems, Inc. All rights reserved.

you install components, you are automatically enrolled in the Citrix Customer Experience Improvement Program (CEIP), which uploads anonymous data.

During installation, you can also choose to participate in other Citrix technologies that collect diagnostics for maintenance and troubleshooting. For information about these programs, see Citrix Insight Services.

- If a VDA installation fails, an MSI analyzer parses the failing MSI log, displaying the exact error code. The analyzer suggests a CTX article, if it's a known issue. The analyzer also collects anonymized data about the failure error code. This data is included with other data collected by CEIP. If you end enrollment in CEIP, the collected MSI analyzer data is no longer sent to Citrix.

During VDA installation

- The Citrix Workspace™ app for Windows is available, but not installed by default when you install a VDA. You or your users can download and install (and upgrade) Citrix Workspace app for Windows and other Citrix Workspace apps from the Citrix website. Alternatively, you can make those Citrix Workspace apps available from your StoreFront server. See the StoreFront documentation.
- The Microsoft Print Spooler Service must be enabled. You cannot successfully install a VDA if that service is disabled.
- Windows Protected Print (WPP) mode must be disabled. You cannot successfully install a VDA if WPP mode is enabled.
- Most supported Windows editions come with Microsoft Media Foundation already installed. If the machine does not have Media Foundation (such as N editions), several multimedia features are not installed and will not work.

  - Windows Media Redirection
  - HTML5 Video Redirection
  - HDX™ RealTime Webcam Redirection

  You can acknowledge the limitation, or end the VDA installation and restart it later, after installing Media Foundation. In the graphical interface, this choice is presented in a message. In the command line, you can use the `/no_mediafoundation_ack` option to acknowledge the limitation.
- When you install the VDA, a new local user group called **Direct Access Users** is created automatically. On a VDA for single-session OS, this group applies only to RDP connections. On a VDA for multi-session OS, this group applies to ICA® and RDP connections.
- The VDA must have valid Controller addresses with which to communicate. Otherwise, sessions cannot be established. You can specify Controller addresses when you install the VDA or later.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remember that it must be done. For more information, see VDA registration.

Restarts after and during VDA installation

A restart is required at the end of the VDA installation. That restart occurs automatically by default.

When you're upgrading a VDA to version 7.17 (or a later supported version), a restart occurs during the upgrade. This cannot be avoided.

To minimize the number of restarts needed during VDA installation:

- Ensure that a supported .NET Framework version is installed before beginning the VDA installation.
- For Windows multi-session OS machines, install and enable the RDS role services before installing the VDA.

If you do not install those prerequisites before installing the VDA:

- If you are using the graphical interface or the command line interface without the `/noreboot` option, the machine restarts automatically after installing the prerequisite.
- If you are using the command line interface with the `/noreboot` option, you must initiate the restart.

When you're upgrading a VDA version, a restart occurs during the upgrade. This cannot be avoided.

Restore on install or upgrade failure

> **Note:**
>
> This feature is available for workstation VDAs only. To ensure a more reliable and streamlined installation experience, the "restore on failure"feature is no longer supported for server VDAs. Citrix recommends creating a backup manually before installing or upgrading a server VDA.

If a workstation VDA installation or upgrade fails, and the "restore on failure"feature is enabled, the machine is returned to a restore point that was set before the installation or upgrade began.

When a workstation VDA installation or upgrade starts with this feature enabled, the installer creates a system restore point before beginning the actual install or upgrade. If the VDA installation or upgrade fails, the machine is returned to the restore point state. The `%temp%/Citrix` folder contains deployment logs and other information about the restore.

By default, this feature is disabled.

If you plan to enable this feature, make sure that system restore is not disabled through a GPO setting (`Computer Configuration` > `Administrative Templates` > `System` > `System Restore`).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To enable this feature when installing or upgrading a workstation VDA:

- When using a VDA installer's graphical interface (such as using **Autostart** or the `XenDesktopVDASetup.exe` command without any restore or quiet options), select the **Citrix Backup and Restore Service** check box on the **Additional Components** page.

  If the install/upgrade completes successfully, the restore point is not used, but is retained.

- Run a VDA installer using the commandline and add one of the following options: `/enablerestorecleanup`, `/enablerestore` or `/includeadditional` "Citrix Backup and Restore".

  - If you use the `/enablerestorecleanup` option, and the install/upgrade completes successfully, the restore point is removed automatically.
  - If you use the /enablerestore or /includeadditional "Citrix Backup and Restore"option, and the install/upgrade completes successfully, the restore point is not used, but is retained.

> **Note:**
>
> If you attempt to use `/enablerestorecleanup`, `/enablerestore` or `/includeadditional` "Citrix Backup and Restore"options on a server VDA, the installer will ignore these options and proceed without creating a backup.

Installers

Full-product installer

Using the full-product installer provided in the ISO, you can:

- Install, upgrade, or remove core components: Delivery Controller, Studio, Director, and License Server.
- Install or upgrade StoreFront.
- Install or upgrade Windows VDAs for single-session or multi-session operating systems.
- Install the Universal Print Server `UpsServer` component on your print servers.
- Install the Federated Authentication Service.
- Install Session Recording.
- Install Workspace Environment Management.

  > **Note:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> The Workspace Environment Management™ Agent installer is not localized. It is available only in English.

To deliver a desktop from a multi-session OS for one user (for example, for web development), use the full-product installer's command-line interface. For details, see Server VDI.

Standalone VDA installers

Standalone VDA installers are available on the Citrix download pages. (They are not available from the product installation media.) The standalone VDA installers are much smaller than the full-product ISO. They more easily accommodate deployments that:

- Use Electronic Software Distribution (ESD) packages that are staged or copied locally
- Have physical machines
- Have remote offices

By default, files in the self-extracting standalone VDAs are extracted to the **Temp** folder. More disk space is required on the machine when extracting to the **Temp** folder than when using the full-product installer. However, files extracted to the **Temp** folder are automatically deleted after the installation completes. Alternatively, you can use the `/extract` command with an absolute path.

Four standalone VDA installers are available for download.

Multi-session OS Virtual Delivery Agent (VDAServerSetup.exe):

Installs a VDA for multi-session OS. It supports all the VDA for multi-session OS options that are available with the full-product installer.

Single-session OS Virtual Delivery Agent (VDAWorkstationSetup.exe):

Installs a VDA for single-session OS. It supports all the VDA for single-session OS options that are available with the full-product installer.

Single-session OS Core Services Virtual Delivery Agent (VDAWorkstationCoreSetup.exe):

Installs a VDA for single-session OS that is optimized for Remote PC Access deployments or core VDI installations. Remote PC Access uses physical machines. Core VDI installations are VMs that are not being used as an image. It installs only the core services necessary for VDA connections such deployments. Therefore, it supports only a subset of the options that are valid with the full-product or `VDAWorkstationSetup.exe` installers.

This installer does not install or contain the components used for:

- App-V.
- Profile Management. Excluding Citrix Profile Management from the installation affects Citrix Director displays. For details, see Install VDAs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Machine Identity Service.
- Citrix MCS IODriver
- Citrix Backup and Restore
- deviceTRUST
- uberAgent
- WEM

The `VDAWorkstationCoreSetup.exe` installer does not install or contain the following components: Citrix Workspace app for Windows (CWA), Citrix Secure Access Client (CSA), Citrix User Personalization Layer (UPL), Session Recording Agent (SRAGENT), and Citrix Assistant App (ASSISTANTAPP).

Using `VDAWorkstationCoreSetup.exe` is equivalent to using the full-product or `VDAWorkstationSetup` installer to install a single-session OS VDA and either:

- In the graphical interface: Selecting the Remote PC Access option on the **Environment** page.
- In the command line interface: Specifying the `/remotepc` option.
- In the command line interface: Specifying `/components vda` plus the `/exclude` option that lists all of the valid additional component names.

You can install the omitted components/features later by running the full-product installer. That action enables you to install all missing components.

The `VDAWorkstationCoreSetup.exe` installer automatically installs the Browser Content Redirection MSI. This automatic installation applies to VDA release 2003 and later supported releases.

Single-session Core Services Virtual Delivery Agent (VDASingleSessionCoreSetup.exe):

A new lightweight Single-Session VDA Meta Installer available for Windows 365 Cloud PC and Remote PC deployments. This installer is built on the existing VDAWorkstationCoreSetup.exe installer, delivering essential VDA components along with Profile Management, deviceTRUST, uberAgent, WEM, Backup and Restore, and the VDA Upgrade Agent. Backup and Restore functionality can be enabled using the command line option /enablerestore or /enablerestorecleanup.

It significantly reduces package size and improves installation reliability for cloud-based workloads. Designed for modern Remote PC scenarios, this installer provides a simplified and high-performance option for deploying Citrix workloads on Windows 365 and Remote PC.

Best practices for using single-session VDA installers

For single-session operating systems, four different installers are available. The full-product VDA installer and VDAWorkstationSetup.exe installer provide installation of all components, while some default and additional components are not included in VDAWorkstationCoreSetup.exe and VDASingleSessionCoreSetup.exe installers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To maintain environment stability, consistent performance, and ongoing supportability, Citrix advises using a consistent installer type throughout the entire life cycle of a Citrix VDA—including installation, upgrade, and uninstallation. Mixing installer types can introduce certain risks.

Risks associated with mixing installer types:

Scenario 1: If a single-session VDA is initially installed using the VDAWorkstationCoreSetup.exe or VDASingleSessionCoreSetup.exe installer and subsequently upgraded with either the full-product VDA installer or the VDAWorkstationSetup.exe installer, components that were previously excluded might be installed during the upgrade unless they are specifically excluded.

Scenario 2: If a single-session VDA is initially installed using the full-product VDA installer or VDAWorkstationSetup.exe and is later upgraded using VDAWorkstationCoreSetup.exe or VDASingleSessionCoreSetup.exe, any components not installed by the core services VDA installer are excluded from the upgrade. These components are neither upgraded during the upgrade process nor removed during uninstallation.

Scenario 3: If a single-session VDA is initially installed using the VDAWorkstationCoreSetup.exe installer, and subsequently upgraded with VDASingleSessionCoreSetup.exe, you'll experience the new features. If you upgrade with VDAWorkstationCoreSetup.exe next time, the newly added components by VDASingleSessionCoreSetup.exe will neither be upgraded in the upgrade process nor removed during uninstallation.

Guidance for addressing mixed installer types:

If it becomes necessary to mix installer types, it is essential to ensure that the same components are included during the upgrade process.

In cases where installer types have inadvertently been mixed, resulting in additional components being installed or certain components falling out of management, and there is a need to restore the previous environment, please proceed as follows:

- **For scenario 1:** Uninstall the VDA from the Windows feature for uninstalling or changing programs, then reinstall the VDA using the installer you originally used (VDAWorkstationCoreSetup.exe or VDASingleSessionCoreSetup.exe).
- **For scenario 2:** Upgrade the missing components utilizing the full-product VDA installer or the VDAWorkstationSetup.exe installer.
- **For scenario 3:** If you intend to continue leveraging new features, upgrade the missing components using the VDASingleSessionCoreSetup.exe installer. Alternatively, if you prefer not to use the new features after upgrading with VDASingleSessionCoreSetup.exe, first uninstall the VDA from the Windows feature for uninstalling or changing programs, then reinstall the VDA using VDAWorkstationCoreSetup.exe.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix installation return codes

The installation log contains the result of component installations as a Citrix return code, not a Microsoft value.

- 0 = Success
- 1 = Failed
- 2 = PartialSuccess
- 3 = PartialSuccessAndRebootNeeded
- 4 = FailureAndRebootNeeded
- 5 = UserCanceled
- 6 = BadCommandLineArgument
- 7 = NewerVersionFound
- 8 = SuccessRebootNeeded
- 9 = FileLockReboot
- 10 = Aborted
- 11 = FailedMedia
- 12 = FailedLicense
- 13 = FailedPrecheck
- 14 = AbortedPendingRebootCheck
- 15 = PrecheckPass - This is returned when the pre-checks pass after using the new /precheckonly command line option.
- 16 = PrecheckFail - This is returned when the pre-checks fail after using the new /precheckonly command line option.
- 17 = OptionalSoftwareFailed - This is returned when one of the new Optional Software components fails to installed and the "Proceed with the VDA installation or upgrade if any other selected components fail."has been selected.

For example, when using tools such as Microsoft System Center Configuration Manager, a scripted VDA installation might appear to fail when the installation log contains the return code 3. This can occur when the VDA installer is waiting for a restart that you must initiate (for example, after an RDS role prerequisite installation on a server). A VDA installation is considered successful only after all prerequisites and selected components are installed, and the machine is restarted after the installation.

Alternatively, you can wrap your installation in CMD scripts (which return Microsoft exit codes) or change the success codes in your Configuration Manager package.

Configure a Microsoft RDS License Server for Windows Server workloads

This product accesses Windows Server remote session capabilities when delivering a Windows Server workload, such as Windows 2016. This typically requires a Remote Desktop Services client access li-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

cense (RDS CAL). The VDA must be able to contact an RDS license server to request RDS CALs. Install and activate the license server. For more information, see the Microsoft document Activate the Remote Desktop Services License Server. For proof of concept environments, you can use the grace period provided by Microsoft.

With this method, you can have this service apply the license server settings. You can configure the license server and per user mode in the RDS console on the image. You can also configure the license server using Microsoft Group Policy settings. For more information, see the Microsoft document License your RDS deployment with client access licenses (CALs).

To configure the RDS license server using Group Policy settings:

1. Install a Remote Desktop Services License Server on an available machine. The machine must always be available. The Citrix product workloads must be able to reach this license server.
2. Specify the license server address and per-user license mode using Microsoft Group Policy. For details, see the Microsoft document Specify the Remote Desktop Licensing Mode for an RD Session Host Server.

Windows 10 workloads require appropriate Windows 10 license activation. We recommend that you follow Microsoft documentation to activate Windows 10 workloads.

Amulet Hotkey CoreStation virtualization environments

September 3, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops™ manages your Amulet Hotkey CoreStation workloads through a Citrix-managed Amulet Hotkey CoreStation plug-in present. With this plug-in, you can create connections to your Amulet Hotkey CoreStation enclosure, create catalogs, and power manage machines in the catalog.

Key steps

1. Set up your Amulet Hotkey CoreStation environment.
2. Create a connection to the Amulet Hotkey CoreStation enclosure.
3. Create an Amulet Hotkey CoreStation machine catalog.

   > **Note:**
   >
   > Before creating a catalog, ensure to have one or more Amulet Hotkey CoreStation nodes and install VDAs on those nodes. You can consider the Amulet Hotkey CoreStation enclosure as the hypervisor and the nodes as VMs.

4. Create a delivery group.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection, see Connection to Amulet Hotkey CoreStation.

More information

- Create and manage connections and resources
- Create machine catalogs

AWS cloud environments

May 13, 2026

This article walks you through setting up your AWS account as a resource location you can use with Citrix Virtual Apps and Desktops. The resource location is used for provisioning workloads in AWS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

EC2 and Amazon WorkSpaces Core Managed Instances. For the list of OS types supported for Amazon WorkSpace Core Managed Instances, see VDAs in Amazon WorkSpaces Core Managed Instances.

Comparison of different configurable resource locations: MCS for AWS EC2, MCS for Amazon WorkSpaces Core Managed Instances, and Quick Deploy for Amazon WorkSpaces Core Bundles.

MCS for AWS EC2	MCS for Amazon WorkSpaces Core Managed Instances	Quick Deploy for Amazon WorkSpaces Core Bundles
Citrix® handles provisioning of VMs in your AWS account	Citrix handles provisioning of VMs in your AWS account	Amazon handles provisioning of VMs in AWS-managed WorkSpaces account
Advanced MCS workflow for VM lifecycle management	Advanced MCS workflow for VM lifecycle management	5-step quick and easy workflow
EC2 instances	WorkSpaces Core Managed Instances (utilize on-demand EC2 instances launched directly into your AWS account)	WorkSpaces Bundles, fully AWS-managed capacity (higher level abstraction)
No Microsoft 365 licensing support	BYOL Microsoft 365 support	BYOL Microsoft 365 support
Windows Server, Windows Desktop, and Linux	Windows Server, Windows Desktop, and Linux	Windows Server, Windows Desktop
Persistent and Non-persistent VMs	Persistent and Non-persistent VMs	Persistent VMs only
Pay-as-you-go only	Pay-as-you-go	Fixed price per month only
Citrix DaaS and Citrix Virtual Apps and Desktops™	Citrix DaaS and Citrix Virtual Apps and Desktops™	Citrix DaaS only

When you complete the tasks in this article, your resource location includes the following components:

- A virtual private cloud (VPC) with public and private subnets inside a single availability zone.
- An instance that runs as both an Active Directory Domain Controller and DNS server, located in the private subnet of the VPC.
- An instance that acts as a bastion host in the public subnet of your VPC. This instance is used to initiate RDP connections to the instances in the private subnet for administration purposes. After you finish setting up your resource location, you can shut down this instance so it is no longer readily accessible. When you must manage other instances in the private subnet, such as VDA instances, you can restart the bastion host instance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Task overview

Set up a virtual private cloud (VPC) with public and private subnets. When you complete this task, AWS deploys a NAT gateway with an Elastic IP address in the public subnet. This action enables instances in the private subnet to access the Internet. Instances in the public subnet are accessible to inbound public traffic while instances in the private subnet are not.

Configure security groups. Security groups act as virtual firewalls that control traffic for the instances in your VPC. You add rules to your security groups that allow instances in your public subnet to communicate with instances in your private subnet. You also associate these security groups with each instance in your VPC.

Create a DHCP options set. With an Amazon VPC, DHCP and DNS services are provided by default, which affects how you configure DNS on your Active Directory Domain Controller. Amazon's DHCP cannot be disabled and Amazon's DNS can be used only for public DNS resolution, not Active Directory name resolution. To specify the domain and name servers handed to instances through DHCP, create a DHCP options set. The set assigns the Active Directory domain suffix and specifies the DNS server for all instances in your VPC. To ensure Host (A) and Reverse Lookup (PTR) records are automatically registered when instances join the domain, you configure the network adapter properties for each instance you add to the private subnet.

Add a bastion host and Domain Controller to the VPC. Through the bastion host, you can log on to instances in the private subnet to set up the domain and join instances to the domain.

Task 1: Set up the VPC

1. From the AWS management console, select **VPC**.
2. From the VPC Dashboard, select **Create VPC**.
3. Select **VPC and more**.
4. Under NAT gateways ($), select **In 1 AZ** or **1 per AZ**.
5. Under DNS options, leave **Enable DNS hostnames** selected.
6. Select **Create VPC**. AWS creates the public and private subnets, Internet gateway, route tables, and default security group.

Task 2: Configure security groups

This task creates and configures the following security groups for your VPC:

- A public security group to associate with the instances in your Public subnet.
- A private security group to associate with the instances in your Private subnet.

To create the security groups:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. In the VPC Dashboard, select **Security Groups**.
2. Create a security group for the public security group. Select **Create Security Group** and enter a name tag and description for the group. In VPC, select the VPC you created earlier. Select **Yes, Create**.

Configure the Public security group

1. From the security group list, select the Public security group.
2. Select the **Inbound Rules** tab and select **Edit** to create the following rules:

Type	Source
ALL Traffic	Select the Private security group.
ALL Traffic	Select the Public security group.
ICMP	0.0.0.0/0
22 (SSH)	0.0.0.0/0
80 (HTTP)	0.0.0.0/0
443 (HTTPS)	0.0.0.0/0
1494 (ICA/HDX)	0.0.0.0/0
2598 (Session Reliability)	0.0.0.0/0
3389 (RDP)	0.0.0.0/0

3. When finished, select **Save**.
4. Select the **Outbound Rules** tab and select **Edit** to create the following rules:

Type	Destination
ALL Traffic	Select the Private security group.
ALL Traffic	0.0.0.0/0
ICMP	0.0.0.0/0

5. When finished, select **Save**.

Configure the private security group

1. From the security group list, select the Private security group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. If you have not setup traffic from the public security group, you must set TCP ports; select the **Inbound Rules** tab and select **Edit** to create the following rules:

Type	Source
ALL Traffic	Select the Private security group.
ALL Traffic	Select the Public security group.
ICMP	Select the Public security group.
TCP 53 (DNS)	Select the Public security group.
UDP 53 (DNS)	Select the Public security group.
80 (HTTP)	Select the Public security group.
TCP 135	Select the Public security group.
TCP 389	Select the Public security group.
UDP 389	Select the Public security group.
443 (HTTPS)	Select the Public security group.
TCP 1494 (ICA/HDX)	Select the Public security group.
TCP 2598 (Session Reliability)	Select the Public security group.
3389 (RDP)	Select the Public security group.
TCP 49152–65535	Select the Public security group.

3. When finished, select **Save.**
4. Select the **Outbound Rules** tab and select **Edit** to create the following rules:

Type	Destination
ALL Traffic	Select the Private security group.
ALL Traffic	0.0.0.0/0
ICMP	0.0.0.0/0
UDP 53 (DNS)	0.0.0.0/0

5. When finished, select **Save**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Task 3: Launch instances

Do the following steps to create two EC2 instances and decrypt the default Administrator password that Amazon generates:

1. From the AWS management console, select **EC2**.
2. From the EC2 Dashboard, select **Launch Instance**.
3. Select a Windows Server machine image and instance type.
4. On the **Configure Instance Details** page, enter a name for the instance and select the VPC you set up earlier.
5. In **Subnet**, make the following selections for each instance:
   - Bastion host: Select the Public subnet
   - Domain Controller: Select the Private subnet
6. In **Auto-assign Public IP address**, make the following selections for each instance:
   - Bastion host: Select **Enable.**
   - Domain Controller: Select **Use default setting** or **Disable**.
7. In **Network Interfaces**, enter a primary IP address within the IP range of your private subnet for the Domain Controller.
8. If necessary, on the **Add Storage** page, modify the disk size.
9. On the **Tag Instance** page, enter a friendly name for each instance.
10. On the **Configure Security Groups** page, select **Select an existing security group** and then make the following selections for each instance:
    - Bastion host: Select the Public security group.
    - Domain Controller: Select the Private security group.
11. Review your selections and then select **Launch**.
12. Create a new key pair or select an existing one. If you create a new key pair, download your private key (.pem) file and keep it in a safe place. You must supply your private key when you acquire the default Administrator password for the instance.
13. Select **Launch Instances**. select **View Instances** to display a list of your instances. Wait until the newly launched instance has passed all status checks before accessing it.
14. Acquire the default Administrator password for each instance:
    a) From the instance list, select the instance and then select **Connect**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) Go to the **RDP client** tab, select **Get Password**, and upload your private key (`.pem`) file when prompted.
c) Select **Decrypt Password** to get the human readable password. AWS displays the default password.

15. Repeat the steps from step 2 until you have created two instances:

- One bastion host instance in your public subnet
- One instance in your private subnet that is for use as a Domain Controller.

Task 4: Create a DHCP options set

1. From the VPC Dashboard, select **DHCP Options Sets**.
2. Enter the following information:

- Name tag: Enter a friendly name for the set.
- Domain name: Enter the fully qualified domain name that you use when you configure the Domain Controller instance.
- Domain name servers: Enter the private IP address you assigned to the Domain Controller instance and the string **AmazonProvidedDNS**, separated by commas.
- NTP servers: Leave this field blank.
- NetBIOS name servers: Enter the private IP address of the Domain Controller instance.
- NetBIOS node type: Enter **2**.

3. Select **Yes, Create.**
4. Associate the new set with your VPC:

a) From the VPC Dashboard, select **Your VPCs** and then select the VPC you set up earlier.
b) Select **Actions > Edit DHCP Options Set**.
c) When prompted, select the new set you created and then select **Save**.

Task 5: Configure the instances

1. Using an RDP client, connect to the public IP address of the bastion host instance. When prompted, enter the credentials for the Administrator account.
2. From the bastion host instance, launch Remote Desktop Connection and connect to the private IP address of the instance you want to configure. When prompted, enter the Administrator credentials for the instance.
3. For all instances in the private subnet, configure the DNS settings:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Select **Start > Control Panel > Network and Internet > Network and Sharing Center > Change adapter settings**. Double-click the network connection displayed.

b) Select **Properties > Internet Protocol Version 4 (TCP/IPv4) > Properties**.

c) Select **Advanced > DNS**. Ensure that the following settings are enabled and select **OK**:

- Register this connection's addresses in DNS
- Use this connection's DNS suffix in DNS registration

4. To configure the Domain Controller:

a) Using Server Manager, add the Active Directory Domain Services role with all default features.

b) Promote the instance to a Domain Controller. During promotion, enable DNS and use the domain name you specified when you created the DHCP options set. Restart the instance when prompted.

For information about AWS permissions, see Required AWS permissions-Amazon EC2 and Required AWS permissions-Amazon WorkSpaces Core Managed Instances.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing connections, see:
  - Connection to AWS EC2
  - Connection to Amazon WorkSpaces Core Managed Instances

More information

- Create and manage connections and resources
- Create machine catalogs

Azure Local environments

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Azure Local (based on Azure Arc) is a hyper-converged infrastructure (HCI) solution that connects the on-premises system to Azure for cloud-based services, monitoring, and management.

Prerequisites

- Azure Local cluster: 2503 or later
  - A storage path created
  - A logical network created with DHCP enabled
- To deploy an Azure Local cluster, refer to the Microsoft documentation About Azure Local deployment.

Consideration

- Windows 10 and 11 multi-session workload is not supported.

Key steps

Following are the key steps to create an MCS catalog in the Azure Local cluster:

1. Create a host connection.
2. Create a catalog.

Where to go next

- For creating a connection to Azure Local, see Connection to Azure Local.

More information

- Create and manage connections and resources

XenServer® virtualization environments

May 13, 2026

XenServer simplifies your operational management, ensuring a high-definition user experience for intensive workloads.

To set up your XenServer, see Prepare to install.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection in XenServer, see Connection to XenServer

More information

- Create and manage connections and resources
- Create machine catalogs

Google Cloud environments

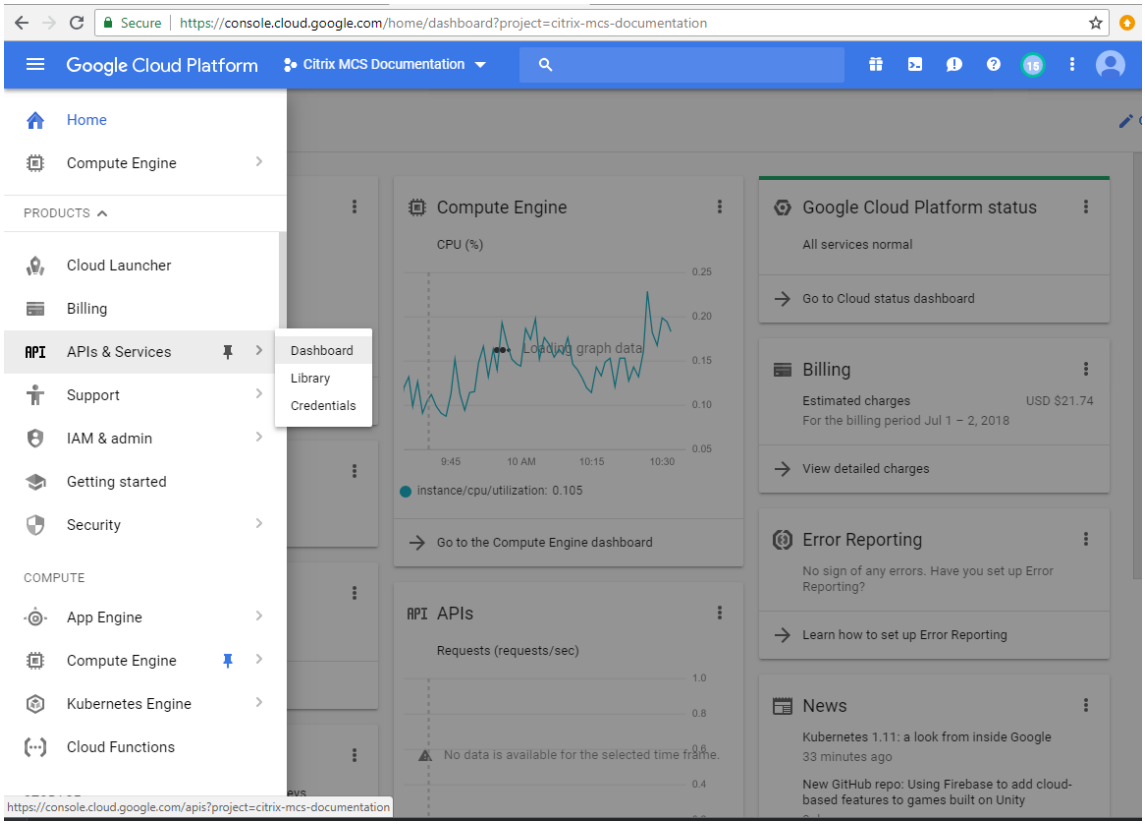
May 15, 2026

Citrix Virtual Apps and Desktops™ lets you provision and manage machines on Google Cloud.

Requirements

- Citrix Cloud™ account. The feature described in this article is available only in Citrix Cloud.
- A Google Cloud project. The project stores all compute resources associated with the machine catalog. It can be an existing project or a new one.
- Enable four APIs in your Google Cloud project. For details, see Enable Google Cloud APIs.
- Google Cloud service account. The service account authenticates to Google Cloud to enable access to the project. For details, see Configure and update service accounts.
- Enable Google private access. For details, see Enable-private-google-access.

Enable Google Cloud APIs

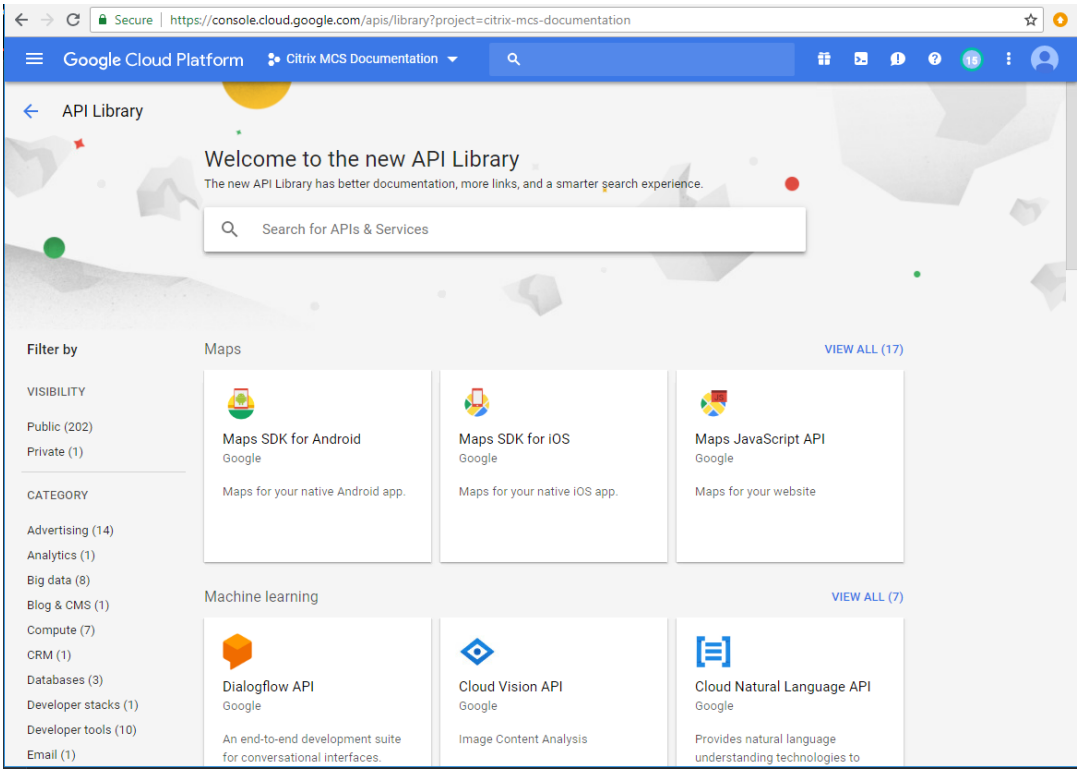


To use the Google Cloud functionality through Web Studio, enable these APIs in your Google Cloud project:

- Compute Engine API
- Cloud Resource Manager API
- Identity and Access Management (IAM) API
- Cloud Build API
- Cloud Key Management Service (KMS)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

From the Google Cloud console, complete these steps:



1. In the upper left menu, select **APIs and Services > Dashboard**.

2. On the **Dashboard** screen, ensure that Compute Engine API is enabled. If not, follow these steps:

    a) Navigate to **APIs and Services > Library**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) In the search box, type *Compute Engine*.

c) From the search results, select **Compute Engine API**.

d) On the **Compute Engine API** page, select **Enable**.

3. Enable Cloud Resource Manager API.

a) Navigate to **APIs and Services > Library**.

b) In the search box, type *Cloud Resource Manager*.

c) From the search results, select **Cloud Resource Manager API**.

d) On the **Cloud Resource Manager API** page, select **Enable**. The status of the API appears.

4. Similarly, enable **Identity and Access Management (IAM) API** and **Cloud Build API**.

You can also use Google Cloud Shell to enable the APIs. To do this:

1. Open the Google Console and load the Cloud Shell.
2. Run the following four commands in the Cloud Shell:

- gcloud services enable compute.googleapis.com
- gcloud services enable cloudresourcemanager.googleapis.com
- gcloud services enable iam.googleapis.com
- gcloud services enable cloudbuild.googleapis.com

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **Authorize** if the Cloud Shell prompts.

Configure and update service accounts

> **Note:**
>
> GCP is introducing changes to Cloud Build Service's default behavior and use of service accounts after April 29, 2024. For more information, see Cloud Build Service Account Change. Your existing Google projects with Cloud Build API enabled before April 29, 2024 are not affected by this change. However, if you want to have existing Cloud Build Service behavior after April 29, you can create or apply the organization policy to disable the constraint enforcement before you enable the Cloud Build API. As a result, the following content is divided into two: Before April 29, 2024 and After April 29, 2024. If you set the new organization policy, follow the section Before April 29, 2024.

Before April 29, 2024

Citrix Cloud uses three separate service accounts within the Google Cloud project:

- *Citrix Cloud Service Account*: This service account enables Citrix Cloud to access the Google project, provision, and manage machines. This service account authenticates to Google Cloud using a key generated by Google Cloud.

  You must create this service account manually as outlined here. For more information, see Create a Citrix Cloud Service Account.

  You can identify this service account with an email address. For example, `<my-service-account>@<project-id>.iam.gserviceaccount.com`.

- *Cloud Build Service Account*: This service account is provisioned automatically after you enable all the APIs mentioned in Enable Google Cloud APIs. To view all automatically created service accounts, navigate to **IAM & Admin > IAM** in the **Google Cloud** console and select the **Include Google-provided role grants** checkbox.

  You can identify this service account by an email address that begins with the **Project ID** and the word **cloudbuild**. For example, `<project-id>@cloudbuild.gserviceaccount.com`

  Verify if the service account has been granted the following roles. If you must add roles, follow the steps outlined in Add roles to the Cloud Build Service Account.

  - Cloud Build Service Account
  - Compute Instance Admin
  - Service Account User

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- *Cloud Compute Service Account*: This service account is added by Google Cloud to instances created in Google Cloud once the Compute API is activated. This account has the IAM basic editor role to do the operations. However, if you delete the default permission to have more granular control, you must add a **Storage Admin** role that requires the following permissions:
  - resourcemanager.projects.get
  - storage.objects.create
  - storage.objects.get
  - storage.objects.list

You can identify this service account by an email address that begins with the **Project ID** and the word **compute**. For example, `<project-id>-compute@developer.gserviceaccount.com`.

Create a Citrix Cloud Service Account To create a Citrix Cloud Service Account, follow these steps:

1. In the Google Cloud console, navigate to **IAM & Admin > Service accounts**.
2. On the **Service accounts** page, select **CREATE SERVICE ACCOUNT**.
3. On the **Create service account** page, enter the required information, and then select **CREATE AND CONTINUE**.
4. On the **Grant this service account access to project** page, click the **Select a role** drop-down menu and select the required roles. Click **+ADD ANOTHER ROLE** if you want to add more roles.

   Each account (personal or service) has various roles defining the management of the project. Grant the following roles to this service account:

   - Compute Admin
   - Storage Admin
   - Cloud Build Editor
   - Service Account User
   - Cloud Datastore User
   - Cloud KMS Crypto Operator

   The Cloud KMS Crypto Operator requires the following permissions:

   - cloudkms.cryptoKeys.get
   - cloudkms.cryptoKeys.list
   - cloudkms.keyRings.get
   - cloudkms.keyRings.list
   - cloudkms.cryptoKeyVersions.useToDecrypt
   - cloudkms.cryptoKeyVersions.useToEncrypt

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Enable all the APIs to get the complete list of roles available while creating a new service account.

5. Click **CONTINUE**
6. On the **Grant users access to this service account** page, add users or groups to grant them access to perform actions in this service account.
7. Click **DONE**.
8. Navigate to the IAM main console.
9. Identify the service account created.
10. Validate the roles are assigned successfully.

Considerations:

When creating the service account, consider the following:

- The steps **Grant this service account access to project** and **Grant users access to this service account** are optional. If you choose to skip these optional configuration steps, the newly created service account does not display in the **IAM & Admin > IAM** page.
- To display roles associated with a service account, add the roles without skipping the optional steps. This process ensures that roles appear for the configured service account.

Citrix Cloud Service Account key The Citrix Cloud Service Account key is required for creating a connection in Citrix DaaS. The key is contained in a credential file (.json). The file is automatically downloaded and saved to the **Downloads** folder after you create the key. When you create the key, be sure to set the key type to JSON. Otherwise, Web Stduio cannot parse it.

To create a Service Account Key, navigate to **IAM & Admin > Service accounts** and click the email address of the Citrix Cloud Service Account. Switch to the **Keys** tab and select **Add Key > Create new key**. Make sure to select **JSON** as the key type.

> **Tip:**
>
> Create keys using the **Service accounts** page in the Google Cloud console. We recommend that you change keys regularly for security purposes. You can provide new keys to the Citrix Virtual Apps and Desktops™ application by editing an existing Google Cloud connection.

Add roles to the Citrix Cloud Service Account To add roles to the Citrix Cloud Service Account:

1. In the Google Cloud console, navigate to **IAM & Admin > IAM**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the **IAM > PERMISSIONS** page, locate the service account you created, identifiable with an email address.

   For example, <my-service-account>@<project-id>.iam.gserviceaccount.com

3. Select the pencil icon to edit the access to the principal of the service account.
4. On the **Edit access to "project-id"** page for the selected principal option, select **ADD ANOTHER ROLE** to add the required roles to your service account one by one and then select **SAVE**.

Add roles to the Cloud Build Service Account To add roles to the Cloud Build Service Account:

1. In the Google Cloud console, navigate to **IAM & Admin > IAM**.
2. On the **IAM** page, locate the Cloud Build service account, identifiable with an email address that begins with the **Project ID** and the word **cloudbuild**.

   For example, <project-id>@cloudbuild.gserviceaccount.com

3. Select the pencil icon to edit the Cloud Build account roles.
4. On the **Edit access to "project-id"page** for the selected principal option, select **ADD ANOTHER ROLE** to add the required roles to your Cloud Build service account one by one and then select **SAVE**.

   > **Note:**
   >
   > Enable all the APIs to get the complete list of roles.

After April 29, 2024

Citrix Cloud uses two separate service accounts within the Google Cloud project:

- *Citrix Cloud Service Account*: This service account enables Citrix Cloud to access the Google project, provision, and manage machines. This service account authenticates to Google Cloud using a key generated by Google Cloud.

  You must create this service account manually.

  You can identify this service account with an email address. For example, <my-service-account>@<project-id>.iam.gserviceaccount.com.

- *Cloud Compute Service Account*: This service account is provisioned automatically after you enable all the APIs mentioned in Enable Google Cloud APIs. To view all automatically created service accounts, navigate to **IAM & Admin > IAM** in the **Google Cloud** console and select the **Include Google-provided role grants** checkbox. This account has the IAM basic editor role to do

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the operations. However, if you delete the default permission to have more granular control, you must add **Storage Admin** role that requires the following permissions:

- resourcemanager.projects.get
- storage.objects.create
- storage.objects.get
- storage.objects.list

You can identify this service account by an email address that begins with the **Project ID** and the word **compute**. For example, `<project-id>-compute@developer.gserviceaccount.com`.

Verify if the service account has been granted the following roles.

- Cloud Build Service Account
- Compute Instance Admin
- Service Account User

Create a Citrix Cloud Service Account To create a Citrix Cloud Service Account, follow these steps:

1. In the Google Cloud console, navigate to **IAM & Admin > Service accounts**.
2. On the **Service accounts** page, select **CREATE SERVICE ACCOUNT**.
3. On the **Create service account** page, enter the required information, and then select **CREATE AND CONTINUE**.
4. On the **Grant this service account access to project** page, click the **Select a role** drop-down menu and select the required roles. Click **+ADD ANOTHER ROLE** if you want to add more roles.

   Each account (personal or service) has various roles defining the management of the project. Grant the following roles to this service account:

   - Compute Admin
   - Storage Admin
   - Cloud Build Editor
   - Service Account User
   - Cloud Datastore User
   - Cloud KMS Crypto Operator

   The Cloud KMS Crypto Operator requires the following permissions:

   - cloudkms.cryptoKeys.get
   - cloudkms.cryptoKeys.list
   - cloudkms.keyRings.get

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- cloudkms.keyRings.list

> **Note:**
>
> Enable all the APIs to get the complete list of roles available while creating a new service account.

5. Click **CONTINUE**
6. On the **Grant users access to this service account** page, add users or groups to grant them access to perform actions in this service account.
7. Click **DONE**.
8. Navigate to the IAM main console.
9. Identify the service account created.
10. Validate the roles are assigned successfully.

Considerations:

When creating the service account, consider the following:

- The steps **Grant this service account access to project** and **Grant users access to this service account** are optional. If you choose to skip these optional configuration steps, the newly created service account does not display in the **IAM & Admin > IAM** page.
- To display roles associated with a service account, add the roles without skipping the optional steps. This process ensures that roles appear for the configured service account.

Citrix Cloud Service Account key The Citrix Cloud Service Account key is required for creating a connection in Citrix DaaS. The key is contained in a credential file (.json). The file is automatically downloaded and saved to the **Downloads** folder after you create the key. When you create the key, be sure to set the key type to JSON. Otherwise, Web Studio cannot parse it.

To create a Service Account Key, navigate to **IAM & Admin > Service accounts** and click the email address of the Citrix Cloud Service Account. Switch to the **Keys** tab and select **Add Key > Create new key**. Make sure to select **JSON** as the key type.

> **Tip:**
>
> Create keys using the **Service accounts** page in the Google Cloud console. We recommend that you change keys regularly for security purposes. You can provide new keys to the Citrix Virtual Apps and Desktops application by editing an existing Google Cloud connection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add roles to the Citrix Cloud Service Account To add roles to the Citrix Cloud Service Account:

1. In the Google Cloud console, navigate to **IAM & Admin > IAM**.
2. On the **IAM > PERMISSIONS** page, locate the service account you created, identifiable with an email address.

   For example, `<my-service-account>@<project-id>.iam.gserviceaccount.com`
3. Select the pencil icon to edit the access to the principal of the service account.
4. On the **Edit access to "project-id"** page for the selected principal option, select **ADD ANOTHER ROLE** to add the required roles to your service account one by one and then select **SAVE**.

Add roles to the Cloud Compute Service Account To add roles to the Cloud Compute Service Account:

1. In the Google Cloud console, navigate to **IAM & Admin > IAM**.
2. On the **IAM** page, locate the Cloud Compute Service Account, identifiable with an email address that begins with the **Project ID** and the word **compute**.

   For example, `<project-id>-compute@developer.gserviceaccount.com`
3. Select the pencil icon to edit the Cloud Build account roles.
4. On the **Edit access to "project-id"page** for the selected principal option, select **ADD ANOTHER ROLE** to add the required roles to your Cloud Build service account one by one and then select **SAVE**.

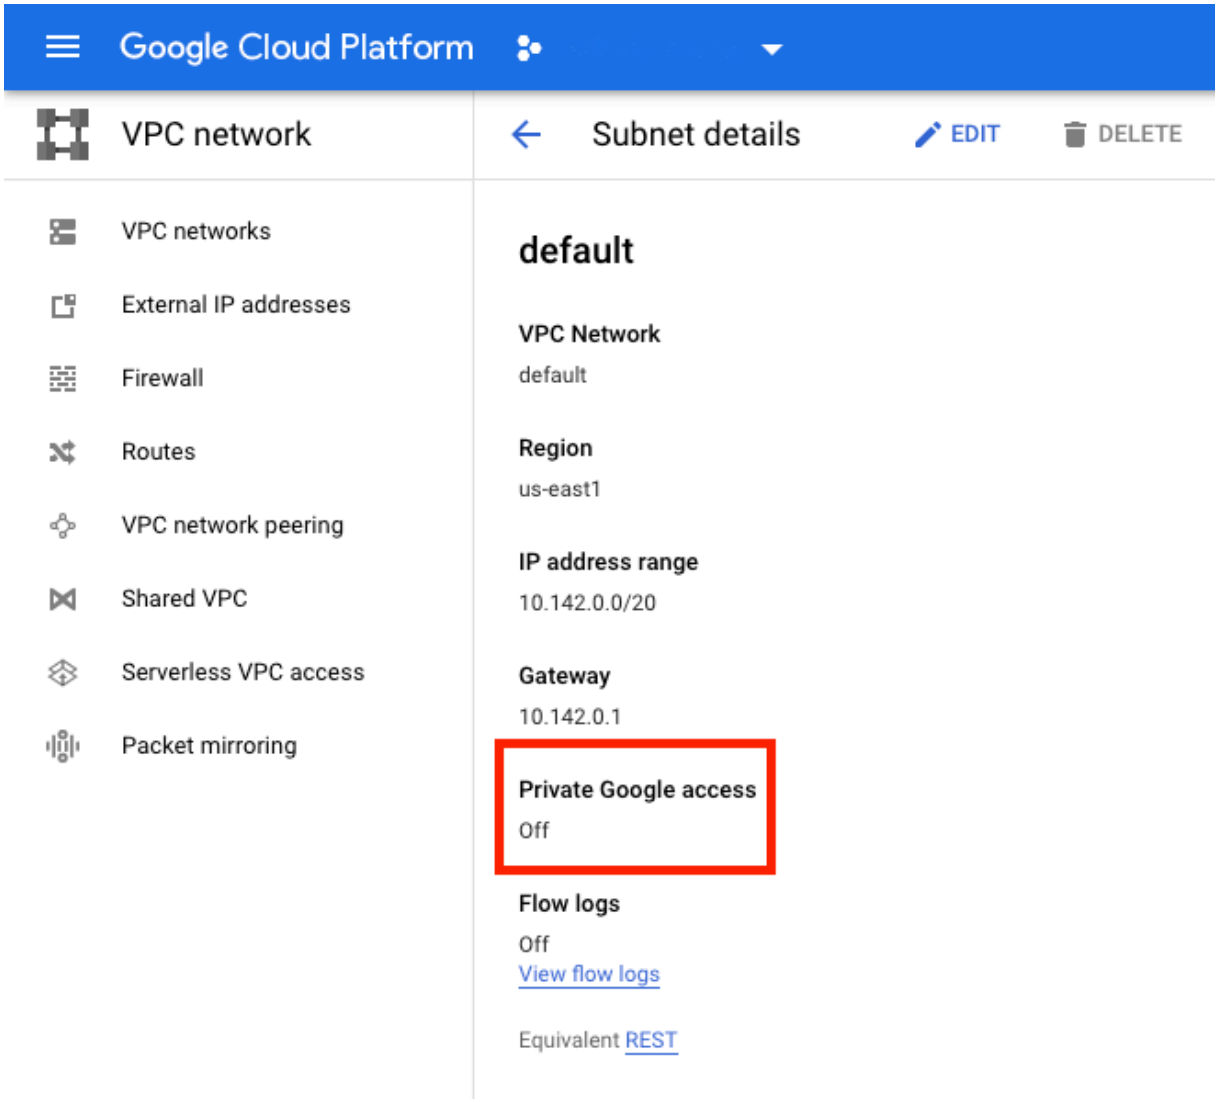
   > **Note:**
   >
   > Enable all the APIs to get the complete list of roles.

Storage permissions and bucket management

Citrix Virtual Apps and Desktops improves the process of reporting cloud build failures for the Google Cloud service. This service runs builds on the Google Cloud. Citrix Virtual Apps and Desktops creates a storage bucket named `citrix-mcs-cloud-build-logs-{ region } -{ 5 random characters }` where the Google Cloud services captures build log information. An option is set on this bucket that deletes the contents after a period of 30 days. This process requires that the service account used for the connection has Google Cloud permissions set to `storage.buckets.update`. If the service account does not have this permission, Citrix Virtual Apps and Desktops ignores errors and proceeds with the catalog creation process. Without this permission, the size of the build logs increases and requires manual cleanup.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Enable private Google access



When a VM lacks an external IP address assigned to its network interface, packets are only sent to other internal IP addresses destinations. When you enable private access, the VM connects to the set of external IP addresses used by the Google API and associated services.

> **Note:**
>
> Whether private Google access is enabled, all VMs that are with and without public IP addresses, must be able to access Google Public APIs, especially if third-party networking appliances have been installed in the environment.

To ensure that a VM in your subnet can access the Google APIs without a public IP address for MCS provisioning:

1. In Google Cloud, access the **VPC network configuration**.
2. In the Subnet details screen, turn on **Private Google access**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information, see Configuring Private Google Access.

> **Important:**
>
> If your network is configured to prevent VM access to the Internet, ensure that your organization assumes the risks associated with enabling Private Google access for the subnet to which the VM is connected.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection in Google Cloud environments, see Connection to Google cloud environments

© 1997–2026 Citrix Systems, Inc. All rights reserved.

More information

- Create and manage connections and resources
- Create machine catalogs

HPE Moonshot virtualization environments

May 13, 2026

Citrix Virtual Apps and Desktops™ manages your HPE Moonshot workloads through a Citrix-managed HPE Moonshot plug-in present. The Citrix-managed HPE Moonshot plug-in is installed automatically while upgrading or installing Citrix Virtual Apps and Desktops version 2503. With this plug-in, you can create connections to your HPE Moonshot chassis, create catalogs, and power manage machines in the catalog.

Key steps

1. Set up your HPE environments.
2. Create a connection to the HPE Moonshot chassis.
3. Create a machine catalog.

   > **Note:**
   >
   > Before creating a catalog, ensure to have one or more HPE Moonshot cartridge nodes and install VDAs on those nodes. You can consider the HPE Moonshot chassis as the hypervisor and the cartridge nodes as VMs.

4. Create a delivery group.
5. Migrate the rest of unmanaged HPE Moonshot nodes to the managed catalog or delivery group.

> **Note:**
>
> Use Web Studio instead of MMC-based Studio.

Troubleshooting

If both Citrix-managed and HPE-managed HPE Moonshot plug-ins are installed, and

- If you want to use the **HPE-managed Moonshot plug-in**, then you must uninstall Citrix-managed HPE Moonshot plug-in and update the `RegisterPlugin` cache. To do so:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Open the PowerShell as an Administrator and run the following command to uninstall Citrix-managed HPE Moonshot plug-in:

```
$CtxMnsht = Get-WmiObject -Class Win32_Product | Where-Object{
 $_.Name -Contains "Citrix HPE Moonshot Plugin" }

$CtxMnsht.Uninstall()
```

2. Run the following command to register HPE-managed Moonshot plug-in:

```
cd "C:\Program Files\Common Files\Citrix\HCLPlugins\"
.\RegisterPlugins.exe -PluginsRoot "C:\Program Files\Common
   Files\Citrix\HCLPlugins\CitrixMachineCreation\v1.0.0.0\"
```

3. After the plug-in registration is successful, restart the following services from the **Task Manager**:

   a) CitrixBrokerService
   b) CitrixHostService
   c) CitrixMachineCreationService

4. Run `Get-HypHypervisorPlugins` to check if the plug-in is installed on the Delivery controller. The `DisplayName` field in the output must show as HPE Moonshot Machine Manager.

- If you want to install the Citrix-managed HPE Moonshot plug-in again, do the following:

1. Install `E:\x64\Citrix Desktop Delivery Controller\MoonshotPlugin.msi`. The `E:\` is the ISO.
2. Open the PowerShell as an Administrator and run the following command to register Citrix-managed HPE Moonshot plug-in:

```
C:\Program Files\Common Files\Citrix\HCLPlugins> .\
   RegisterPlugins.exe -pluginsroot .\CitrixMachineCreation\v1
   .0.0.0\
```

3. After the plug-in registration is successful, restart the following services from the Task Manager:

   a) CitrixBrokerService
   b) CitrixHostService
   c) CitrixMachineCreationService

1. Run `Get-HypHypervisorPlugins` to check if the plug-in is installed on the Delivery controller. The DisplayName field in the output must show as HPE Moonshot.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection in HPE Moonshot, see Connection to HPE Moonshot

More information

- Create and manage connections and resources
- Create machine catalogs

Microsoft Azure Resource Manager cloud environments

May 13, 2026

When using the Microsoft Azure Resource Manager to provision virtual machines in your Citrix Virtual Apps and Desktops™ deployment, get familiar with the following:

- Microsoft Entra ID: https://docs.microsoft.com/en-in/azure/active-directory/fundamentals/active-directory-whatis/
- Consent framework: https://docs.microsoft.com/en-us/azure/active-directory/manage-apps/plan-an-application-integration
- Service principal: https://docs.microsoft.com/en-us/azure/active-directory/develop/app-objects-and-service-principals/

To set up your Microsoft Azure Resource Manager, see Prepare to install.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection in Azure environments, see Connection to Microsoft Azure

More information

- Create and manage connections and resources

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Create machine catalogs
- CTX219211: Set up a Microsoft Microsoft Entra account
- CTX219243: Grant XenApp and XenDesktop access to your Azure subscription
- CTX219271: Deploy hybrid cloud using site-to-site VPN

Microsoft System Center Configuration Manager environments

May 13, 2026

Sites using Microsoft System Center Configuration Manager (Configuration Manager) to manage access to applications and desktops can extend that use to Citrix Virtual Apps and Desktops™ using these options:

- Install VDAs using SCCM.
- **Configuration Manager Wake Proxy feature:** The Remote PC Access Wake on LAN feature is supported with Configuration Manager. For details, see Wake on LAN - SCCM integrated.
- **Citrix Virtual Apps and Desktops properties:** Properties enable you to identify Citrix Virtual Desktops™ for management through Configuration Manager. (In some versions, Configuration Manager uses the former name of Citrix Virtual Apps and Desktops: XenApp and XenDesktop.)

Properties

Properties are available to Microsoft System Center Configuration Manager to manage virtual desktops.

Boolean properties displayed in Configuration Manager appear as `1` or `0`, not true or false.

The properties are available for the `Citrix_virtualDesktopInfo` class in the `Root\Citrix\DesktopInformation` namespace. Property names come from the Windows Management Instrumentation (WMI) provider.

Property	Description
`AssignmentType`	Sets the value of IsAssigned. Valid values are: `ClientIP`, `ClientName`, `None`, and `User` (sets `IsAssigned` to `True`)
`BrokerSiteName`	Returns the same value as `HostIdentifier`
`DesktopCatalogName`	Machine catalog associated with the desktop.
`DesktopGroupName`	Delivery group associated with the desktop.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Property	Description
HostIdentifier	Returns the same value as BrokerSiteName.
IsAssigned	True to assign the desktop to a user, set to False for a random desktop
IsMasterImage	Allows decisions about the environment. For example, install applications on the image and not on the provisioned machines. Valid values are: True on a VM that is used as an image. This value is set during installation based on a selection, or cleared on a VM that is provisioned from that image.
IsVirtualMachine	True for a virtual machine, **false** for a physical machine.
OSChangesPersist	False if the desktop operating system image is reset to a clean state every time it is restarted; otherwise, **true**.
PersistentDataLocation	The location where Configuration Manager stores persistent data. This is not accessible to users.
BrokerSiteName, DesktopCatalogName, DesktopGroupName, HostIdentifier	Determined when the desktop registers with the Controller. They are null for a desktop that has not fully registered.

To collect the properties, run a hardware inventory in Configuration Manager. To view the properties, use the Configuration Manager Resource Explorer. In these instances, the names include spaces or vary slightly from the property names. For example, BrokerSiteName appears as Broker Site Name.

- Configure Configuration Manager to collect Citrix WMI properties from the Citrix VDA
- Create query-based device collections using Citrix WMI properties
- Create global conditions based on Citrix WMI properties
- Use global conditions to define application deployment type requirements

You can also use Microsoft properties in the Microsoft class CCM_DesktopMachine in the Root\ccm_vdi namespace. For more information, see the Microsoft documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Microsoft System Center Virtual Machine Manager virtualization environments

May 13, 2026

Follow this guidance if you use Hyper-V with Microsoft System Center Virtual Machine Manager (VMM) to provide virtual machines.

This release supports the VMM versions listed in System requirements.

> **Note:**
>
> Mixed Hyper-V clusters (containing servers running different Hyper-V versions) are not supported.

You can use Citrix Provisioning (formerly Provisioning Services) and Machine Creation Services™ to provision:

- Generation 1 supported Desktop or Server OS VMs.
- Generation 2 supported Desktop or Server OS VMs, including Secure Boot support.

Install and configure a hypervisor

> **Important:**
>
> All Delivery Controllers must be in the same forest as the VMM servers.

1. Install Microsoft Hyper-V server and VMM on your servers.
2. Install the System Center Virtual Machine Manager console on all Controllers. The console version must match the management server version. Although an earlier console can connect to the management server, provisioning VDAs fails if the versions differ.
3. Verify the following account information:

   The account you use to specify hosts in Studio is a VMM administrator or VMM delegated administrator for the relevant Hyper-V machines. If this account only has the delegated administrator role in VMM, the storage data is not listed in Studio during the host creation process.

   The user account used for Studio integration must also be a member of the administrators local security group on each Hyper-V server. This configuration supports VM life cycle management, such as VM creation, update, and deletion.

   Installing a Controller on a server running Hyper-V is not supported.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In large deployments where a single SCVMM manages multiple clusters in different data centers, you can limit the host groups scope of delegated admins.

To limit the host groups scope, use the Delegated Admin role in Microsoft System Center Virtual Machine Manager (VMM) console:

1. On **Create User Roles Wizard**, select Fabric Administrator (Delegated Administrator) as a user role.
2. In **Members**, add the user account in the Active Directory that you want to use as delegated admin.
3. In **Scope**, select the host groups you want the delegated admin to have access to.
4. Create a new **Run As Account** using delegated admin user credentials. Use these credentials to create a hypervisor connection later. Do not use the main administrator role accounts.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection in SCVMM, see Connection to Microsoft System Center Virtual Machine Manager

More information

- Create and manage connections and resources
- Create machine catalogs

Nutanix virtualization environments

August 19, 2026

Connect Citrix Virtual Apps and Desktops to Nutanix AHV clusters through Nutanix Prism Central using Nutanix AHV Prism Central host connection. This host connection:

- Supports machine catalogs with both power managed and MCS provisioned VDAs.
- Enables MCS master image sharing across AHV clusters using template versions.
- Simplifies certificate trust on host connection.
- Eliminates the need of Nutanix plug-in installation on Cloud Connectors.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

See Nutanix Prism Central on AHV.

You can also use Nutanix Prism Element on AHV using Nutanix Acropolis as the host connection to provide VMs in your Citrix Virtual Apps and Desktops deployment. However, this setup process requires installing and registering the Nutanix plug-in in your Citrix Virtual Apps and Desktops environment. See Nutanix Prism Element on AHV.

For more information on the Nutanix Acropolis MCS plug-in Installation guide, see Nutanix Support Portal.

Nutanix Prism Central on AHV

Citrix has developed and maintains a plug-in that integrates Citrix Virtual Apps and Desktops with Nutanix Prism Central on AHV. This plug-in is integrated with Citrix Delivery Controllers, eliminating the need for separate plug-in installations.

The Nutanix AHV Prism Central plug-in is pre-installed on Delivery Controllers managed by Citrix, eliminating the need for separate installation on Delivery Controllers. For information on Citrix-managed components and services, see Technical overview.

Prerequisites

You need the following for Nutanix AHV Prism Central:

- Prism Central version pc.2025.2 or later. Refer to Supported Hypervisors for Citrix Virtual Apps and Desktops (MCS) and Citrix Provisioning (PVS) for detailed supported Prism Central versions.
- AOS version 7.3 or later for the Nutanix AHV clusters.
- Nutanix AHV clusters must register to the Prism Central.
- The Citrix administrator account must have sufficient permissions to create host connections, machine catalogs, and delivery groups. For more information, see Configure Delegated Administration.
- Citrix Cloud™ communicates with Nutanix Prism Central through the Cloud Connector. Therefore, the Nutanix Prism Central instance must be accessible from the Cloud Connector.

Limitations in the feature

Due to Nutanix Prism and API limitation, power actions like Guest Reboot or Guest Shutdown might fail for a Windows VM. To resolve this issue, we recommend following Nutanix instructions in the document Power actions initiated from Prism or API might fail for Windows VMs to apply settings on VDAs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Key steps

1. Set up your Nutanix virtualization environments. For information, see Prepare to install or Activate an unused domain.
2. Create a connection to the Nutanix AHV Prism Central
3. Create a machine catalog using Nutanix machine template version.

Nutanix Prism Element on AHV

Nutanix Prism Element on AHV requires installing the Nutanix plug-in on all Delivery Controllers where Citrix Virtual Apps and Desktops must create a host connection to the resource location that has a Nutanix hypervisor.

Key steps

1. Install and register the Nutanix plug-in.
2. Set up your Nutanix virtualization environments. For information, see Add a resource type or Activate an unused domain.
3. Create a connection.
4. Create a machine catalog.

Install and register the Nutanix plug-in

Complete the procedure to install and register the Nutanix plug-in on all your Cloud Connectors. For information about installing the Nutanix plug-in, see the Nutanix Documentation site.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection in Nutanix environments, see Connection to Nutanix

More information

- Create and manage connections and resources
- Create machine catalogs

Nutanix cloud and partner solutions

May 13, 2026

Nutanix AHV Prism Central

Citrix Virtual Apps and Desktops supports Nutanix Cloud Clusters (NC2) in the following cloud hypervisors for Citrix-managed Nutanix AHV Prism Central plug-in.

- Amazon Web Services (AWS)
- Microsoft Azure

Nutanix Cloud Clusters

Citrix Virtual Apps and Desktops supports Nutanix Cloud Clusters on AWS and Azure. Nutanix clusters simplify how applications are run on private or multiple public clouds.

For more information on setting up NC2, see:

- Nutanix Cloud Clusters on AWS Deployment and User Guide
- Nutanix Cloud Clusters on Azure Deployment and User Guide.

Requirements

You need the following accounts to use NC2:

- A Nutanix account
- For AWS: An AWS account with the following permissions.
  - IAMFullAccess
  - AWSConfigRole
  - AWSCloudFormationFullAccess
- For Azure:
  - A valid “NC2 on Azure”license
  - An Azure account that includes one of the following roles:
    - Global Administrator
    - Cloud Application Administrator
    - Application Administrator
    - all the permissions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a Nutanix Cluster

1. Log in to your Nutanix account.
2. Navigate to the Nutanix cluster option, and click **Launch**. The **Nutanix Console** opens. For more information:
   - Get Started with Nutanix Cluster on AWS
   - Nutanix Cloud Clusters on Microsoft Azure
3. Select the option to create a new VPC.

Once the cluster is created, retrieve the address of the Nutanix Prism.

Troubleshooting The cluster creation process might fail with the following errors:

- **Cluster failed to create within a given time. Deleting cluster**
- **Host Nutanix Cluster - Node XXXXXXXXXXX: Instance i-xxxxxxxxxxxxx: disable network interface source/dest check error**.
- **Host Nutanix Cluster - Node XXXXXXXXXXX: Unable to obtain instance i-xxxxxxxxxxxxxx network interface info**

If the cluster fails to create, then try to recreate one in a different region. Make sure to delete the Nutanix CloudFormation Stack (CFS) before retrying.

> **Note:**
>
> In addition to other resources, the Nutanix CFS creates:
>
> - One VPC named Nutanix Cluster xxxxxxxxxxxx 10.0.0.0/16
> - Two subnets 10.0.128.0/24 and 10.0.129.0/24
> - One Internet gateway
> - One NAT gateway

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Retrieve the Prism server address

1. Register the NC2 cluster with the Prism Central server. See Registering a Cluster with Prism Central.
2. Use the host name or IP address of the Prism Central server as the address.

NC2 for Nutanix Prism Element

Citrix Virtual Apps and Desktops supports Nutanix Cloud Clusters (NC2) in the following cloud hypervisor for the Nutanix Prism Element plug-in.

- Amazon Web Services (AWS)

Nutanix Cloud Clusters on AWS

For more information on Nutanix Cloud Clusters on AWS, see Nutanix Cloud Clusters on AWS Deployment and User Guide.

> **Tip:**
>
> This support provides the same functionality as a Nutanix on-premises cluster. Only a single cluster is supported, the *Prism Element*. For more information, see here.

You need the following accounts to use NC2 on AWS:

- A Nutanix account
- An AWS account with the following permissions:
  - IAMFullAccess
  - AWSConfigRole
  - AWSCloudFormationFullAccess

For creating a Nutanix Cluster and troubleshooting if cluster creation fails, see Create a Nutanix Cluster and Troubleshooting.

Once the cluster is created, retrieve the address of the **Nutanix Prism**:

Retrieve the prism server address

1. Go to the **Nutanix Console**.
2. In the upper right on the console, hover over the link **Launch Prism Element** and copy the URL.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection of Nutanix cloud and partner solutions, see Connection to Nutanix cloud and partner solutions

More information

- Create and manage connections and resources
- Create machine catalogs

Oracle C3 virtualization environments (Preview)

May 13, 2026

Citrix Virtual Apps and Desktops manages your Oracle Compute Cloud@Customer (Oracle C3) workloads through a Citrix-managed Oracle C3 plug-in in the Citrix Virtual Apps and Desktops control plane. With this plug-in, you can create connections to Oracle C3, create catalogs, and power manage machines in the catalog.

> **Note:**
>
> - Oracle C3 for Citrix Virtual Apps and Desktops 2607 LTSR is only available for customers with Hybrid Rights or Universal License.
> - Isolated Oracle C3 environments are not currently supported.

Prerequisites

Before you begin:

- Ensure that the Oracle C3 REST API is available for your environment. The `<system_name>.<domain name>` of the Oracle C3 is required for API connection. See Using the API to Manage Compute Cloud@Customer Resources.
- Prepare the IAM configuration `.ini` file and private key used for Oracle C3 authentication. Ensure that the region is set to `<system_name>.<domain_name>`.
- If Oracle C3 is protected by a private CA certificate, obtain the certificate thumbprint for trust validation during connection setup.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Key steps

1. Set up your Oracle C3 environment.
2. Create a connection to the Oracle C3 endpoint.
3. Create a machine catalog.

   > **Note:**
   >
   > Before creating a catalog, ensure one or more Oracle C3 machines are available and VDAs are installed on those machines.

4. Create a delivery group.
5. Migrate any remaining unmanaged Oracle C3 machines into managed catalogs or delivery groups.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection, see Connection to Oracle C3

More information

- Create and manage connections and resources
- Create machine catalogs

Red Hat OpenShift virtualization environments

May 13, 2026

Citrix® manages your Red Hat OpenShift workloads through a Citrix-managed OpenShift plug-in. With this plug-in, you can create hosting connections and hosting units to your OpenShift cluster, create catalogs, and power manage machines in the catalog.

The following configurations are supported:

- Networking options:
  - Linux Bridge and OVS Bridge: Available for cluster networking.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Storage options:
  - Local storage: Supported for on-node persistent storage.
  - NetApp storage: Supported for enterprise-grade external storage integration.

Key steps

- Set up your Red Hat OpenShift environment.
- Create a connection and a resource to the OpenShift cluster.
- Create a machine catalog.
- Create a delivery group.

Set up your Red Hat OpenShift environment

1. *Create an OpenShift cluster and obtain the cluster API address*: In the OpenShift console, after setting up a cluster, navigate to **Home > Overview > Details**, and get the cluster API address.
2. *Create a service account and obtain the service account token using the OpenShift command-line interface (CLI) (oc command)*: The service account token is the authentication credential associated with the service account. The service account is used to authenticate the OpenShift plug-in with OpenShift. Each service account is associated with one namespace.
3. *Configure permissions for the service account*: A service account can have multiple roles, and each role consists of permissions that define what actions the OpenShift Plugin can perform on which resources. The roles are bound through **Role Bindings**, and there are two types of **Role Bindings**:
   a) **Cluster-wide Role Binding**: used for receiving events from OpenShift.
   Namespace-bound Role Binding: used for managing VMs in a specific namespace.
   b) **Namespace-bound Role Binding**: used for managing VMs in a specific namespace.
4. *Create a namespace (Project)*: Namespace in OpenShift is an isolated environment that groups resources like VMs or networks, allowing better organization and access control. **Namespace** is the Kubernetes term, while **Project** is the OpenShift term. From the OpenShift Plugin perspective, they are the same. A namespace is required to deploy the VMs. Use the OpenShift console or OpenShift Container Platform CLI to create the name space.
5. *Create one network attachment definition under the target namespace*: Network attachment definitions specify the networking configuration for VMs running in OpenShift. Under **Networking > NetworkAttachmentDefinitions**, you can see the Network Attachment Definitions for each Namespace.
6. *Configure the storage classes*: Storage classes define how VM storage is allocated. Under **Storage > StorageClass**, you can configure and see the list of storage providers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a service account

1. Download and unzip oc Command Line Tool.
2. Access the OpenShift Console using your login ID.
3. Click your user profile and click **Copy login command**.
4. Click **Display Token** and copy the token.
5. Run the login command using oc Command Line. Example:

```
.\oc.exe login --token=<token> --server=<server address>
```

6. Create a service account.
   - If you want to create the service account under the default namespace, run:

```
.\oc.exe create sa <service account name>
```

   - If you want to create the service account under your own namespace, run:

```
.\oc.exe create sa <service account name> -n mynamespace
```

7. Create a YAML file for secret. Example:
   - If you create the service account under the default namespace:

```
apiVersion: v1
kind: Secret
metadata:
name: service account name
annotations:
kubernetes.io/service-account.name: service account name
type: kubernetes.io/service-account-token
```

   - If you create the service account under your own namespace:

```
apiVersion: v1
kind: Secret
metadata:
name: service account name
namespace: mynamespace
annotations:
kubernetes.io/service-account.name: service account name
 type: kubernetes.io/service-account-token
```

8. Apply the YAML.

```
.\oc.exe apply -f <yamlFile.yaml>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The `oc` describes the secret to get the token. The token is used as a password.

Create roles and role bindings for the service account

With the cluster-wide role binding, the service account has permissions to read all VM events across the cluster, allowing the OpenShift plug-in to maintain a single event watcher for all VM-related events. With the namespace role binding the service account has permissions to manage VMs in the target namespace.
You can use a script to create roles and bind them to a service account. See https://github.com/citrix/citrix-mcs-sdk-samples/tree/main/OpenShift/Hosting%20Connection/Role/.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection, see Connection to Red Hat OpenShift

More information

- Create and manage connections and resources
- Create machine catalogs

VMware virtualization environments

May 13, 2026

Follow this guidance if you use VMware to provide virtual machines.

Install vCenter Server and the appropriate management tools. (No support is provided for vSphere vCenter Linked Mode operation.)

If you plan to use MCS, do not disable the Datastore Browser feature in vCenter Server (described in https://kb.vmware.com/s/article/2101567). When you disable this feature, MCS does not work correctly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Where to go next

- Install core components
- Install VDAs
- Create a site
- For creating and managing a connection in VMware environments, see Connection to VMware

More information

- Create and manage connections and resources
- Create machine catalogs

VMware cloud and partner solutions

May 13, 2026

Citrix Virtual Apps and Desktops™ supports the following VMware cloud and partner solutions:

- Azure VMware Solution (AVS)
- Google Cloud VMware Engine
- VMware Cloud on Amazon Web Services (AWS)

Azure VMware Solution (AVS) integration

Citrix Virtual Apps and Desktop service supports AVS. AVS provides cloud infrastructure containing vSphere clusters created by Azure infrastructure. Leverage the Citrix Virtual Apps and Desktop Service to use AVS for provisioning your VDA workload in the same way that you would using vSphere in on-premises enviornments.

Set up the AVS cluster

To enable the Citrix Virtual Apps™ and Desktop Service to use AVS, perform the following steps in Azure:

- Request a host quota
- Register the Microsoft.AVS resource provider
- Network Checklist
- Create an Azure VMware Solution private cloud

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Access an Azure VMware Solution private cloud
- Configure networking for your VMware private cloud in Azure
- Configure DHCP for Azure VMware Solution
- Add a network segment in Azure VMware Solution
- Verify Azure VMware Solution environment

Request host quota for Azure Enterprise Agreement customers In the Azure portal's **Help + Support** page select **New support request**, and include the following information:

- Issue type:Technical
- Subscription:Select your subscription
- Service:All services > Azure VMware Solution
- Resource:General question
- Summary:Need capacity
- Problem type:Capacity Management Issues
- Problem subtype:Customer Request for Additional Host Quota/Capacity

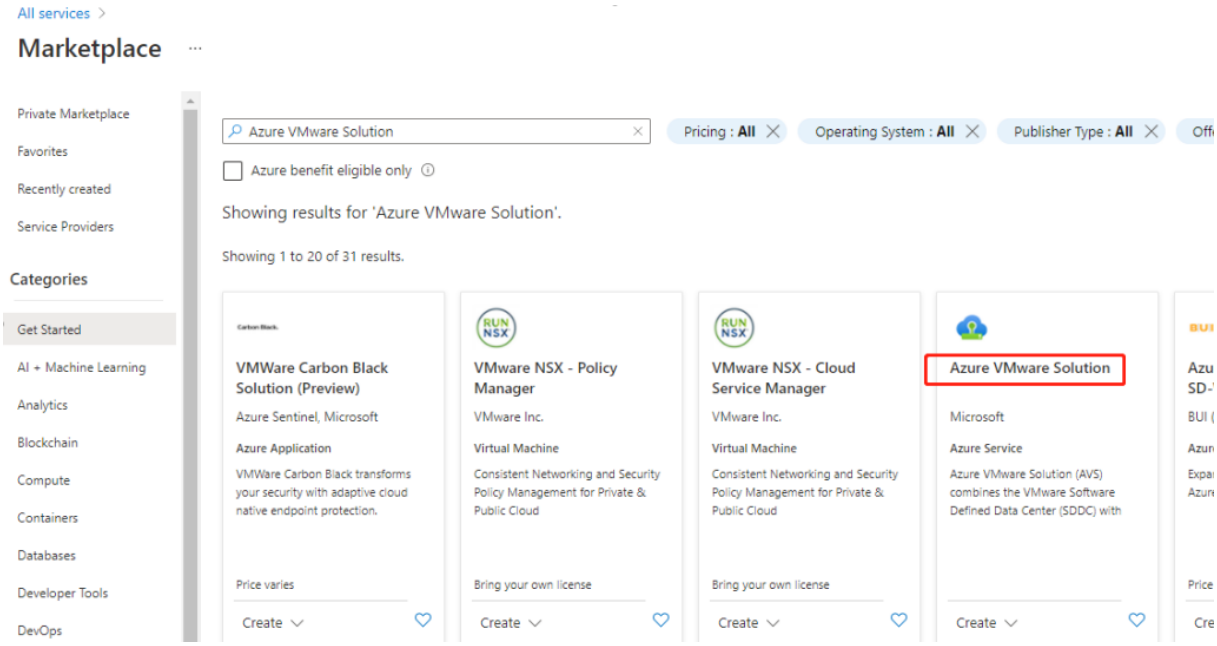
In the **Description** of the support ticket, incldue the following information in the **Details** tab:

- POC or Production
- Region Name
- Number of hosts
- Any other details

> **Note:**
>
> AVS requires a minimum of three hosts, and recommends that you use redundancy of N+1 hosts.

After specifying details for the support ticket, select **Review + Create** to submit the request to Azure.

Register the Microsoft.AVS resource provider After requesting the host quota, register the resource provider:



1. Sign in to the Azure portal.
2. On the Azure portal menu, select **All services**.
3. In the **All services** menu, enter the subscription, and select **Subscriptions**.
4. Select the subscription from the subscription list.
5. Select **Resource providers** and enter **Microsoft.AVS** in the search bar.
6. If the resource provider is not registered, select **Register**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Networking considerations AVS offers networking services requiring specific network address ranges and firewall ports. See Networking planning checklist for Azure VMware Solution for more information.

Create an Azure VMware Solution private cloud After conidering network requirements for your environment, create a ASV private cloud:

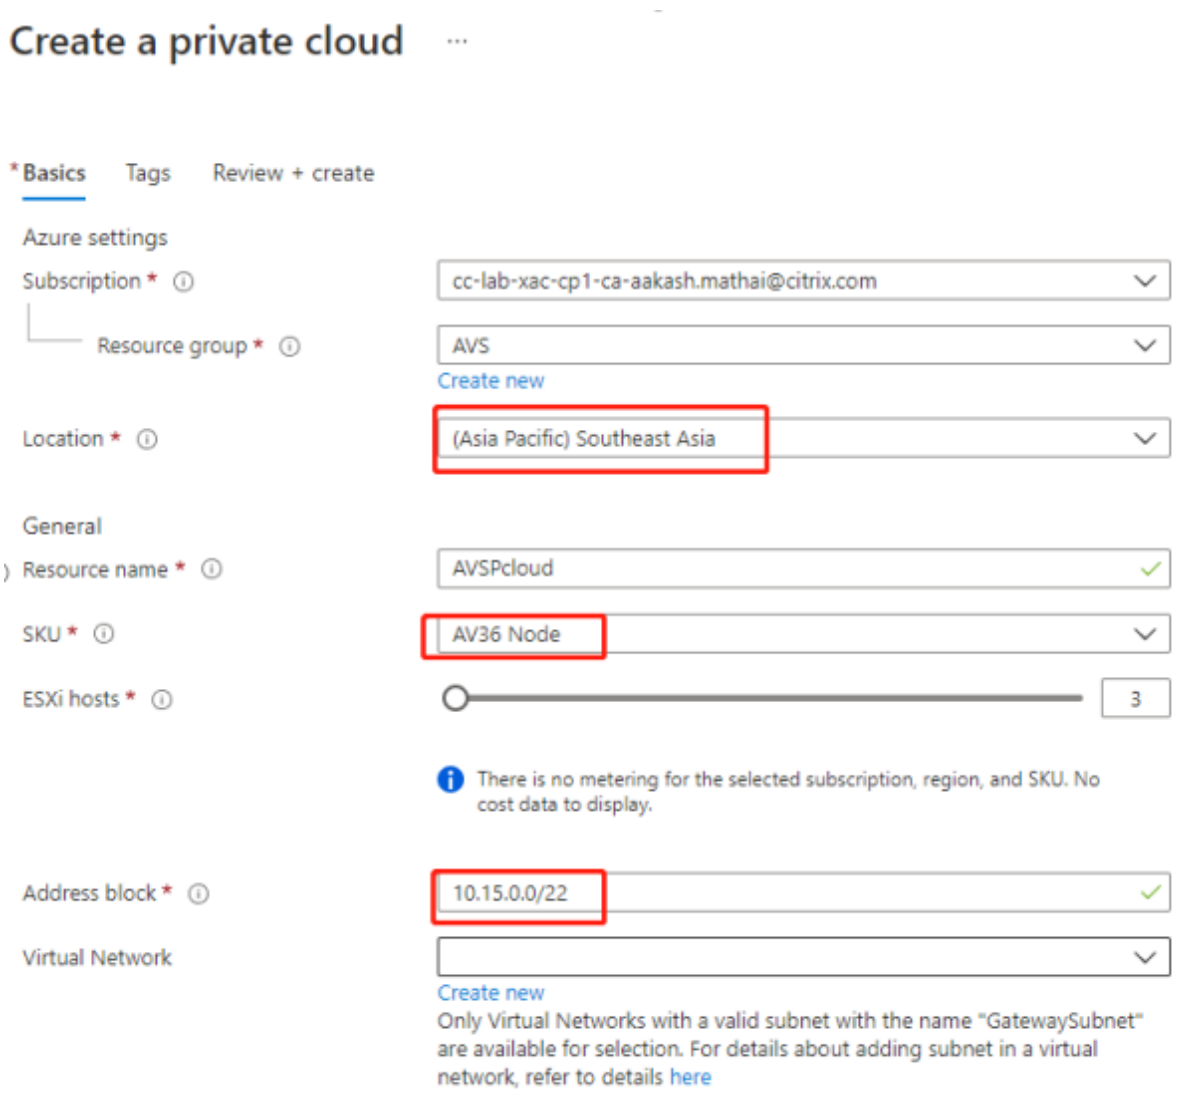
1. Sign in to the Azure portal.
2. Select **Create a new resource**.
3. In the **Search the Marketplace** text box type, *Azure VMware Solution*, and select **Azure VMware Solution** from the list.

image

In the **Azure VMware Solution** window:

1. Select **Create**.
2. Click the **Basics** tab.
3. Enter values for the fields, using the information in the table below:

Field	Value
Subscription	Select the subscription you plan to use for the deployment. All resources in an Azure subscription are billed together.

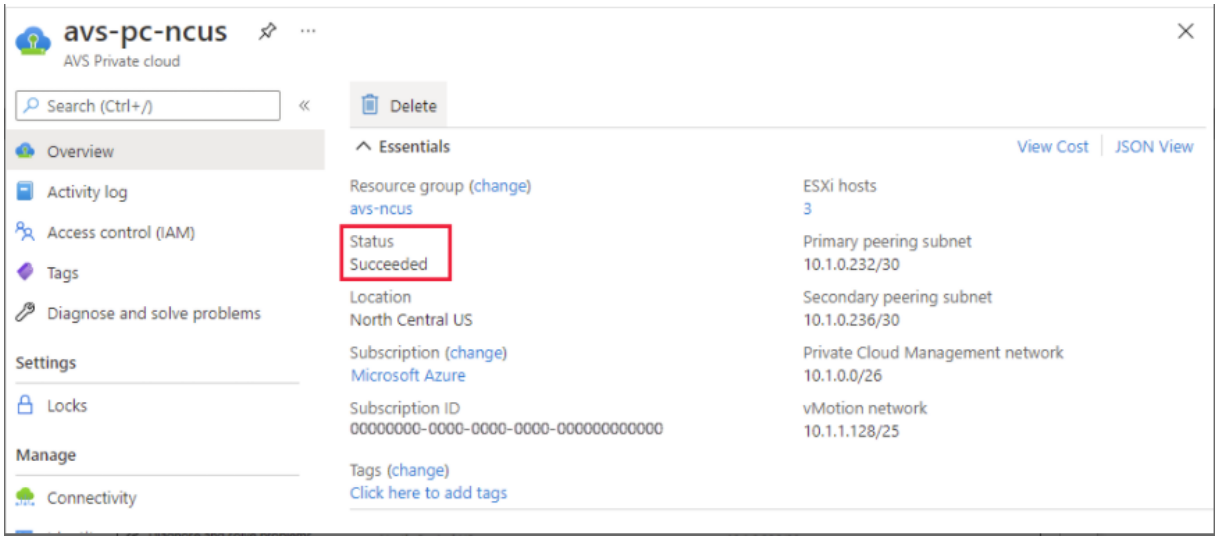


© 1997–2026 Citrix Systems, Inc. All rights reserved.

Field	Value
Resource group	Select the resource group for your private cloud. An Azure resource group is a logical container into which Azure resources are deployed and managed. Alternatively, you can create a new resource group for your private cloud.
Location	Select a location, such as east us. This is the region you defined during the planning phase.
Resource name	Provide the name of your Azure VMware Solution private cloud.
SKU	Select AV36.
Hosts	Shows the number of hosts allocated for the private cloud cluster. The default value is 3, which can be raised or lowered after deployment.
Address block	Provide an IP address block for the private cloud. The CIDR represents the private cloud management network and will be used for the cluster management services, such as vCenter Server and NSX-T Manager. Use /22 address space, for example, 10.175.0.0/22. The address should be unique and not overlap with other Azure Virtual Networks as well as with on-premises networks.
Virtual Network	Leave this blank because the Azure VMware Solution ExpressRoute circuit is established as a post-deployment step.

In the **Create a private cloud** screen:

1. In the **Location** field, select the region that has the AVS; the resource group region is the same as the AVS region.
2. In the **SKU** field, select **AV36 Node**.
3. Specify an IP address in the **Address Block** field. For example, 10.15.0.0/22.
4. Select **Review + Create**.
5. After reviewing the information, click **Create**.



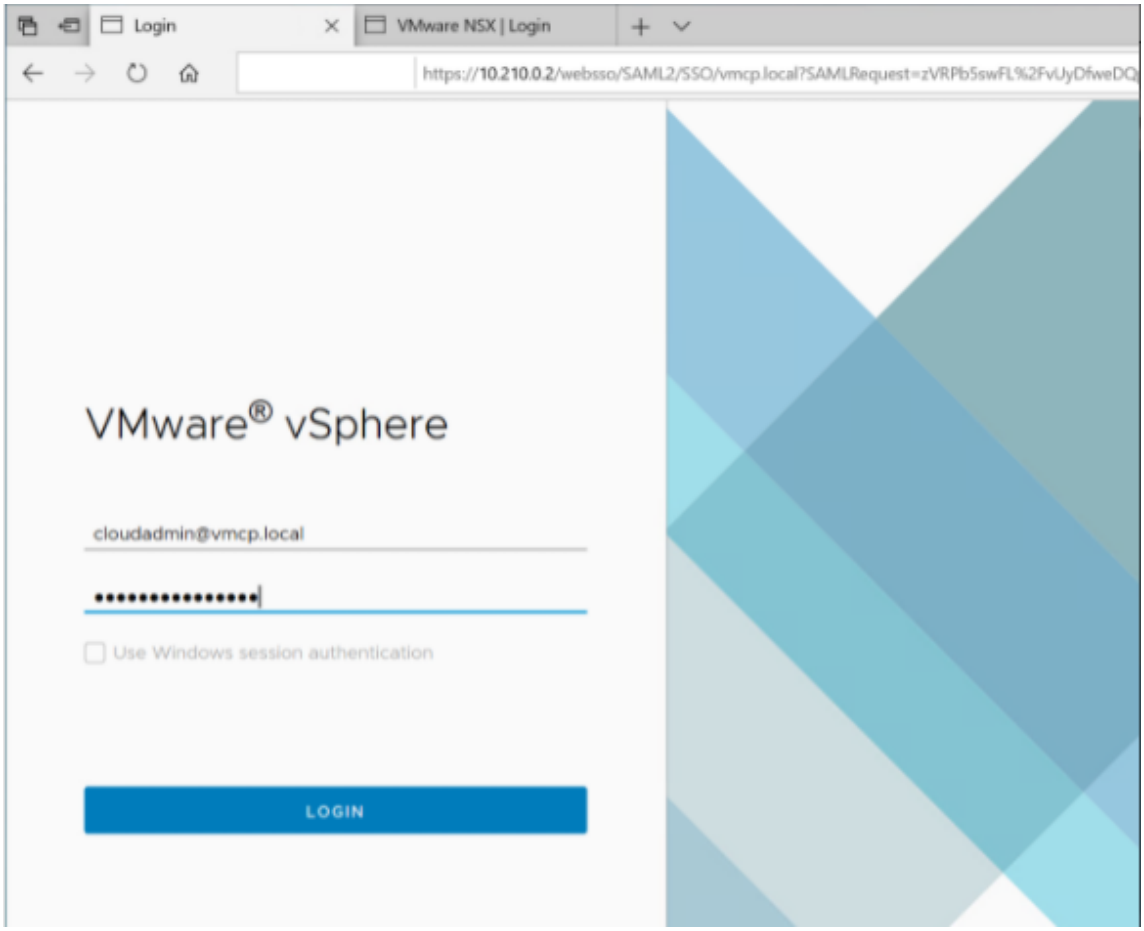
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Tip:**
>
> Creating a private cloud can take 3-4 hours. Adding a single host to cluster can take 30-45 minutes.

Verify that the deployment was successful. Navigate to the resource group you created and select your private cloud. Once the **Status** is **Succeeded** the deployment is complete.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Access an Azure VMware Solution private cloud Once you have created a private cloud, create a Windows VM and connect to the local vCenter of your private cloud.

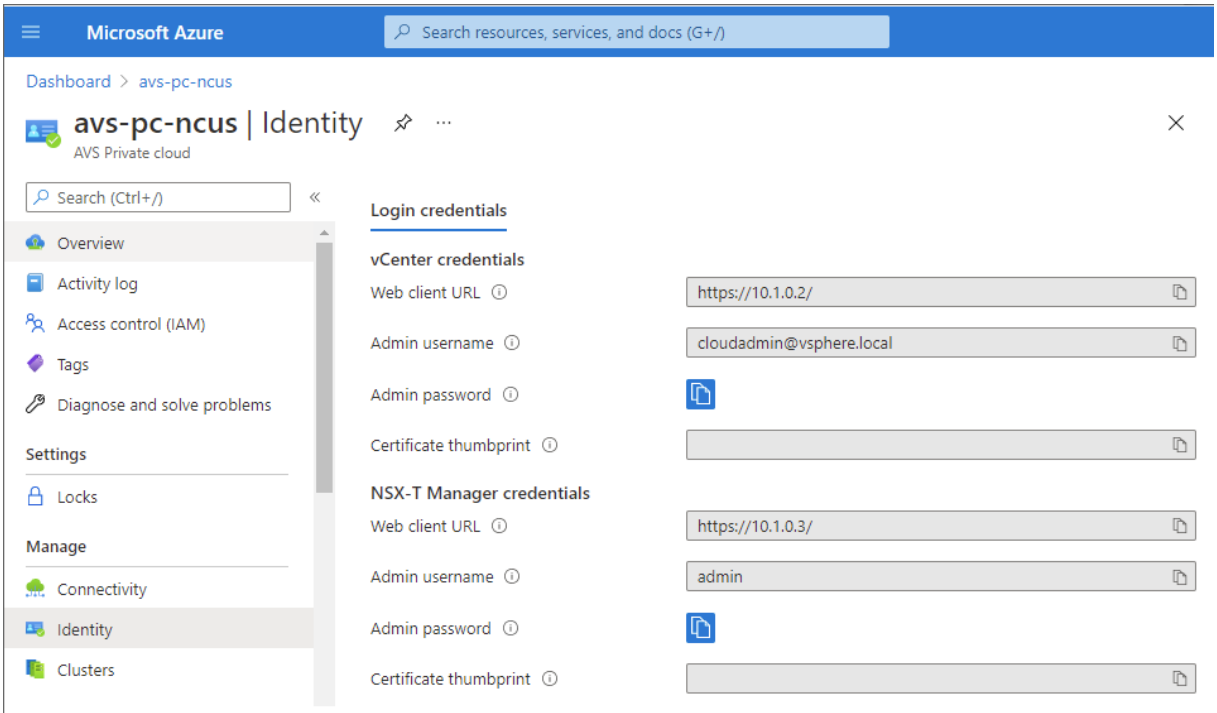


Create a new Windows virtual machine

1. In the resource group, select **+ Add** then search and select **Microsoft Windows 10/2016/2019**.
2. Click **Create**.
3. Enter the required information, then select **Review + Create**.
4. Once validation passes, select **Create** to start the virtual machine creation process.

Connect to the local vCenter of your private cloud

1. Sign in to **vSphere Client with VMware vCenter SSO** as a cloud administrator.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the Azure portal, select your private cloud, and then **Manage> Identity**.

The URLs and user credentials for private cloud vCenter and NSX-T Manager appear:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Display private cloud vCenter and NSX Manager URLs and credentials.

After confirming URLs and user credentials:

1. Navigate to the VM you created in the preceding step and connect to the virtual machine.
2. In the Windows VM, open a browser and navigate to the vCenter and NSX-T Manager URLs in two browser tabs. In the vCenter tab, enter the *cloudadmin@vmcp.local* user credentials from the previous step.

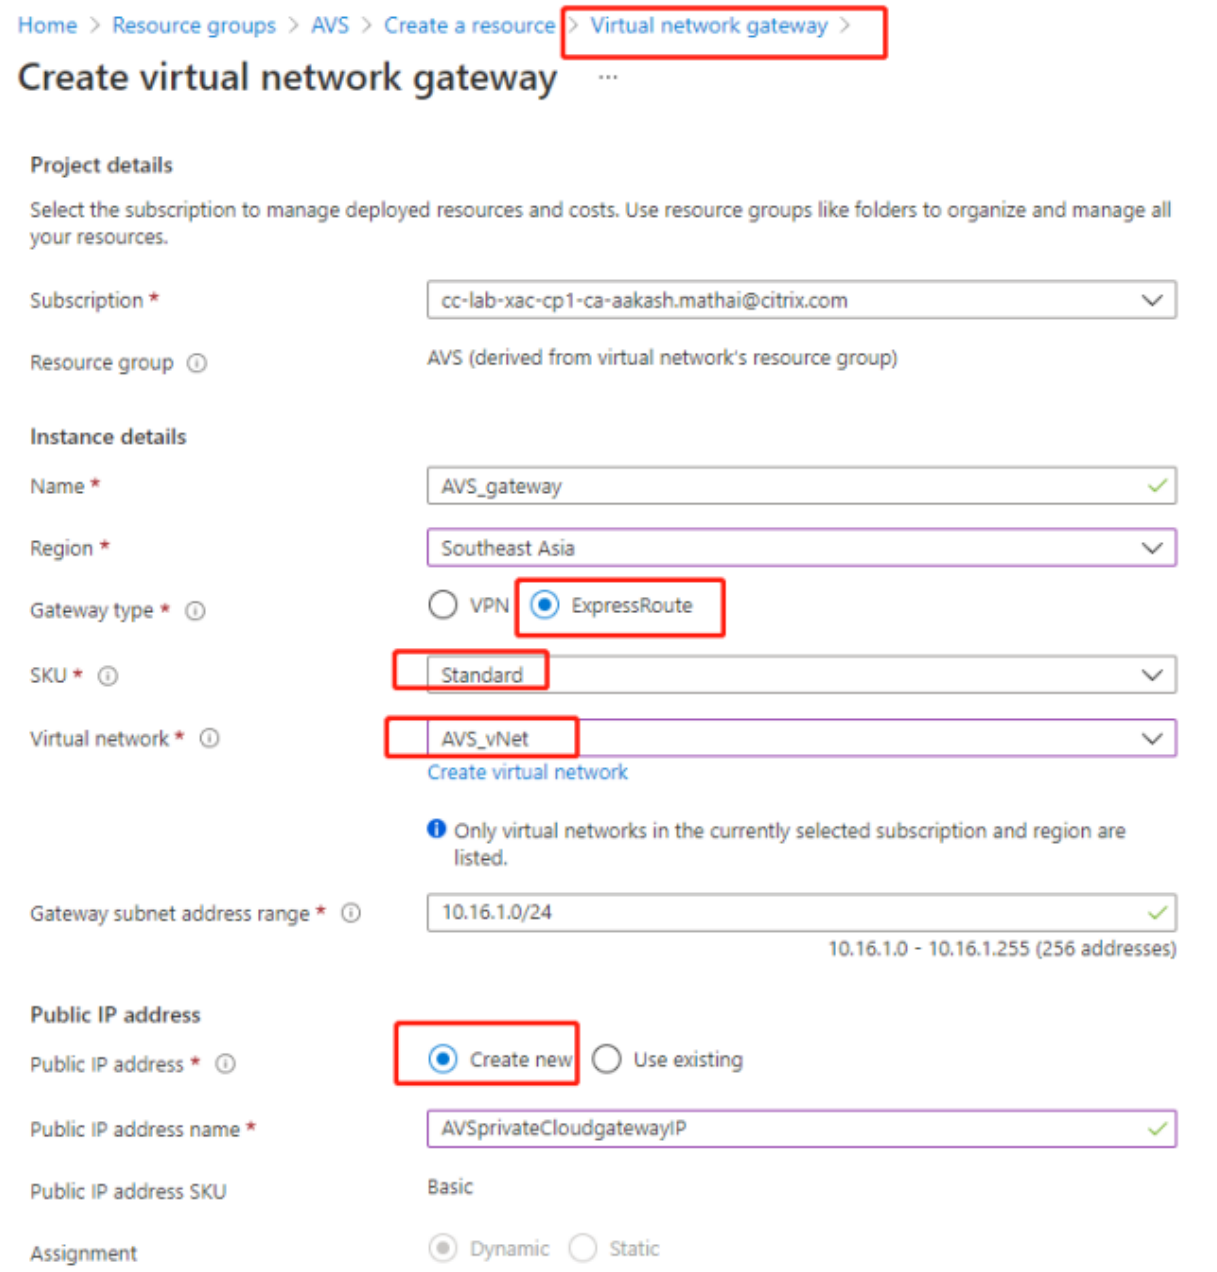
Configure networking for your VMware private cloud in Azure After accessing an ASV private cloud, configure networking by creating a virtual network and gateway.

Create a virtual network

1. Sign in to the Azure portal.
2. Navigate to the previously created resource group.
3. Select **+ Add** to define a new resource.
4. In the **Search the Marketplace** text box, type *virtual network*. Find the virtual network resource and select it.
5. On the **Virtual Network** page, select **Create** to set up the virtual network for your private cloud.
6. On the **Create Virtual Network** page, enter the details for your virtual network.
7. On the **Basics** tab, enter a name for the virtual network, select the appropriate region, and click **Next : IP Addresses.**
8. On the **IP Addresses** tab, under IPv4 address space, enter the previously created address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> Use an address that does not overlap with the address space you used when you created your private cloud.



After entering the address space:

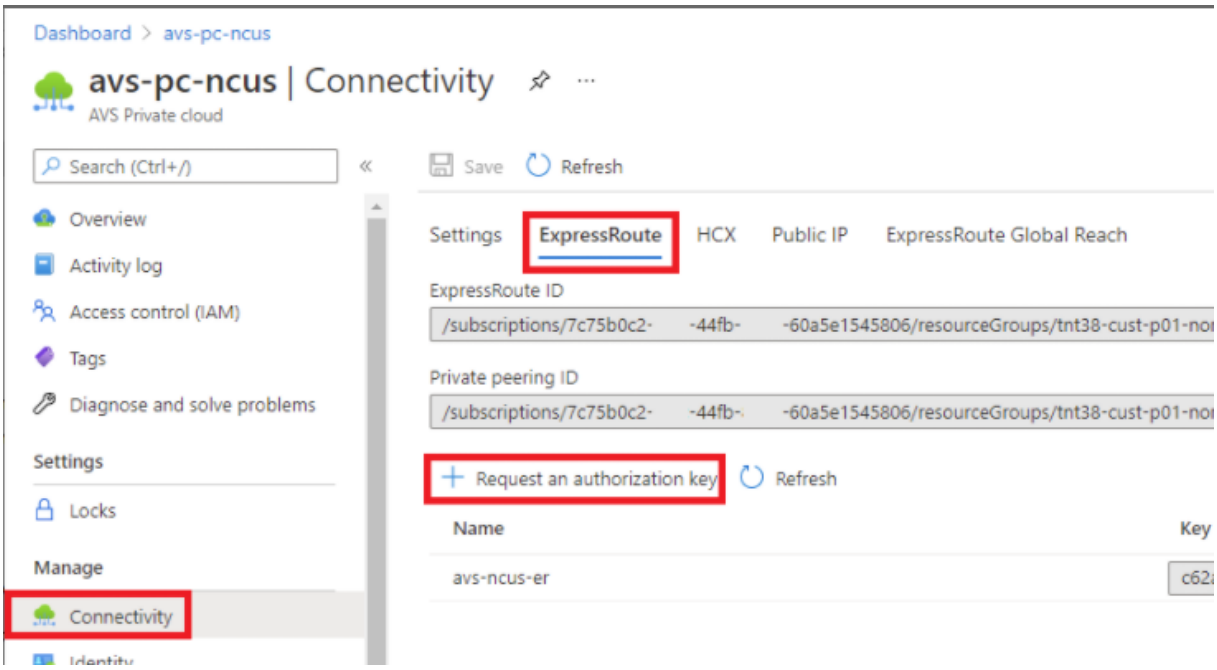
1. Select **+ Add subnet**.
2. On the **Add subnet** page, give the subnet a name and appropriate address range.
3. Click **Add.**
4. Select **Review + create**.
5. Verify the information and click **Create**. Once the deployment is complete, the virtual network appears in the resource group.

Create a virtual network gateway After creating a virtual network, create a virtual network gateway.

1. In your resource group, select **+ Add** to add a new resource.
2. In the **Search the Marketplace** text box, type *virtual network gateway*. Find the virtual network resource and select it.
3. On the **Virtual Network gateway** page, click **Create**.
4. On the **Basics** tab in the **Create virtual network gateway** page, provide values for the fields.
5. Click **Review + create**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After reviewing the virtual network gateway configuration, click **Create** to deploy your virtual network gateway.

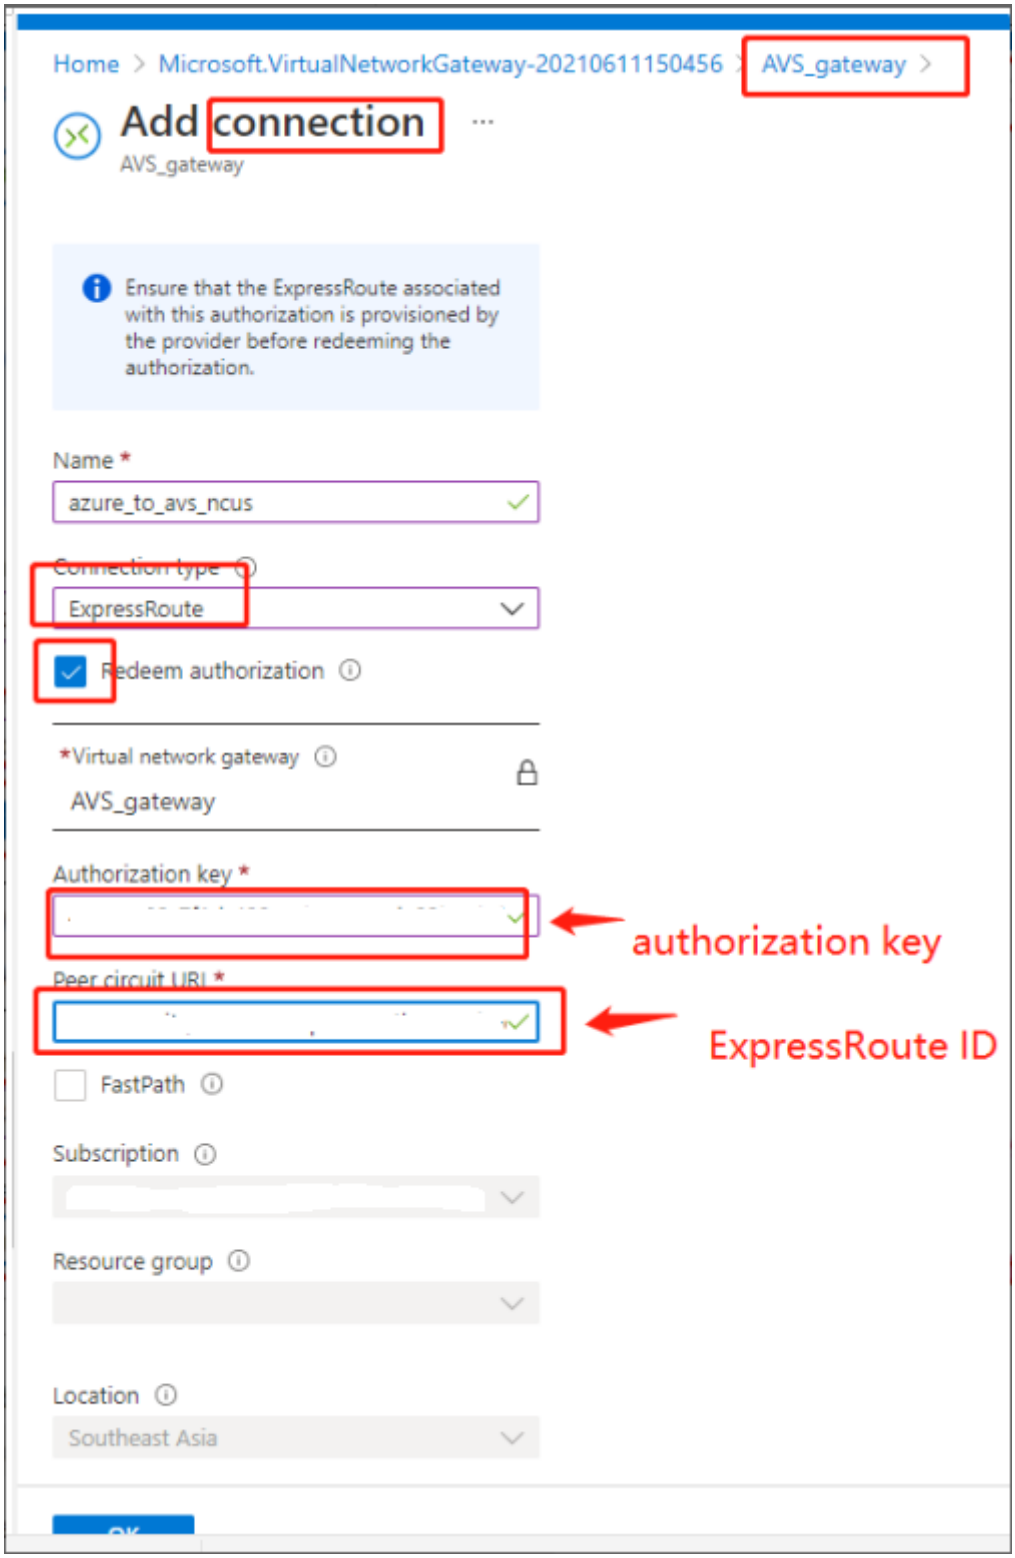


Once the deployment completes, connect your **ExpressRoute** connection to the virtual network gateway containing your Azure AVS private cloud.

Connect ExpressRoute to the virtual network gateway After deploying a virtual network gateway, add a connection between it and your Azure AVS private cloud:

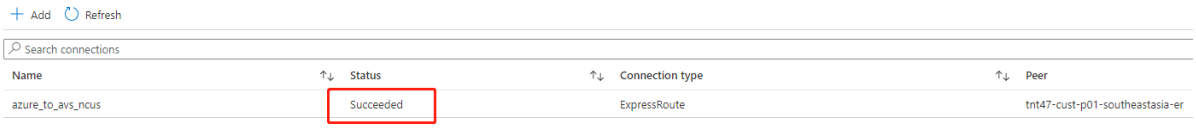
1. Request an ExpressRoute authorization key.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



2. In the Azure portal, navigate to the **Azure VMware Solution private cloud**. Select **Manage> Connectivity > ExpressRoute** and then select **+ Request an authorization key.**

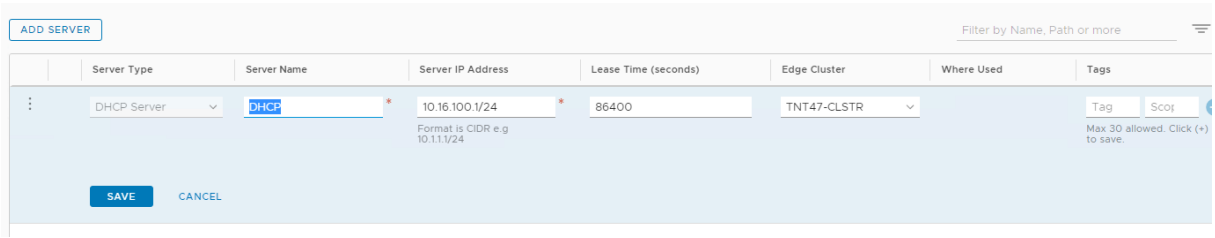
After requesting an authorization key:



1. Enter a name for the key and click **Create**. It may take about 30 seconds to create the key. Once created, the new key appears in the list of authorization keys for the private cloud.
2. Copy the **authorization key** and **ExpressRoute ID**. You'll need them to complete the peering process. The authorization key disappears after some time, so copy it as soon as it appears.
3. Navigate to the **virtual network gateway** you plan to use and select **Connections> + Add**.
4. On the **Add connection** page, provide values for the fields, and select **OK.**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

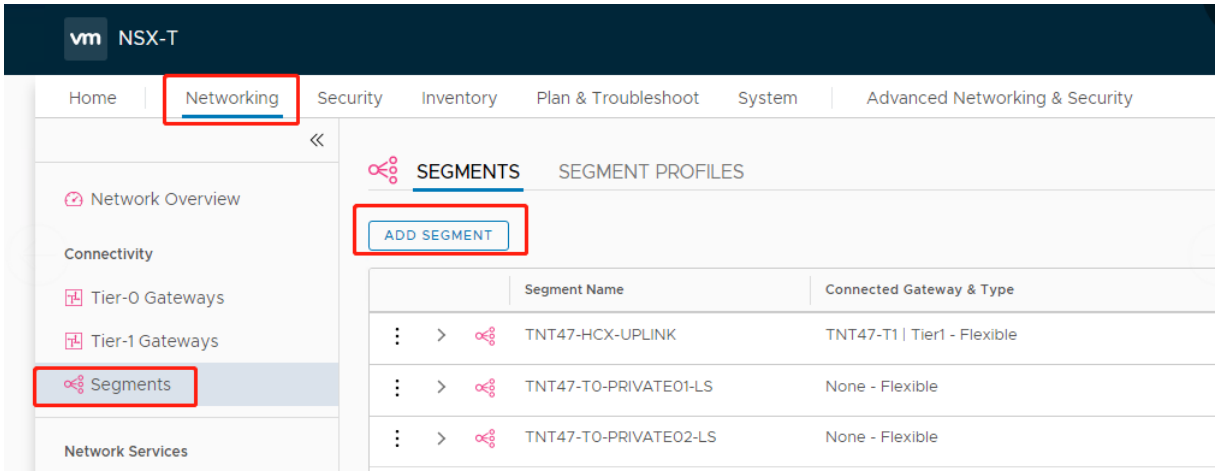
The connection is established between your ExpressRoute circuit and your virtual network:



© 1997–2026 Citrix Systems, Inc. All rights reserved.

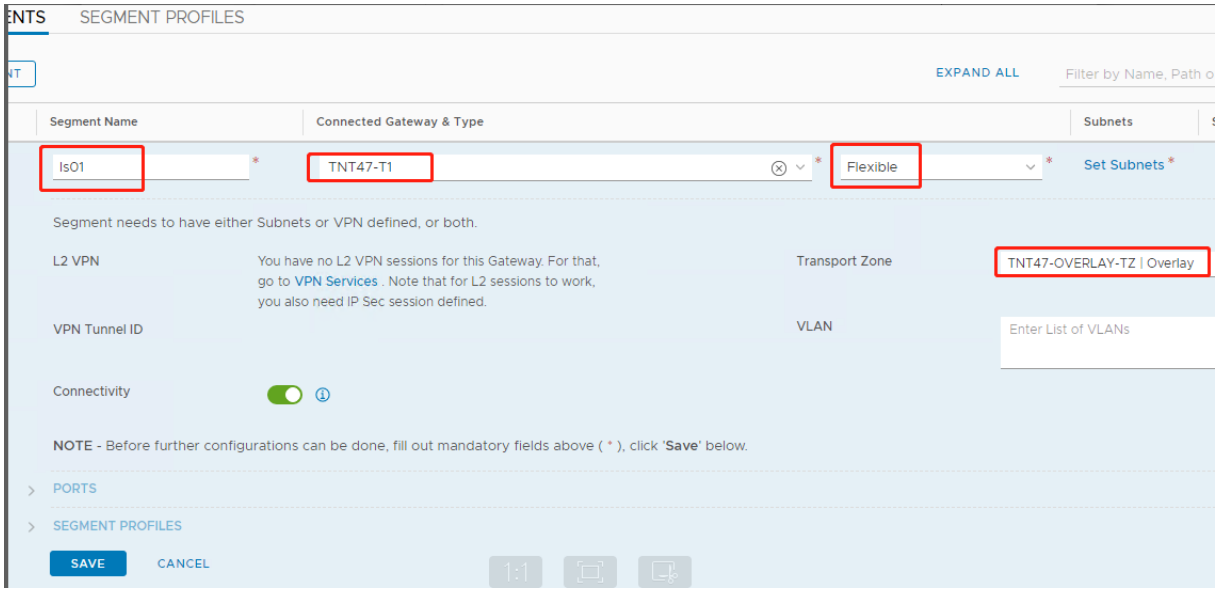
Configure DHCP for Azure VMware Solution After connecting ExpressRoute to the virutal gateway, configure DHCP.

Use NSX-T to host your DHCP server In NSX-T Manager:



1. Select **Networking> DHCP**, and then select **Add Server**.
2. Select **DHCP** for the **Server Type**, provide the server name and IP address.
3. Click **Save**.
4. Select **Tier 1 Gateways**, select the vertical ellipsis on the Tier-1 gateway, and then select **Edit**.
5. Select **No IP Allocation Set** to add a subnet.
6. Select **DHCP Local Server** for the **Type**.
7. For the **DHCP Server**, select **Default DHCP**, and then click **Save**.
8. Click **Save** again and then select **Close Editing**.

Add a network segment in Azure VMware Solution After settnig up DHCP, add a network segment.



To add a network segment, in NSX-T Manager, select **Networking> Segments**, and then click **Add Segment**.

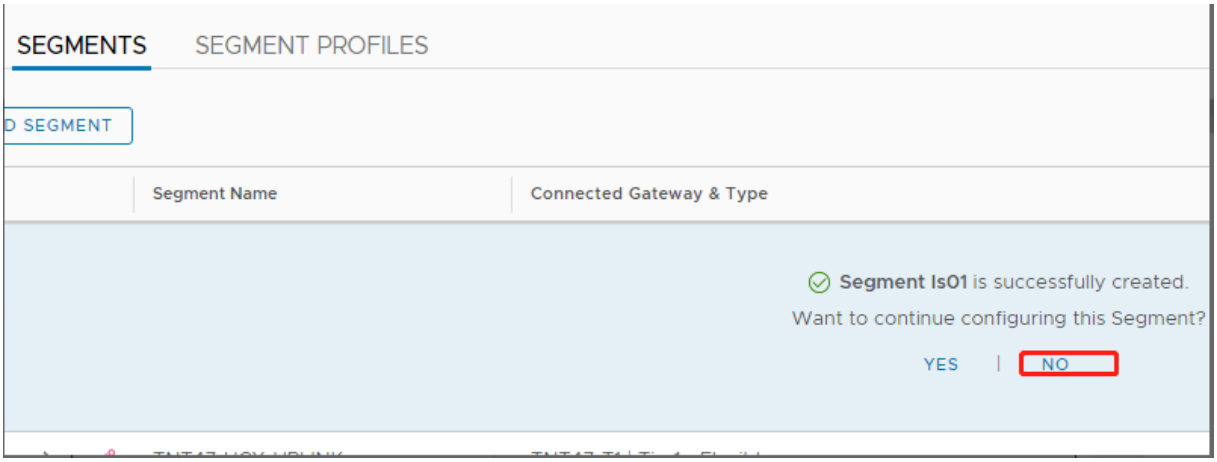
© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the **Segments profile** screen:

1. Enter a **name** for the segment.
2. Select the **Tier-1 Gateway (TNTxx-T1)** as the **Connected Gateway** and leave the **Type** as **Flexible**.
3. Select the pre-configured overlay **Transport Zone(TNTxx-OVERLAY-TZ)**.
4. Click **Set Subnets**.

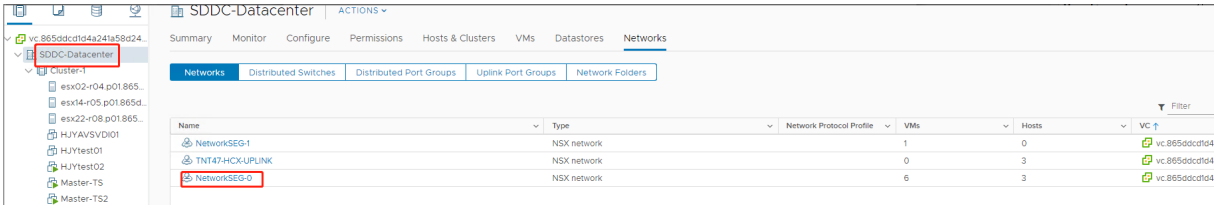
In the **Subnets** section:

1. Enter the gateway IP address.
2. Select **Add**.



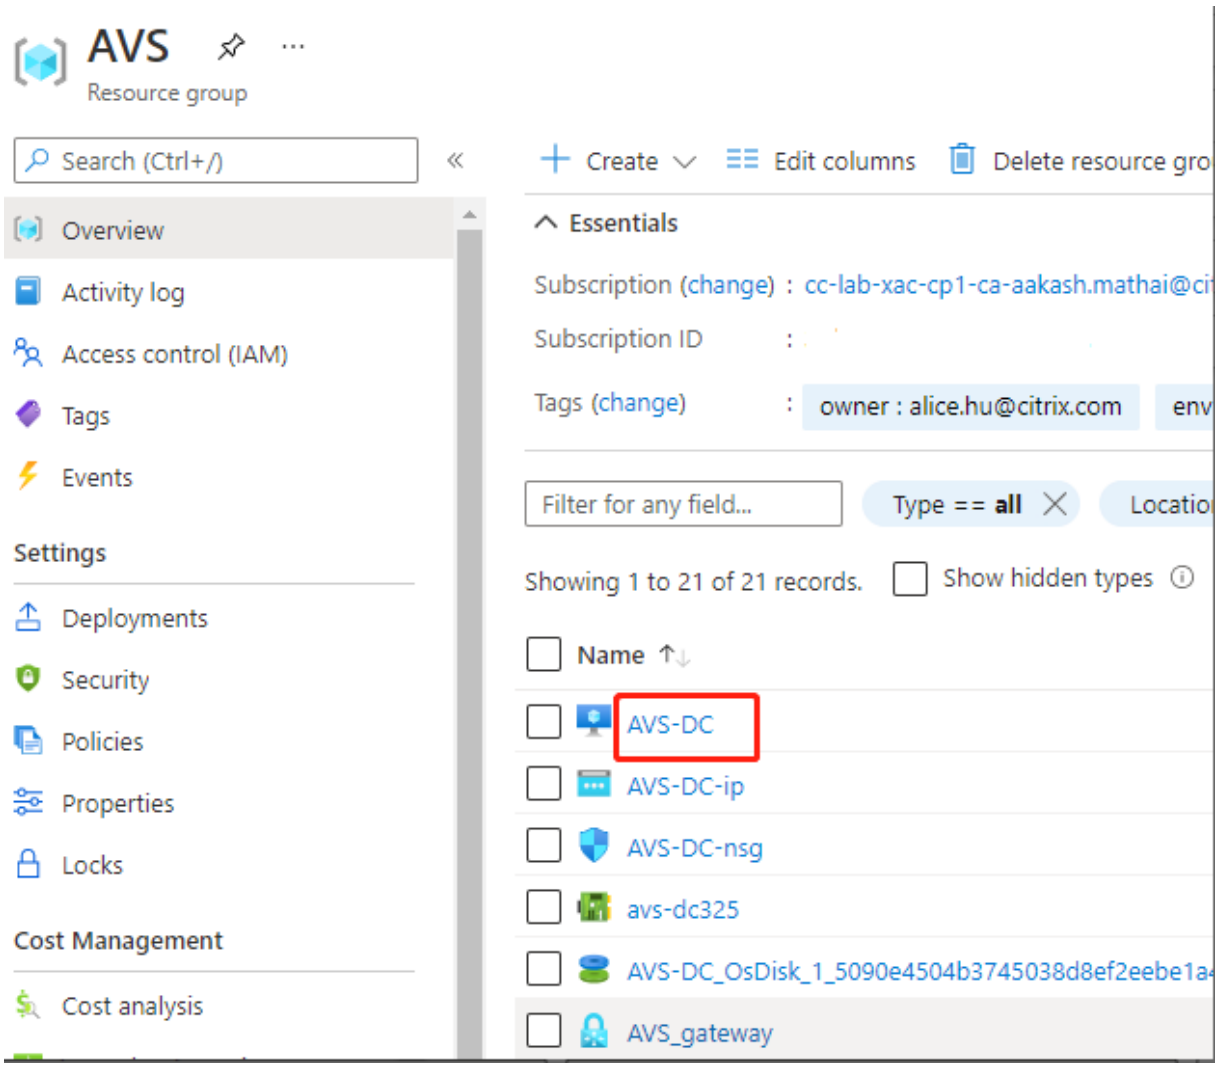
> **Important:**
>
> This segment IP address must belong to the Azure gateway IP address, 10.15.0.0/22.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

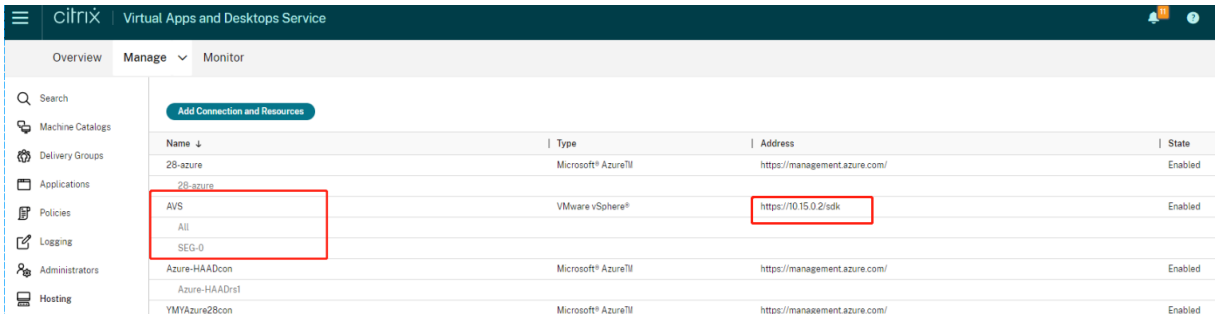


DHCP range should be belong to segment IP address:

Select **No** to decline the option to continue configuring the segment:



In vCenter, select **Networking > SDDC-Datacenter**:



Verify the Azure AVS environment Setup a direct connection and connector in the Azure resource group:

Verify the connection with vCenter credentials:

Google Cloud VMware Engine

Citrix Virtual Apps and Desktops lets you migrate VMware-based on-premises Citrix workloads to Google Cloud VMware Engine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure Google Cloud VMware Engine

The following procedure describes how to acquire and set up cluster on Google Cloud VMware Engine.

Access the VMware Engine portal

1. In the **Google Cloud Console**, click the navigation menu.
2. In the **Compute** section, click **VMware Engine** to open VMware Engine in a new browser tab.

Requirements to create first private cloud You must have access to Google Cloud VMware Engine, available VMware Engine node quota, and an appropriate IAM role. Prepare the following requirements before you continue to create your private cloud:

1. Request API access and node quota. For more information, see Requesting API access and quota.
2. Note the address ranges you want to use for VMware management appliances and the HCX deployment network. For more information, see Networking requirements.
3. Get the VMware Engine Service Admin IAM role.

Create your first private cloud

1. Access the VMware Engine portal.
2. On the VMware Engine Home page, click **Create a private cloud**. The hosting location and hardware node types are listed.
3. Select the number of nodes for the private cloud. At least three nodes are required.
4. Enter a Classless Inter-Domain Routing (CIDR) range for the VMware management network.
5. Enter a CIDR range for the HCX deployment network.

   > **Important:**
   >
   > The CIDR range must not overlap with any of your on-premises or cloud subnets. The CIDR range must be /27 or higher.

6. Select **Review and create**.
7. Review the settings. To change any settings, click **Back**.
8. Click **Create** to begin creating the private cloud.

As VMware Engine creates your new private cloud, it deploys several VMware components and sets up initial Autoscale™ policies for clusters in the private cloud. Private cloud creation can take 30 minutes to 2 hours. After the provisioning is complete, you receive an email.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set up Google Cloud VMware Engine VPN Gateway To establish an initial connectivity to Google Cloud VMware Engine, you can use a VPN gateway. This is an OpenVPN-based client VPN using which you can connect to your VMware Software Defined Data Center (SDDC) vCenter and do any initial configuration required.

Before deploying VPN gateway, configure the **Edge Services** range for the region where your SDDC is deployed. To do this:

1. Log on to the **Google Cloud VMware Engine** portal, and go to **Network > Regional Settings**. Click **Add Region**.
2. Choose the region where your SDDC is deployed and enable **Internet Access** and **Public IP Service**.
3. Supply the Edge Services range noted during planning and click **Submit**. Enabling these services take 10–15 minutes.

   Once complete, the Edge Services show as **Enabled** on the Regional Settings page. Enabling these settings allow Public IPs to be allocated to your SDDC, which is a requirement for deploying a VPN gateway.

To deploy a VPN gateway:

1. In the **Google Cloud VMware Engine** portal, go to **Network > VPN Gateways**. Click **Create New VPN Gateway**.
2. Supply the name for the VPN gateway and the client subnet reserved during planning. Click **Next**.
3. Select users to grant VPN access. Click **Next**.
4. Specify the networks that must be accessible over VPN. Click **Next**.
5. A summary screen is displayed. Verify the selections, and click **Submit** to create the VPN Gateway. The VPN Gateways page is displayed with the status of the new VPN gateway as **Creating**.
6. After the status changes to **Operational**, click the new VPN gateway.
7. Click **Download my VPN configuration** to download a ZIP file containing pre-configured OpenVPN profiles for the VPN gateway. Profiles for connecting through UDP/1194 and TCP/443 are available. Choose your preference and import it into Open VPN, and then connect.
8. Go to **Resources** and select your SDDC.

Connect the VPN

1. Establish a point-to-site connection between your on-premises network and the private cloud through the VPN Gateway setup. See Set up Google Cloud VMware Engine VPN Gateway.
2. Upload the VPN configuration downloaded in Set up Google Cloud VMware Engine VPN Gateway.
3. Import to your VPN client, for example, OpenVPN Connect.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information, see Connecting using VPN.

Create first subnet

Access NSX-T Manager from the VMware Engine portal The process of creating a subnet happens in NSX-T, which you access through VMware Engine. Do the following to access NSX-T Manager.

1. Log on to the **Google Cloud VMware Engine** portal.
2. From the main navigation, go to **Resources**.
3. Click the **Private cloud name** corresponding to the private cloud where you want to create the subnet.
4. On the details page of your private cloud, click the **vSphere Management Network** tab.
5. Click the **FQDN** corresponding to the NSX-T Manager.
6. When prompted, enter your sign-in credentials. If you have set up vIDM and connected it to an identity source, such as Active Directory, use your identity source credentials instead.

   > **Reminder:**
   >
   > You can retrieve generated credentials from the private cloud details page.

Set up DHCP service for the subnet Before you can create a subnet, set up a DHCP service:

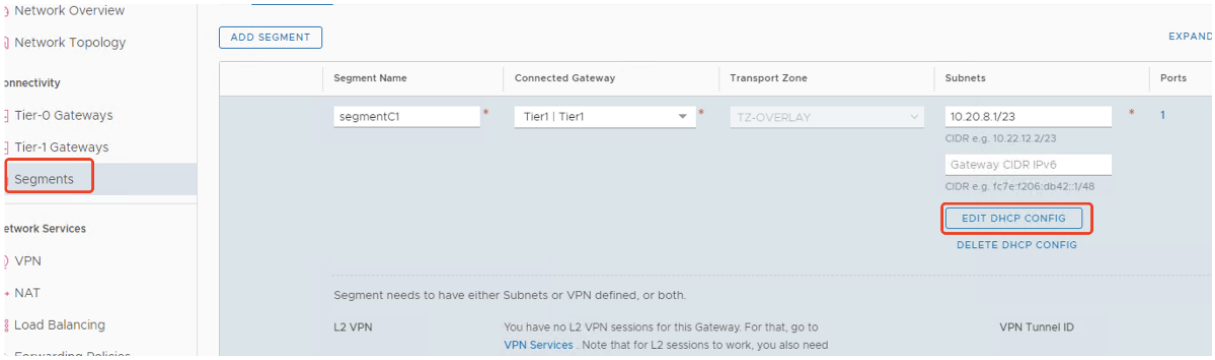
In NSX-T Manager:

1. Go to **Networking > DHCP**. The networking dashboard shows that the DHCP service creates one Tier-0 and one Tier-1 gateway.
2. To begin provisioning a DHCP server, click **Add Server**.
3. Select **DHCP** for the **Server Type**, provide the server name and IP address.
4. Click **Save** to create the DHCP service.

Do the following to attach this DHCP service to the relevant Tier-1 gateway. A default Tier-1 gateway is already provisioned by the DHCP service:

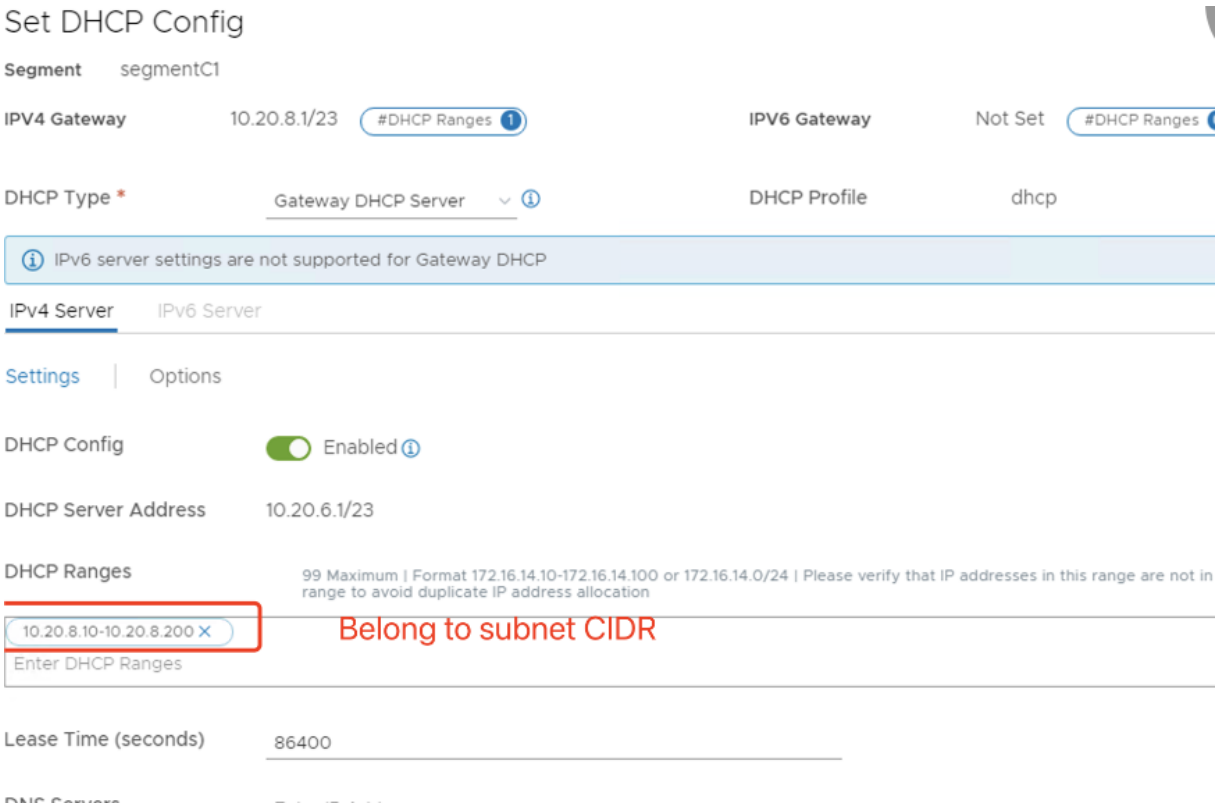
1. Select **Tier 1 Gateways**, select the vertical ellipsis on the Tier-1 gateway, and then select **Edit**.
2. In the **IP Address Management** field, select **No IP Allocation Set**.
3. Select **DHCP Local Server** for the **Type**.
4. Select the DHCP server that you created for the **DHCP Server**.
5. Click **Save**.
6. Click **Close Editing**.

You can now create a network segment in NSX-T. For more information about DHCP in NSX-T, see the VMware documentation for DHCP.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

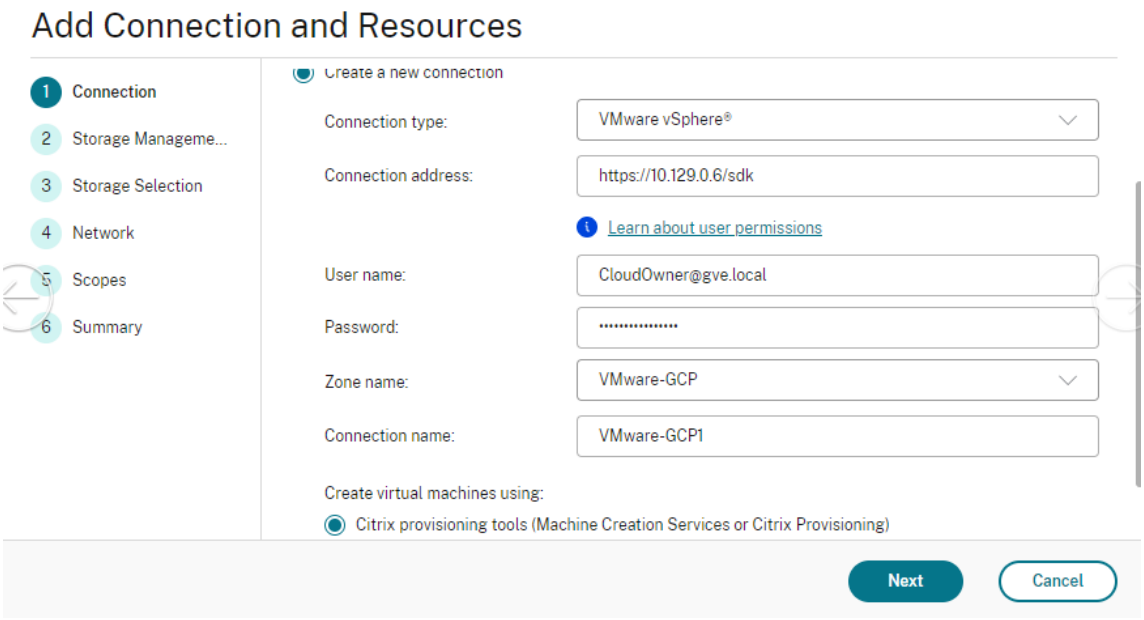
Create a network segment in NSX-T For workload VMs, you create subnets as NSX-T network segments for your private cloud:



1. In NSX-T Manager, go to **Networking > Segments**.
2. Click **Add Segment**.
3. Enter a name for the segment.
4. Select the **Tier-1** as the **Connected Gateway** and leave the Type as **Flexible**.
5. Click **Set Subnets**.
6. Click **Add Subnets**.
7. Enter the subnet range in the **Gateway IP/Prefix Length**. Specify the subnet range with **.1** as the last octet. For example, **10.12.2.1/24**.
8. Specify the DHCP Ranges and click **ADD**.
9. In **Transport Zone**, select **TZ-OVERLAY** from the drop-down list.
10. Click **Save**. You can now select this network segment in vCenter when creating a VM.

In a given region, you can set up at most 100 unique routes from VMware Engine to your VPC network using private services access. This includes, for example, private cloud management IP address ranges, NSX-T workload network segments, and HCX network IP address ranges. This limit includes all private clouds in the region.

> **Note:**
>
> There is a Google Cloud configuration issue because of which you need to configure DHCP range setting several times. Therefore, make sure to configure the DHCP range setting after Google Cloud configuration. Click **EDIT DHCP CONFIG** to configure the DHCP ranges.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create the Google Cloud VMware connection in Citrix Studio

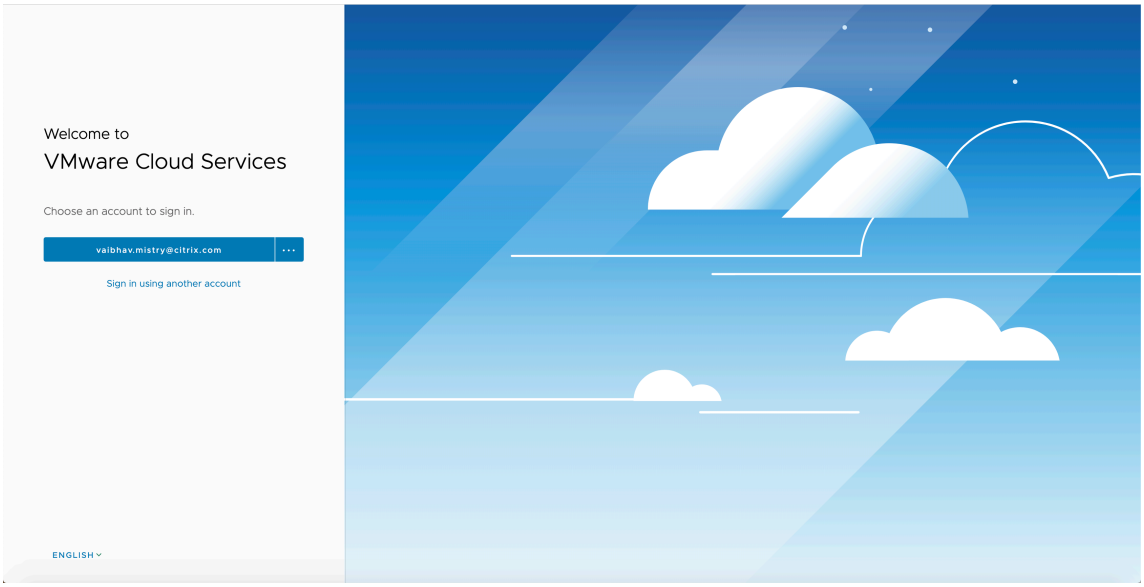
1. Create a machine in vCenter.
2. Launch the Citrix Studio.
3. Select the hosting node, and click **Add Connection and Resources**.
4. On the **Connection** screen, select **Create a new Connection**, and the following details:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Select **Connection type** as **VMware vSphere**.
b) In the **Connection address**, enter the vCenter private IP address.
c) Enter the vCenter credentials.
d) Enter a connection name.
e) Choose the tool to create virtual machines.

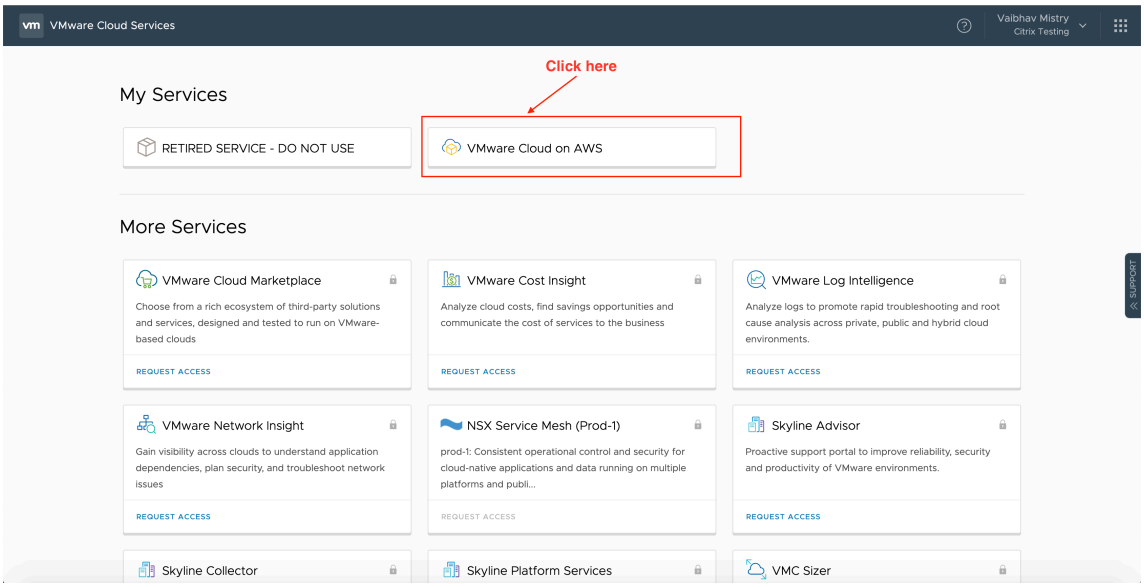
5. On the **Network** screen, select the subnet created in NSX-T server.
6. Complete the wizard.

VMware cloud on Amazon Web Services (AWS)



VMware cloud on Amazon Web Services (AWS) enables you to migrate VMware based on-premises Citrix workloads to AWS Cloud.

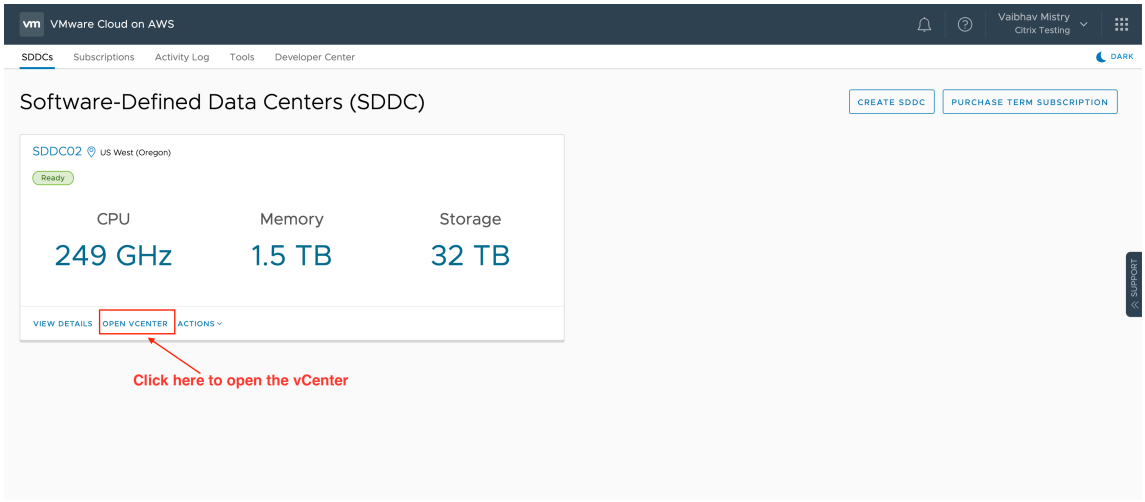
This article describes the procedure to set up a VMware cloud on AWS.

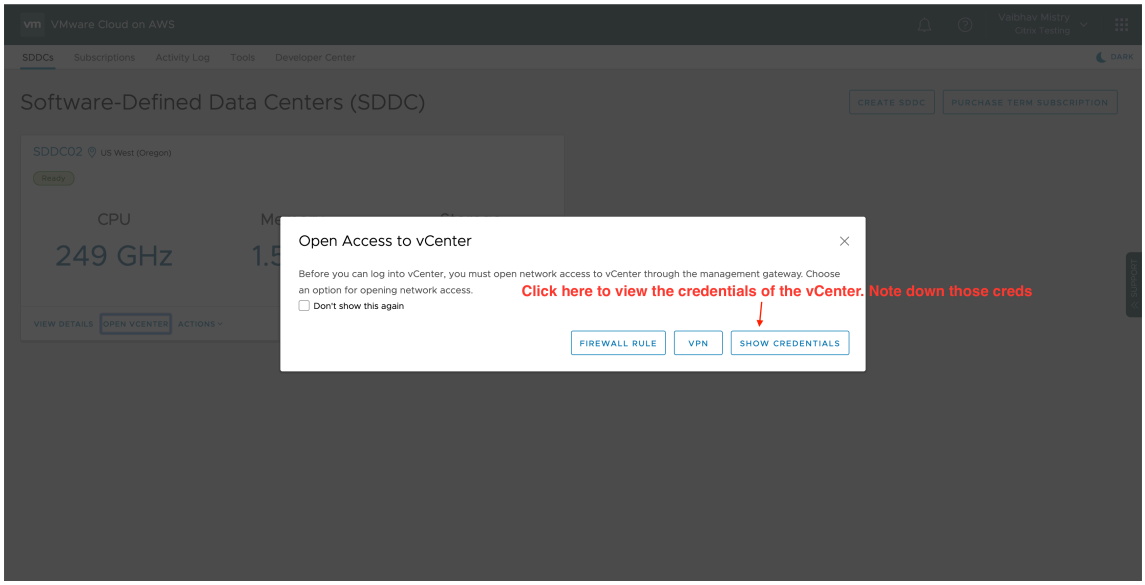


Access the VMware cloud environment

1. Log in to VMware cloud services using the URL https://console.cloud.vmware.com/.

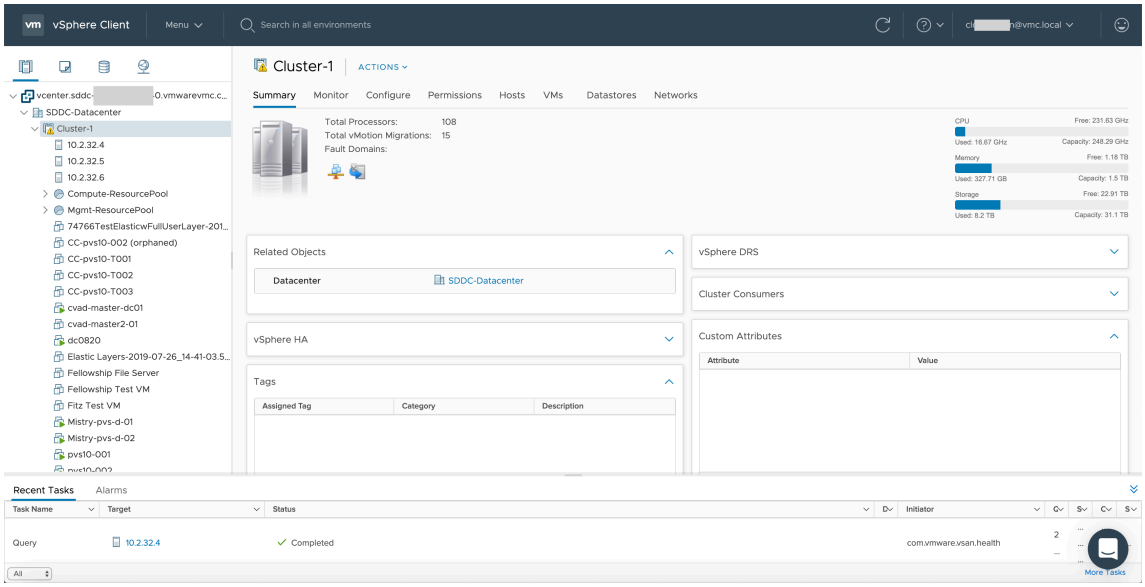
© 1997–2026 Citrix Systems, Inc. All rights reserved.





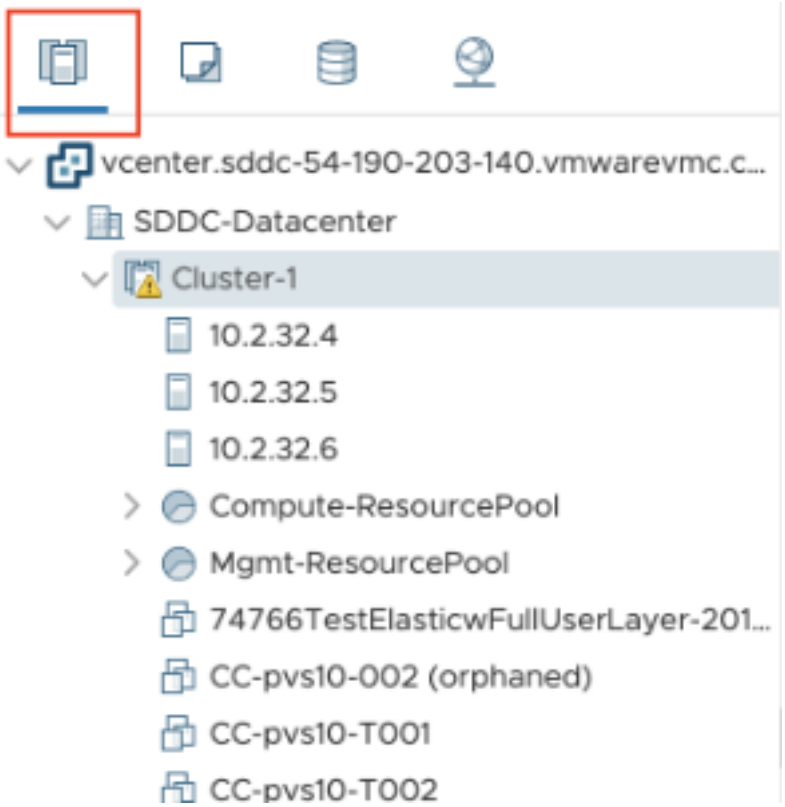
2. Click **VMware Cloud on AWS**. The page Software-Defined Data Centers (SDDC) appears.

3. Click **OPEN VCENTER**, and then click **SHOW CREDENTIALS**. Note the credentials for later use.



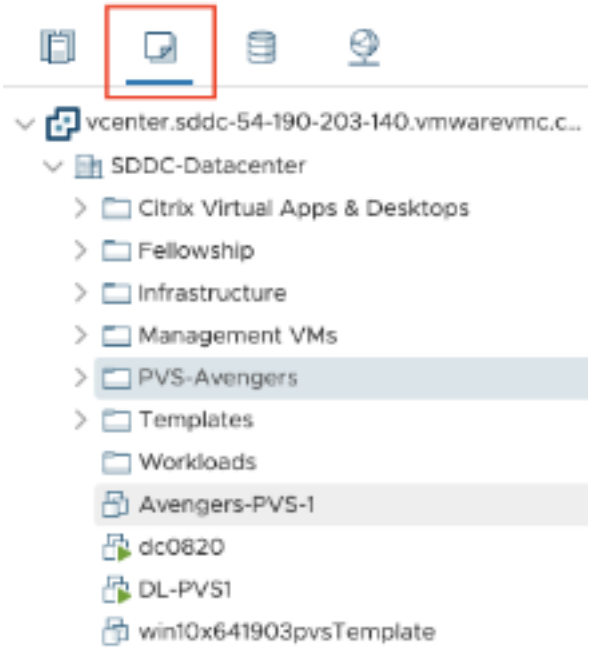
© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Open a Web browser and enter the URL for the vSphere Web Client.
5. Enter the credentials as noted and click **Login**. The vSphere client webpage is similar to the on-premises environment.



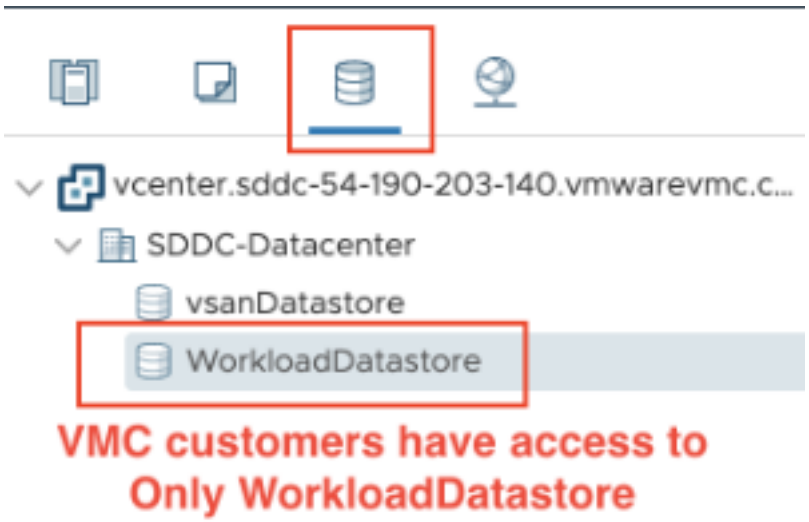
© 1997–2026 Citrix Systems, Inc. All rights reserved.

About VMware cloud environment



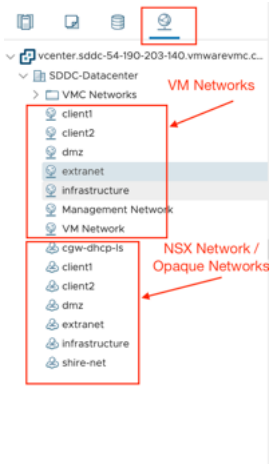
There are four views on the vSphere client webpage.

- Host and Cluster view: You cannot create a new Cluster, but the cloud admin can create multiple resource pools.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- VM and Template view: Cloud admin can create many folders.



- Storage View: Select **WorkloadDatastore** storage when you add hosting unit in the Citrix Studio because you have access to only Workload Datastore.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Network View: The icons are different for VMware cloud networks and opaque networks.

After you set up the cluster, refer to VMware virtualization environments for adding connections and resources.

Where to go next

- Install core components
- Install VDAs
- Create a site

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For creating and managing a connection, see Connection to VMware cloud and partner solutions

More information

- Create and manage connections and resources
- Create machine catalogs

Install core components

May 15, 2026

> **Important:**
>
> - Citrix collects basic licensing data as necessary for its legitimate interests, including license compliance. For more information, see Citrix Licensing Data.
> - Ensure the License Server is running a minimum of version 11.17.2 build 53100. Failure to meet this prerequisite will block the Citrix Virtual Apps and Desktops site upgrades and site creation.

The core components are the Citrix Delivery Controller™, Citrix Studio, Web Studio, Citrix Director, and Citrix License Server.

> **Note:**
>
> Citrix Studio is a Windows-based management console that lets you configure and manage your on-premises Citrix Virtual Apps and Desktops deployment. Web Studio is the next generation of Citrix Studio —a web-based management console offering full feature parity with Citrix Studio. For more information about Web Studio, see Install Web Studio.

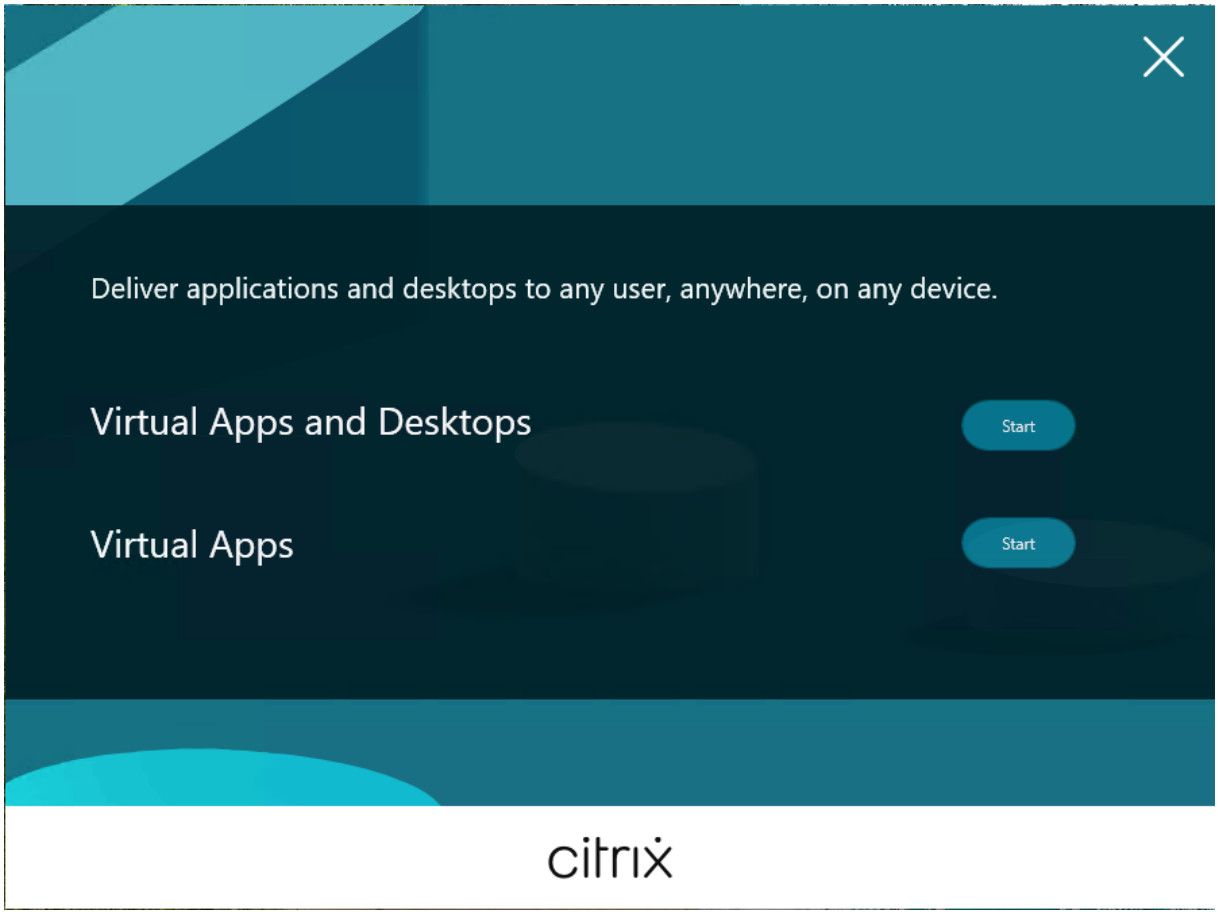
(In versions before 2003, core components included Citrix StoreFront. You can still install StoreFront by clicking the **Citrix StoreFront** tile or running the command available on the installation media.)

Before you start an installation, review this article and Prepare to install.

This article describes the installation wizard sequence when installing core components. Command-line equivalents are provided. For more information, see Install using the command line.

Step 1. Download the product software and launch the wizard

Use your Citrix account credentials to access the Citrix Virtual Apps and Desktops™ download page. Download the product ISO file.



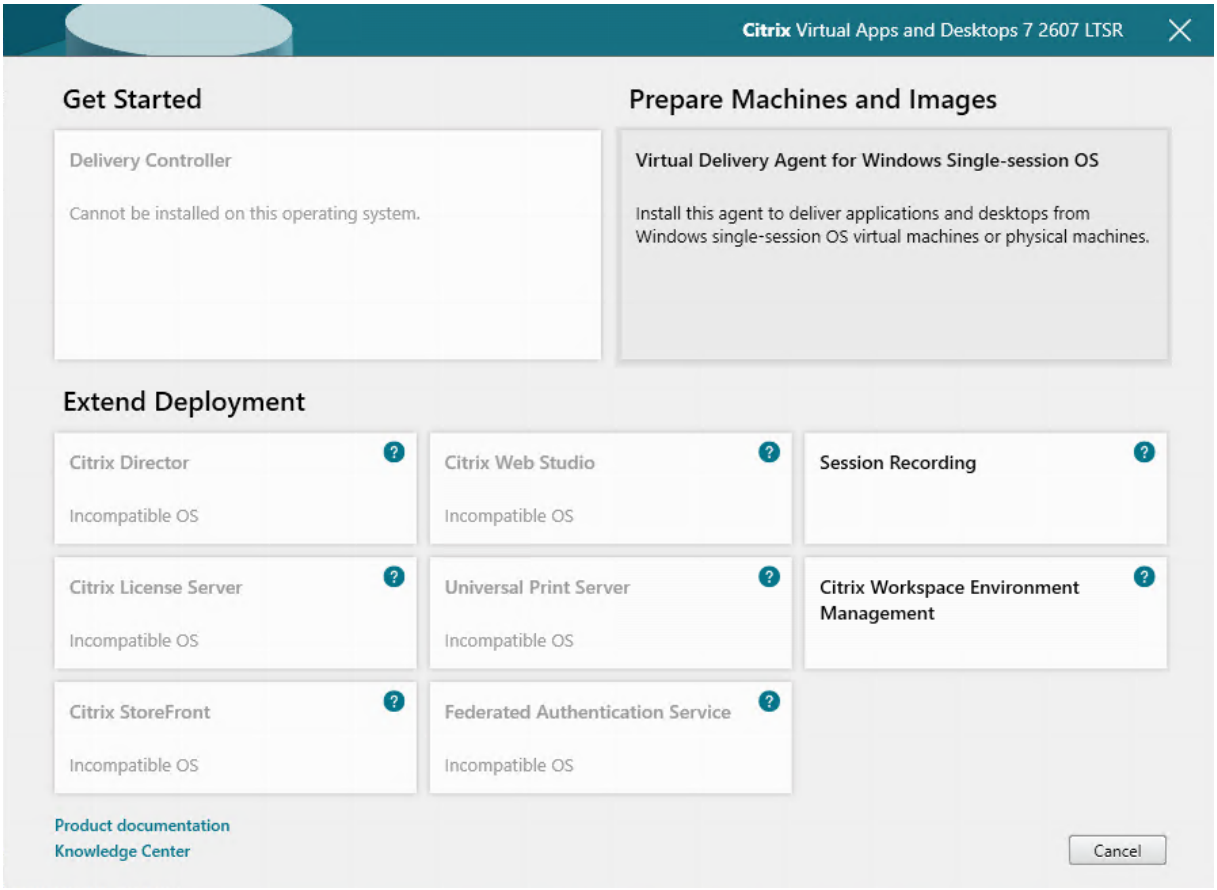
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Unzip the file. Optionally, burn a DVD of the ISO file.

Log on to the machine where you are installing the core components, using a local administrator account.

Insert the DVD in the drive or mount the ISO file. If the installer does not launch automatically, double-click the **AutoSelect** application or the mounted drive.

Step 2. Choose which product to install



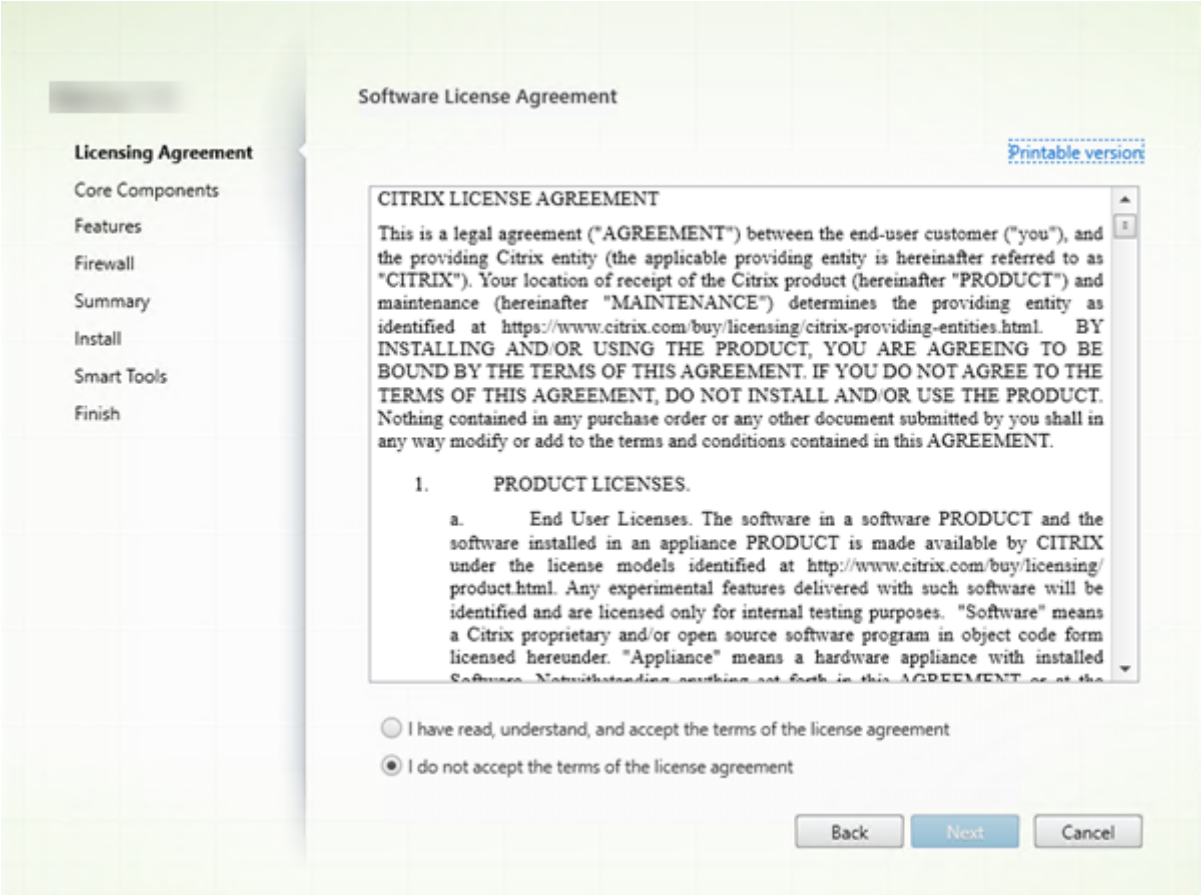
Click **Start** next to the product to install: Virtual Apps or Virtual Apps and Desktops.

(If the machine already has Citrix Virtual Apps and Desktops™ components installed on it, this page does not appear.)

Command-line option: `/xenapp` to install Citrix Virtual Apps. Citrix Virtual Apps and Desktops is installed if option is omitted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 3. Choose what to install

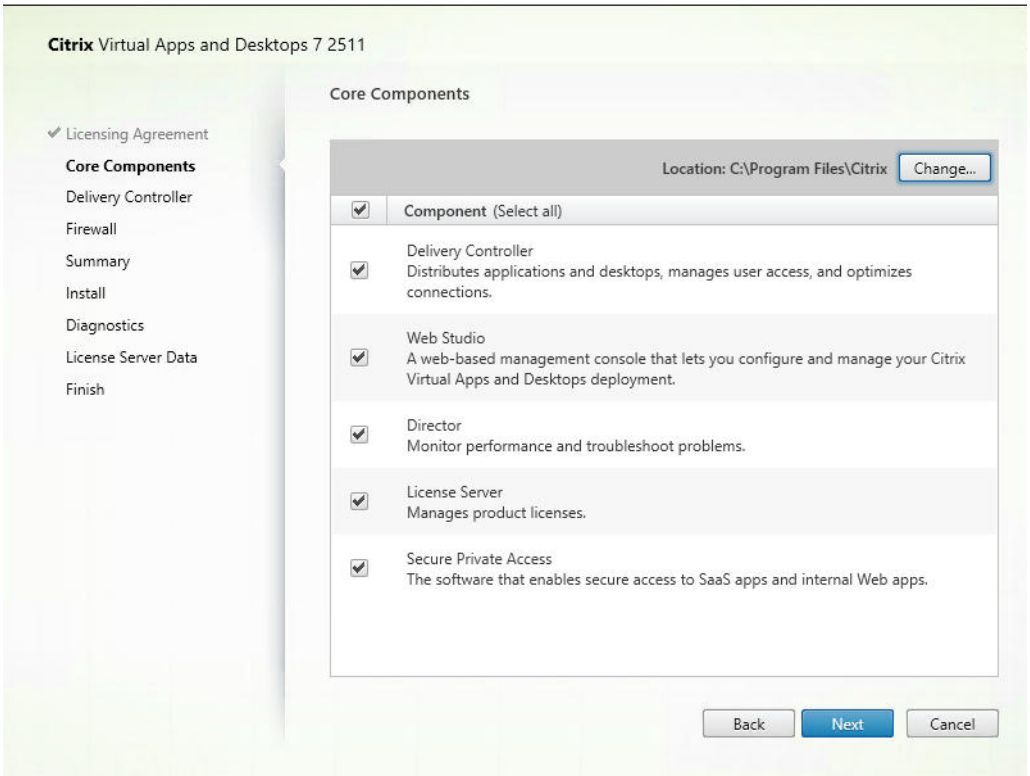


If you're just getting started, select **Delivery Controller**. (On a later page, you select the specific components to install on this machine.)

If you've already installed a Controller (on this machine or another) and want to install another component, select the component from the **Extend Deployment** section.

Command-line option: `/components`

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Step 4. Read and accept the license agreement

On the **Licensing Agreement** page, after you read the license agreement, indicate that you have read and accepted it. Then click **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 5. Select the components to install and the installation location

On the **Core components** page:

- **Location:** By default, components are installed in `C:\Program Files\Citrix`. The default is fine for most deployments. If you specify a different location, it must have execute permissions for the network service.
- **Components:** By default, the check boxes for all core components are selected. Installing all of the core components on one server is fine for proof of concept, test, or small production deployments. For larger production environments, Citrix recommends installing Director, StoreFront, Secure Private Access and the License Server on separate servers.

  > **Note:**
  >
  > If you're installing components on more than one server, install the Citrix License Server and licenses first, before installing other components on other servers. For guidance, see the Automatic installation section of the Licensing Guide for Citrix Virtual Apps and Desktops.

  An icon alerts you when you choose not to install a required core component on this machine. That alert reminds you to install that component, although not necessarily on this machine.

Click **Next**.

Command-line options: `/installdir`, `/components`, `/exclude`

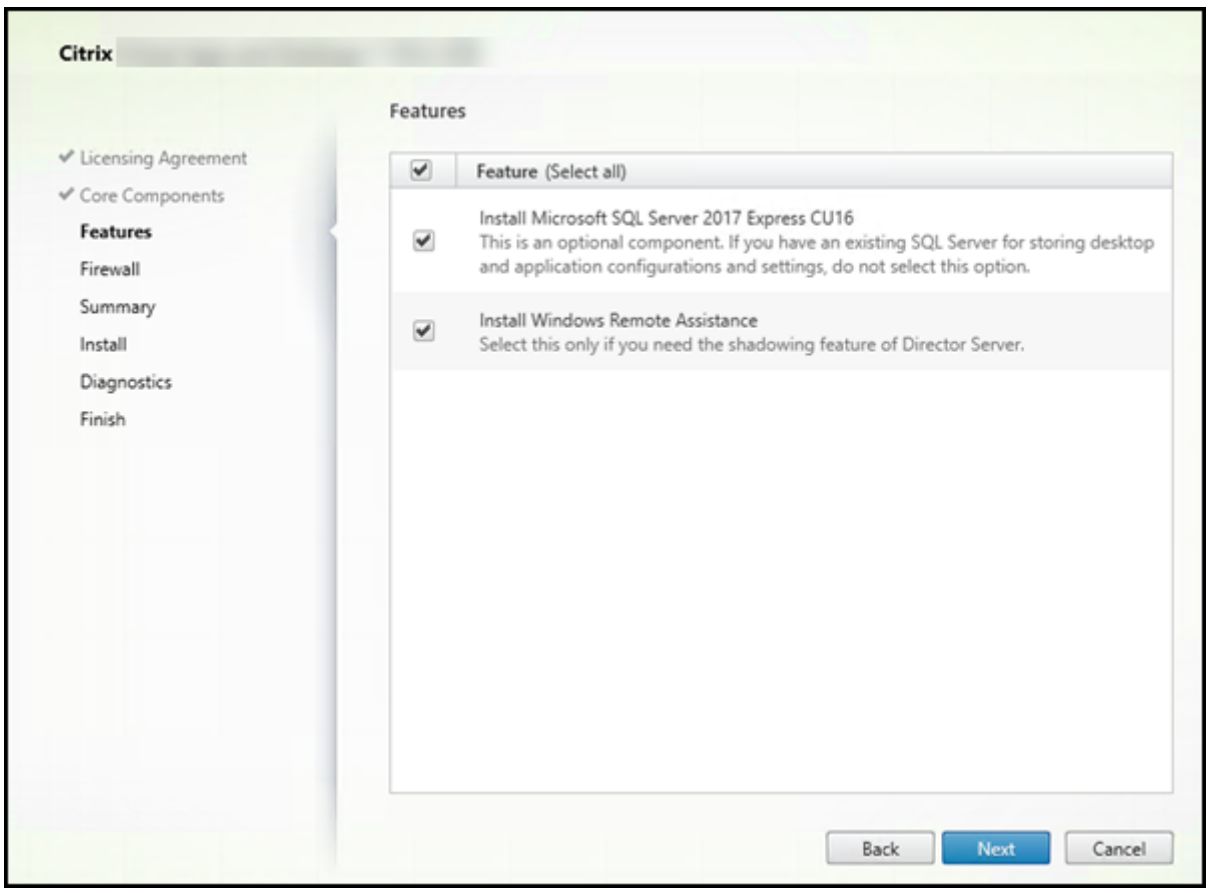
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Hardware check

When you install or upgrade a Delivery Controller, the hardware is checked. The installer alerts you if the machine has less than the recommended amount of RAM (5 GB), which can affect site stability. For more information, see Hardware requirements.

Graphical interface: A dialog box appears.

- Recommended: Click **Cancel** to stop the installation. Add more RAM to the machine and then start the installation again.
- Alternatively, click **Next** to continue with the installation. The site might have stability issues.



Command-line interface: The install/upgrade ends. The install logs contain a message that describes what was found and the available options.

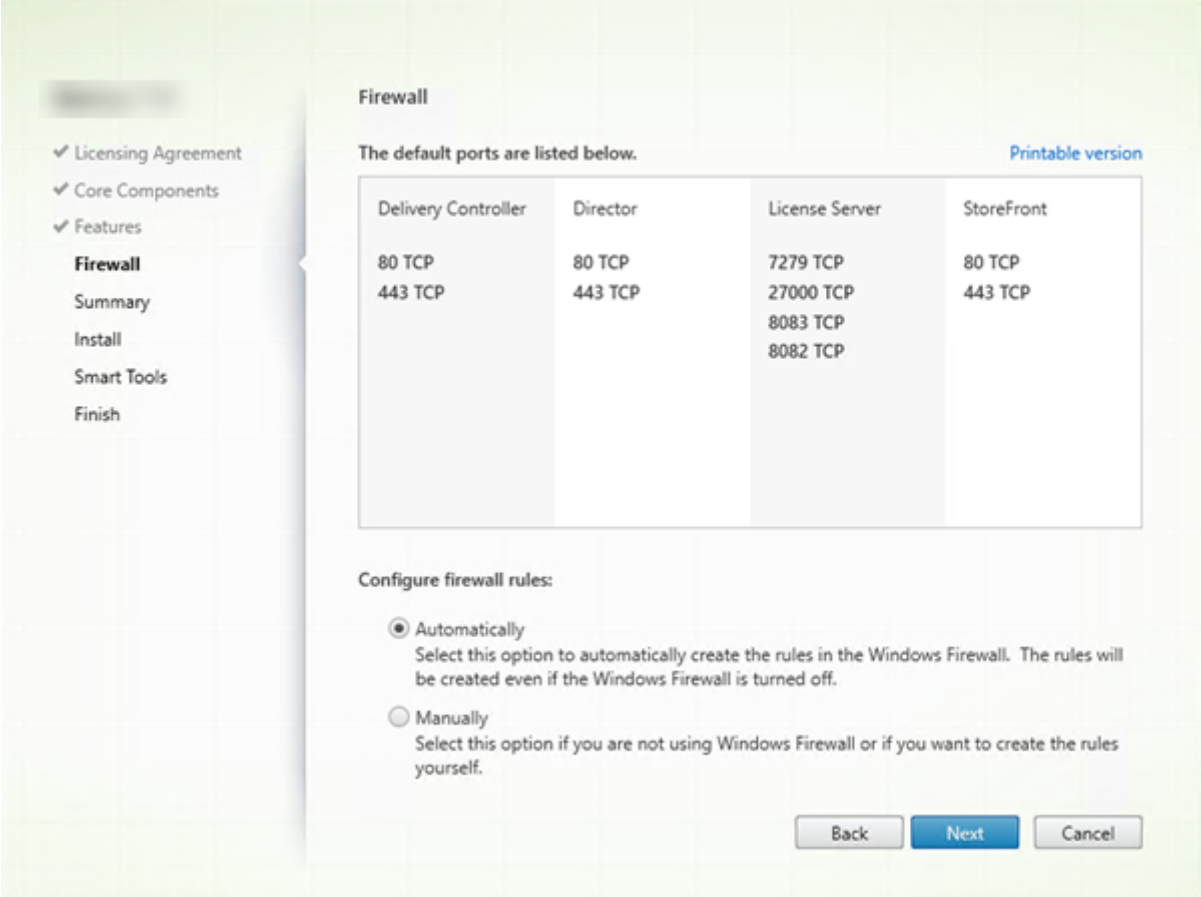
- Recommended: Add more RAM to the machine and then run the command again.
- Alternatively, run the command again with the `/ignore_hw_check_failure` option to override the warning. Your site might have stability issues.

When upgrading, you're also notified if the OS or SQL Server version is no longer supported. See Upgrade a deployment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 6. Enable or disable features

On the **Features** page:



- Choose whether to install Microsoft SQL Server Express for use as the site database. By default, this selection is enabled. If you're not familiar with the Citrix Virtual Apps and Desktops databases, review Databases.
- When you install Director, Windows Remote Assistance is installed automatically. You choose whether to enable shadowing in Windows Remote Assistance for use with Director user shadowing. Enabling shadowing opens TCP port 3389. By default, this feature is enabled. The default setting is fine for most deployments. This feature appears only when you are installing Director.

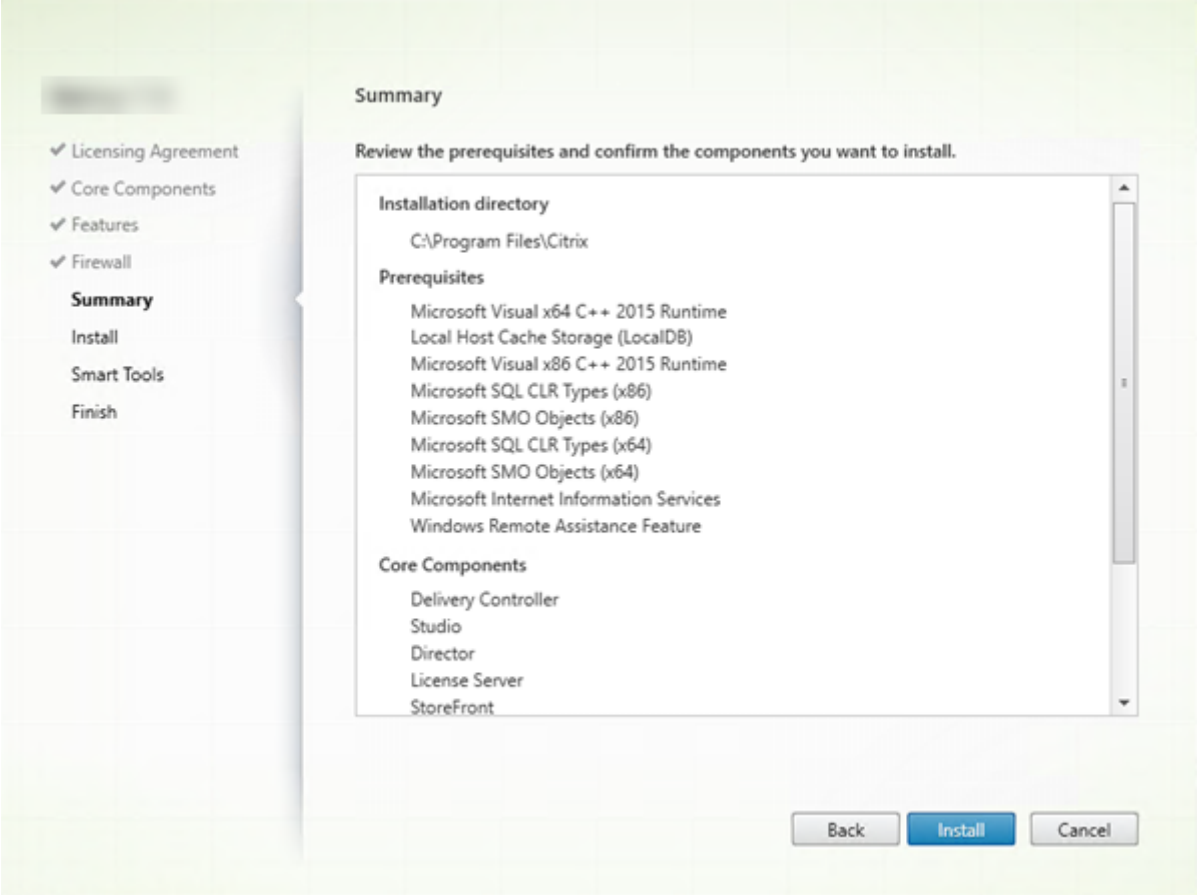
Click **Next**.

Command-line options: `/nosql` (to prevent installation), `/no_remote_assistance` (to prevent enabling)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 7. Open Windows firewall ports

By default, the ports on the **Firewall** page are opened automatically if the Windows Firewall Service is running, even if the firewall is not enabled. The default setting is fine for most deployments. For port information, see Network ports.



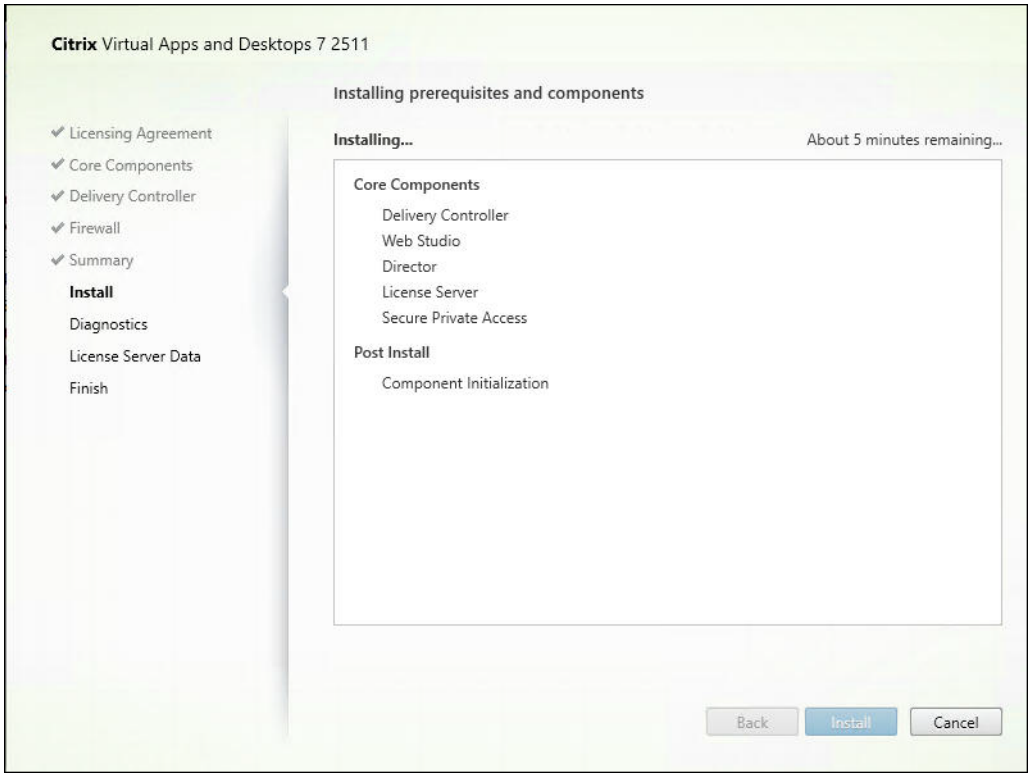
Click **Next**.

(The graphic shows the port lists when you install all the core components on this machine. That type of installation is usually for test deployments only.)

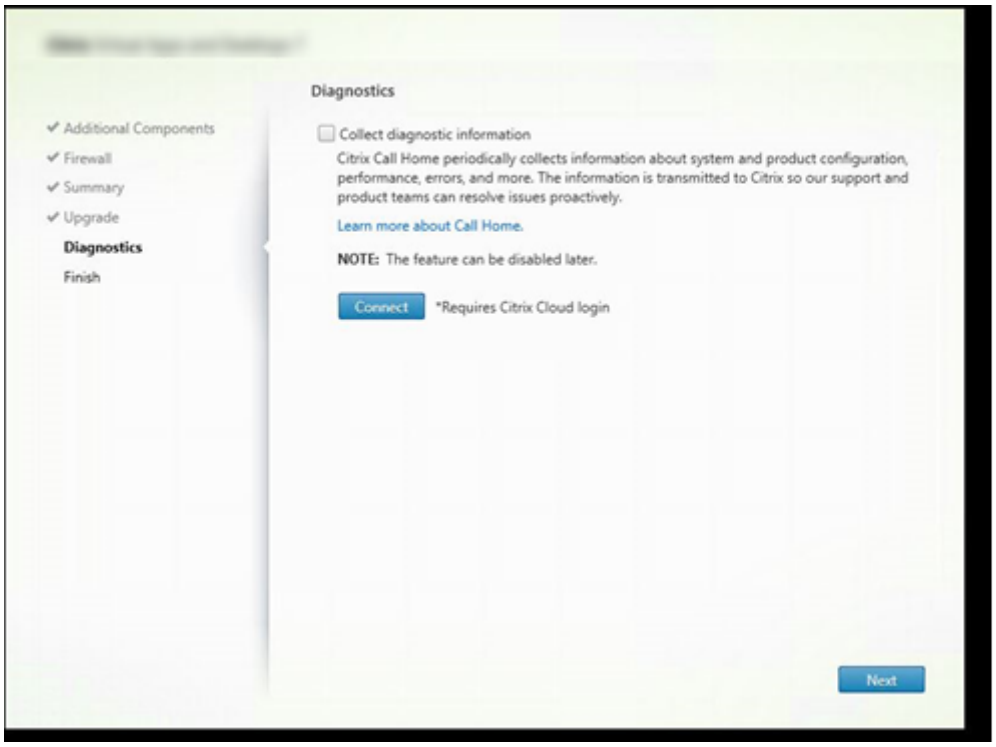
Command-line option: `/configure_firewall`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 8. Review prerequisites and confirm installation



The **Summary** page lists what will be installed. Use the **Back** button to return to earlier wizard pages and change selections, if needed.



When you're ready, click **Install**.

The display shows the progress of the installation:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

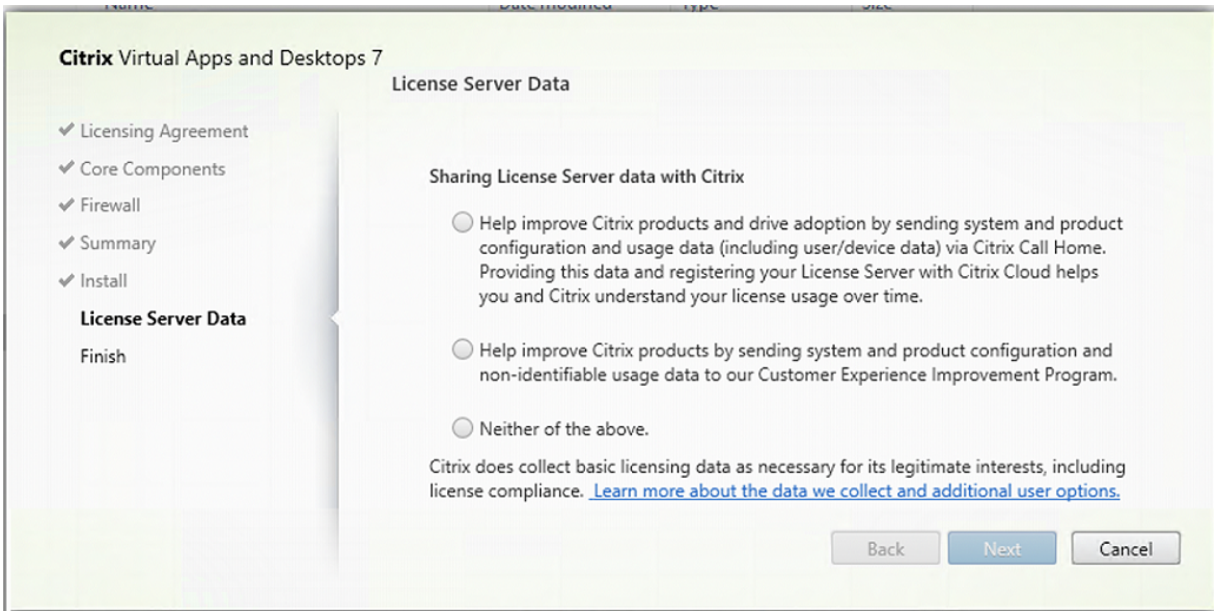
Step 9. Sharing diagnostics information with Cloud Software Group

On the **Diagnostics** page, choose whether to participate in Citrix Call Home.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This page appears when installing a Delivery Controller using the graphical interface. When you install StoreFront (but not a Controller), the wizard displays this page. When you install other core components (but not a Controller or StoreFront), the wizard does not display this page.

During an upgrade, this page does not appear if Call Home is already enabled or if the installer encounters an error related to the Citrix Telemetry Service.



If you choose to participate (the default), click **Connect**. When prompted, enter your Citrix account credentials. You can change your enrollment choice later, after installation.

After your credentials are validated (or if you choose not to participate), click **Next**.

If you click **Connect** on the **Diagnostics** page without first selecting **Collect diagnostic information**, after you close the **Connect to Citrix Insight Services** dialog the **Next** button is disabled. You cannot move to the next page. To reenable the **Next** button, select and immediately deselect **Collect diagnostic information**.

For more information, see Call Home.

Step 10. Sharing License Server data with Cloud Software Group

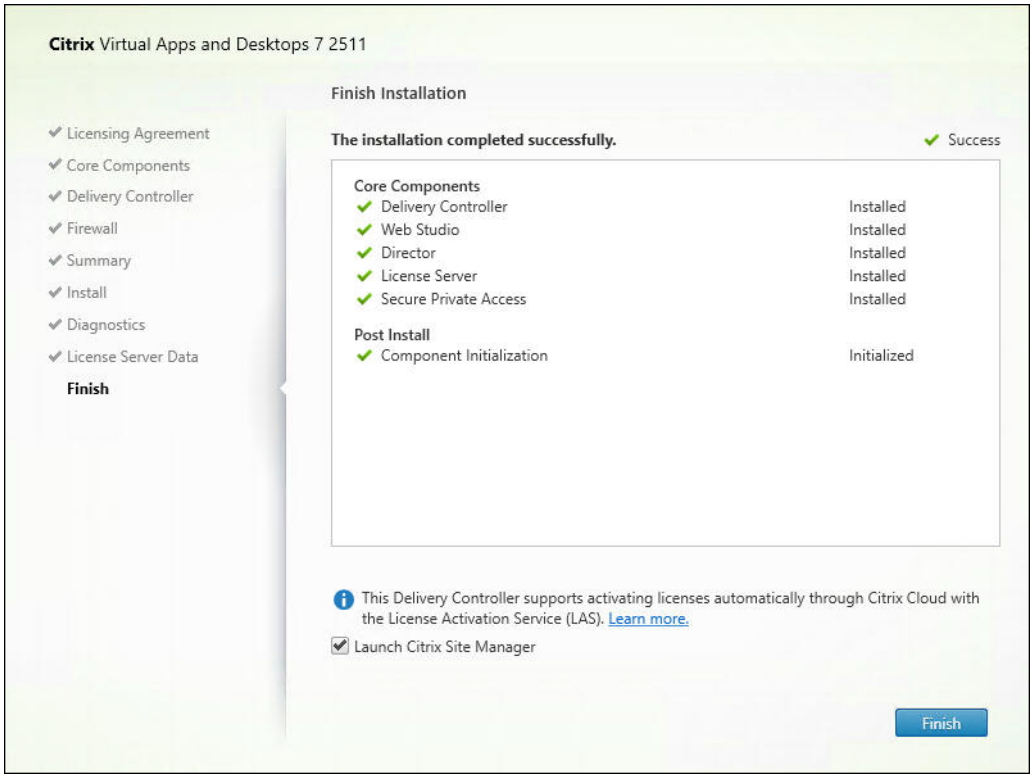
On the **License Server Data** page, we request that you share either Call Home data or Customer Experience Improvement Program (CEIP) data to assist us. In addition, Cloud Software Group also requires the collection of basic licensing data, including license compliance, as necessary for its legitimate interests.

The **License Server Data** page appears when you have installed License Server:

- As a standalone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- As a core component, during installation of a Delivery Controller.



During an upgrade, this page does not appear if the configuration is already set in the `/CITRIX.opt:` file.

License Server monitors several types of user data, such as licensing data, Call Home data and CEIP data. To enable Call Home data and CEIP data collection, you must choose to participate (opt in).

For more information about how to enable Call Home and CEIP data collection when installing by using the command line, see Command line options for installing core components.

For more information about Cloud Software Group licensing data collection, see Citrix Licensing data collection programs.

Step 11. Finish this installation

The **Finish** page contains green check marks for all prerequisites and components that installed and initialized successfully.

Click **Finish**.

> **Note:**
>
> When you upgrade to version 2511, the installer automatically uninstalls Citrix Studio (MMC-based). Your configuration data is stored in the database and isn't affected by the auto-uninstall.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 12. Install remaining core components on other machines

If you installed all the core components on one machine, continue with Next steps. Otherwise, run the installer on other machines to install other components. You can also install more Controllers on other servers.

Next steps

After you install all the required components, use Web Studio to create a site.

After creating the site, install VDAs.

At any time, you can use the full-product installer to extend your deployment with the following components:

- **Universal Print Server server component:** Launch the installer on your print server.

  1. Select **Universal Print Server** in the **Extend Deployment** section.
  2. Accept the license agreement.
  3. On the **Firewall** page, by default, TCP ports 7229 and 8080 are opened in the firewall if the Windows Firewall Service is running, even if the firewall is not enabled. You can disable that default action if you want to open the ports manually.

  To install this component from the command line, see Command-line options for installing a Universal Print Server.

- Federated Authentication Service.
- Session Recording.
- Workspace Environment Management.
- Installing uberAgent
- Installing the deviceTRUST Agent
- WEM-Quick-start guide

Install using the command line

September 1, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> - If you're upgrading, and your current version uses or has the Personal vDisk or AppDisks software installed, see Removing PvD, AppDisks, and unsupported hosts.
> - Citrix collects basic licensing data as necessary for its legitimate interests, including licensing compliance. For more information, see Citrix Licensing Data.

Introduction

This article applies to installing components on machines with Windows operating systems. For information about VDAs for Linux operating systems, see Linux Virtual Delivery Agents.

This article describes how to issue product installation commands. Before beginning any installation, review Prepare to install. That article includes descriptions of the available installers.

To see command execution progress and return values, you must be the original administrator or use **Run as administrator**. For more information, see the Microsoft command documentation.

As a complement to using the installation commands directly, sample scripts are provided on the product ISO that install, upgrade, or remove VDAs on machines in Active Directory. For details, see Install VDAs using scripts.

If you attempt to install or upgrade on a Windows OS version that is not supported for this Citrix Virtual Apps and Desktops version, a message guides you to information about your options. See Earlier operating systems.

For information about how Citrix reports the results of component installations, see Citrix installation return codes.

Use the full-product installer

To access the full product installer's command-line interface:

1. Download the product package from Citrix. Citrix account credentials are required to access the download site.
2. Unzip the file. Optionally, burn a DVD of the ISO file.
3. Log on to the server where you are installing the components, using a local administrator account.
4. Insert the DVD in the drive or mount the ISO file.
5. From the `\x64\XenDesktop Setup` directory on the media, run the appropriate command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To install core components: Run `XenDesktopServerSetup.exe`, with the options listed in Command-line options for installing core components.

To install a VDA: Run `XenDesktopVDASetup.exe` with the options listed in Command-line options for installing a VDA.

To install StoreFront: Run `CitrixStoreFront-x64.exe` in the `x64 > StoreFront` folder on the installation media.

To install the Universal Print Server: Follow the guidance in Command-line options for installing a Universal Print Server.

To install the Federated Authentication Service: Citrix recommends using the graphical interface.

To install Session Recording: Follow the guidance in Session Recording.

To install Workspace Environment Management: Follow the guidance in Workspace Environment Management.

To install Secure Private Access: Run `XenDesktopSPASetup.exe` in the `x64 > XenDesktop` Setup folder on the installation media. Follow the guidance in Command-line options for installing a Secure Private Access.

Command-line options for installing core components

The following parameter options are valid when installing core components with the `XenDesktopServerSetup.exe` command. For more detail about options, see Install core components.

> **Note:**
>
> - Do not use `/exclude` while using command-line options for installing core components.
> - If you upgrade one component using `/components`, then other components might also be upgraded. This is to avoid potential compatibility issues between different components.
> - If you want to upgrade only one component, use the individual installer of that component. See Upgrade a deployment.

- **/ceipoptin** *ceipoptin* [,*ceipoptin*] …

  Enables collection of Call Home data and Customer Experience Improvement Program (CEIP) data. Valid values are:

  - `DIAGNOSTIC`: Choose this value to enable Citrix Licensing to collect Call Home data.
  - `ANONYMOUS`: Choose this value to enable Citrix Licensing to collect unidentified CEIP data (which does not identify users).
  - `NONE`: Choose this value to disable Citrix Licensing collection of CEIP data.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information about Call Home data collection, see Citrix Licensing Call Home.

For more details about CEIP data collection, see Citrix Licensing Customer Experience Improvement Program.

For more details about CEIP data, see Citrix Licensing CEIP data elements.

For more details about License Server licensing data, see Citrix Licensing Data.

- **/components** *component* [,*component*] …

  Comma-separated list of components to install or remove. Valid values are:

  - `CONTROLLER`: Controller
  - `WEBSTUDIO`: Studio
  - `DESKTOPDIRECTOR`: Director
  - `LICENSESERVER`: Citrix License Server
  - `SECUREPRIVATEACCESS`: Secure Private Access

To install only the VDA and exclude the installation of other Citrix components, specify /components vda.

This option is not valid when using the VDAWorkstationCoreSetup_xxxx.exe installer. That installer cannot install the Citrix Workspace app or other Citrix components.

If this option is omitted, all components are installed (or removed, if the /`remove` option is also specified).

(In releases before 2003, valid values included `STOREFRONT`™. For version 2003 and later, use the dedicated StoreFront installation command mentioned in Use the full-product installer).

- **/onlyprereqs**

  Only the prerequisites for the selected components will be installed. No Citrix product components will be installed.

- **/configure_firewall**

  Opens all ports in the Windows firewall used by the components being installed, if the Windows Firewall Service is running, even if the firewall is not enabled. If you are using a third-party firewall or no firewall, you must manually open the ports.

- **/disableexperiencemetrics**

  Prevents automatic upload of analytics collected during installation, upgrade, or removal to Citrix.

- **/help** or **/h**

  Displays command help.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **/ignore_hw_check_failure**

  Allows the Delivery Controller installation or upgrade to continue, even if the hardware checks fail (for example, due to insufficient RAM). For more information, see Hardware check.

- **/ignore_site_test_failure**

  Valid only during Controller upgrade. Usually, any site test failures are ignored and the upgrade proceeds. If omitted (or set to false), any site test failure causes the installer to fail, without performing the upgrade. Default = false

  During an upgrade, this option is ignored if an unsupported SQL Server version is detected. For details, see SQL Server version check.

- **/installdir *directory***

  Existing empty directory where components will be installed. Default = c:\Program Files\Citrix.

- **/logpath *path***

  Log file location. The specified folder must exist. The installer does not create it. Default = `TEMP%\Citrix\XenDesktop Installer`

- **/no_remote_assistance**

  Valid only when installing the Director. Disables the user shadowing feature that uses Windows Remote Assistance.

- **/noreboot**

  Prevents a restart after installation. (For most core components, a restart is not enabled by default.)

- **/noresume**

  By default, when a machine restart is needed during an installation, the installer resumes automatically after the restart completes. To override the default, specify `/noresume`. This can be helpful if you must remount the media or want to capture information during an automated installation.

- **/nosql**

  Prevents the installation of Microsoft SQL Server Express on the server where you are installing the Controller. If this option is omitted, SQL Server Express is installed for use as the site database.

  This option does not affect the installation of SQL Server Express LocalDB used for Local Host Cache.

- **/quiet** or **/passive**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

No user interface appears during the installation. The only evidence of the installation process is in Windows Task Manager. If this option is omitted, the graphical interface launches.

- **/remove**

  Removes the core components specified with the `/components` option.

- **/removeall**

  Removes all installed core components.

- **/sendexperiencemetrics**

  Automatically sends analytics collected during the installation, upgrade, or removal to Citrix. If this option is omitted (or `/disableexperiencemetrics` is specified), the analytics are collected locally, but not sent automatically.

- **/tempdir** *directory*

  Directory that holds temporary files during installation. Default = c:\Windows\Temp.

- **/xenapp**

  Installs Citrix Virtual Apps. If this option is omitted, Citrix Virtual Apps and Desktops™ is installed.

Examples of installing core components

The following command installs a Delivery Controller™, Studio, Citrix Licensing, and SQL Server Express on a server. Firewall ports required for component communications are opened automatically.

```
\x64\XenDesktop Setup\XenDesktopServerSetup.exe /components controller
,webstudio,licenseserver /configure_firewall
```

The following command installs a Citrix Virtual Apps™ Controller, Studio, and SQL Server Express on the server. Firewall ports required for component communication are opened automatically.

```
\x64\XenDesktop Setup\XenDesktopServerSetup.exe /xenapp /components
controller,webstudio /configure_firewall
```

The following command installs a Delivery Controller, Secure Private Access, and SQL Server Express on a server. Firewall ports required for component communication are opened automatically.

```
\x64\XenDesktop Setup\XenDesktopServerSetup.exe /xenapp /components
controller,secureprivateaccess /configure_firewall
```

If you upgrade from Citrix Virtual Apps and Desktops version 2407 to 2411 or later, or perform a fresh installation of version 2411 or later, update the License Server to the latest version (version 11.2.17 build 51000) as the first step. Then, upgrade the Delivery Controller. Failing to do so results in the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

failure of command-line installations and upgrade. Run the following commands to upgrade the License server and components such as Delivery controller, Studio, and Citrix Director (assuming you are inside the \x64 folder in the mounted ISO).

1. Run the following:

```
\x64\Licensing\CitrixLicensing.exe /quiet
```

   If you have copied the Licensing binaries to any of the local drives, then run the following command:

```
\x64\Licensing\CitrixLicensing.exe /quiet /l install.log
```

2. Run the following:

```
\x64\XenDesktop Setup\XenDesktopServerSetup.exe /components "
   CONTROLLER,WEBSTUDIO,DESKTOPDIRECTOR" /CONFIGURE_FIREWALL
```

Use a standalone VDA installer

Citrix account credentials are required to access the download site. You must either have elevated administrative privileges before starting the installation, or use **Run as administrator**.

1. Download the appropriate package from Citrix:
   - Multi-session OS Virtual Delivery Agent: `VDAServerSetup_xxxx.exe`
   - Single-session OS Virtual Delivery Agent: `VDAWorkstationSetup_xxxx.exe`
   - Single-session OS Core Services Virtual Delivery Agent: `VDAWorkstationCoreSetup_xxxx.exe`
2. Either extract the files from the package to an existing directory first and then run the installation command, or simply run the package.

   To extract the files before installing them, use `/extract` with the absolute path, for example `C:\YourExtractFolder\VDAWorkstationCoreSetup.exe /extract %temp%\CitrixVDAInstallMedia`. The directory must exist. Otherwise, the extract fails. Then in a separate command, run the appropriate command, using the valid options listed in this article.
   - For `VDAServerSetup_XXXX.exe`, run `<extract folder>\Extract\Image-Full\x64\XenDesktop Setup\XenDesktopVDASetup.exe`
   - For `VDAWorkstationCoreSetup_XXXX.exe`, run `<extract folder>\Extract\Image-Full\x64\XenDesktop Setup\XenDesktopRemotePCSetup.exe`
   - For `VDAWorkstationSetup_XXXX.exe`, run `<extract folder>\Extract\Image-Full\x64\XenDesktop Setup\XenDesktopVDASetup.exe`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To run the downloaded package, run its name: `VDAServerSetup.exe`, `VDAWorkstationSetup.exe`, or `VDAWorkstationCoreSetup.exe`. Use the valid options listed in this article.

If you are familiar with the full product installer:

- Run the standalone `VDAServerSetup.exe` or `VDAWorkstationSetup.exe` installer as if it was the `XenDesktopVdaSetup.exe` command in everything except its name.
- The `VDAWorkstationCoreSetup.exe` installer is different, because it supports a subset of the options available to the other installers.

Comma-separated list of components to install or remove. Valid values are:

- `VDA`: Virtual Delivery Agent
- `CSA`: Citrix Secure Access™ Client
- `PLUGINS`: Citrix Workspace™ app for Windows
- `UPL`: Citrix User Personalization Layer(only for WS VDA)
- `SRAGENT`: Session Recording Agent
- `ASSISTANTAPP`: Citrix Assistant App (only for WS VDA)
- `CEAL`: Citrix Elastic App Layering (only for TS VDA)

To install the VDA and Citrix Workspace app for Windows, specify /components vda,plugins or do not specify any components at all.

Starting with this version, Citrix Device Trust, Citrix uberAgent, and Citrix Workspace Environment Management™ (WEM) Agent are integrated into the default VDA installation. These components are silently installed as part of the VDA setup and are no longer managed as separate components.

> **Note:**
>
> If an existing standalone version of Citrix uberAgent® is detected in the environment, it will not be installed, upgraded, or uninstalled by the installer.

To install only the VDA and exclude the installation of other Citrix components, specify `/components vda`.

This option is not valid when using the VDAWorkstationCoreSetup_xxxx.exe installer. That installer cannot install the Citrix Workspace app or other Citrix components.

Command-line options for installing a VDA

The following options are valid with one or more of the following commands (installers): `VDAServerSetup_xxxx.exe`, `VDAWorkstationSetup_xxxx.exe`, and `VDAWorkstationCoreSetup.exe`.

For more details about options, see Install VDAs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **/components** *component*[,*component*]

  Comma-separated list of components to install or remove. Valid values are:

  - `VDA`: Virtual Delivery Agent
  - `PLUGINS`: Citrix Workspace app for Windows
  - `CSA`: Citrix Secure Access Client
  - `UPL`: Citrix User Personalization Layer(only for WS VDA)
  - `SRAGENT`: Session Recording Agent
  - `ASSISTANTAPP`: Citrix Assistant App (only for WS VDA)
  - `CEAL`: Citrix Elastic App Layering (only for TS VDA)

To install the VDA and Citrix Workspace app for Windows, specify `/components vda, plugins, CSA, UPL` or do not specify any components at all. If no components are specified, only the VDA, SRAGENT and ASSISTANTAPP will be installed by default.

To install only the VDA and exclude the installation of Citrix Workspace app and other components, specify `/components vda`.

This option is not valid when using the `VDAWorkstationCoreSetup_xxxx.exe` installer. That installer cannot install the Citrix Workspace app.

- **/onlyprereqs**

  Only the prerequisites for the selected components will be installed. No Citrix product components will be installed.

- **/controllers** "*controller* [*controller*]"

  Space-separated FQDNs of Controllers with which the VDA can communicate, enclosed in straight quotation marks. Do not specify both the `/site_guid` and `/controllers` options.

- **/disableexperiencemetrics**

  Prevents the automatic upload of analytics collected during installation, upgrade, or removal to Citrix.

- **/enable_hdx_ports**

  Opens ports in the Windows firewall required by the VDA and enabled features (except Windows Remote Assistance), if the Windows Firewall Service is detected, even if the firewall is not enabled. If you are using a different firewall or no firewall, you must configure the firewall manually. For port information, see Network ports.

  To open the UDP ports that HDX adaptive transport uses, specify the `/enable_hdx_udp_ports` option, in addition to this `/enable_hdx_ports` option.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **/enable_hdx_udp_ports**

  Opens UDP ports in the Windows firewall that HDX adaptive transport uses, if the Windows Firewall Service is detected, even if the firewall is not enabled. If you are using a different firewall or no firewall, you must configure the firewall manually. For port information, see Network ports.

  To open extra ports that the VDA uses, specify the `/enable_hdx_ports` option, in addition to this `/enable_hdx_udp_ports` option.

- **/enable_hdx_tls_dtls**

  Opens TCP and UDP port 443 for HDX™ Direct V1.

- **/enable_real_time_transport**

  Enables or disables the use of UDP for audio packets (RealTime Audio Transport for audio). Enabling this feature can improve audio performance. Include the `/enable_hdx_ports` option if you want the UDP ports opened automatically when the Windows Firewall Service is detected.

- **/enable_remote_assistance**

  Enables the shadowing feature in Windows Remote Assistance for use with Director. If you specify this option, Windows Remote Assistance opens the dynamic ports in the firewall.

- **/enablerestore** or **/enablerestorecleanup**

  (Valid only for single-session VDAs) Enables automatic return to the restore point, if the VDA install or upgrade fails.

  If the install/upgrade completes successfully:

  - `/enablerestorecleanup` instructs the installer to remove the restore point.
  - `/enablerestore` instructs the installer to retain the restore point, even though it was not used.

  For details, see Restore on install or upgrade failure.

- **/ENABLE_SECURE_DEFAULTS**

  Changes the default setting for various features from enabled to disabled for a more secure out-of-box configuration. The relevant features are: client drive redirection, special folder redirection, drag and drop, client TWAIN device redirection, Client USB Plug and Play device redirection, client printer redirection, client clipboard redirection, and client microphone redirection.

- **/enable_ss_ports**

  Opens ports in the Windows Firewall that are required for screen sharing, if the Windows Firewall Service is detected, even if the firewall is not enabled. If you are using a different firewall or no firewall, you must configure the firewall manually.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **/SKIPHDXDRIVERCHECK**

  Skips the checking of the HDX™ Drivers to the VDA Meta-installer.

- **/exclude** "*component*"[,"*component*"]

  Prevents the installation of one or more comma-separated optional components, each enclosed in straight quotation marks. For example, installing or upgrading a VDA on an image that is not managed by MCS does not require the Machine Identity Service component. Valid values are as follows:

Multi-session OS	Single-session OS	Single-session OS Core Services
Citrix Authentication Identity Assertion VDA Plug-in	Citrix Authentication Identity Assertion VDA Plug-in	Citrix Authentication Identity Assertion VDA Plug-in
Citrix Backup and Restore	Citrix Backup and Restore	Citrix Browser Content Redirection

Excluding Citrix Profile Management from the installation (/exclude "Citrix Profile

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Management") affects monitoring and troubleshooting of VDAs with Citrix Director. On the **User details** and **EndPoint** pages, the Personalization panel and the Logon Duration panel fail. On the **Dashboard** and **Trends** pages, the Average Logon Duration panel displays data only for machines that have Profile Management installed.

Even if you are using a third-party user profile management solution, Citrix recommends that you install and run the Citrix Profile Management Service. Enabling the Citrix Profile Management Service is not required.

If you specify both /exclude and /includeadditional with the same component name, that component is not installed.

This option is not valid when using the VDAWorkstationCoreSetup.exe installer. That installer automatically excludes many of these items.

- **/h** or **/help**

  Displays command help.

- **/includeadditional** "*component*"[,"*component*"]

  Includes installation of one or more comma-separated optional components, each enclosed in straight quotation marks. This option can be helpful when you are creating a Remote PC Access deployment, and want to install other components that are not included by default. Valid values are as follows:

Multi-session OS	Single-session OS
Citrix Backup and Restore	Citrix Backup and Restore
Citrix MCS IODriver	Citrix MCS IODriver
Citrix Personalization **for** App-V - VDA	Citrix Personalization **for** App-V - VDA
Citrix Profile Management	Citrix Profile Management
Citrix Profile Management WMI Plug-in	Citrix Profile Management WMI Plug-in
Citrix Rendezvous V2	Citrix Rendezvous V2
Citrix VDA Upgrade Agent	Citrix VDA Upgrade Agent
Citrix Web Socket Vda Registration Tool	Citrix Web Socket Vda Registration Tool
Machine Identity Service	Machine Identity Service
	User Personalization Layer

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you specify both /exclude and /includeadditional with the same component name, that component is not installed.

- **/installdir** *directory*

  Existing empty directory where components will be installed. Default = c:\Program Files\Citrix.

- **/install_mcsio_driver**

  Do not use. Instead, use /includeadditional "Citrix MCS IODriver" or /exclude "Citrix MCS IODriver"

- **/logpath** *path*

  Log file location. The specified folder must exist. The installer does not create it. Default = "%TEMP%\Citrix\XenDesktop Installer"

  This option is not available in the graphical interface.

- **/masterimage**

  Valid only when installing a VDA on a VM. Sets up the VDA as an image to be used to create other machines. This option is equivalent to /mastermcsimage.

  This option is not valid when using the VDAWorkstationCoreSetup_xxxx.exe installer.

- **/mastermcsimage**

  Specifies that this machine will be used as an image with Machine Creation Services. This option is equivalent to /masterimage.

- **/masterpvsimage**

  Specifies that this machine will be used as an image with either Citrix Provisioning™ or a third-party provisioning tool (such as Microsoft System Center Configuration Manager) to provision VMs.

- **/websockettoken** *WebSocketToken*

  Creates a Web Socket VDA. The WebSocketToken is for the token that is required.

- **/websockettokenfile** *FileContainingWebSockToken*

  Creates a Web Socket VDA. The *FileContainingWebSockToken* is for the file that contains the token that is required.

- **/websockettokenstdin** <*WebSocketToken*

  Creates a Web Socket VDA. The <*WebSocketToken* is for the token that is required that is passed in by STDIN.

- **/no_mediafoundation_ack**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Acknowledges that Microsoft Media Foundation is not installed, and several HDX multimedia features will not be installed and will not work. If this option is omitted and Media Foundation is not installed, the VDA installation exits since the pre-conditions are not met. Most supported Windows editions come with Media Foundation already installed, except N editions. If you enable Windows Features > Media Features *manually*, the registry key sought by the Citrix Meta Installer may not have a set value. Check the `SOFTWARE\Microsoft\Windows\CurrentVersion\Setup\Windows-Features\WindowsMediaVersion` registry key before starting the install process to confirm the value exists and is not empty.

- **/nodesktopexperience**

  The Enhanced Desktop Experience feature is no longer available. This option (and policy setting) is ignored, if specified.

  Valid only when installing a VDA for multi-session OS. Prevents enabling of the Enhanced Desktop Experience feature. This feature is also controlled with the Enhanced Desktop Experience Citrix policy setting.

- **/noreboot**

  Prevents a restart after installation. The VDA cannot be used until after a restart.

- **/noresume**

  By default, when a machine restart is needed during an installation, the installer resumes automatically after the restart completes. To override the default, specify `/noresume`. This can be helpful if you must remount the media or want to capture information during an automated installation.

- **/physicalmachine**

  Use this argument along with `/remotepc` for RemotePC installation. Otherwise the VDA might not behave as expected in certain user scenarios.

- **/portnumber** *port*

  Valid only when the `/reconfig` option is specified. Port number to enable for communications between the VDA and the Controller. The previously configured port is disabled, unless it is port 80.

- **/proxyconfig** "*address or PAC file path*"

  If you plan to use the Rendezvous V2 protocol with services such as Gateway Service in your environment and have a non-transparent proxy in your network for outbound connections, specify the proxy here. Only HTTP proxies are supported. The address or PAC file path of the proxy for use with the Rendezvous protocol. This command line automatically installs the Citrix Rendezvous V2 as if /includeadditional "Citrix Rendezvous V2"was used. For feature details, see Rendezvous protocol.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - Proxy address format: `http://<url-or-ip>:<port>`
  - PAC file format: `http://<url-or-ip>:<port>/<path>/<filename>.pac`

- **/quiet** or **/passive**

  No user interface appears during the installation. The only evidence of the installation and configuration process is in Windows Task Manager. If this option is omitted, the graphical interface launches.

- **/reconfigure**

  Customizes previously configured VDA settings when used with the `/portnumber`, `/controllers`, or `/enable_hdx_ports` options. If you specify this option without also specifying the `/quiet` option, the graphical interface for customizing the VDA launches.

- **/remotepc**

  Valid only for Remote PC Access deployments (single-session OS) or brokered connections (multi-session OS). Excludes installation of any additional components (see component lists with `/exclude` and `/includeadditional` options).

  This option is not valid when using the `VDAWorkstationCoreSetup.exe` installer. That installer automatically excludes installation of these components.

  `/remotepc` is not compatible with the `/servervdi` option.

- **/remove**

  Removes the components specified with the `/components` option.

- **/remove_appdisk_ack**

  Authorizes the VDA installer to uninstall the AppDisks™ VDA plug-in if it's installed.

- **/remove_pvd_ack**

  Authorizes the VDA installer to uninstall Personal vDisk if it's installed.

- **/removeall**

  Removes the VDA. It does not remove the Citrix Workspace app (if installed).

- **/REMOVEALLWITHCWA**

  Removes CWA along with the VDA.

- **/sendexperiencemetrics**

  Automatically sends analytics collected during the installation, upgrade, or removal to Citrix. If this option is omitted (or the `/disableexperiencemetrics` option is specified), analytics are collected locally, but not sent automatically.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **/servervdi**

  Installs a VDA for single-session OS on a supported Windows multi-session machine. Omit this option when installing a VDA for multi-session OS on a Windows multi-session machine.

  Before using this option, see Server VDI.

  Use this option only with the full-product VDA installer.

- **/site_guid** *guid*

  Globally Unique Identifier of the site Active Directory Organizational Unit (OU). This associates a virtual desktop with a site when you are using Active Directory for discovery (auto-update is the recommended and default discovery method). The site GUID is a site property displayed in Studio. Do not specify both the `/site_guid` and `/controllers` options.

- **/tempdir** *directory*

  Directory to hold temporary files during installation. Default = c:\Windows\Temp.

  This option is not available in the graphical interface.

- **/virtualmachine**

  Valid only when installing a VDA on a VM. Overrides detection by the installer of a physical machine, where BIOS information passed to VMs makes them appear as physical machines.

  This option is not available in the graphical interface.

- **/xendesktopcloud**

  Indicates that the VDA is installed in a Citrix DaaS (Citrix Cloud™) deployment.

Examples of installing a VDA

Install a VDA with the full-product installer:

The following command installs a VDA for single-session OS and Citrix Workspace app to the default location on a VM. This VDA will be used as an image and use MCS to provision VMs. The VDA will register initially with the Controller on the server named `Contr-Main` in the domain `mydomain`. The VDA will use user personalization layer and Windows Remote Assistance.

```
\x64\XenDesktop Setup\XenDesktopVdaSetup.exe /quiet /components vda
,plugins /controllers "Contr-Main.mydomain.local"/enable_hdx_ports
 /includeadditional "user personalization layer"/mastermcsimage /
enable_remote_assistance
```

Install a single-session OS VDA with the VDAWorkstationCoreSetup standalone installer:

The following command installs a Core Services VDA on a single-session OS for use in a Remote PC Access or VDI deployment. Citrix Workspace app and other non-core services are not installed. The

© 1997–2026 Citrix Systems, Inc. All rights reserved.

address of a Controller is specified, and ports in the Windows Firewall Service will be opened automatically. The administrator will handle restarts.

```
VDAWorkstationCoreSetup .exe /quiet /controllers "Contr-East.domain.
com"/enable_hdx_ports /noreboot
```

Customize a VDA

After you install a VDA, you can customize several settings. From the `\x64\XenDesktop Setup` directory on the product media, run `XenDesktopVdaSetup.exe`, using one or more of the following options, which are described in Command-line options for installing a VDA.

- `/reconfigure` (required when customizing a VDA)
- `/h` or `/help`
- `/quiet`
- `/noreboot`
- `/controllers`
- `/portnumber port`
- `/enable_hdx_ports`

Troubleshoot VDAs

- In the Studio display for a delivery group, the **Installed VDA version** entry in the **Details** pane might not be the version installed on the machines. The machine's Windows Programs and Features display shows the actual VDA version.
- After a VDA is installed, it cannot deliver apps or a desktop to users until it registers with a Delivery Controller.

  To learn about VDA registration methods and how to troubleshoot registration issues, see VDA registration.

Command-line options for installing a Universal Print Server

The following option is valid with the `XenDesktopPrintServerSetup.exe` command.

- **/enable_upsserver_port**

When this option is not specified, the installer displays the **Firewall** page from the graphical interface. Select **Automatically** to have the installer automatically add the Windows firewall rules, or **Manually** to let the administrator manually configure the firewall.

After installing the software on your print servers, configure the Universal Print Server using the guidance in Citrix Universal Print Server (UPS).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Command-line options for installing a Secure Private Access

The following options are valid with both:

1. CVAD installer: `XenDesktopSPASetup.exe`
2. SPA on-prem installer: `SecurePrivateAccessSetup_XXXX.exe`

- **/enable_spa_ports**

  Opens ports in the Windows firewall required by the Secure Private Access, if the Windows Firewall Service is detected, even if the firewall is not enabled. If you are using a different firewall or no firewall, you must configure the firewall manually. For port information, see Network ports.

- **/nosql**

  Prevents the installation of Microsoft SQL Server Express on the server where you are installing the Secure Private Access. If this option is omitted, SQL Server Express is installed for use as the site database.

- **/help or /h or /?**

  Displays command help

- **/noreboot**

  Prevents a restart after installation. Secure Private Access cannot be used until after a restart.

- **/quiet or /passive**

  No user interface appears during the installation. The only evidence of the installation and configuration process is in Windows Task Manager. If this option is omitted, the graphical interface launches.

- **/remove**

  Removes the Secure Private Access.

For more details about the options, see Secure Private Access installer.

More information

For information about how Citrix reports the result of component installations, see Citrix installation return codes.

Install Web Studio

May 15, 2026

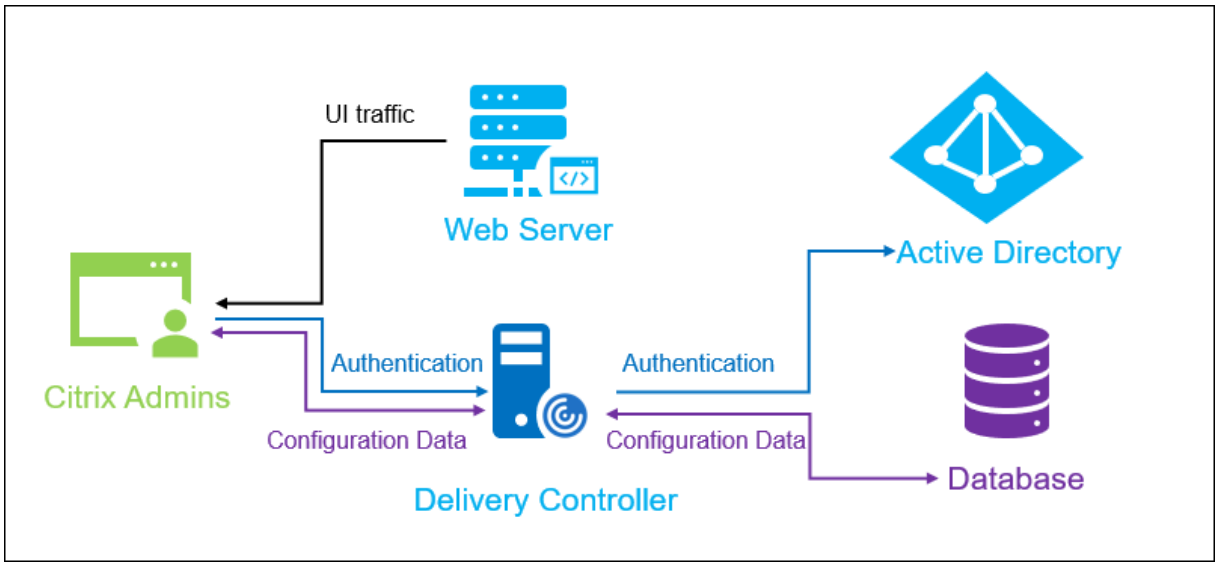
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Citrix Studio (MMC Studio) was removed starting with version 2511 and is no longer supported. This article assumes that Web Studio is the only management console in use.

Introduction

Web Studio is a web-based management console offering full feature parity with Citrix Studio. With the same look and feel as the Citrix DaaS Studio interface, Web Studio modernizes your management experience by providing a native web experience.

You can deploy Web Studio to any Windows server with Internet Information Service (IIS) installed. There are two deployment options:



- Installed on a dedicated server:

  For larger environments where performance and scalability are critical, we recommend installing Web Studio on a dedicated server. This server can optionally also host the Director.

- Integrated with a Delivery Controller™:

  For quick deployments and simpler environments, install Web Studio directly on a Delivery Controller. This approach is ideal for smaller deployments where minimizing administrative overhead is a priority.

The following diagram shows the Web Studio architecture:

A general workflow to get Web Studio up and running is as follows:

1. Install Web Studio.
2. Set up a site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Add Delivery Controllers to Web Studio for management.
4. (Optional) Configure Web Studio as a proxy for Delivery Controllers
5. (Optional) Disable Pendo.
6. Secure server configuration for Web Studio
7. Sign in to Web Studio.

To set up a load-balanced Web Studio deployment, see this article.

New features available in Web Studio

See the What's new article.

System requirements

The following tables list the supported operating systems, browsers, display settings, and hardware requirements for installing and using Studio.

Supported operating systems

Operating system	Editions	Server Core support
Windows Server 2025	Standard, Datacenter	Yes
Windows Server 2022	Standard, Datacenter	Yes
Windows Server 2019	Standard, Datacenter	Yes
Windows Server 2016	Standard, Datacenter	Yes

Supported browsers

Browser	Minimum supported version
Microsoft Edge	92
Firefox ESR (Extended Support Release)	90
Google Chrome	92
Safari	14

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Display requirements

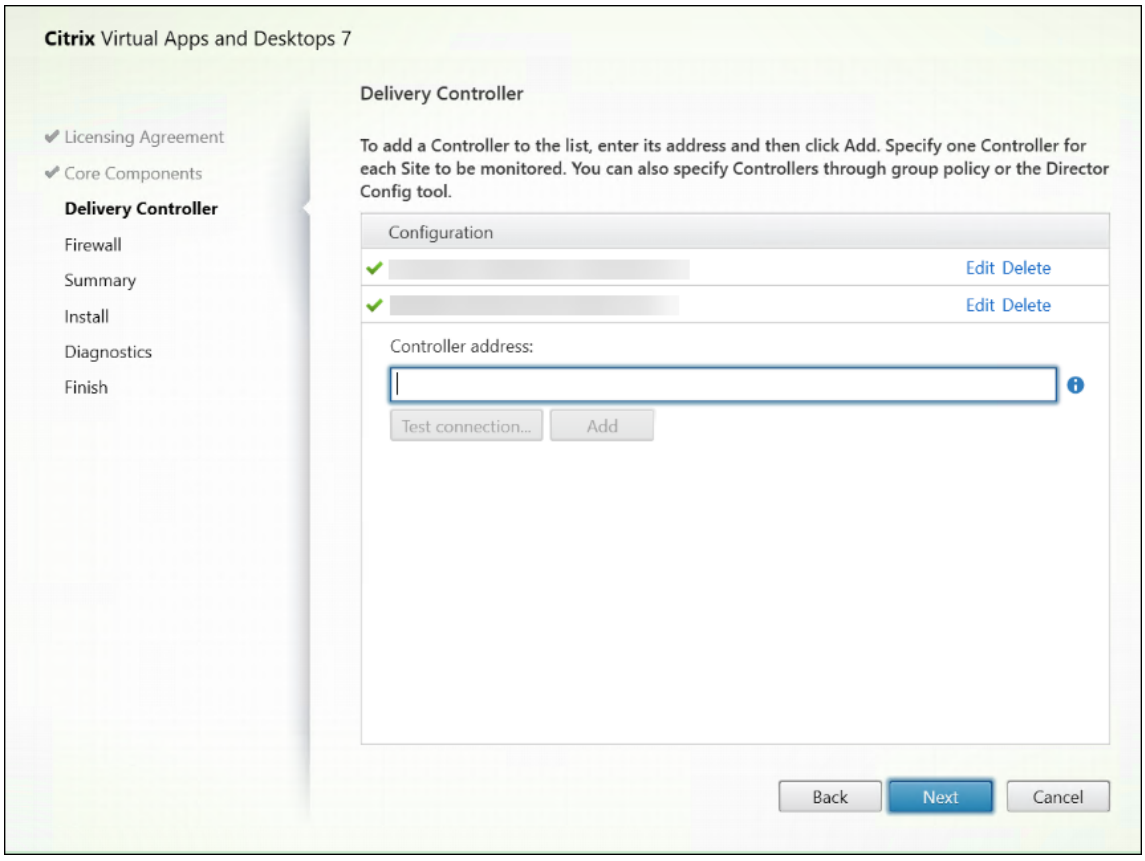
Requirement	Value
Recommended screen resolution	1440 × 1024

Hardware requirements

Resource	Minimum requirement
Memory	1 GB RAM
Disk space	100 MB

Install Web Studio

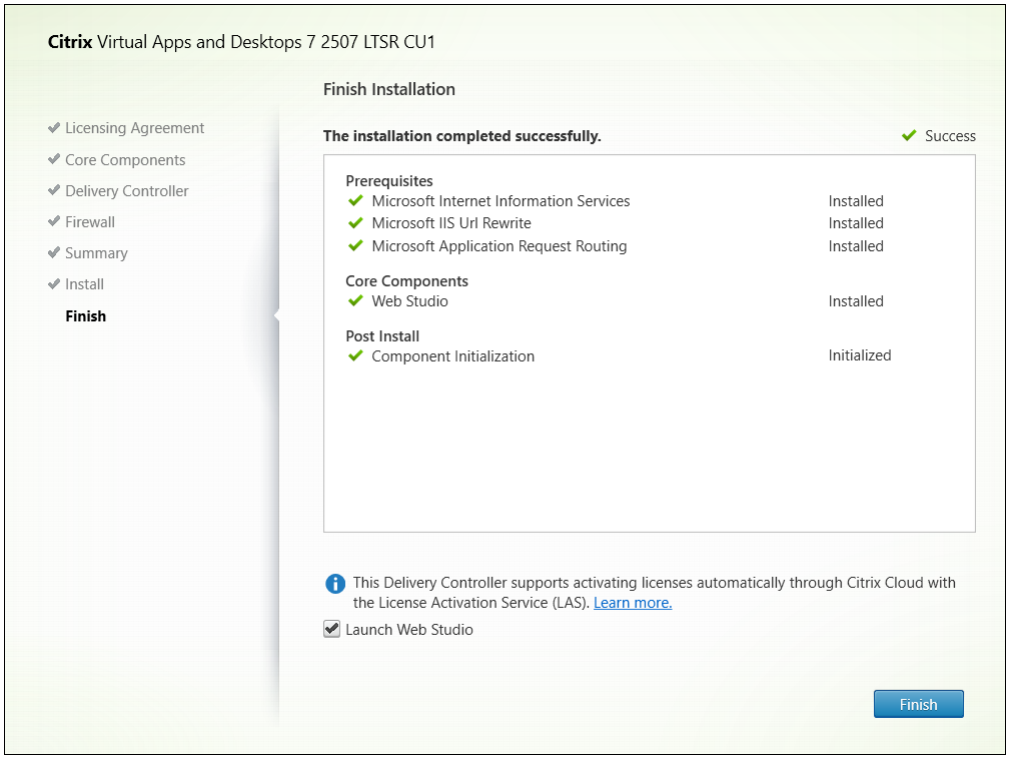
The following information is a supplement to the guidance in Install core components. To install Web Studio:



- Install Web Studio using the full product ISO installer for Citrix Virtual Apps and Desktops™. The ISO installer checks for prerequisites, installs any missing components, sets up the Web Studio website (on the Delivery Controller if included in Delivery Controller installation), and performs basic configuration.
- If Web Studio was not included during installation, use the installer to add Web Studio.
- When installing Web Studio, you are prompted to type the FQDN of a Delivery Controller.

  > **Note:**
  >
  > - We recommend running Web Studio and Delivery Controllers on the same version to ensure full functionality.
  > - You can add more than one Delivery Controller. Web Studio attempts to connect to them in random order. If the Delivery Controller to which Web Studio is attempting to connect is unreachable, Web Studio automatically falls back to other Delivery Controllers.
  > - If Director was selected in **Core Components** and installed, the Delivery Controllers you add here are used for both Web Studio and Director.
  > - If the delivery controller is configured for TLS (recommended) then the entered FQDN must match the common name or a subject alternative name of the certificate in-

© 1997–2026 Citrix Systems, Inc. All rights reserved.



stalled on the delivery controller.

- Web Studio can be installed on any IIS website with **Site ID = 1**, regardless of the site name. This feature enables you to host Web Studio under a custom IIS site instead of the **Default Web Site**.
  - If IIS is not installed before running the ISO installer, the installer automatically configures IIS and deploys Web Studio under the **Default Web Site** (Site ID = 1). After installation, the site name can be renamed as needed.
  - If IIS is already installed, you can create a IIS site in advance with your preferred name and physical path, as long as its **Site ID** is **1**. Web Studio is then installed directly under that site, with no further configuration required.

- On the **Finish** page, review the installed components and then click **Finish**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> You can also use the command line to install Web Studio. Example: `.\XenDesktopServerSetup.exe /components webstudio /controllers "ddc1.studio.local"/configure_firewall /quiet`. For more information, see Install using the command line.

Configure a certificate for TLS

By default, if IIS isn't already configured for HTTPS, the installer creates a self-signed certificate using the server's FQDN as the certificate's common name, and binds it to port 443. This behavior allows users to access Web Studio from the local machine, but users connecting from other machines see security warnings because the certificate isn't trusted. We recommend replacing this certificate with a certificate signed by an enterprise or public certificate authority (CA). For more information, see Enable TLS on web studio and Director. If a TLS certificate is already configured in IIS, the installer makes no changes.

> **Note:**
>
> To learn more about securing your Web Studio deployment, see Secure Web Studio deployment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set up a site

To set up your Citrix Virtual Apps and Desktops deployment (also known as a site), use the tool, Citrix Site Manager. The tool is installed automatically with a Delivery Controller.

To set up a site, follow these steps:

1. On a Delivery Controller, open the desktop Start menu, and then select **Citrix > Citrix Site Manager**.
2. In the Citrix Site Manager, select **Create a site**. The Site Setup wizard appears.
3. Create a site and configure its settings as follows:
   - On the **Introduction** page, type a name for the site.
   - The **Databases** page contains selections for setting up the site, monitoring, and configuration logging databases. For more information, see Step 3. Databases.
   - On the **Licensing** page, specify the License Server address and then indicate which license to use (install). For more information, see Step 4. Licensing.
4. On the **Summary** page, check all settings and click **Submit**.

   The IP address of this Controller is automatically added to the site.

   > **Note:**
   >
   > The user who creates a site becomes a full administrator for it. For more information, see Delegated administration.

If you install a new Controller after creating a site, you must add the Controller to the site. Detailed steps are as follows:

1. Run Citrix Site Manager on this new Controller.
2. Select **Join an existing site**.
3. Type the address of a Controller that is already added to the site.
4. Click **Submit**.

Add Delivery Controllers to Web Studio for management

Use the Studio configuration tool to add the Delivery Controllers to Web Studio for management. This tool is available in the Web Studio installation folder.

By default, the tool is installed in the following default folder.

- `C:\Program Files\Citrix\Web Studio\Tool\StudioConfig.exe`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Suppose you want to configure the following two Delivery Controllers for the site that you want to manage with Web Studio: `ddc1.studio.local` and `ddc2.studio.local`. Run the following PowerShell command:

- `.\StudioConfig.exe --server "ddc1.studio.local,ddc2.studio.local"`

> **Note:**
>
> - The tool requires computer administrator permissions.
> - The Delivery Controller configuration changes might not take effect immediately due to cache settings on the IIS server. For immediate effect, go to the Web Studio server, open Internet Information Services (IIS) Manager, navigate to *Server_name* > **Sites** > *the IIS site name where Web Studio is installed (site ID = 1)*, and select **Restart** in the Manage Website pane.
> - When you redeploy the Delivery Controllers with new FQDNs, update their FQDNs in Web Studio using `StudioConfig.exe` and in the `C:\Program Files\Citrix\Web Studio\Site\assets\json\manifest.json` file. If you don't update the `manifest.json` file, the old FQDNs still appear in the Web Studio sign-in window. As a result, you must enter the new FQDNs as an alternative when signing in.
> - To view all supported parameters, run `StudioConfig.exe --help`.

(Optional) Configure Web Studio as a proxy for Delivery Controllers

By default, when you manage your deployment using the Web Studio console, you connect to both the Web Studio server and the Delivery Controllers through the web browser. We provide you with an option to configure the Web Studio server as a proxy for Delivery Controllers. As a result, you connect only to the Web Studio server when managing your deployment.

This section guides you to configure a Web Studio server as a proxy for Delivery Controllers. We assume that Web Studio and Delivery Controllers are installed on different servers.

Before you start, verify that you have all necessary core components installed in your deployment. For more information, see Install core components.

To enable proxy mode for Web Studio, follow these steps:

1. On the Web Studio server, run Windows PowerShell as an administrator.
2. Run the following command where you replace `fqdn_of_webstudio_machine` with the FQDN of your Web Studio server.

   ```
   & "c:\Program Files\Citrix\Web Studio\Tool\StudioConfig.exe"--enableproxy --proxyserver "fqdn_of_webstudio_machine"
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If you have a load-balanced Web Studio deployment, replace `fqdn_of_webstudio_machine` with the FQDN of the load balancer server (also known as the virtual server). For more information, see Set up a load-balanced Web Studio deployment.

To disable proxy mode for Web Studio, run this PowerShell command:

```
& "c:\Program Files\Citrix\Web Studio\Tool\StudioConfig.exe" --
    disableproxy
```

(Optional) Enable or disable Pendo

Starting with version 2411, Web Studio integrates Pendo, which is enabled by default. Pendo collects your usage data following the Citrix Privacy Policy. It also adds an icon in the bottom-right corner of Web Studio, providing you with contextual feature information and feedback options. If you prefer not to share your usage data, you can disable Pendo using the Studio configuration tool.

This tool is available in the Web Studio installation folder. By default, the tool is installed in the following folder: `C:\Program Files\Citrix\Web Studio\Tool\StudioConfig.exe`.

To disable Pendo, follow these steps:

1. Sign in to Web Studio. If an icon appears in the bottom-right corner, Pendo is enabled.
2. On the Web Studio server, run Windows PowerShell as an administrator.
   Run this PowerShell command:

```
& "c:\Program Files\Citrix\Web Studio\Tool\StudioConfig.exe" --
    disablependo
```

To enable Pendo, run this command:

```
& "c:\Program Files\Citrix\Web Studio\Tool\StudioConfig.exe" --
    enablependo
```

Secure server configuration for Web Studio

Apply the following security configurations to the server hosting Web Studio for better security. These settings are applied at the server level, not in Web Studio itself.

Disable medium-strength SSL ciphers (SWEET32)

The Web Studio server might use the medium-strength cipher `TLS_RSA_WITH_3DES_EDE_CBC_SHA`, which is vulnerable to the SWEET32 attack.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To disable the cipher, run the following PowerShell command on the Web Studio server:
`Disable-TlsCipherSuite -Name TLS_RSA_WITH_3DES_EDE_CBC_SHA`

Disable deprecated TLS 1.0 and 1.1 protocols

TLS 1.0 and TLS 1.1 are deprecated and should not be enabled on the Web Studio server.
To disable them:

1. Open Registry Editor (`regedit.exe`).
2. Go to `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL\Protocols`.
3. Create the following subkeys if they don't exist:
   - `TLS 1.0\Client`
   - `TLS 1.0\Server`
   - `TLS 1.1\Client`
   - `TLS 1.1\Server`
4. In each `Client` and `Server` key, create the following `DWORD (32-bit)` values:
   - `Enabled` = `0`
   - `DisabledByDefault` = `1` (optional but recommended)
5. Restart the server to apply changes.

Sign in to Web Studio

1. Access Web Studio at `https://<address of the server hosting Web Studio>/Citrix/Studio` if the default port number 443 is used. If a different port is configured, use `https://<address of the server hosting Web Studio>:<port number>/Citrix/Studio`.

   The Sign-in page appears if you've added Delivery Controllers to Web Studio and they are reachable.

   > **Note:**
   >
   > The **Unable to sign in** page appears in the following cases:
   >
   > - No Delivery Controllers have been specified for the site. You are prompted to add one to connect.
   > - The specified Delivery Controllers are unreachable. Click **Test** to check connectivity. Or, enter an alternate Delivery Controller and click **Connect**.

2. Enter **User name**, **Password**, and **Domain**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **Sign in**.

Next steps

1. Install VDAs
2. Use Web Studio to deliver virtual apps and desktops to your users by:
   a) Creating a machine catalog
   b) Creating a delivery group
   c) Creating an application group (optional)

Install VDAs

September 3, 2026

> **Important:**
>
> - If you're upgrading and your current version has the Personal vDisk or AppDisks software installed, see Removing PvD, AppDisks, and unsupported hosts.
> - Binaries distributed by Citrix® are now signed. Signed binaries indicate that they are validated by either Citrix-generated certificates or authentic third-party certificates.

There are two types of VDAs for Windows machines: VDA for multi-session OS and VDA for single-session OS. (For information about VDAs for Linux machines, see the Linux Virtual Delivery Agent documentation.)

Before starting an installation, review Prepare to install and complete all preparation tasks.

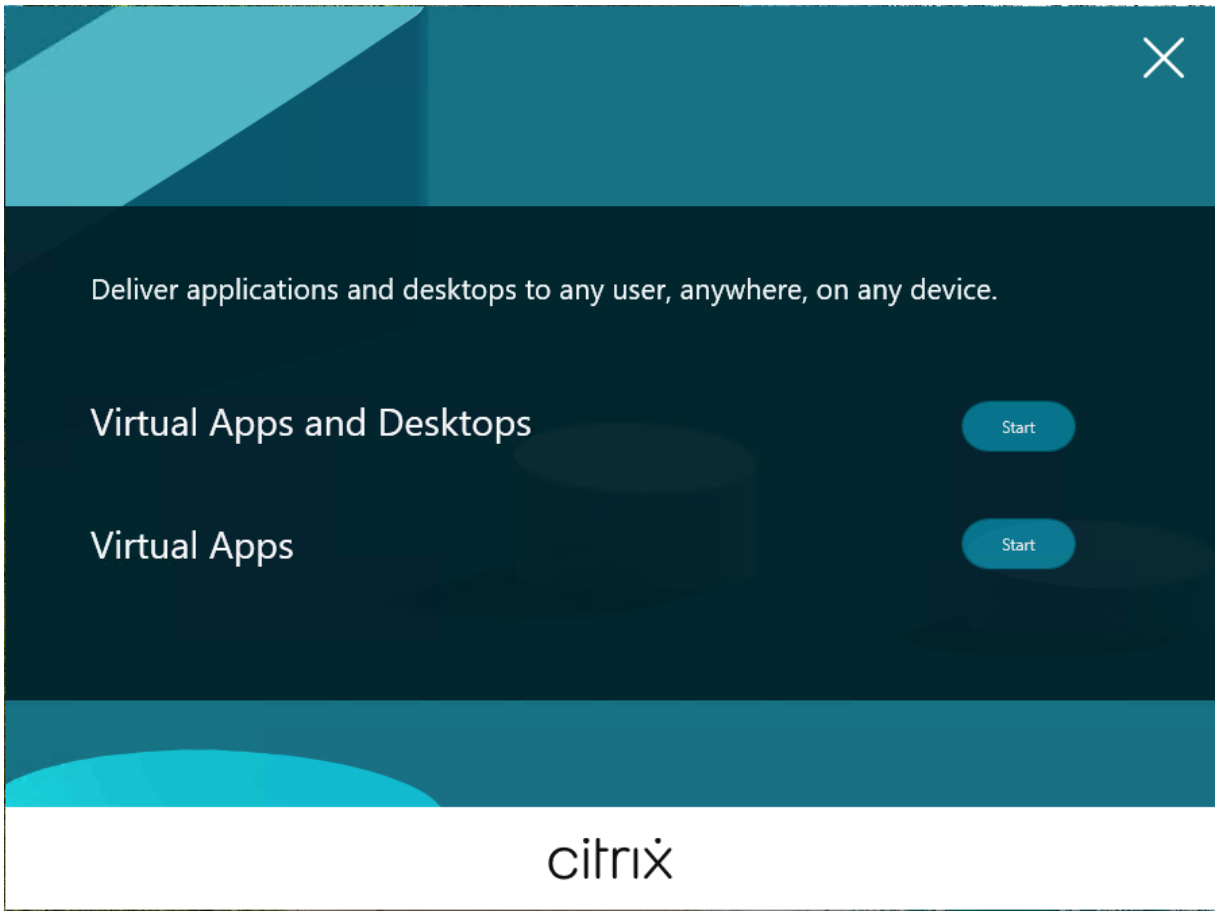
Before installing VDAs, install the core components. You can also create the site before installing VDAs.

This article describes the installation wizard sequence when installing a VDA. Command-line equivalents are provided. For details, see Install using the command line.

Step 1. Download the product software and launch the wizard

If you're using the full-product installer:

1. If you haven't downloaded the product ISO yet:



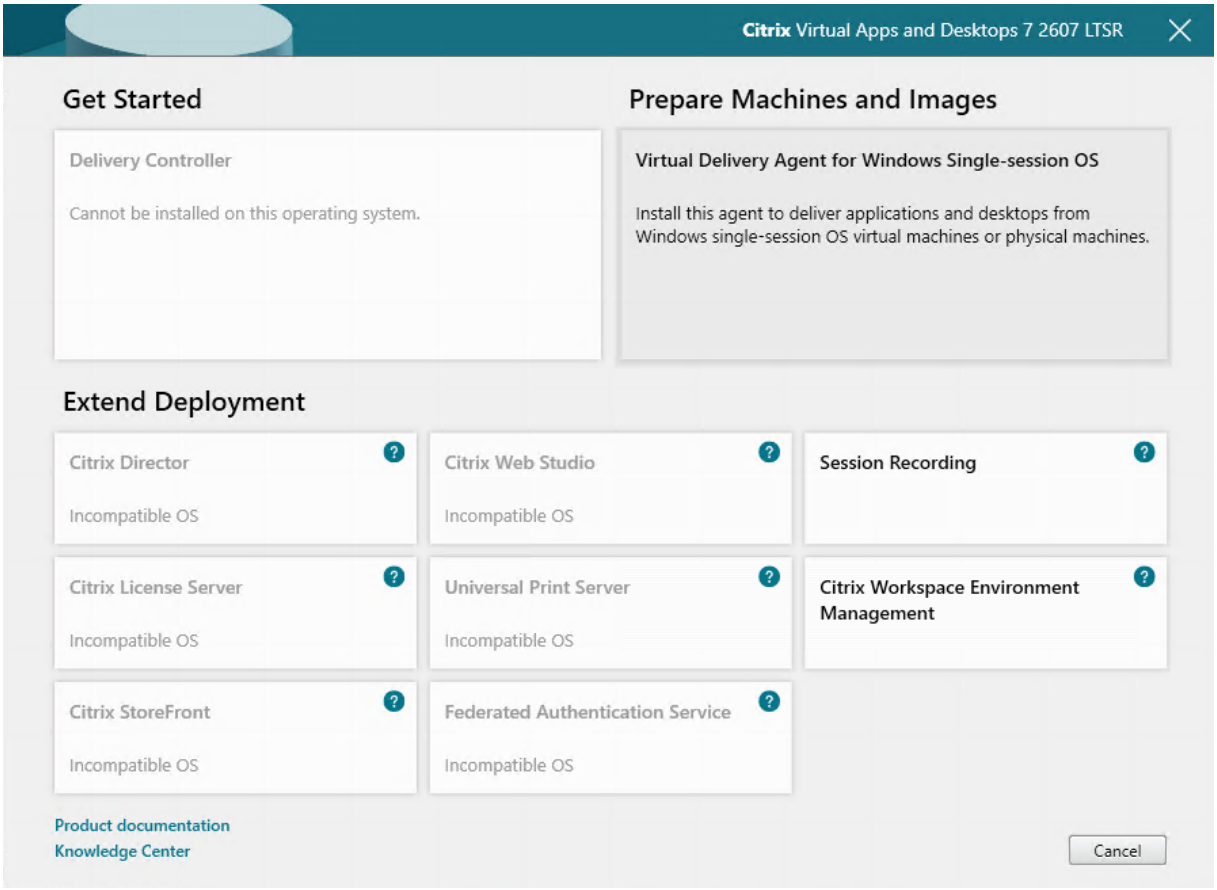
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Use your Citrix account credentials to access the Citrix Virtual Apps and Desktops™ download page. Download the product ISO file.
- Unzip the file. Optionally, burn a DVD of the ISO file.

2. Use a local administrator account on the image or machine where you're installing the VDA. Insert the DVD in the drive or mount the ISO file. If the installer does not launch automatically, double-click the **AutoSelect** application on the mounted drive.

   The installation wizard launches.

Step 2. Choose which product to install



Click **Start** next to the product to install: Citrix Virtual Apps or Citrix Virtual Desktops. (If the machine already has a Citrix Virtual Apps or Citrix Virtual Desktops component installed, this page does not appear.)

Command-line option: /xenapp to install Citrix Virtual Apps. Citrix Virtual Desktops is installed if this option is omitted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

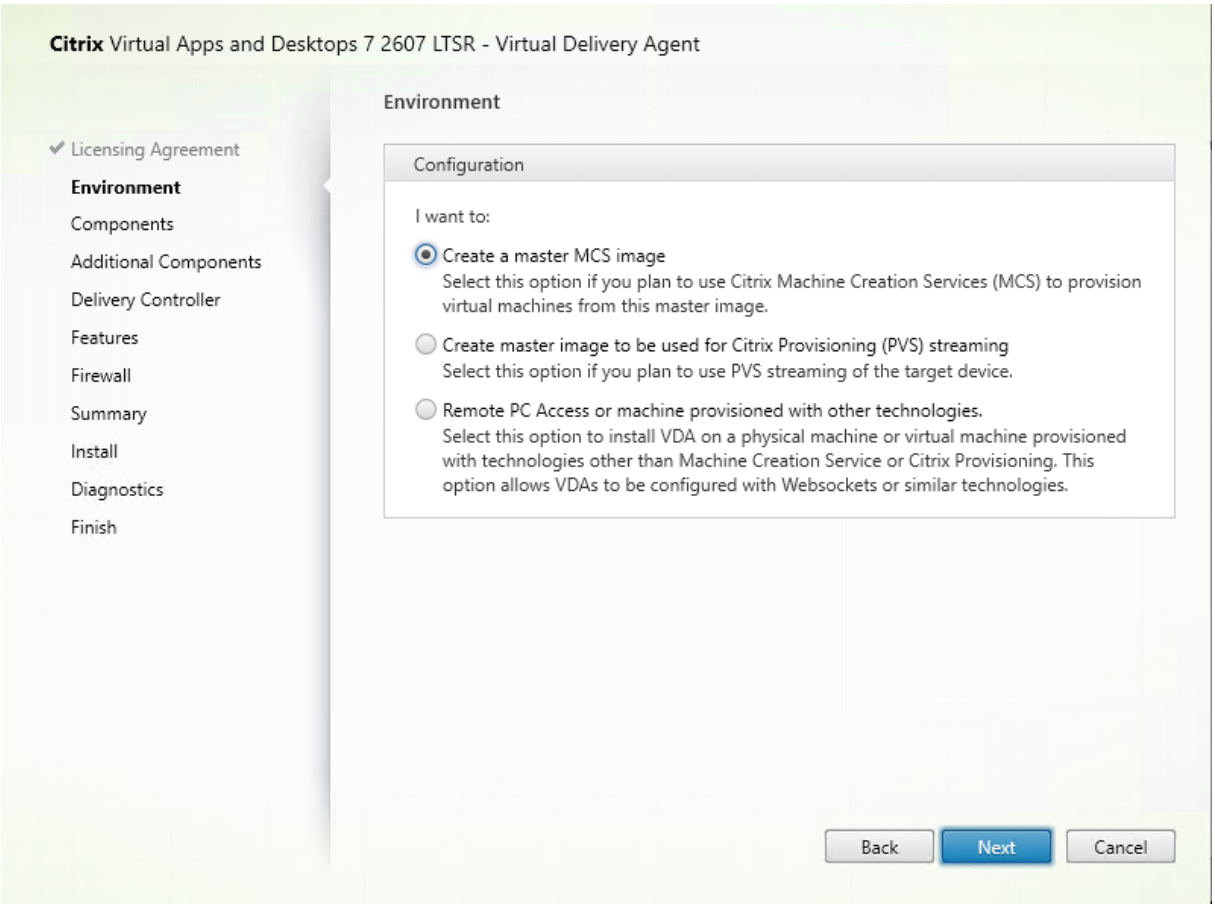
Step 3. Select the VDA

Select the **Virtual Delivery Agent** entry. The installer knows whether it's running on a single-session or multi-session OS, so it offers only the appropriate VDA type.

For example, when you run the installer on a Windows Server 2019 machine, the VDA for multi-session OS option is available. The VDA for single-session OS option is not offered.

If you try to install (or upgrade to) a Windows VDA on an OS that is not supported for this Citrix Virtual Apps and Desktops™ version, a message guides you to information about options.

If you're using a standalone package:



1. Use your Citrix account credentials to access the Citrix Virtual Apps and Desktops™ download page. Download the appropriate package:
    - `VDAServerSetup_2607.exe`: Multi-session OS VDA *version*
    - `VDAWorkstationSetup_2607.exe`: Single-session OS VDA *version*
    - `VDAWorkstationCoreSetup_2607.exe`: Single-session OS Core Services VDA *version*
    - `VDASingleSessionCoreSetup_2607.exe`: New Single-session OS Core Services VDA version

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Right-click the package and choose **Run as administrator.**

   The installation wizard launches.

Step 4. Specify how the VDA will be used

On the **Environment** page, specify how you plan to use the VDA, indicating whether you use this machine as an image to provision more machines.

The option you choose affects which Citrix Provisioning™ tools are installed automatically (if any), and the default values on the Additional Components page of the VDA installer.

Several MSIs (provisioning and other) are installed automatically when you install a VDA. The only way to prevent their installation is with the `/exclude` option in a command-line installation.

Choose one of the following:

- **Create a master MCS image:** Select this option to install a VDA on a VM image, if you plan to use Machine Creation Services™ to provision VMs. This option installs the Machine Identity Service. This is the default option.

  Command-line option: `/mastermcsimage` or `/masterimage`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> The installation media or ISO image must be mounted locally. Mounting an ISO image off a network drive for the purposes of installing software is not supported.

- **Create a master image using Citrix Provisioning or third-party provisioning tools:** Select this option to install a VDA on a VM image, if you plan to use either Citrix Provisioning or third-party provisioning tools (such as Microsoft System Center Configuration Manager) to provision VMs.

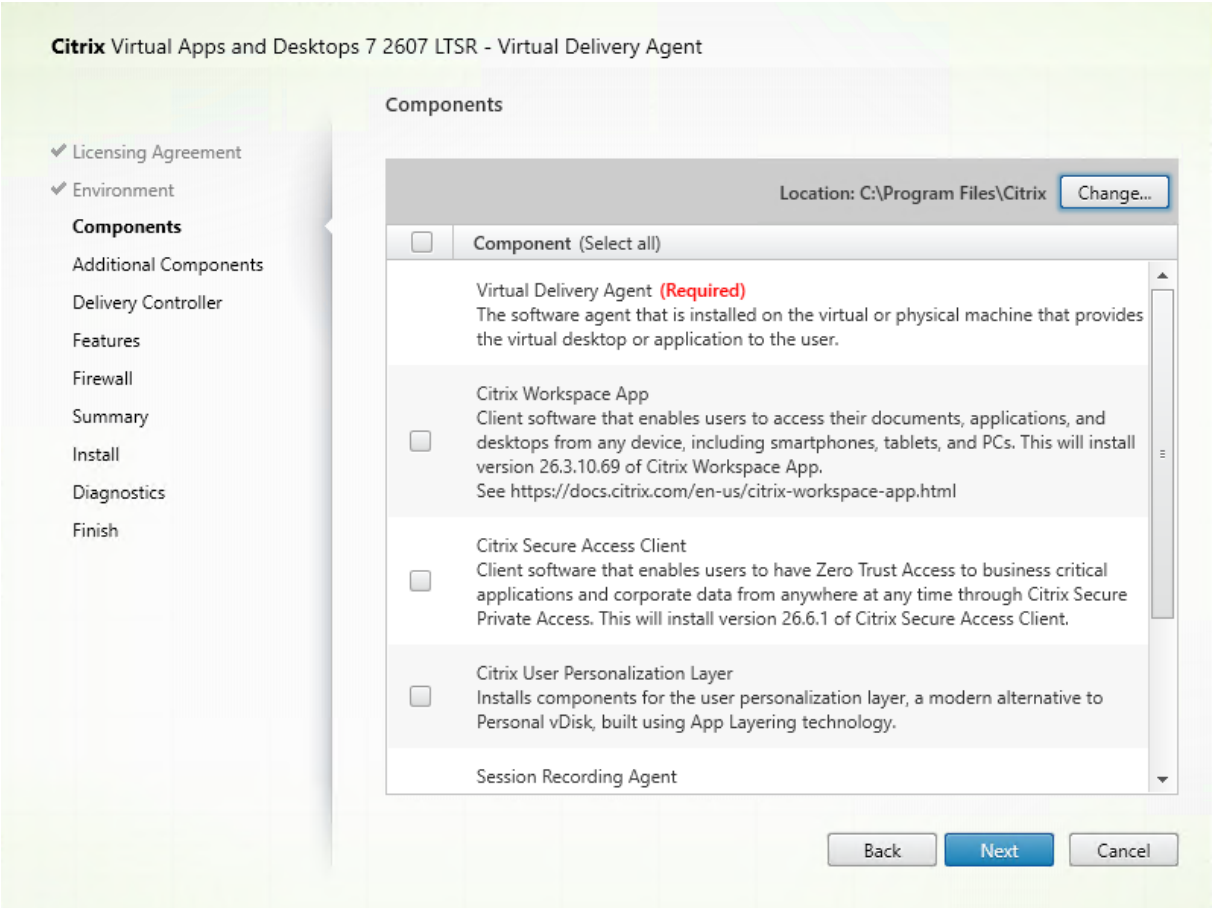
  Command-line option: `/masterpvsimage`

- (Appears only on multi-session OS machines) **Enable brokered connections to a server:** Select this option to install a VDA on a physical or virtual machine that will not be used as an image to provision other machines.

  Command-line option: `/remotepc`

- (Appears only on single-session OS machines) **Enable Remote PC Access:** Select this option to install a VDA on a physical machine for use with Remote PC Access.

  Command-line option: `/remotepc`



Click **Next**.

This page does not appear:

- If you're upgrading a VDA
- If you are using the `VDAWorkstationCoreSetup_xxxx.exe`, `VDASingleSessionCoreSetup_xx .exe`, `VDAServerSetup_xxxx.exe`, or `VDAWorkstationSetup_xxxx.exe` installer

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 5. Select the components to install and the installation location

> **Note:**
>
> Starting with version 2603, components previously listed on the Optional Software page have been moved to the Components page.

On the **Components** page:

- **Location:** By default, VDA is installed in `C:\Program Files\Citrix`. This default is fine for most deployments. If you specify a different location, that location must have `execute` permissions for network service.
- **Components:** By default, Session Recording Agent and Citrix Virtual Desktop Assistant are installed with the VDA. If you are using the `VDAWorkstationCoreSetup.exe` installer or the `VDASingleSessionCoreSetup.exe` installer, only VDA will be installed, and the other components will not be displayed.

Click **Next**.

Command-line options: `/installdir "C:\Program Files\VDA" /components "VDA","CSA","PLUGINS"` to install the Virtual Delivery Agent, Citrix Workspace Environment

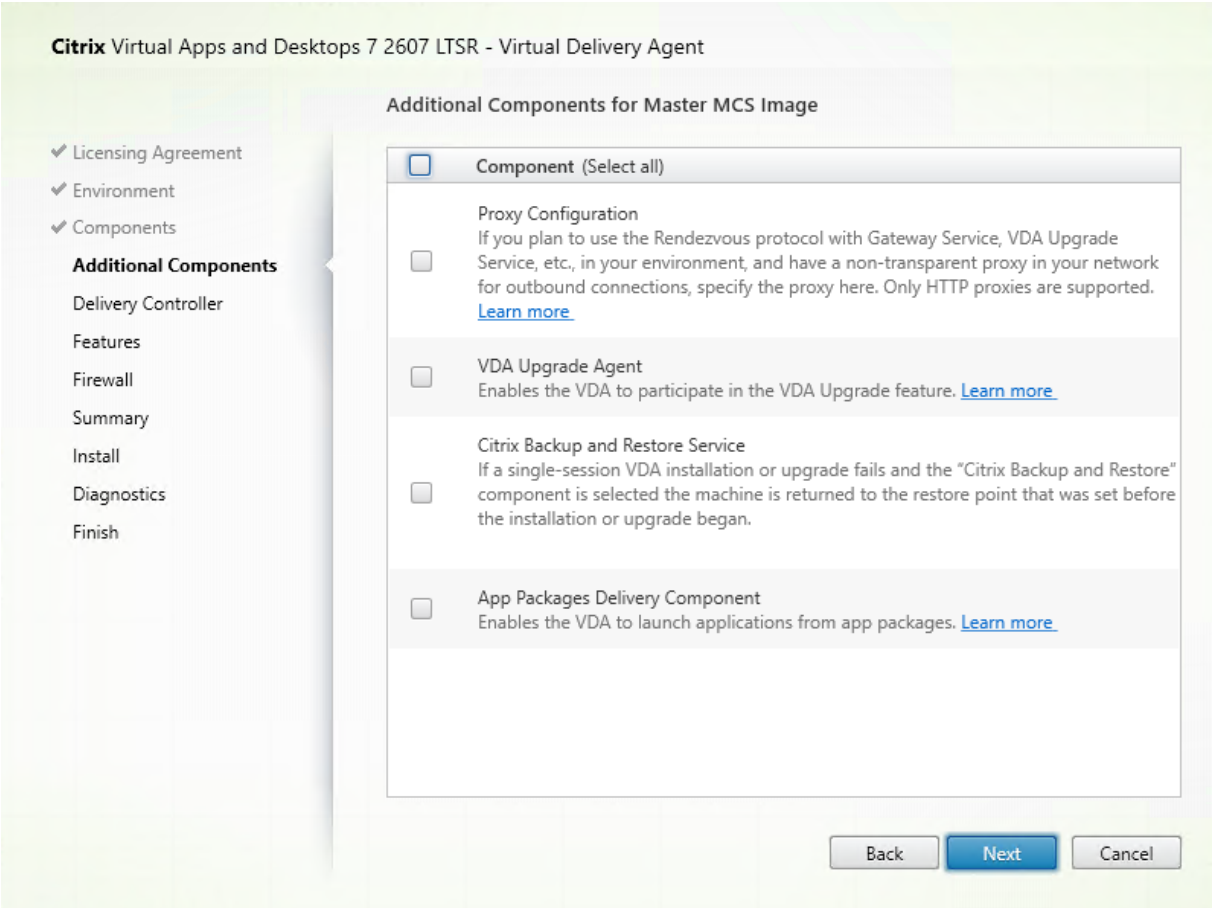
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Management™ agent, Citrix deviceTRUST, Citrix uberAgent, Citrix Secure Access Client, and the Citrix Workspace app into the specified directory.

> **Note:**
>
> You can choose to install, upgrade, or uninstall the Citrix Workspace app and other components during a VDA installation, upgrade, or uninstallation in the following scenarios:
>
> - During VDA installation and upgrade to 2607, you can choose to include or exclude components and CWA plug-ins.
>
> - By default, **Citrix Workspace app (CWA)**, **Citrix Secure Access Client (CSA)**, **Citrix User Personalization Layer (UPL) (Only for WS VDA)**, and **Citrix Elastic App Layering (CEAL) (Only for TS VDA)** are not selected to install, you can select them during installation if needed.
> **Session Recording Agent (SRAGENT)** and **Citrix Virtual Desktop Assistant (ASSISTANTAPP) (now available on both TS VDA and WS VDA)** are selected by default to install, you can deselect them during installation if needed.
>
> - **Citrix Device Trust**, **Citrix uberAgent**, and **Citrix Workspace Environment Management™ agent** are now integrated with the VDA and are always installed. To prevent their installation, administrators must use the supported `/exclude` command-line option. **uberAgent** is also installed by default and, starting with VDA 2511 and also in 2603 it cannot be excluded from the installation through either the GUI or command line (CLI).
>
> - By default, the **Citrix Workspace Environment Management™ agent** runs in **Basic deployment**, a single-machine mode with limited functionality that doesn't connect to a WEM infrastructure. To enable full WEM capabilities by connecting the agent to the WEM service in Citrix Cloud or an on-premises deployment, configure the settings through group policies. For more information, see this WEM article.
>
> - **Citrix User Personalization Layer:** Installs the MSI for the user personalization layer. For details, see User personalization layer.
>
> - **Command-line changes**
>
> `/components VDA,CSA` : The command installs **VDA** and **CSA** (selected), and also **Citrix Device Trust**, **Citrix uberAgent**, and **Citrix Workspace Environment Management agent** (default integrated).
>
> `/components VDA` : The command installs **VDA**, and also **Citrix Device Trust**, **Citrix uberAgent**, and **Citrix Workspace Environment Management agent** as these are now integrated into the VDA itself. If you specify Citrix Device Trust, Citrix uberAgent, and Citrix Workspace Environment Management agent as arguments alongside the `/`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

components option, the VDA Meta-installer logs a notification indicating the removal of these arguments from the /components option. Subsequently, the VDA Meta-installer proceeds with the installation or upgrade of the VDA.



/components : The command is an invalid command and it must always include VDA. Additional components can be added for installation as required.

Using /exclude command for default integrated components: The /exclude option always takes precedence. It can be used to prevent installation of default integrated components. Example: /exclude "Citrix Device Trust","Citrix Universal Print Client". The command installs VDA with Citrix Workspace Environment Management agent, but does not install Citrix Device Trust and Citrix Universal Print Client.

- During a VDA upgrade, if Citrix Workspace app, Citrix Secure Access Client and Citrix User Personalization Layer (Only for WS VDA), Session Recording Agent, Citrix Virtual Desktop Assistant, and Elastic App Layering (Only for TS VDA) are not already installed in the VDA, you can choose to install them.
- During a VDA upgrade, if the User Personalization Layer or Elastic App Layering is already installed, it is selected as **Required** and the component is upgraded.
- During a VDA upgrade, if the version of Citrix Workspace app, and other installed plug-ins can be upgraded, then the option to upgrade them is displayed.
- During a VDA uninstallation, you can choose whether to uninstall the Citrix Workspace app (CWA) and any other installed components. By default, all components except CWA are uninstalled automatically. CWA is treated differently and is not removed unless explicitly selected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 6. Install additional components

The **Additional Components** page contains checkboxes to enable or disable installation of other features and technologies with the VDA. In a command-line installation, you can use the `/exclude` or `/includeadditional` option to expressly omit or include one or more available components:

- **/includeadditional** "*component*"[,"*component*"] …
- **/exclude** "*component*"[,"*component*"] …

The following table indicates the default setting of items on this page. The default setting depends on the option that you selected on the **Environment** page.

Additional Components page	Environment page: "Master image with MCS"or "Master image with Citrix Provisioning" selected	Environment page: "Enable brokered connections to server"(for multi-session OS) or "Remote PC Access"(for single-session OS) selected
App Packages Delivery Component	Not selected	Not selected

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Additional Components page	Environment page: “Master image with MCS”or “Master image with Citrix Provisioning” selected	Environment page: “Enable brokered connections to server”(for multi-session OS) or “Remote PC Access”(for single-session OS) selected
Citrix VDA Upgrade Agent	Not selected	Not selected
Citrix Backup and Restore	Not selected	Not selected
Citrix Rendezvous V2	Not selected	Not selected

This page does not appear if:

- You are using the `VDAWorkstationCoreSetup.exe` installer or `VDASingleSessionCoreSetup.exe`. Also, the command-line options for the additional components are not valid with that installer.
- You are upgrading a VDA and all the additional components are already installed. If some of the additional components are already installed, the page lists only components that are not installed.

Select or clear the following checkboxes. (The components might appear in a different order in the installer.)

- **App Packages Delivery Component:** Install this component if you use applications from Microsoft App-V packages. For details, see Deploy and deliver App-V applications.

  Command-line option: `/includeadditional "App Packages Delivery Component"` to enable component installation, `/exclude "App Packages Delivery Component"` to prevent component installation.

- **Citrix Profile Management:** This component manages user personalization settings in user profiles. For details, see Profile Management.

  Excluding Citrix Profile Management from the installation affects the monitoring and troubleshooting of VDAs with Citrix Director. On the **User details** and **End Point** pages, the **Personalization** panel and the **Logon Duration** panel fail. On the **Dashboard** and **Trends** pages, the **Average Logon Duration** panel display data only for machines that have Profile Management installed.

  Even if you are using a third-party user profile management solution, Citrix recommends that you install and run the Citrix Profile Management Service. Enabling the Citrix Profile Management Service is not required.

  Command-line option: `/includeadditional "Citrix Profile Management"`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

to enable component installation, `/exclude "Citrix Profile Management"` to prevent component installation.

- **Citrix Profile Management WMI Plug-in:** This plug-in provides Profile Management runtime information in WMI (Windows Management Instrumentation) objects (for example, profile provider, profile type, size, and disk usage). WMI objects provide session information to Director.

  Command-line option: `/includeadditional "Citrix Profile Management WMI Plug-in"` to enable component installation, `/exclude "Citrix Profile Management WMI Plug-in"` to prevent component installation.

> **Note:**
>
> Starting with 2507 LTSR, **Citrix Profile Management** and **Citrix Profile Management WMI Plug-in** are now part of the VDA and are installed automatically for **Master Image/MCS/PVS** use cases. These components are **not installed by default** for the **Remote PC** use case. In all instances, installed components are automatically upgraded. The command-line behavior remains unchanged from previous releases.

- **VDA Upgrade Agent:** Applicable only to Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) deployments. Enables the VDA to participate in the VDA Upgrade feature. You can use that feature to upgrade a catalog's VDAs from the management console, immediately or at a scheduled time. If this agent is not installed, you can upgrade a VDA by running the VDA installer on the machine.

  Command-line options: `/includeadditional "Citrix VDA Upgrade Agent"` to enable component installation, `/exclude "Citrix VDA Upgrade Agent"` to prevent component installation.

- **MCSIO write cache for storage optimization:** Installs the Citrix MCS I/O driver. For more information, see Storage shared by hypervisors and Configure cache for temporary data.

  Command-line options: `/includeadditional "Citrix MCS IODriver"` to enable component installation, `/exclude "Citrix MCS IODriver"` to prevent component installation.

  > **Note:**
  >
  > Starting with version 2607, **MCSIO write cache for storage optimization** is now part of the VDA and is installed automatically for **Master Image/MCS** use cases. This component is **not installed by default** for the **Remote PC** use case. In all instances, installed components are automatically upgraded. The command-line behavior remains unchanged from previous releases.

- **Proxy Configuration:** Install this component if you plan to use the Rendezvous protocol with

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the Gateway Service, VDA Upgrade Service, and so on, in your environment, and you have a non-transparent proxy in your network for outbound connections, specify the proxy here. Only HTTP proxies are supported.

If you install this component, specify the address of the proxy or PAC file path on the **Rendezvous Proxy Configuration** page. For feature details, see Rendezvous protocol.

Command-line option: `/includeadditional "Citrix Rendezvous V2"` to enable component installation, `/exclude "Citrix Rendezvous V2"` to prevent component installation.

- **Citrix Backup and Restore:** If a VDA installation or upgrade fails, then this component can return the machine to a backup that was done before the installation or upgrade.

  Make sure that the Microsoft prerequisites are met as mentioned in Prepare to install.

  Command-line option: `/includeadditional "Citrix Backup and Restore"` to enable component installation, `/exclude "Citrix Backup and Restore"` to prevent component installation.

  > **Note:**
  >
  > Starting with version 2603, Citrix Backup and Restore component is available for workstation VDAs only. If the MCS storage optimization is enabled, then the backup or restore for desktop Operating System can fail. To resolve this, disable the MCS storage optimization option in the meta installer.

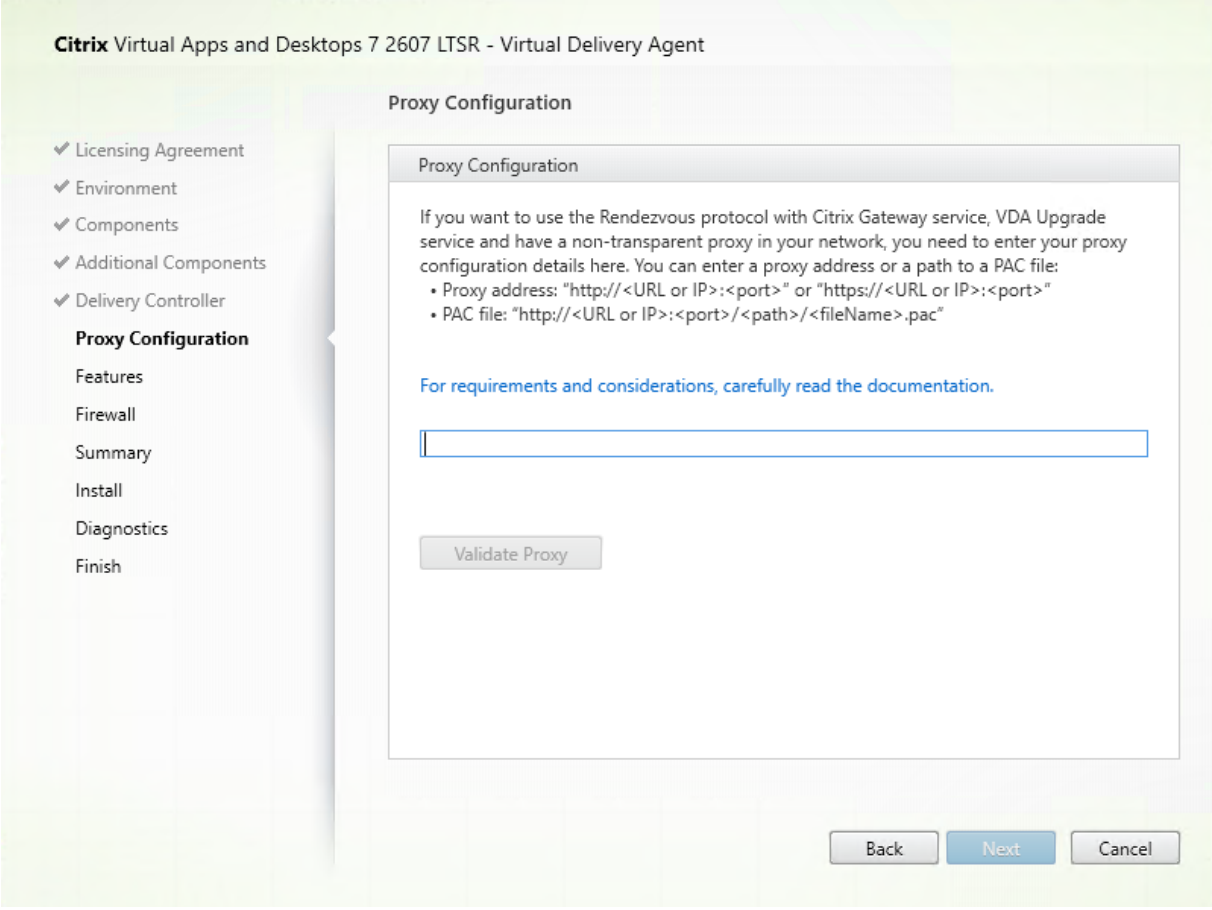
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 7. Delivery Controller™ addresses

On the **Delivery Controller** page, choose how you want to enter the addresses of installed Controllers. Citrix recommends that you specify the addresses while you're installing the VDA (**Do it manually**). The VDA cannot register with a Controller until it has this information. If a VDA cannot register, users cannot access applications and desktops on that VDA.

- **Do it manually:** (default) Enter the FQDN of an installed Controller and then click **Add**. If you've installed more Controllers, add their addresses.
- **Do it later (Advanced):** If you choose this option, the wizard asks you to confirm that's what you want to do before continuing. To specify addresses later, you can either rerun the installer or use Citrix Group Policy. The wizard also reminds you on the **Summary** page.
- **Choose locations from Active Directory:** Valid only when the machine is joined to a domain and the user is a domain user.
- **Use WebSocket Token:** Creates a WebSocket VDA. The WebSocketToken is for the token that is required.
- **Let Machine Creation Services do it automatically:** Valid only when using MCS to provision machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Click **Next**. If you selected **Do it later (Advanced)**, you are prompted to confirm that you will specify Controller addresses later.

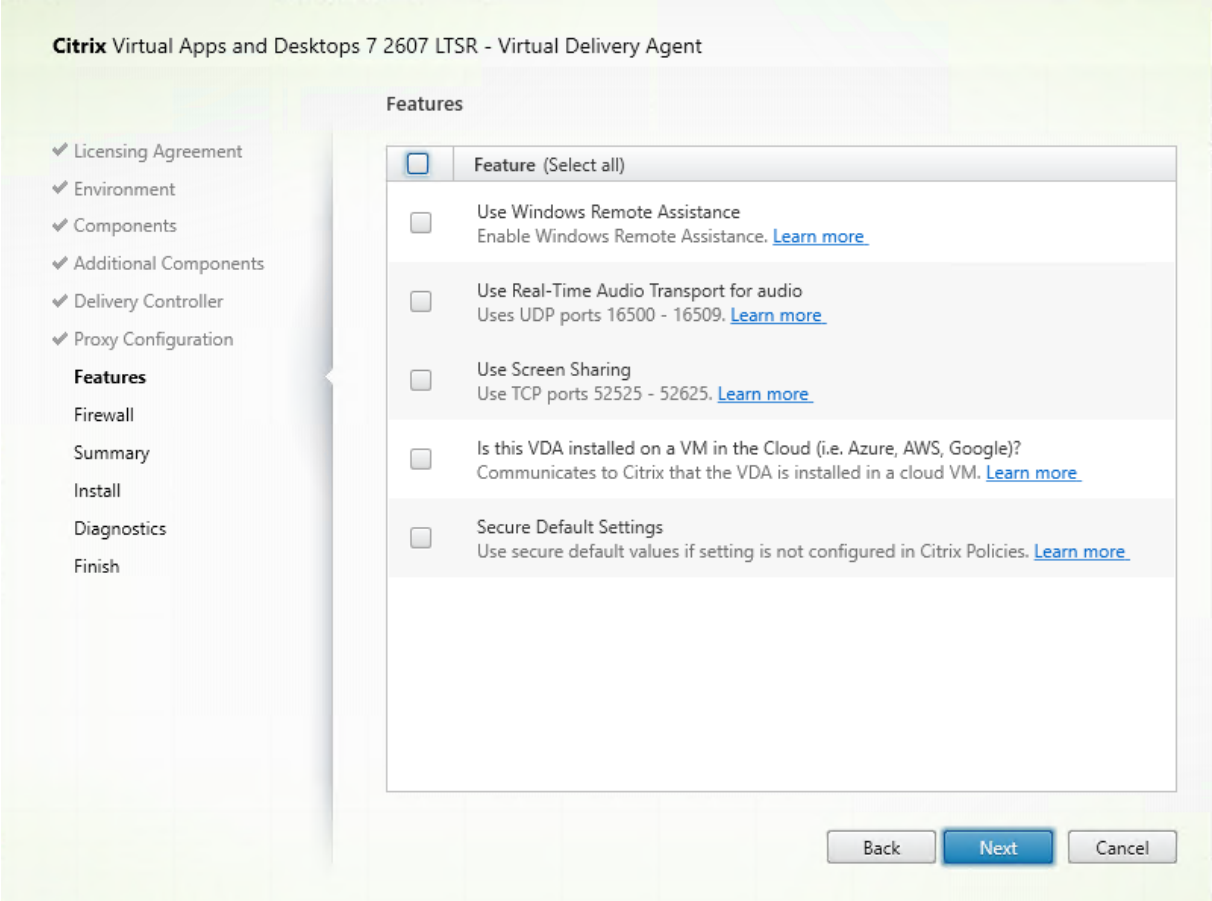
Other considerations:

- The address cannot contain non-alphanumeric characters.
- If you specify addresses during VDA installation and in Group Policy, the policy settings override settings provided during installation.
- Successful VDA registration requires that the firewall ports used to communicate with the Controller are open. That action is enabled by default on the **Firewall** page of the wizard.
- After you specify Controller locations (during or after VDA installation), you can use the auto-update feature to update the VDAs when Controllers are added or removed. For details about how VDAs discover and register with Controllers, see VDA registration.

Command-line option: `/controllers`

Step 8. Proxy Configuration

The **Proxy Configuration** page appears only if you enabled the **Proxy Configuration** check box on the **Additional Components** page.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Select whether you will specify the proxy source by proxy address or PAC file path.
2. Specify the proxy address or PAC file path.
    - Proxy address format: `http://<url-or-ip>:<port>`
    - PAC file format: `http://<url-or-ip>:<port>/<path>/<filename>.pac`

The firewall for the proxy port must be open for the connection test to succeed. If a connection cannot be made to the proxy, you can choose whether to continue with the VDA installation.

Command-line option: `/proxyconfig`

Step 9. Enable or disable features

On the **Features** page, use the check boxes to enable or disable the features you want to use.

- **Use Windows Remote Assistance:** When this feature is enabled, Windows Remote Assistance is used with the user shadowing feature of Director. Windows Remote Assistance opens the dynamic ports in the firewall. (Default = disabled)

  Command-line option: `/enable_remote_assistance`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Use Real-Time Audio Transport for audio:** Enable this feature if voice-over-IP is widely used in your network. The feature reduces latency and improves audio resilience over lossy networks. It allows audio data to be transmitted using RTP over UDP transport. (Default = disabled)

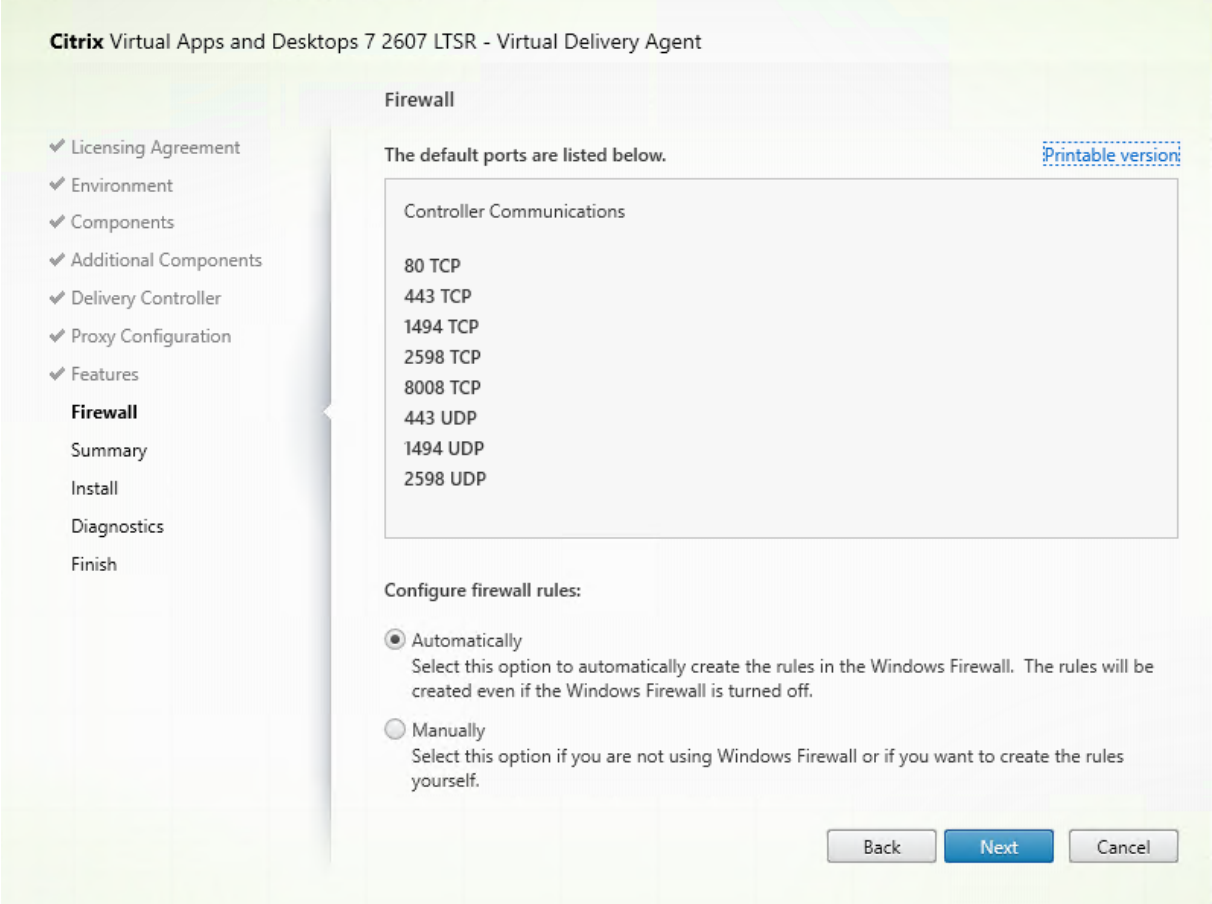
  Command-line option: `/enable_real_time_transport`

- **Use screen sharing:** When enabled, ports used by screen sharing are opened in the Windows firewall. (Default = disabled)

  Command-line option: `/enable_ss_ports`

- **Is this VDA installed on a VM in a cloud:** This setting helps Citrix to correctly identify resource locations for on-premises and service (Citrix Cloud™) VDA deployments for telemetry purposes. This feature has no impact on customer-side utilization. Enable this setting if your deployment uses Citrix DaaS (Default = disabled).

  Command-line option: `/xendesktopcloud`



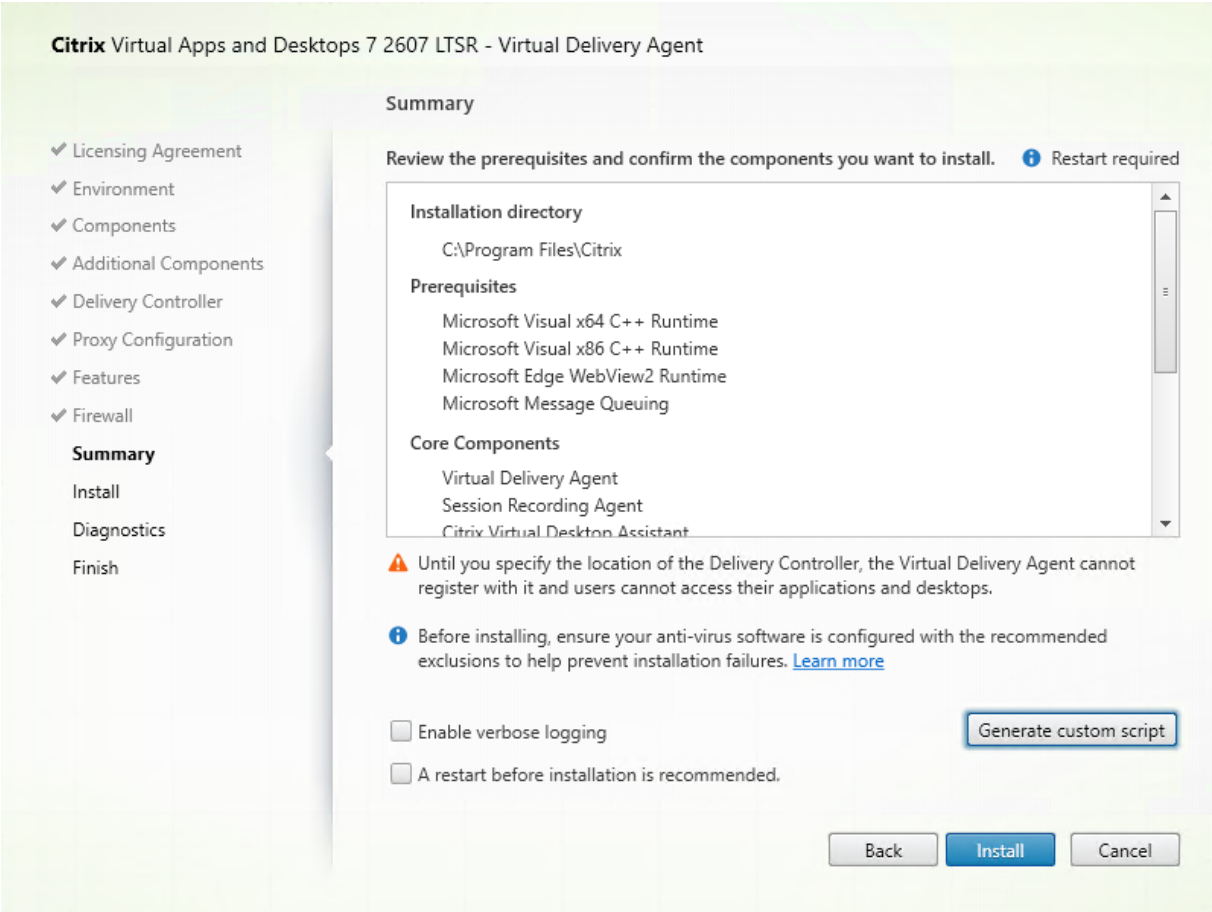
- **Secure Default Settings:** This option changes the default setting for various features from enabled to disabled for a more secure out-of-box configuration. The relevant features are: client drive redirection, special folder redirection, drag and drop, client TWAIN device redirection, Client USB Plug and Play device redirection, client printer redirection, client clipboard redirection, and client microphone redirection.

Command-line option: `/ENABLE_SECURE_DEFAULTS`

Click **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 10. Firewall ports



On the **Firewall** page, by default, the ports are opened automatically if the Windows Firewall Service is running, even if the firewall is not enabled. This default setting is fine for most deployments. For port information, see Network ports.

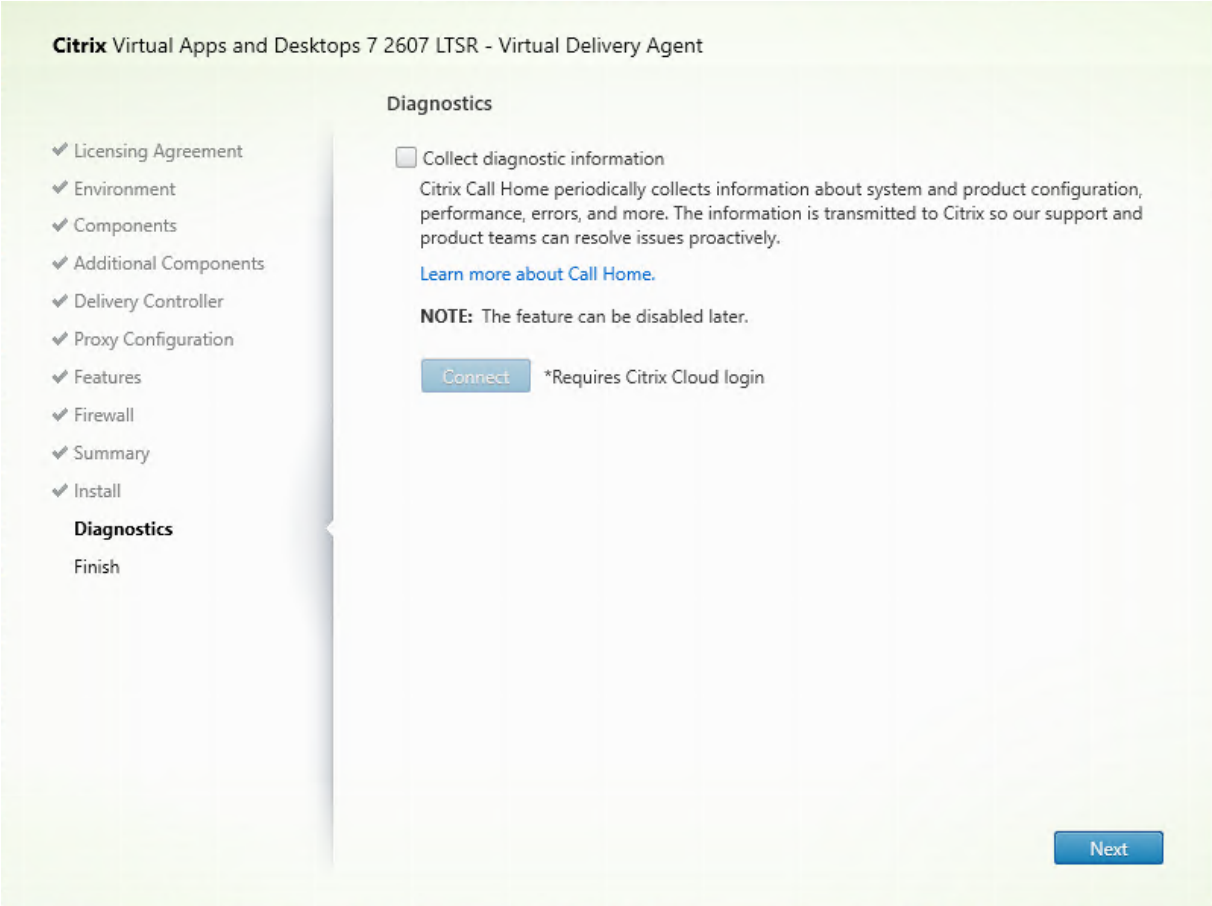
Click **Next**.

Command-line option: `/enable_hdx_ports`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 11. Review prerequisites and confirm installation

The **Summary** page lists what will be installed. Use the **Back** button to return to earlier wizard pages and change selections.



When you're ready, click **Install**.

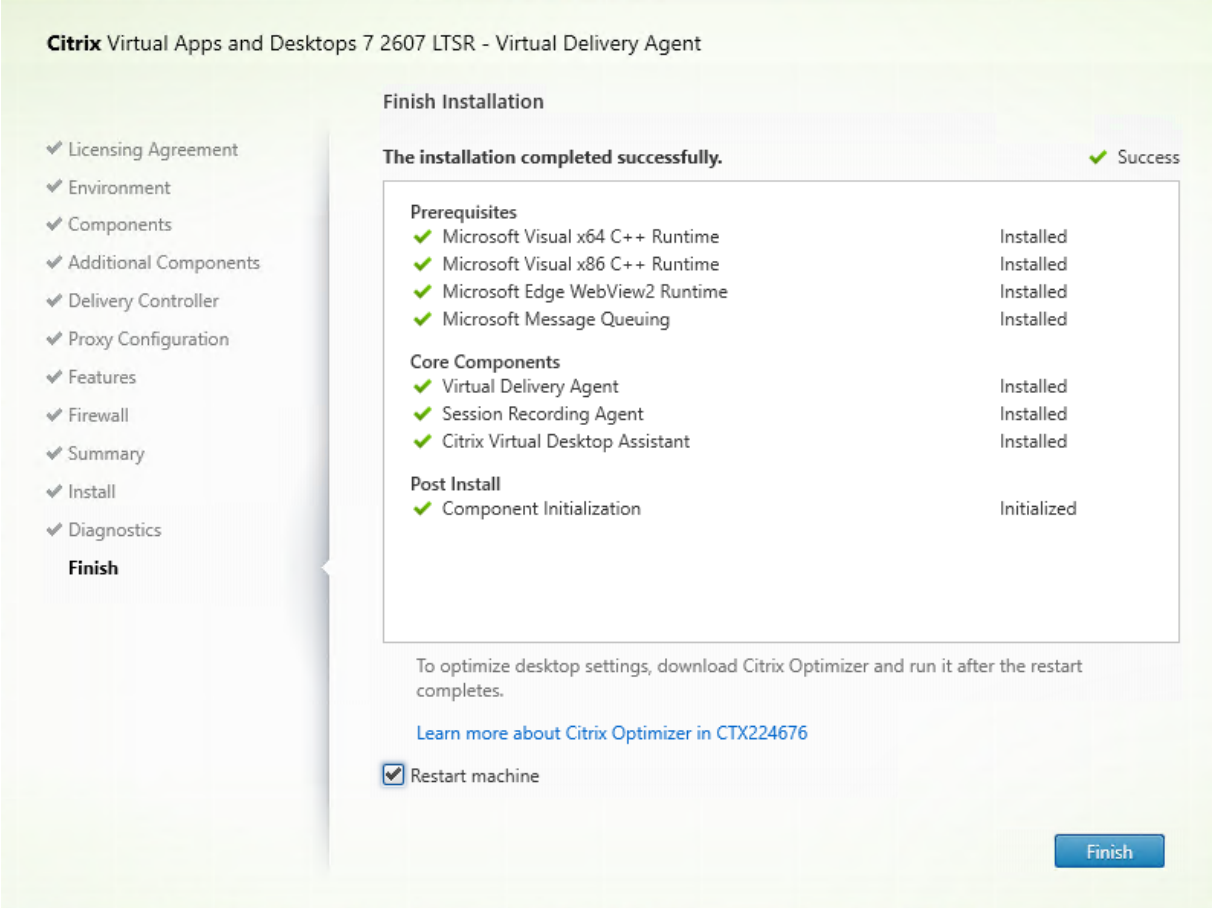
If prerequisites aren't already installed or enabled, the machine might restart once or more times. See Prepare to install.

> **Note:**
>
> At this point, you can also click the **Generate custom script** button on the **Summary** page to create a command-line script based on your current installation selections. This script can be reused to install or upgrade VDA in unattended mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 12. Diagnostics

On the **Diagnostics** page, choose whether to participate in Citrix Call Home. If you choose to participate (the default), click **Connect**. When prompted, enter your Citrix account credentials.



After your credentials are validated (or if you choose not to participate), click **Next**.

When using the full product installer, if you click **Connect** on the **Diagnostics** page without first selecting **Collect diagnostic information**, after you close the **Connect to Citrix Insight Services** dialog the **Next** button is disabled. You cannot move to the next page. To reenable the **Next** button, select and immediately deselect **Collect diagnostic information**.

For more information, see Call Home.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 13. Complete this installation

The **Finish** page contains green check marks for all prerequisites and components that installed and initialized successfully.

Click **Finish**. By default, the machine restarts automatically. Although you can disable this automatic restart, the VDA cannot be used until the machine restarts.

Next steps

Repeat the procedure above to install VDAs on other machines or images, if needed.

After you install all VDAs, launch Studio. If you haven't created a site yet, Studio automatically guides you to that task. After that's done, Studio guides you to create a machine catalog and then a delivery group. See:

- Create a site
- Create machine catalogs
- Create delivery groups

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Optimizer

Citrix Optimizer is a tool for Windows OS that helps Citrix administrators optimize VDAs by removing and optimizing various components.

After installing a VDA and completing the final restart, download and install Citrix Optimizer. See CTX224676. The CTX article contains the download package, plus instructions about installing and using Citrix Optimizer.

Customize a VDA

To customize an installed VDA:

1. From the Windows feature for removing or changing programs, select **Citrix Virtual Delivery Agent** or **Citrix Remote PC Access/VDI Core Services VDA**. Then right-click and select **Change**.
2. Select **Customize Virtual Delivery Agent Settings**. When the installer launches, you can change:
    - Controller addresses
    - TCP/IP port to register with the Controller (default = 80)
    - Whether to open Windows Firewall ports automatically

Troubleshoot

- For information about how Citrix reports the results of component installations, see Citrix installation return codes.
- In the Studio display for a delivery group, the **Installed VDA version** entry in the **Details** pane might not be the version installed on the machines. The machine's Windows Programs and Features display shows the actual VDA version.
- After a VDA is installed, it cannot deliver apps or a desktop to users until it registers with a Delivery Controller.

  To learn about VDA registration methods and how to troubleshoot registration issues, see VDA registration.

Known limitation

When you use Citrix Workspace app for Windows version 1912 or earlier, the session drops after a while. This issue is fixed in the newer LTSR and CR versions of Citrix Workspace app.
For more information on the supported release versions, see Citrix Workspace app for Windows / Citrix Receiver for Windows Long Term Service Releases.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure Windows Defender Access Control related to VDA Installation

May 13, 2026

Customers configure Windows Defender Access Control (WDAC) settings to prohibit loading of unsigned binaries. The unsigned binaries distributed through VDA installers are thus prohibited which restricts the VDA installation.

Citrix® now signs all Citrix-generated binaries with a Citrix code signing certificate. Additionally, Citrix also signs the third-party binaries which are distributed along with our product with a certificate that authenticates those third-party binaries as trusted binaries.

> **Important:**
>
> Upgrading from an older VDA with unsigned third-party binaries to a newer VDA version with signed binaries may not always place the signed binaries on the upgraded machine.
> This is due to a mechanism within the OS where upgrade of the system does not replace binaries with the same version.
> Although the third-party binaries have been signed, their versions, which are controlled by third parties, are not able to be updated by Citrix, resulting in these binaries not being updated. To avoid this limitation:
>
> 1. Include the binaries in an allow list. This eliminates the need for signing the binaries.
> 2. Uninstall the older VDA and install the new VDA. This resembles a fresh VDA install and the signed versions will be installed.

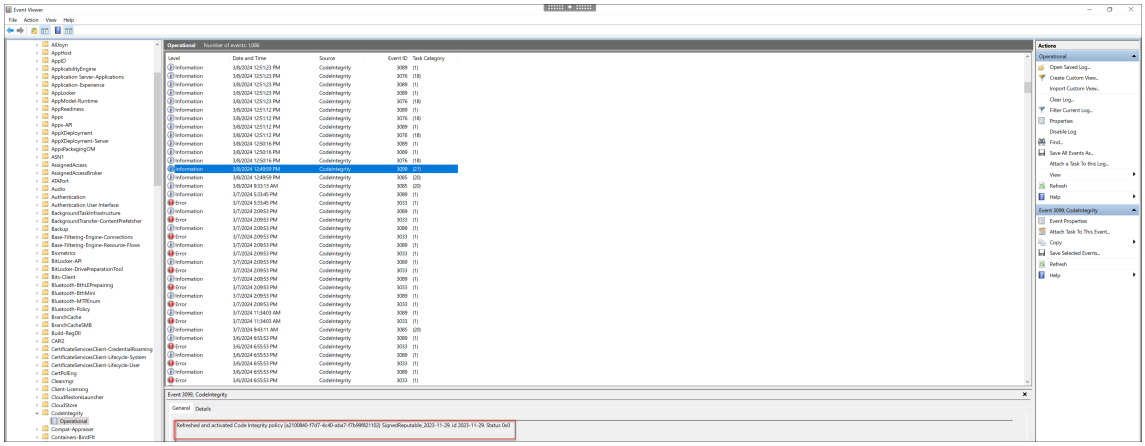
Create a new Base Policy with the Wizard

The WDAC allows you to add trusted binaries to run on your system. After the installation of WDAC, the **Windows Defender Application Control Policy Wizard** opens automatically.

To add the binaries, a new base WDAC policy must be created. Citrix-recommended guidelines for creating a base policy are provided in this section.

- Select **Signed and Reputable Mode** as the base template because it authorizes Windows operating components, apps installed from the Microsoft Store, all Microsoft-signed software, and third-party Windows hardware-compatible drivers.
- **Enable Audit Mode** because it allows you to test new Windows Defender Application Control policies before you enforce them.
- Add **Custom Rule** for **File Rules** to specify the level at which applications are identified and trusted and provide a reference file. By selecting "Publisher"as the rule type, a reference file that is signed by one of the Citrix certificates can be selected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- After the rules are added, navigate to the folder where `.XML` and `.CIP` files are saved. The `.XML` file has all the rules defined in the policy. It can be configured to change, add, or remove any rules.
- Before deploying the WDAC policies, the `.XML` file must be converted to its binary form. The WDAC file converts the `.XML` file to `.CIP` file.
- Copy and paste the `.CIP` file to: C:\WINDOWS\System32\CodeIntegrity\CiPolicies\Active and reboot the machine. The generated policy will be applied in audit mode.
- For a step-by-step process to create a base policy, see Creating a new Base Policy with the Wizard.

When this policy is applied, WDAC does not give warnings about any Citrix files that are signed by the specified publisher/CA authority.

Similarly, we can create a publisher-level rule for the files that have been signed by the third party.

Verify the applied policy

1. After the machine has been rebooted, open the **Event Viewer** and go to **Applications and Services Logs > Microsoft > Windows > CodeIntegrity > Operational**.
2. Make sure the applied policy is activated.

3. Look for logs that have violated the policy and check the properties of that file. First, confirm it has been signed. If not and this machine has gone through a VDA upgrade, this most likely is the case described in the limitation above. If signed, this file is potentially signed with the alternate certificate, as described previously.

An example of a Citrix-generated file signed with a Citrix certificate is `C:\Windows\System32\drivers\picadm.sys`.
An example of a third-party binary signed with the Citrix third-party certificate is `C:\Program Files\Citrix\IcaConfigTool\Microsoft.Practices.Unity.dll`.

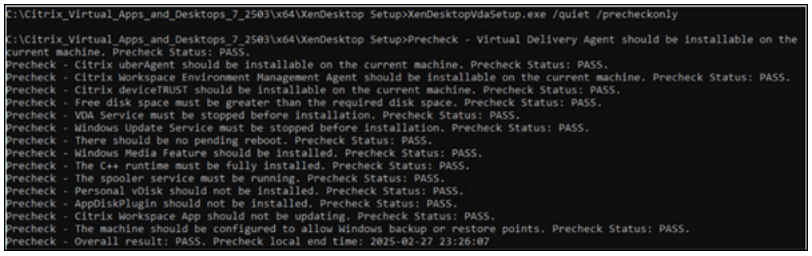
Precheck for VDA install and upgrade

May 13, 2026

Introducing a decoupled pre-flight check for VDA installation and upgrades, enabling customers to proactively identify potential issues before proceeding. This check validates all dependencies and prerequisites, providing a clear pass/fail status for each condition. If any failures occur, detailed remediation guidance with specific recommendations is provided. The actual installation or upgrade process remains separate and must be initiated manually after the pre-check is completed.

This article outlines the steps to perform the precheck for VDA installation and upgrade.

Step 1. Run Command Line



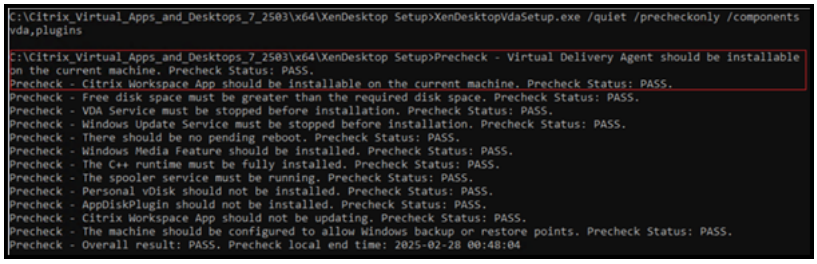
> **Note:**
>
> - The pre-check is supported only in command-line mode.
> - The installation or upgrade is not initiated when running this command.

To perform a precheck, add the `/precheckonly` option to your frequently used command for installation or upgrade. All the precheck conditions for your VDA installation or upgrade will be checked.

Perform precheck for default install and upgrade

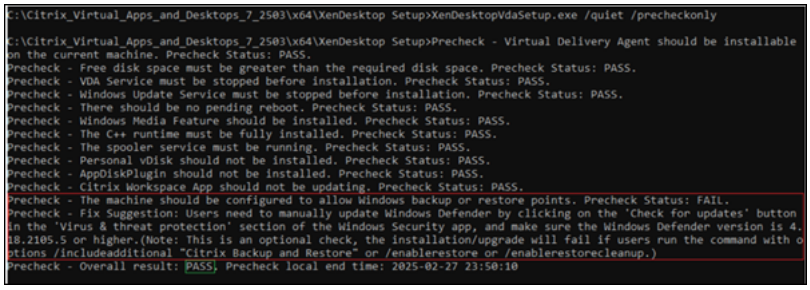
Run the following command to perform a precheck and ensure that the machine status is in acceptable state:

```
\x64\XenDesktop Setup\XenDesktopVdaSetup.exe /quiet /precheckonly
```



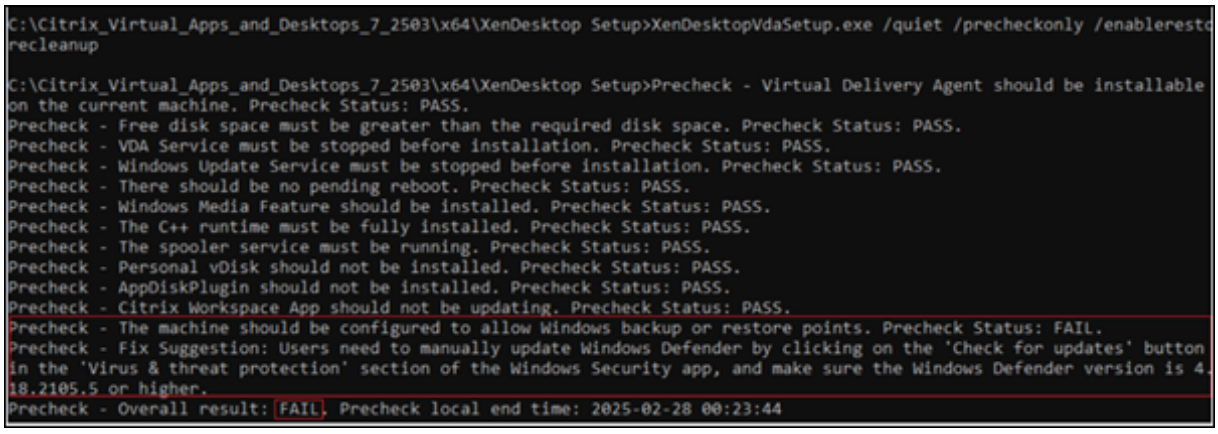
Perform precheck for install and upgrade of specified components

To check prerequisites for specific components before installation or upgrade, add `/precheckonly` to your command.



```
\x64\XenDesktop Setup\XenDesktopVdaSetup.exe /quiet /precheckonly /
components vda,plugins
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Perform precheck for install and upgrade of additional component - Citrix Backup and Restore

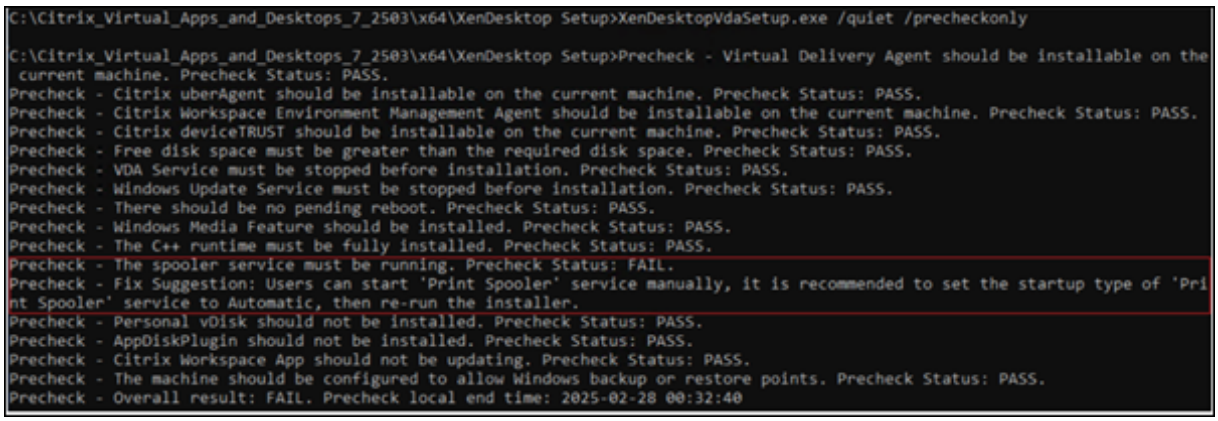
The command `\x64\XenDesktop Setup\XenDesktopVdaSetup.exe /quiet /precheckonly` checks the prerequisites for Citrix Backup and Restore component as an optional check. If all prechecks pass except the optional check, the overall result is PASS.

The following commands check the prerequisites for Citrix Backup and Restore component as part of mandatory check:

- `\x64\XenDesktop Setup\XenDesktopVdaSetup.exe /quiet /precheckonly /includeadditional "Citrix Backup and Restore"`
- `\x64\XenDesktop Setup\XenDesktopVdaSetup.exe /quiet /precheckonly /enablerestore`
- `\x64\XenDesktop Setup\XenDesktopVdaSetup.exe /quiet /precheckonly /enablerestorecleanup`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 2. View precheck results

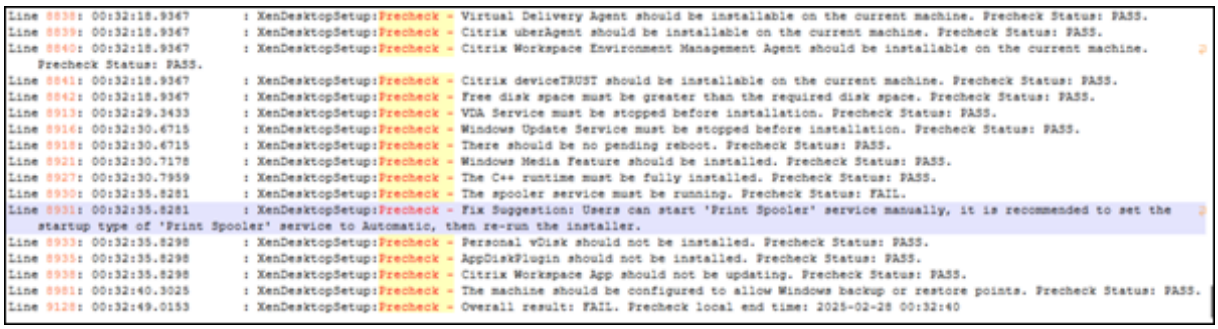


The precheck results are displayed in the command line, logged in `%temp%/Citrix/XenDesktop Installer/XenDesktop Installation.log` and saved in `%temp%/Citrix/XenDesktop Installer/PrecheckResult_{ yyyyMMddHHmmss } .json`. If the precheck fails, the overall result is `FAIL`, with suggested fixes for each issue.

Command line output

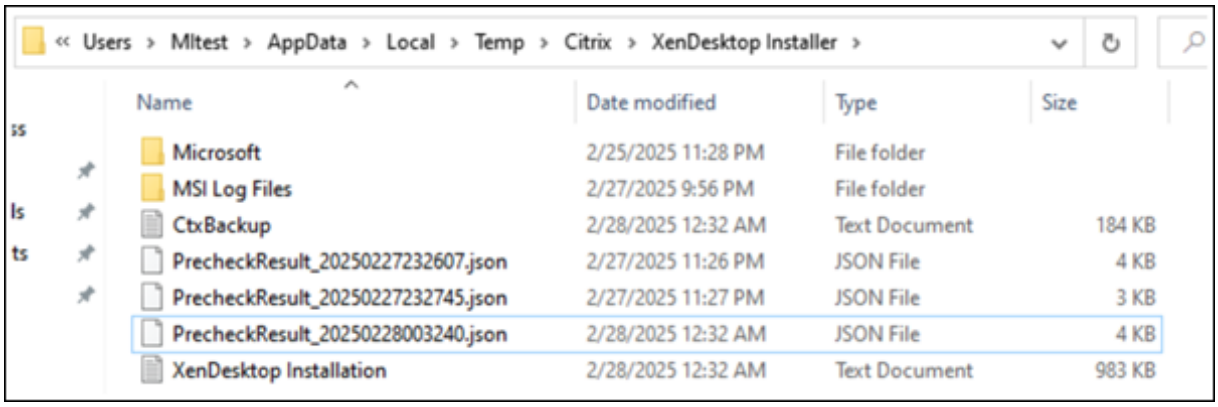
The precheck results in the command line include:

- Precheck criteria
- Precheck status
- Fix suggestions for failure
- Overall result
- End time.



If the result is a `FAIL`, the suggestions to fix are available in the lines starting with **Precheck - Fix Suggestion:**

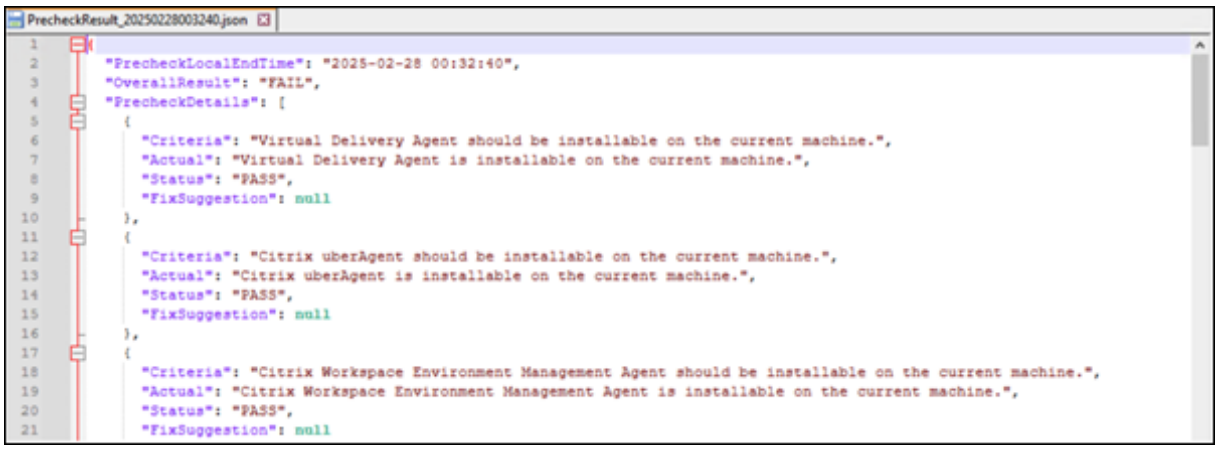
Log output



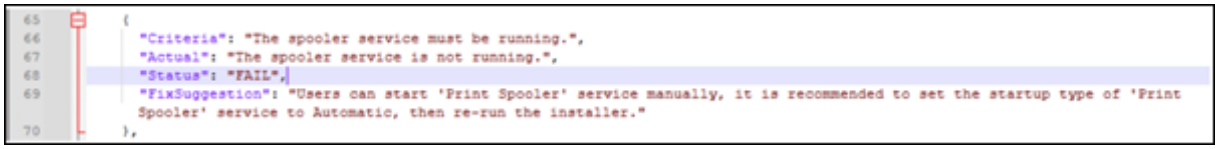
The pre-check results in `XenDesktop Installation.log` mirror those shown in the command line. To locate them, search for `Precheck -` in the log file.
If the overall result is a `FAIL`, the suggestions to fix are available in lines containing `Precheck - Fix Suggestion:`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

JSON output



A `.json` file is generated every time a command with `/quiet /precheckonly` is run. The file is named `PrecheckResult_{ yyyyMMddHHmmss } .json`, with a timestamp suffix.



The `.json` file includes:

- Pre-check local end time
- Overall result
- Pre-check details
    - Criteria
    - Actual value
    - Status
    - Fix suggestion

© 1997–2026 Citrix Systems, Inc. All rights reserved.

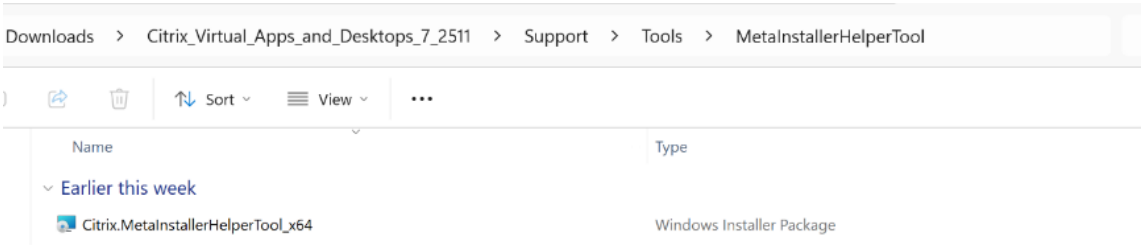
Fix suggestions for each pre-check item with a status of `FAIL` can be found under the pre-check details section in the `.json` file.

VDA Meta Installer Helper Tool

May 13, 2026

1. Introduction

The VDA Meta Installer helper tool includes a set of tools to assist with VDA installation via SCCM task sequences, and a utility for analyzing installation logs and identifying potential issues.

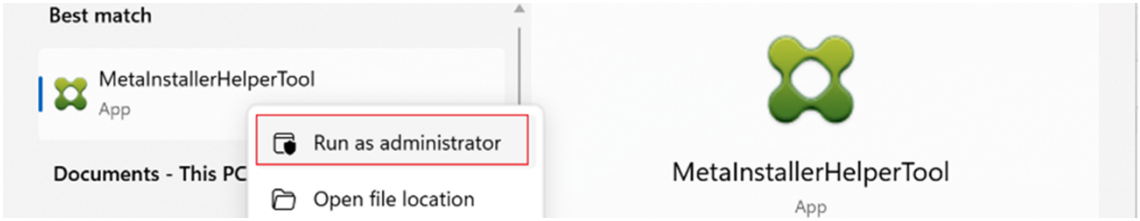


With a simple MSI installation and an intuitive user interface, Meta Installer helper tool offers several essential features:

- **Check SCCM task sequence:** This tool assists in reviewing and validating existing SCCM task sequences to ensure compatibility with VDA installation requirements.
- **Generate task sequence reference:** This tool automatically creates a reference task sequence to help integrate VDA installation into SCCM deployment workflows with minimal manual configuration.
- **VDA Installation Log Analyzer:** This tool helps review installation logs to identify errors, warnings, or failures. The tool generates a report highlighting root causes, possible resolutions, and recommendations for successful deployments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Installation

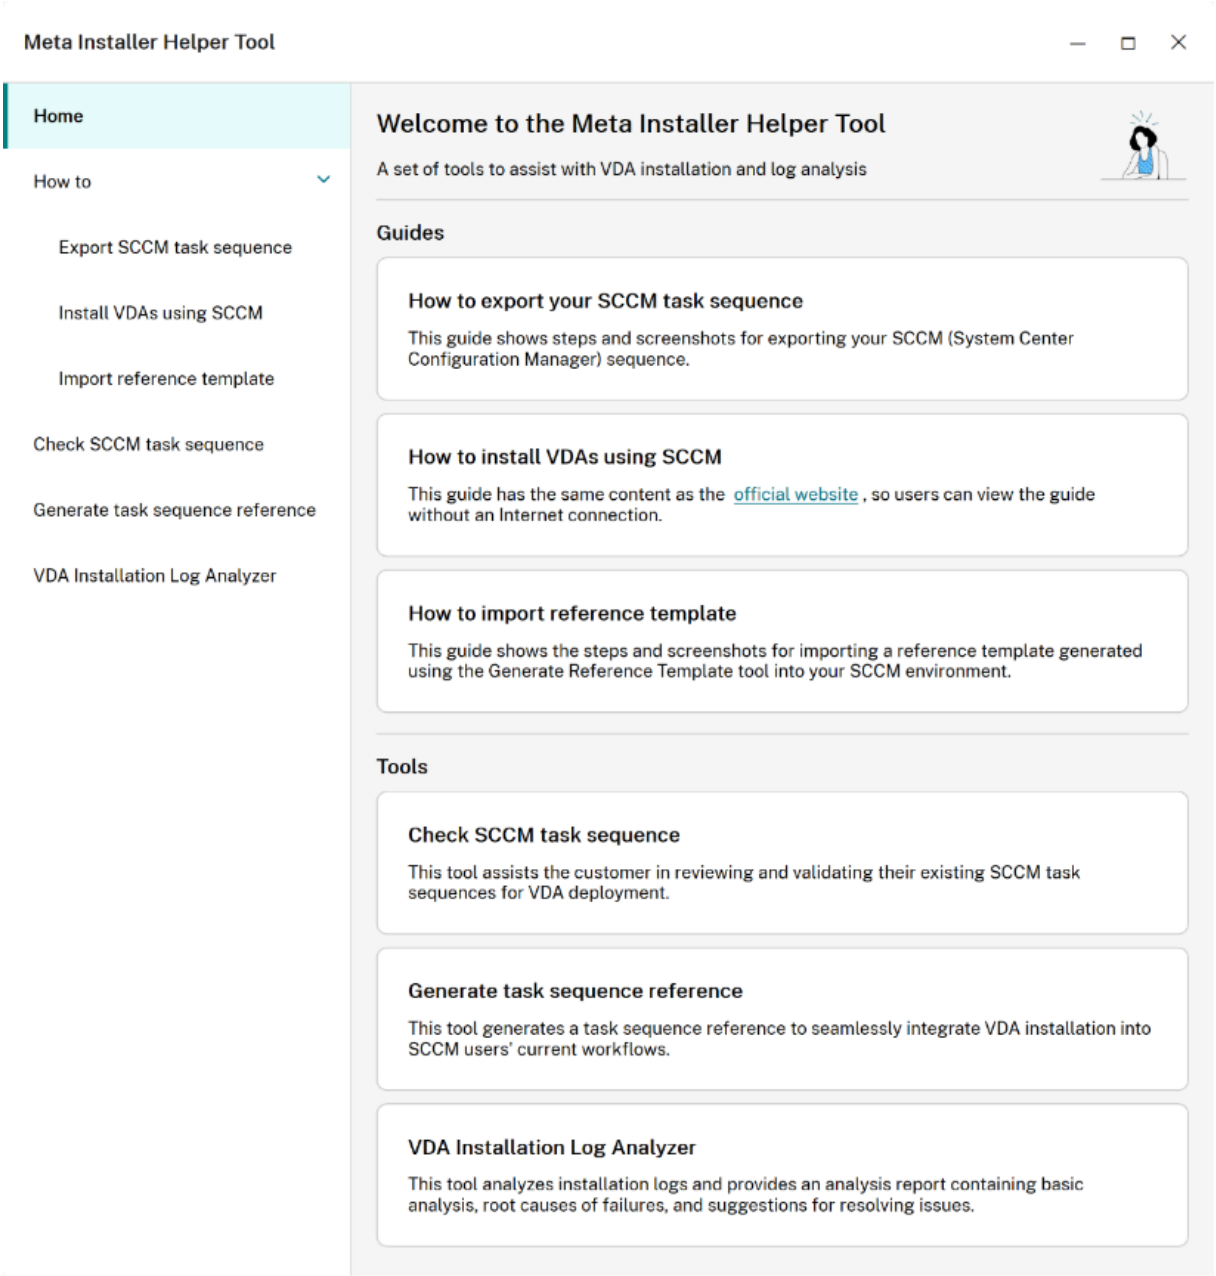


1. Download Citrix Virtual Apps and Desktops product ISO from Citrix Virtual Apps and Desktops Downloads page
2. Find Citrix.MetaInstallerHelperTool_x64.msi from \Support\Tools\MetaInstallerHelperTool folder.

3. Double-click the Citrix.MetaInstallerHelperTool_x64.msi to install the tool.

> **Note:**
>
> This tool is not part of the VDA. You can install it on a VDA or on any local device.

4. After installation, launch the application as an Administrator by searching for "MetaInstallerHelperTool"in the Start Menu.



3. User Interface (UI) Overview

Upon launching the application "MetaInstallerHelperTool", the main user interface will appear, designed for intuitive navigation and ease of use.

The "**Home**"section provides descriptions of the guides in the "How to"section and functional descriptions of the tools for checking SCCM sequences, generating task sequence templates, and analyzing VDA installation log.

You can access these guides and tools by selecting the corresponding tabs from the left-hand navigation panel.

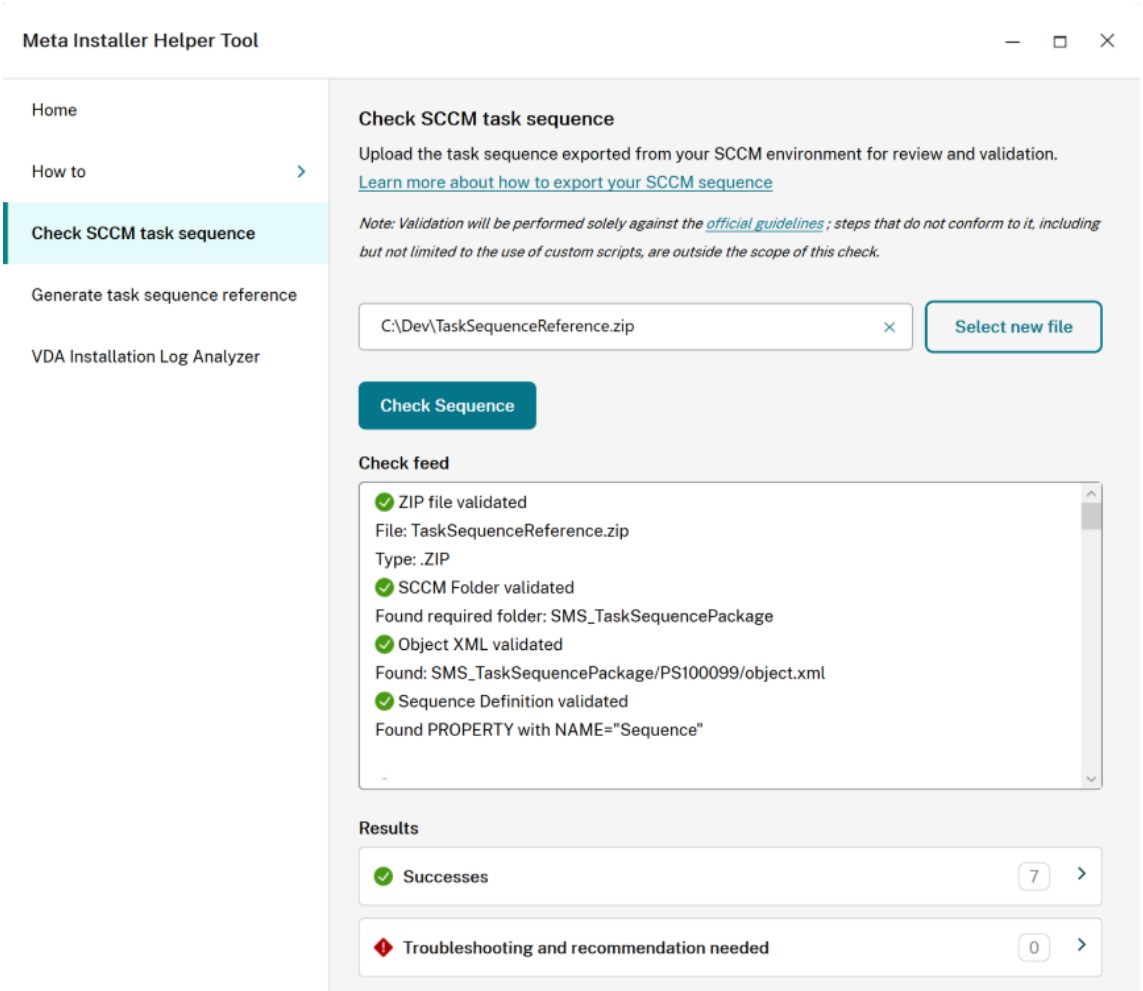
© 1997–2026 Citrix Systems, Inc. All rights reserved.

The "**How to**"section provides guides for exporting task sequences, installing VDAs using SCCM, and importing reference templates with screenshots and steps.

- See "How to export task sequences"to obtain SCCM task sequence for use with the "Check SCCM task sequence"tool.
- See "How to install VDAs using SCCM"to install VDAs. "Check SCCM task sequence"tool and "Generate task sequence template"tool will also refer to this guide.
- See "How to import reference template"to import the template generated by the "Generate task sequence template"tool into your SCCM environment as a reference template.

The **Check SCCM task sequence**, **Generate task sequence template**, and **VDA Installation Log An-**

© 1997–2026 Citrix Systems, Inc. All rights reserved.



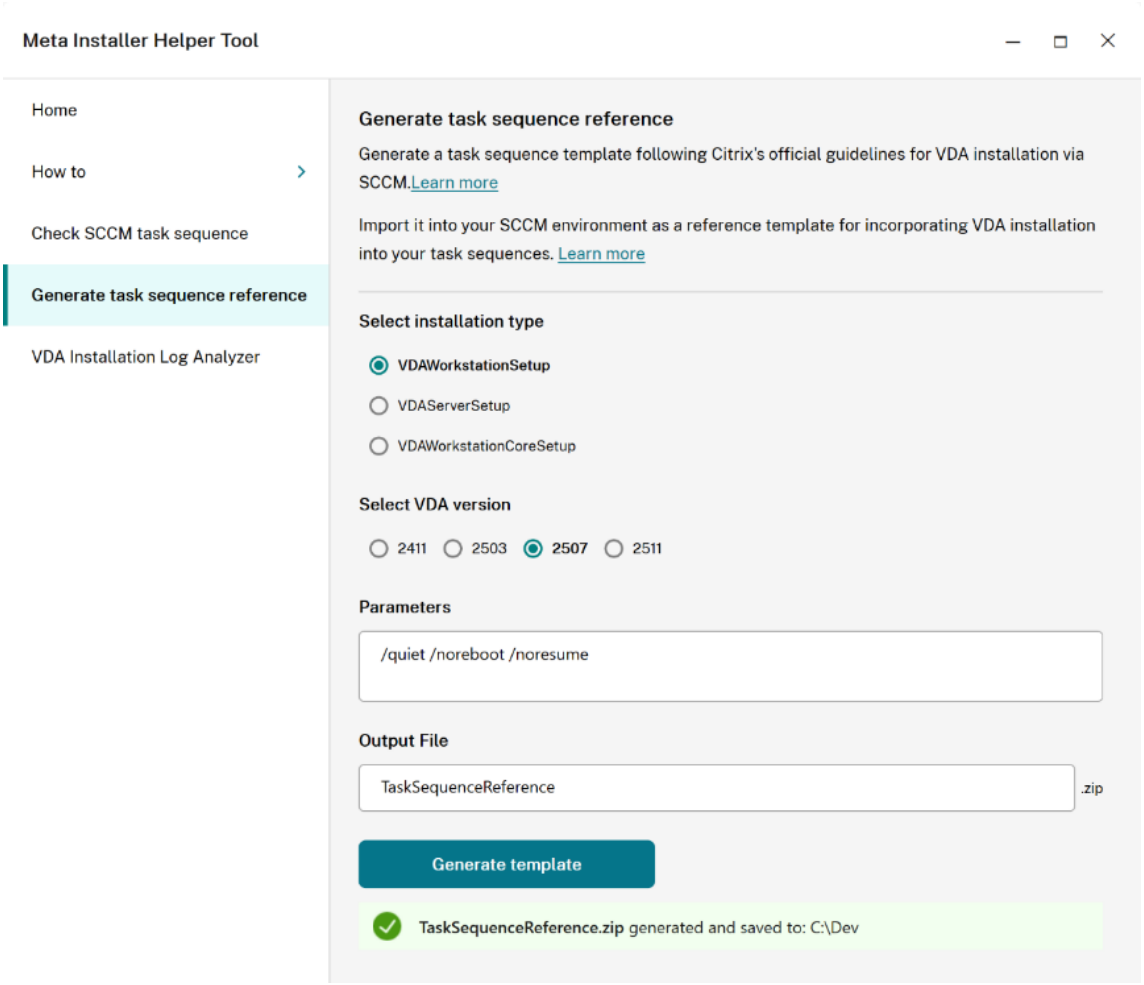
alyzer sections let you perform the core tasks of the Meta Installer Helper Tool.

4. Tools

1. Check SCCM task sequence

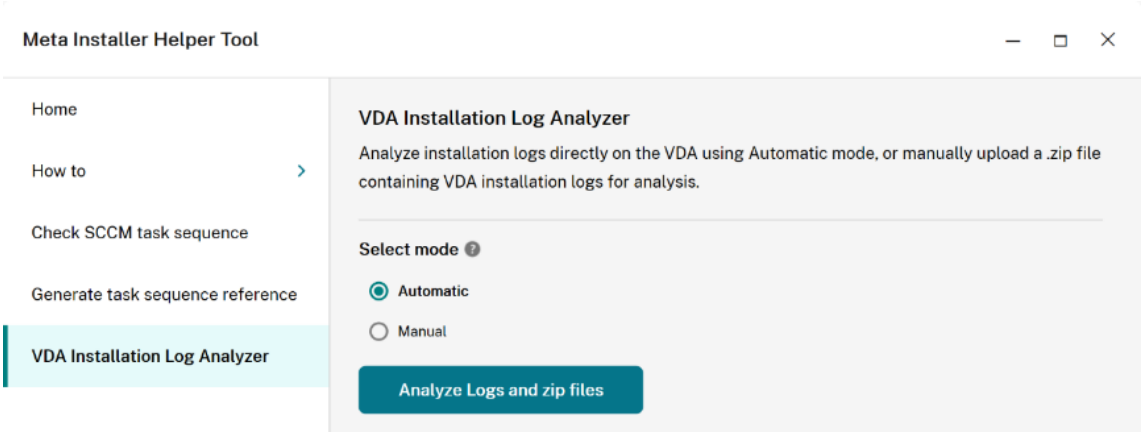
   Upload the task sequence exported from your SCCM environment for review and validation.

   The tool will check if the uploaded file is a zip file and contains the required SCCM Task Sequence folder structure, the required object .xml file, and a valid task sequence definition. It will also do command-line parameter analysis and installation condition analysis based on the task sequence.



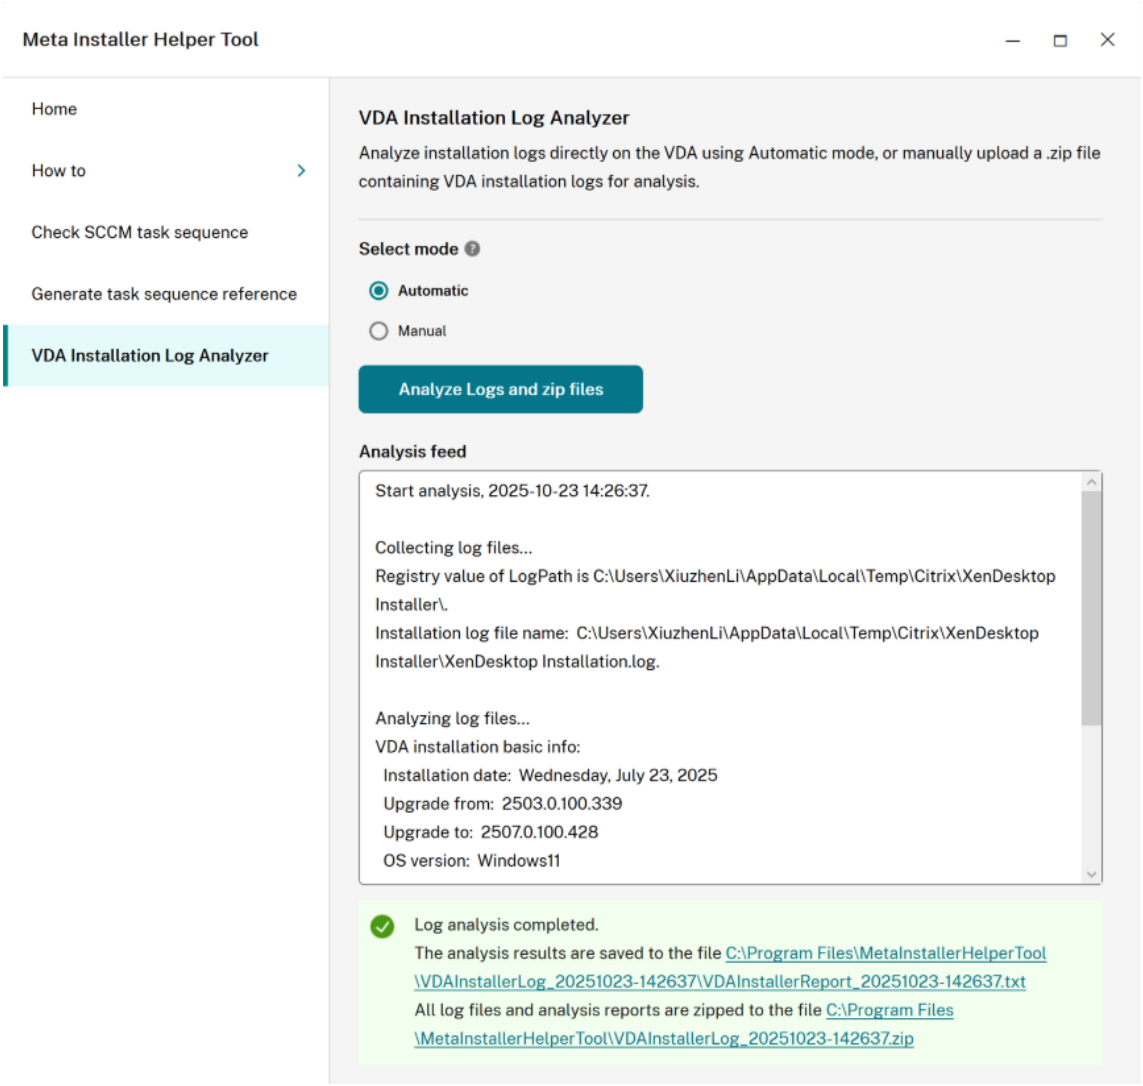
2. Generate task sequence reference

   This tool generates a task sequence template following Citrix's official guidelines for VDA installation via SCCM.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can import it into your SCCM environment as a reference template for incorporating VDA installation into your task sequences.

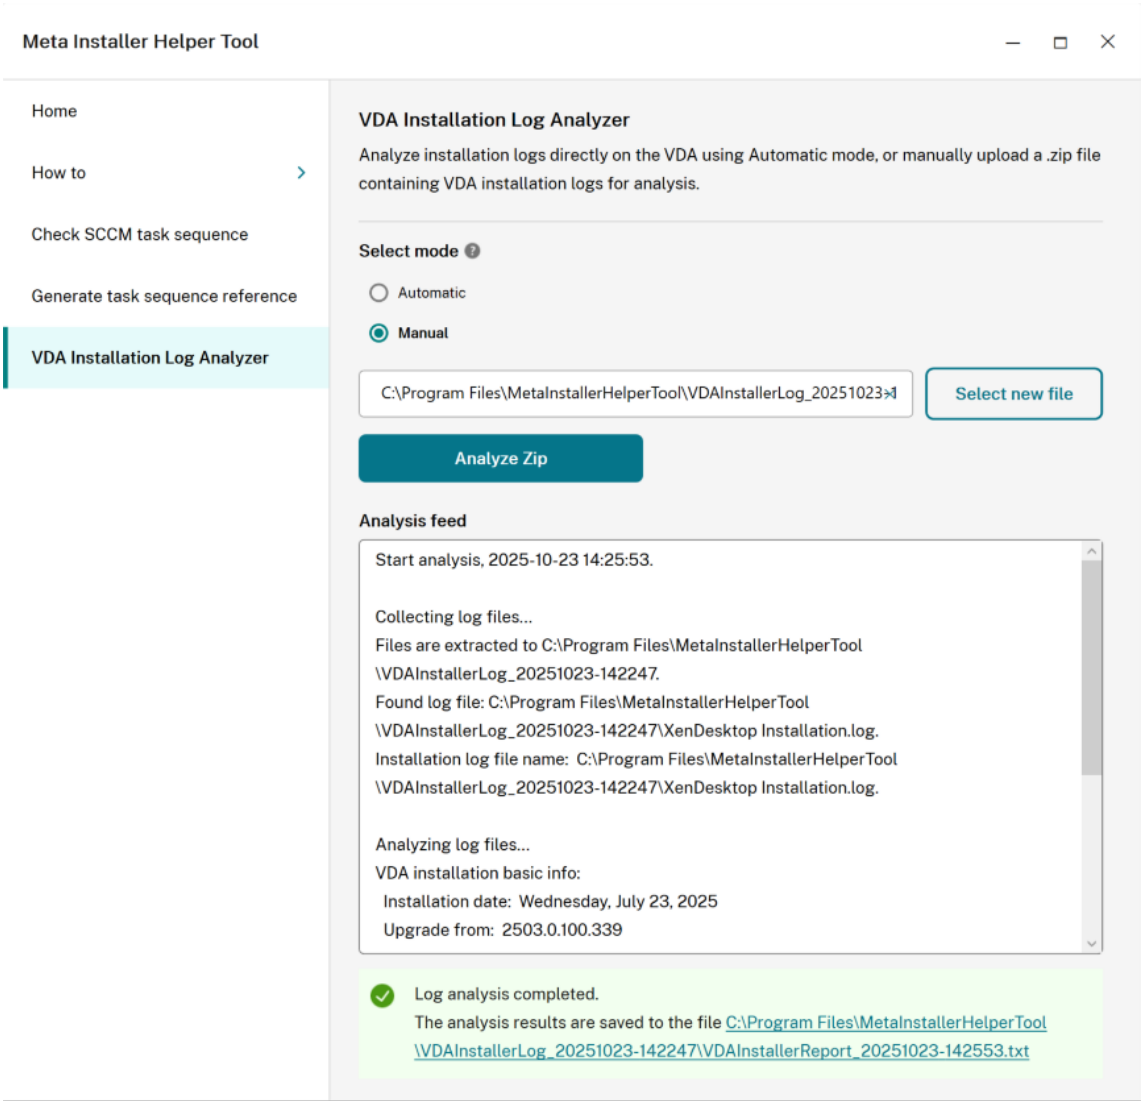


3. VDA Installation Log Analyzer

   Analyze installation logs directly on the VDA using Automatic mode or manually upload a .zip file containing VDA installation logs for analysis.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When running in **Automatic mode** on the VDA, the tool automatically detects the log storage path and analyzes the installation logs locally. The analysis results are saved, and all log files and reports are packaged into a single ZIP file.



In **Manual mode**, you must upload a .zip file that contains the VDA installation logs for analysis. By default, the log files are stored in the following location:
`%TEMP%\Citrix\XenDesktop Installer`

If the default log path has been modified, you can verify the current location in the Windows Registry at:
`Computer\HKLM\Software\Citrix\MetaInstall\LogPath`

The tool extracts the uploaded .zip file, analyzes its contents, and saves the analysis results for review.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Install VDAs using scripts

May 13, 2026

> **Note:**
>
> Citrix is not responsible for issues caused by scripts that are adapted to match customer production environments. For any install related Citrix issues, open a technical support case with the relevant install logs using the Citrix Support portal.

This article applies to installing VDAs on machines with Windows operating systems. For information about VDAs for Linux operating systems, see the Linux Virtual Delivery Agent documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The installation media contains sample scripts that install, upgrade, or remove Virtual Delivery Agents (VDAs) for machines in Active Directory. You can also use the scripts to maintain master images used by Machine Creation Services™ and Citrix Provisioning (formerly Provisioning Services).

Required access:

- The scripts need Everyone Read access to the network share where the VDA installation command is located. The installation command is `XenDesktopVdaSetup.exe` in the full product ISO, or `VDAWorkstationSetup.exe` or `VDAServerSetup.exe` in a standalone installer.
- Logging details are stored on each local machine. To log results centrally for review and analysis, the scripts need Everyone Read and Write access to the appropriate network share.

To check the results of running a script, examine the central log share. Captured logs include the script log, the installer log, and the MSI installation logs. Each installation or removal attempt is recorded in a time-stamped folder. The folder title indicates the operation result with the prefix PASS or FAIL. You can use standard directory search tools to find a failed installation or removal in the central log share. Those tools offer an alternative to searching locally on the target machines.

Before beginning any installation, read and complete the tasks in Prepare to install.

Install or upgrade VDAs using the script

1. Obtain the sample script **InstallVDA.bat** from \Support\AdDeploy\ on the installation media. Citrix recommends that you make a backup of the original script before customizing it.
2. Edit the script:
    - Specify the version of the VDA to install: `SET DESIREDVERSION`. The full value can be found on the installation media in the ProductVersion.txt file. However, a complete match is not required.
    - Specify the network share where the installer will be invoked. Point to the root of the layout (the highest point of the tree). The appropriate version of the installer (32-bit or 64-bit) is called automatically when the script runs. For example: `SET DEPLOYSHARE=\\fileserver1\share1`.
    - Optionally, specify a network share location for storing centralized logs. For example: `SET LOGSHARE=\\fileserver1\log1`).
    - Specify VDA configuration options as described in Install using the command line. The `/quiet` and `/noreboot` options are included by default in the script and are required: `SET COMMANDLINEOPTIONS=/QUIET /NOREBOOT /NORESUME`.
3. Using Group Policy Startup Scripts, assign the script to the OU containing your machines. This OU should contain only machines on which you want to install the VDA. When the machines in

© 1997–2026 Citrix Systems, Inc. All rights reserved.

that OU are restarted, the script runs on all of them. A VDA is installed on each machine that has a supported operating system.

Remove VDAs using the script

1. Obtain the sample script UninstallVDA.bat from \Support\AdDeploy\ on the installation media. Citrix recommends that you make a backup of the original script before customizing it.
2. Edit the script.
   - Specify the version of the VDA to remove: `SET CHECK\\_VDA\\_VERSION`. The full value can be found on the installation media in the ProductVersion.txt file (such as 7.0.0.3018). However, a complete match is not required.
   - Optionally, specify a network share location for storing centralized logs.
3. Using Group Policy Startup Scripts, assign the script to the OU containing your machines. This OU should contain only machines from which you want to remove the VDA. When the machines in the OU are restarted, the script runs on all of them. The VDA is removed from each machine.

Troubleshoot

- The script generates internal log files that describe script execution progress. The script copies a `Kickoff_VDA_Startup_Script` log to the central log share within seconds of starting the deployment. You can verify that the overall process is working. If this log is not copied to the central log share as expected, troubleshoot further by inspecting the local machine. The script places two debugging log files in the `%temp%` folder on each machine:
  - `Kickoff_VDA_Startup_Script_<DateTimeStamp>.log`
  - `VDA_Install_ProcessLog_<DateTimeStamp>.log`

  Review these logs to ensure that the script is:
  - Running as expected.
  - Properly detecting the target operating system.
  - Correctly configured to point to the `ROOT` of the `DEPLOYSHARE` share (contains the file named `AutoSelect.exe`).
  - Capable of authenticating to both the `DEPLOYSHARE` and `LOG` shares.
- For information about how Citrix reports the result of component installations, see Citrix installation return codes.
- In the Studio display for a delivery group, the **Installed VDA version** entry in the **Details** pane might not be the version installed on the machines. The machine's programs and features display shows the actual VDA version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

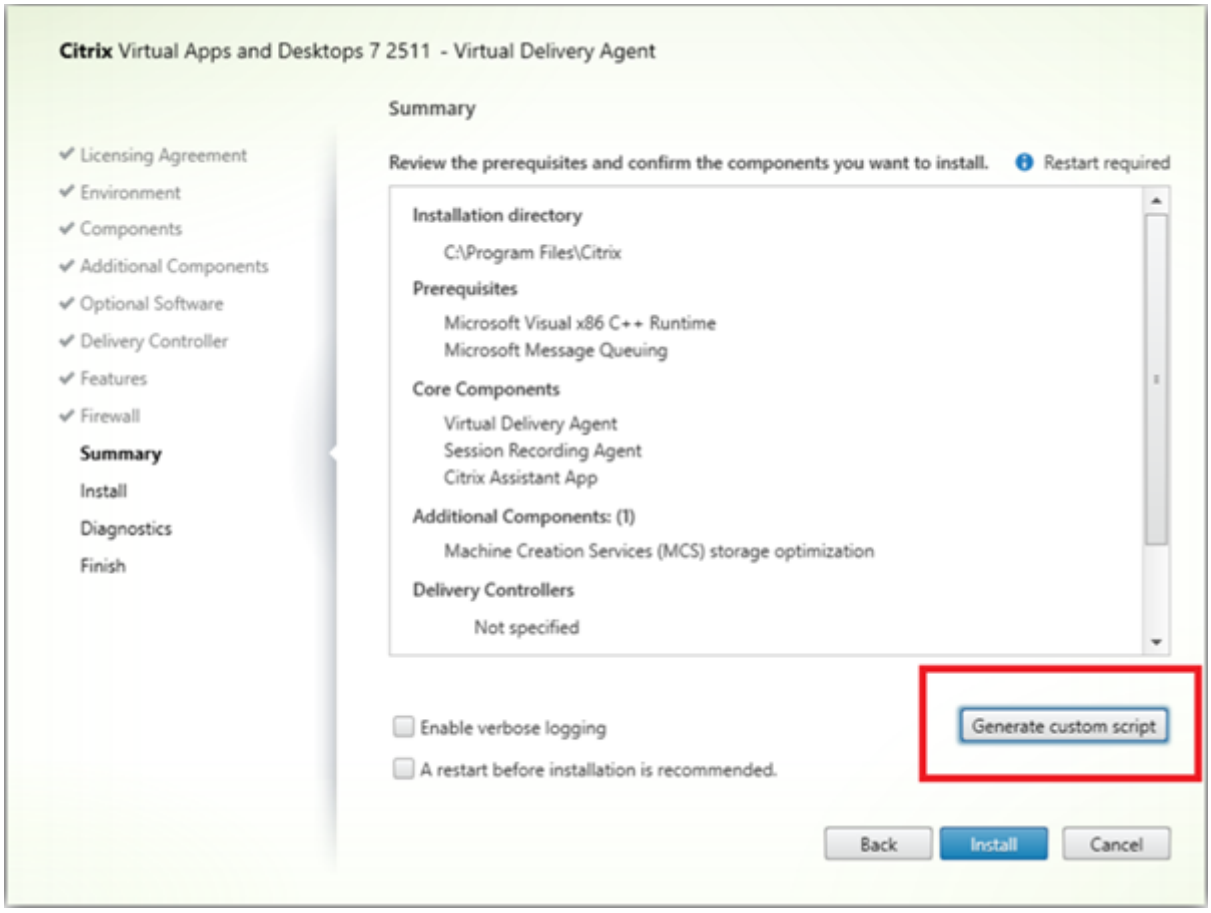
- After a VDA is installed, it cannot deliver apps or a desktop to users until it registers with a Delivery Controller.

  To learn about VDA registration methods and how to troubleshoot registration issues, see VDA registration.

Generate custom script to install or upgrade VDA via command-line

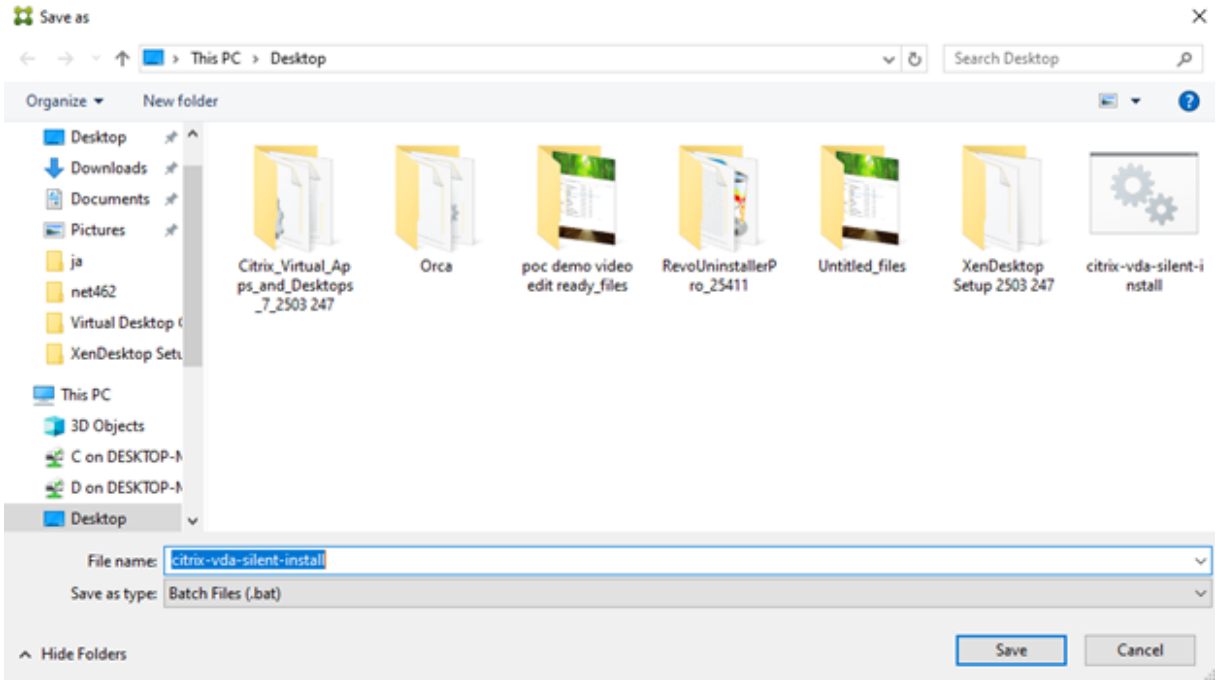
May 13, 2026

The **Generate custom script** button allows you to create a batch or script based on the configuration selections made in the VDA installation UI. The generated script can be exported and used to perform unattended installations or upgrades from the command line. This feature helps automate deployments, ensures configuration accuracy, and reduces manual scripting errors.



Use the following steps to generate the command-line script from the VDA installation UI.

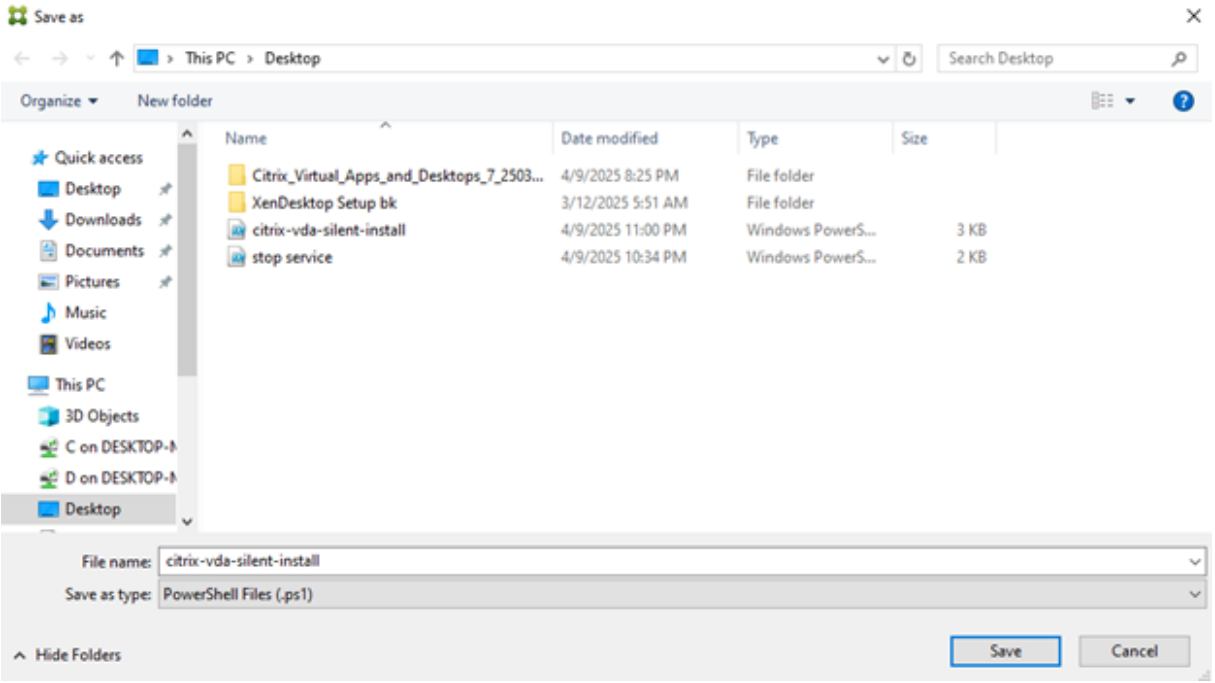
Step 1: Generate a custom script from the installer UI



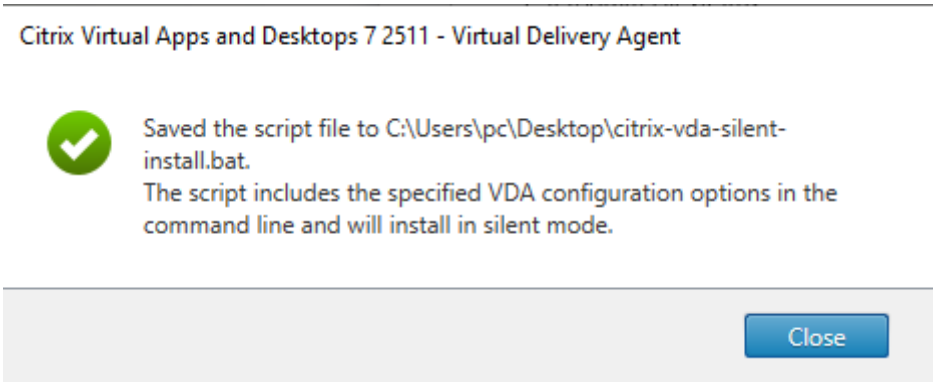
> **Note:**
>
> This feature is supported only in UI mode.

Configure the VDA installation options in the UI as usual. On the **Summary** page, select **Generate custom script** to create a command-line script based on your configuration, as shown in the following screenshot.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

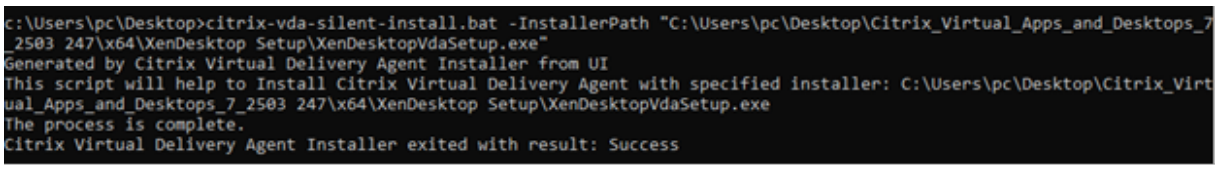


A dialog box appears prompting you to choose a location to save the generated script. You can also select a different directory and rename the script before saving it.

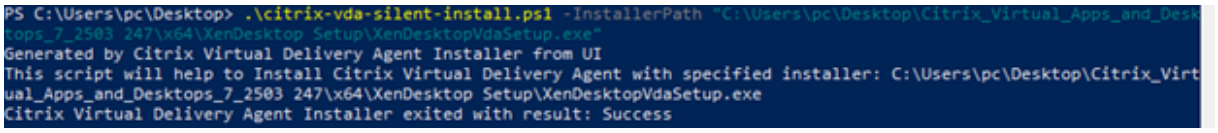


© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, the script is saved as a batch (.bat)file. You can also choose to save it as a PowerShell (.ps1) script.

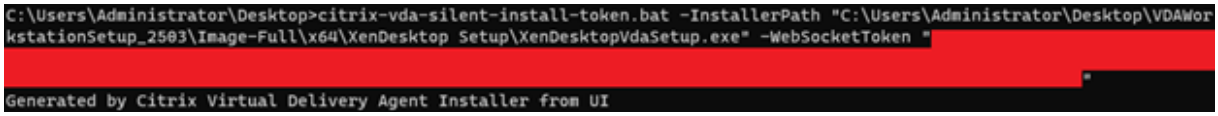


After the script is generated and saved, a confirmation dialog appears showing the file location and describing the purpose of the script. You can edit the generated script using any text editor, such as Notepad. Before running the script, exit the installer UI. Only one VDA installation or upgrade process can run at a time.



Step 2. Install or upgrade VDA using the generated script

The following screenshot shows how to use the generated batch file to install or upgrade the VDA. The only required parameter is the path to the VDA installer. If the installer path is valid, the script runs the installation or upgrade and exits with the same exit code as the VDA installer. A readable result message is displayed to indicate the outcome of the process.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following screenshot shows how to use the generated PowerShell script to install or upgrade the VDA. The only required parameter is the path to the VDA installer. If the installer path is valid, the script runs the installation or upgrade and exits with the same exit code as the VDA installer. A readable status message appears, indicating the result of the process.

> **Note:**
>
> If the Delivery Controller is configured with an enrollment token, run the script as shown in the following screenshot.

The script requires the following parameters: <Path-to-generated-script>, <Path-to-vda-installer>, <Websocket-token-value>.

Third-party VDA deployment methods

May 13, 2026

To successfully deploy a Virtual Delivery Agent (VDA) using Microsoft System Center Configuration Manager (SCCM) or similar software distribution tools, such as Ansible and Microsoft Intunes, Citrix® recommends using the VDA installer in a sequence of steps.

> **Note:**
>
> The following articles describe only recommendations based on how Citrix has tested the environment. You can customize these steps according to your needs. Citrix is not responsible for any updates or tweaks needed to this to fit customer needs.

- Install VDAs using SCCM
- Install VDAs using Ansible
- Install VDAs using Microsoft Intune

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Install VDAs using SCCM

May 13, 2026

Overview

Microsoft Endpoint Configuration Manager, formerly System Center Configuration Manager (SCCM) is a Windows product that enables the management, deployment, and security of devices and applications across an enterprise.

> **Note:**
>
> The following article describes only recommendations based on how Citrix® has tested the environment. You can customize these steps according to your needs. Citrix is not responsible for any updates or tweaks needed to this to fit customer needs.

Recommendations

- To successfully deploy a Virtual Delivery Agent (VDA) using SCCM or similar software distribution tools, Citrix recommends using the VDA installer in a sequence of steps.
- Citrix does not recommend using the VDA Cleanup Utility as part of a VDA installation or upgrade. Use the VDA Cleanup Utility only in the limited case when the VDA installer has previously failed.

Before you begin

The required number of restarts during the installation of the VDA depends on the environment. For example:

- A restart might be required for pending updates or restarts from earlier software installations.
- Files previously locked by other processes might need updates, forcing an extra restart.
- Some optional components in the VDA installer (such as Citrix Profile Management and Citrix Files) might require a restart.
- When you upgrade a VDA, the machine on which it is installed must be in maintenance mode, with no sessions.
- When a VDA installation runs for the first time on a machine, the VDA installer being used is copied onto that machine.
  For more information on VDA installation, see Installers.

SCCM Task Sequencer manages all required restarts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Key steps to deploy VDA using SCCM

The following steps describe how to deploy VDA using SCCM on the virtual machine.

1. Install the VDA.
2. Create an organization unit (OU).
3. Verify the machines.
4. Use VDA to distribute content.

Step 1: Install the VDA

After identifying all prerequisites, use **SCCM Task Sequencer** to complete the following tasks:

1. Install the VDA from an accessible copy of the installation media or from one of the VDA standalone installers:

   - `VDAWorkstationSetup_XXXX.exe`
   - `VDAServerSetup_XXXX.exe`
   - `VDAWorkstationCoreSetup_XXXX.exe`

   For more information about VDA installers, see Installers.

   > **Note:**
   >
   > When you upgrade a VDA, the machine on which it is installed must be in maintenance mode, with no sessions.

2. When a VDA installation runs for the first time on a machine, the VDA installer being used is copied onto that machine.

   - When you use a VDA installer other than `VDAWorkstationCoreSetup_XXXX.exe`, the VDA installer is copied to `%ProgramData%\Citrix\XenDesktopSetup\XenDesktopVdaSetup.exe`.
   - When you use `VDAWorkstationCoreSetup_XXXX.exe`, the VDA installer is copied to `%ProgramData%\Citrix\XenDesktopSetup\XenDesktopRemotePCSetup.exe`.

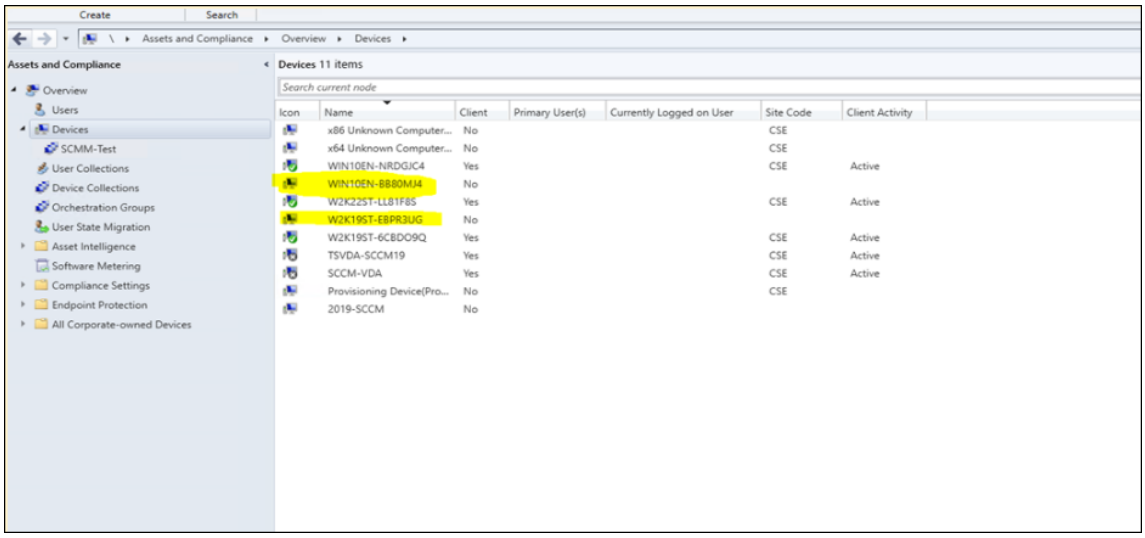
3. The directory location of the VDA installer is also stored in the registry `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\MetaInstall" "MetaInstallerInstallLocation"`.
4. Add the command-line options `/NOREBOOT`, `/NORESUME`, and `/QUIET` to your command-line options.

   - `/QUIET`: Don't show the user interface during installation, so that SCCM has control of the installation process.

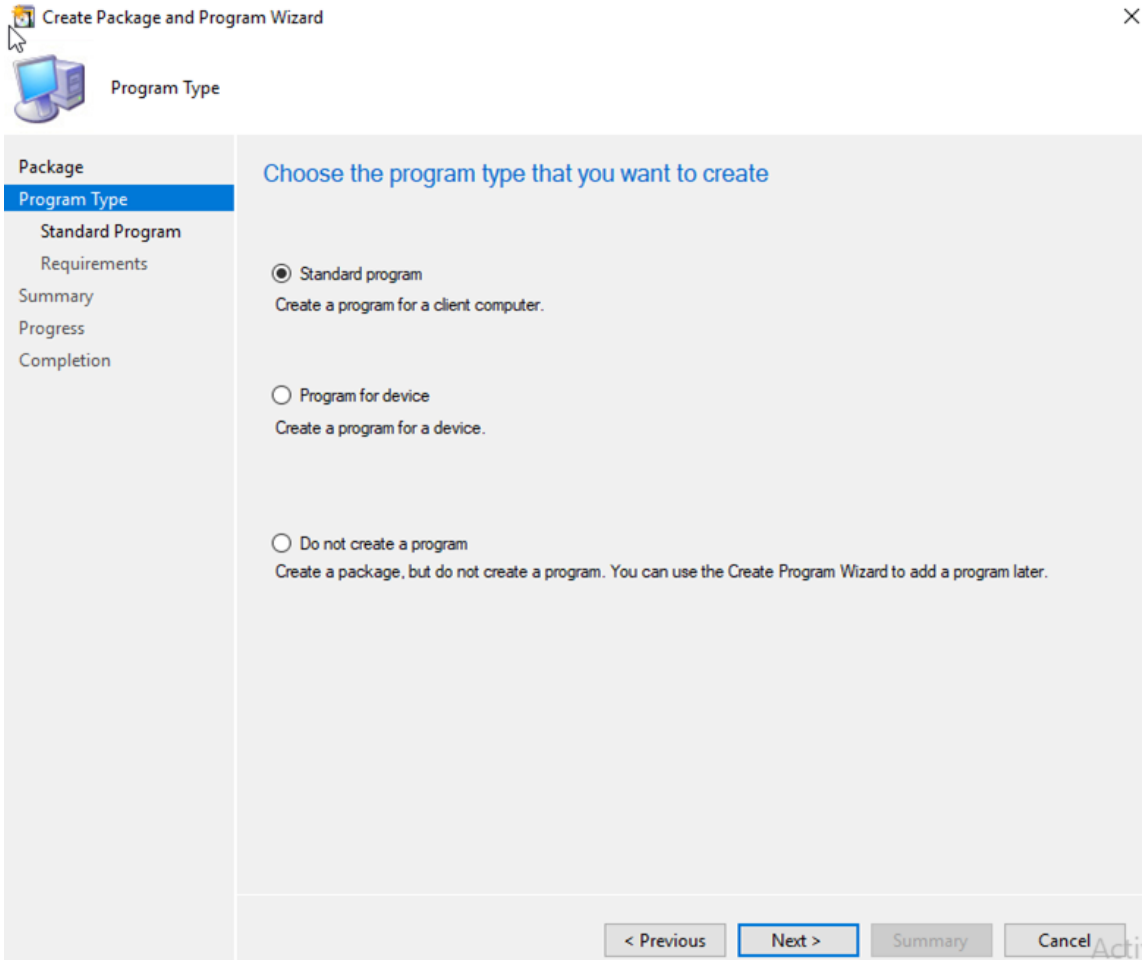
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- /NOREBOOT: Suppress the VDA installer from restarting automatically. SCCM triggers restarts when needed.
- /NORESUME: Usually, when a restart is needed during the installation, the VDA installer sets a runonce registry key (\HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\RunOnce). Windows uses the key to open the VDA installer when the machine restarts. This is an issue for SCCM, because SCCM cannot monitor the installation and capture the exit code.

Step 2: Create an organization unit (OU)

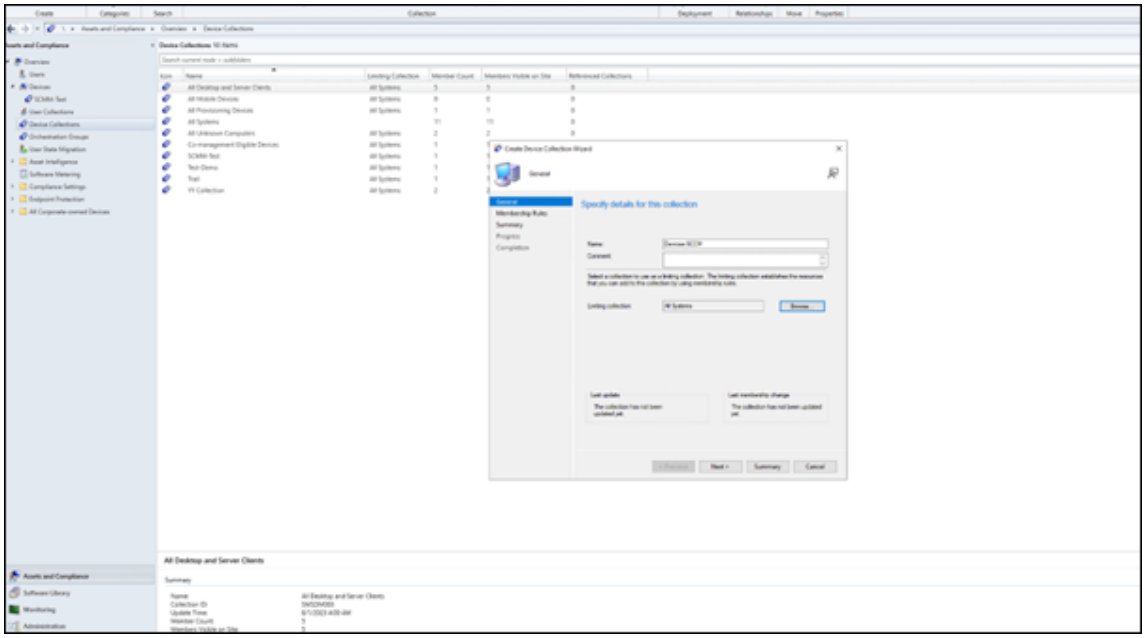


1. Create two domain-joined virtual machines you want to add to the OU. When the virtual machines are initially created, they are in the **Computers** folder. Move the virtual machines to the **SCCM** folder.
   Example: WIN10EN-BB80MJ4.cseblr.com
   W2K19ST-EBPR3UG.cseblr.com

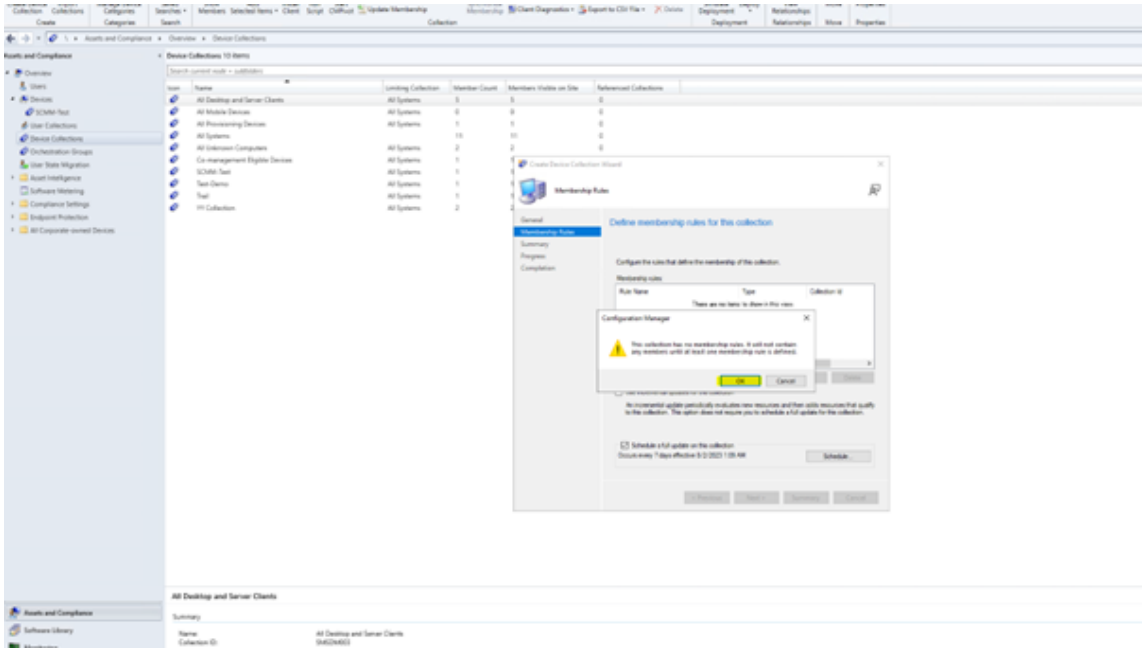


2. In Microsoft Configuration Manager, go to \Administration\Overview\Hierarchy Configuration\Discovery Methods\.
3. Click **Active Directory System Discovery**, and select the **Enable Active Directory System Discovery** check box to enable auto-discovery of the newly created virtual machines.
4. Click the  icon to select new containers.
5. In the **Location** section, add the **Path** where your SCCM virtual machines are located.
6. Go to \Administration\Overview\Site Configuration\Sites and right-click the SCCM VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

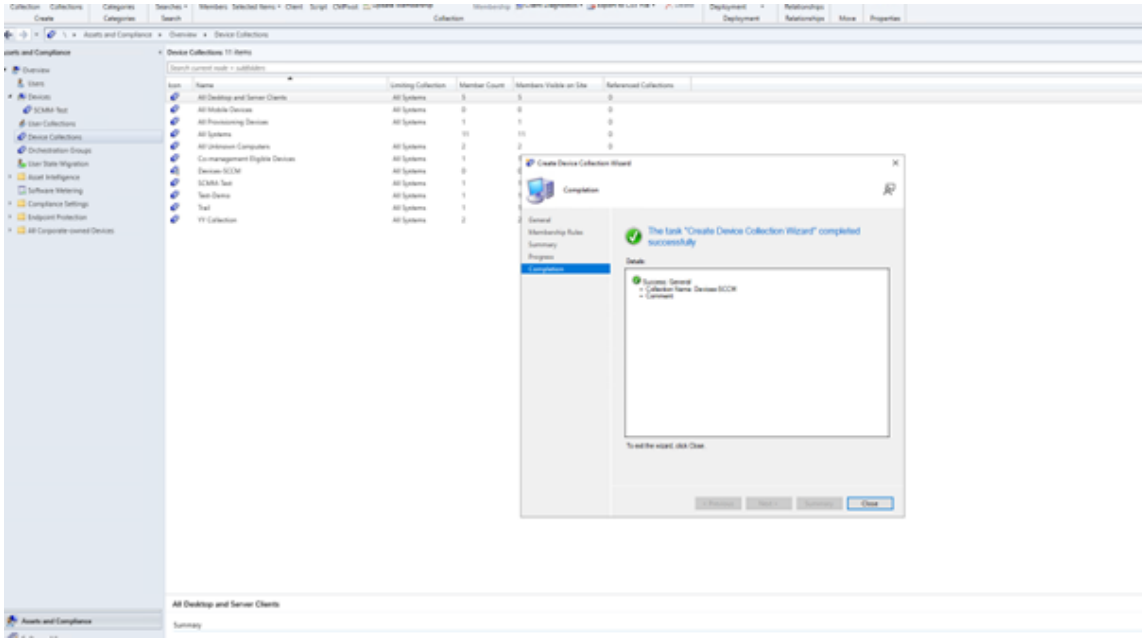


7. Select **Client Installation Settings > Client Push Installation**. The **Client Push Installation Properties** window opens.
8. Once the VMs are set to `Enabled`, you can see the list of VMs as illustrated in the following images.

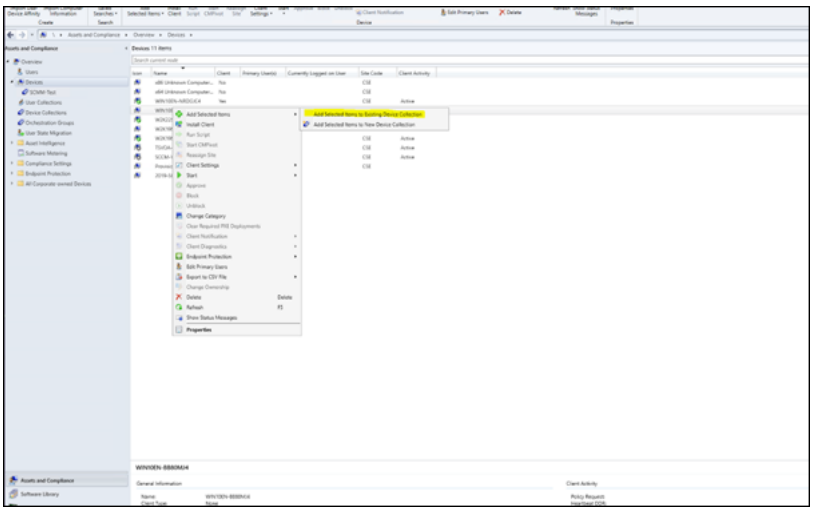


© 1997–2026 Citrix Systems, Inc. All rights reserved.

9. Create **Device collection** to create the OU. Enter the **Name** of the Collection Name.

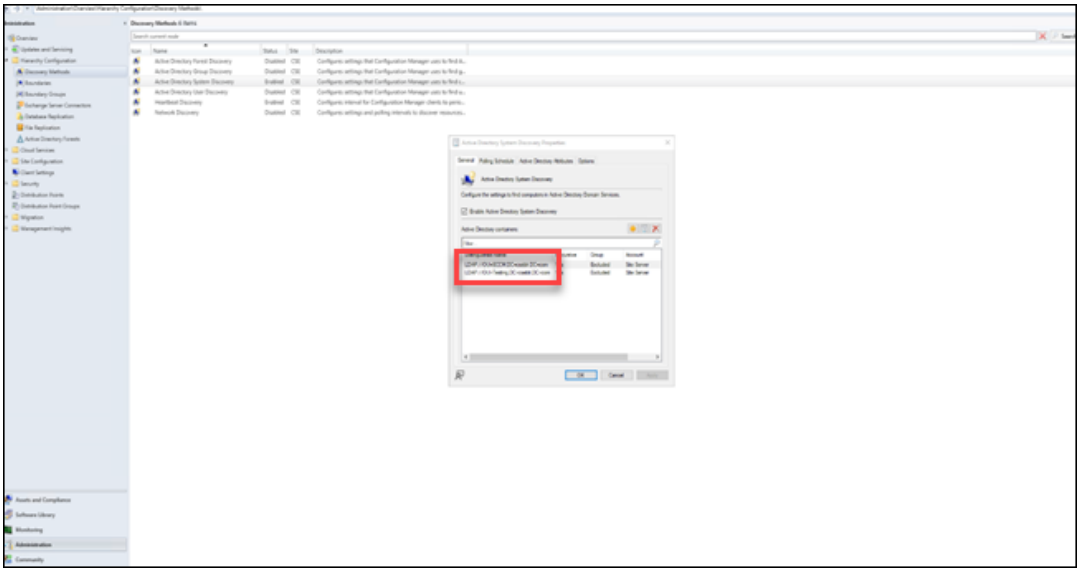


10. Follow the wizard instructions.



The OU is created.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

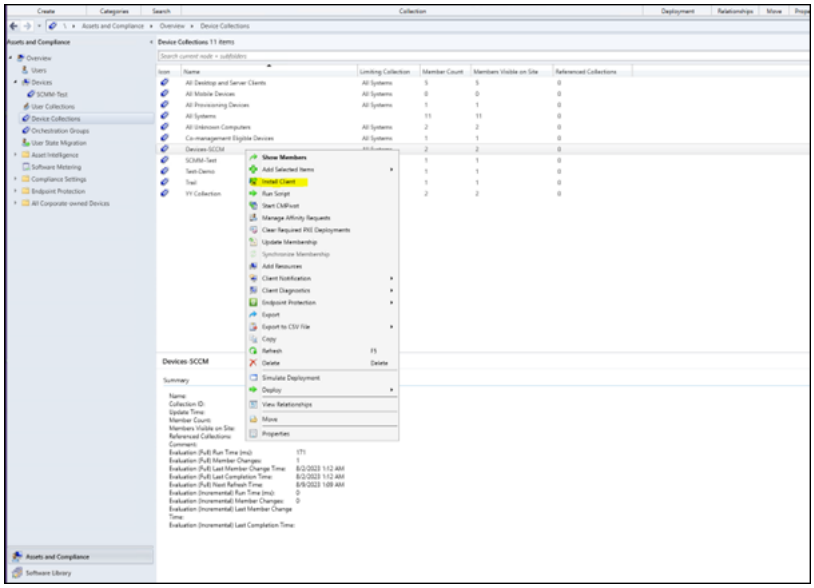


11. Add the created VMs to the newly created Device Collection.

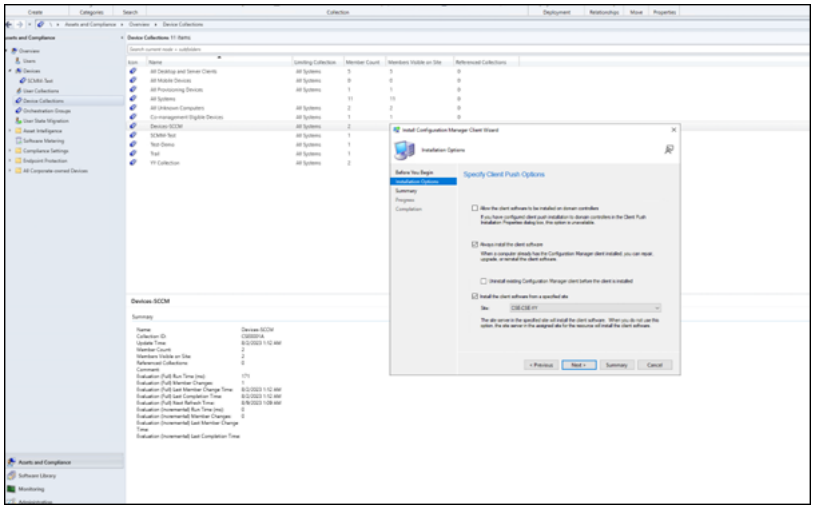
    a) Right-click the VM. Select **Add Selected Items > Add Selected Items to Existing Device Collection**.

    b) In the **Select Collection** window, select the required device name. In this example, it is `Devices-SCCM`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

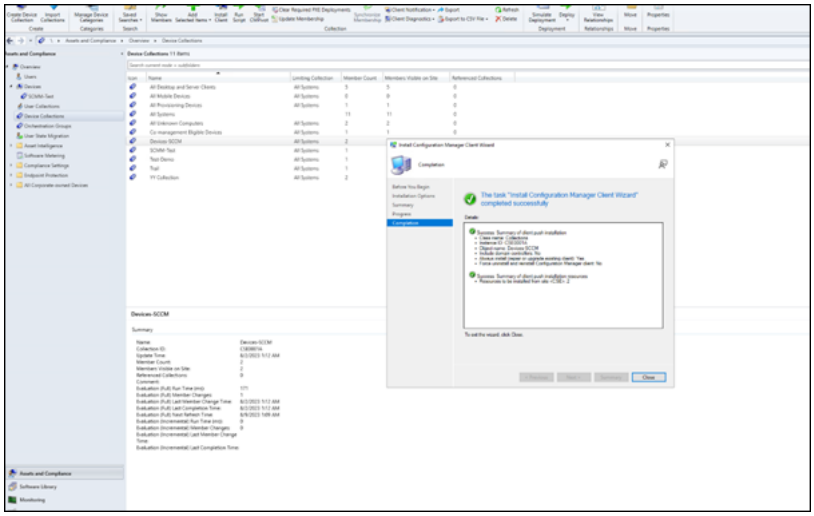


`Devices-SCCM` is listed in **Assets and Compliance > Overview > Device Collections**.



12. Select **Install Client** on Device Collector.

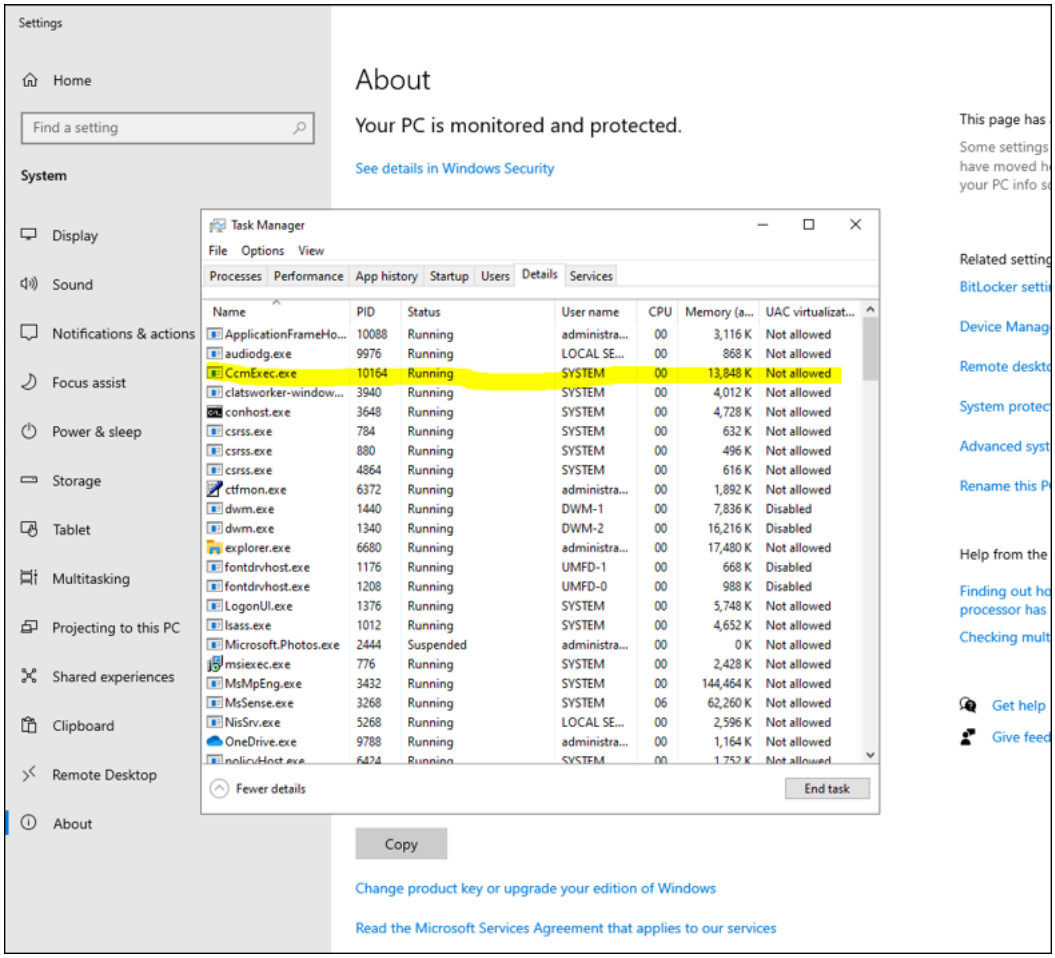
© 1997–2026 Citrix Systems, Inc. All rights reserved.



13. Select the required installation **Site**.

14. Follow the wizard instructions. **Install Configuration Manager Client Wizard** is completed successfully.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



For detailed information, see Manage collections in the Microsoft documentation.

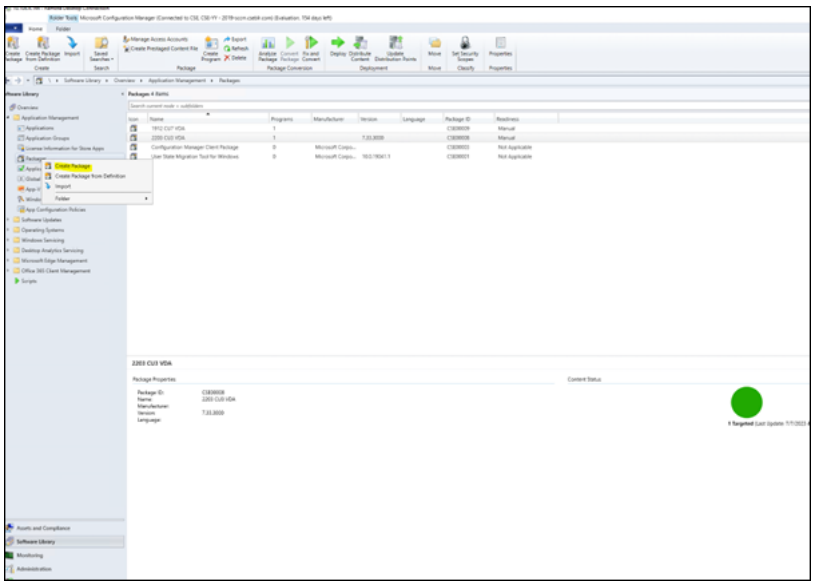
Step 3: Verify the machines

1. On the client machine, verify that the client is installed by checking if the `CCMExec` process is running.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

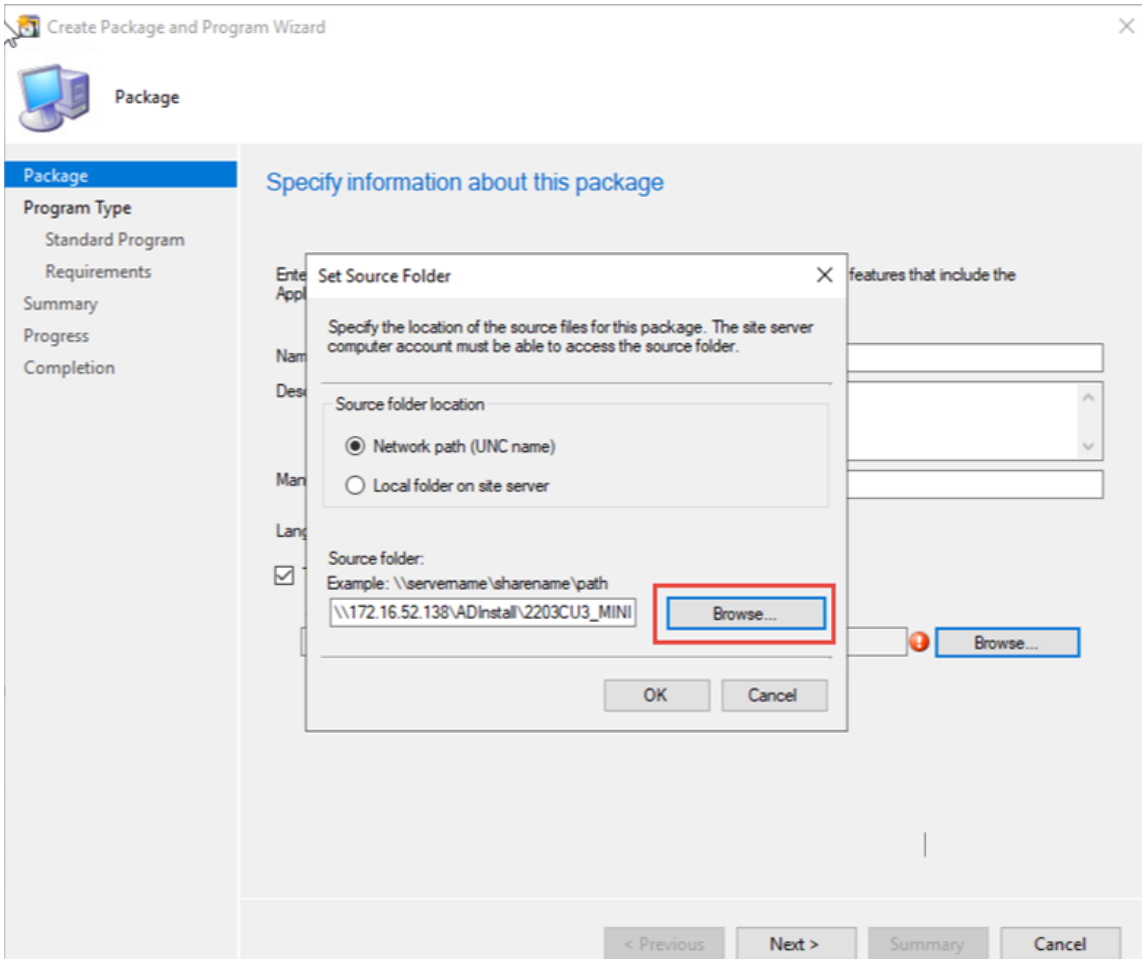
2. Verify if the Client is running for the VMs on SCCM.

Step 4: Use VDA to distribute content



The following steps describe how you can use the deployed VDA to distribute content on the associated virtual machines.

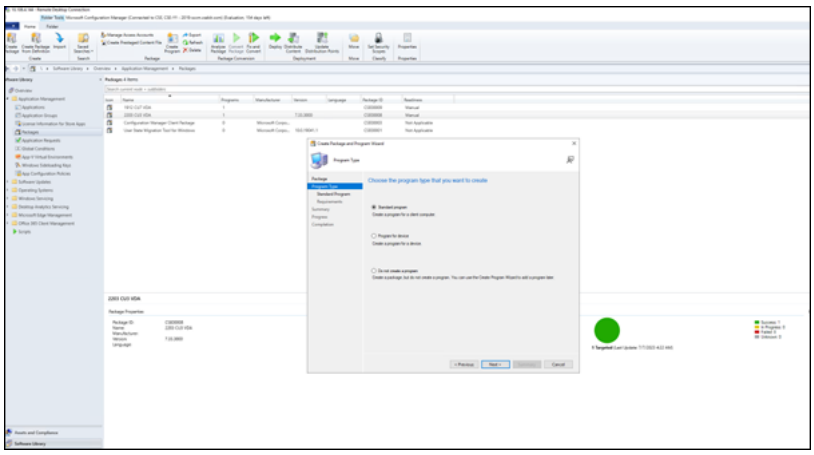
1. Create a package
2. Distribute content



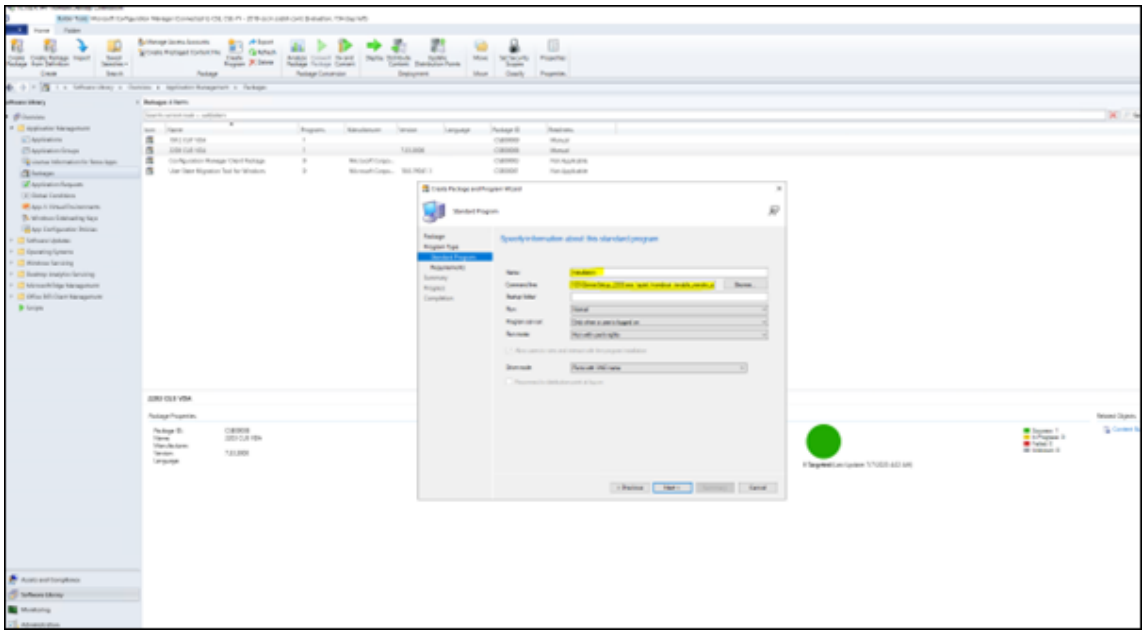
Create a package

1. To create a package, right-click the VDA you want and click **Create Package**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

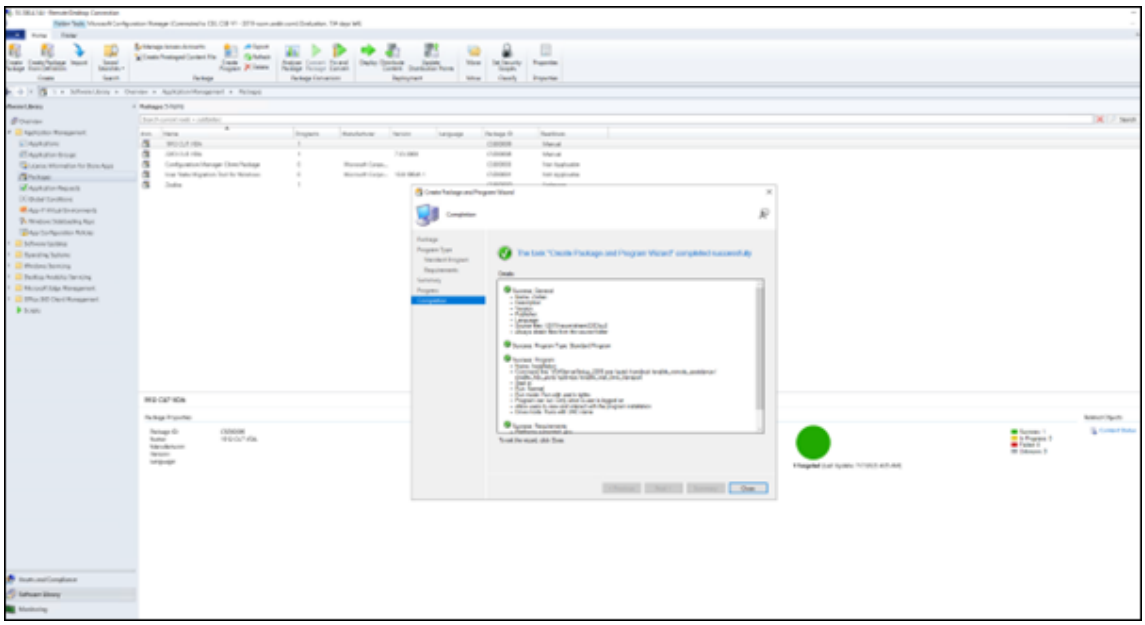


2. Specify the location of the source files for this package by clicking **Browse**.



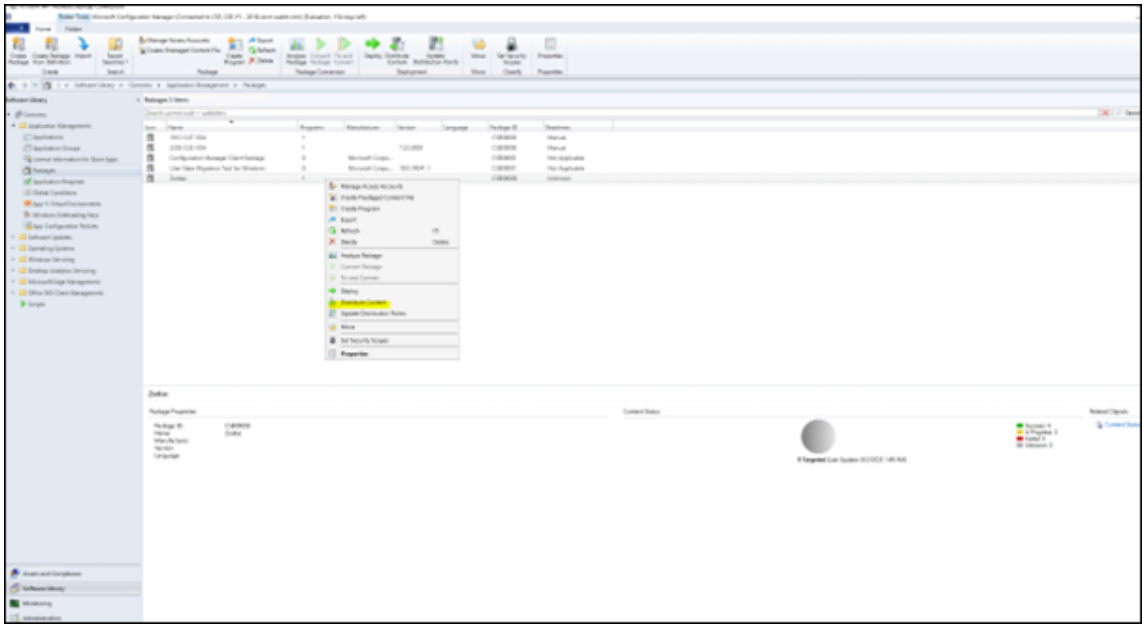
3. Select the package type that you want.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



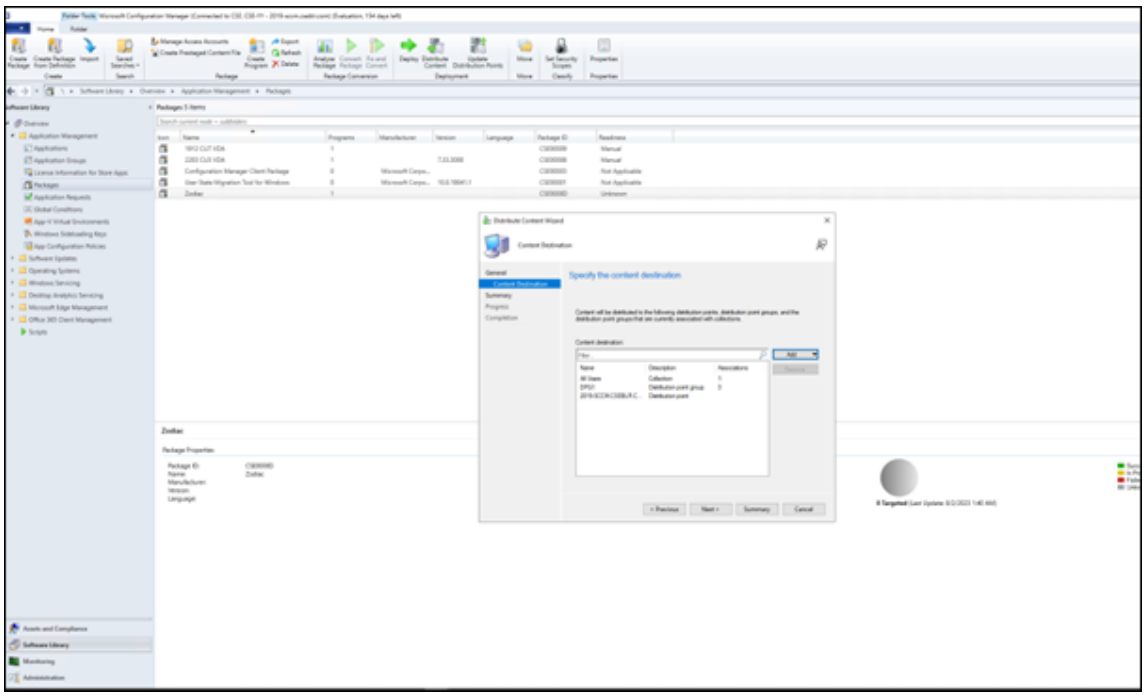
4. Enter the package **Name** and **Command line**.

5. Click **Next**.



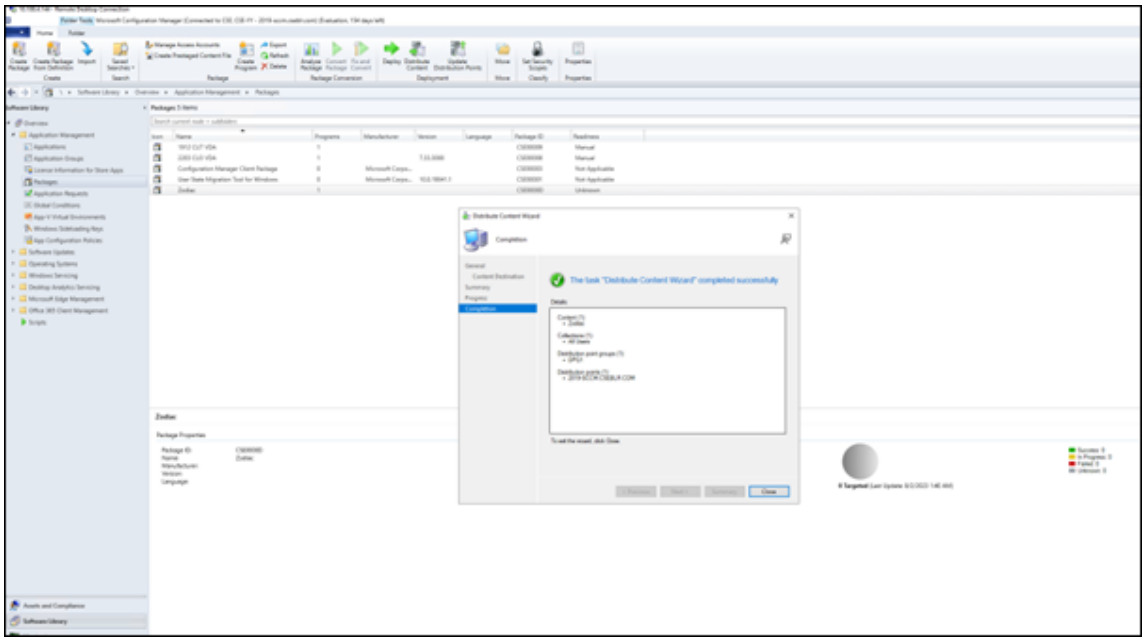
© 1997–2026 Citrix Systems, Inc. All rights reserved.

For detailed information, see the Packages and programs in Configuration Manager in the Microsoft documentation.



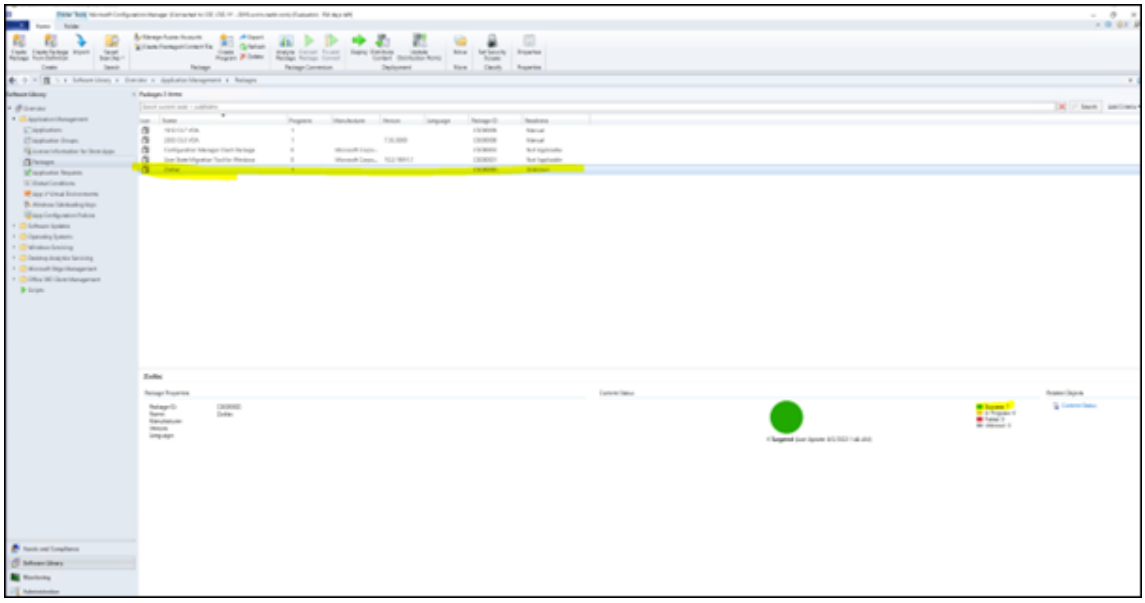
Distribute content

1. Right-click the package name you have created.
2. Select **Distribute Content**.



3. In the **Distribute Content Wizard** window, select the location of the source files for the package that you have created. In this example, it is `2019-SCCM`. Click **Next**.

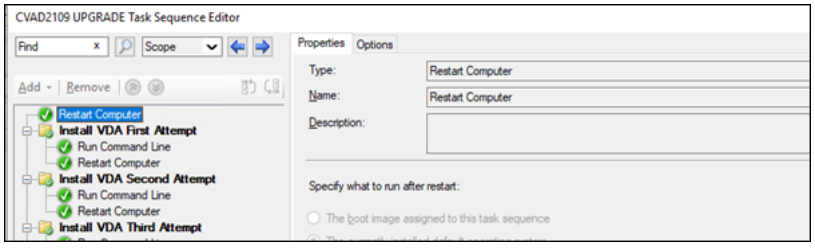
© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. Verify that the Package (in this example, `Zodiac`) is available to deploy.

The following image illustrates that the package is available to deploy.

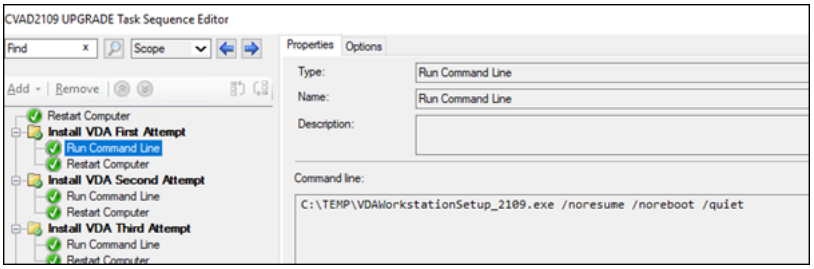
© 1997–2026 Citrix Systems, Inc. All rights reserved.



For detailed information, see Deploy and manage content for Configuration Manager in the Microsoft documentation.

Example installation sequence using SCCM

The following example shows the installation sequence.

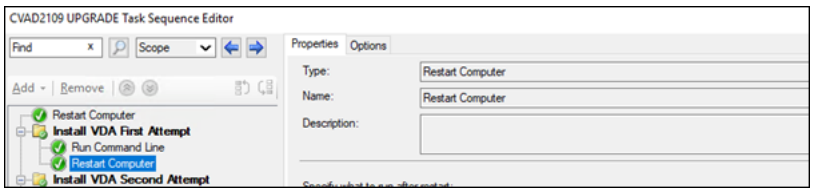


1. **Restart Computer:** Prepare the machine by restarting the machine.

2. **Install VDA First Attempt:** Start the VDA installation.

   a) Add the `/quiet`, `/noreboot`, and `/noresume` options to your command-line options.

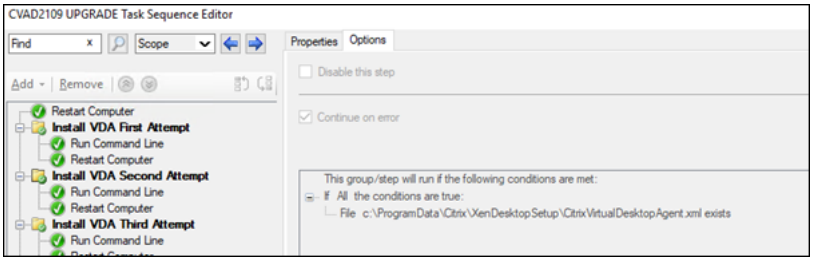
   b) Run the VDA installer of your choice (local image or one of the minimal installers).



© 1997–2026 Citrix Systems, Inc. All rights reserved.

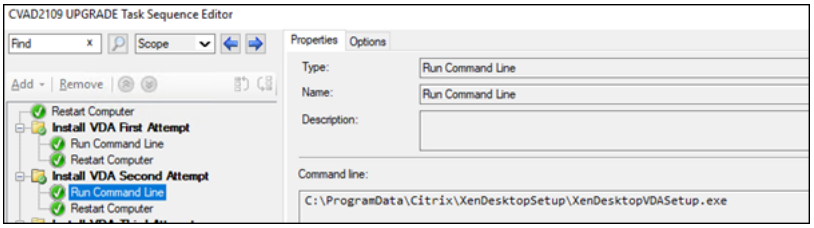
c) SCCM must capture the return code.

- If the return code is 0 or 8, the installation is complete, and a restart is needed.



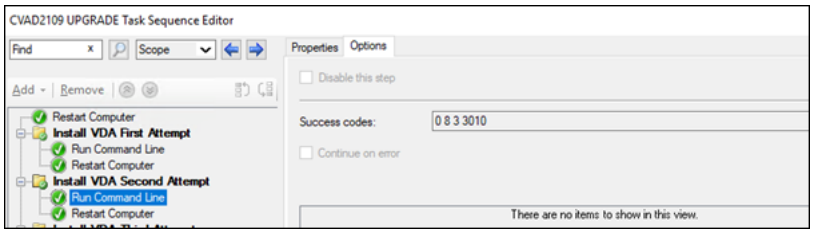
- If a return code is 3, restart the machine and then pass control to **Install VDA Second Attempt**.

3. **Install VDA Second Attempt:** Continue VDA installation.



a) After **Install VDA First Attempt** if the file `%programdata%\Citrix\XenDesktopSetup\CitrixVirtualDesktopAgent.xml` exists, the installation is not complete and must be continued after the restart completes.

b) **Install VDA Second Attempt** repeats until the file `%programdata%\Citrix\XenDesktopSetup\CitrixVirtualDesktopAgent.xml` does not exist or a return code other than 0 or 8 is returned. Treat any other return code as an error, and INSTALL VDA SECOND ATTEMPT should report an error and stop.



c) Resume the VDA installation by running the appropriate VDA installer (`XenDesktopVdaSetup.exe` for most cases, or `XenDesktopRemotePCSetup.exe` if `VDAWorkstationCoreSetup_X.exe` was used) from the file `%programdata%\Citrix\XenDesktopSetup\` directory with no command-line parameters. (The VDA installer uses the parameters it saved during the first run of the installer.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

d) Watch for the return code from the VDA installer.

- 0 or 8: Success, installation complete, restart required.

- 3: Installation is not complete. Restart the machine and repeat INSTALL VDA SECOND ATTEMPT until the file `%programdata%\Citrix\XenDesktopSetup\CitrixVirtualDesktopAgent.xml` does not exist or until a 0 or 8 is returned. Treat any other return code as an error, and INSTALL VDA SECOND ATTEMPT should report an error and end.

For more information about return codes see Citrix installation return codes.

VDA installation command examples

The available installation options vary, depending on which installer is used. See the following articles for command line option details.

- Install VDAs
- Install using the command line

Installation commands for Remote PC Access

- The following command uses the single-session core VDA installer (`VDAWorkstationCoreSetup.exe`):

  ```
  VDAWorkstationCoreSetup.exe /quiet /controllers "control.domain.com" /enable_hdx_ports /noresume /noreboot
  ```

- The following command uses the single-session full VDA installer (`VDAWorkstationSetup.exe`):

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
VDAWorkstationSetup.exe /quiet /remotepc /physicalmachine /
controllers "control.domain.com" /enable_hdx_ports /noresume /
noreboot
```

Installation command for dedicated VDI

- The following command uses the single-session full VDA installer (`VDAWorkstationSetup.exe`):

  ```
  VDAWorkstationSetup.exe /quiet /components vda /controllers "
  control.domain.com" /enable_hdx_ports /enable_remote_assistance /
  noresume /noreboot
  ```

Install VDAs using Microsoft Intune

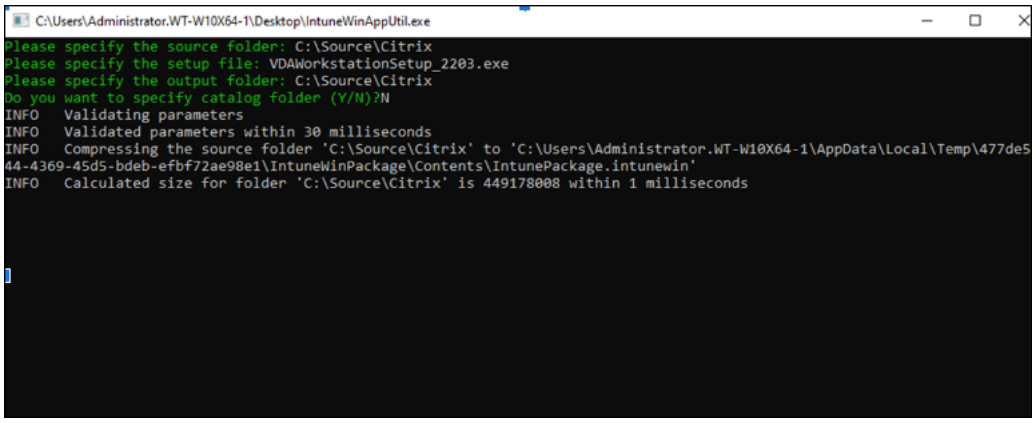
May 13, 2026

Overview

This article describes how to deploy VDAs using Microsoft Intune. For more information, see the Microsoft documentation.

> **Note:**
>
> The following article describes only recommendations based on how Citrix® has tested the environment. You can customize these steps according to your needs. Citrix is not responsible for any updates or tweaks needed to this to fit customer needs.

Key steps to deploy VDA using Microsoft Intune

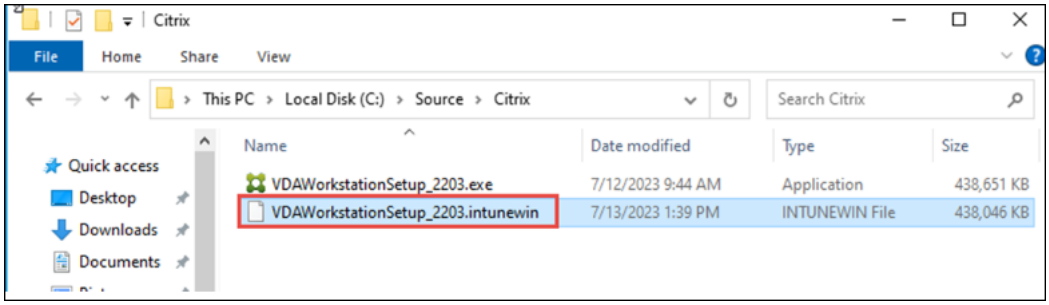


1. Prepare installation for the Citrix VDA.
2. Set up Microsoft 365 Developer Program Subscriber.
3. Add and assign an app.
4. Install the app on the enrolled device.

Step 1: Prepare installation for the Citrix VDA

1. Download the updated IntuneWinAppUtil.exe from GitHub.

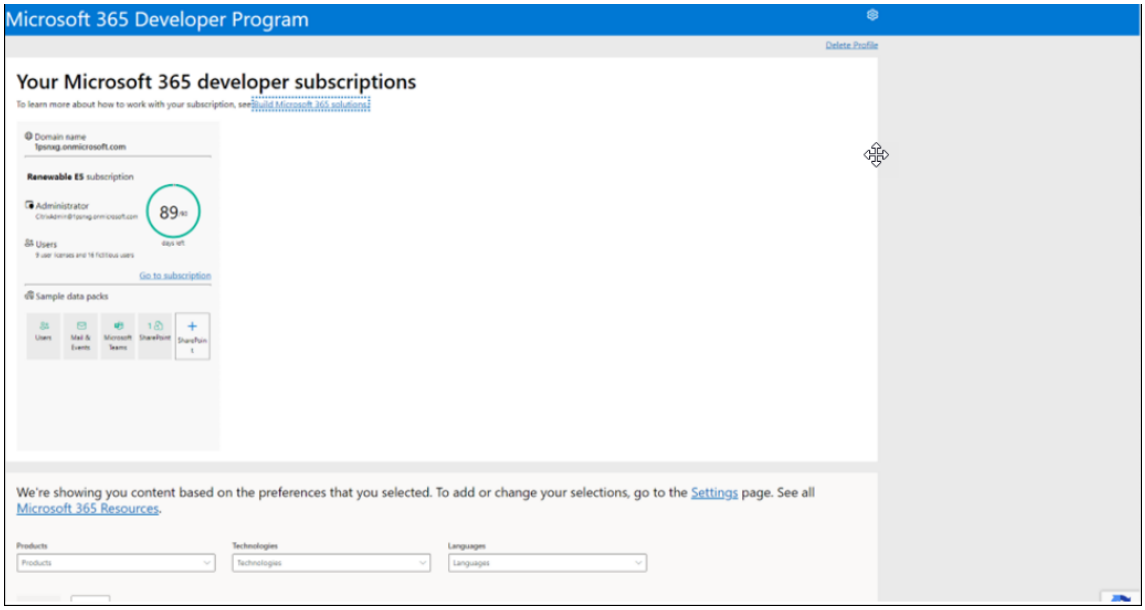
© 1997–2026 Citrix Systems, Inc. All rights reserved.



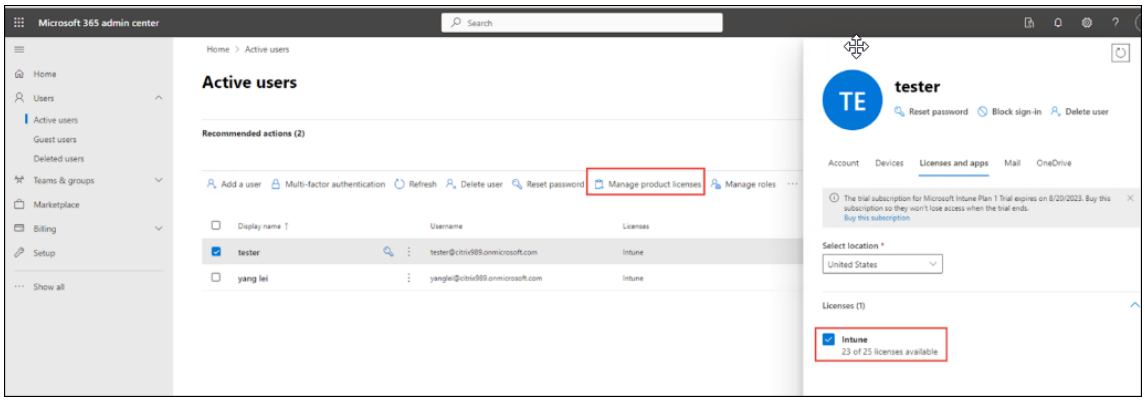
2. Run the `IntuneWinAppUtil.exe` file using **Run as administrator**.
3. Enter the following data:

   a) **Please specify the source folder**: Enter the folder that contains your application setup files. For example, C:\source\Citrix.
   b) **Please specify the setup file**: Enter the setup file name (such as setup.exe or setup.msi). For example, VDAWorkstationSetup_2203.exe.
   c) **Please specify the output folder**: Enter the path of the output folder to generate the .intunewin file. For example, C:\source\Citrix.
   d) **Do you want to specify catalog folder (Y/N)**: Type N.

> **Note:**
>
> Wait a few minutes while **Win32 Content Prep Tool** is running. Once it generates the `.intunewin` file, the status indicates 100% at the bottom of the command prompt.



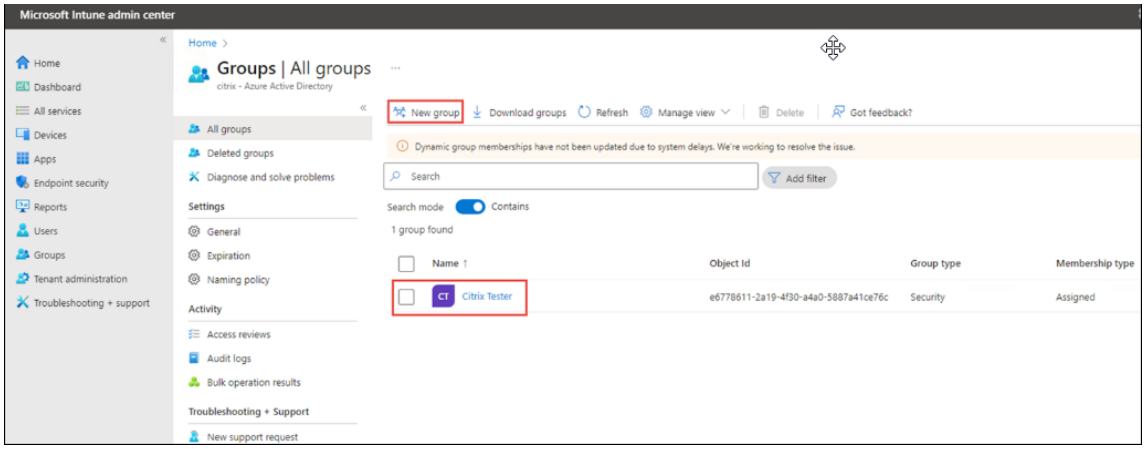
4. Once the process completes, go to the output folder (In this example, `C:\source\Citrix`) to get the Microsoft Intune deployment file.
5. Sign up for a Microsoft Intune free trial.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

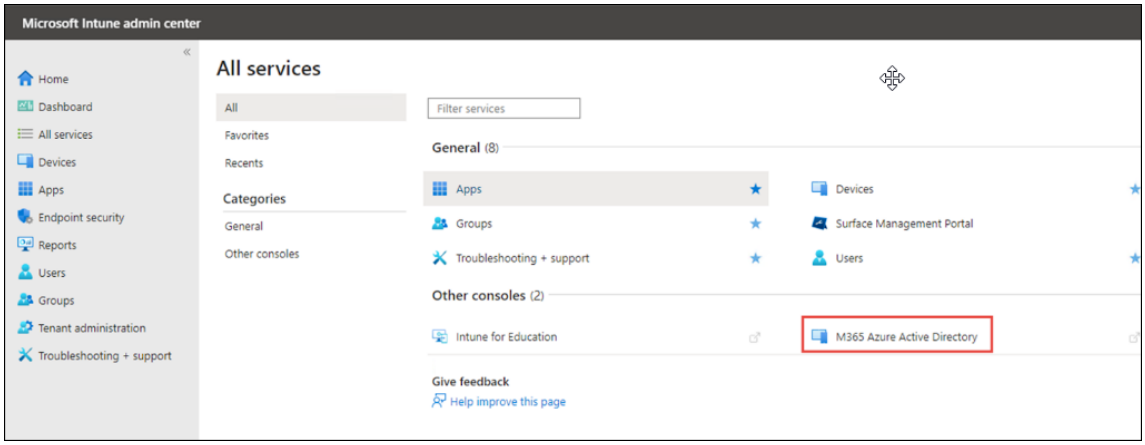
Step 2: Set up Microsoft 365 Developer Program Subscriber

1. Create the Instant sandbox to activate your subscription.
   To get your developer sandbox, go to your Microsoft 365 Developer Program dashboard and select **Add a new subscription**.

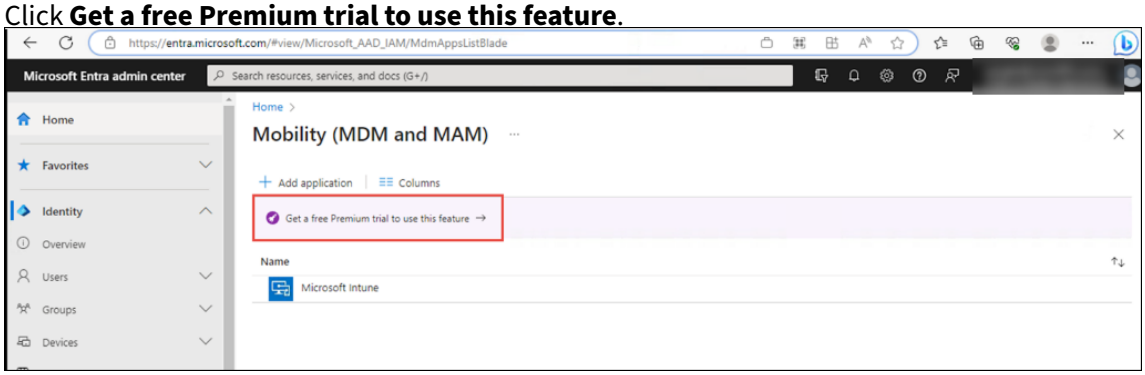


2. Create a user in the Microsoft 365 Admin center and assign a license to the user.

3. Create a group.



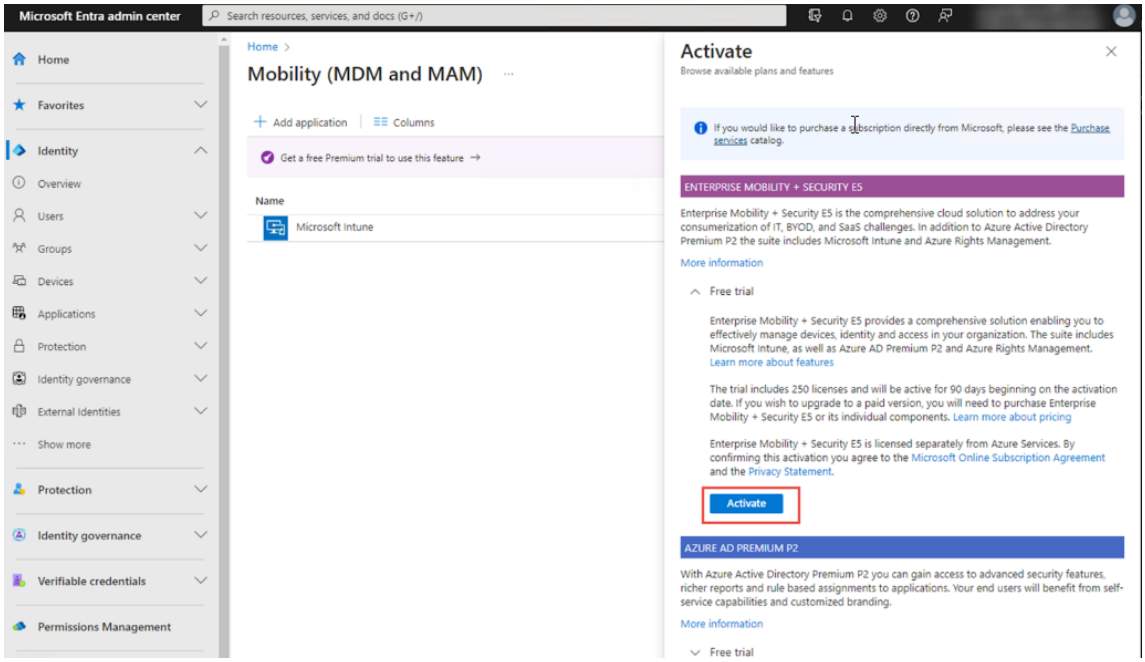
© 1997–2026 Citrix Systems, Inc. All rights reserved.



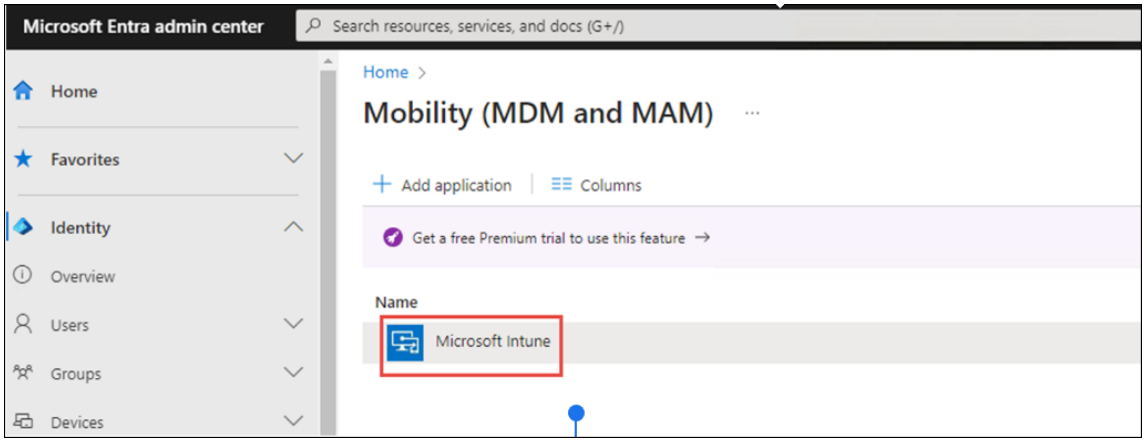
4. Once the group is created, you must provide the MDM authority to the group. Set up automatic enrollment. It can take a minute to activate.
   Or you can manually add the MDM authority to the group by completing the following steps:

   a) Go to **All services > Microsoft Entra**.
   b) Go to **settings > Mobility** and select **Microsoft Intune**.
   c) Select the group you have just created. This opens a page with the MDM user scope.
   d) Click **Save**.

5. In the **All Services** tab, click **M365 Microsoft Entra ID**.

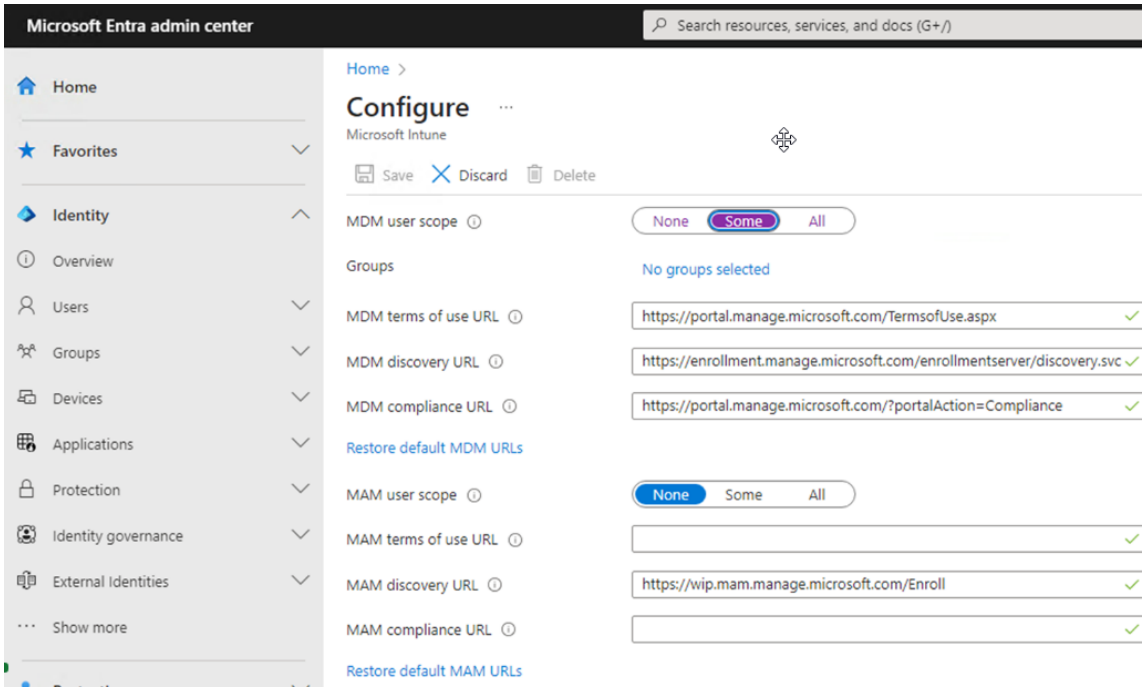


6. Click **Get a free Premium trial to use this feature**.

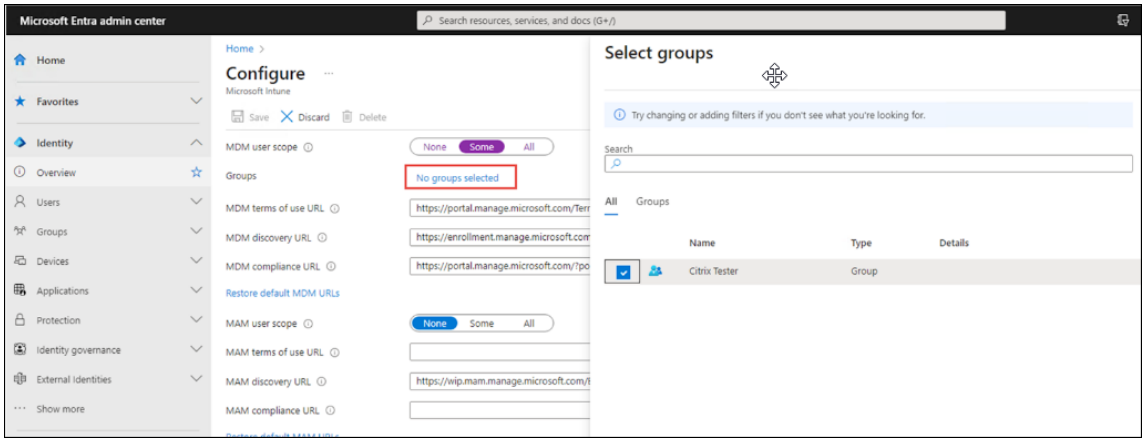


© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Click **Activate**.

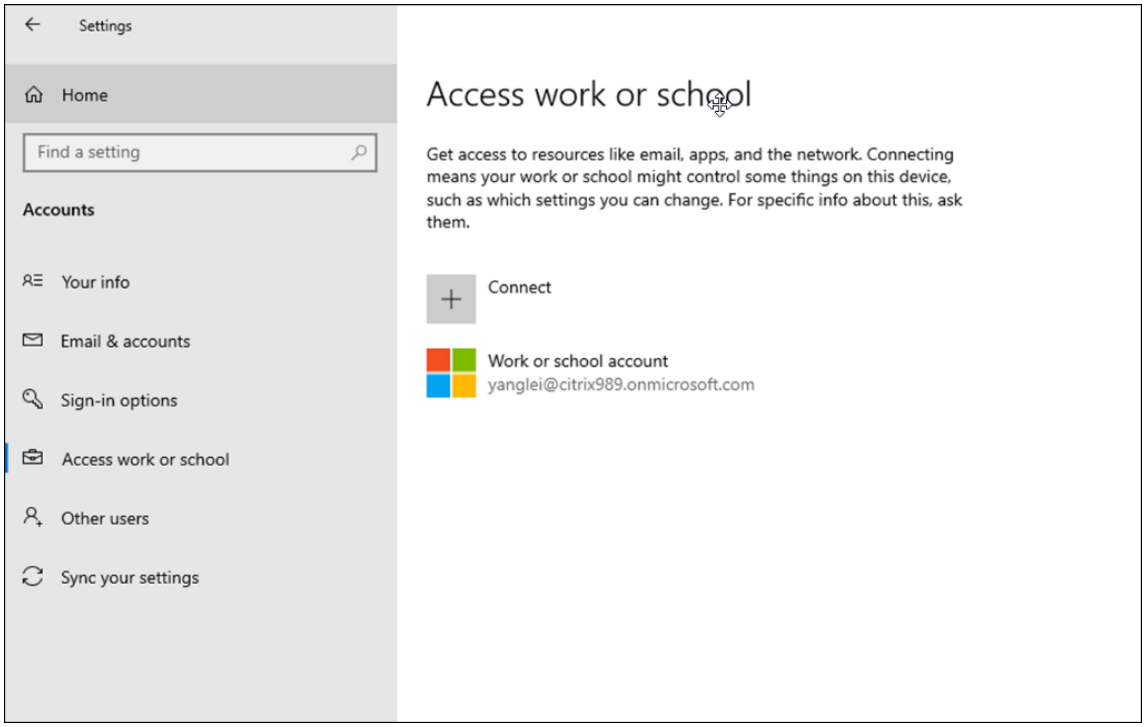


8. Now, click **Microsoft Intune**.

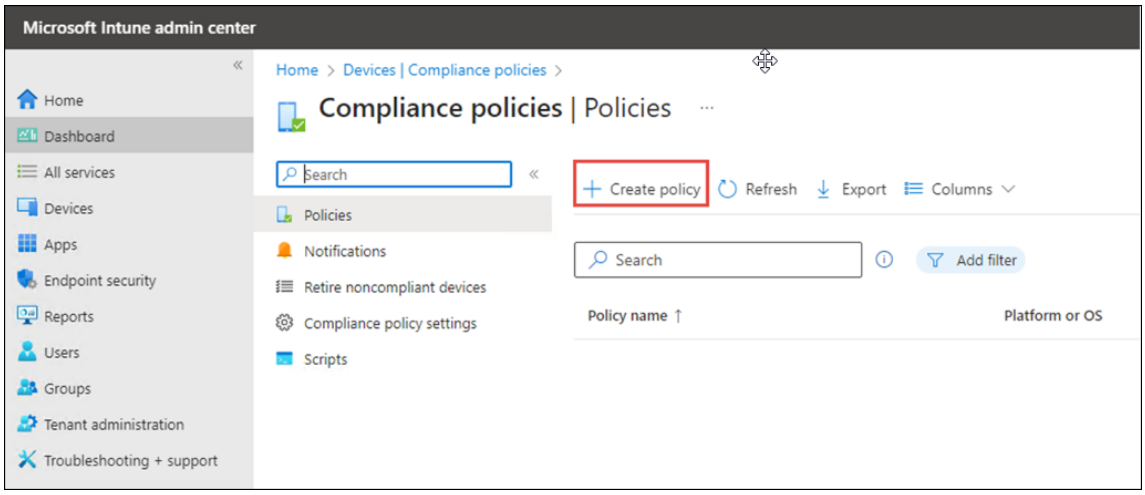


9. In the **Configure** tab, enter the required configurations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

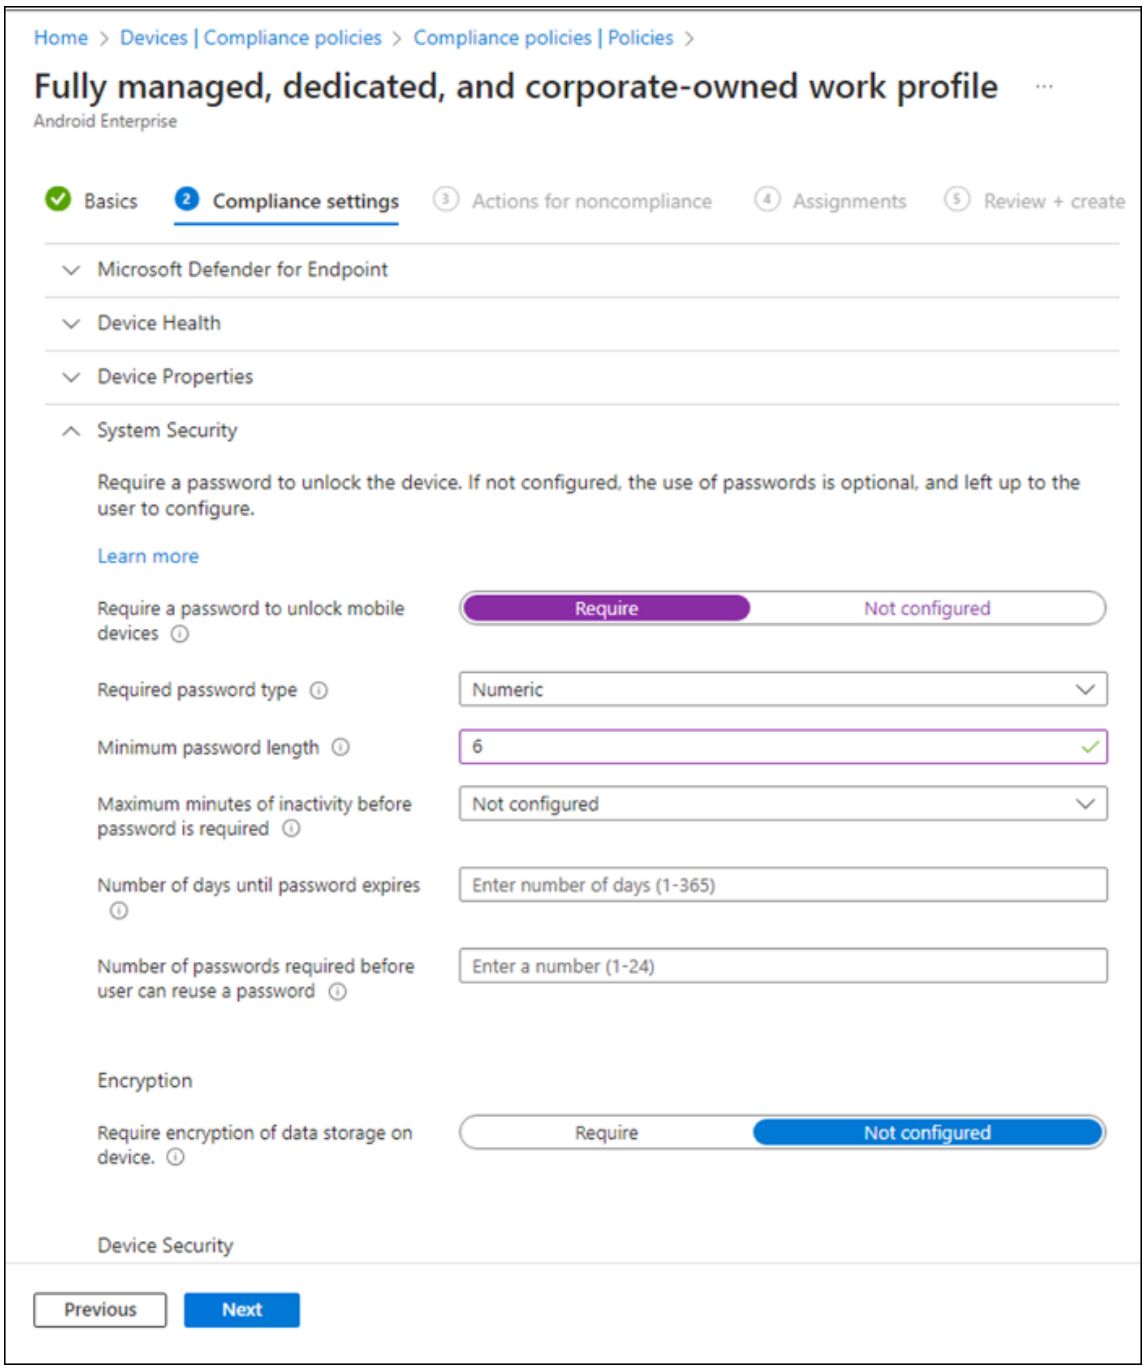


10. To add a group, click **No groups selected**.

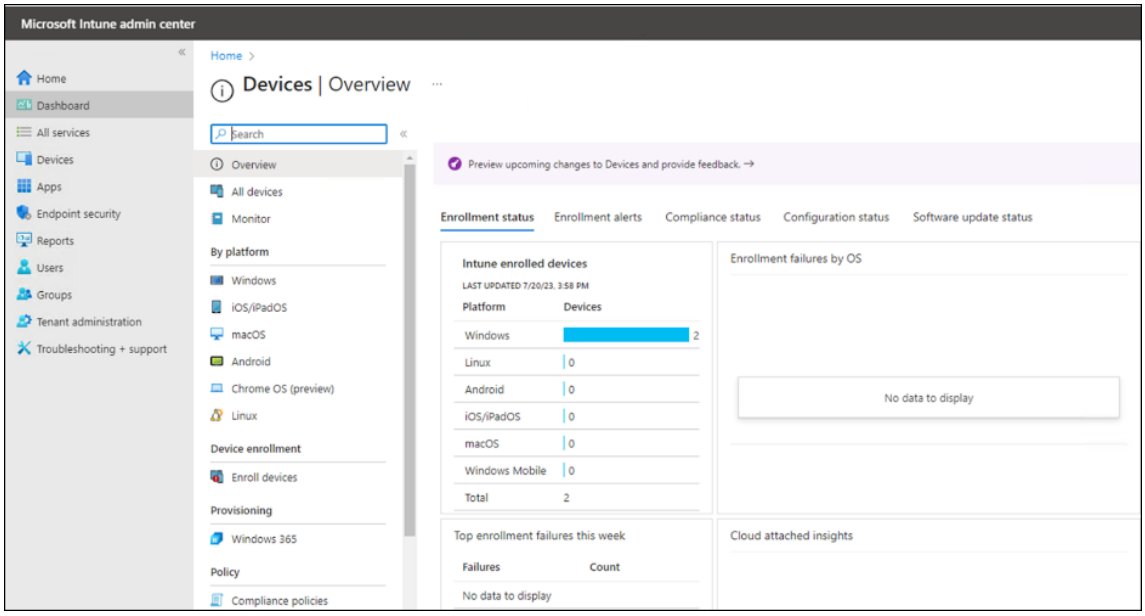


11. Enroll your device.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



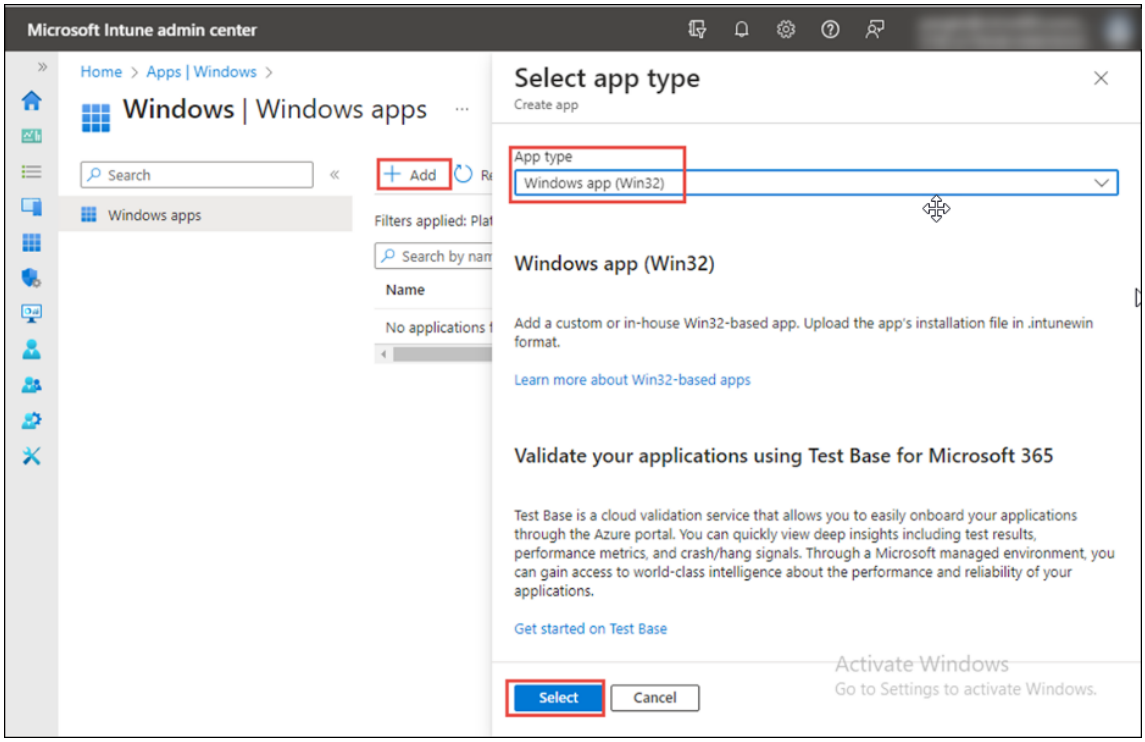
12. Create a device compliance policy to change your newly created Device's compliance to `Compliant`.



13. Go to the **Assignments** tab to add the newly created group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

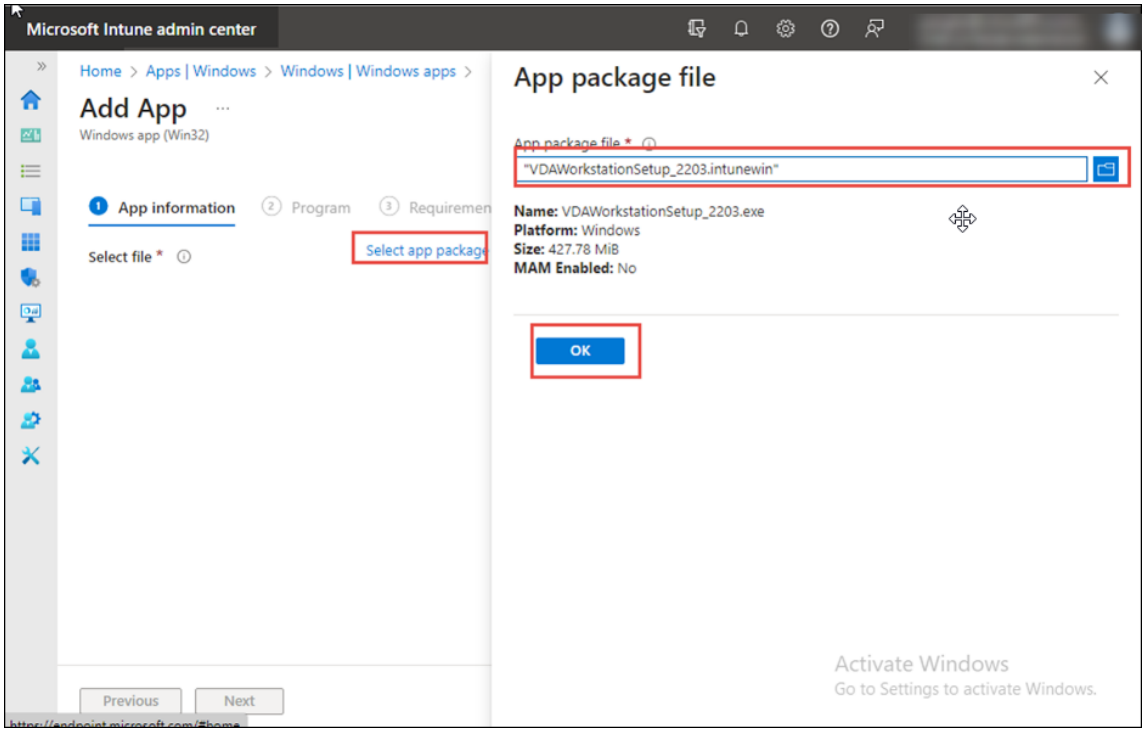
14. Confirm the device enrollment.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

For detailed information, see Microsoft 365 developer program.

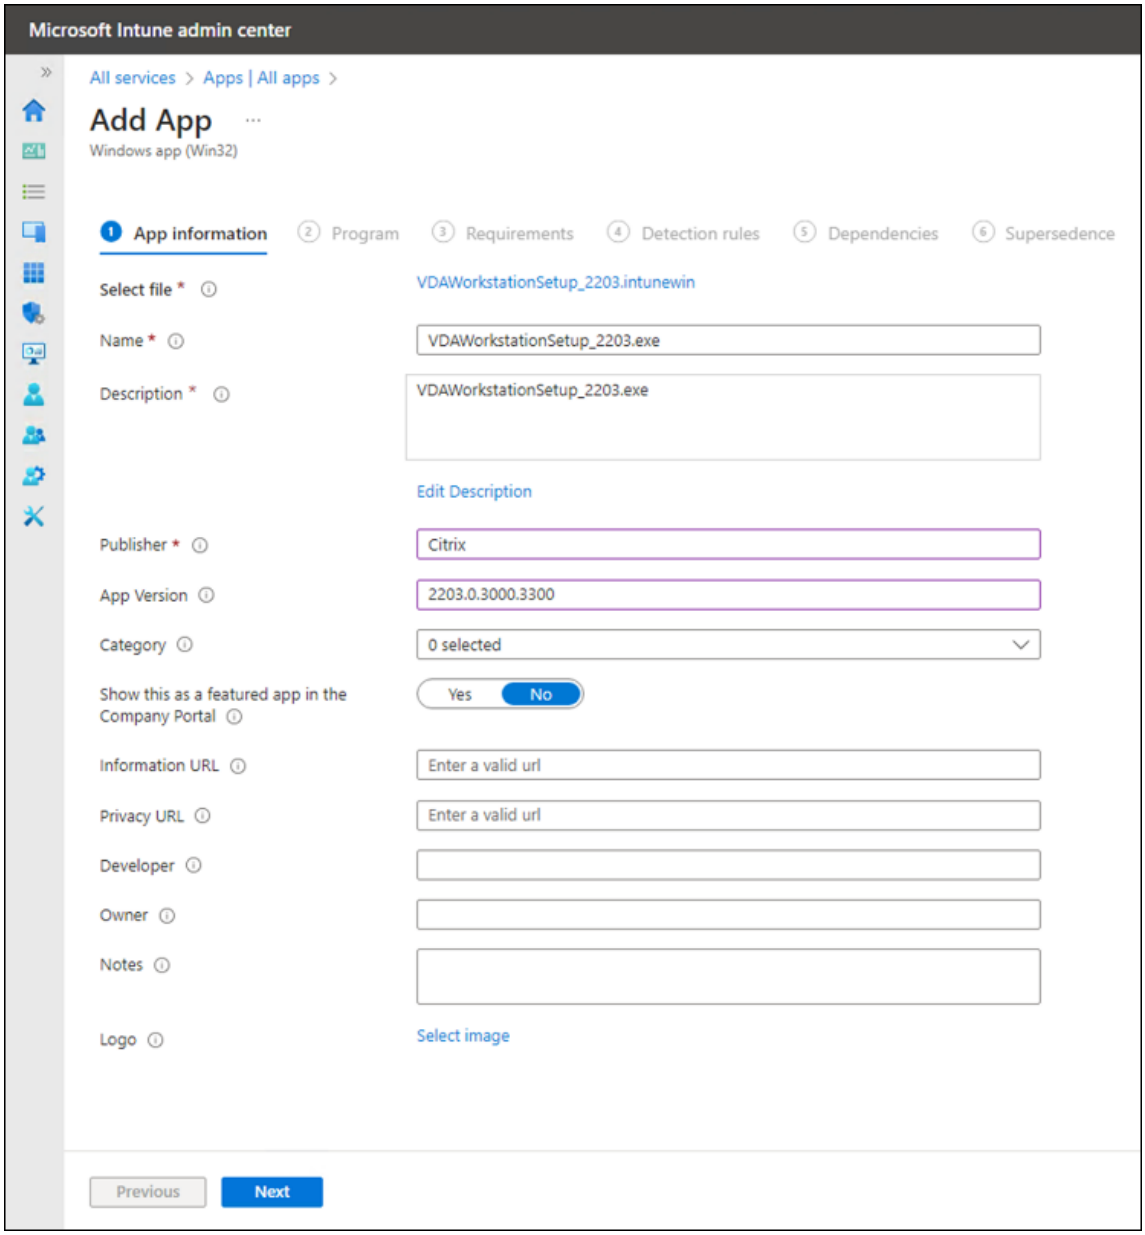
Step 3: Add and assign an app



1. Sign in to Microsoft Intune admin center.
2. Select **Apps > All apps > Add** or go to **Apps > Windows > Windows Apps**.

3. On the **Select app type** pane, select **Other app types > Windows app (Win32)** and click **Select**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. On the **Add app** pane, click **Select app package file**. Click **browse**.
5. Select the prepared file with the extension `.intunewin`. The prepared file is created during the Prepare installation for the Citrix VDA step. A page containing detailed information about the app is displayed.

> **Note:**
>
> - If you are using a server-core machine, you must use the VDA workstation core.
> - If you are using a Windows 10 desktop OS, you must use the VDA workstation.
> - If you are using a server OS (For example, Windows 2022), you must use the VDA server setup.
> - In this example, we are using the 2203 version but this is applicable for all versions.

6. Click **OK** on the **App package file** pane.
7. In the following screen, under the **App Information** tab, enter the **Name** of the App, and enter the **Description** of the Windows App. Enter the **Publisher** name as `Citrix`, and you can specify the additional app information here. Click **Next**.

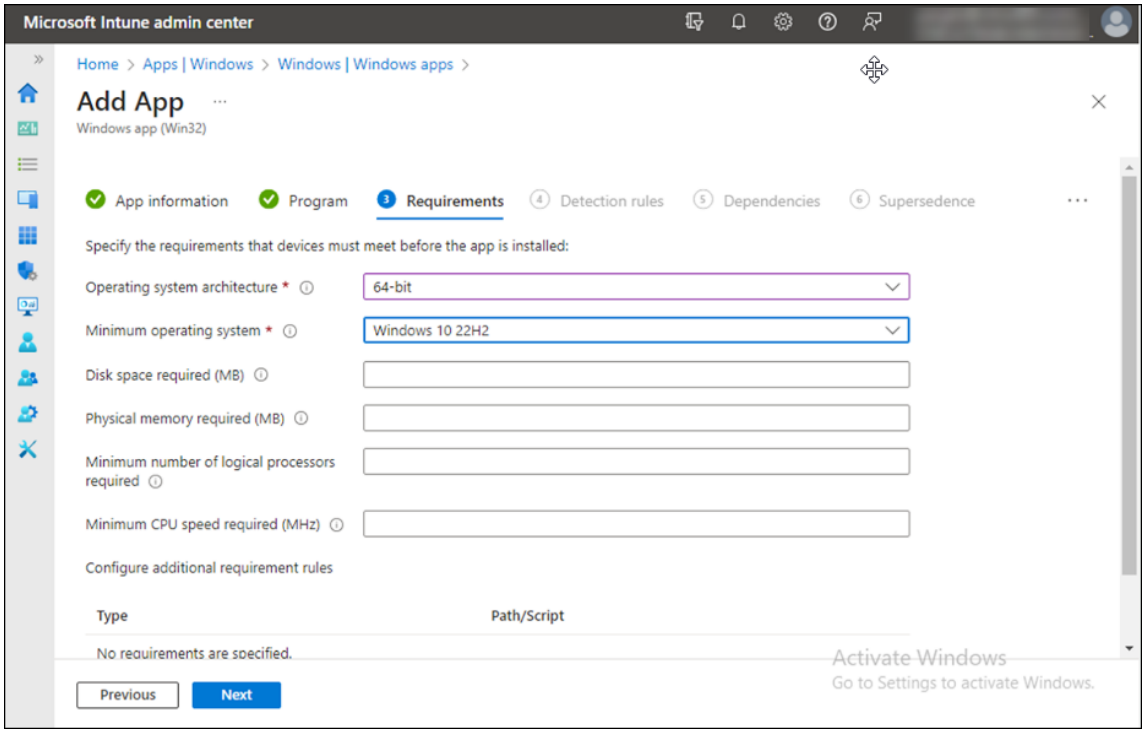
© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. On the next screen, enter the following values:

   - **Install command**: `VDAWorkstationSetup_2203.exe /quiet /noreboot`
   - **Uninstall command**: `VDAWorkstationSetup_2203.exe /quiet /removeall /noreboot`
   - **Install behavior**:
     - **System**: Select this option to install the app on all the devices in the group.
     - **User**: Select this option to install the app only on a specific user device in the group.

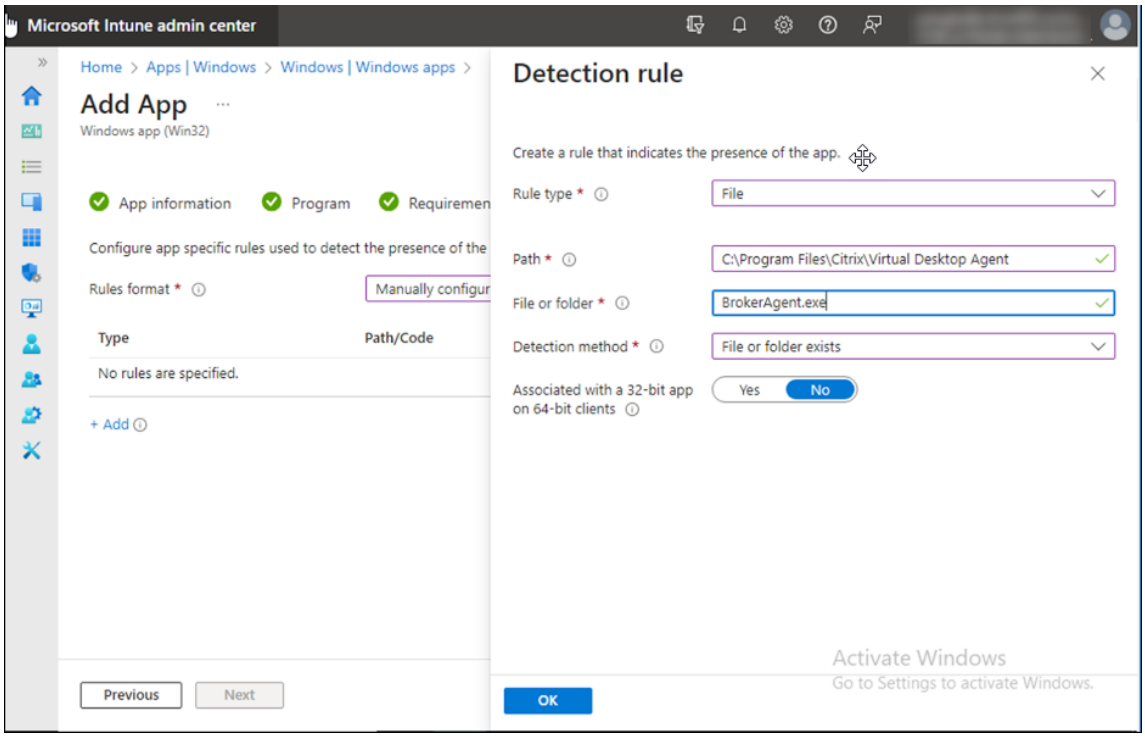
9. Click **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



Note:

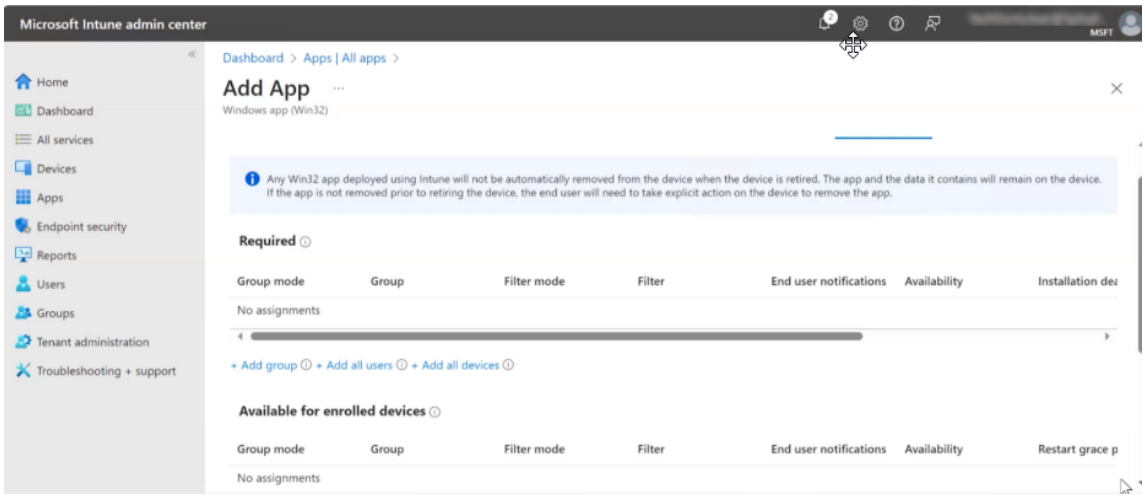
- This example uses the 2203 version, but you can use it with any version.
- Adding `/noreboot` to a command doesn't mean there won't be any reboots during installation or deployment, but only enforces mandatory reboots.
  For more information on scripts, see Command-line options for installing a VDA.
- For **Device restart behavior**, select **Intune will force a mandatory device restart**.
- In the **Return code** text box, enter `0`, `3` and `8` for post-installation success.
  For information on other return codes, see Citrix installation return codes.



10. In the following screen, under the **Requirements** tab, enter the required values. Click **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

11. In the following screen, under the **Detection rule** tab, add **Detection rule** to add the Broker agent. Click **OK**.

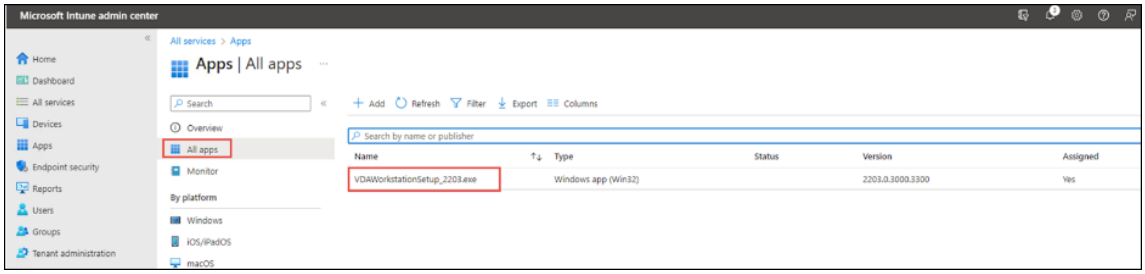


12. In the **Assignments** tab, you can add the devices in the following:

    - **Required**: The devices for which updates occur automatically.

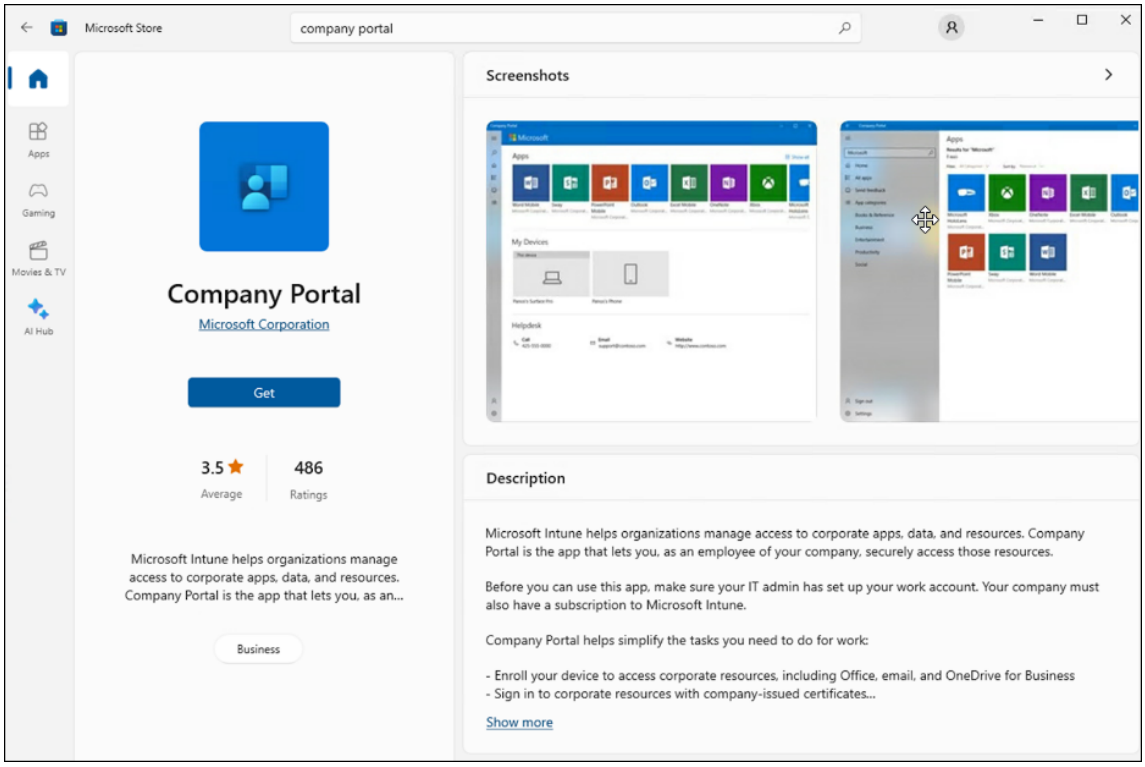
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Available for enrolled devices**: The devices for which updates occur manually.



13. Review the details and click **Create**.

The app is assigned successfully.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

For detailed information, see Add and assign an app.

Step 4: Install the app on the enrolled device

1. Sign in to your enrolled Windows 10 Desktop device.
   The device must be enrolled with Microsoft Intune. Also, you must sign in to the device using an account contained in the group you assigned to the app. For more information, see the Microsoft documentation.
2. From the **Start** menu, open **Microsoft Store**.
3. Browse for the **Company Portal** app and install it.

4. Run the **Company Portal** app.
5. Click the app that you added using Microsoft Intune.
   If you did not successfully assign any apps to the Intune user, the following message is displayed:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Your IT administrator did not make any apps available to you.
```

6. Click **Install**.

Create a site

May 15, 2026

> **Note:**
>
> - During site creation, after you add a license to enable Hybrid Rights License, public cloud hosts (such as Microsoft Azure, Google Cloud Platform, and Amazon Web Services) do not appear in the connection type list until the site creation completes.
> - Do not change the product edition or licensing model manually during or after enabling License Activation Service.

A site is the name you give to a Citrix Virtual Apps and Desktops™ deployment. It comprises the Delivery Controllers and other core components, Virtual Delivery Agents (VDAs), connections to hosts, machine catalogs, and delivery groups. You create the site after you install the core components and before creating the first machine catalog and delivery group.

If your Controller is installed on Server Core, use PowerShell cmdlets in the Citrix Virtual Apps and Desktops SDK to create a site.

When you create a site, you are automatically enrolled in the Citrix Customer Experience Improvement Program (CEIP). CEIP collects anonymous statistics and usage information, and then sends it to Citrix. The first data package is sent to Citrix approximately seven days after you create the site. You can change your enrollment at any time after site creation. Select **Settings** in the Web Studio left pane, and then locate the **Citrix Customer Experience Improvement Program** setting. For details, see http://more.citrix.com/XD-CEIP.

The user who creates a site becomes a full administrator. For more information, see Delegated administration.

Review this article before you create the site, so you know what to expect.

Step 1. Open the site creation wizard - Citrix Site Manager

Use the tool, Citrix Site Manager, to set up your Citrix Virtual Apps and Desktops™ deployment (also known as a site). The tool is installed automatically when you install a Delivery Controller.

To run this tool, open your desktop Start menu on a Delivery Controller, and select **Citrix > Citrix Site Manager**. See Install Web Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 2. Site name

On the **Introduction** page, type a name for the site.

Step 3. Databases

> **Note:**
>
> Starting with version 2411, you can use Azure SQL Managed Instance for databases.

The **Databases** page contains selections for setting up the site, monitoring, and configuration logging databases. For details about database setup choices and requirements, see Databases.

> **Note:**
>
> If an SQL Server Always On Listener is configured for TLS encryption, you might be prompted to enter credentials with database creation permissions. Attempts to create the database still fail even if you enter valid administrator credentials. Verify that the SQL Server certificate includes the listener DNS name in the Subject Alternative Names (SAN). For more information, see https://docs.microsoft.com/en-us/sql/database-engine/availability-groups/windows/listeners-client-connectivity-application-failover#SSLcertificates.

If you choose to install SQL Server Express for use as the site database (the default), a restart occurs after that software is installed. That restart does not occur if you choose not to install the SQL Server Express software for use as the site database.

If you are not using the default SQL Server Express, ensure that the SQL Server software is installed on the machines before creating a site. System requirements lists the supported versions.

If you want to add more Delivery Controllers to the site, and have already installed the Controller software on other servers, you can add those Controllers from this page. If you also plan to generate scripts that set up the databases, add the Controllers before generating the scripts.

Step 4. Licensing

On the **Licensing** page, specify the License Server address and then indicate which license to use (install).

> **Note:**
>
> - Ensure the License Server is running a minimum of version 11.17.2 build 53100 or later. Failure to meet this prerequisite blocks the Citrix Virtual Apps and Desktops site upgrades and site creation.
> - The License Activation Service (LAS) is a cloud-based licensing solution that provides an

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> alternative to the traditional Citrix legacy licensing. For more information, see:
>
> - Citrix Virtual Apps and Desktops document: License Activation Service
> - Licensing document: License Activation Service
>
> - Do not change the product edition or licensing model manually during or after enabling License Activation Service.

- Specify the License Server address in the form `name:[port]`. The *name* must be an FQDN, NetBIOS, or IP address. FQDN is recommended. If you omit the port number, the default is 27000. Click **Connect**. You cannot proceed to the next page until a successful connection is made to the License Server.
- When a connection is made, **Use an existing license** is selected by default. The display lists the compatible products that this product can be configured as, based on currently installed licenses.
  - If the License Server is configured to use License Activation Service (LAS), the Metainstaller displays the entitlements. The entitlements are provided along with their corresponding license expiration dates. If you want to configure this product as one of the listed products using one of those licenses, select that entry.
  - If you already allocated and downloaded a license (using the Citrix Manage Licenses Tool) to use with this product, but haven't installed the license yet:
    - Click **Browse for license file**.
    - In the file explorer, locate and select the license you downloaded. The associated products now appear on the **Licensing** page of the site creation wizard. Select the entry you want to use.
  - If the product you want is not displayed, or if you have no allocated and downloaded licenses, you can allocate, download, and install a license. To do this, the License Server must have internet access. You must have a License Access Code for the product you want. Citrix emails that code to you.
    - Click **Allocate and download**.
    - In the **Allocate Licenses** dialog, enter the License Access Code sent by Citrix. Click **Allocate licenses**.
    - The products associated with the new license appear on the **Licensing** page of the site creation wizard. Select the entry you want to use.
- Alternatively, select **Use the free 30-day trial**, and install licenses later. For details, see the Licensing documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 5. Summary

The **Summary** page lists the information you specified. Use the **Back** button if you want to change anything. When you're finished, click **Finish**.

More information

Host connection, network, and storage

If you are using VMs on a hypervisor or other service to deliver applications and desktops, you can optionally create the first connection to that host. You can also specify storage and network resources for that connection. After creating the site, you can modify this connection and resources, and create more connections. For details, see Connections and resources.

- For information specified on the **Connection** page, see Connections and resources.
  - If you are not using VMs on a hypervisor or other service (or if you use Web Studio to manage desktops on dedicated blade PCs), select the connection type **None**.
  - If you are configuring a Remote PC Access site and plan to use the Wake on LAN feature, select the **Microsoft System Center Virtual Machine Manager** or **Remote PC Wake on LAN** type. For more information, see Wake on LAN.

  In addition to the connection type, specify whether you will use Citrix tools (such as Machine Creation Services™) or other tools to create VMs.
- For information specified on the **Storage** and **Network** pages, see Host storage, Storage management, and Storage selection.
- If you have Hybrid Rights License and have added public cloud host connections (for example, AWS), those connections are listed here. To view those public cloud host connections, refresh Web Studio several minutes after adding them.

Remote PC Access

For information about Remote PC Access deployments, see Remote PC Access.

If you use the Wake on LAN feature, complete the configuration steps on the Microsoft System Center Configuration Manager before creating the site. For details, see Configuration Manager and Remote PC Access Wake on LAN.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create and manage connections and resources

May 13, 2026

> **Important:**
>
> As of Citrix Virtual Apps and Desktops™ 7 2006, if your current deployment uses any of the following technologies, you can upgrade your deployment to the current release only after removing End of Life (EOL) items that use those technologies.
>
> - Personal vDisks (PvDs)
> - AppDisks™
> - Public cloud host types: Citrix CloudPlatform, Microsoft Azure Classic
>
> For details, see Remove PVD, AppDisks, and unsupported hosts.
>
> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

If you want to use public cloud host connections to your deployment, you need Hybrid Rights License to complete your fresh installation or upgrade to the current release.

When the installer detects one or more of the unsupported technologies or host connections without Hybrid Rights License, the upgrade pauses or stops, and an explanatory message appears. The installer logs contain details. For more information, see Upgrade a deployment.

Effect of Hybrid Rights License on host connection

There are three scenarios where the host connection to the public cloud hosts is affected based on Hybrid Rights License entitlement:

- To create a new host connection to the public cloud hosts, you must have Hybrid Rights License.
- If you have Hybrid Rights License but the license has expired, then the existing connections to public cloud hosts are marked as not entitled and enter into maintenance mode. When existing host connections are in maintenance mode, you cannot do the following:
  - Add or modify host connections
  - Create catalog and update image
  - Perform power actions

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When not entitled host connections change to entitled, existing hosting connections are re-enabled.

Introduction

You can optionally create your first connection to hosting resources when you create a Site. Later, you can change that connection and create other connections. Configuring a connection includes selecting the connection type from among the supported hypervisors and the storage and network that you select from the resources for that connection.

Read Only Administrators can view connection and resource details. You must be a Full Administrator to perform connection and resource management tasks. For details, see Delegated administration.

Where to find information about connection types

You can use the supported virtualization platforms to host and manage machines in your Citrix Virtual Apps or Citrix Virtual Desktops environment. The System requirements article lists the supported types.

For details, see the following information sources:

- **XenServer (formerly Citrix Hypervisor™):**
  - XenServer virtualization environments.
  - XenServer® documentation.
- **Nutanix Acropolis:**
  - Nutanix virtualization environments.
  - Nutanix documentation.
- **VMware:**
  - VMware virtualization environments.
  - VMware product documentation.
- **Microsoft Hyper-V:**
  - Microsoft System Center Virtual Machine Manager virtualization environments article.
  - Microsoft documentation.
- **Public Cloud host connections (AWS, Google Cloud, Microsoft Azure, Nutanix cloud and partner solutions, and VMware cloud and partner solutions):** For information related to public cloud hosts, see Set up resource type.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The information sources direct you to the Citrix DaaS™ documentation. If you are familiar with the public cloud hosts in the Citrix DaaS product, the on-premises version has several differences. In on-premises Virtual Apps and Desktops, the management interface is known as Web Studio. Updates are rolled out to the service approximately every four weeks. So, you might find that certain features available with the service are not available with the on-premises version.

Host storage

A storage product is supported when managed by a supported hypervisor. Citrix Support assists those storage product vendors in troubleshooting and resolving issues, and documents those issues in the knowledge center, as needed.

When provisioning machines, data is classified by type:

- Operating system (OS) data, which includes master images.
- Temporary data. This data includes all non-persistent data written to MCS-provisioned machines, Windows page files, user profile data, and any data that is synchronized with ShareFile. This data is discarded each time a machine restarts.

Providing separate storage for each data type can reduce load and improve performance on each storage device, making best use of the host's available resources. It also enables appropriate storage to be used for the different data types –persistence and resilience is more important for some data than others.

Storage can be shared (located centrally, separate from any host, used by all hosts) or local to a hypervisor. For example, central shared storage can be one or more Windows Server 2012 clustered storage volumes (with or without attached storage), or an appliance from a storage vendor. The central storage might also provide its own optimizations such as hypervisor storage control paths and direct access through partner plug-ins.

Storing temporary data locally avoids having to traverse the network to access shared storage. It also reduces load on the shared storage device. Shared storage can be more costly, so storing data locally can lower expenses. These benefits must be weighed against the availability of sufficient storage on the hypervisor servers.

When you create a connection, you choose one of two storage management methods: storage shared by hypervisors, or storage local to the hypervisor.

When using local storage on one or more XenServer hosts for temporary data storage, make sure that each storage location in the pool has a unique name. (To change a name in XenCenter®, right-click the storage and edit the name property.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Storage shared by hypervisors

The storage shared by hypervisors method stores data that needs longer-term persistence centrally, providing centralized backup and management. That storage holds the OS disks.

When you select this method, you can choose whether to use local storage (on servers in the same hypervisor pool) for temporary machine data. This method does not require persistence or as much resilience as the data in the shared storage, referred to as the *temporary data cache*. The local disk helps reduce traffic to the main OS storage. This disk is cleared after every machine restart. The disk is accessed through a write-through memory cache. If you use local storage for temporary data, the provisioned VDA is tied to a specific hypervisor host. If that host fails, the VM cannot start.

Exception: Microsoft System Center Virtual Machine Manager does not allow temporary data cache disks on local storage when using Clustered Storage Volumes (CSV).

Create a connection to store temporary data locally and then enable and configure nondefault values for each VM's cache disk size and memory size. The default values are tailored to the connection type, and are sufficient for most cases. For details, see Create machine catalogs.

The hypervisor can also provide optimization technologies through read caching of the disk images locally. For example, XenServer offers IntelliCache™, which reduces network traffic to the central storage.

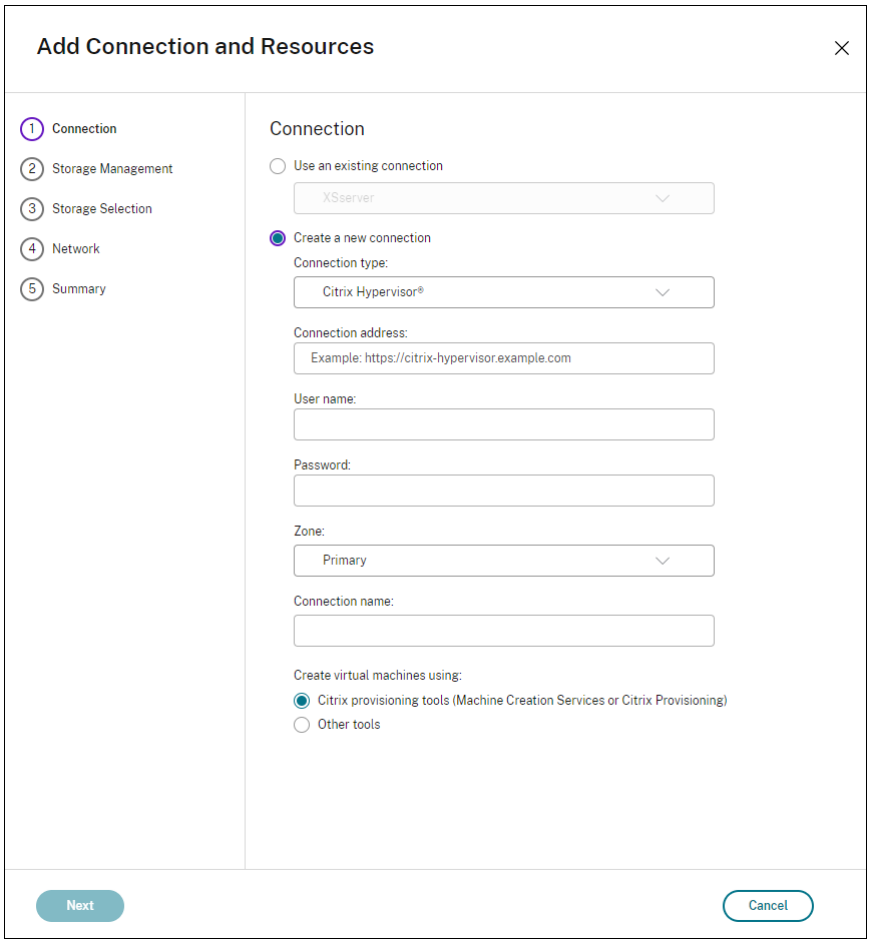
Storage local to the hypervisor

The storage local to the hypervisor method stores data locally on the hypervisor. With this method, master images and other OS data are transferred to the hypervisors in the Site. This process occurs for initial machine creation and future image updates. This process results in significant traffic on the management network. Image transfers are also time-consuming, and the images become available to each host at a different time.

Create a connection and resources

You can optionally create the first connection when you create the Site. The Site creation wizard contains the connection-related pages described in the following sections.

If you are creating a connection after you create the Site, start with step 1.



> **Important:**
>
> The host resources (storage and network) must be available before you create a connection.

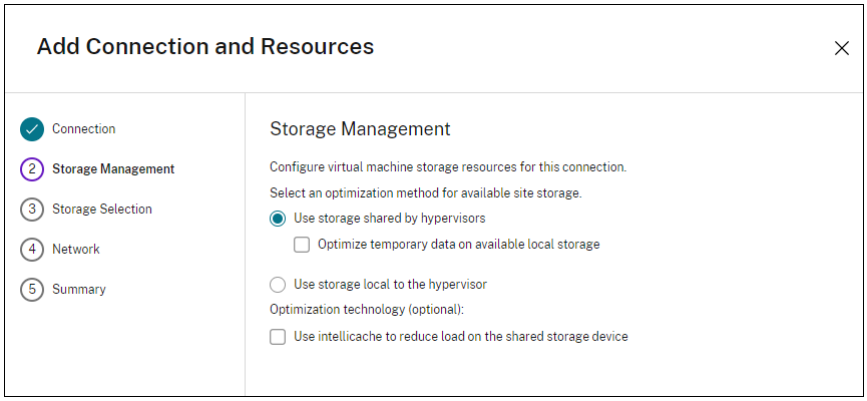
1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select **Add Connections and Resources** in the action bar.
4. The wizard guides you through the following pages (specific page content depends on the selected connection type). After completing each page, click **Next** until you reach the **Summary** page.

Connection

On the **Connection** page:



- To create a connection, select **Create a new Connection**. To create a connection based on the same host configuration as an existing connection, select **Use an existing Connection** and then choose the relevant connection.
- Select the hypervisor you are using in the **Connection type** field. Public cloud host connections are listed in the drop-down list only if you use Hybrid Rights License. Alternatively, you can use the PowerShell command `Get-HypHypervisorPlugin [-ZoneUid] $rluid [-IncludeUnavailable]` false/true to get the following:
  - List of all Citrix supported hypervisor plug-ins, including third party plug-ins.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Availability of hypervisor plugin. If the availability status is **false**, possible reason can be that the hypervisor plug-in is not installed correctly or you are not entitled with Hybrid Rights License.

- The connection address and credentials fields differ, depending on the selected connection type. Enter the requested information.
- Enter a connection name. This name appears in Web Studio.
- Choose the tool you use to create virtual machines: Web Studio tools (such as Machine Creation Services™ or Citrix Provisioning) or other tools.

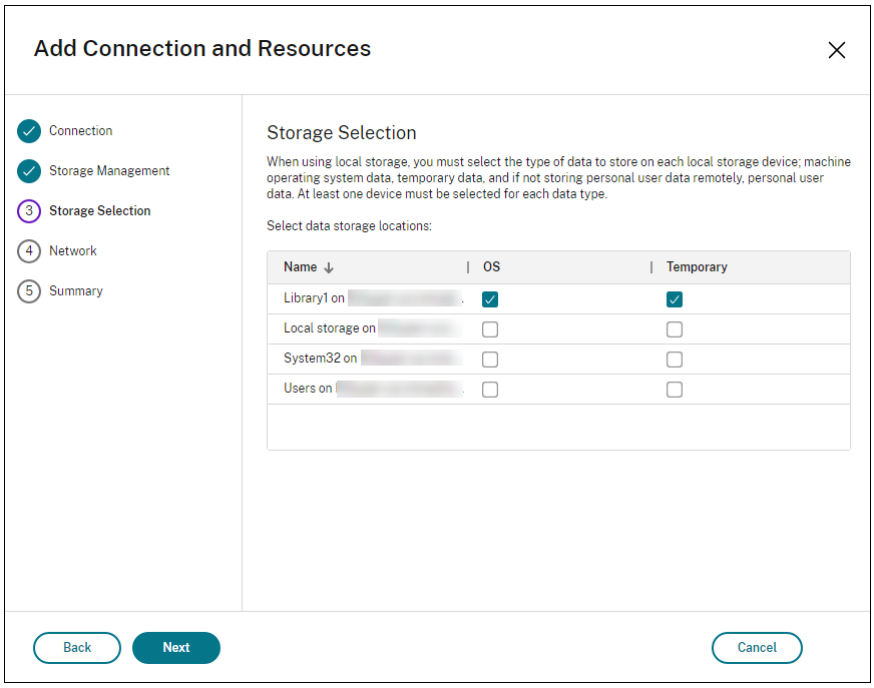
Storage management

For information about storage management types and methods, see Host storage.

If you are configuring a connection to a Hyper-V or VMware host, browse to and then select a cluster name. Other connection types do not request a cluster name.

Select a storage management method: storage shared by hypervisors or storage local to the hypervisor.

- If you choose storage shared by hypervisors, indicate if you want to keep temporary data on the available local storage. (You can specify nondefault temporary storage sizes in the machine catalogs that use this connection.) **Exception:** When using Clustered Storage Volumes (CSV), Microsoft System Center Virtual Machine Manager does not allow temporary data cache disks on local storage. Configuring that storage management setup in Web Studio fails.



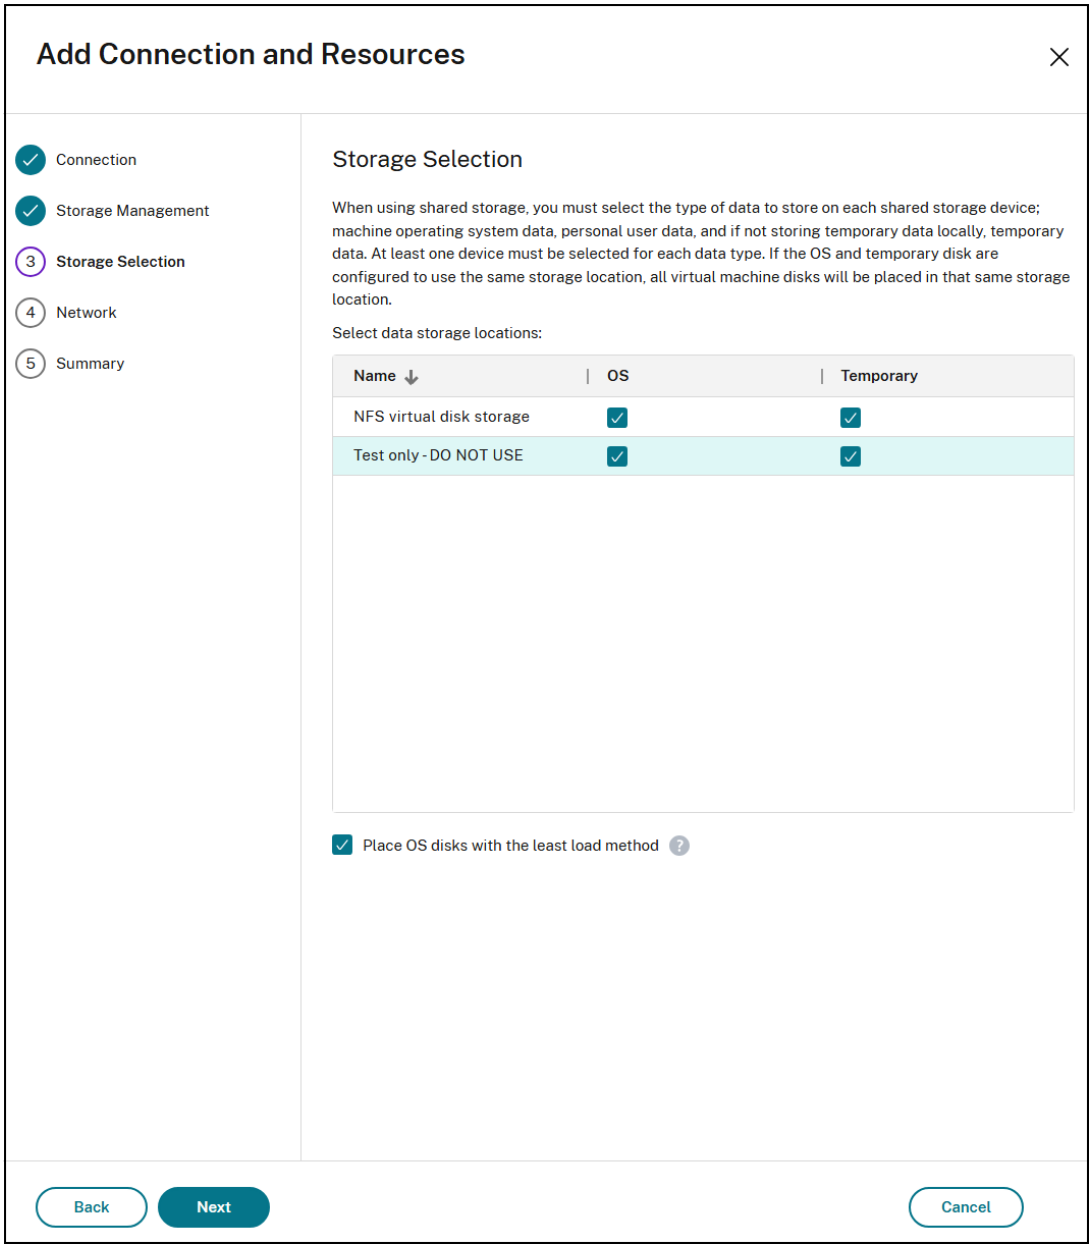
If you use shared storage in a XenServer pool, indicate if you want to use IntelliCache to reduce the load on the shared storage device. See Use IntelliCache for XenServer connections.

> **Note:**
>
> In XenServer, VMware, and SCVMM virtualization environments, you can have Write-back cache (WBC) disk on the same storage location as OS disk. For this, do not select **Optimize temporary**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **data on available local storage**.

Storage selection



For more information about storage selection, see Host storage.

Select at least one host storage device for each available data type. The storage management method you selected on the previous page affects which data types are available for selection on this page. Select at least one storage device for each supported data type before you can proceed to the next page in the wizard.

> **Note:**
>
> - In XenServer, VMware, and SCVMM virtualization environments, MCS places Write-back cache (WBC) disk on the same storage location as OS disk if you configure the available OS storage list the same as the available temporary storage list.
> - If you select at least two or more OS data storage locations, the **Optimize storage load balancing with least load method** option appears. This option allows you to choose the least loaded storage repository for disk allocation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The **Summary** page indicates whether the option is **Enabled** or **Disabled**, depending on your selection. The **Detail**s panel displays changes to the storage allocation method. You can adjust it using the **Edit storage** option on the **OS Storage** page. Alternatively, you can use PowerShell to achieve the same goal. See Flexible storage location option for VMs.

You can get more configuration options on **Storage Selection** page if you choose **Use storage shared by hypervisors** and select **Optimize temporary data on available local storage** on **Storage Management** page. For example, you can select which local storage devices (in the same hypervisor pool) to use for temporary data.

The number of currently selected storage devices is shown (in the preceding graphic, "1 storage device selected"). When you hover over that entry, the selected device names appear.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Click **Select** to change the storage devices to use.
2. In the **Select Storage** dialog box, select or clear the storage device checkboxes, and then click **OK**.

Network

On the **Network** page, enter a name for the resources. This name appears in Web Studio to identify the storage and network combination associated with the connection.

Select one or more networks that the VMs use.

Summary

On the **Summary** page, review your selections. When you're done, click **Finish**.

Remember: Storing temporary data locally allows you to configure nondefault values for temporary data storage when you create the Machine Catalog containing machines using this connection. See Create Machine Catalogs.

Edit connection settings

Do not use this procedure to rename a connection or to create a connection. Those connections are different operations. Change the address only if the current host machine has a new address. Entering an address to a different machine breaks the connection's Machine Catalogs.

You cannot change the **GPU** settings for a connection, because Machine Catalogs accessing this resource must use an appropriate GPU-specific master image. Create a connection.

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select the connection and then select **Edit Connection** in the action bar.
4. Follow the guidance for the settings available when you edit a connection.
5. When you are finished, click **Apply** to apply any changes you made and keep the window open, or click **Save** to apply changes and close the window.

Connection Properties page:

- To change the connection address and credentials, select **Edit settings...** and then enter the new information.
- To specify the high-availability servers for a XenServer connection, select **Edit servers...** and select the servers. Citrix recommends that you select all servers in the pool to allow communication with XenServer if the pool master fails.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If you are using HTTPS and want to configure high-availability servers, do not install a wildcard certificate for all servers in a pool. An individual certificate for each server is required.

Advanced page:

- For a Microsoft System Center Configuration Manager (ConfMgr) Wake on LAN connection type, which is used with Remote PC Access, enter **ConfMgr Wake Proxy**, magic packets, and packet transmission information.
- The throttling threshold settings enable you to specify a maximum number of power actions allowed on a connection. These settings can help when power management settings allow too many or too few machines to start at the same time. Each connection type has specific default values that are appropriate for most cases and must not be changed.
- The **Simultaneous actions (all types)** setting specifies two values: a maximum absolute number that can occur simultaneously on this connection, and a maximum percentage of all machines that use this connection. You must specify both absolute and percentage values. The actual limit applied is the lower of the values.

  For example, in a deployment with 34 machines, if **Simultaneous actions (all types)** is set to an absolute value of 10 and a percentage value of 10, the actual limit applied is 3 (that is, 10 percent of 34 rounded to the nearest whole number, which is less than the absolute value of 10 machines).
- The **Maximum new actions per minute** is an absolute number. There is no percentage value.
- Enter information in the **Connection options** field only under the guidance of a Citrix Support representative or explicit documentation instructions.

Shared Tenants page:

Add tenants and subscriptions that share the Azure Compute Gallery with the subscription of this connection. As a result, when creating or updating catalogs, you can select shared images from those tenants and subscriptions.

- Enter the **Application ID** and **Application secret** for the application associated with this connection. With this information, you can authenticate to Azure. We recommend that you change keys regularly to ensure security.
- Specify shared tenants and subscriptions. You can add up to eight shared tenants. For each tenant, you can add up to eight subscriptions.
- Click **Save** and **Apply** when you're done.

Enter information in the **Connection options** field only under the guidance of a Citrix Support representative.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Edit networks

You can change networks for a connection. Do the following:

1. Go to **Hosting**.
2. Select the target resources under the connection and then select **Edit Network** in the action bar.
3. Select one or more networks for the virtual machines to use.
4. Click **Save** to save your changes and to exit.

Turn maintenance mode on or off for a connection

Turning on maintenance mode for a connection prevents any new power action from affecting any machine stored on the connection. Users cannot connect to a machine when it is in maintenance mode. If users are already connected, maintenance mode takes effect when they log off.

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select the connection. To turn maintenance mode on, select **Turn On Maintenance Mode** in the action bar. To turn maintenance mode off, select **Turn Off Maintenance Mode**.

You can also turn maintenance mode on or off for individual machines. Also, you can turn maintenance mode on or off for machines in Machine Catalogs or Delivery Groups.

Delete a connection

Deleting a connection can result in the deletion of large numbers of machines and loss of data. Ensure that user data on affected machines is backed up or no longer required.

Before deleting a connection, ensure that:

- All users are logged off from the machines stored on the connection.
- No disconnected user sessions are running.
- Maintenance mode is turned on for pooled and dedicated machines.
- All machines in Machine Catalogs used by the connection are powered off.

A Machine Catalog becomes unusable when you delete a connection that is referenced by that catalog. If this connection is referenced by a catalog, you have the option to delete the catalog. Before you delete a catalog, make sure it is not used by other connections.

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select the connection and then select **Delete Connection** in the action bar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. If this connection has machines stored on it, you are asked whether the machines must be deleted. If they are to be deleted, specify what must be done with the associated Active Directory computer accounts.

Rename or test a connection

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select the connection and then select **Rename Connection** or **Test Connection** in the action bar.

Test TLS certificate trust

If a host connection outage occurs due to an untrusted certificate, you can re-trust the certificate in Web Studio. To re-tust:

1. Select **Hosting** in the left pane.
2. Right-click the connection for which you want to re-trust the certificate and select **Test TLS Certificate Trust**.
3. Input the password in the subsequent window and click **Save**.
    - If the certificate must be re-trusted, a warning dialog box pops up with an option to trust the certificate.
    - If the certificate is already trusted, a successful dialog box pops up that says the certificate is trusted.

View machine details on a connection

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select the connection and then select **View Machines** in the action bar.

The upper pane lists the machines accessed through the connection. Select a machine to view its details in the lower pane. Session details are also provided for open sessions.

Use the search feature to find machines quickly. Either select a saved search from the list at the top of the window, or create a search. You can either search by typing all or part of the machine name, or you can build an expression to use for an advanced search. To build an expression, click **Unfold**, and then select from the lists of properties and operators.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Manage machines on a connection

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select a connection and then select **View Machines** in the **Action** pane.
4. Select one of the following in the action bar. Some actions are not available, depending on the machine state and the connection host type.

Action	Description
Start	Starts the machine if it is powered off or suspended.
Suspend	Pauses the machine without shutting it down, and refreshes the list of machines.
Shut down	Requests the operating system to shut down.
Force shut down	Forcibly powers off the machine, and refreshes the list of machines.
Restart	Requests the operating system to shut down and then start the machine again. If the operating system cannot comply, the desktop remains in its current state.
Enable maintenance mode	Temporarily stops connections to a machine. Users cannot connect to a machine in this state. If users are connected, maintenance mode takes effect when they log off. (You can also turn maintenance mode on or off for all machines accessed through a connection, as described above.)
Remove from Delivery Group	Removing a machine from a Delivery Group does not delete it from the Machine Catalog that the Delivery Group uses. You can remove a machine only when no user is connected to it. Turn on maintenance mode to temporarily prevent users from connecting while you are removing the machine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Description
Delete	When you delete a machine, users no longer have access to it, and the machine is deleted from the Machine Catalog. Before deleting a machine, ensure that all user data is backed up or no longer required. You can delete a machine only when no user is connected to it. Turn on maintenance mode to temporarily stop users from connecting while you are deleting the machine.

For actions that involve machine shutdown, if the machine does not shut down within 10 minutes, it is powered off. If Windows attempts to install updates during shutdown, there is a risk that the machine is powered off before the updates are complete.

Edit storage

You can display the status of servers that are used to store operating system and temporary data for VMs that use a connection. You can also specify which servers to use for storage of each data type.

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select the connection and then select **Edit Storage** in the action bar.
4. In the left pane, select the data type: operating system, or temporary.
5. Select or clear the checkboxes for one or more storage devices for the selected data type.
6. Click **OK**.

Each storage device in the list includes its name and storage status. Valid storage status values are:

- **In use:** The storage is being used for creating machines.
- **Superseded:** The storage is being used only for existing machines. No new machines are added in this storage.
- **Not in use:** The storage is not being used for creating machines.

If you clear the checkbox for a device that is currently **In use**, its status changes to **Superseded**. Existing machines will continue to use that storage device (and can write data to it), so it is possible for that location to become full even after it stops being used for creating machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Delete, rename, or test resources

1. Sign in to Web Studio.
2. Select **Hosting** in the left pane.
3. Select the resource and then select the appropriate entry in the action bar: **Delete Resources**, **Rename Resources**, or **Test Resources**.

Flexible storage location option for VMs

The VMs in a machine catalog are allocated various storage services (SR). To balance the VM allocation in different storage, you have two options:

- **Enhanced current round robin allocation method**: Instead of always starting from the same fixed SR, MCS begins the allocation from the SR right after the last used SR.
- **Least load-based allocation method**: Places the VMs on the least current load, determined by comparing the total number of VMs on each SR within the same machine catalog. For example, if a machine catalog contains 100 VMs distributed as follows: 20 VMs on SR1, 30 VMs on SR2, and 50 VMs on SR3, the new VMs are allocated to SR1 first. This method ensures that the load across SR1, SR2, and SR3 is balanced.

This feature is:

- Applicable to all on-premises hypervisors (VMware, XenServer, and Hyper-V)
- Applicable to only OS disk storage.
- Not applicable to the existing VMs

To implement the load-based allocation option, add the custom property `Name="StorageBalanceType" Value="VMCountBasedLeastLoad` while creating or updating a host connection. If you don't use this custom property and value, then by default the enhanced round robin method is applied.

For example:

- While creating a host connection:

```
New-Item -CustomProperties "<CustomProperties xmlns=`"http://
    schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http
    ://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"StorageBalanceType`" Value=`"
    VMCountBasedLeastLoad`" /></CustomProperties>" -
    HypervisorConnectionName "Xen-Connection" -NetworkPath @("
    XDHyp:\Connections\Xen-Connection\Network 0.network") -Path @
    ("XDHyp:\HostingUnits\XS-Network") -PersonalvDiskStoragePath @
    () -RootPath "XDHyp:\Connections\Xen-Connection\" -StoragePath
     @("XDHyp:\Connections\Xen-Connection\NFS virtual disk storage
    .storage")
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- While updating a host connection:

```
Set-Item  -CustomProperties "<CustomProperties xmlns=`"http://
    schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http
    ://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"StorageBalanceType`" Value=`"
    VMCountBasedLeastLoad`" /></CustomProperties>" -Path @("XDHyp
    :\HostingUnits\XS-Network")
```

Detect Orphaned Azure resources

Orphaned resources are unused resources present in the system and they can lead to unnecessary expenses.

Apart from Cloud administrators, any newly created roles with **Use Host Connection to Detect Orphaned Resources in Hypervisor** permission under **Hosts** will be able to detect orphaned resources.

This feature allows you to detect the orphaned Azure resources in the hosts on your Citrix Virtual Apps and Desktops site.

Follow the steps on Web Studio:

1. From **Manage**, select **Hosting** in the left pane.
2. Select a connection, and then select **Detect Orphaned Resources** in the action bar. The **Detect Orphaned Resources** dialog box displays the orphaned resource report.
3. To view the orphaned resource report, select **View Report**.

Alternatively, you can detect orphaned Azure resources using PowerShell. For more information, see Retrieve a list of orphaned resources.

To understand the reasons behind the orphaned resources, and to learn how to proceed further, see Efficiently manage Orphaned Azure resources with Citrix.

Connection timers

You can use policy settings to configure three connection timers:

- **Maximum connection timer:** Determines the maximum duration of an uninterrupted connection between a user device and a virtual desktop. Use the **Session connection timer** and **Session connection timer interval** policy settings.
- **Connection idle timer:** Determines how long an uninterrupted user device connection to a virtual desktop is maintained if there is no input from the user. Use the **Session idle timer** and **Session idle timer interval** policy settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Disconnect timer:** Determines how long a disconnected, locked virtual desktop can remain locked before the session is logged off. Use the **Disconnected session timer** and **Disconnected session timer interval** policy settings.

When you update any of these settings, ensure they are consistent across your deployment.

See the policy settings documentation for more information.

Retrieve a list of orphaned resources

You can get a list of orphaned resources that are created by MCS but are no longer tracked by MCS. This is currently applicable to Azure environments. To get the list, you can use PowerShell commands. You can filter using connections.

By default, the **Full Administrator** and **Cloud Administrator** roles have this permission assigned. To allow other roles to perform this action, assign them the **Use Host Connection to Detect Orphaned Resources in Hypervisor** permission under **Hosts**. For more information, seeCreate and manage roles.

> **Note:**
>
> - The PowerShell command is rejected if any provisioning or image update is in progress.
> - A customer-managed resource tagged with all Citrix tags is detected as an orphaned resource. However, if you add another tag CitrixDetectIgnore with value as true to that resource, then the resource is ignored while detecting orphaned resources.

Limitations

- Only a built-in full admin or cloud admin role admin user can run the PowerShell command and get the list of orphaned resources.
- To avoid incorrect recognition of orphaned resources, do not power on VMs while you are filtering orphaned resources.
- Around 2,000 records are displayed as orphaned in case of possible heavy workload.

To display the list of orphaned resources:

1. Open a **PowerShell** window.
2. Run the following commands:

   a) Get the connection uid. The connection uid is the value of the HypervisorConnectionUid attribute.

```
Get-ChildItem xdhyp:\connections | where {
  $_.PluginId -like 'Azure*'  }
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
3   "
```

b) Get the list of orphaned resources.

```
1 get-provorphanedresource -HypervisorConnectionUid <connection
     uid>
```

To display the list of orphaned resources from an subscription id:

1. Open a **PowerShell** window.
2. Run the following commands:

   a) Find the connection uid using the subscription ID. The connection uid is the value of the HypervisorConnectionUid attribute.

```
1 Get-ChildItem xdhyp:\connections | where {
2   $_.CustomProperties -match '<subscriptionId>'  }
```

   b) Get the list of orphaned resources:

```
1 get-provorphanedresource -HypervisorConnectionUid <connection
     uid>
```

> **Note:**
>
> Check the resources carefully before deleting.

Use WinHttp (netsh) proxy server settings for hosting connection

This feature enhancement allows hosting connections to use the WinHttp (netsh) proxy server settings to be used with the hosting connection. This allows simpler proxy setup and also aligns with the proxy settings configuration used with other Citrix services.

This feature is applicable to the following virtualization environments:

- XenServer
- Google cloud
- Microsoft Azure
- Nutanix
- Red Hat OpenShift
- VMware

To use the WinHttp (netsh) proxy server configured on the Delivery Controllers for the hosting connection, you can include this custom property with the hosting connection.

```
1 <Property xsi:type="StringProperty" Name="
     UseWinHttpProxyForHypervisorTraffic" Value="True" />
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When this custom property is set to `True`, the API calls to the hypervisor are routed through the WinHttp proxy server if set on the machine through `netsh winhttp set proxy` command.
- When this custom property is set to `False`, the API calls ignores all the proxy servers (including the WinINet proxy and .net proxy) configured on the DDCs.
- When this custom property is not present in the hosting connection, the `WinINet` or the `.net` proxy server configuration for the machine is used. This is the existing behavior.

Use cases

- Example 1: No custom property is set on the hosting connection

  The hosting connection will read the WinINet proxy configuration followed by .net proxy configuration and use the proxy settings if configured. If none is configured, a direct connection is created. This is the existing behavior and will continue to work as is.

- Example 2: Custom property is set on the hosting connection with value = True

  The hosting connection will read the WinHttp proxy settings only and will use the proxy settings if present. If not present, no proxy settings will be used for the hosting connection.

- Example 3: Custom property is set on the hosting connection with value = False

  The hosting connection will not read any proxy configuration settings on the machine and will attempt to connect to the hypervisor without a proxy.

Prerequisite

Before setting the custom property while creating the host connection using PowerShell, make sure that you configure the WinHTTP proxy on all the Desktop Delivery Controllers.

Configuration steps

To create a new hosting connection to use the WinHttp proxy settings through CLI:

```
$CustomProperties = "<CustomProperties  xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-instance`">
<!-- Include any other hypervisor specific custom properties here -->
<Property xsi:type=`"StringProperty`" Name=`"UseWinHttpProxyForHypervisorTraffic`" Value=`"True`" />
</CustomProperties>"

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-Item -ConnectionType $ConnectionType -HypervisorAddress @('https://
    hypervisorhost1.example.com') -Path @('XDHyp:\Connections\
    $ConnectionName') -Password $Password -UserName $User -
    CustomProperties $CustomProperties
```

To set the custom property on an existing hosting connection:

1. Copy the existing custom properties from the hosting connection if any present.

```
dir XDHyp:\Connections
```

2. Copy the custom properties for your hosting connection and add the following, and save it to a variable.

```
$CustomProperties
<Property xsi:type=`"StringProperty`" Name=`"
    UseWinHttpProxyForHypervisorTraffic`" Value=`"True`" />
```

Example:

```
Example:
$CustomProperties = "<CustomProperties xmlns=`"http://schemas.
    citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.
    org/2001/XMLSchema-instance`">
<Property xsi:type=`"StringProperty`" Name=`"SubscriptionId`"
    Value=`"123`" />
<Property xsi:type=`"StringProperty`" Name=`"ManagementEndpoint`"
    Value=`"https://management.azure.com/`" />
<Property xsi:type=`"StringProperty`" Name=`"
    AuthenticationAuthority`" Value=`"https://login.microsoftonline
    .com/`" />
<Property xsi:type=`"StringProperty`" Name=`"StorageSuffix`" Value
    =`"core.windows.net`" />
<Property xsi:type=`"StringProperty`" Name=`"TenantId`" Value=`"
    123abc`" />
<Property xsi:type=`"StringProperty`" Name=`"SharedTenants`" Value
    =`"`[ {
  'Tenant':'123abc', 'Subscriptions':['345', '567']  }
  ]`"` /><Property xsi:type=`"StringProperty`" Name=`"
      UseWinHttpProxyForHypervisorTraffic`" Value=`"True`" />
</CustomProperties>"
```

If existing custom property was empty, set the custom property:

```
$CustomProperties = "<CustomProperties  xmlns=`"http://schemas.
    citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.
    org/2001/XMLSchema-instance`">
<Property xsi:type=`"StringProperty`" Name=`"
    UseWinHttpProxyForHypervisorTraffic`" Value=`"True`" />
</CustomProperties>"
```

3. Run `Set-Item` command to update the existing hosting connection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-Item -CustomProperties $CustomProperties -LiteralPath @("XDHyp
    :\Connections\$ConnectionName") -PassThru -UserName $User -
    SecurePassword $Password
```

Where to go next

For information on connection to specific host types, see:

- Connection to AWS
- Connection to XenServer
- Connection to Google cloud environments
- Connection to Microsoft Azure
- Connection to Microsoft System Center Virtual Machine Manager

If you're in the initial deployment process, create a machine catalog.

Connection to Amulet Hotkey CoreStation

September 3, 2026

Create and manage connections and resources describes the general wizards for creating a connection. The following information covers details specific to Amulet Hotkey CoreStation. You can currently create a connection to the Amulet Hotkey CoreStation using PowerShell commands.

> **Note:**
>
> Before creating a connection to Amulet Hotkey CoreStation, you need to first finish setting up your Amulet Hotkey CoreStation account.

Create a connection

You can create a connection to Amulet Hotkey CoreStation using:

- Studio
- PowerShell commands

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a connection using Studio

1. In the **Add Connection and Resources** page, select **Amulet Hotkey CoreStation** as the connection type.
2. Enter the connection address of your Amulet Hotkey CoreStation enclosure Manager. You can use an IP address, host name, or FQDN for the address.
3. Enter your enclosure administrative credentials and a friendly connection name.

   Connection setup stops when either of the situations occurs:

   - DaaS receives a public CA-signed certificate with errors: An error message appears. Follow the on-screen instructions to fix the issue. Otherwise, you can't proceed with connection creation.
   - DaaS receives a private CA-signed certificate: A warning page appears. Compare the received thumbprint with the server's for the certificate validity. If it's valid, select Trust certificate and click OK to proceed with connection creation. DaaS will then trust the certificate and store the thumbprint for future validation.

Create a connection using PowerShell commands

When you create a connection using PowerShell command, provide the following information:

- IP: Amulet Hotkey CoreStation IP Address
- Username: Amulet Hotkey CoreStation username
- Password: Amulet Hotkey CoreStation password

Example:

```
Get-ConfigZone
Get-HypHypervisorPlugin
New-Item `
    -ConnectionType "Custom" `
    -HypervisorAddress $IP `
    -Metadata @{
 "Citrix_Orchestration_Hypervisor_Secret_Allow_Edit"="false" }
  `
    -Path @("XDHyp:\Connections\$connectionName") `
    -Persist `
    -PluginId "AmuletHotkeyCoreStationFactory" `
    -Scope @() `
    -SecurePassword $Password `
    -UserName $UserName `
    -ZoneUid $ZoneUid `
    -SslThumbprint $SslThumbprint
New-BrokerHypervisorConnection -HypHypervisorConnectionUid
   $HypervisorConnectionID
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The `-SslThumbprint` parameter is required only for private CA-signed certificates.

Certificate and thumbprint validation

For creating a successful connection to Amulet Hotkey CoreStation, the certificate must not have errors and the thumbprint must have a correct value. Following are the use cases related to the certificate and thumbprint validation:

- Public CA-signed certificate has errors. The connection is not created successfully. See the error details and resolve the issue.
- Public CA-signed certificate without errors. The connection is created successfully, and the `SslThumbprints` value is `Null`.
- Private CA-signed certificate without errors and a `sslthumbprint` value. The connection is created successfully with a correct `SslThumbprints` value.
- Private CA-signed Certificate with an incorrect thumbprint value. The connection is not created successfully.
- Private CA-signed Certificate without errors. The connection is created successfully. The `SSlThumbprints` is `Null` when creating the connection. The `SSlThumbprints` value is updated to a value by the site service.

Manage connections

Fix certificate issues

Citrix Virtual Apps and Desktops blocks an Amulet Hotkey CoreStation connection when certificate issues arise, preventing you from delivering and managing workloads on associated Amulet Hotkey CoreStation nodes. You'll see an error icon next to the connection in the Host connections list.

See the following table for specific issues and solutions.

Issue	solution
A certificate error occurs to the public CA-signed certificate.	Click the connection and select the **Troubleshoot** tab. View the error details and resolve the issue.
The received certificate is private CA-signed or expired.	Edit the host connection to update the certificate thumbprint. Details steps: 1. Select the connection and click **Edit Connection**. 2. On the **Connection Properties** page, click **Edit settings**. 3. Enter the password to connect to the Amulet Hotkey CoreStation enclosure, and then click **Save**. 4. On the **Warning** page that appears,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Issue	solution

Update thumbprint value

After creating the connection, you can update the thumbprint value of a connection using the `Set-Item` PowerShell command. Follow the steps to update the thumbprint value.

1. Get the connection details of a connection. For example:

```
Get-Item -LiteralPath xdhyp:\connections\AmuletCon-101
```

2. Update the thumbprint value. For example:

```
Set-Item -LiteralPath xdhyp:\connections\AmuletCon-101 -Username
    Administrator -SslThumbprint
    xxxxxxxxxxx12AD048480631BB7AB10D69xxxxx
```

3. Check the updated thumbprint value. For example:

```
Get-Item -LiteralPath xdhyp:\connections\AmuletCon-101
```

> **Note:**
>
> The update fails if you provide an incorrect thumbprint value in the `Set-Item` command.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs.
- For Amulet Hotkey CoreStation information, see Create an Amulet Hotkey CoreStation machine catalog.

More information

- Create and manage connections and resources
- Amulet Hotkey CoreStation virtualization environments

Connection to AWS EC2

May 13, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to AWS cloud environments.

Prerequisites

Do the following before creating a connection to AWS EC2:

- Complete setting up your AWS as a resource location. See AWS virtualization environments.
- Define IAM permissions policy of IAM user or role for Citrix to manage AWS resources on your behalf.

Define IAM permissions

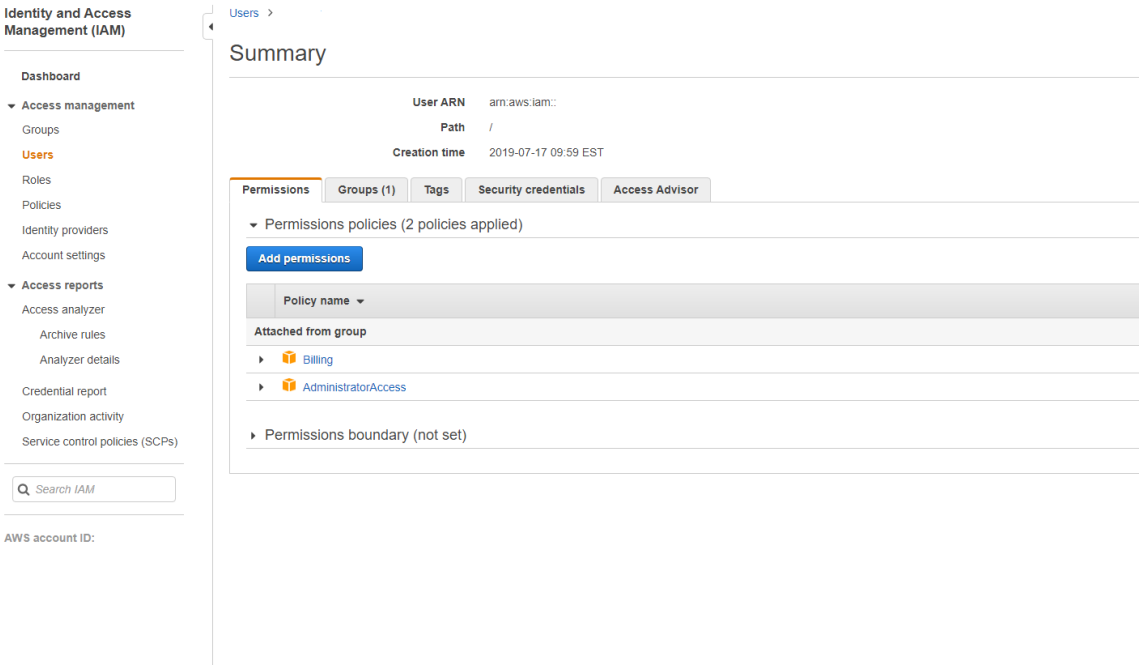
Before creating a host connection, an IAM permissions policy needs to be properly defined for an IAM user or role that gives Citrix proper permissions to provision and manage resources in your AWS account on your behalf. Use the information in this section to define IAM permissions for Citrix Virtual Apps and Desktops on AWS. Amazon's IAM service permits accounts having multiple users, which can be further organized into groups. These users can possess different permissions to control their ability to perform operations associated with the account. For more information about IAM permissions, see the IAM JSON policy reference.

To apply IAM permissions policy to a new group of users:

1. Log in to the AWS management console and select the **IAM service** from the drop-down list.
2. Select **Create a New Group of Users**.
3. Type a name for the new user group and select **Continue**.
4. On the **Permissions** page, choose **Custom Policy** then **Select**.
5. Type a name for the **Permissions policy**.
6. In the **Policy Document** section, enter the relevant permissions.

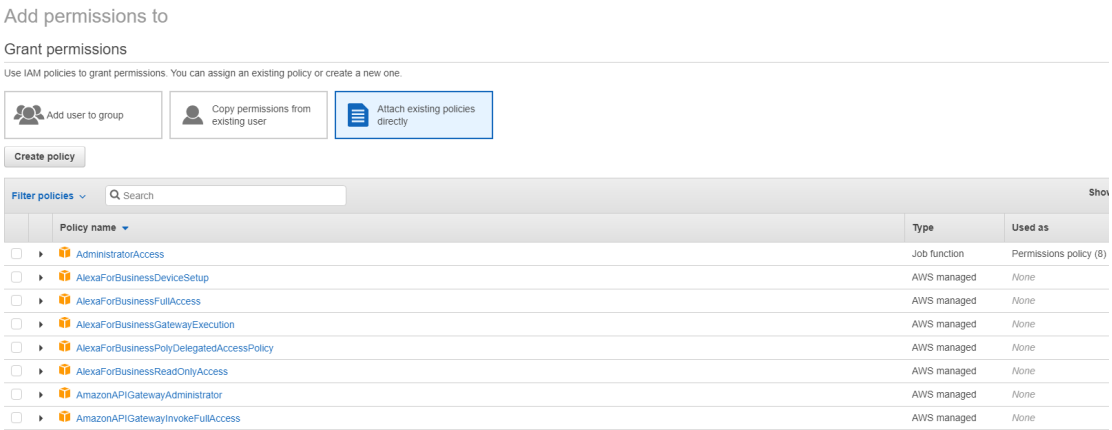
After entering the policy information, select **Continue** to complete the application of the IAM permissions policy to the group of users. Users in the group are granted permissions to do only those actions that are required for Citrix Virtual Apps and Desktops.

> **Important:**
>
> Use the policy text provided in the example provided in this article to list the actions that a Citrix Virtual Apps and Desktops uses to perform actions within an AWS account without restricting



© 1997–2026 Citrix Systems, Inc. All rights reserved.

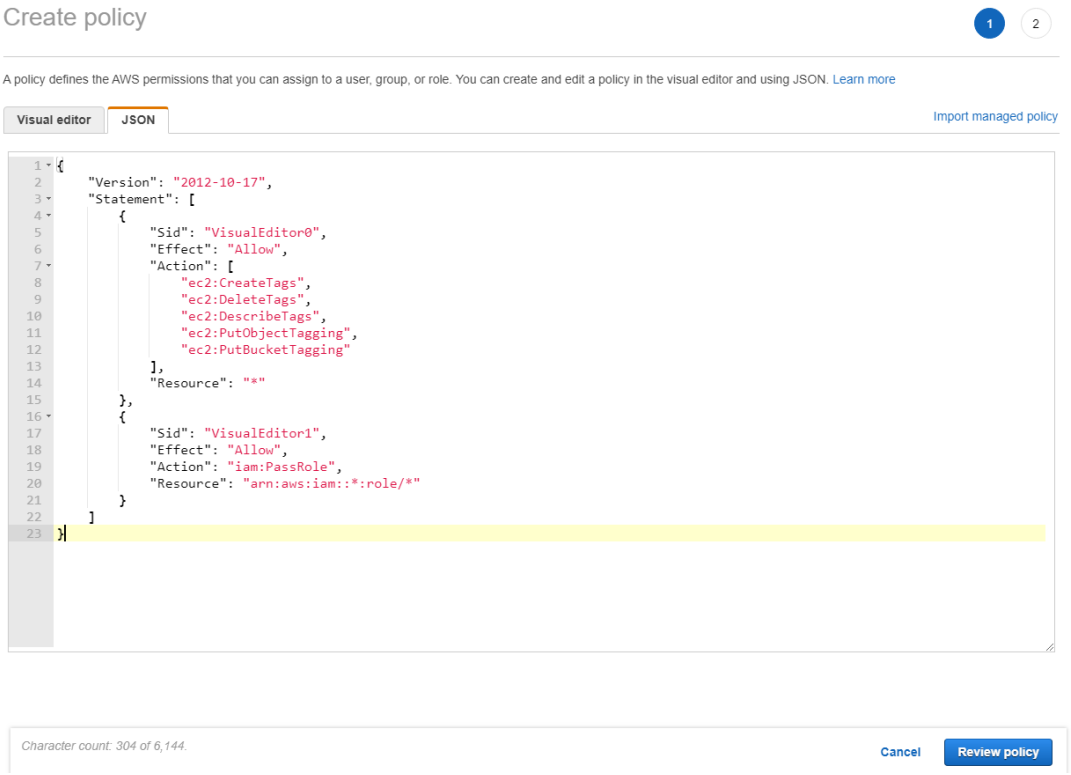
> those actions to specific resources. Citrix recommends that you use the example for testing purposes. For production environments, you might choose to add further restrictions on resources.



Add IAM permissions

Add the permissions in the **IAM** section of the AWS Management Console:

1. In the **Summary** panel, select the **Permissions** tab.
2. Select **Add permissions.**



3. In the **Add Permissions to** screen, grant permissions:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the JSON section, include Required AWS permissions for your environment.

Create a connection

You can create a connection to Amazon EC2 using:

- Web Studio
- PowerShell commands

> **Note:**
>
> Check your proxy server or firewall restrictions and ensure that the following address is contactable: `https://*.amazonaws.com`. Also, make sure that all the addresses mentioned in Citrix Gateway service connectivity are contactable.
>
> If these are not contactable, it might cause failure while creating or updating the host connection.

Create a connection using Web Studio

1. Navigate to **Hosting > Add Connection and Resources** page.
2. On the **Connection** page, follow these steps to configure the connection:
    a) Select **Create a new connection**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) In **Zone**, select the resource location you have set up for your AWS environment.

c) Select **Amazon EC2** as the connection type.

d) Select one of the methods to provision the resources:

- If you select **Use this AWS account to provision resources**, then select **Use IAM user access key** or **Use IAM role**. For the IAM user access key, provide your **API key** and **Secret key** for the IAM user that has proper IAM permissions policy for Citrix to manage resources in your AWS account. For the IAM role, make sure that you've assigned an IAM role to the Delivery Controller instance with proper IAM permissions policy for Citrix to manage resources in your AWS account. See Role-based authentication guide for more information.
- If you select **Use cross-account access to provision resources**, then provide the **ARN** of the IAM role in Account B that the Delivery Controllers in Account A must assume and perform provisioning operations in.

e) Enter a connection name and click **Next**.

3. On the **Virtual Machine Location** page, specify the location where the VMs must be provisioned. Select the cloud region, VPC, and availability zone for creating new VMs.
4. On the **Network** page:

   a) Enter a name for the resources that you selected previously in the availability zone or local zone.
   b) Select one or more subnets in the VPC that you configured in the previous menu.

5. Click through the remaining pages till the **Summary** page.
6. Click **Finish** to create the host connection to Amazon EC2.

Important considerations When you create a connection using Studio:

- Define proper IAM permissions for Citrix to manage your AWS resources.
- If you use an IAM user access key for Citrix to manage your AWS resources, you must provide the API key and secret key values. You can export the key file containing those values from AWS and then import them. You must also provide the region, availability zone, VPC name, subnet addresses, domain name, security group names, and credentials.
- If you use an IAM role for Citrix to manage your AWS resources, you must make sure to assign a role with proper IAM permissions to all of your Delivery Controller(s). Role-based authentication guide for more information.
- The credentials file for the root AWS account (retrieved from the AWS console) is not formatted the same as credentials files downloaded for standard AWS users. Therefore, Citrix Virtual Apps

© 1997–2026 Citrix Systems, Inc. All rights reserved.

and Desktops cannot use the file to populate the API key and secret key fields. Ensure that you are using AWS Identity Access Management (IAM) credentials files.

- The zone can be an availability zone or local zone.

Create a connection using PowerShell

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run the following commands. Following is an example:

```
$connectionName = "demo-hostingconnection"
$cloudRegion = "us-east-1"
$apiKey = "aaaaaaaaaaaaaaaaaaaa"
$apiSecret = " bbbbb "
$secureKey = ConvertTo-SecureString -String $apiSecret
$zoneUid = "00000000-0000-0000-0000-000000000000"
$connectionPath = "XDHyp:\Connections\" + $connectionName

$connection = New-Item -Path $connectionPath -ConnectionType "<
    name of the connection>" -HypervisorAddress " "@("https://ec2.
    cn-north-1.amazonaws.com.cn") -Persist -Scope @() -UserName
    $apiKey -SecurePassword $secureKey -ZoneUid $zoneUid

New-BrokerHypervisorConnection -HypHypervisorConnectionUid
    $connection.HypervisorConnectionUid

$hostingUnitName = "demo-hostingunit"
$availabilityzone = "us-east-1a"
$vpcName = "Default VPC"
$jobGroup = [Guid]::NewGuid()
$hostingUnitPath = "XDHyp:\HostingUnits\" + $HostingUnitName
$rootPath = $connectionPath + "\" + $vpcName + ".
    virtualprivatecloud\"
$availabilityZonePath = @($rootPath + $availabilityzone + ".
    availabilityzone")
$networkPaths = (Get-ChildItem $availabilityZonePath[0] | Where
    ObjectType -eq "Network") | Select-Object -ExpandProperty
    FullPath # will select all the networks in the availability
    zone

New-Item -Path $hostingUnitPath -AvailabilityZonePath
    $availabilityZonePath -HypervisorConnectionName $connectionName
     -JobGroup $jobGroup -PersonalvDiskStoragePath @() -RootPath
    $rootPath -NetworkPath $networkPaths
```

> **Note:**
>
> To create a connection using Role-Based Authentication, specify apiKey and apiSecret as

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
role_based_auth.
```

Limitation

If you change the name of an AWS Virtual Private Cloud (VPC) in the AWS console, then the existing hosting unit in Citrix Cloud™ breaks. When the hosting unit is broken, you cannot create catalogs or add machines to existing catalogs. To resolve the issue, change the name of the AWS VPC back to the original name.

Cross-account provisioning

There are use-cases where the Delivery Controller would like to be placed in a separate AWS account (shared services account or site components account) with IAM roles that have cross-account access (cross-account IAM role) and MCS-provisioned machine catalogs in separate secondary AWS account (workloads accounts), without the need for additional Delivery Controllers in the separate accounts. To support such scenarios, this feature uses VPC peering and cross-account access using IAM roles to make provisioning across different AWS accounts possible for enterprises managing multiple AWS accounts.

With VPC peering, you can have your Delivery Controller, and provisioned VMs in different regions or accounts be able to communicate among each other.

With cross-account access using IAM roles, you allow the primary account (Delivery Controller account) to assume an IAM role to access AWS resources in the secondary account (machine catalog VMs).

To allow Delivery Controller to access the resources of the secondary account, create a host connection after assuming the IAM role from the secondary account.

Prerequisites

Set up the following before creating a host connection for cross-account provisioning:

- Set up VPC peering and configure the security groups in both regions or accounts. See Set up VPC peering.
- Delegate cross-account access using IAM roles. See Delegate cross-account access using IAM role.

Set up VPC peering

Let's assume that VPC A is in the primary account (Account A) and it has the Delivery Controllers and Active Directory. VPC B is in the secondary account (Account B) where you want to provision

© 1997–2026 Citrix Systems, Inc. All rights reserved.

the VMs.

To set up a VPC peering connection between Account A and Account B, do the following:

1. Create a VPC peering connection. See:
    - Different account same region
    - Different account different region
2. Go to your VPC A and to the route table that is associated with the public subnet.
3. Click **Edit Routes > Add route**. Add VPC B's CIDR block in the **Destination** column and add the VPC peering you created in the **Target** column.
4. Repeat Steps 2 and 3, but with the private subnets for VPC A and VPC B (add VPC A's CIDR block). See Update your route tables for a VPC peering connection.
5. Go to the private security group associated with VPC A.
6. Select **Actions**, then **Edit inbound rules**.
7. Select **Add rule**. For type, select **All Traffic**, then in the **Source Column** add:
    - If it is a different region, add VPC B's CIDR Block.
    - If it is a different account but the same region, add the account ID and private security group ID of VPC B separated by a forward slash (Example, 123456789012/sg-1a2b3c4d)
8. Repeat Steps 5 through 7, but with the private security group for VPC B (but add VPC A's CIDR Block or VPC A's account ID and private security group ID of the same region, but different account). See Update your security groups to reference peer security groups.

> **Note:**
>
> There is no charge to create a VPC peering connection. However, while VPC peering within an Availability Zone is free, charges apply when data transfer over a VPC peering connection occurs across multiple Availability Zones and regions. See Pricing for a VPC peering connection.

Delegate cross-account access using IAM roles

After setting up VPC peering across accounts, you delegate cross-account access using IAM roles.

With cross-account access using IAM roles, you allow the primary account (Delivery Controller account) to assume an IAM role to access AWS resources in the secondary account (machine catalog VMs).

To access cross-account resources, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Remember:**
>
> Assumed, VPC A is in the primary account (Account A) and it has the Delivery Controller and Active Directory. VPC B is in the secondary account (Account B) where you want to provision the VMs

1. Set up VPC peering across accounts with the steps mentioned before.
2. Create an IAM role and policy in Account B with minimal Citrix IAM Permissions. See IAM tutorial: Delegate access across AWS accounts using IAM roles. Let's say the arn of this role is "arn:aws:iam::5678:role/citrix-role".
3. Add the Trust policy to the role "arn:aws:iam::5678:role/citrix-role"so that it's allowed to be accessed by Account A role "arn:aws:iam::1234:role/primary-account-citrix-role"as per - Cross account resource access in IAM.
4. Create the IAM role and policy in Account A with the name mentioned before "primary-account-citrix role", which can assume the IAM role and pass the IAM role from the Account B (arn:aws:iam::5678:role/citrix-role).
5. Assign the role "arn:aws:iam::1234:role/primary-account-citrix-role"to all the Delivery Controllers in Account A.

Delivery Controllers can now assume the role from Account B ("arn:aws:iam::5678:role/citrix-role").

Create host connection for cross-account provisioning

Create a host connection in the secondary account (Account B) where you want to provision the VMs. This allows Delivery Controllers of Account A to access the resources in Account B after assuming the role from Account B.

Use PowerShell commands to create the host connection and add the following two custom properties:

- `CrossAccountRoleArn`: If you don't provide `CrossAccountRoleArn` property, then the regular Host Connection is created. In this case, `MaximumAssumeRoleDurationInSeconds` is ignored even if it is provided.
- `MaximumAssumeRoleDurationInSeconds`: `DurationInSeconds` must be between 900 seconds to 3600 seconds. The default is 900 seconds. If you provide a value provided more than 3600, then `DurationInSeconds` is set to 3600.

Example:

```
$connectionName = "cross-account-conn"
$cloudRegion = "us-east-1"
$apiKey = "role_based_auth"
$secretKey = "role_based_auth"
$zoneUid = "xxxxxx"
$secureKey = (ConvertTo-SecureString -String $secretKey -AsPlainText -
    Force)
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$connectionPath = "XDHyp:\Connections\" + $connectionName
$customProperties = '<CustomProperties xmlns="http://schemas.citrix.com
    /2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="CrossAccountRoleArn" Value="
    arn:aws:iam::5678:role/citrix-role" /><Property xsi:type="
    StringProperty" Name="MaximumAssumeRoleDurationInSeconds" Value="
    3600" />
"</CustomProperties>'

$connection = New-Item -Path $connectionPath -ConnectionType "AWS" -
    HypervisorAddress "https://ec2.$($cloudRegion).amazonaws.com" -
    Persist -Scope @() -UserName $apiKey -SecurePassword $secureKey -
    ZoneUid $zoneUid -CustomProperties $customProperties

New-BrokerHypervisorConnection -HypHypervisorConnectionUid $connection.
    HypervisorConnectionUid
```

After the host connection is created, create hosting units using Studio or PowerShell. However, select VPC and Networks.

Edit a connection

You can edit an existing host connection to:

- Modify the option to provide IAM permissions for Citrix to manage resources
- Modify the maximum number of simultaneous actions (or concurrent machines) per hosting connection
- Modify the scope.
- Configure the maximum number of security groups allowed per elastic network interface (ENI) using PowerShell command

Edit options to provide IAM permissions

1. Right-click an existing Amazon EC2 connection.
2. On the **Connection Properties** page, click **Edit settings**.
3. Select one of the options to provide IAM permissions for Citrix to manage resources. Enter the required details and click **Save**.

Modify the maximum number of simultaneous actions

When you create host connections in Studio for Amazon EC2, the following default values display:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Option	Absolute	Percentage
Simultaneous actions (all types)	125	100
Maximum new actions per minute	150	n/a
Maximum concurrent provisioning operations	100	n/a

MCS supports 100 maximum concurrent provisioning operations by default.

Configure these values by accessing the Citrix Studio **Advanced** section on the **Edit Connection** screen.

Alternatively, you can use the Remote PowerShell SDK to set the maximum number of concurrent operations for optimal settings per your environment.

Use the PowerShell custom property, `MaximumConcurrentProvisioningOperations`, to specify the maximum number of concurrent AWS provisioning operations.

Before configuration:

- Ensure you have installed the PowerShell SDK for Cloud.
- Understand that the default value for `MaximumConcurrentProvisioningOperations` is 100.

Perform the following steps to customize the `MaximumConcurrentProvisioningOperations` value:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Enter `cd xdhyp:\Connections\`.
4. Enter `dir` to list the connections.
5. Change or Initialize the Custom Properties string:
    - If the Custom Properties string has a value, copy the Custom Properties into Notepad. Next, change the `MaximumConcurrentProvisioningOperations` property to your preferred value. You can enter a value ranging 1–1000.
      For example, `<Property xsi:type="IntProperty"Name="MaximumConcurrentProvis "Value="xyz"/>`.
    - If the Custom Properties string is empty or null, you must initialize the string by entering the proper syntax for both the schema and the `MaximumConcurrentProvisioningOperations` property.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. In the **PowerShell** window, paste the modified Custom Properties from Notepad and assign a variable to the modified Custom Properties. If you initialized the Custom Properties, add the following lines after the syntax:

   ```
   $customProperties = '<CustomProperties xmlns="http://schemas.
   citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
   org/2001/XMLSchema-instance"><Property xsi:type="IntProperty"
   Name="MaximumConcurrentProvisioningOperations" Value="100"/></
   CustomProperties>'.
   ```

   This string sets the `MaximumConcurrentProvisioningOperations` property to 100. In the Custom Properties string, you must set the `MaximumConcurrentProvisioningOperations` property to a value that aligns with your needs.

7. Enter `Get-XDAuthentication`, which prompts you for your credentials.
8. Run `$cred = Get-Credential`, which might prompt you for solely a Password (or a Name and Password). You might also be prompted for the application ID and associated secret. For connections using role-based authentication, **role_based_auth** is both the Name and Password. Otherwise, enter the AWS API ID and secret.
9. Run `set-item -PSPath 'XDHyp:\Connections<connection-name>'-CustomProperties $customProperties -username $cred.username -Securepassword $cred.password`. You must set the *<connection-name>* to the name of the connection.
10. Enter `dir` to verify the updated CustomProperties string.

Configure security groups per network interface

When editing a host connection, you can now configure the maximum number of security groups allowed per elastic network interface (ENI) using a PowerShell command. For information on AWS security groups quota values, see Security groups.

To configure security groups per network interface:

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run `cd xdhyp:\Connections\`.
4. Run `dir` to list the connections.
5. Run the following PowerShell command to configure security groups per network interface:

   ```
   1 Set-HypHypervisorConnectionMetadata -HypervisorConnectionName aws
       -Name "Citrix_MachineManagement_Options" -Value "
       AwsMaxENISecurityGroupLimit=<number>"
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If you do not set a value for `AwsMaxENISecurityGroupLimit`, then it takes the default value of 5.

Service endpoint URL

Standard zone service endpoint URL

When you use MCS, a new AWS connection is added with an API key and an API secret. With this information, along with the authenticated account, MCS queries AWS for the supported zones using the AWS DescribeRegions EC2 API call. The query is made using a generic EC2 Service Endpoint URL `https://ec2.amazonaws.com/`. Use MCS to select the zone for the connection from the list of supported zones. The preferred AWS service endpoint URL is automatically selected for the zone. However, after you create the service endpoint URL, you can no longer set or modify the URL.

Required AWS permissions

This section contains the complete list of AWS permissions. Use the complete set of permissions as given in the section for the functionality to work correctly.

> **Note:**
>
> The `iam:PassRole` permission is needed only for **role_based_auth**.

Creating a host connection

A new host connection is added using the information obtained from AWS.

                "ec2:DescribeNetworkInterfaces",
                "ec2:DescribeRegions",
                "ec2:DescribeSecurityGroups",
                "ec2:DescribeSnapshots",
                "ec2:DescribeSubnets",
                "ec2:DescribeTags",
                "ec2:DescribeSpotInstanceRequests",
                "ec2:CancelSpotInstanceRequests",
                "ec2:DescribeInstanceCreditSpecifications",
                "ec2:DescribeInstanceAttribute",

                "ec2:GetLaunchTemplateData",
                "ec2:DescribeVolumes",
                "ec2:DescribeVpcs",
                "ec2:DetachVolume",
                "ec2:DisassociateIamInstanceProfile",
                "ec2:RunInstances",
                "ec2:StartInstances",
                "ec2:StopInstances",
                "ec2:TerminateInstances"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }
,
        {

            "Action": [
                "ec2:CreateSecurityGroup",
                "ec2:DeleteSecurityGroup"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }
,
        {

            "Action": [
                "ebs:StartSnapshot",
                "ebs:GetSnapshotBlock",
                "ebs:PutSnapshotBlock",
                "ebs:CompleteSnapshot",
                "ebs:ListSnapshotBlocks",
                "ebs:ListChangedBlocks",
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                "ec2:CreateSnapshot"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }

    ]
}
```

Note:

- The EC2 section related to SecurityGroups is only needed if an Isolation Security Group must be created for the Preparation VM during catalog creation. Once this is done, these permissions are not required.

Importing VMs

A machine catalog is created by importing VMs.

```
{

    "Version": "2012-10-17",
    "Statement": [
        {

            "Action": [
                "ec2:DescribeInstances",
                "ec2:DescribeSecurityGroups",
                "ec2:DescribeAvailabilityZones",
                "ec2:DescribeSubnets",
                "ec2:DescribeVolumes",
                "ec2:DescribeSpotInstanceRequests"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }

    ]
}
```

Note:

The `ec2:DescribeSpotInstanceRequests` is needed only if there is a spot instance in the AWS region from where VMs are going to be imported.

Direct disk upload and download Direct disk upload eliminates the volume worker requirement for machine catalog provisioning, and instead uses public APIs provided by AWS. This functionality

© 1997–2026 Citrix Systems, Inc. All rights reserved.

reduces the cost associated with extra storage accounts and the complexity for maintaining volume worker operations.

> **Note:**
>
> The support for volume worker is removed. The direct disk upload and download permissions are required for machine catalog provisioning.

The following permissions must be added to the policy:

- `ebs:StartSnapshot`
- `ebs:GetSnapshotBlock`
- `ebs:PutSnapshotBlock`
- `ebs:CompleteSnapshot`
- `ebs:ListSnapshotBlocks`
- `ebs:ListChangedBlocks`
- `ec2:CreateSnapshot`
- `ec2:DeleteSnapshot`
- `ec2:DescribeLaunchTemplates`

> **Important:**
>
> - You can add a new VM to existing machine catalogs without any volume worker resources such as volume worker AMI, and volume worker VM.
> - If you delete an existing catalog that used any volume worker before, all artifacts that are volume worker related are deleted.

EBS encryption of created volumes

EBS can auto-encrypt newly created volumes if the AMI is encrypted, or EBS is configured to encrypt all new volumes. However, to implement the functionality, the following permissions must be included in the IAM policy.

```
{

     "Version": "2012-10-17",
     "Statement": [
        {

            "Effect": "Allow",
            "Action": [
                 "kms:CreateGrant",
                 "kms:Decrypt",
                 "kms:DescribeKey",
                 "kms:GenerateDataKeyWithoutPlainText",
                 "kms:GenerateDataKey",
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                    "kms:ReEncryptTo",
                    "kms:ReEncryptFrom"
                ],
                "Resource": "*"
            }

        ]
    }
```

> **Note:**
>
> The permissions can be limited to specific keys by including a Resource and Condition block at the discretion of the user. For example, **KMS Permissions with Condition**:

```
{

     "Version": "2012-10-17",
     "Statement": [
        {

            "Effect": "Allow",
            "Action": [
                "kms:CreateGrant",
                "kms:Decrypt",
                "kms:DescribeKey",
                "kms:GenerateDataKeyWithoutPlainText",
                "kms:GenerateDataKey",
                "kms:ReEncryptTo",
                "kms:ReEncryptFrom"
            ],
            "Resource": [
                "arn:aws:kms:us-east-2:123456789012:key/abcd1234-a123
                   -456d-a12b-a123b4cd56ef"
            ],
            "Condition": {

                "Bool": {

                    "kms:GrantIsForAWSResource": true
                }

             }

        }

    ]
}
```

The following key policy statement is the entire default key policy for KMS keys that is required to allow the account to use IAM policies to delegate permission for all actions (kms:*) on the KMS key.

```
{
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 2
 3 "Sid": "Enable IAM policies",
 4 "Effect": "Allow",
 5 "Principal": {
 6
 7 "AWS": "arn:aws:iam::111122223333:root"
 8  }
 9  ,
10 "Action": "kms:",
11 "Resource": ""
12  }
```

For more information, see the AWS Key Management Service official documentation.

IAM role-based authentication

The following permissions are added to support role-based authentication.

```
1  {

Minimal IAM permissions policy

The following JSON can be used for all currently supported features. You can create host connections, create, update, or delete VMs, and do power management using this policy.
The policy can be applied to the users as explained in Defining IAM permissions sections or you can also use role-based authentication using **role_based_auth** security key and secret key.

> **Important:**
>
> To use **role_based_auth**, first configure the desired IAM role on the Delivery Controller ec2 instance when setting up the Delivery Controllers. Using Web Studio, add the hosting connection and supply the role_based_auth for the authentication key and secret. A hosting connection with these settings then uses role-based authentication.

```

Note:

- The EC2 section related to SecurityGroups is only needed if an Isolation Security Group must be created for the Preparation VM during catalog creation. Once this is done, these permissions are not required.
- The KMS section is only required when using EBS volume encryption.
- The `iam:PassRole` permission section is needed only for **role_based_auth**.
- Specific resource-level permissions can be added instead of full access based on your requirements and environment. Refer to AWS documents Demystifying EC2 Resource-Level Permissions and Access management for AWS resources for more details.
- Use `ec2:CreateNetworkInterface` and `ec2:DeleteNetworkInterface` permissions only if you are using the volume worker method.

Validate permissions on host connection

You can validate permissions on a host connection to do tasks related to creating and managing MCS machine catalogs. This implementation helps you to find out the missing permissions required for different scenarios such as creating, deleting, and updating VMs, power management of VMs, and EBS encryption, ahead of time so that you can avoid being blocked at critical times.

You can validate the permissions on a host connection using the PowerShell command `Test-HypHypervisorConnection`. The result from the command is captured as a list where each item in the list is broken into three sections.

- Category: The action or task a user can do to create and manage an MCS machine catalog.
- Corrective Action: The step an admin must do to resolve a users'missing permissions discrepancy.
- Missing permission: The list of missing permissions for a category.

To validate the permissions, do the following:

1. Create a host connection to AWS.
2. Open a PowerShell window from the Delivery Controller™ host.
3. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
4. Run the following command to verify if you have the required permissions to look up your permissions.

```
1  Test-HypHypervisorConnection -LiteralPath "XDHyp:\Connections\
       AWSCon"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. After you add the missing permissions required to look up your permissions, run the following command to verify if you have permissions in the following categories:

    - Create Update delete
    - Power Management
    - EBS encryption

```
Test-HypHypervisorConnection -LiteralPath "XDHyp:\Connections\
    AWSCon" [-SecurePassword -Password] "password" -UserName "" -
    CustomProperties ""
```

For more information on adding permissions, see Add IAM permissions.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs.
- For AWS specific information, see Create an AWS EC2 catalog.

Connection to Amazon WorkSpaces Core Managed Instances

May 13, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Amazon WorkSpaces Core Managed Instances.

Prerequisites

Do the following before creating a connection to Amazon WorkSpaces Core Managed Instances:

- Complete setting up your AWS as a resource location. See AWS virtualization environments.
- Define IAM permissions policy of IAM user or role for Citrix® to manage AWS resources on your behalf.
- Create a service-linked role.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Define IAM permissions

Before creating a host connection, an IAM permissions policy needs to be properly defined for an IAM user or role that gives Citrix proper permissions to provision and manage resources in your AWS account on your behalf. Use the information in this section to define IAM permissions for Citrix Virtual Apps and Desktops on Amazon WorkSpaces Core Managed Instances. Amazon's IAM service permits accounts having multiple users, which can be further organized into groups. These users can possess different permissions to control their ability to perform operations associated with the account. For more information about IAM permissions, see the IAM JSON policy reference.

> **Note:**
>
> Since Citrix provisions and manages resources and automation in your AWS account on your behalf, configuring IAM permissions policies based on specific tags or resource naming conventions is not supported.

To apply IAM permissions policy to a new group of users:

1. Log in to the AWS management console and select the **IAM service** from the drop-down list.
2. Select **Create a New Group of Users**.
3. Type a name for the new user group and select **Continue**.
4. On the **Permissions** page, choose **Custom Policy**.
5. Type a name for the **Permissions policy**.
6. In the **Policy Document** section, enter the relevant permissions.

After entering the policy information, select **Continue** to complete the application of the IAM permissions policy to the group of users. Users in the group are granted permissions to do only those actions that are required for Citrix Virtual Apps and Desktops.

> **Important:**
>
> Use the policy text provided in the example provided in this article to list the actions that a Citrix Virtual Apps and Desktops uses to perform actions within an AWS account without restricting those actions to specific resources. Citrix recommends that you use the example for testing purposes. For production environments, you might choose to add further restrictions on resources.

Add IAM permissions

Add the permissions in the **IAM** section of the AWS Management Console:

1. In the **Summary** panel, select the **Permissions** tab.
2. Select **Add permissions.**
3. In the **Add Permissions to** screen, grant permissions.
4. In the JSON section, include Required AWS permissions for your environment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a service-linked role

For each of your AWS accounts from which Citrix will call Core V2 APIs, create a service-linked role (SLR).

The steps to create the role:

- Open a Command Line Interface (CLI) in the AWS management console.
- Run the following command in the CLI:

```
aws iam create-service-linked-role --aws-service-name workspaces-instances.amazonaws.com
```

You can also configure the service-linked role using the using the Amazon WorkSpaces Core management console. See Creating a service-linked role (console).

Create a connection

You can create a connection to Amazon WorkSpaces Core Managed Instances using:

- Web Studio
- PowerShell commands

> **Note:**
>
> Check your proxy server or firewall restrictions and ensure that the following addresses are contactable: `https://*.amazonaws.com` and `https://*.api.aws`. Also, make sure that all the addresses mentioned in Citrix Gateway service connectivity are contactable.
>
> If these are not contactable, it might cause failure while creating or updating the host connection.

Create a connection using Web Studio

1. Navigate to **Hosting > Add Connection and Resources** page.
2. On the **Connection** page, follow these steps to configure the connection:
    a) Select **Create a new connection**.
    b) In **Zone**, select the resource location you have set up for your AWS environment.
    c) Select **Amazon WorkSpaces Core** as the connection type.
    d) Select **Use IAM user access key** or **Use IAM role**.

    For the IAM user access key, provide your **API key** and **Secret key** for the IAM user that has proper IAM permissions policy for Citrix to manage resources in your AWS account.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For the IAM role, make sure that you've assigned an IAM role to the Delivery Controller instance with proper IAM permissions policy for Citrix to manage resources in your AWS account. See Role-based authentication guide for more information.

e) Enter a connection name and click **Next**.

3. On the **Virtual Machine Location** page, specify the location where the VMs must be provisioned. Select the cloud region, VPC, and availability zone for creating new VMs.
4. On the **Network** page:

   a) Enter a name for the resources that you selected previously in the availability zone or local zone.
   b) Select one or more subnets in the VPC that you configured in the previous menu.

5. Click through the remaining pages till the **Summary** page.
6. Click **Finish** to create the host connection to Amazon WorkSpaces Core Managed Instances.

Important considerations When you create a connection using Web Studio:

- Define proper IAM permissions for Citrix to manage your AWS resources.
- If you use an IAM user access key for Citrix to manage your AWS resources, you must provide the API key and secret key values. You can export the key file containing those values from AWS and then import them. You must also provide the region, availability zone, VPC name, subnet addresses, domain name, security group names, and credentials.
- If you use an IAM role for Citrix to manage your AWS resources, you must make sure to assign a role with proper IAM permissions to all of your Delivery Controller(s). Role-based authentication guide for more information.
- The credentials file for the root AWS account (retrieved from the AWS console) is not formatted the same as credentials files downloaded for standard AWS users. Therefore, Citrix Virtual Apps and Desktops cannot use the file to populate the API key and secret key fields. Ensure that you are using AWS Identity Access Management (IAM) credentials files.
- The zone can be an availability zone or local zone.

Create a connection using PowerShell

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run the following commands. Following is an example:

```
$connectionName = "demo-hostingconnection"
$cloudRegion = "us-east-1"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$apiKey = "aaaaaaaaaaaaaaaaaaaa"
$apiSecret = " bbbbb "
$secureKey = ConvertTo-SecureString -String $apiSecret
$zoneUid = "00000000-0000-0000-0000-000000000000"
$connectionPath = "XDHyp:\Connections\" + $connectionName

$connection = New-Item -Path $connectionPath -ConnectionType "
    AmazonWorkSpacesCoreMachineManagerFactory" -HypervisorAddress "
     "https://workspaces-instances.$($cloudRegion).api.aws"" -
    Persist -Scope @() -UserName $apiKey -SecurePassword $secureKey
     -ZoneUid $zoneUid

New-BrokerHypervisorConnection -HypHypervisorConnectionUid
    $connection.HypervisorConnectionUid

$hostingUnitName = "demo-hostingunit"
$availabilityzone = "us-east-1a"
$vpcName = "Default VPC"
$jobGroup = [Guid]::NewGuid()
$hostingUnitPath = "XDHyp:\HostingUnits\" + $HostingUnitName
$rootPath = $connectionPath + "\" + $vpcName + ".
    virtualprivatecloud\"
$availabilityZonePath = @($rootPath + $availabilityzone + ".
    availabilityzone")
$networkPaths = (Get-ChildItem $availabilityZonePath[0] | Where
    ObjectType -eq "Network") | Select-Object -ExpandProperty
    FullPath # will select all the networks in the availability
    zone

New-Item -Path $hostingUnitPath -AvailabilityZonePath
    $availabilityZonePath -HypervisorConnectionName $connectionName
     -JobGroup $jobGroup -PersonalvDiskStoragePath @() -RootPath
    $rootPath -NetworkPath $networkPaths
```

> **Note:**
>
> To create a connection using Role-Based Authentication, specify apiKey and apiSecret as `role_based_auth`.

Limitation

If you change the name of an AWS Virtual Private Cloud (VPC) in the AWS console, then the existing hosting unit in Citrix Cloud™ breaks. When the hosting unit is broken, you cannot create catalogs or add machines to existing catalogs. To resolve the issue, change the name of the AWS VPC back to the original name.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cross-account provisioning

There are use-cases where the Cloud Connectors would like to be placed in a separate AWS account (shared services account or site components account) with IAM roles that have cross-account access (cross-account IAM role) and MCS-provisioned machine catalogs in separate secondary AWS account (workloads accounts), without the need for additional Cloud Connectors in the separate accounts. To support such scenarios, this feature uses VPC peering and cross-account access using IAM roles to make provisioning across different AWS accounts possible for enterprises managing multiple AWS accounts.

With VPC peering, you can have your Cloud Connector, and provisioned VMs in different regions or accounts be able to communicate among each other.

With cross-account access using IAM roles, you allow the primary account (Cloud Connector account) to assume an IAM role to access AWS resources in the secondary account (machine catalog VMs).

To allow Cloud Connector to access the resources of the secondary account, create a host connection after assuming the IAM role from the secondary account.

Prerequisites

Set up the following before creating a host connection for cross-account provisioning:

- Set up VPC peering and configure the security groups in both regions or accounts. See Set up VPC peering.
- Delegate cross-account access using IAM roles. See Delegate cross-account access using IAM role.

Set up VPC peering

Let's assume that VPC A is in the primary account (Account A) and it has the Cloud Connectors and Active Directory. VPC B is in the secondary account (Account B) where you want to provision the VMs.

To set up a VPC peering connection between Account A and Account B, do the following:

1. Create a VPC peering connection. See:
    - Different account same region
    - Different account different region
2. Go to your VPC A and to the route table that is associated with the public subnet.
3. Click **Edit Routes > Add route**. Add VPC B's CIDR block in the **Destination** column and add the VPC peering you created in the **Target** column.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Repeat Steps 2 and 3, but with the private subnets for VPC A and VPC B (add VPC A's CIDR block). See Update your route tables for a VPC peering connection.
5. Go to the private security group associated with VPC A.
6. Select **Actions**, then **Edit inbound rules**.
7. Select **Add rule**. For type, select **All Traffic**, then in the **Source Column** add:
    - If it is a different region, add VPC B's CIDR Block.
    - If it is a different account but the same region, add the account ID and private security group ID of VPC B separated by a forward slash (Example, 123456789012/sg-1a2b3c4d)
8. Repeat Steps 5 through 7, but with the private security group for VPC B (but add VPC A's CIDR Block or VPC A's account ID and private security group ID of the same region, but different account). See Update your security groups to reference peer security groups.

> **Note:**
>
> There is no charge to create a VPC peering connection. However, while VPC peering within an availability zone is free, charges apply when data transfer over a VPC peering connection occurs across multiple availability zones and regions. See Pricing for a VPC peering connection.

Delegate cross-account access using IAM roles

After setting up VPC peering across accounts, you delegate cross-account access using IAM roles.

With cross-account access using IAM roles, you allow the primary account (Cloud Connector account) to assume an IAM role to access AWS resources in the secondary account (machine catalog VMs).

To access cross-account resources, do the following:

> **Remember:**
>
> Assumed, VPC A is in the primary account (Account A) and it has the Cloud Connector and Active Directory. VPC B is in the secondary account (Account B) where you want to provision the VMs

1. Set up VPC peering across accounts with the steps mentioned before.
2. Create an IAM role and policy in Account B with minimal Citrix IAM Permissions. See IAM tutorial: Delegate access across AWS accounts using IAM roles. Let's say the arn of this role is "arn:aws:iam::5678:role/citrix-role".
3. Add the Trust policy to the role "arn:aws:iam::5678:role/citrix-role"so that it's allowed to be accessed by Account A role "arn:aws:iam::1234:role/primary-account-citrix-role"as per - Cross account resource access in IAM.
4. Create the IAM role and policy in Account A with the name mentioned before "primary-account-citrix role", which can assume the IAM role and pass the IAM role from the Account B (arn:aws:iam::5678:role/citrix-role).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Assign the role “arn:aws:iam::1234:role/primary-account-citrix-role”to all the Cloud Connectors in Account A.

Cloud Connectors can now assume the role from Account B (“arn:aws:iam::5678:role/citrix-role”).

Create host connection for cross-account provisioning

Create a host connection in the secondary account (Account B) where you want to provision the VMs. This allows Cloud Connectors of Account A to access the resources in Account B after assuming the role from Account B.

Use PowerShell commands to create the host connection and add the following two custom properties:

- `CrossAccountRoleArn`: If you don’t provide `CrossAccountRoleArn` property, then the regular host connection is created. In this case, `MaximumAssumeRoleDurationInSeconds` is ignored even if it is provided.
- `MaximumAssumeRoleDurationInSeconds`: `DurationInSeconds` must be between 900 seconds to 3600 seconds. The default is 900 seconds. If you provide a value provided more than 3600, then `DurationInSeconds` is set to 3600.

Example:

```
$connectionName = "cross-account-conn"
$cloudRegion = "us-east-1"
$apiKey = "role_based_auth"
$secretKey = "role_based_auth"
$zoneUid = "xxxxxx"
$secureKey = (ConvertTo-SecureString -String $secretKey -AsPlainText -Force)
$connectionPath = "XDHyp:\Connections\" + $connectionName
$customProperties = '<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="CrossAccountRoleArn" Value="arn:aws:iam::5678:role/citrix-role" /><Property xsi:type="StringProperty" Name="MaximumAssumeRoleDurationInSeconds" Value="3600" />
"</CustomProperties>'

$connection = New-Item -Path $connectionPath -ConnectionType "AmazonWorkSpacesCoreMachineManagerFactory" -HypervisorAddress "https://workspaces-instances.$($cloudRegion).api.aws" -Persist -Scope @() -UserName $apiKey -SecurePassword $secureKey -ZoneUid $zoneUid -CustomProperties $customProperties

New-BrokerHypervisorConnection -HypHypervisorConnectionUid $connection.HypervisorConnectionUid
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After the host connection is created, create hosting units using Web Studio or PowerShell. However, select VPC and Networks.

Edit a connection

You can edit an existing host connection to:

- Modify the option to provide IAM permissions for Citrix to manage resources
- Modify the maximum number of simultaneous actions (or concurrent machines) per hosting connection
- Modify the scope.
- Configure the maximum number of security groups allowed per elastic network interface (ENI) using PowerShell command

Edit options to provide IAM permissions

1. Right-click an existing Amazon WorkSpaces Core connection.
2. On the **Connection Properties** page, click **Edit settings**.
3. Select one of the options to provide IAM permissions for Citrix to manage resources. Enter the required details and click **Save**.

Modify the maximum number of simultaneous actions

When you create host connections in Studio for Amazon WorkSpaces Core Managed Instances, the following default values display:

Option	Absolute	Percentage
Simultaneous actions (all types)	125	100
Maximum new actions per minute	150	n/a
Maximum concurrent provisioning operations	150	n/a

MCS supports 150 maximum concurrent provisioning operations by default.

You can configure these values by accessing the Citrix Studio **Advanced** section on the **Edit Connection** screen:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Alternatively, you can use the Remote PowerShell SDK to set the maximum number of concurrent operations for optimal settings per your environment.

Use the PowerShell custom property, `MaximumConcurrentProvisioningOperations`, to specify the maximum number of concurrent AWS provisioning operations.

Before configuration:

- Ensure that you have installed the PowerShell SDK for Cloud.
- Understand that the default value for `MaximumConcurrentProvisioningOperations` is 150.

Perform the following steps to customize the `MaximumConcurrentProvisioningOperations` value:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Enter `cd xdhyp:\Connections\`.
4. Enter `dir` to list the connections.
5. Change or Initialize the Custom Properties string:
   - If the Custom Properties string has a value, copy the Custom Properties into Notepad. Next, change the `MaximumConcurrentProvisioningOperations` property to your preferred value. You can enter a value ranging 1–1000.
     For example, `<Property xsi:type="IntProperty"Name="MaximumConcurrentProvis "Value="xyz"/>`.
   - If the Custom Properties string is empty or null, you must initialize the string by entering the proper syntax for both the schema and the `MaximumConcurrentProvisioningOperations` property.
6. In the **PowerShell** window, paste the modified Custom Properties from Notepad and assign a variable to the modified Custom Properties. If you initialized the Custom Properties, add the following lines after the syntax:

```
$customProperties = '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
    org/2001/XMLSchema-instance"><Property xsi:type="IntProperty"
    Name="MaximumConcurrentProvisioningOperations" Value="100"/></
    CustomProperties>'
```

This string sets the `MaximumConcurrentProvisioningOperations` property to 100. In the Custom Properties string, you must set the `MaximumConcurrentProvisioningOperations` property to a value that aligns with your needs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Enter `Get-XDAuthentication`, which prompts you for your credentials.
8. Run `$cred = Get-Credential`, which might prompt you for solely a Password (or a Name and Password). You might also be prompted for the application ID and associated secret. For connections using role-based authentication, **role_based_auth** is both the Name and Password. Otherwise, enter the AWS API ID and secret.
9. Run `set-item -PSPath 'XDHyp:\Connections<connection-name>'-CustomProperties $customProperties -username $cred.username -Securepassword $cred.password`. You must set the <*connection-name*> to the name of the connection.
10. Enter `dir` to verify the updated CustomProperties string.

Configure security groups per network interface

When editing a host connection, you can now configure the maximum number of security groups allowed per elastic network interface (ENI) using a PowerShell command. For information on AWS security groups quota values, see Security groups.

To configure security groups per network interface:

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run `cd xdhyp:\Connections\`.
4. Run `dir` to list the connections.
5. Run the following PowerShell command to configure security groups per network interface:

```
Set-HypHypervisorConnectionMetadata -HypervisorConnectionName aws
    -Name "Citrix_MachineManagement_Options" -Value "
    AwsMaxENISecurityGroupLimit=<number>"
```

> **Note:**
>
> If you do not set a value for `AwsMaxENISecurityGroupLimit`, then it takes the default value of 5.

Service endpoint URL

Standard zone service endpoint URL

When you use MCS, a new Amazon WorkSpaces Core Managed Instances connection is added with an API key and an API secret. With this information, along with the authenticated account, MCS queries AWS for the supported regions and zones using AWS EC2 and Amazon WokrSpaces Core Managed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Instances API calls. The query is made using a Workspace Instances Service Endpoint URL https://workspaces-instances.us-east-1.api.aws/ and EC2 Service Endpoint https:/ec2.us-east-1.api.aws/.

> **Note:**
>
> Make sure that https://workspaces-instances.us-east-1.api.aws/ is contactable.

Required AWS permissions

This section contains the complete list of AWS permissions. Use the complete set of permissions as given in the section for the functionality to work correctly.

> **Note:**
>
> The `iam:PassRole` permission is needed only for using IAM roles for Citrix to manage resources.

Creating a host connection

A new host connection is added using the information obtained from AWS.

```
{

    "Version": "2012-10-17",
    "Statement": [
        {

            "Action": [
                "ec2:DescribeAvailabilityZones",
                "ec2:DescribeSubnets",
                "ec2:DescribeVpcs",
                "ec2:DescribeRegions",
                "workspaces-instances:*"
            ],
            "Effect": "Allow",
            "Resource": "*"
         }

    ]
 }
```

Power management of VMs

VMs are powered on or off.

                "ec2:DescribeVolumes",
                "ec2:DescribeVpcs",
                "ec2:DetachVolume",
                "ec2:DisassociateIamInstanceProfile",
                "ec2:RunInstances",
                "ec2:StartInstances",
                "ec2:StopInstances",
                "ec2:TerminateInstances"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }
,
        {

            "Action": [
                "ec2:CreateSecurityGroup",
                "ec2:DeleteSecurityGroup"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }
,
        {

            "Action": [
                "ebs:StartSnapshot",
                "ebs:GetSnapshotBlock",
                "ebs:PutSnapshotBlock",
                "ebs:CompleteSnapshot",
                "ebs:ListSnapshotBlocks",
                "ebs:ListChangedBlocks",
                "ec2:CreateSnapshot"
            ],
            "Effect": "Allow",
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
            "Resource": "*"
        }
,
       {

            "Action": [
                "workspaces-instances:*"
            ],
            "Effect": "Allow",
            "Resource": "*"
        }

    ]
}
```

Note:

- The EC2 section related to SecurityGroups is only needed if an Isolation Security Group must be created for the Preparation VM during catalog creation. Once this is done, these permissions are not required.

Direct disk upload and download

The following permissions must be added to the policy:

- `ebs:StartSnapshot`
- `ebs:GetSnapshotBlock`
- `ebs:PutSnapshotBlock`
- `ebs:CompleteSnapshot`
- `ebs:ListSnapshotBlocks`
- `ebs:ListChangedBlocks`
- `ec2:CreateSnapshot`
- `ec2:DeleteSnapshot`
- `ec2:DescribeLaunchTemplates`

EBS encryption of created volumes

EBS can auto-encrypt newly created volumes if the AMI is encrypted, or EBS is configured to encrypt all new volumes. However, to implement the functionality, the following permissions must be included in the IAM policy.

```
{

    "Version": "2012-10-17",
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    "Statement": [
       {

           "Effect": "Allow",
           "Action": [
                "kms:CreateGrant",
                "kms:Decrypt",
                "kms:DescribeKey",
                "kms:GenerateDataKeyWithoutPlainText",
                "kms:GenerateDataKey",
                "kms:ReEncryptTo",
                "kms:ReEncryptFrom"
           ],
           "Resource": "*"
        }

   ]
}
```

Note:

The permissions can be limited to specific keys by including a Resource and Condition block at the discretion of the user. For example, **KMS Permissions with Condition**:

```
{

    "Version": "2012-10-17",
    "Statement": [
       {

           "Effect": "Allow",
           "Action": [
                "kms:CreateGrant",
                "kms:Decrypt",
                "kms:DescribeKey",
                "kms:GenerateDataKeyWithoutPlainText",
                "kms:GenerateDataKey",
                "kms:ReEncryptTo",
                "kms:ReEncryptFrom"
           ],
           "Resource": [
               "arn:aws:kms:us-east-2:123456789012:key/abcd1234-a123
                  -456d-a12b-a123b4cd56ef"
           ],
           "Condition": {

               "Bool": {

                   "kms:GrantIsForAWSResource": true
                }

            }

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        }

    ]
}
```

The following key policy statement is the entire default key policy for KMS keys that is required to allow the account to use IAM policies to delegate permission for all actions (kms:*) on the KMS key.

```
{

"Sid": "Enable IAM policies",
"Effect": "Allow",
"Principal": {

"AWS": "arn:aws:iam::111122223333:root"
 }
 ,
"Action": "kms:",
"Resource": ""
 }
```

For more information, see the AWS Key Management Service official documentation.

IAM role-based authentication

The following permissions are added to support role-based authentication.

```
{

     "Version": "2012-10-17",
     "Statement": [
        {

            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws:iam::*:role/*"
         }

    ]
}
```

Minimal IAM permissions policy

The following JSON can be used for all currently supported features. You can create host connections, create, update, or delete VMs, and do power management using this policy.
The policy can be applied to the users as explained in Define IAM permissions sections or you can also use role-based authentication by selecting **Use IAM role** when configuring a host connection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> To use **IAM roles for Citrix to manage resources**, first configure the desired IAM role on the Delivery Controller ec2 instance when setting up the Delivery Controllers. Using Citrix Studio, add the hosting connection and select the **Use IAM role** option. A hosting connection with these settings then uses role-based authentication.

```
{

    "Version": "2012-10-17",
    "Statement": [
        {

            "Action": [
                "ec2:AttachVolume",
                "ec2:AssociateIamInstanceProfile",
                "ec2:AuthorizeSecurityGroupEgress",
                "ec2:RevokeSecurityGroupEgress",
                "ec2:AuthorizeSecurityGroupIngress",

103          }
104  ,
105         {
106
107             "Effect": "Allow",
108             "Action": [
109                 "workspaces-instances:*"
110             ],
111             "Resource": "*"
112          }
113
114
115     ]
116  }
```

Note:

- The EC2 section related to SecurityGroups is only needed if an Isolation Security Group must be created for the Preparation VM during catalog creation. Once this is done, these permissions are not required.
- The KMS section is only required when using EBS volume encryption.
- The `iam:PassRole` permission section is needed only for using IAM roles for Citrix to manage resources.
- Specific resource-level permissions can be added instead of full access based on your requirements and environment. Refer to AWS documents Demystifying EC2 Resource-Level Permissions and Access management for AWS resources for more details.
- Use `ec2:CreateNetworkInterface` and `ec2:DeleteNetworkInterface` permissions only if you are using the volume worker method.

Where to go next

- For creating prepared images, see Create a prepared image for Amazon WorkSpaces Core Managed Instances

More information

- Create and manage connections and resources
- AWS virtualization environments
- For Amazon WorkSpaces Core GitHub PowerShell examples, see citrix-mcs-sdk-samples-Amazon WorkSpaces Core.

Connection to Azure Local

August 21, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Azure Local environments.

Create a hosting connection

You can create a host connection using:

- Web Studio
- PowerShell

Use Web Studio

1. In Web Studio, open **Hosting > Add Connection and Resources**.
2. On the **Connection** page, follow these steps to configure the connection:
   a) Select **Create a new connection**.
   b) Select **Microsoft® Azure™ Arc** as the connection type.
   c) Select an Azure environment.
   d) Select a zone. The options are all resource locations you configured.
   e) Select **Other tools** for creating virtual machines.

      > **Note:**
      >
      > Selecting **Other tools** creates just the hosting connection without a hosting unit.

   f) Click **Next**.
3. On the **Connection Details** page, enter connection details following the guidance in the Wizard. If you use an existing SPN, make sure that the SPN has been granted the contributor role of the subscription. Check Required Azure Local permissionsfor more information.
4. On the **Scopes** page, select one or more scopes for this connection.
5. On the **Summary** page, check the configuration and click **Finish**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use PowerShell

Header of the script Make sure that you provide the correct parameter values defined in the header of the script.

```
$azureSubscription = "" # Azure Subscription ID

$azureTenantId = "" # Microsoft Entra Tenant ID

$appClientId = "" # Client ID of an Microsoft Entra application which is grant with sufficient permissions

$appClientSecret = "" # Client secret of above client ID

$appClientSecretExpirationDateTimestamp = "" # Client secret expiration date in epoch timestamp format

$region = "" # Azure region of your Azure Local cluster

$resourceGroupName = "" # Azure resource group of your Azure Local cluster

$zoneUid = "" # Zone UID of your resource location

$hostingConnectionName = "" # Name of the created hosting connection
```

Create a hosting connection

```
asnp citrix*

[SecureString]$appClientSecretSecureString = $appClientSecret | ConvertTo-SecureString -AsPlainText -Force

$conn = New-Item -ConnectionType "Custom" -CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"StringProperty`" Name=`"SubscriptionId`" Value=`"$azureSubscription`" /><Property xsi:type=`"StringProperty`" Name=`"ManagementEndpoint`" Value=`"https://management.azure.com/`" /><Property xsi:type=`"StringProperty`" Name=`"AuthenticationAuthority`" Value=`"https://login.microsoftonline.com/`" /><Property xsi:type=`"StringProperty`" Name=`"TenantId`" Value=`"$azureTenantId`" /></CustomProperties>" -HypervisorAddress @("https://management.azure.com/") -Path @("XDHyp:\Connections\$hostingConnectionName") -Persist -PluginId "AzureArcFactory" -Scope @() -SecurePassword $appClientSecretSecureString -UserName $appClientId -ZoneUid $zoneUid

New-BrokerHypervisorConnection -HypHypervisorConnectionUid $conn.HypervisorConnectionUid

Set-HypHypervisorConnectionMetadata -HypervisorConnectionUid $conn.HypervisorConnectionUid -Name
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    Citrix_Orchestration_Hypervisor_Secret_Allow_Edit -Value true

Set-HypHypervisorConnectionMetadata -HypervisorConnectionUid $conn.
    HypervisorConnectionUid -Name
    Citrix_Orchestration_Hypervisor_Secret_Expiration_Date -Value
    $appClientSecretExpirationDateTimestamp
```

Create a hosting unit

You can create a hosting unit using:

- Web Studio
- PowerShell

Create a hosting unit Use Web Studio

1. In Web Studio, open **Hosting > Add Connection and Resources**.
2. On the **Connection** page:
   - To create a new hosting connection along with a hosting unit, select **Create a new connection**, then do the following:
     a) Select **Create a new connection**.
     b) Select **Microsoft® Azure™ Arc** as the connection type.
     c) Select an Azure environment.
     d) Select a zone. The options are all resource locations you configured.
     e) Select **Citrix provisioning tools (Machine Creation Services™ or Citrix Provisioning)** for creating virtual machines.
     f) Click **Next**.
   - To create hosting units from an existing host connection, select **Use an existing Connection** and then choose the relevant connection.
3. On the **Connection Details** page, enter connection details following the guidance in the Wizard. If you use an existing SPN, make sure that the SPN has been granted the contributor role of the subscription.
4. On the **Cluster Selection** page, browse resource groups and select the target Azure Local cluster.
5. On the **Storage Selection** page, select at least one storage device for each supported data type before you can proceed to the next page in the wizard. For more information about storage selection, see Host storage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. On the **Network** page, enter a name for the resources. This name appears in Studio to identify the storage and network combination associated with the connection. Select one or more networks that the VMs use.
7. On the **Summary** page, check the details and click **Finish**.

Create a hosting unit using PowerShell

Header of the script

Make sure that you provide the correct parameter values defined in the header of the script.

```
$resourceGroupName = "" # Azure resource group of your Azure Local
    cluster

$clusterName = "" # Name of your Azure Local cluster

$storagePathName = "" # Storage path in your Azure Local cluster that
    wants to be used in this hosting unit

$logicalNetworkName = "" # Logical network in your Azure Local cluster
    that wants to be used in this hosting unit

$zoneUid = "" # Zone UID of your resource location

$hostingConnectionName = "" # Name of the created hosting connection

$hostingUnitName = "" # Name of the created hosting unit
```

Create a hosting unit

```
asnp citrix*

$guid = (New-Guid).Guid

New-HypStorage -StoragePath @("XDHyp:\Connections\
    $hostingConnectionName\$region.region\$resourceGroupName.
    resourcegroup\cluster.folder\$clusterName.cluster\storage.folder\
    $storagePathName.storage") -StorageType "TemporaryStorage" -JobGroup
     $guid

New-Item -Path XDHyp:\HostingUnits -Name $hostingUnitName -
    HypervisorConnectionName $hostingConnectionName -RootPath "XDHyp:\
    Connections\$hostingConnectionName\$region.region\$resourceGroupName
    .resourcegroup\cluster.folder\$clusterName.cluster" -NetworkPath "
    XDHyp:\Connections\$hostingConnectionName\$region.region\
    $resourceGroupName.resourcegroup\cluster.folder\$clusterName.cluster
    \network.folder\$logicalNetworkName.network" -StoragePath "XDHyp:\
    Connections\$hostingConnectionName\$region.region\$resourceGroupName
    .resourcegroup\cluster.folder\$clusterName.cluster\storage.folder\
    $storagePathName.storage" -JobGroup $guid
```

Connection to XenServer®

May 13, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to XenServer virtualization environments.

> **Note:**
>
> Before creating a connection to XenServer, you need to first finish setting up your XenServer account as a resource location. See XenServer virtualization environments.

Create a connection to XenServer

When you create a connection to XenServer (formerly Citrix Hypervisor™), you must provide the credentials for a VM Power Admin or higher-level user.

Citrix recommends using HTTPS to secure communications with XenServer. To use HTTPS, you must replace the default SSL certificate installed on XenServer.

You can configure high availability if it is enabled on the XenServer server. For Citrix Virtual Apps and Desktops versions 2507 LTSR and later, if you are using HTTPS and want to configure high-availability servers, you can install a wildcard certificate for all servers in a pool. However, for versions earlier than 2507 LTSR, an individual certificate for each server is required.

You can select a GPU type and group, or pass through, if the XenServer supports vGPU. The display indicates if the selection has dedicated GPU resources.

When using local storage on one or more XenServer hosts for temporary data storage, make sure that each storage location in the pool has a unique name. (To change a name in XenCenter®, right-click the storage and edit the name property.)

You can use Citrix Provisioning (formerly Provisioning Services) and Machine Creation Services™ (MCS) to provision:

- legacy BIOS for supported Desktop or Server OS VMs.
- UEFI for supported Desktop or Server OS VMs, including Secure Boot.

> **Note:**
>
> Pool operator permissions or higher are required when configuring MCS.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use IntelliCache™ for XenServer connections

Using IntelliCache, hosted VDI deployments are more cost-effective because you can use a combination of shared storage and local storage. This enhances performance and reduces network traffic. The local storage caches the master image from the shared storage, which reduces the number of reads on the shared storage. For shared desktops, writes to the differencing disks are written to local storage on the host and not to shared storage.

- Shared storage must be NFS when using IntelliCache.
- Citrix recommends that you use a high performance local storage device to ensure the fastest possible data transfer.

To use IntelliCache, you must enable it in both this product and XenServer.

- When installing XenServer, select **Enable thin provisioning (Optimized storage for Virtual Desktops)**. Citrix does not support mixed pools of servers that have IntelliCache enabled and servers that do not. For more information, see the XenServer documentation.
- In Citrix Virtual Apps and Desktops™, IntelliCache is disabled by default. You can change the setting only when creating a XenServer connection; you cannot disable IntelliCache later. When you add a XenServer connection:
  - Select **Shared** as the storage type.
  - Select the **Use IntelliCache** check box.

Required XenServer permissions

The XenServer permissions are role-based (RBAC). The Role-Based Access Control (RBAC) feature in XenServer allows you to assign users, roles, and permissions to control who has access to your XenServer and what actions they can perform. The XenServer RBAC system maps a user (or a group of users) to defined roles (a named set of permissions). The roles have associated XenServer permissions to perform certain operations.

For more information, see Role-based access control.

The role hierarchy, in order of increasing permissions is: Read-Only → VM Operator → VM Admin → VM Power Admin → Pool Operator → Pool Admin.

The following section summarizes the minimum role required for each provisioning task.

Creating a host connection

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Task	Minimum role required
Add a host connection using the information obtained from XenServer	Read-Only
View users and their assigned role	Read-Only

Power management of VMs

Task	Minimum role required
Power on or off the VMs	VM Operator

Creating, updating, or deleting VMs

Task	Minimum role required
Add or remove VMs to existing snapshots schedules	VM Power Admin
Add, modify, delete snapshot schedules	Pool Operator
Publish master image	Pool Operator (Requires switch-port locking)
Create a machine catalog	Pool Operator: Requires switch-port locking
Add or remove VMs (not GPU enabled VMs)	VM Admin
Add or remove VMs (GPU enabled VMs)	Pool Operator
Add, remove, or configure virtual disk or CD devices	VM Admin
Manage Tags	VM Operator

For more information on RBAC roles and permissions, see RBAC roles and permissions.

For information on switch port locking, see Use switch port locking.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For XenServer specific information, see Create a XenServer catalog

More information

- Connections and resources
- Create machine catalogs

Connection to Google cloud environments

May 13, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Google cloud environments.

> **Note:**
>
> Before creating a connection to Google cloud environments, you need to first finish setting up your Google cloud account as a resource location. See Google Cloud environments.

Add a connection

Follow the guidance in Create a connection and resources. The following description guides you through setting up a hosting connection:

1. From **Manage > Configuration**, select **Hosting** in the left pane.
2. Select **Add Connection and Resources** in the action bar.
3. On the **Connection** page, select **Create a new Connection** and **Citrix provisioning™ tools**, and then select **Next**.
    - **Connection type**. Select **Google Cloud** from the menu.
    - **Connection name**. Type a name for the connection.
4. On the **Region** page, select a project name from the menu, select a region containing the resources you want to use, and then select **Next**.
5. On the **Network** page, type a name for the resources, select a virtual network from the menu, select a subset, and then select **Next**. The resource name helps identify the region and network combination. Virtual networks with the *(Shared)* suffix appended to their name represent shared VPCs. If you configure a subnet-level IAM role for a shared VPC, only specific subnets of the shared VPC appear on the subnet list.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - The resource name can contain 1–64 characters, and cannot contain only blank spaces or the characters `\ / ; : # . * ? = < > | [ ] { } "' ( )' )`.

6. On the **Summary** page, confirm the information and then select **Finish** to exit the **Add Connection and Resources** window.

After creating the connection and resources, the connection and resources you created are listed. To configure the connection, select the connection and then select the applicable option in the action bar.

Similarly, you can delete, rename, or test the resources created under the connection. To do so, select the resource under the connection and then select the applicable option in the action bar.

Service endpoint URLs

You must have access to the following URLs:

- `https://oauth2.googleapis.com`
- `https://cloudresourcemanager.googleapis.com`
- `https://compute.googleapis.com`
- `https://storage.googleapis.com`
- `https://cloudbuild.googleapis.com`

Google Cloud projects

There are basically two types of Google Cloud projects:

- Provisioning project: In this case, the current admin account owns the provisioned machines in the project. This project is also referred to as a local project.
- Shared VPC project: Project in which machines created in the provisioning project use the VPC from the Shared VPC project. The admin account used for provisioning project has limited permissions in this project, specifically, only permissions to use the VPC.

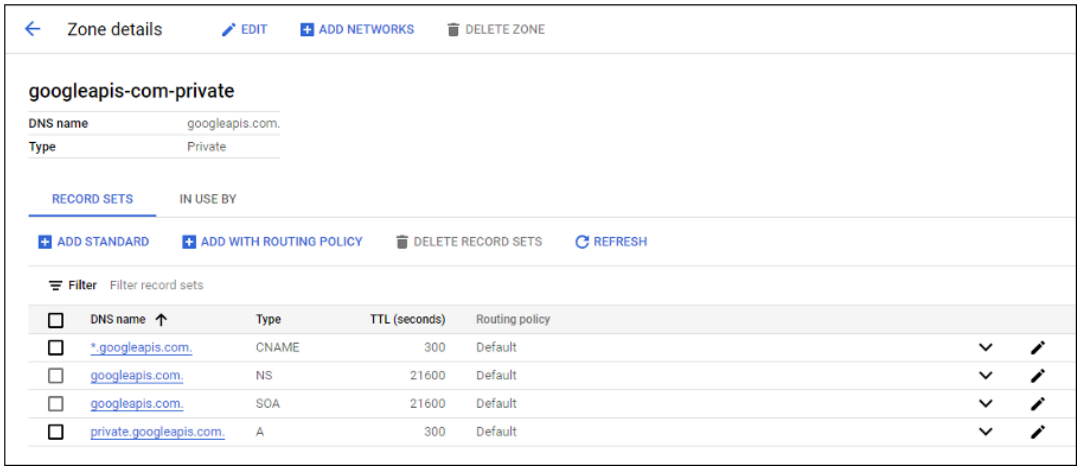
Create a secure environment for GCP managed traffic

You can allow private Google access to your Google Cloud projects. This implementation enhances security to handle sensitive data. To achieve this, you can do one of the following:

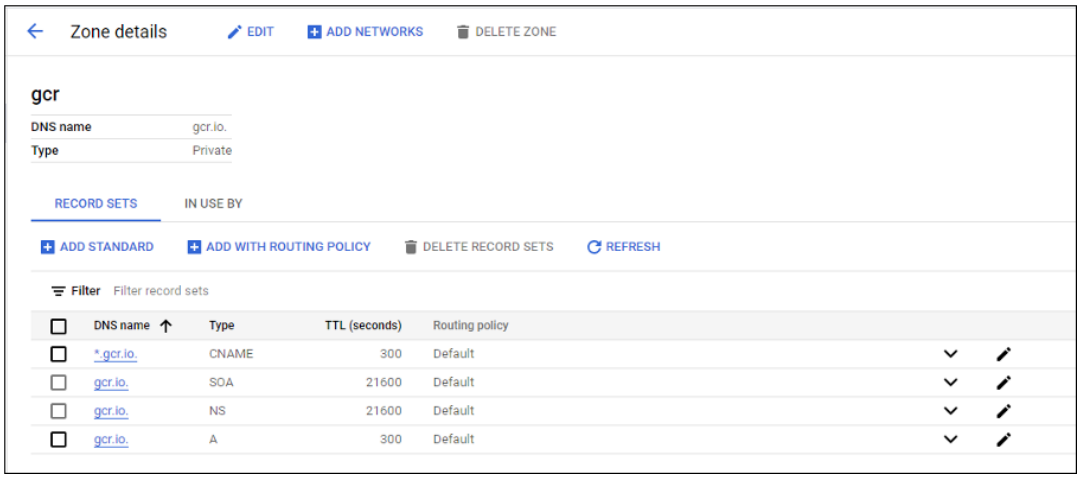
© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Include the following ingress rules of VPC service controls for Cloud Build Service Account. If you do this step, then do not follow the steps below for creating a secure environment for GCP managed traffic.

```
Ingress Rule 1
From:
Identities:
<ProjectID>@cloudbuild.gserviceaccount.com
Source > All sources allowed
To:
Projects =
All projects
Services =
Service name: All services
```

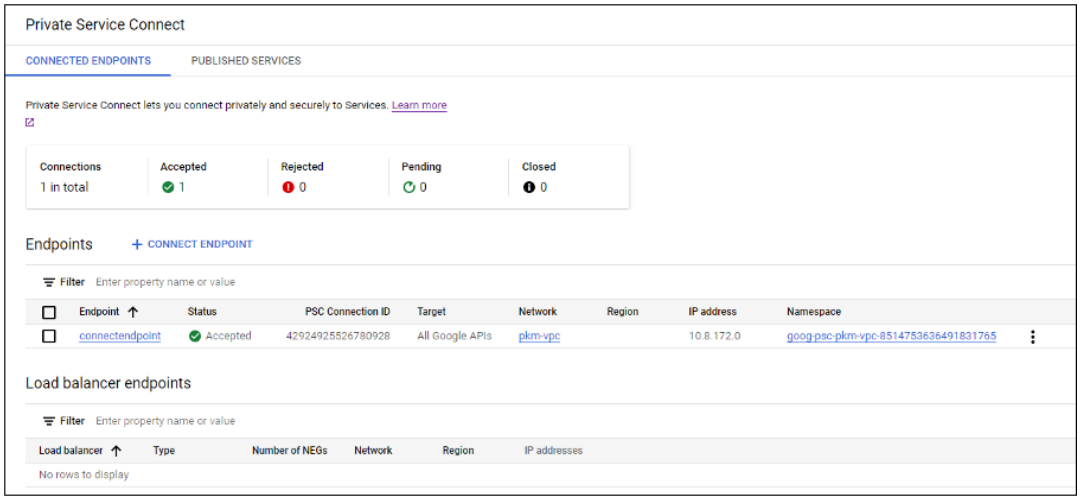


- If you are using a private worker pool, add `UsePrivateWorkerPool` in `CustomProperties`. For information on the private worker pool, see Private pools overview.



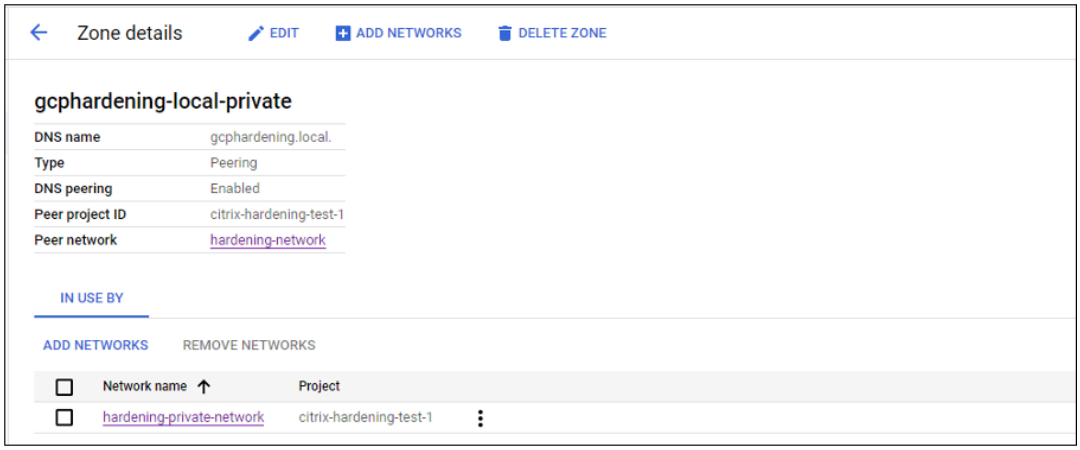
Requirements to create a secure environment for GCP managed traffic

The requirements to create a secure environment for GCP managed traffic are:



- Ensure that the hosting connection is in maintenance mode when updating the custom properties.
- To use private worker pools, the following changes are required:
  - For Citrix Cloud™ Service Account, add the following IAM roles:
    - Cloud Build Service Account
    - Compute Instance Admin
    - Service Account User
    - Service Account Token Creator
    - Cloud Build WorkerPool Owner
  - Create the Citrix Cloud Service Account in the same project that you use for creating a hosting connection.
  - Set up DNS zones for **`private`**`.googleapis.com` and `gcr.io` as described in DNS configuration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



- Set up private Network Address Translation (NAT) or use private service connect. For more information, see Access Google APIs through endpoints.

- If using a peered VPC, create a Cloud DNS zone peering to the peered VPC. For more information, see Create a peering zone.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- In VPC service controls, set up Egress rules so that the APIs and VMs can talk to the internet. Ingress rules are optional. For example:

```
Egress Rule 1
From:
Identities:ANY_IDENTITY
To:
Projects =
All projects
Service =
Service name: All services
```

Enable the private worker pool

To enable the private worker pool, set the custom properties as follows on the host connection:

1. Open a PowerShell window from the Delivery Controller host or use the Remote PowerShell SDK. For more information on Remote PowerShell SDK, see SDKs and APIs.
2. Run the following commands:
   a) `Add-PSSnapin citrix®*`
   b) `cd XDHyp:\Connections\`
   c) `dir`
3. Copy the `CustomProperties` from the connection to a notepad.
4. Append property setting `<Property xsi:type="StringProperty"Name="UsePrivateWorkerPool"Value="True"/>`. For example:

```
```
<CustomProperties xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance" xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation">
<Property xsi:type="StringProperty" Name="UsePrivateWorkerPool"
    Value="True"/>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved. 
```

```
</CustomProperties>
```

5. In the PowerShell window, assign a variable to the modified custom properties. For example: `$customProperty = '<CustomProperties...</CustomProperties>'`.
6. Run `$gcpServiceAccount = "<ENTER YOUR SERVICE ACCOUNT EMAIL HERE>"`.
7. Run `$gcpPrivateKey = "<ENTER YOUR SERVICE ACCOUNT PRIVATE KEY HERE AFTER REMOVING ALL INSTANCES OF \n >"`.
8. Run `$securePassword = ConvertTo-SecureString $gcpPrivateKey -AsPlainText -Force`.
9. Run the following to update an existing host connection:

```
Set-Item -PassThru -Path @('XDHyp:\\Connections\\<ENTER YOUR
    CONNECTION NAME HERE>') -SecurePassword $securePassword -
    UserName $gcpServiceAccount -CustomProperties $customProperty
```

Specify CMEK global and regional key

> **Note:**
>
> Support for CMEK in GCP is currently under Preview.

There are two types of customer-managed encryption keys (CMEK) in GCP:

- Regional: Encryption keys that can only be used by resources in the same region.
- Global: Encryption keys that can be used by resources from multiple regions.

You can browse and use global or regional customer-managed encryption keys (CMEK) from all projects that are accessible to the service account. You can then use the key to create a CMEK enabled MCS machine catalog and update an existing CMEK enabled MCS machine catalog using `Set-ProvScheme` command. For information creating a CMEK enabled catalog using PowerShell, see Create a catalog with CMEK using custom properties.

For this feature, you need additional permissions for the following two service accounts:

- The service account of the current project with which the hosting connection is created.
- The Compute Engine Service Agent of the current project (that has the email: `service-PROJECT_NUMBER@compute-system.iam.gserviceaccount.com`). For more information, see Compute Engine Service Agent.

In Service accounts, you must assign the following roles in the project that has crypto keys that you want to use (for example, shared project):

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Cloud KMS Viewer
- Cloud KMS CryptoKey Encrypter/Decrypter

If you do not assign to the roles, then make sure that you have the following permissions:

- resourcemanager.projects.get
- cloudkms.keyRings.list
- cloudkms.keyRings.get
- cloudkms.cryptoKeys.get
- cloudkms.cryptoKeys.list
- cloudkms.cryptoKeyVersions.useToDecrypt
- cloudkms.cryptoKeyVersions.useToEncrypt

List the encryption keys

You can list the global and regional encryption keys within the same project and all other accessible projects using the PowerShell commands. To do this:

1. Open a PowerShell window from the Delivery Controller™ host or remote PowerShell.
2. Run the command `asnp citrix*` to load Citrix-specific PowerShell modules.
3. Run the following command to list the encryption keys. Example:
   - To list contents of `encryptionKeys` folder:

     ```
     Get-ChildItem XDHyp:\HostingUnits\my-hostingunit\
        encryptionKeys.folder
     ```

   - To get global encryption keys within the same project:

     ```
     Get-Item XDHyp:\HostingUnits\my-hostingunit\encryptionKeys.
        folder\myglobalkeyring.globalkeyring\myglobalkey.cryptokey
     ```

   - To get regional encryption keys within the same project:

     ```
     Get-Item XDHyp:\HostingUnits\my-hostingunit\encryptionKeys.
        folder\regional-ring.keyring\shared-key.cryptokey
     ```

   - To get global encryption keys from another accessible project (for example: myanother-project):

     ```
     Get-Item XDHyp:\HostingUnits\my-hostingunit\encryptionKeys.
        folder\myanotherproject.project\shared-global-ring.
        globalkeyring\shared-key.cryptokey
     ```

   - To get regional encryption keys from another accessible project (for example: myanother-project):

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Get-Item XDHyp:\HostingUnits\my-hostingunit\encryptionKeys.
    folder\myanotherproject .project.project\shared-uscentral.
    keyring\shared-uscentral-key.cryptokey
```

Note:

- The extension of the key ring inventory item for a global key ring is `.globalkeyring`.
- The id of global key rings has the word `global` in it.

Required GCP permissions

This section has the complete list of GCP permissions. Use the complete set of permissions as given in the section for the functionality to work correctly.

Note:

GCP is introducing changes to Cloud Build Services's default behavior and use of service accounts after April 29, 2024. For more information, see Cloud Build Service Account Change. Your existing Google projects with Cloud Build API enabled before April 29, 2024 are not affected by this change. However, if you want to have existing Cloud Build Service behavior after April 29, you can create or apply the organization policy to disable the constraint enforcement before you enable the API. If you set the new organization policy, you can still follow the existing permissions in this section and the items that are marked **Before Cloud Build Service Account Change**. If not, then follow the existing permissions and items that are marked **After Cloud Build Service Account Change**.

Creating a host connection

- Minimum permissions required for Citrix Cloud Service Account in Provisioning project:

```
compute.instanceTemplates.list
compute.instances.list
compute.networks.list
compute.projects.get
compute.regions.list
compute.subnetworks.list
compute.zones.list
resourcemanager.projects.get
```

The following Google defined roles have the permissions as listed above:

- Compute Admin
- Cloud Datastore User

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Additional permissions required for Shared VPC for Citrix Cloud Service Account in Shared VPC project:

```
compute.networks.list
compute.subnetworks.list
resourcemanager.projects.get
```

  The following Google defined roles have the permissions as listed above:

  - Compute Network User

- In Service accounts, you must assign the following roles in the project that has crypto keys that you want to use (for example, shared project):

  - Cloud KMS Viewer
  - Cloud KMS CryptoKey Encrypter/Decrypter

  If you do not assign to the roles, then make sure that you have the following permissions:

  - resourcemanager.projects.get
  - cloudkms.keyRings.list
  - cloudkms.keyRings.get
  - cloudkms.cryptoKeys.get
  - cloudkms.cryptoKeys.list
  - cloudkms.cryptoKeyVersions.useToDecrypt
  - cloudkms.cryptoKeyVersions.useToEncrypt

Power management of VMs

Minimum permissions required for Citrix Cloud Service Account in Provisioning project in case of power managed only catalogs:

```
compute.instanceTemplates.list
compute.instances.list
compute.instances.get
compute.instances.reset
compute.instances.resume
compute.instances.start
compute.instances.stop
compute.instances.suspend
compute.networks.list
compute.projects.get
compute.regions.list
compute.subnetworks.list
compute.zones.list
resourcemanager.projects.get
compute.zoneOperations.get
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following Google defined roles have the permissions as listed above:

- Compute Admin
- Cloud Datastore User

Creating, updating, or deleting VMs

- Minimum permissions required for Citrix Cloud Service Account in Provisioning project:

```
cloudbuild.builds.create
cloudbuild.builds.get
cloudbuild.builds.list
compute.acceleratorTypes.list
compute.diskTypes.get
compute.diskTypes.list
compute.disks.create
compute.disks.createSnapshot
compute.disks.delete
compute.disks.get
compute.disks.list
compute.disks.setLabels
compute.disks.use
compute.disks.useReadOnly
compute.firewalls.create
compute.firewalls.delete
compute.firewalls.list
compute.globalOperations.get
compute.images.create
compute.images.delete
compute.images.get
compute.images.list
compute.images.setLabels
compute.images.useReadOnly
compute.instanceTemplates.create
compute.instanceTemplates.delete
compute.instanceTemplates.get
compute.instanceTemplates.list
compute.instanceTemplates.useReadOnly
compute.instances.attachDisk
compute.instances.create
compute.instances.delete
compute.instances.detachDisk
compute.instances.get
compute.instances.getSerialPortOutput
compute.instances.list
compute.instances.reset
compute.instances.resume
compute.instances.setDeletionProtection
compute.instances.setLabels
compute.instances.setMetadata
compute.instances.setServiceAccount
compute.instances.setTags
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
compute.instances.start
compute.instances.stop
compute.instances.suspend
compute.machineTypes.get
compute.machineTypes.list
compute.networks.list
compute.networks.updatePolicy
compute.nodeGroups.list
compute.nodeTemplates.get
compute.projects.get
compute.regions.list
compute.snapshots.create
compute.snapshots.delete
compute.snapshots.list
compute.snapshots.get
compute.snapshots.setLabels
compute.snapshots.useReadOnly
compute.subnetworks.get
compute.subnetworks.list
compute.subnetworks.use
compute.zoneOperations.get
compute.zoneOperations.list
compute.zones.get
compute.zones.list
iam.serviceAccounts.actAs
resourcemanager.projects.get
storage.buckets.create
storage.buckets.delete
storage.buckets.get
storage.buckets.list
storage.buckets.update
storage.objects.create
storage.objects.delete
storage.objects.get
storage.objects.list
compute.networks.get
compute.resourcePolicies.use
```

The following Google defined roles have the permissions as listed above:

- Compute Admin
- Storage Admin
- Cloud Build Editor
- Service Account User
- Cloud Datastore User

- Additional permissions required for Shared VPC for Citrix Cloud Service Account in Shared VPC project to create a hosting unit using VPC and subnetwork from Shared VPC project:

```
compute.firewalls.list
compute.networks.list
compute.projects.get
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
compute.regions.list
compute.subnetworks.get
compute.subnetworks.list
compute.subnetworks.use
compute.zones.list
resourcemanager.projects.get
```

The following Google defined roles have the permissions as listed above:

- Compute Network User
- Cloud Datastore User

Minimum permissions required when downloading preparation instruction disk to MCS:

- (Before Cloud Build Service Account Change): Assign these permissions to Cloud Build Service Account in Provisioning project.
- (After Cloud Build Service Account Change): Assign these permissions to Cloud Compute Service Account in Provisioning project.

```
compute.disks.create
compute.disks.delete
compute.disks.get
compute.disks.list
compute.disks.setLabels
compute.disks.use
compute.disks.useReadOnly
compute.images.get
compute.images.list
compute.images.useReadOnly

Connection to HPE Moonshot

May 15, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to HPE Moonshot.

> **Note:**
>
> Before creating a connection to HPE Moonshot, you need to first finish setting up your HPE account. See HPE Moonshot virtualization environments.

Create a connection

You can create a connection to HPE Moonshot using:

- Web Studio
- PowerShell commands

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a connection using Web Studio

1. In the **Add Connection and Resources** page, select the **HPE Moonshot** as the connection type.
2. Enter the connection address of your Moonshot iLO Chassis Manager. You can use an IP address, host name, or FQDN for the address.
3. Enter your chassis administrative credentials and a friendly connection name.

Connection setup stops when either of the situations occurs:

- Citrix Virtual Apps and Desktops™ receives a public CA-signed certificate with errors: An error message appears. Follow the on-screen instructions to fix the issue. Otherwise, you can't proceed with connection creation.
- Citrix Virtual Apps and Desktops™ receives a private CA-signed certificate. A warning page appears. Compare the received thumbprint with the server's for the certificate validity. If it's valid, select **Trust certificate** and click **OK** to proceed with connection creation. Citrix Virtual Apps and Desktops will then trust the certificate and store the thumbprint for future validation.

Create a connection using PowerShell commands

When you create a connection using PowerShell command, provide the following information:

- IP: HPE Server IP Address
- Username: HPE username
- Password: HPE password

For example:

```
1 New-Item -ConnectionType "Custom" -HypervisorAddress $IP -Metadata @{
2  "Citrix_Orchestration_Hypervisor_Secret_Allow_Edit"="false" }
3   -Path @("XDHyp:\Connections\$connectionName") -Persist -PluginId "
       HPMoonshotFactory" -Scope @() -SecurePassword $Password -UserName
       $UserName -sslthumbprint $SslThumbprint New-
       BrokerHypervisorConnection -HypHypervisorConnectionUid
       $HypervisorConnectionID
```

> **Note:**
>
> The `sslthumbprint` parameter is required for only Private CA-signed certificates.

Certificate and thumbprint validation

For creating a successful connection to **HPE Moonshot**, the certificate must not have errors and the thumbprint must have a correct value. Following are the use cases related to the certificate and thumbprint validation:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Public CA-signed certificate has errors. The connection is not created successfully. See the error details and resolve the issue.
- Public CA-signed certificate without errors. The connection is created successfully, and the `SslThumbprints` value is **Null**.
- Private CA-signed certificate without errors and a `sslthumbprint` value. The connection is created successfully with a correct `SslThumbprints` value.
- Private CA-signed Certificate with an incorrect thumbprint value. The connection is not created successfully.
- Private CA-signed Certificate without errors. The connection is created successfully. The `SSlThumbprints` is **Null** when creating the connection. The `SSlThumbprints` value is updated to a value by the site service.

> **Note:**
>
> A mismatch in the certificate thumbprint between the Citrix Database and the Moonshot server triggers a warning in Web Studio. However, this warning doesn't appear in MMC-based Studio.

Manage connections

This section details how you can manage connections:

- Fix certificate issues using the Web Studio
- Update thumbprint value using PowerShell command

Fix certificate issues

Citrix Virtual Apps and Desktops blocks an HPE Moonshot connection when certificate issues arise, preventing you from delivering and managing workloads on associated HPE Moonshot nodes. You'll see an error icon next to the connection in the **Host connections** list. See the following table for specific issues and solutions.

Issue	Solution
A certificate error occurs to the public CA-signed certificate	Click the connection and select the **Troubleshoot** tab. View the error details and resolve the issue.
The received certificate is private CA-signed or expired.	Edit the host connection to update the certificate thumbprint. Details steps: 1. Select the connection and click **Edit Connection**. 2. On the **Connection Properties** page, click **Edit settings**. 3. Enter the password to connect to the HPE Moonshot chassis, and then click **Save**. 4. On the **Warning** page that appears, compare the received thumbprint with the server's for certificate validity.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Issue	Solution

Update thumbprint values

After creating the connection, you can update the thumbprint value of a connection using the `Set-Item` PowerShell command. For example, run the following commands:

1. Get the connection details of a connection. For example:

```
Get-Item -LiteralPath xdhyp:\connections\SinMoonshot-101
```

2. Update the thumbprint value. For example:

```
Set-Item -LiteralPath xdhyp:\connections\SinMoonshot-101 -Username
    Administrator -SslThumbprint
   xxxxxxxxxxx12AD048480631BB7AB10D69xxxxx
```

3. Check the updated thumbprint value. For example:

```
Get-Item -LiteralPath xdhyp:\connections\SinMoonshot-101
```

> **Note:**
>
> The update fails if you provide an incorrect thumbprint value in the `Set-Item` command.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For AWS specific information, see Create an HPE Moonshot machine catalog

Connection to Microsoft Azure

May 15, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Azure Resource Manager cloud environments.

> **Note:**
>
> Before creating a connection to Microsoft Azure, you must finish setting up your Azure account as a resource location. See Microsoft Azure Resource Manager cloud environments.

Create service principals and connections

Before creating connections, you must set up service principals that connections use to access Azure resources. You can create a connection in two ways:

- Create a service principal and a connection together using Web Studio
- Create a connection using a previously created service principal

This section shows you how to complete these tasks:

- Create a service principal and connection using Web Studio
- Create a service principal using PowerShell
- Get the application secret in Azure
- Create a connection using an existing service principal

Considerations

- Citrix® recommends using Service Principal with contributor role. However, see Minimum permissions section to get the list of minimum permissions.
- When creating the first connection, Azure prompts you to grant it the necessary permissions. For future connections you must still authenticate, but Azure remembers your previous consent and does not display the prompt again.
- Accounts used for authentication must have permissions to assign roles in the subscription using Azure RBAC. Example, Owner, Role Based Access Control Administrator, or User Access Administrator of the subscription.
- The account used for authentication must be a member of the subscription's directory. There are two types of accounts to be aware of: 'Work or School'and 'personal Microsoft account.' See CTX219211 for details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- While you can use an existing Microsoft account by adding it as a member of the subscription's directory, there can be complications if the user was previously granted guest access to one of the directory's resources. In this case, they might have a placeholder entry in the directory that does not grant them the necessary permissions, and an error is returned.

  Rectify this by removing the resources from the directory and add them back explicitly. However, exercise this option carefully, because it has unintended effects for other resources that the account can access.

- There is a known issue where certain accounts are detected as directory guests when they are actually members. Configurations like this typically occurs with older established directory accounts. Workaround: add an account to the directory, which takes the proper membership value.

- Resource groups are simply containers for resources, and they can contain resources from regions other than their own region. This can potentially be confusing if you expect resources displayed in a resource group's region to be available.

- Ensure that your network and subnet are large enough to host the number of machines you require. This requires some foresight, but Microsoft helps you specify the right values, with guidance about the address space capacity.

Create a service principal and connection using Web Studio

> **Important:**
>
> This feature is not yet available for Azure China subscriptions.

With Web Studio, you can create both a service principal and a connection in a single workflow. Service principals give connections access to Azure resources. When you authenticate to Azure to create a service principal, an application is registered in Azure. A secret key (called client secret or application secret) is created for the registered application. The registered application (a connection in this case) uses the client secret to authenticate to Microsoft Entra ID.

Before you start, make sure that you've met these prerequisites:

- You have a user account in your subscription's Microsoft Entra tenant.
- Accounts used for authentication must have permissions to assign roles in the subscription using Azure RBAC. Example, Owner, Role Based Access Control Administrator, or User Access Administrator of the subscription.
- You have global administrator, application administrator, or application developer permissions for authentication. These permissions can be revoked after you create host connection. For more information about roles, see Microsoft Entra built-in roles.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use the **Add Connection and Resources** wizard to create a service principal and a connection together:

1. On the **Connection** page, select **Create a new connection**, the **Microsoft Azure** connection type, and your Azure environment.
2. Select which tools to use to create the virtual machines and then select **Next**.
3. On the **Connection Details** page, enter your Azure subscription ID and a name for the connection. After you enter the subscription ID, the **Create new** button is enabled.

   > **Note:**
   >
   > The connection name can contain 1–64 characters, and cannot contain only blank spaces nor the characters `\/;:#.*?=<>|[]{ } "'()'`.

4. Select **Create new** and then enter the Microsoft Entra account user name and password.
5. Select **Sign in**.
6. Select **Accept** to give Citrix Virtual Apps and Desktops™ the listed permissions. Citrix Virtual Apps and Desktops creates a service principal that allows it to manage Azure resources on behalf of the specified user.
7. After you select **Accept**, you return to the **Connection** page in the wizard.

   > **Note:**
   >
   > After you successfully authenticate to Azure, the **Create new** and **Use existing** buttons disappear. The **Connection successful** text appears, with a green check mark, indicating the successful connection to your Azure subscription.

8. On the **Connection Details** page, select **Next**.

   > **Note:**
   >
   > You cannot proceed to the next page until you successfully authenticate to Azure and consent to giving the required permissions.

9. Configure resources for the connection. Resources comprise the region and the network.
   - On the **Region** page, select a region.
   - On the **Network** page, do the following:
     - Type a 1–64 character resource name to help identify the region and network combination. A resource name cannot contain only blank spaces nor the characters `\/;:#.*?=<>|[]{ } "'()'`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Select a virtual network/resource group pair. (If you have more than one virtual network with the same name, pairing the network name with the resource group provides unique combinations.) If the region you selected on the previous page does not have any virtual networks, return to that page and select a region that has virtual networks.

10. On the **Summary** page, view a summary of settings and select **Finish** to complete your setup.

View the application ID After you create a connection, you can view the application ID that the connection uses to access Azure resources.

In the **Add Connection and Resources** list, select the connection to view the details. The **Details** tab shows the Application ID.

Create a service principal using PowerShell

To create a service principal using PowerShell, connect to your Azure Resource Manager subscription and use the PowerShell cmdlets provided in the following sections.

Make sure that you have these items ready:

- **SubscriptionId:** Azure Resource Manager `SubscriptionID` for the subscription where you want to provision VDAs.
- **ActiveDirectoryID**: Tenant ID of the application that you registered with Microsoft Entra ID.
- **ApplicationName:** Name for the application to be created in Microsoft Entra ID.

Detailed steps are as follows:

Connect to your Azure Resource Manager subscription.

```
1 `Connect-AzAccount`
```

1. Select the Azure Resource Manager subscription where you want to create the service principal.

   ```
   Get-AzSubscription -SubscriptionId $subscriptionId | Select-
   AzSubscription
   ```

2. Create the application in your AD tenant.

   ```
   $AzureADApplication = New-AzADApplication -DisplayName $ApplicationName
   ```

3. Create a service principal.

   ```
   New-AzADServicePrincipal -ApplicationId $AzureADApplication.AppId
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Assign a role to the service principal.

```
New-AzRoleAssignment -RoleDefinitionName Contributor -ServicePrincipalName
 $AzureADApplication.AppId –scope /subscriptions/$SubscriptionId
```

5. From the output window of the PowerShell console, note the ApplicationId. You provide that ID when creating the host connection.

Get the application secret in Azure

To create a connection using an existing service principal, you must first get the application ID and secret of the service principal in the Azure portal.

Detailed steps are as follows:

1. Get the **Application ID** from the Web Studio or using PowerShell.
2. Sign in to the Azure portal.
3. In Azure, select **Microsoft Entra ID**.
4. From **App registrations** in Microsoft Entra ID, select your application.
5. Go to **Certificates & secrets**.
6. Click **Client secrets**.

Create a connection using an existing service principal

If you already have a service principal, you can use it to create a connection using Web Studio.

Make sure you have these items ready:

- SubscriptionId
- ActiveDirectoryID (tenant ID)
- Application ID
- Application secret

  For more information, see Get the application secret.

- Secret expiration date

Detailed steps are as follows:

In the **Add Connection and Resources** wizard:

1. On the **Connection** page, select **Create a new connection**, the **Microsoft Azure** connection type, and your Azure environment.
2. Select which tools to use to create the virtual machines and then select **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **Connection Details** page, enter your Azure subscription ID and a name for the connection.

   > **Note:**
   >
   > The connection name can contain 1–64 characters, and cannot contain only blank spaces nor the characters `\/;:#.*?=<>|[]{ } "'()'`.

4. Select **Use existing**. In the **Existing Service Principal Details** window, enter the following settings for the existing service principal. After you enter the details, the **Save** button is enabled. Select **Save**. You cannot progress beyond this page until you provide valid details.

   - **Subscription ID**. Enter your Azure subscription ID. To obtain your subscription ID, sign in to the Azure portal and navigate to **Subscriptions > Overview**.
   - **Active Directory ID** (tenant ID). Enter the Directory (tenant) ID of the application that you registered with Azure AD.
   - **Application ID**. Enter the Application (client) ID of the application that you registered with Azure AD.
   - **Application secret**. Create a secret key (client secret). The registered application uses the key to authenticate to Azure AD. We recommend that you change keys regularly for security purposes. Be sure to save the key because you cannot retrieve the key later.
   - **Secret expiration date**. Enter the date after which the application secret expires. You see a warning icon on the specific host connection in the **Hosting** node starting 14 days before the secret key expires. However, if the secret key expires, you receive errors.

     > **Note:**
     >
     > For security purposes, the expiration period cannot be more than two years from now.

   - **Authentication URL**. This field is automatically populated and is not editable.
   - **Management URL**. This field is automatically populated and is not editable.
   - **Storage suffix**. This field is automatically populated and is not editable.
   - **Azure blob storage endpoint to upload or download disks or snapshots**. This field is automatically populated and isn't editable.
   - **Key Vault Service**. This field is automatically populated and isn't editable.
   - **Service bus suffix**. This field is automatically populated and isn't editable.

     Access to the following endpoints is required for creating an MCS catalog in Azure. Access to these endpoints optimizes connectivity between your network and the Azure portal and its services.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Authentication URL: `https://login.microsoftonline.com`
- Management URL: `https://management.azure.com`. This is a request URL for Azure Resource Manager provider APIs. The endpoint for management depends on the environment. For example, for Azure Global, it is `https://management.azure.com`, and for Azure US Government, it is `https://management.usgovcloudapi.net`.
- Storage suffix: `https://*.core.windows.net`. This (*) is a wildcard character for storage suffix. For example, `https://demo.table.core.windows.net`.
- Azure blob storage endpoint to upload or download disks or snapshots: `https://*.storage.azure.net`. This (*) is a wildcard character for blob storage import and export operations. For example, `https://md-impexp-xxxxx.z[00-50].blob.storage.azure.net`.
- Key vault service: `https://*.vault.azure.net`. This (*) is a wildcard character for the key vault name. For example, `https://<your-key-vault-name>.vault.azure.net`.
- Service bus suffix: `https://*.servicebus.windows.net`. This (*) is a wildcard character for namespaces created in the global Azure cloud. For example, `https://{ serviceNamespace } .servicebus.windows.net/{ path }`.

5. After selecting **Save**, you return to the **Connection Details** page. Select **Next** to continue to the next page.
6. Configure resources for the connection. Resources comprise the region and the network.
   - On the **Region** page, select a region.
   - On the **Network** page, do the following:
     - Type a 1–64 character resource name to help identify the region and network combination. A resource name cannot contain only blank spaces nor the characters `\/;:#.*?=<>|[]{ } "'()'`.
     - Select a virtual network/resource group pair. (If you have more than one virtual network with the same name, pairing the network name with the resource group provides unique combinations.) If the region you selected on the previous page does not have any virtual networks, return to that page and select a region that has virtual networks.
7. On the **Summary** page, view a summary of settings and select **Finish** to complete your setup.

Manage service principals and connections

This section details how you can manage service principals and connections:

- Configure Azure throttling settings

© 1997–2026 Citrix Systems, Inc. All rights reserved.

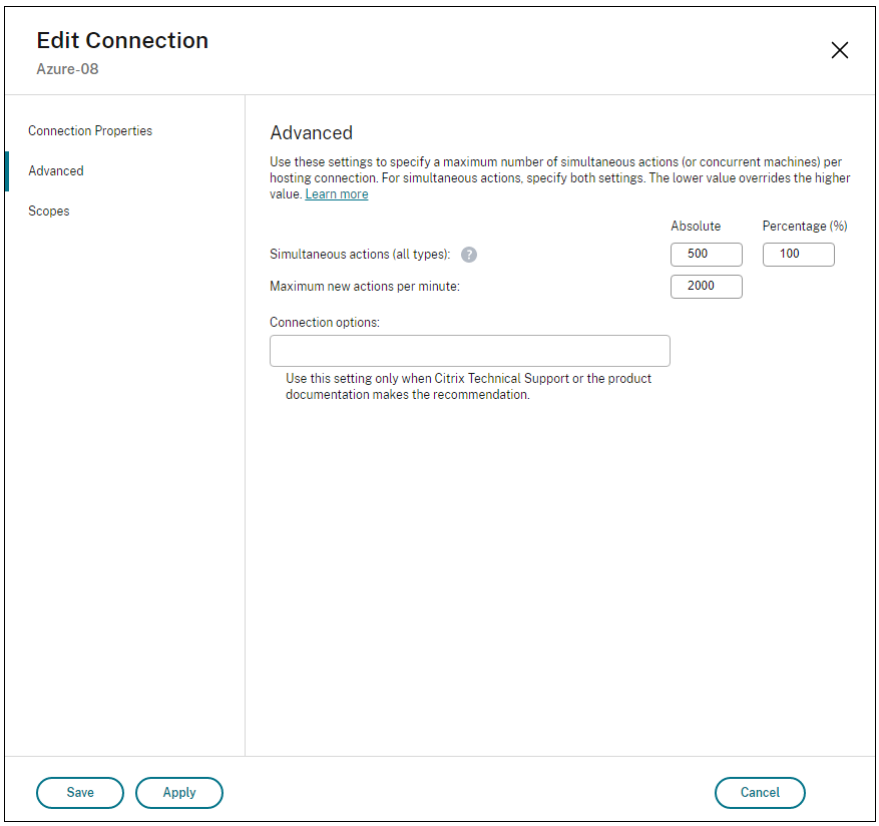
- Enable image sharing in Azure
- Add shared tenants to a connection using Web Studio
- Implement image sharing using PowerShell
- Manage the application secret and secret expiration date

Configure Azure throttling settings

Azure Resource Manager throttles requests for subscriptions and tenants, routing traffic based on defined limits, tailored to the specific needs of the provider. See Throttling Resource Manager requests on the Microsoft site for more information. Limits exist for subscriptions and tenants, where managing many machines can become problematic. For example, a subscription containing many machines might experience performance issues related to power operations.

> **Tip:**
>
> For more information, see Improving Azure performance with Machine Creation Services.

To help mitigate these issues, you can remove MCS internal throttling to use more of the available request quota from Azure.



We recommend the following optimal settings when powering VMs on or off in large subscriptions, for example, those containing 1,000 VMs:

- Absolute simultaneous operations: 500
- Maximum new operations per minute: 2000
- Max concurrency of operations: 500

Use Web Studio to configure Azure operations for a given Azure connection:

1. In Web Studio, select **Hosting** in the left pane.
2. Select the connection.
3. In the **Edit Connection** wizard, select **Advanced**.
4. On the **Advanced** page, use the configuration options to specify the number of simultaneous actions and maximum new actions per minute, and any additional connection options.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

MCS supports 500 maximum concurrent operations by default. Alternatively, you can use the Remote PowerShell SDK to set the maximum number of concurrent operations.

Use the **PowerShell** property, `MaximumConcurrentProvisioningOperations`, to specify the maximum number of concurrent Azure provisioning operations. When using this property, consider:

- Default value of `MaximumConcurrentProvisioningOperations` is 500.
- Configure the `MaximumConcurrentProvisioningOperations` parameter using the PowerShell command `Set-item`.

Enable image sharing in Azure

When creating or updating machine catalogs, you can select shared images from different Azure tenants and subscriptions (shared through the Azure Compute Gallery). To enable image sharing within or across tenants, you must make the necessary settings in Azure:

- Share images within a tenant (across subscriptions)
- Share images across tenants

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Share images within a tenant (across subscriptions) To select an image in Azure Compute Gallery that belongs to a different subscription, the image must be shared with the service principal (SPN) of that subscription.

For example, if there is a service principal (SPN 1), which is configured in Studio as:

Service principal: SPN 1

Subscription: subscription 1

Tenant: tenant 1

The image is in different subscription, which is configured in Studio as:

Subscription: subscription 2

Tenant: tenant 1

If you want to share the image in subscription 2 with subscription 1 (SPN 1), go to subscription 2, and share the resource group with SPN1.

The image must be shared with another SPN using Azure role-based access control (RBAC). Azure RBAC is the authorization system used to manage access to Azure resources. For more information on Azure RBAC, see the Microsoft document What is Azure role-based access control (Azure RBAC). To grant access, you assign roles to service principals at resource group scope with Contributor role. To assign Azure roles, you must have `Microsoft.Authorization/roleAssignments/write` permission, such as User Access Administrator or Owner. For more information on sharing images with another SPN, see the Microsoft document Assign Azure roles using the Azure portal.

For information on selecting an image from a different subscription using PowerShell commands, Select an image from a different subscription.

Share images across tenants To share images across tenants with Azure Compute Gallery, create an application registration.

For example, if there are two tenants (Tenant 1 and Tenant 2) and you want to share your image gallery with Tenant 1, then:

1. Create an application registration for Tenant 1. For more information, see Create the app registration.
2. Give Tenant 2 access to the application by requesting a sign-in using a browser. Replace `Tenant2 ID` with the tenant ID of Tenant 1. Replace `Application (client)ID` with the application ID of the application registration that you created. When done making the replacements, paste the URL into a browser and follow the sign-in prompts to sign into Tenant 2. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
https://login.microsoftonline.com/<Tenant 2 ID>/oauth2/authorize?
    client_id=<Application (client) ID>&response_type=code&
    redirect_uri=https%3A%2F%2Fwww.microsoft.com%2F
```

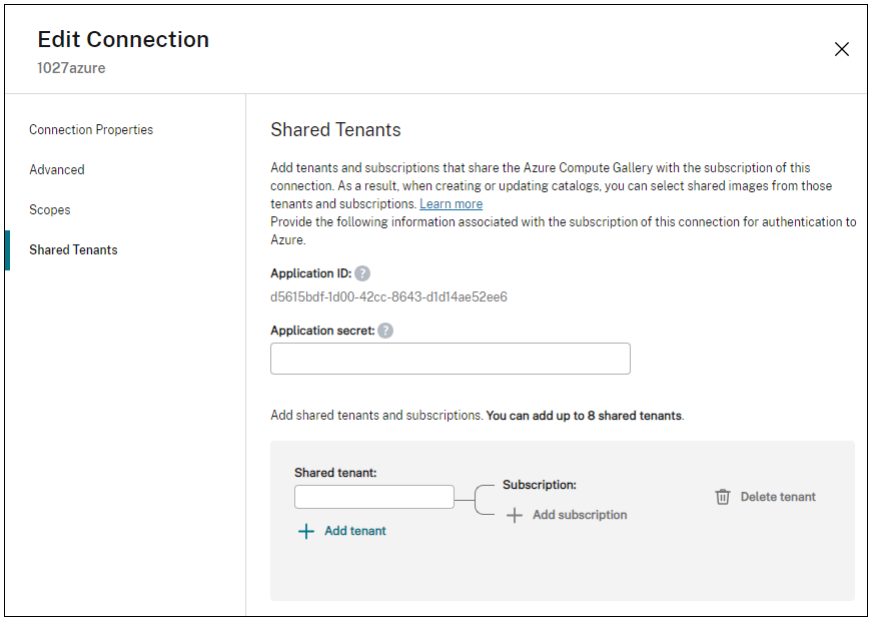
For more information, see Give Tenant 2 access.

3. Give the application access to the Tenant 2 resource group. Sign in as Tenant 2 and give the application registration access to the resource group which has the gallery image. For more information, see Authenticate requests across tenants.

To create a catalog using an image from a different tenant using PowerShell commands:

1. Update hosting connection custom properties with shared tenant IDs.
2. Select an image from a different tenant.

Add shared tenants to a connection using Web Studio



When creating or updating machine catalogs in Web Studio, you can select shared images from different Azure tenant and subscriptions (shared through the Azure Compute Gallery). The feature requires that you provide shared tenant and subscription information for associated host connections.

> **Note:**
>
> Make sure you've configured the necessary settings in Azure to enable image sharing across tenants. For more information, see Share images across tenants.

Complete the following steps for a connection:

1. In Web Studio, select **Hosting** in the left pane.
2. Select the connection and then select **Edit Connection** in the action bar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. In **Shared Tenants**, do the following:
    - Provide the application ID and application secret associated with the subscription of the connection. Citrix Virtual Apps and Desktops™ uses this information to authenticate to Microsoft Entra ID.
    - Add tenants and subscriptions that share the Azure Compute Gallery with the subscription of the connection. You can add up to 8 shared tenants and 8 subscriptions for each tenant.
4. When you are finished, select **Apply** to apply the changes you made and keep the window open, or select **OK** to apply the changes and close the window.

Implement image sharing using PowerShell

This section guides you through the processes of sharing images using PowerShell:

- Select an image from a different subscription
- Update hosting connection custom properties with shared tenant IDs
- Select an image from a different tenant

Select an image from a different subscription You can select an image in Azure Compute Gallery that belongs to a different shared subscription in the same Azure tenant to create and update MCS catalogs using PowerShell commands.

1. In the hosting unit root folder, Citrix creates a new shared subscription folder called `sharedsubscription`.
2. List all shared subscriptions in a tenant.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Get-ChildItem -Path "XDhyp:\HostingUnits\azres\sharedsubscription.
    folder"
```

3. Select one shared subscription, and then list all shared resource groups of that shared subscription.

```
Get-ChildItem -Path "XDhyp:\HostingUnits\azres\image.folder\abc123
    .sharedsubscription"
```

4. Select a resource group, and then list all galleries of that resource group.

```
Get-ChildItem -Path "XDhyp:\HostingUnits\azres\image.folder\abc123
    .sharedsubscription\ xyz.resourcegroup"
```

5. Select a gallery, and then list all image definitions of that gallery.

```
Get-ChildItem -Path "XDhyp:\HostingUnits\azres\image.folder\abc123
    .sharedsubscription\xyz.resourcegroup\testgallery.gallery"
```

6. Select one image definition, and then list all image versions of that image definition.

```
Get-ChildItem -Path "XDhyp:\HostingUnits\azres\image.folder\abc123
    .sharedsubscription\xyz.resourcegroup\sigtestdef.
    imagedefinition"
```

7. Create and update an MCS catalog using the following elements:

   - Resource group
   - Gallery
   - Gallery image definition
   - Gallery image version

   For information on how to create a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

Update hosting connection custom properties with shared tenant IDs Use `Set-Item` to update the hosting connection custom properties with shared tenant IDs and subscription IDs. Add a property `SharedTenants` in `CustomProperties`. The format of `Shared Tenants` is:

```
[{
 "Tenant":"94367291-119e-457c-bc10-25337231f7bd","Subscriptions":["7
    bb42f40-8d7f-4230-a920-be2781f6d5d9"] }
 ,{
 "Tenant":"50e83564-c4e5-4209-b43d-815c45659564","Subscriptions":["06
    ab8944-6a88-47ee-a975-43dd491a37d0"] }
 ]
```

For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-Item -CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-instance`">
<Property xsi:type=`"StringProperty`" Name=`"SubscriptionId`" Value=`"123`" />
<Property xsi:type=`"StringProperty`" Name=`"ManagementEndpoint`" Value=`"https://management.azure.com/`" />
<Property xsi:type=`"StringProperty`" Name=`"AuthenticationAuthority`" Value=`"https://login.microsoftonline.com/`" />
<Property xsi:type=`"StringProperty`" Name=`"StorageSuffix`" Value=`"core.windows.net`" />
<Property xsi:type=`"StringProperty`" Name=`"TenantId`" Value=`"123abc`" />
<Property xsi:type=`"StringProperty`" Name=`"SharedTenants`" Value=`"`[
    {
  'Tenant':'123abc', 'Subscriptions':['345', '567']  }
  ]`"` />
</CustomProperties>"
-LiteralPath @("XDHyp:\Connections\aazure") -PassThru -UserName "advc345" -SecurePassword
$psd
```

> **Note:**
>
> You can add more than one tenant. Each tenant can have more than one subscription.

Select an image from a different tenant You can select an image in the Azure Compute Gallery that belongs to a different Azure tenant to create and update MCS catalogs using PowerShell commands.

1. In the hosting unit root folder, Citrix creates a new shared subscription folder called `sharedsubscription`.
2. List all shared subscriptions.

   ```
   Get-ChildItem XDHyp:\HostingUnits\azres\sharedsubscription.folder
   ```

3. Select one shared subscription, and then list all shared resource groups of that shared subscription.

   ```
   Get-ChildItem XDHyp:\HostingUnits\azres\image.folder\abc123.sharedsubscription
   ```

4. Select a resource group, and then list all galleries of that resource group.

   ```
   Get-ChildItem XDHyp:\HostingUnits\azres\image.folder\abc123.sharedsubscription\ xyz.resourcegroup
   ```

5. Select a gallery, and then list all image definitions of that gallery.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Get-ChildItem XDHyp:\HostingUnits\azres\image.folder\abc123.
    sharedsubscription\xyz.resourcegroup\efg.gallery
```

6. Select one image definition, and then list all image versions of that image definition.

```
Get-ChildItem XDHyp:\HostingUnits\azres\image.folder\abc123.
    sharedsubscription\xyz.resourcegroup\efg.gallery\hij.
    imagedefinition
```

7. Create and update an MCS catalog using the following elements:

   - Resource group
   - Gallery
   - Gallery image definition
   - Gallery image version

   For information on how to create a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

Manage the application secret and secret expiration date

Be sure to change the application secret for a connection before the secret expires. You see a warning icon on the specific host connection in the **Hosting** node starting 14 days before the secret key expires. However, if the secret key expires, you receive errors.

Create an application secret in Azure You can create an application secret for a connection through the Azure portal.

1. Select **Microsoft Entra ID**.
2. From **App registrations** in Microsoft Entra ID, select your application.
3. Go to **Certificates & secrets**.
4. Click **Client secrets > New client secret**.
5. Provide a description of the secret and specify a duration. When you're done, select **Add**.

   > **Note:**
   >
   > Be sure to save the client secret because you cannot retrieve it later.

6. Copy the client secret value and the expiration date.
7. In the Web Studio, edit the corresponding connection and replace the content in the **Application secret** and **Secret expiration date** field with the values you copied.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Change the secret expiration date You can use the Web Studio to add or modify the expiration date for the application secret in use.

> **Note:**
>
> You see a warning icon on the specific host connection in the **Hosting** node starting 14 days before the secret key expires.

1. In the **Add Connection and Resources** wizard, right-click a connection, and click **Edit Connection**.
2. On the **Connection Properties** page, click **Secret expiration date** to add or modify the expiration date for the application secret in use.

Azure Extended Zones

Azure Extended Zones are small-footprint extensions of existing Azure regions, enabling organizations to run workloads closer to their users for improved performance and compliance. MCS on Azure now supports provisioning and power management for VMs in Extended Zones.

To learn more about Azure Extended Zones, see the Microsoft documentation: Azure Extended Zones documentation.

Use cases

This feature is applicable for persistent and non-persistent catalogs:

- Power-managed only VMs: You can import your existing extended zone VMs into a power-managed-only catalog and power-manage them with Citrix MCS.
- MCS Provisioned VMs: You can provision new VMs into an Extended Zone and manage them with MCS. This feature also includes support for image management workflows.

Limitations

There are currently several limitations for using Azure Extended Zones. Many of these limitations are due to current Azure constraints:

- Dedicated hosts are not supported.
- Capacity reservations are not supported.
- Proximity placement groups are not supported.
- Spot VMs are not supported.
- Availability Zones are not supported in Extended Zones.
- Only **StandardSSD_LRS** and **Premium_LRS** storage types are supported.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You cannot currently use the **UseSharedImageGallery** feature to save a mastered image into an Azure Compute Gallery (or Shared Image Gallery) in an Extended Zone. As a byproduct, Ephemeral OS disks are also not supported.
- If you are using an Azure Compute Gallery image version as your master image, ensure that replication has fully completed in the Extended Zone before attempting to use it. Attempting to use the image version before replication completes might result in deployment failure.

Prerequisites

Before using Extended Zones, ensure you have completed the following prerequisite steps:

1. Register with Azure:
    a) Extended Zones are not enabled by default.
    b) Register the `Microsoft.EdgeZones` resource provider in your Azure subscription: Register your subscription for resource provider Microsoft.EdgeZones.
    c) Register each required Extended Zone separately (ex: LosAngeles, Perth): Register for an Azure Extended Zone.
2. Prepare Citrix resources:
    a) Create a virtual network in your Extended Zone.
    b) Create master images and snapshots as needed.

Required permissions

To create a catalog in an Extended Zone, your service principal must have the following permission: `Microsoft.EdgeZones/extendedZones/read`.

For more on minimum required permissions, see Minimum permissions.

Configuration steps

1. Create a Hosting Unit in an Extended Zone

    Extended Zones, which use the `.extendedzone` type, are listed alongside regions in the Citrix MCS inventory. To provision into an extended zone, you must create a new hosting unit tied to that extended zone.

    Example: To create a hosting Unit in Los Angeles Extended Zone

```
1 $RootPath = "XDHyp:\Connections\MyConnectionName\Los Angeles.
     extendedzone"
2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$NetworkPath = "XDHyp:\Connections\MyConnectionName\Los Angeles.
    extendedzone\virtualprivatecloud.folder\MyResourceGroup.
    resourcegroup\MyExtendedZoneNetwork.virtualprivatecloud\
    MyExtendedZoneSubnet.network"

$HostingUnitPath = "XDHyp:\HostingUnits\MyHostingUnitName"

New-Item -HypervisorConnectionName MyConnectionName -NetworkPath @
    ($NetworkPath) -Path @($HostingUnitPath) -RootPath $RootPath -
    StoragePath @()
```

2. Create an MCS Catalog in an Extended Zone

   After creating your Hosting Unit, proceed with catalog creation using Studio or PowerShell. Ensure your catalog references the Extended Zone Hosting Unit.

Troubleshooting

If you encounter issues, check the following:

1. Ensure your subscription is registered for extended zones.
   a) Confirm your subscription is registered with the Microsoft.EdgeZones resource provider.
   b) Ensure that each Extended Zone is registered individually.
2. Verify your service principal has the new permission.
   a) Your service principal must have the `Microsoft.EdgeZones/extendedZones/read` permission.

Inventory items in Extended Zones may be shown as “Unknown Extended Zone”if registration or permissions are missing.

> **Note:**
>
> If creating a catalog in the parent region using a master image from an Extended Zone, registration and permissions for the Extended Zone are still required.

Use a pre-created network security group

Create a Deny-All network security group for image preparation instead of requesting Citrix to create and modify NSG. Edit the custom properties of the hosting unit using a PowerShell command `Set-Item` to include the parameter `NsgForPreparation` to provide the Deny-All network security group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prerequisites

Configure the following permissions required for a service principal:

- `Microsoft.Network/networkSecurityGroups/join/action`: Associate a network security group to a subnet or network interface
- `Microsoft.Network/networkSecurityGroups/read`: Gets network security group
- `Microsoft.Network/networkSecurityGroups/securityRules/read`: Gets rule

Add the pre-created Deny-All network security group

To add the pre-created Deny-All network security group, set the custom properties as follows on the hosting unit:

1. Open a PowerShell window using the Remote PowerShell SDK.
2. Run the following commands:

```
Add-PSSnapin citrix*.
cd XDHyp:\HostingUnits\
Dir
```

3. Select a hosting unit to retrieve the details:

```
Get-Item "XDHyp:\HostingUnits\<hostingunitname>"
```

4. Copy the CustomProperties to a notepad and append property setting `<Property xsi:type="StringProperty"Name="NsgForPreparation"Value="{ ResourceGroupName } /{ NetworkSecurityGroupName } "/>`. For example:

```
<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/
    machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-
    instance`"><Property xsi:type=`"StringProperty`" Name=`"
    NsgForPreparation`" Value=`{
 ResourceGroupName }
 /{
 NetworkSecurityGroupName }
 `"/></CustomProperties>
```

5. In the PowerShell window, assign a variable to the modified custom properties. For example:

```
$customProperty = "<CustomProperties xmlns=`"http://schemas.citrix
    .com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org
    /2001/XMLSchema-instance`"><Property xsi:type=`"StringProperty
    `" Name=`"NsgForPreparation`" Value=`"{
 ResourceGroupName }
 /{
 NetworkSecurityGroupName }
 `"/></CustomProperties>"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Run `$cred = Get-Credential`. If prompted, provide the connection credentials. The credentials are Azure Application ID and secret.
7. Run the following command.

```
Set-Item -PSPath XDHyp:\HostingUnits\<hostingunitname> -
    CustomProperties $customProperty -username $cred.username -
    Securepassword $cred.password
```

> **Important:**
>
> If you get a message stating SubscriptionId is missing, then replace all double quotes (“) with backtick followed by double quotes (“”) in the custom property.

8. Run `dir` to verify the updated `CustomProperties` settings.

> **Note:**
>
> It takes more than a minute for the updates to reflect.

Retrieve network security group details

To retrieve the network security group details, first retrieve the resource groups containing the network security group, and then retrieve the network security group based on the resource group name.

1. Retrieve the resource groups containing network security group. For example:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
    AdditionalDataFilter '{
 "containedresourcetypes": ["networksecuritygroup"] }
 '
```

2. Retrieve the network security group based on the resource group name. For example:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType securitygroup -MaxRecords 5 -
    AdditionalDataFilter '{
 "location": ["eastus", "westus"], "resourcegroup":["
     resourcegroupname"] }
 '
```

Filter empty resource groups

Use the PowerShell command `Get-HypInventoryItem` to filter empty resource groups while selecting a master image, machine profile, or prepared image during the machine catalog creation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Examples:

- Retrieve the maximum records in a page:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5
```

- Retrieve the maximum records in a page, and filter to find resource containers that have specific resources.

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
    AdditionalDataFilter '{
"containedresourcetypes": ["vm", "manageddisk", "snapshot", "
    imageversion", "storageaccount"] }
'
```

- Retrieve with skip to directly indicate the page, and filter to find resource containers that have specific resources.

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
    skip 20 -AdditionalDataFilter '{
"containedresourcetypes": ["vm", "manageddisk", "snapshot", "
    imageversion", "storageaccount"] }
'
```

- Use a token to retrieve the next page, and filter to find resource containers that have specific resources.

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
    AdditionalDataFilter '{
"containedresourcetypes": ["vm", "manageddisk", "snapshot", "
    imageversion", "storageaccount"] }
' -ContinuationToken '
    ew0KICAiJGlkIjogIjEiLA0KICAiTWF4Um93cyI6IDUsDQogICJSb3dzVG9Ta2lwIjogMjUs
    =='
```

- Retrieve all resource groups with tag Citrix internal tag and limit max records with `MaxRecords`.

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5
```

- Filter for machine profile (master image) with tag Citrix internal tag and limit max records with `MaxRecords`.

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
    ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
    AdditionalDataFilter '{
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
2   "containedresourcetypes": ["vm", "templatespecversion"] }
3   '
```

- Filter for Prepared image with tag Citrix internal tag and limit max records with `MaxRecords`.

```
1   Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
        ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
        AdditionalDataFilter '{
2   "containedresourcetypes": ["manageddisk", "snapshot", "
        imageversion"] }
3   '
```

- Filter for machine profile (Prepared image) with tag Citrix internal tag and limit max records with `MaxRecords`.

```
1   Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
        ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
        AdditionalDataFilter '{
2   "containedresourcetypes": ["vm", "templatespecversion"] }
3   '
```

- Filter for Image with tag Citrix internal tag and limit max records with `MaxRecords` and location.

```
1   Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
        ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 5 -
        AdditionalDataFilter '{
2   "containedresourcetypes": ["manageddisk", "snapshot", "
        imageversion", "storageaccount"], "location": ["eastus", "
        westus"] }
3   '
```

- Retrieve all resource group without consideration on tags `CitrixResource`.

```
1   Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\
        ctx04con01unit01" -ResourceType resourceGroup -MaxRecords 50 -
        AdditionalDataFilter '{
2   "containedresourcetypes": ["manageddisk", "snapshot", "
        imageversion", "storageaccount"] }
3   ' -Force $true
```

Connect to Azure Sovereign Airgap cloud environment

The Azure Sovereign Airgap cloud environment is suitable for top-secret workloads that must be on segregated network domains. You can connect to Azure Sovereign Airgap cloud environment using a custom property `DisableInstanceDiscovery` while creating a host connection.

```
1   <Property xsi:type="StringProperty" Name="DisableInstanceDiscovery"
        Value="true" />
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

See Create-HostingConnection.ps1 for more information on creating an Azure host connection.

Required Azure permissions

This section contains the minimum and general permissions required for Azure.

Minimum permissions

Minimum permissions give better security control. However, new features that require additional permissions fail because of using only minimum permissions.

Creating a host connection Add a new host connection using the information obtained from Azure.

```
"Microsoft.Network/virtualNetworks/read",
"Microsoft.Compute/virtualMachines/read",
"Microsoft.Compute/disks/read",
"Microsoft.Resources/providers/read",
"Microsoft.Resources/subscriptions/locations/read",
"Microsoft.Resources/tenants/read",
"Microsoft.Network/networkSecurityGroups/join/action",
"Microsoft.Network/networkSecurityGroups/read",
"Microsoft.Network/networkSecurityGroups/securityRules/read"
```

Power management of VMs Power on or off the machine instances.

```
"Microsoft.Compute/virtualMachines/read",
"Microsoft.Resources/subscriptions/resourceGroups/read",
"Microsoft.Compute/virtualMachines/deallocate/action",
"Microsoft.Compute/virtualMachines/start/action",
"Microsoft.Compute/virtualMachines/restart/action",
"Microsoft.Insights/diagnosticsettings/delete",
"Microsoft.Insights/diagnosticsettings/read",
"Microsoft.Insights/diagnosticsettings/write",
```

Creating, updating, or deleting VMs Create a machine catalog, then add, delete, update machines, and delete the machine catalog.

Following is the list of minimum permissions required when the master image is managed disk or snapshots are located in the same region as the hosting connection.

```
"Microsoft.Resources/subscriptions/resourceGroups/read",
"Microsoft.Resources/deployments/validate/action",
"Microsoft.Resources/tags/read",
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
"Microsoft.Resources/tags/write",
"Microsoft.Compute/virtualMachines/read",
"Microsoft.Compute/virtualMachines/write",
"Microsoft.Compute/virtualMachines/delete",
"Microsoft.Compute/virtualMachines/deallocate/action",
"Microsoft.Compute/snapshots/read",
"Microsoft.Compute/snapshots/write",
"Microsoft.Compute/snapshots/delete",
"Microsoft.Compute/snapshots/beginGetAccess/action",
"Microsoft.Compute/snapshots/endGetAccess/action",
"Microsoft.Compute/disks/read",
"Microsoft.Compute/disks/write",
"Microsoft.Compute/disks/delete",
"Microsoft.Compute/disks/beginGetAccess/action",
"Microsoft.Compute/disks/endGetAccess/action",
"Microsoft.Compute/locations/publishers/artifacttypes/types/versions/
    read",
"Microsoft.Compute/skus/read",
"Microsoft.Compute/virtualMachines/extensions/read",
"Microsoft.Compute/virtualMachines/extensions/write",
"Microsoft.Features/providers/features/read",
"Microsoft.Network/virtualNetworks/read",
"Microsoft.Network/virtualNetworks/subnets/join/action",
"Microsoft.Network/virtualNetworks/subnets/read",
"Microsoft.Network/networkSecurityGroups/read",
"Microsoft.Network/networkSecurityGroups/write",
"Microsoft.Network/networkSecurityGroups/delete",
"Microsoft.Network/networkSecurityGroups/join/action",
"Microsoft.Network/networkInterfaces/read",
"Microsoft.Network/networkInterfaces/write",
"Microsoft.Network/networkInterfaces/delete",
"Microsoft.Network/networkInterfaces/join/action",
"Microsoft.Network/locations/usages/read",
"Microsoft.Compute/capacityReservationGroups/capacityReservations/read"
```

You need the following extra permissions based on minimal permissions for the following features:

- If the master image is a VHD in a storage account located in the same region as the hosting connection:

```
"Microsoft.Storage/storageAccounts/read",
"Microsoft.Storage/storageAccounts/listKeys/action",
```

- If the master image is an ImageVersion from the Shared Image Gallery:

```
"Microsoft.Compute/galleries/read",
"Microsoft.Compute/galleries/images/read",
"Microsoft.Compute/galleries/images/versions/read",
```

- If the master image is a managed disk, then the snapshots, or VHD is in a region different from the region of hosting connection:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
"Microsoft.Storage/storageAccounts/read",
"Microsoft.Storage/storageAccounts/listKeys/action",
"Microsoft.Storage/storageAccounts/write",
"Microsoft.Storage/storageAccounts/delete",
"Microsoft.Storage/checknameavailability/read",
"Microsoft.Storage/locations/usages/read",
"Microsoft.Storage/skus/read",
```

- If you use Citrix-managed resource group:

```
"Microsoft.Resources/subscriptions/resourceGroups/write",
"Microsoft.Resources/subscriptions/resourceGroups/delete",
```

- If you put the master image in Azure Compute Gallery (formerly Shared Image Gallery) in a shared tenant or subscription:

```
"Microsoft.Compute/galleries/write",
"Microsoft.Compute/galleries/images/write",
"Microsoft.Compute/galleries/images/versions/write",
"Microsoft.Compute/galleries/read",
"Microsoft.Compute/galleries/images/read",
"Microsoft.Compute/galleries/images/versions/read",
"Microsoft.Compute/galleries/delete",
"Microsoft.Compute/galleries/images/delete",
"Microsoft.Compute/galleries/images/versions/delete",
"Microsoft.Resources/subscriptions/read",
```

- If you use Azure dedicated host support:

```
"Microsoft.Compute/hostGroups/read",
"Microsoft.Compute/hostGroups/write",
"Microsoft.Compute/hostGroups/hosts/read",
```

- If you use Server Side Encryption (SSE) with Customer Managed Keys (CMK):

```
"Microsoft.Compute/diskEncryptionSets/read",
```

- If you deploy VMs using ARM templates (machine profile):

```
"Microsoft.Resources/deployments/write",
"Microsoft.Resources/deployments/operationstatuses/read",
"Microsoft.Resources/deployments/read",
"Microsoft.Resources/deployments/delete",
"Microsoft.Insights/DataCollectionRuleAssociations/Read",
"Microsoft.Insights/dataCollectionRules/read",
```

- If you use Azure template spec as a machine profile:

```
"Microsoft.Resources/templateSpecs/read",
"Microsoft.Resources/templateSpecs/versions/read",
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Creating, updating, and deleting machines with unmanaged disk Following is the list of minimum permissions required when the master image is VHD and use resource group as provided by admin:

```
"Microsoft.Resources/subscriptions/resourceGroups/read",
"Microsoft.Resources/tags/read",
"Microsoft.Resources/tags/write",
"Microsoft.Storage/storageAccounts/delete",
"Microsoft.Storage/storageAccounts/listKeys/action",
"Microsoft.Storage/storageAccounts/read",
"Microsoft.Storage/storageAccounts/write",
"Microsoft.Storage/checknameavailability/read",
"Microsoft.Storage/locations/usages/read",
"Microsoft.Storage/skus/read",
"Microsoft.Compute/virtualMachines/deallocate/action",
"Microsoft.Compute/virtualMachines/delete",
"Microsoft.Compute/virtualMachines/read",
"Microsoft.Compute/virtualMachines/write",
"Microsoft.Resources/deployments/validate/action",
"Microsoft.Network/networkInterfaces/delete",
"Microsoft.Network/networkInterfaces/join/action",
"Microsoft.Network/networkInterfaces/read",
"Microsoft.Network/networkInterfaces/write",
"Microsoft.Network/networkSecurityGroups/delete",
"Microsoft.Network/networkSecurityGroups/join/action",
"Microsoft.Network/networkSecurityGroups/read",
"Microsoft.Network/networkSecurityGroups/write",
"Microsoft.Network/virtualNetworks/subnets/read",
"Microsoft.Network/virtualNetworks/read",
"Microsoft.Network/virtualNetworks/subnets/join/action",
"Microsoft.Network/locations/usages/read",
```

Cost Management Following is the minimum permission required to retrieve VM pricing:

```
"Microsoft.Consumption/pricesheets/read"
```

Following is the minimum permission required to retrieve VM cost:

```
"Microsoft.CostManagement/query/read"
```

> **Note:**
>
> To view the **Cost Insights** tab for an Azure machine catalog, you must have **Cost Management > Manage > Read cost** permission (default for Cloud Administrators). For information on **Cost Insights** tab, see View catalog details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

General permission

Contributor role has full access to manage all resources. This set of permissions does not block you from getting new features.

The following set of permissions provides the best compatibility going forward although it does include more permissions than needed with the current feature set:

```
"Microsoft.Compute/diskEncryptionSets/read",
"Microsoft.Compute/disks/beginGetAccess/action",
"Microsoft.Compute/disks/delete",
"Microsoft.Compute/disks/endGetAccess/action",
"Microsoft.Compute/disks/read",
"Microsoft.Compute/disks/write",
"Microsoft.Compute/galleries/delete",
"Microsoft.Compute/galleries/images/delete",
"Microsoft.Compute/galleries/images/read",
"Microsoft.Compute/galleries/images/versions/delete",
"Microsoft.Compute/galleries/images/versions/read",
"Microsoft.Compute/galleries/images/versions/write",
"Microsoft.Compute/galleries/images/write",
"Microsoft.Compute/galleries/read",
"Microsoft.Compute/galleries/write",
"Microsoft.Compute/hostGroups/hosts/read",
"Microsoft.Compute/hostGroups/read",
"Microsoft.Compute/hostGroups/write",
"Microsoft.Compute/snapshots/beginGetAccess/action",
"Microsoft.Compute/snapshots/delete",
"Microsoft.Compute/snapshots/endGetAccess/action",
"Microsoft.Compute/snapshots/read",
"Microsoft.Compute/snapshots/write",

Validate host connection in Azure non-secret environment

You can validate permissions on a host connection to do tasks related to creating and managing MCS machine catalogs. This implementation helps you to find out the missing permissions required for different scenarios such as creating, deleting, and updating VMs, power management of VMs, ahead of time so that you can avoid being blocked at critical times.

You can validate the permissions on a host connection using the PowerShell command `Test-HypHypervisorConnection`. The result from the command is captured as a list where each item in the list is broken into three sections.

- Category: The action or task a user can do to create and manage an MCS machine catalog.
- Corrective Action: The step an admin must do to resolve a users' missing permissions discrepancy.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Missing permission: The list of missing permissions for a category.

To validate the permissions, do the following:

1. Create a host connection to Azure.
2. Open a PowerShell window from the Delivery Controller™ host.
3. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
4. Run the following command to verify if you have the required permissions to test a connection.

```
Test-HypHypervisorConnection -LiteralPath "XDHyp:\Connections\
    AzureCon"
```

Role level permission required for the SPN:

- Microsoft.Authorization/roleDefinitions/read (at subscription level or the resource group level if resource group is provided)
- Microsoft.Authorization/roleAssignments/read (at subscription level or the resource group level if resource group is provided)

API level permissions required for the SPN:

Microsoft.Graph:

- Application.Read.All
- Directory.Read.All
- ServicePrincipalEndpoint.Read.All

5. After you add the missing permissions required to look up your permissions, run the following command to verify if you have permissions in the various categories.

   Example:

   To test a connection at the subscription level with higher level of authorization required:

```
Test-HypHypervisorConnection -LiteralPath XDHyp:\Connections\
    AzureCon -SecurePassword $password -UserName 922e65d5-38ae-4cf5
    -xxxx-xxxxxxxxx
```

   Example:

   To test a connection at the resource group level without high level of authorization:

```
Test-HypHypervisorConnection -LiteralPath XDHyp:\Connections\
    testles -CustomProperties $customProperties | Format-List
```

> **Note:**
>
> The CustomProperties parameter is used to provide the resource group level because re-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> source group is a connection specific information.

Example:

To test a connection with the higher level of authorization at resource group level:

```
Test-HypHypervisorConnection -LiteralPath XDHyp:\Connections\
    testles -SecurePassword $password -UserName 922e65d5-38ae-4cf5
    -832b-54122196b7dd -CustomProperties $customProperties
```

For information on permissions, see Required Azure permissions.

Validate host connection in Azure secret environment

You can validate if a host connection has the required permissions in an Azure secret environment using a PowerShell command `Test-HypHypervisorConnection`.

However, to successfully get the validation result, create or update an existing host connection to have a custom property `AuthenticationObjectId`. This property stores the Object ID of the service principal tied to the hosting connection.

> **Note:**
>
> Get the Object ID of the Service Principal from the Azure portal. Do not use the ID of the Application.

Create or update a host connection to include AuthenticationObjectId

Use `New-Item` to create a host connection and add `AuthenticationObjectId` as a custom property. Example:

```
New-Item -ConnectionType 'Azure' -HypervisorAddress @('http://
    hypervisorhost1.example.com','http://hypervisorhost2.example.com')`
    -LoggingId $loggingId -Path @('XDHyp:\\Connections\\Example') -
        Persist -Scope @() `
    -Password 'Password' -UserName 'root' -CustomProperties <Property
        xsi:type="StringProperty" Name="AuthenticationObjectId" Value="
        Object ID of the service principal"/>
```

Use `Set-Item` to update an existing host connection to add `AuthenticationObjectId` as a custom property. The steps to do this are:

1. Open a PowerShell window using the Remote PowerShell SDK.
2. Run the following commands:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Add-PSSnapin citrix*.
cd XDHyp:\Connections\
dir
```

3. Copy the `CustomProperties` from the connection to a notepad and append property setting `<Property xsi:type="StringProperty"Name="AuthenticationObjectId" Value="Object ID of the service principal"/>` to the `CustomProperties`.
4. In the PowerShell window, assign a variable to the modified custom properties.
5. Run `$cred = Get-Credential`. If prompted, provide the connection credentials. The credentials are Azure Application ID and secret.
6. Run `Set-Item -PSPath XDHyp:\Connections\<Connection_Name> -CustomProperties $customProperty -username $cred.username -Securepassword $cred.password`.
7. Run `dir` to verify the updated `CustomProperties` settings.

```
Set-Item -PSPath XDHyp:\Connections\$connName -CustomProperties <
    Property xsi:type="StringProperty" Name="AuthenticationObjectId
    " Value="Object ID of the service principal"/> -username $cred.
    username -Securepassword $cred.password
```

Validate the host connection for the permissions

To validate the host connections for the required roles and permissions, run the following commands:

- If you have roles and permissions assigned at the subscription level:

```
Test-HypHypervisorConnection -LiteralPath XDHyp:\Connections\<
    Your-HostingConnection>
```

- If you have roles and permissions assigned at the resource group level:

```
Test-HypHypervisorConnection -LiteralPath XDHyp:\Connections\<
    Your-HostingConnection>  -CustomProperties $CustomProperties

$CustomProperties = '<CustomProperties xmlns:xsi="http://www.w3.
    org/2001/XMLSchema-instance" xmlns="http://schemas.citrix.com
    /2014/xd/machinecreation">'`
+ '<Property xsi:type="StringProperty" Name="ResourceGroups"
    Value="ExampleResourceGroup" />'`
+ '</CustomProperties>'
```

Connection to Microsoft System Center Virtual Machine Manager

May 13, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Microsoft System Center Virtual Machine Manager (VMM).

> **Note:**
>
> Before creating a connection to VMM, you need to first finish setting up your VMM account as a resource location. See Microsoft System Center Virtual Machine Manager virtualization environments.

Create a connection

If you used MCS to provision VMs, do the following in the connection creation wizard:

- Enter the address as a fully qualified domain name of the host server.
- Enter credentials for the administrator account that you set up earlier. This account must have permission to create new VMs.
- In the Host Details dialog box, select the cluster or standalone host to use when creating VMs.

  > **Important**
  >
  > Browse for a cluster or standalone host even if you are using a single Hyper-V host deployment.

Connection to Nutanix

August 14, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Nutanix.

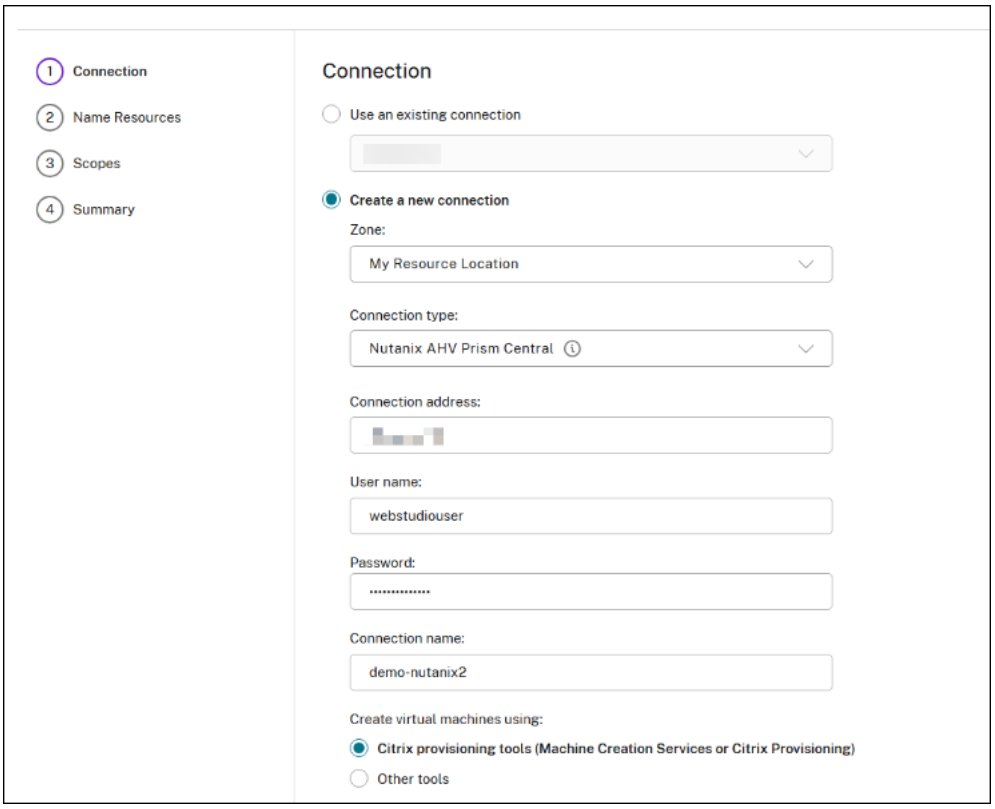
> **Note:**
>
> Before creating a connection to Nutanix, you need to first finish setting up your Nutanix account as a resource location. See Nutanix virtualization environments.

Nutanix AHV Prism Central host connection

See the Prerequisites before creating Nutanix AHV Prism Central host connection.

You can create a connection using one of the following:

- Web Studio
- PowerShell commands



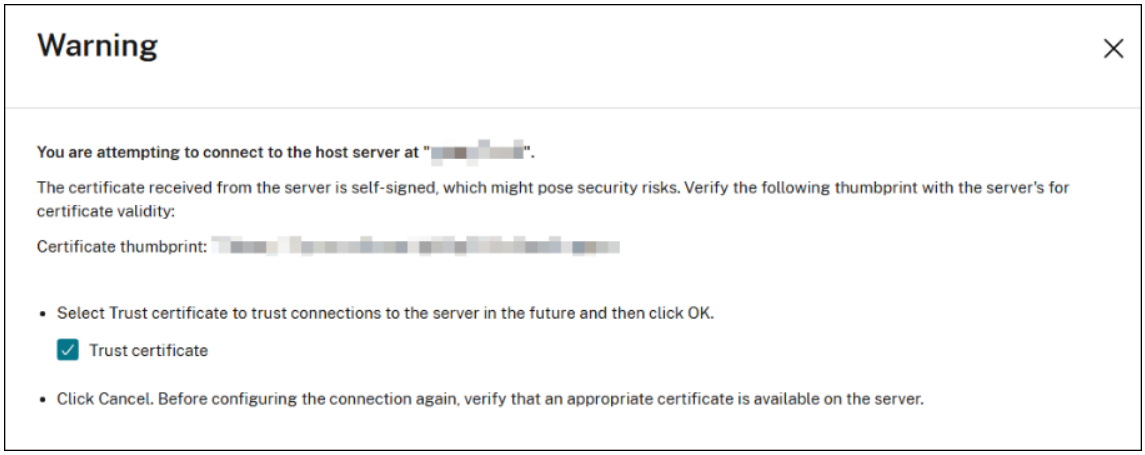
Limitation

- The Nutanix AHV Prism Central host connection doesn't support duplicate object names for items such as templates and networks. Selecting such items for catalog creation might lead to unexpected behavior.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

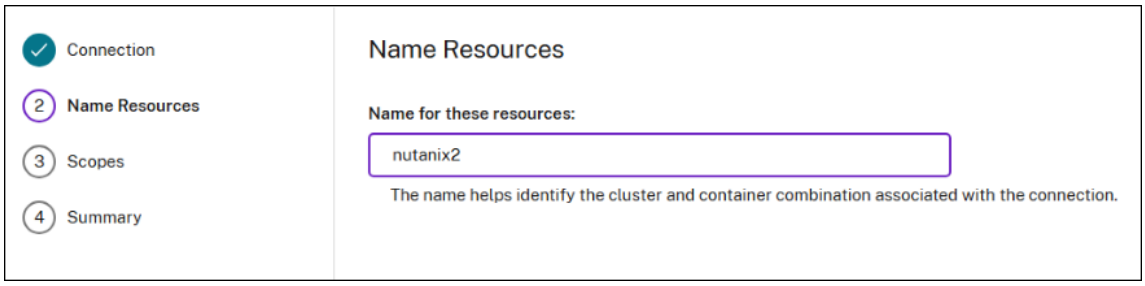
Create a connection using Web Studio

1. Sign in to Citrix Cloud.
2. Click **Manage**.
3. Select **Hosting** in the left pane.
4. Click **Add Connections and Resources** in the action bar.
5. On the **Connection** page:
   a) Select **Create a new connection**.
   b) Select **Nutanix AHV Prism Central** as the connection type.
   c) Enter the IP address of your Nutanix AHV Prism Central as the connection address.
   d) Enter your administrative credentials and a friendly connection name.
   e) Select **Citrix provisioning tools (Machine Creation Services™ or Citrix Provisioning)**.
   f) Click **Next**.



> **Note:**
>
> While creating the host connection, network or cluster selection is not required. A hosting unit name is only needed. Select the network and cluster while creating the machine

© 1997–2026 Citrix Systems, Inc. All rights reserved.



> catalog.

6. After you click **Next**, Citrix Virtual Apps and Desktops receives a private CA-signed certificate and you see a **Warning** page. For information, see Secure connections to the Nutanix Prism Central.

   Compare the received thumbprint with the server's for the certificate validity. If it's valid, select **Trust certificate** and click **OK** to proceed with connection creation. Citrix Virtual Apps and Desktops then trusts the certificate and stores the thumbprint for future validation.

7. On the **Name Resources** page, add a unique name of the resources. Click **Next**.

8. On the **Scopes** page, select one or more scopes for this host.
9. On the **Summary** page, check the configuration and click **Finish**.

> **Note:**
>
> The Nutanix AHV Prism Central connection can co-exist with other types of Nutanix connections.

Secure connections to the Nutanix Prism Central

The Nutanix SSL thumbprint feature simplifies certificate trust when establishing a host connection to a Nutanix Prism Central hypervisor. This feature enables the storage of an untrusted certificate's thumbprint in the site database, ensuring that Citrix Virtual Apps and Desktops consistently recognizes the hypervisor as trusted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When creating a Nutanix host connection, a **Warning** page is displayed, presenting the certificate of the machine you are connecting to and allowing you to decide whether to trust it.

Create a connection using PowerShell

1. Open the PowerShell window.
2. Run `asnp citrix*`.
3. Set following parameters:

```
$ConnectionName = "Name of the connection"
$UserName = "Username of the account on hypervisor"
$ZoneUid = "UID of the zone where the hosting connection will be created"
$HypervisorAddress = "The IP address of the hypervisor"
$SSLThumbprint = "The Nutanix PC SSL thumbprint can be set using PowerShell SDK"
$connectionPath = "XDHyp:\Connections\" + $ConnectionName
$SecureUserInput = Read-Host "Enter the password for the user $($UserName)" -AsSecureString
$EncryptedUserInput = $SecureUserInput | ConvertFrom-SecureString
$SecurePass = ConvertTo-SecureString -String $EncryptedUserInput
```

4. Create an item for the new hosting connection. For example:

```
$connection = New-Item -Path @($connectionPath) -ConnectionType "Custom" -HypervisorAddress ` @($HypervisorAddress) -Persist -PluginId "AcropolisHypervisorPCFactory" -Scope @() ` -SecurePassword $SecurePass -SSLThumbprint @($SSLThumbprint) -UserName $UserName -ZoneUid ` $ZoneUid
```

5. Create a broker hypervisor connection. For example:

```
New-BrokerHypervisorConnection -HypHypervisorConnectionUid $connection.HypervisorConnectionUid
```

Create a hosting unit When you create a hosting unit using the PowerShell command, provide the following required parameters:

- `$HostUnitName`: Name of Hosting Unit to create
- `ConnectionName`: Name of the hypervisor connection previously created

1. Open the PowerShell window.
2. Run `add-pssnapin citrix*`.
3. Run PowerShell commands to create the hosting unit. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

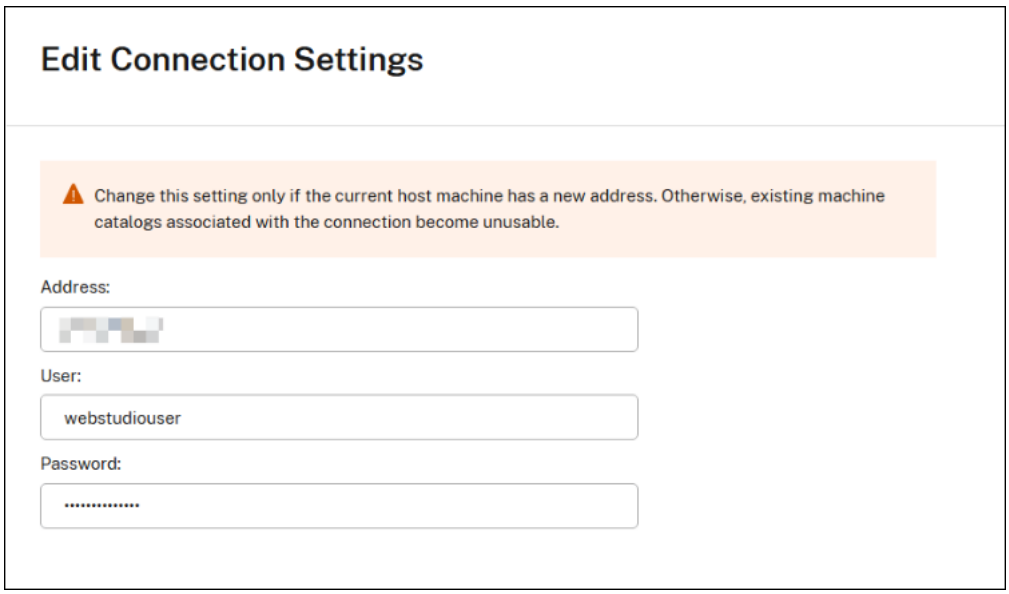
```
$hostUnitPath = "XDHyp:\HostingUnits\" + $HostUnitName
New-Item -Path @($hostUnitPath) -RootPath $connectionPath -
    HypervisorConnectionName $ConnectionName -CustomProperties "" -
    NetworkPath @() -StoragePath @()
```

> **Note:**
>
> While creating the host connection, network or cluster selection is not required. A hosting unit name is only needed. Select the network and cluster while creating the machine catalog.

Manage host connections

You can manage an existing host connection using:

- Web Studio
- PowerShell

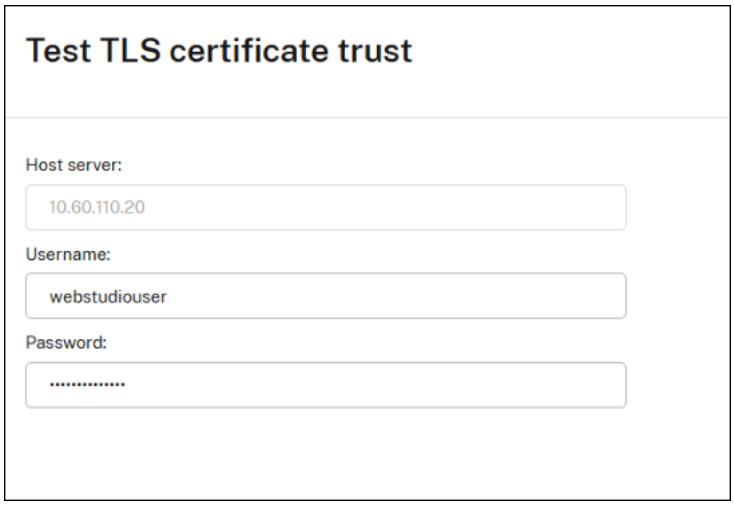


Manage the host connection using Web Studio After creating a host connection, navigate to the **Hosting** node on Web Studio and right-click a connection to do the following:

- **Delete Connection**
- **Rename Connection**
- **Edit Connection**
- **Turn on Maintenance Mode**
- **View Machines**
- **Test Connection**
- **Test TLS certificate trust**

Edit a connection using Web Studio

1. Right-click a connection and click **Edit Connection**.
2. On the **Connection Properties** page, click **Edit settings**.
3. On the **Edit Connection settings** page, you can change the certificate information and click **Save**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Select **Trust certificate** on the **Warning** page to trust the new certificate thumbprint.

Test TLS certificate trust

1. Right-click a connection and click **Test TLS certificate trust**.
2. On the **Test TLS Certificate Trust** page, you can change the certificate information, then click **Test**.

If the test result is not successful, then change the certificate information of the connection using Edit a connection using Web Studio.

Manage the host connection using PowerShell You can use PowerShell commands to:

- Change or update the user credential for a host connection. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$UserName = "Username of the account on hypervisor"
$SecureUserInput = Read-Host "Enter the password for the user $(
    $UserName)" -AsSecureString
$EncryptedUserInput = $SecureUserInput | ConvertFrom-SecureString
$SecurePass = ConvertTo-SecureString -String $EncryptedUserInput
Set-Item  -LiteralPath @("XDHyp:\Connections\<Host connection
    name>")  -SecurePassword $SecurePass -UserName $UserName
```

- Reset SSLThumbprint. For example:

```
$SSLThumbprint =  "The Nutanix PC SSL thumbprint value"
Set-Item  -LiteralPath @("XDHyp:\Connections\<Host connection
    name>")  -SecurePassword $SecurePass -UserName $UserName -
    SSLThumbprint $SSLThumbprint
```

Required permissions

The following permissions are required for the administrative account used for a Nutanix AHV Prism Central host connection.

Creating a host connection *Cluster:*

Nutanix AHV, Nutanix AHV PC, or Nutanix AHV DRaaS host connection

1. Sign in to Citrix Cloud.
2. Click **Manage**.
3. Select **Hosting** in the left pane.
4. Click **Add Connections and Resources** in the action bar.
5. On the **Connection** page, the following connection types are available for selection:
    - **Nutanix AHV**: specify the Prism Element (PE) cluster address, and credentials, and a name for the connection. On the **Network** page, select network(s) and give a name for the hosting unit.

      > **Note:**
      >
      > If you deploy machines using Nutanix AHV (Prism Element) as the resource, select the container where the VM's disk resides.

    - **Nutanix AHV PC**: specify the Prism Central (PC) address, credentials, and a name for the connection. On the **Network** page, select the network, cluster from the list, and give a name for the hosting unit.

      > **Note:**
      >
      > The connection type **Nutanix AHV PC** is only used for creating connection to Nutanix Cloud Cluster (NC2) on Azure. Also, a machine catalog can only be hosted on a single cluster in an NC2 on Azure connection. This type of connection requires a Nutanix plug-in installed on Cloud Connectors

    - **Nutanix AHV DRaaS**: specify your address and user name, and then import the public and private keys contained in your Nutanix DRaaS credential files (`.pem`). (Public and private keys are generated in Nutanix DRaaS cloud by Nutanix DRaaS administrators.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To import the key, locate your credential file, open it with Notepad (or any text editor), and then copy the content. After that, return to the **Connection** page, select **Import key**, paste the content, and then select **Save**. Do not change the credential content or its format.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For Nutanix specific information, see Create a Nutanix catalog

More information

- Create and manage connections and resources
- Nutanix virtualization environments
- Nutanix cloud and partner solutions

Connection to Nutanix cloud and partner solutions

May 13, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Nutanix cloud and partner solutions.

Nutanix AHV Prism Central

Citrix Virtual Apps and Desktops supports Nutanix Cloud Clusters (NC2) in the following cloud hypervisors for Citrix-managed Nutanix AHV Prism Central plug-in.

- AWS
- Microsoft Azure

> **Note:**
>
> - Before creating a connection to NC2 on AWS and Azure, prepare the resources in the cloud platform. See Nutanix cloud and partner solutions.
> - For the permissions to create hosting connection, power management of VMs, and provisioning of catalogs, see Required permissions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Connect to NC2 on Azure and AWS

Connecting to a Nutanix Cloud Cluster (NC2) on Azure or AWS requires access to a deployed Prism Central instance and credentials with the Prism Admin role.

You can create a host connection using:

- Web Studio
- PowerShell

For the complete information on connection, see Connection to Nutanix AHV Prism Central

Nutanix Prism Element

Citrix Virtual Apps and Desktops supports Nutanix Cloud Clusters (NC2) in the following cloud hypervisor for the Nutanix Prism Element plug-in.

- AWS

Connect to Nutanix Prism

After you create a Nutanix cluster, connect to Nutanix Prism.
To connect to Nutanix Prism:

1. Create a bastion VM in the 10.0.129.0/24 subnet.
2. RDP into the bastion VM, go to the URL of the **Prism Element** you copied in the previous section.
3. Log in using the default credentials: `admin:nutanix/4u`. Remember to change the password.

Create a VM on the Nutanix Cluster

After connecting to **Nutanix Prism**, create VMs on the Nutanix cluster.

If the VM needs Internet access

1. Go to the AWS console.
2. Create a new subnet 10.0.130.0/24 in the same VPC as the one created by Nutanix CFS.
3. Add a route to the route table of this subnet to direct all none local traffic to the NAT gateway above.
4. RDP into the bastion VM, go to the URL of the **Prism Element** you copied in the previous section and login.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Add a new network. Go to **Settings>Network Configuration>Create Subnet**. Use the same subnet 10.0.130.0/24 used in AWS.
6. Create all the VMs (AD, CC, VDA, and so on) in that new subnet.

If the VM does not need Internet access

1. RDP into the bastion VM, go to the URL of the **Prism Element** you copied in the previous section and login.
2. Add a new network. Go to **Settings>Network Configuration>Create Subnet**. Use the subnet 10.0.129.0/24.
3. Create all the VMs (AD, CC, VDA, and so on) in that subnet.

> **Tip:**
>
> Make sure that the time and timezone information in the VMs are set up correctly. This is especially true for AD.

Create host connection

1. From Web Studio, select **Hosting** in the left pane.
2. Click **Add Connection and Resources**.
3. On the **Connection** screen, select **Create a new Connection**, and in the **Connection address**, enter `https://xxx.xxx.xxx.xxx:9440`.
4. Follow the UI to complete the wizard.

> **Note:**
>
> All connector VMs must have the Nutanix plug-in installed for the Nutanix option to be available in Web Studio, even if the plug-ins are not used in the Nutanix zone.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For Nutanix specific information, see Create a Nutanix catalog

Connection to Oracle C3 (Preview)

May 13, 2026

The Create and manage connections and resources article describes the generic connection workflow. The following information covers Oracle C3-specific details.

> **Note:**
>
> Before creating a connection to Oracle C3, finish setting up your Oracle C3 environment. See Oracle C3 virtualization environments.

Create a connection

You can create a connection to Oracle C3 using:

- Web Studio
- PowerShell commands

Create a connection using Web Studio

1. In **Add Connection and Resources**, select **Oracle C3** as the connection type.
2. Under **Oracle Compute Cloud@Customer configuration**, select **Import configuration**, and paste the Oracle C3 configuration file (`.ini`) content.
3. Under **Private key**, select **Add key**, and paste the private key content from the credential file (`.pem`).
4. Enter a friendly **Connection name**.
5. Continue with the wizard and validate connectivity.

> **Note:**
>
> **Service account ID** is extracted from the imported configuration and cannot be edited directly in Web Studio. The Oracle C3 endpoint is also derived from the `region` value in the imported configuration and can't be entered manually in this flow. Enter `region` in Oracle C3 format as `<service_name>.<domain_name>` (FQDN-style value).

When you import configuration in Web Studio, the following keys are only imported. All other keys are ignored:

- `user`
- `fingerprint`
- `tenancy`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- region

Connection setup can stop in the following certificate scenarios:

- Certificate validation or thumbprint verification fails: connection creation is blocked until the issue is resolved.

Create a connection using PowerShell commands

When creating a connection using PowerShell, provide:

- Oracle C3 endpoint address, typically https://iaas.<service_name>.<domain_name>.
- Oracle C3 user OCID from the configuration file (user).
- Private key content from the credential file (.pem), passed as a secure string.
- CustomProperties XML containing TenancyOcid, Fingerprint, and Region.
- SSL thumbprint for certificate trust validation, when required.

Example pattern:

```
$CustomProperties = '<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">' +

'<Property xsi:type="StringProperty" Name="TenancyOcid" Value="' + $TenancyOcid + '" />' +

'<Property xsi:type="StringProperty" Name="Fingerprint" Value="' + $Fingerprint + '" />' +

'<Property xsi:type="StringProperty" Name="Region" Value="' + $Region + '" />' +

'</CustomProperties>'

$PrivateKey = ConvertTo-SecureString $PrivateKeyContent -AsPlainText -Force

New-Item -ConnectionType "Custom" `

-HypervisorAddress $Endpoint `

-Path @("XDHyp:\Connections\$ConnectionName") `

-Persist `

-PluginId "OracleC3PluginFactory" `

-CustomProperties $CustomProperties `
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
24
25 -SecurePassword $PrivateKey `
26
27 -UserName $UserOcid `
28
29 -SslThumbprint $SslThumbprint
```

> **Note:**
>
> Set `$Region` to the Oracle C3 region value in `<service_name>.<domain_name>` format. Use `-SslThumbprint` when required by your certificate trust policy.

Certificate and thumbprint validation

For a successful Oracle C3 connection, certificate validation must succeed and thumbprint values must be correct where required.

Manage connections

This section covers:

- Fix certificate issues using Web Studio
- Update thumbprint values using PowerShell

Fix certificate issues

When certificate issues occur, Citrix blocks the Oracle C3 connection to protect workload operations. An error icon appears next to the connection in the **Host connections** list.

To fix:

1. Open the connection from **Host connections**.
2. View **Troubleshoot** details and identify the certificate problem.
3. Select **Edit Connection > Edit settings**.
4. For Oracle C3, re-import the configuration and private key if prompted. When both are available, save changes to trigger a new round of certificate validation, as during connection creation, and validate/trust the updated certificate thumbprint when presented.

Update thumbprint values

You can update thumbprint values after creation by using `Set-Item`.

1. Get connection details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Get-Item -LiteralPath xdhyp:\connections\<OracleC3ConnectionName>
```

2. Update thumbprint value.

```
Set-Item -LiteralPath xdhyp:\connections\<OracleC3ConnectionName>
    `

-Username <UserName> `

-SslThumbprint <ThumbprintValue>
```

3. Verify updated value:

```
Get-Item -LiteralPath xdhyp:\connections\<OracleC3ConnectionName>
```

> **Note:**
>
> Update fails if the supplied thumbprint is incorrect or does not match server certificate trust.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For Oracle C3 specific information, see Create an Oracle C3 machine catalog

- Create and manage connections and resources
- Oracle C3 virtualization environments

Connection to Red Hat OpenShift

May 13, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to Red Hat OpenShift.

> **Note:**
>
> Before creating a connection to Red Hat OpenShift, you need to first finish setting up your Red Hat OpenShift. See Red Hat OpenShift virtualization environments

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a connection

You can create a connection to the Red Hat OpenShift cluster using:

- Web Studio
- PowerShell

Create a connection using Web Studio

1. In Web Studio, open **Hosting > Add Connection and Resources**.
2. On the **Connection** page, follow these steps to configure the connection:
   a) Select **Create a new connection**.
   b) Select **Red Hat OpenShift** as the Connection type.
   c) In the **Connection address** field, enter the IP address, hostname, or FQDN of the OpenShift Server.
   d) Enter your service account token and a friendly connection name.
   e) Select a zone in the **Zone name** field. The options are all resource locations you configured.
   f) Select **Other tools** for creating virtual machines.

   > **Note:**
   >
   > Selecting **Other tools** creates just the hosting connection without a hosting unit.

3. Click **Next**.
4. If a self-signed certificate is detected, a warning page appears with the certificate thumbprint. To proceed:
   a) Compare the thumbprint with the server's to verify the certificate's validity.
   b) If valid, select **Trust certificate** and click **OK** to complete the connection setup.

      The certificate is marked as trusted, and the thumbprint is saved for future validation.
5. On the **Scopes** page, select one or more scopes for this host.
6. On the **Summary** page, check the configuration and click **Finish**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a connection using PowerShell commands

When you create a connection using PowerShell command, provide the following information:

- Hosting connection name
- Cluster API address
- User name
- Password (Service account token)
- SSLThumbprint: This is a CA Cert thumbprint and not the API server thumbprint. The server provides the CA Cert thumbprint if you try to create a hosting connection without specifying the thumbprint.
- ZoneUid

1. Open the PowerShell window.
2. Run `add-pssnapin citrix®*`.
3. Run the following command to create the hosting connection.

   If you try to create a hosting connection without specifying the thumbprint, then the server provides the CA Cert thumbprint. For example:

```
$newItemParameters = @{

ConnectionType= "Custom"
PluginId= "OpenShiftPluginFactory"
HypervisorAddress = "https://api.myopenshiftclusteraddress.
   mydomain.local:6443"
Path= "XDHyp:\Connections\OpenShiftConnectionName"
Persist= $true
UserName= "__ServiceAccount__"
Password= "<service account token>"
ErrorVariable= "connectionError"
  }

& New-Item @newItemParameters

$newItemParameters["SSLThumbprint"] = $connectionError[0].
   ErrorData.Thumbprint
$connection = & New-Item @newItemParameters
$brokerConnection = New-BrokerHypervisorConnection -
   HypHypervisorConnectionUid $connection.HypervisorConnectionUid
```

Create a hosting unit

A hosting unit represents an environment where VMs are created. To create the hosting unit, you need the following inputs from OpenShift:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Namespace
- StorageClasses
- Network Attachment Definition

A hosting unit is a namespace-bound. This means that one hosting unit can access only one namespace and manages the VMs under the namespace.

You can create a hosting unit using:

- Web Studio
- PowerShell

Create hosting units using Web Studio

1. Navigate to **Hosting > Add Connection and Resources**.
2. On the **Connection** page:
   - To create a new hosting connection along with a hosting unit, select **Create a new connection**, then do the following:
     a) Select **Red Hat OpenShift** as the Connection type.
     b) In the **Connection address** field, enter the IP address, hostname, or FQDN of the OpenShift Server.
     c) Enter your service account token and a friendly connection name.
     d) Select a zone in the **Zone name** field. The options are all resource locations you configured.
     e) Select **Citrix provisioning tools (Machine Creation Services™ or Citrix Provisioning) for creating virtual machines**.
     f) Click **Next**.
     g) On the **Warning** page, verify the certificate's validity, and select **Trust certificate**.
   - To create hosting units from an existing host connection, select **Use an existing Connection** and then choose the relevant connection.
3. On the **Namespace Selection** page, select a namespace for this connection.
4. On the **Storage Selection** page, select at least one storage device for each supported data type before you can proceed to the next page in the wizard. For more information about storage selection, see Host storage.
5. On the **Network** page, enter a name for the resources. This name appears in Studio to identify the storage and network combination associated with the connection. Select one or more networks that the VMs use.
6. On the **Summary** page, check the details and click **Finish**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create hosting units using PowerShell

When you create a hosting unit using PowerShell command, provide the following information:

- A hosting connection name
- A hosting unit name
- The target namespace name
- A StorageClasses name
- A NetworkAttachmentDefinition name

1. Open the PowerShell window.
2. Run `add-pssnapin citrix*`.
3. Run PowerShell commands to create the hosting unit. For example:

```
$HostingConnectionName = "OpenShiftConnectionName"
$HostingUnitName = "HostingUnitName"
$TargetNamespace = "TargetNamespaceName"
$StorageClassToUse = "YourStorageClassesName"
$NetworkAttachmentDefinition = "
    YourNetworkAttachmentDefinitionName"
New-HypStorage `
-StoragePath @("XDHyp:\Connections\$HostingConnectionName\
    $TargetNamespace.namespace\$StorageClassToUse.storage") `
-StorageType "TemporaryStorage"
New-Item `
-CustomProperties "" `
-HypervisorConnectionName $HostingConnectionName `
-NetworkPath @("XDHyp:\Connections\$HostingConnectionName\
    $TargetNamespace.namespace\$NetworkAttachmentDefinition.network
    ") `
-Path @("XDHyp:\HostingUnits\$HostingUnitName") -RootPath "XDHyp:\
    Connections\$HostingConnectionName\$TargetNamespace.namespace"
    `
-StoragePath @("XDHyp:\Connections\$HostingConnectionName\
    $TargetNamespace.namespace\$StorageClassToUse.storage")
```

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For Red Hat OpenShift specific information, see Create a Red Hat OpenShift catalog

Connection to VMware

May 15, 2026

Create and manage connections and resources describes the wizards that create a connection. The following information covers details specific to VMware virtualization environments.

> **Note:**
>
> Before creating a connection to VMware, you need to first finish setting up your VMware account as a resource location. See VMware virtualization environments.

Create a connection

In the connection creation wizard:

1. Select the VMware connection type.
2. Specify the address of the access point for the vCenter SDK.
3. Specify the credentials for a VMware user account you set up earlier that has permissions to create VMs. Specify the user name in the form domain/username.

VMware SSL thumbprint

The VMware SSL thumbprint feature eliminates the need to manually create a host connection to a VMware vSphere hypervisor. It is no longer required to manually create a trust relationship between the Delivery Controllers in the Site and the hypervisor's certificate before creating a connection.

The VMware SSL thumbprint feature stores the untrusted certificate's thumbprint on the Site database. This configuration ensures that the hypervisor can be continuously identified as trusted by Citrix Virtual Apps and Desktops™, even if not by the Controllers.

When creating a vSphere host connection in Studio, a dialog box allows you to view the certificate of the machine you are connecting to. You can then choose whether to trust it.

Required privileges

Create a VMware user account and one or more VMware roles with a set or all permissions listed in this article. Base the roles' creation on the specific level of granularity required over the user's permissions to request the various Citrix DaaS™ operations at any time. To grant the user-specific permissions at any point, associate them with the respective role, at the data center level at a minimum, with the **Propagate to children** option selected. However, for `StorageProfile` permissions and a specific

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Tags permission, apply the permissions at the Root vCenter Server level, without **Propagate to Children**. See the notes in each of those tables.

The following tables show the mappings between Citrix Virtual Apps and Desktops™ operations and the minimum required VMware privileges.

> **Note:**
>
> The permissions list display name, specifically the *User Interface*, is different for some vSphere versions. For example, in vSphere 6.7 the *User Interface* permission is **Change Memory** and **Change Settings**, rather than **Settings** and **Memory** as described in the required privileges noted on this page.

Add connections and resources

SDK	User interface
System. Anonymous, System. Read, and System.View	Added automatically. Can use the built-in read-only role.

Power management

SDK	User interface
VirtualMachine.Interact.PowerOff	Virtual machine > Interaction > Power Off
VirtualMachine.Interact.PowerOn	Virtual machine > Interaction > Power On
VirtualMachine.Interact.Reset	Virtual machine > Interaction > Reset
VirtualMachine.Interact.Suspend	Virtual machine > Interaction > Suspend
Datastore.Browse	Datastore > Browse datastore

Provision machines (Machine Creation Services™)

To provision machines using MCS, the following permissions are mandatory:

SDK	User interface
Datastore.AllocateSpace	Datastore > Allocate space
Datastore.Browse	Datastore > Browse datastore

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SDK	User interface
Datastore.FileManagement	Datastore > Low level file operations
Network.Assign	Network > Assign network
Resource.AssignVMToPool	Resource > Assign virtual machine to resource pool
VirtualMachine.Config.AddExistingDisk	Virtual machine > Configuration > Add existing disk
VirtualMachine.Config.AddNewDisk	Virtual machine > Configuration > Add new disk
Virtual machine.Config.Add or remove device	Virtual machine > Configuration > Add or remove device
VirtualMachine.Config.AdvancedConfig	Virtual machine > Configuration > Advanced
VirtualMachine.Config.RemoveDisk	Virtual machine > Configuration > Remove disk
VirtualMachine.Config.CPUCount	Virtual machine > Configuration > Change CPU count
VirtualMachine.Config.Memory	Virtual machine > Configuration > Change memory
VirtualMachine.Config.Settings	Virtual machine > Configuration > Change settings
VirtualMachine.Interact.PowerOff	Virtual machine > Interaction > Power Off
VirtualMachine.Interact.PowerOn	Virtual machine > Interaction > Power On
VirtualMachine.Interact.Reset	Virtual machine > Interaction > Reset
VirtualMachine.Interact.Suspend	Virtual machine > Interaction > Suspend
VirtualMachine.Inventory.CreateFromExisting	Virtual machine > Inventory > Create from existing
VirtualMachine.Inventory.Create	Virtual machine > Inventory > Create new
VirtualMachine.Inventory.Delete	Virtual machine > Inventory > Remove
VirtualMachine.Provisioning.Clone	Virtual machine > Provisioning > Clone virtual machine
VirtualMachine.State.CreateSnapshot	vSphere 5.0, Update 2, vSphere 5.1, Update 1, and vSphere 6.x, Update 1: Virtual machine > State > Create snapshot; vSphere 5.5: Virtual machine > Snapshot management > Create snapshot
VirtualMachine.Config.Rename	Virtual machine > Configuration > Rename

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Image update and rollback

SDK	User interface
Datastore.AllocateSpace	Datastore > Allocate space
Datastore.Browse	Datastore > Browse datastore
Datastore.FileManagement	Datastore > Low level file operations
Network.Assign	Network > Assign network
Resource.AssignVMToPool	Resource > Assign virtual machine to resource pool
VirtualMachine.Config.AddExistingDisk	Virtual machine > Configuration > Add existing disk
VirtualMachine.Config.AddNewDisk	Virtual machine > Configuration > Add new disk
VirtualMachine.Config.AdvancedConfig	Virtual machine > Configuration > Advanced
VirtualMachine.Config.RemoveDisk	Virtual machine > Configuration > Remove disk
VirtualMachine.Interact.PowerOff	Virtual machine > Interaction > Power Off
VirtualMachine.Interact.PowerOn	Virtual machine > Interaction > Power On
VirtualMachine.Interact.Reset	Virtual machine > Interaction > Reset
VirtualMachine.Inventory.CreateFromExisting	Virtual machine > Inventory > Create from existing
VirtualMachine.Inventory.Create	Virtual machine > Inventory > Create new
VirtualMachine.Inventory.Delete	Virtual machine > Inventory > Remove
VirtualMachine.Provisioning.Clone	Virtual machine > Provisioning > Clone virtual machine

Share prepared images

To share prepared images across different hosting connections, the following permissions are mandatory for target hosting connection:

SDK	User interface
Datastore.AllocateSpace	Datastore > Allocate space
Network.Assign	Network > Assign network

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SDK	User interface
Resource.AssignVMToPool	Resource > Assign virtual machine to resource pool
VirtualMachine.Config.Add or remove device	Virtual machine > Configuration > Add or remove device
VirtualMachine.Config.RemoveDisk	Virtual machine > Configuration > Remove disk
VirtualMachine.Config.Settings	Virtual machine > Configuration > Change settings
VirtualMachine.Inventory.Register	Virtual machine > Inventory > Register
VirtualMachine.Inventory.Delete	Virtual machine > Inventory > Remove

Delete provisioned machines

SDK	**User interface**
Datastore.Browse	Datastore > Browse datastore
Datastore.FileManagement	Datastore > Low level file operations
VirtualMachine.Config.RemoveDisk	Virtual machine > Configuration > Remove disk
VirtualMachine.Interact.PowerOff	Virtual machine > Interaction > Power Off
VirtualMachine.Inventory.Delete	Virtual machine > Inventory > Remove

Storage Profile

To view, create, or delete storage policies during catalog creations on a vSAN or vVol datastore, the following permissions are mandatory:

SDK	User interface
StorageProfile.Update	PROFILE-DRIVEN STORAGE > Profile-driven storage update. For vSphere 8: VM storage policies > Update VM storage policies
StorageProfile.View	PROFILE-DRIVEN STORAGE > Profile-driven storage view. For vSphere 8: VM storage policies > View VM storage policies

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Apply the storage profile permissions at the Root vCenter Server level, without **Propagate to Children**.

Tags and Custom Attributes

Tags and custom attributes allow you to attach metadata to the VMs created in vSphere inventory and make it easier to search and filter these objects. To create, edit, assign, and delete tags or categories, the following permissions are mandatory:

SDK	User interface
InventoryService.Tagging.CreateTag	vSphere Tagging > Create vSphere Tag
InventoryService.Tagging.CreateCategory	vSphere Tagging > Create vSphere Tag Category
InventoryService.Tagging.EditTag	vSphere Tagging > Edit vSphere Tag
InventoryService.Tagging.EditCategory	vSphere Tagging > Edit vSphere Tag Category
InventoryService.Tagging.DeleteTag	vSphere Tagging > Delete vSphere Tag
InventoryService.Tagging.DeleteCategory	vSphere Tagging > Delete vSphere Tag Category
InventoryService.Tagging.AttachTag	vSphere Tagging > Assign or Unassign vSphere Tag
InventoryService.Tagging.ObjectAttachable	vSphere Tagging > Assign or Unassign vSphere Tag on Object
Global.ManageCustomFields	Global > Manage custom attributes
Global.SetCustomField	Global > Set custom attribute

> **Note:**
>
> - When MCS creates a machine catalog, it tags the target VMs with special name tags. These tags differentiate the master image from MCS created VMs and prevent using MCS created VMs for image preparation. You can identify the difference by the value of `XdProvisioned` attribute in vCenter. The attribute is set to **True** if MCS creates VMs.
> - Apply the `InventoryService.Tagging.AttachTag` permission at the Root vCenter Server level, without **Propagate to Children**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Cryptographic operations

Cryptographic operations privileges control who can perform which type of cryptographic operation on which type of object. vSphere Native Key Provider uses the `Cryptographer.*` privileges. The following minimum permissions are required for cryptographic operations:

> **Note:**
>
> These permissions are required for creating MCS machine catalogs with vTPM equipped VM.

SDK	User interface
Cryptographer.Access	Privileges > All Privileges > Cryptographic operations > Direct Access
Cryptographer.AddDisk	Privileges > All Privileges > Cryptographic operations > Add disk
Cryptographer.Clone	Privileges > All Privileges > Cryptographic operations > Clone
Cryptographer.Encrypt	Privileges > All Privileges > Cryptographic operations > Encrypt
Cryptographer.EncryptNew	Privileges > All Privileges > Cryptographic operations > Encrypt new
Cryptographer.Decrypt	Privileges > All Privileges > Cryptographic operations > Decrypt
Cryptographer.Migrate	Privileges > All Privileges > Cryptographic operations > Migrate
Cryptographer.ReadKeyServersInfo	Privileges > All Privileges > Cryptographic operations > Read KMS information

Provision machines (Citrix Provisioning™)

These permissions to clone and deploy a template are required to provision VMs using Citrix Virtual Apps and Desktops Setup Wizard and Export Devices Wizard through the Citrix Provisioning console. Set the permissions while creating a hosting connection. You need all the permissions from Provision machines (Machine Creation Services) and the following.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SDK	User interface
VirtualMachine.Config.AddRemoveDevice	Virtual machine > Configuration > Add or remove device
VirtualMachine.Config.CPUCount	Virtual machine > Configuration > Change CPU Count
VirtualMachine.Config.Memory	Virtual machine > Configuration > Memory
VirtualMachine.Config.Settings	Virtual machine > Configuration > Settings
VirtualMachine.Provisioning.CloneTemplate	Virtual machine > Provisioning > Clone template
VirtualMachine.Provisioning.DeployTemplate	Virtual machine > Provisioning > Deploy template
VApp.Export	vApp > Export

> **Note:**
>
> The `VApp.Export` is required for creating MCS machine catalogs using machine profile.

Obtain and import a certificate

To protect vSphere communications, Citrix® recommends that you use HTTPS rather than HTTP.

HTTPS requires digital certificates. Use a digital certificate issued from a certificate authority that meets your organization's security policy.

If you are unable to use a digital certificate issued from a certificate authority, you can use the VMware-installed self-signed certificate. Only use this method if your organization's security policy permits it. Add the VMware vCenter certificate to each Delivery Controller.

1. Add the fully qualified domain name (FQDN) of the computer running vCenter Server to the hosts file on that server, at `%SystemRoot%/WINDOWS/system32/Drivers/etc/`. This step is required only if the FQDN of the computer running vCenter Server is not already present in the domain name system.
2. Obtain the vCenter certificate using any of the following three methods:

   From the vCenter server.

   a) Copy the file rui.crt from the vCenter server to a location accessible on your Delivery Controllers.
   b) On the Controller, navigate to the location of the exported certificate and open the rui.crt file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Download the certificate using a web browser. If you are using Internet Explorer, right-click on Internet Explorer and choose **Run as Administrator** to download or install the certificate.

a) Open your web browser and make a secure web connection to the vCenter server (for example https://server1.domain1.com).
b) Accept the security warnings.
c) Click the address bar displaying the certificate error.
d) View the certificate and click the Details tab.
e) Select **Copy to file and export in .CER format**, providing a name when prompted to do so.
f) Save the exported certificate.
g) Navigate to the location of the exported certificate and open the .CER file.

Import directly from Internet Explorer running as an administrator.

- Open your web browser and make a secure web connection to the vCenter server (for example https://server1.domain1.com).
- Accept the security warnings.
- Click the address bar displaying the certificate error.
- View the certificate.

3. Import the certificate into the certificate store on each of your Controllers.

a) Click the **Install certificate** option, select **Local Machine**, and then click **Next**.
b) Select **Place all certificates in the following store**, and then click **Browse**. Select **Trusted People** and then click **OK**. Click **Next** and then click **Finish**.

If you change the name of the vSphere server after installation, you must generate a new self-signed certificate on that server before importing the new certificate.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For VMware specific information, see Create a VMware catalog

Connection to VMware cloud and partner solutions

May 13, 2026

After setting up Azure VMware Solution (AVS) cluster, Google Cloud VMware Engine, and VMware cloud on AWS, create the connections. See Connection to VMware for creating connections.

Where to go next

- If you're in the initial deployment process, see Create machine catalogs
- For VMware specific information, see Create a VMware catalog

More information

- Connections and resources
- Create machine catalogs

Service accounts for machine identity management

May 13, 2026

A service account is a container for stored credentials, which is configured and used to perform machine identity related operations without user interaction. Create the service account before the operations that require permissions for machine identity management.

You can configure an MCS machine catalog to use a service account to:

- create or delete computer accounts in Active Directory without entering the domain credentials every time.
- manage stale Microsoft Entra joined or Microsoft Intune enrolled devices without manually deleting them through the Microsoft Entra ID or Intune portal.

Supported service account types

Citrix® allows the creation of the following service account based on the type of identity provider.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Identity provider type	Description	Credentials
On-premises Active Directory service account	Manages machine catalogs and computer accounts without entering domain credentials every time.	User name and password of an on-premises Active Directory user accounts.

Credential protection

Citrix stores the credentials of service accounts in the customer's site database. In a Citrix Virtual Apps and Desktops deployment, the site database is a per tenant (customer) database, which is accessible only by the services running for the customer.

The following actions are also enforced to protect the stored credentials:

- The credentials are encrypted using **AES 256** encryption before storing into the database.
- The encryption key is generated per site and stored in the Delivery Controller™ locally, which can only be accessed by the services dedicated to the customer.
- The connection to the database is encrypted using the TLS 1.2 protocol.

On-premises Active Directory service accounts

May 13, 2026

An on-premises Active Directory service account is a container to store the user name and password of a privileged domain user account. The user account must have sufficient permissions to manage computer accounts in an Active Directory. Machine Creation Service can use this service account to do computer accounts related operations without entering the domain credentials every time.

Create an on-premises Active Directory service account

Create an on-premises Active Directory service account using Studio or PowerShell.

Prerequisite

To create an on-premises Active Directory service account, make sure to complete the following task:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Create a domain user account in your Active Directory with sufficient permissions to create, update, and delete computer objects in your Active Directory or specific OUs.

Use Web Studio

1. In the left pane, select **Administrators**.
2. In the **Service Accounts** tab, click **Create Service Account**.
3. On the **Identity Type** page, select **On-premises Active Directory**. Click **Next**.
4. On the **Credentials** page, click **Enter credentials** to provide the username and password of a privileged domain user account which you want to use as the service account.
5. Set the password expiration date or leave it as never expired.
6. Select one or more scopes for this service account.
7. Enter a friendly name and a description (optional) for the service account.
8. Click **Finish** to complete the creation.

Use PowerShell

You can use PowerShell commands to create an on-premises Active Directory service. For example:

```
$credential = ConvertTo-SecureString -String $password -AsPlainText -
    Force
New-AcctServiceAccount -IdentityProviderType ActiveDirectory -
    IdentityProviderIdentifier test.local -AccountId test\svcacct_mcs -
    AccountSecret $credential -SecretExpiryTime 2030/08/15 -DisplayName
    'scvacct_mcs' -Description 'Service account for test.local'
```

> **Note:**
>
> The `$password` is the matching password for the provided domain user account.

Perform machines identity-related actions

After an Active Directory or a Microsoft Entra hybrid based identity pool is associated with a service account, you can do various machines identity-related actions without requiring to enter the domain credentials.

- To create a new identity account using a service account

  ```
  New-AcctADAccount -IdentityPoolName MyPool -Count 2 -
      UseServiceAccount
  ```

- To repair the identity accounts using a service account

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Repair-AcctADAccount -ADAccountName "Domain\account","Domain\
    account2" -UseServiceAccount
```

- To remove identity accounts using service account

```
Remove-AcctADAccount -IdentityPoolName MyPool -RemovalOption
    Delete -ADAccountName "Domain\account","domain\account2" -
    UserServiceAccount
```

Where to go next

- To create on-premises Active Directory joined catalogs, see Identity pool of on-premises Active Directory joined machine identity).
- To manage service accounts, see Manage service accounts.

Manage service accounts

May 13, 2026

Managing service accounts is a critical aspect to ensure that they remain in a healthy state and their credentials are up-to-date. This article describes the steps to view, rename, edit, test, and delete a service account.

View service account details

1. In the left pane, select **Administrators**.
2. Select the **Service Accounts** tab.
3. Select a service account and view its details in the lower panel. See the properties of each service account along with its associated machine catalogs and troubleshooting tips in the lower panel.

Error or warning icons appear beside a service account if:

- the service account is in an unhealthy state.
- the credential of a service account is nearing expiry.

The **Troubleshooting** tab provides information to diagnose and fix the issues.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> After fixing the issues, do a service account test to refresh the status. For more information, see Test a service account.

Rename a service

1. In the left pane, select **Administrators**.
2. Select the **Service Accounts** tab.
3. Select a service account and click **Rename**.

Edit a service account

1. In the left pane, select **Administrators**.
2. Select the **Service Accounts** tab.
3. Select a service account and click **Edit**.

Test a service account

1. In the left pane, select **Administrators**.
2. Select the **Service Accounts** tab.
3. Select a service account and click **Test Service Account**.

- For an on-premises Active Directory service account, credentials are verified during testing.
- For Microsoft Entra service account, application ID and secret along with the required permissions are verified during testing.

Identity and fix the issues according to the recommendations. The **Troubleshooting** tab provides information to diagnose and fix the issues. After fixing the issues, test the service account.

Delete a service account

Before deleting a service account, make sure that the service account is not used by any MCS machine catalogs.

1. In the left pane, select **Administrators**.
2. Select the **Service Accounts** tab.
3. Select a service account and click **Delete**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Image management

May 13, 2026

Introduction

The MCS catalog creation or update process has two phases:

- Mastering: a source image is converted into a published image
- Cloning: new VMs are created from the published image

With the image management functionality, MCS separates the mastering phase from the overall provisioning workflow.

You can prepare various MCS image versions (Prepared Image) from a single source image and use it across multiple different MCS machine catalogs. You can also share prepared image versions across hosting units. This implementation significantly reduces the storage and time costs, and simplifies the VM deployment and image update process.

The benefits of using this image management functionality are:

- Generate prepared images in advance without creating a catalog.
- Reuse prepared images in multiple scenarios, such as creating and updating a catalog.
- Significantly reduce catalog creation or update time.
- Share prepared image versions across hosting units:
    - For Azure and VMware, image versions can be shared across host connections of the same connection type.
    - For Amazon WorkSpaces Core Managed Instances, image versions can be shared across different availability zones, tied to different hosting units, within the same AWS region or in different regions.
    - For AWS EC2, image versions can be shared across different availability zones, tied to different hosting units, within the same AWS region.
    - For XenServer, image versions can only be shared across hosting units within the same host connection.

> **Note:**
>
> - This feature is currently applicable to Amazon WorkSpaces Core Managed Instances, Azure Local, AWS EC2, Azure, Red Hat OpenShift, VMware virtualization, and XenServer environments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - You can create an MCS machine catalog without using prepared images. In that case, you cannot get the benefits of the feature. However, for Amazon WorkSpaces Core Managed Instances, create the MCS catalog using only a prepared image version. You can't create the catalog using a master image directly.

Use cases

Some of the use cases of image management functionality are:

- *Version management*: Image versions allow you to:
  - manage different iterations or updates to a particular image.
  - maintain multiple versions of an image for different purposes.
- *Logical grouping*: You can create multiple image definitions to:
  - logically group image versions based on various criteria such as project, department, or application and desktop type.
  - manage images more efficiently within an organization.
- *Image sharing*: You can share prepared image versions across hosting units within host connections of the same connection type to:
  - ensure consistency and uniformity of images across different hosting units.

What is a prepared image?

With the image management functionality, MCS decouples the mastering phase from the overall catalog creation or update workflow and breaks down the process into two stages:

1. Create prepared images from a single source image.
2. Use the prepared image to create or update an MCS machine catalog.

You can create the prepared images in advance. You can use a single prepared image to create or update multiple MCS provisioned machine catalogs.

Understand how a prepared image is used across multiple MCS machine catalogs when you use the Web Studio from the image:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

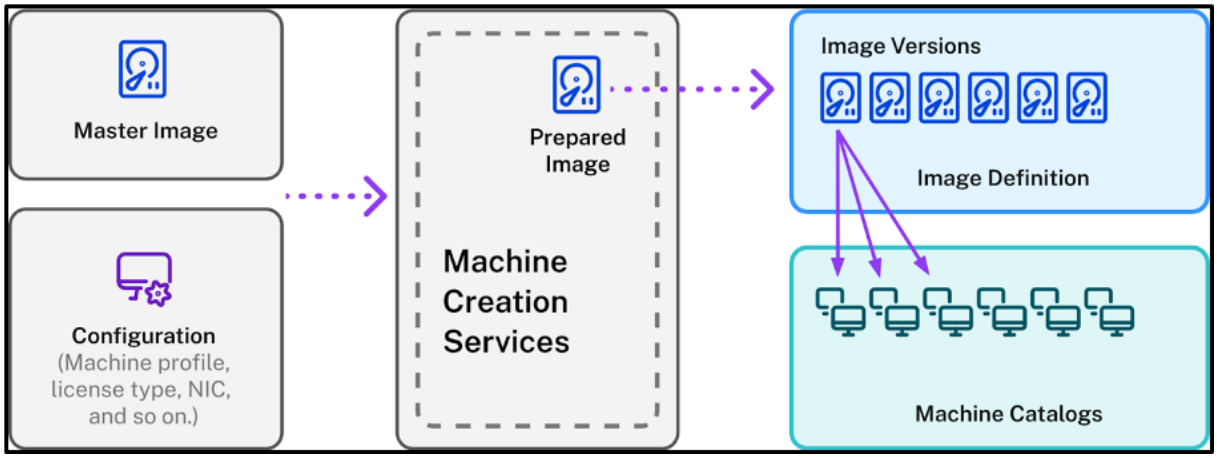

Image definition: Image definitions are a logical grouping of versions of an image. The image definition holds information about:

- why the image was created
- what OS it is for
- other information about using the image.

A catalog isn't created from an image definition, but from the image versions that are created based on the image definition.

Image version: Image versions manage versionings for the image definition. An image definition can have multiple image versions. Use the image versions as prepared images to create or update a catalog.

- For Azure and VMware, image versions can be shared across host connections of the same connection type.
- For Amazon WorkSpaces Core Managed Instances, image versions can be shared across different availability zones, tied to different hosting units, within the same AWS region or in different regions.
- For AWS EC2, image versions can be shared across different availability zones, tied to different hosting units, within the same AWS region.
- For XenServer, image versions can only be shared across hosting units within the same host connection.

Alternatively, if you want to use PowerShell commands to create a provisioning scheme to create or update a catalog, then you must create a prepared image version spec based on the master image version spec as needed for your environment.

- For Azure and VMware, image versions can be shared across host connections of the same connection type.
- For Amazon WorkSpaces Core Managed Instances, image versions can be shared across different availability zones, tied to different hosting units, within the same AWS region or in different

© 1997–2026 Citrix Systems, Inc. All rights reserved.

regions.
- For AWS EC2, image versions can be shared across different availability zones, tied to different hosting units, within the same AWS region.
- For XenServer, image versions can only be shared across hosting units within the same host connection.

Requirement

- For Windows master images, only VDA images version 2311 or later are supported. The MCS/IO component must be explicitly selected and installed. Enabling or disabling the MCS I/O configuration must be determined during machine catalog creation or updates, as it is not enabled by default.s

Limitations

Currently, the feature does not support the following:

- Multiple NIC in Azure
- Persistent data disk feature
- Hibernation for multi-session
- Image type change
- While sharing prepared image version across hosting unit in Azure, the following sharing methods are not allowed:
    - Share Directly
    - Share to public community gallery

Image lifecycle management using the Web Studio

Lifecycle of the image when you use the Web Studio is:

1. Create a prepared image: Create an image definition and its initial image version.
2. Create image versions from the initial image version.
3. If needed, share an image version with a hosting unit in your virtualization environment.
4. Use an image version as a prepared image to create catalogs.
5. Update a machine catalog with a different prepared image.
6. Manage the image definitions and versions: Edit the name and description of image versions, and description of an image definition.
7. Delete an image version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

8. Delete an image definition.

Alternatively, you can also manage images using PowerShell. See Image lifecycle management using PowerShell.

Image lifecycle management using PowerShell

If you want to use PowerShell commands to create a provisioning scheme, then you must create a prepared image version spec based on the master image version spec as needed for your environment.

Master image version spec: A master image version spec is a specific image added or created under an image version. You can add an existing image in the hypervisor as a master image version spec or create a prepared image version spec based on the master image version spec as needed for your environment. The prepared image version spec can be used for multiple provisioning schemes.

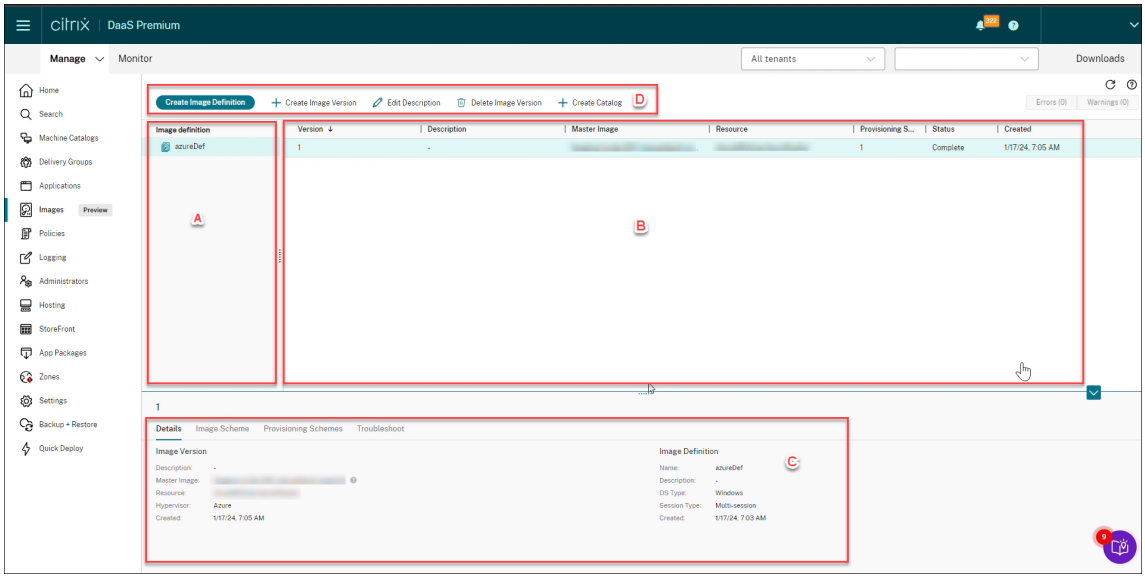
You can share image version specs across hosting units, depending on your virtualization environment:

- In Azure, VMware, and Amazon WorkSpaces Core Managed Instances environments, you can share image version specs across hosting units, whether they are in the same or different host connections of the same connection type. In Azure, the sharing is achieved using the disk sharing capability of Azure Compute Gallery (ACG).
- For AWS EC2, image versions can be shared across different availability zones, tied to different hosting units, within the same AWS region.
- In XenServer, you can share image version specs only across hosting units within the same host connection.

Lifecycle of an image when using PowerShell commands is:

1. Create an image:
    a) Create an image definition.
    b) Add a new configuration for Image Definition in specified Hosting Connection.
    c) Create an image version.
    d) Add a master image version spec.
    e) Create a prepared image version spec.
2. If needed, share an image version spec with another hosting unit in your virtualization environment, whether in the same hosting connection or not.
3. Create an MCS machine catalog using a prepared image version spec:
    a) Create a broker catalog.
    b) Create an identity pool.

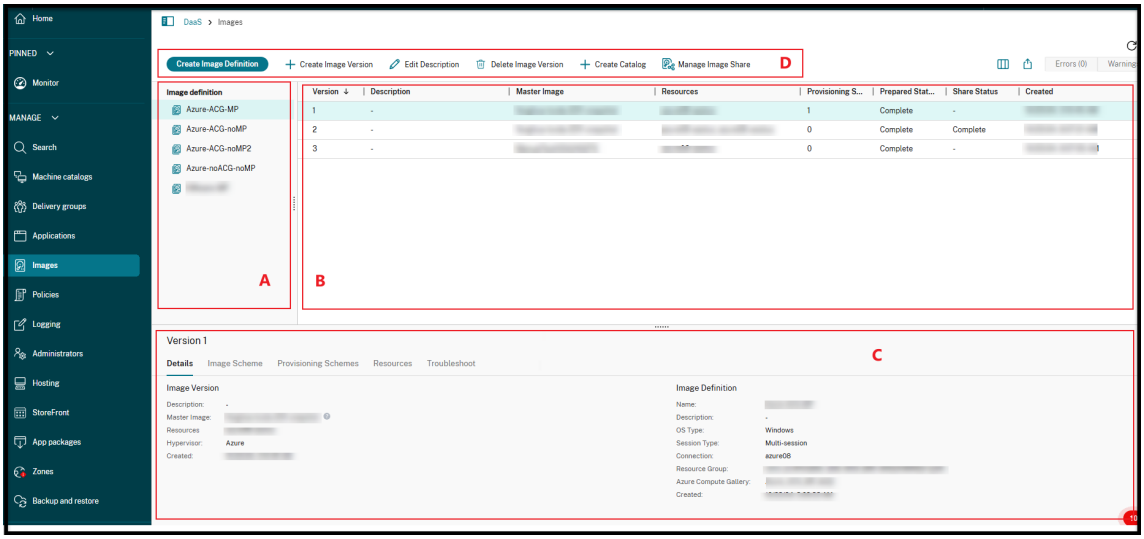
© 1997–2026 Citrix Systems, Inc. All rights reserved.



c) Create a provisioning scheme with the parameter of prepared image version spec Uid using the `New-ProvScheme` command.
d) Link the broker catalog with the provisioning scheme.

4. Create VMs in the MCS machine catalog.
5. Change the prepared image version spec of a provisioning scheme using `Set-ProvScheme` command.
6. Manage the image definitions and versions: Edit the image versions and image definitions.
7. Delete an MCS machine catalog: The deletion order is: machine catalog > shared prepared image version spec (if image sharing) > prepared image version spec > master image version spec > image version > configuration for image definition in the specified hosting connection > image definition. Before deleting the image version spec, ensure that the prepared image version spec is not associated with any MCS machine catalog.

Understand the Images node



Use the **Images** node to create and manage MCS-prepared images. Its main view is divided into four parts:

- Without prepared image being shared across host unit

- With prepared image being shared across host unit:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Label	Part	Description
A	Image definitions	Lists the previously created image definitions.
B	Image versions	Displays image versions of the selected image definition.
C	Details	• The **Details** tab displays detailed information about the selected image definition or version such as Master Image, Resource, Hypervisor, name of the image definition, OS type, and session type. • The **Image Scheme** tab displays information about the template used for preparing images such as hard disk, machine size, license type, disk encryption set, machine profile, and so on. • The **Provisioning Schemes** tab displays the provisioning scheme name used for creating the catalog. • The **Troubleshoot** tab provides the error status of the selected image version.
D	Action bar	Lists the actions that you can take on image definitions and versions such as **Create Image Version**, **Edit Description**, **Manage Image Share** (in case of prepared image sharing), **Delete Image Version**, and **Create Catalog**.

Share prepared images across Azure subscriptions or tenants

To share a prepared image across subscriptions or tenants on the Azure platform, follow this example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Service principal**: SPN 1
- **Subscription**: Subscription 1
- **Tenant**: Tenant 1

You want to share this image with:

- **Service principal**: SPN 2
- **Subscription**: Subscription 2
- **Tenant**: Tenant 2 (can be the same as Tenant 1)

To successfully share and use the image, you must grant SPN 2 the following permissions in **Subscription 1**—at the gallery, resource group, or subscription scope:

- `Microsoft.Resources/subscriptions/read`
- `Microsoft.Compute/galleries/images/read`
- `Microsoft.Compute/galleries/images/versions/read`

> **Note:**
>
> Any service principal that has any permission on a subscription or resource automatically inherits the `Microsoft.Resources/subscriptions/read` permission.

Alternatively, assign the **Compute Gallery Image Reader** built-in role to **SPN 2**.

For step-by-step guidance, see this Microsoft article.

- Create a prepared image machine catalog in XenServer
- Manage prepared image machine catalogs

Create a prepared image for Amazon WorkSpaces Core Managed Instances

May 13, 2026

Create prepared images to create an MCS machine catalog. You can create prepared images using:

- Web Studio
- PowerShell commands

Key steps

1. Create the image definition and the initial image versions.
2. Create image versions from the initial image version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use Web Studio

Create an image definition and initial image version

To create an image definition and the initial image version, do the following:

1. From Web Studio, go to the **Images** node, and click **Create Image Definition**. Click **Next** on the **Introduction** page.
2. On the **Image Definition** page, specify the **OS type** and **Session type** for the image definition.
3. On the **Image** page, select **Resources** (only the resources applicable for the set connection are listed), a master image to use as a template for creating the image version, and a machine profile for capturing hardware properties from. Select a machine profile to capture hardware properties from a VM instance or launch template version.

   > **Note:**
   >
   > - Before selecting an image, verify that the master image has VDA 2311 or later installed and the MCSIO driver is installed on the VDA.
   > - The Instance Metadata Service (IMDS) V2 is only supported and not IMDS V1. For information, see How Instance Metadata Service Version 2 works.

4. On the **Machine Specification** page, select a machine size. The machine size of the machine profile (selected on the **Image** page) is selected by default.
5. On the **NICs** page, select or add NICs for the preparation image. For each NIC, select an associated VPC subnet.
6. On the **Version Description** page, enter a description for the initial image version created.
7. On the **Summary** page, check the details of the image definition and the initial image version created. Enter a name and description for the image definition. Click **Finish**.

Create image versions

Image versions allow for the management of different iterations or updates to a particular image. This functionality enables you to maintain multiple versions of an image for different purposes.

To create image versions from the initial image version, do the following:

> **Note:**
>
> The hosting unit of all the image versions must be the same.

1. Go to the **Images** node, select an image version or an image definition, and click **Create Image Version**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the **Image definition** page, you can change the hosting unit, and reselect the master image and machine profile for that image version.
3. If you want the configuration of the image version to be different from the initial configured image version, then configure the settings on the **Machine Specification** and **NICs** pages of the **Create Image Version** dialog.
4. Add a description for the image version. Click **Finish**.

> **Note:**
>
> If the creation of the image version fails for any reason, the **Troubleshoot** tab at the bottom provides a **Retry** option.

Use PowerShell

The detailed PowerShell commands to create a prepared image version spec are as follows:

1. Check the available image definition names using the `Test-ProvImageDefinitionNameAvailable` command. For example,

```
Test-ProvImageDefinitionNameAvailable -ImageDefinitionName <string
    []>
```

2. Create an image definition using the `New-ProvImageDefinition` command. For example,

```
New-ProvImageDefinition -ImageDefinitionName image1 -OsType
    Windows -VdaSessionSupport MultiSession
```

3. Create a new configuration for image definition in the specified Hosting connection using the `Add-ProvImageDefinitionConnection` command.

```
Add-ProvImageDefinitionConnection -ImageDefinitionName image1 -
    HypervisorConnectionName test-conn
```

4. Create an image version using the `New-ProvImageVersion` command. For example,

```
New-ProvImageVersion -ImageDefinitionName image1 -Description "
    version 1"
```

5. Add a master image version spec to the image version using the `Add-ProvImageVersionSpec` command. For example,

```
Add-ProvImageVersionSpec -ImageDefinitionName  image1  -
    ImageVersionNumber  1 -HostingUnitName wsc -MasterImagePath "
    XDHyp:\HostingUnits\wsc\win10-2411-ami (ami-00123456789abcdef).
    template ” "
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> You can add only one master image version spec to one image version for a hosting unit.

6. Create a prepared image version spec from the master image version spec using the `New-ProvImageVersionSpec` command. The `SourceImageVersionSpecUid` parameter is derived from the `Add-ProvImageVersionSpec` command. For example,

```
New-ProvImageVersionSpec
-SourceImageVersionSpecUid  00000000-0000-0000-0000-00000000000
-MachineProfile 'XDHyp:\HostingUnits\wsc\w2022-2411 (lt
   -00123456789abcdef).launchtemplate\lt-00123456789abcdef (1).
   launchtemplateversion' -RunAsynchronously
```

Example of the complete set of Powershell commands to create image definition, image version, and prepared image version spec:

```
New-ProvImageDefinition -ImageDefinitionName image1 -OsType Windows -
   VdaSessionSupport MultiSession

Add-ProvImageDefinitionConnection -ImageDefinitionName image1 -
   HypervisorConnectionName wsc -CustomProperties $CustomProperties

$imageVersion = New-ProvImageVersion -ImageDefinitionName image1 -
   Description "version 1"

$SourceImageVersionSpec = Add-ProvImageVersionSpec -ImageVersionUid
   $imageVersion.ImageVersionUid `
    -HostingUnitUid $hostingunit.HostingUnitUid `
    -MasterImagePath "XDHyp:\HostingUnits\wsc\win10-2411-ami (ami
       -00123456789abcdef).template "

New-ProvImageVersionSpec -MachineProfile 'XDHyp:\HostingUnits\wsc\w2022
   -2411 (lt-00123456789abcdef).launchtemplate\lt-00123456789abcdef (1)
   .launchtemplateversion' -SourceImageVersionSpecUid
   $SourceImageVersionSpec.ImageVersionSpecUid
Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid
   00000000-0000-0000-0000-00000000000-HostingUnitName wsc
$PreparedImageVersionSpec = Get-ProvImageVersionSpec -ImageVersionUid
   $imageVersion.ImageVersionUid | Where SourceImageVersionSpecUid-eq
   $SourceImageVersionSpec.ImageVersionSpecUid
```

> **Note:**
>
> - All image version specs in an image definition must belong to the same hosting unit.
> - An image version can have only one master image version spec and one prepared image version spec.
> - All image version specs must have a machine profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Share prepared images across availability zones and regions

You can now share a single prepared image across different availability zones, tied to different hosting units, within the same AWS region or in different regions, for your Amazon WorkSpaces Core Managed Instances. This allows you to use one prepared image to create and update MCS machine catalogs in various availability zones and regions. When sharing across different AZs in different regions, the prepared image version is copied from the origina region to the destination regions.

You can maintain a single prepared image and use it to create and update machine catalogs across multiple availability zones and regions tied to different hosting units. This significantly reduces your image management overhead, ensures consistency across deployments, and streamlines the provisioning process. You can also seamlessly update existing machine catalogs with prepared images from a different availability zone or region.

Use cases

- **Centralized Image Management:** You create a prepared image in one availability zone (for example, `us-east-1a`). You can then share this image to other availability zones like `us-east-1b` within the same `us-east-1` AWS region or `us-west-1a` in a different `us-west-1` region. This allows a single image to serve multiple hosting units and simplifies maintenance for you.
- **Efficient Catalog Creation and Updates:** You can use a prepared image created in `AZ 1` (for example, `us-east-1a`) to create new catalogs in `AZ 1`. After sharing this image to `AZ 2` (for example, `us-east-1b`), you can then use the shared image in `AZ 2` to create and update catalogs in `AZ 2`.
- **Cross-hosting unit and hosting connection deployments:** If your environment has multiple hosting units under the same or different AWS region and AWS account, you can efficiently share prepared images between these hosting units.

Limitations

- **Sharing within same AWS Account:** You cannot share across different AWS Accounts in the current implementation.

Important considerations

- **Deletion order:** To delete an original prepared image version specification, you must first delete all its shared image version specifications. Alternatively, you must delete the original and shared specifications simultaneously.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Catalog back-portability:** You can update existing machine catalogs that you deployed before this feature's introduction. Use prepared images that you created in a different availability zone or region from where you originally deployed the catalog.
- **Complete deletion:** When you delete a prepared image, you can no longer use it in any availability zone where you shared or originally created it. Moreover, a prepared image version cannot be deleted until all catalog tied the prepared image version are deleted first.

Prerequisites

Before you configure or use this feature, ensure that you meet the following conditions:

- Your environment must be an Amazon WorkSpaces Core Managed Instances environment.
- You must configure multiple hosting units (each can be tied to different availability zones) and host connections (each can be tied to a different region) under the same AWS account.

Configure using Web Studio UI

You can share prepared images across availability zones tied to different hosting units using the Web Studio UI.

To share a prepared image

1. Navigate to the **Images** node of the Web Studio and select the prepared image version you would like to share with other availability zones.
2. Select **Manage Image Share** at the top navigation bar to manage the image sharing for the selected image version.
3. On the **Manage Image Share** page, select one or more resources you would like to share the image version with. The resources can be in different availability zones from that of the original image version.
4. Click **Save** to share the image version in the resources across other availability zones. The image version is updated such that it is shared across the different resources that you selected. Once complete, use the image version to create catalogs in the availability zones the image version is shared across.

To remove sharing of a prepared image

1. On the **Images** node of the Web Studio, select the prepared image version you would like to remove from sharing.
2. Select **Manage Image Share** at the top navigation bar to manage the image sharing for the selected image version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Clear the checkboxes from one or more resources (availability zones) that you would like to stop sharing the image version with.

   > **Note:**
   >
   > The resources must no longer have any catalogs associated with and created from the shared image version. Any catalogs created from the shared image version to be removed must be deleted first.

4. Click **Save** to remove sharing of the resources across the cleared availability zones. The image version is updated such that it is no longer shared in those availability zones.

Configure using PowerShell

Alternatively, you can share prepared images across availability zones tied to different hosting units using PowerShell commands.

To share a prepared image

1. Ensure that you have the `ImageVersionSpecUid` of the prepared image you want to share. You can retrieve this using `Get-ProvImageVersionSpec` or similar `Get-` commands in PowerShell.
2. Determine the `HostingUnitName` of the availability zone (can be the same or a different region) where you want to make the prepared image available. This is the name of the hosting unit you configured for that specific AZ.
3. **Run the `Add-ProvImageVersionSpecHostingUnit` command:** Use the following PowerShell command. Replace `<ImageVersionSpecUid>` with your image's Uid and `<targetHostingUnitName>` with the name of the hosting unit in the target availability zone that you want to share the image version specification to:

   ```
   Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid <
       ImageVersionSpecUid> -HostingUnitName <targetHostingUnitName>
   ```

4. After successful execution, you can see the image's status in the Web Studio UI indicating that you shared it with the specified hosting unit.

To remove sharing of a prepared image

1. Ensure you have the `ImageVersionSpecUid` of the prepared image from which you want to remove sharing.
2. Determine the `HostingUnitName` of the availability zone from which you want to remove the shared image.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. **Run the `Remove-ProvImageVersionSpecHostingUnit` command:** Use the following PowerShell command. Replace <`ImageVersionSpecUid`> with your image's Uid and <`targetHostingUnitName`> with the name of the hosting unit in the target Availability Zone that you want to remove the sharing of the image version specification from:

```
Remove-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid <
    ImageVersionSpecUid> -HostingUnitName <targetHostingUnitName>
```

Where to go next

- Image management
- For Amazon WorkSpaces Core GitHub PowerShell examples, see citrix-mcs-sdk-samples-Amazon WorkSpaces Core

Create a catalog of Amazon WorkSpaces Core Managed Instances

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to Amazon WorkSpaces Core Managed Instances.

> **Note:**
>
> Currently, creation of catalogs of both persistent and non-persistent VMs (`CleanOnBoot` property is `True` or `False`) is supported.

Prerequisites

Before creating a catalog of Amazon WorkSpaces Core Managed Instances, you need to finish creating:

1. A connection to Amazon WorkSpaces Core Managed Instances. See Connection to Amazon WorkSpaces Core Managed Instances.
2. A prepared image. See Create a prepared image for Amazon WorkSpaces Core Managed Instances.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Network setting during image preparation

During image preparation, a preparation virtual machine (VM) is created based on the original VM. This preparation VM is disconnected from the network. To disconnect the network from the preparation VM, a network security group is created to deny all inbound and outbound traffic. This network security group persists and is reused. The network security group's name is `Citrix.XenDesktop.IsolationGroup-GUID`, where GUID is randomly generated.

A machine profile-based machine catalog

You can use a machine profile to capture the hardware properties from an EC2 instance (VM) or launch template version and apply them to the provisioned machines. Properties that are captured can include, for example, tenancy type, instance type, security groups, network mappings, EBS volume properties, EBS optimization, CPU options, hibernation capability, and other supported AWS configurations.

You can use an AWS EC2 Instance (VM) or AWS Launch Template version as the machine profile input.

> **Note:**
>
> - EBS volume properties are derived only from a machine profile.
> - The Instance Metadata Service (IMDS) V2 is only supported and not IMDS V1. For information, see How Instance Metadata Service Version 2 works.

AWS tenancy

AWS provides the following tenancy options: shared tenancy (the default type) and dedicated tenancy. Shared tenancy means that multiple Amazon WorkSpaces Core instances from different customers might reside on the same piece of physical hardware. Dedicated tenancy means that your Amazon WorkSpaces Core instances run only on hardware with other instances that you have deployed.

> **Note:**
>
> The dedicated instances are only supported (dedicated hosts are currently not supported). Other customers do not use the same piece of hardware.

Tenancy type is captured from machine profile

When you use MCS to create a catalog to provision machines in AWS, the tenancy type is captured from the machine profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Shared hardware**: This setting is suitable for most deployments. Multiple customers share pieces of hardware even though they do not interact with each other. Using shared hardware is the least expensive option for running your Amazon EC2 instances.
- **Dedicated instance**: This setting is more suitable for deployments with specific security or compliance requirements. With a dedicated instance, you still enjoy the benefits of having a host separate from other AWS customers but you do not pay for the entire host. You do not need to worry about the capacity of the host but you are charged at a higher rate for the instances. Additionally, Dedicated Instances provide limited support for Bring Your Own License (BYOL).

Flexible billing

Amazon WorkSpaces Core Managed Instances supports two billing modes:

Billing mode	Description
Monthly	Fixed, monthly flat-rate billing. Ideal for persistent desktops and predictable workloads.
Hourly	Pay-as-you-go billing. This is the AWS default configuration if no billing mode is explicitly specified.

These options provide flexibility for managing compute costs based on your workload's persistence and usage patterns.

This feature requires the use of the Amazon WorkSpaces billing service. By default, MCS uses this service to provision and manage instances, letting you benefit from more competitive flat-rate pricing for persistent workloads.

Prerequisites and considerations

- AWS account configuration: Your AWS account must be configured to use the WorkSpaces billing service. While AWS accounts are switched by default, some customers may request AWS to remain on the legacy EC2 billing service for using WorkSpaces Core Managed Instances.

  > **Note:**
  >
  > If your account is on the legacy EC2 billing service, the **Monthly** billing option is not available.

- Host connection: Flexible billing is only applicable to Amazon WorkSpaces Core host connections. It is not supported for standard AWS EC2 host connections.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Spot instances: Spot instances are not supported with the WorkSpaces billing service.
- Mixed billing: An AWS account must use either WorkSpaces billing or EC2 billing for core managed instances. A mix of both within a single account is not supported.
- Compatibility: Only specific instance types, platform types (OS), and tenancy types are compatible with certain billing modes. MCS performs a preflight check to ensure your selections (Service Offering, Machine Profile, and Prepared Image) match the chosen billing mode.

See Create a machine catalog with a specific billing mode.

Create a catalog

A prepared image and a machine profile is required for creating catalogs of Amazon WorkSpaces Core Managed Instances. You can use an AWS VM Instance or AWS Launch Template version as the machine profile input.

You can create a catalog using:

- Web Studio
- PowerShell

Create a catalog using Web Studio

Create a machine catalog from the Images node

Use the **Create catalog** option in the **Images** node to create a catalog using the image version.

Alternatively, you can select the version when creating a catalog in the **Machine Catalogs** node, linking to the prepared image option in the catalog creation workflow. See Create a machine catalog from the Machine Catalogs node.

To create an MCS machine catalog from the **Images** node, do the following:

1. Select an image version and click **Create catalog**. Click **Next** on the **Introduction** page.
2. On the **Machine Management** and **Image** pages, the settings are pre-selected based on the selected image version. On the Image page, enter a note for the selected prepared image.
3. Complete the settings on the following pages.
4. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.
5. Go to the **Machine Catalogs** node to see the created machine catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the Machine Catalogs node, do the following:

1. Click **Machine Catalogs** on the left navigation pane.
2. Click **Create Machine Catalog**. The **Machine Catalog Setup** page appears.
3. On the **Machine Type** page, select a machine type for the catalog, for example, **Multi-session OS**.
4. On the **Machine Management** page, select the following settings:
    a) Select **Machines that are power managed (for example, virtual machines or blade PCs)**.
    b) Select **Citrix provisioning technology**. Then, select **Citrix Machine Creation Services™**.
    c) In the **Resources** field, select the resources (availability zone or local zone) that you configured while creating the host connection and click **Next**.
5. On the **Desktop experience** page, select either random or static desktop that you want users to have when they log in. If a static desktop is selected, further specify whether you want to save changes that the user makes on the local disk (persistent or non-persistent).
6. On the **Image** page, click **Select an image** to select a prepared image for the machine catalog. Select the prepared version that you created. Click the image version name. To view more details about the selected image version, click the version number, which is underlined. Click **Done**.

    The machine profile associated with the prepared image appears and its hardware properties (for example, instance type, tenancy type, network mappings, security groups, volume properties) are used to create machines in the catalogs. To change the machine profile source to another VM or launch template version click the edit button.
7. On the **Virtual Machines** page:
    a) Enter the number of VMs for the catalog.
    b) The default machine specification is displayed, which is based on the machine profile. To change it, select the edit icon and select a machine specification.
8. On the **NICs** page, select the NICs (or ENIs) for the VMs.
9. On the **Machine Identities** page, configure the machine identity type for the machines in the catalog:
    a) To configure **domain-joined machines (on-premises Active Directory or Microsoft Entra hybrid joined)**, select the domain and create new AD accounts for the VMs to be created in this machine catalog. The provisioned VMs are joined to the domain selected. To provision **non-domain joined machines**, select the non-domain join option.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) Specify the account naming scheme for the new accounts to be created for the VMs.

10. On the **Domain credentials** page, click **Enter credentials** to provide the credentials for the selected domain. Enter admin-level username and password when prompted. You can also use a service account if you have domain credentials already saved previously by following our product docs.
11. Click through the remaining pages until the **Summary** page. Enter a name for the machine catalog and select **Finish** to create the machine catalog.

Limitations on creating a machine catalog in an AWS local zone

- Certain local zones only support certain hardware configurations (for example, Perth local zone does not support GP3 volumes, only GP2).
- Since only gp2 is universally supported across all local zones, and not all support gp3, ID disk creation defaults to using gp2 volume type.
- You must select a machine profile with hardware specifications that are supported in the desired local zone.
- Prepared image AMIs snapshots and ID disk snapshots defaults to being placed in the region, rather than the local zone (due to AWS limitations regarding visibility into EBS snapshot support in local zones).
- Only local zones supporting full EC2 and EBS services are supported zones.

Create a catalog using PowerShell

Create a catalog using a prepared image version spec and machine profile

- Create an MCS non-persistent machine catalog from the prepared image version spec using the `New-ProvScheme` command. For example,

```
New-ProvScheme -ProvisioningSchemeName <string> -
    ImageVersionSpecUid <Guid> -HostingUnitUid <Guid> -
    IdentityPoolUid <Guid> [-CleanOnBoot $true] [-MachineProfile <
    string>] [-ProvisioningSchemeType "MCS"]
```

- Create an MCS persistent machine catalog from the prepared image version spec using the `New-ProvScheme` command. For example,

```
New-ProvScheme -ProvisioningSchemeName <string> -
    ImageVersionSpecUid <Guid> -HostingUnitUid <Guid> -
    IdentityPoolUid <Guid> [-CleanOnBoot $false] [-MachineProfile
    <string>] [-ProvisioningSchemeType "MCS"]
```

Example of the complete set of Powershell commands to create a catalog:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$Catalog = New-BrokerCatalog  -AllocationType "Random"  -IsRemotePC $False  -MinimumFunctionalLevel "L7_20" -Name "wsccatalog" -PersistUserChanges "Discard" -ProvisioningType "MCS" -Scope @() -SessionSupport "MultiSession"

$IdentityPool = New-AcctIdentityPool  -AllowUnicode  -Domain "domainname" -IdentityPoolName "wsccatalog" -IdentityType "ActiveDirectory"  -NamingScheme "aws##" -NamingSchemeType "Numeric" -Scope @()

$PreparedImageVersionSpec = Get-ProvImageVersionSpec -ImageDefinitionName image1 -ImageVersionNumber 1 -Filter "PreparationType -eq 'Mcs'"

$Task = New-ProvScheme -ProvisioningSchemeName wsccatalog -ImageVersionSpecUid $PreparedImageVersionSpec.ImageVersionSpecUid -HostingUnitName wsc -IdentityPoolName wsccatalog -CleanOnBoot -Scope @() -SecurityGroup @() -MachineProfile 'XdHyp:\HostingUnits\cvad-test-scalestress\us-east-1a.availabilityzone\machine-profile-instance i (i-0xxxxxxxx).vm' -RunAsynchronously

Get-ProvTask -TaskId $Task.TaskId
$ProvScheme = Get-ProvScheme -ProvisioningSchemeName wsccatalog

Set-BrokerCatalog -Name $Catalog.Name -ProvisioningSchemeId $ProvScheme.ProvisioningSchemeUid
```

Update the machine profile

To update the machine profile on a catalog that was initially provisioned with a machine profile, do the following. You can also change the tenancy type and hibernation capability of the machine profile source while editing an MCS machine catalog.

1. Run `Set-ProvScheme` command. For example,

```
Set-ProvScheme `
-ProvisioningSchemeUid "<ID" `
-MachineProfile "XDHyp:\HostingUnits\abc\us-east-1a.availabilityzone\citrix-cvad-machineprofile-instance (i-0xxxxxxxx).vm"
```

Create a machine catalog with a specific billing mode

You can specify the billing mode while creating a machine catalog using only PowerShell currently.

Use PowerShell To specify the billing mode through PowerShell, use the `CustomProperties` parameter in the `New-ProvScheme` command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$custprop = "BillingMode,Monthly"

New-ProvScheme -ProvisioningSchemeName "MyCatalog" `
-ImageVersionSpecUid $ImageVersionSpecUid `
-HostingUnitName "wsc-unit" `
-IdentityPoolName "MyIdentityPool" `
-MachineProfile "XdHyp:\HostingUnits\wsc-unit\machine-profile lt-123.
   launchtemplate\lt-123 (1).launchtemplateversion" `
-CustomProperties $custprop `
-CleanOnBoot
```

> **Note:**
>
> If the `BillingMode` property is omitted, the catalog defaults to `Hourly`.

Change the billing mode of an existing catalog

You can convert an existing catalog from `Monthly` to `Hourly`, or vice versa. This change can apply to both new and existing VMs in the catalog.

Important considerations for updates

- Service window: Existing VMs must undergo a service window or power cycle to apply the billing change.
- Validation: MCS validates that the existing instance types and platforms are compatible with the new billing mode before applying the change.

Update using PowerShell

- To update the billing mode of only new VMs added to a catalog, update the billing mode custom property of the provisioning scheme:

  ```
  $custprop = "BillingMode,Hourly"

  Set-ProvScheme -ProvisioningSchemeName "MyCatalog" -
     CustomProperties $custprop
  ```

- To update the billing mode of new and existing VMs in a catalog, create a new provisioning scheme version with the updated custom property, and apply the new version to all VMs:

  ```
  $custprop = "BillingMode,Hourly"

  New-ProvSchemeVersion -ProvisioningSchemeName "MyCatalog" -
     CustomProperties $custprop

  New-ProvSchemeHardwareUpdate -ProvisioningSchemeVersion 2 `
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-StartsNow -AllVMs `
-MaxDurationInMinutes 100 `
-ProvisioningSchemeName "MyCatalog"
```

Monitor billing information

You can verify the billing mode for catalogs and individual virtual machines.

Run the following PowerShell commands to check your account's billing eligibility:

- Returns `BillingMode` as part of CustomProperties

```
Get-ProvScheme –ProvisioningSchemeName "MyCatalog" " | Select
    ProvisioningSchemeName, CustomProperties
```

- Returns `BillingMode` as part of VMInfo

```
Get-ProvVMDetails –ProvisioningSchemeName "MyCatalog" " |
   Select-Object -ExpandProperty VMInfo
```

Troubleshooting and validation

MCS includes preflight checks to prevent incompatible configurations. You may encounter the following errors during catalog creation or editing:

- **NoInstanceConfigFoundForBillingMode**: Occurs if the selected Service Offering (instance type), Tenancy, and Platform Type are not supported for the chosen billing mode.
- **Spot Instance Not Supported**: If you attempt to use Spot instances with a WorkSpaces host connection, validation fails.
- **EC2 billing restriction**: If your AWS account is on the legacy EC2 billing model, attempting to set a Monthly billing mode results in a validation error.

Create a catalog with launch template version using PowerShell

You can create an MCS machine catalog with a launch template version as a machine profile input. You can also update the input of a machine profile catalog from a VM to a launch template version and from a launch template version to a VM.

On the AWS EC2 console, you can provide the instance configuration information of a launch template along with version number. When you specify the launch template version as a machine profile input while creating or updating a machine catalog, the properties from that version of the launch template are copied to the provisioned VDA VMs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following properties can be provided using machine profile input or explicitly as parameters in `New-ProvScheme` or `Set-ProvScheme`commands. If they are provided in `New-ProvScheme` or `Set-ProvScheme` commands, they take precedence over the machine profile values of these properties.

- Service Offering
- Networks

> **Note:**
>
> If service offering is not provided in the machine profile launch template or as a parameter in the `New-ProvScheme` command, you get an appropriate error.

To create a catalog using launch template version as a machine profile input:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Get the list of launch template versions of a launch template. For example:

```
XDHyp:\HostingUnits\test\test-mp-sard (lt-01xxxxx).launchtemplate>
    ls | Select FullPath
```

4. Create an identity pool if not created. For example:

```
New-AcctIdentityPool `
-IdentityPoolName "abc11" `
-NamingScheme "abc1-##" `
-NamingSchemeType Numeric `
-Domain "citrix-xxxxxx.local" `
-ZoneUid "xxxxxxxx" `
```

5. Create a provisioning scheme with a launch template version as a machine profile input. For example:

```
New-ProvScheme `
-ProvisioningSchemeName "MPLT1" `
-HostingUnitUid "c7f71f6a-3f45-4xxx-xxxx-xxxxxxxxxx" `
-IdentityPoolUid "bf3a6ba2-1f80-4xxx-xxxx-xxxxxxxxx" `
-ImageVersionSpecUid ' 24dfb047-e867-527g-896c-25664xxxxx1t ' `
-CleanOnBoot `
-MachineProfile "XDHyp:\HostingUnits\xxxx-ue1a\machineprofiletest
   (lt-01xxxxx).launchtemplate\lt-01xxxxx (1).
   launchtemplateversion"
```

6. Register a provisioning scheme as a broker catalog. For example:

```
New-BrokerCatalog -Name "MPLT1" `
-AllocationType Random `
-Description "Machine profile catalog" `
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-ProvisioningSchemeId fe7df345-244e-4xxxx-xxxxxxxxx `
-ProvisioningType Mcs `
-SessionSupport MultiSession `
-PersistUserChanges Discard
```

7. Complete creating the catalog.

Update the machine profile source

You can also update the input of a machine profile catalog from a VM to a launch template version and from a launch template version to a VM. For example:

- To update the input of a machine profile catalog from a VM to a launch template version:

```
Set-ProvScheme -ProvisioningSchemeName "CloudServiceOfferingTest"
    `
-MachineProfile "XDHyp:\HostingUnits\xxxx-ue1a\machineprofiletest
    (lt-0bxxxxxxxxxxxx).launchtemplate\lt-0bxxxxxxxxxxx (1).
    launchtemplateversion"
```

- To update the input of a machine profile catalog from a launch template version to a VM:

```
Set-ProvScheme -ProvisioningSchemeName "CloudServiceOfferingTest"
    `
-MachineProfile "XDHyp:\HostingUnits\sard-ue1a\us-east-1a.
    availabilityzone\apollo-non-persistent-vda-win2022-2 (i-08
    xxxxxxxxx).vm"
```

MCSIO enabled catalog

MCS Storage Optimization (MCSIO) improves the performance of the VM by caching disk operations in either memory or on a small, high-speed disk. You can create an MCSIO enabled non-persistent catalog using PowerShell commands. To create such a catalog, you must install the MCSIO driver while installing or upgrading the VDA during the preparation of the AMI instance. By default, that driver is not installed.

After an MCSIO AMI is prepared (when installing the VDA, select the option to include the MCSIO driver in the installation), you can create an MCSIO enabled non-persistent catalog.

> **Note:**
>
> The option to configure MCSIO with only disk cache (without memory cache) using Studio has been removed across all hypervisors and cloud service environments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create an MCSIO enabled catalog

The four parameters added to the New-ProvScheme PowerShell command are:

- `UseWriteBackCache`: Turns on caching (write-back cache) for the given provisioning scheme
- `WriteBackCacheDiskSize`: Specifies the size in GB of the temporary disk used for caching
- `WriteBackCacheMemorySize`: Specifies how much memory in MB to use for caching. This is an optional parameter.

> **Note:**
>
> - The value of `WriteBackCacheDiskSize` must be more than zero because at least 1 GB of cache disk storage is required. The cache disk size must not be bigger than the OS disk size.
> - The value of `WriteBackCacheMemorySize` must be non-zero and less than the machine catalog memory size.

The custom properties that affect MCSIO are:

- `WBCDiskStorageType`: Defines the volume type, which is used for the temporary disk in Amazon WorkSpaces Core Managed Instances. This parameter takes a string argument in the format `volume-type[:iops][:throughput]`. The following are the volume types:
  - gp2: Do not use iops and throughput parameters for this volume type
  - gp3: Use iops and throughput parameters for this volume type
  - io1: Use only iops parameter for this volume type
  - io2: Use only iops parameter for this volume type

  The default volume type is **gp2**.
- `PersistWBC`: Controls whether to keep or discard the cache disk whenever the Amazon WorkSpaces Core Managed Instances is powered off. If set to **`true`**, the cache disk is kept. If set to **`false`** (the default), the cache disk is only created and kept while the AMI instance is powered on.
- `PersistOSDisk`: Controls whether to keep or discard the OS disk whenever the Amazon WorkSpaces Core Managed Instances is powered off. If set to **`true`**, the OS disk is kept. If set to **`false`** (the default), the OS disk is only created and kept while the AMI instance is powered on.

Perform the following steps in the PowerShell window to create an MCSIO enabled non-persistent catalog:

1. Open the PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Create a broker catalog and an identity pool.
4. Create the provisioning scheme. For example:

```
$HostingUnitUid = '0xxxx1d9-bbfc-xxxf-bxxb-exxxxxe008b2'
$MasterImageVM = 'XDHyp:\HostingUnits\ctx-test\aws-apollo-non-persistent-multi-mcsio-vda-win2022 (ami-0bf1810488acbxxxb).template'
$NetworkMap = @{
  'NetworkPath' = 'XDHyp:\HostingUnits\ctx-test\us-east-1a.availabilityzone\10.0.128.0`/17 (vpc-0fa6e41d72507fxxx).network'  }

$SecurityGroup = $( 'XDHyp:\HostingUnits\ctx-test\us-east-1a.availabilityzone\private.securitygroup' )
$ServiceOffering = 'XDHyp:\HostingUnits\ctx-test\T3 Medium Instance.serviceoffering'
$CustomProperties = 'WBCDiskStorageType,gp3:6000:250;PersistWBC,false'

$provScheme = New-ProvScheme -ProvisioningSchemeName $CatalogName -HostingUnitUid $HostingUnitUid `
-IdentityPoolUid $acctPool.IdentityPoolUid -CleanOnBoot `
- MasterImageVM $MasterImageVM `
-NetworkMap $NetworkMap `
-ServiceOffering $ServiceOffering `
-SecurityGroup $SecurityGroup `
-CustomProperties $CustomProperties `
-UseWriteBackCache -WriteBackCacheDiskSize 16 -WriteBackCacheMemorySize 256
```

5. Add VMs to the catalog.

Improve boot performance with MCSIO

You can improve the boot performance of VMs if you enable MCSIO and set `PersistWBC` and `PersistOSDisk` custom properties as **`true`**. With such a setting, VMs can boot faster because they do not need to initialize a new cache disk or to recreate a root disk from their template.

Encrypt OS and ID disks

You can create a catalog of VMs with AWS KMS keys (Customer managed key and AWS managed key) that can be used to encrypt OS disk and Identity Disk (ID).

- AWS managed keys are automatically rotated every year.
- Customer managed keys are optional for automatic rotation and can be managed manually.

You can see the following AWS documents for more information on KMS keys:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- AWS KMS concepts
- How automatic key rotation works

For encryption of OS and ID disks, configure one of the following:

- Use a prepared image that is encrypted (for example, an AMI created from an instance or snapshot that contains an EBS root volume encrypted with KMS key)
- Use a machine profile source (VM or launch template) that contains an encrypted EBS root volume.

Limitations

Consider the following limitations:

- MCS currently supports only one disk on prepared image AMI.
- You cannot directly encrypt existing unencrypted EBS volumes or snapshots, or modify the KMS key of an existing encrypted volume. To do that, you must:
  1. Create a new snapshot of that volume.
  2. Create a new volume from that snapshot.
  3. Encrypt the new volume.

See the following AWS documents:

- Encrypt unencrypted resources
- Limitations of automatic or default encryption of EBS volumes: Automatically encrypt existing and new Amazon EBS volumes.

Create a catalog with disk encryption

You can create an MCS machine catalog with disk encryption using:

- Prepared image (created using image management from master image that has encrypted disk)
- Machine profile

Considerations while using machine profile input are:

- The KMS key of the machine profile input takes precedence over the prepared image's KMS key.
- If no machine profile input is provided, then the KMS key of the prepared image AMI is used to encrypt the disks of catalog VMs.
- If the machine profile has Block Device Mappings present, then the block devices present in the prepared image template (AMI) and the machine profile must match. For example, if AMI has a device defined on `/dev/sda1`, then the Machine Profile must also have a device defined on `/dev/sda1`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If there is no key in the machine profile source and the prepared image is unencrypted, then disks of catalog VMs are not encrypted.
- When the prepared image is encrypted, a machine profile source VM or launch template must have an encrypted root volume to be considered a valid input.

Modify an existing catalog

You can modify an existing catalog using the `Set-ProvScheme` PowerShell command to have:

- A machine profile input with a volume containing a new KMS key.
- A prepared image created from the master image with encrypted AMI using image management.

Important considerations:

- The volumes of new VMs added to the catalog are encrypted with the new KMS key.
- To update the encryption settings when there is an existing machine profile, run `Set-ProvScheme` with a new machine profile.
- You cannot modify an existing catalog from having encrypted volumes to unencrypted volumes. You cannot do an image update from an encrypted prepared image AMI to an unencrypted prepared image AMI.

Enable NitroTPM and UEFI secure boot for VM instances

When creating a catalog, you can now select a prepared image (AMI) with NitroTPM and/or UEFI secure boot enabled. Accordingly, the provisioned VMs in the catalog are also enabled with NitroTPM and/or UEFI secure boot. This implementation ensures that the VMs are secured and trusted. For more information on NitroTPM and UEFI Secure Boot, see the Amazon documentation.

Limitations

- You can use both NitroTPM and Secure Boot currently in all AWS Regions (including the AWS GovCloud (US) Regions) except China.
- You cannot enable NitroTPM and UEFI secure boot on existing catalogs. If you want a catalog with NitroTPM and UEFI secure boot enabled, create a new catalog.

Key steps

1. Set up your AWS environment.
2. Create a connection to AWS.
3. Create a master image (AMI) enabled with NitroTPM and/or UEFI secure boot.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Create a prepared image from the master image. See Create a prepared image for Amazon WorkSpaces Core Managed Instances.
5. Create a machine catalog by selecting the prepared image with NitroTPM and UEFI secure boot enabled in Web Studio catalog creation menu or when creating a Provisioning Scheme using PowerShell commands.

VMs added to the created catalog have NitoTPM and UEFI secure boot enabled.

Create an AMI that supports NitroTPM and UEFI secure boot

1. You can create an AMI from a VM that has NitroTPM and/or UEFI secure boot enabled.
   a) Create the instance from using the AWS marketplace images. Example, search for `TPM-Windows_Server-2022-English-Full-Base on the aws-marketplace`.
   b) Download single or multi session VDA.
   c) Create an AMI from that VM.
2. Use the register-image command:

```
--boot-mode (string)
--tpm-support (string)
```

   For more information, see register-image.

See the following AWS documents:

- Determine the supported boot modes of an EC2 instance type
- Requirements for using NitroTPM with Amazon EC2 instances/.

You can open a PowerShell window from the Delivery controller™ host to check if a specific:

- service offering supports NitroTPM or UEFI secure boot

```
(Get-Item -Path "XDHyp:\HostingUnits\aws\T3 Medium Instance.serviceoffering").AdditionalData.BootMode
(Get-Item -Path "XDHyp:\HostingUnits\aws\T3 Medium Instance.serviceoffering").AdditionalData.NitroTpmSupportVersions
```

- template supports NitroTPM or UEFI secure boot

```
(Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\aws" -ResourceType "template -Id "ID").AdditionalData.BootMode

(Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\aws" -ResourceType "template -Id "ID").AdditionalData.TpmSupport
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update the service offering of existing catalog

You can change the service offering of an existing catalog using `Set-ProvScheme`. The change applies to the newly added VMs. However, you get errors in the following scenarios:

AMIs boot mode	AMI supports Nitro TPM?	Service offering supports NitroTPM and UEFI secure boot?
UEFI	No	No
Legacy BIOS	Yes	No
UEFI	Yes	No
UEFI Preferred	Yes	No

Copy tags on VMs

You can copy tags on NICs, and disks (Identity disk, write back cache disk, and OS disk) that are specified in the machine profile to newly created VMs in an MCS machine catalog. You can specify these tags in any of the machine profile sources (AWS VM instance or AWS launch template version). This feature is applicable to persistent and non-persistent machine catalogs and VMs.

> **Note:**
>
> - On the AWS EC2 console, you cannot see the **Tag Network Interfaces** values under the **Launch Template Version Resource Tags**. However, you can run the PowerShell command `aws ec2 describe-launch-template-versions --launch-template-id lt-0bb652503d45dcbcd --versions 12` to see the tag specifications.
> - If a machine profile source (VM or launch template version) has two network interfaces (eni-1 and eni-2), and eni-1 has tag t1 and eni-2 has tag t2, then the VM gets both the two network interfaces' tags.

Filter VM instances using PowerShell

An AWS VM instance that you use as a machine profile VM must be compatible for the machine catalog to create and function correctly. To list the AWS VM instances that can be used as machine profile input VMs, you can use the `Get-HypInventoryItem` command. The command can page and filter the inventory of VMs available on a hosting unit.

Pagination:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Get-HypInventoryItem supports two modes of pagination:

- Paging mode uses the `-MaxRecords` and `-Skip` parameters to return sets of items:
  - `-MaxRecords`: The default is **1**. This controls how many items to return.
  - `-Skip`: The default is **0**. This controls how many items to skip from the absolute beginning (or absolute end) of the list in the hypervisor.
- Scrolling mode uses `-MaxRecords`, `-ForwardDirection`, and `-ContinuationToken` parameters to allow scrolling of the records:
  - `-ForwardDirection`: The default is **True**. This is used along with `-MaxRecords` to return either the next set of matching records or the previous set of matching records.
  - `-ContinuationToken`: The returns the items immediately after (or before if `ForwardDirection` is **false**) but not including the item given in the `ContinuationToken`.

Examples of pagination:

- To return a single record of the machine template with the lowest name. The `AdditionalData` field has the `TotalItemsCount` and the `TotalFilteredItemsCount`:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template
```

- To return 10 records of the machine template with the lowest name:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -MaxRecords 10 | select Name
```

- To return an array of records ending with the highest name:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -ForwardDirection $False -MaxRecords 10
     | select Name
```

- To return an array of records starting at the machine template associated with the given `ContinuationToken`:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -ContinuationToken "ami-07xxxxxxxxx" -
    MaxRecords 10
```

Filtering:

The following additional optional parameters are supported for filtering. You can combine these parameters with the pagination options.

- `-ContainsName "my_name"`: If the given string matches part of an AMI name, then the AMI is included in the `Get` result. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -MaxRecords 100 -ContainName ‘apollo’
     | select Name
```

- `-Tags '{ "Key0": "Value0", "Key1": "Value1", "Key2": "Value2" } '` : If an AMI has at least one of these tags, it is included in the `Get` result. For example:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -MaxRecords 100 -Tags '{
"opex owner": "Not tagged" }
' | select Name
```

> **Note:**
>
> Two tag values are supported. **Not Tagged** tag value matches items which do not have the given tag in their list of tags. **All values** tag value matches items which have the tag regardless of the value of the tag. Otherwise, the match happens only if the item has the tag and the value equals to what is given in the filter.

- `-Id "ami-0a2d913927e0352f3"`: If the AMI matches the given ID, it is included in the `Get` result. For example:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -Id ami-xxxxxxxxxxxxx
```

Filtering on AdditionalData parameter:

The `AdditionalData` filter parameter lists templates or VMs based on their capability, service offering, or any property which is in AdditionalData. For example:

```
(Get-HypInventoryItem -ResourceType "launchtemplateversion" -
    LiteralPath "XDHyp:\HostingUnits\aws" -MaxRecords 200).
    AdditionalData
```

You can also add a `-Warn` parameter to indicate the incompatible VMs. The VMs are included with an `AdditionalData` field named **Warning**. For example:

```
(Get-HypInventoryItem -ResourceType "launchtemplateversion" -
    LiteralPath "XDHyp:\HostingUnits\aws" -MaxRecords 200 -Template "ami
    -015xxxxxxxxx" -Warn $true).AdditionalData
```

Where to go next

- For managing an Amazon Workspaces Core catalog, see Manage a catalog of Amazon WorkSpaces Core Managed Instances

Create a prepared image machine catalog in Azure

May 13, 2026

Create prepared images and use the prepared images to create an MCS machine catalog using:

- Web Studio
- PowerShell commands

The key steps to create an MCS machine catalog using the prepared image are:

1. Create the image definition and the initial image versions.
2. Use the image version as a prepared image to create a catalog

Use Web Studio

Create an image definition and initial image version

To create an image definition and the initial image version, do the following:

1. From Web Studio, go to the **Images** node, and click **Create Image Definition**. Click **Next** on the **Introduction** page.
2. On the **Image Definition** page, specify the **OS type** and **Session type** for the image definition.
3. Select an existing resource group or create a new one for holding the image resources. To enable image sharing, select **Place image versions** in the Azure Compute Gallery and then choose to create a new gallery or use an existing one to hold its image versions.
4. On the **Image** page, select **Resources** (only the resources applicable for the set connection are listed) and a master image to use as a template for creating the image version. You can select the **Use a machine profile** checkbox and select a machine profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - Before selecting an image, verify that the master image has VDA 2311 or later installed and the MCSIO driver is installed on the VDA.
> - If you want to use a confidential VM type prepared image to create an MCS catalog, then create a prepared image using the confidential VM type master image and a confidential VM type machine profile. See Azure confidential VMs for information on preparing confidential VM type master images and machine profiles.

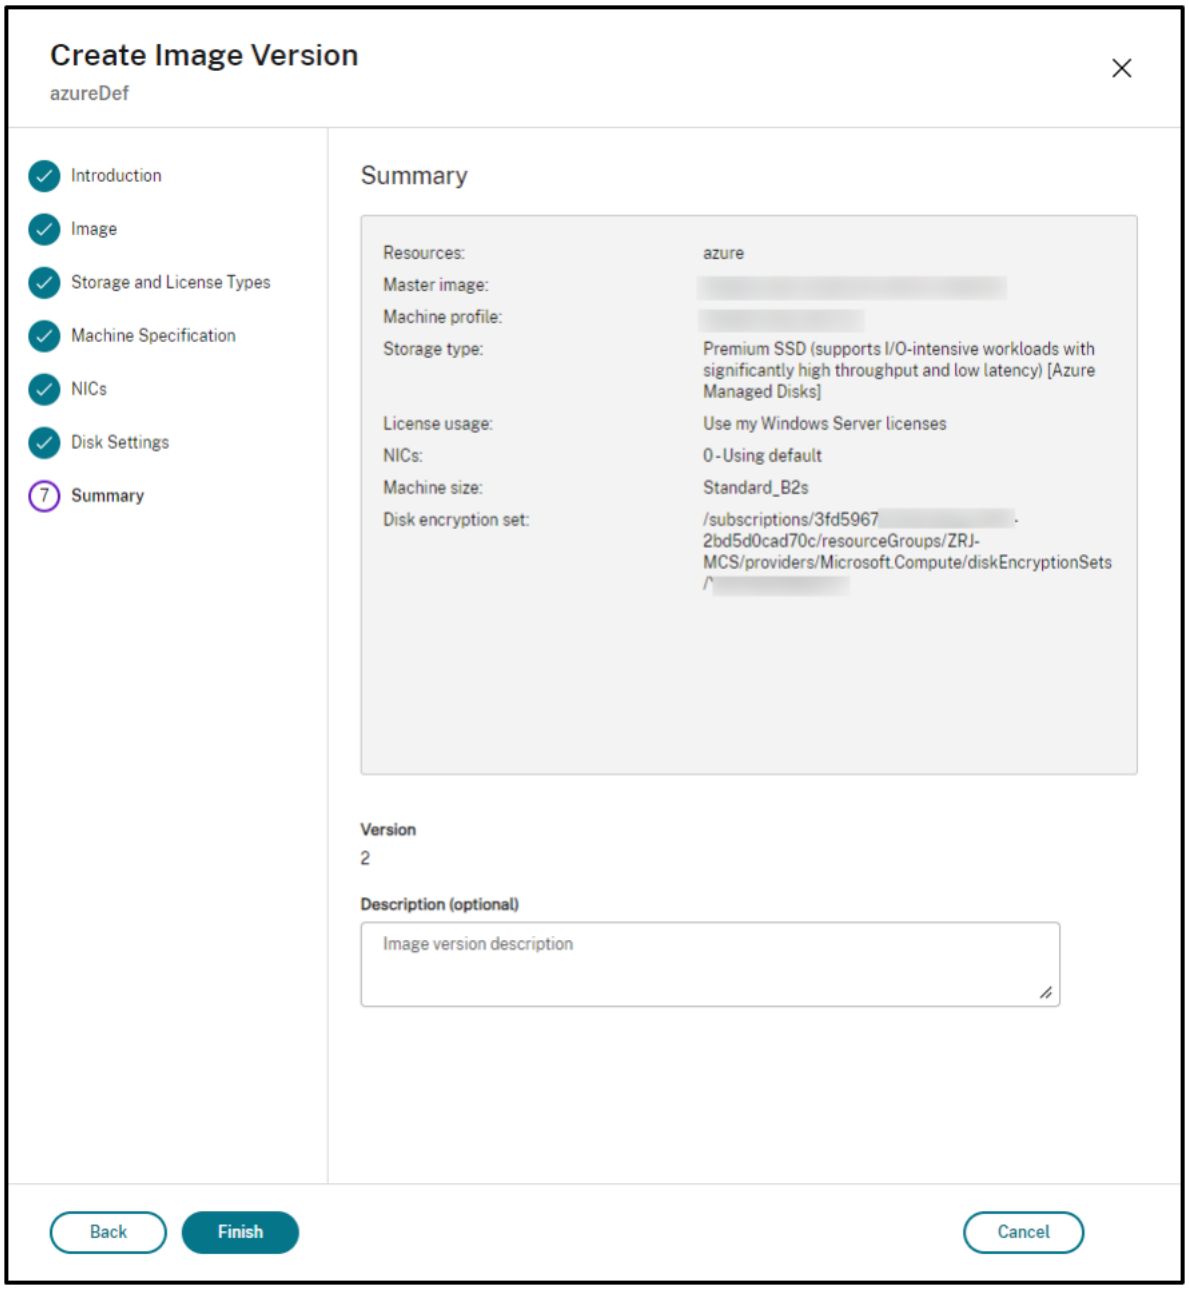
5. On the **Storage and Licenses Types** page, select the storage and license type to be used as part of the image preparation process.

   > **Note:**
   >
   > If you select a machine profile on the **Image** page, the license type of the machine profile is pre-selected based on the profile setting.

6. On the **Machine Specification** page, select a machine size. If you select a machine profile on the **Image** page, the machine size of the machine profile is selected by default.
7. On the **NICs** page, select or add NICs for the preparation image. For each NIC, select an associated virtual network.
8. On the **Disk Settings** page, select the customer-managed encryption key (CMEK). If the machine profile doesn't have a CMEK but the master image has, it pre-selects the CMEK from the master image.
9. On the **Version Description** page, enter a description for the initial image version created.
10. On the **Summary** page, check the details of the image definition and the initial image version created. Enter a name and description for the image definition. Click **Finish**.

Create image versions

Image versions allow for the management of different iterations or updates to a particular image. This functionality enables you to maintain multiple versions of an image for different purposes.



To create image versions from the initial image version, do the following:

> **Note:**
>
> The hosting unit of all the image versions must be the same.

1. Go to the **Images** node, select an image version or an image definition, and click **Create Image Version**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the Image definition page, you can change the hosting unit, and reselect the master image and machine profile for that image version.
3. If you want the configuration of the image version to be different from the initial configured image version, then configure the settings on the **Storage and License Types**, **Machine Specification**, **NICs**, and **Disk Settings** pages of the **Create Image Version** dialog.
4. Add a description for the image version. Click **Finish**.

> **Note:**
>
> If the creation of the image version fails for any reason, the **Troubleshoot** tab at the bottom

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> provides a **Retry** option.

Shared prepared images

To share prepared images across different hosting units for Azure, follow these steps:

1. Right-click an image version and select **Manage Image Share**. All hosting units in your Azure environment appear. The resources where the image version is created from is disabled for any actions.
2. Select the hosting units with which you want to share the image and click **Save**. The **Share Status** column shows In progress.
3. Click the **Resources** tab for more details about the sharing status.

> **Note:**
>
> When the status of the image version sharing is in progress, the option to **Delete Image Version** or **Manage Image Share** is disabled.

Create a machine catalog from the Images node

Use the **Create catalog** option in the **Images** node to create a catalog using the image version.

Alternatively, you can select the version when creating a catalog in the **Machine Catalogs** node, linking to the prepared image option in the catalog creation workflow. See Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Images** node, do the following:

1. Select an image version and click **Create catalog**. Click **Next** on the **Introduction** page.
2. On the **Desktop Experience** page, select the required desktop experience.
3. From the **Image** page to **Disk Settings** page, the settings are pre-selected based on the selected image version.
4. On the **Resource Group** page, you can choose to create a new resource group or use an existing resource group to place the resources of this catalog.
5. Complete the settings on the following pages.
6. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.
7. Go to the **Machine Catalogs** node to see the created machine catalog.

Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Machine Catalogs** node, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Click **Machine Catalogs** on the left navigation pane.
2. Click **Create Machine Catalog**. The **Machine Catalog Setup** page appears. Click **Next** through the **Introduction**, **Machine Type**, and **Machine Management** pages.
3. On the **Machine Management** page, select the following settings:
    a) Select **Machines that are power managed (for example, virtual machines or blade PCs)**.
    b) Select **Citrix provisioning technology**. Then, select **Citrix Machine Creation Services™**.
    c) In the **Resources** field, the resources belonging to different zones are listed. Select any Azure network resource and click **Next**.
4. On the **Image** page: For Master image type, follow the steps:
    a) Select Master image.
    b) Under the Master image, select an image. The blade lists all the images that belong to the same region as those of Resources.
    c) Click **Done**.
    d) For Prepared image type, select **Prepared image**.
    e) Under the **Prepared image**, select an image version of an image definition. If needed, add a note for the selected prepared image version.
    f) Click the image version name. To view more details about the selected image version, click the version number, which is underlined.
    g) If the selected image version is configured with a machine profile, select a machine profile. If the selected image version is not configured with a machine profile, you cannot choose to use a machine profile.
5. Configure the settings on the following pages.
6. On the **Disk Settings** page, if the selected prepared image uses a disk encryption set, then you cannot remove the encryption set, but you can change the key to another encryption key.
7. On the **Resource Group** page, you can choose to create a new resource group or use an existing resource group to place the resources of this catalog.
8. Complete the settings on the following pages.
9. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.

Use PowerShell

Create a prepared image

The detailed PowerShell commands to create a prepared image version spec are as follows:

1. Check the available image definition names using the `Test-ProvImageDefinitionNameAvailable` command. For example,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Test-ProvImageDefinitionNameAvailable -ImageDefinitionName <string
    []>
```

2. Create an image definition using the `New-ProvImageDefinition` command. For example,

```
New-ProvImageDefinition -ImageDefinitionName image1 -OsType
    Windows -VdaSessionSupport MultiSession
```

3. Create a new configuration for image definition in the specified Hosting connection using the `Add-ProvImageDefinitionConnection` command.

   The `CustomProperties` for `Add-ProvImageDefinitionConnection` can include the following. If you do not use the parameters, then default values are used.

   - `ResourceGroups`: The resource group that has the base disks.
   - `UseSharedImageGallery`: Indicator for the type of base disks. Use **`true`** for ACG (image sharing) and **`false`** for snapshot.
   - `ImageGallery`: The gallery name when the base disk is an ACG image version.

   For example,

   - In case of snapshot and customer provided resource group:

```
$CustomerOwnRsourceGroupProperties = @"
<CustomProperties xmlns="http:// schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="ResourceGroups"
    Value="yangj_image" />
</CustomProperties>
"@
```

   - In case of ACG and customer provided resource group and image gallery:

```
$CustomerOwnAllProperties = @"
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="
    UseSharedImageGallery" Value="true" />
<Property xsi:type="StringProperty" Name="ResourceGroups"
    Value="rg" />
<Property xsi:type="StringProperty" Name="ImageGallery" Value
    ="gallery" />
</CustomProperties>
"@
```

   - In case of ACG and customer provided resource group only:

```
$CustomerOwnResourceGroupProperties = @"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="
    UseSharedImageGallery" Value="true" />
<Property xsi:type="StringProperty" Name="ResourceGroups"
    Value="rg" />
</CustomProperties>
"@
```

- In case of ACG and resource group and image gallery managed by Citrix:

```
$CustomerOwnResourceGroupNothingProperties = @"
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="
    UseSharedImageGallery" Value="true" />
</CustomProperties>
"@
```

```
Add-ProvImageDefinitionConnection -ImageDefinitionName image1 -
    HypervisorConnectionName Azure28 [-CustomProperties
    $CustomProperties]
```

4. Create an image version using the `New-ProvImageVersion` command. For example,

```
New-ProvImageVersion -ImageDefinitionName image1 -Description "
    version 1"
```

5. Add a master image version spec to the image version using the `Add-ProvImageVersionSpec` command. For example,

```
Add-ProvImageVersionSpec -ImageDefinitionName  image1  -
    ImageVersionNumber  1 -HostingUnitName azure -MasterImagePath "
    XDHyp:\HostingUnits\azure\image.folder\azureresourcegroup.
    resourcegroup\win2022-snapshot.snapshot"
```

> **Note:**
>
> You can add only one master image version spec to one image version for a hosting unit.

6. Create a prepared image version spec from the master image version spec using the `New-ProvImageVersionSpec` command.

   The CustomProperties for `New-ProvImageVersionSpec` can include the following. If you do not use the parameters, then default values are used:

   - `PreparedImageStorageType`: The storage type to use for the prepared image. Defaults to `Standard_LRS`, can also be `Premium_LRS` or `Standard_ZRS`. `Standard_ZRS` provides zone redundancy for the image.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-ProvImageVersionSpec
-SourceImageVersionSpecUid  c6e7384c-b2f8-46d6-9519-29a2c57ed3cb
-NetworkMapping @{
 "0"="XDHyp:\HostingUnits\azure\virtualprivatecloud.folder\
    azureresourcegroup.resourcegroup\azure-vnet-eastus.
    virtualprivatecloud\dev.network" }

-ServiceOffering"XDHyp:\HostingUnits\azure\serviceoffering.folder\
   Standard_B2ms.serviceoffering" -CustomProperties "<
   CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/
   machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-
   instance`"></CustomProperties>" -RunAsynchronously
```

7. You can also share a prepared image version spec with another hosting unit in all hosting connections by using the `Add-ProvImageVersionSpecHostingUnit` command.

   The CustomProperties for `Add-ProvImageVersionSpecHostingUnit` can include the following. If you do not use the parameters, then values from the source prepared image spec are used:

   - `PreparedImageStorageType`: The storage type to use for the prepared image.

```
Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid xxxxxxx -
   HostingUnitName AzureWest
```

> **Note:**
>
> One hosting unit and preparation type can have only one prepared instance.

Example of the complete set of Powershell commands to create image definition, image version, and prepared image version spec:

```
New-ProvImageDefinition -ImageDefinitionName image1 -OsType Windows -
   VdaSessionSupport MultiSession

$ImageDefinitionCustomProperties = @" <CustomProperties xmlns="http://
   schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3
   .org/2001/XMLSchema-instance"> <Property xsi:type="StringProperty"
   Name="UseSharedImageGallery" Value="true" /> <Property xsi:type="
   StringProperty" Name="ResourceGroups" Value="rg" /> <Property xsi:
   type="StringProperty" Name="ImageGallery" Value="gallery" /> </
   CustomProperties> "@

Add-ProvImageDefinitionConnection -ImageDefinitionName image1 -
   HypervisorConnectionName Azure28 -CustomProperties
   $ImageDefinitionCustomProperties

$imageVersion = New-ProvImageVersion -ImageDefinitionName image1 -
   Description "version 1"

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$SourceImageVersionSpec = Add-ProvImageVersionSpec -ImageVersionUid $imageVersion.ImageVersionUid ` -HostingUnitUid $hostingunit.HostingUnitUid ` -MasterImagePath "XDHyp:\HostingUnits\azure28\image.folder\abc.resourcegroup\def-snapshot.snapshot"

$ImageVersionSpecCustomProperties = @'

<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">

<Property xsi:type="StringProperty" Name="PreparedImageStorageType" Value="Premium_LRS" />

<Property xsi:type="StringProperty" Name="LicenseType" Value="Windows_Client" />

</CustomProperties>

'@

New-ProvImageVersionSpec -NetworkMapping @{
 "0" = "XDHyp:\HostingUnits\azure28\virtualprivatecloud.folder\East US.region\virtualprivatecloud.folder\studio-mcs-infrastructure.resourcegroup\studio-mcs-vnet-eastus.virtualprivatecloud\mcs-dev.network"  }
  -CustomProperties $ImageVersionSpecCustomProperties -ServiceOffering "XDHyp:\HostingUnits\azure28\serviceoffering.folder\Standard_B2s.serviceoffering" -SourceImageVersionSpecUid $SourceImageVersionSpec.ImageVersionSpecUid

$TargetCustomProperties = @'

<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">

<Property xsi:type="StringProperty" Name="PreparedImageStorageType" Value="Standard_ZRS" />

</CustomProperties>

'@

Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid xxxxxxx -HostingUnitName AzureWest  – TargetCustomProperties $TargetCustomProperties

$PreparedImageVersionSpec = Get-ProvImageVersionSpec -ImageVersionUid $imageVersion.ImageVersionUid | Where SourceImageVersionSpecUid-eq $SourceImageVersionSpec.ImageVersionSpecUid
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - All image version specs in an image definition must belong to the same hosting unit.
> - An image version can have only one master image version spec and one prepared image version spec.
> - All image version specs must either have a machine profile or none of the image version specs must have a machine profile.

Create a catalog using a prepared image version spec

Create an MCS machine catalog from the prepared image version spec using the `New-ProvScheme` command. For example,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitUid <Guid> -IdentityPoolUid <Guid> [-VMCpuCount <
    int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-NetworkMapping <
    Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-Metadata <Hashtable
    >] [-ServiceOffering <string>] [-SecurityGroup <string[]>] [-
    TenancyType <string>] [-MachineProfile <string>] [-CustomProperties
    <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >][-ImageAssignmentNote <string>]
```

Or,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitName <string> -IdentityPoolName <string> [-
    VMCpuCount <int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-
    NetworkMapping <Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-
    Metadata <Hashtable>] [-ServiceOffering <string>] [-SecurityGroup <
    string[]>] [-TenancyType <string>] [-MachineProfile <string>] [-
    CustomProperties <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >][-ImageAssignmentNote <string>]
```

If you want to use an ACG image version spec, then set `UseSharedImageGallery` as **`true`**. For example,

```
$provSchemeCustomProperties= @"
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance">
     <Property xsi:type="StringProperty" Name="UseSharedImageGallery"
        Value="true" />
     <Property xsi:type="StringProperty" Name="StorageAccountType" Value
        ="StandardSSD_LRS" />
</CustomProperties>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
"@
New-ProvScheme -ProvisioningSchemeName assignimage -ImageVersionSpecUid
    $PreparedImageVersionSpec.ImageVersionSpecUid `
    -HostingUnitUid $hostingunit.HostingUnitUid `
    -IdentityPoolUid $IdentityPool.IdentityPoolUid `
    -CleanOnBoot -Scope @() -SecurityGroup @() `
    -ServiceOffering "XDHyp:\HostingUnits\azure28\serviceoffering.
       folder\Standard_B2s.serviceoffering" `
    -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\azure28\virtualprivatecloud.folder\East US.
    region\virtualprivatecloud.folder\studio-mcs-infrastructure.
    resourcegroup\studio-mcs-vnet-eastus.virtualprivatecloud\mcs-dev.
    network" }
  `
    -CustomProperties $provSchemeCustomProperties
```

Example of the complete set of Powershell commands to create a catalog:

```
$Catalog = New-BrokerCatalog  -AllocationType "Random"  -IsRemotePC
    $False  -MinimumFunctionalLevel "L7_20" -Name "azurecatalog" -
    PersistUserChanges "Discard" -ProvisioningType "MCS" -Scope @() -
    SessionSupport "MultiSession"

$IdentityPool = New-AcctIdentityPool  -AllowUnicode  -Domain "azure.
    local" -IdentityPoolName "azurecatalog" -IdentityType "
    ActiveDirectory"  -NamingScheme "azure##" -NamingSchemeType "Numeric
    " -Scope @()

$PreparedImageVersionSpec = Get-ProvImageVersionSpec -
    ImageDefinitionName image1 -ImageVersionNumber 1 -Filter "
    PreparationType -eq 'Mcs'"

$Task = New-ProvScheme -ProvisioningSchemeName azurecatalog -
    ImageVersionSpecUid $PreparedImageVersionSpec.ImageVersionSpecUid -
    HostingUnitName azure -IdentityPoolName azurecatalog -CleanOnBoot -
    Scope @() -SecurityGroup @() -ServiceOffering "XDHyp:\HostingUnits\
    azure\serviceoffering.folder\Standard_B2s.serviceoffering" -
    NetworkMapping @{
 "0"="XDHyp:\HostingUnits\azure\virtualprivatecloud.folder\
    azureresourcegroup.resourcegroup\azure-vnet-eastus.
    virtualprivatecloud\dev.network" }
  -CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.
    com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/
    XMLSchema-instance`">    <Property xsi:type="StringProperty" Name
    ="UseSharedImageGallery" Value="true" /><Property xsi:type=`"
    StringProperty`" Name=`"StorageAccountType`" Value=`"
    StandardSSD_LRS`" /></CustomProperties>" -RunAsynchronously

Get-ProvTask -TaskId $Task.TaskId
$ProvScheme = Get-ProvScheme -ProvisioningSchemeName azurecatalog

Set-BrokerCatalog -Name $Catalog.Name -ProvisioningSchemeId $ProvScheme
    .ProvisioningSchemeUid
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Share encrypted prepared image across regions, subscriptions, and tenants

Azure Compute Gallery (ACG) images can be encrypted with a Disk Encryption Set (DES). With ACG sharing feature, you can share an encrypted prepared image across regions, subscriptions and tenants for Azure. The target resource needs to pick a DES in its region from the subscription where the prepared image belongs. You can thereafter create a machine catalog in the resource where the encrypted prepared image is shared.

The key steps to share an encrypted prepared image are:

1. Create Disk Encryption Set (DES) in each region: See the microsoft documentation Use the Azure portal to enable server-side encryption with customer-managed keys for managed disks.
2. Create an image definition for the Azure host connection and image versions in Azure Compute Gallery (ACG) and specify the DES to encrypt the prepared image : See Create an image definition and initial image version.
3. Share the encrypted prepared image across regions, subscriptions, and tenants: You can use Web Studio or PowerShell commands.

You can now create a machine catalog in the resource where the encrypted prepared image is shared. For more information on creating the catalog, see Create a prepared image machine catalog in Azure.

> **Note:**
>
> - If the primary region is not encrypted, the shared regions also cannot have DES.
> - If two host units target the same region, they have the same DES.

Share the encrypted image across regions, subscriptions, and tenants using Web Studio

1. Right-click an image version and select **Manage Image Share**. The resources with region and disk encryption set are listed.
2. Select the resources that you want to share with the image version. The resources where the image version is created from is disabled for any actions. Select a DES from the drop-down menu if DES is not configured for a resource.

   > **Note:**
   >
   > Resources within the same region must use the same encryption key.

3. Click **Save**.
4. Click the **Resources** tab for more details about the sharing status.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - When the status of the image version sharing is in progress, the option to **Delete Image Version** or **Manage Image Share** is disabled.
> - When a resource is successfully shared, the DES is not editable.

Share the encrypted image across regions, subscriptions, and tenants using PowerShell

Use the command `Add-ProvImageVersionSpecHostingUnit` and add the parameter `CustomProperties`. In `CustomProperties`, configure the DES for the target resource. When sharing the prepared encrypted image, each resource picks a DES in its region from the subscription which the prepared image belongs to. For example,

```
$CustomProperties = "<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-instance`">"
 "<Property xsi:type=`"StringProperty`" Name=`"DiskEncryptionSetId`" Value=`"/subscriptions/xxxxxx-7152-46c4-b061-xxxxxx70c/resourceGroups/resourcegroup1/providers/Microsoft.Compute/diskEncryptionSets/desid1`" />"+
 "</CustomProperties>"
Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid <Guid> -HostingUnitUid <Guid> -CustomProperties $CustomProperties
```

Create a prepared image machine catalog in Azure Local

May 13, 2026

Create prepared images and use the prepared images to create an MCS machine catalog using:

- Web Studio
- PowerShell commands

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The key steps to create an MCS machine catalog using the prepared image are:

1. Create the image definition and the initial image versions.
2. Use the image version as a prepared image to create a catalog.

Use Web Studio

Create an image definition and initial image version

To create an image definition and the initial image version, do the following:

1. From Web Studio, go to the **Images** node, and click **Create Image Definition**. Click **Next** on the **Introduction** page.
2. On the **Image Definition** page, specify the **OS type** and **Session type** for the image definition.
3. Select an existing resource group or create a new one for holding the image resources.
4. On the **Image** page, select **Resources** (only the resources applicable for the set connection are listed) and an image to use as a template for creating the image version.

   > **Note:**
   >
   > - Before selecting an image, verify that the master image has VDA 2311 or later installed and the MCSIO driver is installed on the VDA.
   > - For image selection, you can select an Azure Local Gallery Image or a Virtual Machine.

5. On the **Machine Specification** page, select CPU and memory for preparation VM.
6. On the **NICs** page, select NICs for the preparation image. For each NIC, select an associated virtual network.
7. On the **Version Description** page, enter a description for the initial image version created.
8. On the **Summary** page, check the details of the image definition and the initial image version created. Enter a name and description for the image definition. Click **Finish**.

Create image versions

Image versions allow for the management of different iterations or updates to a particular image. This functionality enables you to maintain multiple versions of an image for different purposes.

To create image versions from the initial image version, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The hosting unit of all the image versions must be the same.

1. Go to the **Images** node, select an image version or an image definition, and click **Create Image Version**.
2. On the **Image Definition** page, you can change the hosting unit, and reselect the master image and machine profile for that image version.
3. If you want the configuration of the image version to be different from the initial configured image version, then configure the settings on the **Machine Specification** and **NICs** pages of the **Create Image Version** dialog.
4. Add a description for the image version. Click **Finish**.

> **Note:**
>
> If the creation of the image version fails for any reason, the **Troubleshoot** tab at the bottom provides a **Retry** option.

Create a machine catalog from the Images node

Use the **Create catalog** option in the **Images** node to create a catalog using the image version.

Alternatively, you can select the version when creating a catalog in the **Machine Catalogs** node, linking to the prepared image option in the catalog creation workflow. See Create a machine catalog from the Machine Catalogs node.

To create an MCS machine catalog from the **Images** node, do the following:

1. Select an image version and click **Create catalog**. Click **Next** on the **Introduction** page.
2. On the **Desktop Experience** page, select the required desktop experience.
3. From the **Image** page to **NICs** page, the settings are pre-selected based on the selected image version.
4. On the **Resource Group** page, you can choose to create a new resource group or use an existing resource group to place the resources of this catalog.
5. Complete the settings on the following pages.
6. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.
7. Go to the **Machine Catalogs** node to see the created machine catalog.

Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Machine Catalogs** node, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Click **Machine Catalogs** on the left navigation pane.
2. Click **Create Machine Catalog**. The **Machine Catalog Setup** page appears. Click **Next** through the **Introduction** and **Machine Type** pages.
3. On the **Machine Management** page:
    a) Select **Machines that are power managed (for example, virtual machines or blade PCs)**.
    b) Select **Citrix provisioning technology**. Then, select **Citrix Machine Creation Services™**.
    c) In the **Resources** field, the resources belonging to different zones are listed. Select any Azure network resource and click Next.
4. On the **Image** page:
    - For Master image type, follow these steps:
        a) Select Master image.
        b) Under the Master image, select an image. The blade lists all the images that belong to the same region as those of Resources.
        c) Click **Done**.
    - For Prepared image type, follow these steps:
        a) Select **Prepared image**.
        b) Under the **Prepared image**, select an image version of an image definition. If needed, add a note for the selected prepared image version.
        c) Click the image version name. To view more details about the selected image version, click the version number, which is underlined.
5. Configure the settings on the following pages.
6. On the **Resource Group** page, you can choose to create a new resource group or use an existing resource group to place the resources of this catalog.
7. Complete the settings on the following pages.
8. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.

Use PowerShell

Create a prepared image

The detailed PowerShell commands to create a prepared image version spec for Azure Local are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Check the available image definition names using the `Test-ProvImageDefinitionNameAvailable` command. For example,

```
Test-ProvImageDefinitionNameAvailable -ImageDefinitionName <string
    []>
```

2. Create an image definition using the `New-ProvImageDefinition` command. For example,

```
New-ProvImageDefinition -ImageDefinitionName arc-ACG-image-climber
    -demo -OsType Windows -VDASessionSupport SingleSession -
    Description "arc ACG image for arc"
```

3. Create a new configuration for image definition in the specified Hosting connection using the `Add-ProvImageDefinitionConnection` command.

   The `CustomProperties` for `Add-ProvImageDefinitionConnection` can include the following. If you do not use the parameters, then default values are used.

   `ResourceGroups`: The resource group that has the base disks.

   For example, in the case of a customer-provided resource group:

```
$CustomerOwnRsourceGroupProperties = @"
<CustomProperties xmlns="http:// schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance">
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="
    sz_res_group" />
</CustomProperties>
"@
```

```
Add-ProvImageDefinitionConnection -HypervisorConnectionName
    Azurelocal -ImageDefinitionName arc-ACG-image-climber-demo [-
    CustomProperties $CustomProperties]
```

4. Create an image version using the `New-ProvImageVersion` command. For example,

```
New-ProvImageVersion -ImageDefinitionName arc-ACG-image-climber-
    demo
```

5. Add a master image version spec to the image version using the `Add-ProvImageVersionSpec` command. For example,

```
Add-ProvImageVersionSpec -ImageVersionNumber 1 -HostingUnitName
    network-2 -MasterImagePath XDHyp:\HostingUnits\network-2\image.
    folder\MST-W11WS-2507-11-10-no-sysprep.galleryimage
```

> **Note:**
>
> You can add only one master image version spec to one image version for a hosting unit.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Create a prepared image version spec from the master image version spec using the New-ProvImageVersionSpec command. For example,

```
New-ProvImageVersionSpec -CustomProperties "<CustomProperties
    xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`"
    xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-instance`"><
    Property xsi:type=`"StringProperty`" Name=`"ResourceGroups`"
    Value=`"citrix-xd-39d65e7a-f6c0-4772-9e8d-d6eacb36287f-hilxi`"
    /><Property xsi:type=`"StringProperty`" Name=`"OsType`" Value
    =`"Windows`" /></CustomProperties>" -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\network-2\network.folder\VM-Network-2.
    network" }
  -SourceImageVersionSpecUid "86c1a467-f900-4434-990a-c4ae39faca10
    "
```

Example of the complete set of PowerShell commands to create image definition, image version, and prepared image version spec:

```
## create image definition
New-ProvImageDefinition -ImageDefinitionName arc-ACG-image-climber-demo
    -OsType Windows -VDASessionSupport SingleSession -Description "arc
    ACG image for arc"
## create image definition connection
Add-ProvImageDefinitionConnection -CustomProperties "<CustomProperties
    xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:
    xsi=`"http://www.w3.org/2001/XMLSchema-instance`"></CustomProperties
    >" -HypervisorConnectionUid "8eac2ad2-fc81-45d6-9153-9545a779f8d2" -
    ImageDefinitionUid "39d65e7a-f6c0-4772-9e8d-d6eacb36287f"
## create new image verison
New-ProvImageVersion -ImageDefinitionName arc-ACG-image-climber-demo
## select azure arc ACG image
Import-Module Citrix.Host.Commands
Get-ChildItem -LiteralPath @("XDHyp:\HostingUnits\network-2\image.
    folder") | select-object fullpath
## add verison spec through Azure Arc ACG
Add-ProvImageVersionSpec -ImageVersionUid "29da7e07-b7e9-4c8c-a5f2-4
    c03dbcba451" -HostingUnitUid "51305f67-34b3-4b22-a5d2-b6d7deaff9ba"
    -MasterImagePath XDHyp:\HostingUnits\network-2\image.folder\MST-
    W11WS-2507-11-10-no-sysprep.galleryimage
## create new version spec
New-ProvImageVersionSpec -CustomProperties "<CustomProperties xmlns=`"
    http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http
    ://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"ResourceGroups`" Value=`"citrix-xd-39d65e7a-
    f6c0-4772-9e8d-d6eacb36287f-hilxi`" /><Property xsi:type=`"
    StringProperty`" Name=`"OsType`" Value=`"Windows`" /></
    CustomProperties>" -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\network-2\network.folder\VM-Network-2.network
    " }
  -SourceImageVersionSpecUid "86c1a467-f900-4434-990a-c4ae39faca10"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - All image version specs in an image definition must belong to the same hosting unit.
> - An image version can have only one master image version spec and one prepared image version spec.

Create a catalog using a prepared image version spec

Create an MCS machine catalog from the prepared image version spec using the `New-ProvScheme` command. For example,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitUid <Guid> -IdentityPoolUid <Guid> [-VMCpuCount <
    int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-NetworkMapping <
    Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-Metadata <Hashtable
    >] [-ServiceOffering <string>] [-SecurityGroup <string[]>] [-
    TenancyType <string>] [-MachineProfile <string>] [-CustomProperties
    <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >][-ImageAssignmentNote <string>]
```

Or,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitName <string> -IdentityPoolName <string> [-
    VMCpuCount <int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-
    NetworkMapping <Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-
    Metadata <Hashtable>] [-ServiceOffering <string>] [-SecurityGroup <
    string[]>] [-TenancyType <string>] [-MachineProfile <string>] [-
    CustomProperties <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >][-ImageAssignmentNote <string>]
```

Example of the complete set of PowerShell commands to create a catalog:

```
1 New-AcctIdentityPool -IdentityPoolName arc-climbers-local -NamingScheme
     "arc-c-vm-###" -NamingSchemeType Numeric -Domain "CLIMBERS.LOCAL"
2 New-ProvScheme -ProvisioningSchemeName arc-ACG-img-climber-3 -
    HostingUnitName network-2 -IdentityPoolName arc-climbers-local -
    ImageVersionSpecUid 0525360d-6cb5-4f08-bb2c-aaf5678a0d54
3 New-BrokerCatalog -ProvisioningSchemeId 93fbcebd-3a7a-499e-9d8d-
    c09e02021c5a -AllocationType Static -Name arc-ACG-img-climber-3 -
    PersistUserChanges OnLocal -ProvisioningType MCS -SessionSupport
    SingleSession
```

Where to go next

- Manage catalogs created using prepared images

Create a prepared image machine catalog in Red Hat OpenShift

May 13, 2026

Create prepared images and use the prepared images to create an MCS machine catalog using:

- Web Studio
- PowerShell commands

The key steps to create an MCS machine catalog using the prepared image are:

1. Create the image definition and the initial image versions.
2. Use the image version as a prepared image to create a catalog

Use Web Studio

Create an image definition and initial image version

To create an image definition and the initial image version, do the following:

1. From Studio, go to the **Images** node, and click **Create Image Definition**. Click **Next** on the **Introduction** page.
2. On the **Image Definition** page, specify the **OS type** and **Session type** for the image definition.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **Image** page, select **Resources** (only the resources applicable for the set connection are listed) and a master image to use as a template for creating the image version. You can select the **Use a machine profile** checkbox and select a machine profile.

   > **Note:**
   >
   > Before selecting an image, verify that the master image has VDA 2311 or later installed and the MCSIO driver is installed on the VDA.

4. On the **Machine Specification** page, select a machine size. If you select a machine profile, then you can see the Virtual CPU count derived from the machine profile and it is unchangeable. If you do not select a machine profile, then you can see only the memory size that is derived from the master image.
5. On the **NICs** page, select NICs for the preparation image. For each NIC, select an associated virtual network. The NIC associated with the hosting unit is selected by default.
6. On the **Version Description** page, enter a description for the initial image version created.
7. On the **Summary** page, check the details of the image definition and the initial image version created. Enter a name and description for the image definition. Click **Finish**.

Create image versions

Image versions allow for the management of different iterations or updates to a particular image. This functionality enables you to maintain multiple versions of an image for different purposes.

To create image versions from the initial image version, do the following:

1. Go to the **Images** node, select an image version or an image definition, and click **Create Image Version**.
2. On the **Image** page, you can reselect the master image for this image version.
3. If you want the configuration of the image version to be different from the initial configured image version, then configure the settings on the **Machine Specification** and **NICs** pages of the **Create Image Version** dialog.
4. Add a description for the image version. Click **Finish**.

> **Note:**
>
> If the creation of the image version fails for any reason, the **Troubleshoot** tab at the bottom provides a **Retry** option.

Create a machine catalog from the Images node

Use the **Create catalog** option in the **Images** node to create a catalog using the image version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Alternatively, you can select the version when creating a catalog in the **Machine Catalogs** node, linking to the prepared image option in the catalog creation workflow. See Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Images** node, do the following:

1. Select an image version and click **Create catalog**. Click **Next** on the **Introduction** page.
2. Click **Next** on the **Machine Management** page.
3. On the **Desktop Experience** page, select the required desktop experience.
4. From the **Image** page to **Virtual Machines** page, the settings are pre-selected based on the selected image version.
5. Complete the settings on the following pages.
6. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.
7. Go to the **Machine Catalogs** node to see the created machine catalog.

Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Machine Catalogs** node, do the following:

1. Click **Machine Catalogs** on the left navigation pane.
2. Click **Create Machine Catalog**. The **Machine Catalog Setup** page appears. Click **Next** through the **Introduction**, **Machine Type**, and **Machine Management** pages.
3. On the **Image** page:
    a) Select **Prepared image**.
    b) Under the **Prepared image**, select an image version of an image definition.
    c) Click the image version name. To view more details about the selected image version, click the version number, which is underlined.
4. Configure the settings on the following pages.
5. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.

Use PowerShell

Create a prepared image

The detailed PowerShell commands to create a prepared image version spec are as follows:

1. Check the available image definition names using the `Test-ProvImageDefinitionNameAvailable` command. For example,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Test-ProvImageDefinitionNameAvailable -ImageDefinitionName <string
    []>
```

2. Create an image definition using the `New-ProvImageDefinition` command. For example,

```
New-ProvImageDefinition -ImageDefinitionName image2 -OsType
    Windows -VdaSessionSupport SingleSession
```

3. Create a new configuration for image definition in the specified Hosting connection using the `Add-ProvImageDefinitionConnection` command. For example,

```
Add-ProvImageDefinitionConnection -ImageDefinitionUid $imageDef.
    ImageDefinitionUid -HypervisorConnectionUid "
    00000000-0000-0000-0000-000000000000"
```

4. Create an image version using the `New-ProvImageVersion` command. For example,

```
New-ProvImageVersion -ImageDefinitionName $ImageDefintion.
    ImageDefinitionName -Description "version 1"
```

5. Add a master image version spec to the image version using the `Add-ProvImageVersionSpec` command. For example,

```
Add-ProvImageVersionSpec -MasterImagePath "XDHyp:\HostingUnits\
    YourHostingUnitName\YourMasterImage.vm" -HostingUnitUid "
    11111111-1111-1111-1111-111111111111" -ImageVersionUid
    $imageVersion.ImageVersionUid
```

> **Note:**
>
> You can add only one master image version spec to one image version for a hosting unit.

6. Create a prepared image version spec from the master image version spec using the `New-ProvImageVersionSpec` command. For example,

```
New-ProvImageVersionSpec -SourceImageVersionSpecUid
    $masterImageVersionSpec.ImageVersionSpecUid -NetworkMapping @{
 "1" = "XDHyp:\HostingUnits\YourHostingUnitName\YourNamespaceName.
     namespace\YourNetworkAttachmentDefinition.network"  }
```

Example of the complete set of Powershell commands to create image definition, image version, and prepared image version spec:

```
$imageDef = New-ProvImageDefinition -ImageDefinitionName "
    ImageDefinition" -OsType "Windows" -VDASessionSupport "MultiSession"

$task = Add-ProvImageDefinitionConnection -ImageDefinitionUid $imageDef
    .ImageDefinitionUid -HypervisorConnectionUid "
    00000000-0000-0000-0000-000000000000"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
5
6  $imageVersion = New-ProvImageVersion -ImageDefinitionName "
       ImageDefinition"
7
8
9  $masterImageVersionSpec = Add-ProvImageVersionSpec -MasterImagePath "
       XDHyp:\HostingUnits\YourHostingUnitName\YourMasterImage.vm" -
       HostingUnitUid "11111111-1111-1111-1111-111111111111" -
       ImageVersionUid $imageVersion.ImageVersionUid
10
11
12 $newProvImageVersionSpecResult = New-ProvImageVersionSpec -
       SourceImageVersionSpecUid $masterImageVersionSpec.
       ImageVersionSpecUid -NetworkMapping @{
13  "1" = "XDHyp:\HostingUnits\YourHostingUnitName\YourNamespaceName.
        namespace\YourNetworkAttachmentDefinition.network"  }
```

Note:

- All image version specs in an image definition must belong to the same hosting unit.
- An image version can have only one master image version spec and one prepared image version spec.
- All image version specs must either have a machine profile or none of the image version specs must have a machine profile.

Create a catalog using a prepared image version spec

Create an MCS machine catalog from the prepared image version spec using the `New-ProvScheme` command. For example,

```
1  $getProvImageVersionSpecResult = Get-ProvImageVersionSpec -
       ImageVersionSpecUid $newProvImageVersionSpecResult.
       ImageVersionSpecUid
2
3  New-ProvScheme -ImageVersionSpecUid $newProvImageVersionSpecResult.
       ImageVersionSpecUid -ProvisioningSchemeName "
       ProvSchemeImageDecoupling" -HostingUnitName "YourHostingUnitName" -
       IdentityPoolName "YourIdentityPoolName" -NetworkMapping @{
4   "1" = "XDHyp:\HostingUnits\YourHostingUnitName\YourNamespaceName.
        namespace\YourNetworkAttachmentDefinition.network" }
```

Where to go next

- Manage prepared image machine catalogs

Create a prepared image machine catalog in VMware

May 13, 2026

Create prepared images and use the prepared images to create an MCS machine catalog using:

- Web Studio
- PowerShell commands

The key steps to create an MCS machine catalog using the prepared image are:

1. Create the image definition and the initial image versions.
2. Use the image version as a prepared image to create a catalog

Use Web Studio

Create an image definition and initial image version

To create an image definition and the initial image version, do the following:

1. From Studio, go to the **Images** node, and click **Create Image Definition**. Click **Next** on the **Introduction** page.
2. On the **Image Definition** page, specify the **OS type** and **Session type** for the image definition.
3. On the **Image** page, select **Resources** (only the resources applicable for the set connection are listed) and a master image to use as a template for creating the image version. You can select the **Use a machine profile** checkbox and select a machine profile.

   > **Note:**
   >
   > Before selecting an image, verify that the master image has VDA 2311 or later installed and the MCSIO driver is installed on the VDA.

4. On the **Machine Specification** page, select a machine size. If you select a machine profile, then you can see the Virtual CPU count derived from the machine profile and it is unchangeable. If you do not select a machine profile, then you can see only the memory size that is derived from the master image.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. On the **NICs** page, select or add NICs for the preparation image. For each NIC, select an associated virtual network. If you do not select a machine profile, then the NIC associated with the master image is selected by default. If you select a machine profile, then the NICs are derived from the machine profile and the count is unchangeable.
6. On the **Version Description** page, enter a description for the initial image version created.
7. On the **Summary** page, check the details of the image definition and the initial image version created. Enter a name and description for the image definition. Click **Finish**.

Create image versions

Image versions allow for the management of different iterations or updates to a particular image. This functionality enables you to maintain multiple versions of an image for different purposes.

To create image versions from the initial image version, do the following:

1. Go to the **Images** node, select an image version or an image definition, and click **Create Image Version**.
2. On the **Image** page, you can change the hosting unit within the same hosting connection, and reselect the master image and machine profile for that image version.
3. If you want the configuration of the image version to be different from the initial configured image version, then configure the settings on the **Machine Specification** and **NICs** pages of the **Create Image Version** dialog.
4. Add a description for the image version. Click **Finish**.

> **Note:**
>
> If the creation of the image version fails for any reason, the **Troubleshoot** tab at the bottom provides a **Retry** option.

Share prepared images

Prerequisites Share prepared images replicates images across vCenter Server instances using cold migration. The following prerequisites apply to the hosting units belonging to different hosting connections:

- Cold migration between vCenter Servers: Cold migration requires cross-vCenter migration support in both environments.
    - Both vCenter Servers must run vSphere 7.0 or later (vSphere 8.0+ recommended).
    - Enhanced linked mode is not required.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Port requirement: Ensure the following ports are open for migration:

Source	Destination	Port	Protocol	Purpose
Source vCenter Server	Target vCenter Server	443	TCP	API communication between vCenters
Source ESXi Host	Target ESXi Host	902	TCP	NFC (Network File Copy) data transfer
Source ESXi Host	Target ESXi Host	8000	TCP	vMotion traffic

> **Note:**
>
> Ports must be open bidirectionally. Migration primarily uses NFC (port 902) for data and port 443 for management. Port 8000 may be used depending on the path. The source vCenter must validate the target's SSL certificate thumbprint during the clone operation.

VMkernel adapter configuration:

ESXi Host	Required service
Source ESXi Host	Provisioning or Management
Target ESXi Host	Same service as source (Provisioning or Management)

Both sides must enable the same traffic service (Provisioning or Management) on VMkernel adapters. Mismatches cause migration failure.

Verify in the vSphere Client under **Host > Configure > Networking > VMkernel adapters**.

Known limitation: Custom storage policies are not preserved during cross-vCenter replication. The default storage policy of the target datastore is applied.

- vTPM-enabled machine profile: Key provider compatibility. For profiles with vTPM, both vCenter Servers must access a compatible Key Provider.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Requirement	Detail
Same Key Provider access	The destination vCenter must have access to the same key provider as the source, or use the Native Key Provider as a bridge
Key material	For external KMS: both vCenters must be enrolled to the same KMS cluster (or a KMS cluster that shares key material)
Native Key Provider	Configure a Native Key Provider on both vCenter Servers. Each vCenter's Native Key Provider is independent, but vSphere accepts this combination for cross-vCenter operations. The Native Key Provider can also act as a bridge if the source and destination do not share an external KMS. The Native Key Provider must be backed up on both vCenters before use.

> **Note:**
>
> The Native Key Provider is the simplest option. Configure and back it up on both servers. If using external KMS, ensure both vCenters share the same cluster or key material. Verify Key Provider configuration in the **vSphere Client under vCenter > Configure > Security > Key Providers before enabling image sharing for vTPM-enabled catalogs**.

Share prepared images across different host units To share prepared images across different hosting units, follow these steps:

1. Right-click an image version and select **Manage Image Share**. All hosting units in your VMware environment appear. The resources where the image version is created from is disabled for any actions.
2. Select the hosting units with which you want to share the image and click **Save**.
   The **Share Status** column shows **In progress**.
3. Click the **Resources** tab at the bottom for more details about the sharing status.

> **Note:**
>
> When the status of the image version sharing is in progress, the option to **Delete Image Version** or **Manage Image Share** is disabled.
> To share an image with a hosting unit in a different VMware connection, ensure the following requirements are met:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - The two connections can communicate with each other.
> - The hypervisor versions are consistent.
> - The Provisioning services are enabled on management VMkernel adapters of both the source and target hosts. The **Host > Configure > Networking > VMkernel adapters** is the navigation path in the VMware vSphere Client.

Create a machine catalog from the Images node

Use the **Create catalog** option in the **Images** node to create a catalog using the image version.

Alternatively, you can select the version when creating a catalog in the **Machine Catalogs** node, linking to the prepared image option in the catalog creation workflow. See Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Images** node, do the following:

1. Select an image version and click **Create catalog**. Click **Next** on the **Introduction** page.
2. On the **Desktop Experience** page, select the required desktop experience.
3. From the **Image** page to **Virtual Machines** page, the settings are pre-selected based on the selected image version.
4. Complete the settings on the following pages.
5. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.
6. Go to the **Machine Catalogs** node to see the created machine catalog.

Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Machine Catalogs** node, do the following:

1. Click **Machine Catalogs** on the left navigation pane.
2. Click **Create Machine Catalog**. The **Machine Catalog Setup** page appears. Click **Next** through the **Introduction**, **Machine Type**, and **Machine Management** pages.
3. On the **Image** page:
    a) Select **Prepared image**.
    b) Under the **Prepared image**, select an image version of an image definition.
    c) Click the image version name. To view more details about the selected image version, click the version number, which is underlined.
    d) If the selected image version is configured with a machine profile, select a machine profile. If the selected image version is not configured with a machine profile, you cannot choose to use a machine profile.
4. Configure the settings on the following pages.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.

Use PowerShell

Create a prepared image

The detailed PowerShell commands to create a prepared image version spec are as follows:

1. Check the available image definition names using the `Test-ProvImageDefinitionNameAvailable` command. For example,

```
Test-ProvImageDefinitionNameAvailable -ImageDefinitionName <string
    []>
```

2. Create an image definition using the `New-ProvImageDefinition` command. For example,

```
New-ProvImageDefinition -ImageDefinitionName image2 -OsType
    Windows -VdaSessionSupport SingleSession
```

3. Create a new configuration for image definition in the specified Hosting connection using the `Add-ProvImageDefinitionConnection` command. For example,

```
Add-ProvImageDefinitionConnection -ImageDefinitionName image2 -
    HypervisorConnectionName VMware
```

4. Create an image version using the `New-ProvImageVersion` command. For example,

```
New-ProvImageVersion -ImageDefinitionName $ImageDefintion.
    ImageDefinitionName -Description "version 1"
```

5. Add a master image version spec to the image version using the `Add-ProvImageVersionSpec` command. For example,

```
$MasterImagePath = "XDHyp:\HostingUnits\vmware\win10-master.vm\
    win10-master-snap.snapshot"
$SourceImageVersionSpec = Add-ProvImageVersionSpec -
    ImageDefinitionName $ImageVersion.ImageDefinitionName -
    ImageVersionNumber $ImageVersion.ImageVersionNumber -
    HostingUnitName vmware -MasterImagePath $MasterImagePath
```

> **Note:**
>
> You can add only one master image version spec to one image version for a hosting unit.

6. Create a prepared image version spec from the master image version spec using the `New-ProvImageVersionSpec` command. For example,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-ProvImageVersionSpec -SourceImageVersionSpecUid
    $SourceImageVersionSpec.ImageVersionSpecUid -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\vmware\\DSwitch-VM Network.network" }
  -VMCpuCount 2 -VMMemoryMB 4096 -RunAsynchronously
```

7. You can also share prepared image version spec with another hosting unit within the same hosting connection using the `Add-ProvImageVersionSpecHostingUnit` command. For example,

```
Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid xxxxxxx -
    HostingUnitName VMwareabc
```

Example of the complete set of Powershell commands to create image definition, image version, and prepared image version spec:

```
New-ProvImageDefinition -ImageDefinitionName image2 -OsType Windows -
    VdaSessionSupport Single

Add-ProvImageDefinitionConnection -ImageDefinitionName image2 -
    HypervisorConnectionName VMware

$imageVersion = New-ProvImageVersion -ImageDefinitionName image2

$SourceImageVersionSpec = Add-ProvImageVersionSpec -ImageVersionUid
    $imageVersion.ImageVersionUid `
    -HostingUnitUid $hostingunit.HostingUnitUid `
    -MasterImagePath "XDHyp:\HostingUnits\vmware\shuaiz-win10-master.vm
        \shuaiz-win10-master-snap.snapshot"

New-ProvImageVersionSpec -SourceImageVersionSpecUid
    $SourceImageVersionSpec.ImageVersionSpecUid `
    -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\vmware\\DSwitch-VMNetwork.network" }
  `
    -VMCpuCount 2 -VMMemoryMB 4096

Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid xxxxxxx -
    HostingUnitName VMwareabc
 $PreparedImageVersionSpec = Get-ProvImageVersionSpec -ImageVersionUid
    $imageVersion.ImageVersionUid | Where SourceImageVersionSpecUid-eq
    $SourceImageVersionSpec.ImageVersionSpecUid
```

> **Note:**
>
> - All image version specs in an image definition must belong to the same hosting unit.
> - An image version can have only one master image version spec and one prepared image version spec.
> - All image version specs must either have a machine profile or none of the image version

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> specs must have a machine profile.

Create a catalog using a prepared image version spec

Create an MCS machine catalog from the prepared image version spec using the `New-ProvScheme` command. For example,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitUid <Guid> -IdentityPoolUid <Guid> [-VMCpuCount <
    int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-NetworkMapping <
    Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-Metadata <Hashtable
    >] [-ServiceOffering <string>] [-SecurityGroup <string[]>] [-
    TenancyType <string>] [-MachineProfile <string>] [-CustomProperties
    <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >][-ImageAssignmentNote <string>]
```

Or,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitName <string> -IdentityPoolName <string> [-
    VMCpuCount <int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-
    NetworkMapping <Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-
    Metadata <Hashtable>] [-ServiceOffering <string>] [-SecurityGroup <
    string[]>] [-TenancyType <string>] [-MachineProfile <string>] [-
    CustomProperties <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >][-ImageAssignmentNote <string>]
```

Example of creating a catalog using a prepared image version spec in VMware:

```
New-ProvScheme -ProvisioningSchemeName assignimage -ImageVersionSpecUid
    $PreparedImageVersionSpec.ImageVersionSpecUid `
    -HostingUnitName $hostingunit.c-IdentityPoolName $IdentityPool.
       IdentityPoolName `
    -CleanOnBoot -Scope @() -SecurityGroup @() -VMCpuCount 2 -
       VMMemoryMB 8192 `
    -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\vmware\\DSwitch-VM Network.network" }
```

Example of the complete set of Powershell commands to create a catalog:

```
$Catalog = New-BrokerCatalog  -AllocationType "Random"  -IsRemotePC
    $False  -MinimumFunctionalLevel "L7_20" -Name "vmwarecatalog" -
    PersistUserChanges "Discard" -ProvisioningType "MCS" -Scope @() -
    SessionSupport "MultiSession"
$IdentityPool = New-AcctIdentityPool  -AllowUnicode  -Domain "vmware.
    local" -IdentityPoolName "vmwarecatalog" -IdentityType "
    ActiveDirectory"  -NamingScheme "vmware##" -NamingSchemeType "
    Numeric" -Scope @()
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$PreparedImageVersionSpec = Get-ProvImageVersionSpec -
    ImageDefinitionName image2 -ImageVersionNumber 1 -Filter "
    PreparationType -eq 'Mcs'"
$Task = New-ProvScheme -ProvisioningSchemeName vmwarecatalog -
    ImageVersionSpecUid $PreparedImageVersionSpec.ImageVersionSpecUid -
    HostingUnitName vmware -IdentityPoolName vmwarecatalog -CleanOnBoot
    -Scope @() -SecurityGroup @() -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\vmware\\DSwitch-VM Network.network" }
  -VMCpuCount 2 -VMMemoryMB 4096 -RunAsynchronously
Get-ProvTask -TaskId $Task.TaskId
$ProvScheme = Get-ProvScheme -ProvisioningSchemeName vmwarecatalog
Set-BrokerCatalog -Name $Catalog.Name -ProvisioningSchemeId $ProvScheme
    .ProvisioningSchemeUid
```

Create a prepared image machine catalog in XenServer®

May 13, 2026

Create prepared images and use the prepared images to create an MCS machine catalog using:

- Web Studio
- PowerShell commands

The key steps to create an MCS machine catalog using the prepared image are:

1. Create the image definition and the initial image versions.
2. Use the image version as a prepared image to create a catalog

Use Web Studio

Create an image definition and initial image version

To create an image definition and the initial image version, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. From Studio, go to the **Images** node, and click **Create Image Definition**. Click **Next** on the **Introduction** page.
2. On the **Image Definition** page, specify the **OS type** and **Session type**, and **Connection** for the image definition.
3. On the **Image** page, select **Resources** (only the resources applicable for the set connection are listed) and a master image to use as a template for creating the image version.

   > **Note:**
   >
   > - Before selecting an image, verify that the master image has VDA 2311 or later installed and the MCSIO driver is installed on the VDA.

4. On the **Machine Specification** page, you can see only the memory size that is derived from the master image, and you can change it if needed.
5. On the **NICs** page, select NICs for the preparation image. For each NIC, select an associated virtual network. The NIC associated with the master image is selected by default.
6. On the **Version Description** page, enter a description for the initial image version created.
7. On the **Summary** page, check the details of the image definition and the initial image version created. Enter a name and description for the image definition. Click **Finish**.

Create image versions

Image versions allow for the management of different iterations or updates to a particular image. This functionality enables you to maintain multiple versions of an image for different purposes.

To create image versions from the initial image version, do the following:

1. Go to the **Images** node, select an image version or an image definition, and click **Create Image Version**.
2. On the **Image** page, change the hosting unit, and reselect the master image if needed.
3. To use different settings from the initial image version, configure the settings on the **Machine Specification** and **NICs** pages in the **Create Image Version** dialog.
4. Add a description for the image version. Click **Finish**.

> **Note:**
>
> If the creation of the image version fails for any reason, the **Troubleshoot** tab at the bottom provides a **Retry** option.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Shared prepared image

To share prepared images across different host units for Xenserver, follow these steps:

1. Right-click an image version and select **Manage Image Share**. All the host units under the selected connection are listed. The resources where the image version is created from is disabled for any actions.
2. Select the host units with which you want to share the image and click **Save**. The **Share Status** column shows **In progress**.
3. Click the **Resources** tab for more details about the sharing status.

> **Note:**
>
> When the status of the image version sharing is in progress, the option to delete image version or manage image share is disabled.

Create a machine catalog from the Images node

Use the **Create catalog** option in the **Images** node to create a catalog using the image version.

Alternatively, you can select the version when creating a catalog in the **Machine Catalogs** node, linking to the prepared image option in the catalog creation workflow. See Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Images** node, do the following:

1. Select an image version and click **Create catalog**. Click **Next** on the **Introduction** page.
2. On the **Machine Management** page, select the hosting unit and click **Next**.
3. On the **Desktop Experience** page, select the required desktop experience.
4. From the **Image** page to **Virtual Machine**s page, the settings are pre-selected based on the selected image version.
5. Complete the settings on the following pages.
6. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.
7. Go to the **Machine Catalogs** node to see the created machine catalog.

Create a machine catalog from the Machine Catalogs node

To create an MCS machine catalog from the **Machine Catalogs** node, do the following:

1. Click **Machine Catalogs** on the left navigation pane.
2. Click **Create Machine Catalog**. The **Machine Catalog Setup** page appears. Click **Next** through the **Introduction**, **Machine Type**, and **Machine Management** pages.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **Image** page:
   a) Select **Prepared image**.
   b) Under the **Prepared image**, select an image version of an image definition.
   c) Select the image version. To view more details about the selected image version, click the version number, which is underlined.
4. Complete the settings on the following pages.
5. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.

Use PowerShell

Create a prepared image

The detailed PowerShell commands to create a prepared image version spec are as follows:

1. Check the available image definition names using the `Test-ProvImageDefinitionNameAvailable` command. For example,

```
Test-ProvImageDefinitionNameAvailable -ImageDefinitionName
    xenimage1
```

2. Create an image definition using the `New-ProvImageDefinition` command. For example,

```
$ImageDefintion = New-ProvImageDefinition -ImageDefinitionName
    xenimage1 -OsType Windows -VdaSessionSupport SingleSession
```

3. Create a new configuration for image definition in the specified Hosting connection using the `Add-ProvImageDefinitionConnection` command.

```
Add-ProvImageDefinitionConnection -ImageDefinitionName
    $ImageDefintion.ImageDefinitionName -HypervisorConnectionName
    XenServer1
```

4. Create an image version using the `New-ProvImageVersion` command. For example,

```
$ImageVersion = New-ProvImageVersion -ImageDefinitionName
    $ImageDefintion.ImageDefinitionName -Description "version 1"
```

5. Add a master image version spec to the image version using the `Add-ProvImageVersionSpec` command. For example,

```
$MasterImagePath = "XDHyp:\HostingUnits\xenhu \win10-master.vm\
    win10-master-snap.snapshot"
$SourceImageVersionSpec = Add-ProvImageVersionSpec -
    ImageDefinitionName $ImageDefintion.ImageDefinitionName -
    ImageVersionNumber $ImageVersion.ImageVersionNumber -
    HostingUnitName xenhu -MasterImagePath $MasterImagePath
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> You can add only one master image version spec to one image version for a hosting unit.

6. Create a prepared image version spec from the master image version spec using the `New-ProvImageVersionSpec` command. For example,

```
New-ProvImageVersionSpec -SourceImageVersionSpecUid
    $SourceImageVersionSpec.ImageVersionSpecUid -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\xenhu\VM Network.network" }

-VMCpuCount 2 -VMMemoryMB 4096 -RunAsynchronously
```

7. You can also share prepared image version spec with another hosting unit within the same hosting connection using the `Add-ProvImageVersionSpecHostingUnit` command. For example,

```
Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid xxxxxxx -
    HostingUnitName xenhu2
```

Example of the complete set of Powershell commands to create image definition, image version, and prepared image version spec:

```
$ImageDefintion = New-ProvImageDefinition -ImageDefinitionName
    xenimage1 -OsType Windows -VdaSessionSupport SingleSession

Add-ProvImageDefinitionConnection -ImageDefinitionName $ImageDefintion.
    ImageDefinitionName -HypervisorConnectionName XenServer1

$ImageVersion = New-ProvImageVersion -ImageDefinitionName
    $ImageDefintion.ImageDefinitionName -Description "version 1"

$MasterImagePath = "XDHyp:\HostingUnits\xenhu \win10-master.vm\win10-
    master-snap.snapshot"

$SourceImageVersionSpec = Add-ProvImageVersionSpec -ImageDefinitionName
     $ImageDefintion.ImageDefinitionName -ImageVersionNumber
    $ImageVersion.ImageVersionNumber -HostingUnitName xenhu -
    MasterImagePath $MasterImagePath

New-ProvImageVersionSpec -SourceImageVersionSpecUid
    $SourceImageVersionSpec.ImageVersionSpecUid -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\xenhu\VM Network.network" }

 -VMCpuCount 2 -VMMemoryMB 4096 -RunAsynchronously

Add-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid xxxxxxx -
    HostingUnitName xenhu2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - An image version can have only one master image version spec and one prepared image version spec.
> - All image version specs must either have a machine profile or none of the image version specs must have a machine profile.

Create a catalog using a prepared image version spec

Create an MCS machine catalog from the prepared image version spec using the `New-ProvScheme` command. For example,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitUid <Guid> -IdentityPoolUid <Guid> [-VMCpuCount <
    int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-NetworkMapping <
    Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-Metadata <Hashtable
    >] [-ServiceOffering <string>] [-SecurityGroup <string[]>] [-
    TenancyType <string>] [-MachineProfile <string>] [-CustomProperties
    <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >]
```

Or,

```
New-ProvScheme -ProvisioningSchemeName <string> -ImageVersionSpecUid <
    Guid> -HostingUnitName <string> -IdentityPoolName <string> [-
    VMCpuCount <int>] [-VMMemoryMB <int>] [-UseWriteBackCache] [-
    NetworkMapping <Hashtable>] [-CleanOnBoot] [-Scope <string[]>] [-
    Metadata <Hashtable>] [-ServiceOffering <string>] [-SecurityGroup <
    string[]>] [-TenancyType <string>] [-MachineProfile <string>] [-
    CustomProperties <string>] [-ResetAdministratorPasswords] [-
    UseFullDiskCloneProvisioning] [-RunAsynchronously] [-
    PurgeJobOnSuccess] [-ProvisioningSchemeType <ProvisioningSchemeType
    >]
```

Example of creating a catalog using a prepared image version spec in XenServer:

```
New-ProvScheme -ProvisioningSchemeName assignimage -imageVersionSpecUid
    $PreparedImageVersionSpec.ImageVersionSpecUid 1 `
  -HostingUnitName xenhu -IdentityPoolName poo1 `
  -CleanOnBoot -Scope @() -SecurityGroup @() -VMCpuCount 2 -VMMemoryMB
     8192 `
  -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\xenhu\VM Network.network" }
```

Example of the complete set of Powershell commands to create a catalog:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$CatalogName = "XenCatalog"
$Catalog = New-BrokerCatalog  -AllocationType "Random"  -IsRemotePC $False  -MinimumFunctionalLevel "L7_20" `
  -Name $CatalogName -PersistUserChanges "Discard" -ProvisioningType "MCS" -Scope @() -SessionSupport "MultiSession"

$IdentityPool = New-AcctIdentityPool  -AllowUnicode  -Domain "xen.local" -IdentityPoolName $CatalogName `
  -IdentityType "ActiveDirectory"  -NamingScheme "xen##" -NamingSchemeType "Numeric" -Scope @()

$PreparedImageVersionSpec = Get-ProvImageVersionSpec -ImageDefinitionName xenimage1 -ImageVersionNumber 1 -Filter "PreparationType -eq 'Mcs'"

$Task = New-ProvScheme -ProvisioningSchemeName $CatalogName -ImageVersionSpecUid $PreparedImageVersionSpec.ImageVersionSpecUid `
  -HostingUnitName xenhu -IdentityPoolName $CatalogName -CleanOnBoot -Scope @() -SecurityGroup @() `
  -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\xenhu\VM Network.network" }
  -VMCpuCount 2 -VMMemoryMB 4096 -RunAsynchronously

Get-ProvTask -TaskId $Task.TaskId
$ProvScheme = Get-ProvScheme -ProvisioningSchemeName $CatalogName

Set-BrokerCatalog -Name $Catalog.Name -ProvisioningSchemeId $ProvScheme.ProvisioningSchemeUid
```

- Manage prepared image machine catalogs

Manage prepared image machine catalogs

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can update an existing MCS machine catalog with a different prepared image and manage the image definitions and versions using:

- Web Studio
- PowerShell

Use Web Studio

Update a machine catalog with a different prepared image

To update an existing MCS machine catalog with a different prepared image, do the following:

1. Click **Machine Catalogs** on the left navigation pane and select a machine catalog that you want to update. Right-click and select **Change Prepared Image**.
2. On the **Image** page, select a prepared image. If needed, add a note for the selected prepared image.

   > **Note:**
   >
   > Applicable to Azure: You can also choose an image with ACG not enabled and later select **Place prepared image in Azure Compute Gallery** check box to place the images in the gallery.

3. To roll back to a previously assigned prepared image, click **Use previous image assignment for quick rollback** at the bottom of the wizard.

   A new window opens and displays a list of all available historical image assignments. When you select an image from the list, the corresponding version is automatically selected in the prepared image tree on the image page.
4. On the **Rollout strategy** page, select when you want to update this catalog with the selected prepared image.
5. On the **Summary** page, check the details. Click **Finish**.

You can see the history of image changes made to a catalog. To see the history, do the following:

1. Select a machine catalog.
2. Under the **Template Properties** tab in the **Prepared image** field, click **View Image history**.

Manage the image definitions and versions

You can edit and delete the image definitions and versions to manage the use of various created image versions and definitions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Edit an image definition You can edit the name and description of an image definition.

To edit an image definition, do the following:

1. Go to the **Images** node, select an image definition, and select **Edit Image Definition**.

Edit image version You can edit the description of an image version to specify the purpose of that image version.

To edit an image version, do the following:

1. Go to the **Images** node, select an image version, and select **Edit Description**.

Delete an image version To delete an image version, do the following:

1. Go to the **Images** node, select an image version, and select **Delete Image Version**.

> **Note:**
>
> You cannot delete an image version if it is used by a machine catalog.

Delete an image definition To delete an image definition, do the following:

1. Go to the **Images** node, select an image definition, and select **Delete Image Definition**.

> **Note:**
>
> You cannot delete an image definition if it contains an image version.

Use PowerShell

Update a catalog using a prepared image version spec

You can update a catalog using the `Set-ProvSchemeImage` command. For example,

```
Set-ProvSchemeImage -ProvisioningSchemeUid <Guid> -ImageVersionSpecUid
    <Guid> [-DoNotStoreOldImage] [-RunAsynchronously] [-
    PurgeJobOnSuccess][-ImageAssignmentNote <string>]
```

Or,

```
Set-ProvSchemeImage -ProvisioningSchemeName <string> -
    ImageVersionSpecUid <Guid> [-DoNotStoreOldImage] [-RunAsynchronously
    ] [-PurgeJobOnSuccess][-ImageAssignmentNote <string>]
```

Example of the complete set of Powershell commands to update a catalog:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$PreparedImageVersionSpec = Get-ProvImageVersionSpec -
    ImageDefinitionName image1 -ImageVersionNumber 2 -Filter "
    PreparationType -eq 'Mcs'"

Set-ProvSchemeImage -ProvisioningSchemeName azurecatalog -
    ImageVersionSpecUid $PreparedImageVersionSpec.ImageVersionSpecUid -
    RunAsynchronously -ImageAssignmentNote "Update from VST team"
```

Get the image change history for the provisioning scheme

```
Get-ProvSchemeImageVersionSpecHistory -ProvisioningSchemeName
    azurecatalog
```

Delete image definition, image version, and prepared image version spec

Consider the following before deleting an image definition, image version, and prepared image version spec:

- An image definition can't be deleted if it contains any image version.
- An image version can't be deleted if it contains any image version specification.
- A master image version spec can't be deleted if it is used by any other prepared image version spec.
- A prepared image version spec can't be deleted if it is used by any MCS machine catalog.
- A hosting unit can't be deleted if it is used by any other prepared image version spec.

The detailed steps are as follows:

1. Remove the machine catalog. For example,

   ```
   Remove-ProvScheme -ProvisioningScheneName decouplingCatalog
   ```

2. Remove the shared prepared image version spec. For example,

   ```
   Remove-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid <uid>
       -HostingUnitName AzureWest
   ```

3. Remove a prepared image version spec. For example,

   ```
   $PreparedImageVersionSpec = Get-ProvImageVersionSpec -
       ImageDefinitionName image1 -ImageVersionNumber 1 -Filter "
       PreparationType -eq 'Mcs'"

   Remove-ProvImageVersionSpec -ImageVersionSpecUid
       $PreparedImageVersionSpec.ImageVersionSpecUid -
       RunAsynchronously
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Remove master image version specification. For example,

```
$MasterImageVersionSpec = Get-ProvImageVersionSpec -
    ImageDefinitionName image1 -ImageVersionNumber 1 -Filter "
    PreparationType -eq 'None'"

Remove-ProvImageVersionSpec -ImageVersionSpecUid
    $PreparedImageVersionSpec.ImageVersionSpecUid -RunAsynchronousl
```

> **Note:**
>
> Master image version spec can only be deleted when there is no associated prepared image version spec.

5. Remove an image version. For example,

```
Remove-ProvImageVersion -ImageDefinitionName image1 -
    ImageVersionNumber 1
```

6. Remove the configuration for image definition in the specified hosting connection. For example,

```
Remove-ProvImageDefinitionConnection -ImageDefinitionName xx -
    HypervisorConnectionName xxx
```

7. Remove an image definition. For example,

```
Remove-ProvImageDefinition -ImageDefinitionName image1
```

Example of the complete set of PowerShell commands when prepared image is not shared across host unit:

```
Remove-ProvScheme -ProvisioningSchemeName decouplingCatalog

$PreparedImageVersionSpec = Get-ProvImageVersionSpec -
    ImageDefinitionName image1 -ImageVersionNumber 1 -Filter "
    PreparationType -eq 'Mcs'"

Remove-ProvImageVersionSpec -ImageVersionSpecUid
    $PreparedImageVersionSpec.ImageVersionSpecUid -RunAsynchronously

$MasterImageVersionSpec = Get-ProvImageVersionSpec -ImageDefinitionName
     image1 -ImageVersionNumber 1 -Filter "PreparationType -eq 'None'"

Remove-ProvImageVersionSpec -ImageVersionSpecUid
    $MasterImageVersionSpec.ImageVersionSpecUid -RunAsynchronously

Remove-ProvImageVersion -ImageDefinitionName image1 -ImageVersionNumber
     1

Remove-ProvImageDefinition -ImageDefinitionName image1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Example of the complete set of PowerShell commands when prepared image is shared across host unit:

```
Remove-ProvScheme -ProvisioningSchemeName decouplingCatalog

Remove-ProvImageVersionSpecHostingUnit -ImageVersionSpecUid <uid>
-HostingUnitName AzureWest

$PreparedImageVersionSpec = Get-ProvImageVersionSpec -
    ImageDefinitionName image1 -ImageVersionNumber 1 -Filter "
    PreparationType -eq 'Mcs'"

Remove-ProvImageVersionSpec -ImageVersionSpecUid
    $PreparedImageVersionSpec.ImageVersionSpecUid -RunAsynchronously

$MasterImageVersionSpec = Get-ProvImageVersionSpec -ImageDefinitionName
     image1 -ImageVersionNumber 1 -Filter "PreparationType -eq 'None'"

Remove-ProvImageVersionSpec -ImageVersionSpecUid
    $MasterImageVersionSpec.ImageVersionSpecUid -RunAsynchronously

Remove-ProvImageVersion -ImageDefinitionName image1 -ImageVersionNumber
     1

Remove-ProvImageDefinitionConnection -ImageDefinitionName xx -
    HypervisorConnectionName xxx

Remove-ProvImageDefinition -ImageDefinitionName image1
```

Manage image definition and image version

You can rename and edit an image definition, and edit an image version.

- Rename an image definition using the `Rename-ProvImageDefinition` command. For example:

  ```
  Rename-ProvImageDefinition -ImageDefinitionUid <Guid> -
      NewImageDefinitionName <string>
  ```

  Or,

  ```
  Rename-ProvImageDefinition -ImageDefinitionName <string> -
      NewImageDefinitionName <string>
  ```

- Edit an image definition using the `Set-ProvImageDefinition` command. For example:

  ```
  Set-ProvImageDefinition -ImageDefinitionUid <Guid> [-Description
      <string>]
  ```

  Or,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-ProvImageDefinition -ImageDefinitionName <string> [-
    Description <string>]
```

- Edit an image version using the `Set-ProvImageVersion` command. For example:

```
Set-ProvImageVersion -ImageVersionUid <Guid> [-Description <
    string>]
```

Or,

```
Set-ProvImageVersion -ImageDefinitionName <string> -
    ImageVersionNumber <int> [-Description <string>]
```

Get image definition, image version, prepared image version spec, and provisioning scheme details

- Get image definition details using the `Get-ProvImageDefinition` command. For example:

```
Get-ProvImageDefinition [-ImageDefinitionName <string>] [-
    ImageDefinitionUid <Guid>] [-ReturnTotalRecordCount] [-
    MaxRecordCount <int>] [-Skip <int>] [-SortBy <string>] [-
    Filter <string>]
```

- Get image version details using the `Get-ProvImageVersion` command. For example:
  - To list image versions in an image definition,

```
Get-ProvImageVersion -ImageDefinitionUid <Guid>
```

Or,

```
Get-ProvImageVersion -ImageDefinitionName <string>
```

  - To get an image version detail,

```
Get-ProvImageVersion -ImageVersionUid <Guid>
```

Or,

```
Get-ProvImageVersion -ImageDefinitionName <string> -
    ImageVersionNumber <int>
```

- Get prepared image version spec using the `Get-ProvImageVersionSpec` command. For example:
  - To list all prepared image version specs in an image version,

```
Get-ProvImageVersionSpec -ImageVersionUid <Guid>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To list master image version specs in a prepared image version spec,

```
Get-ProvImageVersionSpec -ImageVersionUid <Guid> -Filter '
    PreparationType -eq "None"'
```

- To list prepared image version specs in an image version, which is associated with a master image,

```
Get-ProvImageVersionSpec -ImageVersionUid <Guid> -Filter '
    PreparationType -eq "MCS" -and SourceImageVersionSpecUid -
    eq "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"'
```

- To get successful prepared image version specs in an image version,

```
Get-ProvImageVersionSpec -ImageVersionUid <Guid> -Filter '
    PreparationType -eq "MCS" -and SourceImageVersionSpecUid -
    eq "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" -and
    ImageVersionSpecStatus -eq "Complete"'
```

- To get a prepared image version spec detail,

```
Get-ProvImageVersionSpec -ImageVersionSpecUid <Guid>
```

- Get provisioning scheme details using the `Get-ProvScheme` command. For example:

```
Get-ProvScheme [[-ProvisioningSchemeName] <String>] [-
    ProvisioningSchemeUid <Guid>] [-ScopeId <Guid>] [-ScopeName <
    String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>]
    [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-
    FilterScope <Guid>]
```

- Get prepared image version spec history of a provisioning scheme using the `Get-ProvSchemeImageVersionSpecHistory` command. For example:

```
Get-ProvSchemeImageVersionSpecHistory [-ProvisioningSchemeName <
    String>] [-ProvisioningSchemeUid <Guid>] [-ImageVersionSpecUid
     <Guid>] [-ImageVersionSpecHistoryUid <Guid>] [-
    ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <
    Int32>] [-SortBy <String>] [-Filter <String>] [-FilterScope <
    Guid>]
```

Create machine catalogs

August 20, 2026

> **Important:**
>
> As of Citrix Virtual Apps and Desktops™ 7 2006, if your current deployment uses any of the following technologies, you can upgrade your deployment to the current release only after removing End of Life (EOL) items that use those technologies.
>
> - Personal vDisks (PvDs)
> - AppDisks™
> - Public cloud host types: Citrix CloudPlatform, Microsoft Azure Classic
>
> For details, see Remove PVD, AppDisks, and unsupported hosts.
>
> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

If you want to use public cloud host connections for your deployment, you need Hybrid Rights License to complete your fresh installation or upgrade to the current release.

When the installer detects one or more of the unsupported technologies or host connections without Hybrid Rights License, the upgrade pauses or stops. An explanatory message appears. The installer logs contain details. For more information, see Upgrade a deployment.

Introduction

Collections of physical or virtual machines are managed as a single entity called a machine catalog. All the machines in a catalog have the same type of operating system: multi-session OS or single-session OS, and Windows or Linux machines.

> **Note:**
>
> For more information about provisioning macOS machines using machine catalogs, see this article in the macOS VDA documentation.

Web Studio guides you to create the first machine catalog after you create the site. After you create the first catalog, Web Studio guides you to create the first delivery group. Later, you can change the catalog you created, and create more catalogs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Tip:**
>
> Upgrading an existing deployment enables the Machine Creation Services (MCS) storage optimization (MCS I/O) feature, no additional configuration is required. The Virtual Delivery Agent (VDA) and the Delivery Controller upgrade handle the MCS I/O upgrade.

Overview

When you create a catalog of VMs, you specify how to provision those VMs. You can use Machine Creation Services™ (MCS). Or, you can use your own tools to provide machines.

Consider:

- MCS supports a single system disk from the virtual machine image. It ignores the rest of the data disks attached to that image.
- If you use MCS to provision VMs, you provide a master image (or snapshot of an image) to create identical VMs in the catalog. Before you create the catalog, you first use the tools to create and configure the master image. This process includes installing a Virtual Delivery Agent (VDA) on the image. Then you create the machine catalog in Web Studio. You select that image (or snapshot), specify the number of VMs to create in the catalog, and configure additional information.
- If your machines are already available, you must still create one or more machine catalogs for those machines.
- If you are creating a catalog using the PowerShell SDK directly, you can specify a hypervisor template (**VMTemplates**), rather than an image or a snapshot.
- Using a template to provision a catalog is considered an experimental feature. When using this method, virtual machine preparation might fail. As a result, the catalog cannot be published using the template.

When using MCS or Citrix Provisioning™ to create the first catalog, you use the host connection that you configured when you created the site. Later (after you create your first catalog and delivery group), you can change information about that connection or create more connections.

After you complete the catalog creation wizard, tests run automatically to ensure that it is configured correctly. When the tests complete, you can view a test report. Run the tests at any time from Web Studio.

> **Note:**
>
> MCS does not support Windows 10 IoT Core and Windows 10 IoT Enterprise. Refer to the Microsoft site for more information.

For technical details about the Citrix Provisioning tools, see Citrix Virtual Apps and Desktops Image Management.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

RDS license check

Web Studio currently does not perform the check for valid Microsoft RDS licenses while creating a machine catalog that contains Windows multi-session OS machines. To view the status of the Microsoft RDS license for a Windows **multi-session OS machine**, go to Citrix Director. View the status of the Microsoft RDS license in the **Machine Details** panel. This panel is in the **Machine Details and the User Details** page. For more information, see Microsoft RDS license health.

VDA registration

A VDA must be registered with a Delivery Controller™ when launching brokered sessions. Unregistered VDAs can result in underutilization of otherwise available resources. There are various reasons that a VDA might not be registered, many of which an administrator can troubleshoot. Web Studio provides troubleshooting information in the catalog creation wizard, and after you add machines from a catalog to a delivery group.

After you add existing machines using the wizard, the list of computer account names indicates whether each machine is suitable for adding to the catalog. Hover over the icon next to each machine to display an informative message about that machine.

If the message identifies a problematic machine, either remove that machine, or add the machine. For example, if a message indicates that information might not be obtained about a machine, add the machine anyway.

For more information, see:

- CTX136668 for VDA registration troubleshooting guidance
- VDA versions and functional levels
- VDA registration methods

MCS catalog creation summary

Here's a brief overview of default MCS actions after you provide information in the catalog creation wizard.

- If you selected a master image (rather than a snapshot), MCS creates a snapshot.
- MCS creates a full copy of the snapshot and places the copy on each storage location defined in the host connection.
- MCS adds the machines to Active Directory, which creates unique identities.
- MCS creates the number of VMs specified in the wizard, with two disks defined for each VM. In addition to the two disks per VM, a master is also stored in the same storage location. If you have multiple storage locations defined, each gets the following disk types:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The full copy of the snapshot which is read-only and shared across the just-created VMs.
- A unique 16 MB identity disk that gives each VM a unique identity. Each VM gets an identity disk.
- A unique difference disk to store writes made to the VM. This disk is thin provisioned (if supported by the host storage) and increases to the maximum size of the master image, if necessary. Each VM gets a difference disk. The difference disk holds changes made during sessions. It is permanent for dedicated desktops. For pooled desktops, it is deleted and a new one created after each restart via the delivery controller.
- For Windows VMs on VDA version 2511 or later, MCS assigns each a unique `MachineGuid` to each machine. This `MachineGuid` is used for licensing purposes by some software installed on the VDA.

Alternatively, when creating VMs to deliver static desktops, you can specify (on the **Machines** page of the catalog creation wizard) thick (full copy) VM clones. Full clones do not require retention of the master image on every data store. Each VM has its own file.

MCS storage considerations

There are many factors when deciding on storage solutions, configurations, and capacities for MCS. The following information provides proper considerations for storage capacity:

Capacity considerations:

- Disks

  The Delta or Differencing (Diff) Disks consume the largest amount of space in most MCS deployments for each VM. Each VM created by MCS is given at minimum 2 disks upon creation.

  - Disk0 = Diff Disk: contains the OS when copied from the Master Base Image.
  - Disk1 = Identity Disk: 16 MB - contains Active Directory data for each VM.

  As the product evolves, you might have to add more disks to satisfy certain use cases and feature consumption. For example:

  - MCS Storage Optimization creates a write cache style disk for each VM. In XenServer, VMware, and SCVMM virtualization environments, MCS places Write-back cache (WBC) disk on the same storage location as OS disk if you configure the available OS storage list the same as the available temporary storage list while creating a host connection.
  - MCS added the ability to use full clones as opposed to the Delta disk scenario described in the previous section.

  Hypervisor features might also enter into the equation. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - XenServer IntelliCache creates a Read Disk on local storage for each XenServer. This option saves on IOPS against the master image which might be held on the shared storage location.

- Hypervisor overhead

  Different hypervisors use specific files that create overhead for VMs. Hypervisors also use storage for management and general logging operations. Calculate the space to include overhead for:

    - Log files
    - Hypervisor specific files. For example:
        - VMware adds more files to the **VM storage** folder. See VMware Best Practices.
        - Calculate your total virtual machine size requirements. Consider a virtual machine containing 20 GB for the virtual disk, 16 GB for the swap file, and 100 MB for log files consuming 36.1 GB total.
    - Snapshots for XenServer; Snapshots for VMware.

- Process overhead

  Creating a catalog, adding a machine, and updating a catalog have unique storage implications. For example:

    - Initial catalog creation requires a copy of the base disk to be copied to each storage location.
    - Adding a machine to a catalog does not require copying of the base disk to each storage location. Catalog creation varies based on the features selected.
    - Updating the catalog to create an extra base disk on each storage location. Catalog updates also experience a temporary storage peak where each VM in the catalog has 2 Diff disks for a certain amount of time.

More considerations:

- **RAM sizing:** Affects the size of certain hypervisor files and disks, including I/O optimization disks, write cache, and snapshot files.
- **Thin / Thick provisioning:** NFS storage is preferred due to the thin provisioning capabilities.

Machine Creation Services (MCS) storage optimization

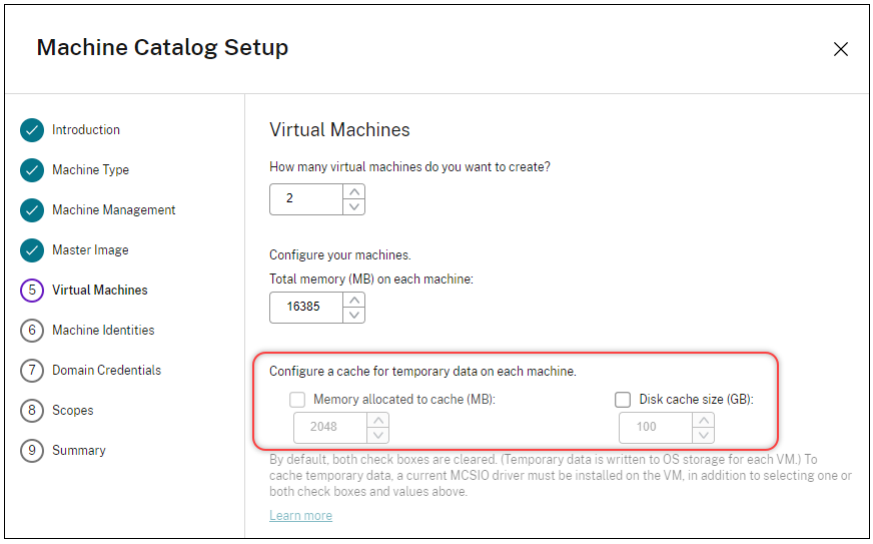
The Machine Creation Services (MCS) storage optimization feature is also known as MCS I/O. This feature is only available on Azure, GCP, XenServer, VMware, AWS, and SCVMM.

- The write cache container is *file-based*, the same functionality found in Citrix Provisioning. For example, the Citrix Provisioning write cache file name is `D:\vdiskdif.vhdx` and the MCS I/O write cache file name is `D:\mcsdif.vhdx`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Achieve diagnostic improvements by including support for a Windows crash dump file written to the write cache disk.
- MCS I/O retains the technology *cache in RAM with overflow to hard disk* to provide the most optimal multi-tier write cache solution. This functionality allows an administrator to balance between the cost in each tier, RAM and disk, and performance to meet the desired workload expectation.

Updating the write cache method from *disk-based* to *file-based* requires the following changes:



1. MCS I/O no longer supports RAM only cache. Specify a disk size in Web Studio during machine catalog creation.
2. The VM write cache disk is created and formatted automatically when booting a VM for the first time. Once the VM is up, the write cache file `mcsdif.vhdx` is written into the formatted volume `MCSWCDisk`.
3. The pagefile is redirected to this formatted volume, `MCSWCDisk`. As a result, this disk size considers the total amount of disk space. It includes the delta between the disk size and the generated workload plus the pagefile size. This is typically associated with VM RAM size.

Enabling MCS storage optimization updates To enable MCS I/O storage optimization functionality, upgrade the Delivery Controller and the VDA to the latest version of Citrix Virtual Apps and Desktops.

> **Note:**
>
> If you upgrade an existing deployment which has MCS I/O enabled, no additional configuration is required. The VDA and the Delivery Controller upgrade handle the MCS I/O upgrade.

When enabling the MCS storage optimization update, consider the following:

- When creating a machine catalog, the administrator can configure the RAM and disk size.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Updating an existing machine catalog to a new VM snapshot containing a VDA configured for version 1903 results in the following behavior: the new snapshot continues to use the existing catalog's MCS I/O setting for RAM and disk size. The existing raw disk is formatted.

> **Important:**
>
> MCS storage optimization changed with Citrix Virtual Apps and Desktops version 1903. This release supports file-based write cache technology, providing better performance and stability. The new functionality provided by MCS I/O might require a higher write cache storage requirement compared to previous Citrix Virtual Apps and Desktops releases. Citrix recommends that you reevaluate the disk size to ensure that it has sufficient disk space for the allocated workflow and extra pagefile size. The pagefile size is typically related to the amount of system RAM. If the existing catalog disk size is insufficient, create a machine catalog and allocate a larger write cache disk.

Assign a specific drive letter to MCS I/O write-back cache disk

You can assign a specific drive letter to the MCS I/O write-back cache disk. This implementation helps you to avoid conflicts between the drive letter of any applications that you use and the drive letter of the MCS I/O write-back cache disk. To assign drive letter to MCS I/O write-back cache disk, you can use PowerShell commands. The supported hypervisors are Azure, GCP, VMware, SCVMM, and XenServer.

> **Note:**
>
> This feature requires VDA version 2305 or later.

Limitations

- Applicable to only Windows operating system
- Applicable drive letter for write-back cache disk: E to Z
- Not applicable when Azure temporary disk is used as a write-back cache disk
- Applicable only when you create a new machine catalog

Assign a drive letter to write-back cache disk

To assign a drive letter to a write-back cache disk:

1. Open the **PowerShell** window.
2. Run `asnp citrix*`.
3. Create an identity pool if not already created.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Create a provisioning scheme using the `New-ProvScheme` command with the property `WriteBackCacheDriveLetter`. For example:

```
New-ProvScheme -CleanOnBoot `
-HostingUnitName "<name>" `
-IdentityPoolName $schemeName `
-ProvisioningSchemeName $schemeName `
-InitialBatchSizeHint 1 `
-UseWriteBackCache -WriteBackCacheDiskSize 127 -
   WriteBackCacheMemorySize 256 -WriteBackCacheDriveLetter E `
-MasterImageVM "XDHyp:\HostingUnits\<name>\image.folder\abcd-
   resources.resourcegroup\
   MCSIOMasterVm_OsDisk_1_d3e2d6352xxxxxxxxx2130aa145ec77.
   manageddisk" `
-NetworkMapping @{
 "0"="XDHyp:\\HostingUnits\\name\\virtualprivatecloud.folder\\East
     US.region\\virtualprivatecloud.folder\\abcd-resources.
    resourcegroup\\abcd-resources-vnet.virtualprivatecloud\\
    default.network" }
  `
-ServiceOffering "XDHyp:\\HostingUnits\\<name>\\serviceoffering.
   folder\\Standard_D2s_v5.serviceoffering" `
-CustomProperties '<CustomProperties xmlns="http://schemas.citrix.
   com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/
   XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="
   true" />
<Property xsi:type="StringProperty" Name="OsType" Value="Windows"
   />
<Property xsi:type="StringProperty" Name="StorageType" Value="
   Premium_LRS"/>
<Property xsi:type="StringProperty" Name="PersistWBC" Value="false
   " />
<Property xsi:type="StringProperty" Name="PersistOsDisk" Value="
   false" />
<Property xsi:type="StringProperty" Name="PersistVm" Value="false"
    />
<Property xsi:type="StringProperty" Name="WBCDiskStorageType"
   Value="Premium_LRS" />
<Property xsi:type="StringProperty" Name="UseTempDiskForWBC" Value
   ="false" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="
   abcd-group1" />
<Property xsi:type="StringProperty" Name="LicenseType" Value="
   Windows_Client" />
<Property xsi:type="StringProperty" Name="SchemaVersion" Value="2"
    />
</CustomProperties>'
```

5. Finish creating the catalog. For information, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Prepare a master image

For information about creating connections hosts, see Connections and resources.

The master image contains the operating system, non-virtualized applications, VDA, and other software.

Good to know:

- A master image might also be known as a clone image, golden image, base VM, or base image. Host vendors use different terms.
- Ensure that the host has enough processors, memory, and storage to accommodate the number of machines created.
- Configure the correct amount of hard disk space needed for desktops and applications. That value cannot be changed later or in the machine catalog.
- Remote PC Access machine catalogs do not use master images.

Install and configure the following software on the master image:

- Integration tools for your hypervisor (such as Citrix VM Tools, Hyper-V Integration Services, or VMware tools). If you omit this step, applications and desktops might not function correctly.
- A VDA. Citrix recommends installing the latest version to allow access to the newest features. Failure to install a VDA on the master image causes the catalog creation to fail.
- Third-party tools as needed, such as antivirus software or electronic software distribution agents. Configure services with settings that are appropriate for users and the machine type (such as updating features).
- Third-party applications that you are not virtualizing. Citrix recommends virtualizing applications. Virtualizing reduces costs by eliminating having to update the master image after adding or reconfiguring an application. Also, fewer installed applications reduce the size of the master image hard disks, which saves storage costs.
- App-V clients with the recommended settings, if you plan to publish App-V applications. The App-V client is available from Microsoft.
- When using MCS, if you localize Microsoft Windows, install the locales and language packs. During provisioning, when a snapshot is created, the provisioned VMs use the installed locales and language packs.

> **Important:**
>
> If you are using MCS, do not run Sysprep on master images.

To prepare a master image:

1. Using your hypervisor's management tool, create a master image and then install the operating system, plus all service packs and updates. Specify the number of vCPUs. You can also

© 1997–2026 Citrix Systems, Inc. All rights reserved.

specify the vCPU value if you create the machine catalog using PowerShell. You cannot specify the number of vCPUs when creating a catalog using Web Studio. Configure the amount of hard disk space needed for desktops and applications. That value cannot be changed later or in the catalog.

2. Ensure that the hard disk is attached at device location 0. Most standard master image templates configure this location by default, but some custom templates might not.
3. Install and configure the software listed above on the master image.
4. If you are not using MCS, join the master image to the domain where applications and desktops are members. Ensure that the master image is available on the host where the machines are created. If you are using MCS, joining the master image to a domain is not required. The provisioned machines are joined to the domain specified in the catalog creation wizard.
5. Citrix recommends that you create and name a snapshot of your master image. If you specify a master image rather than a snapshot when creating a catalog, Web Studio creates a snapshot. You cannot name it.

Volume licensing activation

MCS supports volume licensing activation to automate and manage the activation of Windows operating systems and Microsoft Office. The three models that MCS supports for volume licensing activation are:

- Key Management Service (KMS)
- Active Directory-based activation (ADBA)
- Multiple Activation Key (MAK)

You can change the activation setting after you create the machine catalog.

Key Management Service (KMS)

The KMS is a lightweight service that does not require a dedicated system and can easily be co-hosted on a system that provides other services. This functionality is supported on all Citrix supported Windows versions. During image preparation, MCS does the Microsoft Windows and Microsoft Office KMS rearm. You can skip rearm by running the command `Set-Provserviceconfigurationdata`. For more information on KMS activation, see Activate using Key Management Service.

> **Note:**
>
> All machine catalogs created after running the command `Set-Provserviceconfigurationdata` have the same setting as provided in the command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Active Directory-based activation (ADBA)

ADBA enables you to activate machines through their domain connections. Machines are immediately activated when they join the domain. These machines remain activated as long as they remain joined to the domain and in contact with it. This functionality is supported on all Citrix supported Windows versions. For more information on Active directory-based activation, see Activate using Active Directory-based activation.

Multiple Activation Key (MAK)

MAK is a way of activating volume and authenticating the Windows system with the help of the Microsoft server. You must buy the MAK key from Microsoft which is assigned with a fixed number of activation counts. Every time a Windows system is activated, the activation count reduces. There are two ways of activating the system:

- Online Activation: If the Windows system that you want to activate has internet access, the system automatically activates the Windows on installing the product key. This process reduces the activation count by 1 for the corresponding MAK.
- Offline Activation: If the Windows system is not able to connect to the internet to do the online activation, MCS gets a confirmation id and an installation id from the Microsoft server to get the Windows system activated. This way of activation is useful for non-persistent machine catalogs.

> **Note:**
>
> - MCS doesn't support Microsoft Office activation using MAK.
> - Minimum VDA version required is 2303.

Key requirements

- The Delivery Controller must have internet access.
- Create a new catalog if the new image to be updated has a different MAK Key from the original.
- Install the MAK key on the master image. See Deploy MAK Activation for the steps to install MAK Key on a Windows System.
- If you are not using image preparation:
  1. Add the registry DWORD value `Manual` under `Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SoftwareProtectionPlatfor\Activation`.
  2. Set the value to `1`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Activation Counts To view the number of activations remaining for MAK Key or to check if a VM is consuming two or more activations, use the Volume Activation Management Tool (VAMT). See Install VAMT.

Activate the Windows system using MAK To activate the Windows system using MAK:

1. Install the product key on the master image. This step consumes one activation count.
2. Create an MCS machine catalog.
3. If you aren't using image preparation:

   a) Add the registry DWORD value `Manual` under `Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\SoftwareProtectionPlatfor\Activation`.
   b) Set the value to 1.

   This method disables the option of online activation.
4. Add VMs to the machine catalog.
5. Power on the VMs.
6. Depending on whether it's online or offline activation, the Windows system is activated.

   - If the activation is online, the Windows system is activated after the product key is installed.
   - If the activation is offline, MCS communicates with provisioned VMs to get the activation status of the Windows system. MCS then retrieves a confirmation id and an installed id from the Microsoft server. These IDs are used to activate the Windows system.

Troubleshooting If the provisioned VM is not activated with the installed MAK Key, run `Get-ProvVM` or `Get-ProvScheme` command on a PowerShell window.

- The `Get-ProvScheme` command: See the parameter `WindowsActivationType` associated with the MCS machine catalog from the latest master image.
- The `Get-ProvVM` command. See the parameters `WindowsActivationType`, `WindowsActivationS`, `WindowsActivationStatusErrorCode`, and `WindowsActivationStatusError`.

You can check the error and verify the steps to resolve the issue.

Create a machine catalog using Web Studio

Before creating a catalog:

- Review this section to learn about the choices you make and the information you supply.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Ensure that you have created a connection to the hypervisor, cloud service, and other resources that hosts your machines.
- If you have created a master image to provision machines, ensure that you have installed a VDA on that image.

To start the catalog creation wizard:

1. If this is the first catalog being created, you are guided to the correct selection (such as "Set up the machines and create machine catalogs to run apps and desktops"). The catalog creation wizard opens.
2. If you already created a catalog and want to create another, follow these steps:
    a) Sign in to Web Studio, select **Machine Catalogs** in the left pane, and then select **Create Machine Catalog** in the action bar.
    b) To organize catalogs using folders, create folders under the default **Machine Catalogs** folder. For more information, see Create a catalog folder.
    c) Select the folder where you want to create the catalog, and then click **Create Machine Catalog**. The catalog creation wizard opens.

The wizard walks you through the following items. The wizard pages that you see differ, depending on the selections you make.

Operating system

Each catalog contains machines of only one type. Select one.

- **Multi-session OS:** A multi-session OS catalog provides hosted shared desktops. The machines can be running supported versions of the Windows or Linux operating systems, but the catalog cannot contain both. (See the Linux VDA documentation for details about that OS.)
- **Single-session OS:** A single-session OS catalog provides VDI desktops that you can assign to various different users.
- **Remote PC Access:** A Remote PC Access catalog provides users with remote access to their physical office desktop machines. Remote PC Access does not require a VPN to provide security.

Machine management

This page does not appear when you are creating Remote PC Access catalogs.

The **Machine Management** page indicates how machines are managed and which tools you use to deploy machines.

Choose whether machines in the catalog are power managed through Web Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Machines are power managed through Web Studio, for example, VMs or blade PCs. This option is available only if you already configured a connection to a host.
- Machines are not power managed through Web Studio, for example, physical machines.

If you indicated that machines are power managed through Web Studio, choose which tool to use to create VMs.

- Citrix Provisioning Technology
  - **Citrix Machine Creation Services (MCS)** Creates a catalog of VMs provisioned and imaged using MCS. MCS copies images cloned from a master image to those VMs.
  - **Citrix Provisioning Services (PVS)** Creates a catalog of VMs provisioned using MCS and imaged using PVS. Those VMs serve as PVS target devices and the PVS server can stream a single shared disk image to them.

    > **Note:**
    >
    > - This option is available only for PVS sites registered with Citrix Cloud™ and is currently limited to Azure resources.
    > - While you create a Citrix Provisioning catalog, on the **Target Device** page, you might see that in the drop-down menu to select the farm and site for the machines to be provisioned, there are farms and sites listed that no longer exist . As a workaround, you can run the PowerShell command `Unregister-HypPvsSite` to remove the farms and sites from the database. For information on the PowerShell command, see Unregister-HypPvsSite.

- **Other service or technology** A tool that manages machines already in the data center. Citrix recommends that you use Microsoft System Center Configuration Manager or another third-party application to ensure that the machines in the catalog are consistent.

Desktop types (desktop experience)

> **Note:**
>
> The options on the **Desktop Experience** page varies according to the machine type that you select on the **Machine Type** page.

- For **multi-session OS** machines, users are assigned a random desktop each time they log on. Select one of the following options:
  - **Yes, save changes on the local disk of the machine hosting virtual desktops.** (Persistent)
  - **No, discard all changes and clear virtual desktops when the user logs off.** (Non-persistent)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> For persistent multi-session machines, changes users make to the desktops will be saved and accessible to all authorized users.

- For **single-session OS** machines, you get the following options on the **Desktop Experience** page:
  - **I want users to connect to a new (random) desktop each time they log on.**
  - **I want users to connect to the same (static) desktop each time they log on.**

    For static desktops, you can further decide whether changes made by users will be saved or discarded after they log off.

If you select **Save changes on the local disk of the machine hosting virtual desktops: Persistent**, the fast copy or full copy options are available for the Virtual machine copy mode in the **Virtual Machines** page.

If you select **Discard all changes and clear virtual desktops when the user logs off: Non-persistent**, you cannot configure the Virtual machine copy mode in the **Virtual Machines** page.

Image and machine profile

This page appears only when you are using MCS to create VMs.

1. Select an image type for the machine catalog, and then select an image. Two image types are available:
   - **Master image.** An image that has not yet gone through the image preparation process. The image preparation process is automatically initiated when catalog creation starts.

     > **Note:**
     >
     > - When you are using MCS, do not run Sysprep on master images.
     > - If you specify a master image rather than a snapshot, Web Studio creates a snapshot, but you cannot name it.

   - **Prepared image.** An image that has gone through the image preparation process and can be used for VM creation directly. Opting for prepared images rather than master images during catalog creation ensures faster and more reliable machine catalog creation, along with streamlined image lifecycle management. If needed, add a note for the selected prepared image.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - VMs created using prepared images don't support hibernation.
> - Currently, creating catalogs using prepared images are available only in Azure and VMware environments.

For more information about how to create prepared images, see Image management (preview).

When selecting an image, you can add a note for the selected image if needed.

To enable use of the latest product features, ensure that the master image has the latest VDA version installed. Do not change the default minimum VDA selection. However, if you must use an earlier VDA version, see VDA versions and functional levels.

An error message appears if you select a snapshot or VM that is not compatible with the machine management technology you selected earlier in the wizard.

2. To use an existing VM as the machine profile, select **Use a machine profile**, and then select the VM.

   > **Note:**
   >
   > Currently, using machine profiles is restricted to Azure, AWS, GCP, and VMware VMs.

   For VMware deployments, when creating a machine catalog using a machine profile, you must specify the folder where you want to keep the virtual machines.

   To provide the virtual machine folder location, on the catalog creation wizard, go to **Virtual Machines** page, and go to **Select a folder to place the machines** section and select the virtual machine folder location. If not specified, the system considers the folder of the selected machine profile as the default location.

3. For AWS deployments, you can select a launch template as the machine profile.
4. Select the minimum functional level for the catalog. To enable the use of the latest product features, ensure that the master image has the latest VDA version installed.

Machines

This page does not appear when you are creating Remote PC Access catalogs.

The title of this page depends on what you selected on the **Machine Management** page: **Machines**, **Virtual Machines**, or **VMs and users**.

When using MCS:

- Specify how many virtual machines to create. Enter **0** (zero) if you do not want to create any. Later, you can create VMs for an empty catalog by performing **Add machines**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Choose the amount of memory (in MB) each VM has.
- Each created VM has a hard disk. Its size is set in the master image. You cannot change the hard disk size in the catalog.
- If your deployment contains more than one zone, you can select a zone for the catalog.
- If you are creating static desktop VMs, select a virtual machine copy mode. See Virtual machine copy mode.
- If you are creating random desktop VMs that do not use vDisks, you can configure a cache to be used for temporary data on each machine. See Configure cache for temporary data.

When using other tools:

Add (or import a list of) Active Directory machine account names. You can change the Active Directory account name for a VM after you add/import it. If you specified static machines on the **Desktop Experience** page, you can optionally specify the Active Directory user name for each VM you add.

After you add or import names, you can use the **Remove** button to delete names from the list, while you are still on this page.

When using other tools (but not MCS):

An icon and tooltip for each machine added (or imported) help identify machines that might not be eligible to add to the catalog, or be unable to register with a Delivery Controller. For details, see VDA versions and functional levels.

Add SIDs while creating virtual machines

You can now add the parameter `ADAccountSid` to uniquely identify the machines while creating new virtual machines.

To do this:

1. Create a catalog with the supported identity type.
2. Add machines to the catalog using `NewProvVM`. For example:

```
New-ProvVM  -ProvisioningSchemeName "name"  -ADAccountSid @("SID "
    )  -RunAsynchronously
```

However, you cannot provision a machine with:

- An AD account that is not in the catalog identity pool
- An AD account that is not in available state

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Virtual machine copy mode

The copy mode that you specify on the **Machines** page determines whether MCS creates thin (fast copy) or thick (full copy) clones from the master image. (Default = thin clones)

- Use fast copy clones for more efficient storage use and faster machine creation.
- Use full copy clones for better data recovery and migration support, with potentially reduced IOPS after the machines are created.

> **Note:**
>
> The Full Copy Clone approach is available only for provisioning persistent VMs on multi- or single-session OSs.

VDA versions and functional levels

A catalog's functional level controls which product features are available to machines in the catalog. Using features introduced in new product versions require a new VDA. However, machines in that catalog with an earlier VDA version cannot register.

A menu near the bottom of the **Machines** (or **Devices**) page allows you to select the minimum VDA level. This sets the catalog's minimum functional level. By default, the most current functional level is selected for on-premises deployments. If you follow the Citrix recommendation to always install and upgrade VDAs and core components to the latest version, you don't need to change this selection. However, if you must continue using older VDA versions, select the correct value.

A Citrix Virtual Apps and Desktops release might not include a new VDA version, or the new VDA does not impact the functional level. In such cases, the functional level might indicate a VDA version that is earlier than the installed or upgraded components. Each release's What's new article indicates any change in the default functional level.

The selected functional level affects the list of machines above it. In the list, a tooltip next to each entry indicates whether the machine's VDA is compatible with the catalog at that functional level.

Messages are posted on the page if the VDA on each machine does not meet or exceed the minimum functional level selected. You can continue with the wizard. Those machines will likely not be able to register with a Controller later. Alternatively, you can:

- Remove the machines containing older VDAs from the list, upgrade their VDAs and then add them back to the catalog.
- Choose a lower functional level that prevents access to the latest product features.

A message is also posted if a machine was not be added to the catalog because it is the wrong machine type. Examples include attempting to add a server to a single-session OS catalog, or adding a single-session OS machine originally created for random allocation to a catalog of static machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> At release 1811, an extra functional level was added: **1811 (or newer)**. That level is intended for use with future Citrix Virtual Apps and Desktops features. The **7.9 (or newer)** selection remains the default. That default is valid for all deployments now.
>
> If you select **1811 (or newer)**, any earlier VDA versions in that catalog are unable to register with a Controller. However, if the catalog contains only VDAs at version 1811 or later supported versions, they are all eligible to register. This includes catalogs containing VDAs configured for later Citrix Virtual Apps and Desktops releases, including version 1903 and other 19XX releases before the current release.

Configure cache for temporary data

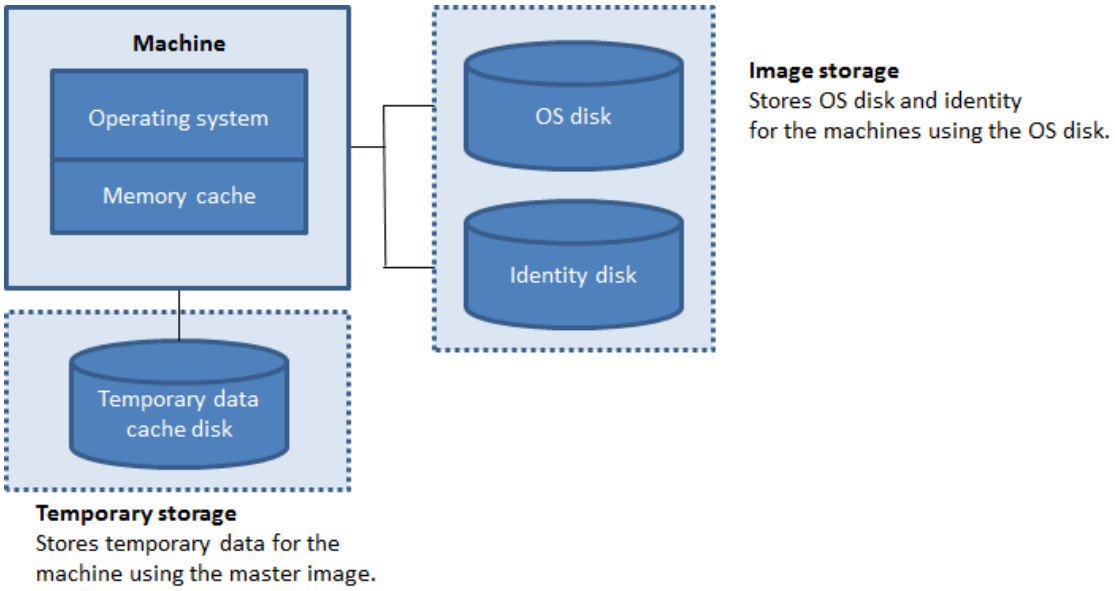
When using MCS to manage random non-persistent machines in a catalog, you can enable Write-Back Cache for machines to improve I/O performance.

Write-back Cache is referred to as MCSIO. For more information, see this blog article.

Prerequisites To enable write-back cache, the catalog must meet the following requirements:

- Uses a connection that specifies storage for temporary data. For more information, see Connections and resources.
- VDAs must be at least version 7.9 and installed with a current MCSIO driver.

  > **Note:**
  >
  > Installing this driver is an option when you install or upgrade a VDA. By default, that driver is not installed.



- To enable drive letter assignment for disk caches, VMs must meet the following additional requirements:
  - Operating System: Windows
  - VDA version: 2305 or later

Considerations

- Write-back caches come in *Memory* cache and *Disk* cache. By default, their default values differ according to the connection type. Generally, the default values are sufficient for most cases; however, consider the space needed for:
  - Temporary data files created by Windows itself, including the Windows page file.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- User profile data.
- ShareFile data that is synced to users' sessions.
- Data that might be created or copied by a session user or any applications users may install inside the session.

- Configuring the write-back cache with a disk cache and no memory cache is removed. To enable a cache for temporary data, we recommend selecting **Disk cache size (GB)** and **Memory allocated to cache (MB)** and specifying a size greater than 0 for the memory cache. Temporary data is initially written to the memory cache. When the memory cache reaches its configured limit, the oldest data is moved to the temporary data cache disk.
- The memory cache is part of the total amount of memory on each machine. Therefore, if you enable the **Memory cache size (MB) (recommended)** checkbox, consider increasing the total amount of memory on each machine.
- If you keep the **Memory cache size (MB) (recommended)** checkbox cleared, temporary data is written directly to the disk cache, using a minimal amount of memory.
- Changing **Disk cache size (GB)** from its default value can affect performance. The size must match user requirements and the load placed on the machine.

  > **Important:**
  >
  > If the disk cache runs out of space, the user's session becomes unusable.

- If you clear the **Disk cache size** checkbox, no cache disk is created. In this case, specify a **Memory allocated to cache** value that is large enough to hold all of the temporary data. This is feasible only if large amounts of RAM are available for allocation to each VM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you clear both checkboxes, temporary data is not cached. It is written to the difference disk (located in the OS storage) for each VM. (This is the provisioning action in releases earlier than 7.9.)
- Do not enable caching if you intend to use this catalog to create AppDisks.
- You cannot change the cache values in a machine catalog after it is created.

Security

The **Security** page appears only if you are creating a machine catalog without assigning a machine profile in AWS virtualization environment. Use the **Security** page to configure the security groups for the VMs. This is also applicable when editing and cloning an existing machine catalog.

If you create a machine profile-based machine catalog, then the security group configurations are inherited from the machine profile and the **Security** page does not appear.

NIC (NICs)

This page does not appear when you are creating Remote PC Access catalogs.

If you plan to use multiple NICs, associate a virtual network with each card. For example, you can assign one card to access a specific secure network, and another card to access a more commonly used network. You can also add or remove NICs from this page.

Machine accounts

This page appears only when creating Remote PC Access catalogs.

On the **Machine Accounts** page, specify the Active Directory machine accounts or Organizational Units (OUs) to add that correspond to users or user groups. Do not use a forward slash (/) in an OU name.

When adding OUs, you can do the following if the domain is not shown in the list:

- Search for it using an exact match.
- Browse all domains to find it.

You can choose a previously configured power management connection or elect not to use power management. If you want to use power management but a suitable connection hasn't been configured yet, you can create that connection later and then edit the machine catalog to update the power management settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Machine identities

This page appears only when using MCS to create VMs.

Each machine in the catalog must have a unique identity. This page lets you configure identities for machines in the catalog. The machines are joined to the identity after they are provisioned. You cannot change the identity type after you create the catalog.

A general workflow to configure settings on this page is as follows:

1. Select an identity from the list.
2. Indicate whether to create accounts or use existing ones, and the location (domain) for those accounts.

You can select one of the following options:

- **On-premises Active Directory**. Machines owned by an organization and signed into with an Active Directory account that belongs to that organization. They exist on-premises.
- **Microsoft Entra hybrid joined**. Machines owned by an organization and signed into with an Active Directory Domain Services account that belongs to that organization. They exist in the cloud and on-premises. For information about the requirements, limitations, and considerations, see Microsoft Entra hybrid joined.

  > **Note:**
  >
  > - Before you can use Microsoft Entra hybrid join, make sure that your Azure environment meets the prerequisites. See Configure Microsoft Entra hybrid join.
  > - This option requires that the master image meets the operating system prerequisite. For more information, see Microsoft Entra hybrid joined devices.

- **Non-domain-joined**. Machines not joined to any domain. For information about the requirements and limitations, see Non-domain-joined.

> **Important:**
>
> - If you select **On-premises Active Directory** or **Microsoft Entra hybrid joined** as the identity type, each machine in the catalog must have a corresponding Active Directory computer account.
> - The **Non-domain-joined** identity type requires version 2311 or later of the VDA as the minimum functional level for the catalog. To make it available, update the minimum functional level.

Before configuring machine identities, make sure that you have permission to create computer accounts in the OU where the machines reside. Each machine in the catalog must have a unique name. Then choose how to configure machine identities:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you create new machine accounts, specify the OU and the machine naming scheme. For more information, see Machine account naming scheme. When you create a catalog, an identity pool is created automatically to hold all machine identities that you defined for this catalog.
- If you use existing machine accounts, choose an existing identity pool in your environment.

> **Note:**
>
> Make sure that OU names do not use forward slashes (/).
>
> When you create a catalog and select **Use existing identity pool** on the **Machine Identities** page, the service account behavior depends on the identity pool configuration:
>
> - If the selected identity pool does not have a service account configured, selecting a stored service account on the **Domain credentials** page does not take effect. The **Add machines** operation can fail with an error indicating that the service account cannot be found. To avoid this, manually enter domain credentials on the **Domain credentials** page.
> - If the selected identity pool has a service account configured, any service account selected on the **Domain credentials** page is ignored. The **Add machines** operation always uses the service account associated with the identity pool.

If you use existing accounts, browse to the accounts or click **Import** and specify a .csv file containing account names. The imported file content must use the format:

- [ADComputerAccount] ADcomputeraccountname.domain

Ensure that there are enough accounts for all the machines you are adding. The Web Studio interface manages those accounts. Therefore, either allow that interface to reset the passwords for all the accounts or specify the account password, which must be the same for all accounts.

For catalogs containing physical or existing machines, select or import existing accounts and assign each machine to both an Active Directory computer account and to a user account.

Machine account naming scheme

Each machine in a catalog must have a unique name. You must specify a machine account naming scheme when creating a catalog. Use wildcards (hash marks) as placeholders for sequential numbers or letters that appear in the name.

When specifying a naming scheme, be aware of the following rules:

- The naming scheme must contain at least one wildcard. You must put all wildcards together.
- The entire name, including wildcards, must contain at least 2 but no more than 15 characters. It must include at least one non-numeric and one # (wildcard) character.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The name must not include spaces or any of the following characters: ,~!@'$%^&.()} { \/*?"<>|=+[];:_"..
- The name cannot end with a hyphen (-).

Also, leave enough room for growth when specifying the naming scheme. Consider this example: If you create 1,000 machine accounts with the scheme "veryverylong#", the last account name created (veryverylong1000) contains 16 characters. Therefore, the naming scheme results in one or more machine names that exceed the maximum of 15 characters.

You can indicate whether the sequential values are numbers (0-9) or letters (A-Z):

- **0-9**. If selected, the specified wildcards resolve to sequential numbers.

  > **Note:**
  >
  > If there is only one wildcard (#), the account names start with 1. If there are two, the account names start with 01. If there are three, the account names start with 001, and so on.

- **A-Z**. If selected, the specified wildcards resolve to sequential letters.

For example, a naming scheme of PC-Sales-## (with **0-9** selected) results in accounts named PC-Sales-01, PC-Sales-02, PC-Sales-03, and so on.

Optionally, you can specify what the account names start with.

- If you select **0-9**, accounts are named sequentially, starting with the specified numbers. Enter one or more digits, depending on how many wildcards you use in the preceding field. For example, if you use two wildcards, enter two digits or more.
- If you select **A-Z**, accounts are named sequentially, starting with the specified letters. Enter one or more letters, depending on how many wildcards you use in the preceding field. For example, if you use two wildcards, enter two letters or more.

Domain credentials

Enter the credentials of an administrator who has permission to perform account operations. Detailed steps are as follows:

1. Click **Enter credentials**. The Windows Security page appears.
2. In the **User name** field, enter the administrator's SamName, user name, or user SID:
   - If you enter a SamName, the **Domain** field populates automatically.
   - If you enter a user name or SID, you can limit the user search to a specific domain by entering the domain name or SID in the **Domain** field.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **Check name** to check whether the user name is valid or unique.
4. In the **Password** field, enter the domain password of the administrator.
5. Click **Done**.

> **Note:**
>
> If the identity type you selected in **Machine Identities** is **Microsoft Entra hybrid joined**, the credentials you enter must have been granted the `Write userCertificate` permission.

Summary, name, and description

On the **Summary** page, review the settings you specified. Enter a name and description for the catalog. This information appears in Web Studio.

When you're done, click **Finish** to start the catalog creation.
When you're done, select **Finish** to start the catalog creation.

In **Machine Catalogs**, the new catalog appears with an inline progress bar.

To view details of the creation progress:

1. Hover the mouse over the machine catalog.
2. In the tooltip that appears, click **View details**.

   A step-by-step progress graph appears where you can see the following:

   - History of steps
   - Progress and running time of the current step
   - Remaining steps

MCS time synchronization

Time synchronization is determined by the master image and the type of machine identity joined catalog. You get the following time synchronization method according to the master image and the catalog:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Master image	Catalog	Resultant time synchronization method
NDJ	AD or Microsoft Entra hybrid	By default, NT5DS. You can disable MCS from changing time synchronization setting using registry settings in the master image
NDJ	NDJ or Microsoft Entra ID	Same as the original time synchronization setting
AD or Microsoft Entra hybrid	AD or Microsoft Entra hybrid	Same as the original time synchronization setting
Microsoft Entra ID	Microsoft Entra ID	Same as the original time synchronization setting

> **Note:**
>
> The original time synchronization is controlled by the following registry setting and cannot be changed:
>
> - Computer\HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\Config
>
> Value: MaxAllowedPhaseOffset, MaxNegPhaseCorrection, and MaxPosPhaseCorrection
>
> - Computer\HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\W32Time\Parameters
>
> Value: Type

To disable MCS from changing the time synchronization setting, set the value of the following registry setting in the master image:

- `Computer\HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix`
- Name: TimeSyncMethodKeep
- Type: DWORD
- 0 (Or, value TimeSyncMethodKeep not configured): Does not keep the original time synchronization setting.
- 1: Keeps original time synchronization setting and default parameters values.

Important consideration about setting custom properties

Custom properties must be set correctly at `New-ProvScheme` and `Set-ProvScheme` in GCP and Azure environments. If you specify a non-existing custom property or properties, you get the following

© 1997–2026 Citrix Systems, Inc. All rights reserved.

error message, and the commands fail to run.

- In Azure: `Invalid property found: <invalid property>. Ensure that the CustomProperties parameter supports the property.`
- In GCP: `Invalid property found: <invalid property>. Ensure that the value supplied for the property is supported in the Hypervisor.`

Troubleshoot

> **Important:**
>
> After creating the machine catalog using Web Studio, you can no longer use the `Get-ProvTask` PowerShell command to retrieve the tasks associated with machine catalog creation. This restriction is a result of Web Studio deleting those tasks after machine catalog creation regardless of whether the catalog is created successfully.

Citrix recommends collecting logs to help the Support team provide solutions. When using Citrix Provisioning, use the following procedure to generate log files:

1. On the master image, create the following registry key with the value of 1 (as a DWORD (32-bit) value): `HKLM\Software\Citrix\MachineIdentityServiceAgent\LOGGING`.
2. Shut down the master image and create a snapshot.
3. On the Delivery Controller, run the following PowerShell command: `Set-ProvServiceConfiguration -Name ImageManagementPrep_NoAutoShutdown -Value $True`.
4. Create a catalog based on that snapshot.
5. When the preparation VM is created on the hypervisor, log in and extract the following files from the root of C:\: Image-prep.log and PvsVmAgentLog.txt.
6. Shut down the machine, at which point it reports the failure.
7. Run the following PowerShell command to re-enable auto shutdown of the image preparation machines: `Remove-ProvServiceConfigurationData -Name ImageManagementPrep_NoAu`
   .

Assign a specific drive letter to an MCS I/O write-back cache disk

You can assign a specific drive letter to an MCS I/O write-back cache disk. This implementation helps you to avoid conflicts between the drive letter of any applications that you use and the drive letter of MCS I/O write-back cache disk. To do this, you can use PowerShell commands. The supported hypervisors are Azure, GCP, VMware, SCVMM, and XenServer.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> This feature requires VDA version 2305 or later.

Limitations

- Applicable to only Windows operating system
- Applicable drive letter for write-back cache disk: E to Z
- Not applicable when Azure temporary disk is used as a write-back cache disk
- Applicable only when you create a new machine catalog

Assign a drive letter to a write-back cache disk

To assign a drive letter to write-back cache disk:

1. Open the **PowerShell** window.
2. Run `asnp citrix*`.
3. Create an identity pool if not already created. For information, see Creating a Catalog.
4. Create a provisioning scheme using the `New-ProvScheme` command with the property `WriteBackCacheDriveLetter`. For example:

```
New-ProvScheme -CleanOnBoot `
-HostingUnitName "<name>" `
-IdentityPoolName $schemeName `
-ProvisioningSchemeName $schemeName `
-InitialBatchSizeHint 1 `
-UseWriteBackCache -WriteBackCacheDiskSize 127 -
   WriteBackCacheMemorySize 256 -WriteBackCacheDriveLetter E `
-MasterImageVM "XDHyp:\HostingUnits\<name>\image.folder\abcd-
   resources.resourcegroup\
   MCSIOMasterVm_OsDisk_1_d3e2d6352xxxxxxxx2130aa145ec77.
   manageddisk" `
-NetworkMapping @{
 "0"="XDHyp:\\HostingUnits\\name\\virtualprivatecloud.folder\\East
     US.region\\virtualprivatecloud.folder\\abcd-resources.
    resourcegroup\\abcd-resources-vnet.virtualprivatecloud\\
    default.network" }
  `
-ServiceOffering "XDHyp:\\HostingUnits\\<name>\\serviceoffering.
   folder\\Standard_D2s_v5.serviceoffering" `
-CustomProperties '<CustomProperties xmlns="http://schemas.citrix.
   com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/
   XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="
   true" />
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<Property xsi:type="StringProperty" Name="OsType" Value="Windows" />
<Property xsi:type="StringProperty" Name="StorageType" Value="Premium_LRS"/>
<Property xsi:type="StringProperty" Name="PersistWBC" Value="false" />
<Property xsi:type="StringProperty" Name="PersistOsDisk" Value="false" />
<Property xsi:type="StringProperty" Name="PersistVm" Value="false" />
<Property xsi:type="StringProperty" Name="WBCDiskStorageType" Value="Premium_LRS" />
<Property xsi:type="StringProperty" Name="UseTempDiskForWBC" Value="false" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="abcd-group1" />
<Property xsi:type="StringProperty" Name="LicenseType" Value="Windows_Client" />
<Property xsi:type="StringProperty" Name="SchemaVersion" Value="2" />
</CustomProperties>'
```

5. Finish creating the catalog.

Validate configuration before creating an MCS machine catalog

You can validate configuration settings before creating an MCS machine catalog using the parameter `-validate` in `New-ProvScheme` command. After you run this PowerShell command with the parameter, you get an appropriate error message if there is an incorrect parameter used or a parameter has conflict with another parameter. You can then use the error message to resolve the issue and successfully create an MCS machine catalog using PowerShell. Currently, this feature is applicable to AWS, Azure, GCP, and VMware virtualization environments.

> **Note:**
>
> While validating, you must not create an actual MCS machine catalog. You must use the result of the command to fix the errors, and then create a successful catalog. Therefore, while running the `New-ProvScheme` command, use a fake identity pool name.

To validate the configuration, do the following steps:

1. Open a PowerShell window from the Delivery Controller host.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run `New-ProvScheme` command and use the parameter `-validate`. Provide a fake identity pool name for the command to work. For example,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$result =New-ProvScheme  -CleanOnBoot -HostingUnitName "vSanRg" -
    IdentityPoolName "mptmpcatalogdemo" -InitialBatchSizeHint 1  -
    MasterImageVM "XDHyp:\HostingUnits\vSanRg\Windows19MasterImage.
    vm\Citrix_XD_NonMachineProfileWin19Machines.snapshot" -
    NetworkMapping @{
 "0"="XDHyp:\HostingUnits\vSanRg\\VM Network.network" }
  -ProvisioningSchemeName "MachineProfileW10Machines"  -Scope @()
-VMCpuCount 2  -VM
MemoryMB 6143 -MachineProfile "XDHyp:\HostingUnits\vSanRg\TRW-
    Win11-tpm-BL-TEMPLATE.template" -TenancyType Shared  -
    FunctionalLevel "L7_20" -Validate
$result.TerminatingError | Format-List -Property *
```

Error message:

```
ErrorData    : {
 [[ValidationFailureCount, xxx], [InvalidMemoryValue, The memory
    size provided 6143 must be a multiple of 4 MB and must be
    greater than or equal to 4 MB.], [InconsistentGuestOsSetting,
    The GuestOs setting - windows9_64Guest of the selected machine
     profile does not match with the setting -
    windows2019srv_64Guest of master image. Please select a
    machine profile that matches the GuestOs setting of the master
     image.], [InconsistentVtpmSetting, The vTPM setting of the
    selected machine profile does not match with the selected
    master image. Please select a machine profile that matches the
     vTPM setting of the master image.], [
    InconsistentFirmwareSetting, The firmware setting - efi of the
     selected machine profile does not match with the setting -
    bios of master image. Please select a machine profile that
    matches the firmware setting of the master image ErrorId
    : ValidationFailure
ErrorMessage : ValidationFailure
Operation    : ValidatingInputs
```

4. After validating the configuration setting, you can create an MCS machine catalog with a real identity pool name and correct parameters.

Onboard VMs to Azure Arc

Azure Arc enables organizations to manage resources such as VMs hosted anywhere as if they are running in Azure. With Azure Arc, you can use Azure services such as Azure Monitor for comprehensive visibility and proactive management of the resources.

To onboard VMs to Azure Arc, create an MCS machine catalog using the `New-ProvScheme` command. You can also update an existing catalog using the `Set-ProvScheme` command. Only the new VMs added to the catalog are onboarded to Azure Arc.

Currently, this feature is applicable to all Citrix on-premises hypervisors Vmware, Nutanix and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SCVMM.

Prerequisites

Consider the following before enabling Azure Arc onboarding on MCS catalog:

- Azure Resource Group with:
  - `Allows` accounts to read, create, and delete Arc servers.
  - `Allows` accounts to manage VM extensions, licenses, and private link scopes.
  - `Azure Connected Machine Resource Administrator` role assigned to the service principal at the resource group scope.

See Assign Azure roles using the Azure portal.

- Master image with
  - VDA: Later than 2311, excluding 2411.

    > **Note:**
    >
    > Azure Arc Onboarding is not supported in CVAD 2411. [BRK-14897]

  - AzureConnectedMachineAgent agent installed. You might download the MSI from under Windows or Linux sections of Microsoft's documentation.

Steps to onboard VM to Azure Arc

1. Setup a service account with `AzureArcResourceManagement` capability.

   The service account is used for authentication or authorization by storing credentials to access identity providers like Microsoft Entra ID. Each service account is tied to a single identity provider.

   To create a new service account to access AzureAD with `AzureArcResourceManagement capability`, run:

   ```
   New-AcctServiceAccount -IdentityProviderType "AzureAD" -
       IdentityProviderIdentifier "tenant-id" -AccountId "
       application-id" -AccountSecret "application-secret" -
       Capabilities "AzureArcResourceManagement"
   ```

   The `application-id` must be of the same service principal that was assigned the Azure Connected Machine Resource Administrator role.

2. Assign the service account to the identity pool. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-AcctIdentityPool -IdentityPoolUid “idn-pool-uid” -
    ServiceAccountUid “service-account-uid”
```

3. Create or update an MCS catalog with the following Arc parameters:

   - `EnableAzureArcOnboarding`: Indicates whether Arc Onboarding needs to be enabled on the catalog.
   - `AzureArcSubscriptionId`: Indicates the Azure subscription where the Arc-connected VMs are created.
   - `AzureArcRegion`: Indicates the Azure region where the Arc-connected VMs are created.
   - `AzureArcResourceGroup`: Indicates the Azure resource group where the Arc-connected VMs are created. See [Prerequisites]for information on Azure Arc Resource Group.

   Example: To enable Azure Arc Onboarding for a new catalog:

   ```
   `New-ProvScheme -ProvisioningSchemeName "demo" -MasterImageVM "
       XDHyp:\HostingUnits\hosting-unit\masterVMName.vm\
       masterSnapshotName.snapshot" -HostingUnitName “hosting-unit”
       -IdentityPoolName “identity-pool” `

   -EnableAzureArcOnboarding -AzureArcSubscriptionId “azure-sub” -
       AzureArcResourceGroup “azure-resourcegroup” - AzureArcRegion
       “azure-region”
   ```

   Example: To enable Azure Arc Onboarding for an existing catalog:

   ```
   Set-ProvScheme -ProvisioningSchemeName "demo" -
       EnableAzureArcOnboarding $true -AzureArcSubscriptionId “azure-
       sub” -AzureArcResourceGroup “azure-resourcegroup” -
       AzureArcRegion “azure-region”
   ```

   Example: To disable Azure Arc Onboarding for an existing catalog:

   ```
   Set-ProvScheme -ProvisioningSchemeName "demo" -
       EnableAzureArcOnboarding $false:
   ```

4. Add new machines to the catalog to onboard Arc.
5. After you power-on the VM, you must see the VM in the Azure portal under **AzureArcResourceGroup** as a connected machine.

Considerations

- Arc onboarding is currently supported for only new VMs. So, if you update an existing catalog using `Set-ProvScheme`, then only newly added VMs are onboarded to Arc when first powered on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The Arc Custom Properties are still supported for existing catalogs for backward compatibility. However, if you run `New-ProvScheme` with Arc CustomProperties such as `EnableAzureArcOnboarding`, then catalog creation fails.
- You must add all the parameters in `New-ProvScheme` and `Set-ProvScheme` if you configure `EnableAzureArcOnboarding` as **`true`**.

Troubleshooting

When creating SCVMM catalog using `New-ProvScheme`, you might get the following error:

```
Master Image/Machine Profile's VM's device id is different than the
    NetworkMapping's device id '0'. Please provide a device id that
    matches the master image/machine profile.
```

In that case,make sure you explicitly specify the `DeviceId` in `NetworkMapping` parameter of `New-ProvScheme`. For example:

```
New-ProvScheme -ProvisioningSchemeType "MCS" -InitialBatchSizeHint 1 -
    HostingUnitName $HostingUnitName `
            -IdentityPoolName $CatalogName -MasterImageVM $MasterImage
                -ProvisioningSchemeName $CatalogName `
            -VMCpuCount 2 -VMMemoryMB 4096  -EnableAzureArcOnboarding `
            -AzureArcSubscriptionId $AzureArcSubscription -
                AzureArcRegion $AzureArcRegion `
            -AzureArcResourceGroup $AzureArcResourceGroup
            -NetworkMapping @{
 "FDDxxxxxx-xxxx-4xxx-9EBC-3xxxxxxxx"="XDHyp:\HostingUnits\<hosting
    unit name>\abc.network" }
```

Image replication of additional storage for supported on-premises hypervisors

This feature enables efficient replication and management of image version specification instances across multiple storage locations supported by on-premises hypervisors.

Use cases

- You can replicate image versions to new or superseded storage locations, allowing virtual machines to be provisioned in additional locations either during or after the image preparation process.
- When a new image version is created and additional storage locations are specified, the prepared image version specification is automatically replicated to those designated storage locations.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If there is a need to use an existing image version with a superseded or newly added storage locations, you can add an image version instance to replicate to the new storage location.
- When a hosting unit is added to an existing image version, along with additional storage, the prepared image version spec instance will be replicated to the specified additional storages within the target hosting unit.

PowerShell commands

- Add a new image instance that replicates a prepared image version spec to the specified storage location.

```
Add-ProvImageVersionSpecInstance -ImageVersionSpecUid <
    ImageVersionSpecUid > -StorageIds "<StorageId1,StorageId2>" -
    RunAsynchronously
```

- Remove an existing image version spec instance replica and not used by any existing VMs.

```
Remove-ProvImageVersionSpecInstance -ImageVersionSpecUid <
    ImageVersionSpecUid >  -ImageInstanceUid < ImageInstanceUid >
    -RunAsynchronously
```

- Get a list of image version specs instances.

```
Get-ProvImageVersionSpecInstance -ImageVersionSpecUid  <
   ImageVersionSpecUid >
```

Where to go next

For information on creating specific cloud services catalogs, see:

- Create an AWS catalog
- Create a XenServer catalog
- Create a Google Cloud Platform catalog
- Create a Microsoft Azure catalog
- Create a Microsoft System Center Virtual Machine Manager catalog
- Create a Nutanix catalog
- Create a VMware catalog

If this is the first catalog created, Web Studio guides you to create a delivery group.

To review the entire configuration process, see Install and configure.

You can create a Citrix Provisioning catalog using Web Studio and PowerShell.
This implementation provides you the following advantages:

- A single unified console to manage both MCS and Citrix Provisioning catalogs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Have new features for Citrix Provisioning catalogs, such as, identity management solution, on-demand provisioning and so on.

Currently, this feature is available only for Azure and VMware workloads. However, in VMware environments, you can currently create the catalogs using only PowerShell commands. For more information, see Create Citrix Provisioning catalogs in Citrix Studio.

More information

- Create and manage connections and resources
- Create catalogs of different join types
- Manage machine catalogs

Create an Amulet Hotkey CoreStation machine catalog

September 3, 2026

Create machine catalogs describes the generic machine-catalog workflow. The following information covers Amulet Hotkey CoreStation specific details.

> **Note:**
>
> Before creating an Amulet Hotkey CoreStation catalog, complete Connection to Amulet Hotkey CoreStation.

You can create an Amulet Hotkey CoreStation machine catalog using:

- Web Studio
- PowerShell commands

Using Web Studio

In the Machine Catalog Setup wizard:

1. On the **Operating System** page, select **Multi-session OS** or **Single-session OS**.
2. On the **Machine Management** page, select **Machines that are power managed and Another service or technology**.
3. On the **Virtual Machines** page, add machines and their Active Directory machine accounts. You can do either of the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Click **Add Machines** to add machines manually. The **Select VMs window** appears. Expand the Amulet Hotkey CoreStation enclosure connection you created earlier and select the nodes you want to add. Then add the associated machine account names.
- Click **Add CSV File** to bulk add machines. For information about using CSV files to add machines, see Use CSV files to bulk add machines to a catalog.

The **Scopes** and **Summary** pages do not contain Amulet Hotkey CoreStation-specific information.

Using PowerShell commands

Run `New-BrokerCatalog` and `New-BrokerMachine` PowerShell commands to create a broker catalog and import machines to the broker catalog.

For example:

```
1 New-BrokerCatalog  -AdminAddress "MyDDC.MyDomain.local" -AdminClientIP
     "103.14.252.249" -AllocationType "Random" -IsRemotePC $False -
     MachinesArePhysical $False -MinimumFunctionalLevel "L7_20" -Name "
     BurMC" -PersistUserChanges "OnLocal" -ProvisioningType "Manual" -
     Scope @() -SessionSupport "MultiSession" -ZoneUid "e166e2cb-25dc
     -4578-bc07-bcf2a82d1463"
2 New-BrokerMachine  -AdminAddress "MyDDC.MyDomain.local" -AdminClientIP
     "103.14.252.249" -CatalogUid 3 -HostedMachineId "c10n1" -
     HypervisorConnectionUid 4 -IsReserved $False -MachineName "S
     -1-5-21-2589939477-3963209805-1860259709-1121"
```

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- For power management, see Power manage Amulet Hotkey CoreStation VMs

More information

- Create and manage connections and resources
- Connection to Amulet Hotkey CoreStation
- Create machine catalogs

Create an AWS EC2 catalog

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to AWS EC2 virtualization environments.

> **Note:**
>
> Before creating an AWS catalog, you need to finish creating a connection to AWS. See Connection to AWS EC2.

Network setting during image preparation

During image preparation, a preparation virtual machine (VM) is created based on the original VM. This preparation VM is disconnected from the network. To disconnect the network from the preparation VM, a network security group is created to deny all inbound and outbound traffic. This network security group persists and is reused. The network security group's name is `Citrix.XenDesktop.IsolationGroup-GUID`, where GUID is randomly generated.

AWS tenancy

AWS provides the following tenancy options:

- Shared tenancy (the default type) and dedicated tenancy. Shared tenancy means that multiple Amazon EC2 instances from different customers might reside on the same piece of physical hardware.
- Dedicated tenancy means that your EC2 instances run only on hardware with other instances that you have deployed. Other customers do not use the same piece of hardware.

Requirements for provisioning to AWS hosts

- An imported BYOL (bring your own license) image (AMI). With dedicated hosts, use and manage your existing licenses.
- An allocation of dedicated hosts with sufficient utilization to satisfy provisioning requests.
- Enabling **auto-placement**.

Options to configure AWS tenancy

- **Use shared hardware**. This setting is suitable for most deployments. Multiple customers share pieces of hardware even though they do not interact with each other. Using shared hardware is the least expensive option for running your Amazon EC2 instances.
- **Use dedicated host**. An Amazon EC2 dedicated host is a physical server with EC2 instance capacity that is fully dedicated, letting you use existing per-socket or per-VM software licenses.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Dedicated hosts have preset utilization based on instance type. For example, a single allocated dedicated host of C4 Large instance types is limited to running 16 instances. See the AWS site for more information.

This setting is suitable for deployments with licensing restrictions or security requirements that need your use of a dedicated host. With a dedicated host, you own an entire physical host and are billed on an hourly basis. Owning that host lets you spin up as many EC2 instances as that host permits, without more charges.

- **Use dedicated instance**. This setting is more suitable for deployments with specific security or compliance requirements. With a dedicated instance, you still enjoy the benefits of having a host separate from other AWS customers but you do not pay for the entire host. You do not need to worry about the capacity of the host but you are charged at a higher rate for the instances.

> **Note:**
>
> You can delete any available preparation identity disk if there is no ongoing catalog creation or image update task.

To configure AWS tenancy using Studio, see Create a catalog using Web Studio and using PowerShell, see Configure AWS dedicated host tenancy using the PowerShell.

Tag AWS operational resources

An Amazon Machine Image (AMI) represents a type of virtual appliance used to create a virtual machine within the Amazon Cloud environment, commonly referred to as EC2. You use an AMI to deploy services that use the EC2 environment. When you create a catalog to provision machines using MCS for AWS, you select the **AMI** to act as the golden image for that catalog.

> **Important:**
>
> Creating catalogs by using both a machine profile and a launch template is required for using operational resource tagging.

To create an AWS catalog, you must first create an AMI for the instance you want to be the golden image. MCS reads the tags from that instance and incorporates them into the launch template. The launch template tags are then applied to all Citrix® resources created in your AWS environment, including:

- Virtual Machines
- VM disks
- VM network interfaces
- S3 buckets
- S3 objects

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Launch templates
- AMIs

You can tag operational resources using Studio and PowerShell while creating a catalog. For Studio, see Create a catalog using Web Studio (**Image** page). For PowerShell, see Tag operational resources using PowerShell.

Create a catalog

You can create a catalog using:

- Web Studio
- PowerShell

Create a catalog using Web Studio

1. Click **Machine Catalogs** on the left navigation pane.
2. Click **Create Machine Catalog**. The **Machine Catalog Setup** page appears.
3. On the **Machine Type** page, select a machine type for the catalog, for example, Multi-session OS.
4. On the **Machine Management** page, select the following settings:
    a) Select Machines that are power managed (for example, virtual machines or blade PCs).
    b) Select **Citrix provisioning technology**. Then, select **Citrix Machine Creation Services™**.
    c) In the **Resources** field, select the resources (availability zone or local zone) that you configured while creating the host connection and click **Next**.
5. On the **Desktop experience** page, select either random or static desktop that you want users to have when they log in.
6. On the **Image** page:
    a) Select a machine template that you want to use as the master image for all machines in the catalog.
    b) If you want VMs in the catalog to inherit configurations from a machine profile, select a machine profile. By default, the **Use a machine profile** checkbox is selected. To change the machine profile source to another VM or launch template version, click the edit button.
    c) Select the **Apply machine tags to operational resources** checkbox to apply machine tags to operational resources. This option controls whether to apply machine tags to every item created in your AWS environment that facilitates provisioning of machines. Operational resources are created as byproducts of catalog creation. They include both temporary and persistent resources, such as preparation VM instances and AMI.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The **Security** page appears only if you are creating a machine catalog without assigning a machine profile.

7. On the **Virtual Machines** page:
   a) Enter the number of VMs for the catalog.
   b) The default machine specification is displayed, which is based on the machine profile. To change it, select the edit icon and select a machine specification.
   c) Configure the AWS tenancy. See Options to configure AWS tenancy.
   d) You can also configure a secondary VM when the primary machine size reaches full capacity. Click **Secondary size** (optional). In the **Secondary machine size** window, the VMs listed have both, Spot and Regular VM types. You may select up to 10 secondary machine sizes. Once the 10 VMs are selected, then the other VMs listed are disabled from further selection. Click **Next**. In the **Secondary machine size** blade, you can select multiple machine sizes and drag and drop to change the priority order. Click **Done**. The selected machine sizes show up in the Secondary size (optional). Click the edit icon to edit as needed.
8. The **Security** page appears only if you are creating a machine catalog without assigning a machine profile. Use the **Security** page to configure the security groups for the VMs. This is also applicable when editing and cloning an existing machine catalog.

   If you create a machine profile-based machine catalog, then the security group configurations are inherited from the machine profile and the **Security** page does not appear.
9. In the **NICs** page, select the NICs (or ENIs) for the VMs.
10. On the **Disk Settings** page, choose whether to enable write-back cache.
11. On the **Machine Identities** page, configure on-premises Active Directory or Microsoft Entra hybrid joined for the machines in the catalog by selecting the domain and creating new AD accounts for the VMs to be created in this machine catalog. The provisioned VMs are joined to the domain selected. Specify the account naming scheme for the new AD accounts to be created for the VMs. Click Next.
12. On the **Domain credentials** page, click **Enter credentials** to provide the credentials for the selected domain. Enter admin-level username and password when prompted. You can also use a service account if you have domain credentials already saved previously by following our product docs.
13. Click through the remaining pages until the **Summary** page. Enter a name for the machine catalog and select **Finish** to create the machine catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Limitations on creating a machine catalog in an AWS local zone

- Certain local zones only support certain hardware configurations (for example, Perth local zone does not support GP3 volumes, only GP2).
- Since only gp2 is universally supported across all local zones, and not all support gp3, ID disk creation defaults to using gp2 volume type.
- You must select a machine profile with hardware specifications that are supported in the desired local zone.
- Prepared image AMIs snapshots and ID disk snapshots defaults to being placed in the region, rather than the local zone (due to AWS limitations regarding visibility into EBS snapshot support in local zones).
- Only local zones supporting full EC2 and EBS services are supported zones.

Create a catalog using PowerShell

Configure AWS dedicated host tenancy using the PowerShell

Alternatively, you can provision AWS dedicated hosts through PowerShell. Use the `New-ProvScheme` cmdlet with the parameter `TenancyType` set to `Host`.

Tag operational resources using PowerShell

To use PowerShell to tag resources:

1. Open a PowerShell window from the DDC host.
2. Run the command `asnp citrix` to load Citrix-specific PowerShell modules.

To tag a resource for a provisioned VM, use the custom property `AwsOperationalResourcesTagging`. Example:

```
1 New-ProvScheme -ProvisioningSchemeName test
2 -CustomProperties " AwsOperationalResourcesTagging,true "
3 -MachineProfile "XDHyp:\HostingUnits\xxxx-ue1a\machineprofiletest (lt
     -01xxxxx).launchtemplate\lt-01xxxxx (1).launchtemplateversion"
4 ... <Other <standard provscheme parameters>
```

MCSIO enabled catalog

MCS Storage Optimization (MCSIO) improves the performance of the VM by caching disk operations in either memory or on a small, high-speed disk. You can create an MCSIO enabled non-persistent catalog using PowerShell commands. To create such a catalog, you must install the MCSIO driver while

© 1997–2026 Citrix Systems, Inc. All rights reserved.

installing or upgrading the VDA during the preparation of the AMI instance. By default, that driver is not installed.

After an MCSIO AMI is prepared (when installing the VDA, select the option to include the MCSIO driver in the installation), you can create an MCSIO enabled non-persistent catalog.

> **Note:**
>
> The option to configure MCSIO with only disk cache (without memory cache) using Studio has been removed across all hypervisors and cloud service environments.

Create an MCSIO enabled catalog

The four parameters added to the New-ProvScheme PowerShell command are:

- `UseWriteBackCache`: Turns on caching (write-back cache) for the given provisioning scheme
- `WriteBackCacheDiskSize`: Specifies the size in GB of the temporary disk used for caching
- `WriteBackCacheMemorySize`: Specifies how much memory in MB to use for caching. This is an optional parameter.

> **Note:**
>
> - The value of `WriteBackCacheDiskSize` must be more than zero because at least 1 GB of cache disk storage is required. The cache disk size must not be bigger than the OS disk size.
> - The value of `WriteBackCacheMemorySize` must be non-zero and less than the machine catalog memory size.

The custom properties that affect MCSIO are:

- `WBCDiskStorageType`: Defines the volume type, which is used for the temporary disk in AWS. This parameter takes a string argument in the format `volume-type[:iops][:throughput]`. The following are the volume types:

  - gp2: Do not use iops and throughput parameters for this volume type
  - gp3: Use iops and throughput parameters for this volume type
  - io1: Use only iops parameter for this volume type
  - io2: Use only iops parameter for this volume type

  The default volume type is **gp2**.

- `PersistWBC`: Controls whether to keep or discard the cache disk whenever the AWS instance is powered off. If set to **`true`**, the cache disk is kept. If set to **`false`** (the default), the cache disk is only created and kept while the AMI instance is powered on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `PersistOSDisk`: Controls whether to keep or discard the OS disk whenever the AWS instance is powered off. If set to **`true`**, the OS disk is kept. If set to **`false`** (the default), the OS disk is only created and kept while the AMI instance is powered on.

Perform the following steps in the PowerShell window to create an MCSIO enabled non-persistent catalog:

1. Open the PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Create a broker catalog and an identity pool.
4. Create the provisioning scheme. For example:

```
$HostingUnitUid = '0xxxx1d9-bbfc-xxxf-bxxb-exxxxxe008b2'
$MasterImageVM = 'XDHyp:\HostingUnits\ctx-test\aws-apollo-non-persistent-multi-mcsio-vda-win2022 (ami-0bf1810488acbxxxb).template'
$NetworkMap = @{
  'NetworkPath' = 'XDHyp:\HostingUnits\ctx-test\us-east-1a.availabilityzone\10.0.128.0`/17 (vpc-0fa6e41d72507fxxx).network'  }

$SecurityGroup = $( 'XDHyp:\HostingUnits\ctx-test\us-east-1a.availabilityzone\private.securitygroup' )
$ServiceOffering = 'XDHyp:\HostingUnits\ctx-test\T3 Medium Instance.serviceoffering'
$CustomProperties = 'WBCDiskStorageType,gp3:6000:250;PersistWBC,false'

$provScheme = New-ProvScheme -ProvisioningSchemeName $CatalogName -HostingUnitUid $HostingUnitUid `
-IdentityPoolUid $acctPool.IdentityPoolUid -CleanOnBoot `
- MasterImageVM $MasterImageVM `
-NetworkMap $NetworkMap `
-ServiceOffering $ServiceOffering `
-SecurityGroup $SecurityGroup `
-CustomProperties $CustomProperties `
-UseWriteBackCache -WriteBackCacheDiskSize 16 -WriteBackCacheMemorySize 256
```

5. Add VMs to the catalog.

Improve boot performance with MCSIO

You can improve the boot performance of VMs if you enable MCSIO and set `PersistWBC` and `PersistOSDisk` custom properties as `true`. With such a setting, VMs can boot faster because they do not need to initialize a new cache disk or to recreate a root disk from their template.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a machine profile-based machine catalog using PowerShell

You can use a machine profile to capture the hardware properties from an EC2 instance (VM) or launch template version and apply them to the provisioned machines. Properties that are captured can include, for example, EBS volume properties, instance type, EBS optimization, CPU options, tenancy type, hibernation capability, security groups, and other supported AWS configurations.

You can use an AWS EC2 Instance (VM) or AWS Launch Template version as the machine profile input.

> **Note:**
>
> EBS volume properties are derived only from a machine profile.

Important considerations

The important considerations while creating an MCS machine catalog:

- If you add machine hardware property parameters in the `New-ProvScheme` and `Set-ProvScheme` commands, then the values provided in the parameters overwrite the values in the machine profile.
- If you set `AwsCaptureInstanceProperties` as **`true`** and do not set `MachineProfile` property, then only IAM roles and tags are captured.
- You cannot set both `AwsCaptureInstanceProperties` and `MachineProfile` at the same time.

  > **Note:**
  >
  > The `AwsCaptureInstanceProperties` is deprecated.

- If a machine profile is not provided, you must explicitly provide the values of the following properties:
  - Security Group
  - ENI or Virtual Network
- You can enable `AwsOperationalResourcesTagging` only if you enable `AwsCaptureInstancePro` or specify a machine profile.

The important consideration after creating an MCS machine catalog is:

- You cannot change a catalog from a machine profile-based to a non-machine profile-based catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure security groups in a machine profile input

You can create an MCS machine catalog where the provisioned VMs are assigned security groups per ENI (Network Interface). To do this, use a machine profile input (EC2 instance or launch template) that has different security groups mapped to distinct ENIs. For example, if machine profile input has ENI A with SG 1 and ENI B with SG 2, then provisioned VMs must also have ENI A with SG 1 and ENI B with SG 2.

Retrieve network interface details

Run the following commands to get the list of network interface data records including the interface SubnetId, assigned security groups, and assigned networks.

```
(Get-HypInventoryItem -LiteralPath 'XdHyp:\HostingUnits\cvad-test' –
   ResourceType vm). AdditionalData
```

> **Note:**
>
> MCS does not currently allow more than one network per network interface.

Create a machine catalog using a machine profile

To create a machine catalog using a machine profile:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Create an identity pool if not already created. For example,

   ```
   New-AcctIdentityPool -IdentityPoolName idPool -NamingScheme ms## -
      Domain abcdf -NamingSchemeType Numeric
   ```

4. Run New-ProvScheme command. For example:

   ```
   New-ProvScheme -ProvisioningSchemeName demet-test-1
   -HostingUnitUid aa633238-9xxd-4cf6-80e8-232a758a1xx1
   -IdentityPoolUid 34d5b088-e312-416f-907d-16573xxxxxc4
   -CleanOnBoot
   -MasterImageVM 'XDHyp:\HostingUnits\cvad-test-scalestress\citrix-
      demet-ami.0 (ami-0ca813xxxxxx061ef).template'
   -MachineProfile 'XdHyp:\HostingUnits\cvad-test-scalestress\us-east
      -1a.availabilityzone\machine-profile-instance i (i-0xxxxxxxx).
      vm'
   ```

5. Complete creating the catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update the machine profile

To update the machine profile on a catalog that was initially provisioned with a machine profile, do the following. You can also change the tenancy type and hibernation capability of the machine profile source while editing an MCS machine catalog.

1. Run `Set-ProvScheme` command. For example,

```
Set-ProvScheme `
-ProvisioningSchemeUid "<ID" `
-MachineProfile "XDHyp:\HostingUnits\abc\us-east-1a.
   availabilityzone\citrix-cvad-machineprofile-instance (i-0
   xxxxxxxx).vm"
```

Create a catalog with launch template version using PowerShell

You can create an MCS machine catalog with a launch template version as a machine profile input. You can also update the input of a machine profile catalog from a VM to a launch template version and from a launch template version to a VM.

On the AWS EC2 console, you can provide the instance configuration information of a launch template along with version number. When you specify the launch template version as a machine profile input while creating or updating a machine catalog, the properties from that version of the launch template are copied to the provisioned VDA VMs.

The following properties can be provided using machine profile input or explicitly as parameters in `New-ProvScheme` or `Set-ProvScheme`commands. If they are provided in `New-ProvScheme` or `Set-ProvScheme` commands, they take precedence over the machine profile values of these properties.

- Service Offering
- Networks
- Tenancy Type

> **Note:**
>
> If service offering is not provided in the machine profile launch template or as a parameter in the `New-ProvScheme` command, you get an appropriate error.

To create a catalog using launch template version as a machine profile input:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Get the list of launch template versions of a launch template. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
XDHyp:\HostingUnits\test\test-mp-sard (lt-01xxxxx).launchtemplate>
    ls | Select FullPath
```

4. Create an identity pool if not created. For example:

```
New-AcctIdentityPool `
-IdentityPoolName "abc11" `
-NamingScheme "abc1-##" `
-NamingSchemeType Numeric `
-Domain "citrix-xxxxxx.local" `
-ZoneUid "xxxxxxxx" `
```

5. Create a provisioning scheme with a launch template version as a machine profile input. For example:

```
New-ProvScheme `
-ProvisioningSchemeName "MPLT1" `
-HostingUnitUid "c7f71f6a-3f45-4xxx-xxxx-xxxxxxxxxx" `
-IdentityPoolUid "bf3a6ba2-1f80-4xxx-xxxx-xxxxxxxxx" `
-MasterImageVM "XDHyp:\HostingUnits\xxxd-ue1a\apollo-non-
   persistent-vda-win2022 (ami-0axxxxxxxxxxx).template" `
-CleanOnBoot `
-MachineProfile "XDHyp:\HostingUnits\xxxx-ue1a\machineprofiletest
   (lt-01xxxxx).launchtemplate\lt-01xxxxx (1).
   launchtemplateversion"
```

6. Register a provisioning scheme as a broker catalog. For example:

```
New-BrokerCatalog -Name "MPLT1" `
-AllocationType Random `
-Description "Machine profile catalog" `
-ProvisioningSchemeId fe7df345-244e-4xxxx-xxxxxxxxx `
-ProvisioningType Mcs `
-SessionSupport MultiSession `
-PersistUserChanges Discard
```

7. Complete creating the catalog.

Update the machine profile source

You can also update the input of a machine profile catalog from a VM to a launch template version and from a launch template version to a VM. For example:

- To update the input of a machine profile catalog from a VM to a launch template version:

```
Set-ProvScheme -ProvisioningSchemeName "CloudServiceOfferingTest"
    `
-MachineProfile "XDHyp:\HostingUnits\xxxx-ue1a\machineprofiletest
    (lt-0bxxxxxxxxxxx).launchtemplate\lt-0bxxxxxxxxxxx (1).
   launchtemplateversion"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To update the input of a machine profile catalog from a launch template version to a VM:

```
Set-ProvScheme -ProvisioningSchemeName "CloudServiceOfferingTest"
    `
-MachineProfile "XDHyp:\HostingUnits\sard-ue1a\us-east-1a.
   availabilityzone\apollo-non-persistent-vda-win2022-2 (i-08
   xxxxxxxxx).vm"
```

Encrypt OS, ID, and WBC disks

You can create a persistent and non-persistent catalog of VMs with AWS KMS keys (Customer managed key and AWS managed key) that can be used to encrypt OS disk, Identity Disk (ID), and write-back cache disk (WBC).

- AWS managed keys are automatically rotated every year.
- Customer managed keys are optional for automatic rotation and can be managed manually.

You can see the following AWS documents for more information on KMS keys:

- AWS KMS concepts
- How automatic key rotation works

For encryption of OS, ID, and WBC disks, configure one of the following:

- Use a master image that is encrypted (for example, an AMI created from an instance or snapshot that contains an EBS root volume encrypted with KMS key)
- Use a machine profile source (VM or launch template) that contains an encrypted EBS root volume.

Limitations

Consider the following limitations:

- MCS currently supports only one disk on master image AMI.
- You cannot directly encrypt existing unencrypted EBS volumes or snapshots, or modify the KMS key of an existing encrypted volume. To do that, you must:

  1. Create a new snapshot of that volume.
  2. Create a new volume from that snapshot
  3. Encrypt the new volume.

See the following AWS documents:

- Encrypt unencrypted resources

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Limitations of automatic or default encryption of EBS volumes: Automatically encrypt existing and new Amazon EBS volumes.

Create a catalog with disk encryption

You can create an MCS machine catalog with disk encryption using:

- Master image
- Machine profile

Considerations while using machine profile input are:

- The KMS key of the machine profile input takes precedence over the master image's KMS key.
- If no machine profile input is provided, then the KMS key of the master image AMI is used to encrypt the disks of catalog VMs.
- If the machine profile has Block Device Mappings present, then the block devices present in the master image template (AMI) and the machine profile must match. For example, if AMI has a device defined on `/dev/sda1`, then the Machine Profile must also have a device defined on `/dev/sda1`.
- If there is no key in the machine profile source and the master image is unencrypted, then disks of catalog VMs are not encrypted.
- When the master image is encrypted, a machine profile source VM or launch template must have an encrypted root volume to be considered a valid input.

Modify an existing catalog

You can modify an existing catalog using the `Set-ProvScheme` PowerShell command to have:

- A machine profile input with a volume containing a new KMS key.
- A master image template AMI encrypted with a new KMS key.

Important considerations:

- The volumes of new VMs added to the catalog are encrypted with the new KMS key.
- To update the encryption settings when there is an existing machine profile, run `Set-ProvScheme` with a new machine profile.
- You cannot modify an existing catalog from having encrypted volumes to unencrypted volumes. You can't do an image update from an encrypted master AMI to an unencrypted master AMI.

Enable NitroTPM and UEFI secure boot for VM instances

When creating a catalog, you can now select a master image (AMI) with NitroTPM and/or UEFI secure boot enabled. Accordingly, the provisioned VMs in the catalog are also enabled with NitroTPM and/or

© 1997–2026 Citrix Systems, Inc. All rights reserved.

UEFI secure boot. This implementation ensures that the VMs are secured and trusted. For more information on NitroTPM and UEFI Secure Boot, see the Amazon documentation.

Limitations

- You can use both NitroTPM and Secure Boot currently in all AWS Regions (including the AWS GovCloud (US) Regions) except China.
- You cannot enable NitroTPM and UEFI secure boot on existing catalogs. If you want a catalog with NitroTPM and UEFI secure boot enabled, create a new catalog.

Key steps

1. Set up your AWS environment.
2. Create a connection to AWS.
3. Create a master image (AMI) enabled with NitroTPM and/or UEFI secure boot.
4. Create a machine catalog by selecting the master image with NitroTPM and UEFI secure boot enabled in Web Studio catalog creation menu or when creating a Provisioning Scheme using PowerShell commands.

VMs added to the created catalog have NitoTPM and UEFI secure boot enabled.

Create an AMI that supports NitroTPM and UEFI secure boot

1. You can create an AMI from a VM that has NitroTPM and/or UEFI secure boot enabled.
   a) Create the instance from using the AWS marketplace images. Example, search for `TPM-Windows_Server-2022-English-Full-Base on the aws-marketplace`.
   b) Download single or multi session VDA.
   c) Create an AMI from that VM.
2. Use the register-image command:

   ```
   --boot-mode (string)
   --tpm-support (string)
   ```

   For more information, see register-image.

See the following AWS documents:

- Determine the supported boot modes of an EC2 instance type
- Requirements for using NitroTPM with Amazon EC2 instances/.

You can open a PowerShell window from the Delivery controller™ host to check if a specific:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- service offering supports NitroTPM or UEFI secure boot

```
(Get-Item -Path "XDHyp:\HostingUnits\aws\T3 Medium Instance.serviceoffering").AdditionalData.BootMode
(Get-Item -Path "XDHyp:\HostingUnits\aws\T3 Medium Instance.serviceoffering").AdditionalData.NitroTpmSupportVersions
```

- template supports NitroTPM or UEFI secure boot

```
(Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\aws" -ResourceType "template -Id "ID").AdditionalData.BootMode

(Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\aws" -ResourceType "template -Id "ID").AdditionalData.TpmSupport
```

Update the service offering of existing catalog

You can change the service offering of an existing catalog using `Set-ProvScheme`. The change applies to the newly added VMs. However, you get errors in the following scenarios:

AMIs boot mode	AMI supports Nitro TPM?	Service offering supports NitroTPM and UEFI secure boot?
UEFI	No	No
Legacy BIOS	Yes	No
UEFI	Yes	No
UEFI Preferred	Yes	No

Copy tags on VMs

You can copy tags on NICs, and disks (Identity disk, write back cache disk, and OS disk) that are specified in the machine profile to newly created VMs in an MCS machine catalog. You can specify these tags in any of the machine profile sources (AWS VM instance or AWS launch template version). This feature is applicable to persistent and non-persistent machine catalogs and VMs.

> **Note:**
>
> - On the AWS EC2 console, you cannot see the **Tag Network Interfaces** values under the **Launch Template Version Resource Tags**. However, you can run the PowerShell command `aws ec2 describe-launch-template-versions --launch-template-id lt-0bb652503d45dcbcd --versions 12` to see the tag

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> specifications.
> - If a machine profile source (VM or launch template version) has two network interfaces (eni-1 and eni-2), and eni-1 has tag t1 and eni-2 has tag t2, then the VM gets both the two network interfaces' tags.

Filter VM instances using PowerShell

An AWS VM instance that you use as a machine profile VM must be compatible for the machine catalog to create and function correctly. To list the AWS VM instances that can be used as machine profile input VMs, you can use the `Get-HypInventoryItem` command. The command can page and filter the inventory of VMs available on a hosting unit.

Pagination:

Get-HypInventoryItem supports two modes of pagination:

- Paging mode uses the `-MaxRecords` and `-Skip` parameters to return sets of items:
  - `-MaxRecords`: The default is **1**. This controls how many items to return.
  - `-Skip`: The default is **0**. This controls how many items to skip from the absolute beginning (or absolute end) of the list in the hypervisor.
- Scrolling mode uses `-MaxRecords`, `-ForwardDirection`, and `-ContinuationToken` parameters to allow scrolling of the records:
  - `-ForwardDirection`: The default is **True**. This is used along with `-MaxRecords` to return either the next set of matching records or the previous set of matching records.
  - `-ContinuationToken`: The returns the items immediately after (or before if `ForwardDirection` is **false**) but not including the item given in the `ContinuationToken` .

Examples of pagination:

- To return a single record of the machine template with the lowest name. The `AdditionalData` field has the `TotalItemsCount` and the `TotalFilteredItemsCount`:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
   -ResourceType template
```

- To return 10 records of the machine template with the lowest name:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
   -ResourceType template -MaxRecords 10 | select Name
```

- To return an array of records ending with the highest name:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -ForwardDirection $False -MaxRecords 10
     | select Name
```

- To return an array of records starting at the machine template associated with the given `ContinuationToken`:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -ContinuationToken "ami-07xxxxxxxxx" -
    MaxRecords 10
```

Filtering:

The following additional optional parameters are supported for filtering. You can combine these parameters with the pagination options.

- `-ContainsName "my_name"`: If the given string matches part of an AMI name, then the AMI is included in the `Get` result. For example:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -MaxRecords 100 -ContainName ' apollo '
     | select Name
```

- `-Tags '{ "Key0": "Value0", "Key1": "Value1", "Key2": "Value2" } '` : If an AMI has at least one of these tags, it is included in the `Get` result. For example:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -MaxRecords 100 -Tags '{
"opex owner": "Not tagged" }
' | select Name
```

> **Note:**
>
> Two tag values are supported. **Not Tagged** tag value matches items which do not have the given tag in their list of tags. **All values** tag value matches items which have the tag regardless of the value of the tag. Otherwise, the match happens only if the item has the tag and the value equals to what is given in the filter.

- `-Id "ami-0a2d913927e0352f3"`: If the AMI matches the given ID, it is included in the `Get` result. For example:

```
Get-HypInventoryItem -LiteralPath "XDHyp:\HostingUnits\ctx-test"
    -ResourceType template -Id ami-xxxxxxxxxxxx
```

Filtering on AdditionalData parameter:

The `AdditionalData` filter parameter lists templates or VMs based on their capability, service offering, or any property which is in AdditionalData. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
(Get-HypInventoryItem -ResourceType "launchtemplateversion" -
    LiteralPath "XDHyp:\HostingUnits\aws" -MaxRecords 200).
    AdditionalData
```

You can also add a `-Warn` parameter to indicate the incompatible VMs. The VMs are included with an `AdditionalData` field named **Warning**. For example:

```
(Get-HypInventoryItem -ResourceType "launchtemplateversion" -
    LiteralPath "XDHyp:\HostingUnits\aws" -MaxRecords 200 -Template "ami
    -015xxxxxxxxx" -Warn $true).AdditionalData
```

Backup SKU list for VMs

Public clouds can sometimes run out of capacity for a specific EC2 instance type ("primary SKU"). If the primary VM configuration is not available, then the VM cannot start resulting in loss of time and business disruption. To address such scenarios, provide a list of backup EC2 instance types ("backup SKUs") that MCS can fall back to in the case of capacity-related issues.

Use a custom property `BackupVmConfiguration` while creating or updating an MCS machine catalog to provide a list of backup EC2 instance types ("Backup SKU List").

If the primary EC2 instance fails, MCS attempts to fall back on the backup EC2 instance types in the order you specify. If MCS is unable to fall back on any of the provided backup EC2 instance types, an error message is displayed. You can then try powering on the primary EC2 instance again. If this fails, MCS retries the backup EC2 instance types.

The backup SKU list can have on-demand instance.

This feature is applicable to both persistent and non-persistent MCS machine catalogs.

Important considerations

- You can provide multiple backup EC2 instance types in the backup SKU list.
- The backup SKU list must be unique.
- A backup EC2 instance cannot be the same as the primary EC2 instance.
- The backup EC2 instances must be valid AWS instance types.
- Do not specify duplicate service offerings. Example: `BackupVmConfiguration,t2.small|t3.small|t2.small` is not valid.
- The service offering specified in the list must be compatible with the machine catalog configuration. For example, if the catalog uses UEFI and the service offering specified in the backup list doesn't support it, then the catalog creation or update fails during preflight.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- You can modify the backup SKU list of an existing catalog using the `Set-ProvScheme` PowerShell command. You can modify existing VMs using the `Set-ProvVM` and `Set-ProvVMUpdateTimeWindow` PowerShell commands.

Configure backup EC2 instances

1. Open a PowerShell window.
2. Run `asnp citrix\*` to load the Citrix-specific PowerShell modules.
3. Create a Broker catalog.
4. Create an identity pool.
5. Add a backup EC2 instance list using the custom property `BackupVmConfiguration` and create a provisioning scheme. For example:

```
$serviceOffering = "XDHyp:\HostingUnits\$hostingUnitName\T3 Medium
    Instance.serviceoffering"
$customProperties = "AwsCaptureInstanceProperties,false;
   AwsOperationalResourcesTagging,false;BackupVmConfiguration,t2.
   small|t2.large|t3.small|t3.large;"
$createdProvScheme = New-ProvScheme -ProvisioningSchemeName
   $provisioningSchemeName -HostingUnitName $hostingUnitName -
   IdentityPoolName $provisioningSchemeName -NetworkMapping
   $networkMapping -SecurityGroup $securityGroupPath -
   ServiceOffering $serviceOffering -MasterImageVM $masterImageVm
   -CustomProperties $customProperties
```

6. Update the BrokerCatalog with the unique Id of the provisioning scheme.
7. Create and add VMs to the catalog.

Create a catalog using AWS Spot instance

Compared to On-demand instances, Spot instances offer cost savings of up to 90%. Spot instances may be interrupted by Amazon EC2 if capacity becomes unavailable, making them suitable for non-critical applications and desktops only.

For information on Spot instances, see the AWS doc Spot Instances.

Additionally, you can use Spot instances as both primary EC2 instance type and backup EC2 instance. You can provide a list of backup EC2 instance types (“Backup SKUs”that can be On-demand and Spot instances) using PowerShell that MCS can fall back to in capacity-related issues.

Important considerations

- You must create a catalog of Spot instances only with machine profile workflow.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Only a persistent Spot instance request type is supported. A one-time Spot Instance request is not supported.
- Only the **Stop** and **Hibernate** interruption behaviors are supported.
- You can change the configuration of an existing catalog from On-demand to Spot instances and vice versa. However, changing an EC2 instance from On-demand to Spot is complex. See the AWS documentation Switch an EC2 instance from on-demand to spot pricing.
- When you delete a provisioned Spot instance, cancel the existing spot instance request. Or else, AWS creates a new Spot instance.

Steps to create a catalog using AWS Spot instances

1. Create a machine profile source with Spot instance. For steps to create a Spot instance, see Create a Spot Instance request.
2. Create a machine catalog using a machine profile with `New-ProvScheme` PowerShell command. You can update a catalog using the `Set-ProvScheme` command.

Use Spot instances as backup SKU

You can use Spot instances as both primary EC2 instance type and backup EC2 instance. You can provide a list of backup EC2 instance types ("Backup SKUs"that can be On-demand and Spot instances) using PowerShell that MCS can fall back to in capacity-related issues.

> **Note:**
>
> You can specify duplicate Spot instances in the backup SKUs list. Example: `BackupVmConfiguration ,t2.small:Spot|t2.small|t3.small` is valid.

Required permissions

You need the following permissions if you use Spot instance as a primary or backup EC2 instance:

- `ec2:DescribeSpotInstanceRequests`
- `ec2:CancelSpotInstanceRequests`

Configure backup Spot instances

1. Open a PowerShell window.
2. Run `asnp citrix\*` to load the Citrix-specific PowerShell modules.
3. Create a Broker catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Create an identity pool.
5. Add a backup EC2 instance list using the custom property `BackupVmConfiguration` and create a provisioning scheme. For example:

```
$serviceOffering \= "XDHyp:\\HostingUnits\\$hostingUnitName\\T3
    Medium Instance.serviceoffering"
$customProperties \= "AwsCaptureInstanceProperties,false;
    AwsOperationalResourcesTagging,false;BackupVmConfiguration,t2.
    small|t2.large|t3.small:Spot|t3.large:Spot"
$createdProvScheme \= New-ProvScheme \-ProvisioningSchemeName
    $provisioningSchemeName \-HostingUnitName $hostingUnitName \-
    IdentityPoolName $provisioningSchemeName \-NetworkMapping
    $networkMapping \-SecurityGroup $securityGroupPath \-
    ServiceOffering $serviceOffering \-MasterImageVM $masterImageVm
     \-CustomProperties $customProperties
```

6. Update the BrokerCatalog with the unique Id of the provisioning scheme.
7. Create and add VMs to the catalog.

Where to go next

- If this is the first catalog created, you are guided to create a delivery group.
- To review the entire configuration process, see Install and configure.
- To manage catalogs, see Manage machine catalogs and Manage an AWS EC2 catalog.

More information

- Create and manage connections and resources
- Connection to AWS EC2
- Create machine catalogs

Create an Azure Local catalog

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to Azure Local environments.

> **Note:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> Before creating an Azure Local machine catalog, you need to finish creating a connection to Azure Local. See Connection to Azure Local.

Requirements

- VDA version: 2507 and later
- Windows 10/11 multi-session workload is not supported

Create a master image

A master image is required to create a machine catalog.

MCS uses Azure Local VM image as the master image. Before using MCS to provision workload in Azure Local cluster, you need to prepare an Azure Local VM image with VDA installed.

1. Create an Azure Local VM using Azure portal.
2. Connect to the created Azure Local VM to install VDA and required software.
3. Create a scheduled task using Windows Task Scheduler to run the following script at VM startup under System context.

```
$tagFileName = 'E6DA6616-8EC4-48E0-BE93-58CE6ACE3CFB.tag'

$foundDrive = $null

foreach ($drive in Get-PSDrive -PSProvider FileSystem) {

$tagPath = Join-Path $drive.Root $tagFileName

if (Test-Path $tagPath) {

    $foundDrive = $drive.Root

    break

 }

 }

if ([string]::IsNullOrEmpty($foundDrive)) {
  exit 0  }

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$installScript = Join-Path $foundDrive 'install.ps1'

if (Test-Path $installScript) {

powershell.exe -NoProfile -ExecutionPolicy Bypass -File
   $installScript

 }
  else {
  exit 1  }

sc.exe stop mocguestagent 2>$null

sc.exe delete mocguestagent 2>$null

Remove-Item 'HKLM:\SYSTEM\CurrentControlSet\Services\EventLog\
   Application\mocguestagent' -Recurse -Force -ErrorAction
   SilentlyContinue

$setupComplete = 'C:\Windows\Setup\Scripts\SetupComplete.cmd'

if (Test-Path $setupComplete) {
  & $setupComplete  }
```

4. Stop the Azure Local VM.
5. Refer Create VM image from existing Azure Local VM to create an Azure Local VM image from the prepared Azure Local VM.

> **Note:**
>
> When you prepare a master image using Azure Local VM with Azure Connected Machine agent version 1.61 or later installed and onboarded, catalog creation in MCS fails in the image preparation process due to access denial when deleting the agent configuration file. As a workaround, do the following while creating a master image: Navigate to `C:\ProgramData\AzureConnectedMachineAgent\Config\agentconfig.json`, right-click the file, select **Properties**, and clear the **Read-only** attribute check box.

Create a catalog

You can create Azure Local catalogs to create, deliver, and power manage machines in your Azure Local environment.

> **Note:**
>
> - The length of the catalog name must be no more than 49 characters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - Avoid using Microsoft Azure reserved words in catalog name or machine naming scheme. See the Microsoft document for details.

Yon can create the catalog using:

- Web Studio
- PowerShell

Create a catalog using Web Studio

You can create an MCS machine catalog in the Azure Local environment.

In the Machine Catalog Setup wizard:

1. On the **Operating System** page, select **Multi-session OS** or **Single-session OS**.
2. On the **Machine Management** page:
   a) Select **Machine that are power managed (for example, virtual machines or blade PCs)**.
   b) Select to deploy machines using **Citrix provisioning technology**.
   c) Select the Azure Local hosting unit under Citrix Machine Creation Services (MCS).
3. On the **Desktop Experience** page, select the option according to the machine type you select on Machine Type page.
4. On the **Image** page:
   a) Select a master image. Currently, Azure Local doesn't support Prepared image.
   b) You can add a note to the selected image.

   > **Note:**
   >
   > - OS type is automatically populated after selecting the master image.
   > - Machine profile is not supported.

5. On the **NICs** page, select one or more NICs, associate a virtual network with each card.
6. On the **Virtual Machines** page:
   a) Specify how many virtual machines to create. Enter 0 if you do not want to create any. Later, you can create VMs for an empty catalog by adding machines.
   b) Choose the amount of memory (in MB) and virtual CPU count each VM has.
   c) Configure Write-Back Cache for machines to improve I/O performance.
7. Follow the on-screen instructions to complete the remaining steps, which don't include Azure Local specific information.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can also use Web Studio to create Azure Local catalogs to deliver and manage the power of existing machines in your Azure Local cluster.

In the Machine Catalog Setup wizard:

1. On the **Operating System** page, select **Multi-session OS** or **Single-session OS**.
2. On the **Machine Management** page, select **Machines that are power managed**, and then select **Other service or technology** as the way of deploying machines.
3. On the **Virtual Machines** page, add machines and their Active Directory machine accounts. You can:
   - Add machines manually: Click **Add Machines** to add machines manually. The **Select VMs** window appears. Expand the Azure Local connection you created earlier and select the VMs you want to add. Then add the associated machine account names.
   - Add machines using a CSV file: Click **Import from CSV file to bulk adds machines**. For information about using CSV files to add machines, see Use CSV files to bulk add machines to a catalog.
4. Follow the on-screen instructions to complete the remaining steps, which don't include Azure Local specific information.

Create a catalog using PowerShell

You can create an MCS machine catalog in Azure Local environment using PowerShell commands.

Header of the script Make sure that you provide the correct parameter values defined in the header of the script.

```
$catalogName = "" # Name of the catalog you want to create

$masterImageResourceGroupName = "" # Name of resource group that the master Azure Local VM image resides in

$catalogResourceGroup = "" # Name of resource group that the created VMs reside in

$masterImage = "" # Name of the master Azure Local VM image you want to use

$vNet = "" # Name of the logical network that the created VMs should be attached to

$masterImagePath = "XDHyp:\HostingUnits\$hostingUnitName\image.folder\$masterImageResourceGroupName.resourcegroup\$masterImage"

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$networkMapping = @{
 "0"="XDHyp:\HostingUnits\$hostingUnitName\\network.folder\$vNet.
    network" }

$customPropertiesXml = "<CustomProperties xmlns=`"http://schemas.citrix
    .com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/
    XMLSchema-instance`"><Property xsi:type=`"StringProperty`" Name=`"
    ResourceGroups`" Value=`"$catalogResourceGroup`" /><Property xsi:
    type=`"StringProperty`" Name=`"OsType`" Value=`"Windows`" /></
    CustomProperties>"
```

Create an MCS catalog with 1 VM asnp citrix*

Create Machine Catalog

```
New-BrokerCatalog -AllocationType "Random" -IsRemotePC $false -
    MinimumFunctionalLevel "L7_34" -Name $catalogName -
    PersistUserChanges "Discard" -ProvisioningType "MCS" -SessionSupport
     "SingleSession"
```

Create Identity Pool

```
New-AcctIdentityPool -AllowUnicode $true -Domain "test.local" -
    IdentityPoolName $catalogName -IdentityType "ActiveDirectory" -
    NamingScheme "demoVM#" -NamingSchemeType "Numeric" -OU "CN=Computers
    ,DC=test,DC=local"
```

Create Provisioning Scheme

```
New-ProvScheme -CleanOnBoot $true -CustomProperties
    $customPropertiesXml -HostingUnitName $hostingUnitName -
    IdentityPoolName $catalogName -MasterImageVM $masterImagePath -
    NetworkMapping $networkMapping -ProvisioningSchemeName $catalogName
    -ProvisioningSchemeType "MCS" -VMCpuCount 4 -VMMemoryMB 8192
```

Link Catalog to Provisioning Scheme

```
$schemeUid =(Get-ProvScheme -ProvisioningSchemeName $catalogName).
    ProvisioningSchemeUid.Guid

Set-BrokerCatalog -Name $catalogName -ProvisioningSchemeId $schemeUid
```

Create AD account

```
New-AcctADAccount -Count 1 -IdentityPoolName $catalogName
```

Provision VM

```
New-ProvVM -ADAccountName "domain\demoVM1" -ProvisioningSchemeName
    $catalogName
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add machine to broker catalog

```
New-BrokerMachine -CatalogName $catalogName -MachineName 'domain\
    demoVM1'
```

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- For power managing Azure Local VMs, see Power manage Azure Local VMs.

More information

Create a XenServer® catalog

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to XenServer virtualization environments.

> **Note:**
>
> Before creating a XenServer catalog, you need to finish creating a connection to XenServer. See Connection to XenServer.

Create a machine catalog using a XenServer connection

GPU-capable machines require a dedicated master image. Those VMs require video card drivers that support GPUs. Configure GPU-capable machines to allow the VM to operate with software that uses the GPU for operations.

1. In XenCenter®, create a VM with standard VGA, networks, and vCPU.
2. Update the VM configuration to enable GPU use (either Passthrough or vGPU).
3. Install a supported operating system and enable RDP.
4. Install Citrix VM Tools and NVIDIA drivers.
5. Clear the Virtual Network Computing (VNC) Admin Console to optimize performance, and then restart the VM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. You are prompted to use RDP. Using RDP, install the VDA and then restart the VM.
7. Optionally, create a snapshot for the VM as a baseline template for other GPU master images.
8. Using RDP, install customer-specific applications that are configured in XenCenter and use GPU capabilities.

Limitations

- If a Citrix Virtual Apps and Desktops deployment with its VMs hosted on Citrix Hypervisor 8.2 Cumulative Update 1 uses multiple GFS2 SRs in a single MCS catalog, the VMs in the catalog cannot access the VDIs during deployment. The error "VDI is currently in use"is reported.
- Citrix Hypervisor 8.2 Cumulative Update 1 doesn't support MCS full clone VMs with GFS2 SRs.

For more information, see Constraints.

These constraints do not apply to XenServer 8 and later.

Create a machine catalog using a machine profile

When you create a catalog to provision machines using MCS, you can use a machine profile to capture the hardware properties from a virtual machine and apply them to newly provisioned VMs in the catalog. If the `MachineProfile` parameter is not used, the hardware properties are captured from the master image VM or snapshot.

> **Note:**
>
> Currently, you can use only a VM as a machine profile input.

You can update the memory and disk cache sizes after creating the MCS catalogs when MCSIO is enabled. You can explicitly configure the following parameters to overwrite the values of the parameters in the machine profile input:

- `VMCpuCount`
- `VMMemory`
- `NetworkMapping`

To create a catalog with a machine profile:

1. Open the PowerShell window.
2. Run `asnp citrix*`.
3. Create an identity pool. The identity pool is a container for the Active Directory (AD) accounts for the VMs to be created. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-AcctIdentityPool -Domain "citrix-xxxxxx.local" -
    IdentityPoolName "ExampleIdentityPool" -NamingScheme "abc1-##"
    -NamingSchemeType "Numeric" -Scope @() -ZoneUid "xxxxxxxx"
```

4. Create the required AD computer accounts in Active Directory.

```
$password = "password123" | ConvertTo-SecureString -AsPlainText -
    Force
New-AcctIdentity -IdentityPoolName "ExampleIdentityPool" -Count 10
     -ADUserName "citrix-xxxxxx\admin1" -ADPassword $password
Set-AcctAdAccountUserCert -IdentityPoolName "ExampleIdentityPool"
    -ADUserName "citrix-xxxxxx\admin1" -ADPassword $password
```

5. Run the New-ProvScheme command to create a catalog. For example:

```
New-ProvScheme -CleanOnBoot -HostingUnitName "ExampleHostingUnit"
    -IdentityPoolName "ExampleIdentityPool" -InitialBatchSizeHint 2
     -CustomProperties '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
    org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="
    true" />
</CustomProperties>'
-MasterImageVM "XDHyp:\HostingUnits\ExampleHostingUnit\ExampleVDA.
    vm\ExampleVDA.snapshot" -ProvisioningSchemeName "ExampleCatalog
    " -Scope @() -SecurityGroup @()
-MachineProfile "XDHyp:\HostingUnits\ExampleHostingUnit\
    ExampleMachineProfile.vm"
```

6. Register provisioning scheme as a broker catalog. For example:

```
$ConfigZone = Get-ConfigZone | Where-Object {
  $_.Name -eq "xxxxxx"  }

New-BrokerCatalog -Name "MPLT1" -AllocationType Random -
    Description "Machine profile catalog" -ProvisioningSchemeId
    fe7df345-244e-4xxxx-xxxxxxxxx -ProvisioningType Mcs -
    SessionSupport MultiSession -PersistUserChanges Discard -
    ZoneUid ($ConfigZone.Uid)
```

7. Add VMs to the catalog.

To update a catalog with a new machine profile:

1. Run the Set-ProvScheme command. For example:

```
Set-ProvScheme -ProvisioningSchemeName "ExampleCatalog" -
    MachineProfile "XDHyp:\HostingUnits\ExampleHostingUnit\
    ExampleMachineProfileVm.vm\ExampleMachineProfileSnapshot.
    snapshot"
```

   For more information on the Set-ProvScheme command, see Set-ProvScheme.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - The `Set-ProvScheme` command in this case does not change the machine profile of the existing VMs in the catalog. Only the newly created VMs added to the catalog have the new machine profile.
> - You cannot convert a machine profile-based machine catalog to non-machine profile-based machine catalog.

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- To manage catalogs, see Manage machine catalogs and Manage a XenServer catalog

Create a Google Cloud Platform catalog

May 15, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to Google cloud environments.

> **Note:**
>
> Before creating a Google cloud platform (GCP) catalog, you need to finish creating a connection to GCP. See Connection to Google cloud environments.

Prepare a master VM instance and a persistent disk

> **Tip:**
>
> Persistent disk is the Google Cloud term for virtual disk.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To prepare your master VM instance, create and configure a VM instance with properties that match the configuration you want for the cloned VDA instances in your planned machine catalog. The configuration does not apply only to the instance size and type. It also includes instance attributes such as metadata, tags, GPU assignments, network tags, and service account properties.

As part of the mastering process, MCS uses your master VM instance to create the Google Cloud *instance template*. The instance template is then used to create the cloned VDA instances that comprise the machine catalog. Cloned instances inherit the properties (except the VPC, subnet, and persistent disk properties) of the master VM instance from which the instance template was created.

After configuring the properties of the master VM instance to your specifics, start the instance and then prepare the persistent disk for the instance.

We recommend that you manually create a snapshot of the disk or an image of the disk. Doing so lets you use a meaningful naming convention to track versions, gives you more options to manage earlier versions of your master image, and saves time for machine catalog creation. If you do not create your own snapshot, MCS creates a temporary snapshot for you (which is deleted at the end of the provisioning process). Manually creating a multi-regional snapshot of the OS disk or image also allows you to use the same master image for machine catalogs in different GCP regions.

Create a machine catalog

You can create a machine catalog in two ways:

- Create a machine catalog using Web Studio
- Create a machine catalog using PowerShell

Create a machine catalog using Web Studio

> **Note:**
>
> Create your resources before you create a machine catalog. Use the naming conventions established by Google Cloud when configuring machine catalogs. See Bucket and object naming guidelines for more information.

Follow the guidance in Create machine catalogs. The following description is unique to Google Cloud catalogs.

1. Sign in to Web Studio and select **Machine Catalogs** in the left pane.
2. Select **Create Machine Catalog** in the action bar.
3. On the **Operating System** page, select **Multi-session OS** and then select **Next**.
    - Citrix Virtual Apps and Desktops™ also supports single-session OS.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. On the **Machine Management** page, select the **Machines that are power managed** and the **Citrix Machine Creation Services™** options and then select **Next**. If there are multiple resources, select one from the menu.
5. On the **Image** page, complete these steps as needed, and then click **Next**.
   a) Select the master image. You can select the following image types:
      - Virtual Machine (whose regions are the same as the selected hosting units).
      - Snapshots (support multi-region snapshots).
      - OS image (support multi-region public and non-public images).
        If you want to use the sole tenancy functionality, be sure to select an image whose node group property is correctly configured. See Enable zone selection.

   b) To inherit machine properties from a machine profile, select **Use a machine profile** and select a profile from **Virtual machine** tab or from **Instance templates** tab.

      > **Note:**
      >
      > - Currently, VMs in this catalog inherit the storage, machine type, and disk encryption, settings from the selected machine profile.
      > - If you select an instance template as the machine profile, then all zones are selected by default. You can select the zones as required.

   c) Select the minimum functional level for the catalog.
6. On the **Storage Types** page, select the type of storage used to contain the operating system for this machine catalog. Each of the following storage options has unique price and performance characteristics. (An identity disk is always created using the zonal standard persistent disk.)

   - Standard persistent disk
   - Balanced persistent disk
   - SSD persistent disk

   For details about Google Cloud storage options, see https://cloud.google.com/compute/docs/disks/.
7. On the **Virtual Machines** page, specify how many VMs you want to create, view the detailed specification of the VMs, and then select **Next**. If you use sole tenant node groups for machine catalogs, be sure to select **only** the zones where reserved sole tenant nodes are available. See Enable zone selection.
8. On the **Disk Settings** page, you can configure the following settings:

   - Choose whether to enable write-back cache. After enabling write-back cache, you can do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Configure the size of the disk and RAM used for caching temporary data. For more information, see Configure cache for temporary data.
- Select the storage type for the write-back cache disk. The following storage options are available to use for the write-back cache disk:
  - Standard persistent disk
  - Balanced persistent disk
  - SSD persistent disk

  For details about Google Cloud storage options, see Storage options.
- Select the type for the write-back cache disk.
  - **Use non-persistent write-back cache disk**. If selected, the write-back cache disk does not persist for the provisioned VMs. The disk is deleted during power cycles and any data redirected to the disk will be lost.
  - **Use persistent write-back cache disk**. If selected, the write-back cache disk persists for the provisioned VMs. Enabling this option increases your storage costs.

- When MCS storage optimization (MCS I/O) is enabled, you can do either of the following:
  - Choose whether to retain system disks for VDAs during power cycles. For more information, see Enabling MCS storage optimization updates.
  - Update the memory and disk cache sizes.
- Choose whether to use your own key to protect disk contents. To use the feature, you must first create your own Customer Managed Encryption Keys (CMEKs). For more information, see Use Customer Managed Encryption Keys (CMEK).

  > **Note:**
  >
  > It is available only in the Studio interface.

  After creating the keys, you can select one of those keys from the list. You cannot change the key after you create the catalog. Google Cloud does not support rotating keys on existing persistent disks or images. Therefore, after you provision a catalog, the catalog is tied to a specific version of the key. If that key is disabled or destroyed, the instances and disks encrypted with it become unusable until the key is reenabled or restored.

9. On the **Computer Accounts** page, select an Active Directory account and then select **Next**.
   - If you select **Create new Active Directory accounts**, select a domain and then enter the sequence of characters representing the naming scheme for the provisioned VM computer accounts created in the Active Directory. The account naming scheme can contain 1–64 characters, and cannot contain blank spaces, or non-ASCII or special characters.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you select **Use existing Active Directory accounts**, select **Browse** to navigate to the existing Active Directory computer accounts for the selected machines.

10. On the **Domain Credentials** page, select **Enter credentials**, type the user name and password, select **Save**, and then select **Next**.
    - The credential you type must have permissions to perform Active Directory account operations.
11. On the **Summary** page, confirm the information, specify a name for the catalog, and then select **Finish**.

    > **Note:**
    >
    > Starting with version 2402, GCP catalog names must comply with these rules:
    >
    > - Start with a lowercase letter.
    > - Include only lowercase letters (a-z), numbers, and hyphens.
    > - End with either a lowercase letter or a number.
    >
    > When you attempt to rename existing GCP catalogs that don't comply with these rules, error messages appear and guide you to rename them according to the updated rules.

Machine catalog creation might take a long time to complete. To verify that the machines are created on the target node groups, go to the Google Cloud console.

Import manually created Google Cloud machines

You can *create a connection to Google Cloud* and then *create a catalog containing Google Cloud machines*. Then, you can manually power cycle Google Cloud machines through Citrix Virtual Apps and Desktops™. With this feature, you can:

- Import manually created Google Cloud multi-session OS machines into a Citrix Virtual Apps and Desktops machine catalog.
- Remove manually created Google Cloud multi-session OS machines from a Citrix Virtual Apps and Desktops catalog.
- Use existing Citrix Virtual Apps and Desktops power management capabilities to power manage Google Cloud Windows multi-session OS machines. For example, set a restart schedule for those machines.

This functionality does not require changes to an existing Citrix Virtual Apps and Desktops provisioning workflow, nor the removal of any existing feature. We recommend that you use MCS to provision machines in Web Studio instead of importing manually created Google Cloud machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Shared Virtual Private Cloud

Shared Virtual Private Clouds (VPCs) comprise a host project, from which the shared subnets are made available, and one or more service projects that use the resource. Shared VPCs are desirable options for larger installations because they provide centralized control, usage, and administration of shared corporate Google cloud resources. For more information, see the Google Documentation site.

With this feature, Machine Creation Services (MCS) supports provisioning and managing machine catalogs deployed to Shared VPCs. This support, which is functionally equivalent to the support currently provided in local VPCs, differs in two areas:

1. You must grant extra permissions to the Service Account used to create the Host Connection. This process allows MCS to access and use Shared VPC Resources.
2. You must create two firewall rules, one each for ingress and egress. These firewall rules are used during the image mastering process.

New permissions required

A Google Cloud service account with specific permissions is required when creating the host connection. These additional permissions must be granted to any service accounts used to create Shared VPC based host connections.

> **Tip:**
>
> These additional permissions are not new to Citrix Virtual Apps and Desktops. They are used to facilitate the implementation of local VPCs. With Shared VPCs, these additional permissions allow access to other shared VPC resources.

A maximum of four extra permissions must be granted to the service account associated with the host connection to support Shared VPC:

1. **compute.firewalls.list** - This permission is mandatory. It allows MCS to retrieve the list of firewall rules present on the Shared VPC.
2. **compute.networks.list** - This permission is mandatory. It allows MCS to identify the Shared VPC networks available to the service account.
3. **compute.subnetworks.list** –This permission is optional depending on how you use VPCs. It allows MCS to identify the subnets within the visible Shared VPCs. This permission is already required when using local VPCs but must also be assigned in the Shared VPC host project.
4. **compute.subnetworks.use** - This permission is optional depending on how you use VPCs. It is necessary to use subnet resources in the provisioned machine catalogs. This permission is already required for using local VPCs but must also be assigned in the Shared VPC host project.

When using these permissions, consider that there are different approaches based on the type of permission used to create the machine catalog:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Project-level permission:
  - Allows access to all Shared VPCs within the host project.
  - Requires the permissions #3 and #4 must be assigned to the service account.
- Subnet-level permission:
  - Allows access to specific subnets within the Shared VPC.
  - Permissions #3 and #4 are intrinsic to the subnet level assignment and therefore do not need to be assigned directly to the service account.

Select the approach that matches your organizational needs and security standards.

> **Tip:**
>
> For more information about the differences between project-level and subnet-level permissions, see the Google Cloud documentation.

Firewall Rules

During the preparation of a machine catalog, a machine image is prepared to serve as the master image system disk for the catalog. When this process occurs, the disk is temporarily attached to a virtual machine. This VM must run in an isolated environment that prevents all inbound and outbound network traffic. This is accomplished through a pair of deny-all firewall rules; one for ingress and one for egress traffic. When using Google Cloud local VPCs, MCS creates this firewall in the local network and applies it to the machine for mastering. After mastering completes, the firewall rule is removed from the image.

We recommend keeping the number of new permissions required to use Shared VPCs to a minimum. Shared VPCs are higher-level corporate resources and typically have more rigid security protocols in place. For this reason, create a pair of firewall rules in the host project on the shared VPC resources, one for ingress and one for egress. Assign the highest priority to them. Apply a new target tag to each of these rules, using the following value:

```
citrix-provisioning-quarantine-firewall
```

When MCS creates or updates a machine catalog, it searches for firewall rules containing this target tag. It then examines the rules for correctness and applies them to the machine used to prepare the master image for the catalog. If the firewall rules are not found, or the rules are found but the rules or their priorities are incorrect, a message similar to the following appears:

```
"Unable to find valid INGRESS and EGRESS quarantine firewall rules
for VPC <name> in project <project>. "Please ensure you have created
 'deny all'firewall rules with the network tag 'citrix-provisioning-
quarantine-firewall'and proper priority.""Refer to Citrix Documentation
 for details."
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuring the shared VPC

Before adding the Shared VPC as a host connection in Web Studio, complete the following steps to add service accounts from the project you intend to provision into:

1. Create an IAM role.
2. Add the service account used to create a CVAD host connection to the Shared VPC host project IAM role.
3. Add the Cloud Build service account from the project you intend to provision into to the Shared VPC host project IAM role.
4. Create firewall rules.

Create an IAM role Determine the access level of the role —*project level access* or a more restricted model using *subnet level access*.

Project level access for IAM role. For the project level IAM role, include the following permissions:

- compute.firewalls.list
- compute.networks.list
- compute.subnetworks.list
- compute.subnetworks.use

To create a project level IAM role:

1. In the Google Cloud console, navigate to **IAM & Admin > Roles**.
2. On the **Roles** page, select **CREATE ROLE**.
3. On the **Create Role** page, specify the role name. Select **ADD PERMISSIONS**.
    a) On the **Add permissions** page, add permissions to the role, individually. To add a permission, type the name of the permission in the **Filter table** field. Select the permission and then select **ADD**.
    b) Select **CREATE**.

Subnet-level IAM role. This role omits the addition of the permissions `compute.subnetworks.list` and `compute.subnetworks.use` after selecting **CREATE ROLE**. For this IAM access level, the permissions `compute.firewalls.list` and `compute.networks.list` must be applied to the new role.

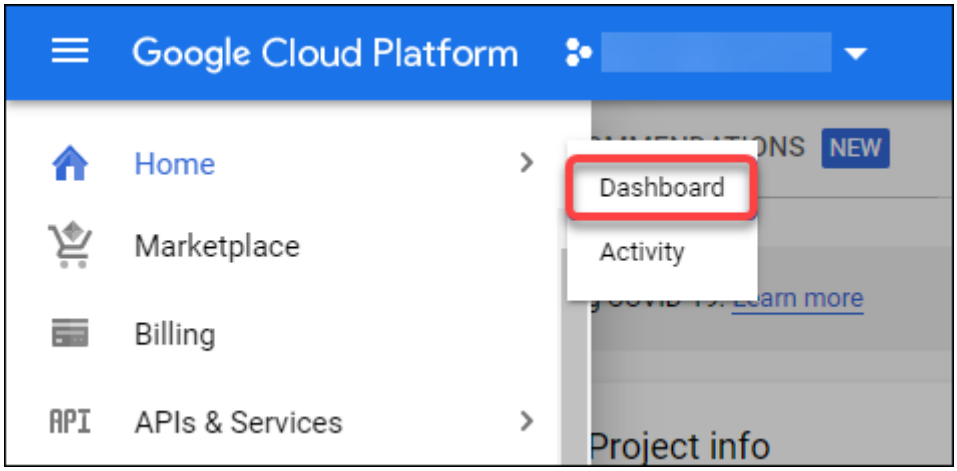
To create a subnet level IAM role:

1. In the Google Cloud console, navigate to **VPC network** > **Shared VPC**. The **Shared VPC** page appears, displaying the subnets of the Shared VPC networks that the host project contains.
2. On the **Shared VPC** page, select the subnet that you want to access.
3. In the top-right corner, select **ADD MEMBER** to add a service account.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. On the **Add members** page, complete these steps:
    a) In the **New members** field, type the name of your service account and then select your service account in the menu.
    b) Select the **Select a role** field and then **Compute Network User**.
    c) Select **SAVE**.
5. In the Google Cloud console, navigate to **IAM & Admin** > **Roles**.
6. On the **Roles** page, select **CREATE ROLE**.
7. On the **Create Role** page, specify the role name. Select **ADD PERMISSIONS**.
    a) On the **Add permissions** page, add permissions to the role, individually. To add a permission, type the name of the permission in the **Filter table** field. Select the permission, and then select **ADD**.
    b) Select **CREATE**.

Add a service account to the host project IAM role After creating an IAM role, do the following steps to add a service account for the host project:



1. In the Google Cloud console, navigate to the host project and then to **IAM & Admin > IAM**.
2. On the **IAM** page, select **ADD** to add a service account.
3. On the **Add members** page:
    a) In the **New members** field, type the name of your service account and then select your service account in the menu.
    b) Select a role field, type the IAM role you created, and then select the role in the menu.
    c) Select **SAVE**.

The service account is now configured for the host project.

Add the cloud build service account to the shared VPC Every Google Cloud subscription has a service account that is named after the project ID number, followed by `cloudbuild.gserviceaccount`. For example: `705794712345@cloudbuild.gserviceaccount`.

You can determine what the project ID number is for your project by selecting **Home** and **Dashboard** in the Google Cloud console:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Find the **Project Number** below the **Project Info** area of the screen.

Perform the following steps to add the Cloud Build service account to the Shared VPC:

1. In the Google Cloud console, navigate to the host project and then to **IAM & Admin** > **IAM**.
2. On the **Permissions** page, select **ADD** to add an account.
3. On the **Add members** page, complete these steps:

    a) In the **New members** field, type the name of the Cloud Build service account and then select your service account in the menu.
    b) Select the **Select a role** field, type `Computer Network User`, and then select the role in the menu.
    c) Select **SAVE**.

Create firewall rules As part of the mastering process, MCS copies the selected machine image and uses it to prepare the master image system disk for the catalog. During mastering, MCS attaches the disk to a temporary virtual machine, which then runs preparation scripts. This VM must run in an isolated environment that prohibits all inbound and outbound network traffic. To create an isolated environment, MCS requires two *deny all* firewall rules (an ingress rule and an egress rule). Therefore, create two firewall rules in the *Host Project* as follows:

1. In the Google Cloud console, navigate to the host project and then to **VPC network > Firewall**.
2. On the **Firewall** page, select **CREATE FIREWALL RULE**.
3. On the **Create a firewall rule** page, complete the following:

    - **Name**. Type a name for the rule.
    - **Network**. Select the Shared VPC network to which the ingress firewall rule applies.
    - **Priority**. The smaller the value is, the higher the priority of the rule is. We recommend a small value (for example, 10).
    - **Direction of traffic**. Select **Ingress**.
    - **Action on match**. Select **Deny**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Targets**. Use the default, **Specified target tags**.
- **Target tags**. Type `citrix-provisioning-quarantine-firewall`.
- **Source filter**. Use the default, **IP ranges**.
- **Source IP ranges**. Type a range that matches all traffic. Type `0.0.0.0/0`.
- **Protocols and ports**. Select **Deny all**.

4. Select **CREATE** to create the rule.
5. Repeat steps 1–4 to create another rule. For **Direction of traffic**, select **Egress**.

Add a connection Add a connection to the Google cloud environments. See Add a connection.

Enable zone selection

Citrix Virtual Apps and Desktops supports zone selection. With zone selection, you specify the zones where you want to create VMs. With zone selection, administrators can place sole tenant nodes across zones of their choice. To configure sole tenancy, you must complete the following on Google Cloud:

- Reserve a Google Cloud sole-tenant node
- Create the VDA master image

Reserving a Google Cloud sole-tenant node

To reserve a sole-tenant node, refer to the Google Cloud documentation.

> **Important:**
>
> A node template is used to indicate performance characteristics of the system that is reserved in the node group. Those characteristics include the number of vGPUs, the amount of memory allocated to the node, and the machine type used for machines created on the node. For more information see the Google Cloud documentation.

Creating the VDA master image

To deploy machines on the sole-tenant node successfully, you need to take extra steps when creating a master VM image. Machine instances on Google Cloud have a property called *node affinity labels*. Instances used as master images for catalogs deployed to the sole-tenant node require a *node affinity label* that matches the name of the **target node group**. To achieve this, keep the following in mind:

- For a new instance, set the label in the Google Cloud console when creating an instance. For details, see Provision a sole-tenant VM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For an existing instance, set the label by using the **gcloud** command line. For details, see Configure node affinity labels.

> **Note:**
>
> If you intend to use sole tenancy with a shared VPC, see Shared Virtual Private Cloud.

Create a machine catalog After setting the node affinity label, configure the machine catalog.

Customer Managed Encryption Keys (CMEK)

You can use Customer Managed Encryption Keys (CMEK) for MCS catalogs. When using this functionality, you assign the Google Cloud Key Management Service `CryptoKey Encrypter/Decrypter` role to the Compute Engine Service Agent. Citrix Virtual Apps and Desktops account must have the correct permissions in the project where the key is stored. Refer to Helping to protect resources by using Cloud KMS keys for more information.

Your Compute Engine Service Agent is in the following form: `service-<Project _Number>@compute-system.iam.gserviceaccount.com`. This form is different than the default Compute Engine Service Account.

> **Note:**
>
> This Compute Engine Service Account might not appear in the Google Console **IAM Permissions** display. In such cases, use the `gcloud` command as described in Helping to protect resources by using Cloud KMS keys.

Assign permissions to Citrix Virtual Apps and Desktops account

Google Cloud KMS permissions can be configured in various ways. You can either provide *project level* KMS permissions or *resource level* KMS permissions. See Permissions and roles for more information.

Project level permissions One option is to provide Citrix Virtual Apps and Desktops account with project-level permissions to browse Cloud KMS resources. To do this, create a custom role, and add the following permissions:

- `cloudkms.keyRings.list`
- `cloudkms.keyRings.get`
- `cloudkms.cryptokeys.list`
- `cloudkms.cryptokeys.get`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Assign this custom role to your Citrix Virtual Apps and Desktops. This allows you to browse regional keys in the relevant project in the inventory.

Resource Level Permissions For the other option, resource level permissions, in the Google Cloud console, browse to the `cryptoKey` you use for MCS provisioning. Add Citrix Virtual Apps and Desktops account to a key ring or a key that you use for catalog provisioning.

> **Tip:**
>
> With this option, you cannot browse regional keys for your project in the inventory because Citrix Virtual Apps and Desktops account does not have project-level list permissions on the Cloud KMS resources. However, you can still provision a catalog using CMEK by specifying the correct `cryptoKeyId` in the `ProvScheme` custom properties, described below.

Provisioning with CMEK using custom properties

When creating your Provisioning Scheme via PowerShell, specify a `CryptoKeyId` property in `ProvScheme CustomProperties`. For example:

```
1 '<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
     machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
     instance">
2     <Property xsi:type="StringProperty" Name="CryptoKeyId" Value="<
        yourCryptoKeyId>" />
3 </CustomProperties>'
```

The `cryptoKeyId` must be specified in the following format:

`projectId:location:keyRingName:cryptoKeyName`

For example, if you'd like to use the key `my-example-key` in key ring `my-example-key-ring` in the region `us-east1` and project with ID `my-example-project-1`, your `ProvScheme` custom settings would resemble:

```
1 '<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
     machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
     instance">
2     <Property xsi:type="StringProperty" Name="CryptoKeyId" Value="my-
        example-project-1:us-east1:my-example-key-ring:my-example-key"
        />
3 </CustomProperties>'
```

All MCS provisioned disks and images related to this provisioning scheme use this customer managed encryption key.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Tip:**
>
> If you use global keys, the customer properties location must say `global` and not the **region** name, which in the example above is **us-east1**. For example: `<Property xsi:type="StringProperty"Name="CryptoKeyId"Value="my-example-project-1:global:my-example-key-ring:my-example-key"/>`.

Rotating customer managed keys

Google Cloud does not support rotating keys on existing persistent disks or images. Once a machine is provisioned it is tied to the key version in use at the time it was created. However, a new version of the key can be created and that new key is used for newly provisioned machines or resources created when a catalog is updated with a new master image.

Important considerations about key rings Key rings cannot be renamed or deleted. Also, you might incur unforeseen charges when configuring them. When deleting or removing a key ring, Google Cloud displays an error message:

```
Sorry, you can't delete or rename keys or key rings. We were concerned about the security implications of allowing multiple keys or key versions over time to have the same resource name, so we decided to make names immutable. (And you can't delete them, because we wouldn't be able to do a true deletion--there would still have to be a tombstone tracking that this name had been used and couldn't be reused).
We're aware that this can make things untidy, but we have no immediate plans to change this.
If you want to avoid getting billed for a key or otherwise make it unavailable, you can do so by deleting all the key versions; neither keys nor key rings are billed for, just the active key versions within the keys.
```

> **Tip:**
>
> For more information, see Editing or deleting a key ring from the console.

Uniform bucket-level access compatibility

Citrix Virtual Apps and Desktops is compatible with uniform bucket-level access control policy on Google Cloud. This functionality augments the use of IAM policy that grants permissions to a service account to allow for the manipulation of resources, including storage buckets. With uniform bucket level access control, Citrix Virtual Apps and Desktops allows you to use an access control list (ACL) to control access to storage buckets or objects stored in them. See Uniform bucket-level access for

© 1997–2026 Citrix Systems, Inc. All rights reserved.

overview information about Google Cloud uniform bucket-level access. For configuration information, see Require uniform bucket-level access.

Create a machine catalog using PowerShell

This section details how you can create catalogs using PowerShell:

- Create a catalog with persistent write-back cache disk
- Improve boot performance with MCSIO
- Create a machine catalog using a machine profile
- Create a machine catalog with machine profile as an instance template
- Use PowerShell to create a catalog with shielded VM
- Create Windows 11 VMs on the sole-tenant node

Create a catalog with persistent write-back cache disk

To configure a catalog with persistent write-back cache disk, use the PowerShell parameter `New-ProvScheme CustomProperties`.

> **Tip:**
>
> Use the PowerShell parameter here only for cloud-based hosting connections. If you want to provision machines using a persistent write-back cache disk for an on-premises solution (for example, XenServer®) PowerShell is not needed because the disk persists automatically.

This parameter supports an extra property, `PersistWBC`, used to determine how the write-back cache disk persists for MCS provisioned machines. The `PersistWBC` property is only used when the `UseWriteBackCache` parameter is specified, and when the `WriteBackCacheDiskSize` parameter is set to indicate that a disk is created.

> **Note:**
>
> This behavior applies to both Azure and GCP where the default MCSIO write-back cache disk is deleted and re-created when power cycling. You can choose to persist the disk to avoid the deletion and recreation of MCSIO write-back cache disk.

Setting the `PersistWBC` property to **`true`** does not delete the write-back cache disk when the Citrix Virtual Apps and Desktops administrator shuts down the machine from the management interface.

Setting the `PersistWBC` property to **`false`** deletes the write-back cache disk when the Citrix Virtual Apps and Desktops administrator shuts down the machine from the management interface.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> If the `PersistWBC` property is omitted, the property defaults to **`false`** and the write-back cache is deleted when the machine is shut down from the management interface.

For example, using the CustomProperties parameter to set `PersistWBC` to **`true`**:

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
   instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
    />
<Property xsi:type="StringProperty" Name="StorageAccountType" Value="
   Premium_LRS" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="
   benvaldev5RG3" />
<Property xsi:type="StringProperty" Name="PersistWBC" Value="true" />
</CustomProperties>
```

> **Note:**
>
> The `PersistWBC` property can only be set using the `New-ProvScheme` PowerShell cmdlet. Attempting to alter the `CustomProperties` of a provisioning scheme after creation has no impact on the machine catalog and the persistence of the write-back cache disk when a machine is shut down.

For example, set `New-ProvScheme` to use the write-back cache while setting the `PersistWBC` property to **`true`**:

```
New-ProvScheme
-CleanOnBoot
-CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.com
   /2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/
   XMLSchema-instance`"><Property xsi:type=`"StringProperty`" Name=`"
   UseManagedDisks`" Value=`"true`" /><Property xsi:type=`"
   StringProperty`" Name=`"StorageAccountType`" Value=`"Premium_LRS`"
   /><Property xsi:type=`"StringProperty`" Name=`"ResourceGroups`"
   Value=`"benvaldev5RG3`" /><Property xsi:type=`"StringProperty`" Name
   =`"PersistWBC`" Value=`"true`" /></CustomProperties>"
-HostingUnitName "adSubnetScale1"
-IdentityPoolName "BV-WBC1-CAT1"
-MasterImageVM "XDHyp:\HostingUnits\adSubnetScale1\image.folder\
   GoldImages.resourcegroup\W10MCSIO-01
   _OsDisk_1_a940e6f5bab349019d57ccef65d2c7e3.manageddisk"
-NetworkMapping @{
 "0"="XDHyp:\HostingUnits\adSubnetScale1\\virtualprivatecloud.folder\
    CloudScale02.resourcegroup\adVNET.virtualprivatecloud\
    adSubnetScale1.network" }

-ProvisioningSchemeName "BV-WBC1-CAT1"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-ServiceOffering "XDHyp:\HostingUnits\adSubnetScale1\serviceoffering.
   folder\Standard_D2s_v3.serviceoffering"
-UseWriteBackCache
-WriteBackCacheDiskSize 127
-WriteBackCacheMemorySize 256
```

Improve boot performance with MCSIO

You can improve boot performance for Azure and GCP managed disks when MCSIO is enabled. Use the PowerShell `PersistOSDisk` custom property in the `New-ProvScheme` command to configure this feature. Options associated with `New-ProvScheme` include:

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
   instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
    />
<Property xsi:type="StringProperty" Name="StorageAccountType" Value="
   Premium_LRS" />
<Property xsi:type="StringProperty" Name="Resource ``````<!--NeedCopy
   -->
````````Groups" Value="benvaldev5RG3" />
<Property xsi:type="StringProperty" Name="PersistOsDisk" Value="true"
   />
</CustomProperties>
```

To enable this feature, set the `PersistOSDisk` custom property to **`true`**. For example:

```
New-ProvScheme
-CleanOnBoot
-CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.com
   /2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/
   XMLSchema-instance`"><Property xsi:type=`"StringProperty`" Name=`"
   UseManagedDisks`" Value=`"true`" /><Property xsi:type=`"
   StringProperty`" Name=`"StorageAccountType`" Value=`"Premium_LRS`"
   /><Property xsi:type=`"StringProperty`" Name=`"ResourceGroups`"
   Value=`"benvaldev5RG3`" /><Property xsi:type=`"StringProperty`" Name
   =`"PersistOsDisk`" Value=`"true`" /></CustomProperties>"
-HostingUnitName "adSubnetScale1"
-IdentityPoolName "BV-WBC1-CAT1"
-MasterImageVM "XDHyp:\HostingUnits\adSubnetScale1\image.folder\
   GoldImages.resourcegroup\W10MCSIO-01
   _OsDisk_1_a940e6f5bab349019d57ccef65d2c7e3.manageddisk"
-NetworkMapping @{
 "0"="XDHyp:\HostingUnits\adSubnetScale1\\virtualprivatecloud.folder\
    CloudScale02.resourcegroup\adVNET.virtualprivatecloud\
    adSubnetScale1.network" }

-ProvisioningSchemeName "BV-WBC1-CAT1"
-ServiceOffering "XDHyp:\HostingUnits\adSubnetScale1\serviceoffering.
   folder\Standard_D2s_v3.serviceoffering"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.
```

```
-UseWriteBackCache
-WriteBackCacheDiskSize 127
-WriteBackCacheMemorySize 256
```

Create a machine catalog using a machine profile

When you create a catalog to provision machines using Machine Creation Services (MCS), you can use a machine profile to capture the hardware properties from a virtual machine and apply them to newly provisioned VMs in the catalog. When `MachineProfile` parameter is not used, the hardware properties are captured from the master image VM or snapshot.
Some properties you define explicitly, for example, `StorageType`, `CatalogZones` and `CryptoKeyIs` are ignored from machine profile.

- To create a catalog with a machine profile, use the `New-ProvScheme` command. For example, `New-ProvScheme –MachineProfile "path to VM"`. If you do not specify the `MachineProfile` parameter, hardware properties are captured from the master image VM.
- To update a catalog with a new machine profile, use the `Set-ProvScheme` command. For example, `Set-ProvScheme –MachineProfile "path to new VM"`. This command does not change the machine profile of the existing VMs in the catalog. Only the newly created VMs added to the catalog have the new machine profile.
- You can also update the master image, however, when you update the master image, the hardware properties are not updated. If you want to update the hardware properties, you must update the machine profile using `Set-ProvScheme` command. These changes will only apply to the new machines in the catalog. For updating the hardware properties of an existing machine, you can use the command `Set-ProvVMUpdateTimeWindow` with `-StartsNow`and `-DurationInMinutes -1` parameters.

  > **Note:**
  >
  > - `StartsNow` indicates that the scheduled start time is the current time.
  > - `DurationInMinutes` with a negative number (for example, –1) indicates no upper bound on the schedule's time window.

Create a machine catalog with machine profile as an instance template

You can select a GCP instance template as an input for the machine profile. Instance templates are lightweight resources in GCP, therefore, are very cost effective.

Create a new machine catalog with machine profile as an instance template

1. Open a PowerShell window.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Find an instance template in your GCP project using the following command:

```
cd XDHyp:\HostingUnits\<HostingUnitName>\instanceTemplates.folder
```

4. Create a new machine catalog with machine profile as an instance template using New-ProvScheme command:

```
New-ProvScheme -ProvisioningSchemeName <CatalogName>  -
    HostingUnitName <HostingUnitName> -IdentityPoolName <identity
    pool name> -MasterImageVM
XDHyp:\HostingUnits\<HostingUnitName> \Base.vm\Base.snapshot -
    MachineProfile XDHyp:\HostingUnits\<HostingUnitName>\
    instanceTemplates.folder\mytemplate.template
```

   For more information on the New-ProvScheme command, see https://developer-docs.citrix.com/projects/citrix-daas-sdk/en/latest/MachineCreation/New-ProvScheme/.

5. Finish creating the machine catalog using PowerShell commands. For information on how to create a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

Change the machine profile of an existing machine catalog to be an instance template

The detailed steps to change the machine profile of an existing machine catalog to be an instance template are:

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run the following command:

```
Set-ProvScheme -ProvisioningSchemeName  <CatalogName> -
    MachineProfile XDHyp:\HostingUnits\<HostingUnitName>\
    instanceTemplates.folder\<TemplateName>.template
```

   For information on the Set-ProvScheme command, see https://developer-docs.citrix.com/projects/citrix-daas-sdk/en/latest/MachineCreation/Set-ProvScheme/.

Use PowerShell to create a catalog with shielded VM

You can create an MCS machine catalog with shielded VM properties. A shielded virtual machine is hardened by a set of security controls that provide verifiable integrity of your Compute Engine instances, using advanced platform security capabilities like secure boot, a virtual trusted platform module, UEFI firmware and integrity monitoring.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

MCS supports creating the catalog using the machine profile workflow. If you use machine profile workflow, then you must enable the shielded VM properties of a VM instance. You can then use this VM instance as a machine profile input.

To create an MCS machine catalog with shielded VM using machine profile workflow.

1. Enable shielded VM options of a VM instance in Google Cloud console. See Quickstart: Enable Shielded VM options.
2. Create an MCS machine catalog with machine profile workflow by using the VM instance.
   a) Open a PowerShell window.
   b) Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
   c) Create an identity pool if not already created.
   d) Run the `New-ProvScheme` command. For example:

```
New-ProvScheme -ProvisioningSchemeName <catalog-name>
-HostingUnitName gcp-hostint-unit
-MasterImageVM XDHyp:\HostingUnits\gcp-hostint-unit\catalog-
    vda.vm
-MachineProfile XDHyp:\HostingUnits\gcp-hostint-unit\catalog-
    machine.vm
```

3. Finish creating the machine catalog.

To update machine catalog with a new machine profile:

1. Run the `Set-ProvScheme` command. For example:

```
Set-ProvScheme -ProvisioningSchemeName <catalog-name>
-MasterImageVM XDHyp:\HostingUnits\<hostin-unit>\catalog-vda.vm
-MachineProfile "DHyp:\HostingUnits\<hostin-unit>\catalog-machine.
    vm
```

To apply the change done in `Set-ProvScheme` to the existing VMs, run the `Set-ProvVMUpdateTimeWindow` command.

1. Run `Set-ProvVMUpdateTimeWindow` command. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog -
    VMName <List-Of-Vm-Names> -StartsNow -DurationInMinutes -1
```

2. Restart the VMs.

Create Windows 11 VMs on the sole-tenant node

You can create Windows 11 VMs in GCP. However, if you install Windows 11 on the master image, then you must enable vTPM during the master image creation process. Also, you must enable vTPM on the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

machine profile source (VM or instance template).

The key steps to create Windows 11 VMs on the sole-tenant node are:

1. Set up the Google Cloud virtualization environments. For information, see Google Cloud environments.
2. Install VDA. See Install VDAs.
3. Create a connection to Google cloud environments. For information, see Connection to Google cloud environments.
4. Create a Windows 11 Bring Your Own License (BYOL) master image and import the image to Google Cloud. See Create a Windows 11 BYOL master image.
5. Create the machine profile source: Provision VM on the sole-tenant node and enable the vTPM of the source machine profile. See Provision VM on sole-tenant node.
6. Create an MCS machine catalog using the Windows 11 machine profile source enabled with vTPM. The machine profile source must have the same instance type as described in the sole-tenant node. See Create an MCS machine catalog using the Windows 11 machine profile source.

Create a Windows 11 BYOL master image

There are two option to create a Windows 11 BYOL master image and import the master image to Google Cloud:

- Use Google Cloud Cloud Build Tools
- Create the master image on any other hypervisor

Use Google Cloud Cloud Build Tools

1. Upload the Windows 11 ISO, GCP SDK, .NET framework and PowerShell installer files to the GCP storage bucket.
2. Provide the file location in the cloud build `.yaml` file as parameter.
3. Run the following Cloud Build from the command line to build the final Windows 11 image. GCP bootstraps and creates the master image in the selected project using Daisy workflow in GCP and the master image is imported into GCP.

```
gcloud compute instances import INSTANCE-NAME--source-uri=gs://
    BUCKET/IMAGE-OVF-FILE.ovf --guest-os-features=UEFI_COMPATIBLE
    --byol --machine-type=MACHINE-TYPE --zone=ZONE
```

> **Note:**
>
> Replace all the capital letter text with the actual resource details.

For the complete information, see Create custom Windows BYOL images.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create the master image on any other hypervisor

1. Create the Windows 11 master image using any other hypervisor.
2. Export the master image in an OVF format to the local machine.
3. Upload the OVF files to the GCP storage bucket using the local gcloud CLI.

```
gsutil cp LOCAL_IMAGE_PATH_OVF_FILES gs://BUCKET_NAME/
```

4. Run the following Cloud Build from the command line to build the final Windows 11 image. GCP bootstraps and creates the master image in the selected project using Daisy workflow in GCP and the master image is imported into GCP.

```
gcloud compute instances import INSTANCE-NAME --source-uri=gs://
    BUCKET/IMAGE-OVF-FILE.ovf --guest-os-features=UEFI_COMPATIBLE
    --byol --machine-type=MACHINE-TYPE --zone=ZONE
```

> **Note:**
>
> Replace all the capital letter text with the actual resource details.

Provision VM on sole-tenant node

Use sole-tenant nodes to keep your VMs physically separated from VMs in other projects, or to group your VMs together on the same host hardware. For information on the sole-tenant node, see the GCP document Sole-tenancy overview.

For provisioning a VM (machine profile source) on the sole-tenant node, see the GCP document Provision VMs on sole-tenant nodes.

> **Note:**
>
> - Select the same Instance type and region as the node group.
> - Enable vTPM in the Shielded VM section. For more information, see Quickstart: Enable Shielded VM options.
> - Disable the Bitlocker on the source VM.

Create an MCS machine catalog using the Windows 11 machine profile source

You can create an MCS machine catalog to create Windows 11 VMs using the Web Studio or PowerShell commands.

> **Note:**
>
> - For the master image, select the Windows 11 Snapshot or VM.
> - For the machine profile source, select the Windows 11 VM as machine profile. The machine

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> profile source must have the same instance type as described in the sole-tenant node.

For information on using the Web Studio, see Create a machine catalog using Web Studio.

For information on PowerShell commands, see Create a machine catalog using a machine profile

After you create the catalog and power on the VMs, you can see the Windows 11 VMs running on the sole tenant node on the Google Cloud console.

VMs and disks with inherited labels

MCS machine catalog VMs and disks (Identity Disk, Write-cache Back Disk, and OS disk) can inherit the labels of a machine profile source (GCP VM instance or instance template). You can use the labels to distinguish instances owned by different teams (for example, team:research and team:analytics), and further use it for cost accounting or budgeting. For more information on labels, see the GCP document Organize resources using labels.

You can create a new catalog, update an existing catalog, and update existing VMs to inherit the labels using the machine profile source.

This feature is applicable to persistent and non-persistent MCS machine catalogs.

You can do the following:

- Create a catalog with inherited labels
- Update an existing catalog with inherited labels
- Update existing VMs with inherited labels
- Retrieve information for VM and boot disk labels
- Remove a VM

Create a catalog with inherited labels

To create an MCS machine catalog where VMs and disk inherit labels from the machine profile source, do the following:

1. Create a machine profile source (VM instance or instance template) with labels. For information on creating VMs with labels, see the GCP document Create resources with labels. An Instance template is created from the VM and takes the labels defined in the VM.
2. Create an MCS catalog using Web Studio or PowerShell commands.
3. If using Web Studio, on the **Image** page, select **Use a machine profile**, and then select the VM or template.
4. If using PowerShell commands, do the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Open the PowerShell window.

b) Run asnp citrix*.

c) Create an identity pool. The identity pool is a container for the Active Directory (AD) accounts for the VMs to be created.

d) Create the required AD computer accounts in Active Directory.

e) Run the `New-ProvScheme` command to create a catalog. For example:

New-ProvScheme with template as machine profile input (Persistent catalog):

```
New-ProvScheme `
-ProvisioningSchemeName "catalog-name" `
-HostingUnitUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-IdentityPoolUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-MasterImageVM "XDHyp:\HostingUnits\hosting-unit-name\vm-name.
   vm" `
-MachineProfile "XDHyp:\HostingUnits\hosting-unit-name\
   instanceTemplates.folder\instance-template-name.template" `
```

New-ProvScheme with instance template as machine profile input (Non-Persistent catalog):

```
New-ProvScheme `
-ProvisioningSchemeName "catalog-name" `
-HostingUnitUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-IdentityPoolUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-MasterImageVM "XDHyp:\HostingUnits\hosting-unit-name\vm-name.
   vm" `
-MachineProfile "XDHyp:\HostingUnits\hosting-unit-name\
   instanceTemplates.folder\instance-template-name.template" `
-CleanOnBoot
```

New-ProvScheme with VM instance as machine profile input (Persistent catalog):

```
New-ProvScheme `
-ProvisioningSchemeName "catalog-name" `
-HostingUnitUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-IdentityPoolUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-MasterImageVM "XDHyp:\HostingUnits\hosting-unit-name\vm-name.
   vm" `
-MachineProfile "XDHyp:\HostingUnits\hosting-unit-name\vm-name
   .vm" `
```

New-ProvScheme with VM instance as machine profile input (Non-Persistent catalog):

```
New-ProvScheme `
-ProvisioningSchemeName "catalog-name" `
-HostingUnitUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-IdentityPoolUid "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" `
-MasterImageVM "XDHyp:\HostingUnits\hosting-unit-name\vm-name.
   vm" `
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
6  -MachineProfile "XDHyp:\HostingUnits\hosting-unit-name\vm-name
       .vm" `
7  -CleanOnBoot
```

f) Register provisioning scheme as a broker catalog.

g) Add VMs to the catalog.

Update an existing catalog with inherited labels

To update an existing catalog to have a new machine profile, run the Set-ProvScheme command. After you run the command, all the new VMs added to the catalog have the labels of the new machine profile source. The non-persistent catalog is updated on the next power on.

For example:

Set-ProvScheme with instance template as machine profile input:

```
1  Set-ProvScheme `
2  -ProvisioningSchemeName "catalog-name" `
3  -MachineProfile "XDHyp:\HostingUnits\hosting-unit-name\
       instanceTemplates.folder\instance-template-name.template" `
```

Set-ProvScheme with VM instance as machine profile input:

```
1  Set-ProvScheme `
2  -ProvisioningSchemeName "catalog-name" `
3  -MachineProfile "XDHyp:\HostingUnits\hosting-unit-name\vm-name.vm" `
```

Update existing VMs with inherited labels

To update existing VMs with the updated machine profile source, run the following commands:

1. `Set-ProvScheme`
2. `Set-ProvVMUpdateTimeWindow`. For example:

```
1  Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog -
       VMName <List-Of-Vm-Names> -StartsNow -DurationInMinutes -1
```

3. Restart the VMs.

Retrieve information for VM and boot disk labels

After creating the VMs, you can get the information of the VM and boot disk label using the `Get-Item` command with the `AdditionalData` parameter.

For retrieving information of the VM label, run the following command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
(Get-Item XDHyp:\HostingUnits\hosting-unit-name\vm_name.vm).
   AdditionalData.Tags
```

For retrieving information of the boot disk label, run the following command:

```
(Get-Item XDHyp:\HostingUnits\hosting-unit-name\vm_name.vm\bootdisk-
   name.attacheddisk).AdditionalData.Tags
```

> **Note:**
>
> To maintain consistency across the various hypervisors, we have used the term Tags to display GCP labels.

Remove a VM

You can choose to remove a VM from a catalog but not delete the VM from the GCP. In this case, the Citrix labels are only removed from the VM. All other added labels are not deleted from the VM. You can remove a VM using Web Studio or use PowerShell commands.

Using Web Studio

1. Select and right-click the VM.
2. Click **Delete**.
3. Select **Remove the virtual machines from the catalog but do not delete the virtual machines**.

Using PowerShell commands Run `Remove-ProvVM` with `ForgetVM` parameter. For more information, see the SDK doc Remove-ProvVM.

Google Cloud Marketplace

You can browse and select images offered by Citrix on **Google Cloud Marketplace** to create machine catalogs. Currently, MCS supports only the machine profile workflow for this feature.

To search for Citrix VDA VM product through Google Cloud Marketplace, go to https://console.cloud.google.com/marketplace.

You can use a custom image or a Citrix ready® image on **Google Cloud Marketplace** to update an image of a machine catalog.

> **Note:**
>
> If the machine profile does not contain storage type information, the value is derived from cus-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> tom properties.

The supported Google Cloud Marketplace images are:

- Windows 2019 Single Session
- Windows 2019 Multi Session
- Ubuntu

Example of using a Citrix ready image as a source for creating a machine catalog:

```
New-ProvScheme -ProvisioningSchemeName GCPCatalog \
-HostingUnitName GcpHu -IdentityPoolName gcpPool -CleanOnBoot \
-MasterImageVM XDHyp:\HostingUnits\GcpHu\images.folder\citrix-daas-
   win2019-single-vda-v20220819.publicimage \
-MachineProfile XDHyp:\HostingUnits\GcpHu\Base.vm
```

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- To manage catalogs, see Manage machine catalogs and Manage a Google Cloud Platform catalog

More information

- Create and manage connections and resources
- Connection to Google cloud environments
- Create machine catalogs

Create an HPE Moonshot machine catalog

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to HPE Moonshot environments.

> **Note:**
>
> - Create a connection to HPE Moonshot
> - Make sure to have one or more HPE Moonshot nodes available and install VDAs on those nodes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - For information about creating the initial HPE Moonshot cartridge image, see the OS Deployment on Moonshot User Guide.

You can create an HPE Moonshot machine catalog using:

- Web Studio
- PowerShell commands

Create a machine catalog using Web Studio

In the **Machine Catalog Setup** wizard:

1. On the **Operating System** page, select **Multi-session OS** or **Single-session OS**.
2. On the **Machine Management** page, select **Machines that are power managed** and **Another service or technology**.
3. On the **Virtual Machines** page, add machines and their Active Directory machine accounts. You can do either of the following:
   - Click **Add Machines** to add machines manually. The **Select VMs** window appears. Expand the HPE Moonshot chassis connection you created earlier and select the nodes (VMs) you want to add. Then add the associated machine account names.
   - Click **Add CSV File** to bulk add machines. For information about using CSV files to add machines, see Use CSV files to bulk add machines to a catalog.

The **Scopes** and **Summary** pages do not contain HPE Moonshot-specific information.

Create a machine catalog using PowerShell commands

Run the `New-BrokerCatalog` and `New-BrokerMachine` PowerShell commands to create a broker catalog and import machines to the broker catalog.

For example:

```
1 New-BrokerCatalog  -AdminAddress "MyDDC.MyDomain.local" -AdminClientIP

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- To manage catalogs, see Manage machine catalogs and Manage an HPE Moonshot catalog

More information

- Create and manage connections and resources
- Connection to HPE Moonshot
- Create machine catalogs

Create a Microsoft Azure catalog

August 21, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to Microsoft Azure Resource Manager cloud environments.

> **Note:**
>
> Before creating a Microsoft Azure catalog, you need to finish creating a connection to Microsoft Azure. See Connection to Microsoft Azure.

Create a machine catalog

You can create a machine catalog in two ways:

- Create a machine catalog using an Azure Resource Manager image in Web Studio
- Create a machine catalog using PowerShell

Create a machine catalog using an Azure Resource Manager image in Web Studio

An image can be a disk, snapshot, or an image version of an image definition inside the Azure Compute Gallery that is used to create the VMs in a machine catalog. Before creating the machine catalog, create an image in the Azure Resource Manager. For general information about images, see Create machine catalogs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Support for using a master image from a region different from that configured in the host connection is deprecated. Use Azure Compute Gallery to replicate the master image to the desired region.

When creating an MCS machine catalog, a temporary VM is created based on the original VM to perform preparation tasks such as enabling DHCP and license rearm. This temporary VM is called a preparation VM. The name of this preparation VM follows the format **Preparati-84x9n**, where the last five characters are randomly generated to avoid duplication. The naming convention for this preparation VM is fixed and cannot be customized. After the preparation tasks are completed, the preparation VM is destroyed.

To disconnect the network from the preparation VM, a network security group is created to deny all inbound and outbound traffic. The network security group is created automatically once per catalog. The network security group's name is `Citrix-Deny-All-a3pgu-GUID`, where GUID is randomly generated. For example, `Citrix-Deny-All-a3pgu-3f161981-28e2-4223-b797-88b04d336dd1`.

In the machine catalog creation wizard:

- The **Machine Type** and **Machine Management** pages do not contain Azure-specific information. Follow the guidance in the Create machine catalogs article.
- On the **Image** page, choose an image that you want to use as the template for creating machines in this catalog.

  If you select **Master image** as the image type to use, click **Select an image** and follow these steps to select a master image as necessary:

  1. (Applicable only to connections configured with shared images within or across tenants) Select a subscription where the image resides.
  2. Select a resource group.
  3. Navigate to the Azure VHD, the Azure Compute Gallery, or the Azure image version. Add a note for the selected image if needed.

  When selecting an image, consider the following:

  - Verify that a Citrix VDA is installed on the image.
  - If you select a VHD attached to a VM, you must shut down the VM before proceeding to the next step.

  > **Note:**
  >
  > - The subscription corresponding to the connection (host) that created the machines

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in the catalog is denoted with a green dot. The other subscriptions are those that have the Azure Compute Gallery shared with that subscription. In those subscriptions, only shared galleries are shown. For information about how to configure shared subscriptions, see Share images within a tenant (across subscriptions) and Share images across tenants.

- Using a machine profile with Trusted Launch as **Security Type** is mandatory when you select an image or snapshot that has Trusted Launch enabled. You can then enable or disable SecureBoot and vTPM by specifying their values in the machine profile. Trusted Launch is not supported for Shared Image Gallery. For information about Azure Trusted Launch, see https://docs.microsoft.com/en-us/azure/virtual-machines/trusted-launch.
- You can create a provisioning scheme using ephemeral OS disk on Windows with Trusted Launch. When you select an image with Trusted launch, then you must select a machine profile with Trusted Launch that is enabled with vTPM. To create machine catalogs using ephemeral OS disk, see How to create machines using ephemeral OS disks.
- When image replication is in progress, you can proceed and select the image as the master image and complete the setup. However, catalog creation might take longer to complete while the image is being replicated. MCS requires the replication to complete within an hour starting from catalog creation. If the replication times out, catalog creation fails. You can verify the replication status in Azure. Try again if the replication is still pending or after the replication completes.
- When you select a master image for machine catalogs in Azure, MCS identifies the OS type based on the master image and machine profile you select. If MCS can't identify it, select the OS type that matches the master image.
- You can provision a Gen2 VM catalog by using a Gen2 image to improve boot time performance. However, creating a Gen2 machine catalog using a Gen1 image is not supported. Similarly, creating a Gen1 machine catalog using a Gen2 image is also not supported. Also, any older image that does not have generation information is a Gen1 image.

If you select **Prepared image** as the image type to use, click **Select an image** and select a prepared image as necessary.

To ensure successful VM creation, verify that the image has Citrix VDA 2311 or later installed and MCSIO is present on the VDA.

Once you select an image, the **Use a machine profile (mandatory for Microsoft Entra ID)** checkbox is automatically selected. Click **Select a machine profile** to browse to a VM or an ARM template spec from a list of resource groups. VMs in the catalog can inherit configurations from the selected machine profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Validate the ARM template spec to make sure whether it can be used as a machine profile to create a machine catalog. There are two ways to validate the ARM template spec:

- After you select the ARM template spec from the resource group list, click **Next**. Error messages appear if the ARM template spec has errors.
- Run one of the following PowerShell commands:
  - `Test-ProvInventoryItem -HostingUnitName <string> -InventoryPath <string>`
  - `Test-ProvInventoryItem -HostingUnitUid <Guid> -InventoryPath <string>`

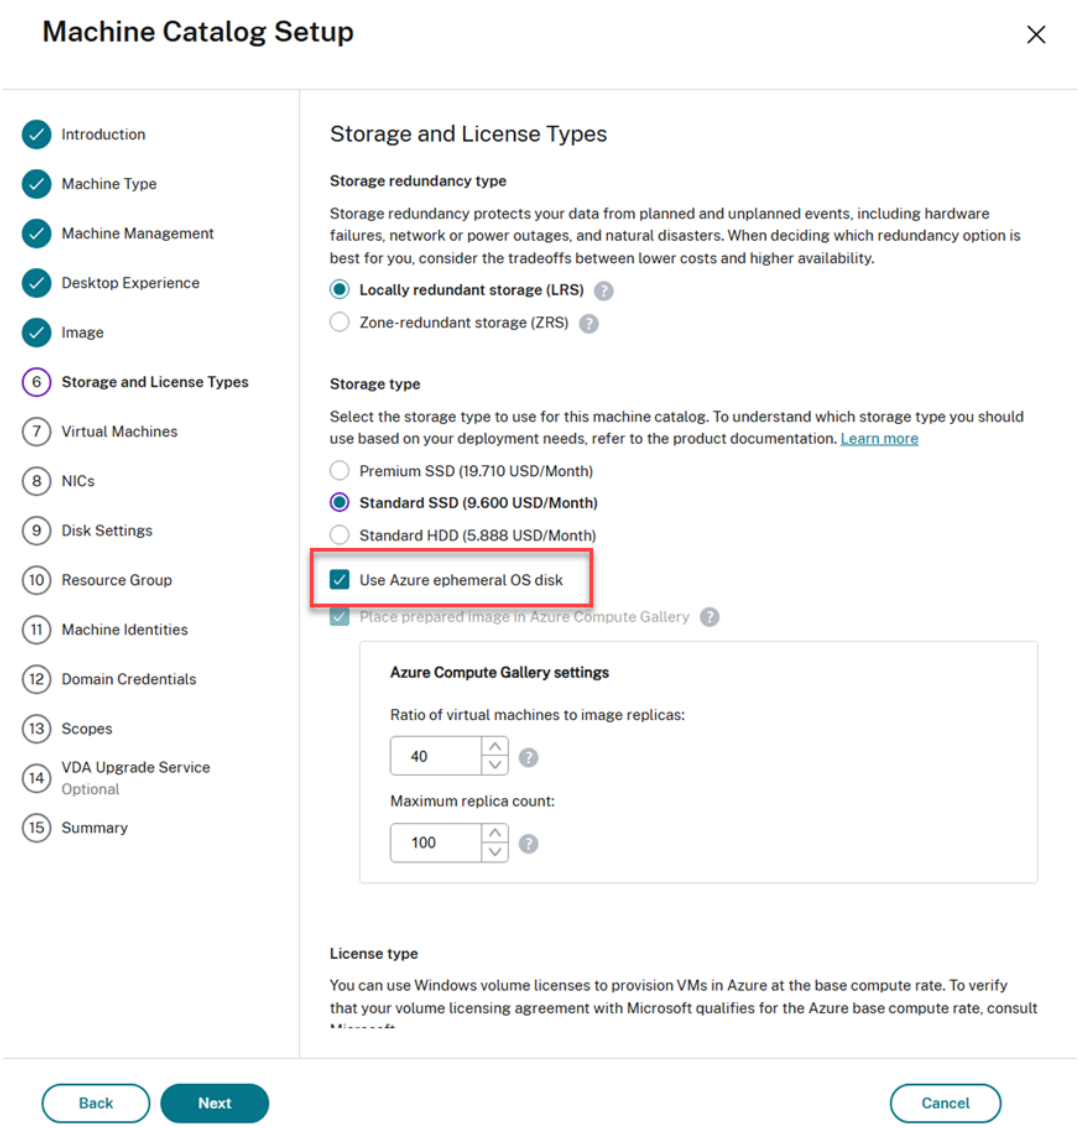
Examples of configurations that VMs can inherit from a machine profile include:

- Accelerated networking
- Boot diagnostics
- Host disk caching (relating to OS and MCSIO disks)
- Machine size (unless otherwise specified)
- Tags placed on the VM

After you create the catalog, you can view the configurations that the image inherits from the machine profile. On the **Machine Catalogs** node, select the catalog to view its details in the lower pane. Then, click the **Template Properties** tab to view machine profile properties. The **Tags** section displays up to three tags. To view all tags placed on the VM, click **View all**.

If you want MCS to provision VMs on an Azure dedicated host, enable the **Use a dedicated host group** checkbox and then select a host group from the list. A host group is a resource that represents a collection of dedicated hosts. A dedicated host is a service that provides physical servers that host one or more VMs. Your server is dedicated to your Azure subscription, not shared with other subscribers. When you use a dedicated host, Azure ensures that your VMs are the only machines running on that host. This feature is suitable for scenarios where you must meet regulatory or internal security requirements. To learn more about host groups and considerations for using them, see Azure dedicated hosts.

> **Important:**
>
> - Only host groups that have Azure auto-placement enabled are shown.
> - Using a host group changes the **Virtual Machines** page offered later in the wizard. Only machine sizes that the selected host group contains are shown on that page. Also, Availability Zones are selected automatically and not available for selection.



- The **Storage and License Types** page appears only when you use an Azure Resource Manager image.
  - Select the **Storage redundancy type**:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Local redundant storage (LRS): LRS allows you to choose from all available storage types. When using LRS, Azure deploys the Virtual Machines (VMs) exclusively within the specified availability zone.
    - Zone redundant storage (ZRS): ZRS allows for greater flexibility in VM placement, as Azure can launch VMs in any available zone. This is a key advantage over Local Redundant Storage (LRS), ensuring VM availability even if the disk's original zone becomes inaccessible. ZRS, however, is only compatible with Premium SSD and Standard SSD storage types.

- Select the **Storage types** to use for the machine catalog: The storage type determines which machine sizes are offered on the **Virtual Machines** page of the wizard.
    - **Premium SSD**. Offers a high-performance, low-latency disk storage option suitable for VMs with I/O-intensive workloads.
    - **Standard SSD**. Offers a cost-effective storage option that is suitable for workloads that require consistent performance at lower IOPS levels.
    - **Standard HDD**. Offers a reliable, low-cost disk storage option suitable for VMs that run latency-insensitive workloads.
- Select the **Use Azure ephemeral OS disk**. Azure ephemeral OS disk offers a cost-effective storage option that reuses the local disk of the VMs to host the operating system disk. Alternatively, you can use PowerShell to create machines that use ephemeral OS disks. For more information, see Azure ephemeral disks. Consider the following when using an ephemeral OS disk:
  - Azure ephemeral OS disk and MCS I/O cannot be enabled at the same time.
  - To update machines that use ephemeral OS disks, you must select an image whose size does not exceed the size of the VM's cache disk or temporary disk.
  - You cannot use the **Retain VM and system disk during power cycles** option offered later in the wizard.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - The identity disk is always created using Standard SSD irrespective of the storage type that you choose.
> - If you select **ZRS** as the **Storage redundancy**, you get the option to only select **Premium SSD** and **Standard SSD**.

For details about Azure storage types and storage replication, see the following:

- https://docs.microsoft.com/en-us/azure/storage/common/storage-introduction/
- https://docs.microsoft.com/en-us/azure/virtual-machines/premium-storage-performance/
- https://docs.microsoft.com/en-us/azure/storage/common/storage-redundancy/

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Select whether to use existing Windows licenses or Linux licenses.

- Windows licenses: Using Windows licenses along with Windows images (Azure platform support images or custom images) lets you run Windows VMs in Azure at a reduced cost. There are two types of licenses:
  - **Windows Server license**. Lets you use your Windows Server or Azure Windows Server licenses, allowing you to use Azure Hybrid Benefits. For details, see https://azure.microsoft.com/en-us/pricing/hybrid-benefit/. Azure Hybrid Benefit reduces the cost of running VMs in Azure to the base compute rate, waiving the cost of extra Windows Server licenses from the Azure gallery.
  - **Windows Client license**. Lets you bring your Windows 10 and Windows 11 licenses to Azure, allowing you to run Windows 10 and Windows 11 VMs in Azure without the need for extra licenses. For details, see Client Access Licenses and Management Licenses.

You can verify that the provisioned VM is using the licensing benefit by running the following PowerShell command: `Get-AzVM -ResourceGroup MyResourceGroup -Name MyVM`.

- For the Windows Server license type, verify that the license type is **Windows_Server**. More instructions are available at https://docs.microsoft.com/en-us/azure/virtual-machines/windows/hybrid-use-benefit-licensing/.
- For the Windows Client license type, verify that the license type is **Windows_Client**. More instructions are available at https://docs.microsoft.com/en-us/azure/virtual-machines/windows/windows-desktop-multitenant-hosting-deployment/.

Alternatively, you can use the `Get-Provscheme` PowerShell SDK to do the verification. For example: `Get-Provscheme -ProvisioningSchemeName "My Azure Catalog"`. For more information about this cmdlet, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/MachineCreation/Get-ProvScheme/.

- Linux licenses: With bring-your-own-subscription (BYOS) Linux licenses, you do not have to pay for the software. The BYOS charge only includes the compute hardware fee. There are two types of licenses:
  - **RHEL_BYOS**: To use RHEL_BYOS type successfully, enable Red Hat Cloud Access on your Azure subscription.
  - **SLES_BYOS**: The BYOS versions of SLES include support from SUSE.

  You can set the LicenseType value to Linux options at `New-ProvScheme` and `Set-ProvScheme`.

  Example of setting LicenseType to RHEL_BYOS at `New-ProvScheme`:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-ProvScheme -CleanOnBoot -ProvisioningSchemeName "
    azureCatalog" -RunAsynchronously -Scope @() -SecurityGroup
    @() -CustomProperties '<CustomProperties xmlns="http://
    schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi="http
    ://www.w3.org/2001/XMLSchema-instance"><Property xsi:type="
    StringProperty" Name="UseManagedDisks" Value="true" /><
    Property xsi:type="StringProperty" Name="StorageAccountType
    " Value="StandardSSD_LRS" /><Property xsi:type="
    StringProperty" Name="ResourceGroups" Value="hu-dev-mcs"
    /><Property xsi:type="StringProperty" Name="OsType" Value="
    Linux" /><Property xsi:type="StringProperty" Name="
    LicenseType" Value="RHEL_BYOS" /></CustomProperties>'
```

Example of setting LicenseType to SLES_BYOS at `Set-ProvScheme`:

```
Set-ProvScheme -ProvisioningSchemeName "azureCatalog" -
    CustomProperties '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.
    w3.org/2001/XMLSchema-instance"><Property xsi:type="
    StringProperty" Name="UseManagedDisks" Value="true" /><
    Property xsi:type="StringProperty" Name="StorageAccountType
    " Value="StandardSSD_LRS" /><Property xsi:type="
    StringProperty" Name="ResourceGroups" Value="hu-dev-mcs"
    /><Property xsi:type="StringProperty" Name="OsType" Value="
    Linux" /><Property xsi:type="StringProperty" Name="
    LicenseType" Value="SLES_BYOS" /></CustomProperties>'
```

> **Note:**
>
> If `LicenseType` value is empty, then the default values are Azure Windows Server License or Azure Linux License, depending on OsType value.

Example of setting LicenseType to empty:

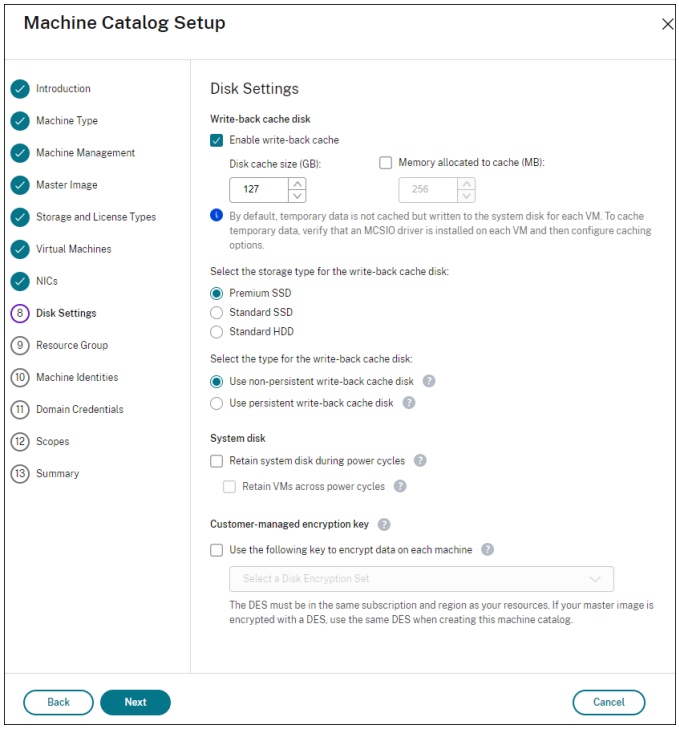
```
Set-ProvScheme -ProvisioningSchemeName "azureCatalog" -
    CustomProperties '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.
    w3.org/2001/XMLSchema-instance"><Property xsi:type="
    StringProperty" Name="UseManagedDisks" Value="true" /><
    Property xsi:type="StringProperty" Name="StorageAccountType
    " Value="StandardSSD_LRS" /><Property xsi:type="
    StringProperty" Name="ResourceGroups" Value="hu-dev-mcs"
    /><Property xsi:type="StringProperty" Name="OsType" Value="
    Linux" /></CustomProperties>'
```

See the following documents to understand License types and their benefits:

- https://docs.microsoft.com/en-us/dotnet/api/microsoft.azure.management.compute.models.virtualmachine.licensetype?view=azure-dotnet
- https://docs.microsoft.com/en-us/azure/virtual-machines/linux/azure-hybrid-benefit-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

linux



Azure Compute Gallery (formerly Azure Shared Image Gallery) is a repository for managing and sharing images. It lets you make your images available throughout your organization. We recommend that you store an image in SIG when creating large non-persistent machine catalogs because doing that enables faster resets of VDA OS disks. After you select **Place prepared image in Azure Compute Gallery**, the **Azure Compute Gallery settings** section appears, letting you specify more Azure Compute Gallery settings:

- **Ratio of virtual machines to image replicas**. Lets you specify the ratio of virtual machines to image replicas that you want Azure to keep. By default, Azure keeps a single image replica for every 40 non-persistent machines. For persistent machines, that number defaults to 1,000.
- **Maximum replica count**. Lets you specify the maximum number of image replicas that you want Azure to keep. The default is 100.

> **Note:**
>
> A gallery is created in ACG to store the image. This gallery is accessible only to MCS for VM creation and doesn't appear on the **Select an image** page.

- On the **Virtual Machines** page, indicate how many VMs you want to create and the machine size. After catalog creation, you can change the machine size by editing the catalog.
- The **NICs** page does not contain Azure-specific information. Follow the guidance in the Create machine catalogs article.
- On the **Disk Settings** page, choose whether to enable write-back cache. With the MCS storage optimization feature enabled, you can configure the following settings when creating a catalog. These settings apply to both Azure and GCP environments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After enabling write-back cache, you can do the following:

- Configure the size of the disk and RAM used for caching temporary data. For more information, see Configure cache for temporary data.
- Select the storage type for the write-back cache disk. The following storage options are available to use for the write-back cache disk:
  - Premium SSD
  - Standard SSD
  - Standard HDD

  > **Note:**
  >
  > If you select **ZRS** as **Storage redundancy** on the **Storage and License Types** page, then write-back cache disk storage redundancy is set as ZRS by default

- Choose whether you want the write-back cache disk to persist for the provisioned VMs. Select **Enable write-back cache** to make the options available. By default, **Use non-persistent write-back cache disk** is selected.
- Select the type for the write-back cache disk.
  - **Use non-persistent write-back cache disk**. If selected, the write-back cache disk is deleted during power cycles. Any data redirected to it will be lost. If the VM's temporary disk has sufficient space, it is used to host the write-back cache disk to reduce your costs. After catalog creation, you can check whether the provisioned machines

© 1997–2026 Citrix Systems, Inc. All rights reserved.

use the temporary disk. To do so, click the catalog and verify the information on the **Template Properties** tab. If the temporary disk is used, you see **Non-persistent Write-back Cache Disk** and its value is **Yes (using VM's temporary disk)**. If not, you see **Non-persistent Write-back Cache Disk** and its value is **No (not using VM's temporary disk)**.

- **Use persistent write-back cache disk**. If selected, the write-back cache disk persists for the provisioned VMs. Enabling the option increases your storage costs.

> **Note:**
>
> A catalog automatically uses Azure Temp Disk for WBC disk if all the following criteria are met:
>
> - MCSIO is enabled.
> - The WBC disk is non-persistent.
> - The VM size includes a Temp Disk large enough for the WBC disk.
> - No drive letter is specified for the WBC disk.
>
> This feature applies to both catalog creation and editing, helping reduce your storage costs.

- Choose whether to retain VMs and system disks for VDAs during power cycles.

  Retain VM and system disk during power cycles. Available when you've selected **Enable write-back cache**. By default, VMs and the system disks are deleted on shutdown and recreated on startup. If you want to reduce VM restart times, select this option. Keep in mind that enabling this option also increases storage costs.

- Choose whether to enable **Storage cost savings**. If enabled, save storage costs by downgrading the storage disk to Standard HDD when the VM shuts down. The VM switches to its original settings on restart. The option applies to both storage and write-back cache disks. Alternatively, you can also use PowerShell. See Change the storage type to a lower tier when a VM is shut down.

  > **Note:**
  >
  > Microsoft imposes restrictions on changing the storage type during VM shutdown. It's also possible that Microsoft will block storage type changes in the future. For more information, see this Microsoft article.

- Choose whether to encrypt data on machines in this catalog and which encryption key to use. Server-side encryption with a customer-managed key (CMK) lets you manage encryption at a managed disk level and protect data on the machines in the catalog. Default settings are inherited from either the machine profile or the master image, with the profile taking priority:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you're using a *machine profile* with a *CMK*, the **Use the following key to encrypt data on each machine** option is auto-selected and defaults to the key from the *machine profile*.
- If you're using a *machine profile* with a Platform Managed Key (PMK) and the *master image* is *CMK* encrypted, the **Use the following key to encrypt data on each machine** option is auto-selected and defaults to the key from the master image.
- If you're *not* using a *machine profile* and the *master image* is *CMK* encrypted, the **Use the following key to encrypt data on each machine** option is auto-selected and defaults to the key from the *master image*.

For more information, see Azure server side encryption.

- On the **Resource Group** page, choose whether to create resource groups or use existing groups.
  - If you choose to create resource groups, select **Next**.
  - If you choose to use existing resource groups, select groups from the **Available Provisioning Resource Groups** list. **Remember**: Select enough groups to accommodate the machines you're creating in the catalog. A message appears if you choose too few. You might want to select more than the minimum required if you plan to add more VMs to the catalog later. You can't add more resource groups to a catalog after the catalog is created.

  For more information, see Azure resource groups.
- On the **Machine Identities** page, choose an identity type and configure identities for machines in this catalog. If you select the VMs as **Microsoft Entra joined**, you can add them to a Microsoft Entra security group. Detailed steps are as follows:

  1. From the **Identity type** field, select **Microsoft Entra joined**. The **Microsoft Entra security group (optional)** option appears.
  2. Click **Microsoft Entra security group: Create new**.
  3. Enter a group name, and then click **Create**.
  4. Follow the onscreen instructions to sign in to Azure.
     If the group name doesn't exist in Azure, a green icon appears. Otherwise, an error message appears requesting you to enter a new name.
  5. Enter the machine account naming scheme for the VMs.

  After catalog creation, Citrix Virtual Apps and Desktops accesses Azure on your behalf and creates the security group and a dynamic membership rule for the group. Based on the rule, VMs with the naming scheme specified in this catalog are automatically added to the security group.

  Adding VMs with a different naming scheme to this catalog requires you to sign in to Azure. Citrix Virtual Apps and Desktops™ can then access Azure and create a dynamic membership rule based on the new naming scheme.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

When deleting this catalog, deleting the security group from Azure also requires signing in to Azure.

- The **Domain Credentials** and **Summary** pages do not contain Azure-specific information. Follow the guidance in the Create machine catalogs article.

  > **Tip:**
  >
  > On the **Summary** page, you can view the estimated monthly cost for the virtual machines in this machine catalog based on Azure's public list price. If the connection hosting the catalog has the `Microsoft.Consumption/pricesheets/read` permission in Azure, the estimate is calculated using your organization's contracted pricing instead.
  >
  > Select the cost estimate to see detailed information. For a more accurate estimate, adjust settings such as daily power-on hours, workdays per week, and savings options based on your usage.

Complete the wizard.

Conditions for Azure temporary disk to be eligible for write-back cache disk

You can use the Azure temporary disk as write-back cache disk only if all the following conditions are satisfied:

- The write-back cache disk must non-persist as the Azure temporary disk is not appropriate for persistent data.
- The chosen Azure VM size must include a temporary disk.
- The ephemeral OS disk is not required to be enabled.
- Accept to place the write-back cache file on Azure temporary disk.
- The Azure temporary disk size must be greater than the total size of (write-back cache disk size + reserved space for paging file + 1 GB buffer space).

Non-persistent write-back cache disk scenarios

The following table describes three different scenarios when temporary disk is used for write-back cache while creating machine catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Scenario	Outcome
All conditions to use temporary disk for write-back cache are satisfied.	The WBC file `mcsdif.vhdx` is placed on the temporary disk.
Temporary disk has insufficient space for write-back cache usage.	A VHD disk `MCSWCDisk` is created and WBC file `mcsdif.vhdx` is placed on this disk.
Temporary disk has sufficient space for write-back cache usage but `UseTempDiskForWBC` is set to **false**.	A VHD disk `MCSWCDisk` is created and WBC file `mcsdif.vhdx` is placed on this disk.

Create an Azure template spec

You can create an Azure template spec in the Azure portal and use it in Web Studio and PowerShell commands to create or update an MCS machine catalog.

To create an Azure template spec for an existing VM:

1. Go to the Azure portal. Select a resource group, and then select the VM and network interface. From the **...** menu on the top, click **Export template**.
2. Clear the **Include parameters** checkbox if you want to create a template spec for catalog provisioning. Verify in the JSON file that the `parameters` and `variables` sections are:

```
"parameters": {
  }
 ,
"variables": {
  }
```

3. Click **Download** to save the template as JSON file.
4. On the Azure portal, select **Template specs** and click **Import Template**.
5. Browse and import the machine profile (in JSON) saved on your computer.
6. Provide the **Name**, **Subscription**, **Resource Group**, **Location**, and **Version**. Click **Next: Edit Template**.
7. Create **Review+Create** and create the template spec.
8. On the **Template Specs** page, verify the template spec you just created. Click the template spec. On the left panel, click **Versions**.
9. You can create a new version by clicking **Create new version**. Specify a new version number, change to the current template spec, and click **Review + Create** to create the new version of the template spec.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can get information about the template spec and template version using the following PowerShell commands:

- To get information about the template spec, run:

```
get-item XDHyp:\HostingUnits\East\machineprofile.folder\abc.
    resourcegroup\bggTemplateSpec.templatespec
```

- To get information about the template spec version, run:

```
get-item XDHyp:\HostingUnits\East\machineprofile.folder\abc.
    resourcegroup\bggTemplateSpec.templatespec\bgg1.0.
    templatespecversion
```

Use template spec in creating or updating a catalog

You can create or update an MCS machine catalog using a template spec as a machine profile input. To do this, you can use the Web Studio or PowerShell commands.

- For Web Studio, see Create a machine catalog using an Azure Resource Manager image in Web Studio
- For PowerShell, see Use template spec in creating or updating a catalog using PowerShell

Azure server-side encryption

Citrix Virtual Apps and Desktops supports customer-managed encryption keys for Azure managed disks through Azure Key Vault. With this support you can manage your organizational and compliance requirements by encrypting the managed disks of your machine catalog using your own encryption key. For more information, see Server-side encryption of Azure Disk Storage.

When using this feature for managed disks:

- To change the key that the disk is encrypted with, you change the current key in the `DiskEncryptionSet`. All resources associated with that `DiskEncryptionSet` change to be encrypted with the new key.
- When you disable or delete your key, any VMs with disks using that key automatically shut down. After shutting down, the VMs are not usable unless the key is enabled again or you assign a new key. Any catalog using the key cannot be powered on, and you cannot add VMs to it.

Important considerations when using customer-managed encryption keys

Consider the following when using this feature:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- All resources related to your customer-managed keys (Azure Key Vaults, disk encryption sets, VMs, disks, and snapshots) must reside in the same subscription and region.
- Disks, snapshots, and images encrypted with customer-managed keys cannot move to another resource group and subscription.
- Refer to the Microsoft site for limitations on disk encryption sets per region.

> **Note:**
>
> See Quickstart: Create a Key Vault using the Azure portal for information on configuring Azure server-side encryption.

Azure Customer-managed encryption key

When creating a machine catalog, you can choose whether to encrypt data on the machines provisioned in the catalog. Server-side encryption with a customer-managed encryption key lets you manage encryption at a managed disk level and protect data on the machines in the catalog. A Disk Encryption Set (DES) represents a customer-managed key. To use this feature, you must first create your DES in Azure. A DES is in the following format:

- `/subscriptions/12345678-1234-1234-1234-123456789012/resourceGroups/Sample-RG/providers/Microsoft.Compute/diskEncryptionSets/SampleEncryption`

Select a DES from the list. The DES you select must be in the same subscription and region as your resources.

See Creating a machine catalog using customer-managed key.

Azure disk encryption at host

You can create an MCS machine catalog with encryption at host capability. Currently, MCS supports only the machine profile workflow for this feature. You can use a VM or a template spec as an input for a machine profile.

This encryption method does not encrypt the data through the Azure storage. The server hosting the VM encrypts the data and then the encrypted data flows through the Azure storage server. Hence, this method of encryption encrypts data end to end.

Restrictions:

Azure disk encryption at host is:

- Not supported for all Azure machine sizes
- Incompatible with Azure disk encryption

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To create a machine catalog with encryption at host capability:

1. Check if the subscription has the encryption at host feature enabled or not. To do this, see https://learn.microsoft.com/en-us/rest/api/resources/features/get?tabs=HTTP/. If not enabled, you must enable the feature for the subscription. For information on enabling the feature for your subscription, see https://learn.microsoft.com/en-us/azure/virtual-machines/disks-enable-host-based-encryption-portal?tabs=azure-powershell#prerequisites/.
2. Check if a particular Azure VM size supports encryption at host or not. To do this, in a PowerShell window, run one of the following:

```
PS XDHyp:\Connections\<your connection>\east us.region\
   serviceoffering.folder>
```

```
PS XDHyp:\HostingUnits\<your hosting unit>\serviceoffering.folder>
```

3. Create a VM or a template spec, as an input for machine profile, in Azure portal with encryption at host enabled.
   - If you want to create a VM, select a VM size that supports encryption at host. After you create the VM, the VM property **Encryption at host** is enabled.
   - If you want to use a template spec, assign the parameter `Encryption at Host` as **true** inside `securityProfile`.
4. Create an MCS machine catalog with machine profile workflow by either selecting a VM or a template spec.
   - OS disk / Data Disk: Gets encrypted through Customer-managed key and Platform-managed key
   - Ephemeral OS Disk: Gets encrypted only through Platform-managed key
   - Cache Disk: Gets encrypted through Customer-managed key and Platform-managed key

   You can create the machine catalog using Web Studio or running PowerShell commands.

Retrieve encryption at host information from a machine profile

You can retrieve the encryption at host information from a machine profile when you run the PowerShell command with the `AdditionalData` parameter. If `EncryptionAtHost` parameter is **True**, it indicates that the encryption at host is enabled for the machine profile.

For example: When the machine profile input is a VM, run the following command:

```
(get-item XDHyp:\HostingUnits\myAzureNetwork\machineprofile.folder\abc.
   resourcegroup\def.vm).AdditionalData
```

For example: When the machine profile input is a template spec, run the following command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
(get-item XDHyp:\HostingUnits\myAzureNetwork\machineprofile.folder\abc.
   resourcegroup\def_templatespec.templatespec\EncryptionAtHost.
   templatespecversion).AdditionalData
```

Double encryption on managed disk

You can create a machine catalog with double encryption. Any catalogs created with this feature have all disks server side encrypted with both platform and customer-managed keys. You own and maintain the Azure Key Vault, Encryption Key, and the Disk Encryption Sets (DES).

Double encryption is platform-side encryption (default) and customer-managed encryption (CMEK). Therefore, if you are a high security sensitive customer who is concerned about the risk associated with any encryption algorithm, implementation, or a compromised key, you can opt for this double encryption. Persistent OS and data disks, snapshots, and images are all encrypted at rest with double encryption.

> **Note:**
>
> - You can create and update a machine catalog with double encryption using Web Studio and PowerShell commands. See Create a machine catalog with double encryption for PowerShell commands.
> - You can use a non-machine profile-based workflow or machine profile-based workflow for creating or updating a machine catalog with double encryption.
> - If you use non-machine profile-based workflow to create a machine catalog, you can reuse the stored `DiskEncryptionSetId`.
> - If you use a machine profile, you can use a VM or template spec as a machine profile input.

Limitations:

- Double encryption is not supported for Ultra Disks or Premium SSD v2 disks.
- Double encryption is not supported on unmanaged disks.
- If you disable a DiskEncryptionSet key associated with a catalog, then the VMs of the catalog are disabled.
- All resources related to your customer-managed keys (Azure Key Vaults, disk encryption sets, VMs, disks, and snapshots) must be in the same subscription and region.
- You can only create up to 50 disk encryption sets per region per subscription.

Azure resource groups

Azure provisioning resource groups provide a way to provision the VMs that provide applications and desktops to users. You can create a resource group or use an existing resource group to provision VMs

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in an MCS machine catalog. You can use the same resource group in multiple machine catalogs. For information about Azure resource groups, see the Microsoft documentation.

Azure Resource Group Usage

There is no limit on the number of virtual machines, managed disks, snapshots, and images per Azure Resource Group. (The limit of 240 VMs per 800 managed disks per Azure Resource Group has been removed.)

- When using a full-scope service principal to create a machine catalog, MCS creates only one Azure Resource Group and uses that group for the catalog.
- When using a narrow scope service principal to create a machine catalog, you must supply an empty, pre-created Azure Resource Group for the catalog.

Azure ephemeral disks

An Azure ephemeral disk allows you to repurpose the cache disk or temporary disk or NVMe disk to store the OS disk for an Azure-enabled virtual machine. This functionality is useful for Azure environments that require a higher performant SSD disk over a standard HDD disk. For information on creating a catalog with an Azure ephemeral disk, see Create a catalog with an Azure ephemeral disks.

> **Note:**
>
> Persistent catalogs do not support ephemeral OS disks.

Ephemeral OS disks require that your provisioning scheme uses managed disks and a Shared Image Gallery.

Store an ephemeral OS temporary disk

You have the option of storing an ephemeral OS disk on the VM temp disk, a resource disk, or an NVMe Disk. This functionality enables you to use an ephemeral OS disk with a VM that either doesn't have a cache, or has insufficient cache. Such VMs have a temp or resource disk or a NVMe Disk to store an ephemeral OS disk, such as Ddv4.

Consider the following:

- An ephemeral disk is stored in the VM cache disk, or the VMs temporary (resource) disk or the NVMe disk. The cache disk is preferred over the temporary disk, unless the cache disk is not large enough to hold the contents of the OS disk.
- For updates, a new image that is larger than the cache disk but smaller than the temp disk results in replacing the ephemeral OS disk with the VM's temp disk.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Azure ephemeral disk and Machine Creation Services (MCS) storage optimization (MCS I/O)

Azure ephemeral OS disk and MCS I/O cannot be enabled at the same time.

The important considerations are as follows:

- You cannot create a machine catalog with both ephemeral OS disk and MCS I/O enabled at the same time.
- The PowerShell parameters (`UseWriteBackCache` and `UseEphemeralOsDisk`) fail with proper error messages if you set them to **true** in `New-ProvScheme` or `Set-ProvScheme`.
- For existing machine catalogs created with both features enabled, you can still:
  - update a machine catalog.
  - add or delete VMs.
  - delete a machine catalog.

Azure Compute Gallery

Use Azure Compute Gallery (formerly Azure Shared Image Gallery) as a published image repository for MCS provisioned machines in Azure. You can store a published image in the gallery to accelerate the creation and hydration of OS disks, improving start and application launch times for non-persistent VMs. The shared image gallery contains the following three elements:

- *Gallery*: Images are stored here. MCS creates one gallery for each machine catalog.
- *Gallery Image Definition*: This definition includes information (operating system type and state, Azure region) about the published image. MCS creates one image definition for each image created for the catalog.
- *Gallery Image Version*: Each image in a Shared Image Gallery can have multiple versions, and each version can have multiple replicas in different regions. Each replica is a full copy of the published image.

> **Note:**
>
> Shared Image Gallery functionality is only compatible with managed disks. It is not available for legacy machine catalogs.

For more information, see Azure Compute Gallery overview.

For information on creating or updating a machine catalog using Azure Compute Gallery image using PowerShell, see Create or update a machine catalog using an Azure Compute Gallery image.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Azure confidential VMs

Azure confidential computing VMs ensure that your virtual desktop is encrypted in memory and protected in use.

You can use MCS to create a catalog with Azure confidential VMs. You must use the machine profile workflow to create such a catalog. You can use both VM and ARM template spec as a machine profile input.

You can also use a confidential VM type Azure master image and a confidential VM type Azure machine profile to create a prepared image, and then use this prepared image to create an MCS catalog.

Important considerations for confidential VMs

The important considerations for supported VM sizes and creating machine catalog with confidential VMs are as follows:

- To check the VM sizes supported by Confidential VMs, see Sizes.
- Create machine catalogs with confidential VMs.
    - You can create a machine catalog with Azure Confidential VMs using Web Studio and PowerShell commands.
    - You must use machine profile-based workflow for creating a machine catalog with Azure Confidential VMs. You can use a VM or template spec as a machine profile input.
    - The master image and the machine profile input must be both enabled with the same confidential security type. Different Azure resources use different labels to indicate the confidential VM type.

      For Azure snapshot, managed disk or virtual machine, the security types are:

        - ConfidentialVM_DiskEncryptedWithCustomerKey.
        - ConfidentialVM_DiskEncryptedWithPlatformKey.
        - ConfidentialVM_VMGuestStateOnlyEncryptedWithPlatformKey

      For Azure ARM template spec version, the security types are:

        - VMGuestStateOnly: Confidential VM with only VM guest state encrypted
        - DiskWithVMGuestState: Confidential VM with both OS disk and VM guest state encrypted with platform managed key or customer managed key. Both normal and Ephemeral OS disk can be encrypted.
    - You can get confidential VM information of various resource types such as managed disk, snapshot, Azure Compute Gallery image, VM, and ARM template spec using the AdditionalData parameter. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
PS C:\Users\username> (get-item XDHyp:\HostingUnits\mynetwork
    \image.folder\username-dev-testing-rg.resourcegroup\
    username-dev-tsvda.vm).AdditionalData
```

The additional data fields are:

- DiskSecurityType
- ConfidentialVMDiskEncryptionSetId
- DiskSecurityProfiles

  To get the confidential computing property of a machine size, run the following command: `(Get-Item -path "XDHyp:\Connections\my-connection-name\East US.region\serviceoffering.folder\abc.serviceoffering").AdditionalData`

  The additional data field is `ConfidentialComputingType`.

- You cannot change the master image or machine profile from confidential to non-confidential security type, or from non-confidential to confidential security type.
- You get appropriate error messages for any incorrect configuration.

Prepare master images and machine profiles

Before creating a set of confidential VMs, follow these steps to prepare a master image and a machine profile for them:

1. In the Azure portal, create a confidential VM with specific settings, such as:

   - **Security Type**: Confidential virtual machines
   - **Confidential OS disk encryption**: Enabled.
   - **Key management**: Confidential disk encryption with a platform-managed key
     For more information about creating confidential VMs, see this Microsoft article.

2. Prepare the master image on the VM created. Install the necessary applications and VDA on the created VM.

   > **Note:**
   >
   > Creating confidential VMs using VHD is not supported. Instead, use Azure Compute Gallery, managed disks, or snapshots for this purpose.

3. Create the machine profile using either of these ways:

   - Use the existing VM created in step 1 if it possesses the needed machine properties.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you opt for an ARM template spec as the machine profile, create the template spec as needed. Specifically, configure parameters that meet your confidential VM requirements, such as *SecurityEncryptionType* and *diskEncryptionSet* (for customer-managed key). For more information, see Create an Azure template spec.

  > **Note:**
  >
  > - Ensure the master image and the machine profile have the same security key type.
  > - To create confidential VMs requiring confidential OS disk encryption with a customer-managed key, make sure that the disk encryption set IDs in both the master image and the machine profile are identical.

If you want to use a confidential VM type prepared image to create an MCS catalog, then create a prepared image using the confidential VM type master image and a confidential VM type machine profile. See Create an image definition and initial image version for information on creating prepared images.

Create confidential VMs using Web Studio or PowerShell commands

To create a set of confidential VMs, create a machine catalog using a master image and a machine profile derived from a desired confidential VM.

To create the catalog using Web Studio, follow the steps described in Create machine catalogs. Keep the following considerations in mind:

- On the **Image** page, select a master image and a machine profile you've prepared for the confidential VM creation. The machine profile selection is mandatory and only profiles that match the same security encryption type as the selected master image are available for selection.
- On the **Virtual Machines** page, only machine sizes that support confidential VMs appear for selection.
- On the **Disk Settings** page, you can't specify the disk encryption set because it's inherited from the selected machine profile.

Boot Integrity Monitoring

If your VM has Secure Boot and virtual Trusted Platform Module (vTPM) enabled, and `GuestAttestation` extension installed, Microsoft Defender for Cloud can remotely validate that your VM boots in a healthy way. This monitoring is called **Boot Integrity Monitoring**. For more information on Boot Integrity Monitoring, see Boot integrity monitoring overview.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can enable Boot Integrity Monitoring for MCS machine catalog VMs (persistent and non-persistent VMs) using a machine profile (VM or template spec). Boot Integrity Monitoring is only supported for Trusted Launch and Confidential VMs.

You can update an existing catalog to use boot integrity using `Set-ProvScheme` to point to a boot integrity enabled machine profile. New VMs added to the catalog are then enabled with integrity monitoring.

You can also update an existing VM in a catalog using `Set-ProvVmUpdateTimeWindow`, `Set-ProvVm`, or `Maintenance Cycles`. You can convert a:

- VM without integrity monitoring to have integrity monitoring
- VM with integrity monitoring to without integrity monitoring

Create machine catalog enabled with integrity monitoring

Required permissions:

Ensure that you have the following permissions:

- `Microsoft.Compute/virtualMachines/extensions/read`
- `Microsoft.Compute/virtualMachines/extensions/write`

Do the following to create an MCS machine catalog enabled with integrity monitoring:

1. Create a machine profile (VM or template spec) with `GuestAttestation` extension installed. (link to the content below)
2. Create an MCS machine catalog using the machine profile input using the Web Studio or PowerShell commands.

   > **Note:**
   >
   > You can check the `GuestAttestationExtensionEnabled` status of a VM or template spec using the `Get-Item` PowerShell command with the `AdditionalData` parameter.

3. Add VMs to the catalog.

Create a machine profile enabled with GuestAttestation extension installed Create a VM or template spec as a machine profile input with integrity monitoring enabled, which implies GuestAttestation extension is installed.

To create a VM with integrity monitoring enabled, do the following:

1. Sign in to the Azure portal.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. If you are creating a new VM:

    a) Select **Security type** as **Trusted launch virtual machines** or **Confidential virtual machines**.

    b) Click **Configure security features** and select **Integrity monitoring** checkbox.

    > **Note:**
    >
    > For integrity monitoring, you must enable Secure boot and vTPM.

3. On the **Overview** page, go to the **Security type** section and verify that the **Security type** is **Trusted launch** or **Confidential virtual machines** and **Integrity monitoring** is enabled.
4. Navigate to the **Extensions + applications page** to verify that `GuestAttestation` is installed.

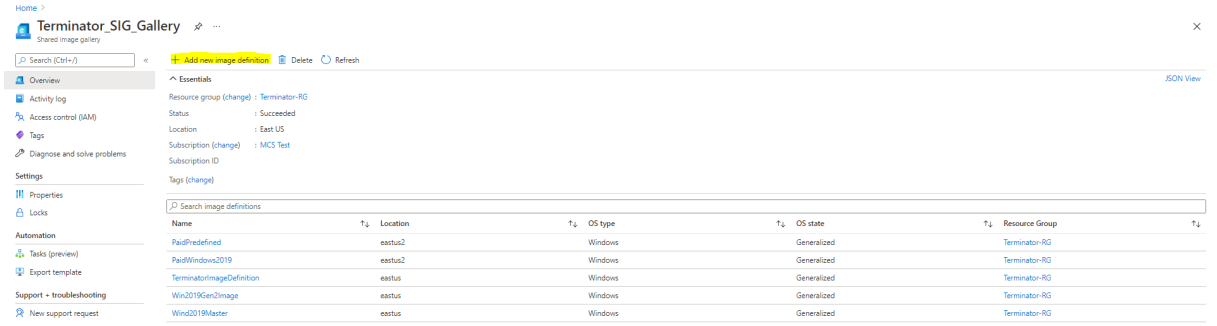
To enable integrity monitoring of an existing VM, see Enable integrity monitoring-Azure portal.

To create a template spec with `GuestAttestation` extension installed:

- You can install GuestAttestation using a template spec. See Enable integrity monitoring-template spec.

    > **Note:**
    >
    > In this template spec, under **Settings**, you can configure the endpoints to use for attestation. If you do not configure, then Azure decides what endpoints to configure

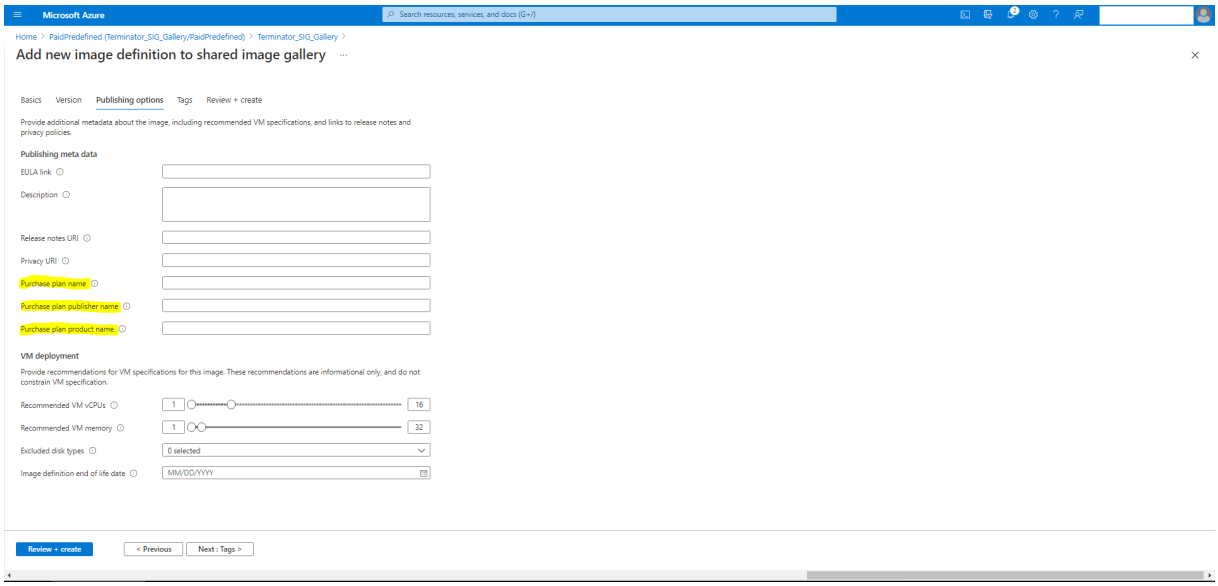
Azure Marketplace



Citrix Virtual Apps and Desktops supports using a master image on Azure that contains plan information to create a machine catalog. For more information, see Microsoft Azure Marketplace.

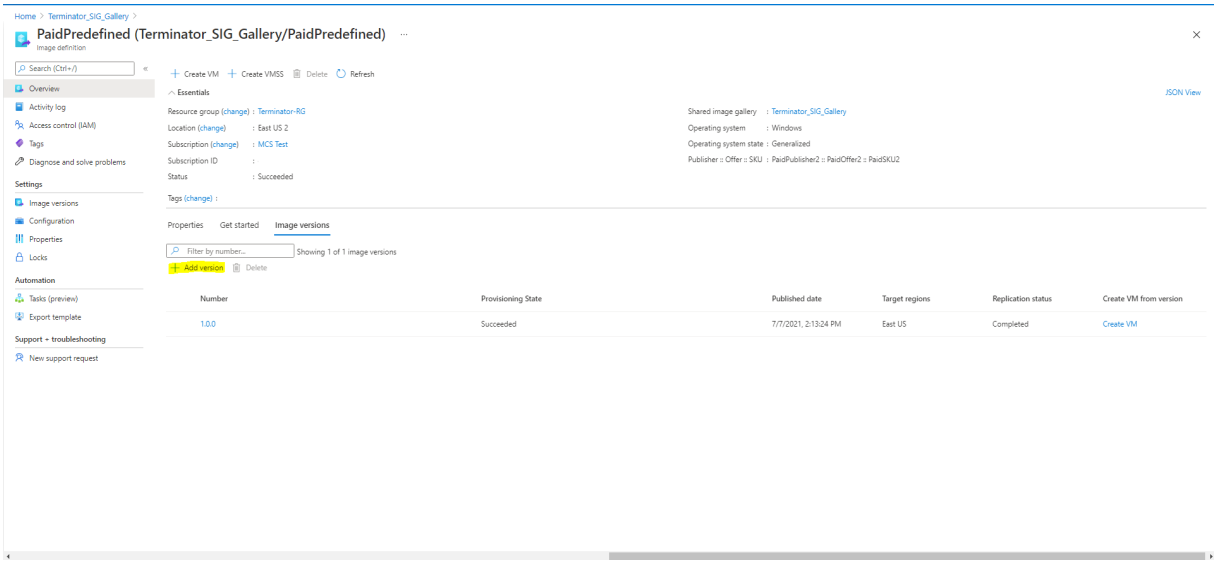
> **Tip:**
>
> Some images found on the Azure Marketplace, like the standard Windows Server image, do not append plan information. Citrix Virtual Apps and Desktops feature is for paid images.

Ensure that the image created in Shared Image Gallery contains Azure plan information



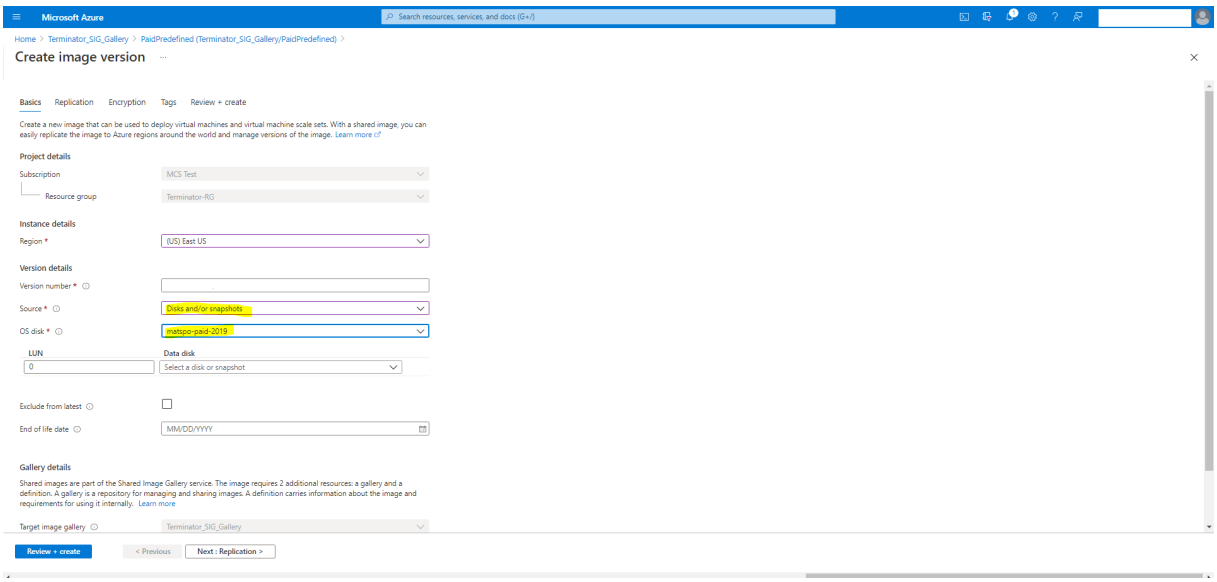
Use the procedure in this section to view Shared Image Gallery images in Web Studio. These images can optionally be used for a master image. To put the image into a Shared Image Gallery, create an image definition in a gallery.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



In the **Publishing options** page, verify the purchase plan information.

The purchase plan information fields are initially empty. Populate those fields with the purchase plan information used for the image. Failure to populate purchase plan information can cause the machine catalog process to fail.



After verifying the purchase plan information, create an image version within the definition. This is used as the master image. Click **Add version**:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In the **Version details** section, select the image snapshot or managed disk as the source:

Create a catalog of on-demand capacity reservation VMs

On-demand capacity reservation enables you to reserve compute capacity in an Azure region or an Availability Zone for any duration of time. For more information on Azure on-demand capacity reservation, see the Microsoft documentation On-demand Capacity Reservation.

You can create an MCS machine catalog of Azure VMs with on-demand capacity reservation using a machine profile (VM or template spec). You can also update an existing machine catalog and existing VMs to have or remove on-demand capacity reservation.

This feature is applicable to persistent and non-persistent machine catalogs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Limitations

This feature is not applicable to:

- Spot VMs
- Host group
- Hibernation enabled VMs

For more information on limitations, see the Microsoft documentation Limitations and restrictions.

Steps to create a catalog of on-demand capacity reservation VMs

1. Create a machine profile source (VM or ARM template spec). For creating a VM or an ARM template spec, see Associate a VM to a Capacity Reservation group.
2. Run the following PowerShell command to check if a machine profile has on-demand capacity reservation enabled or not. If the machine profile is enabled with on-demand capacity reservation, then you get the `capacityReservationGroup id`.

   For example,

   If the machine profile source is a VM, run the following command:

   ```
   (Get-Item "XDHyp:\HostingUnits\azure-res-conn2\machineprofile.
      folder\fifthcolumn.resourcegroup\demand-capacity.vm").
      AdditionalData
   ```

   If the machine profile source is a template spec, run the following command:

   ```
   (Get-Item "XDHyp:\HostingUnits\azure-res-conn2\machineprofile.
      folder\fifthcolumn.resourcegroup\fc-aeh-templatespec.
      templatespec\14.0.0-capacity-reservation.templatespecversion").
      AdditionalData
   ```

3. Create a machine catalog using a machine profile using Web Studio or PowerShell commands.

You can update a catalog using the `Set-ProvScheme` command. You can also update existing VMs using the PowerShell command `Set-ProvVmUpdateTimeWindow`. The machine profile is updated on the next power on.

Nested virtualization

If you configure the master VM with nested virtualization enabled, then all VMs in the MCS machine catalog created using that master VM, have nested virtualization enabled. This feature is applicable to both persistent and non-persistent VMs. You can update an existing MCS machine catalog and existing VMs to have nested virtualization through image update.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Currently, only Dv3 and Ev3 VM sizes support nested virtualization.

For information on nested virtualization, see the Microsoft blog Nested Virtualization in Azure.

NVMe-only SKUs

Typically, the older generations of general purpose, memory optimized, and compute optimized VMs (D/Ev5 or Fv2 and older) support SCSI. The newer generations (Da/Ea/Fav6 and newer) typically support only the NVMe storage interface. MCS supports the NVMe storage controller type to support the new VM SKUs on Azure.

For information on NVMe, see the Microsoft documentation General FAQ for NVMe.

You can create an MCS catalog using a service offering that:

- supports both SCSI and NVMe, see Create a catalog using a service offering that supports both SCSI and NVMe
- supports only NVMe, see Create a catalog using a service offering that supports only NVMe

Limitations

- All service offerings that support NVMe do not support Trusted Launch at the same time.
- NVMe isn't supported for Gen 1 VMs.
- Some OS images might not support NVMe. In that case, the NVMe option is grayed out on the Azure UI.

Create a catalog using a service offering that supports both SCSI and NVMe

1. Create a VM to be used as a master image.

   a) Use a marketplace image that supports NVMe. A list of Azure Marketplace images that support NVMe can be found at Supported OS images for remote NVMe.

   b) Take a snapshot of the OS Disk of the VM to use in the `MasterImageVM` parameter of the `New-ProvScheme` command or use the managed disk directly.

   Check whether your master image supports NVMe or not using one of the following ways:

   - Check the `SupportedDiskControllerTypes` in the `AdditionalData` field of `Get-Item`. For example:

     ```
     (get-item XDHyp:\HostingUnits\mynetwork\image.folder\abc.
        resourcegroup\deg-snapshot).AdditionalData
     ```

     The `SupportedDiskControllerTypes` must be `SCSI, NVMe`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Use Azure CLI and PowerShell

2. Use a service offering that supports both NVMe and SCSI.
3. Use a VM or template spec as a machine profile that has NVMe enabled. Take any VM that has `DiskControllerType` set to NVMe. Use the VM directly as a machine profile or export template and use the template spec as a machine profile.

Create a catalog using a service offering that supports only NVMe

1. Create a VM to be used as a master image. Use a marketplace image that supports NVMe. A list of Azure Marketplace images that support NVMe can be found at Supported OS images for remote NVMe.
2. Use a service offering that supports only NVMe.

> **Note:**
>
> As the service offering supports NVMe, you do not need a machine profile with `DiskControllerType` set to `NVMe` to enable NVMe on the catalog. However, if you use a machine profile, it must have the `DiskControllerType` either set to `NVMe` or must have it blank or not specified.

Modify existing persistent VMs

NVMe configuration cannot be changed on a VM once it is created. The way to change NVMe configuration for a persistent VM is to redeploy the VM. The logic to do this is:

1. Save the current state of the VM.
2. After powering on an existing VM, detect whether the VM requires redeployment.
    a) If the configuration change is from NVMe to NVMe or SCSI to SCSI, redeployment of the VM is not required.
    b) If the configuration change is from SCSI to NVMe and conversely, redeploy and recreate the VM.

Create a machine catalog using PowerShell

This section details how you can create catalogs using PowerShell:

- Create a catalog with non-persistent write-back cache disk
- Create a catalog with persistent write-back cache disk
- Improve boot performance with MCSIO

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Use template spec in creating or updating a catalog using PowerShell
- Machine catalogs with Trusted Launch
- Use machine profile property values
- Create a machine catalog with customer-managed encryption key
- Create a machine catalog with double encryption
- Create a catalog with an Azure ephemeral disks
- Azure dedicated hosts
- Create or update a machine catalog using an Azure Compute Gallery image
- Configure Shared Image Gallery
- Provision machines into specified Availability Zones
- Storage types
- Create a catalog using Azure Spot VMs
- Configure backup VM sizes
- Copy tags on all resources
- Provision catalog VMs with Azure Monitor Agent installed

Create a catalog with non-persistent write-back cache disk

To configure a catalog with non-persistent write-back cache disk, use the PowerShell parameter `New-ProvScheme CustomProperties`. The custom property `UseTempDiskForWBC` indicates whether you are accepting to use the Azure temporary storage to store the write-back cache file. This must be configured to true when running `New-ProvScheme` if you want to use the temporary disk as write-back cache disk. If this property is not specified, the parameter is set to **False** by default.

For example, using the `CustomProperties` parameter to set `UseTempDiskForWBC` to **true**:

```
-CustomProperties '<CustomProperties xmlns=" http://schemas.citrix.com
   /2014/xd/machinecreation" xmlns:xsi=" http://www.w3.org/2001/
   XMLSchema-instance"> `
<Property xsi:type="StringProperty" Name="PersistWBC" Value="false"/> `
<Property xsi:type="StringProperty" Name="PersistOsDisk" Value="false
   "/> `
<Property xsi:type="StringProperty" Name="PersistVm" Value="false"/> `
<Property xsi:type="StringProperty" Name="StorageAccountType" Value="
   Premium_LRS"/> `
<Property xsi:type="StringProperty" Name="WBCDiskStorageType" Value="
   Premium_LRS"/> `
<Property xsi:type="StringProperty" Name="LicenseType" Value="
   Windows_Client"/> `
<Property xsi:type="StringProperty" Name="UseTempDiskForWBC" Value="
   true"/> `
</CustomProperties>'
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> After you commit the machine catalog to use Azure local temporary storage for write-back cache file, it cannot be changed to use VHD later.

Create a catalog with persistent write-back cache disk

To configure a catalog with persistent write-back cache disk, use the PowerShell parameter `New-ProvScheme CustomProperties`. This parameter supports an extra property, `PersistWBC`, used to determine how the write-back cache disk persists for MCS provisioned machines. The `PersistWBC` property is only used when the `UseWriteBackCache` parameter is specified, and when the `WriteBackCacheDiskSize` parameter is set to indicate that a disk is created.

Examples of properties found in the `CustomProperties` parameter before supporting `PersistWBC` include:

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
   instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
    />
<Property xsi:type="StringProperty" Name="StorageAccountType" Value="
   Premium_LRS" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="
   benvaldev5RG3" />
</CustomProperties>
```

When using these properties, consider that they contain default values if the properties are omitted from the `CustomProperties` parameter. The `PersistWBC` property has two possible values: **true** or **false**.

Setting the `PersistWBC` property to **true** does not delete the write-back cache disk when the Citrix Virtual Apps and Desktops administrator shuts down the machine using Web Studio.

Setting the `PersistWBC` property to **false** deletes the write-back cache disk when the Citrix Virtual Apps and Desktops administrator shuts down the machine using Web Studio.

> **Note:**
>
> If the `PersistWBC` property is omitted, the property defaults to **false** and the write-back cache is deleted when the machine is shutdown using Web Studio.

For example, using the `CustomProperties` parameter to set `PersistWBC` to true:

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
   instance">
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
    />
<Property xsi:type="StringProperty" Name="StorageAccountType" Value="
   Premium_LRS" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="
   benvaldev5RG3" />
<Property xsi:type="StringProperty" Name="PersistWBC" Value="true" />
</CustomProperties>
```

> **Important:**
>
> The `PersistWBC` property can only be set using the `New-ProvScheme` PowerShell cmdlet. Attempting to alter the `CustomProperties` of a provisioning scheme after creation has no impact on the machine catalog and the persistence of the write-back cache disk when a machine is shut down.

For example, set `New-ProvScheme`to use the write-back cache while setting the `PersistWBC` property to true:

```
New-ProvScheme
-CleanOnBoot
-CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.com
   /2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/
   XMLSchema-instance`"><Property xsi:type=`"StringProperty`" Name=`"
   UseManagedDisks`" Value=`"true`" /><Property xsi:type=`"
   StringProperty`" Name=`"StorageAccountType`" Value=`"Premium_LRS`"
   /><Property xsi:type=`"StringProperty`" Name=`"ResourceGroups`"
   Value=`"benvaldev5RG3`" /><Property xsi:type=`"StringProperty`" Name
   =`"PersistWBC`" Value=`"true`" /></CustomProperties>"
-HostingUnitName "adSubnetScale1"
-IdentityPoolName "BV-WBC1-CAT1"
-MasterImageVM "XDHyp:\HostingUnits\adSubnetScale1\image.folder\
   GoldImages.resourcegroup\W10MCSIO-01
   _OsDisk_1_a940e6f5bab349019d57ccef65d2c7e3.manageddisk"
-NetworkMapping @{
 "0"="XDHyp:\HostingUnits\adSubnetScale1\\virtualprivatecloud.folder\
    CloudScale02.resourcegroup\adVNET.virtualprivatecloud\
    adSubnetScale1.network" }

-ProvisioningSchemeName "BV-WBC1-CAT1"
-ServiceOffering "XDHyp:\HostingUnits\adSubnetScale1\serviceoffering.
   folder\Standard_D2s_v3.serviceoffering"
-UseWriteBackCache
-WriteBackCacheDiskSize 127
-WriteBackCacheMemorySize 256
```

Improve boot performance with MCSIO

You can improve boot performance for Azure and GCP managed disks when MCSIO is enabled. Use the PowerShell `PersistOSDisk` custom property in the `New-ProvScheme` command to configure

© 1997–2026 Citrix Systems, Inc. All rights reserved.

this feature. Options associated with `New-ProvScheme` include:

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true" />
<Property xsi:type="StringProperty" Name="StorageAccountType" Value="Premium_LRS" />
<Property xsi:type="StringProperty" Name="Resource ``````<!--NeedCopy-->
````````Groups" Value="benvaldev5RG3" />
<Property xsi:type="StringProperty" Name="PersistOsDisk" Value="true" />
</CustomProperties>
```

To enable this feature, set the `PersistOSDisk` custom property to **`true`**. For example:

```
New-ProvScheme
-CleanOnBoot
-CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"StringProperty`" Name=`"UseManagedDisks`" Value=`"true`" /><Property xsi:type=`"StringProperty`" Name=`"StorageAccountType`" Value=`"Premium_LRS`" /><Property xsi:type=`"StringProperty`" Name=`"ResourceGroups`" Value=`"benvaldev5RG3`" /><Property xsi:type=`"StringProperty`" Name=`"PersistOsDisk`" Value=`"true`" /></CustomProperties>"
-HostingUnitName "adSubnetScale1"
-IdentityPoolName "BV-WBC1-CAT1"
-MasterImageVM "XDHyp:\HostingUnits\adSubnetScale1\image.folder\GoldImages.resourcegroup\W10MCSIO-01_OsDisk_1_a940e6f5bab349019d57ccef65d2c7e3.manageddisk"
-NetworkMapping @{
 "0"="XDHyp:\HostingUnits\adSubnetScale1\\virtualprivatecloud.folder\CloudScale02.resourcegroup\adVNET.virtualprivatecloud\adSubnetScale1.network" }

-ProvisioningSchemeName "BV-WBC1-CAT1"
-ServiceOffering "XDHyp:\HostingUnits\adSubnetScale1\serviceoffering.folder\Standard_D2s_v3.serviceoffering"
-UseWriteBackCache
-WriteBackCacheDiskSize 127
-WriteBackCacheMemorySize 256
```

Use template spec in creating or updating a catalog using PowerShell

You can create or update an MCS machine catalog using a template spec as a machine profile input. To do this, you can use the Web Studio or PowerShell commands.

For Web Studio, see Create a machine catalog using an Azure Resource Manager image in Web Stu-

© 1997–2026 Citrix Systems, Inc. All rights reserved.
```

dio

Using PowerShell commands:

1. Open the **PowerShell** window.
2. Run `asnp citrix*`.
3. Create or update a catalog.

    - To create a catalog:

        a) Use the `New-ProvScheme` command with a template spec as a machine profile input. For example:

```
New-ProvScheme -MasterImageVM "XDHyp:/HostingUnits/azure/
    image.folder/fgthj.resourcegroup/nab-ws-
    vda_OsDisk_1_xxxxxxxxxxa.manageddisk"
MachineProfile "XDHyp:/HostingUnits/azure/machineprofile.
    folder/fgthj.resourcegroup/test.templatespec/V1.
    templatespecversion"
-ProvisioningSchemeName <String>
-HostingUnitName <String>
-IdentityPoolName <String>
[-ServiceOffering <String>][-CustomProperties <String>
[-LoggingId <Guid>]
[-BearerToken <String>][-AdminAddress <String>]
[<CommonParameters>]
```

        b) Finish creating the catalog.

    - To update a catalog, use `Set-ProvScheme` command with a template spec as a machine profile input. For example:

```
Set-ProvScheme -MasterImageVm 'XDHyp://Connections/Azure/East
    Us.region/vm.folder/MasterDisk.vm'
MachineProfile 'XDHyp:/HostingUnits/azure/machineprofile.
    folder/fgthj.resourcegroup/testing.templatespec/V1.
    templatespecversion'
[-ProvisioningSchemeName] <String>
[-CustomProperties <String>][-ServiceOffering <String>] [-
    PassThru]
[-LoggingId <Guid>] [-BearerToken <String>][-AdminAddress <
    String>] [<CommonParameters>]
```

Machine catalogs with Trusted Launch

To successfully create a machine catalog with Trusted Launch, use:

- A master image enabled with Trusted Launch. You must use a machine profile, however, it is not necessary for the machine profile to be Trusted Launch enabled. If you use a master image enabled with Trusted Launch and a machine profile not enabled with Trusted Launch, you get

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a warning message because of the mismatched Trusted Launch configuration between master image and machine profile.
- A VM size that supports Trusted Launch
- A Windows VM version that supports Trusted Launch. Currently, Windows 10, Windows 11, Windows Server 2016, 2019, and 2022 support Trusted Launch.

To view the Citrix Virtual Apps and Desktops offering inventory items, and to determine whether the VM size supports Trusted Launch, run the following command:

1. Open a PowerShell window.
2. Run **asnp citrix*** to load the Citrix-specific PowerShell modules.
3. Run the following command:

```
$s = (ls XDHyp:\HostingUnits\<name of hosting unit>\
    serviceoffering.folder\"<VM size>.serviceoffering)
```

4. Run `$s | select -ExpandProperty Additionaldata`
5. Check the value of the `SupportsTrustedLaunch` attribute.
    - If `SupportsTrustedLaunch` is **True**, the VM size supports Trusted Launch.
    - If `SupportsTrustedLaunch` is **False**, the VM size does not support Trusted Launch.

As per Azure's PowerShell, you can use the following command to determine the VM sizes that support Trusted Launch:

```
(Get-AzComputeResourceSku | where {
 $_.Locations.Contains($region) -and ($_.Name -eq "<VM size>")  }
 )[0].Capabilities
```

Following are the examples that describe whether the VM size supports Trusted Launch after you run the Azure PowerShell command.

- *Example 1*: If the Azure VM supports only Generation 1, that VM does not support Trusted Launch. Therefore, the `TrustedLaunchDisabled` capability is not displayed after you run the Azure PowerShell command.
- *Example 2*: If the Azure VM supports only Generation 2 and the `TrustedLaunchDisabled` capability is **True**, the Generation 2 VM size is not supported for Trusted Launch.
- *Example 3*: If the Azure VM supports only Generation 2 and the `TrustedLaunchDisabled` capability is not displayed after you run the PowerShell command, the Generation 2 VM size is supported for Trusted Launch.

For more information on Trusted Launch for Azure virtual machines, see the Microsoft document Trusted Launch for Azure virtual machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

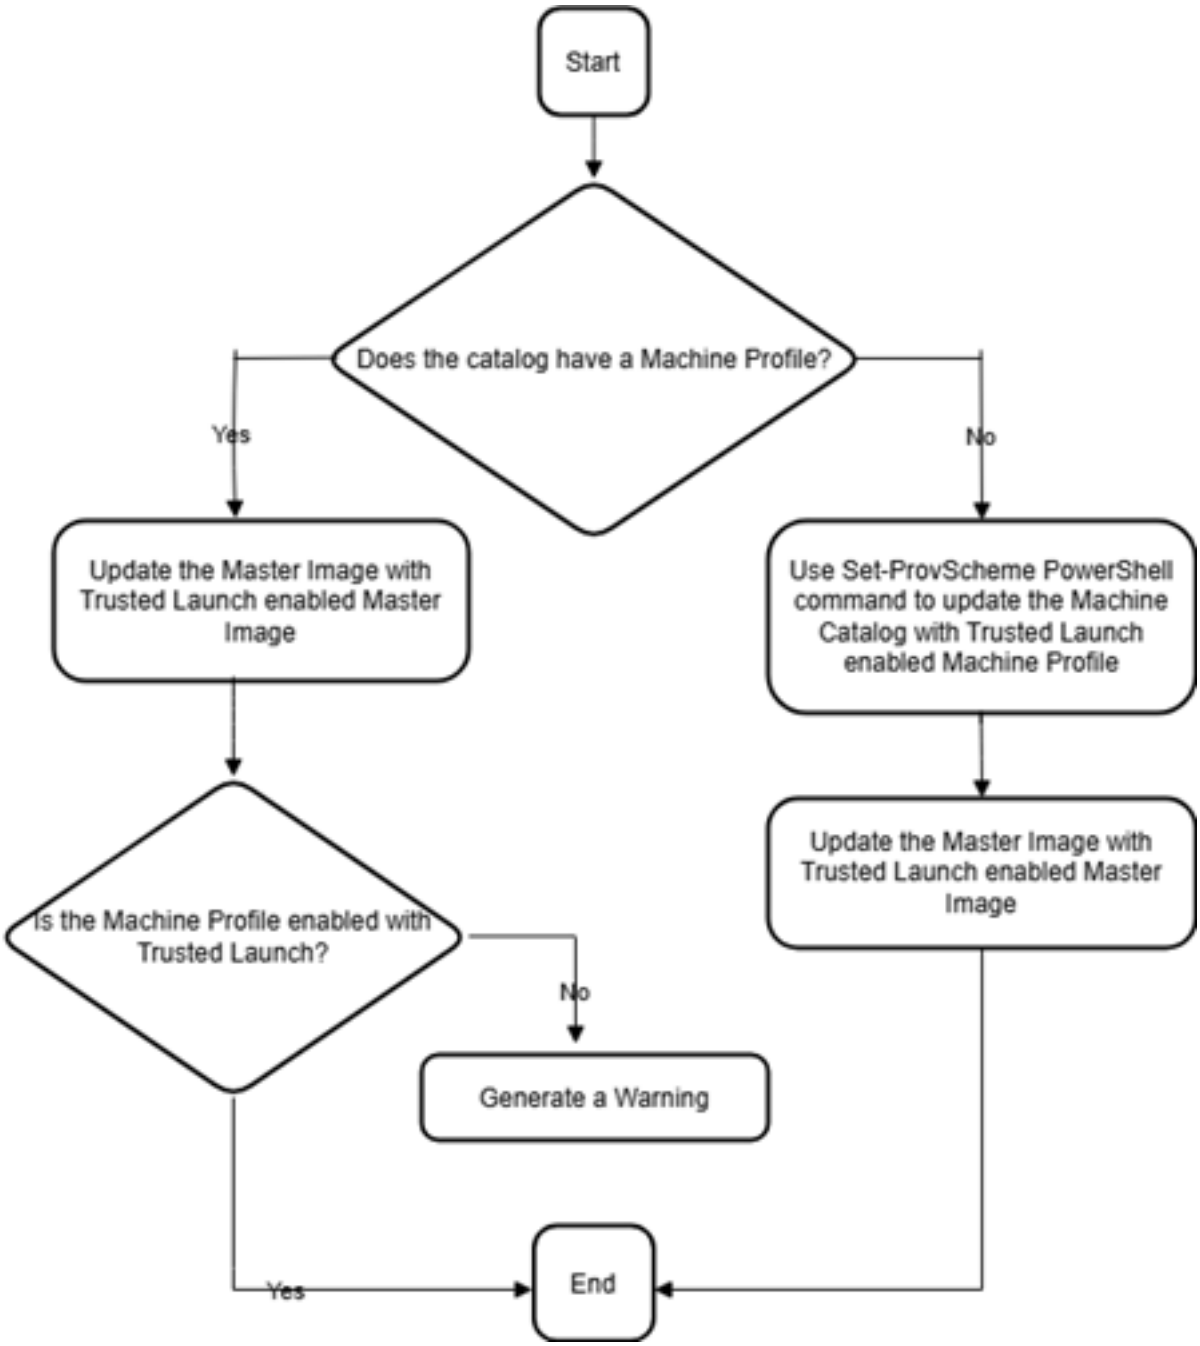
Create a machine catalog with Trusted Launch

1. Create a master image enabled with Trusted Launch. See the Microsoft documentation Trusted Launch VM Images.
2. Create a VM or template spec with security type as **trusted launch virtual machines**. For more information on creating a VM or template spec, see the Microsoft document Deploy a trusted launch VM.
3. Create a machine catalog using the Web Studio or PowerShell commands.
   - If you want to use Web Studio, see Create a machine catalog using an Azure Resource Manager image in Web Studio.
   - If you want to use PowerShell commands, use the `New-ProvScheme` command with the VM or the template spec as a machine profile input. For the complete list of commands to create a catalog, see Creating a catalog.

     Example of `New-ProvScheme` with VM as machine profile input:

```
New-ProvScheme -CleanOnBoot -HostingUnitName "name" -
    IdentityPoolName "name" -InitialBatchSizeHint 1
-MasterImageVM "XDHyp:/HostingUnits/azure/image.folder/fgthj.
    resourcegroup/nab-ws-vda_OsDisk_1_xxxxxxxxxxa.manageddisk"
-MachineProfile "XDHyp:\HostingUnits\<adnet>\machineprofile.
    folder\<def.resourcegroup>\<machine profile vm.vm>"
-ProvisioningSchemeName <String>
-HostingUnitName <String>
-IdentityPoolName <String>
[-ServiceOffering <String>][-CustomProperties <String>]
[<CommonParameters>]
```

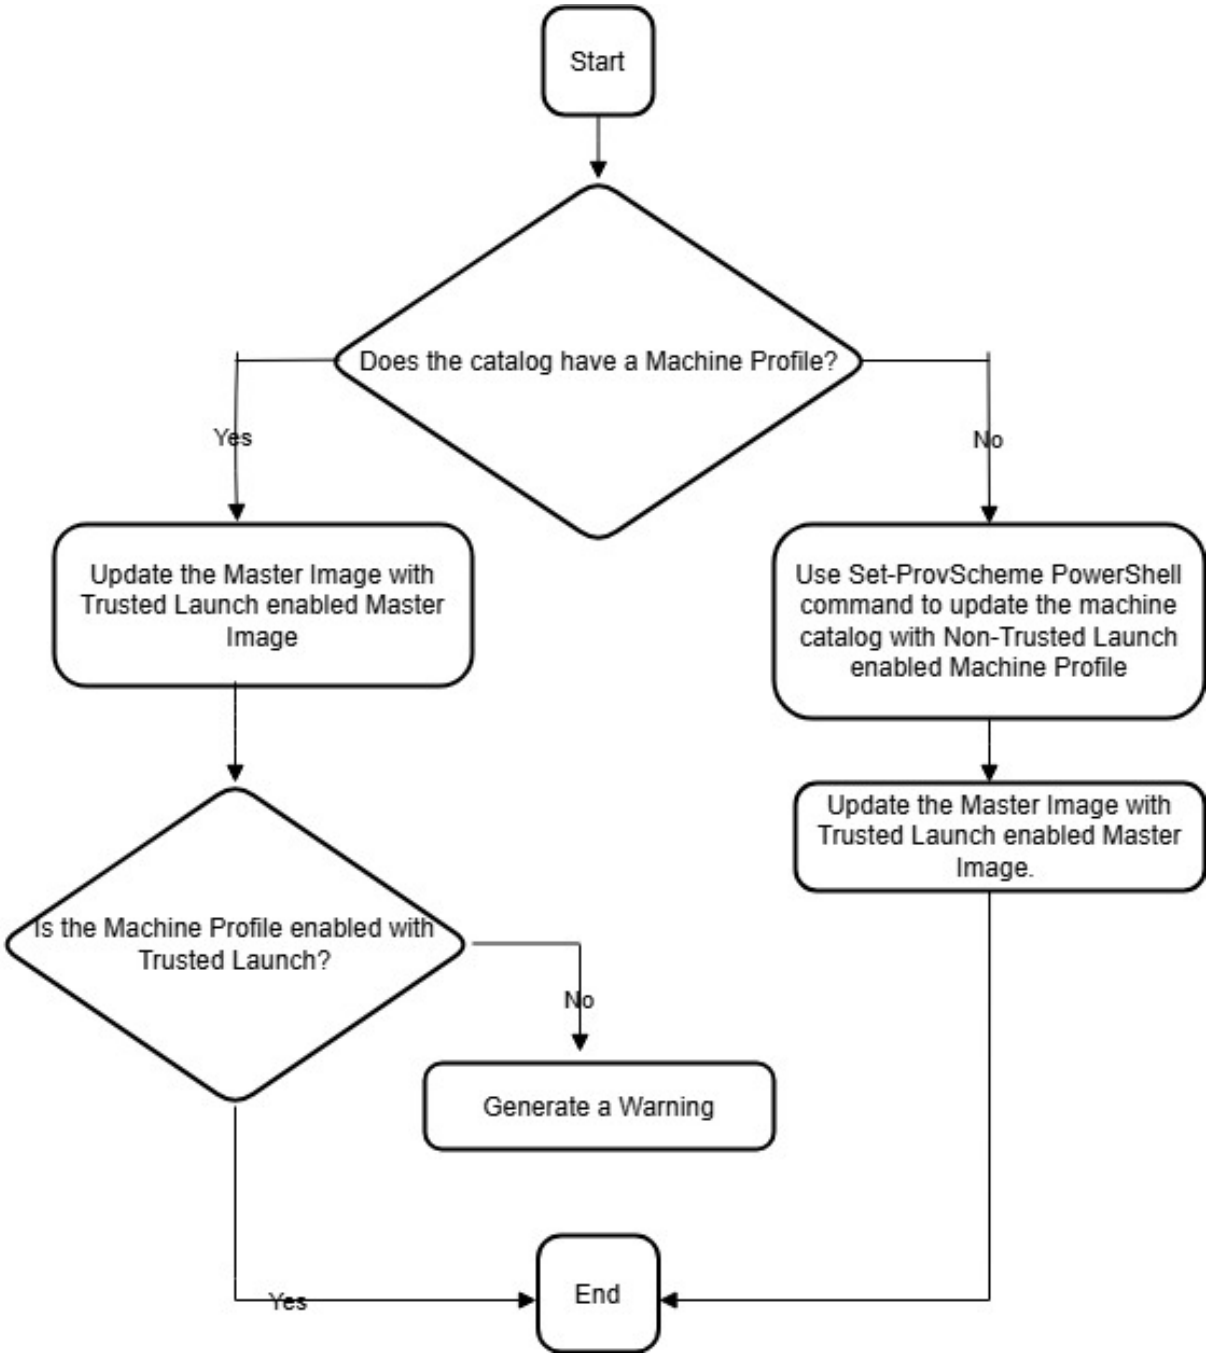
     Example of `New-ProvScheme` with template spec as machine profile input:



```
New-ProvScheme -CleanOnBoot -HostingUnitName "name" -
    IdentityPoolName "name" -InitialBatchSizeHint 1
-MasterImageVM "XDHyp:/HostingUnits/azure/image.folder/fgthj.
    resourcegroup/nab-ws-vda_OsDisk_1_xxxxxxxxxxa.manageddisk"
MachineProfile "XDHyp:/HostingUnits/azure/machineprofile.
    folder/fgthj.resourcegroup/test.templatespec/V1.
    templatespecversion"
-ProvisioningSchemeName <String>
-HostingUnitName <String>
-IdentityPoolName <String>
[-ServiceOffering <String>][-CustomProperties <String>]
[<CommonParameters>]
```

Update a machine catalog with Trusted Launch

You can update both persistent and non-persistent machine catalogs:



© 1997–2026 Citrix Systems, Inc. All rights reserved.

For persistent machine catalog:

For non-persistent machine catalog:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Errors while creating machine catalogs with Trusted Launch

You get appropriate errors in the following scenarios while creating a machine catalog with Trusted Launch:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Scenario	Error
If you select a machine profile while creating an unmanaged catalog	`MachineProfileNotSupportedForUnmanagedCata`
If you do not select a machine profile while creating a managed catalog with a master image source with Trusted Launch as the security type	`MachineProfileNotFoundForTrustedLaunchMaste`
If you select a machine profile with a security type different from the security type of the master image	`SecurityTypeConflictBetweenMasterImageAndMa`
If you select a VM size that does not support Trusted Launch but use a master image that supports Trusted Launch while creating a catalog	`MachineSizeNotSupportTrustedLaunch`

Use machine profile property values

The machine catalog uses the following properties that are defined in the custom properties:

- Availability zone
- Dedicated Host Group Id
- Disk Encryption Set Id
- OS type
- License type
- Storage type

If these custom properties are not defined explicitly, then the property values are set from the ARM template spec or VM, whichever is used as the machine profile. In addition, if `ServiceOffering` is not specified, then it is set from the machine profile.

> **Note:**
>
> If some of the properties are missing from the machine profile and not defined in the custom properties, then the default values of the properties take place wherever applicable.

The following section describes some scenarios at `New-ProvScheme` and `Set-ProvScheme` when `CustomProperties` either have all the properties defined or values are derived from the MachineProfile.

- New-ProvScheme Scenarios
    - MachineProfile has all the properties and CustomProperties are not defined. Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
\machineprofile.folder\azure.resourcegroup\mpA.vm"
```

The following values are set as custom properties for the catalog:

```
Get-ProvScheme | select CustomProperties
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/
   XMLSchema-instance">
<Property xsi:type="StringProperty" Name="StorageAccountType"
    Value="<mpA-value>"/>
<Property xsi:type="StringProperty" Name="OSType" Value="<mpA
   -value>"/>
<Property xsi:type="StringProperty" Name="LicenseType" Value=
   "<mpA-value>"/>
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId
   " Value="<mpA-value>"/>
<Property xsi:type="StringProperty" Name="
   DedicatedHostGroupId" Value="<mpA-value>"/>
<Property xsi:type="StringProperty" Name="Zones" Value="<mpA-
   value>"/>
</CustomProperties>
```

- MachineProfile has some properties and CustomProperties are not defined. Example: MachineProfile only has LicenseType and OsType.

  ```
  New-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
  \machineprofile.folder\azure.resourcegroup\mpA.vm"
  ```

  The following values are set as custom properties for the catalog:

  ```
  Get-ProvScheme | select CustomProperties
  <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
     machinecreation" xmlns:xsi="http://www.w3.org/2001/
     XMLSchema-instance">
  <Property xsi:type="StringProperty" Name="OSType" Value="<mpA
     -value>"/>
  <Property xsi:type="StringProperty" Name="LicenseType" Value=
     "<mpA-value>"/>
  </CustomProperties>
  ```

- Both MachineProfile and CustomProperties define all properties. Example:

  ```
  New-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
  \machineprofile.folder\azure.resourcegroup\mpA.vm"-CustomProperties
   $CustomPropertiesA
  ```

  Custom properties take priority. The following values are set as custom properties for the catalog:

  ```
  Get-ProvScheme | select CustomProperties
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="StorageAccountType"
     Value="<CustomPropertiesA-value>"/>
<Property xsi:type="StringProperty" Name="OSType" Value="<
    CustomPropertiesA-value>"/>
<Property xsi:type="StringProperty" Name="LicenseType" Value=
    "<CustomPropertiesA-value>"/>
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId
    " Value="<CustomPropertiesA-value>"/>
<Property xsi:type="StringProperty" Name="
    DedicatedHostGroupId" Value="<CustomPropertiesA-value>"/>
<Property xsi:type="StringProperty" Name="Zones" Value="<
    CustomPropertiesA-value>"/>
</CustomProperties>
```

- Some properties are defined in MachineProfile and some properties are defined in CustomProperties. Example:
  - CustomProperties define LicenseType and StorageAccountType
  - MachineProfile define LicenseType, OsType, and Zones

  ```
  New-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
  \machineprofile.folder\azure.resourcegroup\mpA.vm"-CustomProperties
   $CustomPropertiesA
  ```

  The following values are set as custom properties for the catalog:

  ```
  Get-ProvScheme | select CustomProperties
  <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
      machinecreation" xmlns:xsi="http://www.w3.org/2001/
      XMLSchema-instance">
  <Property xsi:type="StringProperty" Name="StorageAccountType"
       Value="<CustomPropertiesA-value>"/>
  <Property xsi:type="StringProperty" Name="OSType" Value="<mpA
      -value>"/>
  <Property xsi:type="StringProperty" Name="LicenseType" Value=
      "<CustomPropertiesA-value>"/>
  <Property xsi:type="StringProperty" Name="Zones" Value="<mpA-
      value>"/>
  </CustomProperties>
  ```

- Some properties are defined in MachineProfile and some properties are defined in CustomProperties. In addition, ServiceOffering is not defined. Example:
  - CustomProperties define StorageType
  - MachineProfile define LicenseType

  ```
  New-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
      \machineprofile.folder\azure.resourcegroup\mp.vm"
  ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-ServiceOffering "XDHyp:\HostingUnits\azureunit\
    serviceoffering.folder\<explicit-machine-size>.
    serviceoffering"
```

The following values are set as custom properties for the catalog:

```
Get-ProvScheme | select ServiceOffering
serviceoffering.folder\<explicit-machine-size>.
    serviceoffering

Get-ProvScheme | select CustomProperties
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="StorageAccountType"
     Value="explicit-storage-type"/>
<Property xsi:type="StringProperty" Name="LicenseType" Value=
    "value-from-machineprofile"/>
</CustomProperties>
```

- If the OsType is in neither in the CustomProperties nor in the MachineProfile, then:
  - The value is read from the master image.
  - If the master image is an unmanaged disk, the OsType is set to Windows. Example:

```
New-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
\machineprofile.folder\azure.resourcegroup\mpA.vm"-MasterImageVM
 "XDHyp:\HostingUnits\azureunit\image.folder\linux-master-
image.manageddisk"
```

The value from the master image is written to the custom properties, in this case Linux.

```
Get-ProvScheme | select CustomProperties
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="OSType" Value="
    Linux"/>
</CustomProperties>
```

- Set-ProvScheme Scenarios
  - An existing catalog with:
    - CustomProperties for `StorageAccountType` and OsType
    - MachineProfile `mpA.vm` that defines zones
  - Updates:
    - MachineProfile mpB.vm that defines StorageAccountType
    - A new set of custom properties $CustomPropertiesB that defines LicenseType and OsType

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
\machineprofile.folder\azure.resourcegroup\mpB.vm"-CustomProperties
 $CustomPropertiesB
```

The following values are set as custom properties for the catalog:

```
1  Get-ProvScheme | select CustomProperties
2  <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
      machinecreation" xmlns:xsi="http://www.w3.org/2001/
      XMLSchema-instance">
3  <Property xsi:type="StringProperty" Name="StorageAccountType"
       Value="<mpB-value>"/>
4  <Property xsi:type="StringProperty" Name="OSType" Value="<
      CustomPropertiesB-value>"/>
5  <Property xsi:type="StringProperty" Name="LicenseType" Value=
      "<CustomPropertiesB-value>"/>
6      </CustomProperties>
```

- An existing catalog with:
  - CustomProperties for `StorageAccountType` and OsType
  - MachineProfile `mpA.vm` that defines StorageAccountType and LicenseType
- Updates:
  - A new set of custom properties $CustomPropertiesB that defines StorageAccountType and OsType.

```
Set-ProvScheme -CustomProperties $CustomPropertiesB
```

The following values are set as custom properties for the catalog:

```
1  Get-ProvScheme | select CustomProperties
2  <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
      machinecreation" xmlns:xsi="http://www.w3.org/2001/
      XMLSchema-instance">
3  <Property xsi:type="StringProperty" Name="StorageAccountType"
       Value="<CustomPropertiesB-value>"/>
4  <Property xsi:type="StringProperty" Name="OSType" Value="<
      CustomPropertiesB-value>"/>
5  <Property xsi:type="StringProperty" Name="LicenseType" Value=
      "<mp-A-value>"/>
6  </CustomProperties>
```

- An existing catalog with:
  - CustomProperties for `StorageAccountType` and OsType
  - MachineProfile `mpA.vm` that defines Zones
- Updates:
  - A MachineProfile mpB.vm that defines StorageAccountType and LicenseType

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `ServiceOffering` is not specified

```
Set-ProvScheme -MachineProfile "XDHyp:\HostingUnits\azureunit
\machineprofile.folder\azure.resourcegroup\mpB.vm"
```

The following values are set as custom properties for the catalog:

```
Get-ProvScheme | select ServiceOffering
serviceoffering.folder\<value-from-machineprofile>.
   serviceoffering

Get-ProvScheme | select CustomProperties
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/
   XMLSchema-instance">
<Property xsi:type="StringProperty" Name="StorageAccountType"
    Value="<mpB-value>"/>
<Property xsi:type="StringProperty" Name="OSType" Value="<
   prior-CustomProperties-value>"/>
<Property xsi:type="StringProperty" Name="LicenseType" Value=
   "<mpB-value>"/>
</CustomProperties>
```

Create or update a catalog with multiple NICs per VM

MCS supports multiple NICs per VM. You can associate multiple NICs on a VM to multiple subnets, however, those subnets must be in the same virtual network (VNet). You can use PowerShell command to:

- Create a catalog with multiple NICs on a VM
- Update an existing catalog configuration to have multiple NICs on a VM so that newly created VMs have multiple NICs
- Update an existing VM to have multiple NICs

You can create or update a non-machine profile-based machine catalog and machine profile-based machine catalog to have multiple NICs on a VM. Currently, for a machine profile-based machine catalog, you can only have the same number of NICs as specified in the machine profile source.

Property such as accelerated networking is derived from the machine profile source.

> **Note:**
>
> The VM size must support the same number of NICs and corresponding accelerated networking, otherwise you get an error.

You can retrieve the maximum number of NICs associated with a selected VM size. A PowerShell property called `MaxNetworkInterfaces` displays the maximum NIC count when you run the PowerShell `get-item` command with the `AdditionalData` parameter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Retrieve the maximum NIC count

To retrieve the maximum NIC count:

1. Open a **PowerShell** window from the Delivery Controller™ host.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run `Get-ChildItem -Path "XDHyp:\Connections\abc-connection\East US.region\serviceoffering.folder"` to list all available VM sizes.
4. Run `get-item -Path "XDHyp:\Connections\abc-connection\East US.region\serviceoffering.folder\Standard_M416ms_v2.serviceoffering").AdditionalData`
5. Check `MaxNetworkInterfaces` to know the maximum NIC count.

Create a catalog with multiple NICs on a VM

To create a catalog with multiple NICs on a VM, do the following:

1. Open a PowerShell window from the Delivery Controller host.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Create an identity pool if not already created.
4. Create the provisioning scheme:

   - If creating a non-machine profile-based machine catalog, run `New-ProvScheme` command with `NetworkMappings` parameter. You can add multiple subnets to the parameter `NetworkMappings`. For example:

     ```
     New-Provscheme -NetworkMappings @{
     "0"="subnetpath1";"1"="subnetpath1" }
     ```

   - If creating a machine profile-based machine catalog:

     a) Create a VM in Azure to have multiple NICs. For information, see Create and manage a Windows virtual machine that has multiple NICs. You can also create a new VM, and then attach a network interface in the Networking page of Azure portal.

     b) Run `New-ProvScheme` command with the VM as a machine profile input.

     > **Note:**
     >
     > When creating a machine profile-based machine catalog, the count of `NetworkMappings` must be the same as the `NetworkInterfaceCount` of the machine profile. The `NetworkInterfaceCount` can be retrieved from `AdditionalData` of `Get-item -Path "machine profile path"`.

5. Finish creating the catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update a catalog to have multiple NICs on a VM

To update a catalog to have multiple NICs on a VM, do the following:

1. Open a **PowerShell** window from the Delivery Controller host.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Update the provisioning scheme:
    - If creating a non-machine profile-based machine catalog, run the `Set-ProvScheme` command with `NetworkMappings` parameter. You can add multiple subnets to parameter `NetworkMappings`. For example:

      ```
      Set-Provscheme -NetworkMappings @{
      "0"="subnetpath1";"1"="subnetpath1" }
      ```

    - If creating a machine catalog based on a machine profile:
        a) Create a VM in Azure to have multiple NICs. For information, see Create and manage a Windows virtual machine that has multiple NICs.
        b) Run `Set-ProvScheme` command with the VM as a machine profile input.

Update an existing VM to have multiple NICs on a VM

You can also update an existing VM using `Set-ProvVMUpdateTimeWindow` and also perform power cycle on existing VM during the update time window.

Provision catalog VMs with Azure Monitor Agent installed

Azure monitoring is a service which you can use to collect, analyze, and act on telemetry data from your Azure and on-premises environments.

Azure Monitor Agent (AMA) collects monitoring data from compute resources like virtual machines and delivers the data to Azure monitor. It currently supports the collection of Event Logs, Syslog and Performance metrics and sends it to Azure Monitor Metrics and Azure Monitor Logs data sources.

To enable monitoring by uniquely identifying the VMs in monitoring data, you can provision the VMs of an MCS machine catalog with AMA installed as an extension.

Requirements

- Permissions: Ensure that you have the minimum Azure permissions as specified in Required Azure permissions and the following permissions to use Azure Monitor:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - `Microsoft.Compute/virtualMachines/extensions/read`
  - `Microsoft.Compute/virtualMachines/extensions/write`
  - `Microsoft.Insights/DataCollectionRuleAssociations/Read`
  - `Microsoft.Insights/dataCollectionRuleAssociations/write`
  - `Microsoft.Insights/DataCollectionRules/Read`

- Data Collection Rule: Set up a data collection rule in Azure portal. For information about setting up a DCR, see Create a data collection rule. A DCR is platform specific (Windows or Linux). Ensure that you create a DCR as per the required platform.
  The AMA uses Data Collection Rules (DCR) to manage the mapping between the resources, such as VMs, and data sources, like Azure Monitor Metrics and Azure Monitor Logs.
- Default Workspace: Create a workspace in Azure portal. For information on creating a workspace, see Create a Log Analytics workspace. When you collect logs and data, the information is stored in a workspace. A workspace has a unique workspace ID and resource ID. The workspace name must be unique for a given resource group. After you create a workspace, configure data sources and solutions to store their data in the workspace.
- Whitelisted the monitor extension: The extensions `AzureMonitorWindowsAgent` and `AzureMonitorLinuxAgent` are Citrix defined whitelisted extensions. To view the list of whitelisted extensions, use the PoSH command, `Get-ProvMetadataConfiguration`.
- Master Image: Microsoft recommends removing extensions from an existing machine before creating a new machine from it. If the extensions are not removed, it might lead to leftover files and unexpected behavior. For more information, see If the VM is recreated from an existing VM.

To provision catalog VMs with AMA enabled:

1. Set up a machine profile template.
   - If you want to use a VM as a machine profile template:
     a) Create a VM on Azure portal.
     b) Power on the VM.
     c) Add the VM to the data collection rule under **Resources**. This invokes agent installation on the template VM.

     > **Note:**
     >
     > If you must create a Linux catalog, set up a Linux machine.

   - If you want to use template spec as a machine profile template:
     a) Set up a template spec.
     b) Add the following extension and data collection rule association to the generated template spec:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```

     "dataCollectionRuleId": "/subscriptions/<azure-
        subscription>/resourcegroups/<azure-resource-group
        >/providers/microsoft.insights/datacollectionrules
        /<azure-data-collection-rule>"
      }

     }
```

2. Create or update an existing MCS machine catalog.

   - To create a new MCS catalog:

     a) Select that VM or template spec as a machine profile in the Web Studio.
     b) Proceed with the next steps to create the catalog.

   - To update an existing MCS catalog, use the following PoSH commands:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To have the new VMs get the updated machine profile template, run the following command:

```
Set-ProvScheme -ProvisioningSchemeName "name"
-MachineProfile "XDHyp:\HostingUnits\Unit1\machineprofile.
   folder\abc.resourcegroup\ab-machine-profile.vm"
```

- To update existing VMs with the updated machine profile template:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-
   catalog -StartsNow -DurationInMinutes -1
```

3. Power on catalog VMs.
4. Go to Azure portal and check if the monitor extension is installed on the VM and the VM is showing up under DCR's Resources. After a few minutes monitoring data is displayed on the Azure Monitor.

Troubleshooting

For information in troubleshooting guidance for Azure Monitor Agent, see the following:

- https://learn.microsoft.com/en-us/azure/azure-monitor/agents/azure-monitor-agent-troubleshoot-windows-vm/
- https://learn.microsoft.com/en-us/azure/azure-resource-manager/troubleshooting/create-troubleshooting-template/

Create a machine catalog with customer-managed encryption key

The detailed steps on how to create a machine catalog with customer-managed encryption key are:

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Enter `cd xdhyp:/`.
4. Enter `cd .\HostingUnits\(your hosting unit)`.
5. Enter `cd diskencryptionset.folder`.
6. Enter `dir` to get the list of the Disk Encryption Sets.
7. Copy the Id of a Disk Encryption Set.
8. Create a custom property string to include the Id of the Disk Encryption Set. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$customProperties = "<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-instance`">
<Property xsi:type=`"StringProperty`" Name=`"StorageAccountType`" Value=`"Standard_LRS`" />
<Property xsi:type=`"StringProperty`" Name=`"persistWBC`" Value=`"False`" />
<Property xsi:type=`"StringProperty`" Name=`"PersistOsDisk`" Value=`"false`" />
<Property xsi:type=`"StringProperty`" Name=`"UseManagedDisks`" Value=`"true`" />
<Property xsi:type=`"StringProperty`" Name=`"DiskEncryptionSetId`" Value=`"/subscriptions/0xxx4xxx-xxb-4bxx-xxxx-xxxxxxxx/resourceGroups/abc/providers/Microsoft.Compute/diskEncryptionSets/abc-des`"/>
</CustomProperties>
```

9. Create an identity pool if not already created. For example:

```
New-AcctIdentityPool -IdentityPoolName idPool -NamingScheme ms## -Domain def.local -NamingSchemeType Numeric
```

10. Run the New-ProvScheme command: For example:

```
New-ProvScheme -CleanOnBoot -HostingUnitName "name" -IdentityPoolName "name" -InitialBatchSizeHint 1
-MasterImageVM "XDHyp:\HostingUnits\azure-res2\image.folder\def.resourcegroup\def.snapshot"
-NetworkMapping @{
 "0"="XDHyp:\HostingUnits\azure-res2\\virtualprivatecloud.folder\def.resourcegroup\def-vnet.virtualprivatecloud\subnet1.network" }

-ProvisioningSchemeName "name"
-ServiceOffering "XDHyp:\HostingUnits\azure-res2\serviceoffering.folder\Standard_DS2_v2.serviceoffering"
-MachineProfile "XDHyp:\HostingUnits\<adnet>\machineprofile.folder\<def.resourcegroup>\<machine profile vm.vm>"
-CustomProperties $customProperties
```

11. Finish creating the machine catalog.

Create a machine catalog with double encryption

You can create and update a machine catalog with double encryption using Web Studio and PowerShell commands.

The detailed steps on how to create a machine catalog with double encryption are:

1. Create an Azure Key Vault and DES with Platform-managed and customer-managed keys. For

© 1997–2026 Citrix Systems, Inc. All rights reserved.

information on how to create an Azure Key Vault and a DES, see Use the Azure portal to enable double encryption at rest for managed disks.

2. To browse available DiskEncryptionSets in your hosting connection:

   a) Open a **PowerShell** window.
   b) Run the following PowerShell commands:
      i. `asnp citrix*`
      ii. `cd xdhyp:`
      iii. `cd HostingUnits`
      iv. `cd YourHostingUnitName` (ex. azure-east)
      v. `cd diskencryptionset.folder`
      vi. `dir`

   You can use an Id of the `DiskEncryptionSet` to create or update a catalog using custom properties.

3. If you want to use machine profile workflow, create a VM or template spec as a machine profile input.

   - If you want to use a VM as a machine profile input:
     a) Create a VM in Azure Portal.
     b) Navigate to **Disks>Key management** to encrypt the VM directly with any `DiskEncryptionSetID`.
   - If you want to use a template spec as a machine profile input:
     a) In the template, under `properties>storageProfile>osDisk>managedDisk`, add `diskEncryptionSet` parameter and add the id of the double encryption DES.

4. Create the machine catalog.

   - If using Web Studio, do one of the following in addition to the steps in Create machine catalogs.
     - If you do not use machine profile-based workflow, on the **Disk Settings** page, select **Use the following key to encrypt data on each machine**. Then, select your double encryption DES from the drop-down menu. Continue creating the catalog.
     - If using machine profile workflow, on the **Image** page, select a master image and a machine profile. Make sure that the machine profile has a disk encryption set id in its properties.

     All machines created in the catalog are double encrypted by the key associated with the DES you selected.
   - If using PowerShell commands, do one of the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If not using machine profile-based workflow, add the custom property `DiskEncryptionSetId` in the `New-ProvScheme` command. For example:

```
New-ProvScheme -CleanOnBoot -CustomProperties '<
    CustomProperties xmlns="http://schemas.citrix.com/2014/
    xd/machinecreation" xmlns:xsi="http://www.w3.org/2001/
    XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks"
     Value="true" />
<Property xsi:type="StringProperty" Name="
    StorageAccountType" Value="Premium_LRS" />
<Property xsi:type="StringProperty" Name="
    DiskEncryptionSetId" Value="/subscriptions/12345678-
    xxxx-1234-1234-123456789012/resourceGroups/Sample-RG/
    providers/Microsoft.Compute/diskEncryptionSets/
    SampleEncryptionSet" />
</CustomProperties>'
-HostingUnitName "Redacted"
-IdentityPoolName "Redacted"
-InitialBatchSizeHint 1
-MasterImageVM "Redacted"
-NetworkMapping @{
"0"="Redacted" }

-ProvisioningSchemeName "Redacted"
-ServiceOffering "Redacted"
```

- If using machine profile-based workflow, use a machine profile input in the `New-ProvScheme` command. For example:

```
New-ProvScheme -CleanOnBoot
-HostingUnitName azure-east
-IdentityPoolName aio-ip
-InitialBatchSizeHint 1
-MasterImageVM XDHyp:\HostingUnits\azure-east\image.folder
    \abc.resourcegroup\fgb-vda-snapshot.snapshot
-NetworkMapping @{
"0"="XDHyp:\HostingUnits\azure-east\virtualprivatecloud.
    folder\apa-resourceGroup.resourcegroup\apa-
    resourceGroup-vnet.virtualprivatecloud\default.network"
     }

-ProvisioningSchemeName aio-test
-MachineProfile XDHyp:\HostingUnits\azure-east\
    machineprofile.folder\abc.resourcegroup\abx-mp.
    templatespec\1.0.0.templatespecversion
```

5. Finish creating a catalog using remote PowerShell SDK. For information on how to create a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/. All machines created in the catalog are double encrypted by the key associated with the DES you selected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Convert an unencrypted catalog to use double encryption

You can update a machine catalog's encryption type (using custom properties or machine profile).

- If not using machine profile-based workflow, add the custom property DiskEncryptionSetId in the `Set-ProvScheme` command. For example:

```
Set-ProvScheme -ProvisioningSchemeName "SampleProvSchemeName"
-CustomProperties '<CustomProperties xmlns="http://schemas.citrix
   .com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.org
   /2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId"
   Value="/subscriptions/12345678-xxxx-1234-1234-123456789012/
   resourceGroups/Sample-RG/providers/Microsoft.Compute/
   diskEncryptionSets/SampleEncryptionSet" />
</CustomProperties>'
```

- If using machine profile-based workflow, use a machine profile input in the `Set-ProvScheme` command. For example:

```
Set-ProvScheme -ProvisioningSchemeName mxiao-test -MachineProfile
    XDHyp:\HostingUnits\azure-east\machineprofile.folder\aelx.
   resourcegroup\elx-mp.templatespec\1.0.0.templatespecversion
```

Once successful, all new VMs that you add in your catalog are double encrypted by the key associated with the DES you selected.

Verify the catalog is double encrypted

- In the Web Studio:
  1. Navigate to **Machine Catalogs**.
  2. Select the catalog you want to verify. Click the **Template Properties** tab located near the bottom of the screen.
  3. Under **Azure Details**, verify the Disk Encryption Set ID in **Disk Encryption Set**. If the catalog's DES Id is blank, the catalog is not encrypted.
  4. In the Azure Portal, verify that the encryption type of the DES associated with the DES Id is platform-managed and customer-managed keys.
- Using PowerShell command:
  1. Open the **PowerShell** window.
  2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
  3. Use `Get-ProvScheme` to get the information of your machine catalog. For example:

```
Get-ProvScheme -ProvisioningSchemeName "SampleProvSchemeName"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Retrieve the DES Id custom property of the machine catalog. For example:

```
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId"
    Value="/subscriptions
   /12345678-1234-1234-1234-123456789012/resourceGroups/Sample
   -RG/providers/Microsoft.Compute/diskEncryptionSets/
   SampleEncryptionSet" />
```

5. In the Azure Portal, verify that the encryption type of the DES associated with the DES Id is platform-managed and customer-managed keys.

Create a catalog with an Azure ephemeral disks

To use ephemeral disks, you must set the custom property `UseEphemeralOsDisk` to **true** when running `New-ProvScheme`.

> **Note:**
>
> If the custom property `UseEphemeralOsDisk` is set to **false** or a value is not specified all provisioned VDAs continue to use a provisioned OS disk.

The following is an example set of custom properties to use in the provisioning scheme:

```
"CustomProperties": [
            {

                "Name": "UseManagedDisks",
                "Value": "true"
             }
 ,
            {

                "Name": "StorageType",
                "Value": "Standard_LRS"
             }
 ,
            {

                "Name": "UseSharedImageGallery",
                "Value": "true"
             }
 ,
            {

                "Name": "SharedImageGalleryReplicaRatio",
                "Value": "40"
             }
 ,
            {

```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
                    "Name": "SharedImageGalleryReplicaMaximum",
                    "Value": "10"
                }
    ,
                {

                    "Name": "LicenseType",
                    "Value": "Windows_Server"
                }
    ,
                {

                    "Name": "UseEphemeralOsDisk",
                    "Value": "true"
                }

            ],
```

Configure an ephemeral disk for a catalog

To configure an Azure ephemeral OS disk for a catalog, use the `UseEphemeralOsDisk` parameter in `Set-ProvScheme`. Set the value of the `UseEphemeralOsDisk` parameter to **true**.

> **Note:**
>
> To use this feature, you must also enable the parameters `UseManagedDisks` and `UseSharedImageGallery`.

For example:

```
Set-ProvScheme -ProvisioningSchemeName catalog-name -CustomProperties <
    CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
     />
<Property xsi:type="StringProperty" Name="UseSharedImageGallery" Value=
    "true" />
<Property xsi:type="StringProperty" Name="UseEphemeralOsDisk" Value="
    true" />
</CustomProperties>'
```

Configure storage type used by ephemeral disks

By default, `Standard_LRS` is the storage type used by the ephemeral OS disk feature. You can set the storage type to use SSDs instead for increased disk IOPS on read operations by specifying the `StorageType` custom property. Current supported values are `Standard_LRS`, `StandardSSD_LRS`, and `Premium_LRS`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

`StorageType` can also be updated on existing ephemeral machines with `Set-ProvScheme` and `Set-ProvVMUpdateTimeWindow`.

Important considerations for ephemeral disks

To provision ephemeral OS disks using `New-ProvScheme`, consider the following constraints:

- The VM size used for the catalog must support ephemeral OS disks.
- The size of the cache or temporary disk associated with the VM size must be greater than or equal to the size of the OS disk.
- The temporary disk size must be greater than the cache disk size.

Also consider these issues when:

- Creating the provisioning scheme.
- Modifying the provisioning scheme.
- Updating the image.

Azure dedicated hosts

You can use MCS to provision VMs on Azure dedicated hosts. Before provisioning VMs on Azure dedicated hosts:

- Create a host group.
- Create hosts in that host group.
- Ensure that there is sufficient host capacity reserved for creating catalogs and virtual machines.

You can create a catalog of machines with host tenancy defined through the following PowerShell script:

```
1 New-ProvScheme <otherParameters> -CustomProperties '<CustomProperties
     xmlns="http://schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi
     ="http://www.w3.org/2001/XMLSchema-instance">
2  <Property xsi:type="StringProperty" Name="HostGroupId" Value="
      myResourceGroup/myHostGroup" />
3  ...other Custom Properties...
4  </CustomProperties>
```

When using MCS to provision virtual machines on Azure dedicated hosts, consider:

- A *Dedicated host* is a catalog property and cannot be changed once the catalog is created. Dedicated tenancy is currently not supported on Azure.
- A pre-configured Azure host group, in the region of the hosting unit, is required when using the `HostGroupId` parameter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Azure auto-placement is required. This functionality makes a request to onboard the subscription associated with the host group. For more information, see VM Scale Set on Azure Dedicated Hosts - Public Preview. If auto-placement is not enabled, MCS throws an error during catalog creation.

Create or update a machine catalog using an Azure Compute Gallery image

When selecting an image to use for creating a machine catalog, you can select images you created in the Azure Compute Gallery.

For these images to appear, you must:

1. Configure a Citrix Virtual Apps and Desktops site.
2. Connect to the Azure Resource Manager.
3. In the Azure portal, create a resource group. For details, see Create an Azure Compute Gallery using the portal.
4. In the resource group, create an Azure Compute Gallery.
5. In the Azure Compute Gallery, create an image definition.
6. In the image definition, create an image version.

Use the following PowerShell commands to create or update a machine catalog using an image from Azure Compute Gallery:

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Select a resource group, and then list all galleries of that resource group.

```
Get-ChildItem -LiteralPath @("XDHyp:\HostingUnits\testresource\
    image.folder\sharedImageGalleryTest.resourcegroup")
```

4. Select a gallery, and then list all image definitions of that gallery.

```
Get-ChildItem -LiteralPath @("XDHyp:\HostingUnits\testresource\
    image.folder\sharedImageGalleryTest.resourcegroup\
    sharedImageGallery.sharedimagegallery")
```

5. Select one image definition, and then list all image versions of that image definition.

```
Get-ChildItem -LiteralPath @("XDHyp:\HostingUnits\testresource\
    image.folder\sharedImageGalleryTest.resourcegroup\
    sharedImageGallery.sharedimagegallery\sigtestimage.
    imagedefinition")
```

6. Create and update an MCS catalog using the following elements:

    - Resource group

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Gallery
- Gallery image definition
- Gallery image version

For information on how to create a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

Configure Shared Image Gallery

Use the `New-ProvScheme` command to create a provisioning scheme with Shared Image Gallery support. Use the `Set-ProvScheme` command to enable or disable this feature for a provisioning scheme and to change the replica ratio and replica maximum values.

Three custom properties were added to provisioning schemes to support the Shared Image Gallery feature:

`UseSharedImageGallery`

- Defines whether to use the Shared Image Gallery to store the published images. If set to **True**, the image is stored as a Shared Image Gallery image, otherwise the image is stored as a snapshot.
- Valid values are **True** and **False**.
- If the property is not defined, the default value is **False**.

`SharedImageGalleryReplicaRatio`

- Defines the ratio of machines to gallery image version replicas.
- Valid values are integer numbers greater than 0.
- If the property is not defined, default values are used. The default value for persistent OS disks is 1000 and the default value for non-persistent OS disks is 40.

`SharedImageGalleryReplicaMaximum`

- Defines the maximum number of replicas for each gallery image version.
- If the property is not defined, the default value is 100.
- If the property is not defined, the default value is 100.

> **Tip:**
>
> When using Shared Image Gallery to store a published image for MCS provisioned catalogs, MCS sets the gallery image version replica count based on the number of machines in the catalog, the replica ratio, and the replica maximum. The replica count is calculated by dividing the number of machines in the catalog by the replica ratio (rounding up to the nearest integer value) and then capping the value at the maximum replica count. For example, with a replica ratio of 20

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> and a maximum of 5, 0–20 machines have one replica created, 21–40 have 2 replicas, 41–60 have 3 replicas, 61–80 have 4 replicas, 81+ have 5 replicas.

Use case: Updating the Shared Image Gallery replica ratio and replica max

The existing machine catalog uses Shared Image Gallery. Use the `Set-ProvScheme` command to update the custom properties for all existing machines in the catalog and any future machines:

```
Set-ProvScheme -ProvisioningSchemeName catalog-name -CustomProperties '
    <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance"> <Property xsi:type="StringProperty" Name="StorageType"
    Value="Standard_LRS"/> <Property xsi:type="StringProperty" Name="
    UseManagedDisks" Value="True"/> <Property xsi:type="StringProperty"
    Name="UseSharedImageGallery" Value="True"/> <Property xsi:type="
    IntProperty" Name="SharedImageGalleryReplicaRatio" Value="30"/> <
    Property xsi:type="IntProperty" Name="
    SharedImageGalleryReplicaMaximum" Value="20"/></CustomProperties>'
```

Use Case: Converting a snapshot catalog to a Shared Image Gallery catalog

For this use case:

1. Run `Set-ProvScheme` with the `UseSharedImageGallery` flag set to **True**. Optionally include the `SharedImageGalleryReplicaRatio` and `SharedImageGalleryReplicaMaximum` properties.
2. Update the catalog.
3. Power cycle the machines to force an update.

For example:

```
Set-ProvScheme -ProvisioningSchemeName catalog-name -CustomProperties '
    <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance"> <Property xsi:type="StringProperty" Name="StorageType"
    Value="Standard_LRS"/> <Property xsi:type="StringProperty" Name="
    UseManagedDisks" Value="True"/> <Property xsi:type="StringProperty"
    Name="UseSharedImageGallery" Value="True"/> <Property xsi:type="
    IntProperty" Name="SharedImageGalleryReplicaRatio" Value="30"/> <
    Property xsi:type="IntProperty" Name="
    SharedImageGalleryReplicaMaximum" Value="20"/></CustomProperties>'
```

> **Tip:**
>
> The parameters `SharedImageGalleryReplicaRatio` and `SharedImageGalleryReplicaMaximum` are not required. After the `Set-ProvScheme` command completes the Shared Image Gallery

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> image has not yet been created. Once the catalog is configured to use the gallery, the next catalog update operation stores the published image in the gallery. The catalog update command creates the gallery, the gallery image, and the image version. Power cycling the machines updates them, at which point the replica count is updated, if appropriate. From that time, all existing non-persistent machines are reset using the Shared Image Gallery image and all newly provisioned machines are created using the image. The old snapshot is cleaned up automatically within a few hours.

Use Case: Converting a Shared Image Gallery Catalog to a snapshot catalog

For this use case:

1. Run `Set-ProvScheme` with the `UseSharedImageGallery` flag set to **False** or not defined.
2. Update the catalog.
3. Power cycle the machines to force an update.

For example:

```
Set-ProvScheme -ProvisioningSchemeName catalog-name -CustomProperties '
    <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance"> <Property xsi:type="StringProperty" Name="StorageType"
    Value="Standard_LRS"/> <Property xsi:type="StringProperty" Name="
    UseManagedDisks" Value="True"/> <Property xsi:type="StringProperty"
    Name="UseSharedImageGallery" Value="False"/></CustomProperties>'
```

> **Tip:**
>
> Unlike updating from a snapshot to a Shared Image Gallery catalog, the custom data for each machine is not yet updated to reflect the new custom properties. Run the following command to see the original Shared Image Gallery custom properties: `Get-ProvVm -ProvisioningSchemeName catalog-name`. After the `Set-ProvScheme` command completes the image snapshot has not yet been created. Once the catalog is configured to not use the gallery, the next catalog update operation stores the published image as a snapshot. From that time, all existing non-persistent machines are reset using the snapshot and all newly provisioned machines are created from the snapshot. Power cycling the machines updates them, at which point the custom machine data is updated to reflect that `UseSharedImageGallery` is set to **False**. The old Shared Image Gallery assets (gallery, image, and version) are automatically cleaned up within a few hours.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Provision machines into specified Availability Zones

You can provision machines into specific Availability Zones in Azure environments. You can achieve that using the PowerShell.

> **Note:**
>
> - If no zones are specified, MCS lets Azure place the machines within the region. If more than one zone is specified, MCS randomly distributes the machines across them.
> - If you select ZRS as Storage redundancy on the **Storage and License Types** page, then you get a warning suggesting to clear the zone selection and let Azure manage the VM availability zones. You get the warning only if you select a machine profile or host group that has availability zones.

Configure Availability Zones through PowerShell

Using PowerShell, you can view the offering inventory items by using `Get-Item`. For example, to view the *Eastern US region* `Standard_B1ls` service offering:

```
1 $serviceOffering = Get-Item -path "XDHyp:\Connections\my-connection-
     name\East US.region\serviceoffering.folder\Standard_B1ls.
     serviceoffering"
```

To view the zones, use the `AdditionalData` parameter for the item:

```
$serviceOffering.AdditionalData
```

If Availability Zones are not specified, there is no change in how machines are provisioned.

To configure Availability Zones through PowerShell, use the **Zones** custom property available with the `New-ProvScheme` operation. The **Zones** property defines a list of Availability Zones to provision machines into. Those zones can include one or more Availability Zones. For example, `<Property xsi:type="StringProperty"Name="Zones"Value="1, 3"/>` for Zones 1 and 3.

Use the `Set-ProvScheme` command to update the zones for a provisioning scheme.

If an invalid zone is provided, the provisioning scheme is not updated, and an error message appears providing instructions on how to fix the invalid command.

> **Tip:**
>
> If you specify an invalid custom property, the provisioning scheme is not updated and a relevant error message appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Storage types

Select different storage types for virtual machines in Azure environments that use MCS. For target VMs, MCS supports:

- OS disk: premium SSD, SSD, or HDD
- Write back cache disk: premium SSD, SSD, or HDD

When using these storage types, consider the following:

- Ensure that your VM supports the selected storage type.
- If your configuration uses an Azure ephemeral disk, you do not get the option for write-back cache disk setting.

> **Tip:**
>
> `StorageType` is configured for an OS type and storage account. `WBCDiskStorageType` is configured for write-back cache storage type. For a normal catalog, `StorageType` is required. If `WBCDiskStorageType` is not configured, the `StorageType` is used as the default for `WBCDiskStorageType`.

If WBCDiskStorageType is not configured, then StorageType is used as the default for WBCDiskStorageType

Configure storage types

To configure storage types for VM, use the `StorageType` parameter in `New-ProvScheme`. Set the value of the `StorageType` parameter to one of the supported storage types.

The following is an example set of the `CustomProperties` parameter in a provisioning scheme:

```
1 Set-ProvScheme -ProvisioningSchemeName catalog-name -CustomProperties '
     <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
     machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
     instance">
2 <Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
      />
3 <Property xsi:type="StringProperty" Name="StorageType" Value="
     Premium_LRS" />
4 <Property xsi:type="StringProperty" Name="LicenseType" Value="
     Windows_Client" />
5 </CustomProperties>'
```

Enable zone-redundant storage

You can select zone-redundant storage during catalog creation. It synchronously replicates your Azure managed disk across multiple availability zones, which allows you to recover from a failure in one zone by utilizing the redundancy in others.

You can specify **Premium_ZRS** and **StandardSSD_ZRS** in the storage type custom properties. ZRS storage can be set using existing custom properties or through the **MachineProfile** template. ZRS storage is also supported with `Set-ProvVMUpdateTimeWindow` command with `-StartsNow` and `-DurationInMinutes -1` parameters, and you can change existing machine from LRS to ZRS storage.

Limitations:

- Supported only for managed disks
- Supported only with premium and standard solid-state drives (SSD)
- Not supported with `StorageTypeAtShutdown`
- Available only in certain regions.
- Performance of Azure drops when creating ZRS disks at scale. Therefore, for the first power on, turn on the machines in smaller batches (less than 300 machines at a time)

Set zone-redundant storage as the disk storage type You can select zone-redundant storage during the initial catalog creation, or you can update your storage type in an existing catalog.

Select zone-redundant storage using PowerShell commands When creating a new catalog in Azure using the `New-ProvScheme` PowerShell command, use `Standard_ZRS` as the value in the `StorageAccountType`.
For example:

```
1 <Property xsi:type="StringProperty" Name="StorageAccountType" Value="
     StandardSSD_ZRS" />
```

When setting this value, it is validated by a dynamic API that determines if it can be used properly. The following exceptions can occur if the use of ZRS is not valid for your catalog:

- **StorageTypeAtShutdownNotSupportedForZrsDisks**: The StorageTypeAtShutdown custom property cannot be used with ZRS storage.
- **StorageAccountTypeNotSupportedInRegion**: This exception occurs if you try to use ZRS Storage in an Azure Region that does not support ZRS
- **ZrsRequiresManagedDisks**: You can use zone-redundant storage only with managed disks.

You can set the disk storage type using the following custom properties:

- `StorageType`

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `WBCDiskStorageType`
- `IdentityDiskStorageType`

> **Note:**
>
> During catalog creation, the machine profile's OS disk `StorageType` is used if the custom properties are not set.

Capture diagnostic settings on VMs and NICs from a machine profile

You can capture diagnostic settings on VMs and NICs from a machine profile while creating a machine catalog, updating an existing machine catalog, and updating existing VMs.

You can create a VM or template spec as a machine profile source.

Key steps

1. Set up required IDs in Azure. You must provide these IDs in the template spec.
    - Storage account
    - Log analytics workspace
    - Event hub namespace with the standard tier pricing
2. Create machine profile source.
3. Create a new machine catalog, update an existing catalog, or update existing VMs.

Set up required IDs in Azure

Set up one of the following in Azure:

- Storage account
- Log analytics workspace
- Event hub namespace with the Standard tier pricing

Set up a storage account Create a standard storage account in Azure. In the template spec, give the full resourceId for the storage account as the `storageAccountId`.

Once VMs are set up to log data to the storage account, the data can be found under the `insights-metrics-pt1m` container.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Set up a log analytics workspace Create a log analytics workspace. In the template spec, give the full resourceId for the log analytics workspace as the workspaceId.

Once VMs are set up to log data to the workspace, data can be queried under Logs in Azure. You can run the following command in Azure under Logs to show a count of all the metrics logged by a resource:

```
AzureMetrics | summarize Count=count()by ResourceId
```

Set up an event hub Do the following to set up an event hub in Azure portal:

1. Create an event hub namespace with the standard tier pricing.
2. Create an event hub underneath the namespace.
3. Navigate to **Capture** under the event hub. Switch ON the toggle to capture with the Avro output type.
4. Create a new container in an existing storage account to capture the logs.
5. In the template spec, specify the `eventHubAuthorizationRuleId` in the following format: `/subscriptions/093f4c12-704b-4b1d-8339-f339e7557f60/resourcegroups/matspo/providers/Microsoft.EventHub/namespaces/matspoeventhub/authorizationrules/RootManageSharedAccessKey`
6. Specify the name of the event hub.

Once VMs are set up to log data to the event hub, the data is captured into the configured storage container.

Create a machine profile source

You can create a VM or template spec as a machine profile source.

Create a VM based machine profile with diagnostic settings If you want to create a VM as your machine profile, then first set up diagnostic settings on the template VM itself. You can refer to the detailed instructions provided in the Microsoft documentation Diagnostic settings in Azure Monitor.

You can run the following commands to verify that there are now diagnostic settings associated with the VM or NIC:

```
1 az monitor diagnostic-settings list --resource-group matspo --resource
    matspo-tog-cc2659 --resource-type microsoft.network/
    networkInterfaces
```

```
1 az monitor diagnostic-settings list --resource-group matspo --resource
    matspo-tog-cc2 --resource-type microsoft.compute/virtualMachines
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a template spec-based machine profile with diagnostic settings If you want to use a VM that already has diagnostic settings enabled and export it into an ARM template spec, these settings won't be automatically included within the template. You must manually add or modify diagnostic settings within the ARM template.

However, if you want a VM as your machine profile, MCS ensures that the critical diagnostic settings are accurately captured and applied to the resources within your MCS catalog.

1. Create a standard template spec that defines a VM and NIC(s).
2. Add additional resources to deploy the diagnostic settings according to the spec: Microsoft.Insights diagnosticSettings. For scope, reference either a VM or NIC that's in the template by name with a partial ID. For example, for creating diagnostic settings attached to a VM named test-VM in the template spec, specify the scope as:

```
"scope": "microsoft.compute/virtualMachines/test-VM",
```

3. Use the template spec as a machine profile source.

Create or update a catalog with diagnostic settings

After you create a machine profile source, you can now create a machine catalog using `New-ProvScheme` command, update an existing machine catalog using `Set-ProvScheme` command, and update existing VMs using `Request-ProvVMUpdate` command.

Page file location determination

The page file location is determined according to the following scenario:

> **Note:**
>
> The default page file location is OS disk.

Scenario	Location
Page file setting is specified in the custom properties	As specified in the custom properties
Ephemeral OS disk or hibernation is enabled	OS disk
VM has a temporary disk	Temporary disk
MCS I/O is enabled	WBC disk

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Page file setting scenarios

The following table describes some of the possible scenarios of page file setting during image preparation and provisioning scheme update:

During	Scenario	Outcome
Image preparation	You set the source image page file on the temporary disk, while the VM size that you specify in the provisioning scheme has no temporary disk	The page file is placed on the OS
Image preparation	You set the source image page file on the OS disk, while the VM size that you specify in the provisioning scheme has a temporary disk	The page file is placed on the temporary disk
Image preparation	You set the source image page file on the temporary disk and enable the ephemeral OS disk in the provisioning scheme	The page file is placed on the OS disk
Provisioning scheme update	You attempt to update the provisioning scheme when the VDA version is earlier than 2311	Modifies the page file setting with a warning
Provisioning scheme update	You attempt to update the provisioning scheme when the VDA version is 2311 or later	Determines the page file location as per Page file location determination

Specify page file setting

Using PowerShell commands, you can specify page file settings, including the location and size. This overrides the page file settings determined by MCS as per Page file location determination. You can do this by running the following `New-ProvScheme` command during machine catalog creation.

Important considerations

Consider the following before proceeding with the catalog creation:

- You must provide all the custom properties ('PageFileDiskDriveLetterOverride', 'InitialPageFileSizeInMB', and 'MaxPageFileSizeInMB') in the `New-ProvScheme` command or none of them.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- This feature is not supported through Citrix Studio.
- The initial page file size must be between 16 MB and 16777216 MB.
- The maximum page file size must be greater than or equal to the initial page file size and less than 16777216 MB.
- You can set both the initial page file size and maximum page file size to zero at the same time.

> **Note:**
>
> You can modify the page file settings of the newly added VMs of an existing catalog, without updating the master image. To modify the page file settings, you need VDA version 2311 or later. You can modify the page file settings using the PowerShell commands. For more information, see Modify page file settings.

```
New-ProvScheme -CleanOnBoot `
-HostingUnitName "zijinnet" `
-IdentityPoolName "PageFileSettingExample" `
-ProvisioningSchemeName "PageFileSettingExample" `
-InitialBatchSizeHint 1 `
-MasterImageVM "XDHyp:\HostingUnits\zijinnet\image.folder\neal-zijincloud-resources.resourcegroup\CustomWin10VDA_OsDisk_1_9473d7c8a6174b2c8284c7d3efeea88f.manageddisk" `
-NetworkMapping @{
 "0"="XDHyp:\\HostingUnits\\zijinnet\\virtualprivatecloud.folder\\East US.region\\virtualprivatecloud.folder\\neal-zijincloud-resources.resourcegroup\\neal-zijincloud-resources-vnet.virtualprivatecloud\\default.network" }
  `
-ServiceOffering "XDHyp:\\HostingUnits\\zijinnet\\serviceoffering.folder\\Standard_B2ms.serviceoffering" `
-CustomProperties '<CustomProperties xmlns=" http://schemas.citrix.com/2014/xd/machinecreation" xmlns:xsi=" http://www.w3.org/2001/XMLSchema-instance"> `
<Property xsi:type="StringProperty" Name="PersistOsDisk" Value="false"/> `
<Property xsi:type="StringProperty" Name="PersistVm" Value="false"/> `
<Property xsi:type="StringProperty" Name="PageFileDiskDriveLetterOverride" Value="d"/> `
<Property xsi:type="StringProperty" Name="InitialPageFileSizeInMB" Value="2048"/> `
<Property xsi:type="StringProperty" Name="MaxPageFileSizeInMB" Value="8196"/> `
<Property xsi:type="StringProperty" Name="StorageAccountType" Value="Premium_LRS"/> `
<Property xsi:type="StringProperty" Name="LicenseType" Value="Windows_Client"/> `
</CustomProperties>'
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Modify page file settings

You can modify the page file settings of the newly added VMs to an existing catalog without updating the master image. Currently, this feature is applicable to only Azure environments.

To modify the page file settings, you need VDA version 2311 or later. You can modify the page file settings using the PowerShell commands.

Following are the various page file settings that you can modify in the Azure environment:

- `PageFileDiskDriveLetterOverride`
- `InitialPageFileSizeInMB`
- `MaxPageFileSizeInMB`

Modify the page file settings of an existing catalog

To modify the page file settings of an existing machine catalog, run the `Set-ProvScheme` command. In this case, the updates are applied only to the new VMs added to the catalog. For example:

```
1  Set-ProvScheme -ProvisioningSchemeName $schemeName -CustomProperties '<
       CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
       machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
       instance">
2  <Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
        />
3  <Property xsi:type="StringProperty" Name="OsType" Value="Windows" />
4  <Property xsi:type="StringProperty" Name="StorageType" Value="
       StandardSSD_LRS" />
5  <Property xsi:type="StringProperty" Name="
       PageFileDiskDriveLetterOverride" Value="D" />
6  <Property xsi:type="StringProperty" Name="InitialPageFileSizeInMB"
       Value="2048" />
7  <Property xsi:type="StringProperty" Name="MaxPageFileSizeInMB" Value
       ="8196" />
8  <Property xsi:type="StringProperty" Name="LicenseType" Value="
       Windows_Client" />
9  <Property  xsi:type="StringProperty" Name="Zones" Value="1" />
10 <Property xsi:type="StringProperty" Name="ResourceGroups" Value="neal-
       test-group1" />
11 <Property xsi:type="StringProperty" Name="SchemaVersion" Value="2" />
12 </CustomProperties>'
```

> **Note:**
>
> If you enable the write back cache and try to set the `PageFileDiskDriveLetterOverride` to `C:` using the PowerShell command, MCS IO driver automatically redirects the page file to a correct disk drive and not `C:`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a catalog using Azure Spot VMs

Azure Spot VMs allow you to take advantage of Azure's unused computing capacity at a significant cost savings. However, the ability to allocate an Azure Spot VM depends on the current capacity and pricing. Therefore, Azure might evict your running VM, fail to create the VM, or fail to power on the VM as per the Eviction policy. Therefore, Azure Spot VMs are good for some non-critical applications and desktops. For more information, see Use Azure Spot Virtual Machines.

Limitations

- All VM sizes aren't supported for Azure Spot VMs. For more information, see Limitations.

  You can run the following PowerShell command to check whether a VM size supports Spot VMs or not. If a VM size supports Spot VM, then `SupportsSpotVM` is **True**.

  ```
  (Get-Item "XDHyp:\HostingUnits\azure-res-conn2\serviceoffering.
     folder\Standard_D2ds_v4.serviceoffering"). AdditionalData
  ```

- Currently, Azure Spot VMs do not support hibernation.

Requirement

While creating the machine profile source (VM or template spec) for Azure Spot VMs catalog, you must select Azure Spot Instance (if using VM) or set `priority` as `Spot` (if using template spec).

Steps to create a catalog using Azure Spot VMs

1. Create a machine profile source (VM or launch template).
   - For creating a VM using Azure portal, see Deploy Azure Spot Virtual Machines using the Azure portal.
   - For creating a template spec, add the following properties under **resources > type: Microsoft.Compute/virtualMachines > properties** in the template spec. For example:

     ```
     "priority": "Spot",
     "evictionPolicy": "Deallocate",
     "billingProfile": {

     "maxPrice": 0.01
      }
     ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - Eviction policy can be **Deallocate** or **Delete**.
> - For non-persistent VMs, MCS always sets the eviction policy as **Delete**. If the VM is evicted, it is deleted along with any non-persistent disks (For example, OS disk). Any persistent disks (for example, Identity disk) are not deleted. However, an OS disk is persistent if the catalog type is persistent or the `PersistOsDisk` custom property is set to True. Similarly, a WBC disk is persistent if the `PersistWbc` custom property is set to **True**.
> - For persistent VMs, MCS always sets the eviction policy as Deallocate. If the VM is evicted, it is deallocated. No changes are made to the disks.
> - Maximum price is the price you are willing to pay per hour. If you are using **Capacity Only**, then this is **-1**. The maximum price can only be null, -1, or a decimal greater than zero. For more information, see Pricing.

2. You can run the following PowerShell command to check if a machine profile is Azure Spot VM enabled or not. If the `SpotEnabled` parameter is **True** and `SpotEvictionPolicy` is set to **Deallocate** or **Delete**, then the machine profile is Azure Spot VM enabled. For example,

   - If the machine profile source is a VM, run the following command:

   ```
   (Get-Item "XDHyp:\HostingUnits\azure-res-conn2\machineprofile
       .folder\fifthcolumn.resourcegroup\kb-spot-delete.vm").
       AdditionalData
   ```

   - If the machine profile source is a template spec, run the following command:

   ```
   (Get-Item "XDHyp:\HostingUnits\azure-res-conn2\machineprofile
       .folder\fifthcolumn.resourcegroup\fc-aeh-templatespec.
       templatespec\14.0.0-spot-delete.templatespecversion").
       AdditionalData
   ```

3. Create a machine catalog using a machine profile with `New-ProvScheme` PowerShell command.

You can update a catalog using the `Set-ProvScheme` command. You can also update existing VMs using the PowerShell command `Set-ProvVmUpdateTimeWindow`. The machine profile is updated on the next power on.

Evictions on a running Azure Spot VM

If the computing capacity is unavailable or the price per hour is higher than the maximum price as configured, Azure evicts a running Spot VM. By default, you are not notified of an eviction. The VM simply freezes and the VM is evicted. Microsoft recommends using Scheduled Events to monitor evictions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

See Continuously monitor for eviction. You can also run scripts from within a VM to get a notification before the eviction. For example, Microsoft has a polling script in Python ScheduledEvents.cs.

Troubleshooting

- You can see Spot VM properties in the provisioned VM's customMachineData using the `Get-ProvVM` command. If the priority field is set to **Spot**, then Spot is in use.
- You can check if a VM is using Spot in Azure Portal:
    1. Find the VM in the Azure Portal.
    2. Go to the **Overview** page.
    3. Scroll down to the bottom and locate the **Azure Spot** section.
        - If Spot is not in use, then this field is empty.
        - If Spot is in use, the **Azure Spot** and **Azure Spot eviction policy** fields are set.

1. You can check the billing profile or maximum price per hour for the VM on the Configuration page.

Configure backup VM sizes

Public clouds can run out of capacity for a specific VM size. When Azure lacks capacity, MCS falls back to a preconfigured list of backup VM sizes. This curated list, tailored by the customer to their workload requirements, increases the likelihood that one of these sizes has sufficient capacity to boot on Power On or Resume if the VM was previously hibernated.

When a power action is initiated, MCS implements an automated fallback sequence to ensure high availability. The workflow is as follows:

1. Initiation: A user or administrator issues a **PowerOn** or **Resume** command via Web Studio.
2. Exception Monitoring: MCS attempts to start the VM using the primary configuration. It monitors for specific Azure capacity exceptions likeQuota Exceeded, Allocation Failed orZonal Allocation Failed and SKU Not Available(Can just go general on this and say we monitor Azure for any capacity or allocation failures)
3. Sequential Fallback: If one of the above errors occurs, MCS automatically iterates through the BackupVmConfiguration list sequentially until the VM successfully starts. If all sizes in the BackupVmConfiguration fail, the power action is marked as failed.
4. Update vs. Re-creation Logic:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Direct Update: In most cases, MCS performs a simple VM size update to the backup SKU and then powers the VM on.
- Delete and Re-create: To maintain environment integrity, certain transitions require the existing VM to be deleted and a new one created in its place. This occurs when:
  - Switching between Spot and Regular VM types.
  - Switching between VM sizes with Resource Disk (Temporary Storage) support and those without.

5. Data Persistence & Recovery: During a "Delete and Re-create"operation, if all backup sizes also fail due to extreme Azure capacity shortages, the VM may temporarily disappear from the Azure Portal. However, no data loss occurs. Upon the next PowerOn attempt, MCS will recreate the VM using the original settings and reattach the existing OS, Identity, and Data disks.
6. Spot VM Billing & MaxPrice Behavior
   If your primary configuration utilizes a Machine Profile (VM Template) with Spot priority and a specific Billing Profile (MaxPrice), the following logic applies during fallback:
   - Primary Size: Uses the MaxPrice defined in your Machine Profile. Eviction is based on Price or Capacity.
   - Backup Spot Sizes: The BackupVmConfiguration property does not currently support a unique `MaxPrice` input for each SKU, MCS handles the transition as follows:
   - MaxPrice Reset: MCS sets the MaxPrice to -1.
   - Eviction Policy Shift: This changes the Azure eviction behavior from Price-based to Capacity-based.
   - Pricing: You will be charged the current Spot price, capped at the standard Pay-As-You-Go (PAYG) rate for that backup SKU. This ensures the VM is only evicted if Azure truly runs out of physical capacity, rather than because of a price fluctuation.
7. Persistence of Backup State: Once started, the VM remains on the backup size for the duration of the session until a Shutdown or Hibernate request is processed.
8. Restoration of Primary Size: Upon the next PowerOn or Resume, MCS always attempts to "home"the VM back to its Primary Service Offering (as defined in the Catalog or Machine Profile). If the primary size remains unavailable, the fallback sequence repeats.

Challenges with hibernation

Azure does not allow size changes on a hibernated VM, as explained General limitations. The VM must be in a Stopped state. Therefore, before changing the size, MCS issues a Deallocate request to clear the hibernated state, which causes the VM's hibernation state to be lost. MCS then loops over the backup sizes, updates the VM size, and powers it on.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Backup VM size unsupported scenarios

The following configurations are unsupported:

- For persistent VMs, the following scenarios are unsupported:
  - VM uses DiskControllerType SCSI, but Backup VM size supports only DiskControllerType NVMe.
  - VM uses DiskControllerType NVMe, but Backup VM size supports only DiskControllerType SCSI.
- For non-persistent VMs with MCSIO enabled, switching to a size without temporary storage is unsupported if the write-back cache disk uses Resource Disk temporary storage.

Prerequisites to configure Backup VM sizes

If any of the following are unmet, an error is thrown.

- Supported only when the Machine Profile is in use on the Machine Catalog.
- Type is optional and can be either Spot or Regular. Defaults to Regular if unspecified.
- Each combination of ServiceOffering must be unique to avoid repeated configurations.
- Regional Quota must have enough cores for the ServiceOffering.
- Network interface count must not exceed the maximum allowed for a ServiceOffering.
- ServiceOfferings in this BackupVmConfiguration list must be compatible with current Custom Properties, capabilities of the Master Image and the MachineProfile. Some failure scenarios are:
  - Azure Dedicated Hosts: Hosts in the Host Group must support the ServiceOffering if dedicated hosts are used.
  - Ephemeral OS Disk: ServiceOffering must support Ephemeral OS Disks if enabled in custom properties.
  - Premium Storage: ServiceOffering must support Premium storage if specified in custom properties.
  - Accelerated Networking: ServiceOffering must support Accelerated Networking if it is enabled in MachineProfile.
  - DiskEncryptionAtHost: ServiceOffering must support Encryption at Host if enabled in MachineProfile.
  - Temporary Storage: If MCSIO is in use and Write Back Cache is on the Temporary disk, use of a VM size that does not have Temporary Storage is not allowed.
  - HyperVGeneration: ServiceOffering must be compatible with the VM generation (1 or 2) specified in MasterImageVM.
  - TrustedLaunch: ServiceOffering must support TrustedLaunch if enabled in MachineProfile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Confidential VMs: ServiceOffering must support Confidential VM if enabled in MachineProfile.

Create a catalog with backup VM sizes

> **Note:**
>
> To address the issue of the Studio UI freezing, replace all the single quotes with `"` while running the PowerShell commands.

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Create a Broker catalog. This catalog is populated with machines that are about to be created.
4. Create an identity pool. This becomes a container for AD accounts created for the machines that are to be created.
5. Create a provisioning scheme with the machine profile. See How to configure backup configuration.
6. Update the `BrokerCatalog` with the unique Id of the provisioning scheme.
7. Create and add VMs to the catalog.

Update an existing catalog

You can update a provisioning scheme using the `Set-ProvScheme` command. See How to configure backup configuration.

Update existing VMs

You can update existing VMs in a catalog using `Set-ProvVMUpdateTimeWindow` PowerShell command. The command updates the VMs created from the provisioning scheme associated with the catalog on the next power on within the given time window. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
    StartTimeInUTC "3/12/2022 3am" -DurationInMinutes 60`
```

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
    StartsNow -DurationInMinutes 60
```

You can configure the backup VM size list for a selected number of existing MCS VMs using the `Set-ProvVM` command. However, to apply the updates, set an update time window for the VMs using `Set-ProvVMUpdateTimeWindow` and start the VMs within the window. For example,

1. Run the `Set-ProvVM` command to configure the backup VM size list for a selected existing MCS VM. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-ProvVM -ProvisioningSchemeName "name" -VMName "Vm-001"
-CustomProperties
"<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/
   machinecreation`"xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-
   instance`">
<Property xsi:type=`"StringProperty`" Name=`"UseManagedDisks`"
   Value=`"true`" />
<Property xsi:type=`"StringProperty`" Name=`"StorageAccountType`"
   Value=`"Premium_LRS`" />
<Property xsi:type=`"StringProperty`" Name=`"LicenseType`" Value=`
   "Windows_Server`"/>
<Property xsi:type=`"StringProperty`" Name=`"PersistWBC`" Value=`"
   true`"/>  <Property xsi:type=`"StringProperty`" Name=`"
   BackupVmConfiguration`" Value=`"[{
 &quot;ServiceOffering&quot;: &quot;Standard_D2as_v4&quot;, &quot;
    Type&quot;: &quot;Spot&quot; }
 , {
 &quot;ServiceOffering&quot;: &quot;Standard_D2s_v3&quot;, &quot;
    Type&quot;: &quot;Regular&quot; }
 , {
 &quot;ServiceOffering&quot;: &quot;Standard_D2s_v3&quot;, &quot;
    Type&quot;: &quot;Spot&quot; }
 ]`"/> </CustomProperties>"
```

2. Run the `Set-ProvVMUpdateTimeWindow` command to apply the updates. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
   StartsNow -DurationInMinutes 60
```

Copy tags on all resources

You can copy tags specified in a machine profile to all the resources such as multiple NICs and disks (OS disk, Identity disk, and write-back cache disk) of a new VM or an existing VM in a machine catalog. The machine profile source can be a VM or an ARM template spec.

> **Note:**
>
> You must add the policy on the tags (See Assign policy definitions for tag compliance) or add the tags in a machine profile source to retain the tags on the resources.

Prerequisites

Create the machine profile source (VM or ARM template spec) to have tags on VM, disks, and NICs of that VM.

- If you want to have a VM as a machine profile input, then apply tags on the VM and all the resources in the Azure portal. See Apply tags with Azure portal.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you want to have ARM template spec as a machine profile input, then add the following tag block under each resource.

```
 "tags": {

"TagC": "Value3"
 }
,
```

> **Note:**
>
> You can have a maximum of one disk and at least one NIC in the template spec.

Copy tags to the resources of a VM in a new machine catalog

1. Create a non-persistent or persistent catalog with a VM or ARM template spec as a machine profile input.
2. Add a VM to the catalog and power it on. You must see the tags specified in the machine profile copied to the corresponding resources of that VM.

   > **Note:**
   >
   > You get an error if there is a mismatch in the number of NICs provided in the machine profile and the number of NICs you want the VMs to use.

Modify tags on the resources of an existing VM

1. Create a machine profile with the tags on all the resources.
2. Update the existing machine catalog with the updated machine profile. For example:

```
Set-ProvScheme -ProvisioningSchemeName <YourCatalogName> -
    MachineProfile <PathToYourMachineProfile>
```

3. Turn off the VM on which you want to apply the updates.
4. Request scheduled update for the VM. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName <
    YourCatalogName>  -VMName machine1 -StartsNow -
    DurationInMinutes -1
```

5. Turn on the VM.
6. You must see the tags specified in the machine profile copied to the corresponding resources.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> You get an error if there is a mismatch in the number of NICs provided in the machine profile and the number of NICs provided in the `Set-ProvScheme`.

Create a preformatted WBC disk catalog

You can create a preformatted WBC disk catalog to improve startup performance of provisioned machines. To implement this functionality, create an Azure catalog with WBC enabled and include an additional custom property `PreformatWriteBackCache` as `True`.

You can update an existing catalog using the `Set-ProvScheme` command to update the WBC disk size.

This feature is compatible with the Image management workflow where MCS separates the mastering phase from the overall provisioning workflow. For information on Image management, see Image management.

Example of creating an Azure catalog with WBC enabled and `PreformatWriteBackCache` as `True`:

```
$customProperties = @'
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance">
<Property xsi:type="StringProperty" Name="PreformatWriteBackCache"
    Value="true" />
</CustomProperties>
'@

New-ProvScheme -CleanOnBoot `
-ProvisioningSchemeName "provisioningschemename" `
-HostingUnitName "hostingunitname" `
-IdentityPoolName "identitypoolnamename" `
-MasterImageVM "XDHyp:\HostingUnits\AzureHostingUnit\image.folder\rg.
    resourcegroup\masterImage.manageddisk" `
-CustomProperties $customProperties `
-NetworkMapping $networkMapping `
-UseWriteBackCache `
-WriteBackCacheDiskSize 30
```

Example of updating the WBC disk cache size of an existing catalog:

```
Set-ProvScheme -ProvisioningSchemeName provisioningschemename -
    WriteBackCacheDiskSize 127
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Delete WBC disk at shutdown for MCS provisioned Citrix Provisioning™ catalogs

While creating an MCS provisioned Citrix Provisioning catalogs in Azure, you can provision the WBC disk to be non-persistent (`PersistWBC` as False). This configuration helps to delete the write-back cache (WBC) disk after you shut down the VM for MCS provisioned Citrix Provisioning catalogs in Azure.

Condition:

You must set the custom property `PreformatWriteBackCache` as `True` for this feature to work.

Example of creating an Azure catalog with `PersistWBC` as `False` and `PreformatWriteBackCache` as `True`:

```
$customProperties = @'
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
   instance">
<Property xsi:type="StringProperty" Name="PersistWBC" Value="false" />
<Property xsi:type="StringProperty" Name="PreformatWriteBackCache"
   Value="true" />
</CustomProperties>
'@

New-ProvScheme -CleanOnBoot `
-ProvisioningSchemeName "provisioningschemename" `
-HostingUnitName "hostingunitname" `
-IdentityPoolName "identitypoolnamename" `
-MasterImageVM "XDHyp:\HostingUnits\AzureHostingUnit\image.folder\rg.
   resourcegroup\masterImage.manageddisk" `
-CustomProperties $customProperties `
-NetworkMapping $networkMapping `
-UseWriteBackCache `
-WriteBackCacheDiskSize 30
```

You can also update an existing catalog using the `Set-ProvScheme` command to update the `PersistWBC` custom property.

Provision data disk

You can create and assign a persistent data disk to an MCS created persistent or non-persistent VM of an MCS machine catalog in Azure.

The data disk must be provisioned from a managed disk as an image source.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Data disk properties

The data disk derives properties from custom properties or OS disk template if the properties are not specified in the custom properties.

- Properties derived from custom properties
  - `DiskEncryptionSetId`
  - `Zones`
  - `StorageType`
- Properties derived from OS disk template if not specified in custom properties
  - `DiskEncryptionSetId`
  - `Zones`
  - `StorageType`

> **Note:**
>
> - If Zone Redundant Storage (ZRS) is not specified in custom properties or OS disk template, then the data disk is placed in the same zone as the OS disk and Identity disk.
> - Tags are derived only from the OS disk template.

Limitations

The following operations are currently not supported:

- Provisioning of more than one data disk.
- Provisioning of non-persistent data disks.
- Creating a data disk with a template.
- Modifying existing catalogs and VMs to use data disks.
- Resetting the data disk.
- Image update of the data disk.
- Using a source other than a managed disk.
- Storing data disk in Azure Compute Gallery (ACG).
- Using `StorageTypeAtShutdown` for the data disk

Create a catalog with data disk

Include the following parameters in the `New-ProvScheme` PowerShell command to provision an MCS machine catalog with data disk.

- `DataDisk`: Path to a valid ManagedDisk type of inventory item.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- `DataDiskPersistence`: To indicate whether the `DataDisk` is persistent or non-persistent. However, currently, only persistent data disks are supported.

For example:

```
New-ProvScheme  -CleanOnBoot -HostingUnitName "<HostingUnitName >" -
    IdentityPoolName "<IdentityPoolName >" -InitialBatchSizeHint 1 -
    MasterImageVM disk.manageddisk -NetworkMapping <NetworkMapping > -
    ProvisioningSchemeName "<ProvisioningSchemeName >" -DataDisk "XDHyp
    :\HostingUnits\Azure-Resources-1\image.folder\<resourcegroupname>\
    xxxx-datadisk.manageddisk"  -DataDiskPersistence "Persistent"  -
    Scope @() -VMCpuCount 4  -VMMemoryMB 6144  -TenancyType Shared  -
    FunctionalLevel "L7_20"
```

Determine if a data disk is in use

Do the following to verify if the data disk is assigned to a VM:

- Run `Get-ProvVm` and check the VM's `CustomVmData`. If the VM is using the data disk, there is a disk record with role `DiskRole.DataDisk`.
- Check if a data disk is present under the VM in the Azure portal.

Delete a data disk

If you delete the catalog, the data disk is deleted unless you use `forgetVM` or `purgeDBOnly` option. If you delete the VM, the data disk is deleted unless you use the `forgetVM` or `purgeDBOnly` option.

Migrate from unmanaged to managed disks

On September 30, 2025, Azure will officially retire unmanaged disks (that is, VHDs). Any existing VMs using unmanaged disks will be stopped and deallocated after the deadline.

However, you can migrate your MCS provisioned VMs from unmanaged to managed disks, which helps to avoid service outages due to Azure's unmanaged disk retirement plans.

All unmanaged disks attached to the VM are converted. This includes the Identity Disk, OS Disk, and WBC Disk (if used).

For more information on Azure's unmanaged disk retirement plan, see Migrate your Azure unmanaged disks by September 30, 2025.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use cases

This feature applies to persistent and non-persistent MCS-provisioned catalogs.

It also supports migration for both on-demand and non-on-demand (legacy) VMs:

- On-Demand VMs: Transition your existing disks from unmanaged to managed disks to align with Azure's updated support.
- Non-On-Demand (Legacy) VMs: Legacy or non-on-demand VMs only support unmanaged disks. Use this feature to convert your legacy VMs to on-demand while also migrating to managed disks.

For more information on on-demand provisioning, see Azure on-demand provisioning.

Limitations

- Once a machine catalog or VM is converted to managed disks, it cannot be converted back to unmanaged disks
- For non-on-demand (legacy) VMs, the migration process includes converting them to on-demand provisioning. You cannot convert the disks only and continue to use non-on-demand VMs.

Important considerations

- Conversion does not occur automatically. It happens as part of a power-on operation.
- If multiple updates are requested for a VM, the disk conversion takes precedence. Additional updates are deferred until a subsequent power on.
- Once the VM is successfully converted and powered on, VHDs for the VM are cleaned up to save costs. The storage account itself are not cleaned up.
    - A base disk might still exist in the storage account. You can run a catalog update, and a new snapshot (or ACG) base disk is created.
    - Once all the VMs in the catalog are converted and the new base disk is created, the empty storage account can be deleted.

Required permissions

You need the following permission on your Azure Service Principal to allow conversion from unmanaged to managed disks:

```
1 Microsoft.Compute/virtualMachines/convertToManagedDisks/write
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration steps

For On-Demand Catalogs:

1. Run `Set-ProvScheme` (or `Set-ProvVM` for persistent VMs) to update `UseManagedDisks` to `True`. For example:

```
Set-ProvScheme -ProvisioningSchemeName "<provscheme-name>" -
    CustomProperties "<CustomProperties xmlns=`"http://schemas.
    citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.
    org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"UseManagedDisks`" Value=`"true`" /></
    CustomProperties>"
```

```
Set-ProvVM -ProvisioningSchemeName "<provscheme-name>" -VMName "<
    vm-name>" -CustomProperties "<CustomProperties xmlns=`"http://
    schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http
    ://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"UseManagedDisks`" Value=`"true`" /></
    CustomProperties>"
```

2. Run `Set-ProvVMUpdateTimeWindow‘` to apply the updates. In this example, the update is applied on the next power on for the VM.

```
Set-ProvVmUpdateTimeWindow -ProvisioningSchemeName "<provscheme-
    name>" -VMName "<vm-name>"
```

3. Power on the VMs.

For Non-On-Demand (Legacy) Catalogs:

1. Run `Set-ProvScheme` (or `Set-ProvVM` for persistent VMs) to configure `Set DeploymentSchema` to `1.1`. For example:

```
Set-ProvScheme -ProvisioningSchemeName "<provscheme-name>" -
    CustomProperties "<CustomProperties xmlns=`"http://schemas.
    citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.
    org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"DeploymentSchema`" Value=`"1.1`" /></
    CustomProperties>"
```

```
Set-ProvVM -ProvisioningSchemeName "<provscheme-name>" -VMName "<
    vm-name>" -CustomProperties "<CustomProperties xmlns=`"http://
    schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http
    ://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"DeploymentSchema`" Value=`"1.1`" /></
    CustomProperties>
```

2. Run `Set-ProvVMUpdateTimeWindow` to apply the updates. In this example, the update is applied on the next power on for the VM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-ProvVmUpdateTimeWindow -ProvisioningSchemeName "<provscheme-name>" -VMName "<vm-name>"
```

3. Power on the VMs.

Troubleshooting

If a VM fails to convert from unmanaged to managed disks:

- Verify that the `UseManagedDisks` or `DeploymentSchema` custom properties are set correctly:
  - If using `Set-ProvScheme`, verify the ProvScheme custom properties by running `Get-ProvScheme`. For more information, see Get-ProvScheme.
  - If using `Set-ProvVM`, verify that the VM has a new configuration with the updated custom property by running `Get-ProvVMConfiguration`. For more information, see Set-ProvVM.
- Verify that the following permission is present in your Azure Service Principal:
  - `Microsoft.Compute/virtualMachines/convertToManagedDisks/write`
- Run `Get-ProvOperationEvent` to view any warnings for the Provisioning Scheme. For more information, see Get-ProvOperationEvent. For example:

```
Get-ProvOperationEvent -LinkedObjectType ProvisioningScheme -LinkedObjectUid <your-provscheme-id>
```

Where to go next

Create a Microsoft System Center Virtual Machine Manager catalog

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to Microsoft System Center Virtual Machine Manager (VMM) virtualization environments.

> **Note:**
>
> Before creating a VMM catalog, you need to finish creating a connection to VMM. See Connection to Microsoft System Center Virtual Machine Manager.

Create a master VM

1. Install a VDA on the master VM, and select the option to optimize the desktop to improve performance.
2. Take a snapshot of the master VM to use as a backup.
3. Create virtual desktops.

MCS on SMB 3 file shares

For machine catalogs created with MCS on SMB 3 file shares for VM storage, ensure that credentials meet the following requirements. These requirements ensure that calls from the Controller's Hypervisor Communications Library (HCL) connect successfully to SMB storage:

- VMM user credentials must include full read write access to the SMB storage.
- Storage virtual disk operations during VM life cycle events are performed through the Hyper-V server using the VMM user credentials.

When you use SMB storage, enable the Authentication Credential Security Support Provider (CredSSP) from the Controller to individual Hyper-V machines. Use this process for VMM 2012 SP1 with Hyper-V on Windows Server 2012. For more information, see CTX137465.

The HCL uses `CredSSP` to open a connection to the Hyper-V machine. This feature passes Kerberos-encrypted user credentials to the Hyper-V machine. The **PowerShell** commands in the session on the remote Hyper-V machine run with the credentials provided. In this case, the credentials of the VMM user, so that communication commands to storage work correctly.

The following tasks use PowerShell scripts that originate in the HCL and are then sent to the Hyper-V machine to act on the SMB 3.0 storage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Consolidate master image**: A master image creates an MCS provisioning scheme (machine catalog). It clones and flattens the master VM ready for creating VMs from the new disk created (and removes dependency on the original master VM).

  ConvertVirtualHardDisk on the root\virtualization\v2 namespace

  Example:

```
$ims = Get-WmiObject -class $class -namespace "root\\virtualization\\v2
    ";
$result = $ims.ConvertVirtualHardDisk($diskName, $vhdastext)
$result
```

- **Create difference disk:** Creates a difference disk from the master image generated by consolidating the master image. The difference disk is then attached to a new VM.

  CreateVirtualHardDisk on the root\virtualization\v2 namespace

  Example:

```
$ims = Get-WmiObject -class $class -namespace "root\\virtualization\\v2
    ";
$result = $ims.CreateVirtualHardDisk($vhdastext);
$result
```

- **Upload identity disks:** The HCL cannot directly upload the identity disk to SMB storage. Therefore, the Hyper-V machine must upload and copy the identity disk to the storage. Because the Hyper-V machine cannot read the disk from the Controller, the HCL must first copy the identity disk through the Hyper-V machine as follows.

  1. The HCL uploads the Identity to the Hyper-V machine through the administrator share.
  2. The Hyper-V machine copies the disk to the SMB storage through a PowerShell script running in the PowerShell remote session. A folder is created on the Hyper-V machine and the permissions on that folder are locked for the VMM user only (through the remote PowerShell connection).
  3. The HCL deletes the file from the administrator share.
  4. When the HCL finishes uploading the identity disk to the Hyper-V machine, the remote PowerShell session copies the identity disks to SMB storage. It then deletes it from the Hyper-V machine.

  The identity disk folder is recreated if it is deleted so that it is available for reuse.

- **Download identity disks:** As with uploads, the identity disks pass though the Hyper-V machine to the HCL. The following process creates a folder that only has VMM user permissions on the Hyper-V server if it does not exist.

  1. The Hyper-V machine copies the disk from the SMB storage to the local Hyper-V storage through a PowerShell script. This script runs in the PowerShell V3 remote session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. HCL reads the disk from the Hyper-V machine's administrator share into memory.
3. HCL deletes the file from the administrator share.

Create catalog with a machine profile

You can use a machine profile to create and update an MCS machine catalog in System Center Virtual Machine Manager (SCVMM) environments. You can enable vTPM. You can also add custom tags of a machine profile VM to the provisioned VMs.

Important considerations

- Master image can only be a snapshot and not a VM.
- You can only use VM as the machine profile source.
- You can configure VTPM from the Hyper-V console and not from the SCVMM console.
- If the master image has vTPM enabled, then you must enable the vTPM on the machine profile source.
- vTPM is only supported on Generation 2 machines.
- The following parameters overwrite the values captured in a machine profile if provided separately:
  - VMCpuCount
  - VMMemoryMB
  - Disk storage
- The custom tags are inherited only from the machine profile and not from the master image. The `CitrixProvisioningSchemeId` tag is added by default to the VM. If you do not want to include the `CitrixProvisioningSchemeId` tag, then add the `-NoVmTagging` parameter while creating a hosting unit. Example:

  ```
  New-Item -HypervisorConnectionName $ConnectionName ` -NetworkPath
   @($NetworkPath)` -Path @($HostingUnitPath)` -PersonalvDiskStoragePath
   @()` -RootPath $RootPath ` -StoragePath @($StoragePath)` -
  NoVmTagging
  ```

- You can update an existing catalog using the `Set-ProvScheme` command.
- You can update the memory and disk cache sizes after creating the MCS catalogs when MCSIO is enabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a machine catalog using a machine profile

1. Create a VM to be a machine profile source. For more information, see Provision virtual machines in the VMM fabric. You cannot change the **Generation** once selected. You can do the following in SCVMM:
    - To enable vTPM:
        a) After you create the VM, log in to the Hyper-V host and find your VM under the **Hyper-V Manager**.
        b) Right-click the VM, then go to **Settings**.
        c) Under **Security**, select the **Enable Trusted Platform Module** checkbox.
2. Open a **PowerShell** window.
3. Run `asnp citrix®*` to load the Citrix-specific PowerShell modules.
4. Create a Broker catalog. This catalog is populated with machines which are about to be created.
5. Create an identity pool. This becomes a container for AD accounts created for the machines that are to be created.
6. Create a provisioning scheme with the machine profile. For example:

```
New-ProvScheme -HostingUnitName "<hostingunit name>"
-IdentityPoolName "ID1" -MasterImageVM "XDHyp:\HostingUnits\HU1\<
    path to the checkpoint/snapshot>"
-ProvisioningSchemeName "<catalogname>"  -MachineProfile "XDHyp:\<
    path to the machine profile VM>"
```

7. Updates the Broker catalog with the unique Id of the provisioning scheme.
8. Create and add VMs to the catalog.

Update an existing catalog

You can update an existing catalog using the Set-ProvScheme command. For example:

```
Set-ProvScheme -ProvisioningSchemeName "<catalogname>" -MachineProfile
    "XDHyp:\<path to the machine profile VM>"
```

Remove a VM

You can choose to remove a VM from a catalog but not delete the VM from the SCVMM. In this case, the `CitrixProvisioningSchemeId` tag is only removed from the VM. The custom tags are not deleted from the VM. You can remove a VM using Web studio or PowerShell commands.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove a VM using Web Studio

1. Select and right-click the VM.
2. Click **Delete**.
3. Select **Remove the virtual machines from the catalog but do not delete the virtual machines**.

Using PowerShell commands `Remove-ProvVM` with `ForgetVM` parameter. For more information, see:

- Remove tags
- Delete machines without hypervisor access

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- To manage catalogs, see Manage machine catalogs and Manage a Microsoft System Center Virtual Machine Manager catalog

More information

- Create and manage connections and resources
- Connection to Microsoft System Center Virtual Machine Manager
- Create machine catalogs

Create a Nutanix catalog

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to Nutanix virtualization environments.

> **Note:**
>
> Before creating a Nutanix catalog, you need to finish creating a connection to Nutanix. See Connection to Nutanix.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a machine catalog using Nutanix machine template version

When creating an MCS-provisioned machine catalog with a Citrix-managed Nutanix AHV Prism Central host connection, the base image is created from a Nutanix VM template version. A key advantage is that Nutanix Prism Central allows a VM template to be used across multiple clusters. As a result, Citrix administrators can use a single Nutanix VM template version as the master VM for multiple MCS machine catalogs, even if those catalogs are on different Nutanix clusters.

You can also choose a template version as a source for the machine profile. The master image's template version defaults as the machine profile for new catalogs. However, you can change the template version for the machine profile. The following hardware properties are captured from the machine profile: CPU, memory, cores per socket, GPUs, and Categories. You can even optionally specify CPU, memory, core per socket properties to overwrite the settings of the selected machine profile.

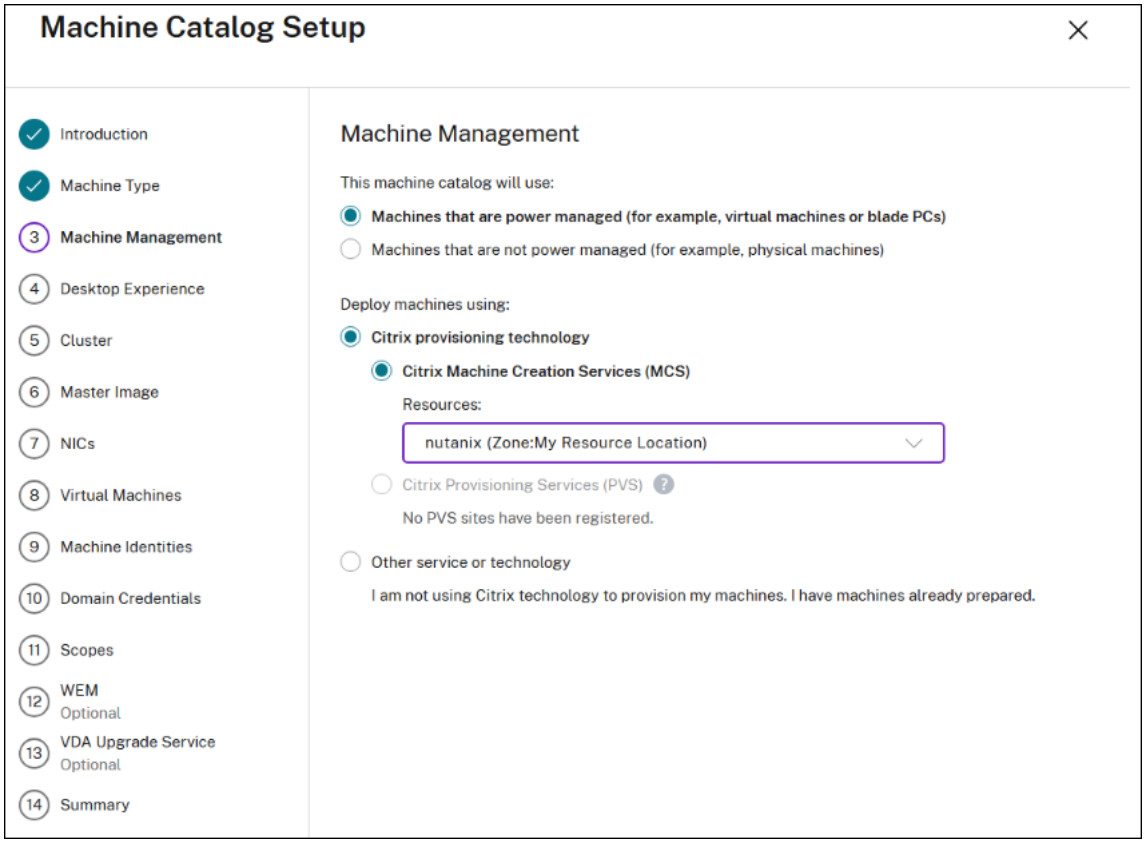
> **Note:**
>
> Categories are key-value pairs used to group and manage entities like virtual machines, clusters, and images for applying policies and automation.

Before creating the catalog, create a master VM, and convert it to a VM template version in Nutanix Prism Central. See Nutanix documentation for the steps.

You can create a catalog using:

- Web Studio. You can also create a catalog using existing VMs. See Create a machine catalog using existing machines (power managed)
- PowerShell commands

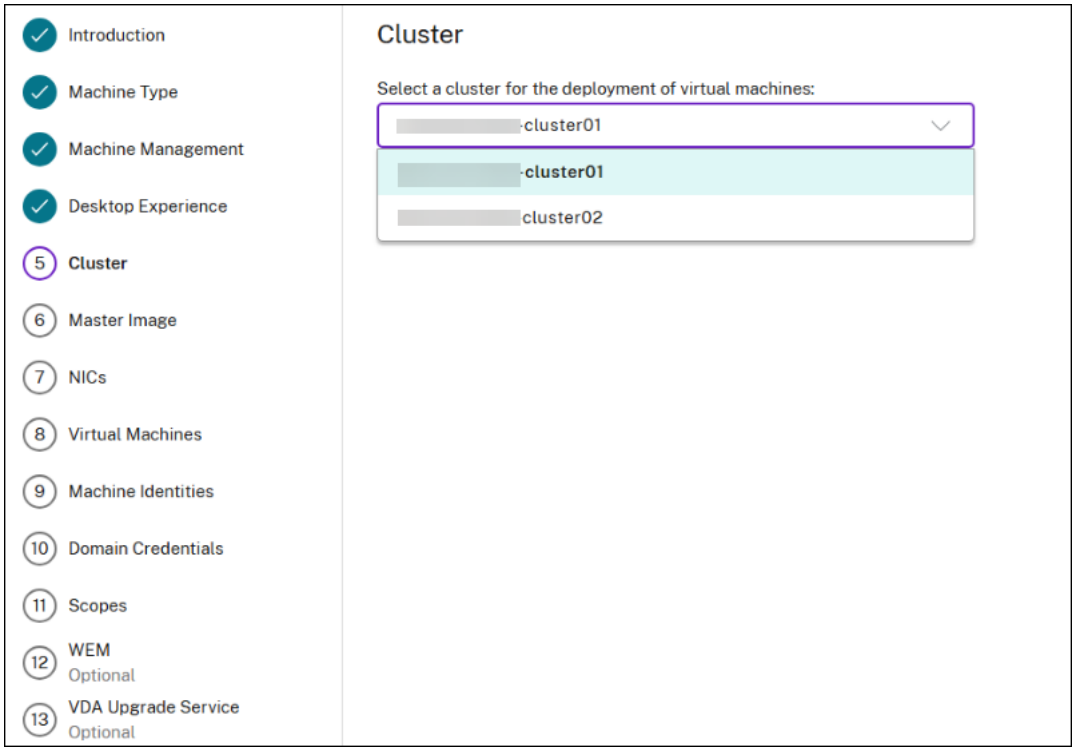
Limitations



- Attaching multiple NICs to the same subnet is not supported.
- Due to Nutanix limitation, each MCS provisioned machine catalog can only be assigned with NICs in a single type of network among Overlay networks, VLAN Basic Subnets, and VLAN Subnets.
- In some scenarios, updating MCS master image for a non-persistent machine catalog might cause potential issues. See Secure Boot and vTPM in Nutanix Prism Central.
- When selecting a Nutanix VM template as the master image, the template name or template version name must not contain any characters like **#** or **&**.

Create a machine catalog using Web Studio

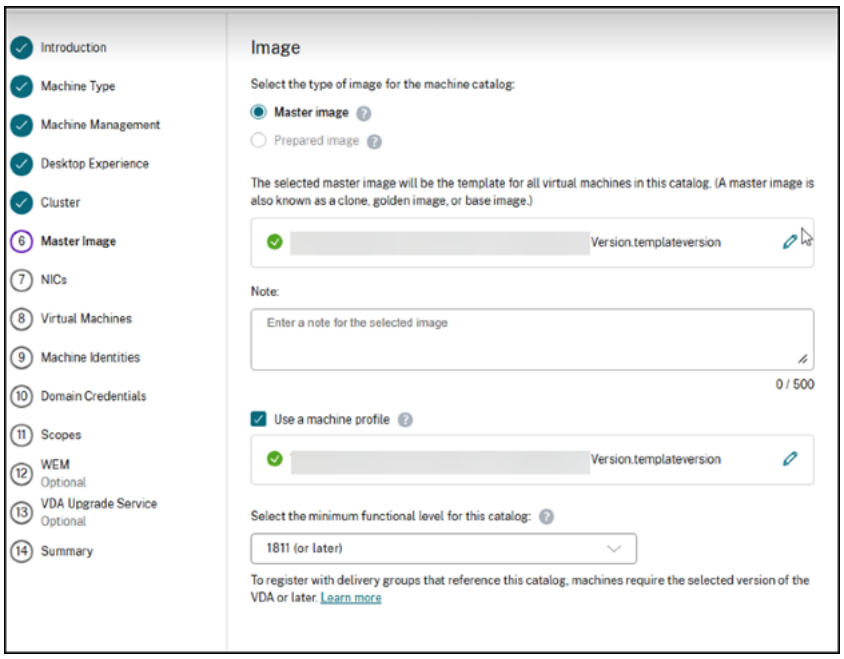
In the Machine Catalog Setup wizard:



© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. On the **Machine Type** page, select **Multi-session OS**, **Single-session OS**, or **Remote PC Access**.
2. On the **Machine Management** page, select **Machines that are power managed** and **Citrix Machine Creation Services™** as the deployment method. Select the **Resources**.

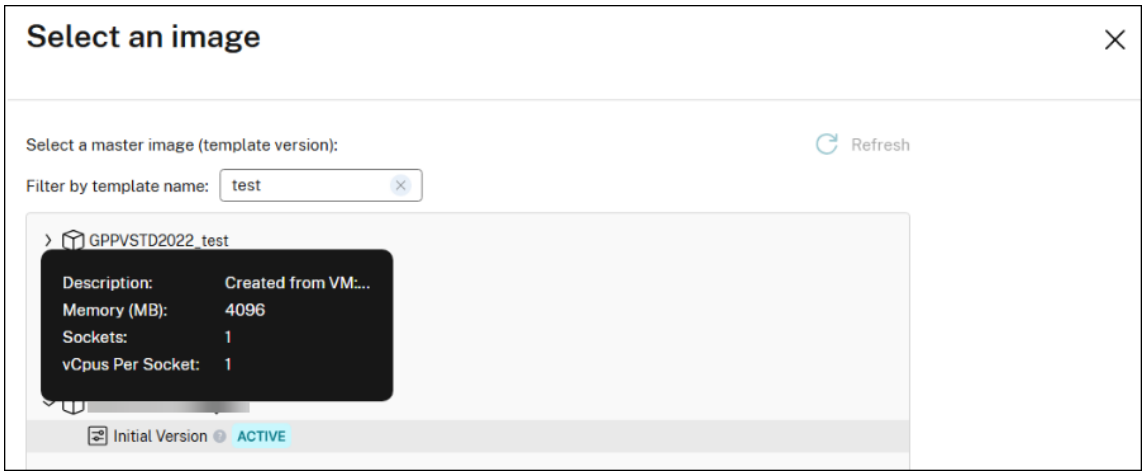
3. On the **Desktop Experience** page, select one of the two options.
4. On the **Cluster** page, select a cluster for the deployment of the VMs.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

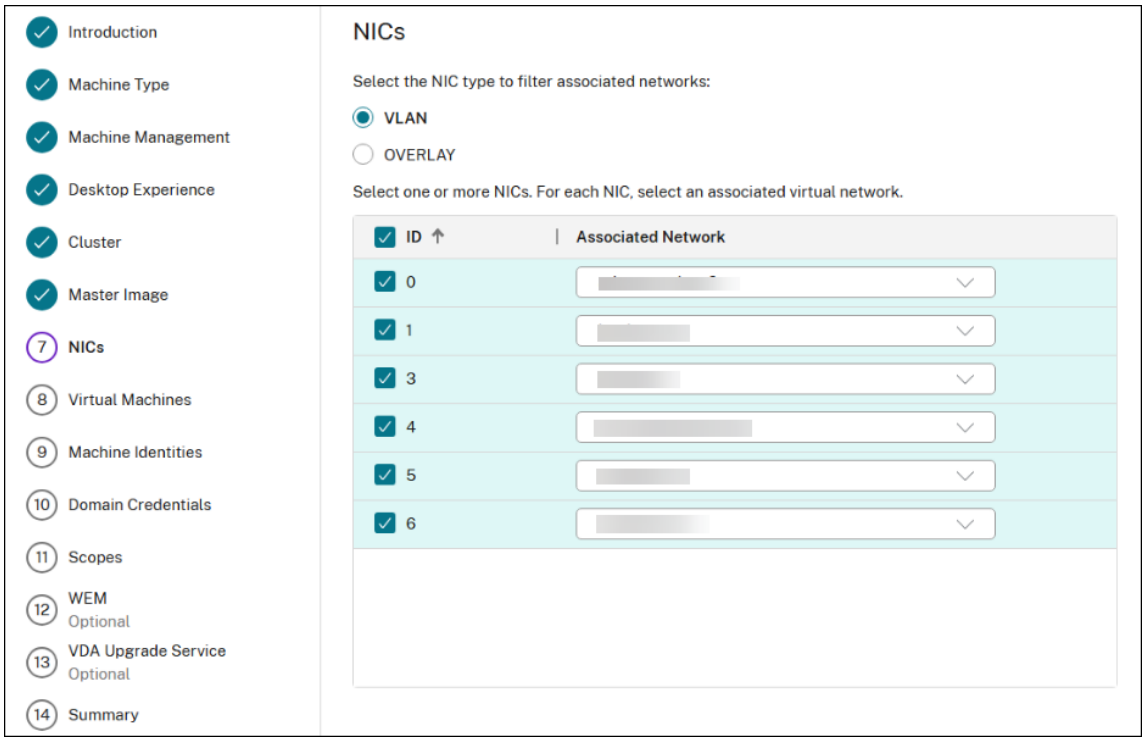
5. On the **Master Image** page, click **Master Image** and select a master image (template version). You can filter machine templates by name. The master image's template version defaults as the machine profile for new catalogs. However, you can change the template version for the machine profile.

   > **Note:**
   >
   > You can use a single Nutanix VM template version as the master VM for multiple MCS machine catalogs, even if those catalogs are on different Nutanix clusters.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

Filter machine templates by name:



See description of a template:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. On the **NICs** page:
   - Select the NIC type to filter associated networks.
   - Select one or more NICs that the master image contains and then select an associated virtual network for each NIC.

7. On the **Virtual Machines** page, indicate the number of virtual machines you want to create and configure your machines for Total memory (MB) on each machine, Virtual CPUs, and Cores per CPU. These values are automatically populated from the machine profile.
8. On the **Summary** page, check the details of the machine catalog. Enter a name and description for the machine catalog. Click **Finish**.

Export the machine profile You can export the machine profile used by the machine catalog to a JSON file.

1. Select the machine catalog and navigate to the **Templates Properties** tab.
2. Under **Machine Profile** details, click **Export** next to the **Last version**.

Create a machine catalog using PowerShell commands

1. Open the PowerShell window.
2. Run `asnp citrix*`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Create an identity pool if not already created. For example:

```
New-AcctIdentityPool    -Domain "<string>" -IdentityPoolName "<
    string>" -IdentityType "ActiveDirectory"  -NamingScheme "DemoVM
    -##" -NamingSchemeType "Numeric" -ZoneUid "GUID" -Scope @()
```

4. Create a provisioning scheme.

   For example: Without a machine profile

```
New-ProvScheme -CustomProperties "<CustomProperties xmlns=`"http:
    //schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http
    ://www.w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"
    StringProperty`" Name=`"ClusterId`" Value=`"00062c63-1fb0-58c9
    -4fc8-5c2573352378`" /><Property xsi:type=`"StringProperty`"
    Name=`"CPUCores`" Value=`"1`" /></CustomProperties>" -
    HostingUnitName "<Hosting unit name>" -IdentityPoolName "<
    string>" -InitialBatchSizeHint 1  -MasterImageVM "XDHyp:\
    HostingUnits\<Hosting Unit Name>\Templates.folder\<template
    name>.template\<template version name>.templateversion" -
    NetworkMapping @{
 "5"="XDHyp:\HostingUnits\<Hosting unit name>\Clusters.folder\<
     Cluster Name>.cluster\<Network name>.network" }
  -ProvisioningSchemeName "<Catalog name>" -ProvisioningSchemeType
      "MCS" -RunAsynchronously -Scope @() -VMCpuCount 2 -
     VMMemoryMB 10240
```

   For example: With a machine profile

   Use a machine profile to capture hardware properties from a template version and apply them to provisioned VMs. If you don't specify machine profile, hardware properties are captured from the master image template version.

> **Note:**
>
> - The OS Disk, vTPM, and Secure Boot properties are always captured from the master image, even when a machine profile is used.
> - Since OS Disk is not read from the machine profile, you can create a diskless VM and convert it to a template version that can be used for the machine profile.
> - As the complete JSON spec of the machine profile template version is stored, you can create the VMs even if you delete the template version from the Prism Central.

   Properties captured from the machine profile are:

Property	Property Name in API (GetTemplateVersionById)	Comments/References
CPU	**numSockets**	
RAM	**memorySizeBytes**	

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Property	Property Name in API (GetTemplateVersionById)	Comments/References
Core	**numCoresPerSocket**	
Categories	**categories**	Category Management
GPU	**gpus**	GPUs Summary View
Threads Per Core	**numThreadsPerCore**	aCLI-VM
Numa Nodes	**numNumaNodes**	
Enable VCPU Hard Pinning	**isVcpuHardPinningEnabled**	
Enable CPU Passthrough	**isCpuPassthroughEnabled**	
Enable Memory Overcommit	**isMemoryOvercommitEnabled**	Creating a VM through Prism Central (AHV)
Enable GPU Console Access	**isGpuConsoleEnabled**	
Enable CPU Hot Plug	**isCpuHotplugEnabled**	
Enable SCSI Controller	**isScsiControllerEnabled**	
Timezone	**hardwareClockTimezone**	Creating a VM through Prism Central (AHV)
Enable AHV branding	**isBrandingEnabled**	
Enable VGA Console	**isVgaConsoleEnabled**	
VM	**isAgentVm**	Creating a VM through Prism Central (AHV)

> **Note:**
>
> Using the same master image template version, you can create different catalogs with various machine profiles, each featuring a distinct set of properties mentioned above. For example, you might assign different Categories that can be linked to Nutanix Policies, adjust CPU/Memory, modify Memory Overcommit settings, or add and remove multiple GPUs.

The command-line parameters, such as `VMCpuCount`, `VMMemoryMB`, and `CPUCores` in the `CustomProperties`, can be provided and takes precedence over the values for these parameters from the machine profile template version. If not provided, these are read from the given machine profile.

```
$customProperties = @"
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance">
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    <StringProperty Name="ClusterId" Value="00062c63-1fb0-58c9-4
       fc8-5c2573352378" />
    <StringProperty Name="CPUCores" Value="2" />
</CustomProperties>
"@

New-ProvScheme -HostingUnitName "<Hosting unit name>" `
           -IdentityPoolName "<string>" `
           -InitialBatchSizeHint 1 `
           -MasterImageVM "XDHyp:\HostingUnits\<Hosting Unit Name
              >\Templates.folder\<template name>.template\<
              template version name>.templateversion" `
           -MachineProfile "XDHyp:\HostingUnits\<Hosting Unit Name
              >\Templates.folder\<template name for machine
              profile>.template\<template version name>.
              templateversion" `
           -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\<Hosting unit name>\Clusters.folder\<
    Cluster Name>.cluster\<Network name>.network" }
  `
           -ProvisioningSchemeName "<Catalog name>" `
           -ProvisioningSchemeType "MCS" `
           -CustomProperties $customProperties `
           -RunAsynchronously `
           -VMCpuCount 2 `
           -Scope @()
```

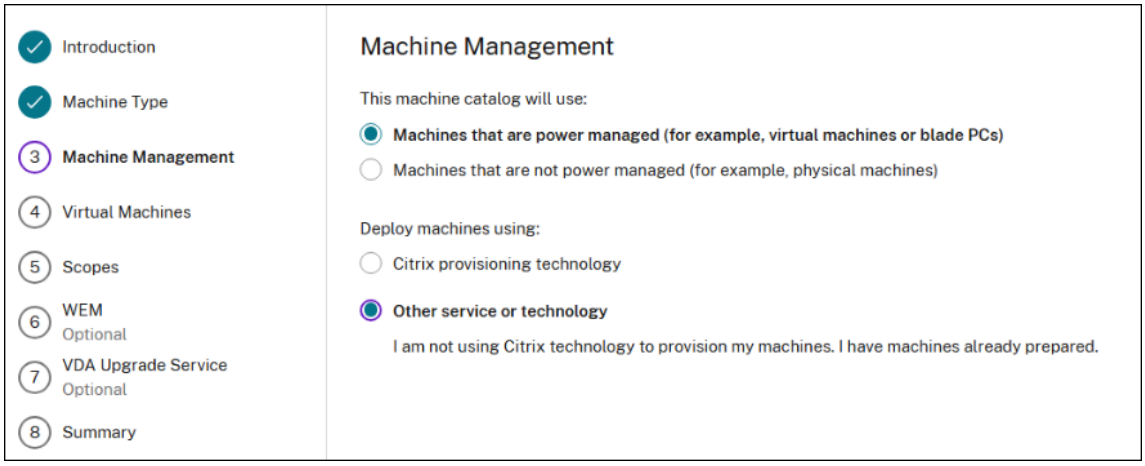
5. Register a provisioning scheme as a broker catalog. For example:

```
New-BrokerCatalog -AllocationType "Random" -IsRemotePC $False  -
   MinimumFunctionalLevel "L7_20" -Name "<Catalog Name>" -
   PersistUserChanges "Discard" -ProvisioningType "MCS"    -
   SessionSupport "MultiSession" -ZoneUid "GUID"  -
   ProvisioningSchemeId fe7df345-244e-4xxxx-xxxxxxxxx `  -Scope @
   ()
```

Create a machine catalog with existing machines (power managed)

You can create a machine catalog with existing machines (power managed) using:

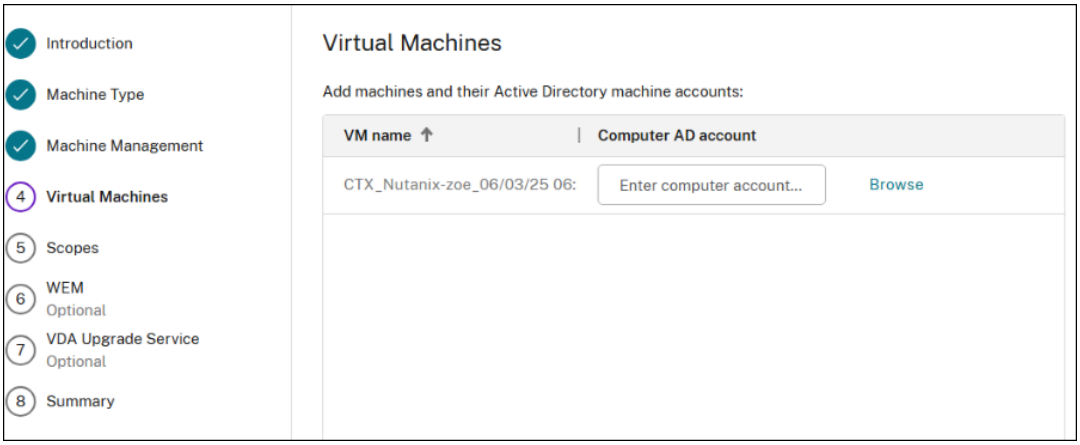
- Web Studio
- PowerShell



Create a machine catalog with existing machines (power managed) using Web Studio

In the Machine Catalog Setup wizard:

1. On the **Operating System** page, select **Multi-session OS** or **Single-session OS**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the **Machine Management** page, select **Machines that are power managed** and **Other service or technology**.

3. On the **Virtual Machines** page, add machines and their Active Directory machine accounts. You can do one of the following:

   - Click **Import from CSV file** to bulk add machines.
   - Click **Add Machines** to add machines manually. The **Select VMs** window appears. Expand the Nutanix AHV Prism Central connection that you created earlier and select the VMs you want to add. Then add the associated machine account names.

4. The **Scopes** and **Summary** pages do not contain information specific to Nutanix AHV Prism Central.

Create a machine catalog with existing machines (power managed) using PowerShell

1. Open the PowerShell window.
2. Run `asnp citrix*`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Create a catalog to have power-managed VMs that are assigned to the user. For example:

```
New-BrokerCatalog -AllocationType "Permanent"  -IsRemotePC $False
    -MachinesArePhysical $False  -Name "<Catalog Name>" -
    PersistUserChanges "OnLocal" -ProvisioningType "Manual" -Scope
    @() -SessionSupport "SingleSession" -ZoneUid "fb202053-8c35-4
    db2-a299-a8d9538ec6be"
```

4. Add VMs to the catalog. For example:

```
New-BrokerMachine  -CatalogUid 6 -HostedMachineId "d859caf3-4bf0
    -447b-b012-8af0594c7d88" -HypervisorConnectionUid 1 -IsReserved
     $False  -MachineName "S
    -1-5-21-1334627847-1250330507-3910179295-100245"
```

Create a machine catalog using a Nutanix snapshot

This section describes how to create an MCS provisioned machine catalog with Nutanix Acropolis (Prism Element) host connection. Before creating the catalog, create master images and snapshots in Nutanix. For more information, see the Nutanix documentation.

In the Machine Catalog Setup wizard:

- The **Container** or **Cluster and Container** page is unique to Nutanix.
  - If you deploy machines by using Nutanix AHV XI as the resources, on the **Container** page, select a container where the VMs' identity disks will be placed.
  - If you deploy machines by using Nutanix AHV PC as the resources, you see the **Cluster and Container** page. Select which cluster to use for the deployment of VMs and then a container.
- On the **Image** page, select the image snapshot. Use the Acropolis console to rename your snapshots if needed. If you rename snapshots, restart the catalog creation wizard to see a refreshed list.
- On the **Virtual Machines** page, indicate the number of virtual CPUs and the number of cores per vCPU.
- On the **NICs** page, select the NIC type to filter associated networks. This option is available only for Nutanix AHV PC connections.
- The **Machine Identities**, **Domain Credentials**, **Scopes**, and **Summary** pages do not contain Nutanix-specific information.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Limitations

When creating an MCS catalog with Nutanix host connection (specifically, Nutanix AHV plug-in 2.7.1 and Nutanix AHV plug-in 2.5.1), the hard disk size of provisioned VMs are incorrectly displayed on Web Studio.

- Nutanix AHV plug-in 2.7.1: The size displayed is smaller (1 GB) than the real storage size.
- Nutanix AHV plug-in 2.5.1: The size displayed is smaller (32 GB) than the real storage size.

However, this works as designed if the master image VM is a snapshot in VM.

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- To manage catalogs, see Manage machine catalogs and Manage a Nutanix catalog

Create an Oracle C3 machine catalog (Preview)

May 13, 2026

Create machine catalogs describes the generic machine-catalog workflow. The following information covers Oracle C3-specific details.

> **Note:**
>
> Before creating an Oracle C3 catalog, complete these prerequisites:
>
> - Connection to Oracle C3.
> - Ensure one or more Oracle C3 machines are available for onboarding.
> - Prepare those machines with required VDA readiness.

You can create an Oracle C3 machine catalog using:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Web Studio
- PowerShell commands

Create a machine catalog using web Studio

In the Machine Catalog Setup wizard:

1. On **Operating System** page, select **Multi-session OS** or **Single-session OS**.
2. On **Machine Management** page, select **Machines that are power managed** and **Another service or technology**.
3. On **Virtual Machines** page, add machines and associated machine accounts by doing one of the following:
    - Select **Add Machines** to add Oracle C3 machines manually from the Oracle C3 connection.
    - Select **Add CSV File** to bulk add Oracle C3 machines and machine account mappings.

The **Scopes** and **Summary** pages do not contain Oracle C3-specific information.

Create a machine catalog using PowerShell commands

Use `New-BrokerCatalog` and `New-BrokerMachine` to create the catalog and import existing Oracle C3 machines.

Example pattern:

```
New-BrokerCatalog -AllocationType "Random" -ProvisioningType "Manual" `

-SessionSupport "MultiSession" -Name "OracleC3-Catalog" `

-PersistUserChanges "OnLocal"

New-BrokerMachine -CatalogUid <CatalogUid> `

-HostedMachineId <OracleC3MachineId> `

-HypervisorConnectionUid <OracleC3ConnectionUid> `

-MachineName <Domain\MachineAccount>
```

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- For power management, see Power manage Oracle C3 VMs

Create a Red Hat OpenShift catalog

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to Red Hat OpenShift virtualization environments.

> **Note:**
>
> Before creating a Red Hat OpenShift catalog, finish creating a connection and hosting unit to Red Hat OpenShift. See Connection to Red Hat OpenShift.

Create a master image VM

A master image VM is required to create a machine catalog.

1. Access the OpenShift Console using your login ID.
2. Navigate to **Virtualization > VirtualMachines** to see the list of VMs, including master image VMs.
3. Create a master image. When creating a master image, make sure that the master image VM has only one storage device.

> **Note:**
>
> - Ensure that a routable NAD is added to the master image VM according to the customer's requirements for the cluster environment.
> - When the master image is joined to a domain, it might lose domain trust after being used for catalog creation. This issue affects Citrix Virtual Apps and Desktops™ 2503 due to a limitation in the OpenShift environment. The workaround is not to join domain in master images. Citrix is working with Red Hat to enhance network isolation capabilities.
> - When creating an MCS machine catalog in a Red Hat OpenShift virtualization environment, you can't use a master image and a machine profile that have different operating system types. This is due to how Red Hat OpenShift manages each OS type. Therefore, using a Windows VM as the master image with a non-Windows (example, Linux) VM as the machine

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> profile, or the other way around, is not supported.
> - Currently, the VMs created using `InstanceType` are not supported as a master image.

Create a catalog

You can create OpenShift catalogs to create, deliver, and power manage machines in your OpenShift environments.

- Create a catalog using Web Studio
- Create a catalog using PowerShell commands

Create a catalog using Web Studio

You can create an MCS machine catalog in the Red Hat OpenShift environment with or without a machine profile using Web Studio. A VM is used as a machine profile input.

In the Machine Catalog Setup wizard:

1. On the **Operating System** page, select **Multi-session OS** or **Single-session OS**.
2. On the Machine Management page:
   - Select **Machines that are power managed (for example, virtual machines or blade PCs)**.
   - Select to deploy machines using **Citrix provisioning technology Citrix Machine Creation Services™ (MCS)**.
   - Select the Openshift hosting unit under Citrix Machine Creation Services (MCS)
3. On the **Desktop Experience** page, select the option according to the machine type you select on the **Machine Type** page.
4. On the **Image** page:
   a) Select a master image. Currently, Openshift doesn't support Prepared image.
   b) You can add a note for the selected image.
   c) You can select the Use a machine profile checkbox and select a machine profile.
   d) To enable use of the latest product features, ensure that the master image has the latest VDA version installed. Do not change the default minimum VDA selection. However, if you must use an earlier VDA version, see VDA versions and functional levels.
5. On the **NICs** page, select one or more NICs, associate a virtual network with each card.
6. On the **Virtual Machines** page:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Specify how many virtual machines to create. Enter 0 (zero) if you do not want to create any. Later, you can create VMs for an empty catalog by adding machines.
b) Choose the amount of memory (in MB) each VM has.
c) If you are creating a random non-persistent catalog, you can enable Write-Back Cache for machines to improve I/O performance. See Configure cache for temporary data.

7. Follow the on-screen instructions to complete the remaining steps, which don't include OpenShift-specific information.

You can also use Studio to create Openshift catalogs to deliver and manage the power of existing machines in your OpenShift environments. Do the following:

In the Machine Catalog Setup wizard:

1. On the **Operating System** page, select **Multi-session OS or Single-session OS**.
2. On the **Machine Management** page, select **Machines that are power managed and Another service or technology**.
3. On the **Virtual Machines** page, add machines and their Active Directory machine accounts. You can:

   - *Add machines manually*: Click **Add Machines to add machines manually**. The **Select VMs** window appears. Expand the OpenShift connection you created earlier and select the nodes (VMs) you want to add. Then add the associated machine account names.
   - *Add machines using a CSV file*: Click **Add CSV File to bulk add machines**. For information about using CSV files to add machines, see Use CSV files to bulk add machines to a catalog.

4. Follow the on-screen instructions to complete the remaining steps, which don't include OpenShift-specific information.

Create a catalog using PowerShell commands

You can create an MCS machine catalog in the Red Hat OpenShift environment using PowerShell commands. You can create the machine catalog with or without using a machine profile. A VM is used as a machine profile input.

1. Open a PowerShell window.
2. Run `asnp citrix*`.
3. Run PowerShell commands to

   a) Create an identity pool
   b) Create AD accounts
   c) Create an MCS machine catalog with persistent VMs with or without a machine profile.
   d) Add VMs to the catalog

© 1997–2026 Citrix Systems, Inc. All rights reserved.

e) Create a broker catalog
f) Add broker machines to the new VMs

Following is a sample script:

Create an identity pool

```
New-AcctIdentityPool `
    -IdentityPoolName "IdentityPoolName" `
    -ZoneUid "00000000-0000-0000-0000-000000000000" `
    -NamingScheme "vm###" `
    -NamingSchemeType "Numeric" `
    -AllowUnicode `
    -Domain "MyDomain.local" `
    -AdminAddress "MyDDC.MyDomain.Local"
```

Create AD accounts

```
New-AcctADAccount `
    -IdentityPoolUid "11111111-1111-1111-1111-111111111111" `
    -ADUserName "MyDomain\MyUserName" `
    -ADPassword SecurePassword `
    -Count 1 `
    -AdminAddress "MyDDC.MyDomain.Local"
```

Create a provisioning scheme with persistent machines (without machine profile)

```
New-ProvScheme `
    -ProvisioningSchemeName "ProvisioningSchemeName" `
    -HostingUnitName "HostingUnitName" `
    -IdentityPoolName "IdentityPoolName" `
    -ProvisioningSchemeType "MCS" `
    -MasterImageVM "XDHyp:\HostingUnits\HostingUnitName\TargetNamespace
        .namespace\MasterImageVM.vm" `
    -NetworkMapping @{
 "0" = "XDHyp:\HostingUnits\HostingUnitName\TargetNamespace.namespace\
    MyNetwork.network"  }
  `
    -VMCpuCount 1 `
    -VMMemoryMB 4096 `
    -InitialBatchSizeHint 1 `
    -AdminAddress "MyDDC.MyDomain.Local"
```

Create a provisioning scheme with persistent machines (with machine profile)

```
New-ProvScheme `
    -ProvisioningSchemeName "ProvisioningSchemeName" `
    -HostingUnitName "HostingUnitName" `
    -IdentityPoolName "IdentityPoolName" `
    -ProvisioningSchemeType "MCS" `
    -MasterImageVM "XDHyp:\HostingUnits\HostingUnitName\TargetNamespace
        .namespace\MasterImageVM.vm" `
    -NetworkMapping @{
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
 "0" = "XDHyp:\HostingUnits\HostingUnitName\TargetNamespace.namespace\
    MyNetwork.network"  }
  `
    -VMCpuCount 1 `
    -VMMemoryMB 4096 `
    -InitialBatchSizeHint 1 `
    -AdminAddress "MyDDC.MyDomain.Local" `
    -MachineProfile "XDHyp:\HostingUnits\HostingUnitName\
       TargetNamespace.namespace\MachineProfileVM.vm"
```

Create new ProvVMs

```
New-ProvVM `
    ProvisioningSchemeName "ProvisioningSchemeName" `
    ADAccountName "MyDomain\vm001" `
    AdminAddress "MyDDC.MyDomain.Local"

Lock-ProvVM `
    -ProvisioningSchemeName "ProvisioningSchemeName" `
    -Tag "Brokered" `
    -VMID "TargetNamespace:vm001"
```

Create new broker catalog

```
New-BrokerCatalog `
    -Name "ProvisioningSchemeName" `
    -ProvisioningType "MCS" `
    -SessionSupport "MultiSession" `
    -AllocationType "Random" `
    -PersistUserChanges "OnLocal" `
    -ZoneUid "00000000-0000-0000-0000-000000000000" `
    -AdminAddress "MyDDC.MyDomain.Local"
```

Set broker catalog metadata

```
Set-BrokerCatalogMetadata `
    -CatalogId "1" `
    -Name "Citrix_DesktopStudio_IdentityPoolUid" `
    -Value "11111111-1111-1111-1111-111111111111"

Set-BrokerCatalog `
    -Name "ProvisioningSchemeName " `
    -ProvisioningSchemeId "22222222-2222-2222-2222-222222222222"
```

Create broker machines for the new ProvVMs

```
New-BrokerMachine `
    -CatalogUid "33333333-3333-3333-3333-333333333333" `
    -AdminAddress "MyDDC.MyDomain.Local" `
    -MachineName "S-0-0-00-0000000000-0000000000-000000000-000000"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

vCPU calculation and CPU topology constraints

When updating the CPU configuration of an OpenShift virtual machine, the plugin computes the number of sockets based on the requested vCPU count and the existing CPU topology (cores and threads) from the machine profile.

The formula used is:

```
sockets = requestedVCpuCount / (cores × threads)
```

Requirements

- The machine profile's cores and threads values must both be greater than zero.
- The requested vCPU count must be an exact multiple of cores × threads. If it is not evenly divisible, the update will be rejected.
- Only the sockets value is adjusted; the cores and threads values from the machine profile are preserved as-is.

Example

Machine profile	Requested vCPU	Computed sockets	Valid?
cores=2, threads=2	8	8 / (2×2) = 2	Yes
cores=2, threads=2	6	6 / (2×2) = 1.5	No
cores=4, threads=1	12	12 / (4×1) = 3	Yes

Known limitation

If the machine profile defines a CPU topology where cores × threads is greater than 1, only vCPU counts that are exact multiples of that product are supported.

Ensure that the requested vCPU count aligns with the machine profile's topology when creating or updating a provisioning scheme.

Where to go next

- If this is the first catalog created, Web Studio guides you to create a delivery group
- To review the entire configuration process, see Install and configure
- For power management, see Power manage Red Hat OpenShift VMs

More information

- Create and manage connections and resources
- Connection to Red Hat OpenShift
- Create machine catalogs

Create a VMware catalog

May 13, 2026

Create machine catalogs describes the wizards that create a machine catalog. The following information covers details specific to VMware virtualization environments.

> **Note:**
>
> Before creating a VMware catalog, you need to finish creating a connection to VMware. See Connection to VMware.

Create a master VM

Use a master VM to provide user desktops and applications in a machine catalog. On your hypervisor:

1. Install a VDA on the master VM, selecting the option to optimize the desktop, which improves performance.
2. Take a snapshot of the master VM to use as a back-up.

> **Note:**
>
> You can use MCS to provision VMs in vSAN 8.0 environment.

Create a machine catalog using a machine profile

You can create an MCS machine catalog using a machine profile. The source of the machine profile input is a VMware template. The machine profile captures the hardware properties from a VMware template and applies them to the newly provisioned VMs in the catalog.

> **Note:**
>
> - Master image input (snapshot) and machine profile input (VMware template) must either be both vTPM enabled or both vTPM disabled. This rule applies to both `New-ProvScheme` and `Set-ProvScheme`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - If the master image is vTPM enabled, then the VMware template can only come from the same VM source as the master image.
> - Encrypted storage policy only supports full clone.
> - The machine profile-based catalogs utilize the provided VMware template to gather storage controller information, relying on the attached virtual disks. The template must include a virtual disk which is required to retrieve the storage controller information that is used to configure virtual disks for the virtual machines.

The VMware template in the machine profile must exist during the catalog life cycle to allow provisioning of VMs to the catalog. Without a VMware template, you cannot provision new VMs. When a VMware template gets deleted, you must supply a new template using the `Set-ProvScheme` command.

- MCS captures properties of a VMware template. You can create new a VMware template referencing stored properties of VMware template using the Get-Provscheme command.
- Alternatively, if the machine catalog and provisioned VMs exist, then an MCS provisioned machine can also be used to create a new VMware template.
- When MCSIO is enabled, you can update the memory and disk cache sizes after creating the MCS catalogs.

Based on different OS, you can create a machine catalog with different configurations:

- If windows 11 is installed on the master image, then it is a requirement to have vTPM enabled for the master image. Therefore, the VMware template, which is a source of machine profile, must have vTPM attached to it.
- If windows 10 is installed on the master image with no vTPM attached, then you can create a machine catalog with non-vTPM VMware template as source for machine profile.

There is another configuration where you can create a machine catalog using full copy disk mode with machine profile template applied with encrypted storage policy.

To create a machine catalog using PowerShell commands with machine profile as input:

1. Open a **PowerShell** window.
2. Run `asnp citrix®*`.
3. Run the following commands:

    - To create a machine catalog with vTPM attached VMware template as a source for machine profile input and windows11 installed master image:

```
$identityPool = New-AcctIdentityPool  -IdentityPoolName "<
    string>"
-NamingScheme "<string>-###"
-NamingSchemeType Numeric
-Domain "<domain name"
-ZoneUid "<Uid>"  -Scope @()
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$provScheme =New-ProvScheme  -CleanOnBoot
-HostingUnitName "vSanRg"
-IdentityPoolName "<string>"
-InitialBatchSizeHint 1
-MasterImageVM "XDHyp:\HostingUnits\<hosting unit name>\<
   snapshot name>.snapshot"
-NetworkMapping @{
"0"="XDHyp:\HostingUnits\<hosting unit name>\\<network name>.
   network" }

-ProvisioningSchemeName "<string>"
-Scope @() -VMCpuCount 4
-VMMemoryMB 6144
-MachineProfile "XDHyp:\HostingUnits\<hosting unit name>\<
   template name>.template" -TenancyType Shared
-FunctionalLevel "L7_20"
```

```
$catalog = New-BrokerCatalog
-AllocationType "Static"
-PersistUserChanges  "OnLocal"
-Description "<string>"
-IsRemotePC $False
-MinimumFunctionalLevel 'L7_9'
-Name "<catalog name>"
-ProvisioningType 'MCS'
-Scope @()
-SessionSupport "SingleSession" -ZoneUid "<Uid>"
```

```
Set-BrokerCatalog -Name "<string>"
-ProvisioningSchemeId $provScheme.ProvisioningSchemeUid.Guid
```

- To create a machine catalog with Non-vTPM VMware template as source for machine profile and Windows10 installed master image:

```
$identityPool = New-AcctIdentityPool
-IdentityPoolName "<string>"
-NamingScheme "<string>-###" -NamingSchemeType Numeric
-Domain "<domain name>"
-ZoneUid "<Uid>"  -Scope @()
```

```
$provScheme =New-ProvScheme
-CleanOnBoot -HostingUnitName "<string>"
-IdentityPoolName "<string>"
-InitialBatchSizeHint 1
-MasterImageVM "XDHyp:\HostingUnits\<hosting unit name>\<
   snapshot name>.snapshot
-NetworkMapping @{
"0"="XDHyp:\HostingUnits\<hosting unit name>\\<string>.
   network" }

-ProvisioningSchemeName "<string>"  -Scope @() -VMCpuCount 4
    -VMMemoryMB 8192
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-MachineProfile "XDHyp:\HostingUnits\<hosting unit name>\<
    template name>.template"
-TenancyType Shared  -FunctionalLevel "L7_20"
```

```
$catalog = New-BrokerCatalog
-AllocationType "Static"
-PersistUserChanges  "OnLocal"
-Description "<string>"
-IsRemotePC $False
-MinimumFunctionalLevel 'L7_9' -Name "<string>" -
    ProvisioningType 'MCS' -Scope @()
-SessionSupport "SingleSession" -ZoneUid "<Uid"
```

```
Set-BrokerCatalog -Name "<string>"
-ProvisioningSchemeId $provScheme.ProvisioningSchemeUid.Guid
```

- To create a machine catalog using Full copy disk mode with machine profile template applied with encrypted storage policy:

```
$identityPool = New-AcctIdentityPool
-IdentityPoolName "<string>"
-NamingScheme "<string>-###"
-NamingSchemeType Numeric
-Domain "<domain name>"
-ZoneUid "<Uid>"  -Scope @()
```

```
$provScheme =New-ProvScheme
-HostingUnitName "<string>"
-IdentityPoolName "<string>"
-InitialBatchSizeHint 1
-MasterImageVM "XDHyp:\HostingUnits\<hosting unit name>\<
    snapshot name>.snapshot"
-NetworkMapping @{
"0"="XDHyp:\HostingUnits\<hosting unit name>\\<string>.
    network" }

-ProvisioningSchemeName "<string>"
-Scope @() -VMCpuCount 4  -VMMemoryMB 8192 -MachineProfile "
    XDHyp:\HostingUnits\<hosting unit name>\<template name>.
    template"
-TenancyType Shared
-FunctionalLevel "L7_20" -UseFullDiskCloneProvisioning
```

```
$catalog = New-BrokerCatalog
-AllocationType "Static"
-PersistUserChanges  "OnLocal"
-Description "<string>"  -IsRemotePC $False
-MinimumFunctionalLevel 'L7_9'
-Name "<string>" -ProvisioningType 'MCS' -Scope @()
-SessionSupport "SingleSession" -ZoneUid "<Uid>"
```

```
Set-BrokerCatalog -Name "<string>"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
    -ProvisioningSchemeId $provScheme.ProvisioningSchemeUid.Guid
```

To update a machine profile, use the Set-ProvScheme command. For example:

```
Set-ProvScheme -ProvisioningSchemeName 'name' -IdentityPoolName 'name'
    -MachineProfile 'XDHyp:\HostingUnits\<hosting unit name>\<template
    name>.template'
```

Check for multiple NICs

You get various error messages during the pre-flight checks for multiple NICs when using a machine profile and the `NetworkMapping` parameter in the `New-ProvScheme` and `Set-ProvScheme` commands.

The pre-flight checklist for multiple NICs is as follows:

- Only NIC count from the machine profile template is used and validated. The network to which these NICs point towards is not used or validated against the hosting unit networks.
- If the NIC count in the machine profile template is greater than the number of networks in the hosting unit, you get an error message.
- If the NIC count in the machine profile template is zero, you get an error message.
  When the NIC count in the machine profile template is one, then:
  - If no network mapping is specified in the `New-ProvScheme` or `Set-ProvScheme` command, and the hosting unit network is one, then the hosting unit network is used.
  - If network mapping is specified, then the specified network mapping is used if it is valid.
- When the NIC count in the machine profile template is greater than 1, or the hosting unit network count is greater than 1, then:
  - Valid network mapping is required in the command, and it should provide mapping for each NIC (that is, NetworkMapping count should be same as the machine profile NIC count).
  - Multiple NICs cannot be mapped to the same network in the hosting unit.
  - `NetworkMapping` count and machine profile NIC count must be less than or equal to the hosting unit network count.
  - `NetworkMapping` must be provided for each id from 0 to n-1, where n is the number of network adapters in the machine profile template.

Provision a Data disk on MCS created VM

A Data disk allows storage of persistent data like event logs, security traces, and application data. You can create and assign a persistent or non-persistent Data disk to an MCS created persistent or non-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

persistent VM of an MCS machine catalog in VMware.

Provision the Data disk from the master image. The prepared master image Data disk is stored in `<Prov Scheme Name>-dataDisk-<datastoreId>` folder.

You can create both machine profile and non-machine profile-based MCS catalog. For machine profile-based MCS catalog, you can use the same master image VM as the Data disk source for the machine profile.

The provisioned VM's Data disk derives properties like storage policy and size from the master image. For machine profile based catalog, it can optionally use the VM template's Data disk for deriving the properties. If the VM template doesn't have a data disk, then Storage's default policy is used.

The Data disk of the provisioned VM is created in the same directory as the OS and Identity disk.

Supported Data disk scenarios

Following are the supported OS disk and Data disk scenarios:

- Persistent OS disk with persistent Data disk
- Non-persistent OS Disk with persistent Data disk
- Non-persistent OS Disk with non-persistent Data disk

> **Note:**
>
> A persistent machine catalog cannot have a non-persistent Data disk.

Limitations

The following operations are currently not supported:

- Provisioning of more than one Data disk.
- Resetting the Data disk.
- Updating an MCS catalog with a Data disk to a non-Data disk MCS catalog. Similarly, updating an MCS catalog without a Data disk to a Data disk MCS catalog.

Key steps

1. Create a master image VM with a Data disk in VMware. For a machine profile-based MCS catalog, you can use the same master image VM as the Data disk source for the machine profile.
2. Create an MCS machine catalog with Data disk provisioned VMs using the `New-ProvScheme` PowerShell command. See Create a catalog with Data disk provisioned VMs.
3. Add VMs to the catalog using the `New-ProvVM` PowerShell command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Log in to the VM to see if the Data disk is formatted correctly. If there is content on the Data disk referenced in the master image VM, then that content is also on the Data disk.

Create a master image VM with Data disk in VMware

1. Create a VM with two hard disks. One is the OS disk and second is the Data disk. Follow this guide to add a New Hard Disk (Data disk) to an existing VM.
2. Log in to the VM to initialize the disk, set the desired drive letter, and add the content.

Create a catalog with Data disk provisioned VMs

Include the following parameters in the `New-ProvScheme` PowerShell command to provision an MCS machine catalog with Data disk.

- `DataDisk`: To Specify the path of the Data disk specified.
- `DataDiskPersistence`: To indicate whether the DataDisk is persistent or non-persistent.

  The Data disk cannot be non-persistent if `CleanOnBoot` is false. You cannot change the value of `DataDiskPersistence` for a machine catalog once configured.

After you create the catalog, add VMs using the `New-ProvVM` command.

Image update

Run `Publish-ProvMasterVMImage` command to update the source of the OS and Data disk. After running the `Publish-ProvMasterVMImage` command:

- The new VMs are created with the updated OS and Data disks.
- The existing VMs' non-persistent disks are updated on the next power cycle.
- The existing VMs' persistent disks are not updated on the next power cycle.

Delete the Data disk

If you delete the catalog, the Data disk is deleted unless you use `forgetVM` or `purgeDBOnly` option. If you delete the VM, the Data disk is deleted unless you use the `forgetVM` or `purgeDBOnly` option. These conditions are applicable to only persistent MCS machine catalogs.

Troubleshooting

If the catalog fails to create, see CTX294978.

Identity pools of different machine identity join types

May 13, 2026

Using MCS, you can provision machines as on-premises AD joined, Microsoft Entra hybrid joined, or non-domain-joined.

For information about how to configure machine identities in the Web Studio, see Create machine catalogs.

For specific information on how to create identity pools of different machine identity join types, see the following:

- Identity pool of on-premises Active Directory joined machine identity
- Identity pool of Microsoft Entra hybrid joined machine identity
- Identity pool of non-domain-joined machine identity

Identity pool of on-premises Active Directory joined machine identity

June 3, 2026

This article describes how to create identity pool of on-premises Active Directory joined machine identity.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use Web Studio

The following information is a supplement to the guidance in Create machine catalogs.

1. On the **Machine Identities** page:
   a) Select identity type as **On-premises Active Directory**.
   b) Select an Active Directory account option:
      - **Create new Active Directory accounts**:
        - If you select **Create new Active Directory accounts** and do not use an existing identity pool, select a domain for those accounts and specify an account naming scheme.

      To find a specific domain quickly, type the domain name in the search box at the top of the **Location (domain)** dropdown and click **Enter**. **Web Studio** shows a progress indicator while it retrieves the matching domain. If the domain you typed is on the domain exclusion list, **Web Studio** notifies you that the domain is excluded and provides a link to **Settings > Site settings > Add domains to exclusion list**, where you can review or remove it.

      > **Note:**
      >
      > To speed up domain lookups in environments with many forests or partially reachable trusts, add unreachable or unneeded domains to the exclusion list. For more information, see Configure the domain exclusion list.

        - If you select **Create new Active Directory accounts** and use an existing identity pool to create new accounts, then select an identity pool from the list.
      - **Use existing Active Directory accounts**: You can browse or import from CSV file, and reset password or specify the same password for all accounts.

   c) Click **Next**.
2. On the **Domain credentials** page, select a service account or enter credentials manually. For information on service accounts, see On-premises Active Directory service accounts.

Modify the service account association

To change the associated service account or add an association to an existing MCS machine catalog, use the **Edit Machine Catalog** page.

- To add a service account, click **Select service account** on the **Service Account** page.
- To change the service account association, click the edit icon on the **Service Account** page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use PowerShell

You can associate an on-premises service account with an MCS created machine catalog by associating an on-premises service account with the identity pool. You can create an identity pool or update an existing identity pool to associate it with a service account.

For example: To create a new identity pool and associate it with a service account, run the following:

```
New-AcctIdentityPool -IdentityType ActiveDirectory -IdentityPoolName
    MyPool -NamingScheme Acc#### -Domain MyDomain.com -NamingSchemeType
    Numeric -OU "CN=MyOU,DC=MyDomain,DC=com" -ServiceAccountUid
    $serviceAccountUid
```

For example: To update an existing identity pool to associate it with a service account, run the following:

```
$identityPoolUid = (Get-ProvScheme -ProvisioningSchemeName "
    MyProvScheme").IdentityPoolUid
Set-AcctIdentityPool -IdentityPoolUid $identityPoolUid -
    ServiceAccountUid $serviceAccountUid
```

> **Note:**
>
> The `$serviceAccountUid` must be a valid UID of an on-premises Active Directory service account.

Identity pool of Microsoft Entra hybrid joined machine identity

May 13, 2026

This article describes how to create identity pool of:

- Microsoft Entra hybrid joined catalogs
- Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune

For information on requirements, limitations, and considerations, see Microsoft Entra hybrid joined.

Create Microsoft Entra hybrid joined catalogs

Use Web Studio

The following information is a supplement to the guidance in Create machine catalogs.

On the **Machine Identities** page of the catalog creation wizard:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Select **Microsoft Entra hybrid joined**. The created machines are owned by an organization and are signed into with an Active Directory account that belongs to that organization.
- To enroll the created machines into Microsoft Intune (including Configuration Manager) for device management, select **Enroll the machines in Microsoft Intune with Configuration Manager**. To avoid errors during catalog creation, ensure that the master image meets the following requirements:
  - Has VDA version 2405 or later installed.
  - Has the **Configuration Manager client** installed with the site code unassigned. For more information, see this Microsoft article.

> **Note:**
>
> If you select **Microsoft Entra hybrid joined** as the identity type, each machine in the catalog must have a corresponding AD computer account.

- Click **Add Extension Attributes** to store unique, custom data directly on your Entra ID device objects. On the **Add Extension Attributes** page, add **Extension attributes** and **Value**.

> **Note:**
>
> - You can add a maximum of 15 extension attributes.
> - The name and value must be unique and can't be empty.

Add or modify extension attributes

To change or add additional extension attributes to an existing MCS machine catalog, or add extension attributes to an MCS catalog without a service account, use the **Edit Machine Catalog** wizard.

- To change or add additional extension attributes, navigate to the **Microsoft Entra Device Extension Attributes** page. Click the pencil icon, and add or update extension attributes.
- To add extension attributes to an MCS catalog without a Microsoft Entra service account:
  1. Navigate to the **Service Account** page. Select a Microsoft Entra service account for the Microsoft Intra ID.
  2. Go to the Microsoft Entra Device Extension Attributes page, click **Add Extension Attributes**.

Use PowerShell

The following are PowerShell steps equivalent to operations in Web Studio. For information on how to create a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The difference between on-premises AD joined catalogs and Microsoft Entra hybrid joined ones lies in the creation of the identity pool and the machine accounts.

To create an identity pool along with the accounts for Microsoft Entra hybrid joined catalogs:

```
New-AcctIdentityPool -AllowUnicode -IdentityType "HybridAzureAD" -
    Domain "corp.local" -IdentityPoolName "HybridAADJoinedCatalog" -
    NamingScheme "HybridAAD-VM-##" -NamingSchemeType "Numeric" -OU "CN=
    AADComputers,DC=corp,DC=local" -Scope @() -ZoneUid "81291221-d2f2-49
    d2-ab12-bae5bbd0df05"
New-AcctIdentity -IdentityPoolName "HybridAADJoinedCatalog" -Count 10 -
    ADUserName "corp\admin1" -ADPassword $password
Set-AcctAdAccountUserCert -IdentityPoolName "HybridAADJoinedCatalog" -
    All -ADUserName "corp\admin1" -ADPassword $password
```

> **Note:**
>
> `$password` is the matching password for an AD user account with Write Permissions.

All other commands used to create Microsoft Entra hybrid joined catalogs are the same as for traditional on-premises AD joined catalogs.

To create a new identity pool with specified extension attributes and associate it with a service account, run the following:

```
New-AcctIdentityPool -IdentityPoolName HybridAzureAD -NamingScheme ACC
    #### -NamingSchemeType Numeric -Domain "abc.local" -IdentityType
    HybridAzureAD -ServiceAccountUid $serviceAccountUid -
    EntraIDExtensionAttributes @{
 "extensionAttribute1" = "val1"; "extensionAttribute2" = "val2" }
```

When a VM is powered on for the first time, after joining Microsoft Entra ID, the VM reports its Entra ID deviceId to MCS.

For example: To check the `EntraIDDeviceID`, run `Get-AcctADAccount` or `Get-AcctIdentity` .

```
Get-AcctADAccount -IdentityPoolName MyPool
```

After reboot, for persistent and non-persistent VMs, the `EntraIDDeviceID` remains the same.

> **Note:**
>
> MCS automatically removes associated device IDs and extension attributes when you delete a VM from the catalog but don't delete from Azure.

To edit extension attributes for the existing catalog, run the following:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - After upgrading existing catalog VMs to VDA version 2511 or later, a reboot is necessary. This reboot allows the VM to report its Entra ID deviceId to MCS, enabling MCS to then configure the VM's extension attributes.
> - The existing catalog should have an AzureAD type of service account with permission "Device.ReadWrite.All".

To add some new attributes:

```
Set-AcctIdentityPool -IdentityPoolName MyPool -
    EntraIDExtensionAttributes @{
 "extensionAttribute1" = "val1"; "extensionAttribute2" = "val2" }
```

To remove some existing attributes

```
Set-AcctIdentityPool -IdentityPoolName MyPool -
    EntraIDExtensionAttributes @{
  }
```

OR

```
Set-AcctIdentityPool -IdentityPoolName MyPool -
    EntraIDExtensionAttributes @{
 extensionAttribute1 = ""; extensionAttribute2 = "" }
```

`Set-AcctIdentityPool` also updates the Entra ID device's extension attributes for VMs that are already joined to Entra ID and possess an `EntraIDDeviceID` value within their identities.

View the status of the Microsoft Entra hybrid join process

In the Web Studio, the status of the Microsoft Entra hybrid join process is visible when Microsoft Entra hybrid joined machines in a delivery group are in a powered-on state. To view the status, use Search to identify those machines and then for each check **Machine Identity** on the **Details** tab in the lower pane. The following information can appear in **Machine Identity**:

- Microsoft Entra hybrid joined
- Not yet joined to Microsoft Entra ID

> **Note:**
>
> - You might experience delayed Microsoft Entra hybrid join when the machine initially powers on. This is caused by the default machine identity sync interval (30 minutes of Microsoft Entra Connect). The machine is in Microsoft Entra hybrid joined state only after the machine identities are synced to Microsoft Entra ID through Microsoft Entra Connect.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - If machines fail to be in Microsoft Entra hybrid joined state, they are not registered with the Delivery Controller. Their registration status appears as **Initialization**.

Also, using the Web Studio, you can learn why machines are unavailable. To do that, click a machine on the **Search** node, check **Registration** on the **Details** tab in the lower pane, and then read the tooltip for additional information.

Troubleshoot

If machines fail to be Microsoft Entra hybrid joined, do the following:

- Check if the machine account has been synced to Microsoft Entra ID through the Microsoft Microsoft Entra ID portal. If synced, **Not yet joined to Microsoft Entra ID** appears, indicating pending registration status.

  To sync machine accounts to Microsoft Entra ID, make sure:

  - The machine account is in the OU that is configured to be synced with Microsoft Entra ID. Machine accounts without the **userCertificate** attribute are not synced to Microsoft Entra ID even they are in the OU that is configured to be synced.
  - The attribute **userCertificate** populates in the machine account. Use Active Directory Explorer to view the attribute.
  - Microsoft Entra Connect must have been synced at least once after the machine account is created. If not, manually run the `Start-ADSyncSyncCycle -PolicyType Delta` command in the PowerShell console of the Microsoft Entra Connect machine to trigger an immediate sync.

- Check if the Citrix managed device key pair for Microsoft Entra hybrid join is correctly pushed to the machine by querying the value of **DeviceKeyPairRestored** under **HKEY_LOCAL_MACHINE\SYSTEM\Cur**

  Verify that the value is 1. If not, possible reasons are:

  - `IdentityType` of the identity pool associated with the provisioning scheme is not set to `HybridAzureAD`. You can verify this by running `Get-AcctIdentityPool`.
  - The machine is not provisioned using the same provisioning scheme of the machine catalog.
  - The machine is not joined to the local domain. Local domain joined is a prerequisite of the Microsoft Entra hybrid join.

- Check diagnostic messages by running the `dsregcmd /status /debug` command on the MCS-provisioned machine.

  - If Microsoft Entra hybrid join is successful, **AzureAdJoined** and **DomainJoined** are **YES** in the output of the command line.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If not, refer to the Microsoft documentation to troubleshoot the issues: https://docs.microsoft.com/en-us/azure/active-directory/devices/troubleshoot-hybrid-join-windows-current.
- If you get the error message **Server Message: The user certificate is not found on the device with id: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx**, then run the following PowerShell command to repair the user certificate:

```
Repair-AcctIdentity -IdentityAccountName TEST\VM1 -Target
    UserCertificate
```

For more information about the user certificate issue, see CTX566696.

Create Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune

You can create co-management enabled catalogs for Microsoft Entra hybrid joined catalogs enrolled in Microsoft Intune for persistent single and multi-session VMs. You can create co-management enabled catalogs using both Studio and PowerShell.

Use Web Studio

The following information is a supplement to the guidance in Create machine catalogs.

In the **Machine Catalog Setup** wizard:

- On the **Machine Identities** page, select **Microsoft Entra hybrid joined** and then **Enroll the machines in Microsoft Intune with Configuration Manager**. Using this action, Configuration Manager and Microsoft Intune (that is, co-managed) manages the VMs.

Use PowerShell

The following are the PowerShell steps equivalent to steps in Studio.

To enroll machines in Microsoft Intune with Configuration Manager using the Remote PowerShell SDK, use the `DeviceManagementType` parameter in `New-AcctIdentityPool`. This feature requires that the catalog is Microsoft Entra hybrid joined and that Microsoft Entra ID possesses the correct Microsoft Intune license.

The difference between Microsoft Entra hybrid joined catalogs and co-management enabled ones lies in the creation of the identity pool. For example:

```
New-AcctIdentityPool -AllowUnicode -DeviceManagementType "
    IntuneWithSCCM" IdentityType="HybridAzureAD" -IdentityPoolName "
    CoManagedCatalog" -NamingScheme "CoManaged-VM-##" -NamingSchemeType
    "Numeric" -Scope @() -ZoneUid "81291221-d2f2-49d2-ab12-bae5bbd0df05"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshoot

If machines fail to enroll in Microsoft Intune or fail to reach co-management state, do the following:

- Check Intune license

  Check if your Microsoft Entra tenant is assigned with the appropriate Intune license. See Microsoft Intune licensing for license requirements of Microsoft Intune.

- Check Microsoft Entra hybrid join status

  Check if the MCS-provisioned machines are Microsoft Entra hybrid joined. The machines are not eligible for co-management if not Microsoft Entra hybrid joined. See Troubleshoot to troubleshoot Microsoft Entra hybrid join issues.

- Check co-management eligibility

  - Check if the MCS-provisioned machines are correctly assigned with the expected Configuration Manager site. To get the assigned site, run the following PowerShell command on the affected machines.

    ```
    (New-Object -ComObject "Microsoft.SMS.Client").
       GetAssignedSite()
    ```

  - If no site is assigned to the VM, use the following command to check if the Configuration Manager site can be automatically discovered.

    ```
    (New-Object -ComObject "Microsoft.SMS.Client").
       AutoDiscoverSite()
    ```

  - Ensure that boundaries and boundary groups are well configured in your Configuration Manager environment if no site code can be discovered. See Considerations for details.
  - Check `C:\Windows\CCM\Logs\ClientLocation.log` for any Configuration Manager client site assignment issues.
  - Check the co-management states of the machines. Open the **Configuration Manager control panel** on the affected machines and go to the **General** tab. The value of Co-management property must be **Enabled**. If not, check logs under `C:\Windows\CCM\Logs\CoManagementHandler.log`.

- Check Intune enrollment

  Machines might fail to enroll in Microsoft Intune even if all prerequisites are satisfied. Check Windows event logs under **Application and Services Logs > Microsoft > Windows > DeviceManagement-Enterprise-Diagnostics-Provider** for Intune enrollment issues.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Identity pool of non-domain-joined machine identity

May 15, 2026

This article describes how to create identity pool of non-domain-joined catalogs using Citrix Virtual Apps and Desktops.

For information on requirements, limitations, and considerations, see Non-domain-joined.

Before you create the machine catalog, you need the following:

1. New resource location
    - Navigate to the Citrix Cloud™ admin UI > upper left hamburger menu > **Resource Locations**.
    - Click **+ Resource Location**.
    - Enter a name for the new resource location and click **Save**.
2. Create a hosting connection. See Create and manage connections section for details.

Using Citrix Virtual Apps and Desktops™, you can create catalogs based on workgroups or non-domain-joined machines. Creating non-domain-joined machines depends on how the account identity pool is created. The account identity pool is the mechanism used by MCS to create and track machine names during catalog provisioning.

Use Web Studio

The following information is a supplement to the guidance in Create machine catalogs.

In the catalog creation wizard:

- On the **Machine Identities** page, select **Non-domain-joined**. The created machines are not joined to any domain.

> **Note:**
>
> The **Non-domain-joined** identity type requires version 2311 or later of the VDA as the minimum functional level for the catalog. To make it available, update the minimum functional level if necessary.

Use PowerShell

You can create an identity pool for non-domain-joined catalogs using the Remote PowerShell SDK.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use the PowerShell parameters, **WorkgroupMachine** and **IdentityType** to create an identity pool for non-domain-joined catalogs. The parameters eliminate the need to specify all AD-specific parameters including domain administrator credentials:

```
New-AcctIdentityPool -AllowUnicode -IdentityType "Workgroup" -
    WorkgroupMachine -IdentityPoolName "NonDomainJoinedCatalog" -
    NamingScheme "NDJ-VM-##" -NamingSchemeType "Numeric" -Scope @() -
    ZoneUid "81291221-d2f2-49d2-ab12-bae5bbd0df05"
```

All other commands used to create non-domain-joined catalogs are the same as for the traditional on-premises Active Directory joined catalogs.

Manage machine catalogs

May 15, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Introduction

You can add or remove machines from a machine catalog, rename, change the description, or manage a catalog's Active Directory computer accounts.

Maintaining catalogs can also include making sure that each machine has the latest OS updates. Including antivirus updates, operating system upgrades, or configuration changes.

- Catalogs containing pooled random machines created using Machine Creation Services™ (MCS) maintain machines by updating the master image used in the catalog and then updating the machines. This method enables you to efficiently update large numbers of user machines.
- For catalogs containing static, permanently assigned machines, and for Remote PC Access Machine catalogs, you manage updates to users' machines outside of Web Studio. Perform this task either individually or collectively using third-party software distribution tools.

For information about creating and managing connections to host hypervisors, see Connections and resources.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> MCS does not support Windows 10 IoT Core and Windows 10 IoT Enterprise. Refer to the Microsoft site for more information.

About persistent instances

When updating an MCS catalog created using persistent, or dedicated instances, any new machines created for the catalog use the updated image. Pre-existing instances continue to use the original instance. The process of updating an image is done the same way for any other type of catalog. Consider the following:

- With persistent disk catalogs, the pre-existing machines are not updated to the new image, but any new machines added to the catalog use the new image.
- For non-persistent disk catalogs, the machine image is updated the next time the machine is reset.
- With persistent machine catalogs, updating the image also updates the catalog instances that use it.
- For catalogs that do not persist, if you want different images for different machines, the images must reside in separate catalogs.

Manage machine catalogs

You can manage a machine catalog in two ways:

- Using Web Studio
- Using PowerShell

Use Web Studio

This section details how you can manage catalogs using Web Studio:

- Manage machine catalogs
    - Introduction
    - About persistent instances
- Manage machine catalogs
- Use Web Studio
- View catalog details
    - Add machines to a catalog

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Delete machines from a catalog
- Edit a catalog
- Rename a catalog
- Move a catalog to a different zone
- Delete a catalog
- Convert legacy MCS catalogs in Azure to machine profile-based catalogs
- Manage Active Directory computer accounts in a catalog
- Update a catalog
    - Update or create a master image
    - Change the master image
    - Roll back the master image
- Change the functional level or undo the change
- Clone a catalog
- Organize catalogs using folders
    - Create a catalog folder
    - Move a catalog
    - Manage catalog folders
- Upgrade VDAs
- Retry catalog creation
- Enroll non-MCS provisioned VDAs using tokens
- Use PowerShell
- Retrieve warnings and errors associated with a catalog
- Add descriptions to an image
- Reset OS disk
- Change the network setting for an existing provisioning scheme
- Manage versions of a machine catalog
- Convert a non-machine profile-based machine catalog to machine profile-based machine catalog
- Repair the identity information of active computer accounts
    - Conditions
    - Reset identity disk
- Change cache configuration on an existing machine catalog

View catalog details

1. Use the search function to locate a specific machine catalog. Refer to Search for instances for instructions.
2. From the search results, select a catalog as necessary.
3. Refer to the following table for descriptions of the catalog columns.
4. Refer to the following table for descriptions of the catalog columns.

Column	Description
Machine Catalog	The name and the allocation type of the catalog. Allocation types include • Random: Machines in the catalog are allocated to a user randomly. • Permanent: Machines in the catalog are allocated to a user permanently.
Machine Type	The supported session type of the machines in the catalog. Possible values include • OS type: Multi-session OS (Virtual); User data: Discard. • OS type: Multi-session OS (Virtual); User data: On local disk • OS type: Single-session OS (Remote PC Access) • OS type: Single-session OS (Virtual); User data: Discard • OS type: Single-session OS (Virtual); User data: On local disk
Machine Count	The machine count in the catalog and the provisioning methods include: Machine Creation Services (MCS machine), Manual, and Citrix Provisioning™ Services.
Allocated Count	The number of machines in the catalog assigned to a delivery group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Column	Description
Folder	The location of the catalog within the **Machine Catalogs** tree. It displays the name of the folder that the catalog is in (including the trailing backslash), or − if the catalog is at the root level.
VDA Upgrade	VDA Upgrade State. Possible values include: Not configured, Scheduled, Available, and Up to date.
Image Status	The status of the image update of the catalog. Applicable only to non-persistent machine catalogs. Possible values include: Fully updated, Partially updated, Pending updates, Preparing

5. Click a tab in the bottom details pane for more information about a selected catalog.

Tab	Description
Details	Summarizes key machine catalog settings, such as machine type, provisioning method, service account, OS, and VDA version, enabling you to quickly view and manage your resources.
Template Properties	Available for MCS provisioned catalogs only. Displays detailed provisioning information for the selected catalog, including • Machine Template Properties • Hypervisor-Specific Details • Machine Profile Properties
Machines	Displays a paginated list of machine names in the selected catalog.
Delivery Groups	Available for Remote PC catalogs. Displays delivery groups associated with the selected catalog. It displays delivery group name and catalog association.
Tags	Not available in multi-tenant environments. Displays tag name and description of the tags assigned to the selected machine catalog.
Workspace Environment Management	Only visible when WEM service is provisioned and accessible. Displays Workspace Environment Management System optimization settings.
Cost Insights	Applicable to only Azure MCS catalogs, this displays • Total cost incurred over the past 30 days. • A comparison between the current 30-day total cost and the previous 30-day period. Access requires the Citrix **Cost Management > Manage > Read cost** permission (default for Cloud Administrators) to view the tab, and the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Tab	Description
Troubleshoot	Displays catalog errors or warnings with recommended actions.

Add machines to a catalog

Before you start:

- Make sure that the virtualization host has sufficient processors, memory, and storage to accommodate the additional machines.
- Make sure that you have enough unused Active Directory computer accounts. If you are using existing accounts, the number of machines you can add is limited by the number of accounts available.
- If you use Web Studio to create Active Directory computer accounts for the additional machines, you must have appropriate domain administrator permission.

To add machines to a catalog:

1. From Studio, select **Machine Catalogs** in the left pane.
2. Select a machine catalog and then select **Add machines** in the action bar.
3. On the **Virtual Machines** page, select the number of virtual machines to add.
4. On the **Machine Identities** page, configure the settings as follows:
    - Select an identity from the list.
    - If applicable, indicate whether to create accounts or use existing ones, and the location (domain) for those accounts.

      If there are insufficient existing Active Directory accounts for the number of VMs you are adding, select the domain and location where the accounts are created.

      If you use existing Active Directory accounts, browse to the accounts or select **Import** and specify a `.csv` file containing account names. Make sure that there are enough accounts for all the machines you are adding. Studio manages these accounts. Allow that interface to reset the passwords for all the accounts, or specify the account password, which must be the same for all accounts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If this identity pool is used by other catalogs, you can't change it to a different pool using Studio. Instead, use the **Set-ProvScheme** PowerShell cmdlet.
- Specify an account naming scheme, using hash marks to indicate where sequential numbers or letters appear. For example, a naming scheme of PC-Sales-## (with 0-9 selected) results in computer accounts named PC-Sales-01, PC-Sales-02, PC-Sales-03, and so on.
- Optionally, you can specify what the account names start with.

  When specifying what the account names start with, be aware of the following scenario: If the starting numbers or letters are already in use, the first account created is named using the nearest unused numbers or letters thereafter.

5. On the **Domain Credentials** page, select **Enter credentials** and enter user credentials with sufficient permissions to create machine accounts.

The machines are created as a background process, and can take much time when creating many machines. Machine creation continues even if you close the Studio.

Delete machines from a catalog

After you delete a machine from a machine catalog, users can no longer access it, so before deleting a machine, ensure that:

- User data is backed up or no longer required.
- All users are logged off. Turning on maintenance mode stops new connections from being made to a machine.
- Machines are powered off.

To delete machines from a catalog:

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select a catalog and then select **View Machines** in the action bar.
4. Select one or more machines and then select **Delete** in the action bar.

Choose whether to delete the machines being removed. If you choose to delete the machines, indicate if the Active Directory accounts for those machines are kept, disabled, or deleted.

Edit a catalog

1. On the **Description** page, change the catalog description.
2. Select **Machine Catalogs** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select a catalog and then select **Edit Machine Catalog** in the action bar.
4. On the **Scopes** page, change the scopes.
5. On the **NIC** page, perform the following actions:

   - To change the subnet mapping of an NIC, select a network from the **Associated Network** field.
   - To add a subnet mapping, select **Add NIC**, select a network from the **Associated Network** field, and click **Save**.

   Only those subnets present in the host associated with the catalog appear in the **Associated Network** field.

   You can only add NIC to Azure machine catalogs without machine profiles.

   > **Note:**
   >
   > - For AWS machine catalogs, you cannot map the same subnet to more than one NIC.
   > - For machine catalogs with machine profiles, the number of NICs on the catalog must be equal to the number of NICs on the machine profile.
   > - This feature is not supported for IBM Cloud hypervisors.
   > - This feature is supported only for Nutanix Prism Element in case of Nutanix hypervisors.

6. You might see other pages depending on the catalog type.

   For catalogs created using an Azure Resource Manager image, the following pages are visible. Keep in mind that changes you make apply only to machines you add to the catalog later. Existing machines remain unchanged.

   - On the **Virtual Machines** page, change the machine size and availability zones where you want to create machines.

     > **Note:**
     >
     > - Only the machine sizes that the catalog supports are shown.
     > - If necessary, select **Show only machine sizes used in other machine catalogs** to filter the machine size list.
     > - For Azure catalogs, if **ZRS** is the **Storage redundancy** on the **Storage and License Types** page, then you get a warning suggesting to clear the zone selection and let Azure manage the VM availability zones.

   - On the **Machine Profile** page, choose whether to use or change a machine profile.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> For Azure catalogs, when you modify a machine profile that includes availability zones and choose ZRS for storage redundancy, a warning suggests you to clear the zone selection.

- (Visible only when the catalog is configured with a dedicated group host) On the **Dedicated host group** page, choose whether to change a host group.
- On the **Storage and License Types** page, choose whether to change the storage redundancy type (for Azure catalog), storage type, license type, and Azure Computer Gallery settings (available only when **Place prepared image in Azure Gallery** is in use).

> **Note:**
>
> If the newly selected setting doesn't support the current machine size, a warning dialog box appears, informing you that changing the setting resets the machine size setting. If you choose to continue, a red dot appears next to the **Virtual Machines** menu, prompting you to select a new machine size.

- On the **License Type** page, choose whether to change the Windows license or Linux license setting.

For Remote PC Access catalogs, the following pages are visible:

- On the **Power Management** page, change the power management settings and select a power management connection.
- On the **Organizational Units** page, add or remove Active Directory OUs.

7. Click **Apply** to apply the changes you made and click **Save** to exit.

Rename a catalog

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select a catalog and then select **Rename Machine Catalog** in the action bar.
4. Enter the new name.

Move a catalog to a different zone

If your deployment has more than one zone, you can move a catalog from one zone to another.

Moving a catalog to a different zone, other than the hypervisor containing the VMs in that catalog, affects performance.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select a catalog and then select **Move** in the action bar.
4. Select the zone where you want to move the catalog.

Delete a catalog

Before deleting a catalog, ensure that:

- All users are logged off and you don't run any disconnected sessions.
- Maintenance mode is turned on for all machines in the catalog so that new connections cannot be made.
- All machines in the catalog are powered off.
- The catalog is not associated a delivery group. In other words, the delivery group does not contain machines from the catalog.

To delete a catalog:

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select a catalog and then select **Delete Machine Catalog** in the action bar.
4. Indicate whether the machines in the catalog are deleted. If you choose to delete the machines, indicate whether the Active Directory computer accounts for those machines are retained, disabled, or deleted.

Convert legacy MCS catalogs in Azure to machine profile-based catalogs

To convert a non-machine profile-based machine catalog to a machine profiled-based machine catalog, complete the following steps:

1. On the **Machine Catalogs** page, right-click the **Machine Catalog** name that you want to convert, and then select **Edit Machine Catalog**.
2. On the **Edit Machine Catalog > Machine Profile** page, select the **Use a machine profile (mandatory for Microsoft Entra ID)** check box.
3. Click **Select a machine profile**.
4. On the **Select a machine profile** page, select a virtual machine or launch template to use as a machine profile.
5. If some current settings differ from the new machine profile settings, select the required option for the settings you want to use and click **Continue**.
6. Click **Apply**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Currently, this feature is supported only for Azure, AWS, and VMware.

Manage Active Directory computer accounts in a catalog

To manage Active Directory accounts in a machine catalog, you can:

- Free unused machine accounts by removing Active Directory computer accounts from single-session OS and multi-session OS catalogs. Those accounts can then be used for other machines.
- Add accounts so that when more machines are added to the catalog, the computer accounts are already in place. Do not use a forward slash (/) in an OU name.

To manage Active Directory accounts:

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select a catalog and then select **Manage AD accounts** in the action bar.
4. Choose whether to add or delete computer accounts. If you add accounts, specify what to do with the account passwords: either reset them all or enter a password that applies to all accounts.

   You might reset passwords if you do not know the current account passwords; you must have permission to perform a password reset. When entering a password, the password is changed on the accounts as they are imported. When deleting an account, choose whether the account in Active Directory is kept, disabled, or deleted.

Indicate if Active Directory accounts are retained, disabled, or deleted when you remove machines from a catalog or delete a catalog.

Update a catalog

We recommend that you save copies or snapshots of master images before updating the machines in the catalog. The database keeps a historical record of the master images used with each machine catalog. Roll back, or revert, machines in a catalog to use the previous version of the master image. Perform this task if users encounter problems with updates you deployed to their desktops. This minimizes user downtime. Do not delete, move, or rename master images. You cannot revert a catalog to use them.

After a machine is updated, it restarts automatically.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update or create a master image

Before you update the machine catalog, either update an existing master image or create one on your host hypervisor.

1. On your hypervisor, take a snapshot of the current VM and give the snapshot a meaningful name. This snapshot can be used to revert (roll back) machines in the catalog, if needed.
2. If necessary, power on the master image, and log on.
3. Install updates or make any required changes to the master image.
4. Power off the VM.
5. Take a snapshot of the VM. Give it a meaningful name that is recognized when the catalog is updated in Web Studio. Although Web Studio can create a snapshot, Citrix recommends that you create it using the hypervisor management console. Then select that snapshot in Web Studio. This process enables you to provide a meaningful name and description rather than an automatically generated name. For GPU master images, you can change the master image only through the XenServer® console.

Change the master image

To prepare and roll out the update to all machines in a catalog:

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select a catalog and then select **Change Master Image** in the action bar.
4. On the **Image** page, select the host and the image you want to roll out.

   > **Tip:**
   >
   > For an MCS-created catalog, you can annotate its image by adding a note for the image. A note can contain up to 500 characters. Each time you change the master image, a note-related entry is created whether you add a note. If you update a catalog without adding a note, the entry appears as null (-). To view note history for the image, select the catalog, click **Template Properties** in the low pane, and then click **View note history**.

5. On the **Rollout Strategy** page, choose when the machines in the machine catalog are updated with the new master image: on the next shutdown or immediately.

   > **Note:**
   >
   > The **Rollout Strategy** page is not available for persistent VMs because rollout is only applicable to non-persistent VMs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Verify the information on the **Summary** page and then click **Finish**. Each machine restarts automatically after it is updated.

To track the update progress, locate the catalog in **Machine Catalogs** to view the inline progress bar and the step-by-step progress graph.

When updating a catalog using PowerShell SDK directly, rather than Web Studio, specify a hypervisor template (**VMTemplates**). Use this as an alternative to an image or a snapshot of an image.

To roll out a new master image to Azure based machine catalog:

1. From Web Studio, select **Machine Catalogs** in the left pane.
2. Select an Azure catalog and then select **Change Master Image** in the action bar.
3. On the **Change Master Image** page, select an image under Master image. The blade lists all the images that belong to the same region as those of Resources.

Rollout strategy:

Updating images on the next shutdown will immediately affect any machines not currently in use, that is, machines that do not have an active user session. A system that is in use receives the update when the current active session ends. Consider the following:

- New sessions cannot be launched until the update has completed on applicable machines.
- For single-session OS machines, machines are immediately updated when the machine is not in use, or when users are not logged in.
- For a multi-session OS with child machines, reboots do not occur automatically. To apply the updated master image, restart the machines using Studio, PowerShell, or Workspace. Restarting from the machines or the hypervisor doesn't apply the update.

> **Tip:**
>
> Limit the number of machines being rebooted by using the advanced settings for a host connection. Use these settings to modify the actions taken for a given catalog; advanced settings vary depending on the hypervisor.

Roll back the master image

After you roll out an updated or new master image, you can roll it back. This process might be necessary if issues occur with the newly updated machines. When you roll back, machines in the catalog are rolled back to the last working image. Any new features that require the newer image are no longer available. As with the rollout, rolling back a machine includes a restart.

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select the catalog and then select **Roll Back Master Image** in the action bar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Specify when to apply the earlier master image to machines, as described in the preceding section for the rollout operation.

The rollback is applied only to machines that need to be reverted. Machines that are not updated with the new or updated master image do not receive notification messages and are not forced to log off.

To track the rollback progress, locate the catalog in **Machine Catalogs** to view the inline progress bar and the step-by-step progress graph.

Change the functional level or undo the change

Change the functional level for the machine catalog after you upgrade the VDAs on the machines to a newer version. Citrix recommends upgrading all VDAs to the latest version to enable access to all the newest features.

Before changing the functional level for a machine catalog:

- Start the upgraded machines so that they register with the Controller. This process lets Web Studio determine that the machines in the catalog need upgrading.

To change the functional level for a catalog:

1. Sign in to Web Studio.
2. Select **Machine Catalogs** in the left pane.
3. Select the catalog. The **Details** tab in the lower pane displays version information.
4. Select **Change Functional Level**. If Web Studio detects that the catalog needs upgrading, it displays a message. Follow the prompts. If one or more machines cannot be upgraded, a message explains why. To ensure that all machines function properly, Citrix recommends you resolve machine issues before clicking **Change** to proceed.

After the catalog change completes, you can revert the machines to their previous VDA versions by selecting the catalog and then selecting **Undo Functional Level Change** in the action bar.

Clone a catalog

Before cloning a catalog, be aware of the following considerations:

- You cannot change settings associated with operating system and machine management. The cloned catalog inherits those settings from the original.

> **Note:**

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> If you select an Azure catalog to clone and select a Master image, the blade lists all the images that belong to the same region as those of Resources.

- Cloning a catalog can take some time to complete. If necessary, select **Hide progress** to run the cloning in the background.
- The cloned catalog inherits the name of the original and has a suffix `Copy`. You can change the name. See Rename a catalog.
- After cloning completes, be sure to assign the cloned catalog to a delivery group.

1. Sign in to Web Studio, and then select **Machine Catalogs** in the left pane.
2. Select a catalog and then select **Clone** in the action bar.
3. In the **Clone Selected Machine Catalog** window, view the settings for the cloned catalog and configure settings as applicable. Select **Next** to proceed to the next page.
4. On the **Summary** page, view a summary of the settings and select **Finish** to start cloning.
5. If necessary, select **Hide progress** to run the cloning in the background.

Organize catalogs using folders

You can create folders to organize catalogs for easy access. For example, you can organize catalogs by image type or by organization structure.

> **Tip:**
>
> You can set your preferred default view (folder or list view) for the Machine Catalogs node by clicking the **Folder** icon in the upper right of the action bar.

Create a catalog folder

Before you start, first plan how to organize your catalogs. Consider the following:

- You can nest folders up to five levels deep (excluding the default root folder).
- A catalog folder can contain catalogs and subfolders.
- All nodes in Web Studio (such as **Machine Catalogs**, **Delivery Groups**, **Applications**, and **Application Groups**) share the same folder tree in the back end. To avoid name conflicts when renaming or moving folders, use unique names for first-level folders across different nodes.

  If you create a folder using the `New-BrokerAdminFolder` SDK cmdlet and want it to appear under the **Machine Catalogs** node, you must add the `ContainsMachineCatalogs` metadata using the `Set-BrokerAdminFolderMetadata` cmdlet.

  Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-BrokerAdminFolderMetadata -AdminFolderId {
adminFolderUid }
 -Name ContainsMachineCatalogs -Value true
```

To create a catalog folder, follow these steps:

1. Select **Machine Catalogs** in the left pane.
2. In the folder hierarchy, select a folder and then select **Create Folder** in the **Action** bar.
3. Enter a name for the new folder, and then click **Done**.

> **Tip:**
>
> If you create a folder in an unintended location, you can drag it to the correct location.

Move a catalog

You can move a catalog between folders. Detailed steps are as follows:

1. Select **Machine Catalogs** in the left pane.
2. View catalogs by folder. You can also turn on **View all** above the folder hierarchy to view all catalogs at a time.
3. Right-click a catalog and then select **Move Machine Catalog**.
4. Select the folder to which you want to move the catalog, and then click **Done**.

> **Tip:**
>
> You can drag a catalog to a folder.

Manage catalog folders

You can delete, rename, and move catalog folders.

You can delete a folder only if it and its subfolders don't contain catalogs.

To manage a folder, follow the below steps:

1. Select **Machine Catalogs** in the left pane.
2. In the folder hierarchy, select a folder, and then select an action in the **Action** bar as needed:
   - To rename the folder, select **Rename Folder**.
   - To delete the folder, select **Delete Folder**.
   - To move the folder, select **Move Folder**.
3. Follow onscreen instructions to complete the remaining steps.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Upgrade VDAs

You can use the Studio interface to upgrade VDAs with ease. For more information and step-by-step guidance, see Citrix VDA Upgrade Service documentation.

Retry catalog creation

> **Note:**
>
> This feature applies only to MCS catalogs.

Failed catalogs are marked with an error icon. To see the details, go to the **Troubleshoot** tab of each catalog. Before retrying catalog creation, be aware of the following considerations:

- Check the troubleshooting information first and resolve the issues. The information describes the issues found and provides recommendations for resolving them.
- You cannot change settings associated with Operating system and machine management. The catalog inherits those settings from the original.
- The creation can take some time to complete. If necessary, select **Hide progress** to run the creation in the background.

To retry creating a catalog, do the following:

1. From Web Studio, select **Machine Catalogs** in the left pane.
2. Select the catalog and then go to its **Troubleshoot** tab.
3. Click the retry hyperlink to retry creating the catalog.
4. In the wizard that appears, change settings where necessary. If there is no need to make changes, you can go to the **Summary** page directly.
5. After you finish, select **Finish** to start the creation.

Enroll non-MCS provisioned VDAs using tokens

You can now generate and manage enrollment tokens for non-MCS-provisioned VDAs. This implementation allows VDA registration over WebSocket without provisioning the VDAs with MCS. This feature also supports Linux Virtual Delivery Agent, Citrix Virtual Delivery Agent for macOS, and non-domain joined VDAs with Citrix Virtual Apps and Desktops™.

Before you begin

1. Configure your site. For more information, see Create a site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Install TLS certificates on the Delivery Controllers. For more information, see Install TLS server certificates on Controllers.
3. Install root CA and intermediate CA on VDA to trust the Delivery Controller.
4. Enable WebSocket connection on the Delivery Controller. Run the following command on each Delivery Controller present on your site:

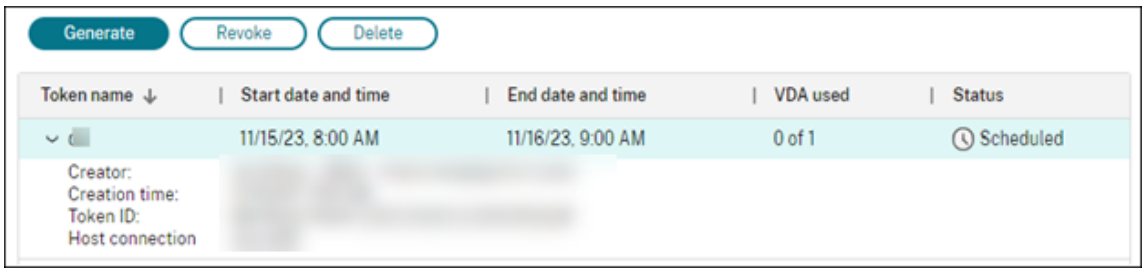
```
New-ItemProperty "HKLM:\SOFTWARE\Citrix\DesktopServer\WorkerProxy"
     -Name "WebSocket_Enabled" -PropertyType "DWord" -Value 1 -
    Force
```

> **Note:**
>
> Ensure that you restart the Delivery Controllers after enabling the WebSocket.

Generate enrollment tokens

After you decide to enable token-based enrollment for non-Citrix provisioned machines, you must first generate tokens on a per-machine catalog basis, and then share them with VDA installation administrators.

An enrollment token features:



- Registration range: 1–5000 VDA machines
- Validity period: up to 14 days

To generate a token for a catalog using Web Studio, follow these steps:

1. In **Web Studio > Machine Catalogs**, locate a non-MCS-provisioned catalog, which has **Provisioning method: Manual** displayed in the **Machine Count** column.
2. Right-click the catalog, and then select **Manage Enrollment Tokens**.
3. On the **Generate enrollment token** page that appears, provide the following token information:
   - Type a name for the token.
   - Enter its validity period. The period must be no more than 14 days. The token is valid only for the specified period.
   - (Optional) Select a host connection for power management of VDAs enrolled with the token. Options include all host connections under this catalog's zone.
   - Enter the token usage limits (between 1–5000).
4. Click **Generate**.
5. In the **Token successfully generated** window that appears, copy the token and save it in a safe place, or click **Download** to download it to the **Downloads** folder.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A token record appears in the token list.

6. Share the token with VDA installation administrators.

   For more information about how to install VDA and a token on machines, see Install VDAs.

Manage tokens

You have two options to revoke a token and make it unavailable for VDA enrollment:

- Revoke: Revoke the token but retain it in the list for logging purposes.
- Delete: Revoke the token and delete it from the list.

> **Note:**
>
> Expired tokens are automatically deleted in 14 days.

Enroll machines to catalogs using the WebSocket VDA enrollment tool

The WebSocket VDA enrollment tool facilitates token-based enrollment for VDA machines. This tool helps you convert a connection to a WebSocket connection by adding the VDA to the machine catalog using the enrollment token.

> **Note:**
>
> This tool is designed to enroll VDA machines that haven't been enrolled in any machine catalog.

Follow the instructions to run the enrollment tool:

1. Log in to the VDA.
2. Locate the tool `EnrollMachine.exe`, in `C:\Program Files\Citrix\Virtual Desktop Agent\Web Socket Vda Enrollment Tool`.
3. Run the tool with the appropriate input parameters. For example, `EnrollMachine.exe -websocket_token_string:xxxxxxxxx`

The following table describes the input parameters of the enrollment tool:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Parameter Name	Required	Description	Example
-websocket_token_stdin	Yes	Reads the enrollment token.	.\EnrollMachine.exe -websocket_token_stdin
-websocket_token_string		Reads the enrollment token directly from the command line parameter.	.\EnrollMachine.exe -websocket_token_string:<token>
-websocket_token_file:[token-file-path]		Reads the enrollment token from the path provided.	.\EnrollMachine.exe -websocket_token_file:C:\token\test2.txt
log:[log-file-path]	No	Shows the Enrollment tool logs.	.\EnrollMachine.exe log:[C:\ProgramData\Citrix\EnrollMachine\EnrollMachine.txt]
-help	No	Shows a brief help text.	.\EnrollMachine.exe -help

After successful enrollment, you will receive a success message on the tool and in the logs. Ensure to sign in to the Web Studio to verify that the VDA machine is added to the catalog and that the status of the machine is registered.

Troubleshooting By default, you can find the logs of the enrollment tool at:

C:\ProgramData\Citrix\EnrollMachine\EnrollMachine.txt

If you have specified a different path for the logs, you can use log:[log-file-path] to retrieve your logs.

The following table lists the codes returned by the enrollment tool:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Code	String	Description
0	Success	VDA is successfully added to the machine catalog.
-1	InvalidArgument	The input parameter in the enrollment token is invalid.
-2	BrokerAgentNotFound	The broker agent service is not found.
-3	TokenInvalid	The token entered is invalid.
-4	TokenMissingRequiredClaims	The required claims for the token are missing, for example, CustomerId, or Enrollment URIs.
-5	InternalError	A general error has occurred.
-6	TimedOut	The task has timed out.
-7	FailedToDetermineMachineADJoinedStatus	The service that returns the machine AD joined status failed.
-8	ADMachineFailedToFindSid	The service that returns the AD machine Sid failed.
-9	EnrollRequestFailed	The request failed due to an HTTP error.
-10	EnrollResponseMissingRequiredFields	The enrollment tool response is missing the parameter `VirtualSiteId`.
-11	InsufficientPermission	You do not have the required permission to run the task.
-12	FailedToDetermineMachineAadJoinedStatus	The service that checks the machine AD join status throws an error.
-13	AadMachineFailedToFindDeviceId	The additional parameter `AAD device id` added by the system is empty.
-14	AadDeviceIdNotValid	The additional parameter `AAD device id` added by the system is not a valid guid.
-15	NoValidMacAddress	Invalid MAC address.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Code	String	Description
-16	FailedToGetComputerHostNameForVdaInstanceName	Failed to get the computer host name to set the additional parameter `VdaInstanceName`.
-17	VirtualDesktopAgentRegistryKeyFailedToOpen	Failed to open the VDA registry key to write the list of Delivery controllers.
-18	Failed Token reached the max count	Failed Token reached the max count.

Use PowerShell

This section details how you can manage catalogs using PowerShell:

- Retrieve warnings and errors associated with a catalog
- Add descriptions to an image
- Reset OS disk
- Change the network setting for an existing provisioning scheme
- Manage versions of a machine catalog
- Convert a non-machine profile-based machine catalog to machine profile-based machine catalog
- Repair the identity information of active computer accounts
- Change cache configuration on an existing machine catalog
- VDA update support via local file share access

Retrieve warnings and errors associated with a catalog

You can get historical errors and warnings to understand issues with your MCS machine catalog and fix those issues.

Using PowerShell commands, you can:

- Get a list of errors or warnings
- Change the warning state from **New** to **Acknowledged**
- Delete the errors or warnings

To run the PowerShell commands:

1. Open a PowerShell window.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.

To get a list of errors and warnings:

Run `Get-ProvOperationEvent` command.

- With no parameters: Gets all errors and warnings
- With `LinkedObjectType` and `LinkedObjectUid` parameter: Gets all errors and warnings associated with a specific provisioning scheme
- With `EventId` parameter: Gets a specific error or warning that matches this event ID
- With `Filter` parameter: Gets errors or warnings by customized filter

To change the state of errors or warnings from **New** to **Acknowledged**:

Run `Confirm-ProvOperationEvent` command.

- With `EventId` parameter: Sets the state of a specific error or warning that matches this event ID. You can get the `EventId` of a specific error or warning as an output from `Get-ProvOperationEvent` command
- With `LinkedObjectType` and `LinkedObjectUid` parameters: Sets the state of all the errors and warnings associated with a specific provisioning scheme
- With `All` parameter: Sets the state of all errors and warnings as **Acknowledged**

To delete the errors or warnings:

Run `Remove-ProvOperationEvent` command.

- With `EventId` parameter: Removes a specific error or warning that matches this event ID. You can get the `EventId` of a specific error or warning as an output from `Get-ProvOperationEvent` command
- With `LinkedObjectType` and `LinkedObjectUid` parameters: Removes all errors and warnings associated with a specific provisioning scheme
- With `All` parameter: Removes all errors and warnings

For more information, see Citrix PowerShell SDK.

Delete machines without hypervisor access

When deleting a VM or a provisioning scheme, MCS needs to remove tags from the VM, and sometimes from the base disk as well, so that the resources included in the deletion options are no longer tracked or identified by MCS. However, some of these resources are only accessible through hypervisor. Use the `PurgeDBOnly` option in `Remove-ProvVM` PowerShell to delete VM resource objects such as VM, base disk, image in ACG, and so on from the database even when there is no hypervisor access.

This option is enabled on:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- all supported hypervisors
- persistent and non-persistent VMs

Limitations

You cannot use the commands -PurgeDBOnly and -ForgetVM at the same time.

Use the PurgeDBOnly command

When running the PowerShell command `Remove-ProvVM -ProvisioningSchemeName SCVMM-MC -VMName SCVMM01 -ForgetVM` the deletion operation might fail in the following scenarios:

- The host connection is in maintenance mode
- Invalid credentials
- Authentication failure
- Unauthorized operation
- The hypervisor is unreachable

> **Note:**
>
> Remove-provVM -ForgetVM targets only persistent VMs. If one of the VMs in the list is non-persistent, the operation fails.

When the operation fails because the hypervisor is unreachable, the following prompt appears:

`Try to use -PurgeDBOnly option to clean DDC database.`

Use the `-PurgeDBOnly` option in the `Remove-ProvVM` PowerShell command to delete references of a VM from MCS database. For example,

```
Remove-ProvVM -ProvisioningSchemeName SCVMM-MC -VMName SCVMM01 -
PurgeDBOnly
```

Add descriptions to an image

You can add informative descriptions about changes related to image updates for machine catalogs. Use this feature to add a description when creating a catalog, or when you update an existing master image for a catalog. You can also display information for each master image in the catalog. Use the following commands to add or view image descriptions:

- To add a note while creating a machine catalog with a master image, use the parameter `MasterImageNote` in the `NewProvScheme` command. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
C:\PS>New-ProvScheme -ProvisioningSchemeName <name> -
    HostingUnitName <name> -IdentityPoolName <name> -MasterImageVM
XDHyp:\HostingUnits\<hosting unit name>\<vm name>.vm\Base.
    snapshot -MasterImageNote "Note"
```

- To update the master image associated with a machine catalog, use the parameter `MasterImageNote` in the `Publish-ProvMasterVMImage` command. For example:

```
C:\PS>Publish-ProvMasterVMImage -ProvisioningSchemeName <name> -
    MasterImageVM XDHyp:\HostingUnits\<hosting unit name>\<vm name
    >.vm\base.snapshot -MasterImageNote "Note"
```

- To display the information for each image, use the Get-ProvSchemeMasterVMImageHistory command. For example:

```
C:\PS>Get-ProvSchemeMasterVMImageHistory -ProvisioningSchemeName
    MyScheme -Showall
```

To track the rollback progress, locate the catalog in **Machine Catalogs** to view the inline progress bar and the step-by-step progress graph.

You cannot roll back in certain scenarios, including the following. (The **Roll Back Master Image** option is not visible).

- You do not have permission to roll back.
- The catalog was not created using MCS.
- The catalog was created using an image of the OS disk.
- The snapshot used to create the catalog has become corrupted.
- User changes to the machines in the catalog do not persist.
- Machines in the catalog are running.

Reset OS disk

Use the PowerShell command `Reset-ProvVMDisk` to reset the OS disk of a persistent VM in an MCS created machine catalog. Currently, this feature is applicable to AWS, Azure, XenServer, Google Cloud. SCVMM, and VMware virtualization environments.

To successfully run the PowerShell command, make sure that:

- The target VMs are in a persistent MCS catalog.
- The MCS machine catalog is functioning properly.
- This implies that the provisioning scheme and host exist, and the provisioning scheme has correct entries.
- Hypervisor is not in maintenance mode.
- Target VMs are powered-off and in maintenance mode.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Perform the following steps to reset the OS disk:

1. Open a PowerShell window.
2. Run **asnp citrix*** to load the Citrix-specific PowerShell modules.
3. Run the PowerShell command `Reset-ProvVMDisk` in any one of the following ways:

   - Specify the list of VMs as a comma-separated list, and perform the reset on each VM:

     ```
     Reset-ProvVMDisk -ProvisioningSchemeName "xxx" -VMName ("abc"
         ,"def") -OS
     ```

   - Specify the list of VMs as an output from `Get-ProvVM` command, and perform the reset on each VM:

     ```
     (Get-ProvVM -ProvisioningSchemeName "xxx") | Reset-ProvVMDisk
         "abc" -OS
     ```

   - Specify a single VM by name:

     ```
     Reset-ProvVMDisk -ProvisioningSchemeName "xxx" -VMName "abc"
         -OS
     ```

   - Create separate reset tasks for each of the VMs returned by the `Get-ProvVM` command. This is less efficient because each task will perform the same redundant checks, such as hypervisor capability check, connection check for each VM.

     ```
     Get-ProvVM -ProvisioningSchemeName "xxx" | Reset-ProvVMDisk -
         ProvisioningSchemeName "xxx" -OS
     ```

4. A confirmation prompt appears that lists the VMs to be reset along with a warning message that it is an unrecoverable operation. If you do not provide an answer and press **Enter**, no further action takes place.

   > **Note:**
   >
   > Do not take VMs out the of the maintenance mode or power them on until the completion of the reset process.

   You can run the PowerShell command `-WhatIf` to print the action it would take and exit without performing the action.

   You can also bypass the confirmation prompt using one of the following methods:

   - Provide the `-Force` parameter:

     ```
     Reset-ProvVMDisk -ProvisioningSchemeName "xxx" -VMName "abc"
         -OS -Force
     ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Provide the `-Confirm:$false` parameter:

```
Reset-ProvVMDisk -ProvisioningSchemeName "xxx" -VMName "abc"
    -OS -Confirm:$false
```

- Before running the `Reset-ProvVMDisk`, change `$ConfirmPreference` to **None**:

```
PS C:\Windows\system32> $ConfirmPreference='None'
PS C:\Windows\system32> $ConfirmPreference
None
PS C:\Windows\system32> Reset-ProvVMDisk -
    ProvisioningSchemeName "xxx" -VMName "abc" -OS
```

5. Run `Get-ProvTask` to get the status of the tasks returned by `Reset-ProvVMDisk` command.

Change the network setting for an existing provisioning scheme

You can change the network setting for an existing provisioning scheme so that the new VMs are created on the new subnetwork. Use the parameter `-NetworkMapping` in the `Set-ProvScheme` command to change the network setting.

> **Note:**
>
> This feature is supported on Citrix Virtual Apps and Desktops 2203 LTSR CU3 and later versions.

To change the network setting for an existing provisioning scheme, do the following:

1. In the PowerShell window, run the command `asnp citrix*` to load the PowerShell modules.
2. Run `(Get-Provscheme -ProvisioningSchemeName "name").NetworkMaps` to get to the network path that you want to change.
3. Assign a variable to the new network setting. For example:

```
$NewNetworkMap = @{
 "0"= "XDHYP:\HostingUnits\MyNetworks\Network 0.network" }
```

4. Run `Set-ProvScheme -ProvisioningSchemeName "name"-NetworkMapping $NewNetworkMap`.
5. Run `(Get-Provscheme -ProvisioningSchemeName "name").NetworkMaps` to verify the new network setting for the existing provisioning scheme.

Manage versions of a machine catalog

When an MCS machine catalog is updated with the `Set-ProvScheme` command, the current configuration is saved as a version. You can then manage the various versions of the machine catalog using

© 1997–2026 Citrix Systems, Inc. All rights reserved.

PowerShell commands. You can:

- See the list of versions of a machine catalog
- Use any previous version to update the machine catalog
- Manually delete a version if it is not used by a VM of that machine catalog
- Change the maximum number of versions to be retained by the machine catalog (default is 99)

A version includes the following information of a machine catalog:

- VMCpuCount
- VMMemoryMB
- CustomProperties
- ServiceOffering
- MachineProfile
- NetworkMapping
- SecurityGroup

Run the following commands (provided as examples) to manage the various versions of a machine catalog.

- To see the configuration details of the various versions of a machine catalog:

```
Get-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog
```

- To see the configuration details of a particular version of a machine catalog:

```
Get-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog -
    Version 2
```

- To see the total number of versions associated with a machine catalog:

```
(Get-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog).
    Count
```

- To use any previous version to update the machine catalog:

```
Set-ProvScheme -ProvisioningSchemeName AzureCatalog -Version 2
```

- To manually delete a version if it is not used by a VM of that machine catalog:

```
Remove-ProvSchemeVersion -ProvisioningSchemeName AzureCatalog -
    Version 3
```

- To set the maximum number of versions to be retained by the machine catalog (default is 99). This setting is applied across all the catalogs. For example, in this case, a maximum of 15 versions will be retained for all the MCS provisioned catalogs.

```
Set-ProvServiceConfigurationData -Name "MaxProvSchemeVersions" -
    Value 15
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If the number of versions reaches the maximum number of versions, then a new version cannot be created if older versions are in use by any of the VMs in the machine catalog. In that case, do one of the following:

- Increase the limit of the maximum number of versions to be retained by the machine catalog.
- Update some VMs that are on older versions so that those older versions are no longer referenced by any VMs, and can be deleted.

Convert a non-machine profile-based machine catalog to machine profile-based machine catalog

You can use a VM, template spec (in case of Azure), launch template (in case of AWS), or VMware template (in case of VMware) as a machine profile input to convert a non-machine profile-based machine catalog to machine profile-based machine catalog. New VMs added to the catalog take property values from the machine profile unless overwritten by explicit custom property.

> **Note:**
>
> An existing machine profile-based machine catalog cannot be changed to a non-machine profile-based machine catalog.

To do this:

1. Create a persistent or non-persistent machine catalog with VMs and without a machine profile.
2. Open the **PowerShell** window.
3. Run the `Set-ProvScheme` command to apply the property values from the machine profile to the new VMs added to the machine catalog. For example:
   - In the case of Azure:

     ```
     Set-ProvScheme -ProvisioningSchemeName xxxx -MachineProfile
        XDHyp:\HostingUnits\<HostingUnitName>\machineprofile.
        folder\<ResourceGroupName>\<TemplateSpecName>\<VersionName
        >
     ```

   - In the case of AWS:

     ```
     Set-ProvScheme -ProvisioningSchemeName xxxx -MachineProfile "
        XDHyp:\HostingUnits\<hosting-unit>\<launch-template>.
        launchtemplate\<launch-template-version>.
        launchtemplateversion"
     ```

   - In the case of VMware:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-ProvScheme -ProvisioningSchemeName "my-prov-scheme" -
    MachineProfile "XDHyp:\HostingUnits\my-hosting-unit\my-
    template.template"
```

> **Note:**
>
> Set the `FolderID` as the custom property to avoid deriving `FolderID` from the VMware template.

Repair the identity information of active computer accounts

You can reset the identity information of active computer accounts that have identity-related problems. You can choose to reset only the machine password and trust keys, or reset all configuration of the identity disk. This implementation is applicable to both persistent and non-persistent MCS machine catalogs.

> **Note:**
>
> Currently, the feature is supported for AWS, GCP, Azure, SCVMM, XenServer, and VMware virtualization environments.

Conditions

Ensure the following to successfully reset the identity disk:

- Turn off and set the VM to maintenance mode
- Do not include the parameter -OS in the PowerShell command

Reset identity disk

To reset identity disk:

1. Open the **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Reset the identity information.
    - To reset only the machine password and trust keys, run the following command:

      ```
      Repair-AcctIdentity -IdentityAccountName TEST\VM1 -
          PrivilegedUserName TEST\admin1 -PrivilegedUserPassword
          $password -Target IdentityInfo
      ```

      The description of the parameters used in the command are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- IdentityAccountName: The name of the identity account that must be repaired.
- PrivilegedUserName: User account that has write permission on identity provider (AD or AzureAD).
- PrivilegedUserPassword: Password for PrivilegedUserName.
- Target: Target for the repair action. It can be IdentityInfo to repair account password/trust key, and UserCertificate to repair user certificate attributes of Microsoft Entra hybrid joined machine identities.

- To reset all configuration of the identity disk, run the following commands in the following order:

```
Repair-AcctIdentity -IdentityAccountName TEST\VM1 -
   PrivilegedUserName TEST\admin1 -PrivilegedUserPassword
   $password -Target IdentityInfo
```

```
Reset-ProvVMDisk ProvisioningSchemeName <name> -VMName <name>
     -Identity
```

- To completely recreate the identity disk:

```
Reset-ProvVMDisk -ProvisioningSchemeName <name> -VMname <name
   > -Identity -Recreate
```

> **Note:**
>
> If the machine is a Windows machine using VDA version 2511 or later, it will keep using the same `MachineGuid` as before regardless of the `-Recreate` setting.

4. Type **y** to confirm the action. You can also skip the confirmation prompt using the `-Force` parameter. For example:

```
Reset-ProvVMDisk -ProvisioningSchemeName <name> -VMName <name> -
   Identity -Force
```

5. Run `Get-ProvVM -ProvisioningSchemeName <name -VMName <name>` to check the updated identity disk setting. The attributes of the identity disk (for example, `IdentityDiskId`) must be updated. The `StorageId` and `IdentityDiskIndex` must not change.

Change cache configuration on an existing machine catalog

After creating a non-persistent catalog with MCSIO enabled, you can use the Set-ProvScheme command to modify the following parameters:

- WriteBackCacheMemorySize
- WriteBackCacheDiskSize

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This feature is currently applicable to:

- GCP and Microsoft Azure environments, and
- a non-persistent catalog with MCSIO enabled

Requirements

The requirements to modify the cache configuration are:

- Update to the latest version of VDA (2308 or later).
- Enable the parameter `UseWriteBackCache` for the existing machine catalog. Use `New-ProvScheme` to create a machine catalog with `UseWriteBackCache` enabled. For example:

```
New-ProvScheme -ProvisioningSchemeName $CatalogName -
    HostingUnitUid $HostingUnitUid `
-IdentityPoolUid $acctPool.IdentityPoolUid -CleanOnBoot `
-MasterImageVM $MasterImage `
-ServiceOffering $ServiceOffering `
-NetworkMap $NetworkMap `
-SecurityGroup $SecurityGroup `
-UseWriteBackCache -WriteBackCacheDiskSize 8
```

Change the cache configuration

Run the Set-ProvScheme command. For example:

```
Set-ProvScheme -ProvisioningSchemeName $provScheme.
    ProvisioningSchemeName -WriteBackCacheDisk32 -
    WriteBackCacheMemorySize 128
```

> **Note:**
>
> - The value of `WriteBackCacheDiskSize` must be more than zero because at least 1 GB of cache disk storage is required.
> - The value of `WriteBackCacheMemorySize` must be less than the machine catalog memory size.
> - These changes only affect new VMs added to the catalog after the change is made. Existing VMs are not affected by these changes.

VDA Update Support via Local File Share Access

Specify the VDA installer location through PowerShell cmdlets which reduces your effort from providing network rules to allow each VDA to go and fetch the new VDA installer from the Citrix Managed

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Azure CDN.

PowerShell cmdlets

Two new optional parameters added to **New-VusCatalogSchedule** and **New-VusMachineUpgrade** cmdlets that allow you to use installers from a local file share

- **VdaWorkstationPackageUri** - to specify the UNC path to the workstation OS VDA installer
- **VdaServerPackageUri** - to specify the UNC path to the server OS VDA installer

Prerequisites

- VUS Agent Installer that comes with VDA 2311
- VDA Upgrade Agent to version 7.40.0.35 or later (using the VDA installer version 2311 or later)
- Virtual Apps and Desktops Remote PowerShell SDK version 7.40 or newer (released on Jan 10, 2024 or later)

How to Set File Share Permissions

The network shares containing VDA installer packages must have read access for the VDA Upgrade Agent service which runs as Local System (NT AUTHORITY\SYSTEM principal).

- **Domain-Joined file share permission**

  When the VDA machine is domain-joined, then the **Local System** account (VUA runs as Local System), uses computer credentials when accessing network shares.

  The least privilege permission can be set by granting the **Read** access to Domain Computers.

  1. Choose people on your network who you want to share the file with.
  2. Click **Advanced Sharing Settings** and turn on **File and Printer Sharing**.

- **Non-Domain Joined file share permission**

  When the VDA machine is non-domain joined, then the **Local System** account (VUA runs as Local System), uses **ANONYMOUS LOGON** when accessing network shares.

  1. Select a shared folder.
  2. Disable the password protection.
     a) Go to Folder **Properties**.
     b) Select **Network and Sharing Center**.
     c) Turn off **Password Protected Sharing**.
  3. Click **Advanced Sharing** to grant a share permission.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Select **Permissions**.
b) Grant a **Read** share permission to **ANONYMOUS LOGON**.

4. Select the **Security Tab** to grant folder permissions
   a) Click **Edit** to add permissions to the shared folder
   b) Select the shared folder to grant folder permissions to **ANONYMOUS LOGON**.
5. Click **Advanced** to turn on **File and Printer Sharing**.
6. Add the shared folder name to **Network Access Security Policy**.

> **Note:**
>
> Restart your machine for the change to take effect immediately.

VDA Updates from a Local File Share

1. Download the VDA installer and place it in the shared file.

   > **Note:**
   >
   > With Virtual Upgrade Service, you can select from either the Current Release track or the LTSR track.
   >
   > **For Example:** If the machine catalog is set to Current Release that is 2311, and the VDA version is 2305, you must upgrade the VDA to version 2311.

   a) Navigate to the **Downloads** page on our website.
   b) Select **Citrix Virtual Apps and Desktops** as the product.
   c) Select **Citrix Virtual Apps and Desktops 7 2311, All Editions**.
   d) Select the VDA installer from the **Components that are on product ISO but also packaged separately** expandable.

2. Select the relevant VDA installer based on the catalog type.

   - Download the **Multi-session OS VDA installer** if the catalog type is **multi session**
   - Download the **Single-session OS VDA installer** if the catalog type is **single session**
   - Download the **Single-session OS Core Services VDA installer** if the catalog type is **Remote PC Access**

> **Note:**
>
> The version of the file share installer has to **exactly** match the version of the latest installer version published by VUS to the cloud.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Storage migration of VMs

You can move the disk storage of existing VMs from an old storage to a new storage in VMware and XenServer environments. During migration, MCS retains the VM capabilities such as power management, reset OS disk, and so on. You can also add new VMs to the machine catalog using the new disk storage. To do this, use the PowerShell command `Move-ProvVMDisk`.

You can migrate full clone persistent VMs and non-persistent VMs.

- For persistent Full Clone VMs: OS Disk, Identity Disk, and non-MCS provisioned disks.
- For non-persistent VMs: OS Disk, Identity Disk, and Write-back Cache (WBC) disk.

The new storage must satisfy the following conditions:

- It must be within the same cluster of the old storage.
- The host on which the VM is running must have access to both the old and new datastores.

Migrate the disk storage

To migrate the disk storage:

1. Add a destination storage to an existing hosting unit. You can run the PowerShell command `Add-Hyphostingunitstorage` to add the destination storage:

   If you do not want to add new VMs to the old storage, then change the old storage to **Superseded**. You can do this using Studio or PowerShell commands. For Studio, see Edit storage. Alternatively, run `Set-Hyphostingunitstorage` and set `Superseded` as **`true`** to disable new VM creation in the old storage.

   > **Note:**
   >
   > For non-persistent VMs:
   >
   > - If WBC is used, then configure the WBC destination storage in the hosting unit.
   > - If OS destination storage is configured, then WBC (if used) must be compatible with OS destination storage.
   > - If OS destination storage is not configured, then WBC (if used) must be compatible with the current OS storage.

2. Turn off the VMs and turn on the **Maintenance Mode**.
3. Get the information about the provisioning scheme, hosting unit, OS disk storage, and WBC disk storage.

   - Run `ProvResourceInStorage` for OS storage information. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
$result=Get-ProvSchemeResourceInStorage -
    ProvisioningSchemeName xxxxx
$result
$result.ProvResourceInStorage | Format-List -Property *
```

- Run `TemporaryStorageInfo` for WBC storage information. For example:

```
$result=Get-ProvSchemeResourceInStorage -
    ProvisioningSchemeName xxxxx
$result
$result.TemporaryStorageInfo | Format-List -Property *
```

4. Migrate the OS disk, Identity disk, and WBC disk (applicable to non-persistent VMs) to the destination storage using the `Move-ProvVMDisk` PowerShell command.

> **Note:**
>
> - Always provide the OS and Identity disks in the DiskType and `DestinationStorageId` parameters.
> - The `DestinationStorageId` for OS disk and Identity disk must be the same.

Example:

Persistent VMs:

```
(Get-ProvVM -ProvisioningSchemeName xxxxx) | Move-ProvVMDisk -
    ProvisioningSchemeName "myFullCloneProvScheme" -VMName "
    machine01" -DiskType OS,Identity -DestinationStorageId
    datastore1,datastore1
```

> **Important:**
>
> For persistent VM, all disks are moved. You cannot select which disks to move.

Non-persistent VMs:

```
(Get-ProvVM -ProvisioningSchemeName xxxxx) | Move-ProvVMDisk -
    ProvisioningSchemeName "myCleanOnBootProvScheme" -VMName "
    machine01" -DiskType OS,Identity,WBC -DestinationStorageId None
    ,None,datastore1
```

> **Important:**
>
> - If you don't want to migrate a specific disk, set the value as `None` for the `DestinationStorageId` parameter.
> - If the VM has WBC disk, then add the WBC disk in `DiskType` parameter and add the required information in `DestinationStorageId` parameter.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Migrate existing MCS provisioned catalogs to prepared image machine catalog

You can convert an existing MCS provisioned machine catalog into a prepared image machine catalog using a PowerShell command `Set-ProvSchemeImage`. However, you cannot revert to the legacy catalog after migration. Currently, this feature is applicable to Azure and VMware virtualization environments.

Limitations

Consider the following limitations:

- If the MCS catalog uses a persistent data disk, the catalog cannot be migrated to use a prepared image.
- If the MCS catalog uses unmanaged disks, the catalog cannot be migrated to use a prepared image.

Migrate to prepared image machine catalog

To migrate, do the following:

1. Create an image definition and image versions using Studio or PowerShell commands. See the steps to create image definitions and image versions in:
    - Azure:
        - Web Studio
        - PowerShell
    - VMware:
        - Web Studio
        - PowerShell
2. Run `Get-ProvScheme` command to get the provisioning scheme UID. For example:

```
Get-ProvScheme -ProvisioningSchemeName <name> | select
    ProvisioningSchemeName, ProvisioningSchemeUid
```

3. Run `Get-ProvImageVersionSpec` command to get the Image definition name, image version spec uid. For example:

```
Get-ProvImageVersionSpec -ImageDifinitionName <name> -Filter {
 IsPrepared -eq $true }
  | select ImageDefinitionName ImageVersionSpecUId
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. Run `Set-ProvSchemeImage` command to migrate an existing MCS provisioned machine catalog into a prepared image machine catalog. For example:

```
Set-ProvSchemeImage -ProvisioningSchemeName [
    ProvisioningSchemeName] -ImageVersionSpecUid [
    ImageVersionSpecUid]
```

5. Run `Get-ProvScheme` command to check that the catalog is migrated. For example:

```
Get-ProvScheme -ProvisioningSchemeName <name> | select
    ProvisioningSchemeName, ProvisioningSchemeUid,
    ImageVersionSpecUid
```

Troubleshoot

- For machines with "Power State Unknown"status, see CTX131267 for guidance.
- To fix VMs that continuously show an unknown power state, see How to fix VMs that continuously show an unknown power state.

Where to go next

For information on managing specific cloud services catalogs, see:

- Manage an AWS catalog
- Manage a XenServer catalog
- Manage a Google Cloud Platform catalog
- Manage a Microsoft Azure catalog
- Manage a Microsoft System Center Virtual Machine Manager catalog
- Manage a VMware catalog

Manage an AWS EC2 catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to AWS EC2 cloud environments.

> **Note:**
>
> Before managing an AWS catalog, you need to finish creating an AWS catalog. See Create an AWS EC2 catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove tags

When you create a catalog or a VM, MCS- created tags are created on the following resources:

- Virtual machine
- Root disk volume
- Identity disk volume
- NIC
- Root disk image (AMI)
- Launch template
- Snapshot of AMI or root disk

You can remove VMs and machine catalogs from Citrix® database and remove MCS- created tags. You can use:

- `Remove-ProvVM` with `ForgetVM` parameter to remove VMs and MCS- created tags from a single VM or a list of VMs from a machine catalog.
- `Remove-ProvScheme` with `ForgetVM` parameter to remove a machine catalog from the Citrix database and resources from a machine catalog.

This feature is only applicable to persistent VMs.

To do this:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Unlock the VM before removing the VMs. For example:

```
Unlock-ProvVM -ProvisioningSchemeName "<name>" -VMID "<id"
```

4. Run one of the following commands to remove VMs, machine catalog, and MCS- created tags from resources.
   - Run `Remove-ProvVM` with `ForgetVM` to remove VMs from Citrix database and tags from VMs. For example:

```
Remove-ProvVM -ProvisioningSchemeName "<name>" -VMName "<name
    >" -ForgetVM
```

   - Run `Remove-ProvScheme` to remove machine catalog from Citrix database and resources from a machine catalog. For example:

```
Run Remove-ProvScheme -ProvisioningSchemeName "<name>" -
    ForgetVM
```

5. Verify that the VM is removed from the Delivery Controller™, however, not from the hypervisor.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Run `Get-ProvVM -ProvisioningSchemeName "<name>"-VMName "<name>"`. This must return nothing.

b) Go to AWS EC2 console. You must see the VMs, however, the tags are now removed. Tags from the following resources are removed:

- Virtual machine
- Root disk volume
- Identity disk volume
- NIC

6. If you remove the machine catalog, verify that the catalog is removed from the Delivery Controller.

a) Run `Get-ProvScheme -ProvisioningSchemeName "forgetvmdemo"`. This must return an error.

b) Verify in AWS EC2 console that the following resources are removed.

- Root disk image (AMI)
- Launch template
- Snapshot of AMI or root disk

Identify resources created by MCS

Following are the tags that MCS adds to the resources. The tags in the table are represented as "key" :"value".

Resource name	Tag
ID disk	"Name": "VMName_IdentityDisk"
	"XdConfig": "XdProvisioned=true"
	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
Image	"XdConfig": "XdProvisioned=true"
	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
NIC	"Description": "XD NIC"
	"XdConfig": "XdProvisioned=true"
	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
OS disk	"Name": "VMName_rootDisk"

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Resource name	Tag
	“XdConfig”: “XdProvisioned=True”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” [when AwsCaptureInstanceProperties = true] “Citrix Resource”: “” [when AwsCaptureInstanceProperties = true and AwsOperationalResourcesTagging = true] “CitrixOperationalResource”: “”
PrepVM	“Name”: “Preparation - CatalogName - xxxxxxxxxx” “XdConfig”: “XdProvisioned=true”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” [when AwsCaptureInstanceProperties = true] “Citrix Resource”: “” [when AwsCaptureInstanceProperties = true and AwsOperationalResourcesTagging = true] “CitrixOperationalResource”: “”
Published snapshot	“XdConfig”: “XdProvisioned=true”
	If not a snapshot for Volume Worker AMI, then “CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”
Template	[when AwsCaptureInstanceProperties = true] “XdConfig”: “XdProvisioned=true”

Manage a catalog of Amazon WorkSpaces Core Managed Instances

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to Amazon WorkSpaces Core Managed Instances.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Before managing a catalog of Amazon WorkSpaces Core Managed Instances, you need to finish creating a catalog of Amazon WorkSpaces Core Managed Instances. See Create a catalog of Amazon WorkSpaces Core Managed Instances.

Remove tags

When you create a catalog or a VM, tags are created on the following resources:

- Virtual machine
- Root disk volume
- Identity disk volume
- Elastic network interface (ENI)
- Root disk image (AMI)
- Launch template
- Snapshot of AMI or root disk

You can remove VMs and machine catalogs from Citrix® database and remove Citrix-created tags. You can use:

- `Remove-ProvVM` with `ForgetVM` parameter to remove VMs and Citrix-created tags from a single VM or a list of VMs from a machine catalog.

  > **Note:**
  >
  > With the `ForgetVM` parameter, the VMs are removed from the Citrix's provisioning scheme database, however, the VMs continue to remain in the hypervisor.

- `Remove-ProvScheme` with `ForgetVM` parameter to remove a machine catalog from the Citrix database and resources from a machine catalog.

To do this:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Unlock the VM before removing the VMs. For example:

   ```
   1 Unlock-ProvVM -ProvisioningSchemeName "<name>" -VMID "<id"
   ```

4. Run one of the following commands to remove VMs, machine catalog, and Citrix-created tags from resources.

   - Run `Remove-ProvVM` with `ForgetVM` to remove VMs from Citrix database and Citrix-created tags from VMs. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Remove-ProvVM -ProvisioningSchemeName "<name>" -VMName "<name
    >" -ForgetVM
```

- Run `Remove-ProvScheme` to remove machine catalog from Citrix database and resources from a machine catalog. For example:

```
Run Remove-ProvScheme -ProvisioningSchemeName "<name>" -
    ForgetVM
```

5. Verify that the VM is removed from the Delivery Controller™, but, not from the hypervisor.
   a) Run `Get-ProvVM -ProvisioningSchemeName "<name>"-VMName "<name>"`. This must return nothing.
   b) Go to AWS EC2 console. You must see the VMs, however, the Citrix-created tags are now removed. Citrix-created tags from the following resources are removed:
      - Virtual machine
      - Root disk volume
      - Identity disk volume
      - ENI
6. If you remove the machine catalog, verify that the catalog is removed from the Delivery Controller.
   a) Run `Get-ProvScheme -ProvisioningSchemeName "forgetvmdemo"`. This must return an error.
   b) Verify in AWS EC2 console that the following resources are removed.
      - Root disk image (AMI)
      - Launch template
      - Snapshot of AMI or root disk

Identify resources created by MCS

Following are the tags that MCS adds to the resources on AWS platform. The tags in the table are represented as “key”:”value”.

Resource name	Tag
ID disk	“Name”: “VMName_IdentityDisk”
	“XdConfig”: “XdProvisioned=true”

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Resource name	Tag
Image	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “XdConfig”: “XdProvisioned=true”
ENI	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “Description”: “XD Nic” “XdConfig”: “XdProvisioned=true”
OS disk	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “Name”: “VMName_rootDisk” “XdConfig”: “XdProvisioned=True”
PrepVM	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “Name”: “Preparation - CatalogName - xxxxxxxxxx” “XdConfig”: “XdProvisioned=true”
Published snapshot	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “XdConfig”: “XdProvisioned=true”
Template	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “XdConfig”: “XdProvisioned=true”
VM in catalog	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “XdConfig”: “XdProvisioned=true”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”

Manage a XenServer® catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to XenServer virtualization environments.

> **Note:**
>
> Before managing a XenServer catalog, you need to finish creating a XenServer catalog. See Create a XenServer catalog.

Identify resources created by MCS

Following are the tags that MCS adds to the resources. The tags in the table are represented as "key":"value".

Resource name	Tag
Published base disk and its copy on each network or local storage	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
ID disk	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
OS disk	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
Prep VM	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
VM in catalog	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"
WBC disk	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx"

Manage a Google Cloud Platform catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to Google cloud environments.

> **Note:**
>
> Before managing a Google Cloud Platform catalog, you need to finish creating a Google Cloud Platform catalog. See Create a Google Cloud Platform catalog.

Manage machine catalog

To add machines to a catalog, update machines, and roll back an update, see Manage machine catalogs.

Power management

Citrix DaaS™ lets your power management of Google Cloud machines. Use the **Search** node in the left pane to locate the machine you want to power manage. The following power actions are available:

- Delete
- Start
- Restart
- Force Restart
- Shut Down
- Force Shutdown
- Add to Delivery Group
- Manage Tags
- Turn On Maintenance Mode

You can also power manage Google Cloud machines by using Autoscale. To do so, add the Google Cloud machines to a Delivery Group and then enable Autoscale for that Delivery Group. For more information about Autoscale, see Autoscale.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update provisioned machines using PowerShell

The `Set-ProvScheme` command changes the provisioning scheme. However, it does not affect existing machines. Using the PowerShell command `Set-ProvVMUpdateTimeWindow`, you can now apply the current provisioning scheme to an existing persistent or non-persistent machine or set of machines. Currently, in GCP, the property update supported by this feature is machine profile.

You can update:

- A single VM
- A list of specific VMs or all existing VMs associated with a provisioning scheme ID
- A list of specific VMs or all existing VMs associated with a provisioning scheme name

To update the existing VMs:

1. Check the configuration of the existing machines. For example,

```
Get-ProvScheme | select ProvisioningSchemeName,
    ProvisioningSchemeVersion
```

2. Update the provisioning scheme. For example,

```
`Set-ProvScheme –ProvisioningSchemeName "my-catalog" –
    MachineProfile "XDHyp:\HostingUnits\<hosting-unit>\
    machineprofileinstance.vm"
```

3. Check if the current property of the VM matches the current provisioning scheme, and if there is any pending update action on the VM. For example,

```
Get-ProvVM | select VMName, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeVersion
```

   You can also find machines with a particular version. For example,

```
Get-ProvVM -Filter "ProvisioningSchemeVersion -eq 1" | select
    VMName, ProvisioningSchemeVersion
```

4. Update existing machines.

   - To update all the existing machines:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog
    -StartsNow -DurationInMinutes -1
```

   - To update a list of specific machines:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog
    -VMName <List-Of-Vm-Names> -StartsNow -DurationInMinutes
   -1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To update machines based on the output of `Get-ProvVM`:

```
Get-ProvVM -ProvisioningSchemeName "my-catalog" | Set-
    ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog
    -StartsNow -DurationInMinutes -1
```

5. Find machines with an update scheduled. For example,

```
Get-ProvVM -Filter "ProvisioningSchemeUpdateAfter" | select VMName
    , ProvisioningSchemeUpdateAfter
```

6. Restart the machines. At the next power-up, property changes are applied to the existing machines. You can check the updated status using the following command:

```
Get-ProvVM | select VMName, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeVersion
```

Change disk related custom properties of an existing catalog

You can change the following disk related custom properties of an existing catalog and existing VMs of the catalog:

- `PersistOSDisk`
- `PersistWBC`
- `StorageType`
- `IdentityDiskStorageType`
- `WbcDiskStorageType`

> **Note:**
>
> - `StorageType` property is for OS disk
> - `PersistOsDisk` property can be set only for non-persistent catalog with write-back cache enabled

This implementation helps you to select different storage types for different disks even after you create a catalog and thus, balance pricing associated with different storage types.

To do this, use PowerShell commands `Set-ProvScheme` and `Set-ProvVMUpdateTimeWindow`:

1. Open a **PowerShell** window.
2. Run `asnp citrix®*`.
3. Run `Get-ProvVM -VMName <VM name>` to get the custom properties.
4. Change the custom properties string:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) Copy the custom properties to a Notepad and change the custom properties.

b) In the **PowerShell** window, paste the modified custom properties from Notepad and assign a variable to the modified custom properties. For example:

```
$cp =  '<CustomProperties xmlns=http://schemas.citrix.com
   /2014/xd/machinecreation xmlns:xsi="http://www.w3.org/2001/
   XMLSchema-instance">
<Property xsi:type="StringProperty" Name="CatalogZones" Value
   ="" />
<Property xsi:type="StringProperty" Name="PersistWBC" Value="
   true" />
<Property xsi:type="StringProperty" Name="PersistOSDisk" Value
   ="true" />
<Property xsi:type="StringProperty" Name="WBCDiskStorageType"
   Value="pd-standard" />
<Property xsi:type="StringProperty" Name="StorageType" Value="
   pd-standard" />
</CustomProperties>'
```

5. Update the existing catalog. For example:

```
Set-ProvScheme -ProvisioningSchemeName <yourCatalogName> -
   CustomProperties $cp
```

6. Update the existing VMs. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog -
   VMName <List-Of-Vm-Names> -StartsNow -DurationInMinutes -1
```

7. Restart the VMs. At the next power up, custom property changes are applied to the existing VMs.

Protect accidental machine deletion

Citrix DaaS lets you protect MCS resources on the Google Cloud to prevent accidental deletion. Configure the provisioned VM by setting the `deletionProtection` flag to TRUE.

By default, VMs provisioned through MCS or Google Cloud plug-in are created with InstanceProtection enabled. The implementation is applicable to both persistent and non-persistent catalogs. The non-persistent catalogs are updated when the instances get re-created from the template. For existing persistent machines, you can set the flag in the Google Cloud console. For more information about setting the flag, see the Google Documentation site. New machines added to persistent catalogs are created with `deletionProtection` enabled.

If you attempt to delete a VM instance for which you have set the `deletionProtection` flag, the request fails. However, if you are granted the permission `compute.instances.setDeletionProtection` or assigned the IAM **Compute Admin** role, you can reset the flag to allow the resource to be deleted.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Identify resources created by MCS

Following are the tags that MCS adds to the resources. The tags in the table are represented as “key” :”value”.

Resource name	Tag
ID disk	“CitrixResource”: “internal”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”
Image	“CitrixResource”: “internal”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”
OS disk	“CitrixResource”: “internal”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”
PrepVM	“CitrixResource”: “internal”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”
Published snapshot	“CitrixResource”: “internal”
Storage bucket	“Citrixresource”: “internal”
Template	“CitrixResource”: “internal”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”
VM in catalog	“CitrixResource”: “internal”
	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”. The plug-in also adds this label for MCS provisioned VMs: “citrix-provisioning-scheme-id”: “provSchemeId”. You can use this label to filter by catalog in the GCP console.
WBC disk	“CitrixResource”: “internal”
	CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx”

> **Note:**
>
> A VM is not visible in the Citrix inventory if a **CitrixResource** tag is added to identify it as a resource

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> created by MCS. You can remove or rename the tag to make it visible.

Manage an HPE Moonshot catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to HPE Moonshot catalog.

> **Note:**
>
> Before managing a HPE Moonshot catalog, you need to finish creating a HPE Moonshot catalog.

Power management

Citrix Virtual Apps and Desktops™ lets you do power management of HPE Moonshot machines. Use the **Search** node in the navigation pane to locate the machine you want to power manage. The following power actions are available:

- Start
- Shut Down
- Force Shutdown
- Restart
- Reset

> **Note:**
>
> **Suspend** and **Resume** power actions are not supported.

More information

- Create and manage connections and resources

Manage a Microsoft Azure catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to Microsoft Azure Resource Manager cloud environments.

> **Note:**
>
> Before managing a Microsoft Azure catalog, you need to finish creating a Microsoft Azure catalog. See Create a Microsoft Azure catalog.

Change the storage type to a lower tier when a VM is shut down

You can save storage costs by switching the storage type of a managed disk to a lower tier when you shut down a VM. To do this, use the `StorageTypeAtShutdown` custom property.

The storage type of the disk changes to a lower tier (as specified in the `StorageTypeAtShutdown` custom property) when you shut down the VM. After you power on the VM, the storage type changes back to the original (as specified in `StorageType` custom property or `WBCDiskStorageType` custom property).

> **Important:**
>
> The disk does not exist until the VM is powered on at least once. Therefore, you cannot change the storage type when you first power on the VM.

Requirements

- Applicable to a managed disk. This implies that you set the custom property `UseManagedDisks` to true.
- Applicable to a persistent and non-persistent catalog with a persistent OS disk. This implies that you set the custom property `persistOsDisk` to true.
- Applicable to a non-persistent catalog with a persistent WBC disk. This implies that you set the custom property `persistWBC` to true.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Restriction

- As per Microsoft, you can only change the disk type twice per day. See the Microsoft document. As per Citrix, the `StorageType` update happens whenever there is a Start or Deallocate action for the VM. Therefore, limit the number of power actions per VM to twice per day. For example, one power action in the morning to start the VM and one in the evening to deallocate the VM.

Change the storage type to a lower tier

Before proceeding with the steps, see the Requirements and Restriction.

1. Add the custom property `StorageTypeAtShutdown`, set the value to Standard_LRS (HDD), and create a catalog using `New-ProvScheme`. For information on creating a catalog using PowerShell, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

   > **Note:**
   >
   > If `StorageTypeAtShutdown` has any value other than empty or Standard_LRS (HDD), the operation fails.

   Example of setting custom properties while creating a persistent catalog:

```
$customProperties='<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/machinecreation"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true" />
<Property xsi:type="StringProperty" Name="StorageType" Value="Premium_LRS" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="" />
<Property xsi:type="StringProperty" Name="LicenseType" Value="Windows_Client" />
<Property xsi:type="StringProperty" Name="SchemaVersion" Value="2" />
<Property xsi:type="StringProperty" Name="OsType" Value="Windows" />
<Property xsi:type="StringProperty" Name="StorageTypeAtShutdown" Value="Standard_LRS" />
</CustomProperties>'
```

   Example of setting custom properties while creating a non-persistent catalog:

```
$customProperties='<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/machinecreation"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true" />
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<Property xsi:type="StringProperty" Name="StorageType" Value="
    Premium_LRS" />
<Property xsi:type="StringProperty" Name="WbcDiskStorageType"
    Value="Standard_SSD_LRS" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value=""
    />
<Property xsi:type="StringProperty" Name="LicenseType" Value="
    Windows_Client" />
<Property xsi:type="StringProperty" Name="SchemaVersion" Value="2"
    />
<Property xsi:type="StringProperty" Name="OsType" Value="Windows"
    />
<Property xsi:type="BooleanProperty" Name="persistWBC" Value=true
    />
<Property xsi:type="BooleanProperty" Name="persistOsDisk" Value=
    true />
<Property xsi:type="StringProperty" Name="StorageTypeAtShutdown"
    Value="Standard_LRS" />
</CustomProperties>'
```

> **Note:**
>
> When you use a machine profile, the custom property takes precedence over the property defined in `MachineProfile`.

2. Shut down the VM and check the storage type of the VM in the Azure portal. The storage type of the disk changes to a lower tier, as specified in the `StorageTypeAtShutdown` custom property.
3. Turn on the VM. The storage type of the disk switches back to the storage type mentioned in:
   - `StorageType` custom property for OS disk
   - `WBCDiskStorageType` custom property for WBC disk only if you specify it in `CustomProperties`. Otherwise, it switches back to the storage type mentioned in `StorageType`.

Apply `StorageTypeAtShutdown` to an existing catalog

Before proceeding with the steps, see the Requirements and Restriction.

Use `Set-ProvScheme` to add a VM to an existing catalog. The feature applies to new VMs added after running `Set-ProvScheme`. The existing machines are not affected.

Example of setting custom properties while adding a VM to an existing catalog:

```
$customProperties='<CustomProperties xmlns="http://schemas.citrix.com
    /2014/xd/machinecreation"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
    />
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
<Property xsi:type="StringProperty" Name="StorageType" Value="
    Premium_LRS" />
<Property xsi:type="StringProperty" Name="WbcDiskStorageType" Value="
    Standard_SSD_LRS" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="" />
<Property xsi:type="StringProperty" Name="LicenseType" Value="
    Windows_Client" />
<Property xsi:type="StringProperty" Name="SchemaVersion" Value="2" />
<Property xsi:type="StringProperty" Name="OsType" Value="Windows" />
<Property xsi:type="BooleanProperty" Name="persistWBC" Value=true />
<Property xsi:type="BooleanProperty" Name="persistOsDisk" Value=true />
<Property xsi:type="StringProperty" Name="StorageTypeAtShutdown" Value
    ="Standard_LRS" />
</CustomProperties>'

$ProvScheme = Get-Provscheme -ProvisioningSchemeName $CatalogName

Set-ProvScheme -ProvisioningSchemeName $ProvScheme.
    ProvisioningSchemeName -CustomProperties $customProperties
```

Change the storage type of existing VMs to a lower tier on shutdown

Before proceeding with the steps, see the Requirements and Restriction.

You can save storage costs by changing the storage type of existing VMs to a lower tier when the VMs are shut down. To do this, use the `StorageTypeAtShutdown` custom property.

To change the Storage type of existing machines in a catalog to a lower tier when the VMs are shut down:

1. Open a PowerShell window.
2. Run `asnp citrix®*` to load the Citrix-specific PowerShell modules.
3. Run `Get-Provscheme -ProvisioningSchemeName $CatalogName`.
4. Change the custom properties string.

   ```
   $customProperties = '<CustomProperties xmlns="http://schemas.
       citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
       org/2001/XMLSchema-instance">
   <Property xsi:type="StringProperty" Name="StorageTypeAtShutdown"
       Value="Standard_LRS" />
   </CustomProperties>'
   ```

5. Update the provisioning scheme of the existing catalog. The update applies to new VMs added after running `Set-ProvScheme`.

   ```
   Set-ProvScheme -ProvisioningSchemeName $CatalogName -
       CustomProperties $customProperties
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Update the existing VMs to enable `StorageTypeAtShutdown`.

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName $CatalogName -
    StartsNow -DurationInMinutes -1
```

7. When you power on the machines next time, the `StorageTypeAtShutdown` property of the machines is updated. The storage type changes at the next shutdown.
8. Run the following command to view the `StorageTypeAtShutdown` value for each VM in a catalog:

```
Get-ProvVM -ProvisioningSchemeName <catalog-name> | foreach {
  $vmName = $_.VMName; $storageTypeAtShutdown = ($_.CustomVmData |
      ConvertFrom-Json).StorageTypeAtShutdown.
     DiskStorageAccountType; return New-Object psobject -Property
     @{
  "VMName" = $vmName; "StorageTypeAtShutdown" =
     $storageTypeAtShutdown  }
   }
```

Update provisioned machines to current provisioning scheme state

The `Set-ProvScheme` command changes the provisioning scheme. However, it does not affect existing machines. Using the PowerShell command `Set-ProvVMUpdateTimeWindow`, you can apply the current provisioning scheme to an existing persistent or non-persistent machine or set of machines. You can also schedule a time slot for the configuration updates of the existing MCS provisioned machines. Any power on or restart during the scheduled time slot applies a scheduled provisioning scheme update to a machine. Currently, in Azure, you can update `ServiceOffering`, `MachineProfile` and the following custom properties:

- `StorageType`
- `WBCDiskStorageType`
- `IdentityDiskStorageType`
- `LicenseType`
- `DedicatedHostGroupId`
- `PersistWBC`
- `PersistOsDisk`
- `PersistVm`
- `Zones`

> **Note:**
>
> - You can only update `StorageType`, `WBCDiskStorageType`, and `IdentityDiskStorageType` custom properties for a catalog using managed disk in Azure environments.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - If you run `Set-ProvVMUpdateTimeWindow` twice, then the most recent command takes effect.
> - If a VM is updated with `Set-ProvVMUpdateTimeWindow` and the current availability zones list provided by the Zones custom property was changed to not include the zone the VM is currently using, then the VM's persistent disks will be copied to the new zone and originals deleted. For instance, a VM provisioned in zone 3 updated with the Zones custom property set to "1,2"will move the VM and its disks to either zone 1 or 2, depending on which of the two zones has less machines to balance machines between zones 1 and 2.
> - If the Zones custom property is cleared entirely (set to an empty value), the VM's zone affinity is removed, allowing Azure to place the VM in any availability zone based on capacity. In this case, the VM's persistent disks remain in their original zone and are not moved.

You can update:

- A single VM
- A list of specific VMs or all existing VMs associated with a provisioning scheme ID
- A list of specific VMs or all existing VMs associated with a provisioning scheme name (machine catalog name)

After you make the following changes to the provisioning scheme, VM instance gets recreated for persistent catalogs in Azure:

- Change the `MachineProfile`
- Remove `LicenseType`
- Remove `DedicatedHostGroupId`

> **Note:**
>
> The OS disk of existing machines along with all its data remains as is and a new VM is attached to the disk.

Before updating the existing VMs:

1. Check the configuration of the existing machines. For example,

```
Get-ProvScheme | select ProvisioningSchemeName,
    ProvisioningSchemeVersion
```

2. Update the provisioning scheme. For example,

   - With VM as a machine profile input:

```
Set-ProvScheme -ProvisioningSchemeName "my-catalog" -
    MachineProfile "XDHyp:\HostingUnits\<hosting-unit>\
    machineprofile.folder\<resource-group>.resourcegroup\<
    virtual-machine>.vm"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- With template spec as a machine profile input:

```
Set-ProvScheme -ProvisioningSchemeName "my-catalog"
-MachineProfile "XDHyp:\HostingUnits\<hosting-unit>\
   machineprofile.folder\<resource-group>.resourcegroup\<
   template-spec>.templatespec\<template-spec-version>.
   templatespecversion"
-ServiceOffering "XDHyp:\HostingUnits\<hosting-unit>\
   serviceoffering.folder\<service-offering>.serviceoffering"
```

- With just service offering:

```
Set-ProvScheme -ProvisioningSchemeName "my-catalog" -
   ServiceOffering "XDHyp:\HostingUnits\<hosting-unit>\
   serviceoffering.folder\<service-offering>.serviceoffering"
```

3. Check if the current property of the VM matches the current provisioning scheme, and if there is any pending update action on the VM. For example,

```
Get-ProvVM | select VMName, ProvisioningSchemeUpdateRequested,
   ProvisioningSchemeVersion
```

You can also find machines with a particular version. For example,

```
Get-ProvVM -Filter "ProvisioningSchemeVersion -eq 1" | select
   VMName, ProvisioningSchemeVersion
```

To request updates for existing machines to apply at the next restart:

1. Run the following commands to update existing machines and have the updates apply at the next restart.

- To update all the existing machines. For example,

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog
    -StartsNow -DurationInMinutes -1
```

- To update a list of specific machines. For example,

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog
    -VMName <List-Of-Vm-Names> -StartsNow -DurationInMinutes
   -1
```

- To update machines based on the output of Get-ProvVM. For example,

```
Get-ProvVM -ProvisioningSchemeName "my-catalog" | Set-
   ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog
   -StartsNow -DurationInMinutes -1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - `StartsNow` indicates that the scheduled start time is the current time.
> - `DurationInMinutes` with a negative number (for example, –1) indicates no upper bound on the schedule's time window.

2. Find machines with an update scheduled. For example,

```
Get-ProvVM -Filter "ProvisioningSchemeUpdateAfter" | select VMName
    , ProvisioningSchemeUpdateAfter
```

3. Restart the machines. At the next power-up, property changes are applied to the existing machines. You can check the updated status using the following command. For example,

```
Get-ProvVM | select VMName, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeVersion
```

To schedule a VM to update to the latest provisioning settings next time it starts in the scheduled time window:

1. Run the following commands:

   - To schedule an update with start time as the current time

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog
    -VMName vm1 -StartsNow -DurationInMinutes 120
```

   - To schedule an update on a weekend

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName "my-
    catalog" -VMName "vm1" -StartTimeInUTC "10/15/2022
    9:00am" -DurationInMinutes (New-TimeSpan -Days 2).
    TotalMinutes
```

> **Note:**
>
> - `VMName` is optional. If not specified, the update is scheduled for the entire catalog.
> - Instead of `StartTimeInUTC`, use `StartsNow` to indicate that the schedule start time is the current time.
> - `DurationInMinutes` is optional. Default is 120 minutes. A negative number (for example, –1) indicates no upper bound on the schedule's time window.

2. Check the update status.

```
Get-ProvVM | select VMName, ProvisioningSchemeUpdateRequested,
    ProvisioningSchemeUpdateUntil, ProvisioningSchemeVersion
```

3. Power on the VM. If you power on the machine after the scheduled time slot, configuration update is not applied. If you power on the machine within the scheduled time slot,

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the machine is powered off, and
  - you do not power on the machine, configuration update is not applied
  - you power on the machine, configuration update is applied
- If the machine is powered on, and
  - you do not restart the machine, configuration update is not applied
  - you restart the machine, configuration update is applied

To cancel the configuration update:

You can also cancel a configuration update of a single VM, multiple VMs, or an entire catalog. To cancel a configuration update:

1. Run `Clear-ProvVMUpdateTimeWindow`. For example:
   - To cancel the configuration update scheduled for a single VM:

```
Clear-ProvVMUpdateTimeWindow -ProvisioningSchemeName “ my-catalog “ -VMName “ vm1 ”
```

   - To cancel the configuration update scheduled for multiple VMs:

```
Clear-ProvVMUpdateTimeWindow -ProvisioningSchemeName "my-catalog" -VMName "vm1","vm2"
```

> **Note:**
>
> The VMs must be from the same catalog.

Update properties of individual VMs

You can update properties of individual VMs in a persistent MCS machine catalog using the PowerShell command `Set-ProvVM`. However, the updates are not applied immediately. You must set the time window using the PowerShell command `Set-ProvVMUpdateTimeWindow` for the updates to apply.

This implementation helps you to manage individual VMs efficiently without updating the entire machine catalog. Currently, this feature is applicable only to the Azure environment.

Currently, the properties that you can update are:

- `CustomProperties`
- `ServiceOffering`
- `MachineProfile`

Using this feature, you can:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Update the properties of a VM
- Retain the properties updated on a VM after the machine catalog is updated
- Revert the configuration updates applied to a VM

Before updating properties of a VM:

1. Open a **PowerShell** window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Check the configuration of the existing machine catalog. For example:

```
Get-ProvScheme -ProvisioningSchemeName AzureCatalog
```

4. Check the configuration of the VM on which you want to apply the updates. For example:

```
Get-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1
```

Update properties of a VM

Do the following to update the properties on a VM:

1. Turn off the VM on which you want to apply the updates.
2. Update the properties of the VM. For example, if you want to update storage type (`StorageType`) custom property of the VM, run the following:

```
Set-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1 -
    CustomProperties "...<Property Name='StorageType' Value='
    Premium_LRS' />..."
```

You can update properties of two VMs in a machine catalog simultaneously. For example:

```
Set-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1 -
    CustomProperties "...<Property Name='StorageType' Value='
    Premium_LRS' />..."
```

```
Set-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine2 -
    CustomProperties "...<Property Name='StorageType' Value='
    StandardSSD_LRS' />..."
```

> **Note:**
>
> The updates are not applied immediately.

3. Get the list of properties that are specified to be updated and the configuration version. For example:

```
Get-ProvVMConfiguration -ProvisioningSchemeName AzureCatalog -
    VMName machine1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Check the property value of `Version` and the properties to be updated (in this case, `StorageType`).

4. Check the configuration version. For example:

```
1 Get-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1
```

Check the property value of `ProvVMConfigurationVersion`. The update is not yet applied. The VM is still in the old configuration.

5. Request scheduled update. For example:

```
1  Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName AzureCatalog -
      StartsNow -DurationInMinutes -1
```

For more information on scheduled updates, see Update provisioned machines to current provisioning scheme state.

> **Note:**
>
> Any pending provisioning scheme update is also applied.

6. Restart the VM. For example:

```
1 New-BrokerHostingPowerAction -MachineName machine1 -Action TurnOn
```

7. Check the configuration version. For example:

```
1 Get-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1
```

Check the property value of `ProvVMConfigurationVersion`. The update is now applied. The VM now has the new configuration.

8. To apply further configuration updates on the VM, turn off the VM, and repeat the steps.

Retain the properties updated on a VM after the machine catalog is updated

Do the following to retain the properties updated on a VM:

1. Turn off the VM on which you want to apply the updates.
2. Update the machine catalog. For example, if you want to change the VM size (`ServiceOffering`) and storage type (`StorageType`), run the following:

```
1 Set-ProvScheme -ProvisioningSchemeName AzureCatalog -
      ServiceOffering Standard_E4_v3 -CustomProperties "...<Property
      Name='StorageType' Value='StandardSSD_LRS' />..."
```

3. Get the configuration details of the machine catalog. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Get-ProvScheme -ProvisioningSchemeName AzureCatalog
```

The `ProvisioningSchemeVersion` is now incremented by one. The VM size and storage type are also updated.

4. Update the properties of the VM. For example, provide a machine profile to the VM.

```
Set-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1 -
    MachineProfile "XDHyp:\HostingUnits\<hosting-unit>\
    machineprofile.folder\<resource-group>.resourcegroup\<template-
    spec>.templatespec\<template-spec-version>.templatespecversion"
```

> **Note:**
>
> The machine profile input has a tag and a different VM size (`ServiceOffering`) specified.

5. Get the list of properties that the VM will have after merging the configuration updates on the VM with the machine catalog updates. For example:

```
Get-ProvVMConfigurationResultantSet -ProvisioningSchemeName
    AzureCatalog -VMName machine1
```

> **Note:**
>
> Any updates on the VM will override the updates done on the machine catalog.

6. Request scheduled update for the VM. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName AzureCatalog -
    VMName machine1 -StartsNow -DurationInMinutes -1
```

7. Restart the VM. For example:

```
New-BrokerHostingPowerAction -MachineName machine1 -Action TurnOn
```

The VM keeps its updated VM size as derived from the machine profile. The tag values as specified in the machine profile are also applied to the VM. However, the storage type is derived from the latest provisioning scheme.

8. Get the configuration version of the VM. For example:

```
Get-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1
```

The `ProvisioningSchemeVersion` and `ProvVMConfigurationVersion` now shows the latest version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Revert the configuration updates applied to a VM

1. After applying the updates to a VM, turn off the VM.
2. Run the following command to remove the updates that are applied on the VM. For example:

```
Set-ProvVM -RevertToProvSchemeConfiguration -
    ProvisioningSchemeName AzureCatalog -VMName machine1
```

3. Request scheduled update for the VM. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName AzureCatalog -
    VMName machine1 -StartsNow -DurationInMinutes -1
```

4. Restart the VM. For example:

```
New-BrokerHostingPowerAction -MachineName machine1 -Action TurnOn
```

5. Check the configuration version of the VM. For example:

```
Get-ProvVM -ProvisioningSchemeName AzureCatalog -VMName machine1
```

   The `ProvVMConfigurationVersion` value is now the configuration version of the machine catalog.

Change disk encryption

You can change the disk encryption in Azure virtualization environments and do the following:

- Create an MCS machine catalog with disk encryption set (DES) that is different from the master image DES using the `New-ProvScheme` command. For example:

```
$customProperties = @"
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
    machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
    instance">
<Property xsi:type="DiskEncryptionSetId" Name="Zones" Value="/
    subscriptions/XXXXXXXXXXXXXXXXXXXXXXXXXXXXXX/resourceGroups/
    testrsg/providers/Microsoft.Compute/diskEncryptionSets/test-
    diskEncryptionSet"/>
</CustomProperties>
"@
New-ProvScheme -CleanOnBoot `
-ProvisioningSchemeName $provisioningSchemeName `
-HostingUnitName $hostingUnitName `
-IdentityPoolName $identityPoolName `
-InitialBatchSizeHint $numberOfVms `
-masterImagePath $masterImagePath `
-NetworkMapping $networkMapping `
-CustomProperties $customProperties
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Change the disk encryption type from one DES key to another DES key of an existing MCS machine catalog and existing VMs using `Set-ProvScheme` and `Set-ProvVMUpdateTimeWindow` commands. After you restart the VMs, you can see the updated DES key. For example:

```
$customProperties = '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
    org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId"
    Value="/subscriptions/456c683e2ed7/resourceGroups/testrg/
    providers/Microsoft.Compute/diskEncryptionSets/
    diskEncryptionSet1" />
</CustomProperties>'
Set-ProvScheme -ProvisioningSchemeName azure-catalog -
    CustomProperties $customProperties
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog
    -VMName azu01, azu02 -StartsNow -DurationInMinutes -1
```

- Update an MCS machine catalog and VM that was not previously CMEK enabled to have customer-managed encryption key (CMEK) encryption (DES), disk encryption at host, or double encryption using `Set-ProvScheme` and `Set-ProvVMUpdateTimeWindow` commands. For information on different encryption types, see Azure server side encryption, Azure disk encryption at host, and Double encryption on managed disk.
- Update an existing MCS machine catalog and VMs to be non-encrypted that was previously encrypted using `Set-ProvScheme` and `Set-ProvVMUpdateTimeWindow` commands. For example:

```
$customProperties = '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
    org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId"
    Value="" />
</CustomProperties>'
Set-ProvScheme -ProvisioningSchemeName azure-catalog -
    CustomProperties $customProperties
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog
    -VMName azu01, azu02 -StartsNow -DurationInMinutes -1
```

- Enable disk encryption with private endpoint (an MCS machine catalog that used a host connection enabled with `ProxyHypervisorTrafficThroughConnector`). For information on how to enable disk encryption with private endpoints, see Enable disk encryption with private endpoint.

Enable disk encryption with private endpoint

As per the Azure limitation, currently, you can't have server-side encryption with customer-managed keys for private endpoints. However, you can update an existing MCS machine catalog and VMs with

© 1997–2026 Citrix Systems, Inc. All rights reserved.

private endpoints to be encrypted with the DES key.

Update an existing machine catalog with private endpoints The detailed steps to update an existing machine catalog with private endpoints are as follows:

1. Create a catalog without disk encryption through `ProxyHypervisorTrafficThroughConnector`.
2. Run `Set-ProvScheme` to update the catalog with `DiskEncryptionSetId`.

   > **Note:**
   >
   > `DiskEcryptionSetId` can be configured through `CustomProperties` or `MachineProfile`. When it is defined in both `CustomProperties` and `MachineProfile`, the properties defined in `CustomProperties` are applied.

   Example when using `CustomProperties`:

   ```
   $customProperties = '<CustomProperties xmlns="http://schemas.
       citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
       org/2001/XMLSchema-instance">
   <Property xsi:type="StringProperty" Name="DiskEncryptionSetId"
       Value="/subscriptions/456c683e2ed7/resourceGroups/testrg/
       providers/Microsoft.Compute/diskEncryptionSets/
       diskEncryptionSet1"/>
   </CustomProperties>'
   Set-ProvScheme -ProvisioningSchemeName azure-catalog -
       CustomProperties $customProperties
   ```

   Example when using MachineProfile: Use a VM that has disk encryption enabled or a template spec with disk encryption settings:

   ```
   Set-ProvScheme -ProvisioningSchemeName azure-catalog -
       MachineProfile "XDHyp:\HostingUnits\azureunit\machineprofile.
       folder\testrg.resourcegroup\new-template.vm"
   ```

   Alternatively, you can update a machine profile using Web Studio.

3. Run `Set-ProvVMUpdateTimeWindow` to update existing catalog VMs. For example:

   ```
   Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
       VMName azu01, azu02 -StartsNow -DurationInMinutes -1
   ```

4. After you restart the VMs, you can see the updated disk encryption on the VM's disks in Azure portal.
5. Run `Set-ProvScheme` to unset the disk encryption before adding new catalog VMs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> This step is required because you are updating a private endpoint catalog. If you do not do this step, then you will get errors while trying to add new VMs to the catalog.

For example:

```
$customProperties = '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
    org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId"
    Value="" />
</CustomProperties>'
Set-ProvScheme -ProvisioningSchemeName azure-catalog -
    CustomProperties $customProperties
```

6. Add new VMs to the catalog.

Update individual catalog VMs The detailed steps to update individual catalog VMs are as follows:

1. Create a catalog without disk encryption through `ProxyHypervisorTrafficThroughConnector`.
2. Run `Set-ProvVM` to update catalog VM with `DiskEncryptionSetId`.

> **Note:**
>
> The `DiskEcryptionSetId` can be configured through either `CustomProperties` or `MachineProfile`.

Example when using `CustomProperties`:

```
$customProperties = '<CustomProperties xmlns="http://schemas.
    citrix.com/2014/xd/machinecreation" xmlns:xsi="http://www.w3.
    org/2001/XMLSchema-instance">
<Property xsi:type="StringProperty" Name="DiskEncryptionSetId"
    Value="/subscriptions/456c683e2ed7/resourceGroups/testrg/
    providers/Microsoft.Compute/diskEncryptionSets/
    diskEncryptionSet1" />
</CustomProperties>'
Set-ProvVM -ProvisioningSchemeName azure-catalog  -VMName azu01 -
    CustomProperties $customProperties
```

Example when using MachineProfile:

```
Set-ProvVM -ProvisioningSchemeName azure-catalog  -VMName azu01 -
    MachineProfile "XDHyp:\HostingUnits\azureunit\machineprofile.
    folder\testrg.resourcegroup\new-template.vm"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Run `Set-ProvVMUpdateTimeWindow` to update existing catalog VMs. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName azure-catalog -
    VMName azu01 -StartsNow -DurationInMinutes -1
```

4. After you restart the VMs, you can see the updated disk encryption on the VMs disks in Azure portal.
5. Add new VMs to the catalog.

Use temporary disk as WBC disk for existing catalogs

You can use Azure temporary disk as write-back cache disk (WBC) disk for existing MCS machine catalogs. Use the `Set-ProvScheme` PowerShell command to update existing catalogs and VMs.

Prerequisites

The existing catalog must satisfy the following conditions:

> **Note:**
>
> If the existing catalog doesn't meet the following requirements, the WBC disk is not placed inside the temporary disk.

- MCSIO is enabled: The custom properties `WriteBackCacheMemorySize`, `WriteBackCacheDiskSiz` , and `UseWriteBackCache` are enabled.
- Ephemeral OS disk is not enabled.
- WBC is non-persistent: `PersistWBC` is **`false`**.
- `UseTempDiskForWBC` is null or false.
- The temporary disk size must be greater than the total size of (write-back cache disk size + reserved space for paging file + 1 GB buffer space).

> **Important:**
>
> Changing a service offering from one with a temporary disk to one without, or the reverse, is not allowed.

Update existing catalogs

To update an existing catalog, run the following commands:

1. Run `Set-ProvScheme` on the existing catalog to update the `UseTempDiskForWBC` to **`true`**. For example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Set-ProvScheme -ProvisioningSchemeName name -CustomProperties "<
    CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/
    machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-
    instance`"><Property xsi:type=`"StringProperty`" Name=`"
    StorageAccountType`" Value=`"Standard_LRS`"/><Property xsi:type
    =`"StringProperty`" Name=`"UseManagedDisks`" Value=`"True`"/><
    Property xsi:type=`"StringProperty`" Name=`"ManagedDisksPreview
    `" Value=`"False`"/><Property xsi:type=`"StringProperty`" Name
    =`"PersistOsDisk`" Value=`"False`"/><Property xsi:type=`"
    StringProperty`" Name=`"UseTempDiskForWBC`" Value=`"True`"/><
    Property xsi:type=`"StringProperty`" Name=`"PersistWBC`" Value
    =`"False`"/></CustomProperties>"
```

2. Add new machines to the catalog and power on. The new VMs have a WBC disk inside the temporary disk.

Retrieve information for Azure VMs, snapshots, OS disk, and gallery image definition

You can display information for an Azure VM, including OS disk and type, snapshot and gallery image definition. This information is displayed for resources on the master image when a machine catalog is assigned. Use this functionality to view and select either a Linux or Windows image. A PowerShell property, `TemplateIsWindowsTemplate`, was added to the `AdditionDatafield` parameter. This field contains Azure-specific information: VM type, OS disk, gallery image information, and OS type information. Setting `TemplateIsWindowsTemplate` to **True** indicates that the OS type is Windows; setting `TemplateIsWindowsTemplate` to **False** indicates that the OS type is Linux.

> **Tip:**
>
> Information displayed by the `TemplateIsWindowsTemplate` PowerShell property is derived from the Azure API. Sometimes, this field might be empty. For example, a snapshot from a data disk does not contain the `TemplateIsWindowsTemplate` field because the OS type cannot be retrieved from a snapshot.

For example, set the Azure VM `AdditionData` parameter to **True** for Windows OS type using PowerShell:

```
PS C:\Users\username> (get-item XDHyp:\HostingUnits\mynetwork\image.
    folder\username-dev-testing-rg.resourcegroup\username-dev-tsvda.vm).
    AdditionalData
Key Value
ServiceOfferingDescription Standard_B2ms
HardDiskSizeGB 127
ResourceGroupName FENGHUAJ-DEV-TESTING-RG
ServiceOfferingMemory 8192
ServiceOfferingCores 2
TemplateIsWindowsTemplate True
ServiceOfferingWithTemporaryDiskSizeInMb 16384
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
SupportedMachineGenerations Gen1,Gen2
```

Clone an MCS catalog

Split an existing persistent and non-persistent MCS catalog into multiple catalogs. By creating a clone of the original provisioning scheme, you can apply different catalog-level policies and configurations to specific subsets of VMs. This functionality is particularly useful when different functional roles within an organization, such as Finance or Executives, require different resource configurations (for example, backup limits) compared to standard users.

Example usage

An administrator manages a large catalog of VMs. The Executive team requires a higher number of backups than the standard policy allows. The administrator uses the `Copy-ProvScheme` command to clone the existing catalog provisioning scheme into a new catalog. This allows the administrator to apply a dedicated backup policy to the new Executive catalog while maintaining the original settings for the rest of the organization.

Applicability

- Azure environments
- Persistent and non-persistent MCS catalogs
- MCS provisioned Citrix Provisioning catalogs

Limitations

- **Provisioning scheme:** Only the latest version of the provisioning scheme is copied.
- **Backup schedules**: The backup schedule is not copied to the new catalog; the new catalog must have its own backup schedule configured.
- **Identity pools**: Identity-related objects are not cloned and remain shared using the same `ADAccountIdentityPool`.
- **Delivery groups**: Delivery group operations and user assignments are not changed or associated during the cloning process.

Important considerations

- **Resource Groups (TargetLocation)**:
  - If you do not provide a `TargetLocation` (Azure Resource Group):

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For a Citrix managed resource group, a new Citrix managed resource group is created.
- For a BYO (Bring Your Own) resource group, the new provisioning scheme resources are created in the same resource group.

- If you provide a `TargetLocation`:
  - The resources are created in the provided resource group.
  - The specified resource group must already exist in Azure.

- **Base Disk Snapshot**: A copy of the base disk snapshot is always made, regardless of the resource group configuration.

Prerequisites

- An existing provisioning scheme (source catalog) must be available.
- If specifying a target location, the target Azure Resource Group must exist.

Configure using PowerShell

1. Open a PowerShell window.
2. Run the `Copy-ProvScheme` command using the required parameters: `SourceProvisioningSchemeN` (or `SourceProvisioningSchemeUid`) and `TargetProvisioningSchemeName`.

   Example 1: Copy a provisioning scheme by name.

   This example copies the scheme named "Backup"to a new scheme named "TestCopy".

   ```
   Copy-ProvScheme -SourceProvisioningSchemeName Backup -
       TargetProvisioningSchemeName TestCopy
   ```

   Example 2: Copy a provisioning scheme by Uid to a specific Resource Group

   This example copies a scheme using its Uid and specifies a target resource group named "TestRg".

   ```
   Copy-ProvScheme -SourceProvisioningSchemeUid 771e205d-1ee5-4ad2-
       b044-ecf3d7f24ec7 -TargetProvisioningSchemeName TestCopy -
       TargetLocation TestRg
   ```

Identify resources created by MCS

Following are the tags that MCS adds to the resources. The tags in the table are represented as "key" :"value".

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Resource name	Tag
ID disk	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
Image	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
NIC	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
OS disk	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
PrepVM	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
Published snapshot	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
Resource group	“CitrixResource”: “Internal” CitrixSchemaVersion: 2.0
Storage account	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
VM in catalog	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”
WBC disk	“CitrixProvisioningSchemeId”: “xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx” “CitrixResource”: “Internal”

> **Note:**
>
> A VM is not visible in the Citrix inventory if a **CitrixResource** tag is added to identify it as a resource

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> created by MCS. You can remove or rename the tag to make it visible.

Remove tags

When you create a catalog or a VM, tags are created on the following resources:

- Resource group
- Virtual machine
- OS disk
- Identity disk
- Network interface
- Storage account

You can remove VMs and machine catalogs from Citrix database and remove tags. You can use:

- `Remove-ProvVM` with `ForgetVM` parameter to remove VMs and tags from a single VM or a list of VMs from a machine catalog.
- `Remove-ProvScheme` with `ForgetVM` parameter to remove a machine catalog from the Citrix database and tags from an entire machine catalog.

This feature is only applicable to persistent VMs.

To do this:

1. Open a **PowerShell** window.
2. Run **asnp citrix*** to load the Citrix-specific PowerShell modules.
3. Run `Remove-ProvVM` to delete VMs from Citrix database and tags from VMs.
   For example:

```
Remove-ProvVM -ProvisioningSchemeName “ProvisioningSchemeName” -VMName “vmname” -ForgetVM
```

4. Run `Remove-ProvScheme` to delete machine catalog from Citrix database and tags from machine catalogs. For example:

```
Remove-ProvScheme -ProvisioningSchemeName “ProvisioningSchemeName” -ForgetVM
```

> **Note:**
>
> After you use `ForgetVM` parameter in `Remove-ProvScheme`, MCS deletes all snapshots including base disk snapshot if the provisioning scheme is present in either bring your own resource group (BYORG) or Citrix managed resource group.

Manage a Microsoft System Center Virtual Machine Manager catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to Microsoft System Center Virtual Machine Manager (VMM) virtualization environments.

> **Note:**
>
> Before managing a VMM catalog, you need to finish creating a VMM catalog. See Create a Microsoft System Center Virtual Machine Manager catalog.

Identify resources created by MCS

Following are the tags that MCS adds to the resources. The tags in the table are represented as "key":"value".

Resource name	Tag
Prep VM	Tag string: "CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" Custom property entry: "XdConfig:" XdProvisioned=True"
VM in catalog	Tag string: "CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" Custom property entry: "XdConfig:" XdProvisioned=True"

More information

- Create and manage connections and resources

Manage a Nutanix catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to Nutanix AHV Prism Central environments.

> **Note:**
>
> Before managing a machine catalog on Nutanix AHV Prism Central, you need to finish creating a machine catalog on Nutanix AHV Prism Central. See Create a Nutanix catalog.

You can manage a machine catalog on Nutanix AHV Prism Central using:

- Web Studio
- PowerShell

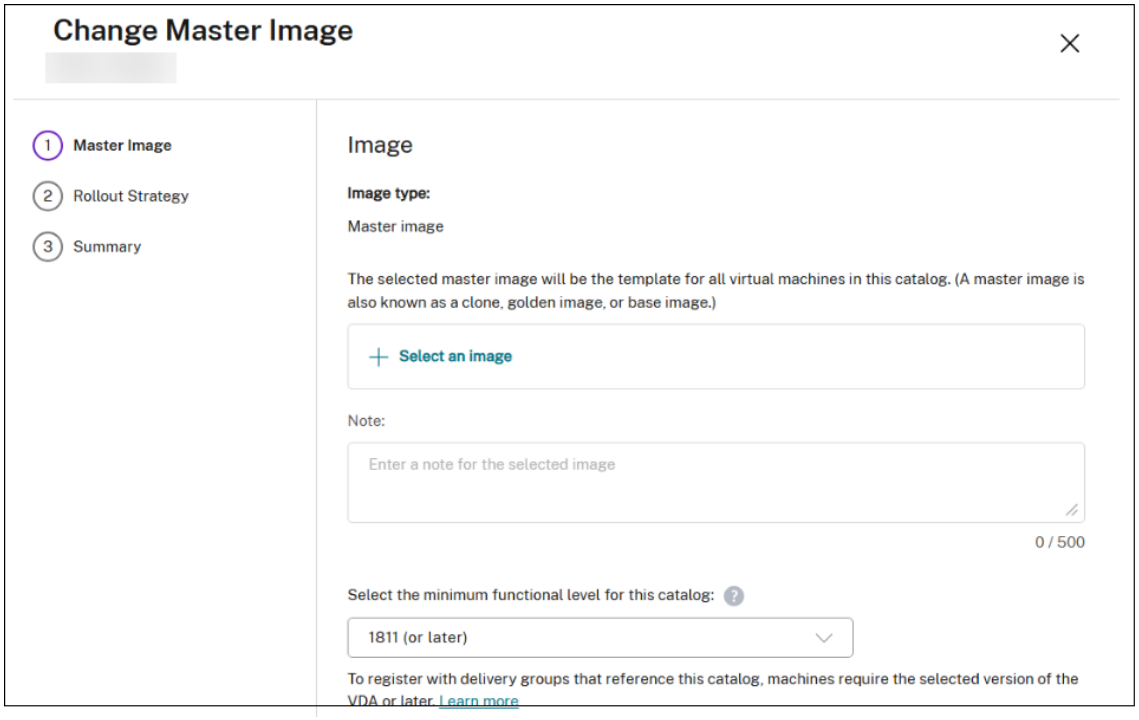
Use Web Studio

Following are the options to manage a machine catalog on Nutanix AHV Prism Central using Web Studio:

Option	Description
Add Machines	Create and add VMs to the machine catalog.
Delete Machine Catalog	Delete a machine catalog. You can choose to delete VMs at the same time or leave persistent VMs intact.
Change Master Image	Change the master image used as a template for all VMs in the catalog.
Add or change Machine Profile	Change the template version of the machine profile or add a machine profile to an existing catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Option	Description
Manage Configuration Set	Bind a catalog to a Workspace Environment Management™ configuration set or switch to a different configuration.
Edit Machine Catalog	Modify configurations for the catalog, such as NICs and Virtual Machines.
View Machines	Jump to the **Search** node to see all VMs that belong to the catalog.
Rename Machine Catalog	Change the catalog name.
Upgrade VDAs	Upgrade VDAs on a per-catalog basis. This feature only applies to static persistent machines.
Change Functional Level	Select the minimum functional level for the catalog. Setting a functional level makes all features available.
Test Machine Catalog	Test whether the catalog has errors or warnings.
Manage Tags	Create, edit, and delete tags. Select tags to apply to the catalog.
Move Machine Catalog	Move the catalog to another folder.



> **Note:**
>
> Currently, the **Clone** option is not available.

Change master image

To change the master image for a catalog, follow these steps:

1. On the **Machine Catalogs** page, right-click the machine catalog you want to update, and select **Change Master Image**.
2. On the **Change Master Image** page, click **Select an image**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **Select an image** page, expand a template and select a template version to use as the master image. You can filter machine templates by name.
4. On the **Rollout Strategy** page, choose when you want the update to be applied.

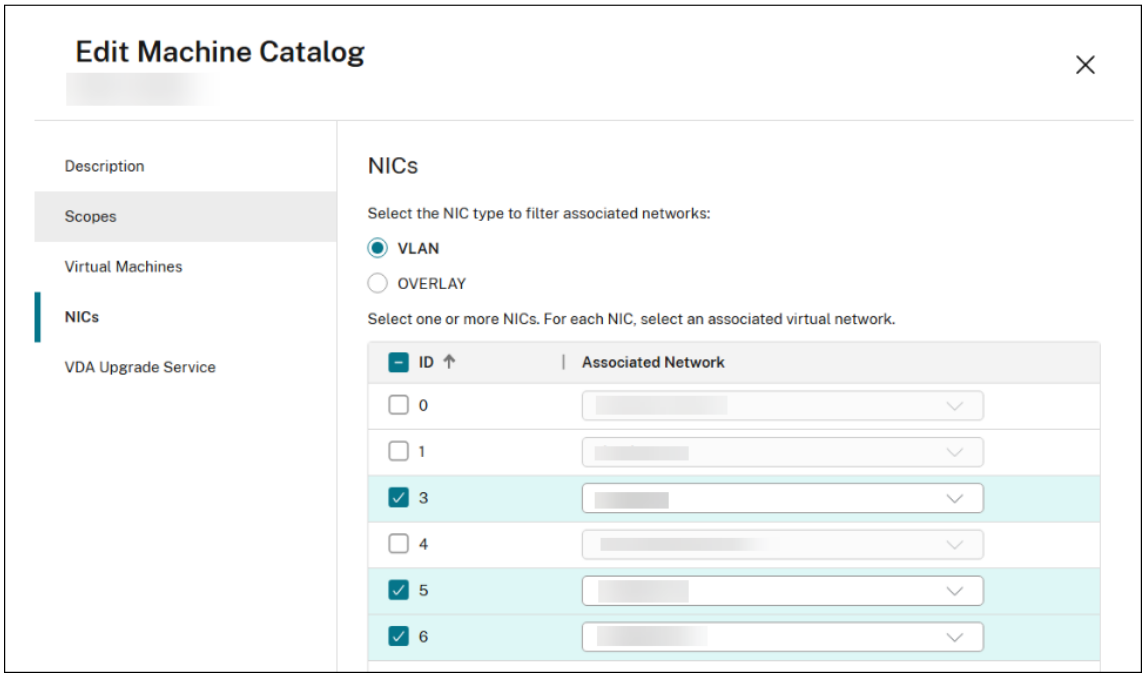
> **Note:**
>
> For an MCS provisioned non-persistent catalog with the Nutanix AHV Prism Central host connection plug-in, updating the master image to switch the boot configuration between Legacy and UEFI, prevents existing VMs from starting at their next boot.
> When you update the master image, only the OS disk is update. The hardware properties remain unchanged. To update the hardware properties, see Add or change the machine profile, Change NICs and Change VMs configuration.

Add or change the machine profile

To add or change a machine profile for a catalog, follow these steps:

1. On the **Machine Catalogs** page, right-click the machine catalog you want to modify, and select **Edit Machine Catalog**.
2. On the **Machine Profile** page,
    - If the machine catalog already has a machine profile, then click the pencil icon to select a different machine profile template version. You can filter by the template name. Confirm the machine profile settings.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



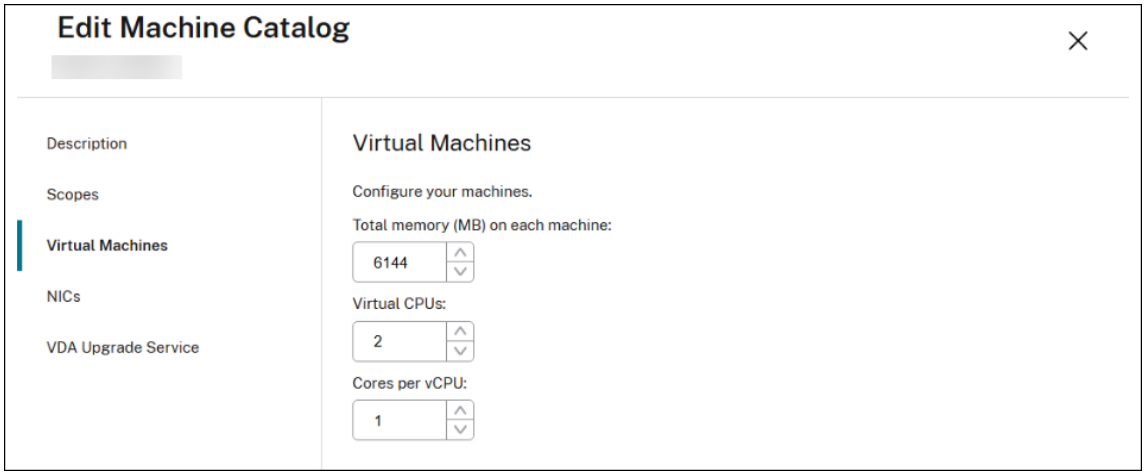
- If the machine catalog doesn't have a machine profile, then select Use a machine profile and select a machine profile. Confirm the machine profile settings.

3. The **Virtual Machines** page must reflect the updated configuration as per the selected machine profile template version.

Change NICs

To change NICs for a catalog, follow these steps:

1. On the **Machine Catalogs** page, right-click the machine catalog you want to modify, and select **Edit Machine Catalog**.
2. On the **NICs** page:
   a) Select an NIC type
   b) Select or clear the boxes to select NICs, and choose an associated virtual network for each NIC.



Change VMs configuration

To change the configuration of VMs, including Memory, CPU count, and Cores per vCPU, follow these steps:

1. On the **Machine Catalogs** page, right-click the machine catalog you want to modify, and select **Edit Machine Catalog**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the **Virtual Machines** page, use the up or down arrow, or enter values directly to adjust the Memory, CPU count, and Cores per vCPU for the VMs.

Use PowerShell

Change master image

The required parameters are:

- `ProvisioningSchemeName`: Name of the provisioning scheme to edit.
- `MasterImage`: Literal path to the new master image.

Run the following command. For example:

```
1 Set-ProvSchemeMetadata  -Name "ImageManagementPrep_DoImagePreparation"
     -ProvisioningSchemeName "<ProvisioningSchemeName>" -Value "True"
2
3 Publish-ProvMasterVMImage  -MasterImageVM "<Literal path to the new
     master image- template version> -ProvisioningSchemeName "<
     ProvisioningSchemeName>" -RunAsynchronously
```

> **Note:**
>
> When you update the master image, only the OS disk is update. The hardware properties remain unchanged. To update the hardware properties, see Add or change the machine profile, Change NICs and Change NIC and VM's configuration.

Add or change machine profile

Use the `Set-ProvScheme` command:

- To update a catalog with a new machine profile, or

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To update an existing catalog that does not have a machine profile to start using the machine profile as the source of hardware specification.

> **Note:**
>
> This does not update the hardware specification of the existing VMs in the catalog. Only the new VMs added to the catalog have the hardware specification from the given machine profile.

To change machine profile or convert an existing catalog to start using machine profile:

```
Set-ProvScheme -ProvisioningSchemeName <ProvScheme Name> `
               -MachineProfile "XDHyp:\HostingUnits\<Hosting Unit Name
                  >\Templates.folder\<Template Name>.template\<Template
                   Version Name>.templateversion"
```

The machine profile must have at least one NIC, and the number of NICs in the machine profile must match the subnet mappings in NetworkMapping

The total number of NICs for the template version can be obtained from the `AdditionalData` of its inventory item using the following:

```
$tv = Get-Item -Path "XDHyp:\HostingUnits\<Hosting Unit Name>\Templates
   .folder\<Template Name>.template\<Template Version Name>.
   templateversion"
$tv.AdditionalData.TotalNics
```

To change machine profile with overridden hardware specification:

Certain configurations can be configured using specific command-line parameters. These command line parameters, such as `VMCpuCount` and `VMMemoryMB`, and `CPUCores` in the `CustomProperties`, takes precedence over the values in the Machine Profile template version.

```
$customProperties = @"
    <CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
       machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
       instance">
        <StringProperty Name="ClusterId" Value="00062c63-1fb0-58c9-4fc8
           -5c2573352378" />
        <StringProperty Name="CPUCores" Value="2" />
    </CustomProperties>
"@

Set-ProvScheme -ProvisioningSchemeName <ProvScheme Name> `
               -MachineProfile "XDHyp:\HostingUnits\<Hosting Unit Name
                  >\Templates.folder\<Template Name>.template\<Template
                   Version Name>.templateversion" `
               -CustomProperties $customProperties `
               -VMCpuCount 4 `
               -VMMemoryMB 4096
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Change NIC and VM's configuration

The required parameters are:

- `ProvisioningSchemeName`: Name of the provisioning scheme to edit.
- `NetworkMapping`: Updated network mapping.

Run the following command. For example:

```
Set-ProvScheme  -CustomProperties "<CustomProperties xmlns=`"http://
    schemas.citrix.com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.
    w3.org/2001/XMLSchema-instance`"><Property xsi:type=`"StringProperty
    `" Name=`"ClusterId`" Value=`"000xxxx-1fb0-xxxxx-4fc8-5c257335xxxx`"
     /><Property xsi:type=`"StringProperty`" Name=`"CPUCores`" Value
    =`"1`" /></CustomProperties>"  -NetworkMapping @{
 "6"="XDHyp:\HostingUnits\<Hosting Unit Name>\Clusters.folder\<Cluster
    Name>\<Network name>.network" }
  -ProvisioningSchemeName "<ProvisioningSchemeName>" -VMCpuCount 4
```

Reset OS disk for persistent VMs

Resetting the OS disk in persistent VMs, especially those with vTPM enabled, can break applications relying on vTPM keys and BitLocker, potentially preventing boot. Therfore, this feature allows:

- Resetting the OS disk for persistent VMs and preserving VM hardware configurations.
- Managing vTPM-enabled VMs to avoid breaking vTPM dependency during disk swaps.

You can reset OS disk for persistent VMs using the `Reset-ProvVMDisk` PowerShell command.

- For vTPM-enabled VMs: A new VM is created from a recovery point using the original hardware info, preserving vTPM keys.
- For non-vTPM VMs: The OS disk is replaced.

For examples, see Reset OS disk.

Migrate machine catalogs to Citrix-managed Nutanix AHV Prism Central host connection

Migrate your Citrix machine catalogs, and their associated VMs from existing Nutanix AHV (for Prism Element) and Nutanix AHV PC (for NC2 on Azure) host connections to the Citrix-managed Nutanix AHV Prism Central host connection. For migration, use PowerShell commands, which also include fast rollback options in case of issues, and commands to clean up source resources post-migration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Benefits

- **Minimized disruption**: You smoothly transition to the Nutanix AHV Prism Central plug-in. This has minimal impact on your existing deployments.
- **Seamless upgrade path**: It provides a clear, and supported path for you to upgrade your infrastructure, and leverage the new management interface.
- **Data integrity and safety**: Rollback options ensure you revert the environment to its original state in case of unforeseen issues. This reduces risk.
- **Resource efficiency**: You clean up source resources after successful migration. This optimizes storage, and management overhead.
- **Flexibility**: It supports migration for catalogs provisioned by both MCS, and third-party technologies. This offers broader applicability.

Applicability

This feature is applicable to machine catalogs under Nutanix AHV (for Prism Element) and Nutanix AHV PC (for NC2 on Azure) host connections:

- Machine catalogs managed by MCS, including both persistent and non-persistent types.
- Power-managed-only machine catalogs that contain VMs provisioned by third-party technologies.

System Requirements

- **Nutanix AHV Prism Element (PE) AOS Version**: You require a minimum of 6.8.
- **Nutanix Prism Central (PC) Version**: You require a minimum of 2024.3.

> **Note:**
>
> Nutanix Prism Central 7.3 requires AOS 7.3 due to a Nutanix known issue.

Limitations

- **PVS catalogs arent supported**: This feature **doesn't** support machine catalogs created using **Citrix Provisioning Services** (PVS) Xendesktop Setup Wizard.
- **Rollback restrictions**:
  - Only allow rollback of a migrated catalog if you **haven't** modified the catalog after the initial migration.
  - When you execute the "**Cleanup Source Resources**"operation, it clears the migration state. This prevents any subsequent rollback.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **No re-migration**: A machine catalog that you already migrated isn't supported for re-migration.
- **Multi-host connection VMs**: Migration of power-managed-only machine catalog that contains VMs imported from multiple host connections is not supported.

Important Considerations

- **Nutanix cluster management**: Hosting Nutanix AHV clusters must be registered to a Nutanix Prism Central. .
- **Master image template creation**: For MCS machine catalogs, the migration command provides an option to generate a vm template version on Prism Central from the original snapshot of the machine catalog master image. This vm template version can later be used as the MCS master image of machine catalogs under Prism Central host connection. By default, this option is not enabled.
- **Rollback pre-conditions**:
  For a successful rollback to be possible, the original source environment—including the host connection, base disks—must remain unchanged. You must also avoid making any configuration changes to the migrated machine catalog and adding/removing VMs until the migration is confirmed to be successful.
  After that confirmation, you may perform the final Cleanup Source Resources operation, but be aware that this is an irreversible step that will make a rollback impossible.

Required permissions for migration and rollback

To migrate catalogs or rollback, you need the following permissions:

Prism Element administrator:

- Create Virtual Machine

Prism Central administrator:

- Create VM Templates
- Delete VM Templates
- Delete VM Recovery Point
- Delete Virtual machine

For the complete list of specific permissions needed for Citrix-managed Nutanix AHV Prism Central host connection, see Required permissions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

How to migrate

You manage this feature through dedicated PowerShell cmdlets. The general workflow involves three main operations: Migration, Rollback, and Cleanup source resources.

Migrate a machine catalog

- This operation moves a machine catalog, and its associated VMs from a source Nutanix AHV or Nutanix AHV PC host connection to a target Citrix-managed Nutanix AHV Prism Central host connection.
- For MCS provisioned catalogs, this process creates new base disks in the target connection .
- You optionally choose to create a master VM equivalent (VM template version) in the target connection from the original master image snapshot.

1. **Create a new Nutanix AHV Prism Central host connection**: Before migrating, register the hosting Nutanix AHV cluster to a Nutanix Prism Central, and establish a new Nutanix AHV Prism Central host connection that points to the target Nutanix Prism Central instance. This connection serves as the destination for your migrated catalogs. For details, see Nutanix AHV Prism Central host connection.
2. **Migrate an existing machine catalog**: For an existing machine catalogs, use the `Switch-ProvCatalog` PowerShell cmdlet to initiate the migration to Citrix-managed Nutanix AHV Prism Central host connection.

   ```
   c:\PS>Switch-ProvCatalog -BrokerCatalogUid <Catalog_UID> -
       DestinationHypervisorConnectionName "DestinationConnection" -
       DestinationHostingUnitName "DestinationUnit" -
       CreateMasterImageAtDestination
   ```

   - Replace <`Catalog_UID`> with the unique identifier of the machine catalog you wish to migrate. Use following PowerShell cmdlet to locate the `BrokerCatalogUid` by catalog name `Get-BrokerCatalog -Name <Catalog Name>`.
   - `DestinationConnection` is the name of the new **Nutanix AHV Prism Central host connection** created in Step 1.
   - `DestinationUnit` is the name you give to the hosting unit within the `DestinationConnection` where the machine catalog will reside.
   - The `-CreateMasterImageAtDestination` parameter is optional. It creates a master image VM template version on the target Prism Central.
3. **Verify migration completion**: After executing the migration cmdlet, monitor the task status in the PowerShell window to ensure it completes successfully. When the migration completes, the catalog is moved to the target host connection created in step 1. You must see a status

© 1997–2026 Citrix Systems, Inc. All rights reserved.

finished with the task type SwitchProvCatalog. Followings are recommended steps to verify the migration completion:

- Check the status of the catalog in Studio.
- Verify that the VMs within the catalog are now associated with the new destination hypervisor connection.
- Verify that the VMs within the catalog are showing the correct power state.
- Test the functionality of the migrated machine catalog by adding or removing machines or issuing power operations ensuring that the catalog is functioning correctly.

Rollback a migrated catalog

This operation reverts a machine catalog, and its VMs to their original source host connection. It removes any resources you created during the migration process.

> **Important:**
>
> You only perform rollback if you have not modified the catalog after migration, and you have not run the **Cleanup Source Resources** operation. The original source connection remains unchanged, and still contains its base disks.

```
c:\PS>Switch-ProvCatalog -BrokerCatalogUid <Catalog_UID> -Rollback
```

Clean up source resources

After a successful migration, this operation removes source resources, for example, base disks, from the original hypervisor connection.

> **Important:**
>
> When you execute this command, it clears the migration state. This makes subsequent rollbacks impossible.

```
c:\PS>Switch-ProvCatalog -BrokerCatalogUid <Catalog_UID> -
    CleanupSourceResources
```

You receive a confirmation prompt before proceeding, as this action is irreversible. Acknowledge the prompt to complete the cleanup.

More information

Manage a VMware catalog

May 13, 2026

Manage machine catalogs describes the wizards that manage a machine catalog. The following information covers details specific to VMware virtualization environments.

> **Note:**
>
> Before managing a VMware catalog, you need to finish creating a VMware catalog. See Create a VMware catalog.

Update the folder ID of a machine catalog

You can update the folder ID of an MCS machine catalog by specifying the `FolderId` in the custom properties of `Set-ProvScheme` command. The VMs created after updating the folder ID are created under this new folder ID. If this property is not specified in `CustomProperties`, then VMs are created under the folder where the master image is located.

Perform the following steps to update the folder ID of a machine catalog.

1. Open a Web browser and enter the URL for the **vSphere Web Client**.
2. Enter the credentials and click **Login**.
3. Create a VM placement folder in **vSphere Web Client**.
4. Open a PowerShell window.
5. Run **asnp citrix®*** to load the Citrix-specific PowerShell modules.
6. Specify the `FolderID` in the `CustomProperties` of `Set-ProvScheme`. In this example, the folder ID value is `group-v2406`.

```
Set-ProvScheme -ProvisioningSchemeUid "50bb319c-2e83-4a37-9ea1-94
    f630687372" -CustomProperties "<CustomProperties xmlns=""http
    ://schemas.citrix.com/2014/xd/machinecreation"" xmlns:xsi=""
    http://www.w3.org/2001/XMLSchema-instance""><Property xsi:type=
    ""StringProperty"" Name=""FolderId"" Value=""group-v2406"" /></
    CustomProperties>"
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

7. Add a VM to the machine catalog using Studio.
8. Check the new VM on vSphere Web Client. The new VM is created under the new folder.

Find the folder ID in vSphere

Access Managed Object Browser (MOB) on any ESXi or vCenter server system to find the folder ID of the VMs.

The MOB is a web-based server application available inbuilt in all ESX/ESXi and vCenter server systems. This vSphere utility allows you to view detailed information about objects like VMs, datastores, and resource pools.

1. Open a web browser and enter `http://x.x.x.x/mob`, where x.x.x.x is the IP address of the vCenter Server or ESX/ESXi host. For example, https://10.60.4.70/mob.
2. On the **Home** page of MOB, click the value of the property **content**.
3. Click the value of the **rootFolder**.
4. Click the value of the **childEntity**.
5. Click the value of the **vmFolder**.
6. You can find the folder ID in the value of the **childEntity**.

Identify resources created by MCS

Following are the tags that MCS adds to the resources. The tags in the table are represented as "key" :"value".

Resource name	Tag
Prep VM	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" "XdConfig:"XdProvisioned=True"
VM in catalog	"CitrixProvisioningSchemeId": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx" "XdConfig:"XdProvisioned=True"

Power Management

May 13, 2026

With Citrix Virtual Apps and Desktops™, you can power manage MCS-provisioned VMs across various supported hypervisors and cloud services. The power management operation provides you:

- Optimal user experience
- Cost management and power savings

The power actions available are:

- Start
- Shut down
- Restart
- Suspend
- Resume
- Force restart
- Force shutdown

> **Note:**
>
> - For a non-persistent VM, power cycle (shutdown/start and restart) results in OS disk getting reset.
> - Power action capabilities and behaviors vary depending on hypervisors or cloud services.

The article covers key power management features associated with certain supported hypervisors.

- Power manage AWS VMs
- Power manage Azure VMs

Power manage Amulet Hotkey CoreStation VMs

September 3, 2026

Citrix Virtual Apps and Desktops™ lets you do power management of Amulet Hotkey CoreStation VMs. Use the **Search** node in the navigation pane to locate the machine you want to power manage.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following power actions are available:

- Start
- Shut Down
- Force Shutdown
- Force Restart
- Restart

> **Note:**
>
> - Reset, Suspend, and Resume power actions are not supported.
> - Shut Down/Restart: Request the node to Shutdown the operating system and turn off. This is equivalent to a short press on the power button for a physical desktop machine. The Workstation might not respond to the shutdown request if there are active users or running programs which interrupt the shutdown or OS updates need to be installed.

Power manage AWS VMs

May 13, 2026

For information on required permissions, see Required AWS permissions.

Instance Hibernation

The hibernation process stores the in-memory state of the instance, along with its private, and elastic IP addresses, allowing it to pick up exactly where it left off.

When an instance is instructed to hibernate, it writes the in-memory state to a file in the root EBS volume, and then shuts itself down. An Amazon EBS volume is a durable, block-level storage device that you can attach to your instances. After you attach a volume to an instance, you can use it as you would use a physical hard drive. Encrypt the root EBS volume of the instance. The encryption ensures proper protection for sensitive data when it is copied from memory to the EBS volume. For information on EBS encryption, see Amazon EBS encryption.

Following are the limitations of the supported instance hibernation:

- Instance memory (RAM) of only up to 150 GB is supported
- UEFI boot mode is not supported
- The General Purpose SSD and Provisioned IOPS SSD are only supported as EBS volume types.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create hibernation supported VMs

To create hibernation supported VMs:

1. Create a host connection. See Connection to AWS.
2. Launch an instance with EBS root encrypted and the **Stop-Hibernate** property enabled. For more information on how to launch the instance, encrypt root EBS volume, and enable hibernation, see https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/launching-instance.html/. Use this instance as a master image to create an AMI.
3. Prepare the master image:
   a) Install a VDA on the master image. Citrix recommends installing the latest version to allow access to the newest features. Failure to install a VDA on the master image causes the catalog creation to fail. For more information on how to install a VDA, see Install VDAs.
   b) Join the master image to the domain where applications and desktops are members. Ensure that the master image is available on the host where the machines are created.
4. Create an AMI from that instance. For information on creating an AMI from an instance, see Create an AMI from an Amazon EC2 Instance.
5. Create a machine catalog using `New-ProvScheme` command. Set the `AwsCaptureInstanceProperty` custom property as **True**. For information on enabling AWS instance properties in Web Studio, see **Applying AWS instance properties and tagging operational resources in Web Studio**.

```
New-ProvScheme  -AdminAddress "xxx" -CleanOnBoot
-CustomProperties "AwsCaptureInstanceProperties,true;"
-HostingUnitName "xxx" -IdentityPoolName $catalog_name -
   InitialBatchSizeHint 1
-MasterImageVM "xyz.template" -NetworkMapping @{
 "0"="XDHyp:\HostingUnits\MyConn\\us-east-2a.availabilityzone
    \10.0.0.0``/24 (vpc-0f1771e45671aedcd).network" }

-ProvisioningSchemeName $catalog_name
-RunAsynchronously -Scope @() -SecurityGroup @("xxx") -
   ServiceOffering "xxx"
```

   For information on creating machine catalog using PowerShell commands, see https://developer-docs.citrix.com/projects/citrix-daas-sdk/en/latest/.

VMs that can be hibernated are created if:

- You select an AMI created from a master image that has the **Stop-Hibernate** property enabled.
- The master VM is domain joined and has the VDA installed.
- You select the correct VM size (service offering) that can handle hibernation.

The **New-ProvScheme** command fails with an appropriate error message if:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The master VM is hibernation enabled but the service offering is not capable of handling hibernation.
- If the master VM is not domain joined and has no VDA installed.

Hibernation status of service offerings and AMI

To get the hibernation status of the service offerings and AMI (templates), run the following commands:

- `Get-HypConfigurationObjectForItem 'XDHyp:\HostingUnits\MyConn\WIN2016-ADDC-2021.09.10.145334-a1968709-10c4-47d5-9642-21e743159a7b (ami-0e6c5b33a52d2a6b6).template'`
- `Get-HypConfigurationObjectForItem 'XDHyp:\HostingUnits\MyConn\R6i Sixteen Extra Large Instance.serviceoffering'`

Update service offering of an existing hibernation supported provisioning scheme

1. Run the `Set-ProvScheme` command. For example,

```
Set-ProvScheme -ProvisioningSchemeName <String> -ServiceOffering <String>
```

The system displays an exception message if the service offering is not compatible.

Create machine catalog with hibernation support

When creating machine catalogs, you can use a machine profile that supports hibernation.

1. In the catalog creation wizard, follow the instructions till the selection of the machine profile.
2. On the **Machine Template** page, click **Select a machine profile** and select a machine profile.
3. On the **Virtual Machine** page, click the **Edit** icon and select a VM.

   > **Note:**
   >
   > If the machine profile is hibernation enabled, the system displays only those VMs that can be hibernated.

4. Follow the onscreen instructions to complete all settings. The **Summary** page displays the hibernation status of the catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> In the edit machine catalog, when you change the machine profile to a hibernation-enabled one, you are be asked to reconfigure your VMs accordingly.

Update machine catalog that supports hibernation

If you try to update an existing machine catalog with a machine catalog that does not support hibernation, the update fails with an appropriate error message.

Power management of hibernated VMs

You can do the following power management operations on the hibernated VMs:

1. Suspend VM from the running state.
2. Resume VM from the suspended state.
3. Restart VM from the suspended state.

Power manage Azure Local VMs

May 13, 2026

Citrix Virtual Apps and Desktops™ lets you do power management of Azure Local VMs. Use the **Search** node in the navigation pane to locate the machine you want to power manage.

The following power actions are available:

- Start
- Shut Down
- Force Shutdown
- Restart

> **Note:**
>
> Reset, Suspend, and Resume power actions are not supported.

Power manage Azure VMs

May 15, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For information on required permissions, see Required Azure permissions.

Azure on-demand provisioning

With Azure on-demand provisioning, VMs are created only when Citrix Virtual Apps and Desktops™ initiates a power-on action, after the provisioning completes.

When you use MCS to create machine catalogs in the Azure Resource Manager, the Azure on-demand provisioning feature:

- Reduces your storage costs
- Provides faster catalog creation

When you create an MCS catalog, the Azure portal displays the network security groups, network interfaces, base images, and identity disks in the resource groups.

The Azure portal does not show a VM until Citrix Virtual Apps and Desktops™ initiates a power-on action for it. There are two types of machines with the following differences:

- For a pooled machine, the operating system disk and write-back cache exist only when the VM exists. When you shut down a pooled machine in the console, the VM isn't visible in the Azure portal. There's a significant storage cost saving if you routinely shut down machines (for example, outside of working hours).
- For a dedicated machine, the operating system disk is created the first time the VM is powered-on. The VM in the Azure portal remains in storage until the machine identity is deleted. When you shut down a dedicated machine in the console, the VM is still visible in the Azure portal.

> **Note:**
>
> Support for Azure catalogs created before on-demand provisioning feature ("legacy"catalogs) is deprecated. Therefore, recreate Azure legacy catalog VMs. The catalogs are then provisioned as on-demand that saves storage cost.

Preserve a provisioned virtual machine when power cycling

Choose whether to preserve a provisioned virtual machine when power cycling. Use the PowerShell parameter `New-ProvScheme CustomProperties`. This parameter supports an extra property, `PersistVm`, used to determine if a provisioned virtual machine persists when power cycled. Set the `PersistVm` property to **true** to persist a virtual machine when powered-off, or set the property to **false** to ensure that the virtual machine isn't preserved when powered-off.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The `PersistVm` property only applies to a provisioning scheme with the properties `CleanOnBoot` and `UseWriteBackCache` enabled. If the `PersistVm` property isn't specified for non-persistent virtual machines, they're deleted from the Azure environment when powered-off.

In the following example, the `New-ProvScheme CustomProperties` parameter sets the `PersistVm`property to **true**:

```
<CustomProperties xmlns="http://schemas.citrix.com/2014/xd/
   machinecreation" xmlns:xsi="http://www.w3.org/2001/XMLSchema-
   instance">
<Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true"
    />
<Property xsi:type="StringProperty" Name="StorageType" Value="
   Standard_LRS" />
<Property xsi:type="StringProperty" Name="PersistWBC" Value="false" />
<Property xsi:type="StringProperty" Name="PersistOsDisk" Value="true"
   />
<Property xsi:type="StringProperty" Name="PersistVm" Value="true" />
<Property xsi:type="StringProperty" Name="ResourceGroups" Value="demo-
   resourcegroup" />
<Property xsi:type="StringProperty" Name="LicenseType" Value="
   Windows_Client" />
</CustomProperties>
```

In the following example, the `New-ProvScheme CustomProperties` parameter preserves the write-back cache by setting `PersistVM` to **true**:

```
New-ProvScheme
-AzureAdJoinType "None"
-CleanOnBoot
-CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix.com
   /2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/
   XMLSchema-instance`"><Property xsi:type=`"StringProperty`" Name=`"
   UseManagedDisks`" Value=`"true`" /><Property xsi:type=`"
   StringProperty`" Name=`"StorageType`" Value=`"Standard_LRS`" /><
   Property xsi:type=`"StringProperty`" Name=`"PersistWBC`" Value=`"
   false`" /><Property xsi:type=`"StringProperty`" Name=`"
   PersistOsDisk`" Value=`"true`" /><Property xsi:type=`"
   StringProperty`" Name=`"PersistVm`" Value=`"true`" /><Property xsi:
   type=`"StringProperty`" Name=`"ResourceGroups`" Value=`"demo-
   resourcegroup`" /><Property xsi:type=`"StringProperty`" Name=`"
   LicenseType`" Value=`"Windows_Client`" /></CustomProperties>"
-HostingUnitName "demo"
-IdentityPoolName "NonPersistent-MCSIO-PersistVM"
-MasterImageVM "XDHyp:\HostingUnits\demo\image.folder\scale-test.
   resourcegroup\demo-snapshot.snapshot"
-NetworkMapping @ {
"0"="XDHyp:\HostingUnits\demo\\virtualprivatecloud.folder\East US.
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
        region\virtualprivatecloud.folder\ji-test.resourcegroup\jitest-vnet
        .virtualprivatecloud\default.network" }
10
11  -ProvisioningSchemeName "NonPersistent-MCSIO-PersistVM"
12   -ServiceOffering "XDHyp:\HostingUnits\demo\serviceoffering.folder\
        Standard_B2ms.serviceoffering" -UseWriteBackCache
13   -WriteBackCacheDiskSize 127
14   -WriteBackCacheMemorySize 256
```

> **Tip:**
>
> The `PersistVm` property determines whether to preserve a provisioned virtual machine. The `PersistOsdisk` property determines whether to persist the OS disk. To preserve a provisioned virtual machine, preserve the OS disk first. Do not delete the OS disk without first deleting the virtual machine. You can use the `PersistOsdisk` property without using specifying the `PersistVm` parameter.

Customize power on behavior at storage type change failure

At power-on, the storage type of a managed disk can fail to change to the desired type due to a failure on Azure. In these scenarios, the VM would remain off with a failure message sent to you. However, you can either choose to power on the VM even when storage can't be restored to its configured type or choose to keep the VM powered-off.

- If you configure the custom property `FailSafeStorageType` as **true** (default setting) or do not specify it in `New-ProvScheme` or `Set-ProvScheme` commands:
  - On power-on, the VM powers on with the incorrect storage type.
  - On shutdown, the VM remains off with the incorrect storage type.
- If you configure the custom property `FailSafeStorageType` as **false** in `New-ProvScheme` or `Set-ProvScheme` commands:
  - On power-on, the VM remains off with the incorrect storage type.
  - On shutdown, the VM remains off with the incorrect storage type.

To create a machine catalog:

1. Open a PowerShell window.
2. Run `asnp citrix®*` to load the Citrix-specific PowerShell modules.
3. Create an identity pool if not already created.
4. Add the custom property in `New-ProvScheme`. For example:

```
1  New-ProvScheme -HostingUnitName "Azure-Resources-1" -
       IdentityPoolName "name" -InitialBatchSizeHint 1
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
-MasterImageVM "XDHyp:\HostingUnits\Azure-Resources-1\image.folder
   \abc.resourcegroup\def.snapshot"
-NetworkMapping @{
 "0"="XDHyp:\HostingUnits\Azure-Resources-1\ght.folder\abc.
    resourcegroup\abc-vnet.virtualprivatecloud\default.network" }

-ProvisioningSchemeName "name"
-ServiceOffering "XDHyp:\HostingUnits\Azure-Resources-1\
   serviceoffering.folder\Standard_DS2_v2.serviceoffering"
-CustomProperties "<CustomProperties xmlns=`"http://schemas.citrix
   .com/2014/xd/machinecreation`" xmlns:xsi=`"http://www.w3.org
   /2001/XMLSchema-instance`">
<Property xsi:type=`"StringProperty`" Name=`"StorageType`" Value=`
   "Premium_LRS`" />
<Property xsi:type=`"StringProperty`" Name=`"StorageTypeAtShutdown
   `" Value=`"Standard_LRS`" />
<Property xsi:type=`"StringProperty`" Name=`"FailSafeStorageType`"
    Value=`"true`" />
</CustomProperties>"
```

5. Create the machine catalog. For information on how to create a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/creating-a-catalog/.

To update an existing machine catalog so to include `FailSafeStorageType` custom property. This update does not affect existing VMs.

1. Update the custom property in `Set-ProvScheme` command. For example:

```
Set-ProvScheme -ProvisioningSchemeName <String> -CustomProperties "
<CustomProperties xmlns=`"http://schemas.citrix.com/2014/xd/
   machinecreation`" xmlns:xsi=`"http://www.w3.org/2001/XMLSchema-
   instance`">
<Property xsi:type=`"StringProperty`" Name=`"StorageType`" Value=`"
   Premium_LRS`" />
<Property xsi:type=`"StringProperty`" Name=`"IdentityDiskStorageType
   `" Value=`"Premium_LRS`" />
<Property xsi:type=`"StringProperty`" Name=`"FailSafeStorageType`"
   Value=`"false`" />
</CustomProperties>"
```

To apply the change done in Set-ProvScheme to the existing VMs, run the `Set-ProvVMUpdateTimeWindow` command with `-StartsNow` and `-DurationInMinutes -1` parameters.

1. Run `Set-ProvVMUpdateTimeWindow` command with `-StartsNow` and `-DurationInMinutes -1` parameters command. For example:

```
Set-ProvVMUpdateTimeWindow -ProvisioningSchemeName my-catalog -
   VMName <List-Of-Vm-Names> -StartsNow -DurationInMinutes -1
```

2. Restart the VMs.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create hibernation-capable VMs

In Azure environments, you can create an MCS machine catalog that supports hibernation. Using this feature, you can suspend a VM, and then reconnect to the previous state of the VM when a user signs in again.

The hibernation capability applies to the following:

- Single-session OS
- Persistent and non-persistent VMs
- Static and random (pooled) VDI desktops

You can resume to the same session after you hibernate a VM, irrespective of whether the VDI desktop is static or random.

In this section, see the following:

- Prerequisites
- Limitations
- Create and manage a hibernation-capable machine catalog
- Create a machine catalog for existing hibernation-capable VMs
- Check the hibernation property
- Power management of VMs (Manual and Automated)

Prerequisites to use hibernation

To use hibernation, make sure to complete the following tasks:

- Install the Azure VM Agent on the master image for both Windows and Linux. The page file of the Windows image can be on the temporary disk. MCS sets the page file location to the C: drive in the base disk when hibernation is enabled on the machine catalog.
- MCS automatically sets the hibernation property for the generated resources. You do not need to configure properties of the master resources to support hibernation.
- Use a VM size in your subscription that supports hibernation.
- Create a hibernation-capable machine profile (VM or template spec) so that VMs inherit the hibernation-capability. To create the VM, see Getting started with hibernation.

  > **Note:**
  >
  > As per Microsoft, you can deploy hibernation enabled VMs from an OS disk. This feature is supported for certain regions currently and will be available for all the regions soon. For more information, see Deploy hibernation enabled VMs from an OS disk.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To create the template spec, do the following:

1. Open the Azure Portal. Choose a VM whose configuration you want to use in the template. Select **Export template** in the left pane.
2. Clear the **Include parameters** checkbox. Copy the context and save it as a JSON file, for example, `VMExportTemplate.json`.
3. Ensure that the parameter `hibernationEnabled` is **`true`** on the template. If the parameter is not **`true`**, check the VM configuration that you used. You can specify a supported VM size in the template file. However, you can also specify the machine size while creating the catalog.
4. Add the template for the network interface resource to the JSON file `VMExportTemplate.json`. As a result, you have an ARM template file having two resources.
5. Select **Azure Portal > Template specs > Import template > Choose local template file** to import this template file as an ARM template spec.
6. After the ARM Template specification is created, you can use it as a machine profile.

> **Note:**
>
> It might take a few minutes to sync to Citrix Studio.

For more information, see the Microsoft document Prerequisites to use hibernation.

Limitations

- Only single-session OS machine catalogs (persistent and non-persistent) are supported.
- Ephemeral OS disks and MCS I/O features do not support Azure hibernation.
- Hibernation might fail during the Automatic Windows updates.

For more information, see the Microsoft document.

Create and manage a hibernation-capable machine catalog

To create hibernation-capable VMs, you can create and manage a hibernation-capable machine catalog using:

- Web Studio, or
- PowerShell commands

Create a catalog using Web Studio

1. Select **Create Machine Catalog**. The catalog creation wizard opens.
2. On the **Machine Type** page, select the **Single-session OS** machine type for this catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **Machine Management** page, select the settings as follows:
    a) Select **Machines that are power managed (for example, virtual machines or blade PCs)**.
    b) Select **Citrix Machine Creation Services™ (MCS)**.
4. On the **Desktop Experience** page, select the random or static desktop experience as needed.
5. On the **Image** page, select a master image. Select the checkbox **Use a machine profile** and select a machine profile that supports hibernation. Click the tooltip to know if a machine profile supports hibernation.

    > **Note:**
    >
    > If you select an Azure managed Master image, the blade lists all the images that belong to the same region as those of Resources.

6. On the **Storage and License Types** page, select the storage and license to use for this catalog.
7. On the **Virtual Machines** page, select the count of VMs, VM size, and availability zone.

    > **Note:**
    >
    > The machine sizes that support hibernation are only shown for your selection.

8. On the **NICs** page, add the NICs you want the VMs to use.
9. On the **Disk Settings** page, select the storage type and size of the write-back cache disk.
10. On the **Resource Group** page, select the resource group to provision VMs.
11. On the **Machine Identities** page, select **Create new Active Directory accounts**. Then, specify an account naming scheme.
12. On the **Domain Credentials** page, click **Enter credentials**. Enter your domain credentials to perform account creation in the target Active Directory domain.
13. On the **Summary** page, enter a name for the machine catalog, and then click **Finish**.

When the MCS machine catalog creation is complete, locate the catalog in the catalog list, and then click the **Template Properties** tab. The value of the parameter **Hibernation** must be **Supported**.

If you want to edit a machine catalog, consider the following restrictions:

- If the current machine catalog supports hibernation, you can't:
    - Change the VM size to a hibernate-incapable one.
    - Change the machine profile to a hibernate-incapable one.
- If the current machine catalog does not support hibernation, you can't:
    - currently, change the machine profile to a hibernate-capable one using the Web Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Create a machine catalog for managing existing hibernation-capable VMs If you already have hibernation-capable VMs and want to suspend and resume them, create a machine catalog to import those VMs for power management.

> **Note:**
>
> You can create a machine catalog containing both hibernation-capable and incapable VMs. However, if you want hibernation-related functionality, you must create the machine catalog with only hibernation-capable VMs.

To create a catalog for existing hibernation-capable VMs using Web Studio, follow the on-screen instructions to complete the steps and pay attention to the following key settings:

1. On the **Machine Management** page, select **Machines that are power managed**, and then select **Other service or technology** as the way of deploying machines.
2. On the **Virtual Machines** page, add or import only the hibernation-capable VMs.

Create a machine catalog using PowerShell commands After you meet all the requirements to use hibernation, you can create a hibernation-capable machine catalog using the `New-ProvScheme` command. For information on how to create a catalog using the Remote PowerShell SDK, see New-ProvScheme.

While creating the catalog, you can check whether a VM size and machine profile supports hibernation or not using the following PowerShell commands:

- For the VM size, run the following command and check whether the property `supportsHibernation` is **True**. For example,

```
Get-ChildItem -AdminAddress "MyDDC.MyDomain.local" -LiteralPath @
    ("XDHyp:\HostingUnits\ <VirtualNetwork> \serviceoffering.
    folder") | select Name, AdditionalData | ConvertTo-Json
```

- For the machine profile, run the following command and check whether the property `supportsHibernation` is **True**. For example,

```
Get-ChildItem -AdminAddress "MyDDC.MyDomain.local" -LiteralPath @
    ("XDHyp:\HostingUnits\ <VirtualNetwork> \machineprofile.folder
    \abc.resourcegroup")|select Name, AdditionalData|ConvertTo-
    Json
```

If you want to edit a machine catalog, consider the following restrictions:

- If the current machine catalog supports hibernation, you can't:
  - Change the VM size to a hibernate-incapable one
  - Change the machine profile to a hibernate-incapable one

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the current machine catalog does not support hibernation, you can't:
  - currently, change the machine profile to a hibernate-capable one using Web Studio.

For information on how to modify VM size and machine profile of a catalog using the Remote PowerShell SDK, see https://developer-docs.citrix.com/projects/citrix-virtual-apps-desktops-sdk/en/latest/MachineCreation/Set-ProvScheme/.

Check hibernation property

You can check the hibernation property of a machine catalog, VM, and a broker machine using the PowerShell commands:

- To check the hibernation property of a provisioning scheme, run the following PowerShell commands. The `HibernationEnabled` parameter must be `True`.

```
(Get-ProvScheme -provisioningSchemeName <YourSchemeName>).
   VMMetadata -join "" |  ConvertFrom-Json | Select
   HibernationEnabled
```

- To check the hibernation property of a provisioning VM, run the following PowerShell commands. The `SupportsHibernation` parameter must be `True`.

```
(Get-ProvVM -VMName <YourVMName>).CustomVmData | ConvertFrom-Json
    | Select SupportsHibernation
```

- To check the hibernation capacity of a broker machine, run the following PowerShell commands. The **Suspend** and **Resume** power actions indicate hibernation capability.

```
(Get-BrokerMachine -MachineName <YourMachineName>).
   SupportedPowerActions
```

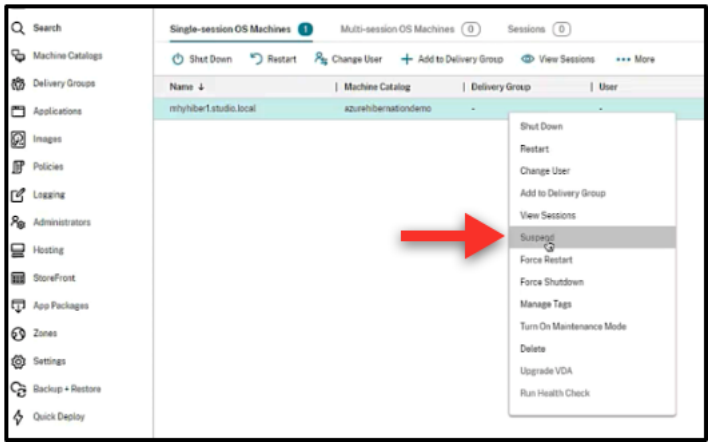
Power management of hibernation-capable VMs

You can perform the following power management operations on the hibernation-capable VMs:

- **Suspend** VM from the running state
- **Resume** VM from the suspended state
- **Force shut** down VM from a suspended state
- **Force restart** the VM from the suspended state

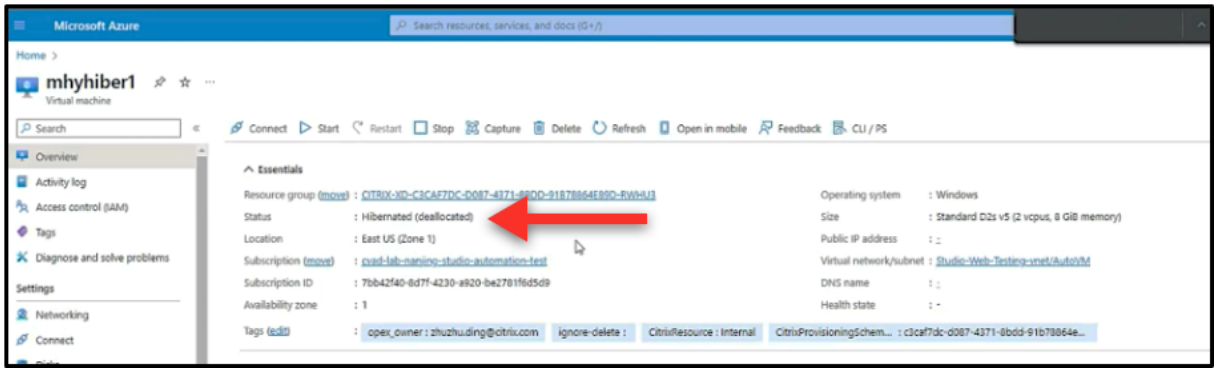
See the following for more information:

- Suspend
- Resume



© 1997–2026 Citrix Systems, Inc. All rights reserved.

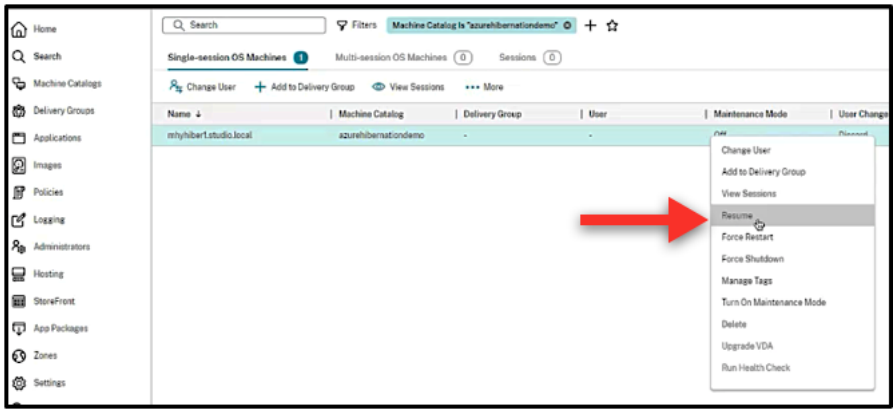
Suspend You can suspend a VM using one of the following ways:



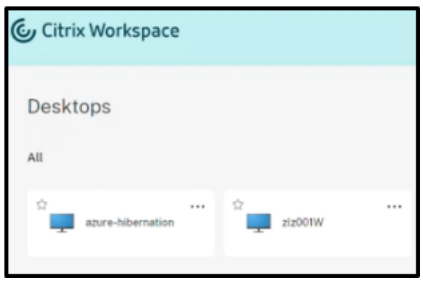
- **Manually** using Web Studio
- **Automatically** using the timeout policy: For more information, see Miscellaneous settings.

To manually suspend a VM:

1. Right-click the VM, and select **Suspend**. Click **Yes** to confirm the action. The **Power State** changes from **Suspending** to **Suspended**.

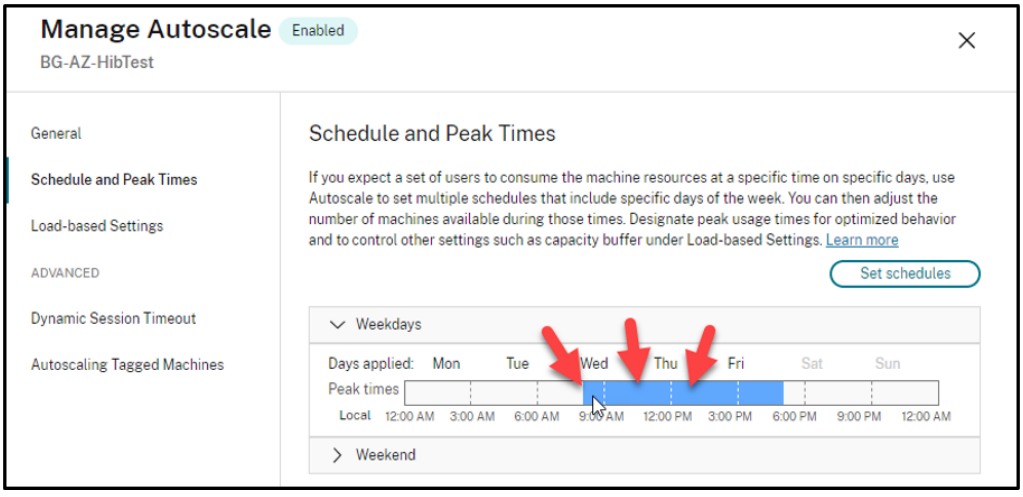


You can check the status of the VM in the Azure portal.



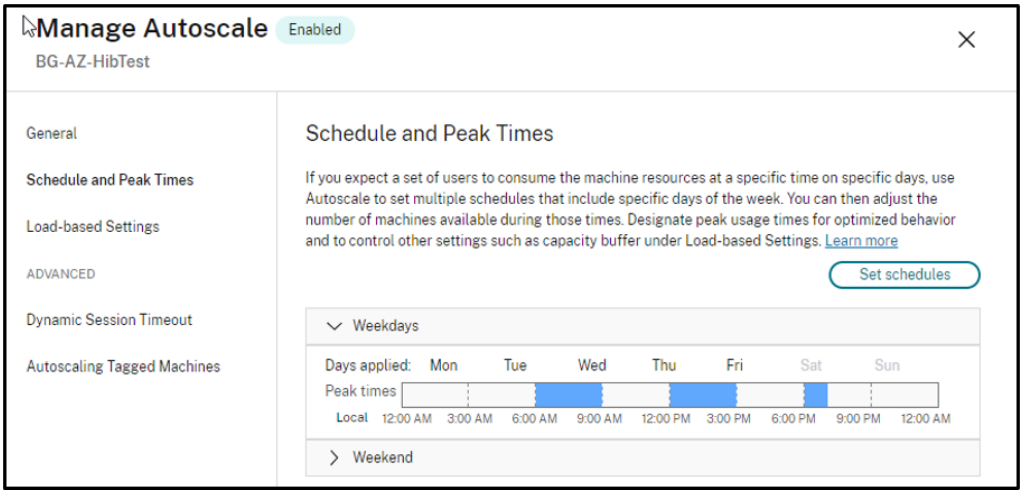
Resume To resume a hibernated VM, use one of the following ways:

- **Manually**:
  - Administrators can resume the VM using the Web Studio.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- End users can start the VM using the Citrix Workspace™ menu once they click the desktop icon.



- **Automatically**:
  - Autoscale™ can automatically power on the hibernated machines if you configure the peak times correctly. You can set the peak times in 30-minutes intervals by clicking the time-schedule. Each blue frame represents a timeslot marked as peak time. The peak times can have consecutive and non-consecutive time slots.
    - Consecutive time slots

    - Non-consecutive time slots

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> In **Manage Autoscale > Load-based Settings**, if the **Action** is configured as **Suspend**, then make sure that all VMs within that delivery group have hibernation capability. Otherwise, VMs that can't hibernate continues to run.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Get warnings messages for hibernation failure

You can get warning messages using a PowerShell command `Get-ProvOperationEvent` in case of hibernation failure of MCS-provisioned and existing hibernation-capable VMs. For information about the Powershell command, see the SDK documentation Get-ProvOperationEvent.

To do this:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Open a PowerShell window.
2. Run `asnp citrix*` to load Citrix-specific PowerShell modules.
3. Run `Get-ProvOperationEvent` to get the warning message in case of hibernation failure.

```
Get-ProvOperationEvent -filter {
  OperationName -eq "Suspend"  }
```

Output:

```
EventAdditionalData : Error code = OperationNotAllowed and Error message = The Hibernate-Deallocate Operation cannot be performed on a VM that has extension 'AzureHibernateExtension' in failed state. For more information, see https://aka.ms/hibernate-resume/errors. Error details from the extension : Enabling
                  hibernate failed. Response from the powercfg command. Exit Code: 1. Error message:
                  Hibernation failed with the following error: The request is not supported.

                  The following items are preventing hibernation on this system.
                    The current Device Guard configuration has disabled hibernation.

```

Troubleshooting hibernation issues You get the following error message if you try to enable both hibernation and trusted launch VM features, however, configuration of the guest OS is not correct.

Error code	Error message
OperationNotAllowed	The Hibernate-Deallocate Operation cannot be performed on a VM that has extension 'AzureHibernateExtension' in failed state. For more information, see https://aka.ms/hibernate-resume/errors/. Error details from the extension : Enabling hibernate failed. Response from the powercfg command. Exit Code: 1. Error message: Hibernation failed with the following error: The request is not supported. The following items are preventing hibernation on this system. **The current Device Guard configuration has disabled hibernation. An internal system component has disabled hibernation**.

To resolve the issue, ensure that virtualization is enabled within the guest VM. For example, confirm that Hyper-V is enabled in a Windows environment. As per Microsoft Windows limitation, hibernation is only supported with nested virtualization when trusted launch is enabled on the VM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information on warning messages, see the Microsoft document Troubleshooting VM hibernation.

> **Note:**
>
> Error messages related to failure in resuming a VM will be available in a future release.

More information

For more information on Citrix Azure hibernation, see the Citrix Tech Zone article.

Power manage Oracle C3 VMs (Preview)

May 13, 2026

Citrix Virtual Apps and Desktops™ lets you do power management of Oracle C3 VMs. Use the **Search** node in the navigation pane to locate the machine you want to power manage.

The following power actions are available:

- Start
- Shut Down
- Force Shutdown
- Restart
- Reset

> **Note:**
>
> Suspend and Resume power actions are not supported.

Power manage Red Hat OpenShift VMs

May 13, 2026

Citrix Virtual Apps and Desktops™ lets you do power management of Red Hat OpenShift VMs. Use the Search node in the navigation pane to locate the machine you want to power manage.

The following power actions are available:

- Start
- Shut Down

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Force Shutdown
- Restart

> **Note:**
>
> Reset, Suspend, and Resume power actions are not supported.

Power manage Nutanix AHV VMs

August 6, 2026

With Citrix DaaS™, you can power manage Nutanix AHV VMs. Use the **Search** node in the navigation pane to find the machine you want to power manage.

You can use the following power actions:

- Start
- Shut Down
- Force Shutdown
- Force Restart
- Restart

> **Note:**
>
> - Reset, Suspend, and Resume power actions are not supported.
> - Shut Down or Restart: The VM might not respond to the shutdown request if active users or running programs interrupt the shutdown, or if the OS requires updates. To ensure that guest shutdown and restart work properly on Windows VMs, apply the recommended power action settings on the VDA, such as screen saver and display power settings. For more information, see Nutanix KB.

Security policies

May 13, 2026

This article describes security features on various supported cloud services. The security features include:

- Security groups
- Secure boot
- Encryption capabilities

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Security groups

May 13, 2026

Security group is a group of security rules to filter network traffic between resources in a virtual network. The security rules allow or deny inbound network traffic to, or outbound network traffic from, several types of resources. Each rule specifies the following properties:

- Name: A unique name within the network security group
- Priority: Rules are processed in priority order, with lower numbers processed before higher numbers, because lower numbers have higher priority
- Source or Destination: Any, or an individual IP address, classless inter-domain routing (CIDR) block (10.0.0.0/24, for example), service tag, or application security group
- Protocol: The protocols based on which you add rules for each security group
- Direction: Whether the rule applies to inbound, or outbound traffic
- Port range: You can specify an individual or range of ports
- Action: Allow or deny

See the following for more information on supported hypervisors:

- Security groups in AWS
- Security groups in Microsoft Azure
- Security groups in Google Cloud Platform

Security groups in AWS

Security groups act as virtual firewalls that control traffic for the instances in your VPC. You add rules to your security groups that allow instances in your public subnet to communicate with instances in your private subnet. You can also associate these security groups with each instance in your VPC. Inbound rules control the incoming traffic to your instance, and outbound rules control the outgoing traffic from your instance.

For more information on the network setting during image preparation, see Network setting during image preparation.

When you launch an instance, you can specify one or more security groups. To configure security groups, see Configure security groups.

Security groups in Microsoft Azure

Citrix Virtual Apps and Desktops supports network security groups in Azure. Network security groups are expected to associate with subnets. For more information, see Network security groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information on network security group created during image preparation, see Create a machine catalog using an Azure Resource Manager image.

Security groups in Google Cloud Platform

During the preparation of a machine catalog, a machine image is prepared to serve as the master image system disk for the catalog. When this process occurs, the disk is temporarily attached to a virtual machine. This VM must run in an isolated environment that prevents all inbound and outbound network traffic. This is accomplished through a pair of deny-all firewall rules. For more information, see Firewall Rules.

Secure Boot and vTPM

May 13, 2026

Secure Boot is a feature of the Unified Extensible Firmware Interface (UEFI), which is responsible for booting the system. It ensures that only trusted software is loaded during the boot process.

Trusted Platform Module (TPM) is a hardware chip that provides secure storage for cryptographic keys and other sensitive data. A Virtual Trusted Platform Module (vTPM) performs the same functions as a TPM, but it performs cryptographic coprocessor capabilities in software. While TPM can enhance security, it's not a requirement for Secure Boot.

See the following for more information on supported hypervisors:

- Secure Boot and NitroTPM in AWS
- Secure Boot and vTPM in Google Cloud Platform
- Secure Boot and vTPM in Microsoft Azure
- Secure Boot and vTPM in Nutanix Prism Central
- vTPM in VMware
- Secure Boot and vTPM for XenServer®

Secure Boot and NitroTPM in AWS

In AWS environments, you can select a master image (AMI) with NitroTPM and/or UEFI Secure Boot enabled. Accordingly, the provisioned VMs in the catalog are also enabled with NitroTPM and/or UEFI Secure Boot. This implementation ensures that the VMs are secured and trusted. For more information on NitroTPM and UEFI Secure Boot, see the Amazon documentation. For creating a catalog enabled with NitroTPM and UEFI Secure Boot, see Enable NitroTPM and UEFI secure boot for VM instances.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Secure Boot and vTPM in Google Cloud Platform

You can provision shielded virtual machines on Google Cloud Platform (GCP). Shielded VM's verifiable integrity is achieved by using the following features:

- Secure Boot
- vTPM-enabled Measured Boot
- Integrity monitoring

For more information on using PowerShell to create a catalog with shielded VM, see Using PowerShell to create a catalog with shielded VM.

> **Note:**
>
> If you install Windows 11 on the master image, then you must enable vTPM during the master image creation process. Also, if you use a machine profile for creating the catalog, then you must enable vTPM on the machine profile source (VM or instance template). For information on creating Windows 11 VMs on the sole-tenant node, see Create Windows 11 VMs on the sole-tenant node.

Secure Boot and vTPM in Microsoft Azure

In Azure environments, you can create machine catalogs enabled with Trusted Launch. Azure offers Trusted Launch as a seamless way to improve the security of generation 2 VMs. Trusted Launch protects against advanced and persistent attack techniques. To enable Trusted Launch, use a machine profile-based catalog configuration. At the root of Trusted Launch is Secure Boot for your VM. Trusted Launch also uses the vTPM to perform remote attestation by the cloud. This is used for platform health checks and for making trust-based decisions. You can individually enable Secure Boot and vTPM.
For more information on creating a machine catalog with Trusted Launch, see Machine catalogs with Trusted launch.

Secure Boot and vTPM in Nutanix Prism Central

MCS supports creating a machine catalog with vTPM, UEFI, and Secure Boot with Nutanix Prism Central. You can select a master image (template) with vTPM and UEFI Secure Boot enabled.

In Nutanix Prism Central, UEFI Secure Boot does not require vTPM. However, to link a vTPM to a VM, the VM must be UEFI booted, irrespective of whether Secure Boot is enabled or not.

Furthermore, vTPM, UEFI, and Secure Boot enabled VMs can be imported from Nutanix Prism Central and can be power managed by Citrix Virtual Apps and Desktops.

Nutanix provides support for vTPM and UEFI Secure Boot. See:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- vTPM (Virtual Trusted Platform Module) support on AHV.
- Secure Boot Support for VMs
- Securing AHV VMs with a Virtual Trusted Platform Module

vTPM in VMware

MCS supports creating a machine catalog with vTPM. If Windows 11 is installed on the master image, then it is a requirement to have vTPM enabled for the master image. If machine profile-based configuration is used and vTPM is enabled, then VMs in the catalog inherit the same vTPM content from the VM template. If the machine profile is not used and the master image is vTPM enabled, then VMs in the catalog have blank vTPM. For more information, see Create a machine catalog using a machine profile.

Secure Boot and vTPM for XenServer®

XenServer provides UEFI Secure Boot on some of its supported VM operating systems. Secure Boot prevents unsigned, incorrectly signed or modified binaries from being run during boot. On a UEFI-enabled VM that enforces Secure Boot, all drivers must be signed. For more information, see Guest UEFI and Secure Boot.

In XenServer 8, vTPM is not required for UEFI Secure Boot. However, to link a vTPM to a VM, that VM must be UEFI booted, whether Secure Boot is enabled or not. Windows 11 VM requires a linked vTPM and it is created automatically when the Windows 11 VM is created from the provided template. For other operating systems, a vTPM is optional. For more information, see vTPM.

Encryption capabilities

May 13, 2026

Encryption capabilities protect the content of virtual machines from attacks by malicious guests on a shared virtual machine host and from attacks launched by the hypervisor control software that manages all the virtual machines on the host.

See the following for more information on supported cloud services:

- Encryption capabilities in AWS
- Encryption capabilities in Google Cloud Platform
- Encryption capabilities in Microsoft Azure

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Encryption capabilities in AWS

This section describes the encryption capabilities in AWS virtualization environments.

Automatic encryption

You can turn on automatic encryption of new Amazon EBS volumes and snapshot copies created in your account. For more information, see Automatic encryption.

Encryption capabilities in Google Cloud Platform

This section describes the encryption capabilities in Google Cloud Platform (GCP) virtualization environments.

If you need more control over key operations than what Google-managed encryption keys allows, you can use customer-managed encryption keys. When using a customer-managed encryption key, an object is encrypted with the key by Cloud Storage at the time it's stored in a bucket, and the object is automatically decrypted by Cloud Storage when the object is served to requesters. For more information, see Customer-managed encryption keys.

You can use Customer Managed Encryption Keys (CMEK) for MCS catalogs. For more information, see Using Customer Managed Encryption Keys (CMEK).

Encryption capabilities in Microsoft Azure

This section describes the encryption capabilities in Azure virtualization environments.

Azure server side encryption

Most Azure managed disks are encrypted with Azure Storage encryption, which uses server-side encryption (SSE) to protect your data and to help you meet your security and compliance commitments. Citrix Virtual Apps and Desktops supports customer-managed encryption keys for Azure managed disks through Azure Key Vault. For more information, see Azure server side encryption.

Azure disk encryption at host

You can create an MCS machine catalog with encryption at host capability.

This encryption method does not encrypt the data through the Azure storage. The server hosting the VM encrypts the data and then the encrypted data flows through the Azure storage server. Hence, this method of encryption encrypts data end to end.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For more information on creating MCS machine catalog with encryption at host capability, see Azure disk encryption at host.

Azure double encryption

Double encryption is platform-side encryption (default) and customer managed encryption (CMEK). Therefore, if you are a high security sensitive customer who is concerned about the risk associated with any encryption algorithm, implementation, or a compromised key, you can opt for this double encryption. Persistent OS and data disks, snapshots, and images are all encrypted at rest with double encryption. For more information, see Double encryption on managed disk.

Azure confidential VMs

Azure confidential computing VMs ensure that your virtual desktop is encrypted in memory and protected in use.

You can use MCS to create a catalog with Azure confidential VMs. You must use the machine profile workflow to create such a catalog. You can use both VM and ARM template spec as a machine profile input.

For more information, see Azure confidential VMs.

Service Window

August 21, 2026

The Service Window feature provides a capability to schedule and automate operations on MCS-provisioned VMs. This feature currently supports various operations such as Reset OS disk and hardware configuration changes. You can schedule these operations and return later to verify completion, rather than performing updates manually.

You can schedule operations for either a specific list of VMs or an entire machine catalog. Each operation runs at the time specified. Multiple operations can be scheduled for the same VM. However, you cannot schedule more than one hardware update for a single VM.

You can also:

- Add a description for the Service Window.
- Provide a detailed message to be displayed to any users who are logged on when the operation runs.
- Specify how many days the task metadata should be retained after completion.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Configure how many buffer minutes are granted to save work for the logged on users before the operation is forcibly executed.

Advantages

Improved user experience and continuity

- **Graceful session handling**: Instead of abrupt disconnections, you can define a professional notification to save the work before the VM is powered down.
- **Scheduled downtime**: You can move heavy update tasks to off-peak hours (for example, 2:00 AM) without requiring you to manually log in at that time.
- **Cost-efficient hardware updates**: Updating hardware using Service Window saves significant costs on large implementations. This feature automatically analyses if a VM requires a reboot to apply settings. Therefore, by avoiding unnecessary reboots, Service Window minimize these expenses.

Advanced hardware flexibility

- **Update hardware configurations**: Use Service Window to schedule the hardware updates. The system intelligently manages the update flow, checking for reboot necessity and handling session log-offs, ensuring that your catalog evolves to meet new resource demands with zero manual oversight.
- **Flexible SKU reconfiguration**: Easily update SKUs, which previously required manual recreation of the catalog.
- **Hibernation support for existing VMs**: Overcomes the "temporary disk"limitation. The Service Window allows the MCSIO driver to relocate the pagefile to the C: Drive and enable hibernation properties on VMs that were already deployed.

Important consideration

- **User notification**: Logged on users receive an initial alert regarding the Service Window operation, ensuring they have sufficient time to save their work. Once the notification period expires, the machine automatically powers down to perform the operation.

Service Window operations

The Service Window currently supports OS disk resets, repair Active Directory account for existing MCS provisioned catalogs, enable Entra Hybrid join for existing MCS provisioned catalogs, and hardware configuration changes. These operations can be performed using Web Studio or PowerShell.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Web Studio: Currently, supported exclusively for Azure environments. For guidance, refer to the specific hypervisor articles.

PowerShell commands: Generic commands are outlined in this article, while detailed, hypervisor-specific scripts can be found on our GitHub page https://github.com/citrix/citrix-mcs-sdk-samples/.

Reset OS disk

OS disk resets can be done using the PowerShell command `New-ProvMaintenanceCycle`. The commands creates a new Service Window for an entire catalog or specific VMs. The cycle starts at the time you specify in `ScheduledStartTimeInUTC`. You also provide `MaxDurationInMinutes`, which indicates the maximum time the Service Window can run.

Example: Reset OS disk for specific VMs

```
New-ProvMaintenanceCycle -Operation ResetOSDisk -
    MaintenanceCycleDescription "Resetting Boot Disk" -StartsNow -
    MaxDurationInMinutes 100 -ProvisioningSchemeName CVC -
    PurgeDBAfterInDays 1 -SessionWarningTimeInMinutes 15 -
    SessionWarningLogOffTitle "Scheduled Maintenance" -
    SessionWarningLogOffMessage "There is a scheduled maintenance coming
     up and involves turning off the machine, please save your work and
    log out, Thank You" -VMName VDA02,VDA03
```

Example: Reset OS disk for the entire catalog

```
New-ProvMaintenanceCycle -Operation ResetOSDisk -
    MaintenanceCycleDescription "Resetting Boot Disk" -StartsNow -
    MaxDurationInMinutes 100 -ProvisioningSchemeName CVC -
    PurgeDBAfterInDays 1 -SessionWarningTimeInMinutes 15 -
    SessionWarningLogOffTitle "Scheduled Maintenance" -
    SessionWarningLogOffMessage "There is a scheduled maintenance coming
     up and involves turning off the machine, please save your work and
    log out, Thank You" -AllVMs
```

Update hardware settings

Schedule hardware updates using Service Window, thereby having full control over when the changes take effect. You can choose to target only the newly created VMs, an entire catalog (new and existing VMs), or specific VMs as needed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To update hardware settings for new VMs or entire catalog, select a provisioning scheme version and run the PowerShell command `New-ProvSchemeHardwareUpdate`. You can apply a previously created provisioning scheme version to VMs. You can also enable hibernation on a VM with temporary disk.
- To update hardware settings for specific VMs, select a VM configuration version, and run the PowerShell command `New-ProvVmHardwareUpdate`.

Important considerations

- New machines added to a catalog after scheduling a hardware update continues to be created with older specifications until the specified UTC time for applying new specifications.
- A single validation failure during the Service Window creation prevents the cycle from being created and return an error message.
- For enabling hibernation, consider the following:
  - The VDA version must be greater than 2503.
  - Machine Creation Services I/O (MCSIO) must be installed.
  - The machine profile must support hibernation.
  - The VM SKU and operating system must support hibernation.
  - If VBS is enabled, Hyper-V must also be enabled. Nested virtualization requires Trusted Launch on the VM.
  - The free OS disk size must be larger than the VM's memory size.

Schedule hardware updates on an entire machine catalog or new VMs

1. Run `New-ProvSchemeVersion` to create a new provisioning scheme version with updated hardware settings. For more information, see the SDK doc.
2. Run the PowerShell command `New-ProvSchemeHardwareUpdate` to schedule a Service Window for hardware updates as specified in the provisioning scheme version.

Example: `AllVMs` (new and existing) in the machine catalog are considered for the update:

```
New-ProvSchemeHardwareUpdate -ProvisioningSchemeVersion 4 -
    MaintenanceCycleDescription "Updating RAM and CPU Count to 8GB and 4
    " -StartsNow -MaxDurationInMinutes 100 -ProvisioningSchemeName CVC -
    PurgeDBAfterInDays 1 -SessionWarningTimeInMinutes 15 -
    SessionWarningLogOffTitle "Scheduled Maintenance" -
    SessionWarningLogOffMessage "There is a scheduled maintenance coming
     up and involves turning off the machine, please save your work and
    log out, Thank You" -AllVMs
```

Example: `NewVMsOnly` (new and existing) in the machine catalog are considered for the update:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-ProvSchemeHardwareUpdate -ProvisioningSchemeVersion 4 -
    MaintenanceCycleDescription "Updating RAM and CPU Count to 8GB and 4
    " -StartsNow -MaxDurationInMinutes 100 -ProvisioningSchemeName CVC -
    PurgeDBAfterInDays 1 -SessionWarningTimeInMinutes 15 -
    SessionWarningLogOffTitle "Scheduled Maintenance" -
    SessionWarningLogOffMessage "There is a scheduled maintenance coming
     up and involves turning off the machine, please save your work and
    log out, Thank You" -NewVMsOnly
```

Run `Get-ProvSchemeHardwareUpdate` to retrieve Service Window objects associated with hardware scheme updates. Example:

```
Get-ProvSchemeHardwareUpdate -MaintenanceCycleId xxxx-xxxx-yyyy-zzzz
```

Schedule hardware updates on specific VMs

1. Run `New-ProvVmConfiguration` to create a new provisioning VM configuration. For more information, see the SDK doc.
2. Run the PowerShell command `New-ProvVmHardwareUpdate` to schedule a Service Window for hardware updates as specified in the VM configuration version.

> **Note:**
>
> For each VM, any personalized settings (VM configuration version) always take precedence over the specifications defined in the provisioning scheme version. If a particular setting is not personalized on the VM, its value is inherited from the associated provisioning scheme version.

Example:

```
New-ProvVmHardwareUpdate -ProvVmConfigurationVersion 4 -StartsNow -
    MaxDurationInMinutes 100 -ProvisioningSchemeName CVC -VMName
    AbcTest01
```

Run `Get-ProvVmHardwareUpdate` to retrieve Service Window objects associated with hardware VM updates. Example:

```
Get-ProvVmHardwareUpdate -MaintenanceCycleId xxxx-xxxx-yyyy-zzzz
```

You can also remove a personalization used to create provisioning VM versions using `Remove-ProvVmConfiguration` command. Example:

```
Remove-ProvVmConfiguration -Version 2 -VMName AbcTest01
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Repair AD account for existing catalogs

You can repair Active Directory (AD) computer accounts for existing on-premises AD joined and Microsoft Entra Hybrid joined MCS machine catalogs using Service Window. This is useful when VMs have lost domain trust. This feature applies to both persistent and non-persistent MCS machine catalogs.

To repair AD accounts for an existing MCS machine catalog, you can use PowerShell commands to complete the following steps:

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run the `New-ProvIdentityUpdate` command in any one of the following ways:
    - To repair AD account for specific VMs by name:

    ```
    New-ProvIdentityUpdate -MaintenanceCycleDescription 'repair
        AD account' -Operation RepairADAccount -
        MaxDurationInMinutes 60 -ProvisioningSchemeName <catalog-
        name> -VMName @("vm-1", "vm-2") -StartsNow
    ```

    - To schedule the operation for a future time instead of starting immediately:

    ```
    New-ProvIdentityUpdate -MaintenanceCycleDescription 'repair
        AD account' -Operation RepairADAccount -
        MaxDurationInMinutes 60 -ProvisioningSchemeName <catalog-
        name> -AllVMs -ScheduledStartTimeInUTC "2026-04-01T02
        :00:00Z"
    ```

4. Run `Get-ProvMaintenanceCycle` to check the status of the maintenance cycle.

For more information, see Citrix PowerShell SDK

> **Note:**
>
> - This feature applies to on-premises Active Directory joined, and Microsoft Entra Hybrid joined MCS machine catalogs only. It does not support Entra ID joined and non-domain joined machines.
> - The provisioning scheme's identity pool must have an on-premises Active Directory service account with sufficient permission to reset the password of the computer account in the domain.

Enable Entra Hybrid join for existing MCS provisioned catalogs

You can now convert existing on-premises Active Directory joined MCS machine catalogs to Microsoft Entra Hybrid joined catalogs using Service Window. This feature applies to both persistent and non-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

persistent MCS machine catalogs.

To enable Entra Hybrid join for an existing MCS machine catalog, you can use PowerShell commands to complete the following steps:

1. Open a PowerShell window.
2. Run `asnp citrix*` to load the Citrix-specific PowerShell modules.
3. Run the `New-ProvIdentityUpdate` command in any one of the following ways:
   - To enable Entra Hybrid join for all VMs in a catalog immediately:

     ```
     New-ProvIdentityUpdate -MaintenanceCycleDescription 'enable
         Entra hybrid join' -Operation
         MigrateActiveDirectoryToEntraHybridJoin -
         MaxDurationInMinutes 60 -ProvisioningSchemeName <catalog-
         name> -AllVMs -StartsNow
     ```

   - To enable Entra Hybrid join for specific VMs by name: :

     ```
     New-ProvIdentityUpdate -MaintenanceCycleDescription 'enable
         Entra hybrid join' -Operation
         MigrateActiveDirectoryToEntraHybridJoin -
         MaxDurationInMinutes 60 -ProvisioningSchemeName <catalog-
         name> -VMName @("vm-1", "vm-2") -StartsNow
     ```

   - To enable Entra Hybrid join and specify a target OU for new VMs:

     ```
     New-ProvIdentityUpdate -MaintenanceCycleDescription 'enable
         Entra hybrid join' -Operation
         MigrateActiveDirectoryToEntraHybridJoin -
         MaxDurationInMinutes 60 -ProvisioningSchemeName <catalog-
         name> -AllVMs -StartsNow -OU "OU=SyncedDevices,DC=example,
         DC=com"
     ```

   - To schedule the operation for a future time instead of starting immediately:

     ```
     New-ProvIdentityUpdate -MaintenanceCycleDescription 'enable
         Entra hybrid join' -Operation
         MigrateActiveDirectoryToEntraHybridJoin -
         MaxDurationInMinutes 60 -ProvisioningSchemeName <catalog-
         name> -AllVMs -ScheduledStartTimeInUTC "2026-04-01T02
         :00:00Z"
     ```

4. Run `Get-ProvMaintenanceCycle` to check the status of the maintenance cycle.

For more information, see Citrix PowerShell SDK

> **Note:**
>
> - To make sure the catalog works correctly, you must convert all the existing virtual machines

© 1997–2026 Citrix Systems, Inc. All rights reserved.

in the catalog to Microsoft Entra Hybrid joined.

- This feature does not support MCS-provisioned catalogs that share an identity pool.
- The base image of the existing provisioning scheme must have VDA version 2212 or later installed, see Requirements for Microsoft Entra hybrid joined.
- The provisioning scheme's identity pool must have an on-premises Active Directory service account with permission to set the userCertificate property in the domain.
- Ensure that the OU containing the computer accounts is configured to sync to Entra ID through Microsoft Entra Connect. You have two options:
  - Configure Azure AD Connect to synchronize devices from the original OU to Entra ID.
  - Move existing computer accounts into an Azure AD Connect sync-configured OU manually.

Miscellaneous PowerShell commands associated with Service Window

- `Get-ProvMaintenanceCycle`: Retrieves information of all the Service Windows. Example:

```
Get-ProvMaintenanceCycle -MaintenanceCycleId 10073b8e-7e94
    -4527-8580-0e448eae0ad1
```

- `Get-ProvMaintenanceCycleVM`: Retrieves information of each Service Window operation for individual VMs, along with its status. Example:

```
Get-ProvMaintenanceCycleVM -MaintenanceOperation HardwareUpdate -
    VirtualMachineSid 42263076-44ae-1ff9-f58b-62d57ddf8db5
```

  The various Service Window statuses are:

  - Running
  - Failed
  - Completed
  - Cancelling
  - Cancelled
  - NotProcessed
  - Pending
  - Incomplete
  - Repaired
  - Recovering

- `Remove-ProvMaintenanceCycle`: Removes a Service Window when the Service Window is not active. Example:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Remove-ProvMaintenanceCycle -MaintenanceCycleId 867af1ba-5b72-402e-9dc3-033298248f8e
```

- `Cancel-ProvMaintenanceCycle`: If the operation has not yet started by MCS on a VM, then this PowerShell command cancels the operation. MCS does not cancel an operation that is currently running on the VM. Example:

```
Cancel-ProvMaintenanceCycle -MaintenanceCycleId 867af1ba-5b72-402e-9dc3-033298248f8e
```

- `Restart-ProvMaintenanceCycle`: If a Service Window has failed or is incomplete due to external causes, such as the hypervisor being down or insufficient time, this command helps restart the cycle and process any failed or not-processed jobs. Example:

```
Restart-ProvMaintenanceCycle -MaintenanceCycleId 4f363b78-458a-403a-82e5-7fcc6caa498b -ScheduledStartTimeInUTC "June 19th 2024, 6AM" -MaxAllocatedDurationInMinutes 400
```

- `Update-ProvMaintenanceCycle`: If a Service Window is already scheduled and has not started, this command alters certain parameters.

  Example: Update maximum duration:

```
Update-ProvMaintenanceCycle -MaintenanceCycleId 4f363b78-458a-403a-82e5-7fcc6caa498b -MaxDurationInMinutes 100
```

  Example: Update VMs for a provisioning scheme:

```
Update-ProvMaintenanceCycle -MaintenanceCycleId 4f363b78-458a-403a-82e5-7fcc6caa498b -ProvisioningSchemeUid 867af1ba-5b72-402e-9dc3-033298248f8e -VMName ncn01,ncn02
```

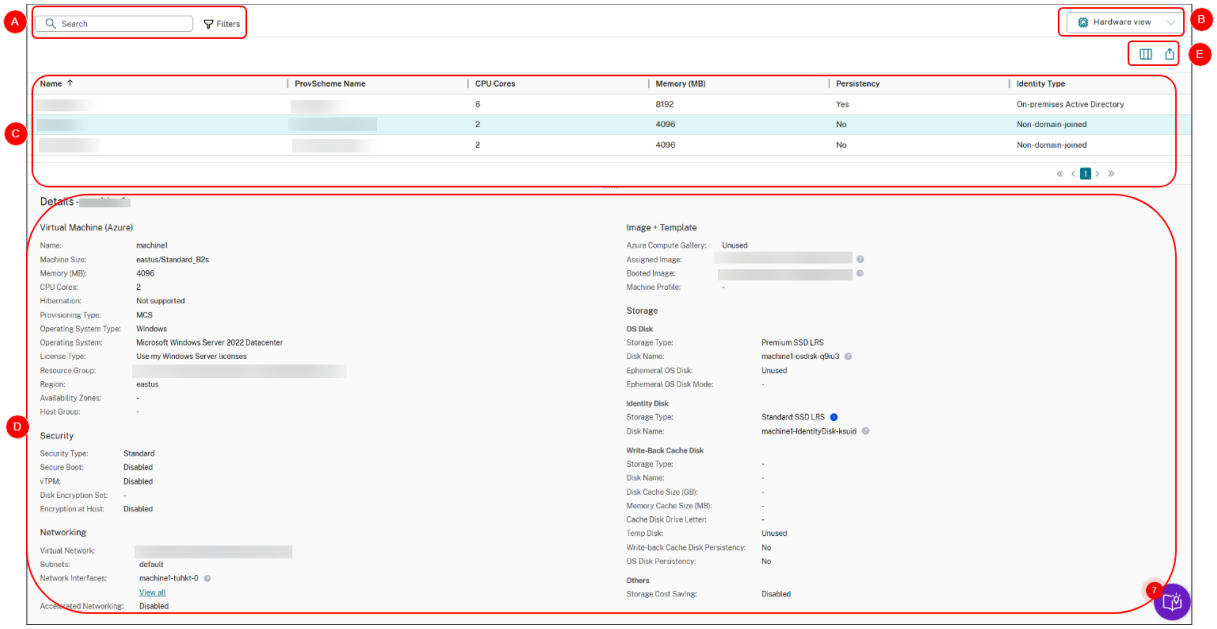
Where to go next

For managing Service Window operations using Web Studio in Azure, see Service Window operations in Azure.

Service Window operations in Azure

May 13, 2026

This article describes how to perform Service Window operations using Web Studio in Azure environments.



The Service Window currently supports OS disk resets and hardware configuration changes.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use the **Hardware view** in both **Search** and **Machine Catalog** nodes to update hardware settings and reset OS disk.

Hardware view in Search node

Hardware view within the **Search** node displays your MCS-provisioned VMs and their critical properties, including machine security settings, network details, images, and machine profile details.

Callout	Area	Description
A	Search bar	Provides a quick search and a filter-based search that allows you to define complex search criteria. For more information, see Search for machines.
B	Switch to Default view	Switch from Hardware view to Default view.
C	Main view	Displays your MCS-provisioned machines and their critical properties. You can customize the view by selecting the **Column to display** icon. For more information about available columns, see Machine columns. **Tip:** Use filters to quickly narrow down machines by specific properties. For example, **Identity Type = Microsoft Entra joined** to view all Microsoft Entra joined machines.
D	Details pane	Displays details information for the selected machine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Callout	Area	Description
E	List-level actions	Displays actions that you can perform on the the entire displayed list: **Export** icon: Export the list of machines displayed in the main view to a CSV file. **Column to display** icon: Customize the main view for the list.

Reference: Machine columns

This table lists all columns in Hardware view and their descriptions.

Column	Description
Name	The DNS host name of the machine.
Provisioning Scheme Name	The name of the provisioning scheme used to provision the machine.
CPU Cores	The number of CPU cores allocated to the machine.
Memory (MB)	The amount of memory (in MB) allocated to the machine.
Persistency	Indicates whether the machine's disk and data persist across restarts.
Identity Type	The identity type of the machine.
Pending Image Update	Indicates whether the VM image for the machine is outdated and due to be updated to a new image at the machine's next reboot.
Last Boot Time (UTC)	The date and time (in UTC) when the machine was last started.
Use WBC	Indicates whether the machine is configured with WBC (aka MCSIO).
WBC Disk Size (GB)	The MCSIO disk-cache size of the machine.
WBC Memory Size (MB)	The MCSIO memory-cache size of the machine.
Identity Provider	The identity provider of the machine.
Activation Type	Valid only for Windows VDAs. The Windows license activation type of the machine. Values include: Unsupported VDA, Key Management Service, Multiple Activation Key, and Not valid.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update hardware settings for VMs

This feature provides a centralized way to manage and apply changes to VM hardware settings, such as storage, licenses, and NICs using Service Window.

Limitations

- Currently, supported for only Azure MCS Persistent VMs.
- Not supported for Quick Deploy catalog VMs.
- All VMs must belong to the same catalog.
- To avoid potential issues, upgrade VDA to version 2503 or later if you do the following□
  - Enable hibernation for existing VMs that are using temporary disk.
  - Change the VM size between Azure sku with temp disk and Azure sku without temp disk.

Update hardware settings for a single VM

1. Navigate to the **Search** node. Switch to the **Hardware view**. Right-click a VM you want to update, and then select **Update Hardware**.
2. On the **Update Hardware** page, click **Create version**. Configure only the settings you want to change. There are no default settings.
3. Navigate to the **Summary** page and click **Finish**.
4. Choose either **Schedule** or **Save version only** to confirm when you want to apply the changes to the selected VM.
   - If you select **Schedule**, you are redirected to the **Apply to VM** page. Configure the schedule time and information, then click **Save**. A new hardware version is created with a schedule. The VM updates when the schedule finishes.
   - If you select **Save version only**, the system creates a new hardware version without immediately applying the changes to the selected VM.

> **Note:**
>
> The newly created hardware version inherits the changes from the previous version.

You can still apply the hardware changes to the VM, even if you save them without scheduling an application time.

1. Navigate to the **Search** node. Switch to the **Hardware view**. Right-click a VM, and then select **Update Hardware**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. On the **Update Hardware** page, select a version. Click **Apply to VM** to create a schedule. The VM updates when the schedule finishes.

Update hardware settings for multiple VMs

1. Navigate to the **Search** node. Switch to the **Hardware view**. Select multiple VMs, right-click, and then select **Update Hardware**.
2. On the **Create hardware version** wizard, there are no default settings. Configure only the settings you want to change.
3. Configure a schedule on the **Schedule** page.
4. Navigate to the **Summary** page. Finish the creation workflow.
5. After creation, you can right-click each VM and select **Update hardware** to view version details.

Manage hardware versions for single VMs

You can delete hardware versions, cancel schedules, and clear customization for single VMs.

- **Delete hardware versions**: On the **Update Hardware** page, select one or more versions and click **Delete** to remove versions.
- **Cancel a schedule**: On the **Update Hardware** page, if you want to cancel a schedule that hasn't even started yet, click **Cancel** in the **Schedule** status column to cancel it.
- **Clear customization**: On the **Update Hardware** page, if you want to create or apply a version that removes all custom hardware settings, click **Clear Customization**. To create the version and schedule it to apply, select **Schedule**. To create the version without applying it, select **Save version only**.

Reset OS disk

This feature provides a way to reset the OS disk for one VM or multiple VMs using Service Window.

Limitations

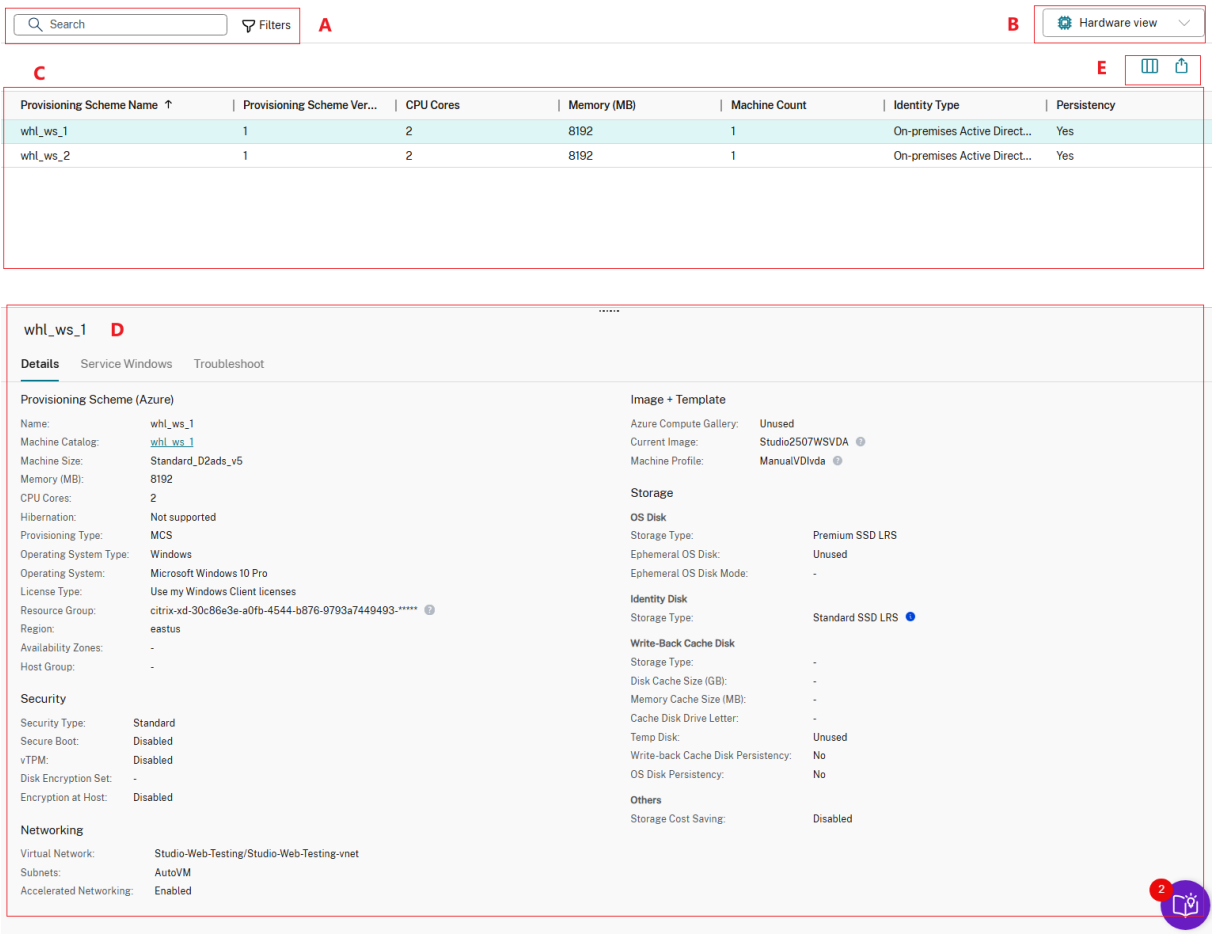
- Currently, supported for only Azure MCS Persistent VMs.
- Not supported for Quick Deploy catalog VMs.
- All VMs must belong to the same catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Reset OS disk for a single or multiple VMs

1. Navigate to the **Search** node. Switch to the **Hardware view**. Right-click a VM or multiple VMs whose OS disk you want to reset, and then select **Reset OS Disk** if it's available.
2. Choose to reset immediately or schedule it later.

Monitor task status for VM



To check whether the reset OS disk is applied successfully or not:

1. Select the VM.
2. Navigate to **Details > Service Windows** tab and see the **Status** column.
3. Click the Task ID to access the **Task center**. This center provides detailed task progress and results. See Monitor and manage tasks in Task Center.

Hardware view in Machine Catalogs node

Hardware view within the **Machine Catalogs** node displays your provisioning schemes and their critical properties, including security settings, network details, images, and machine profile details.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Callout	Area	Description
A	Search bar	Provides a quick search and a filter-based search that allows you to define complex search criteria.
B	Hardware view dropdown	Select to switch from **Hardware view** to **Default view**.
C	Main view	Displays your provisioning schemes and their critical properties. You can customize the view by selecting the Column to display icon. For more information about available columns, see Provisioning Scheme columns.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Callout	Area	Description
D	Details pane	Displays details information for the selected provisioning scheme.
E	List-level actions	Displays actions that you can perform on the the entire displayed list: **Export** icon: Export the list of catalogs displayed in the main view to a CSV file. **Column** to display icon: Customize the main view for the list.

Reference: ProvScheme columns

This table lists all columns in **Hardware view** and their descriptions.

Column	Description
ProvScheme Name	The name of the provisioning scheme.
ProvScheme Version	The version number of provisioning scheme
CPU Cores	The number of CPU cores allocated to the provisioning scheme.
Memory (MB)	The amount of memory (in MB) allocated to the provisioning scheme.
Machine count	The number of machines provisioned by the provisioning scheme.
Persistency	Indicates whether the provisioning scheme's disk and data persist across restarts.
Identity Type	The identity type of the provisioning scheme.
Use WBC	Indicates whether the provisioning scheme is configured with WBC (aka MCSIO).
WBC Disk Size (GB)	The MCSIO disk-cache size of the provisioning scheme.
WBC Memory Size (MB)	The MCSIO memory-cache size of the provisioning scheme.
Activation Type	Valid only for Windows VDAs. The Windows license activation type of the provisioning scheme. Values include: Unsupported VDA, Key Management Service, Multiple Activation Key, and Not valid.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Update hardware settings for machine catalogs

This feature provides a centralized way to manage and apply changes to a machine catalog VMs hardware settings, such as machine profiles, storage, licenses, and NICs using Service Window. Changes applies to both existing and new VMs.

You can do the following:

- Update hardware settings for a machine catalog
- Manage hardware versions
- Monitor task status for a machine catalog

Limitations

- Currently, supported for only Azure MCS machine catalogs.
- Not supported for Quick Deploy catalogs.
- To avoid potential issues, upgrade VDA to version 2503 or later if you do the following□
  - Enable hibernation for existing VMs that are using temporary disk.
  - Change the VM size between Azure sku with temp disk and Azure sku without temp disk.

Steps to update hardware settings for a machine catalog

1. Go to **Machine Catalog** node, switch to **Hardware** view, right-click a machine catalog that you want to update, and then select **Update Hardware**.
2. On the **Update Hardware** page, click **Create version**. Configure only the settings you want to change. There are no default settings.
3. Navigate to the **Summary** page and click **Finish**.
4. Choose either **Schedule** or **Save version only** to confirm when you want to apply the changes to the selected machine catalog.
   - If you select **Schedule**, you are redirected to the **Apply to machine catalog** page. Configure the schedule time and information, then click **Save**. A new hardware version is created with a schedule. The machine catalog updates when the schedule finishes.
   - If you select **Save version only**, the system creates a new hardware version without immediately applying the changes to the selected machine catalog.

> **Note:**
>
> The newly created hardware version inherits the changes from the previous version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can still apply the hardware changes to the machine catalog, even if you save them without scheduling an application time.

1. Right-click a machine catalog, and then select **Update Hardware**.
2. On the **Update Hardware** page, select a version. Click **Apply to machine catalog** to create a schedule. The machine catalog updates when the schedule finishes.

Manage hardware versions for machine catalog

You can delete hardware versions and cancel schedules for machine catalogs.

- **Delete hardware versions**: On the **Update Hardware** page, select one or more versions and click **Delete** to remove versions.
- **Cancel a schedule**: On the **Update Hardware** page, if you want to cancel a schedule that hasn't even started yet, click **Cancel** in the **Schedule** status column to cancel it.

Monitor task status for machine catalog

To check whether the hardware updates are applied successfully or not:

1. Select the machine catalog.
2. Navigate to **Details > Service Windows** tab and see the **Status** column.
3. Click the Task ID to access the **Task center**. This center provides detailed task progress and results. See Monitor and manage tasks in Task Center

Load balance machines

May 13, 2026

Load balancing helps organizations achieve the cost balance they want while being able to take advantage of all the cloud has to offer. Load balancing is configured at the delivery group level.

> **Note:**
>
> Load balancing applies only to multi-session OS machines.

Load balancing has two options:

- Horizontal load balancing
- Vertical load balancing

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, horizontal load balancing is enabled.

Horizontal load balancing: In the horizontal load balancing model, the incoming user session is assigned to the least-loaded machine available. Consider this example, in a deployment, let's assume we have two VDAs. One has an active user session (User 1), and the second user (User 2) is waiting for a session. The horizontal load balancing algorithm assigns User 2 to VDA 2 because of the more favorable load index. Thus, the horizontal algorithm distributes sessions across all available VDAs, which might hinder machines from turning off when the load decreases.

Vertical load balancing: In the vertical load balancing model, the sessions are assigned to the VDAs with the highest load index. This helps consolidate the incoming user sessions to VDAs that are already being used by other users and helps to reduce the number of VDAs that must be powered on and kept ready for user sessions. Let's consider the same deployment as the one mentioned in the horizontal load balancing. User 1 is assigned to VDA 1, and the vertical load balancing algorithm is applied to the User 2 session. User 2 is assigned to VDA 1 because the higher load index is on VDA 1. Therefore, all incoming sessions are assigned to the most-loaded VDA until the high load index watermark is met. Only then, the other VDA starts receiving sessions.

Load balancing setting at site level

You can configure load balancing for all delivery groups (site-wide setting).

To configure this feature from Studio, select **Settings** in the left pane. Select an option under **Load Balancing Sessions on Machines**.

Alternatively, you can use PowerShell to enable or disable vertical load balancing site-wide. Use the `UseVerticalScalingForRdsLaunches` setting in the `Set-BrokerSite` cmdlet. Use `Get-BrokerSite` to display the value of the `UseVerticalScalingForRdsLaunches` setting. See the cmdlet help for details.

> **Tip:**
>
> To specify the maximum number of sessions a machine can host, use the Maximum number of sessions policy setting.

Load balancing setting at delivery group level

You can configure load balancing at the delivery group level and override the load balancing setting inherited from the site level.

You can configure this during creating a delivery group or editing an existing delivery group. See Step 2. Load balancing.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Load management

Load management measures the server load and determines which server to select under the current environment conditions. This selection is based on:

- **Server maintenance mode status**: A multi-session OS machine is considered for load balancing only when maintenance mode is off.
- **Server load index**: Determines how likely a server delivering multi-session OS machines is to receive connections. The index is a combination of load evaluators: the number of sessions and the settings for performance metrics such as CPU, disk, and memory use. Load evaluators are specified in load management policy settings. By default, the load index only uses the number of sessions in its calculation, and not CPU, disk, or memory until they are configured in load management policy settings. For information on policy settings, see Load management policy settings.

  A server load index of 10000 indicates that the server is fully loaded. If no other servers are available, users might receive a message that the desktop or application is currently unavailable when they launch a session.
  You can monitor the load index in Director (Monitor), a Studio search, and the SDK.

  In console displays, to display the **Server Load Index** column (which is hidden by default), select a machine, right-click a column header, and then select **Select Column**. In the **Machine category**, select **Load Index**.

  In the SDK, use the `Get-BrokerMachine` cmdlet. For details, see CTX202150.
- **Concurrent logon tolerance policy setting**: The maximum number of concurrent requests to log on to the server. (This setting is equivalent to load throttling in XenApp 6.x versions.)

  When all servers are at or higher than the concurrent logon tolerance setting, the next logon request is assigned to the server with the lowest pending logons. If more than one server meets these criteria, the server with the lowest load index is selected. See Concurrent logon tolerance.

  > **Tip:**
  >
  > To enforce the logon tolerance setting and cause concurrent logons that exceed the specified number to fail, you can run `Set-BrokerServiceConfigurationData Core.LogonToleranceIsHardLimit -SettingValue $true`.

Create delivery groups

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

A delivery group is a collection of machines chosen from one or more machine catalogs. Delivery groups define which users can access those machines, and the applications and desktops available to them.

Creating a delivery group is the next step after setting up your site and machine catalogs. You can later modify the initial settings or create additional delivery groups as needed.

Some features and settings are only configurable when editing an existing delivery group. For more details, see Manage delivery groups

Before you begin

Before creating a delivery group:

- Review this article to understand the required choices and information.
- Ensure that you have created a connection to the hypervisor, cloud service, or other resource hosting your machines.
- Make sure a machine catalog with virtual or physical machines is available.

To create a delivery group:

1. If you have created a site and a machine catalog without a delivery group, Web Studio guides you to the correct starting place to create one.

Pages of the Wizard

If you have created a site and a machine catalog but not a delivery group, Web Studio guides you to the correct starting point to create one.

If you have already created a delivery group and want to create another, follow these steps:

1. Select **Delivery groups**.
2. In the action pane, select **Create Delivery Group**.
3. To organize delivery groups, you can create folders under the default **Delivery Groups** folder. For more information, see Create a folder.
4. Select the folder where you want to create the group, then click **Create Delivery Group**. The group creation wizard opens.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. The wizard starts with an **Introduction** page, which you can choose to skip in future launches. It then guides you through several pages, as described in the following table. After completing each page, click **Next** to proceed until you reach the final page.

	Multi-session OS	Single-session OS static (assigned)	Single-session OS shared (pooled)	Remote PC Access
Pages	Machines	Machines	Machines	Machines
	Load Balancing	Delivery Type	Users	Users
	Users	Users	Applications	Applications
	Applications	Applications	Desktops	Desktop Assignment Rules
	Desktops	Desktop Assignment Rules	App Protection	App Protection
	App Protection	App Protection	Scopes	Scopes
	Scopes	Scopes	License agreement	License agreement
	License agreement	License agreement	Policy Set	Policy Set
	Policy Set	Policy Set	Local Host Cache	Summary
	Summary	Summary	Summary	

> **Note:**
>
> - You see the **Machine Allocation** page (just after the **Machines** page) if there is any available assigned machine in the selected single-session OS static machine catalog.
> - The Local Host Cache setting page is available only for delivery groups containing power-managed single-session pooled machines.

Machines page

1. To create a delivery group with single-session suspend-capable only VMs, select **Make suspend capability required for this delivery group**.

   > **Note:**
   >
   > This feature is applicable to only single-session suspend-capable machines.

2. Select a machine catalog and select the number of machines you want to use from that catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Important considerations

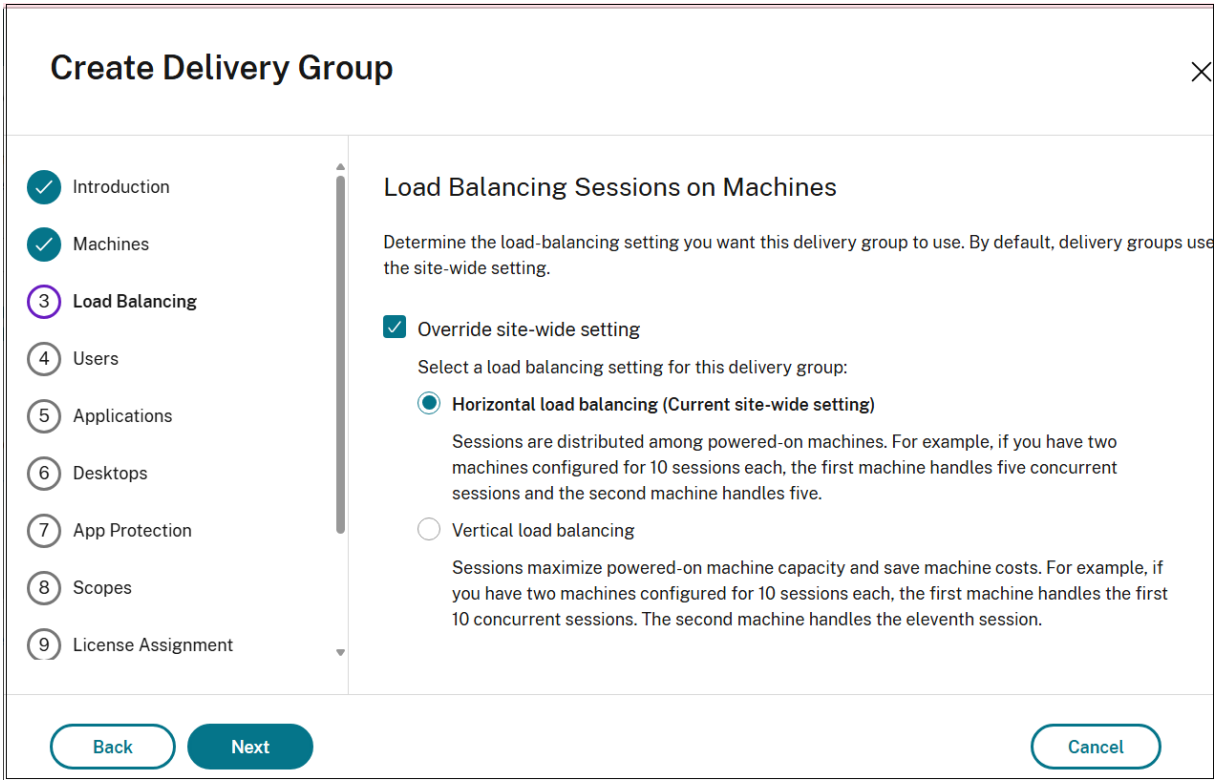
- When choosing a catalog, the list only shows catalogs with at least one unused machine.
- A catalog can provide machines to more than one delivery group. A machine can be used in only one delivery group. When you add more machines to the delivery group, Web Studio suggests the same catalog by default.
- A delivery group can use machines from more than one catalog; however, those catalogs must contain the same machine types (multi-session OS, single-session OS, or Remote PC Access). All machines within a delivery group must have the same assignment type (pooled or static). In other words, you cannot mix machine types in a delivery group.
- Citrix recommends using the latest VDA version on all machines.
- For **Remote PC Access**, when you create a site, a catalog named **Remote PC Access Machines** and a delivery group named **Remote PC Access Desktops** are created automatically. Each machine in a **Remote PC Access Machines** catalog is automatically associated with a delivery group.
- The following compatibility checks are performed:
  - MinimumFunctionalLevel must be compatible
  - SessionSupport must be compatible
  - AllocationType must be compatible for SingleSession
  - Remote PC Access is only compatible with Remote PC Access catalog

Machine Allocation page

The **Machine Allocation** page is available if there is any available assigned machine in the single-session OS static machine catalog selected on the **Machines** page.

Using this page, manage user assignments and desktop display names for machines in this delivery group.

- Use the **Display name** field to manage the desktop display name.
- Click **Browse** and select users or groups.



Load Balancing page

The **Load Balancing Sessions on Machines** page is available for multi-session OS machines.

Using this page, configure the load-balancing setting you want this delivery group to use. By default, delivery groups use the site-wide setting.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. To configure a load balancing setting for this delivery group, select the **Override site-wide** setting checkbox.
2. Select either **Horizontal load balancing** or **Vertical load balancing** option as required. For information on Horizontal and Vertical load balancing methods, see Load balance machines.

If you select **Vertical load balancing**, make sure that the Concurrent logon tolerance and Maximum number of sessions policies are configured appropriately.

Delivery Type page

The **Delivery Type** page appears only for single-session OS static (assigned) machines.

Using this page, configure the machines in the catalog to deliver desktops or applications to your users.

1. Select either **Applications** or **Desktops.** You cannot enable both.

> **Note:**
>
> If you select machines from a multi-session OS or single-session OS random (pooled) catalog, the delivery type is assumed to be applications and desktops. You can deliver applications, desktops, or both.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Users page

The **Users** page is available for all machine types. However, the options of the page vary with different types of machines.

Using this page, specify how users can access resources in the delivery group.

How user access control works

User access in a delivery group is controlled through specified user lists when you create or edit access settings.

- Users who meet *all* of the following conditions can access **applications** in a delivery group:
  - Have access to resources (apps and desktops) in this delivery group. By default, access is determined by the deployment's user access list (users in the Active Directory), which is not configured through Studio. See Add or remove users in a delivery group.
  - Have access to applications in this group. By default, the application entitlement policy rule includes everyone. See the PowerShell SDK `BrokerAppEntitlementPolicyRule` cmdlets for details.
  - Have access to application groups that include this application.
- Users who meet *both* of the following conditions can access desktops in a delivery group:
  - Have access to resources (apps and desktops) in this delivery group. By default, access is determined by the deployment's user access list (users in the Active Directory), which is not configured through Studio. You can add or remove users from the default user scope. See Add or remove users in a delivery group.
  - Have access to desktops in this group. For more information, see Desktops (or Desktop Assignment Rules page).

Configuration steps

1. Select one of the options to allow or restrict the use of resources in the delivery group□
   - **Allow any authenticated users to use resources:** To access applications and desktops, the users and group members you specify by name must present credentials such as smart card or user name and password to StoreFront™ or Citrix Workspace™ app. (For delivery groups containing single-session OS machines, you can import user data (a list of users) later by editing the delivery group.)
   - **Restrict use of resources:** Alternatively, you can restrict use of a delivery group by adding users or user groups to the **Allow list**. Only users on the **Allow list** can access apps and

© 1997–2026 Citrix Systems, Inc. All rights reserved.

desktops in the delivery group. You can also add users and user groups to a block list by clicking **Add block list**, which prevents users from using apps and desktops in the selected delivery group. A block list is meaningful only when used to block users in the allow list.

2. Choose the identity type for user logon to the session:

   - **Active Directory**: Allows users to log on to resources in the delivery group using Active Directory credentials.
   - **Microsoft Entra hybrid identity**: Allows users to log on to resources in the delivery group using either Active Directory or Microsoft Entra hybrid identity.

   > **Note:**
   >
   > If Microsoft Entra single sign-on (SSO) is not configured, the **Microsoft Entra hybrid identity** option is unavailable.

3. For multi-session OS machines, select **Grant access to unauthenticated (anonymous) users; no credentials are required** if you want users to access applications and desktops without presenting credentials to StoreFront or Citrix Workspace app. For example, at kiosks, the application might require credentials, but the Citrix access portal and tools do not.

   - Unauthenticated user accounts are created on demand when a session is launched, and named AnonXYZ, in which XYZ is a unique three-digit value.
   - Unauthenticated user sessions have a default idle timeout of 10 minutes, and are logged off automatically when the client disconnects. Reconnection, roaming between clients, and Workspace Control are not supported.

4. Select **Require sessions to launch in a user's home zone (if configured**) to prevent sessions from defaulting to other available zones if the user's home zone has sufficient resources.
5. Select **Allow session roaming between client devices with the user** if you want the sessions to follow, regardless of the device or whether current sessions exist.See Session roaming.

The following table describes your choices on the **Users** page:

Enable access for	Add/assign users and user groups?	Enable the "Give access to unauthenticated users" checkbox?
Only authenticated users	Yes	No
Only unauthenticated users	No	Yes
Both authenticated and unauthenticated users	Yes	Yes

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Applications page

The **Applications** page is available for all machine types. However, the applications that you can add vary with different types of machines.

Using this page you can add packaged applications to desktops in this group.

Important considerations

- You can add packaged applications to delivery groups. The packages containing those applications are automatically mounted each time users sign in to their desktops or Remote PCs.
- By default, new applications you add are placed in a folder named Applications. You can specify a different folder. For details, see the Applications article.
- You can change the properties for an application when you add it to a delivery group, or later. For details, see the Applications article.
- If you try to add an application and one with the same name exists in that folder, you are prompted to rename the application you are adding. If you decline, the application is added with a suffix that makes it unique within that application folder.
- When you add an application to more than one delivery group, a visibility issue can occur if you do not have permission to view the application in all those delivery groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the delivery groups to which the application was added.
- If you publish two applications with the same name to the same users, change the Application name (for user) property. Otherwise, users see duplicate names in the Citrix Workspace app.

Configuration steps

1. Select the **Add** menu to display the application sources.
    - **From Start menu:** Applications are discovered through one of the currently registered VDAs that are assigned to the delivery group. When you select this source, a new page launches with a list of discovered applications; select those you want to add and then select **OK**.
    - **Manually:** Applications located on a VDA in the delivery group or elsewhere in your network. Selecting this source opens a new page where you specify an application to add in the following ways:
        - Type the path to the executable, working directory, optional command line arguments, and display names for administrators and users.
        - Select an application from a VDA in the delivery group. To do so, click **Browse**, enter credentials for accessing the VDA, wait to be connected to the VDA, and then select

© 1997–2026 Citrix Systems, Inc. All rights reserved.

an application from the VDA. The properties of the selected application automatically populate fields on the page.

- **Existing:** Applications previously added to the deployment, perhaps in another delivery group. When you select this source, a new page launches with a list of discovered applications; select those you want to add and then select **OK**.
- **Application packages:** Applications in App-V, MSIX, MSIX app attach, or FlexApp application packages. When you select this source, the **Add Applications from Packages** page launches. Select an application package source, select the applications you want to add from the resulting display, and then select **OK**.

  > **Note:**
  >
  > - This option is dimmed if no application package is configured for the site.
  > - To publish MSIX or MSIX app attach apps, the delivery group's functional level must be 2106 or later. For FlexApp apps, the functional level must be 2206 or later. When a functional level requirement isn't met, the corresponding options in the **Application package source** drop-down list are dimmed.

- **Application group:** Application groups that exist in the deployment.

If an application source or application is not available or valid, it is either not visible or cannot be selected. For example, the **Existing** source is not available if no applications have been added to the deployment. Or, an application might not be compatible with the supported session types on machines in the selected machine catalog.

Desktops (or Desktop Assignment Rules) page

The title of this page depends on the machine catalog you chose earlier in the wizard:

- If you choose a catalog containing multi-session or pooled single-session machines, this page is titled **Desktops**.
- If you choose a catalog containing single-session static machines and specified "Desktops"on the **Delivery Type** page, this page is titled **Desktop Assignment Rules**.

  > **Note:**
  >
  > If you choose a catalog containing single-session static machines and specified "Applications"on the **Delivery Type** page, then you do not see the page.

1. (Optional) To update the default desktop icon, select **Change**. Browse to select an `.ico` or an `.exe` file from your local machine or a VDA machine. The maximum supported icon file size is 500 KB. This icon overrides the default icon for all desktops in the group unless a different icon is set for an individual desktop.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select **Add**. In the dialog box:

   a) In the **Display name** and **Description** fields, type the information to be displayed in the Citrix Workspace app.

   b) For multi-session or pooled single-session OS machines: To add a tag restriction to a desktop, select **Restrict launches to machines with this tag** and then select the tag from the menu.

   c) Using the radio buttons, you can either:

      i. **Allow everyone with access to this delivery group to use a desktop.** All users in the delivery group can launch a desktop (for groups with pooled machines) or be assigned a machine when they launch the desktop (for groups with single-session static machines).

      ii. **Restrict desktop use** by adding users and user groups to the **Allow list**. Only users on the **Allow list** can access a desktop. You can also add users and user groups to a block list by clicking **Add block list,**, which prevents users from using desktops in the selected delivery group. A block list is meaningful only when used to block users in the allow list.

   d) If the group contains single-session static machines, specify the maximum number of desktops per user. This must be a value of one or greater. The setting is not mandatory. You can assign machines manually or use RemotePC to have the machines assigned automatically.

   e) (Optional) Select **Change** to update the desktop icon for pooled desktops or the desktop assignment rule for single-session static desktops. Browse to select an icon from an `.ico` or an `.exe` file from your local machine or a VDA machine. The maximum supported icon file size is 500 KB. The specified icon overrides the default icon set at the delivery group level.

   f) Enable or disable the desktop (for multi-session machines) or desktop assignment rule (for single-session static machines): Disabling a desktop stops desktop delivery. Disabling a desktop assignment rule stops desktop auto-assignment to users.

   g) When you are finished with the dialog box, select **OK**.

Maximum instances of a desktop in a site (PowerShell only)

To configure the maximum instances of a desktop in the site (PowerShell only):

- In PowerShell, use the appropriate BrokerEntitlementPolicyRule cmdlet with the MaxPerEntitlementInstances parameter. For example, the following cmdlet modifies the `tsvda-desktop` rule to set the maximum concurrent instances of a desktop allowed in the site to two. When

© 1997–2026 Citrix Systems, Inc. All rights reserved.

there are two desktop instances running, an error occurs if a third subscriber attempts to start a desktop.

```
Set-BrokerEntitlementPolicyRule -Name tsvda-desktop -MaxPerEntitlementInst
 2
```

- For guidance, use the Get-Help cmdlet. For example, `Get-Help Set-BrokerEntitlementPolicyRu -Parameter MaxPerEntitlementInstances`.

App Protection page

The **App Protection** page is available for all machine types.
Using this page, you provide enhanced security for Citrix published apps and desktops.

The following information is supplemental to the App protection article in the Citrix Virtual Apps and Desktops documentation.

- You must have a valid App Protection entitlement. To purchase the App Protection feature, contact your Citrix sales representative.
- App protection requires XML trust. To enable XML trust, go to **Settings > Enable XML trust**.

Protection is applied under the following conditions:

- **Anti-screen capture**:
  - On Windows and macOS, only the window of the protected content is blank. App protection is active when a protected window is not minimized.
  - On Linux, the entire capture is blank. App protection is active whether a protected window is minimized or not.
- **Anti-keylogging**: Enabled if a protected window is in focus. To disable protection, change focus to another window.

Scopes page

The **Scopes** page is available for all machine types.

Using this page, group objects (for example, connections, catalogs, and delivery groups) in a way that is relevant to your organization.

License assignment page

The **License assignment** page is available for all machine types.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using this page, specify which license you want the delivery group to use. By default, the delivery group uses the site license. For more information, see Multi-type licensing.

Policy Set page

The **Policy Set** page is available for all machine types.

Using this page, specify which policy set you want this delivery group to use.

Local Host Cache setting page

This page is available only for delivery groups containing power-managed single-session pooled machines.

By default, pooled machines that are power managed are unavailable when in Local Host Cache (LHC) mode due to data exposure risks. To change the default behavior and make them available for new user connections when in LHC mode, select **Keep resources available**.

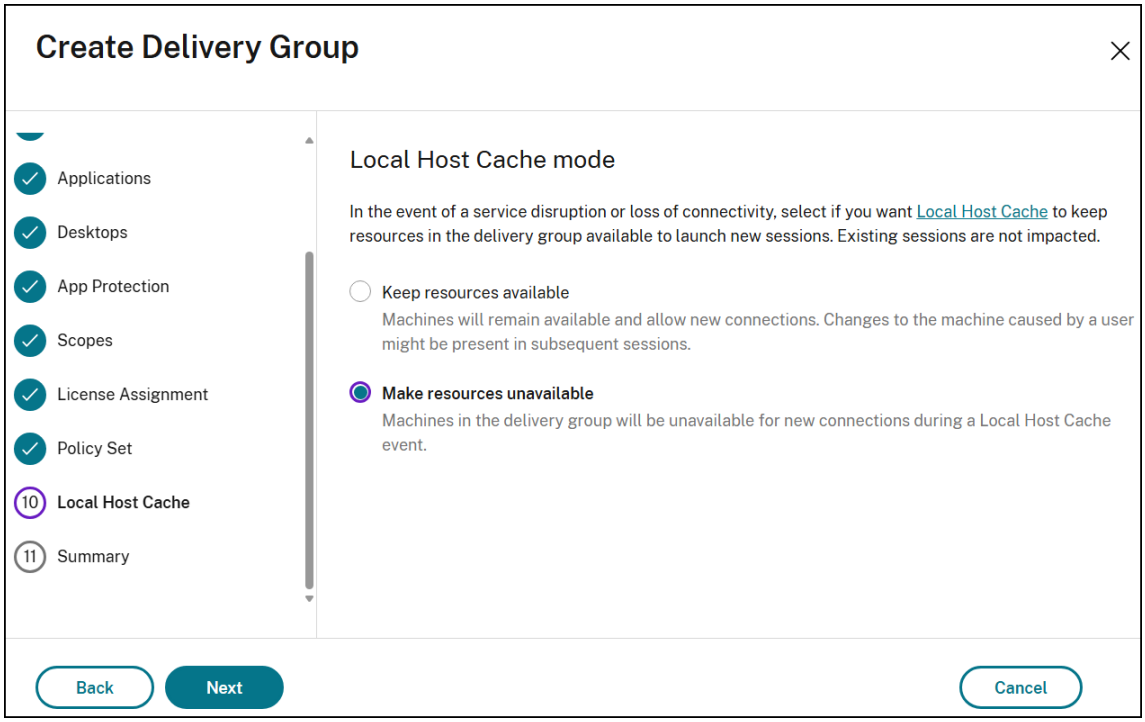
Alternatively, you can change the default behavior using PowerShell commands. For more information, see Application and desktop support.

> **Important:**
>
> Enabling access to power-managed single-session pooled machines can cause data and changes from previous user sessions being present in subsequent sessions.

One-time use pooled desktops in Local Host Cache

During a Local Host Cache (LHC) outage, pooled desktops can be used on a one-time basis. This is achieved by issuing a hygiene blob to capable VDAs and initiating reboots. This process guarantees a clean state for the desktops upon recovery from the outage. For machines that are not capable or legacy, participation only occurs if reuse is explicitly enabled.
The feature improves customer sentiment during outages by making availability more seamless.

Prerequisites



- VDA version 2407 or later for full hygiene enforcement. Legacy VDAs (prior to VDA version 2407) can be used only when reuse is enabled. These VDAs do not receive the hygiene blob or enforced reboots.
- Machine catalogs with single session machines.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure one-time use of pooled desktops

1. Create an MCS catalog with single session machines using VDA build 2407 or greater.
2. Create a corresponding delivery group. Set the `ReuseMachinesWithoutShutdownInOutage` desktop group setting to **`false`** for the delivery group from Remote PowerShell or select **Make resources unavailable** in Web Studio on the **Local Host Cache mode** page when creating a delivery group.

```
Set-BrokerDesktopGroup -Name "name" -
    ReuseMachinesWithoutShutdownInOutage $false
```

3. After you complete the configuration, during LHC outage mode, machines are available for one-time use. When out of LHC outage mode, machines that were tainted are rebooted and available to be used again.

> **Note:**
>
> A machine is classified as tainted once a user session has been initiated following its most recent power-on. An untainted machine refers to a machine that has not launched any user sessions since its latest power-on event.

Summary page

Enter a name for the delivery group. You can also (optionally) enter a description, which appears in the Citrix Workspace app and in Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Review the summary information and then click **Finish**.

Limitation

Assignment of a desktop to a client IP address only works with a very limited set of client types and configurations. Performing access filtering based on the client IP address uses the public IP address for cloud clients.

Enable canary deployment with merge groups (Preview)

Use merge groups to implement a canary deployment model for your application and desktop resources. This feature allows you to publish multiple versions of the same resource while presenting them as a single icon to end users.

Merge groups let you direct specific user groups to different implementation versions of the same resource. You can designate a percentage of users (like 5%) to test a new version while keeping others on the stable version. If issues occur with the new version, you can easily failover users to the stable version without disrupting their experience. This feature supports both high-availability and disaster recovery scenarios without requiring re-enumeration or configuration changes.

Example usage

To streamline the user experience when different versions of an application are available, consider using the merge group feature. For instance, if you have Microsoft Word 2016 and Microsoft Word 2019, instead of displaying two separate icons, group them into a single icon. By using the merge group feature, the system can determine which version of the application (for example, Word 2016 or Word 2019) to launch for a specific user.

Limitation

When a user's preferred resource in a Merge Group is temporarily unavailable (e.g., in maintenance mode), the Broker launches a session on a fallback resource. If the preferred resource becomes available again before the user reconnects, the Broker will create a new session on the preferred resource instead of reconnecting to the existing session on the fallback resource.

Impact: The user will have two active sessions, one on each resource, but can only access the session on the preferred resource. The disconnected session on the fallback resource becomes inaccessible.

Workaround: Admins can log off the orphaned session from Studio or reboot the machine hosting it.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Commands to configure merge groups

> **Note:**
>
> For the detailed command description, see the SDK documentation.

Action	Command	Description
Create Merge Groups	`New-BrokerMergeGroup`	Creates a Merge Group with the specified Name and Description (optional).
Set Merge Groups	`Set-BrokerMergeGroup`	Sets the Name, Description, MergeGroupSetUid, and the DefaultResourceUid of a Merge Group. DefaultResource is the icon resource of the Merge Group. In Citrix Workspace app, the merge group inherits the icon of this resource.
Delete Merge Groups	`Remove-BrokerMergeGroup`	Deletes the specified Merged Groups. The deletion fails if the merge group contains merged resources. To delete such a merge group, you need the `Force` parameter –it deletes both the merge group and its associated `MergedResources` in the merge group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Command	Description
Create Merged Resources	`New-BrokerMergedResource`	Creates a new merged resource in the site. Create either a merged resource with an applicationUid or an EntitlementPolicyRuleUid (shared/random desktop groups). This is also just a wrapper on top of the application resource or the entitlement policy rule. Deleting the merged resource doesn't delete the application or the Entitlement Policy Rule.
Set Merged Resources	`Set-BrokerMergedResource`	Sets the properties of a `MergedResource` object. Users parameter deletes any previous users associated with the merged resource and sets the new list (or a single user) as the list of users for this Merged Resource. If you want to add more users to the existing list of users, you can use the `AddUsers` parameter. If you want to remove users to the existing list of users, you can use the `RemoveUsers` parameter.
Delete Merged Resources	`Remove-BrokerMergedResource`	Deletes the specified Merged Resources.

Manage delivery groups

July 3, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Introduction

This article describes procedures for managing delivery groups from the management console. In addition to changing settings specified when creating the group, you can configure other settings that are not available when you create a delivery group.

Procedure categories include: general, users, machines, and sessions. Some tasks span more than one category. For example, "Prevent users from connecting to machines"is described in the machines category, but it also affects users. If you can't find a task in one category, check a related category.

Other articles also contain related information:

- Applications contain information about managing applications in delivery groups.
- Managing delivery groups requires the Delivery Group Administrator built-in role permissions. For details, see Delegated administration.

General

- View group details
- Change preferred properties
- Change the delivery type
- Change StoreFront™ addresses
- Change the functional level
- Manage Remote PC Access delivery groups
- Organize delivery groups using folders
- Manage App Protection
- Change the suspend capability for a delivery group

© 1997–2026 Citrix Systems, Inc. All rights reserved.

View group details

1. Use the search function to locate a specific delivery group. Refer to Search for instances for instructions.
2. From the search results, select a group as necessary.
3. Refer to the following table for descriptions of the group columns.
4. Click a tab in the bottom details pane for more information about this group.

Column	Description
Delivery Group	The group name and the session type. Session types include Single-session OS and Multi-session OS.
Delivering	The type of resources delivered from this group. Possible values include Applications, Desktops, and Applications and Desktops. “Static machine assignment”appears if the delivery group consists of dedicated machines.
Session in Use	The number of machines that are set up and the number of machines that are in a Disconnected state.
Allocated Count	The number of machines in the catalog assigned to a delivery group.
Folder	The location of the group within the **Delivery Groups** tree. It displays the name of the folder that the group is in (including the trailing backslash), or − if the group is at the root level.

Change preferred properties

Preferred properties control how users access and launch resources from a delivery group. To change preferred properties for a delivery group, follow these steps:

1. From Studio, select **Delivery Groups** in the left pane.
2. Select a group and then select **Edit** in the action bar.
3. On the **Preferences** page, change any of the settings in the following table.
4. Select **Apply** to apply any changes you made and keep the window open. Or, select **OK** to apply changes and close the window.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Setting	Description
Description	The text that Citrix Workspace™ (or StoreFront) uses and that users see.
Enable Delivery Group	Whether the delivery group is enabled.
Time zone	The time zone in which the machines of this delivery group reside. This setting automatically shows the time zone set in **Settings > Date and Time** for a newly created delivery group. You can choose a different time zone for the delivery group if needed. The drop-down menu lists the time zones supported by the site. **Note:** Changing the time zone on a delivery group might reboot the machines in that delivery group. To avoid this, ensure to change the time zone settings outside of production hours.
Enable Secure ICA®	Secures communications to and from machines in the delivery group using SecureICA, which encrypts the ICA protocol. The default level is 128 bit. The level can be changed using the SDK. Citrix® recommends using more encryption methods such as TLS encryption when traversing public networks. Also, SecureICA does not check data integrity.

Change the delivery type of a delivery group

The delivery type indicates what the group can deliver: applications, desktops, or both.

Before changing an **application only** or **desktops and applications** type to the **desktops only** type, delete all applications from the group.

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Delivery Type** page, select the delivery type you want.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Change StoreFront addresses

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **StoreFront** page, select or add StoreFront URLs. These URLs are used by the Citrix Workspace™ app, which is installed on each machine in the delivery group.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

You can also specify StoreFront server addresses by selecting **StoreFront** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Change the functional level

Change the functional level for the delivery group after you upgrade the VDAs on its machines and the machine catalogs containing the machines used in the delivery group.

Before you start:

- If you use Citrix Provisioning™ (formerly Provisioning Services), upgrade the VDA version in the Citrix Provisioning console.
- Start the machines containing the upgraded VDA so that they can register with a Delivery Controller. This process tells the console about what needs upgrading in the delivery group.
- If you must continue to use earlier VDA versions, newer product features are not available. For more information, see the upgrade documentation.

To change the functional level for a delivery group:

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Change Functional Level** in the action bar. The **Change Functional Level** action appears only if upgraded VDAs are detected.
3. Click **Change**.

The display indicates you which, if any, machines cannot be changed to the functional level and why. You can then cancel the change action, resolve the machine issues, and then perform the change action again.

After the change completes, you can revert the machines to their previous states. Select the delivery group and then select **Undo Functional Level Change** in the action bar.

Manage Remote PC Access delivery groups

If a machine in a Remote PC Access machine catalog is not assigned, the machine is temporarily assigned to a delivery group associated with that catalog. This temporary assignment enables the machine to be assigned to a user later.

The delivery group-to-machine catalog association has a priority value. Priority determines the machine's assigned delivery group when it registers with the system or when a user needs a machine assignment. The lower the value, the higher the priority. If a Remote PC Access machine catalog has multiple delivery group assignments, the software selects the match with the highest priority. Use the PowerShell SDK to set this priority value.

When first created, Remote PC Access machine catalogs are associated with a delivery group. Machine accounts or Organizational Units added to the catalog later can be added to the delivery group. This association can be switched off or on.

To add or remove a Remote PC Access machine catalog association with a delivery group:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Select **Delivery Groups** in the left pane.
2. Select a Remote PC Access group.
3. In the **Details** section, click the **Machine Catalogs** tab and then select a Remote PC Access catalog.
4. To add or restore an association, click **Add Desktops**. To remove an association, click **Remove Association**.

Organize delivery groups using folders

You can create folders to organize delivery groups for easy access.

> **Tip:**
>
> You can set your preferred default view (folder or list view) for the Delivery Groups node by clicking the **Folder** icon in the upper right of the action bar.

Required roles By default, you need to have the following built-in role to create and manage delivery group folders: Cloud Administrator, Full Administrator, or Delivery Group Administrator. If necessary, you can customize roles for creating and managing delivery group folders. For more information, see Required permissions.

Create a delivery group folder Before you start, plan how to organize your delivery groups. Consider the following:

- You can nest folders up to five levels (excluding the default root folder).
- A folder can contain delivery groups and subfolders.
- All nodes in Web Studio (such as **Machine Catalogs**, **Delivery Groups**, **Applications**, and **Application Groups**) share the same folder tree in the back end. To avoid name conflicts when renaming or moving folders, use unique names for first-level folders across different nodes.

  If you create a folder using the `New-BrokerAdminFolder` SDK cmdlet and want it to appear under the **Delivery Groups** node, you must add the `ContainsDeliveryGroups` metadata using the `Set-BrokerAdminFolderMetadata` cmdlet.

  Example:

```
Set-BrokerAdminFolderMetadata -AdminFolderId {
adminFolderUid }
 -Name ContainsDeliveryGroups -Value true
```

To create a delivery group folder, follow these steps:

1. Select **Delivery Groups** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. In the folder hierarchy, select a folder and then select **Create Folder** in the **Action** bar.
3. Enter a name for the new folder, and then click **Done**.

> **Tip:**
>
> If you create a folder in an unintended location, you can drag it to the correct location.

Move a delivery group

You can move a delivery group between folders. Detailed steps are as follows:

1. Select **Delivery Groups** in the left pane.
2. View groups by folder. You can also turn on **View all** above the folder hierarchy to view all groups at a time.
3. Right-click a group and then select **Move Delivery Group**.
4. Select the folder to which you want to move the group, and then click **Done**.

> **Tip:**
>
> You can drag a group to a folder.

Manage delivery group folders

You can delete, rename, and move delivery group folders.

Be aware that you can delete a folder only if it and its subfolders don't contain delivery groups.

To manage a folder, follow these steps:

1. Select **Delivery Groups** in the left pane.
2. In the folder hierarchy, select a folder, and then select an action in the **Action** bar as needed:
   - To rename the folder, select **Rename Folder**.
   - To delete the folder, select **Delete Folder**.
   - To move the folder, select **Move Folder**.
3. Follow onscreen instructions to complete the remaining steps.

Required permissions The following table lists the permissions required to perform actions on delivery group folders.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Action	Required permissions
Create delivery group folders	Create Delivery Group Folder
Delete delivery group folders	Remove Delivery Group Folder
Move delivery group folders	Move Delivery Group Folder
Rename delivery group folders	Edit Delivery Group Folder
Move delivery groups to folders	Edit Delivery Group Folder and Edit Delivery Group Properties

Manage App Protection

The following information is supplemental to App protection. Mind the following details:

- You must have a valid App Protection entitlement. To purchase the App Protection feature, contact your Citrix sales representative.
- App Protection requires XML trust. To enable XML trust, go to **Settings > Enable XML trust**.
- Regarding anti-screen-capturing:
  - On Windows and macOS, only the window of the protected content is blank. App Protection is active when a protected window is not minimized.
  - On Linux, the entire capture is blank. App Protection is active whether a protected window is minimized or not.

To choose an App Protection method for a delivery group, follow these steps:

1. Select **Delivery Groups** in the left pane.
2. Select a group and then select **Edit** in the action bar.
3. On the **App Protection** page, you can see the following options:

Options	Description
Do not apply	Select this option to not apply the setting.
Apply to this delivery group	Select **Anti-keylogging** and/or **Anti key capturing** options. Hover over each of these settings to read the details in the tool tip.
Apply contextually	To apply this setting, configure the access policy in the **Access Policy settings** page. a) Click **Access Policy** in the left pane and click **Add**. b) On the **Add Policy** page, do the following • i. Enter a **Policy name** and configure the settings as required. • ii. In the **Filter** and **Value** fields, enter the details and click **Done**. The new

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Options	Description

4. On the **Delivery Group** page, select the **Delivery Group** and click the **Details** tab at the bottom. The new **App Protection** settings applied are displayed.

Change the suspend capability for a delivery group

Make the suspend capability required or optional for a delivery group:

- **Required** - The delivery group can only include those VMs that are suspend capable.
- **Optional** - The delivery group can include VMs that are or aren't suspend capable.

Before you begin You can only change the suspend-capability of a delivery group to `Required` if all the VMs present in the delivery group are suspend-capable.

To change the suspend-capability of a delivery group :

1. From Web Studio, go to **Delivery Groups** in the left pane.
2. Select a group, and then click **Change Suspend Capability** in the action bar.
3. Click **Yes** to confirm your action.

Users

This section covers the following topics:

- Add or remove users
- Restrict user access to desktops and apps in a delivery group
- Restrict access to resources in a delivery group
- Restrict user access to resources across all delivery groups
- Configure user scope for an access policy

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add or remove users in a delivery group

For detailed information about users, see Users.

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Users** page:
   - To add users, click **Add**, and then specify the users you want to add.
   - To remove users, select one or more users and then click **Remove**.
   - Select or clear the checkbox to allow access by unauthenticated users.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Import or export user lists For delivery groups containing physical single-session OS machines, you can import user information from a .csv file after you create the delivery group. You can also export user information to a .csv file. The .csv file can contain data from a previous product version.

The first line in the CSV file must contain two column headers, separated by a comma. Make sure that the first header is `Machine Account` and the second header is `User Names`. (You can include additional headers but they are not supported.) Subsequent lines in the file contain comma-separated data. The `Machine Account` entries can be computer SID, FQDN, or domain and computer name pairs.

To import or export user information:

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Machine Allocation** page, select **Import** list or **Export** list, and then browse to the file location.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Restrict access to desktops and apps in a delivery group

You can manage user access to resources in a delivery group by performing the following tasks:

- Restrict desktop access to specific users
- Restrict application access to specific users

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Restrict desktop access to specific users Users who meet *both* of the following conditions can access desktops in a delivery group:

- Have access to resources (apps and desktops) in this delivery group.

  By default, access is determined by the deployment's user access list, which is not configured through Studio. You can add or remove users from the default user scope. See Add or remove users in a delivery group.

- Have access to desktops in this group.

  For more information, see Step 8. Desktops (or Desktop Assignment Rules).

To restrict access to a desktop to specific users, see Restrict desktop use when creating and editing a delivery group.

Restrict application access to specific users Users who meet *all* of the following conditions can access applications in a delivery group:

- Have access to resources (apps and desktops) in this delivery group.

  By default, access is determined by the deployment's user access list, which is not configured through Studio. You can add or remove users from the default user scope. See Add or remove users in a delivery group.

- Have access to applications in this group.

  By default, the application entitlement policy rule includes everyone. See the PowerShell SDK `BrokerAppEntitlementPolicyRule` cmdlets for details. If needed, you can restrict user access to applications in a delivery group using steps described in this section.

- Have access to application groups that include this application.

To restrict application access to specific users at the delivery group level, follow these steps:

1. In Studio, select **Delivery Groups** in the left pane.
2. Select a delivery group, and then select **Edit** in the action bar.
3. To restrict application access, follow these steps:

   a) In the left pane, click the **Application Assignment Rule**.

   b) To allow specific users to access applications, select **Restrict application use**, and then click **Add** in the **Allow list** area and specify users or user groups to include.

   c) To block specific users from accessing applications, click **Add** in the **Block list** area and specify the users or user groups to exclude.

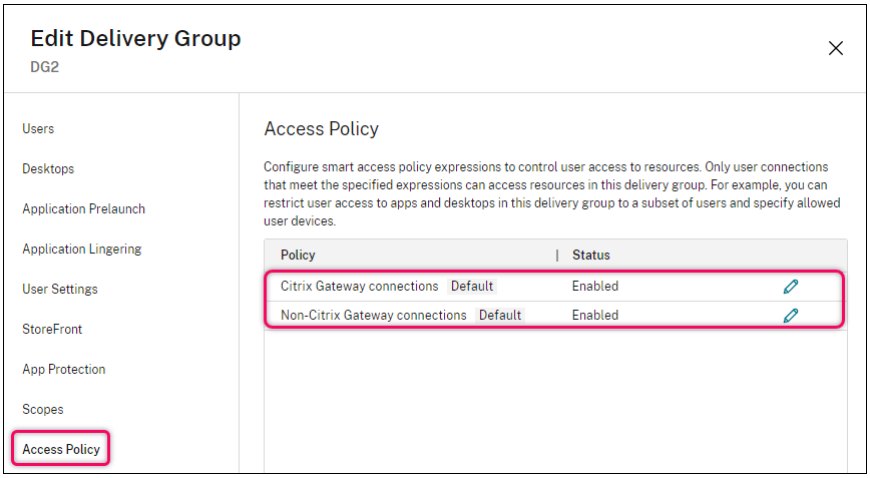
© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> - If you select **Restrict application use** but leave both the Allow and Block lists empty, no users can use applications in this group.
> - If you select **Restrict application use** and leave the Allow list empty, all users except users in the **Block list** can use the applications.

Restrict access to resources in a delivery group

Any changes you make to restrict user access to resources in a delivery group supersede previous settings, regardless of the method you use. You can:

- **Restrict admin access using delegated administration scopes:** You can create and assign a scope that permits administrators to access all applications and another scope that provides access to only certain applications. For details, see Delegated administration.
- **Restrict user access through smart access policy expressions:** You can configure access policy rules to control user access to a specific delivery group. Examples include:
  - Restrict access to a subset of users and specify allowed user devices.
  - Restrict access to users connected through Workspace (instead of StoreFront).
  - Restrict access to users connected through a specific Workspace URL.



This section guides you through how to restrict user access to delivery groups through access policy rules:

- About access policy rules
- Add access policy rules
- Manage access policy rules using Web Studio
- Add and refine policy rules using PowerShell

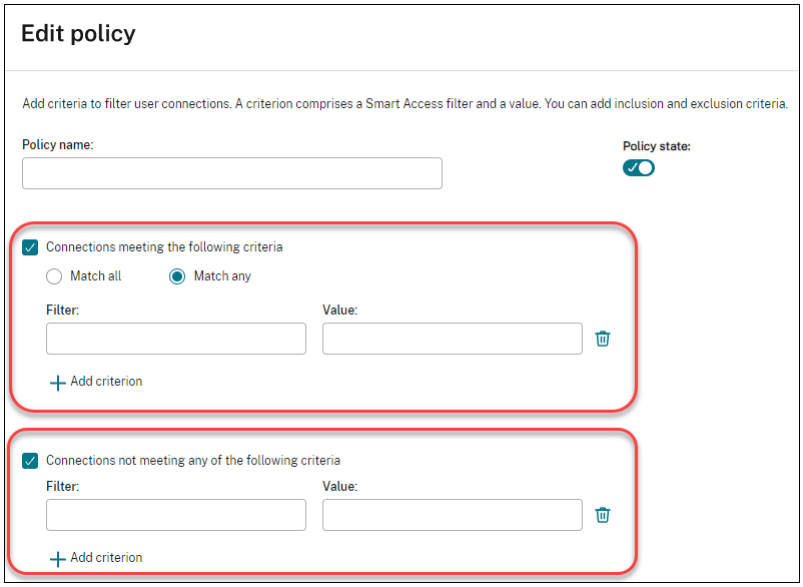
About access policy rules You can configure multiple access policy rules for a delivery group. Apps and desktops in a delivery group appear in a user's StoreFront or Workspace when the user's connection matches any access policy rule you defined for the delivery group, irrespective of order.

Each rule can be individually enabled or disabled. A disabled rule is ignored when the access policy is evaluated.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In Web Studio, the Access Policy list includes the following default SmartAccess policy rules. You can add more as necessary.

- **Citrix Gateway connections.** This policy allows only user connections made through Citrix Gateway can access resources within the delivery group. User connections made through Workspace when either the Device Posture or Network Location features are enabled are also considered connections through Citrix Gateway.
- **Non-Citrix Gateway connections.** This policy allows only user connections made not through Citrix Gateway can access resources within the delivery group.



> **Note:**
>
> - To prevent the default rules from overriding a newly configured one, you must either disable the default rules or refine them to exclude the filters used in the new policy.
> - The default policies can't be deleted but they can be disabled. To disable a policy, click the **Edit** icon and then change the **Policy state** to **Disabled**.
> - The policy list also shows rules added using PowerShell commands. Those policies can be deleted but can't be edited in Web Studio.

Add access policy rules using Web Studio An access policy rule comprises a set of filters. For more information about filters, see this article. When adding an access policy rule, you add multiple condition filters to the rule as needed.

To add a policy for a delivery group using Web Studio, follow these steps:

1. In the console, select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Access Policy** page, click **Add**. The **Add Policy** page appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

4. In the **Policy name** field, type a descriptive name for the policy. The name must be unique in your deployment.
5. To define the criteria for allowed user connections, follow these steps:
   a) Select **Connections meeting the following criteria**.
   b) Click **Add criterion**.
   c) In the **Filter** field, type the name of the filter that you want to use. In the **Value** field, type a desired value for the filter. For example, to allow only users connected through Workspace (instead of StoreFront) to access resources in this delivery group, type `Citrix-Via-Workspace` for **Filter** and `True` for **Value**.
   d) To add more criteria, repeat steps b-c.
   e) Select the relationship among the criteria:
      - **Match any**. Allows access only when the incoming user connection meets any of the configured filter criteria.
      - **Match all**. Allows access only when the incoming user connection meets all of the configured filter criteria.
6. To define the criteria for prohibited user connections, follow these steps:
   a) Select **Connections not meeting any of the following criteria**.
   b) Click **Add criterion**.
   c) In the **Filter** field, type the name of the filter that you want to use. In the **Value** field, type a desired value for the filter. For example, to prohibit users connected through the `example.cloud.com` Workspace URL from accessing resources in this delivery group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Type `Citrix.Workspace.UsingDomain` for **Filter** and `example.cloud.com` for **Value**.

d) To add more criteria, repeat steps b-c.

> **Note:**
>
> User connections meeting any of the configured criteria are prohibited from resources in this delivery group.

7. Click **Done**.

   The new policy appears in the policy list.

8. Review and refine the default policy rules to avoid unintentional overlaps with connections covered by this new policy. To refine the existing policies, use the following ways:

   - Disable the default policy rules.
   - Configure the default policy rules to exclude the SmartAccess filters that you added to the inclusion criteria of the new policy. For more information, see Manage policy rules using Web Studio and Add and manage access policy rules using PowerShell.

> **Important:**
>
> As explained in About access policy rules, when a user's connection matches one or more policy rules in a delivery group, the user gains access to its resources. Therefore, after creating a rule, you must carefully review and refine the existing rules to avoid any unintentional overlaps with connections covered by the new rule.

Manage access policy rules using Web Studio You can use the inclusion and exclusion criteria to refine the default policies. For example, to restrict access to a subset of those connections, follow these steps:

1. Edit a default policy.
2. Select **Connections meeting any of the following criteria**.
3. Add, edit, or remove the SmartAccess policy expressions for the allowed user access scenarios.

For more information, see the Citrix Gateway documentation.

Add and manage access policy rules using PowerShell You can use the following PowerShell cmdlets to add and manage access policy rules for delivery groups:

- New-BrokerAccessPolicyRule
- Get-BrokerAccessPolicyRule
- Set-BrokerAccessPolicyRule

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Rename-BrokerAccessPolicyRule
- Remove-BrokerAccessPolicyRule

For more information, see the relative articles in the Citrix Developer Documentation.

Restrict user access to resources across all delivery groups

You can configure resource filtering rules to control user access to applications and desktops across all delivery groups. These rules let you specify the resource type, apply tag-based restrictions, and enforce access conditions based on factors such as network location and store connection context.

Required permission To perform this task, you must be an administrator role with the **Manage resource filter** permission.

Add a resource filtering rule To add a resource filtering rule, complete the following steps:

1. Go to **Delivery Groups > Settings**.
2. Select **Manage** in the **Resource filter** tile.
3. In the **Manage resource filter rules** dialog box, click **Add**.
4. Enter a **Name** and **Description** for the rule.
5. Select the resource type that the rule applies to:
   - **Applications**
   - **Desktops**
   - **Both**
6. Select the tag that identifies the resources that the rule applies to.

   > **Note:**
   >
   > If you select **Both** as the resource type, selecting a tag is required.

7. Configure the **Smart Access filter** to define the conditions under which the resources are filtered.
8. Click **Add** to save the rule.

Configure user scope for an access policy

By default, all access policies in a delivery group apply to the same set of users. You can configure an access policy to apply to specific users using Studio, PowerShell, or the Rest API.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To apply an access policy to specified users using Studio, follow these steps:

1. From Studio, select **Delivery Groups** in the left pane.
2. Select a group and then select **Edit Delivery Group** in the action bar.
3. On the **Users** page, select **Use contextual access.**
4. Select the access policy that you want to configure, and click **User access scope**. The **User access scope** page appears.
5. To define which authenticated users this policy applies to:
    - To apply this policy to *any* authenticated users, select **Allow any authenticated users to use resources**.
    - To apply this policy to specific users, keep **Restrict use of resources** selected. Then, use the allow list and block list to add or remove users for this policy.
6. To apply this access policy to users who don't provide credentials, select **Grant access to unauthenticated (anonymous) users; no credentials are required**.

Machines

- Manage user assignments for machines
- Change assignments of machines to users
- Enable Local Host Cache for power-managed single-session pooled VDAs
- Change the maximum number of machines per user
- Update a machine
- Add, change, or remove a tag restriction for a desktop
- Remove a machine
- Prevent users from connecting to a machine (maintenance mode)
- Shut down and restart machines
- Create and manage restart schedules for machines
- Enable one-time restart schedule
- Power manage machines

Manage user assignments for machines

Manage user assignments for machines in a delivery group. When desktop assignment rules are configured for the delivery group, machines are randomly assigned to users upon initial desktop launch and remain assigned to the users unless their user assignments are modified. If you want to manually assign an unassigned machine to specific users or change the existing user assignment for a machine, follow the steps described in this topic to make changes. Using these steps, you can also modify names displayed in the Citrix Workspace App for machines assigned to users.

Detailed steps are as follows:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. From Studio, select **Delivery Groups** from the left pane.
2. Select a group, and then select **Edit** in the action bar.
3. In the left pane, select **Machine Allocation**. The following details for each machine in the group appear:

   - **Machine name:** Shows the name of a machine.
   - **Display name:** Shows the machine's display name in Citrix Workspace App.
   - **Users:** Shows users assigned to this machine. If desktop assignment rules are configured, machines are randomly assigned to users upon their initial desktop launch and remain assigned to them unless their user assignments are modified.

4. Locate a machine, and then assign users to it or change its user assignment:

   - Click **Browser** to browser to users.
   - In the **Users** column, enter a semicolon-separated list of user names.
   - Click **Import from CSV file** to import the setting details using a CSV file.
   - Click **Change** to update the machine's desktop icon. Browse to select an `.ico` or an `.exe` file from your local machine or a VDA machine. The specified icon overrides the default icon set only at the machine level.

5. (Optional) If the machine is assigned to users, modify its display name as needed.

   > **Note:**
   >
   > The Display name field is enabled only when the machine is assigned to users:
   >
   > - If the machine is assigned to a user based on a desktop assignment rule, this field shows the display name configured in that rule.
   > - If the machine is manually assigned to users and the field is left blank, the delivery group's published name (if specified) is used as the machine's display name. The delivery group's name is used if the published name is unspecified. Note that you can specify published names for delivery groups only through PowerShell.

6. Select **Apply** to apply changes and keep the window open. Or, select **OK** to apply changes and close the window.

Change assignments of machines to users in a delivery group

You can change the assignments of single-session OS machines provisioned with MCS. You cannot change assignments for multi-session OS machines or machines provisioned with Citrix Provisioning.

1. Select **Delivery Groups** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select a group and then click **Edit** in the action bar.
3. On the **Desktops** or **Desktop Assignment Rules** page (the page title depends on the type of machine catalog that the delivery group uses), specify the new users.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Enable Local Host Cache for power-managed single-session pooled VDAs

By default, power-managed single-session pooled machines are unavailable when in Local Host Cache mode. You can override the default behavior on a per-delivery group basis. Detailed steps are as follows:

1. From Studio, select **Delivery Groups** in the left pane.

   In the group list, groups containing single-session pooled machines provisioned by MCS or Citrix Provisioning display a warning icon.

2. Select a group as needed, then select **Edit** in the action bar.
3. On the **Local Host Cache** page, select **Keep resources available**.
4. Select **Apply** to apply any changes you made and keep the window open. Or, select **OK** to apply changes and close the window.

Alternatively, you can override the default behavior using PowerShell commands. For more information, see Application and desktop support.

> **Important:**
>
> Enabling access to power-managed single-session pooled machines can cause data and changes from previous user sessions being present in subsequent sessions.

Change the maximum number of machines per user in a delivery group

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Desktop Assignment Rules** page, set the maximum desktops per user value.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Update a machine in a delivery group

1. Select **Delivery Groups** in the left pane.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select a group and then click **View Machines** in the action bar.
3. Select a machine and then click **Update Machines** in the action bar.

To choose a different image, select **Image** and then select a snapshot.

To apply changes and notify machine users, select **Rollout notification to end-users**. Then specify:

- When to update the master image: now or on the next restart
- The restart distribution time (the total time to begin updating all machines in the group)
- Whether users are notified of the restart
- The message users receive

Add, change, or remove a tag restriction for a desktop

Adding, changing, and removing tag restrictions can have unanticipated effects on which desktops are considered for launch. Review the considerations and cautions in Tags.

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Desktops** page, select the desktop and click **Edit**.
4. To add a tag restriction, select **Restrict launches to machines with the tag** and then select the tag.
5. To change or remove a tag restriction, either:
   - Select a different tag.
   - Remove the tag restriction by clearing **Restrict launches to machines with this tag**.
6. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Remove a machine from a delivery group

Removing a machine deletes it from a delivery group. It does not delete it from the machine catalog that the delivery group uses. Therefore, that machine is available for assignment to another delivery group.

Machines must be shut down before they can be removed. To temporarily stop users from connecting to a machine while you are removing it, put the machine into maintenance mode before shutting it down.

Machines might contain personal data, so use caution before allocating the machine to another user. Consider reimaging the machine.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **View Machines** in the action bar.
3. Ensure that the machine is shut down.
4. Select the machine and then click **Remove from Delivery Group** in the action bar.

You can also remove a machine from a delivery group through the connection the machine uses.

Prevent users from connecting to a machine (maintenance mode) in a delivery group

When you need to temporarily stop new connections to machines, you can turn on maintenance mode for one or all machines in a delivery group. You might do this before applying patches or using management tools.

- When a multi-session OS machine is in maintenance mode, users can connect to existing sessions, but cannot start new sessions.
- When a single-session OS machine (or a PC using Remote PC Access) is in maintenance mode, users cannot connect or reconnect. Current connections remain connected until they disconnect or log off.

To turn maintenance mode on or off:

1. Select **Delivery Groups** in the left pane.
2. Select a group.
3. To turn on maintenance mode for all machines in the delivery group, click **Turn On Maintenance Mode** in the action bar.

   To turn on maintenance mode for one machine, click **View Machines** in the action bar. Select a machine, and then click **Turn On Maintenance Mode** in the action bar.
4. To turn maintenance mode off for one or all machines in a delivery group, follow the previous instructions, but click **Turn Off Maintenance Mode** in the action bar.

Windows Remote Desktop Connection (RDC) settings also affect whether a multi-session OS machine is in maintenance mode. Maintenance mode is on when any of the following occur:

- Maintenance mode is set to on, as described earlier.
- RDC is set to **Don't allow connections to this computer**.
- RDC is not set to **Don't allow connections to this computer**. The **Remote Host Configuration User Logon Mode** setting is either **Allow reconnections, but prevent new logons** or **Allow reconnections, but prevent new logons until the server is restarted**.

You can also turn maintenance mode on or off for:

- A connection, which affects the machines using that connection.
- A machine catalog, which affects the machines in that catalog.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Shut down and restart machines in a delivery group

This procedure is not supported for Remote PC Access machines.

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **View Machines** in the action bar.
3. Select the machine and then click one of the following entries in the action bar:

    - **Force shut down:** Forcibly powers off the machine and refreshes the list of machines.
    - **Restart:** Requests the operating system to shut down and then start the machine again. If the operating system cannot comply, the machine remains in its current state.
    - **Force restart:** Forcibly shuts down the operating system and then restarts the machine.
    - **Suspend:** Pauses the machine without shutting it down, and refreshes the list of machines.
    - **Shut down:** Requests the operating system to shut down.

For non-force actions, if the machine does not shut down within 10 minutes, it is powered off. If Windows attempts to install updates during the shutdown, there is a risk that the machine is powered off before the updates finish.

Citrix recommends that you prevent single-session OS machine users from selecting **Shut down** within a session. See the Microsoft policy documentation for details.

You can also shut down and restart machines on a connection.

Create and manage restart schedules for machines in a delivery group

> **Note:**
>
> - When a restart schedule is applied to a delivery group with Autoscale™ enabled, its machines are just powered off and left for Autoscale to power them on.
> - When restart schedules are applied to random single-session machines, those machines are powered off rather than restarted, to save costs. We recommend that you use Autoscale to power on machines.
> - Changing the time zone on a delivery group might reboot the machines in that delivery group. To avoid this, ensure to change the time zone settings outside of production hours.

A restart schedule specifies when machines in a delivery group are periodically restarted. You can create one or more schedules for a delivery group. A schedule can affect either:

- All the machines in the group.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- One or more (but not all) machines in the group. The machines are identified by a tag that you apply to the machine. This is called a tag restriction, because the tag restricts an action to only items that have the tag.

For example, let's say all of your machines are in one delivery group. You want every machine restarted once every week, and you want the machines used by the accounting team restarted daily. To accomplish this, set up one schedule for all machines, and another schedule for only the machines in accounting.

A schedule includes the day and time that the restart begins, and the duration.

You can enable or disable a schedule. Disabling a schedule can be helpful when testing, during special intervals, or when preparing schedules before you need them.

You cannot use schedules for automated power-on or shutdown from the management console, only to restart.

Schedule overlap Multiple schedules can overlap. In the example above, both schedules affect the accounting machines. Those machines might be restarted twice on Sunday. The scheduling code is designed to avoid restarting the same machine more often than intended, but it cannot be guaranteed.

- If the schedules coincide precisely in start and duration times, it is more likely that the machines are restarted only once.
- The more the schedules differ in start and duration times, it's more likely that multiple restarts occur.
- The number of machines affected by a schedule also affects the chance of an overlap. In the example, the weekly schedule that affects all machines might initiate restarts faster than the daily schedule for accounting machines, depending on the duration specified for each.

For an in-depth look at restart schedules, see Reboot schedule internals.

View restart schedules

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. Select the **Restart Schedule** page.

The **Restart Schedule** page contains the following information for each configured schedule:

- Schedule name
- Tag restriction used if any
- How often the machine restarts occur
- Whether machine users receive a notification
- Whether the schedule is enabled

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add (apply) tags When you configure a restart schedule that uses a tag restriction, ensure that the tag has been added to the machines that the schedule affects. In the example above, each of the machines used by the accounting team has a tag applied. For details, see Tags.

Although you can apply more than one tag to a machine, a restart schedule can specify only one tag.

1. Select **Delivery Groups** in the left pane.
2. Select the group containing the machines controlled by the schedule.
3. Click **View Machines** and then select the machines you want to add a tag to.
4. Click **Manage Tags** in the action bar.
5. If the tag exists, enable the checkbox next to the tag name. If the tag does not exist, click **Create** and then specify the name for the tag. After the tag is created, enable the checkbox next to the newly created tag name.
6. Click **Save** in the **Manage Tags** dialog.

Create a restart schedule

> **Note:**
>
> Restart schedules can be applied to all power managed and non-power managed multi-session machines.

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Restart Schedule** page, click **Add**.
4. On the **Add Restart Schedule** page:
    - To enable the schedule, select **Yes**. To disable the schedule, select **No**.
    - Type a schedule name and description.
    - For **Restrict to tag**, apply a tag restriction.
    - For **Include machines in maintenance mode**, choose whether to include machines that are in maintenance mode in this schedule. To use PowerShell instead, see Scheduled restarts for machines in maintenance mode.
    - For **Restart frequency**, select how often the restart occurs: daily, weekly, monthly, or once. If you select **Weekly** or **Monthly**, you can specify one or more specific days.
    - For **Repeats every**, specify how often you want the schedule to run.
    - For **Start date**, specify a start date for the first occurrence of the schedule.
    - For **Begin restart at**, specify, in 24-hour clock format, the time of day to begin the restart.
        - For **Restart duration**:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- To forcibly restart machines with unresponsive sessions, select **Forced restart**, then select one of the following options:
  - **Restart all machines at once**
  - **Restart all machines within a time period**, and specify the time by **Hour** or **Minute**.
- To wait for all sessions to drain before restarting, select **Graceful restart**.

  Upon starting a restart schedule that is configured to use graceful restart:
  - All idle machines belonging to the delivery group are restarted immediately.
  - Each machine belonging to a delivery group with one or more active sessions is restarted when all sessions are logged off.

  > **Note:**
  >
  > Graceful restart schedules can only restart power managed machines.

- In **Send notification to users**, determine whether to display a notification message on the applicable machines before a restart begins. By default, no message appears.
- If you choose to display a message 15 minutes before the restart begins, you can choose to repeat the message every five minutes after the initial message. By default, the message does not repeat.
- Enter the notification title and text. There is no default text.

  If you want the message to include a countdown to restart, include the variable **%m%**. Unless you chose to restart all machines at the same time, the message appears on each machine at the appropriate time before the restart.

5. Click **Done** to apply the changes and to close the **Add Restart Schedule** window.
6. Click **Apply** to apply the changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Restart after drain Another restart duration value is available when using PowerShell to create or update a machine restart schedule (`New-BrokerRebootSchedulev2` or `Set-BrokerRebootSchedulev2`).

When you enable the restart after drain feature with the `-UseNaturalReboot <Boolean>` parameter, all machines are restarted after draining all sessions. When the restart time is reached, machines are put into the drain state and then restarted when all sessions are logged off.

This feature is supported for delivery groups containing single-session or multi-session machines. You can use this option for machines that are power managed and also for machines that are not power managed.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

In an on-premises environment, this feature is supported only when using PowerShell. The feature is not available in Web Studio.

Edit, remove, enable, or disable a restart schedule

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit** in the action bar.
3. On the **Restart Schedule** page, select the checkbox for a schedule.
    - To edit a schedule, click **Edit**. Update the schedule configuration, using the guidance in Create a restart schedule.
    - To enable or disable a schedule, click **Edit**. Select or clear the **Enable restart schedule** checkbox.
    - To remove a schedule, click **Remove**. Confirm the removal. Removing a schedule does not affect any tags applied to machines in the affected machines.

Scheduled restarts delayed due to database outage

> **Note:**
>
> This feature is available only in PowerShell.

If a site database outage occurs before a scheduled restart begins for machines (VDAs) in a delivery group, the restarts begin when the outage ends. This can have unintended results.

For example, let's say you've scheduled a delivery group's restarts to occur during off-production hours (beginning at 03:00). A site database outage occurs one hour before a scheduled restart begins (02:00). The outage lasts six hours (until 08:00). The restart schedule begins when the connection between the Delivery Controller and the site database is restored. The VDA restarts now begin five hours after their original schedule, resulting in VDAs restarting during production hours.

To help avoid this situation, you can use the `MaxOvertimeStartMins` parameter for the `New-BrokerRebootScheduleV2` and `Set-BrokerRebootScheduleV2` cmdlets. The value specifies the maximum number of minutes beyond the scheduled start time that a restart schedule can begin.

- If the database connection is restored within that time (scheduled time + `MaxOvertimeStartMins`), the VDA restarts begin.
- If the database connection is not restored within that time, the VDA restarts do not begin.
- If this parameter is omitted or has a zero value, the scheduled restart begins when the connection to the database is restored, regardless of the outage duration.

For more information, see the cmdlet help. This feature is available only in PowerShell. You cannot set this value when configuring a restart schedule in Web Studio.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Scheduled restarts for machines in maintenance mode

> **Note:**
>
> This feature is available only in PowerShell. The option `IgnoreMaintenanceMode` is supported with Citrix Virtual Apps and Desktops™ 7 2006 and later.

To indicate whether a restart schedule affects machines that are in maintenance mode, use the `IgnoreMaintenanceMode` option with `BrokerRebootScheduleV2` cmdlets.

For example, the following cmdlet creates a schedule that restarts machines that are in maintenance mode (in addition to machines that aren't in maintenance mode).

```
New-Brokerrebootschedulev2 rebootSchedule1 -DesktopGroupName <myDesktopGroup
> -IgnoreMaintenanceMode $true
```

The following cmdlet modifies an existing restart schedule.

```
Set-Brokerrebootschedulev2 rebootSchedule1 -IgnoreMaintenanceMode
$true
```

For more information, see the cmdlet help. This feature is available only in PowerShell.

Enable one-time restart schedule

If you want to enable one-time restart schedule using PowerShell, use the following `BrokerCatalogRebootSch` PowerShell commands to create, modify, and delete a restart schedule:

- Get-BrokerCatalogRebootSchedule
- New-BrokerCatalogRebootSchedule
- Set-BrokerCatalogRebootSchedule
- Remove-BrokerCatalogRebootSchedule
- Rename-BrokerCatalogRebootSchedule

Limitations:

- A catalog reboot schedule associated with a catalog that is without a configured timezone is created but does not start.
- When a catalog reboot schedule is created, then the reboot schedule runs only on the catalog VMs belonging to a delivery group.

Example,

- To create a restart schedule of the VMs in the catalog named **BankTellers** to begin on Feb 3, 2022, between 2 AM and 4 AM.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
C:\PS> New-BrokerCatalogRebootSchedule -Name BankTellers -
    CatalogName BankTellers  -StartDate "2022-02-03" -StartTime "
    02:00" -Enabled $true -RebootDuration 120
```

- To create a restart schedule of the VMs in the catalog having UID 17 to begin on Feb 3, 2022, between 1 AM and 5 AM. Ten minutes before the restart, each VM is set to display a message box with the title **WARNING: Reboot pending**, and the message **Save your work**, in every user session.

```
C:\PS> New-BrokerCatalogRebootSchedule -Name 'Update reboot' -
    CatalogUid 17 -StartDate "2022-02-03" -StartTime "01:00" -
    Enabled $true -RebootDuration 240 -WarningTitle "WARNING:
    Reboot pending" -WarningMessage "Save your work" -
    WarningDuration 10
```

- To rename the catalog restart the schedule named **Old Name** to **New Name**.

```
C:\PS> Rename-BrokerCatalogRebootSchedule -Name "Old Name" -
    NewName "New Name"
```

- To display all catalog restart schedules with UID 1, and then rename the catalog reboot schedule with the UID 1 to **New Name**.

```
C:\PS> Get-BrokerCatalogRebootSchedule -Uid 1 | Rename-
    BrokerCatalogRebootSchedule -NewName "New Name" -PassThru
```

- To set the catalog restart schedule named **Accounting** to display a message with the title, **WARNING: Reboot pending, and the message**, **Save your work**, ten minutes before the restart of each VM. The message appears in every user session on that VM.

  “‘

  C:\PS> Set-BrokerCatalogRebootSchedule -Name Accounting -WarningMessage “Save your work”-WarningDuration 10 -WarningTitle “WARNING: Reboot pending”

- To display all restart schedules that are disabled, and then enable all disabled restart schedules.

```
C:\PS> Get-BrokerCatalogRebootSchedule -Enabled $false | Set-
    BrokerCatalogRebootSchedule -Enabled $true
```

- To set the catalog restart schedule with UID 17 to display the message **Rebooting in %m% minutes** fifteen, ten, and five minutes before the restart of each VM.

```
C:\PS> Set-BrokerCatalogRebootSchedule 17 -WarningMessage "
    Rebooting in %m% minutes." -WarningDuration 15 -
    WarningRepeatInterval 5
```

- To configure the time zone for the catalog named **MyCatalog**.

```
C:\PS> Set-BrokerCatalog -Name "MyCatalog" -TimeZone <TimeZone>
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Power manage machines in a delivery group

You can power manage only virtual single-session OS machines, not physical machines (including Remote PC Access machines). Single-session OS machines with GPU capabilities cannot be suspended, so power-off operations fail. For multi-session OS machines, you can create a restart schedule.

In delivery groups containing pooled machines, virtual single-session OS machines can be in one of the following states:

- Randomly allocated and in use
- Unallocated and unconnected

In delivery groups containing static machines, virtual single-session OS machines can be:

- Permanently allocated and in use
- Permanently allocated and unconnected (but ready)
- Unallocated and unconnected

During normal use, static delivery groups typically contain both permanently allocated and unallocated machines. Initially, all machines are unallocated, except for manually allocated ones when the delivery group was created. As users connect, machines become permanently allocated. You can fully power manage the unallocated machines in those delivery groups, but only partially manage the permanently allocated machines.

- **Pools and buffers:** For pooled delivery groups and static delivery groups with unallocated machines, a pool (in this instance) is a set of unallocated or temporarily allocated machines that are kept in a powered-on state, ready for users to connect. A user gets a machine immediately after logon. The pool size (the number of machines kept powered-on) is configurable by time of day. For static delivery groups, use the SDK to configure the pool.

  A buffer is an extra standby set of unallocated machines that are turned on when the number of machines in the pool falls below a threshold. The threshold is a percentage of the delivery group size. For large delivery groups, a significant number of machines might be turned on when the threshold is exceeded. So, plan delivery group sizes carefully or use the SDK to adjust the default buffer size.

- **Power state timers:** You can use power state timers to suspend machines after users have disconnected for a specified amount of time. For example, machines suspend automatically outside of office hours if users are disconnected for at least 10 minutes.

  You can configure timers for weekdays and weekends, and for peak and nonpeak intervals.

- **Partial power management of permanently allocated machines:** For permanently allocated machines, you can set power state timers, but not pools or buffers. The machines are turned on at the start of each peak period, and turned off at the start of each off-peak period. You do not

© 1997–2026 Citrix Systems, Inc. All rights reserved.

have the fine control that you have with unallocated machines over the number of machines that become available to compensate for machines that are consumed.

Power manage virtual single-session OS machines

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit Delivery Group** in the action bar.
3. On the **Power Management** page, select **Weekdays** in **Power manage machines**. By default, weekdays are Monday to Friday.
4. For random Delivery groups, in **Machines to be powered on**, click **Edit** and then specify the pool size during weekdays. Then, select the number of machines to power on.
5. In **Peak hours**, set the peak and off-peak hours for each day.
6. Set the power state timers for peak and non-peak hours during weekdays: In **During peak hours > When disconnected**, specify the delay (in minutes) before suspending any disconnected machine in the delivery group, and then select **Suspend**. In **During off-peak hours > When disconnected**, specify the delay before turning off any logged-off machine in the delivery group, and then select **Shutdown**. This timer is not available for delivery groups with random machines.
7. Select **Weekend** in **Power manage machines**, and then configure the peak hours and power state timers for weekends.
8. Click **Apply** to apply any changes you made and keep the window open. Or, click **Save** to apply changes and close the window.

Use the SDK to:

- Shut down, rather than suspend, machines in response to power state timers, or if you want the timers to be based on logoffs, rather than disconnections.
- Change the default weekday and weekend definitions.
- Disable power management. See CTX217289.

Power manage VDI machines transitioning to a different time period with disconnected sessions

> **Important:**
>
> This enhancement applies only to VDI machines with disconnected sessions. It does not apply to VDI machines with logged off sessions.

In earlier releases, a VDI machine transitioning to a time period where an action (disconnect action=" **Suspend**"or "**Shutdown"**) was required remained powered on. This scenario occurred if the machine disconnected during a time period (peak or off-peak times) where no action (disconnect action=" **Nothing**") was required.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Starting with Citrix Virtual Apps and Desktops 7 1909, the machine is suspended or powered off when the specified disconnection time elapses, depending on the disconnect action configured for the destination time period.

For example, you configure the following power policies for a VDI delivery group:

- Set `PeakDisconnectAction` to "Nothing"
- Set `OffPeakDisconnectAction` to "Shutdown"
- Set `OffPeakDisconnectTimeout` to "10"

For more information about the disconnect action in the power policy, see https://developer-docs.citrix.com/projects/delivery-controller-sdk/en/latest/Broker/about_Broker_PowerManagement/#power-policy and https://developer-docs.citrix.com/projects/delivery-controller-sdk/en/latest/Broker/Get-BrokerDesktopGroup/.

In earlier releases, a VDI machine with a session disconnected during peak times remained powered on when it transitioned from peak to off-peak. Starting with Citrix Virtual Apps and Desktops 7 1909, the `OffPeakDisconnectAction` and the `OffPeakDisconnectTimeout` policy actions are applied to the VDI machine on period transition. As a result, the machine is powered off 10 minutes after it transitions to off-peak.

If you want to revert to the previous behavior (that is, take no action on machines that transition from peak to off-peak or off-peak to peak with disconnected sessions), do one of the following:

- Set the `LegacyPeakTransitionDisconnectedBehaviour` registry value to `1`, the equivalent of *true* which enables the previous behavior. By default, the value is `0`, or *false*, which triggers disconnect power policy actions on period transition.
  - Path: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\DesktopServer`
  - Name: `LegacyPeakTransitionDisconnectedBehaviour`
  - Type: `REG_DWORD`
  - Data: `0x00000001 (1)`
- Configure the setting by using the `Set-BrokerServiceConfigurationData` PowerShell command. For example:
  - `PS C:\> Set-BrokerServiceConfigurationData HostingManagement.LegacyPeakTransitionDisconnectedBehaviour -SettingValue $true`

A machine must meet the following criteria before power policy actions can be applied to it on period transition:

- Have a disconnected session.
- Have no pending power actions.
- Belong to a VDI (single session) delivery group that transitions to a different time period.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Have a session that disconnects during a certain time period (peak or off-peak times) and transitions to a period where a power action is assigned.

Change the percentage of VDAs in a powered state for catalogs

1. Adjust the peak hours for the delivery group from the **Power management** section for the delivery group.
2. Make a note of the Desktop Group name.
3. With administrator privileges, start PowerShell and run the following commands. Replace "Desktop Group Name"with the name of your desktop group that has a changed percentage of the VDAs running.

   ```
   asnp Citrix*

   # Set-BrokerDesktopGroup "Desktop Group Name"-PeakBufferSizePercent
    100
   ```

   A value of 100 means that 100% of the VDAs are in the ready state.
4. Verify the solution by running:

   ```
   #Get-BrokerDesktopGroup "Desktop Group Name"
   ```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

It can take up to an hour for changes to take effect.

To shut down the VDAs after the user logs off, enter:

```
# Set-BrokerDesktopGroup "Desktop Group Name"-ShutDownDesktopsAfterUse
 $True
```

To restart VDAs during peak hours, so that they're ready for users after they log off, enter:

```
# Set-BrokerDesktopGroup "Desktop Group Name"-AutomaticPowerOnForAssignedDurin
 $True
```

Sessions

- Log off or disconnect a session, or send a message to users
- Configure session prelaunch and session linger
- Control session reconnection when disconnected from machine in maintenance mode
- Configure session roaming

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Log off or disconnect a session

1. Select **Delivery Groups** in the left pane.
2. Select a delivery group and then select **View Machines** in the action bar.
3. In the middle pane, select the machine, select **View Sessions** in the action bar, and then select a session.
    - Alternatively, in the middle pane, select the **Session** tab and then select a session.
4. To log off from a session, select **Log off** in the action bar. The session closes and the user is logged out. The machine becomes available to other users unless it is allocated to a specific user.
5. To disconnect a session, select **Disconnect** in the action bar. Applications continue to run in the session and the machine remains allocated to that user. The user can reconnect to the same machine.

You can configure power state timers for single-session OS machines to automatically handle unused sessions. For details, see Power managed machines.

Send a message to a delivery group

1. Select **Delivery Groups** in the left pane.
2. Select a delivery group and then select **View Machines** in the action bar.
3. In the middle pane, select a machine to which you want to send a message.
4. In the action bar, select **View Sessions**.
5. In the middle pane, select all sessions and then select **Send Message** in the action bar.
6. Type your message and click **OK**. You can specify the level of severity if needed. Options include **Critical**, **Question**, **Warning**, and **Information**.

Alternatively, you can send a message using Citrix Director. For more information, see Send messages to users.

Configure session prelaunch and session linger in a delivery group

These features are supported only on multi-session OS machines.

The session prelaunch and session linger features help specified users access applications quickly, by starting sessions before they are requested (session prelaunch) and keeping application sessions active after a user closes all applications (session linger).

By default, session prelaunch and session linger are not used. A session starts (launches) when a user starts an application, and remains active until the last open application in the session closes.

Considerations:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The delivery group must support applications, and the machines must be running a VDA for multi-session OS, minimum version 7.6.
- These features are supported only when using Citrix Workspace app for Windows, and also require extra Citrix Workspace app configuration. For instructions, search for session prelaunch in the product documentation for your Citrix Workspace app for Windows version.
- Citrix Workspace app for HTML5 is not supported.
- When using session prelaunch, if a user's machine is put into suspend or hibernate mode, prelaunch does not work (regardless of session prelaunch settings). Users can lock their machines/sessions. However, if a user logs off from Citrix Workspace app, the session is ended and prelaunch no longer applies.
- When using session prelaunch, physical client machines cannot use the suspend or hibernate power management functions. Client machine users can lock their sessions but must not log off.
- Prelaunched and lingering sessions consume a concurrent license, but only when connected. If using a user/device license, the license lasts 90 days. Unused prelaunched and lingering sessions disconnect after 15 minutes by default. This value can be configured in PowerShell (`New-BrokerSessionPreLaunch` cmdlet).
- Careful planning and monitoring of your users' activity patterns are essential to tailoring these features to complement each other. Optimal configuration balances the benefits of earlier application availability for users against the cost of keeping licenses in use and resources allocated.
- You can also configure session prelaunch for a scheduled time of day in Citrix Workspace app.

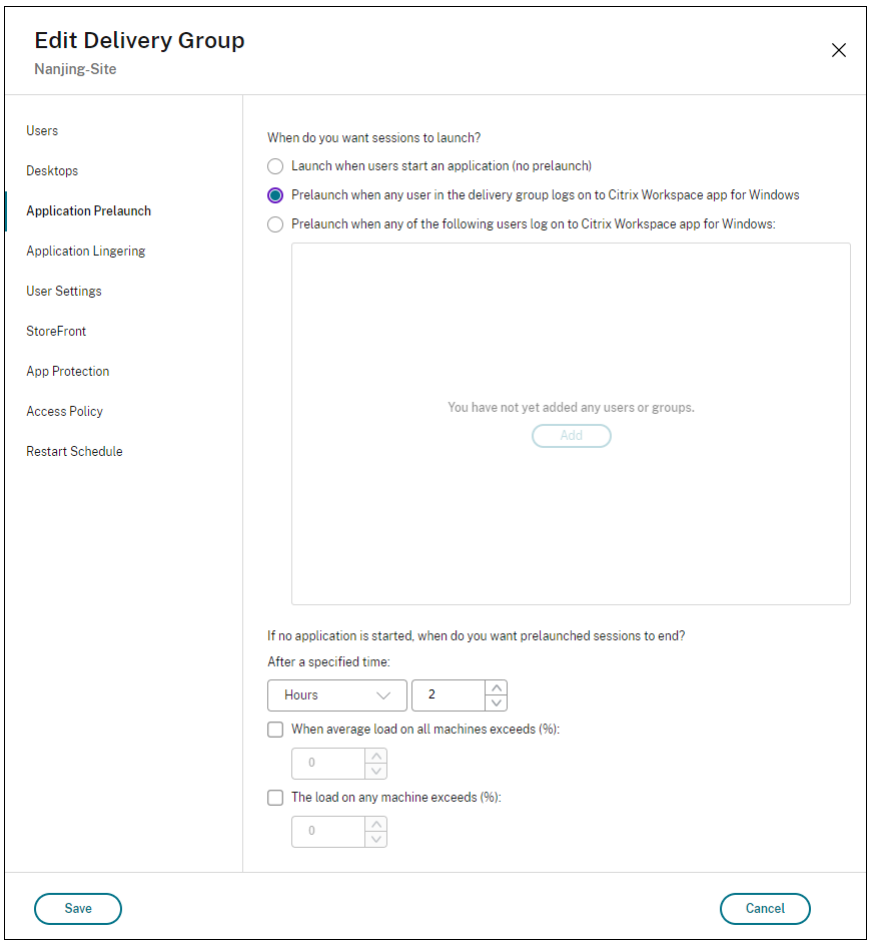
How long unused prelaunched and lingering sessions remain active There are several ways to specify how long an unused session remains active if the user does not start an application: a configured timeout and server load thresholds. You can configure all of them. The event that occurs first causes the unused session to end.

- **Timeout:** A configured timeout specifies the number of minutes, hours, or days an unused prelaunched or lingering session remains active. If you configure too short a timeout, prelaunched sessions end before they provide the user benefit of quicker application access. If you configure too long a timeout, incoming user connections might be denied because the server doesn't have enough resources.

  You can enable this timeout from the SDK only (`New-BrokerSessionPreLaunch` cmdlet), not from the management console. If you disable the timeout, it does not appear in the console display for that delivery group or in the **Edit Delivery Group** pages.

- **Thresholds:** Automatically ending prelaunched and lingering sessions based on server load ensures that sessions remain open as long as possible, assuming that server resources are available. Unused prelaunched and lingering sessions do not cause denied connections because they are ended automatically when resources are needed for new user sessions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



You can configure two thresholds: the average percentage load of all servers in the delivery group, and the maximum percentage load of a single server in the group. When a threshold is exceeded, the sessions that have been in the prelaunch or lingering state for the longest time are ended. Sessions are ended one-by-one at minute intervals until the load falls below the threshold. While the threshold is exceeded, no new prelaunch sessions are started.

Servers with VDAs that have not registered with a Controller and servers in maintenance mode are considered fully loaded. An unplanned outage causes prelaunch and lingering sessions to end automatically to free capacity.

To enable session prelaunch

1. Select a group and then click **Edit Delivery Group** in the action bar.
2. On the **Application Prelaunch** page, enable session prelaunch by choosing when sessions launch:
    - When a user starts an application. This is the default setting. Session prelaunch is disabled.
    - When any user in the delivery group logs on to Citrix Workspace app for Windows.
    - When anyone in a list of users and user groups logs on to Citrix Workspace app for Windows. Be sure to also specify users or user groups if you choose this option.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. A prelaunched session is replaced with a regular session when the user starts an application. If the user does not start an application (the prelaunched session is unused), the following settings affect how long that session remains active.

   - When a specified time interval elapses. You can change the time interval (1–99 days, 1–2376 hours, or 1–142,560 minutes)
   - When the average load on all machines in the delivery group exceeds a specified percentage (1–99%)
   - When the load on any machine in the delivery group exceeds a specified percentage (1–99%)

   Recap: A prelaunched session remains active until one of the following events occurs: a user starts an application, the specified time elapses, or a specified load threshold is exceeded.

To enable session linger

1. Select **Delivery Groups** in the left pane.
2. Select a group and then click **Edit Delivery Group** in the action bar.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. On the **Application Lingering** page, enable session linger by selecting **Keep sessions active until**.

4. Several settings affect how long a lingering session remains active if the user does not start another application.

   - When a specified time interval elapses. You can change the time interval: 1–99 days, 1–2376 hours, or 1–142,560 minutes.
   - When the average load on all machines in the delivery group exceeds a specified percentage: 1–99%.
   - When the load on any machine in the delivery group exceeds a specified percentage: 1–99%.

   Recap: A lingering session remains active until one of the following events occurs: a user starts an application, the specified time elapses, or a specified load threshold is exceeded.

Control session reconnection when disconnected from machine in maintenance mode

> **NOTE:**
>
> This feature is available only in PowerShell.

You can control whether sessions that are disconnected on machines in maintenance mode are allowed to reconnect to machines in the delivery group.

Before version 2106, reconnection was not allowed for single-session pooled desktop sessions that had disconnected from machines in maintenance mode. As of version 2106, you can configure a delivery group to allow or prohibit reconnections (regardless of session type) after disconnection from a machine in maintenance mode.

When creating or editing a delivery group (`New-BrokerDesktopGroup`, `Set-BrokerDesktopGroup`), use the `-AllowReconnectInMaintenanceMode` <**boolean**> parameter to allow or prohibit

© 1997–2026 Citrix Systems, Inc. All rights reserved.

reconnections for machines that were disconnected from a machine in maintenance mode.

- When set to true, sessions can reconnect to machines in the group.
- When set to false, sessions cannot reconnect to machines in the group.

Default values:

- Single-session: Disabled
- Multi-session: Enabled

Configure session roaming

By default, session roaming is enabled for delivery groups. Sessions roam between client devices with the user. When the user launches a session and then moves to another device, the same session is used and applications are simultaneously available on both devices. You can view the applications on multiple devices. The applications follow, regardless of the device or whether current sessions exist. Often, printers and other resources assigned to the application also follow. Alternatively, you can use PowerShell. For more information, see Session roaming.

Configure session roaming for applications To configure session roaming for applications, follow these steps:

1. In the console, select **Delivery Groups** in the left pane.
2. Select a group and then select **Edit Delivery Group** in the action bar.
3. On the **Users** page, enable session roaming by selecting the **Sessions roam with users as they move between devices** checkbox.
    - When enabled, if a user launches an application session and then moves to another device, the same session is used and available on both devices. When disabled, the session no longer roams between devices.
4. Select **OK** to apply changes and close the window.

Configure session roaming for desktops To configure session roaming for a desktop, follow these steps:

1. In the console, select **Delivery Groups** in the left pane.
2. Select a group and then select **Edit** in the action bar.
3. On the **Desktops** page, select the desktop and select **Edit**.
4. Enable session roaming by selecting the **Session roaming** checkbox.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When enabled, if the user launches the desktop and then moves to another device, the same session is used, and applications are available on both devices. When disabled, the session no longer roams between devices.

Select **OK** to apply changes and close the window.

Applications

View and add applications to a delivery group.

1. In the console, select **Delivery Groups** in the left pane.
2. Select a group. If this group contains applications, **View Applications** appears in the action bar.
3. Select **View Applications**. You are directed to the **Applications** node where all applications available in this group appear.
4. To add more applications to this group, go to the **Delivery Groups** node, select the group, and select **Add Applications** in the action bar.

Seamless log in from Citrix Secure Access™ Client on VDA

You can seamlessly log in to Citrix Workspace using Single Sign-On (SSO) from the Citrix Secure Access (CSA) client present on the VDA to Citrix Secure Private Access. This feature is applicable to both single and multi-session VDAs.

The steps to achieve this are as follows:

1. Edit an existing delivery group to enable SPA SSO. For example,

```
Set-BrokerDesktopGroup -Name <String> -SpaSsoEnabled 1
```

2. Check the status of SPA SSO of a delivery group using the Get -BrokerDesktopGroup PowerShell command. For example:

```
Get-BrokerDesktopGroup -Name <String> -property 'SpaSsoEnabled'
```

3. In SPA, create Application and Policy. See Configure TCP/UDP apps and Configure access policies for the applications.
4. RDP into the single-session or multi-session VDA and install the latest CSA agent.
5. Open Citrix Workspace and log into the single-session or multi-session VDA.

Troubleshoot

- VDAs that are not registered with a Delivery Controller are not considered when launching brokered sessions. This results in underutilization of otherwise available resources. There are

© 1997–2026 Citrix Systems, Inc. All rights reserved.

various reasons that a VDA might not be registered, many of which an administrator can troubleshoot. The details display provides troubleshooting information in the catalog creation wizard, and after you add a catalog to a delivery group.

After you create a delivery group, the details pane for a delivery group indicates the number of machines that can be registered but are not. For example, one or more machines are powered on and not in maintenance mode, but are not currently registered with a Controller. When viewing a "not registered, but should be"machine, review the **Troubleshoot** tab in the details pane for possible causes and recommended corrective actions.

For messages about functional level, see VDA versions and functional levels.

For information about VDA registration troubleshooting, seeCTX136668.

- In the display for a delivery group, the **Installed VDA version** in the details pane might differ from the actual version installed on the machines. The machine's Windows Programs and Features display shows the actual VDA version.
- For machines with **Power State Unknown** status, see CTX131267 for guidance.

Create application groups

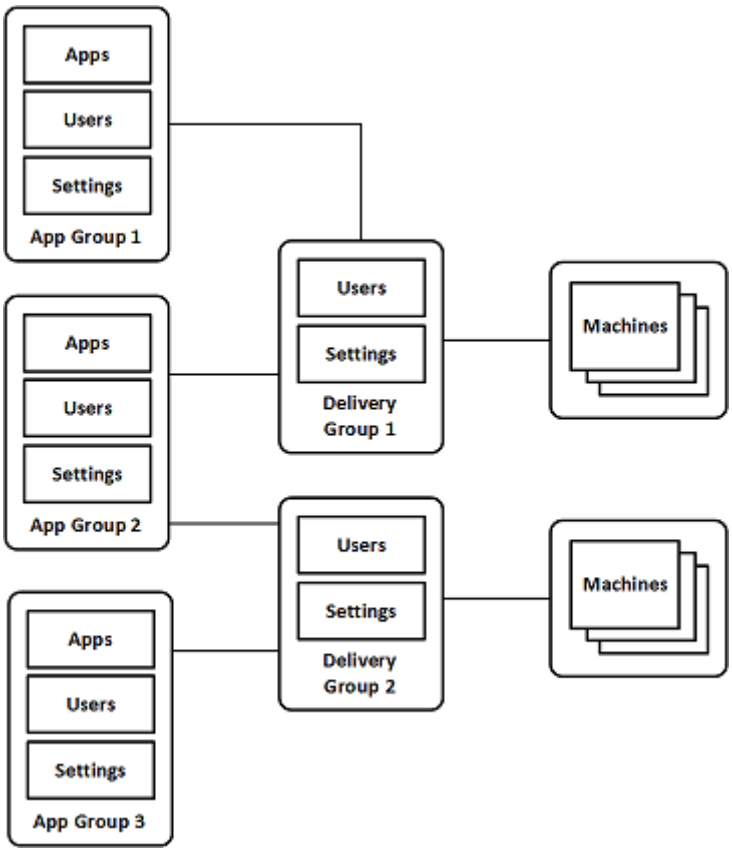
May 15, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Introduction

Application groups let you manage collections of applications. Create application groups for applications shared across different delivery groups. Or, applications used by a subset of users within delivery groups. Application groups are optional; they offer an alternative to adding the same applications to multiple delivery groups. Associate delivery groups with more than one application group, and associate an application group with more than one delivery group.

Using application groups can provide application management and resource control advantages over using more delivery groups:



© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The logical grouping of applications and their settings lets you manage those applications as a single unit. For example, you don't have to add (publish) the same application to individual delivery groups one at a time.
- Session sharing between application groups can conserve resource consumption. In other cases, disabling session sharing between application groups can be beneficial.
- You can use the tag restriction feature to publish applications from an application group, considering only a subset of the machines in selected delivery groups. With tag restrictions, you can use your existing machines for more than one publishing task, saving the costs associated with deploying and managing extra machines. A tag restriction can be thought of as subdividing (or partitioning) the machines in a delivery group. Using an application group or desktops with a tag restriction can be helpful when isolating and troubleshooting a subset of machines in a delivery group.

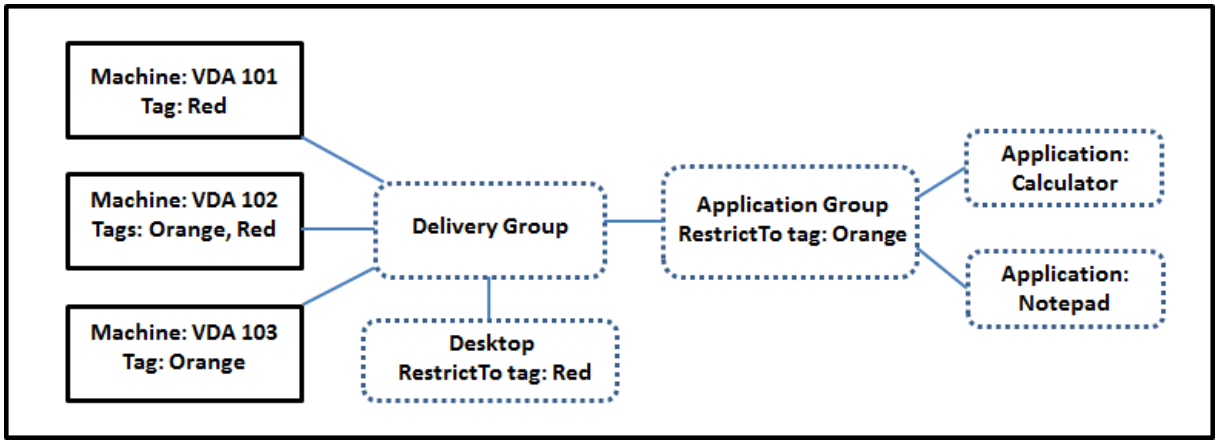
Example configurations

Example 1:

The following graphic shows a Citrix Virtual Apps and Desktops™ deployment that includes application groups:

In this configuration, applications are added to the application groups, not the delivery groups. The

© 1997–2026 Citrix Systems, Inc. All rights reserved.



delivery groups specify which machines are used. (Although not shown, the machines are in machine catalogs.)

Application group 1 is associated with delivery group 1. Access the applications in application group 1 by the users specified in application group 1. These groups only appear as long as they are also in the user list for delivery group 1. This configuration follows the guidance that the user list for an application group is a subset (a restriction) of the user lists for the associated delivery groups. The settings in application group 1 (such as application session sharing between application groups, associated delivery groups) apply to applications and users in that group. The settings in delivery group 1 apply to users in application groups 1 and 2, because those application groups have been associated with that delivery group.

Application group 2 is associated with two delivery groups: 1 and 2. Each of those delivery groups is assigned a priority in application group 2, indicating the order in which the delivery groups are checked when an application is launched. Delivery groups with equal priority are load balanced. Access the applications in application group 2 by the users specified in application group 2. However, they must also appear in the user lists for delivery group 1 and delivery group 2.

Example 2:

This simple layout uses tag restrictions to limit which machines are considered for certain desktop and application launches. The site has one shared delivery group, one published desktop, and one application group configured with two applications.

Tags have been added to each of the three machines (VDA 101–103).

The application group was created with the "Orange"tag restriction. Each of its applications is launched only on machines in that delivery group that have the tag "Orange,"VDA 102 and 103.

For more comprehensive examples and guidance for using tag restrictions in application groups (and for desktops), see Tags.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Guidance and considerations

Citrix recommends adding applications to either application groups or delivery groups, but not both. Otherwise, the additional complexity of having applications in two group types can make it more difficult to manage.

By default, an application group is enabled. After you create an application group, you can edit the group to change this setting. See Manage application groups.

By default, application session sharing between application groups is enabled. See Session sharing between application groups.

Citrix recommends upgrading your delivery groups to the current version. This process requires:

1. Upgrading VDAs on the machines used in the delivery group.
2. Upgrading the machine catalogs containing those machines.
3. Upgrading the delivery group.

For details, see Manage delivery groups.

To use application groups, your core components must be minimum version 7.9.

Creating application groups requires the delegated administration permission of the Delivery Group Administrator built-in role. See Delegated administration for details.

This article refers to "associating"an application with more than one application group. It differentiates that action from adding instances of that application from an available source. Similarly, delivery groups are associated with application groups, rather than being additions or components of one another.

Session sharing with application groups

When application session sharing is enabled, all applications launch in the same application session. This saves the costs associated with launching more application sessions, and allows the use of application features that involve the clipboard, such as copy-paste operations. However, in some situations you can clear session sharing.

When you use application groups you can configure application session sharing in the following three ways which extend the standard session sharing behavior available when you are using only delivery groups:

- Session sharing enabled between application groups.
- Session sharing enabled only between applications in the same application group.
- Session sharing disabled.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Session sharing between application groups

You can enable application session sharing between application groups, or you can disable it to limit application session sharing only to applications in the same application group.

- **An example when enabling session sharing between application groups is helpful:**

  Application group 1 contains Microsoft Office applications such as Word and Excel. Application group 2 contains other applications such as Notepad and Calculator, and both application groups are attached to the same delivery group. A user who has access to both application groups starts an application session by launching Word, and then launches Notepad. If the controller finds that the user's existing session running Word is suitable for running Notepad then Notepad is started within the existing session. If Notepad cannot be run from the existing session—for example if the tag restriction excludes the machine that the session is running on—then a new session on a suitable machine is created rather than using session sharing.

- **An example when disabling session sharing between application groups is helpful:**

  A configuration with a set of applications that do not interoperate well with other applications that are installed on the same machines. Such as two different versions of the same software suite or two different versions of the same web browser. You prefer not to allow a user to launch both versions in the same session.

  Create an application group for each version of the software suite, and add the applications for each version of the software suite to the corresponding application group. If session sharing between groups is disabled for each of those application groups, a user specified in those groups can run applications of the same version in the same session. The user can still run other applications at the same time, but not in the same session. When launching one of the different-versioned applications, or any application that is not contained in an application group, that application is launched in a new session.

This session sharing between application groups feature is not a security sandboxing feature. It is not foolproof, and it cannot prevent users from launching applications into their sessions through other means (for example, through Windows Explorer).

If a machine is at capacity, new sessions are not started on it. New applications are started in existing sessions on the machine as needed using session sharing.

You can only make prelaunched sessions available to application groups which have application session sharing allowed. (Sessions which use the session linger feature are available to all application groups.) These features must be enabled and configured in each of the delivery groups associated with the application group. You cannot configure them in the application groups.

By default, application session sharing between application groups is enabled when you create an application group. You cannot change this when you create the group. After you create an application group, you can edit the group to change this setting. See Manage application groups.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Disable session sharing within an application group

You can prevent application session sharing between applications which are in the same application group.

- **An example when disabling session sharing within application groups is helpful:**

  You want your users to access multiple simultaneous full screen sessions of an application on separate monitors.

  You create an application group and add the applications to it.

By default, application session sharing is enabled when you create an application group. You cannot change this setting when you create the group. After you create an application group, you can edit the group to change this setting. See Manage application groups.

Create an application group

To create an application group:

1. Sign in to Web Studio.
2. Select **Applications** in the left pane, and then select the **Application Groups** tab.
3. To organize application groups using folders, create folders under the **Application Groups** root folder. For more information, see Organize application groups using folders.
4. Select the folder where you want to create the group, and then click **Create Application Group**. The group creation wizard launches with an **Introduction** page. You can remove the page from future launches of this wizard.
5. Follow the wizard to configure settings on the pages described below. When you are done with each page, select **Next** until you reach the **Summary** page.

Step 1. Delivery Groups

The **Delivery Groups** page lists all delivery groups, with the number of machines each group contains.

- The **Compatible Delivery Groups** list contains delivery groups that you can select. Compatible delivery groups contain random (not permanently or statically assigned) multi-session or single-session OS machines.
- The **Incompatible Delivery Groups** list contains delivery groups that you cannot select. Each entry explains why it is not compatible, such as containing statically assigned machines.

An application group can be associated with delivery groups containing shared (not private) machines that can deliver applications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

You can also select delivery groups containing shared machines that deliver only desktops, if both of the following conditions are met:

- The delivery group contains shared machines and was created with a XenDesktop version earlier than 7.9.
- You have Edit Delivery Group permission.

The delivery group type is automatically converted to "desktops and applications"when the application group creation wizard is committed.

Although you can create an application group that has no associated delivery groups (perhaps to organize applications or to serve as storage for applications not currently used) the application group cannot be used to deliver applications until it specifies at least one delivery group. Also, you cannot add applications to the application group from the **From Start** menu source if there are no delivery groups specified.

The delivery groups that you select specify the machines that are used to deliver applications. Select the check boxes next to the delivery groups that you want to associate with the application group.

To add a tag restriction, select **Restrict launches to machines with the tag** and then select the tag from the drop-down list.

Step 2. Users

Specify application users in the application group. Either allow all users and user groups in the delivery groups that you selected on the previous page, or select specific users and user groups from those delivery groups. If you restrict use to specified users, then only the users specified in the delivery group, the application group can access the applications in this group. Essentially, the user list in the application group provides a filter on the user lists in the delivery groups.

Enabling or disabling application use by unauthenticated users is available only in delivery groups, not in application groups.

For information about where user lists are specified in a deployment, see Where user lists are specified.

Step 3. Applications

Good to know:

- By default, new applications you add are placed in a folder named **Applications**. You can specify a different folder. If you try to add an application and one with the same name exists in that folder, you are prompted to rename the application you are adding. If you agree with the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

suggested unique name, the application is added with that new name. Otherwise, you must rename it yourself before it can be added. For details, see Manage application folders.

- You can change an application's properties (settings) when you add it, or later. See Change application properties. If you publish two applications with the same name to the same users, change the **Application name (for user)** property in Web Studio. Otherwise, users see duplicate names in Citrix Workspace app.
- When you add an application to more than one application group, a visibility issue can occur if you do not have sufficient permission to view the application in all of those groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the groups to which the application was added.

Click the **Add** from the drop-down menu to display the application sources.

- **From Start menu:** Applications that are discovered on a machine in the selected delivery groups. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add, and then click **OK**.

  This source cannot be selected if you selected any of the following:

  - Application groups that have no associated delivery groups.
  - Application groups with associated delivery groups that contain no machines.
  - A delivery group containing no machines.

- **Manually defined:** Applications located in the site or elsewhere in your network. When you select this source, a new page launches where you type the path to the executable, working directory, optional command line arguments, and display names for administrators and users. After entering this information, click **OK**.

- **Existing**: Applications previously added to the site. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add and then click **OK**. This source cannot be selected If the site has no applications.

- **App-V**: Applications in App-V packages. When you select this source, a new page launches where you select **App-V server** or **Application Library**. From the resulting display, select the check boxes of applications to add, and then click **OK**. For more information, see Deploy and deliver App-V applications. This source cannot be selected (or might not appear) if App-V is not configured for the site.

As noted, certain entries in the **Add** drop-down menu are not selectable if there is no valid source of that type. Sources that are incompatible are not listed at all (for example, you cannot add application groups to application groups, so that source is not listed when you create an application group).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 4. Scopes

This page appears only if you have previously created a custom scope. By default, the **All** scope is selected. For more information, see Delegated administration.

Step 5. Summary

Enter a name for the application group. You can also (optionally) enter a description.

Review the summary information and then click **Finish**.

Manage application groups

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Introduction

This article describes how to manage the application groups you created.

See Applications for information about managing applications in application groups or delivery groups, including how to:

- Add or remove applications in an application group.
- Change application group associations.

Managing application groups requires the delegated administration permissions of the Delivery Group Administrator built-in role. See Delegated administration for details.

Enable or disable an application group

When an application group is enabled, it can deliver the applications that have been added to it. Disabling an application group disables each application in that group. However, if those applications are also associated with other enabled application groups, they can be delivered from those other

© 1997–2026 Citrix Systems, Inc. All rights reserved.

groups. If the application was explicitly added to delivery groups associated with the application group, disabling the application group does not affect the applications in those delivery groups.

An application group is enabled when you create it. You cannot change this configuration when you create the group.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Edit Application Group** in the action bar.
3. On the **Settings** page, select or clear the **Enable Application Group** check box.
4. Click **Apply** to keep the window open, or click **Save** to apply changes and close the window.

Enable or disable application session sharing between application groups

Session sharing between application groups is enabled when you create an application group. You cannot change this configuration when you create the group. For more information, see Session sharing with application groups.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Edit Application Group** in the action bar.
3. On the **Settings** page, select or clear the **Enable application session sharing between Application Groups** check box.
4. Click **Apply** to keep the window open, or click **Save** to apply changes and close the window.

Disable application session sharing within an application group

Session sharing between applications in the same application group is enabled by default when you create an application group. If you disable application session sharing between application groups, session sharing between applications in the same application group remains enabled.

You can use the PowerShell SDK to configure application groups with application session sharing disabled between the applications they contain. In some circumstances this option is desirable. For example, you might want users to start non-seamless applications in full-size application windows on separate monitors.

When you disable application session sharing within an application group, each application in that group launches in a new application session. If a suitable disconnected session is available which is running the same application, it is reconnected. For example, when launching Notepad with a disconnected session with Notepad running, that session is reconnected instead of creating a one. When multiple suitable disconnected sessions are available, one of the sessions is chosen to reconnect to, in a random but deterministic manner. When the situation reoccurs in the same circumstances, the same session is chosen, but the session is not necessarily predictable otherwise.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use the PowerShell SDK either to disable application session sharing for all applications in an existing application group, or to create a group with application session sharing disabled.

PowerShell cmdlet examples

To disable session sharing, use the Broker PowerShell cmdlets `New-BrokerApplicationGroup` or `Set-BrokerApplicationGroup` with the parameter `SessionSharingEnabled` set to `False` and the parameter `SingleAppPerSession` set to `True`.

- For example, to create an application group with application session sharing disabled for all applications in the group:

  ```
  New-BrokerApplicationGroup AppGr1 -SessionSharingEnabled $False -SingleAppPerSession $True
  ```

- For example, to disable application session sharing between all applications in an existing application group:

  ```
  Set-BrokerApplicationGroup AppGR1 -SessionSharingEnabled $False -SingleAppPerSession $True
  ```

Considerations

- To enable the `SingleAppPerSession` property you must set the `SessionSharingEnabled` property to False. The two properties must not be enabled at the same time. The `SessionSharingEnabled` parameter refers to sharing sessions between application groups.
- Application session sharing works only for applications that are associated with application groups but are not associated with delivery groups. All applications associated directly with a delivery group share session by default.
- If an application is assigned to multiple application groups, make sure that the groups do not have conflicting settings. For example, one group with the option set to `True`, and another group's option set to `False` results in unpredictable behavior.

Rename an application group

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Rename Application Group** in the action bar.
3. Specify the new unique name and then click **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add, remove, or change the priority of delivery group associations with an application group

An application group can be associated with delivery groups containing shared (not private) machines that can deliver applications.

You can also select delivery groups containing shared machines that deliver only desktops, if both of the following conditions are met:

- The delivery group contains shared machines and was created with a version earlier than 7.9.
- You have Edit Delivery Group permission.

The delivery group type is automatically converted to "desktops and applications" when the **Edit Application Group** dialog is committed.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Edit Application Group** in the action bar.
3. Select the **Delivery Groups** page.
4. To add delivery groups, click **Add**. Select the check boxes of available delivery groups. (Incompatible delivery groups cannot be selected.) When you finish your selections, click **OK**.
5. To remove delivery groups, select the check boxes of the groups you want to remove and then click **Remove**. Confirm the deletion when prompted.
6. To change the priority of delivery groups, select the check box of the delivery group and then click **Edit Priority**. Enter the priority (0 = highest) and then click **OK**.
7. Click **Apply** to apply any changes you made and keep the window open, or click **Save** to apply changes and close the window.

Add, change, or remove a tag restriction in an application group

Adding, changing, and removing tag restrictions can have unanticipated effects on which machines are considered for application launch. Review the considerations and cautions in Tags.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Edit Application Group** in the action bar.
3. Select the **Delivery Groups** page.
4. To add a tag restriction, select **Restrict launches to machines with the tag** and then select the tag from the drop-down list.
5. To change or remove a tag restriction, select a different tag or remove the tag restriction entirely by clearing **Restrict launches to machines with this tag**.
6. Click **Apply** to apply any changes you made and keep the window open, or click **Save** to apply changes and close the window.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Add or remove users in an application group

For detailed information about users, see Create application groups.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Edit Application Group** in the action bar.
3. Select the **Users** page. Indicate whether you want to allow all users in the associated delivery groups to use applications in the application group, or only specific users and groups. To add users, click **Add**, and then specify the users you want to add. To remove users, select one or more users and then click **Remove**.
4. Click **Apply** to apply any changes you made and keep the window open, or click **Save** to apply changes and close the window.

Add, change, or remove an application icon in an application group

Perform the following steps to add, change, or remove an application icon.

1. Select **Applications** in the left pane.
2. On the **Applications** tab, select an application and then select **Properties**.

   To make changes at an application group level, navigate to the **Application Groups** tab, select an application in a group, and then select **Properties**.
3. Select the **Delivery** page and then select **Change**. The **Select Icon** window appears.
4. In the **Select Icon** window, do either of the following:

   - To add an icon, select **Add** and then browse to the icon.
   - To remove an icon, select it and then select **Remove**.
   - To change an icon, select it for the application.

   > **Important:**
   >
   > - You cannot add an icon whose size is greater than 200 KB.
   > - You can add only .icon files.
   > - You cannot remove built-in icons.
   > - You cannot remove an icon of an application that is in use.
5. Select **Save** to apply changes and close the window.

Change scopes in an application group

You can change a scope only if you have created a scope (you cannot edit the All scope). For more information, see Delegated administration.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Edit Application Group** in the action bar.
3. Select the **Scopes** page. Select or clear the check box next to a scope.
4. Click **Apply** to apply any changes you made and keep the window open, or click **Save** to apply changes and close the window.

Change scopes in an application group

You can change a scope only if you have created a scope (you cannot edit the All scope). For more information, see Delegated administration.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group, and then select **Edit Application Group** in the action bar.
3. Select the **Scopes** page. Select or clear the check box next to the scopes you want to change.
4. Select **Apply** to apply any changes you made and keep the window open, or select **Save** to apply changes and close the window.

Delete an application group

An application must be associated with at least one delivery group or application group. If deleting an application group results in one or more applications no longer belonging to a group, you are warned that deleting that group also removes those applications. You can then confirm or cancel the deletion.

Deleting an application does not delete it from its original source. However, if you want to make it available again, you must add it again.

1. Select **Applications** in the left pane, and then select the **Application Groups** tab.
2. Select an application group and then select **Delete Group** in the action bar.
3. Confirm the deletion when prompted.

Organize application groups using folders

You can create folders to organize application groups for easy access.

Required roles

By default, you can create and manage folders for application groups if you have one of the following built-in roles:

- Cloud Administrator

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Full Administrator
- Application Group Administrator

You can delegate management actions to other users by creating custom roles. The following table lists the permissions required for each action.

Action	Required permissions
Create application group folders	Create Application Group Folder
Delete application group folders	Remove Application Group Folder
Move application groups folders	Move Application Group Folder
Rename application group folders	Edit Application Group Folder
Move application groups to folders	Edit Application Group Folder, Edit Application Group Properties

For more information, see Create and manage roles.

Create and manage folders

You can use the Actions bar or the right-click menu to create and manage application group folders. In addition, you can drag an application group or a folder to a desired location in the folder tree.

Good to know:

- You can nest folders up to five levels (excluding the default root folder).
- A folder can contain application groups and subfolders. You can delete a folder only if it and its subfolders don't contain application groups.
- All nodes in Web Studio (such as **Machine Catalogs**, **Delivery Groups**, **Applications**, and **Application Groups**) share the same folder tree in the back end. To avoid name conflicts when renaming or moving folders, use unique names for first-level folders across different nodes.

  If you create a folder using the `New-BrokerAdminFolder` SDK cmdlet and want it to appear under the **Application Groups** node, you must add the `ContainsApplicationGroups` metadata using the `Set-BrokerAdminFolderMetadata` cmdlet.

  Example:

```
Set-BrokerAdminFolderMetadata -AdminFolderId {
adminFolderUid }
 -Name ContainsApplicationGroups -Value true
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remote PC Access

May 15, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

Remote PC Access is a feature of Citrix Virtual Apps and Desktops™ that enables organizations to easily allow their employees to access corporate resources remotely in a secure manner. The Citrix platform makes this secure access possible by giving users access to their physical office PCs. If users can access their office PCs, they can access all the applications, data, and resources they need to do their work. Remote PC Access eliminates the need to introduce and provide other tools to accommodate teleworking. For example, virtual desktops or applications and their associated infrastructure.

Remote PC Access uses the same Citrix Virtual Apps and Desktops components that deliver virtual desktops and applications. As a result, the requirements and process of deploying and configuring Remote PC Access are the same as those required for deploying Citrix Virtual Apps and Desktops for the delivery of virtual resources. This uniformity provides a consistent and unified administrative experience. Users receive the best user experience by using Citrix HDX™ to deliver their office PC session.

The feature consists of a machine catalog of type **Remote PC Access** that provides this functionality:

- Ability to add machines by specifying OUs. This ability facilitates the addition of PCs in bulk.
- Automatic user assignment based on the user that logs into the office Windows PC. We support single user and multiple users assignments. By default, we automatically assign multiple users to the next unassigned machine. To restrict automatic assignment to a single user, sign in to Web Studio, go to **Settings** and turn off the **Enable automatic assignment of multiple users for Remote PC Access** setting.

Citrix Virtual Apps and Desktops can accommodate more use cases for physical PCs by using other types of machine catalogs. These use cases include:

- Physical Linux PCs
- Pooled physical PCs (that is, randomly assigned, not dedicated)

> **Notes:**
>
> For details on the supported OS versions, see the system requirements for the VDA for single-session OS and Linux VDA.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> For on-premises deployments, Remote PC Access is valid only for Citrix Virtual Apps and Desktops Advanced or Premium licenses. Sessions consume licenses in the same way as other Citrix Virtual Desktops™ sessions. For Citrix Cloud, Remote PC Access is valid for Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) and Workspace Premium Plus.

Considerations

While all the technical requirements and considerations that apply to Citrix Virtual Apps and Desktops in general also apply to Remote PC Access, some might be more relevant or exclusive to the physical PC use case.

> **Important:**
>
> Windows 11 physical systems (and some running Windows 10) include virtualization-based security features that result in the VDA software's incorrectly detecting them as virtual machines. To mitigate this issue, you have the following options:
>
> - Use the "/physicalmachine"option along with the "/remotepc"option as part of the VDA command-line installation
> - Add the following registry value after the VDA is installed if the previously mentioned option was not used
>   `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA`
>   - Name: ForceEnableRemotePC
>   - Type: DWORD
>   - Data: 1

Deployment considerations

While planning the deployment of Remote PC Access, make a few general decisions.

- You can add Remote PC Access to an existing Citrix Virtual Apps and Desktops deployment. Before choosing this option, consider the following:
  - Are the current Delivery Controllers or Cloud Connectors appropriately sized to support the additional load associated with the Remote PC Access VDAs?
  - Are the on-premises site databases and database servers appropriately sized to support the additional load associated with the Remote PC Access VDAs?
  - Will the existing VDAs and the new Remote PC Access VDAs exceed the number of maximum supported VDAs per site?
- You must deploy the VDA to office PCs through an automated process. The following are the available options:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

  - Electronic Software Distribution (ESD) tools such as SCCM: Install VDAs using SCCM.
  - Deployment scripts: Install VDAs using scripts.
- Review the Remote PC Access security considerations.

> **Note:**
>
> When designing Remote PC Access, you must consider the number of physical monitors connected to the GPU on the remote PC and currently configured/operating. Even if the monitor is not used in the Citrix session, but is detected by the GPU, the monitor's presence is counted towards the maximum supported monitor limit by the GPU.

Machine catalog considerations

The type of machine catalog required depends on the use case:

- Remote PC Access machine catalog
  - Windows dedicated PCs
  - Windows dedicated multi-user PCs. This use case applies to physical office PCs that multiple users can access remotely in different shifts.
  - Pooled Windows PCs. This use case applies to physical PCs that multiple random users can access, such as computer labs.
- Single-session OS machine catalog
  - Static - Dedicated Linux PCs
  - Random - Pooled Linux PCs

Once you identify the type of machine catalog, consider the following:

- A machine can be assigned to only one machine catalog at a time.
- To facilitate delegated administration, consider creating machine catalogs based on geographic location, department, or any other grouping that eases delegating administration of each catalog to the appropriate administrators.
- When choosing the OUs in which the machine accounts reside, select lower-level OUs for greater granularity. If such granularity is not required, you can choose higher-level OUs. For example, in the case of Bank/Officers/Tellers, select **Tellers** for greater granularity. Otherwise, you can select **Officers** or **Bank** based on the requirement.
- Moving or deleting OUs after being assigned to a Remote PC Access machine catalog affects VDA associations and causes issues with future assignments. Therefore, make sure to plan accordingly so that OU assignment updates for machine catalogs are accounted for in the Active Directory change plan.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If it is not easy to choose OUs to add machines to the machine catalog because of the OU structure, you don't have to select any OUs. You can use PowerShell to add machines to the catalog afterward. User auto-assignments continue to work if the desktop assignment is configured correctly in the Delivery Group. A sample script to add machines to the machine catalog along with user assignments is available in GitHub.
- Integrated Wake on LAN is available only with the **Remote PC Access** type machine catalog.

Linux VDA considerations

These considerations are specific to the Linux VDA:

- Use the Linux VDA on physical machines only in non-3D mode. Due to limitations on NVIDIA's driver, the local screen of the PC cannot be blacked out and displays the activities of the session when HDX 3D mode is enabled. Showing this screen is a security risk.
- Use machine catalogs of type single-session OS for physical Linux machines.
- Automatic user assignment is not available for Linux machines.
- If users are already logged on to their PCs locally, attempts to launch the PCs from StoreFront™ fail.
- Power saving options are not available for Linux machines.

Technical requirements and considerations

This section contains the technical requirements and considerations for physical PCs.

- The following are not supported:
  - KVM switches or other components that can disconnect a session.
  - Hybrid PCs, including All-in-One and NVIDIA Optimus laptops and PCs.
  - Dual boot machines.
- Connect the keyboard and mouse directly to the PC. Connecting to the monitor or other components that can be turned off or disconnected, can make these peripherals unavailable. If you must connect the input devices to components such as monitors, do not turn those components off.
- The PCs must be joined to an Active Directory Domain Services domain.
- Secure Boot is supported on Windows 10 and Windows 11 only.
- The PC must have an active network connection. A wired connection is preferred for greater reliability and bandwidth.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If using Wi-Fi, do the following:

  1. Set the power settings to leave the wireless adapter turned on.
  2. Configure the wireless adapter and network profile to allow automatic connection to the wireless network before the user logs on. Otherwise, the VDA does not register until the user logs on. The PC isn't available for remote access until a user has logged on.
  3. Ensure that the Delivery Controllers or Cloud Connectors can be reached from the Wi-Fi network.

- You can use Remote PC Access on laptop computers. Ensure that the laptop is connected to a power source instead of running on the battery. Configure the laptop power options to match the options of a desktop PC. For example:

  1. Disable the hibernate feature.
  2. Disable the sleep feature.
  3. Set the close lid action to **Do Nothing**.
  4. Set the "press the power button"action to **Shut Down**.
  5. Disable video card and NIC energy-saving features.

- Remote PC Access is supported on Surface Pro devices with Windows 10. Follow the same guidelines for laptops mentioned previously.

- If using a docking station, you can undock and redock laptops. When you undock the laptop, the VDA reregisters with the Delivery Controllers or Cloud Connectors over Wi-Fi. However, when you redock the laptop, the VDA doesn't switch to use the wired connection unless you disconnect the wireless adapter. Some devices provide built-in functionality to disconnect the wireless adapter upon establishing a wired connection. The other devices require custom solutions or third-party utilities to disconnect the wireless adapter. Review the Wi-Fi considerations mentioned previously.

  Do the following to enable docking and undocking for Remote PC Access devices:

  1. In the **Start** menu, select **Settings > System > Power & Sleep**, and set **Sleep** to **Never**.
  2. Under the **Device Manager > Network adapters > Ethernet adapter** go to **Power Management** and clear **Allow the computer to turn off this device to save power**. Ensure that **Allow this device to wake the computer** is checked.

- Multiple users with access to the same office PC see the same icon in Citrix Workspace. When a user logs on to Citrix Workspace, that resource appears as unavailable if already in use by another user.

- Install the Citrix Workspace app on each client device (for example, a home PC) that accesses the office PC.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configuration sequence

This section contains an overview of how to configure Remote PC Access when using the **Remote PC Access** type machine catalog. For information on how to create other types of machine catalogs, see the Create machine catalogs.

1. On-premises site only - To use the integrated Wake on LAN feature, configure the prerequisites outlined in Wake on LAN.
2. If a new Citrix Virtual Apps and Desktops site was created for Remote PC Access:

    a) Select the **Remote PC Access** Site type.
    b) On the **Power Management** page, choose to enable or disable power management for the default Remote PC Access machine catalog. You can change this setting later by editing the machine catalog properties. For details on configuring Wake on LAN, see Wake on LAN.
    c) Complete the information on the **Users** and **Machine Accounts** pages.

    Completing these steps creates a machine catalog named **Remote PC Access Machines** and a Delivery Group named **Remote PC Access Desktops**.
3. If adding to an existing Citrix Virtual Apps and Desktops site:

    a) Create a machine catalog of type **Remote PC Access** (Operating System page of the wizard). For details on how to create a machine catalog, see Create machine catalogs. Make sure to assign the correct OU so that the target PCs are made available for use with Remote PC Access.
    b) Create a Delivery Group to provide users access to the PCs in the machine catalog. For details on how to create a Delivery Group, see Create Delivery Groups. Make sure to assign the Delivery Group to an Active Directory group that contains the users that require access to their PCs.
4. Deploy the VDA to the office PCs.

    - We recommend using the single-session OS core VDA installer (VDAWorkstationCoreSetup.exe).
    - You can also use the single-session full VDA installer (VDAWorkstationSetup.exe) with the `/remotepc/physicalmachine` option, which achieves the same outcome as using the core VDA installer.

        > **Note:**
        >
        > For RemotePC installation, use `/physicalmachine` argument with `/remotepc` for VDA to behave as expected in certain user scenarios.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Consider enabling Windows Remote Assistance to allow help desk teams to provide remote support through Citrix Director. To do so, use the /`enable_remote_assistance` option. For details, see Install using the command line.
- To be able to see logon duration information in Director, you must use the single-session full VDA installer and include the **Citrix User Profile Management WMI Plugin** component. Include this component by using the /`includeadditional` option. For details, see Install using the command line.
- For information about deploying the VDA using SCCM, see Install VDAs using SCCM.
- For information about deploying the VDA through deployment scripts, see Install VDAs using scripts.

After you successfully complete steps 2–4, users are automatically assigned to their own machines when they log in locally on the PCs.

5. Instruct users to download and install Citrix Workspace app on each client device that they use to access the office PC remotely. Citrix Workspace app is available from `https://www.citrix.com/downloads/` or the application stores for supported mobile devices.

Features managed through the registry

> **Caution:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Disable multiple user auto-assignments

On each Delivery Controller™, add the following registry setting:

`HKEY_LOCAL_MACHINE\Software\Citrix\DesktopServer`

- Name: AllowMultipleRemotePCAssignments
- Type: DWORD
- Data: 0

Sleep mode (minimum version 7.16)

To allow a Remote PC Access machine to go into a sleep state, add this registry setting on the VDA, and then restart the machine. After the restart, the operating system power saving settings are respected.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The machine goes into sleep mode after the preconfigured idle timer passes. After the machine wakes up, it reregisters with the Delivery Controller.

`HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA`

- Name: DisableRemotePCSleepPreventer
- Type: DWORD
- Data: 1

Session management

By default, a remote user's session is automatically disconnected when a local user initiates a session on that machine (by pressing CTRL+ATL+DEL). To prevent this automatic action, add the following registry entry on the office PC, and then restart the machine.

`HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA\RemotePC`

- Name: SasNotification
- Type: DWORD
- Data: 1

By default, the remote user has preference over the local user when the connection message is not acknowledged within the timeout period. To configure the behavior, use this setting:

`HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA\RemotePC`

- Name: RpcaMode
- Type: DWORD
- Data:
  - 1 - The remote user always has preference if he or she does not respond to the messaging UI in the specified timeout period. This behavior is the default if this setting is not configured.
  - 2 - The local user has preference.

The timeout for enforcing the Remote PC Access mode is 30 seconds by default. You can configure this timeout but do not set it lower than 30 seconds. To configure the timeout, use this registry setting:

`HKLM\SOFTWARE\Citrix\PortICA\RemotePC`

- Name: RpcaTimeout
- Type: DWORD
- Data: number of seconds for timeout in decimal values

When a user wants to forcibly get the console access: The local user can press Ctrl+Alt+Del twice in a gap of 10 seconds to get local control over a remote session and force a disconnect event.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After the registry change and machine restart, if a local user presses Ctrl+Alt+Del to log on to that PC while it is in use by a remote user, the remote user receives a prompt. The prompt asks whether to allow or deny the local user's connection. Allowing the connection disconnects the remote user's session.

Session management logging

Remote PC Access now has logging capabilities that log when someone tries to access a PC with an active ICA® session. This allows you to monitor your environment for unwanted or unexpected activity and be able to audit such events if you need to investigate any incidents.

Events are logged using Windows Event Viewer and are in **Applications and Services > Citrix > Host-Core > ICA Service > Admin**.

There are three distinct events that are logged when using Remote PC Access.

Ctrl+Alt+Del event

This event appears when the local user presses Ctrl+Alt+Del on the console keyboard with an active remote session.

Event details

- Log name: Application and Services
- Event ID: 43, 44, 45
- Source: ICA Service

Event ID 43 This event ID appears when the SasNotification registry value does not exist or when the SasNotification registry value is 0.

- Message:

```
Ctrl+Alt+Del has been pressed on the endpoint.
The session management behavior is set to automatically
   disconnect the remote session.
```

Event ID 44 This event ID appears when the SasNotification registry value is 1 and the RpcaMode registry value is 1 or the RpcaMode registry value does not exist.

- Message:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Ctrl+Alt+Del has been pressed on the endpoint.
The session management behavior is set to notify the
    remote user. The user preference is set to remote user
    .
```

Event ID 45 This event ID appears when the SasNotification registry value is 1 and the RpcaMode registry value is 2.

- Message:

```
Ctrl+Alt+Del has been pressed on the endpoint.
The session management behavior is set to notify the
    remote user.
The user preference is set to local user.
```

Remote session disconnect event

This event appears when the remote session has been disconnected for various reasons.

Event details

- Log name: Application and Services
- Event ID: 46, 47, 48
- Source: ICA Service

Event ID 46 This event ID appears when the remote session has been disconnected and when the SasNotification registry value does not exist or the SasNotification registry value is 0.

- Message:

```
The remote session for <remoteUserName> has been
    disconnected.
```

Event ID 47 This event ID appears when the remote user agrees to disconnect the session and when the SasNotification registry value is 1 and the RpcaMode registry value is 1 or the RpcaMode registry value is 2 or the RpcaMode registry value does not exist.

- Message:

```
The remote session for <remoteUserName> has been
    disconnected because the user accepted the request to
    disconnect the session.
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Event ID 48 This event ID appears when the remote user does not decline the disconnect request within the specific timeout period and when the SasNotification registry value is 1 and the RpcaMode registry value is 2.

- Message:

```
The remote session for <remoteUserName> has been
    disconnected because the user did not decline the
    disconnection request within the configured timeout
    period (<timeout period>).
```

Ctrl+Alt+Del pressed twice event This event appears when Ctrl+Alt+Del is pressed twice within 10 seconds.

Event details

- Log name: Application and Services
- Event ID: 49
- Source: ICA Service

Event ID 49 This event ID appears when Ctrl+Alt+Del is pressed twice within 10 seconds.

- Message:

```
The remote session for <remoteUserName> has been forcibly
    disconnected.
```

Wake on LAN

Remote PC Access supports Wake on LAN, which gives users the ability to turn on physical PCs remotely. This feature enables users to keep their office PCs turned off when not in use to save energy costs. It also enables remote access when a machine has been turned off inadvertently.

With the Wake on LAN feature, the magic packets are sent directly from the VDA running on the PC to the subnet in which the PC resides when instructed by the delivery controller. This allows the feature to work without dependencies on extra infrastructure components or third-party solutions for delivery of magic packets.

Limitation

Remote PC Access with the Wake on LAN feature does not support automatic power-on during peak times.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

System requirements

The following are the system requirements for using the Wake on LAN feature:

- Control plane:
  - Citrix DaaS™
  - Citrix Virtual Apps and Desktops 2009 or later
- Physical PCs:
  - VDA version 2009 or later
  - Windows 10 or Windows 11. For supportability details, see the VDA system requirements.
  - Wake on LAN enabled in BIOS/UEFI
  - Wake on LAN enabled in network adapter's properties within Windows configuration

Configure Wake on LAN

Configure Wake on LAN using Studio To create the Wake on LAN connection:

1. In the left pane, select the **Hosting** node.
2. Select **Add Connection and Resources**.
3. On the **Connection** page of the wizard, provide the following:
   a) Connection type: Remote PC Wake on LAN
   b) Zone name: select the zone where the Remote PC Access catalog resides
   c) Connection name: enter a name for the Wake on LAN connection
4. Finalize the remaining steps in the Add Connection and Resources wizard.

To add the Wake on LAN connection to a Remote PC Access machine catalog:

1. If you are creating a new Remote PC Access machine catalog, you can add the connection on the **Machine Type** page of the Machine Catalog Setup wizard using the drop-down list.
2. If you want to add the Wake on LAN connection to an existing machine catalog:
   a) Navigate to the **Machine Catalogs** node on the left.
   b) Select the appropriate Remote PC Access machine catalog.
   c) Right-click on the machine catalog or select the **More** menu above.
   d) Select **Edit Machine Catalog**.
   e) In the **Power Management** page, select **Yes**.
   f) Select the appropriate connection from the drop-down list.
   g) Select **Save**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The configuration of Wake on LAN through Studio is only available with Citrix DaaS at this time.

Configure Wake on LAN using PowerShell To configure Wake on LAN using PowerShell:

1. Create the Remote PC Access machine catalog if you do not have one already.
2. Create the Wake on LAN host connection if you do not have one already.
3. Retrieve the Wake on LAN host connection's unique identifier.
4. Associate the Wake on LAN host connection with a machine catalog.

To create the Wake on LAN host connection:

```
# Load Citrix SnapIns
Add-PSSnapIn -Name "*citrix*"

# Provide the name of the Wake on LAN host connection
[string]$connectionName = "Remote PC Access Wake on LAN"

# Create the hypervisor connection
$hypHc = New-Item -Path xdhyp:\Connections `
                -Name $connectionName `
                -HypervisorAddress "N/A" `
                -UserName "woluser" `
                -Password "wolpwd" `
                -ConnectionType Custom `
                -PluginId VdaWOLMachineManagerFactory `
                -CustomProperties "<CustomProperties></CustomProperties
                   >" `
                -Persist

$bhc = New-BrokerHypervisorConnection -HypHypervisorConnectionUid
    $hypHc.HypervisorConnectionUid

# Wait for the connection to be ready before trying to use it
while (-not $bhc.IsReady)
{

    Start-Sleep -s 5
    $bhc = Get-BrokerHypervisorConnection -HypHypervisorConnectionUid
        $hypHc.HypervisorConnectionUid
 }
```

When the host connection is ready, run the following commands to retrieve the host connection's unique identifier:

```
$bhc = Get-BrokerHypervisorConnection -Name "<WoL Connection Name>"
$hypUid = $bhc.Uid
```

After you retrieve the connection's unique identifier, run the following commands to associate the

© 1997–2026 Citrix Systems, Inc. All rights reserved.

connection with the Remote PC Access machine catalog:

```
Get-BrokerCatalog -Name "<Catalog Name>" | Set-BrokerCatalog -
    RemotePCHypervisorConnectionUid $hypUid
```

Design considerations

When you are planning to use Wake on LAN with Remote PC Access, consider the following:

- Multiple machine catalogs can use the same Wake on LAN host connection.
- For a PC to wake up another PC, both PCs must be in the same subnet and use the same Wake on LAN host connection. It does not matter if the PCs are in the same or different machine catalogs.
- Host connections are assigned to specific zones. If your deployment contains more than one zone, you need a Wake on LAN host connection in each zone. The same applies to machine catalogs.
- Magic packets are broadcasted using the global broadcast address 255.255.255.255. Ensure that the address is not blocked.
- There must be at least one PC turned on in the subnet - for every Wake on LAN connection - to be able to wake up machines in that subnet.

Operational considerations

The following are considerations for using the Wake on LAN feature:

- The VDA must register at least once before the PC can be woken up using the integrated Wake on LAN feature.
- Wake on LAN can only be used to wake up PCs. It does not support other power actions, such as restart or shut down.
- After the Wake on LAN connection is created, it is visible in Web Studio. However, editing its properties within Web Studio is not supported if using Citrix Virtual Apps and Desktops on-premises.
- Magic packets are sent in one of the two ways:

  1. When a user tries to launch a session to their PC and the VDA is unregistered
  2. When an administrator manually sends a power on command from Web Studio or PowerShell

- Because the delivery controller is unaware of a PC's power state, Web Studio displays **Not Supported** under power state. The delivery controller uses the VDA registration state to determine whether a PC is on or off.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshoot

Monitor blanking not working

If the Windows PC's local monitor is not blank while there is an active HDX session (the local monitor displays what's happening in the session) it is likely due to issues with the GPU vendor's driver. To resolve the issue, give the Citrix Indirect Display driver (IDD) higher priority than the graphic card's vendor driver by setting the following registry value:

`HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Graphics\AdapterMerits`

- Name: CitrixIDD
- Type: DWORD
- Data: 3

For more details about display adapter priorities and monitor creation, see the Knowledge Center article CTX237608.

Session disconnects when you select Ctrl+Alt+Del on the machine that has session management notification enabled

The session management notification controlled by the **SasNotification** registry value only works when Remote PC Access mode is enabled on the VDA. If the physical PC has the Hyper-V role or any virtualization-based security features enabled, the PC reports as a virtual machine. If the VDA detects that it is running on a virtual machine, it automatically disables Remote PC Access mode. To enable Remote PC Access mode, add the following registry value:

`HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA`

- Name: ForceEnableRemotePC
- Type: DWORD
- Data: 1

Restart the PC for the setting to take effect.

Diagnostic information

Diagnostic information about Remote PC Access is written to the Windows Application Event log. Informational messages are not throttled. Error messages are throttled by discarding duplicate messages.

- 3300 (informational): Machine added to catalog
- 3301 (informational): Machine added to delivery group

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- 3302 (informational): Machine assigned to user
- 3303 (error): Exception

Power management

If power management for Remote PC Access is enabled, subnet-directed broadcasts might fail to start machines that are on a different subnet from the Controller. If you need power management across subnets using subnet-directed broadcasts, and AMT support is not available, try the Wake-up proxy or Unicast method. Ensure those settings are enabled in the advanced properties for the power management connection.

The active remote session records the local touchscreen input

When the VDA enables Remote PC Access mode, the machine ignores the local touchscreen input during an active session. If the physical PC has the Hyper-V role or any virtualization-based security features enabled, the PC reports as a virtual machine. If the VDA detects that it is running on a virtual machine, it automatically disables Remote PC Access mode. To enable Remote PC Access mode, add the following registry setting:

`HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA`

- Name: ForceEnableRemotePC
- Type: DWORD
- Data: 1

Restart the PC for the setting to take effect.

More resources

The following are other resources for Remote PC Access:

- Solution design guidance: Remote PC Access Design Decisions.
- Examples of Remote PC Access architectures: Reference Architecture for Citrix Remote PC Access Solution.

Cloud Connector Standalone Citrix Secure Ticketing Authority (STA) service

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If using on-premises Site aggregation with Citrix Workspace™ or using Citrix Gateway Service with StoreFront, Cloud Connectors handle Secure Ticket Authority (STA) traffic for your Citrix Virtual Apps and Desktops™ site. The standalone STA service enables you to have more control over the delivery of STA tickets in your environment.

The standalone Citrix STA service is installed on every Cloud Connector in a Resource Location by default. The standalone STA service shifts STA ticketing from the Citrix Cloud™ ticketing service to the Cloud Connectors and standardizes ticketing operations across both normal and LHC modes. The standalone STA service reduces reliance on cloud services and reduces intermittent LHC events.

System requirements

- If using on-premises StoreFront™: Version 2311 or later
- Delivery Controller™: 2503 or later

Enable Standalone STA service

To enable the Standalone STA service, which enables the Citrix Gateway Service with on-prem Delivery Controllers and improves resiliency for on-prem site aggregation to the Citrix Workspace service, configure the following Registry Key:

1. On your Cloud Connectors, set the registry key `HKEY_LOCAL_MACHINE\Software\Citrix\XaXdCloudProxyPersist\StandaloneStaServiceForced` to 1.

Name: `StandaloneStaServiceForced`
Type: DWORD
Value: 1

Once the registry key is configured, restart the Citrix Remote Broker Provider Service for the change to take effect.

Important considerations

- For using Citrix Workspace and on-premises Citrix Gateway in an on-premises environment, see Aggregate Virtual Apps and Desktops in workspaces.
- For using on-premises StoreFront with Citrix Gateway Service, see Citrix Gateway Service for StoreFront.
- Configure on-premises StoreFront to use the FQDN of Cloud Connectors as STA servers. The on-premises NetScaler® Gateway vServer must include the complete list of Cloud Connectors configured as STAs, matching those specified in StoreFront.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- When you are using Citrix Workspace with an on-premises NetScaler Gateway vServer for ICA® proxy: Configure NetScaler Gateways to use all Cloud Connectors as the STA servers.

Limitations

- Dual STA ticket redemption is not supported for Citrix Workspace.
- If DaaS is not configured in your cloud tenant, Configuration Syncs will not happen, and 517 errors will be logged in the event log.

Publish content

May 13, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.

You can publish an application that is simply a URL or UNC path to a resource, such as a Microsoft Word document or a web link. This feature is known as published content. The ability to publish content adds flexibility to how you deliver content to users. You benefit from the existing access control and management of applications. You can also specify whether to use local or published applications to open the content.

The published content appears just like other applications in StoreFront™ and Citrix Workspace™ app. Users access it in the same way they access applications. On the client, the resource opens as usual.

- If a locally installed application is appropriate, it is launched to open the resource.
- If a File Type Association has been defined, a published application launches to open the resource.

You publish content using the PowerShell SDK. You cannot use Web Studio to publish content. However, you can use Web Studio to edit application properties later, after they are published.

Configuration overview and preparation

Publishing content uses the `New-BrokerApplication` cmdlet with the following key properties. (See the cmdlet help for descriptions of all cmdlet properties.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
New-BrokerApplication –ApplicationType PublishedContent -
    CommandLineExecutable location -Name app-name -DesktopGroup delivery
    -group-name
```

The `ApplicationType` property must be `PublishedContent`.

The `CommandLineExecutable` property specifies the location of the published content. The following formats are supported, with a limit of 255 characters.

- HTML website address (for example, http://www.citrix.com)
- Document file on a web server (for example, `https://www.citrix.com/press/pressrelease.doc`)
- Directory on an FTP server (for example, `ftp://ftp.citrix.com/code`)
- Document file on an FTP server (for example, `ftp://ftp.citrix.com/code/Readme.txt`>)
- UNC directory path (for example, `file://myServer/myShare or \\\\\myServer\\myShare`)
- UNC file path (for example, `file://myServer/myShare/myFile.asf` or `\\myServer\myShare\myFile.asf`)

Ensure that you have the correct SDK.

- For Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) deployments, download and install the Citrix Virtual Apps and Desktops Remote PowerShell SDK.
- For on-premises Citrix Virtual Apps and Desktops deployments, use the PowerShell SDK that is installed with the Delivery Controller. Adding a published content application requires a minimum version 7.11 Delivery Controller.

The following procedures use examples. In the examples:

- A machine catalog has been created.
- A delivery group named `PublishedContentApps` has been created. The group uses a multi-session OS machine from the catalog. The WordPad application has been added to the group.
- Assignments are made for the delivery group name, the `CommandLineExecutable` location, and the application name.

Get started

On the machine containing the PowerShell SDK, open PowerShell.

The following cmdlet adds the appropriate PowerShell SDK snap-in, and assigns the returned delivery group record.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
Add-PsSnapin Citrix\* $dg = Get-BrokerDesktopGroup –Name PublishedContentApps
```

If you are using Citrix DaaS, authenticate by entering your Citrix Cloud™ credentials. If there is more than one customer, choose one.

Publish a URL

After assigning the location and application name, the following cmdlet publishes the Citrix home page as an application.

```
$citrixUrl = "https://www.citrix.com/"
$appName = "Citrix Home Page"

New-BrokerApplication –ApplicationType PublishedContent –
    CommandLineExecutable $citrixURL –Name $appName –DesktopGroup $dg.
    Uid
```

Verify success:

- Open StoreFront and log on as a user who can access applications in the PublishedContentApps delivery group. The display includes the newly created application with the default icon. To learn about customizing the icon, see https://www.citrix.com/blogs/2013/08/21/xd-tipster-changing-delivery-group-icons-revisited-xd7/.
- Click the **Citrix Home Page** application. The URL launches in a new tab in a locally running instance of your default browser.

Publish resources located at UNC paths

In this example, the administrator has already created a share named `PublishedResources`. After assigning the locations and application names, the following cmdlets publish an RTF and a DOCX file in that share as a resource.

```
$rtfUNC = "\\GMSXJ-EDGE0.xd.local\\PublishedResources\\PublishedRTF.rtf
    "
$rtfAppName = "PublishedRTF"

New-BrokerApplication –ApplicationType PublishedContent
 –CommandLineExecutable $rtfUNC -Name $rtfAppName
-DesktopGroup $dg.Uid

$docxUNC = "\\GMSXJ-EDGE0.xd.local\PublishedResources\PublishedDOCX.
    docx"
$docxAppName = "PublishedDOCX"

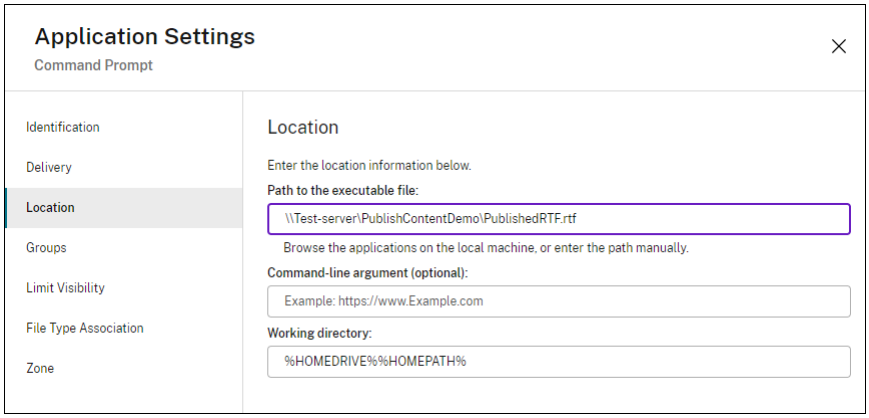
New-BrokerApplication –ApplicationType PublishedContent
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
12  – CommandLineExecutable $docxUNC -Name $docxAppName
13 -DesktopGroup $dg.Uid
```

Verify success:

- Refresh your StoreFront window to see the newly published documents.
- Click the **PublishedRTF** and **PublishedDOCX** applications. Each document opens in a locally running WordPad.



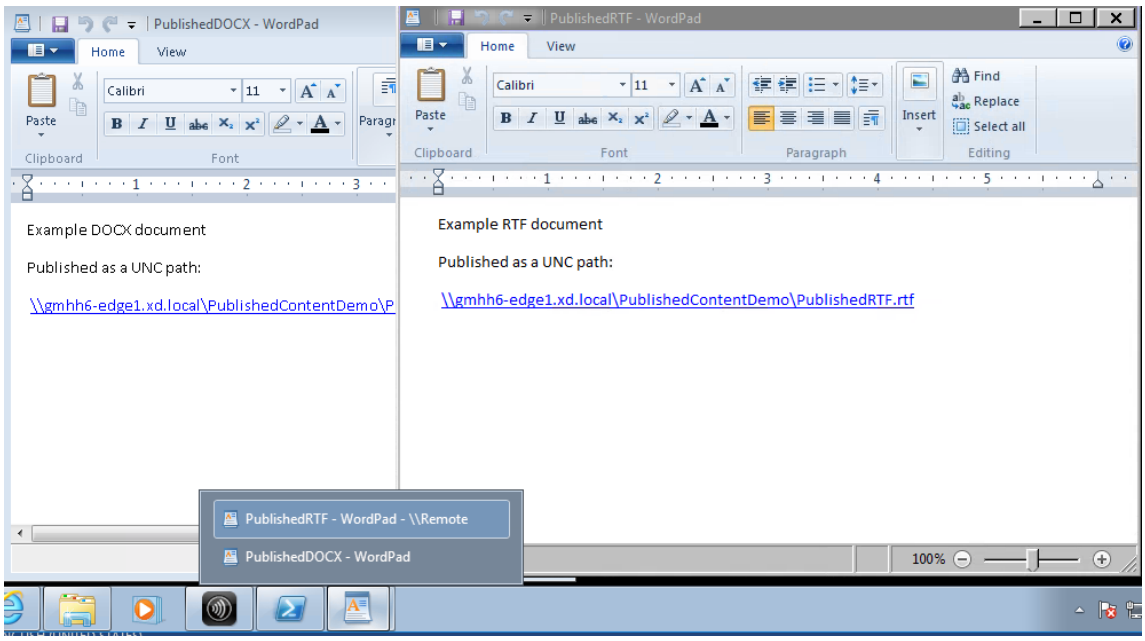
View and edit PublishedContent applications

You manage published content using the same methods that you use for other application types.

To view and edit `PublishedContent` applications, follow these steps:

1. Sign in to Web Studio and select **Applications** in the left pane.
2. On the **Applications** tab, select a PublishedContent application, and then select **Properties**.

   Application properties (such as user visibility, group association, and shortcut) apply to the published content. However, you cannot change the command-line argument or working directory properties on the **Location** page.
3. To change the resource, modify the **Path to the executable file** field on that page.



4. To use a published application to open a `PublishedContent` application (rather than a local application), follow these steps:

   In this example, the published WordPad application is edited to create a File Type Association for .rtf files.

   a) Turn on maintenance mode for the delivery group.
   b) Edit the **File Type Association** property.
   c) Turn off maintenance mode when you're done.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

d) Refresh StoreFront to load the File Type Association changes, and then click the **PublishedRTF** and **PublishedDOCX** applications. Notice the difference. **PublishedDOCX** still opens in the local WordPad. However, **PublishedRTF** now opens in the published WordPad due to the file type association.

For more information

- Create machine catalogs
- Create delivery groups
- Change application properties

Server VDI

September 3, 2026

Use the Server VDI (Virtual Desktop Infrastructure) feature to deliver a desktop from a server operating system for a single user.

- Enterprise administrators can deliver server operating systems as VDI desktops, which can be valuable for users such as engineers and designers.
- Service Providers can offer desktops from the cloud. Those desktops comply with the Microsoft Services Provider License Agreement (SPLA).

Support:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- In Citrix Virtual Apps and Desktops™ and Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) deployments, Server VDI is supported on Windows Server 2022, Windows Server 2019, and Windows Server 2025.
- All Server VDI deployments support the user personalization layer technology.
- For Server VDI to work with TWAIN devices such as scanners, the Windows Server Desktop Experience feature must be installed.
- The following features cannot be used with Server VDI:
  - Hosted applications
  - Local App Access
  - Direct (non-brokered) desktop connections
  - Remote PC Access

Install and configure Server VDI

1. Prepare the Windows server for installation.
   - Use Windows Server Manager to ensure that the Remote Desktop Services role services are not installed. If they were previously installed, remove them. The VDA installation fails if these role services are installed.
   - Ensure that the **Restrict each user to a single session** property is enabled. On the Windows server, edit the registry for the Terminal Server setting:

     `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server`

     `DWORD fSingleSessionPerUser = 1`
2. Use the Citrix Virtual Apps and Desktops installer's command line interface to install a VDA on a supported server or server master image, specifying the `/servervdi` option. (By default, the installer's graphical interface blocks the Windows single-session OS VDA on a server operating system. Using the command line overrides this behavior.) Use one of the following commands:
   - Citrix Virtual Apps and Desktops™ deployments:
     - `XenDesktopVdaSetup.exe /servervdi`
     - `VDAWorkstationSetup.exe /servervdi`
   - Citrix DaaS™ deployments:
     - `VDAWorkstationSetup.exe /servervdi`

   Other options:
   - Use `/controllers` to specify Delivery Controllers or Cloud Connectors.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Use `/enable_hdx_ports` to open ports in the firewall, unless the firewall is to be configured manually.
- Use `/mastermcsimage` (or `/masterimage`) if you are installing the VDA on an image, and will use MCS to create server VMs from that image.
- For all option details, see Install using the command line.

3. Create a machine catalog for Server VDI. In the catalog creation wizard:

   - On the **Operating System** page, select **Single-session OS**.
   - On the **Summary** page, specify a machine catalog name and description for administrators that clearly identifies it as Server VDI. This is the only indicator in Studio that the catalog supports Server VDI.

   When using search in Studio, the Server VDI catalog is displayed on the **Single-session OS Machines** tab, even though the VDA is installed on a multi-session machine.

4. Create a Delivery Group and select the Server VDI catalog you created.

If you did not specify Delivery Controllers or Cloud Connectors during VDA installation, remember to specify them afterward. For details, see VDA registration.

User personalization layer

May 15, 2026

> **Note:**
>
> Starting with version 2511, Citrix Web Studio (web-based) is the only management console for Citrix Virtual Apps and Desktops™. Citrix Studio (MMC-based) has been removed from the installer. This article applies only to Web Studio. For information about Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops 7 2212 or earlier.rticle in Citrix Virtual Apps and Desktops 7 2212 or earlier.

The user personalization layer feature for Citrix Virtual Apps and Desktops extends the capabilities of non-persistent machine catalogs to preserve users'data and locally installed applications across sessions. Powered by underlying Citrix App Layering technology, the user personalization layer feature supports Citrix Provisioning and Machine Creation Services™ (MCS) in a non-persistent machine catalog.

You install the user personalization layer components alongside the Virtual Delivery Agent within the master image. A VHD file stores locally user-installed applications. The VHD mounted on the image acts as the user's own virtual hard drive.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> You can deploy user personalization layers in Citrix Virtual Apps and Desktops™, or App Layering user layers enabled in an image template, not both. Don't install the user personalization layer feature on a layer within App Layering.

This feature replaces Personal vDisk (PvD), while also providing a persistent workspace experience for users in a non-persistent (pooled) desktop environment.

To deploy the user personalization layer feature, install and configure it using the steps detailed in the article.

Application support

Aside from the following exceptions, all applications that a user installs locally on the desktop are supported in the user personalization layer.

Exceptions

The following applications are the exception and are not supported on the user personalization layer:

- Enterprise applications, such as MS Office and Visual Studio.
- Applications that modify the network stack or hardware. Example: a VPN client.
- Applications that have boot level drivers. Example: a virus scanner.
- Applications with drivers that use the driver store. Example: a printer driver.

  > **Note:**
  >
  > You can make printers available using Windows Group Policy Objects (GPOs).

Do *not* allow users to install any unsupported applications locally. Rather, install these applications directly on the master image.

Applications that require a local user or administrator account

When a user installs an application locally, the app goes into their user layer. If the user then adds or edits a local user or group, the changes do not persist beyond the session.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Important:**
>
> Add any required local user or group in the master image.

Requirements

The user personalization layer feature requires the following components:

- Citrix Virtual Apps and Desktops 7 1909 or later
- Virtual Delivery Agent (VDA), version 1912 or later
- Citrix Provisioning™, version 1909 or later
- Windows File Share (SMB), or Azure Files with on-prem AD authentication enabled

You can deploy the User personalization layer feature on the following Windows versions when the OS is deployed as a single session. Support is limited to a single user on a single session.

- Windows 11 Enterprise x64
- Windows 10 Enterprise x64, version 1607 or later
- Windows Server 2019 (Azure Files supported)
- Windows Server 2022 (Azure Files supported)

For Citrix Virtual Apps and Desktops 7, the use of Azure Files with User personalization layers is supported on Windows Server 2022, Windows Server 2019, and Windows 10 clients.

> **Note:**
>
> If you are using a server OS, only Server VDI is supported. For deployment details, see the Server VDI article.
>
> User personalization layer supports just one user at a time per machine, and then the machine has to reboot to reset the disks. You cannot use the user personalization layer with multi-session server operating systems, only with single-session server systems. User personalization layer is supported for non-persistent desktops only.

Uninstall the user personalization layer feature, if installed. Reboot the master image before installing the latest release.

Set up your file share

The user personalization layer feature requires Windows Server Message Block (SMB) storage. To create a Windows file share, follow the usual steps for the Windows operating system that you are on.

For more about using Azure Files with Azure-based catalogs, see Set up Azure Files storage for User personalization layers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Recommendations

Follow the recommendations in this section for a successful user personalization layer deployment.

Microsoft System Center Configuration Manager (SCCM)

If you are using SCCM with the user personalization layer feature, follow the Microsoft guidelines for preparing your image in a VDI environment. Refer to this Microsoft TechNet article for more information.

User layer size

A user layer is a thin-provisioned disk that expands as space on the disk is used. The default size allowed for a user layer is 10 GB, the minimum we recommend.

> **Note:**
>
> During installation, if the value is set to zero (0), the default user layer size is set to 10 GB.

If you want to change the user layer size, you can enter a different value for the **User Layer Size** policy. See **Step 5: Create delivery group custom policies**, under **Optional: Click Select next to User Layer Size in GB.**

Tools for overriding the User Layer Size (Optional)

You can override the User Layer Size by using a Windows tool to define a quota on the user layer file share.

Use one of the following Microsoft quota tools to set a hard quota on the user layer directory named **Users**:

- File Server Resource Manager (FSRM)
- Quota Manager

> **Note:**
>
> Increasing the quota affects new user layers and expands existing ones. Decreasing the quota only affects new user layers. Existing user layers never decrease in size.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Deploy a User personalization layer

When deploying the user personalization feature, you define the policies within Web Studio. You then assign the policies to the delivery group bound to the machine catalog, where the feature is deployed.

If you leave the master image with no user personalization layer configuration, the services remain idle and do not interfere with authoring activities.

If you set the policies in the master image, the services attempt to run and mount a user layer within the master image. The master image exhibits unexpected behaviors and instability.

To deploy the user personalization layer feature, complete the following steps in this order:

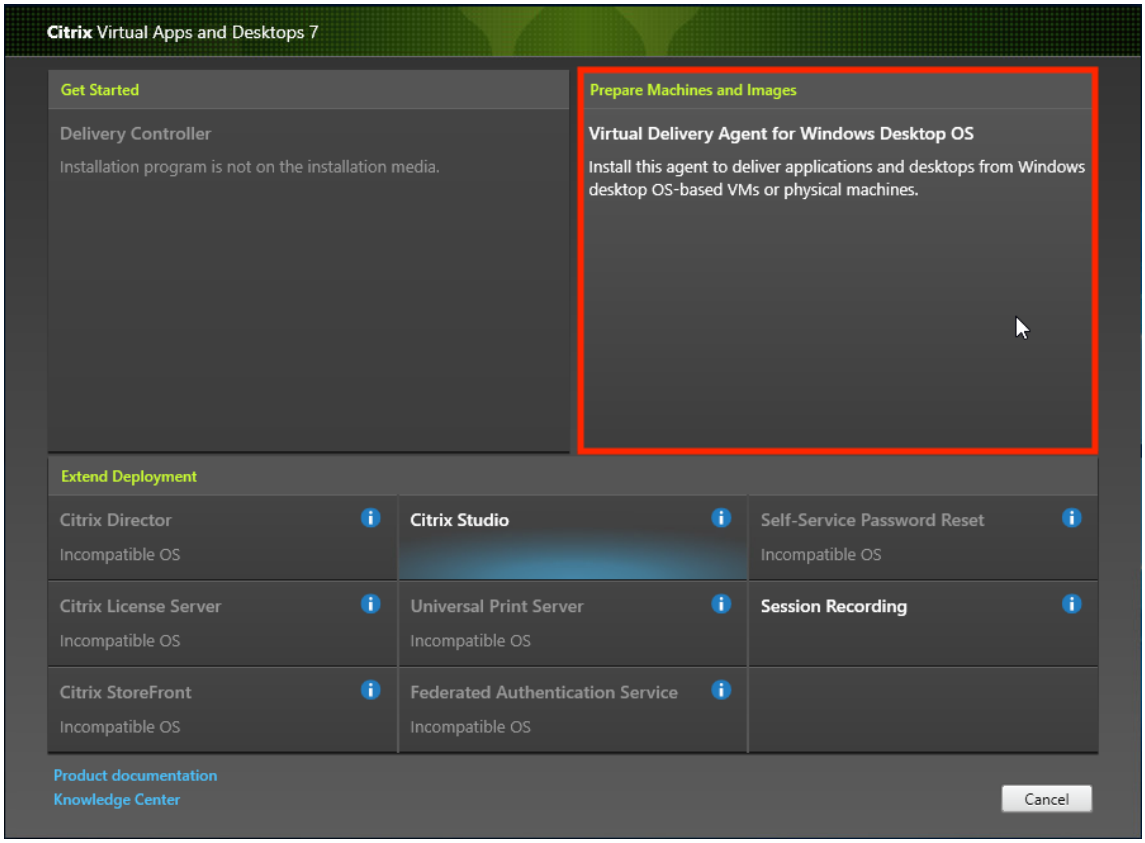
- Step 1: Verify the availability of a Citrix Virtual Apps and Desktops environment.
- Step 2: Prepare your master image.
- Step 3: Create a machine catalog.
- Step 4: Create a delivery group.
- Step 5: Create delivery group custom policies.

> **Note:**
>
> Logging in for the first time after upgrading Windows 10 on the image takes longer than usual. The user's layer needs to update for the new version of Windows 10, which then increases logon time.

Step 1: Verify that the Citrix Virtual Apps and Desktops environment is available

Ensure that your Citrix Virtual Apps and Desktops environment is available to use with this new feature. For setup details, see Install and configure Citrix Virtual Apps and Desktops.

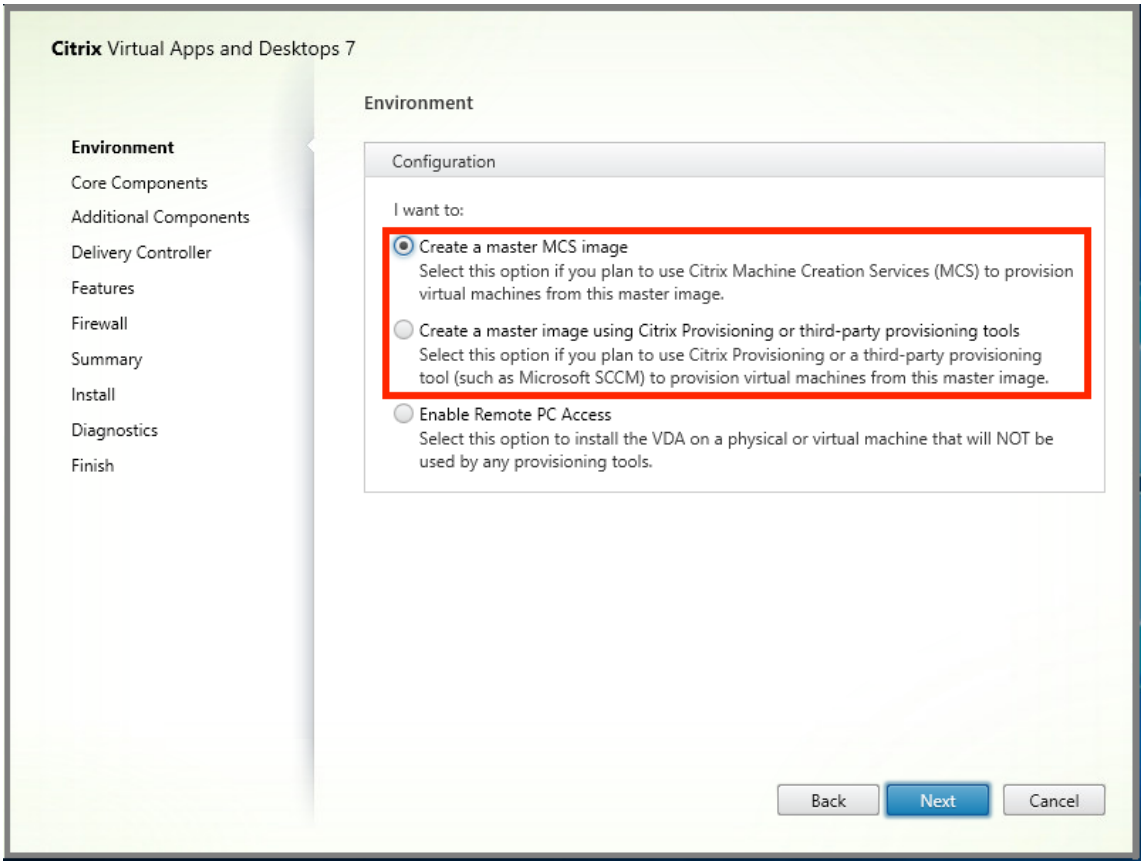
Step 2: Prepare your master image



To prepare your master image:

1. Locate the master image. Install your organization's enterprise applications and any other apps your users generally find useful.
2. If you are deploying Server VDI, follow the steps in the Server VDI article. Be sure to include the optional component, the **User personalization layer**. For details, see the Command-line options for installing a VDA.
3. If you are using Windows 10, install Virtual Delivery Agent (VDA) 1912 or later. If an older version of the VDA is already installed, uninstall the old version first. When installing the new version,

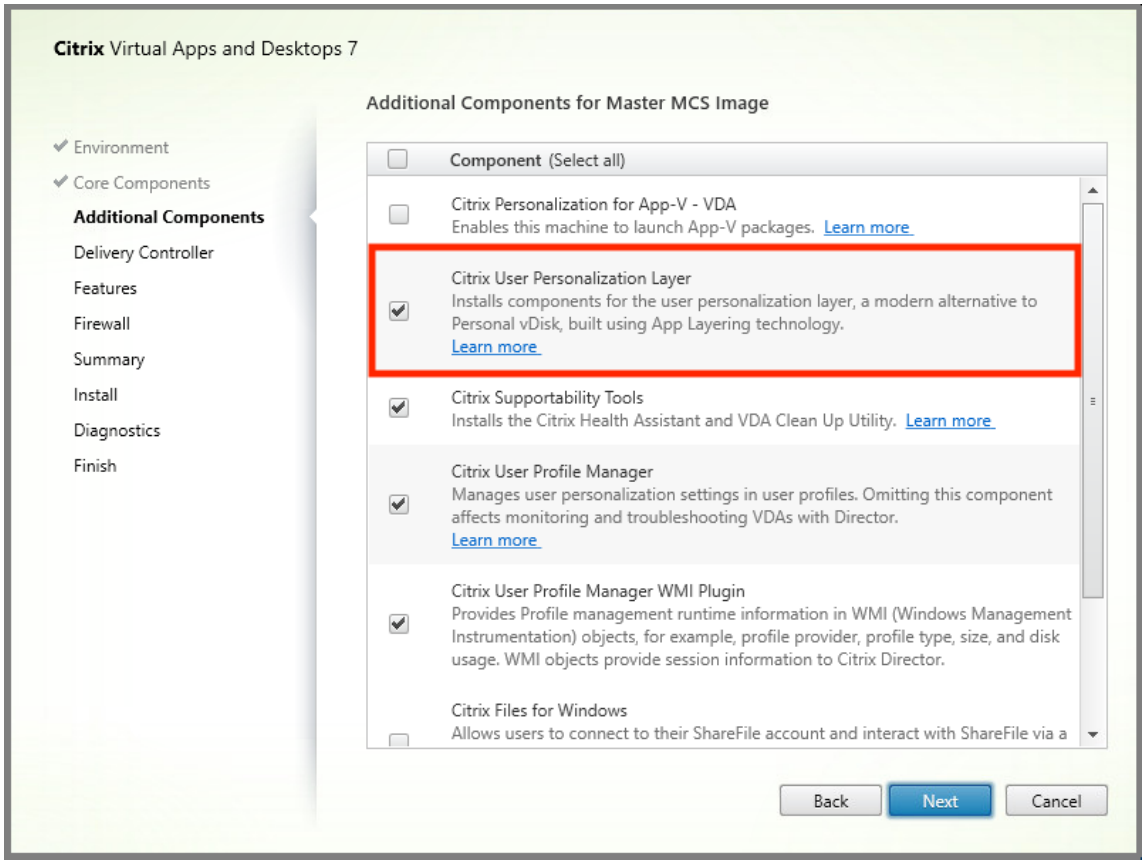
© 1997–2026 Citrix Systems, Inc. All rights reserved.



be sure to select and install the optional component, the **Citrix User Personalization Layer**, as follows:

a) Click the **Virtual Delivery Agent for Windows Desktop OS** tile:

a) **Environment:** Select either **Create a master MCS image** or **Create a master image using Citrix Provisioning or third-party provisioning tools**.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

a) **Core Components:** Click **Next**.

b) **Additional Components:** Check **Citrix User Personalization Layer**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

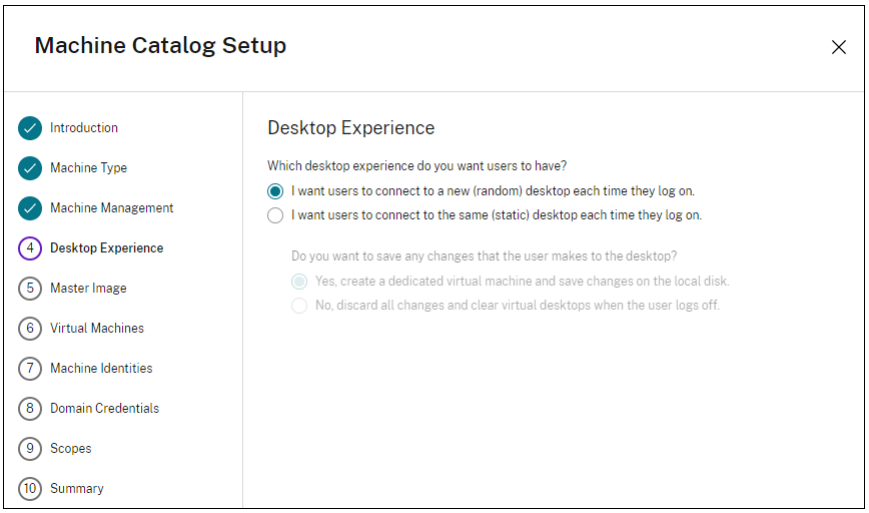
a) Click through the remaining installation screens, configure the VDA as needed, and click **Install**. The image reboots one or more times during installation.

4. Leave **Windows updates** disabled. The user personalization layer installer disables Windows updates on the image. Leave the updates disabled.

The image is ready for you to upload into Web Studio.

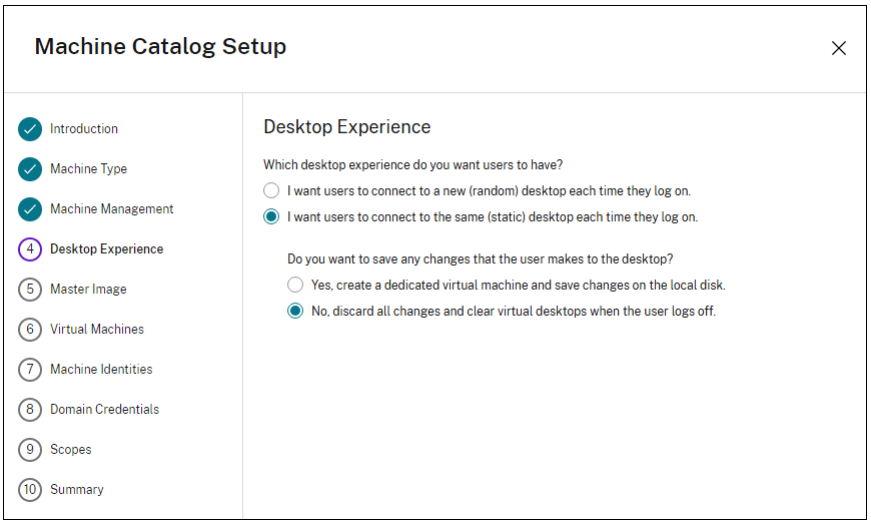
> **Note:**
>
> If you simply want to upgrade the user personalization layer (UPL), you can do so with a newer version of UPL and the standalone package. You do not need to upgrade the VDA.

Step 3: Create a machine catalog



In Web Studio, follow the steps to create a machine catalog. Use the following options during catalog creation:

1. Select **Operating System** and set it to **Single-session OS**.
2. Select **Machine Management** and set it to **Machines that are power managed**. For example, virtual machines or blade PCs.



© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select **Desktop Experience** and set it to either **pooled-random** or **pooled-static** catalog type, as in the following examples:

   - **Pooled-random:**

   - **Pooled-static:** If you select pooled-static, configure desktops to discard all changes and clear virtual desktops when the user logs off, as shown in the following screenshot:

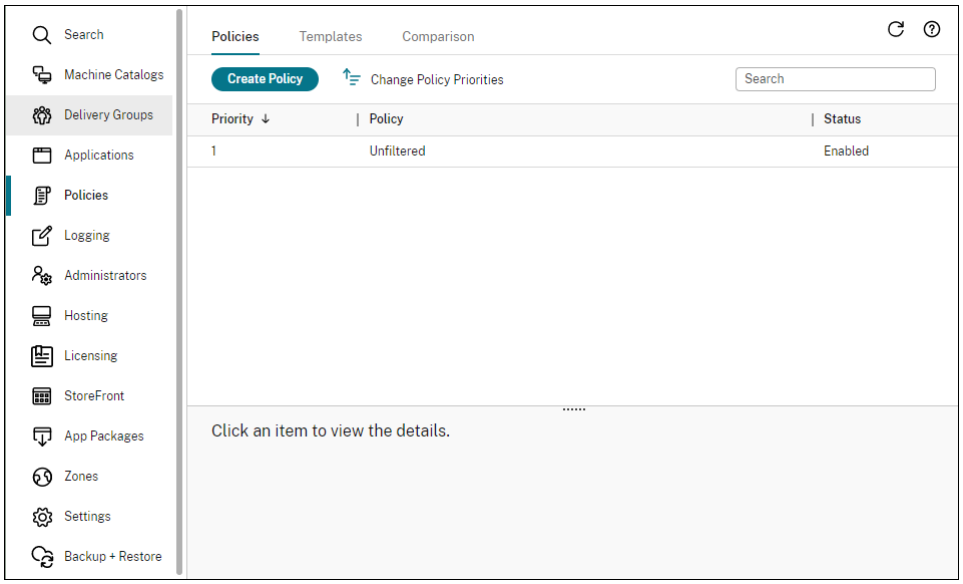
> **Note:**
>
> User personalization layer does not support pooled-static catalogs configured to use Citrix Personal vDisk or assigned as dedicated virtual machines.

4. If you are using MCS, select **Image** and the snapshot for the image created in the previous section.
5. Configure the remaining catalog properties as needed for your environment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 4: Create a delivery group

Create and configure a **delivery group**, including machines from the machine catalog you created. For details, see the Create Delivery Groups.

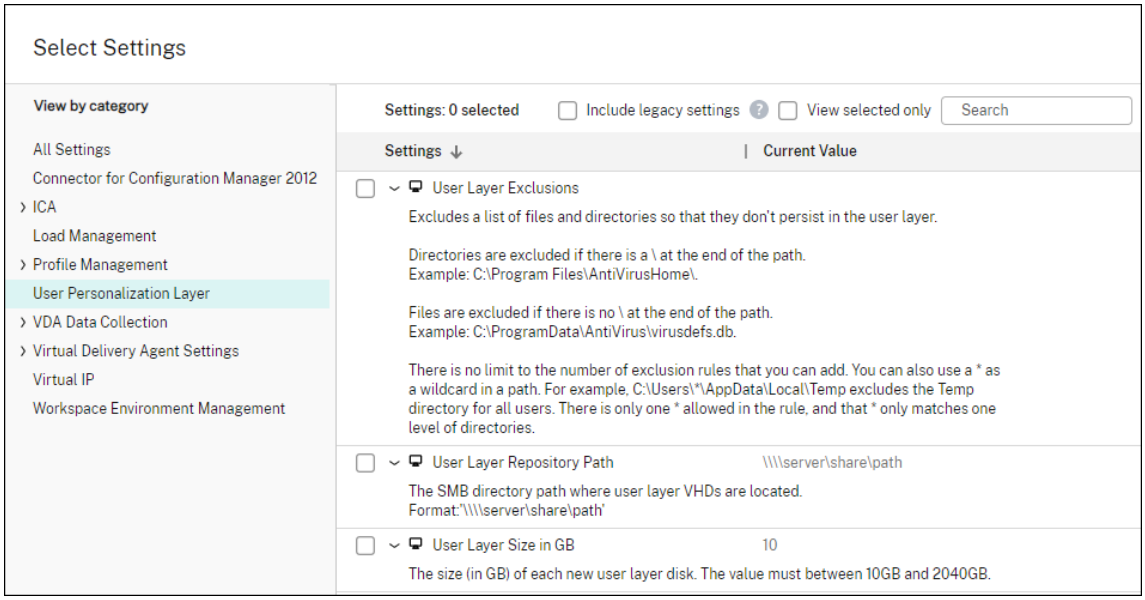


Step 5: Create delivery group custom policies

To enable the mounting of user layers within the Virtual Delivery Agents, you use the configuration parameters to specify:

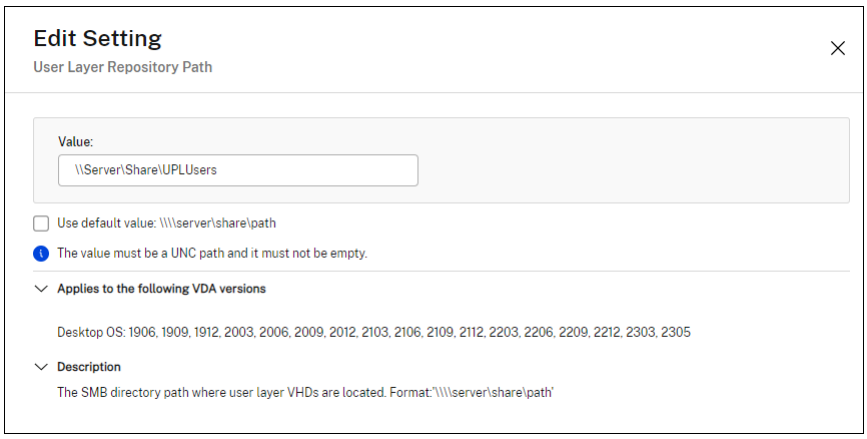
- Where on the network to access the user layers.
- How large to permit the user layer disks to grow.

To define the parameters as custom Citrix policies in Web Studio and assign them to your delivery group.



1. Sign in to Web Studio and select **Policies** in the left pane:

2. Select **Create Policy** in the action bar. The Create Policy window appears.
3. Type `user layer` into the search field. The following three policies appear in the list of available policies:
   - User Layer Exclusions
   - User Layer Repository Path
   - User Layer Size GB

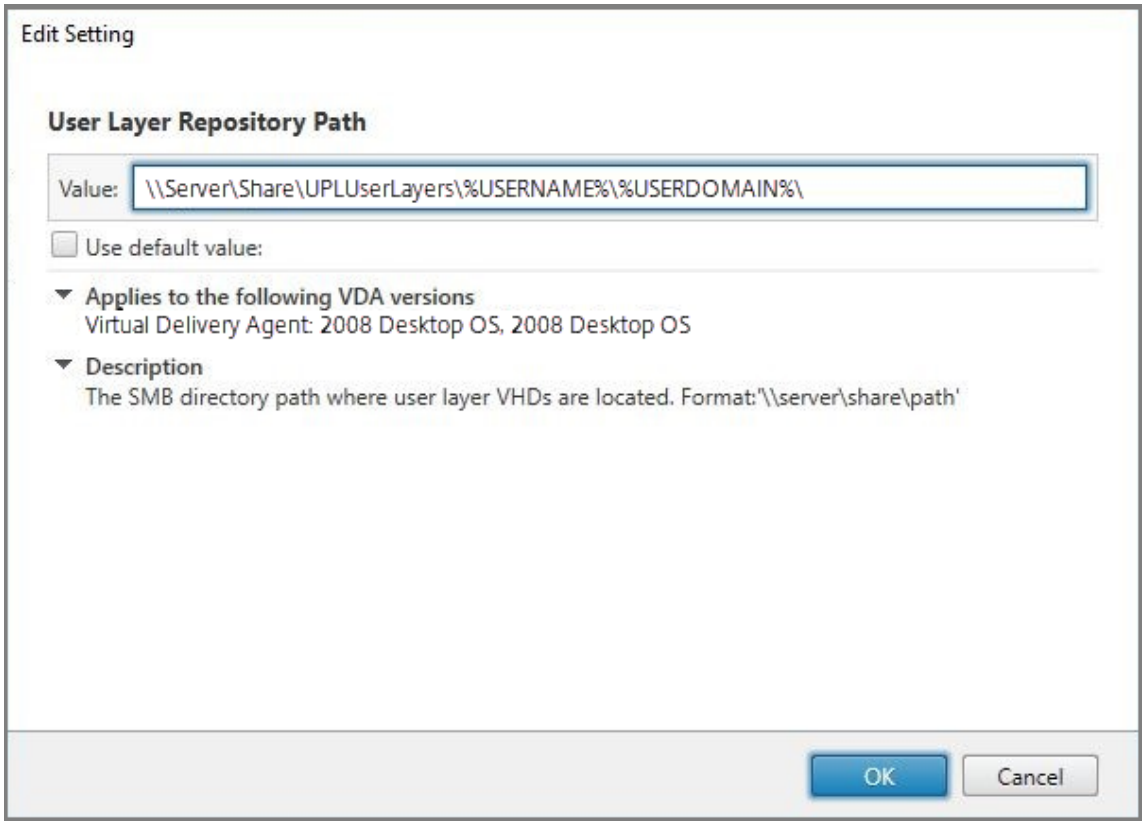


© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Increasing the size affects new user layers and expands existing user layers. Decreasing the size only affects new user layers. Existing user layers never decrease in size.

4. Mark the check box next to **User Layer Repository Path** and click **Edit**. The **Edit Setting** window appears.
5. Enter a path in the **Value** field, and click **Save**:

   - **Path format:** `\\server-name-or-address\share-name\folder`
   - **Path example:** `\\Server\Share\UPLUsers`
   - **Resulting paths example:** For a user named **Alex** in **CoolCompanyDomain**, the path is: `\\Server\Share\UPLUsers\Users\CoolCompanyDomain_Alex\A_OK`



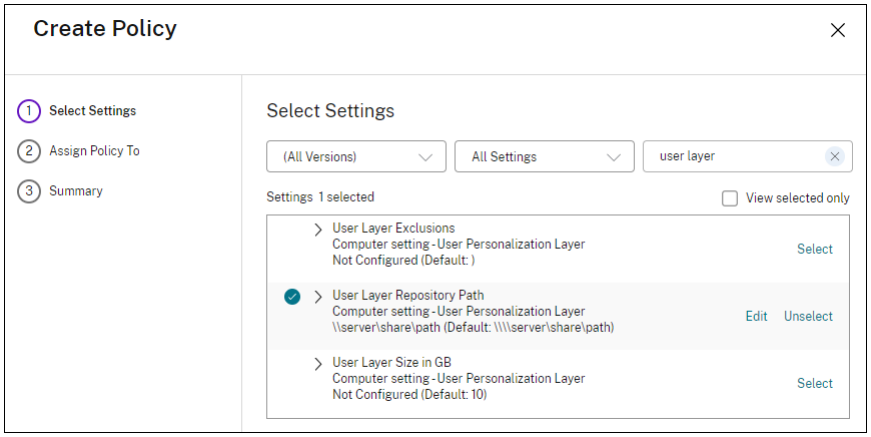
You can customize the path using the %USERNAME% and %USERDOMAIN% variables, machine environment variables, and Active Directory (AD) attributes. When expanded, these variables

© 1997–2026 Citrix Systems, Inc. All rights reserved.

result in explicit paths.

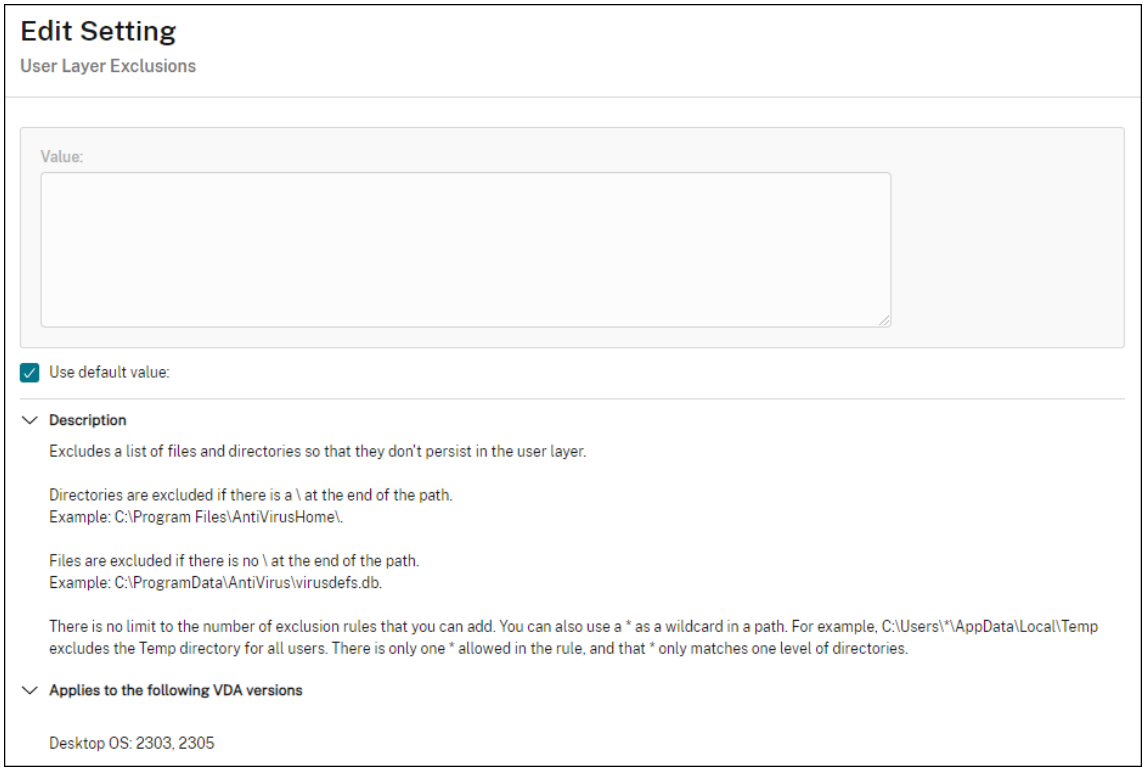
Example of environment variables:

- **Path format:** `\\Server-name-or-address\share-name\folder-with-environment-variables`
- **Path example:** `\\Server\Share\UPLUserLayers\\%USERNAME%\\%USERDOMAIN%`
- **Resulting paths example:** For a user named **Alex** in **CoolCompanyDomain**, the path would be: `\\Server\Share\UPLUserLayers\Alex\CoolCompanyDomain\A_OK`



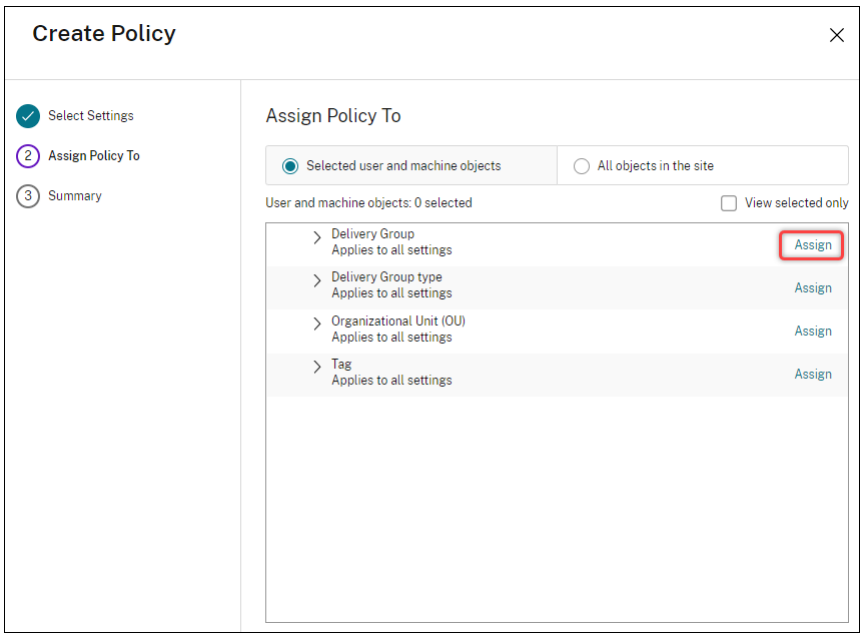
Example of custom AD attributes:

- Path format: `\\Server-name-or-address\share-name\AD-attribute`
- Path example: `\\Server\share\\#sAMAccountName#`
- Resulting paths example: `\\Server\share\JohnSmith` (if #sAMAccountName# resolves to JohnSmith for the current user)



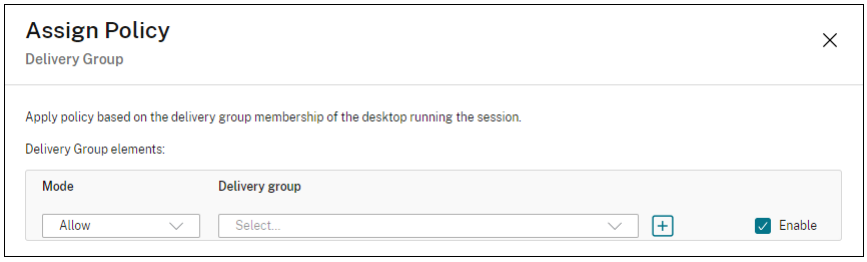
6. Optional: Mark the check box next to **User Layer Size in GB** and click **Edit**:

© 1997–2026 Citrix Systems, Inc. All rights reserved.



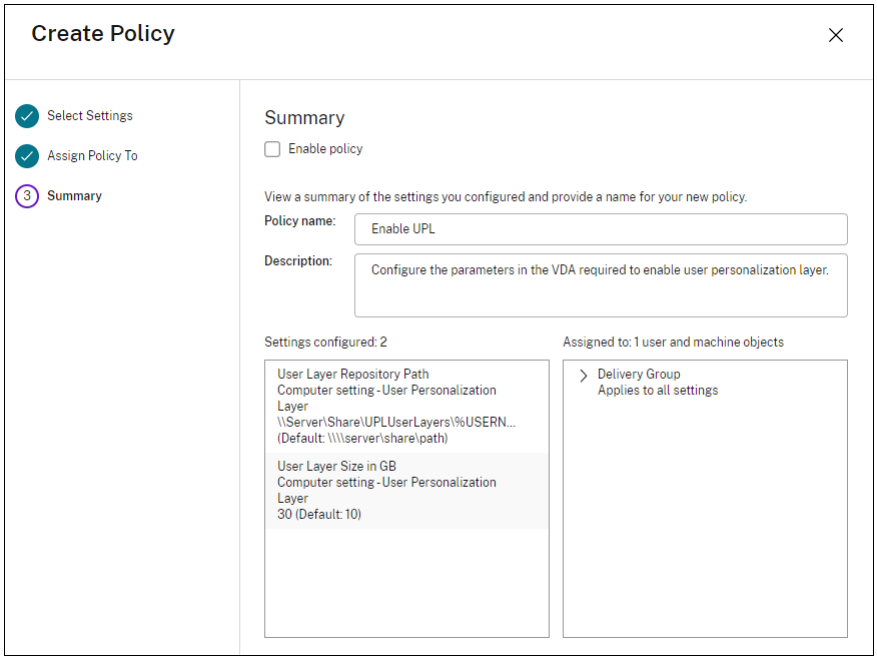
The Edit Settings window appears.

7. Optional: Change the default value of **10 GB** to the maximum size that each user layer can grow. Click **Save**.
8. Optional: Mark the check box next to **User Layer Exclusions** and click **Edit**.



9. Optional: Specify the files and folders to exclude, then click **Save**. For more information, see the Citrix App Layering documentation.
10. Click **Next** to configure the users and machines to which you want to assign. Click the **Delivery Group Assign** link highlighted in this image:

© 1997–2026 Citrix Systems, Inc. All rights reserved.



11. In the **Delivery Group** menu, select the delivery group created in the previous section. Click **OK**.

12. Enter a name for the policy. Click the check box to enable the policy, and click **Finish**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure security settings on the user layer folder

As a domain administrator, you can specify more than one storage location for your user layers. Create a `\Users` subfolder For each storage location (including the default location). Secure each location using the following settings.

Setting name	Value	Apply to
Creator Owner	Modify	Subfolders and Files only
Owner Rights	Modify	Subfolders and Files only
Users or group	Create Folder/Append Data; Traverse Folder/Execute File; List Folder/Read Data; Read Attributes	Selected Folder Only
System	Full Control	Selected Folder, Subfolders, and Files
Domain Admins, and selected Admin group	Full Control	Selected Folder, Subfolders, and Files

User layer messages

When a user is unable to access their user layer, they receive one of these notification messages.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **User Layer In Use**

  ```
  We were unable to attach your user layer because it is in use.
  Any changes you make to application settings or data will not be
  saved. Be sure to save any work to a shared network location.
  ```

- **User Layer Unavailable**

  ```
  We were unable to attach your user layer. Any changes you make to
   application settings or data will not be saved. Be sure to save
  any work to a shared network location.
  ```

- **System not reset after user sign-out**

  ```
  This system was not shut down properly. Please log off immediately
   and contact your system administrator.
  ```

Log files to use when troubleshooting

The log file, ulayersvc.log, contains the output of the user personalization layer software where changes are logged.

```
1 C:\ProgramData\Unidesk\Logs\ulayersvc.log
```

User Layer/UPL space reclamation

You can use **User Layer/UPL space reclamation** to automatically compress the VHDX files every time the user logs off.
For more information, see User Layer/UPL space reclamation

Limitations

Keep the following limitations in mind when installing and using the user personalization layer feature.

- Do *not* attempt to deploy the user personalization layer software on a layer within App Layering. Either deploy user personalization layers in Citrix Virtual Apps and Desktops or enable user layers in an App Layering image template, not both. Either process produces the user layers that you need.
- Do *not* configure the user personalization layer feature with persistent machine catalogs.
- Do *not* use Session hosts.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Do *not* update the machine catalog with an image running a new OS install (even the same version of Windows 10). The best practice is to apply updates to the OS within the same master image used when creating the machine catalog.
- Do *not* use boot-time drivers or any other early boot personalization.
- Do *not* migrate PvD data to the user personalization layer feature.
- Do *not* migrate existing user layers from the full App Layering product to the user personalization layer feature.
- Do *not* change the user layer SMB path to access user layers created using a different master OS image.
- When a user logs out of a session and then logs in again, the new session runs on a different machine in the pool. In a VDI environment, Microsoft Software Center lists an application as **Installed** on the first machine but shows it as **Unavailable** on the second machine.

  To find out the true status of the application, instruct the user to select the application in the Software Center and click **Install**. SCCM then updates the status to the true value.
- Software Center occasionally stops immediately after launching within a VDA that has the user personalization layer feature enabled. To avoid this issue, follow Microsoft's recommendations for Implementing SCCM in a XenDesktop VDI environment. Also, make sure that the `ccmexec` service is running before you start the Software Center.
- In Group Policies (Computer Settings), User layer settings override settings applied to the master image. Therefore, the changes you make in Computer Settings using a GPO are not always present for the user on the next session login.

  To get around this issue, create a User Logon Script that issues the command:

  ```
  gpupdate /force
  ```

  For example, one customer set the following command to run at each user login:

  ```
  gpudate /Target:Computer /force
  ```

  For best results, apply changes to Computer Settings directly on the user layer, after the user has logged in.
- A domain user account must not be the last user to have logged in to a master image. Otherwise, the machines provisioned from that image might have issues.
- Custom certificates do not persist when UPL is enabled in a pure Microsoft Entra environment, due to an underlying issue in Windows running on Azure. If Microsoft fixes this issue in a future enhancement, we will update this article.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove components

May 13, 2026

To remove components, Citrix® recommends using the Windows feature for removing or changing programs. Alternatively, you can remove components using the command line, or a script on the installation media.

When you remove components, prerequisites are not removed, and firewall settings are not changed. For example, when you remove a Delivery Controller™, the SQL Server software and the databases are not removed.

If you upgraded a Controller from an earlier deployment that included Web Interface, you must remove the Web Interface component separately. You cannot use the installer to remove Web Interface.

For information about removing features not mentioned below, see the feature's documentation.

Preparation

Before removing a Controller, remove it from the site. For details, see Remove a Controller.

Close Studio and Director before removing them.

Remove components using the Windows feature for removing or changing programs

From the Windows feature for removing or changing programs:

- To remove a Controller, Studio, Director, License Server, or StoreFront, right-click **Citrix Virtual Apps *version*** or **Citrix Virtual Apps and Desktops™ *version*** and select **Uninstall**. The installer launches. Select the components to be removed.

  Alternatively, you can remove StoreFront™ by right-clicking **Citrix StoreFront** and selecting **Uninstall**.

- To remove a VDA, right-click **Citrix Virtual Delivery Agent *version*** and select **Uninstall**. The installer launches and you can select the components to be removed. The machine restarts automatically after the removal, by default.

- To remove the Universal Print Server, right-click **Citrix Universal™ Print Server** and select **Uninstall**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove core components using the command line

From the \x64\XenDesktop Setup directory, run the XenDesktopServerSetup.exe command.

- To remove one or more components, specify the /remove and /components options.
- To remove all components, specify the /removeall option.

For command and parameter details, see Install using the command line.

For example, the following command removes Web Studio.

```
\x64\XenDesktop Setup\XenDesktopServerSetup.exe /remove /components
webstudio
```

While upgrading if you have installed License Server first using the commands \x64\Licensing\CitrixLicensing.exe /quiet or \x64\Licensing\CitrixLicensing.exe /quiet /l install.log and then installed the core components, then follow the same order to uninstall:

1. Uninstall License Server using the command line:

```
1 CitrixLicensing.exe /quiet /uninstall /l uninstall.log
```

2. Uninstall components using the GUI or command line. For information, see Remove components.

If you uninstall the License Server and components using the command line XenDesktopServerSetup.exe or removeall, then clean up the registry entry and the remaining files.

To clean registry entries :

1. Search for the registry key Citrix Licensing and delete that entry. Mostly, you can find the entry in the following location:

```
1 "Computer\HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\
    Windows\CurrentVersion\Uninstall\
```

2. Delete the folder pointed by the **Uninstall String** in the registry key.

Remove VDAs using the command line

From the \x64\XenDesktop Setup directory, run the XenDesktopVdaSetup.exe command.

- To remove one or more components, use the /remove and /components options. For example, to remove the VDA and Citrix Workspace app, use /remove /components vda,plugin.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- The `/removeall` option removes only the VDA. It does not remove the Citrix Workspace app.

For command and parameter details, see Install using the command line.

The machine restarts automatically after the removal, by default.

To remove VDAs using a script in Active Directory, see Install or remove VDAs using scripts.

Upgrade and migrate

May 15, 2026

> **Note:**
>
> File based licensing system, traditionally used for activating various on-premises components, will be End of Life (EOL) on April 15, 2026. License Activation Service (LAS) is the next generation technology for product activations across the suite of Citrix products. LAS will be the only way to activate and license Citrix on-premises components after April 15, 2026. To remain supported, your Citrix Virtual Apps and Desktops deployment must be on a LAS compatible version. The minimum required CVAD versions that are LAS compatible are:
>
> - CVAD 2203 LTSR CU7
> - CVAD 2402 LTSR CU3
> - CVAD 2507 LTSR
> - CVAD 2411
>
> If you have questions or concerns, contact Customer Care. Citrix might limit or suspend your Citrix Maintenance for non-compliance with these requirements without liability in addition to any other remedies Citrix might have at law or equity. These requirements don't apply where prohibited by law or regulation.

Introduction

Upgrading changes your deployment to the Citrix Virtual Apps and Desktops™ 7 **Current Release (CR)** without having to set up new machines or sites. This is known as an in-place upgrade.

Upgrading gives you access to the latest features and technologies that you're eligible for. Upgrades can also contain fixes, clarifications, and enhancements from earlier versions.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Upgrade overview

1. Review the Upgrade a deployment article before beginning the upgrade. This is the primary information source for learning how to prepare for and implement an upgrade.
2. Ensure that your current Customer Success Services dates are valid and have not expired. For more information, see the Customer Success Services renewal licenses article.
3. Complete the preparation guidance.
4. Run installers to upgrade core components.
5. Upgrade the system databases and the site.
6. Upgrade VDAs on images (or directly on machines).
7. Upgrade other components.

Each preparation and upgrade step is detailed in Upgrade a deployment.

Versions you can upgrade

You can upgrade to Citrix Virtual Apps and Desktops™ 2507 LTSR from:

- Virtual Apps and Desktops 2402 LTSR with or without CUs, up to and including CU2
- Virtual Apps and Desktops 2203 LTSR with or without CUs, up to and including CU6
- Currently supported CR versions of Citrix Virtual Apps and Desktops

> Note:
>
> - Before initiating the upgrade process, Citrix® recommends that customers test the upgrade in a controlled environment and verify that it meets their specific requirements. Additionally, we advise reviewing all relevant product documentation, including the deprecation list and known issues, to ensure a seamless transition. This approach helps mitigate potential disruptions to production systems and enhances the overall upgrade experience.
> For more information on the list of supported versions, see Product Matrix.

Frequently asked questions

This section answers some commonly asked questions about upgrading Citrix Virtual Apps and Desktops.

- **What is the correct order to upgrade my Virtual Apps and Desktops environment?**

  For an illustration and description of the recommended upgrade sequence, see Upgrade sequence and Upgrade procedure.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **My site has several Delivery Controllers (in different zones). What happens if I upgrade only some of them? Am I required to upgrade every Controller in the site during the same maintenance window?**

  The best practice is to upgrade all Delivery Controllers during the same maintenance window, as various services on each Controller communicate with each other. Keeping different versions might cause issues. During a maintenance window, we recommend you upgrade half of the Controllers, upgrade the site, and then upgrade the remaining Controllers. For details, see the Upgrade procedure.

- **Can I go directly to the latest version, or do I have to do incremental upgrades?**

  You can almost always upgrade to the latest version and skip intermediate releases, unless explicitly stated in the **What's new** article for the version you're upgrading to.
  See the [Upgrade Guide](/en-us/upgrade).

- **Can a customer upgrade from a Long Term Service Release (LTSR) environment to a Current Release?**

  Yes. Customers are not required to remain on a Long Term Service Release for an extended period. Customers can move an LTSR environment to a Current Release, based on business requirements and features.

- **Are mixed versions of components allowed?**

  Within each site, Citrix recommends upgrading all components to the same version. Although you can use earlier versions of some components, all features in the latest version might not be available. For more information, see Mixed environment considerations.

- **How often must a Current Release be upgraded?**

  Current Releases reach End of Maintenance (EOM) 6 months after the release date. Citrix recommends that customers adopt the latest Current Release. Current Releases reach End of Life (EOL) 18 months after the release date.

  For more information, see [Current Release Lifecycle](https://www.citrix.com/support/product-lifecycle/milestones/citrix-virtual-apps-and-desktops.html).

- **What is recommended: upgrade to LTSR or CR?**

  Current Releases (CRs) deliver the latest and most innovative app, desktop, and server virtualization features and functionality. This allows you to stay on leading-edge technology and ahead of your competition.

  Long Term Service Releases (LTSRs) are ideal for large enterprise production environments that prefer to retain the same base version for an extended period.

For details, see [Servicing Options](https://www.citrix.com/support/citrix-customer-success-services/citrix-virtual-apps-and-desktops-servicing-options.html).

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Do I need to upgrade my licenses?**

  Ensure that the current license date has not expired, and is valid for the release you are upgrading to. See CTX111618. For information about renewal, see Customer Success Services renewal licenses.

- **How long does an upgrade take?**

  The time required to upgrade a deployment varies, depending on the infrastructure and network. So, we can't provide an exact time.

- **What are the best practices?**

  Ensure that you understand and follow the preparation guidance.

- **Are sysadmin privileges required for a Citrix Virtual Apps and Desktops site upgrade?**

  No. For a standard site upgrade using Windows Authentication (the default), db_owner permissions on the existing databases (site, logging, and monitoring) are sufficient for the Site Manager to update the schemas. sysadmin is primarily required only for initial site creation or if the process must automatically create new databases and server-level logins.

- **Why does the Site Manager sometimes prompt for elevated rights during an upgrade?**

  The Site Manager might check for elevated rights if the upgrade requires server-level actions, such as:

  - Adding a new Delivery Controller: This requires creating a new SQL login for the Delivery Controller's machine identity.
  - Modifying logins: Actions that require `securityadmin` or `dbcreator` roles are often simplified into a request for sysadmin.
  - Automatic creation: If the Site Manager is tasked with automatically creating new database structures or mapping users rather than using pre-staged scripts.

- **Can I upgrade my database without granting the Citrix admin sysadmin rights?**

  Yes, you can upgrade by performing a manual upgrade. The Citrix admin uses the Site Manager to obtain the upgrade SQL script, then provides the db owner with the script to perform database upgrade. After the database is upgraded, the Citrix admin goes back to the Site Manager to finish the entire upgrade process.

- **Why do Citrix services run under the machine account?**

  Citrix services run under the Network Service account by default because it allows the server to use its own identity (the Machine Account, for example, DOMAIN\SERVER$) to securely communicate with other servers and the SQL database without the need for manual password management. This setup relies on Windows Authentication, which is the most secure and recommended method for connecting to SQL because it uses the existing trust within Active Directory.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- **Which operating systems are supported?**

  The System requirements article for the version you're upgrading to lists the supported OSs.

  If your current deployment uses operating systems that are no longer supported, see Earlier operating systems.

- **Which versions of VMware vSphere (vCenter + ESXi) are supported?**

  CTX131239 lists the supported hosts and versions, plus links to known issues.

- **When does my version go EOL?**

  Check the Product Matrix.

- **What are the known issues with the latest release?**

  - Citrix Virtual Apps and Desktops
  - StoreFront
  - Citrix Provisioning
  - Citrix License Server
  - Citrix Workspace app for Windows

More information

[Long Term Service Release (LTSR)](https://www.citrix.com/support/citrix-customer-success-services/citrix-virtual-apps-and-desktops-servicing-options.html)

Long Term Service Release (LTSR) deployment updates use Cumulative Updates (CUs). A CU updates baseline components of the LTSR, and each CU includes its own metainstaller.

Each CU has dedicated documentation. For example, for the 2203 LTSR, check the link on that LTSR's **What's new** page for the latest CU. Each CU page includes supported version information, instructions, and a link to the CU download package.

Migrate

Migrate to the cloud

You can use the Automated Configuration tool for Citrix Virtual Apps and Desktops to migrate your on-premises deployment onto the cloud. For more information, see Migrate to Cloud.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Legacy migration

Migrating moves data from an earlier deployment to a newer version. The process includes installing newer components and creating a new site, exporting data from the older farm, and then importing the data to the new site.

There are no supported tools or scripts for migrating XenApp and XenDesktop versions, or migrating earlier Citrix Virtual Apps and Desktops versions. *Upgrading* is supported for the Citrix Virtual Apps and Desktops versions described in this product documentation.

For earlier XenApp 6.x migration content, see the following. Neither the scripts nor the articles are supported or maintained.

- Open source migration scripts for XenApp 6.x versions are available at https://github.com/citrix/xa65migrationtool. Citrix does not support or maintain these migration scripts
- Changes in 7.x
- Upgrade a XenApp 6.5 worker to a new VDA
- Migrate XenApp 6.x

Upgrade a deployment

Introduction

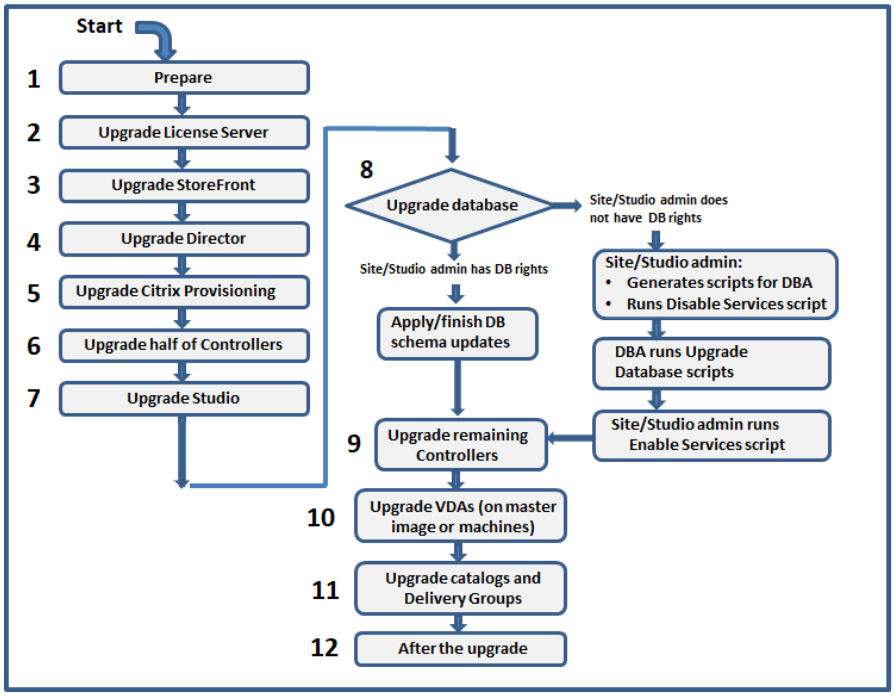
> **Note:**
>
> This article covers upgrades for deployments involving Web Studio. For information about upgrades involving Citrix Studio, see the equivalent article in Citrix Virtual Apps and Desktops™ 7 2212 or earlier.

You can upgrade certain deployments to newer versions without having to first set up new machines or sites. This is called an in-place upgrade.

To learn which Citrix Virtual Apps and Desktops versions you can upgrade, see the Versions you can upgrade.

Before you upgrade to any of the Citrix Virtual Apps and Desktops releases, ensure that your current Customer Success Services dates are valid and have not expired. For more information, see the Customer Success Services renewal licenses article.

To start an upgrade, you run the installer from the new version to upgrade previously installed core components, VDAs, and certain other components. Then you upgrade the database and the site.



You can upgrade any component that can be installed with the full-product installer (and the standalone VDA installers), if there is a newer version provided. For other components that are not installed with the full-product installer (such as Citrix Provisioning™ and Profile Management), see that component's documentation for guidance. For host upgrades, see the appropriate documentation.

Review all the information in this article before beginning an upgrade.

Upgrade sequence

The following diagram shows the steps the upgrade sequence. Upgrade procedure contains details of each step in the diagram.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> To avoid failures, you must upgrade all Delivery Controllers and database before performing any of the provisioning and delivery group related tasks such as creating a new machine catalog, deleting a machine catalog, updating a machine in a delivery group, and so on.

Hybrid Rights Licenses

Hybrid Rights licenses are term-based subscription licenses that are provided, in addition to the cloud service subscription, when a customer transitions or trades up from a perpetual license to a cloud service subscription. You can also purchase a Hybrid Rights add-on with your DaaS subscriptions.

If you have a Hybrid Rights license with a SaaS attribute, when you upgrade to Citrix Virtual Apps and Desktops™ LTSR 2203 and later, you become eligible to access capabilities not available with Citrix Virtual Apps and Desktops LTSR 1912. These capabilities include provisioning and hosting workloads in public clouds, such as Microsoft Azure, AWS EC2, and Google Cloud. Before deploying the new license file, update your License Server to the most recent version. Failure to meet this prerequisite will block the Citrix Virtual Apps and Desktops site upgrades and site creation.

If you have access to a Hybrid Rights license with no SaaS attribute, follow these steps to get access to the new Hybrid Rights license with SaaS attribute:

> **Note:**
>
> - You get an email with a new license code. For more information see, Use license access

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> code.
> - Your existing licenses are rescinded. Rescinded licenses must be deleted from License Servers followed by new license installation. For more information, see Deleting license files.

1. Go to citrix.com Manage Licenses portal and download the new Hybrid Rights license file with cloud provisioning rights enabled (SaaS attribute). For more information, see Download licenses. The following image shows the Hybrid Rights license file with the SaaS attribute in the Increments section.

2. Install the Hybrid Rights license file on the License Server. For more information, see Install licenses.
3. If there is a change in license editions or model, make sure you run the broker command to set the edition and the model and then start the in-place upgrade. For more information about Broker commands, see Broker PowerShell SDK section.

For more information about public cloud support with Citrix Virtual Apps and Desktops Current Releases and Long Term Service Releases, see CTX270373.

Upgrade procedure

Most of the main product components can be upgraded by running the product installer on the machine containing the component.

If one machine contains more than one component (for example, Studio and License Server), all components on that machine are upgraded, if the product media contains newer versions of their software.

To use the installers:

- To run the full product installer's graphical interface, log on to the machine and then insert the media or mount the ISO drive for the new release. Double-click **AutoSelect**.
- To use the command-line interface, issue the appropriate command. See Install using the command line.

Step 1: Prepare

Before you begin an upgrade, make sure you're ready. Read and complete any necessary tasks:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Remove PVD, AppDisks™, and unsupported hosts
- VDAs that have PvD or AppDisk components
- Limitations
- Mixed environment considerations
- Earlier operating systems
- Preparation
- Preliminary site tests
- SQL Server version check

Step 2: Upgrade License Server

If the installation has a new version of the Citrix License Server software, upgrade this component first before any other components.

If you have not yet determined whether your License Server is compatible with the new version, it is essential that you run the installer on the License Server before upgrading any other core components.

Step 3: Upgrade StoreFront™

If the installation media contains a new version of the StoreFront software, run the installer on the machine containing the StoreFront server.

- In the graphical interface, choose **Citrix StoreFront** from the **Extend deployment** section.
- From the command line, run `CitrixStoreFront-x64.exe`, which is available in the Citrix Virtual Apps and Desktops installation media's `x64` folder.

Step 4: Upgrade Director

If the installation media contains a new version of the Director software, run the installer on the machine containing Director.

Step 5: Upgrade Citrix Provisioning

The Citrix Provisioning installation media is available separately from the Citrix Virtual Apps and Desktops installation media. To learn how to install and upgrade Citrix Provisioning server and target device software, see the Citrix Provisioning product documentation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Step 6: Upgrade half of Delivery Controllers

For example, if your site has four Controllers, run the installer on two of them.

Leaving half of the Controllers active allows users to access the site. VDAs can register with the remaining Controllers. There might be times when the site has reduced capacity because fewer Controllers are available. The upgrade causes only a brief interruption in establishing new client connections during the final database upgrade steps. The upgraded Controllers cannot process requests until the entire site is upgraded.

If your site has only one Controller, it is inoperable during the upgrade.

Preliminary site tests run on the first Controller, before the actual upgrade starts. For details, see Preliminary site tests.

> **Note:**
>
> Site Manager is upgraded automatically along with Delivery Controllers.

Step 7: Upgrade Web Studio

If you haven't already upgraded Web Studio (because it was on the same machine as another component), run the installer on the machine containing Studio.

> **Note:**
>
> After you upgrade Web Studio, the version information might not update immediately. You might be prompted to upgrade Web Studio even though it's already up to date. To address the issue, go to the Web Studio server, open Internet Information Services (IIS) Manager, navigate to Start Page > Sites > Default Web Site, and select **Restart** in the **Manage Website** pane.

Step 8: Upgrade database and site

> **Note:**
>
> To avoid failures, you must upgrade all Delivery Controllers and database before performing any of the provisioning and delivery group related tasks such as creating a new machine catalog, deleting a machine catalog, updating a machine in a delivery group, and so on.

Check Preparation for the permissions required to update the schema of the SQL Server databases.

- If you have sufficient permission to update the SQL Server database schema, you can initiate an automatic database upgrade. Continue with Upgrade the database and site automatically.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If you do not have sufficient database permissions, you can initiate a manual upgrade that uses scripts, and proceed with the help of your database administrator (someone who has the required permissions). For a manual upgrade, the Site Manager user generates the scripts and then runs the scripts that enable and disable services. The database administrator runs other scripts that update the database schema, using either the SQLCMD utility or the SQL Server Management Site Manager in SQLCMD mode. Continue with Upgrade the database and site manually.
- If you have a multi-zone deployment and want to upgrade the database and site automatically, Citrix recommends that the dbschema upgrade must be performed in the same zone that hosts the SQL server databases of the site. Otherwise, upgrading the database and site automatically might fail.

Citrix strongly recommends that you back up the database before upgrading. See CTX135207. During a database upgrade, product services are disabled. During that time, Controllers cannot broker new connections for the site, so plan carefully.

Upgrade the database and site automatically using Site Manager

1. Launch Site Manager on the upgraded Delivery Controllers.
2. Indicate that you want to start the site upgrade automatically and confirm that you are ready.

Upgrade the database and site automatically using PowerShell cmdlet As an alternative to using Site Manager, use the PowerShell SDK cmdlet `Update-XDSite` to automatically upgrade the database and site. For more information, see Citrix Virtual Apps and Desktops SDK Guide.

1. On the second Delivery Controller, open a PowerShell session.
2. Run the `Update-XDSite` cmdlet.

The cmdlet automatically detects all components that require upgrading and performs the following actions:

- Disconnects database connections, updates the necessary database tables, and reconnects services. If the database was already upgraded by other scripts or standalone tools, this step is skipped.
- Runs any additional upgrade steps required for the environment. Global-level upgrades that are already complete are skipped.

Upgrade the database and site manually

1. Launch Site Manager on the upgraded Delivery Controllers.
2. Indicate that you want to upgrade the site manually. The wizard checks for License Server compatibility and requests confirmation.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Confirm that you have backed up the database.

   The wizard generates and displays the scripts and a checklist of upgrade steps. If a database's schema has not changed since the product version being upgraded, that script is not generated. For example, if the logging database schema does not change, the `UpgradeLoggingDatabase.sql` script is not generated.

4. Run the following scripts in the order shown.

   - `DisableServices.ps1`: The Site Manager user runs this PowerShell script on a Controller to disable product services.
   - `UpgradeSiteDatabase.sql`: The database administrator runs this SQL script on the server containing the Site database
   - `UpgradeMonitorDatabase.sql`: The database administrator runs this SQL script on the server containing the Monitor database.
   - `UpgradeLoggingDatabase.sql`: The database administrator runs this SQL script on the server containing the Configuration Logging database. Run this script only if this database changes (for example, after applying a hotfix).
   - `EnableServices.ps1`: The Site Manager user runs this PowerShell script on a Controller to enable product services.

   After the database upgrade completes and product services are enabled, Site Manager automatically tests the environment and configuration, and then generates an HTML report. If problems are identified, you can restore the database backup. After resolving issues, you can upgrade the database again.

5. After completing the checklist tasks, click **Finish upgrade**.

Step 9: Upgrade remaining Delivery Controllers

Upgrade the remaining Delivery Controllers. After completing the upgrade, close and reopen Site Manager. Site Manager might then prompt you to perform an additional site upgrade to register the Delivery Controller's services to the site.

Step 10: Upgrade VDAs

> **Important:**
>
> If you're upgrading a VDA to version 1912 or later, see Upgrading VDAs to 1912 or later.

Run the product installer on machines containing VDAs.

If you used Machine Creation Services™ and a master image to create machines, go to your host and upgrade the VDA on the master image. You can use any of the available VDA installers.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- For graphic interface guidance, see Install VDAs.
- For command line guidance, see Install using the command line.

If you used Citrix Provisioning to create machines, see the Citrix Provisioning product documentation for guidance about upgrading.

Step 11: Update machine catalogs and Delivery Groups

- Update catalogs that use machines with upgraded VDAs.
- Upgrade catalogs that use machines with upgraded VDAs.
- Upgrade Delivery Groups that use machines with upgraded VDAs.

Step 12: After the upgrade

Upgrade other components in your deployment. For guidance, see the following product documentation:

- StoreFront
- AppDNA
- Citrix App Layering
- HDX RealTime Optimization Pack
- Profile Management
- Citrix Provisioning
- Session Recording
- Workspace Environment Management

If you need to replace the Microsoft SQL Server Express LocalDB software with a later version, see Replace SQL Server Express LocalDB.

Dbschema upgrade

When you update your deployment, several database schemas can be upgraded. The following table lists which database schemas are upgraded in the process:

From\To	1912 CU1	1912 CU2	1912 CU3	1912 CU4	1912 CU5	2203
7.15 RTM or 7.15 CU releases	Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config; Logging
1912 RTM	Config	Site, Config	Site, Config	Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config; Logging
1912 CU1		Site	Site, Config	Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config; Logging
1912 CU2			Site, Config	Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config; Logging
1912 CU3				Site; Monitor; Config	Site; Monitor; Config	Site; Monitor; Config; Logging
1912 CU4					Site, Config	Site; Monitor; Config; Logging
1912 CU5						Site; Monitor; Config; Logging
2112						Site; Monitor; Config

Definition of terms:

- Site: Site Datastore. Dbschema update is made to the Site Datastore.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Monitor: Monitor Datastore. Dbschema update is made to the Monitor Datastore.
- Config: Configuration table. Studio version, Licensing information, or both are updated in the Configuration table.
- Logging: Logging Datastore. Dbschema update is made to the Logging Datastore.

Upgrade VDAs to 2203 or later

If the Personal vDisk (PvD) component was ever installed on a VDA, that VDA cannot be upgraded to version 2203 or later. To use the new VDA, you must uninstall the current VDA and then install the new VDA.

This instruction applies even if you never used PvD.

Here's how the PvD component might have been installed in earlier versions:

- In the VDA installer's graphical interface, PvD was an option on the **Additional Components** page.
- On the command line, the `/baseimage` option installed PvD. If you specified this option, or used a script that contained this option, PvD was installed.

If you don't know whether your VDA has PvD installed, run the installer for the new VDA (2203 or later) on the machine or image.

- If PvD is installed, a message appears, indicating there is an incompatible component.
  - From the graphical interface, click **Cancel** on the page containing the message, and then confirm that you want to close the installer.
  - From the CLI, the command simply fails with the displayed message.
- If PvD is not installed, the upgrade proceeds.

What to do

If the VDA does not have PvD installed, follow the usual upgrade procedure.

If the VDA has PvD installed:

1. Uninstall the current VDA.
2. Install the new VDA.

If you want to continue using PvD on your Windows 10 (1607 and earlier, without updates) machines, VDA 7.15 LTSR is the latest supported version.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> *Can I use Personal vDisk with Windows 7 desktops in XenApp and XenDesktop 7.15 LTSR?*
>
> Citrix excluded Personal vDisk (PvD) from XenApp and XenDesktop 7.6 LTSR which was announced in January 2016. Additionally, Citrix has announced the deprecation of the PvD technology and recommends that customers start using Citrix App Layering going forward. Citrix App Layering (version 4.4 and later) is a compatible component of XenApp and XenDesktop 7.15 LTSR. However, to help customers with existing PvD deployments on Windows 7 migrate to Citrix App Layering technology, Citrix has decided to provide limited time support for PvD deployments for Windows 7 desktops through XenApp and XenDesktop 7.15 LTSR Cumulative Updates (CUs) until Jan 14, 2020. The PvD component will be removed from LTSR CUs and not supported after Jan 14, 2020. Also, use of PvD for Windows 7 beyond Jan 14, 2020 will render LTSR sites non-compliant. Also, PvD for Windows 10 remains excluded from 7.15 LTSR. Therefore, customers must not use it with their 7.15 LTSR sites.

Remove PvD, AppDisks, and unsupported hosts

The following technologies and host types are not supported in Citrix Virtual Apps and Desktops 7 Current Release deployments:

- **Personal vDisks (PvD)** for storing data next to users'VMs in catalogs. The user personalization layer feature now handles user persistence.
- **AppDisks** for managing applications used in Delivery Groups.
- **Host types:** Azure Classic, CloudPlatform (the original Citrix product).
    - For host types supported in this release, see System requirements.

If your current deployment uses PvDs or AppDisks, or has connections to unsupported host types (for example, Microsoft Azure Classic), you can upgrade to version 2006 (or later supported versions) only after removing items that use those technologies. If your current deployment uses public cloud host connections (for example, AWS), ensure that you have Hybrid Rights License before upgrading. When the installer detects one or more of the unsupported technologies or host connections without Hybrid Rights License, the upgrade pauses or stops, and an explanatory message appears. The installer logs contain details.

To help ensure a successful upgrade, review and follow the applicable guidance for removing the unsupported items.

- Remove PvD
- Remove AppDisks
- Remove unsupported host items

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Even if you did not use PvD or AppDisks in your deployment, related MSIs might have been included in an earlier VDA installation or upgrade. Before you can upgrade your VDAs to version 2006 (or a later supported version), you must remove that software, even if you never used it. When using the graphical interface, that removal can be done for you, or you can include removal options when using the CLI. For details, see Upgrading VDAs that have PvD or AppDisks components.

Remove PvD

A deployment upgrade cannot succeed until you remove all machines that are configured to use PvD. This affects catalogs and Delivery Groups.

To remove PvD from groups and catalogs:

1. From Studio, if a Delivery Group contains machines from a catalog that uses PvD, remove those machines from the group.
2. From Studio, delete all catalogs containing machines that use PvD.

VDA upgrades: The deployment upgrade does not detect whether VDAs have the AppDisk or PvD components installed. However, the VDA installers do. For details, see VDAs that have PvD or AppDisks components.

If you plan to use App Layering instead of PvD, see Migrating PvD to App Layering for information about moving data.

Remove AppDisks

A deployment upgrade cannot proceed until you remove AppDisks from all Delivery Groups that use them, and then remove the AppDisks themselves.

1. Select **Delivery Groups** in the Studio navigation pane.
2. Select a group and then click **Manage AppDisks** in the Action pane.
3. Click the action that removes the AppDisk from the group.
4. Repeat steps 2 and 3 for each Delivery Group that uses AppDisks.
5. Select **AppDisks** in the Studio navigation pane.
6. Select an AppDisk and click the action that deletes the AppDisk.
7. Repeat steps 5 and 6 for each AppDisk.

VDA upgrades: The deployment upgrade does not detect whether VDAs have the AppDisk or PvD components installed. However, the VDA installers do. For details, see VDAs that have PvD or AppDisks components.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Remove unsupported host items

A deployment upgrade to version 2006 (or later supported version) cannot proceed if the site has connections to unsupported host types, such as Citrix CloudPlatform or Microsoft Azure Classic. Complete the following tasks before attempting an upgrade.

From Studio:

- Delete all connections to unsupported hosts.
- If a Delivery Group contains machines from a catalog created with a master image from an unsupported host, remove those machines from the group.
- Delete all catalogs that were created using a master image from an unsupported host.

VDAs that have PvD or AppDisks components

If the components that enable PvD and AppDisks technologies are installed on a VDA, that VDA cannot be upgraded until those components are removed.

> **Note:**
>
> When upgrading to version 1912, you had to uninstall the current VDA and then install the new VDA. In this version, you're asked if you want Citrix to remove the component and then continue the upgrade.

The AppDisk and PvD components might have been installed in earlier VDA versions, even if you never used those technologies:

- Graphical interface: In the VDA installers, the **Additional Components** page contained the **Citrix AppDisk / Personal vDisk** option. The 7.15 LTSR and earlier 7.x releases enabled this option by default. So, if you accepted the defaults (or explicitly enabled the option in any release that offered it), that component was installed.
- CLI: Specifying the `/baseimage` option installed the component.

What to do If the VDA installer does not detect the AppDisks or PvD components in the currently installed VDA, the upgrade proceeds as usual.

If the installer detects AppDisks or PvD components in the currently installed VDA:

- Graphical interface: The upgrade pauses. A message asks if you want the unsupported components removed automatically. If you click **OK**, the components are removed automatically and the upgrade proceeds.
- CLI: To avoid command failure, include the following options in the command:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- /remove_appdisk_ack
- /remove_pvd_ack

Limitations

The following limitations apply to upgrades:

- **Selective component install:** If you install or upgrade any components to the new version but choose not to upgrade other components (on different machines) that require upgrade, Studio reminds you. For example, let's say an upgrade includes new versions of the Controller and Studio. You upgrade the Controller but you do not run the installer on the machine where Studio is installed. Studio will not let you continue to manage the site until you upgrade Studio.

  You do not have to upgrade VDAs, but Citrix recommends upgrading all VDAs to enable you to use all available features.

- **Early Release or Technology Preview versions:** You cannot upgrade from an Early Release, Technology Preview, or preview version.

- **Components on earlier operating systems:** You cannot install current VDAs on operating systems that are no longer supported by Microsoft or Citrix. For more information, see Earlier operating systems.

- **Mixed environments/sites:** If you must continue to run earlier version sites and current version sites, see Mixed environment considerations.

- **Product selection:** When you upgrade from an earlier version, you do not choose or specify the product (Citrix Virtual Apps or Citrix Virtual Apps and Desktops) that was set during the installation.

Mixed environment considerations

When you upgrade, Citrix recommends that you upgrade all components and VDAs so that you can access all the new and enhanced features in your edition and version.

For example, although you can use current VDAs in deployments containing earlier Controller versions, new features in the current release might not be available. VDA registration issues can also occur when using non-current versions.

In some environments, you might not be able to upgrade all VDAs to the most current version. In that case, when you create a machine catalog, you can specify the VDA version installed on the machines. (This is called the functional level.) By default, this setting specifies the minimum recommended VDA version. The default value is sufficient for most deployments. Consider changing the setting to an

© 1997–2026 Citrix Systems, Inc. All rights reserved.

earlier version only if the catalog contains VDAs earlier than the default. Mixing VDA versions in a machine catalog is not recommended.

If a catalog is created with the default minimum VDA version setting, and one or more machines has a VDA earlier than the default version, those machines cannot register with the Controller, and will not work.

For more information, see VDA versions and functional levels.

Multiple sites with different versions

When your environment contains sites with different product versions (for example, a XenDesktop 7.18 site and a Citrix Virtual Apps and Desktops 1909 site), Citrix recommends using StoreFront to aggregate applications and desktops from different product versions. For details, see the StoreFront documentation.

In a mixed environment, continue using the Studio and Director versions for each release, but ensure that different versions are installed on separate machines.

Earlier operating systems

Let's say you installed an earlier version of a component on a machine that was running a supported operating system (OS) version. Now, you want to use a newer component version, but that OS is no longer supported for the current version of the component.

For example, assume that you installed a server VDA on a Windows Server 2016 machine. Now you want to upgrade that VDA to the current release, but Windows Server 2016 is not supported in the current release you're upgrading to.

If you try to install or upgrade a component on an operating system that is no longer allowed, an error message displays, such as "Cannot be installed on this operating system".

These considerations apply to upgrading Current Release and Long Term Service Release versions. (It does not affect applying CUs to an LTSR version.)

Follow the links to learn which OSs are supported:

- Citrix Virtual Apps and Desktops (Current Release):
  - Delivery Controller, Studio, Director, VDAs, Universal Print Server
  - Federated Authentication Service
  - For StoreFront, Self-Service Password Reset, and Session Recording, see the system requirements article for the current release.
- For LTSRs, see the components lists for your LTSR version and CU. (Select your LTSR version from the main Citrix Virtual Apps and Desktops product documentation page.)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Invalid operating systems

The following table lists the earlier operating systems that are not valid for installing/upgrading components in the current release. It indicates the latest valid component version supported for each listed OS, and the component version when installation and upgrade became invalid.

The operating systems in the table include service packs and updates.

Operating system	Component/feature	Latest valid version	Install/upgrade not possible as of version
Windows 7 and Windows 8	VDA	7.15 LTSR	7.16
Windows 7 and Windows 8	Other installer components	7.17	7.18
Windows 10 versions earlier than 1607	VDA	7.15 LTSR	7.16
Windows 10 x86 version	VDA	1906.2.0	1909
Windows Server 2008 R2	VDA	7.15 LTSR	7.16
Windows Server 2008 R2	Other installer components	7.17	7.18
Windows Server 2012	VDA	7.15 LTSR	7.16
Windows Server 2012	Other installer components	7.17	7.18
Windows Server 2012 R2	Other installer components *	1912 LTSR	2003
Windows Server 2012 R2	Server VDI	7.15 LTSR	7.16
Windows Server 2016	Server VDI	7.15 LTSR	7.16

Windows XP and Windows Vista are not valid for any 7.x components or technologies.

* Applies to Delivery Controller, Studio, Director, and VDAs.

What you can do

You have choices. You can:

- Continue with the current OS

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Reimage or upgrade the machine
- Add new machines and then remove old machines

Continue with the current OS These methods are feasible for VDAs. If you want to continue using machines with the earlier OS, you can choose one of the following:

- Continue using the installed component version.
- Download the latest valid component version and then upgrade the component to that version. (This assumes that the latest valid component version isn't already installed.)

For example, you have a 7.14 VDA on a Windows 7 SP1 machine. The latest valid VDA version on Windows 7 OS machines is XenApp and XenDesktop 7.15 LTSR. You can either continue using 7.14, or download a 7.15 LTSR VDA and then upgrade your VDA to that version. Those earlier VDA versions work in deployments containing Delivery Controllers with newer versions. For example, a 7.15 LTSR VDA can connect to a Citrix Virtual Apps and Desktops 7 1808 Controller.

Reimage or upgrade the machine These methods are feasible for VDAs and other machines that do not have core components (such as Delivery Controllers) installed. Choose one of the following:

- After taking the machine out of service (turning on maintenance mode and allowing all sessions to close), you can reimage it to a supported Windows OS version, and then install the latest version of the component.
- To upgrade the OS in a VDA machine without reimaging, you must first install the VDA version that is supported on the OS that you are upgrading to or upgrade the VDA after upgrading the OS. Otherwise, the Citrix software will be unsupported. You can upgrade to the following minimum OS versions when performing an in-place upgrade without uninstalling the VDA:
  - Windows 11 with 2023-07 Cumulative Update for Windows 11 (KB5028185) or later installed (build 22621.1992 or later).
  - Windows 10 with 2023-07 Dynamic Update for Windows 10 (KB5028311) installed.
- If the Windows version you plan to upgrade to does not align with the aforementioned guideline, you must uninstall the VDA before upgrading the OS, and then install a supported VDA version after the OS upgrade is complete.

Add new machines and then remove old machines This method is feasible if you must upgrade the OS on machines containing a Delivery Controller™ or other core component.

Citrix recommends that all Controllers in a site have the same OS. The following upgrade sequence minimizes the interval when different Controllers have different OSs.

1. Take a snapshot of all Delivery Controllers in the site and then back up the site database.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Install new Delivery Controllers on clean servers with supported operating systems.
3. Add the new Controllers to the site.
4. Remove the Controllers that are running on operating systems that are not valid for the current release. Follow the recommendations for removing Controllers in Delivery Controllers.

Preparation

Before beginning an upgrade, review the following information and complete necessary tasks.

> **Note:**
>
> Although upgrading VDAs occurs later in the upgrade sequence, it's a good idea to choose an installer and review the procedure before you start the upgrade, so you know what to expect.

Choose an installer and interface

Use the full-product installer from the product ISO to upgrade components. You can upgrade VDAs using the full-product installer or one of the standalone VDA installers. All installers offer graphical and command-line interfaces.

For more information, see Installers.

Installation specifics: After you complete any preparation work and are ready to start the installer, the installation article shows you what you will see (if you're using the graphical interface) or what to type (if you're using the command-line interface).

- Install/upgrade core components using the graphical interface
- Install/upgrade core components using the command line
- Install/upgrade VDAs using the graphical interface
- Install/upgrade VDAs using the command line

For single-session operating systems, four different installers are available. Citrix advises using a consistent installer type throughout the entire life cycle of a Citrix VDA—including installation, upgrade, and uninstallation. For more information, see Best practices for using single-session VDA installers

When upgrading a VDA to the current release, a machine restart occurs during the upgrade process. (This requirement started with the 7.17 release.) This cannot be avoided. The upgrade resumes automatically after the restart (unless you specify `/noresume` on the command line).

Database actions

Back up the site, monitoring, and configuration logging databases. Follow the instructions in CTX135207. If any issues are discovered after the upgrade, you can restore the backup.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

For information about upgrading SQL Server versions that are no longer supported, see SQL Server version check. (This refers to the SQL Server that is used for the site, monitor, and configuration logging databases.)

Microsoft SQL Server Express LocalDB is installed automatically, for use with Local Host Cache. If you need to replace an earlier version, the new version must be SQL Server Express LocalDB 2019. For details about replacing SQL Server Express LocalDB with the new version after you upgrade the components and the site, see Replace SQL Server Express LocalDB.

Ensure that your Citrix licensing is up-to-date

For a comprehensive look at managing Citrix Licensing, see Activate, upgrade, and manage Citrix licenses.

You can use the full-product installer to upgrade the License Server. Or, you can download and upgrade the license components separately. See Upgrade.

Before upgrading, be sure your Customer Success Services / Software Maintenance / Subscription Advantage date is valid for the new product version. The date must be at least 2021.11.15.

Ensure that your Citrix License Server is compatible

Ensure that your Citrix License Server is compatible with the new version. There are two ways to do this:

- Before upgrading any other Citrix components, run the `XenDesktopServerSetup.exe` installer from the ISO layout on the machine containing a Delivery Controller. If there are any incompatibility issues, the installer reports it with recommended steps to resolve the issues.
- From the `XenDesktop Setup` directory on the installation media, run the command: `.\LicServVerify.exe -h <license-server-fqdn> -p 27000 -v`. The display indicates whether the License Server is compatible. If the License Server is incompatible, upgrade the license server.

Back up any StoreFront modifications

Before starting an upgrade, if you have modified files in `C:\inetpub\wwwroot\Citrix\<StoreName>\App_Data`, such as *default.ica* and *usernamepassword.tfrm*, back them up for each store. After the upgrade you can restore them to reinstate your modifications.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Close applications and consoles

Before starting an upgrade, close all programs that might potentially cause file locks, including administration consoles and PowerShell sessions.

Restarting the machine ensures that any file locks are cleared, and that there are no Windows updates pending.

Before starting an upgrade, stop and disable any third-party monitoring agent services.

Ensure that you have proper permissions

In addition to being a domain user, you must be a local administrator on the machines where you are upgrading product components.

The site database and the site can be upgraded automatically or manually. For an automatic database upgrade, the Studio user's permissions must include the ability to update the SQL Server database schema (for example, the `db_securityadmin` or `db_owner` database role). For details, see Databases.

If the Studio user does not have those permissions, initiating a manual database upgrade generates scripts. The Studio user runs some of the scripts from Studio. The database administrator runs other scripts, using a tool such as SQL Server Management Studio.

Other preparation tasks

- Back up templates and upgrade hypervisors, if needed
- Complete any other preparation tasks dictated by your business continuity plan.

Preliminary site tests

When you upgrade Delivery Controllers and a site, preliminary site tests run before the actual upgrade begins. These tests verify:

- The site database can be reached and has been backed up
- Connections to essential Citrix services are working correctly
- The Citrix License Server address is available
- The configuration logging database can be reached
- Ensure you have Hybrid Rights License if you want to add public cloud host connections (for example, AWS). Otherwise, the preliminary site test pauses or stops, and an explanatory message appears.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

After the tests run, you can view a report of the results. You can then fix any issues that were detected, and run the tests again. Failure to run the preliminary site tests and then resolve any issues can impact how your site works.

The report containing the test results is an HTML file (`PreliminarySiteTestResult.html`) in the same directory as the installation logs. That file is created if it does not exist. If the file exists, its content is overwritten.

Run the tests

- When you're using the installer's graphical interface to upgrade, the wizard includes a page where you can start the tests and then display the report. After the tests run and you have viewed the report and resolved any issues that were found, you can rerun the tests. When the tests complete successfully, click Next to continue with the wizard.
- When you're using the command-line interface to upgrade, the tests run automatically. By default, if a test fails, the upgrade is not performed. After you view the report and resolve issues, rerun the command.

Citrix recommends always running the preliminary site tests and then resolving any issues before you continue the Controller and site upgrade. The potential benefit is well worth the few moments to run the tests. However, you can override this recommended action.

- When upgrading with the graphical interface, you can choose to skip the tests and continue with the upgrade.
- When upgrading from the command line, you cannot skip the tests. By default, a failed site test causes the installer to fail, without performing the upgrade. Usually, if you include the `/ignore_site_test_failure` option, any test failures are ignored and the upgrade proceeds. (See SQL Server version check for exceptions.)

When upgrading multiple Controllers

When you start an upgrade on one Controller, and then start an upgrade of another Controller in the same site (before the first upgrade completes):

- If the preliminary site tests are completed on the first Controller, the preliminary site tests page does not appear in the wizard on the other Controller.
- If the tests on the first Controller are ongoing when you start the upgrade on the other Controller, the site tests page appears in the wizard on the other Controller. However, if the tests on the first Controller finish, only the test results from the first Controller are retained.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Test failures not related to the site's health

- If the preliminary site tests fail due to insufficient memory, make more memory available and then rerun the tests.
- If you have permission to upgrade, but not run site tests, the preliminary site tests fail. To resolve this, rerun the installer with a user account that has permission to run the tests.

SQL Server version check

A successful Citrix Virtual Apps and Desktops deployment requires a supported version of Microsoft SQL Server for the site, monitor, and configuration logging databases. Upgrading a Citrix deployment with a SQL Server version that's no longer supported can result in functionality issues, and the site will be unsupported.

To learn which SQL Server versions are supported for the Citrix release you're upgrading to, see the System requirements article for that release.

When upgrading a Controller, the Citrix installer checks the currently installed SQL Server version used for the site, monitor, and configuration logging databases.

- If the check determines that the currently installed SQL Server version is not a supported version in the Citrix release you're upgrading to:
  - Graphical interface: The upgrade halts with a message. Click **I understand** and then click **Cancel** to close the Citrix installer. (You cannot continue with the upgrade.)
  - Command-line interface: the command fails (even if you included the /`ignore_db_check_failur` option with the command).

  Upgrade the SQL Server version, and then start the Citrix upgrade again.
- If the check cannot determine which SQL Server version is currently installed, see if your currently installed version is supported in the version you're upgrading to (System requirements).
  - Graphical interface: The upgrade halts with a message.
    - If the currently installed SQL Server version is supported, click **I understand** to close the message, and then click **Next** to continue with the Citrix upgrade.
    - If the currently installed SQL Server version is not supported, click **I understand** to close the message, and then click **Cancel** to end the Citrix upgrade. Upgrade your SQL Server to a supported version and then start the Citrix upgrade again.
  - Command-line interface: The command fails with a message. After closing the message:
    - If the currently installed SQL Server version is supported, run the command again with the /`ignore_db_check_failure` option.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- If the currently installed SQL Server version is not supported, upgrade your SQL Server to a supported version. Run the command again to start the Citrix upgrade.

Upgrading SQL Server

If you bring up new SQL Server servers and migrate the site database, then connection strings must be updated.

If the site currently uses SQL Server Express for the site database (that Citrix installed automatically during site creation):

1. Install the latest SQL Server Express version.
2. Detach the database.
3. Attach the database to the new SQL Server Express.
4. Migrate connection strings.

For more information, see Configuring connection strings and the Microsoft SQL Server product documentation.

Replace SQL Server Express LocalDB

Microsoft SQL Server Express LocalDB is a feature of SQL Server Express that Local Host Cache uses on a standalone basis. Local Host Cache does not require any components of SQL Server Express other than SQL Server Express LocalDB.

When upgrading Delivery Controllers to Citrix Virtual Apps and Desktops version 2203 LTSR or later versions, the supported version is SQL Server Express LocalDB 2019 or SQL Server Express LocalDB 2022.

There are two ways of updating SQL Server Express LocalDB:

- Automatic update
- Manual update

Automatic update

When you upgrade Delivery Controllers, the metainstaller automatically installs the latest compatible version of the SQL Server Express LocalDB. The metainstaller does not uninstall the old LocalDB version. You must manually uninstall the old version after you confirm the new version works correctly.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Verify new SQL Server Express LocalDB installation Before uninstalling the old version, verify that the new SQL Server Express LocalDB installation is working correctly:

1. Use Command Prompt to navigate to the SqlLocalDB instance:
   - For SQL LocalDB 2014: `cd C:\Program Files\Microsoft SQL Server\120\Tools\Binn`
   - For SQL LocalDB 2017: `cd C:\Program Files\Microsoft SQL Server\140\Tools\Binn`
   - For SQL LocalDB 2019: `cd C:\Program Files\Microsoft SQL Server\150\Tools\Binn`
   - For SQL LocalDB 2022: `cd C:\Program Files\Microsoft SQL Server\160\Tools\Binn`
2. Run `SqlLocalDB i`.

   You must see two files: CitrixHA and MSSQLLocalDB.

Manual update

Prerequisites

- The Citrix Virtual Apps and Desktops installation media.
- The PsExec tool from the Windows Sysinternals toolbox.

Procedure

1. Complete the upgrade of your Citrix Virtual Apps and Desktops components, databases, and site. (Those database upgrades affect the site, monitoring, and configuration logging databases. They do not affect the Local Host Cache database that uses SQL Server Express LocalDB.)
2. Log on to the Delivery Controller, where you would like to update SQL Server Express LocalDB.
3. Download PsExec from Microsoft and place it in an easily accessible location on that Delivery Controller, such as C:\Temp.
4. Stop the Citrix High Availability Service on the Delivery Controller from the Windows System Services.
5. Open the Command Prompt on the Delivery Controller, navigate to the location with PsExec (example, `C:\Temp`), and then run the following command to elevate the command prompt with the Network Service account:

```
1 psexec -i -u "NT AUTHORITY\NETWORKSERVICE" cmd
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Run `whoami` to confirm that the command prompt is running as the Network Service account. You must get the following output: `nt authority\networkservice`.
7. Use the command prompt to navigate to the SQL LocalDB instance:
   - If upgrading from SQL LocalDB 2014:

     ```
     cd "C:\Program Files\Microsoft SQL Server\120\Tools\Binn"
     ```

   - If upgrading from SQL LocalDB 2017:

     ```
     cd "C:\Program Files\Microsoft SQL Server\140\Tools\Binn"
     ```

   - If upgrading from SQL LocalDB 2019:

     ```
     cd "C:\Program Files\Microsoft SQL Server\150\Tools\Binn"
     ```

8. Stop and delete the SQL LocalDB instance: `CitrixHA`.

   ```
   SqlLocalDB stop CitrixHA

   SqlLocalDB delete CitrixHA
   ```

9. Remove the following files from the Delivery Controller:

   ```
   C:\Windows\ServiceProfiles\NetworkService\HADatabaseName.*
   C:\Windows\ServiceProfiles\NetworkService\HADatabaseName_log.*
   C:\Windows\ServiceProfiles\NetworkService\HAImportDatabaseName.* (if exists)
   C:\Windows\ServiceProfiles\NetworkService\HAImportDatabaseName_log.* (if exists)
   ```

10. Uninstall your existing SQL LocalDB SQL Server Express from the Delivery Controller using the native Windows feature for removing programs.
11. Reboot the Delivery Controller after the uninstallation is complete.
12. Stop the Citrix High Availability Service on the Delivery Controller from the Windows System Services.
13. Mount the Citrix Virtual Apps and Desktops installation media to your Delivery Controller.
14. Install SQL Server Express LocalDB 2022 as an administrator on the Delivery Controller.
    a) Use the `sqllocaldb.msi` file in the `Support > SQLLocalDB` folder of the Citrix Virtual Apps and Desktops installation media. For example, if the installation media is mounted to the `E drive` letter, the file can be found at `E:\Support\SQLLocalDB\sqllocaldb.msi`. A restart is required to complete the installation.
    b) The new SQL LocalDB must be in `C:\Program Files\Microsoft SQL Server\160\Tools\Binn`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

15. Start the Citrix High Availability Service on the Delivery Controller from the Windows System Services.
16. In the Command Prompt of the Delivery Controller, navigate to `C:\Program Files\Microsoft SQL Server\160\Tools\Binn` and run `SqlLocalDB i` to confirm that the CitrixHA instance was created. The `CitrixHA` must be included in the list of instances returned.

    > **Note:**
    >
    > It can take up to 15 minutes for the CitrixHA database to be created after starting the Citrix High Availability Service.

17. Ensure that the Local Host Cache database files are created to confirm that the High Availability Service (secondary broker) can take over if needed.
    a) On the Delivery Controller, browse to `C:\Windows\ServiceProfiles\NetworkService`.
    b) Verify that `HaDatabaseName.mdf` and `HaDatabaseName_log.ldf` are created.
18. Repeat the steps on the remaining Delivery Controllers.

Proxy Support for VDA Upgrade Agent

May 13, 2026

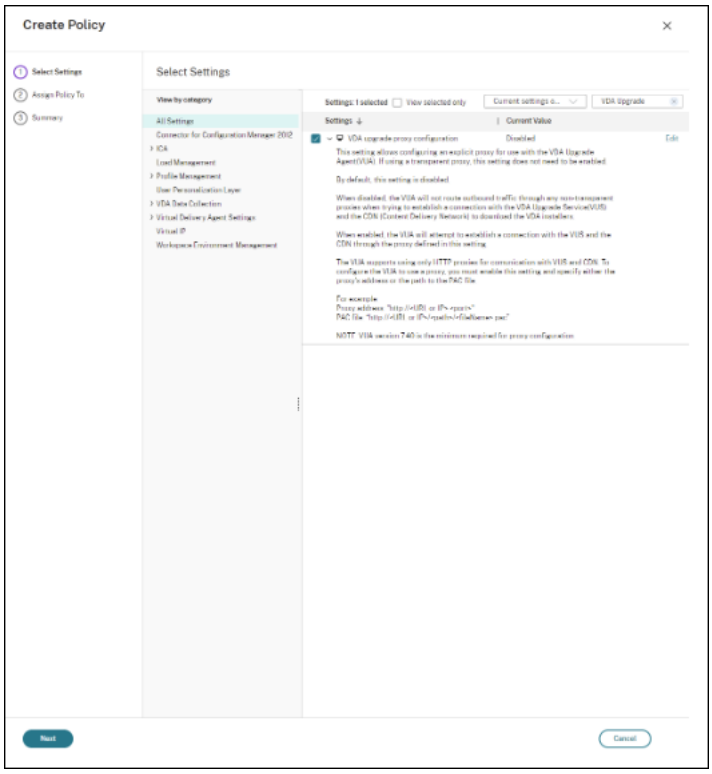
Proxy Support for VDA Upgrade Agent has been added in 2311 VDA.

VDA Upgrade Agent from 2311 VDA i,e Version: 7.40 can recognize and send traffic through the Proxy.

VDA Upgrade Agent (VUA) Supports Proxy in the form of Hostname:Port (IP:Port) and PAC file.

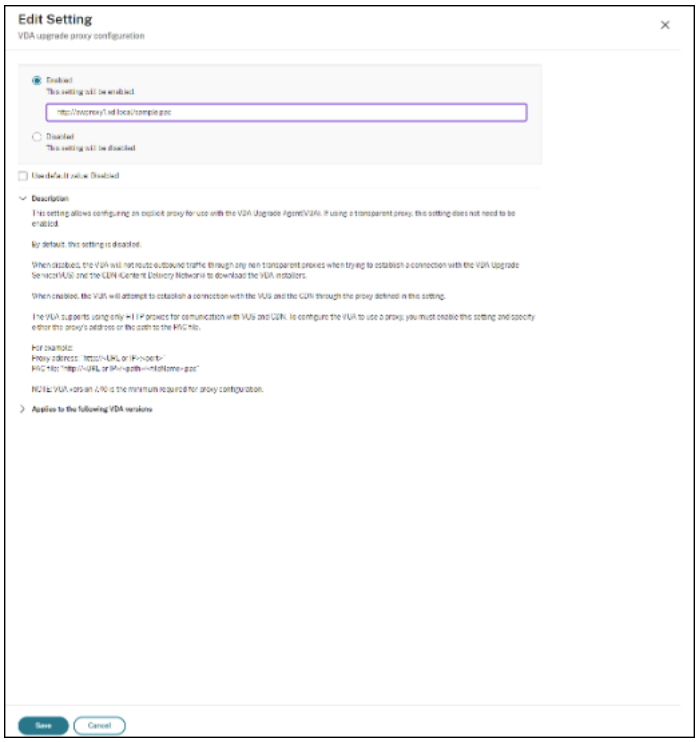
Only HTTP proxies are supported.
Packet decryption and inspection are not supported.

Proxy authentication is not supported.
SOCKS5 is not supported.



Configuring VDA Upgrade Agent Proxy

VDA Upgrade Agent Proxy can be configured in 2 ways:



1. **Configuring VDA Upgrade Agent Policy** using **Webstudio Policy**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Select **VDA upgrade proxy configuration** from the **Settings** on the **Create Policy** page.

3. Enable the setting. By default, the setting is disabled.

4. Configuring VDA Upgrade Agent using Registry Key.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The registry Key is set to Meta-Installer during VDA Installation.

Registry:

Key: HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\VirtualDesktopAgent

Value type: String

Value name: ProxySettings

Value data: Proxy address or path to pac file.

For Example:

a) Proxy address: http://<URL or IP>:<port>
b) Pac file: http://<URL or IP>/<path/<filename>.pac

Secure

May 15, 2026

Citrix Virtual Apps and Desktops™ offers a secure-by-design solution that allows you to tailor your environment to your security needs.

One security concern IT faces with mobile workers is lost or stolen data. By hosting applications and desktops, Citrix Virtual Apps and Desktops™ securely separates sensitive data and intellectual property from end-point devices by keeping all data in a data center. When policies are enabled to allow data transfer, all data is encrypted.

The Citrix Virtual Apps and Desktops data centers also make incident response easier with a centralized monitoring and management service. Director allows IT to monitor and analyze data that is being accessed around the network, and Studio allows IT to patch and remedy most vulnerabilities in the data center instead of fixing the problems locally on each end-user device.

Citrix Virtual Apps and Desktops also simplify audits and regulatory compliance because investigators can use a centralized audit trail to determine who accessed what applications and data. Director gathers historical data regarding updates to the system and user data usage by accessing Configuration Logging and OData API.

Delegated administration allows you to set up administrator roles to control access to Citrix Virtual Apps and Desktops at a granular level. This allows flexibility in your organization to give certain administrators full access to tasks, operations, and scopes while other administrators have limited access.

Citrix Virtual Apps and Desktops give administrators granular control over users by applying policies at different levels of the network - from the local level to the Organizational Unit level. This control

© 1997–2026 Citrix Systems, Inc. All rights reserved.

of policies determines if a user, device, or groups of users and devices can connect, print, copy/paste, or map local drives, which can minimize security concerns with third-party contingency workers. Administrators can also use the Desktop Lock feature so end users can only use the virtual desktop while preventing any access to the local operating system of the end-user device.

Administrators can increase security on Citrix Virtual Apps or Citrix Virtual Desktops by configuring the Site to use the Transport Layer Security (TLS) protocol of the Controller or between end users and Virtual Delivery Agents (VDA). The protocol can also be enabled on a Site to provide server authentication, data stream encryption, and message integrity checks for a TCP/IP connection.

Citrix Virtual Apps and Desktops also support multifactor authentication for Windows or a specific application. Multifactor authentication can also be used to manage all resources delivered by Citrix Virtual Apps and Desktops. These methods include:

- Tokens
- Smart cards
- RADIUS
- Kerberos
- Biometrics

Citrix Virtual Desktops can be integrated with many third-party security solutions, ranging from identity management to antivirus software. A list of supported products can be found at http://www.citrix.com/ready.

Select releases of Citrix Virtual Apps and Desktops are certified for Common Criteria standard. For a list of those standards, go to https://www.commoncriteriaportal.org/cc/.

FIDO2 and WebAuthn authentication

May 13, 2026

Local authorization and virtual authentication using FIDO2 and WebAuthn

Users can authenticate to applications that leverage FIDO2 or WebAuthn in their virtual session using FIDO2 security keys and integrated biometrics devices with TPM 2.0 and Windows Hello.

For more information about FIDO2, see FIDO2: WebAuthn & CTAP.

For information about using this feature, see FIDO2 redirection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **NOTE**
>
> Please note that this feature does not support logging into the virtual session using WebAuthn or FIDO2. This feature only allows using these authentication methods in applications within the virtual session.

Prerequisites and Configuration

June 19, 2026

Supportability matrix

Session host operating system	Web application authentication	UWP application authentication
Windows Server 2016	Supported via USB redirection	Not supported
Windows Server 2019	Supported	Not supported
Windows Server 2022	Supported	Supported
Windows Server 2025	Supported	Supported
Windows 10	Supported	Supported
Windows 11	Supported	Supported

> **Note:**
>
> Support for the authentication methods listed above depends on the capabilities of the underlying operating system. For example, UWP applications are not supported on Windows Server 2019 due to an OS limitation.

For additional information, please review the requirements below.

Web application authentication

Requirements

The following are the requirements for using FIDO2 and WebAuthn authentication with web applications:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix® control plane

- Citrix Virtual Apps and Desktops™ 2203 or later

Session host

- Operating system
  - Windows 10 22H2 or later
  - Windows 11
  - Windows Server 2019 or later
- VDA
  - Windows: version 2203 or later

Client device

- Operating system
  - Windows 10 22H2 or later
  - Windows 11
  - Linux: Please refer to the Workspace app for Linux system requirements
  - Mac: Please refer to the Workspace app for Mac system requirements
- Workspace app
  - Windows: version 2402 or later
  - Linux: 2303 or later
  - Mac: 2307 or later

Web browser requirements

- 32-bit and 64-bit browsers

Authentication methods supported

- FIDO2 Security Key
- Windows Hello
  - TPM 2.0
  - Integrated biometrics
    - Facial recognition
    - Fingerprint scanner
  - WebAuthn

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Passkeys

> **Note:**
>
> - Support for the authentication methods listed above depends on the capabilities of the underlying client operating system.
> - Passkeys are not supported on Windows 10 client devices and/or session hosts.

UWP application authentication

With the release of Citrix Virtual Apps and Desktops™ 2112, Citrix supports WebAuthn and FIDO2 authentication in UWP applications.

Applications such as Microsoft Teams, Microsoft Outlook for Office 365 and OneDrive use a UWP application for authentication as a link to Microsoft Entra ID. Citrix now supports using FIDO2 to authenticate those applications.

Requirements

The following are the requirements for using FIDO2 and WebAuthn authentication with UWP applications:

Citrix control plane

- Citrix Virtual Apps and Desktops 2112 or later

Session host

- Operating system
  - Windows 10 22H2 or later
  - Windows 11
  - Windows Server 2022 or later
- VDA
  - Windows: version 2203 or later

Client device

- Operating system
  - Windows 10 22H2 or later
  - Windows 11

© 1997–2026 Citrix Systems, Inc. All rights reserved.

    - Linux: Please refer to the Workspace app for Linux system requirements
    - Mac: Please refer to the Workspace app for Mac system requirements
- Workspace app
    - Windows: version 2402 or later
    - Linux: 2303 or later
    - Mac: 2307 or later

UWP application requirements

- 32-bit and 64-bit applications

Authentication methods supported

- FIDO2 Security Key
- Windows Hello
    - TPM 2.0
    - Integrated biometrics
        - Facial recognition
        - Fingerprint scanner
    - WebAuthn
    - Passkeys

> **Note:**
>
> Support for the authentication methods listed above depends on the capabilities of the underlying operating system.
>
> In scenarios where FIDO2 redirection is not available because the feature is not supported by the client or VDA or the operating system, USB based FIDO2 keys can be redirected using USB redirection.
> It is also possible to use USB redirection to redirect USB based FIDO2 keys in scenarios where FIDO2 redirection is available. In this case, you must disable FIDO2 redirection and configure the appropriate USB redirection rules.
> Please refer to the USB redirection device rules documentation for details on how to configure FIDO2 keys using USB redirection rules.

Configuration

FIDO2 redirection is enabled by default. No additional configuration is required to authenticate to applications running in Chrome, Edge, Brave and Firefox browsers. For information about relevant

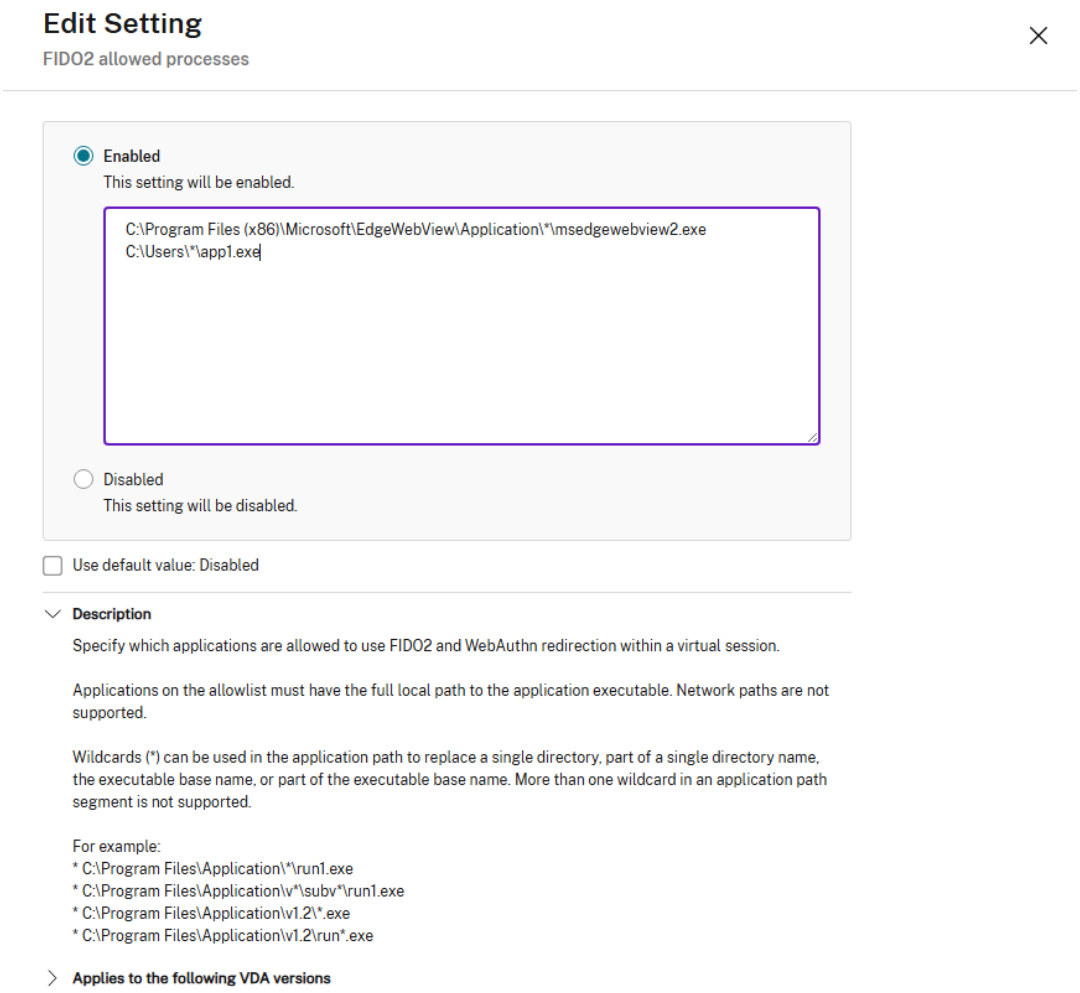
© 1997–2026 Citrix Systems, Inc. All rights reserved.

policy settings, see FIDO2 redirection settings.

For enterprises using any other applications that require FIDO2 authentication, additional configuration in the registry is needed. For more information, see Advanced configuration.

> **Note:**
>
> FIDO2 redirection is supported in double-hop scenarios as long as the Citrix Workspace App for Windows installed on the intermediate hop VDA is version 2503 or later. Additionally, this is only supported when the 2nd hop connection is over ICA.

Advanced configuration for custom applications



June 19, 2026

For enterprises that have any other web applications (i.e not Chrome, Edge, Firefox or Brave), the following change needs to be made for FIDO2 redirection to work inside HDX sessions:

1. Configure the **FIDO2 allowed processes** policy setting in Studio.
    - Add the full path of the application in the text field. Additional details on policy setting usage can be found in the policies section.

      > **Note:**
      >
      > The use of wildcards (*) is supported. You can use wildcards when the names of directories or executables change based on the version of the application, or if the application is installed in the users' profiles.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

2. Add the following registry keys and values:

   a) For 64 bit applications (e.g. “app1.exe”):

   - Key: `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\CtxHook\AppInit_DLLs\CtxWebAuthnHook\app1.exe`

   b) For 32 bit applications:

   - Key: `HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Citrix\CtxHook\AppInit_DLLs\CtxWebAuthnHook\app1.exe`

3. Reboot the VDA after setting the registry values for FIDO2 redirection to be enabled for app1.exe.

> **Note:**
>
> - `msedgewebview2.exe` needs to be configured only in the Studio policy setting. Step 2 and 3 are not needed for `msedgewebview2.exe`.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> - Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot.
> - Guarantee that problems resulting from the incorrect use of the Registry Editor can be solved.
> - Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.
> - The registry keys configured in Step 2 persists across VDA upgrades.

FIDO2 diagnostics tool

August 12, 2026

`CtxFido2Diagnostics.exe` is a command-line tool on the VDA that helps Citrix administrators and support engineers diagnose and resolve FIDO2 redirection configuration issues in HDX sessions. The tool collects and displays key configuration data in JSON format, enabling rapid identification of policy misconfigurations, missing application hookings, and version mismatches.

The tool is located at: `C:\Program Files\Citrix\HDX\bin\CtxFido2Diagnostics.exe`

The tool's path is included in the system environment variables during VDA installation, so you can run it from any directory by typing `CtxFido2Diagnostics.exe`.

Requirements

Session host

- **Operating system:** Windows 10 1809 or later, Windows 11 21H2 or later, Windows Server 2019 or later

Client device

- **Operating system:** Windows 10 1809 or later

Information displayed

When you run `CtxFido2Diagnostics.exe` from within an HDX session, the tool outputs a JSON object containing the following diagnostic information:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

CVAD Version

Displays the version of Citrix Virtual Apps and Desktops installed on the session host. Use this to verify that the VDA version supports FIDO2 redirection and the specific WebAuthn features required by your deployment.

Example:

```
"CVAD Version": "2607.0.100.407"
```

CWA Version

Displays the version of Citrix Workspace app installed on the client device. Both the VDA and Citrix Workspace app must meet minimum version requirements for FIDO2 redirection to function correctly.

Example:

```
"CWA Version": "CWA for Windows, 26.3.10.69"
```

Fido2PolicyEnabled

Indicates whether the FIDO2 redirection policy is enabled (`true`) or disabled (`false`) for the current session. When this value is `false`, FIDO2 redirection does not function regardless of other configuration settings.

Administrators configure this policy through Citrix Studio or Citrix Group Policy under **ICA > FIDO2**.

Example:

```
"Fido2PolicyEnabled": true
```

Session ID

Displays the ID of the current HDX session. This value is useful for correlating the diagnostic output with session logs in Director or event viewer entries during troubleshooting.

Example:

```
"Session ID": 2
```

© 1997–2026 Citrix Systems, Inc. All rights reserved.

WebAuthn API Version

Displays the WebAuthn API version supported by the current CVAD and CWA combination. The API version determines which FIDO2/WebAuthn capabilities are available for redirection.

Example:

```
"WebAuthn API Version": 7
```

FIDO2 Allowed Processes Registry setting

Lists the application process paths configured through the registry on the session host that are permitted to use FIDO2 redirection. These paths correspond to the registry value at:

`HKLM\SOFTWARE\Citrix\CtxHook\AppInit_DLLs\CtxWebAuthnHook\`

This list typically includes supported browsers (Chrome, Edge, Firefox, Brave), the Azure AD Broker Plugin, and the Citrix ICA client itself. The FIDO2 diagnostics tool executable is also included so it can perform diagnostic calls.

FIDO2 Allowed Processes Studio Policy setting

Lists additional application process paths configured by administrators through Citrix Studio policy setting that are allowed to use FIDO2 redirection. These entries supplement the registry-based list and allow administrators to add custom applications (such as third-party authenticator utilities) without modifying the registry directly.

FIDO2 Redirection Hookable Applications

Lists the application executable names that the FIDO2 hooking module has successfully identified and can intercept for WebAuthn API redirection. Only applications appearing in this list will have their FIDO2 authentication requests redirected to the client device.

If an application appears in the allowed processes list but does not appear here, the hooking module was unable to attach to it. This can indicate a compatibility issue, an application that is not currently running, or a configuration problem.

Related information

For detailed guidance on resolving FIDO2 redirection issues identified by this tool, see Troubleshoot FIDO2 redirection.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Troubleshooting

June 19, 2026

The following steps should be followed to troubleshoot FIDO2 redirection issues:

1. **Check system requirements**
    a) Validate system requirements are being met for FIDO2 redirection based on the official Citrix documentation.
2. **Verify device connection**
    a) For physical FIDO2 keys:
        i. Ensure the FIDO2 key is correctly inserted and visible on the client endpoint.
        ii. Use your operating system device manager (e.g., Device Manager on Windows, System Information on macOS) to confirm the device is recognized and functioning.
        iii. If the device is not detected:
            A. Try reinserting the key or using a different USB port.
            B. Test the key on another device to rule out hardware issues.
    b) For built-in authenticators (ex. Windows Hello, etc.) -
        i. Confirm the feature is enabled and configured on your client device.
    c) This is important because if the client device does not recognize the FIDO2 key, Citrix cannot redirect it to the HDX session.
3. **Verify Citrix policy settings and configuration**
    a) Review FIDO2/WebAuthn redirection and USB redirection settings in your Citrix policies.
        i. FIDO2 redirection policy is enabled.
        ii. If EdgeWebView2 or custom desktop applications are being used, appropriate file paths are added in the **FIDO2 allowed processes** policy setting.
        iii. **No** device rules are set for FIDO2 keys to redirect the device using generic USB redirection.
    b) If Citrix components have been updated recently, verify that your configuration aligns with the new versions.
4. **Use HDX Monitor for Diagnostics**
    a) Launch an HDX session and open the web browser or the UWP application and navigate to the authentication page.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) Select the sign in method as security key or Webauthn or FIDO2. You should see a dialog prompt from the wfica32.exe process as a result of the FIDO2 call being redirected (see attached screenshot). If this isn't the case:

i. Ensure that the key is not being redirected using the generic USB virtual channel. If the key is redirected inside the HDX session, you will likely see a dialog prompt that says "Insert your security key into the USB port". To resolve this, disable USB redirection or ensure that the security key is not redirected inside the HDX session.
ii. Open HDX Monitor in the HDX session and navigate to the **FIDO2 - Webauthn Redirection** node.
iii. Ensure that the FIDO2 Allow Redirection policy is set to **True** and the application that requires FIDO2/WebAuthn authentication is listed in the **FIDO2 Redirection Hooked Applications**. If the application is not present, add it to the appropriate registry location based on the information in the advanced configuration.
iv. Ensure that the full path of the applications that require FIDO2/WebAuthn authentication are listed in the **FIDO2 allowed processes** policy setting. If the full path is not present, add it to the **FIDO2 allowed processes** policy setting in Studio. For additional information, reference the configuration section.
v. (Legacy) If FIDO2 redirection is configured using the legacy registry based settings, migrate your configuration to the **FIDO2 allowed processes** policy setting in Studio, and ensure the full path of the applications that require FIDO2/WebAuthn authentication are included. For additional information, reference the configuration section.

> **Note:**
>
> If you do not already have HDX Monitor installed on your session host, you can install it from the Support folder of the Citrix Virtual Apps and Desktops installer.

1. **Collect logs and contact technical support**

a) If the issue persists after following the above steps -

i. Collect HDX Monitor output, Citrix Workspace App and VDA CDF logs.
ii. Document all troubleshooting steps you have taken and any error messages encountered.
iii. Contact your IT support team or Citrix Support, providing the collected information for faster resolution.

Common Issues and Solutions

1. **FIDO2 authentication may not work with webpages opened using Microsoft Edge browser**

a) **Potential cause**: Sandboxed instances of Edge with an AppContainer do not allow Citrix to hook into the process, which prevents redirection of WebAuthn calls from working.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

b) **Solution**: This can be addressed by updating the appropriate setting in Group policy editor or via Intune. Additional information on this can be found here. Alternatively, setting the **DynamicCodeSettings** registry value to 0 should also help resolve the issue.

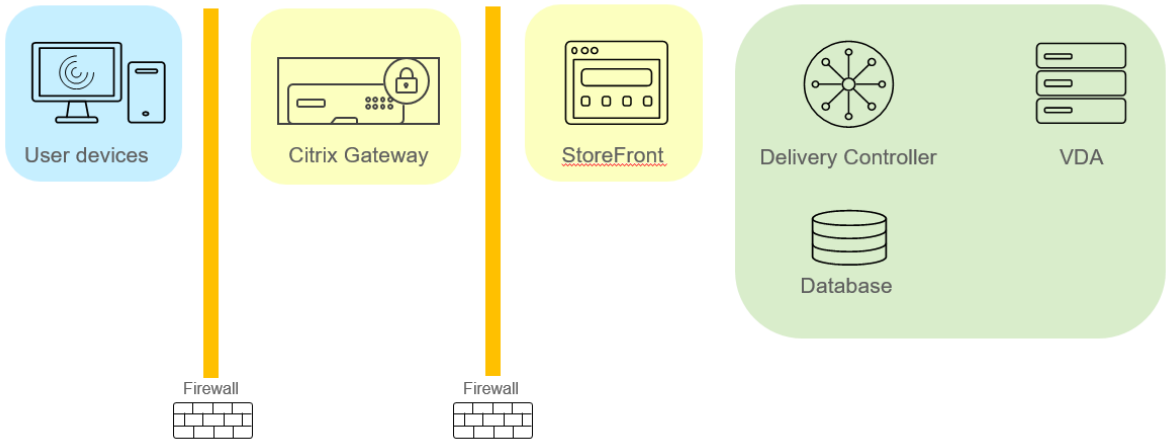
- **Key**: `Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Edge\`
- **Value name**: `DynamicCodeSettings`
- **Value type**: `DWORD`
- **Value data**: 0

2. **FIDO2 (ex. Yubikeys) redirection doesn't work in web browsers**

a) **Potential cause**: FSLogix Profile management AppMasking rules related to browser might prevent the Citrix FIDO2 service from viewing and validating the file path where the browser is installed.

b) **Solution**: Disabling the relevant hiding rules in FSLogix that make the Chrome file path invisible to the Citrix FIDO2 service will ensure the Yubikey is successfully redirected and appears in the browser.

Integrate Citrix Virtual Apps and Desktops™ with Citrix Gateway



May 15, 2026

StoreFront™ servers are deployed and configured to manage access to published resources and data. For remote access, adding Citrix Gateway in front of StoreFront is recommended.

> **Note:**
>
> For detailed configuration steps on how to integrate Citrix Virtual Apps and Desktops with Citrix Gateway, see the StoreFront documentation.

The following diagram illustrates an example of a simplified Citrix deployment that includes Citrix Gateway. Citrix Gateway communicates with StoreFront to protect apps and data delivered by Citrix Virtual Apps and Desktops™. The user devices run Citrix Workspace™ app to create a secure connection and access their apps, desktops, and files.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Users log on and authenticate using Citrix Gateway. Citrix Gateway is deployed and secured in the DMZ. Two-factor authentication is configured. Based on the user credentials, users are provided with the relevant resources and applications. Applications and data are on appropriate servers (not shown on the diagram). Separate servers used for security sensitive applications and data.

Security considerations and best practices

May 15, 2026

> **Note:**
>
> Your organization might need to meet specific security standards to satisfy regulatory requirements. This document does not cover this subject, because such security standards change over time. For up-to-date information on security standards and Citrix products, consult the Citrix Trust Center.

Firewalls

Protect all machines in your environment with perimeter firewalls, including at enclave boundaries as appropriate.

All machines in your environment must be protected by a personal firewall. When you install core components and VDAs, you can choose to have the ports required for component and feature communication opened automatically if the Windows Firewall Service is detected (even if the firewall is not enabled). You can also choose to manually configure those firewall ports. If you use a different firewall, you must manually configure it. For more information on required ports, see Tech Paper: Communication Ports Used by Citrix Technologies.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

If you are migrating a conventional environment to this release, you may need to reposition an existing perimeter firewall or add new perimeter firewalls. For example, suppose there is a perimeter firewall between a conventional client and database server in the data center. When this release is used, that perimeter firewall must be placed so that the virtual desktop and user device are on one side, and the database servers and Delivery Controllers in the data center are on the other side. Therefore, consider creating an enclave within your data center to contain the database servers and Controllers. Also consider having protection between the user device and the virtual desktop.

> **Note:**
>
> TCP ports 1494 and 2598 are used for ICA and CGP and are therefore likely to be open at firewalls so that users outside the data center can access them. Citrix recommends that you do not use these ports for anything else, to avoid the possibility of inadvertently leaving administrative interfaces open to attack. Ports 1494 and 2598 are officially registered with the Internet Assigned Number Authority (http://www.iana.org/).

Secure communications with Delivery Controller™

Encrypting communication using HTTPS

StoreFront and NetScaler gateway communicate with the XML service running on the delivery controller over HTTP or HTTPS. Depending on configuration, VDAs may communicate with the delivery controller using WebSocket. Director communicates with the monitor data using OData over HTTP or HTTPS. It is recommended that you enable HTTPS and disable HTTP. This requires that you Enable TLS on Delivery Controllers.

- To configure StoreFront to connect using HTTPS, see Add resource feeds for Citrix Virtual Apps and Desktops and Add Citrix Gateway appliance.
- To configure a NetScaler gateway to connect to the Delivery Controller using HTTPS, see Configuring the Secure Ticket Authority on NetScaler Gateway.

Security Keys

You can use Security Keys to ensure that only authorized StoreFront and NetScaler servers are able to connect to DaaS via the cloud connectors. This is especially important if you have enabled XML trust.

XML trust

By default, when StoreFront connects to the delivery controller for actions such as enumeration and launch, StoreFront must pass through the user's Active Directory credentials so that DaaS can authen-

© 1997–2026 Citrix Systems, Inc. All rights reserved.

ticate the user and check the user's group membership. However when using other authentication methods such as domain pass-through, smart cards or SAML, StoreFront does not have the Active Directory password. In this case you must enable "XML Trust". With XML trust enabled, Citrix Virtual Apps and Desktops allows StoreFront to perform actions on behalf of a user such as enumerating and launching applications without validating the user's password. Before enabling XML trust, use Security Keys or another mechanism such as firewalls or IPsec to ensure that only trusted StoreFront servers are able to connect to the Delivery Controllers.

Use the Citrix Virtual Apps and Desktops PowerShell SDK to check, enable, or disable the XML trust setting.

- To check the XML trust setting's current value, run `Get-BrokerSite` and inspect the value of `TrustRequestsSentToTheXMLServicePort`.
- To enable or disable XML trust, run `Set-BrokerSite` with parameter `TrustRequestsSentToTheXml`.

Communication between VDA and Delivery Controller

There are two mechanisms for VDAs communicating with controllers.

- Windows Communication Foundation

  Windows Communication Foundation (WCF) message-level protection secures communication between the Delivery Controller and the VDA. This eliminates the need for extra transport-level protection using TLS. The default port used for communication between VDA and Delivery Controller is 80. However, you can customize the port. For information, see Customize a VDA.

  For information on message security in WCF, see the Microsoft documentation Message Security in WCF.

  The WCF configuration uses Kerberos for mutual authentication between the Controller and VDA. Encryption uses AES in CBC mode with a 256-bit key. Message integrity uses SHA-1.

  According to Microsoft, the Security protocols used by WCF conform to standards from OASIS (Organization for the Advancement of Structured Information Standards), including WS-SecurityPolicy 1.2. Also, Microsoft states that WCF supports all algorithm suites listed in Security Policy 1.2.

  Communication between the Controller and VDA uses the basic256 algorithm suite, whose algorithms are as stated before.

  The WCF configuration uses SOAP over HTTP protocol along with the message-level security encryption.

- WebSockets

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This is the modern replacement for WCF. It provides the benefit that only the TLS port 443 for communication from the VDA to the Delivery Controller. It is currently only available for MCS provisioned machines. For more information, see WebSocket communication between VDA and Delivery Controller.

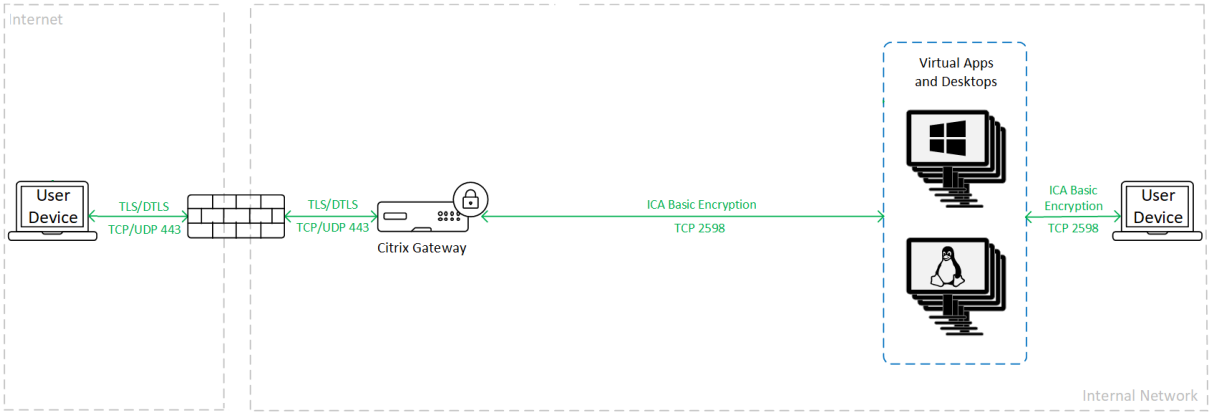
Secure communications between Delivery Controller and License Server

The Delivery controller communicates with the License Server over HTTPS. By default it uses a self-signed certificate but it is recommended that you replace this with a certificate issued by an enterprise or public certificate authority. For more information, see Manually install a certificate used by the Citrix Licensing Manager and Web Services for Licensing.

Secure communications between web browsers and Web Studio and Director

Web Studio and Director may be installed on the same machine as the Delivery Controller or a separate machines. Users connect to Web Studio and Director using a web browser. By default Web Studio enables HTTPS using a self-signed certificate, while Director installed stand-alone does not configure HTTPS. It is recommended that you Enable TLS on Web Studio and Director, using an appropriate certificate.

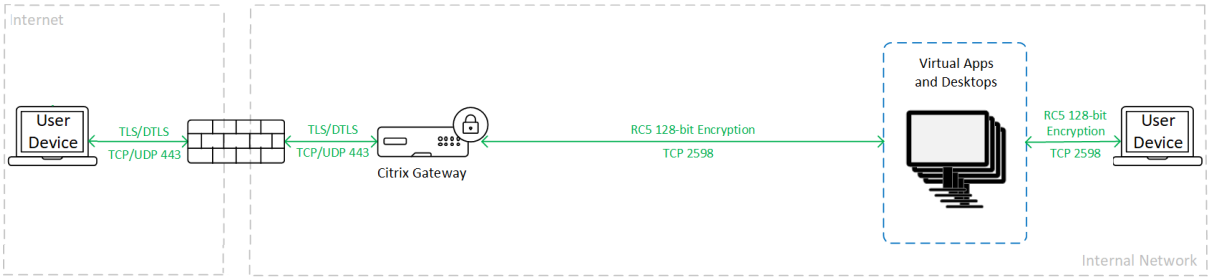
Securing ICA® communications



Citrix Virtual Apps and Desktops™ provides several options for securing ICA traffic between the client and the VDA. The following are the options available:

- **Basic encryption:** The default setting.
- **SecureICA:** Allows encrypting session data using RC5 (128-bit) encryption.
- **VDA TLS/DTLS:** Allows using network-level encryption using TLS/DTLS.

Basic encryption

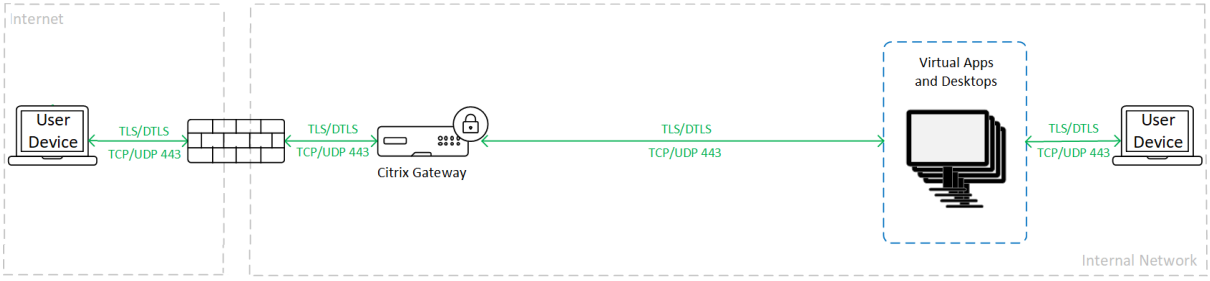


When using basic encryption, traffic is encrypted as shown in the following graphic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

SecureICA

When using SecureICA, traffic is encrypted as shown in the following graphic.



For more information see Security policy settings

> **Note 1:**
>
> SecureICA is not supported when the Workspace app for HTML5.
>
> **Note 2:**
>
> Citrix SecureICA forms part of the ICA/HDX protocol but it is not a standards-compliant network security protocol like Transport Layer Security (TLS).

VDA TLS/DTLS

When using VDA TLS/DTLS encryption, traffic is encrypted as shown in the following graphic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

To configure VDA TLS/DTLS, see TLS settings on VDAs.

Virtual channels

Use the virtual channel allow list to control which non-Citrix virtual channels are allowed in your environment.

Secure communications with print server

You can enable TLS for TCP-based connections between the Virtual Delivery Agent (VDA) and the Universal Print Server. For more information, see Transport Layer Security (TLS) on Universal Print Server.

Secure communication with the site database

For information about enabling TLS to the Site database, see CTX137556.

VDA machine security

General recommendations

Ensure that your VDAs are kept up to date with the latest operating security updates and antivirus.

Application security

To prevent non-admin users from performing malicious actions, Citrix® recommends that you configure Windows AppLocker rules for installers, applications, executables, and scripts on the VDA host.

8.3 file names

You can disable 8.3 file names on VDAs. See Microsoft fsutil documentation.

Data storage considerations

Your desktop environment might consist of various types of desktops, such as pooled and dedicated desktops. Users must never store data on desktops that are shared among the users, such as pooled desktops. If users store data on dedicated desktops, that data must be removed if the desktop is later made available to other users.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

User account management

Apply Windows best practice for account management. Do not create an account on a template or image before it is duplicated by Machine Creation Services or Provisioning Services. Do not schedule tasks using stored privileged domain accounts. Do not manually create shared Active Directory machine accounts. These practices will help prevent a machine attack from obtaining local persistent account passwords and then using them to log on to MCS/PVS shared images belonging to others.

Grant users only the capabilities they require. Microsoft Windows privileges continue to be applied to desktops in the usual way: configure privileges through User Rights Assignment and group memberships through Group Policy. One advantage of this release is that it is possible to grant a user administrative rights to a desktop without also granting physical control over the computer on which the desktop is stored.

Note the following when planning for desktop privileges:

- By default, when non-privileged users connect to a desktop, they see the time zone of the system running the desktop instead of the time zone of their own user device. For information on how to allow users to see their local time when using desktops, see the Manage Delivery Groups article.
- A user who is an administrator on a desktop has full control over that desktop. If a desktop is a pooled desktop rather than a dedicated desktop, the user must be trusted in respect of all other users of that desktop, including future users. All users of the desktop need to be aware of the potential permanent risk to their data security posed by this situation. This consideration does not apply to dedicated desktops, which have only a single user; that user should not be an administrator on any other desktop.
- A user who is an administrator on a desktop can generally install software on that desktop, including potentially malicious software. The user can also potentially monitor or control traffic on any network connected to the desktop.

Manage logon rights

Logon rights are required for both user accounts and computer accounts. As with Microsoft Windows privileges, logon rights continue to be applied to desktops in the usual way: configure logon rights through User Rights Assignment and group memberships through Group Policy.

The Windows logon rights are: log on locally, log on through Remote Desktop Services, log on over the network (access this computer from the network), log on as a batch job, and log on as a service.

For computer accounts, grant computers only the logon rights they require. The logon right "Access this computer from the network"is required for the computer accounts of Delivery Controllers.

For user accounts, grant users only the logon rights they require.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

According to Microsoft, by default the group Remote Desktop Users is granted the logon right "Allow log on through Remote Desktop Services"(except on domain controllers).

Your organization's security policy may state explicitly that this group should be removed from that logon right. Consider the following approach:

- The Virtual Delivery Agent (VDA) for Multi-session OS uses Microsoft Remote Desktop Services. You can configure the Remote Desktop Users group as a restricted group, and control membership of the group via Active Directory group policies. Refer to Microsoft documentation for more information.
- For other components of Citrix Virtual Apps and Desktops™, including the VDA for Single-session OS, the group Remote Desktop Users is not required. So, for those components, the group Remote Desktop Users does not require the logon right "Allow log on through Remote Desktop Services"; you can remove it. Additionally:
    - If you administer those computers via Remote Desktop Services, ensure that all such administrators are already members of the Administrators group.
    - If you do not administer those computers via Remote Desktop Services, consider disabling Remote Desktop Services itself on those computers.

Although it is possible to add users and groups to the login right "Deny logon through Remote Desktop Services", the use of deny logon rights is not generally recommended. Refer to Microsoft documentation for more information.

Delivery Controller security

Windows services on Delivery Controller

Delivery Controller installation creates the following Windows services:

- Citrix AD Identity Service (NT SERVICE\CitrixADIdentityService): Manages Microsoft Active Directory computer accounts for VMs.
- Citrix Analytics (NT SERVICE\CitrixAnalytics): Collects site configuration usage information for use by Citrix, if this collection been approved by the site administrator. It then submits this information to Citrix, to help improve the product.
- Citrix App Library (NT SERVICE\CitrixAppLibrary): Supports management and provisioning of AppDisks, AppDNA integration, and management of App-V.
- Citrix Broker Service (NT SERVICE\CitrixBrokerService): Selects the virtual desktops or applications that are available to users.
- Citrix Configuration Logging Service (NT SERVICE\CitrixConfigurationLogging): Records all configuration changes and other state changes made by administrators to the site.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Citrix Configuration Service (NT SERVICE\CitrixConfigurationService): Site-wide repository for shared configuration.
- Citrix Delegated Administration Service (NT SERVICE\CitrixDelegatedAdmin): Manages the permissions granted to administrators.
- Citrix Environment Test Service (NT SERVICE\CitrixEnvTest): Manages self-tests of the other Delivery Controller services.
- Citrix Host Service (NT SERVICE\CitrixHostService): Stores information about the hypervisor infrastructures used in a Citrix Virtual Apps or Citrix Virtual Desktops deployment, and also offers functionality used by the console to enumerate resources in a hypervisor pool.
- Citrix Machine Creation Services (NT SERVICE\CitrixMachineCreationService): Orchestrates the creation of desktop VMs.
- Citrix Monitor Service (NT SERVICE\CitrixMonitor): Collects metrics for Citrix Virtual Apps or Citrix Virtual Desktops, stores historical information, and provides a query interface for troubleshooting and reporting tools.
- Citrix StoreFront Service (NT SERVICE\ CitrixStorefront): Supports management of StoreFront. (It is not part of the StoreFront component itself.)
- Citrix StoreFront Privileged Administration Service (NT SERVICE\CitrixPrivilegedService): Supports privileged management operations of StoreFront. (It is not part of the StoreFront component itself.)
- Citrix Config Synchronizer Service (NT SERVICE\CitrixConfigSyncService): Propagates configuration data from the main site database to the Local Host Cache.
- Citrix High Availability Service (NT SERVICE\CitrixHighAvailabilityService): Selects the virtual desktops or applications that are available to users when the main site database is unavailable.

Delivery Controller installation also creates the following Windows services. These are also created when installed with other Citrix components:

- Citrix Diagnostic Facility COM Server (NT SERVICE\CdfSvc): Supports the collection of diagnostic information for use by Citrix Support.
- Citrix Telemetry Service (NT SERVICE\CitrixTelemetryService): Collects diagnostic information for analysis by Citrix, such that the analysis results and recommendations can be viewed by administrators to help diagnose issues with the site.

Delivery Controller installation also creates the following Windows service. This is not currently used. If it has been enabled, disable it.

- Citrix Remote Broker Provider (NT SERVICE\XaXdCloudProxy)

Delivery Controller installation also creates these following Windows services. These are not currently used, but must be enabled. Do not disable them.

- Citrix Orchestration Service (NT SERVICE\CitrixOrchestration)
- Citrix Trust Service (NT SERVICE\CitrixTrust)

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Except for the Citrix StoreFront™ Privileged Administration Service, these services are granted the logon right Log on as a service and the privileges Adjust memory quotas for a process, Generate security audits, and Replace a process level token. You do not need to change these user rights. These privileges are not used by the Delivery Controller and are automatically disabled.

Except for the Citrix StoreFront Privileged Administration service and the Citrix Telemetry Service, the Delivery Controller Windows services listed before are configured to log on as the NETWORK SERVICE identity. Do not alter these service settings.

The Citrix Config Synchronizer Service needs the NETWORK SERVICE account to belong to the Local Administrator group on the Delivery Controller. This allows Local Host Cache to work correctly.

The Citrix StoreFront Privileged Administration service is configured to log on Local System (NT AUTHORITY\SYSTEM). This is required for Delivery Controller StoreFront operations that are not normally available to services (including creating Microsoft IIS sites). Do not alter its service settings.

The Citrix Telemetry Service is configured to log on as its own service-specific identity.

You can disable the Citrix Telemetry Service. Apart from this service, and services that are already disabled, do not disable any other of these Delivery Controller Windows services.

Manage logon rights

The computer accounts of VDAs must have login right "Access this computer from the network". See Active Directory OU-based Controller discovery.

Client access

Client access is normally provided by deploying Citrix StoreFront. For more information on securing StoreFront, see StoreFront documentation.

To allow remote users to security connect to StoreFront and the VDAs, deploy a NetScaler® gateway.

Citrix recommends that clients connect to StoreFront using Citrix Workspace app. For more more information, see the security sections of the documentation for Citrix Workspace app for each operating system. Alternatively users may use a web browser to access StoreFront.

Consider providing users with thin clients where users have limited ability to run applications other than Citrix Workspace™ app. Where devices are managed by your organization you should put in policies to ensure deployment of operating system security updates and anti-virus software. However in many cases users need to be able to connect from un-managed device outside of the control of your organization. Consider using the following features:

- Endpoint Analysis to scan endpoints for security information such as operating system and anti-virus and denies access to clients that do not meet your security requirements.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- App Protection blocks key loggers and screen capture.

Mixed-version environments

Mixed-version environments, for instance where the VDAs have a different version to the Delivery Controller, are inevitable during some upgrades. Follow best-practice and minimize the time that Citrix components of different versions co-exist. In mixed-version environments, security policy, for example, might not be uniformly enforced.

> **Note:**
>
> This is typical of other software products. The use of an earlier version of Active Directory only partially enforces Group Policy with later versions of Windows.

The following scenario describes a security issue that can occur in a specific mixed-version Citrix environment. When Citrix Receiver 1.7 is used to connect to a virtual desktop running the VDA in XenApp and XenDesktop 7.6 Feature Pack 2, the policy setting **Allow file transfer between desktop and client** is enabled in the Site but cannot be disabled by a Delivery Controller running XenApp and XenDesktop 7.1. It does not recognize the policy setting, which was released in the later version of the product. This policy setting allows users to upload and download files to their virtual desktop, which is the security issue. To work around this, upgrade the Delivery Controller (or a standalone instance of Studio) to version 7.6 Feature Pack 2 and then use Group Policy to disable the policy setting. Alternatively, use local policy on all affected virtual desktops.

Remote PC Access security considerations

Remote PC Access implements the following security features:

- Smart card use is supported.
- When a remote session connects, the office PC's monitor appears as blank.
- Remote PC Access redirects all keyboard and mouse input to the remote session, except CTRL+ALT+DEL and USB-enabled smart cards and biometric devices.
- SmoothRoaming is supported for a single user only.
- When a user has a remote session connected to an office PC, only that user can resume local access of the office PC. To resume local access, the user presses Ctrl-Alt-Del on the local PC and then logs on with the same credentials used by the remote session. The user can also resume local access by inserting a smart card or leveraging biometrics, if your system has appropriate third-party Credential Provider integration. This default behavior can be overridden by enabling Fast User Switching via Group Policy Objects (GPOs) or by editing the registry.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> Citrix recommends that you do not assign VDA administrator privileges to general session users.

Automatic assignments

By default, Remote PC Access supports automatic assignment of multiple users to a VDA. In XenDesktop 5.6 Feature Pack 1, administrators can override this behavior using the RemotePCAccess.ps1 PowerShell script. This release uses a registry entry to allow or prohibit multiple automatic remote PC assignments. This setting applies to the entire Site.

> **Caution:**
>
> Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

To restrict automatic assignments to a single user:

On each Controller in the Site, set the following registry entry:

```
HKEY\_LOCAL\_MACHINE\Software\Citrix|DesktopServer
Name: AllowMultipleRemotePCAssignments
Type: REG_DWORD
Data: 0 = Disable multiple user assignment, 1 = (Default) Enable
   multiple user assignment.
```

If there are any existing user assignments, remove them using SDK commands for the VDA to subsequently be eligible for a single automatic assignment.

- Remove all assigned users from the VDA: `$machine.AssociatedUserNames | %{ Remove-BrokerUser-Name $_ -Machine $machine`
- Remove the VDA from the Delivery Group: `$machine | Remove-BrokerMachine -DesktopGroup $desktopGroup`

Restart the physical office PC.

Manage certificates

May 13, 2026

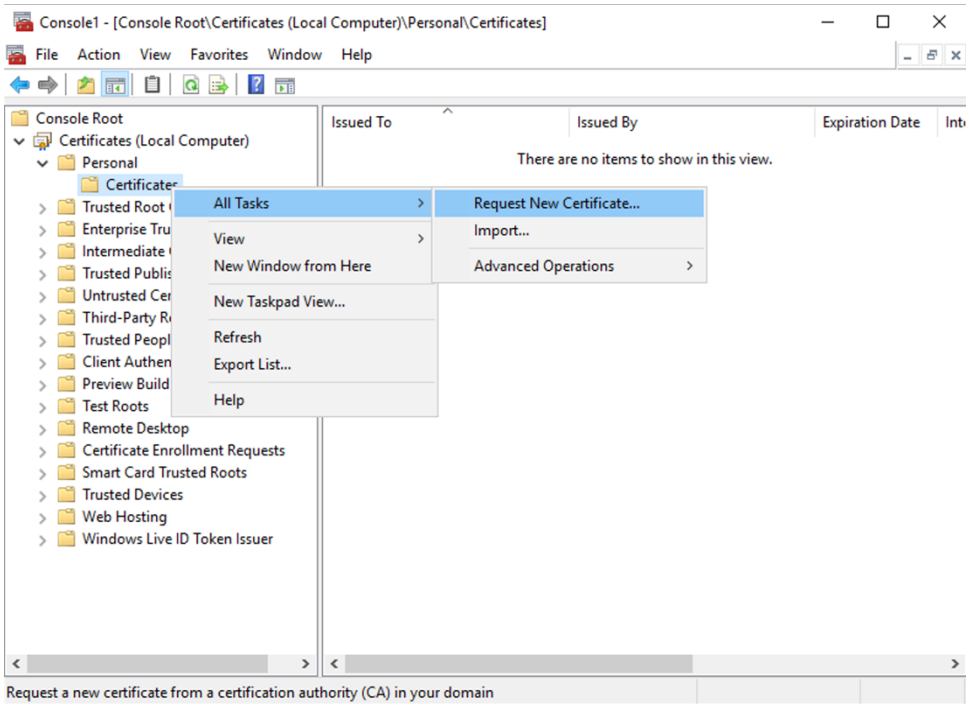
© 1997–2026 Citrix Systems, Inc. All rights reserved.

TLS uses certificates to establish trust between two parties. You must install a suitable certificate on each server providing a service, and ensure that machines connecting to that server trust that certificate. There are the following options for signing certificates:

- Self-signed certificates. These are not recommended. These are difficult to manage as you must manually copy this certificate to any other machine that must trust that certificate.
- Enterprise certification authority. If you have existing PKI in place, then this is normally the simplest option signing certificate for use between internal devices.
- Public certification authority. This requires that you prove ownership of the domain to the certificate authority. It has the advantage that unmanaged client devices are normally pre-configured to trust certificates from major public certification authorities.

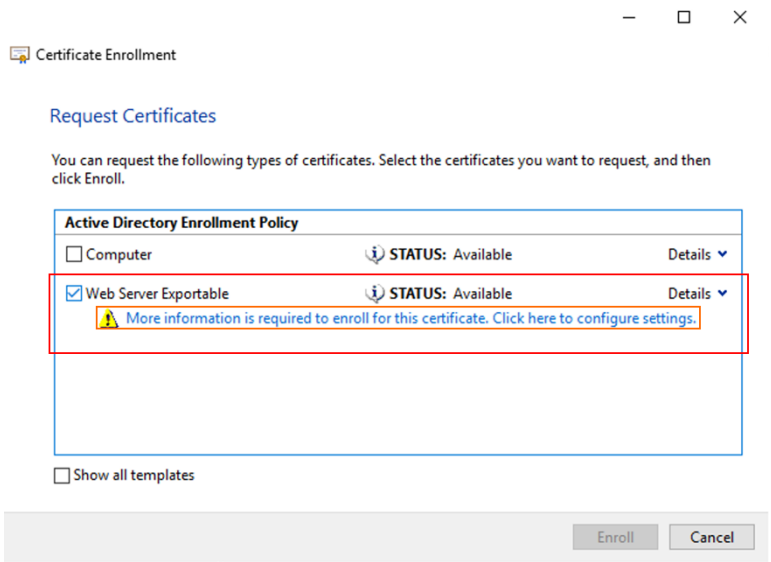
Create a new certificate

Follow your organization's policies and procedures for creating certificates.



Create certificate using Microsoft Certificate Authority

If the Microsoft Certificate Authority is integrated into an Active Directory domain or into the trusted forest the Delivery Controllers are joined to, you can acquire a certificate from the Certificates MMC snap-in Certificate Enrollment wizard. The Microsoft Certificate Authority needs to have a certificate template published suitable for use by web servers.

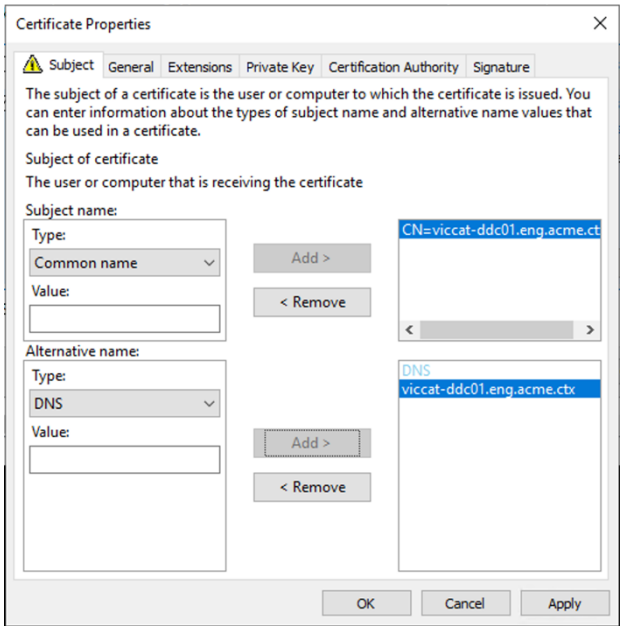


The root certificate is automatically deployed to other machine on the domain using group policy. Therefore all other machines on the domain trust certificates created using the Microsoft Certificate Authority. If you have machines not on the domain then you need to export the Root Certification Authority Certificate and import it into those machines.

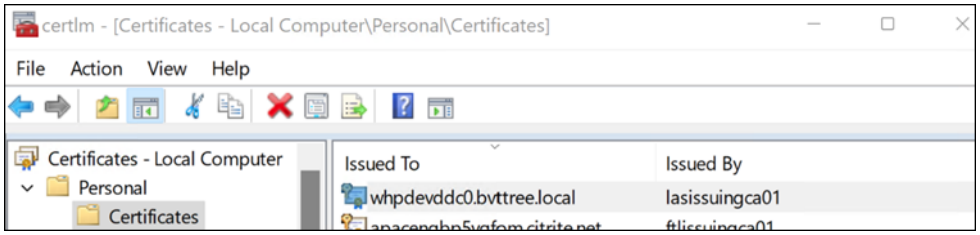
1. On the server, open the MMC console and add the Certificates snap-in. When prompted select Computer account.
2. Expand **Personal > Certificates**, then use the **All Tasks > Request New Certificate** context menu command.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Click **Next** to begin, and **Next** to confirm that you are acquiring the certificate from Active Directory enrollment.
4. Select a suitable template such as **Web Server Exportable**. If the template has been set up to automatically provide the values for Subject you can click **Enroll** without providing more details. Otherwise click on **More information is required to enroll for this certificate. Click here to configure settings.**



5. To provide more details for the certificate template, click the **Details** arrow button and configure the following:

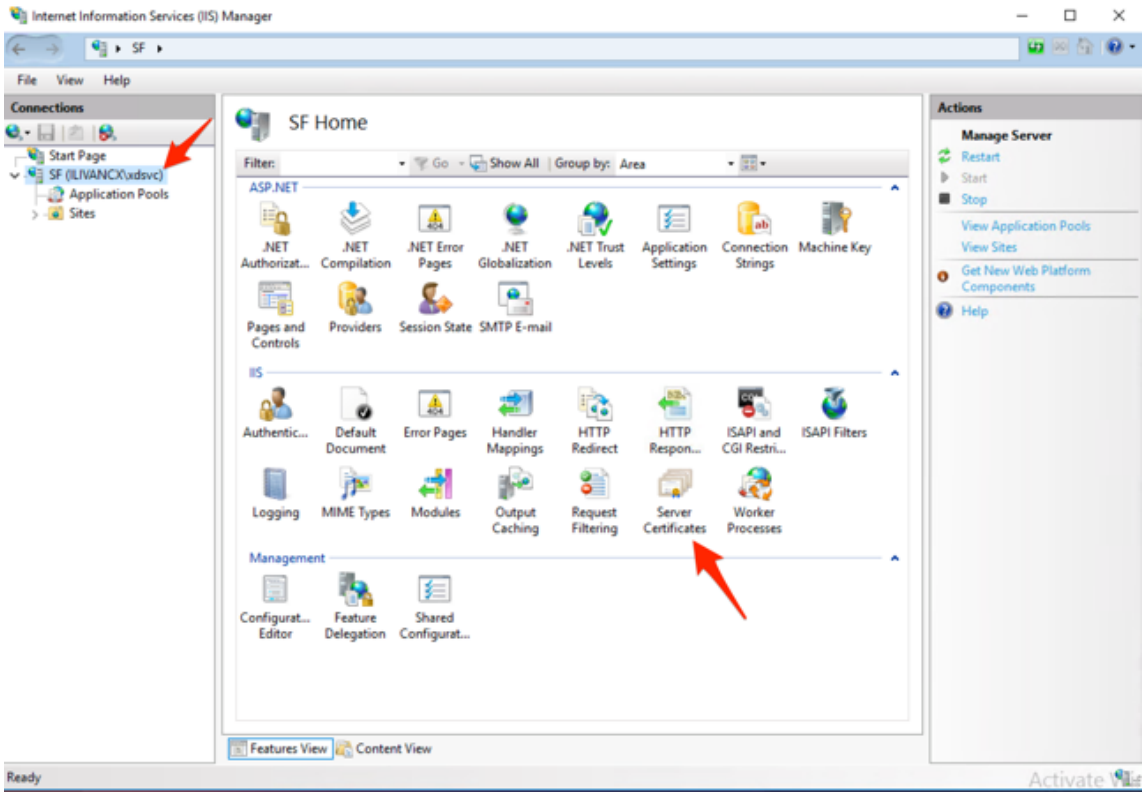


© 1997–2026 Citrix Systems, Inc. All rights reserved.

Subject name: select Common Name and add the FQDN of the server.

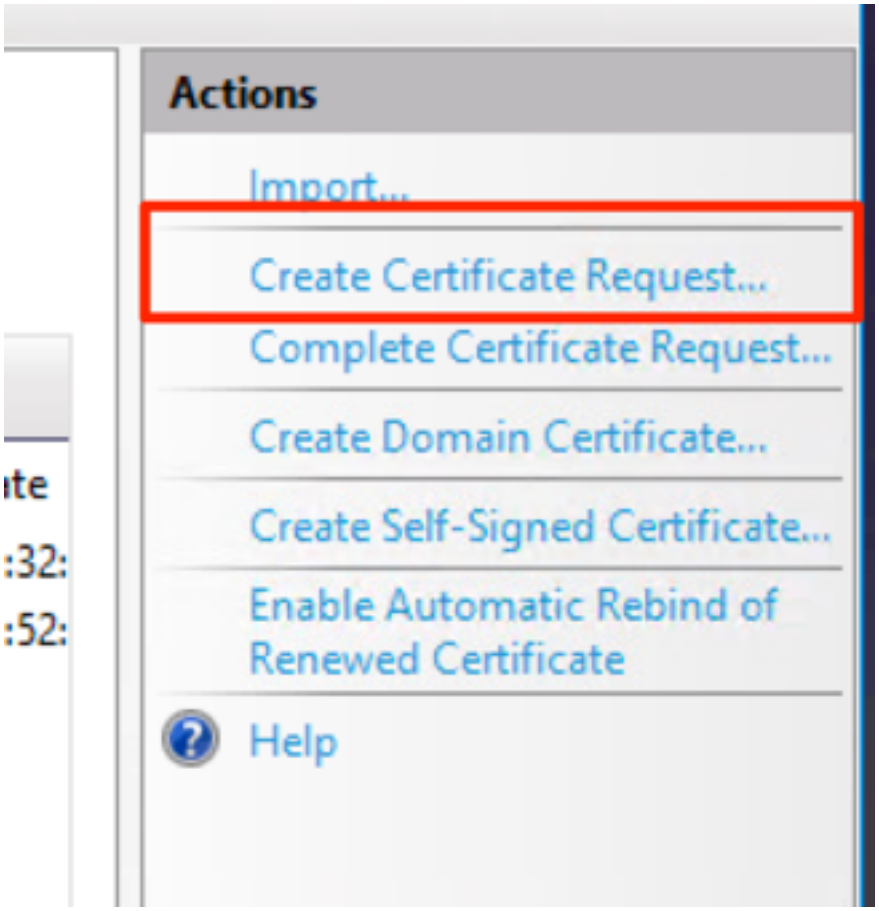
Alternative name: select DNS and add the FQDN of the server.

6. Press **OK**.
7. Press **Enroll** to create the certificate. It is displayed in the list of certificates.



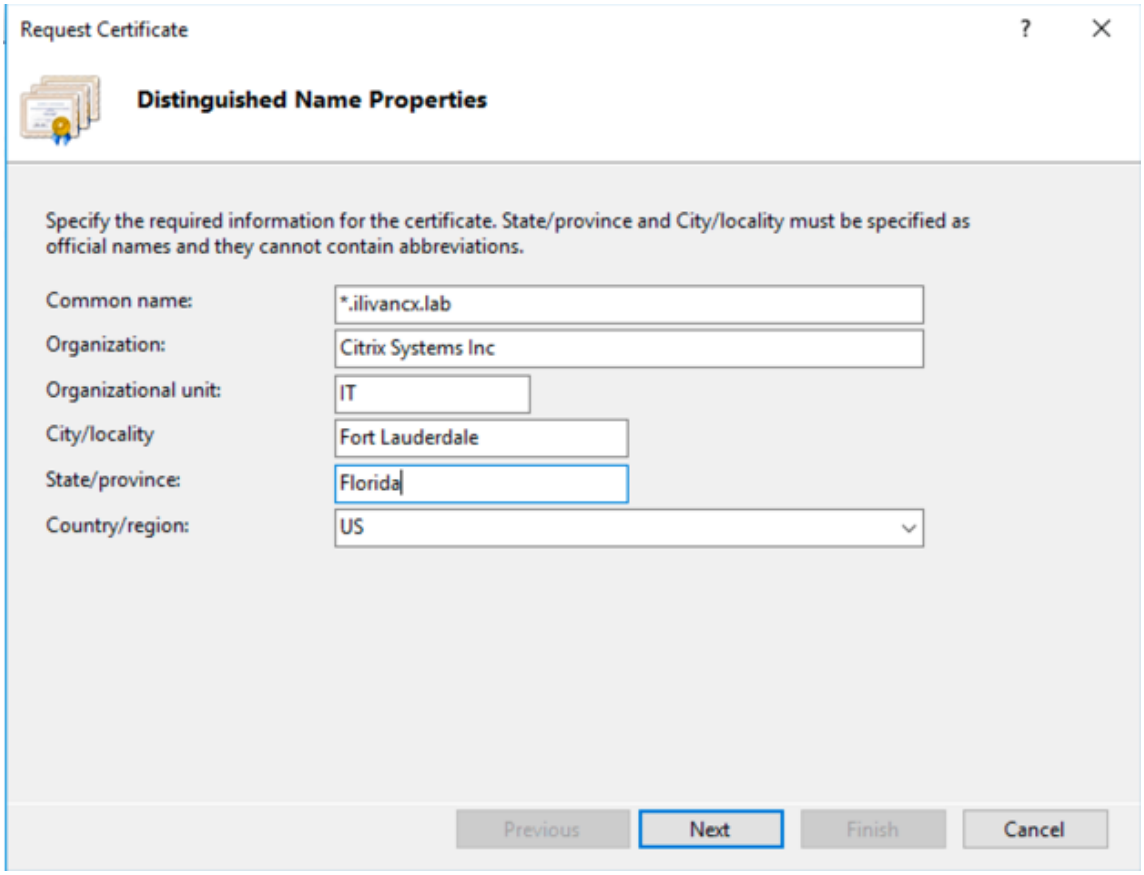
Create a certificate request using IIS

If IIS is installed on the server then complete the following steps:



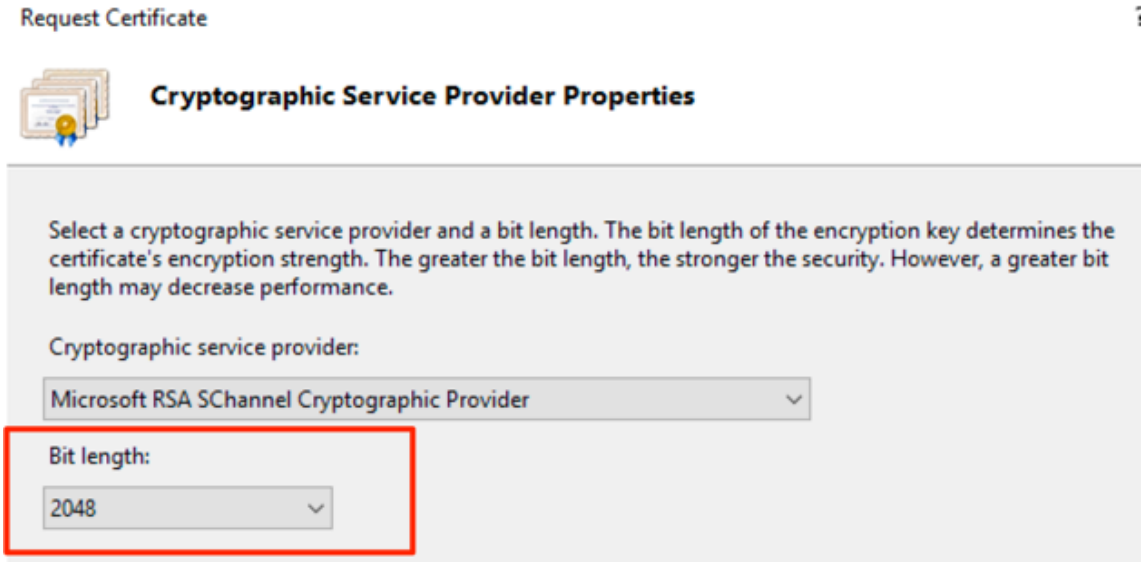
1. Open **Internet Information Service (IIS) Manager**
2. Select the server node in the Connections list.
3. Open **Server Certificates**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



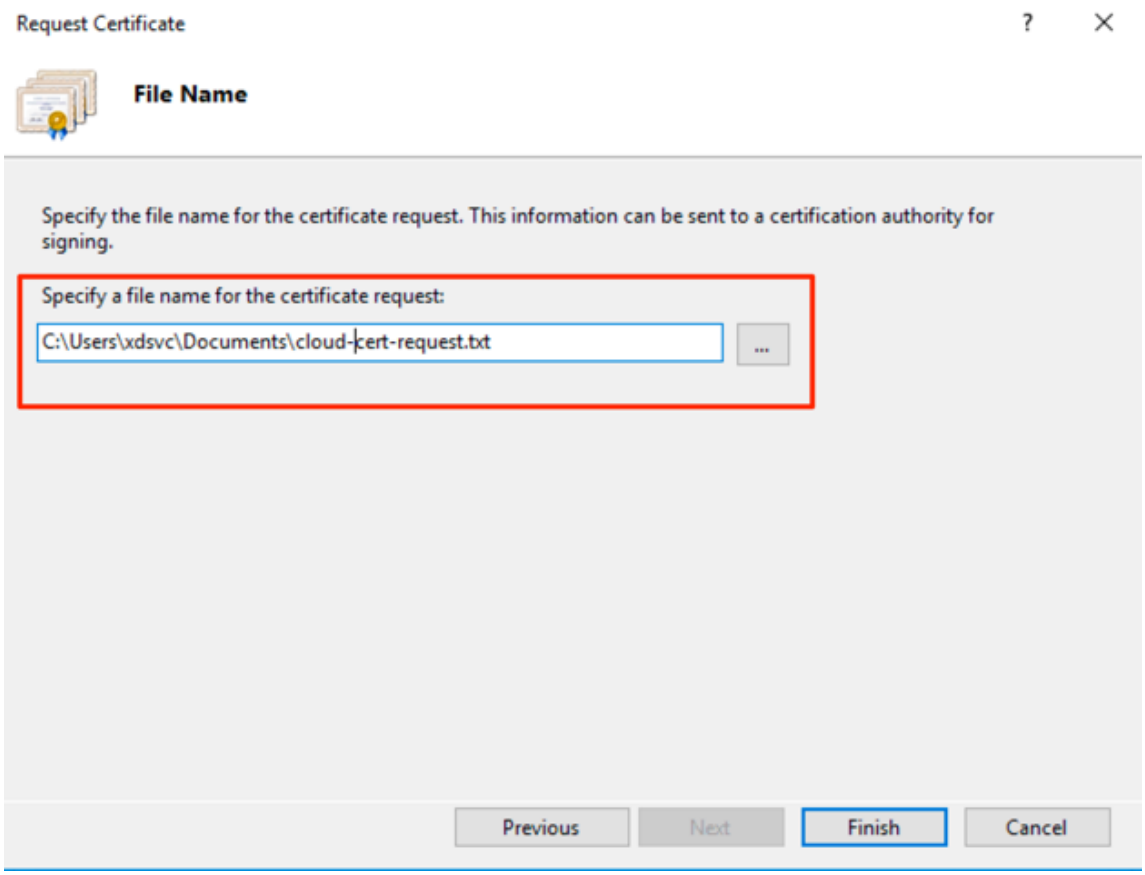
4. From the **Actions** pane, select **Create Certificate Request**....

© 1997–2026 Citrix Systems, Inc. All rights reserved.

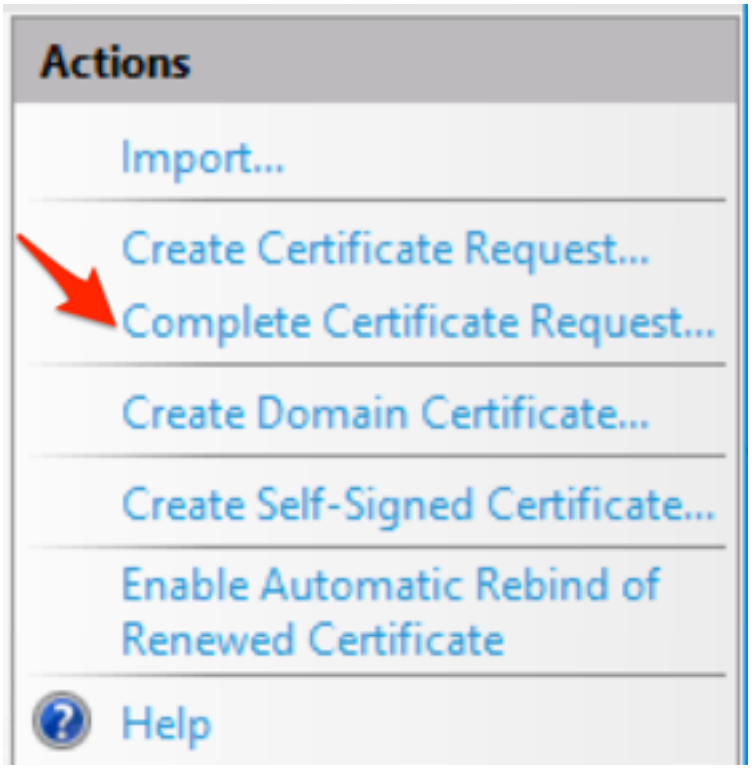


5. Enter the **Distinguished name properties**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

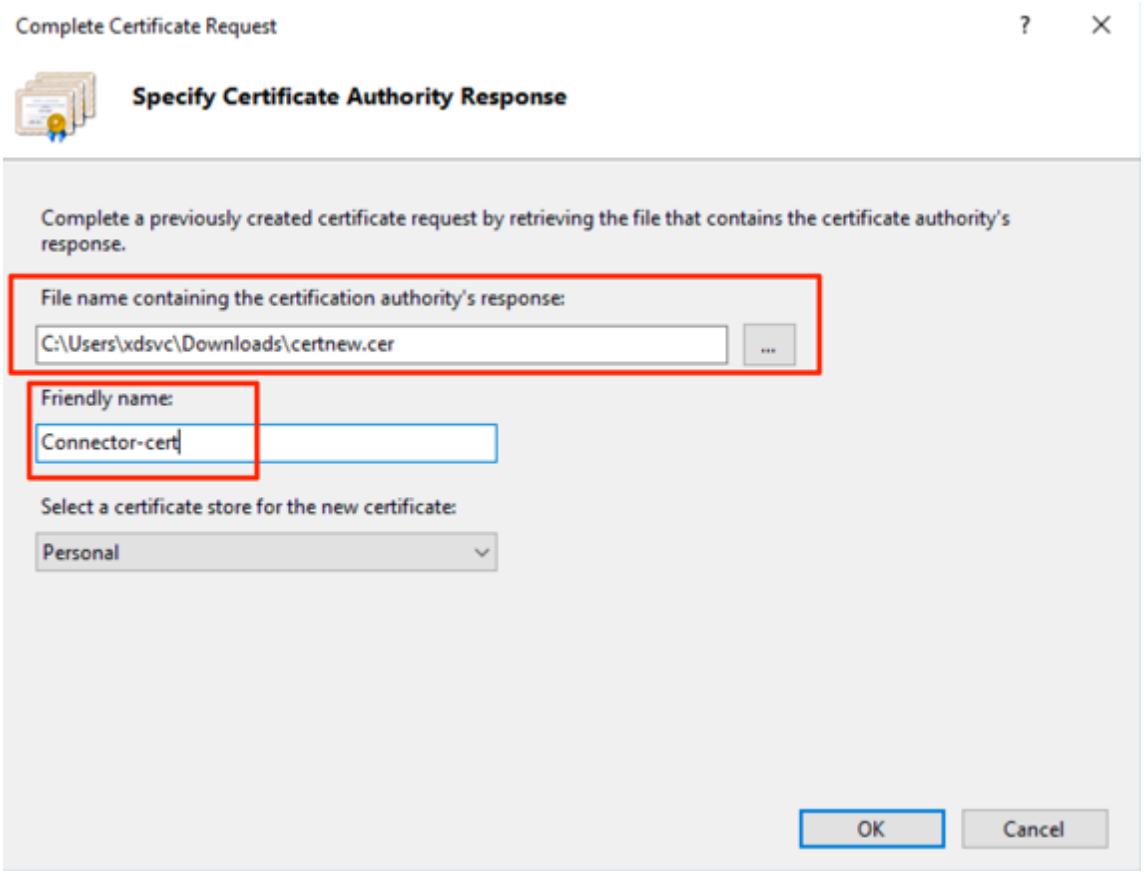


6. On the **Cryptographic Service Provider Properties** screen, leave the **Cryptographic service provider** as the default. Select a key size of **2048** or higher.



7. Choose a file name and press **Finish**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



8. Upload your CSR to your certificate authority.
9. Once you have received the certificate, from the **Actions** pane, select **Complete Certificate Request**....

© 1997–2026 Citrix Systems, Inc. All rights reserved.

10. Select the certificate, provide a **Friendly name** and press **OK**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

There is no way to set the subject alternative name. Therefore the certificate is limited to the server specified using the common name.

Create a certificate signing request from certificates snap-in

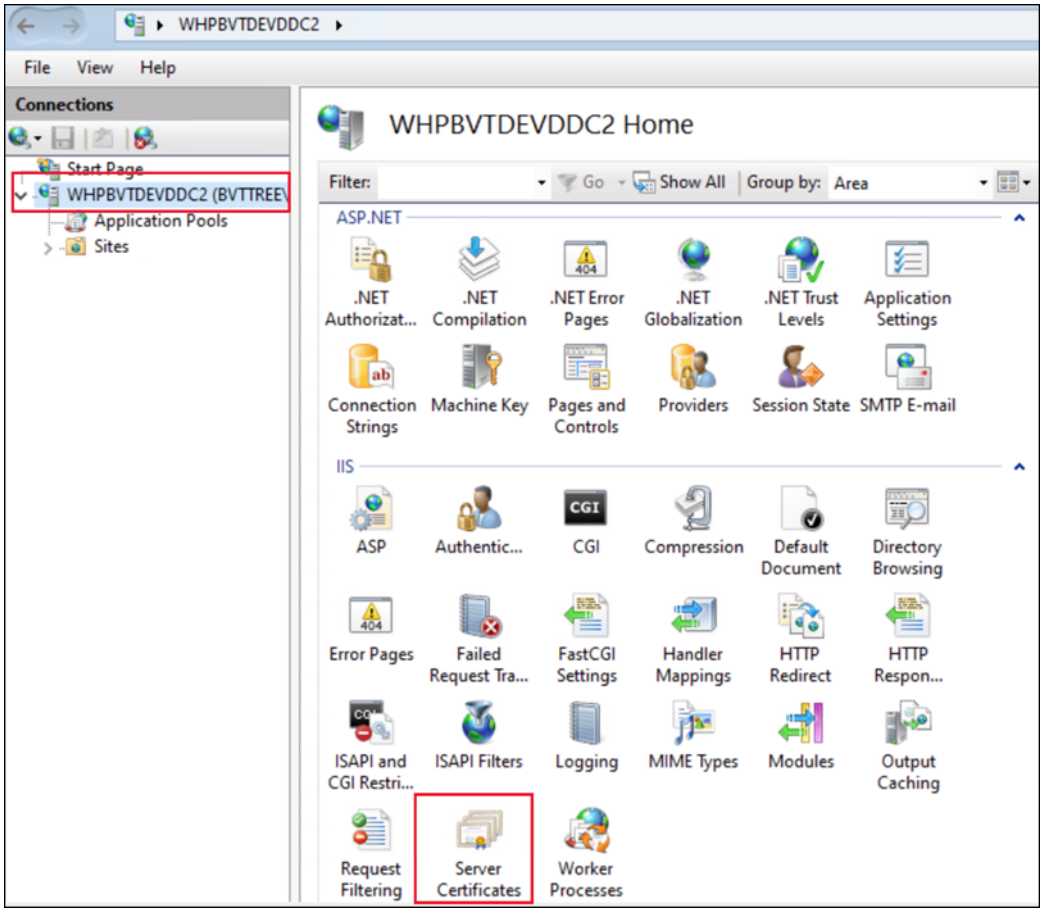
From within the Certificates mmc snap-in you can create a certificate signing request. This generates a file that you can send to a certificate authority who will provide the certificate. You must then import the certificate to combine it with the local private key.

1. On the server, open the MMC console and add the Certificates snap-in. When prompted select Computer account.
2. Expand **Personal** > **Certificates**
3. Select **All Tasks** > **Advanced Operations** > **Create Custom Request**.
4. On **Before You Begin**, select **Next**.
5. On the **Select Certificate Enrollment Policy** screen, select a suitable existing policy, or **Proceed without enrollment policy**.
6. On the **Custom request** screen, if using an enrolment policy, choose an appropriate template, if available, such as **Web Server Exportable**.
7. On the **Certificate Information** screen, expand **Details** and select **Properties**.
8. In the **Certificate Properties** window, on the **General** tab, enter a suitable friendly name.
9. On the **Subject tab**:
    a) Under **Subject name**, select **Common name** and enter the FQDN of the server. You can enter a wildcard. Select **Add**.
    b) Under **Subject name**, add appropriate values for Organization, Organizational Unit, Locality, State, Country.
    c) Under **Alternative name**, select **DNS**. Add the server FQDN. You may add multiple server FQDNs or a wildcard FQDN.
10. On the **Extensions** tab:
    - Under **Key usage** add **Digital signature** and **Key encipherment**.
    - Under **Extended Key Usage (application policies)**, add **Server Authentication** and **Client Authentication**.
11. On the **Private Key** tab.
    - Under **Select cryptographic Service Provider (CSP)** choose a suitable provider.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

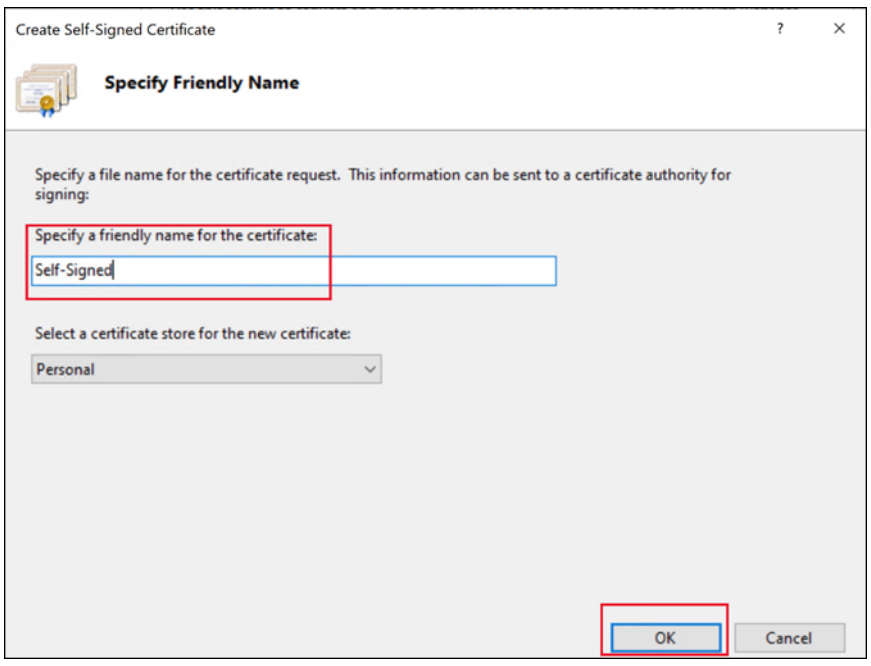
- Under **Key options**, select a suitable key size. For RSA providers, at minimum use a key size of 2048. For greater security you may wish to choose 4096 but this will have a slight impact on performance.
- Under **Key options**, select **Make private key exportable**.

12. Select **OK**.
13. Select **Next**.
14. Select **Browse** and save your request.
15. Select **Finish**.
16. Upload your CSR to your certificate authority.
17. Once you have received the certificate, import it on the same server so it is linked to the private key.



Create a new self-signed certificate

A self-signed certificate is created during installation of a delivery controller™ and web studio. You can generate a new self-signed certificate and use it to replace the existing one.



Using IIS manager If IIS is installed on the server then you can perform the following steps:

1. Log on to the server as an administrator.
2. Open the IIS Manager
3. Open **Server Certificates**
4. In the **Actions** pane, select **Create Self-Signed Certificate**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. In **Create Self-Signed Certificate**, enter a name for the certificate and click **OK**. The self-signed certificate is then created.

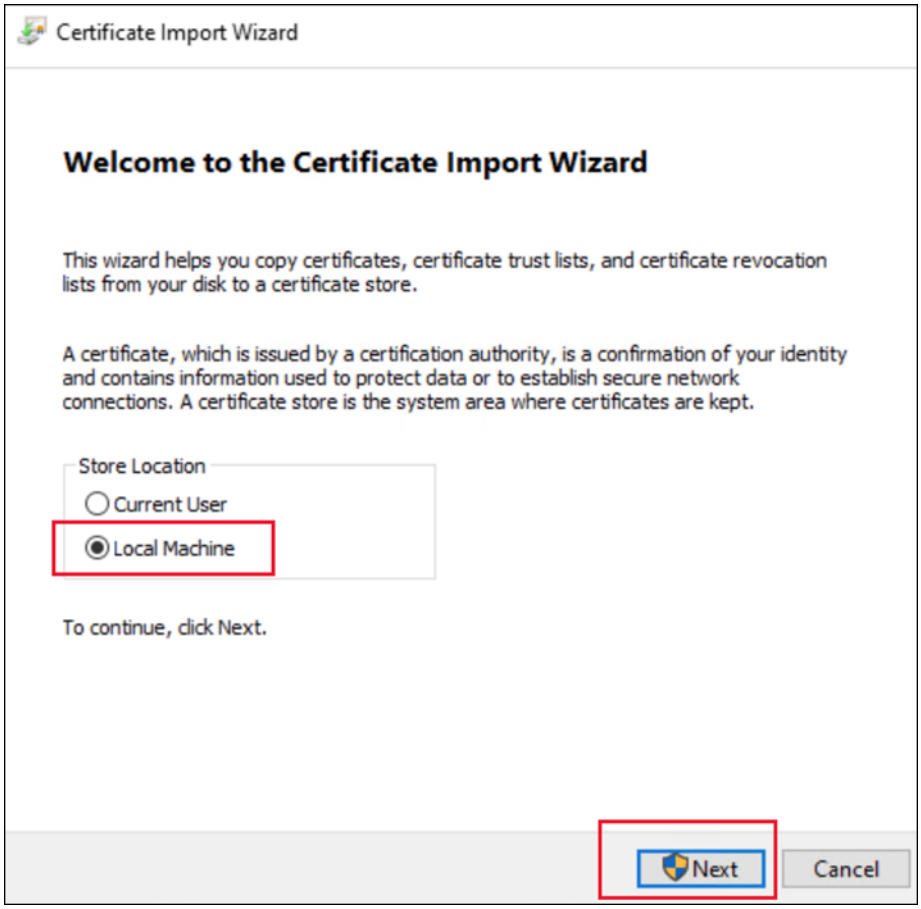
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Using PowerShell You can use PowerShell to create a self-signed certificate:

```
$certSubject = "CN=myddc.example.com" # The FQDN of the server.
$friendlyName = "Self-Signed-3"
$expireYears = 5

## Create new self-signed certificate under LocalMachine\My
$certificate = New-SelfSignedCertificate -Subject $certSubject -
    CertStoreLocation "Cert:\LocalMachine\My\" -KeyExportPolicy
    Exportable -KeySpec Signature -KeyLength 2048 -KeyAlgorithm RSA -
    HashAlgorithm SHA256 -FriendlyName $friendlyName -NotAfter $([System
    .DateTime]::Now.AddYears($expireYears))

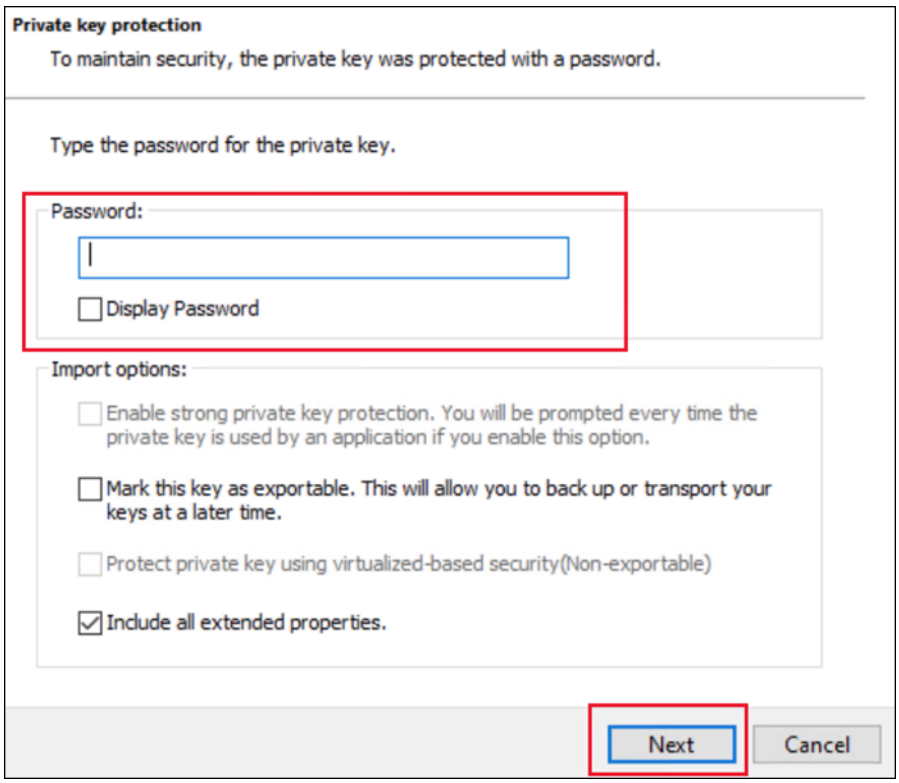
# Add to trusted root certificates
$rootCertStore = Get-Item "Cert:\LocalMachine\Root\"
$rootCertStore.Open([System.Security.Cryptography.X509Certificates.
    OpenFlags]::ReadWrite)
$rootCertStore.Add($certificate)
```



Import existing certificate

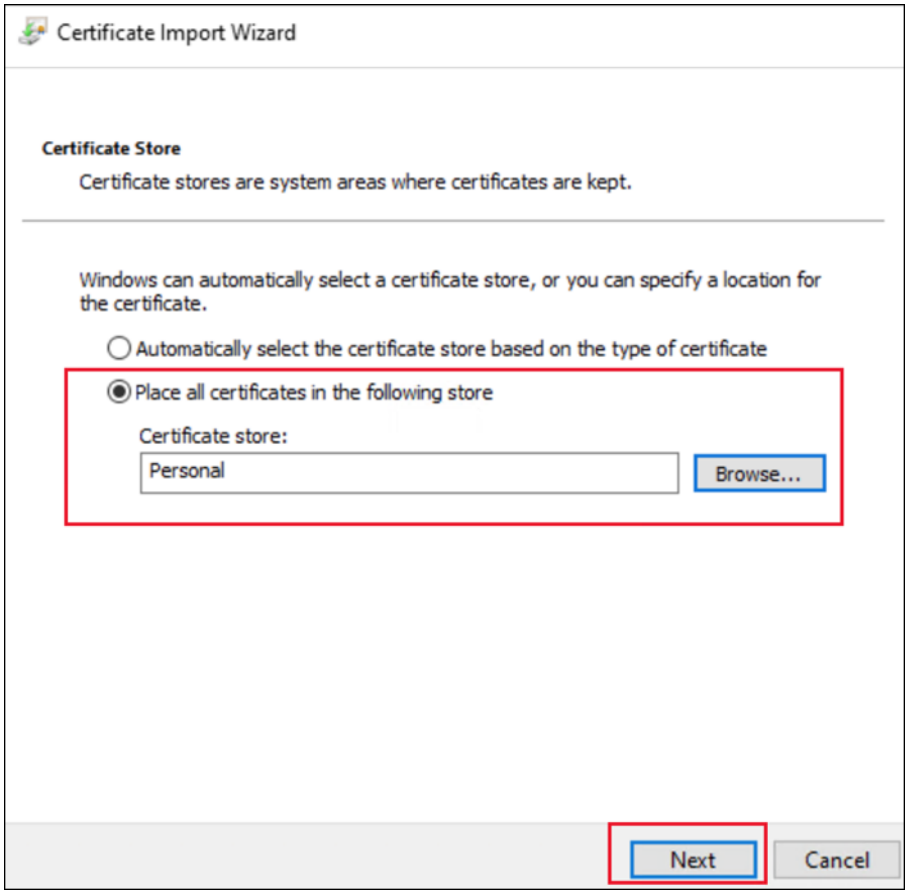
You can import an existing certificate into the server using any of the following methods.

Certificate import wizard



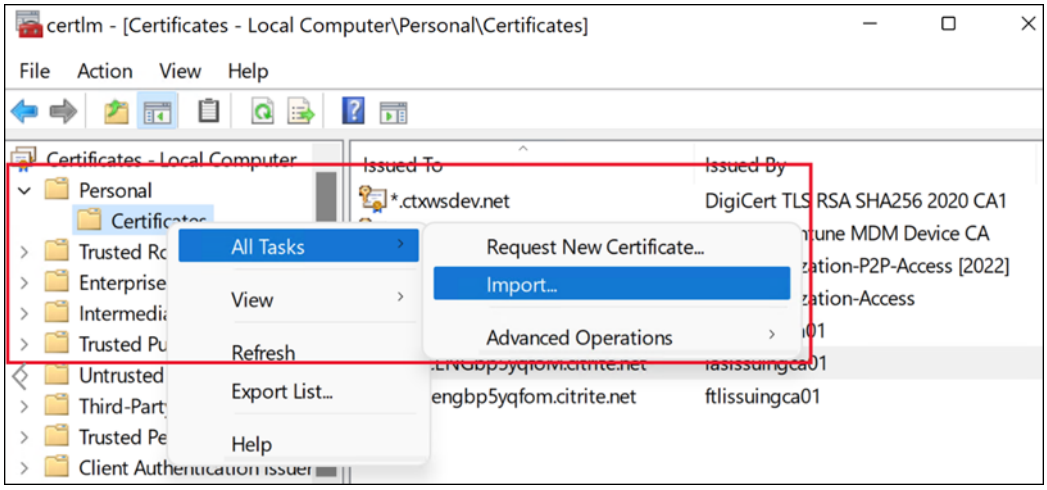
1. Double click the PFX file, or right click the file and select **Install PFX**. This opens the **Certificate Import Wizard**.
2. For **Store Location**, select **Local Machine**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



3. Enter the password if required.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. Select the **Certificate Store**. For server certificates, choose **Personal**. If this is a root certificate or self-signed certificate that you wish to trust from this machine then choose **Trusted Root Certification Authorities**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Use the Manage Computer certificates console

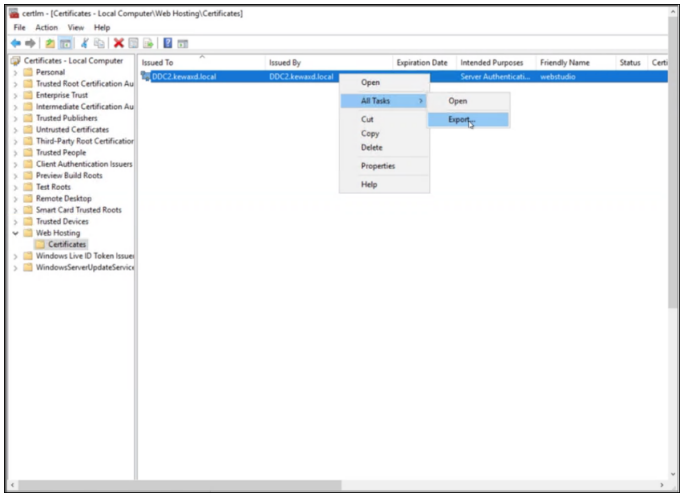
1. Open the Manage Computer Certificates console and navigate to the appropriate certificate store. For server certificates this is normally. **Personal** > **Certificates**. To trust a root or self-signed certificate, choose **Trusted Root Certification Authorities** > **Certificates**.
2. Right click the certificate and select > **All Tasks** > **Import**....

© 1997–2026 Citrix Systems, Inc. All rights reserved.

3. Select **Browse...** and select the file.
4. Enter the password if required.

Use PowerShell

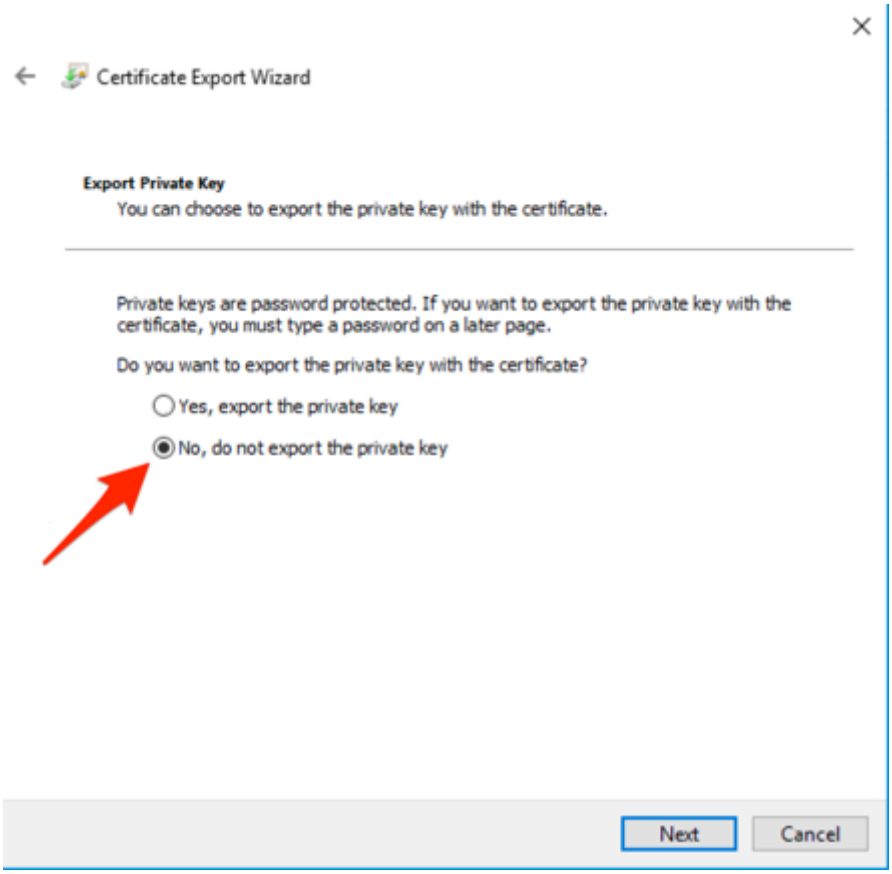
To import a certificate, use the PowerShell cmdlet Import-PfxCertificate. For example, to import certificate `certificate.pfx` with password 123456 into the personal certificate store, run the following command:



```
Import-PfxCertificate -Password $(ConvertTo-SecureString -String "
    123456" -AsPlainText -Force) -CertStoreLocation Cert:\LocalMachine\
    My\ -FilePath .\Desktop\certificate.pfx
```

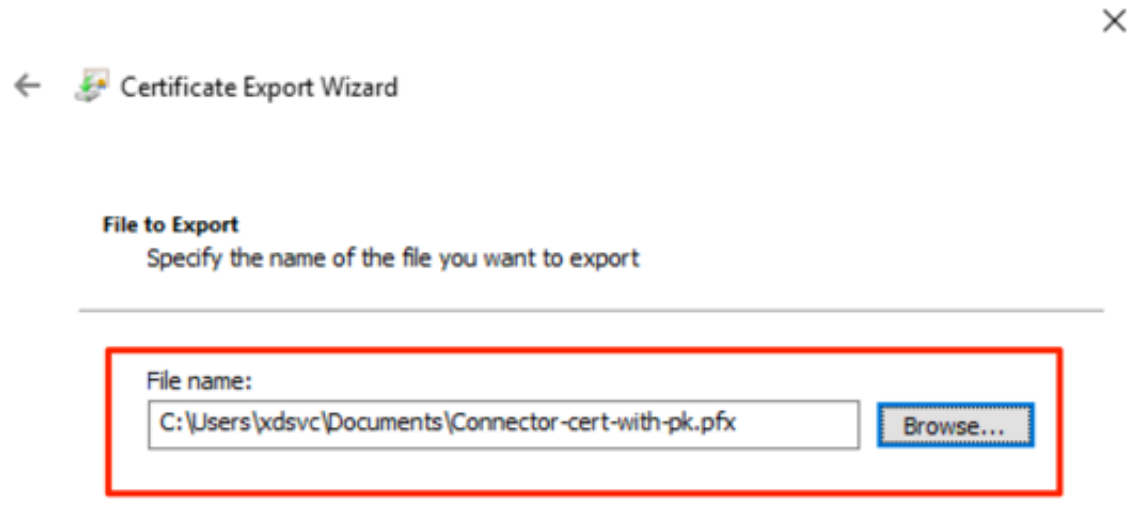
To import a trusted root certificate, set the `CertStoreLocation` to `Cert:\LocalMachine\Root\`.

Export certificate without private key



To export a certificate so that you can import it into other devices to trust the certificate, you should exclude the private key.

1. Open the Manage Computer Certificates. Navigate to **Personal** > **Certificates** and select the certificate you wish to export.
2. From the **Action** menu, select **All Tasks** then **Export**.

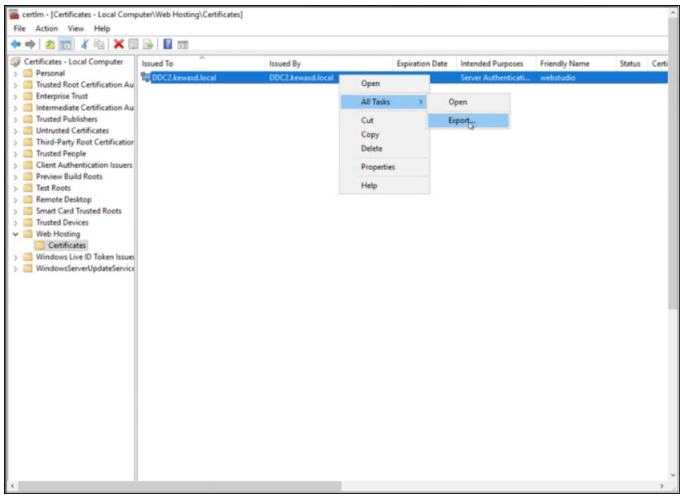


3. Choose **No, do not export the private key**, then press **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

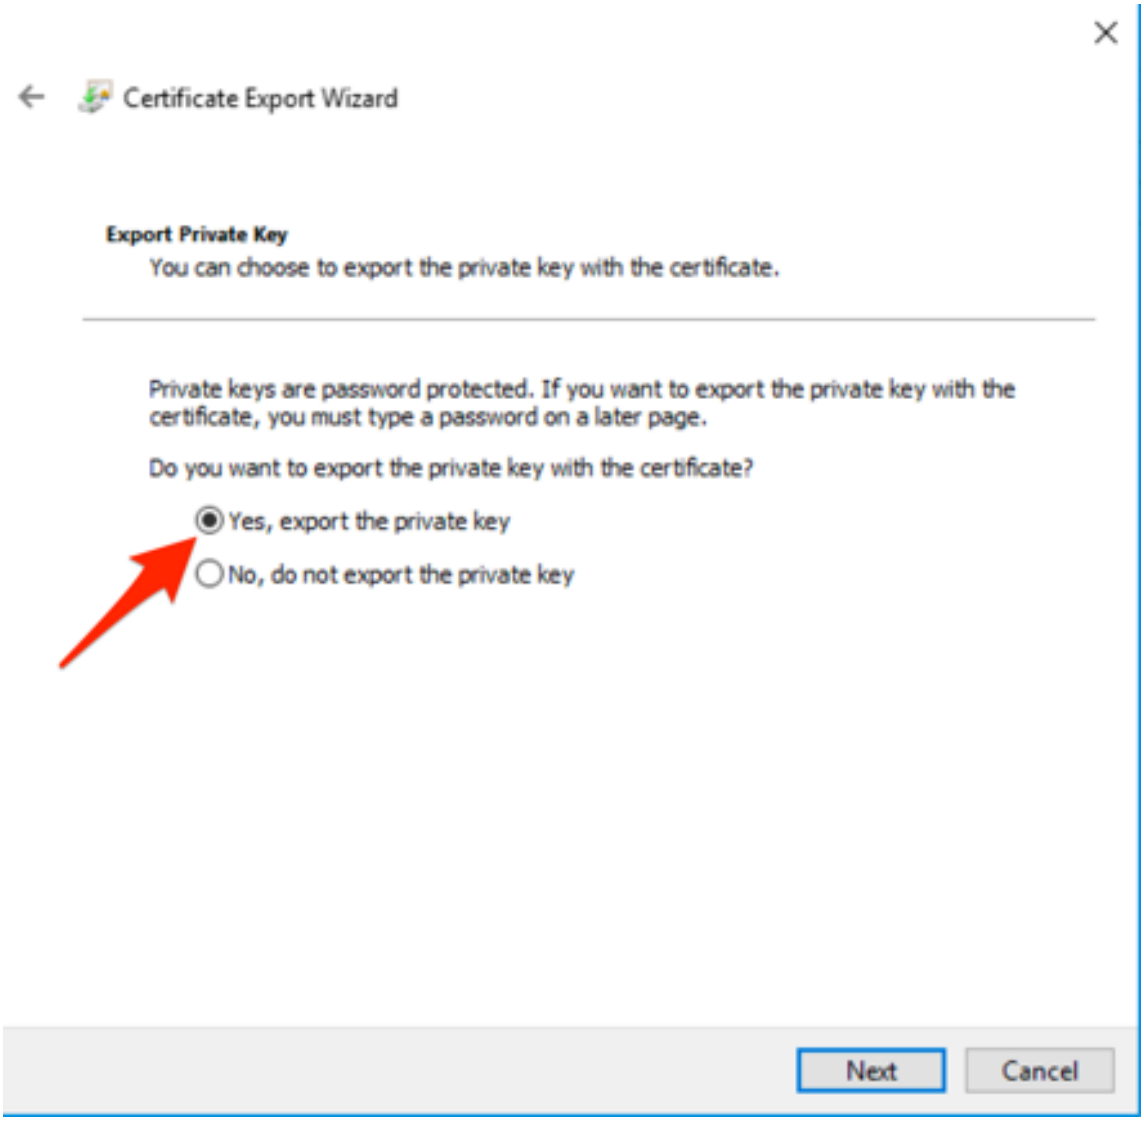
4. Select format **DER encoded binary X.509 (.CER)** (the default) and press **Next**.
5. Enter a file name and press **Next**.

6. Select **Finish**.



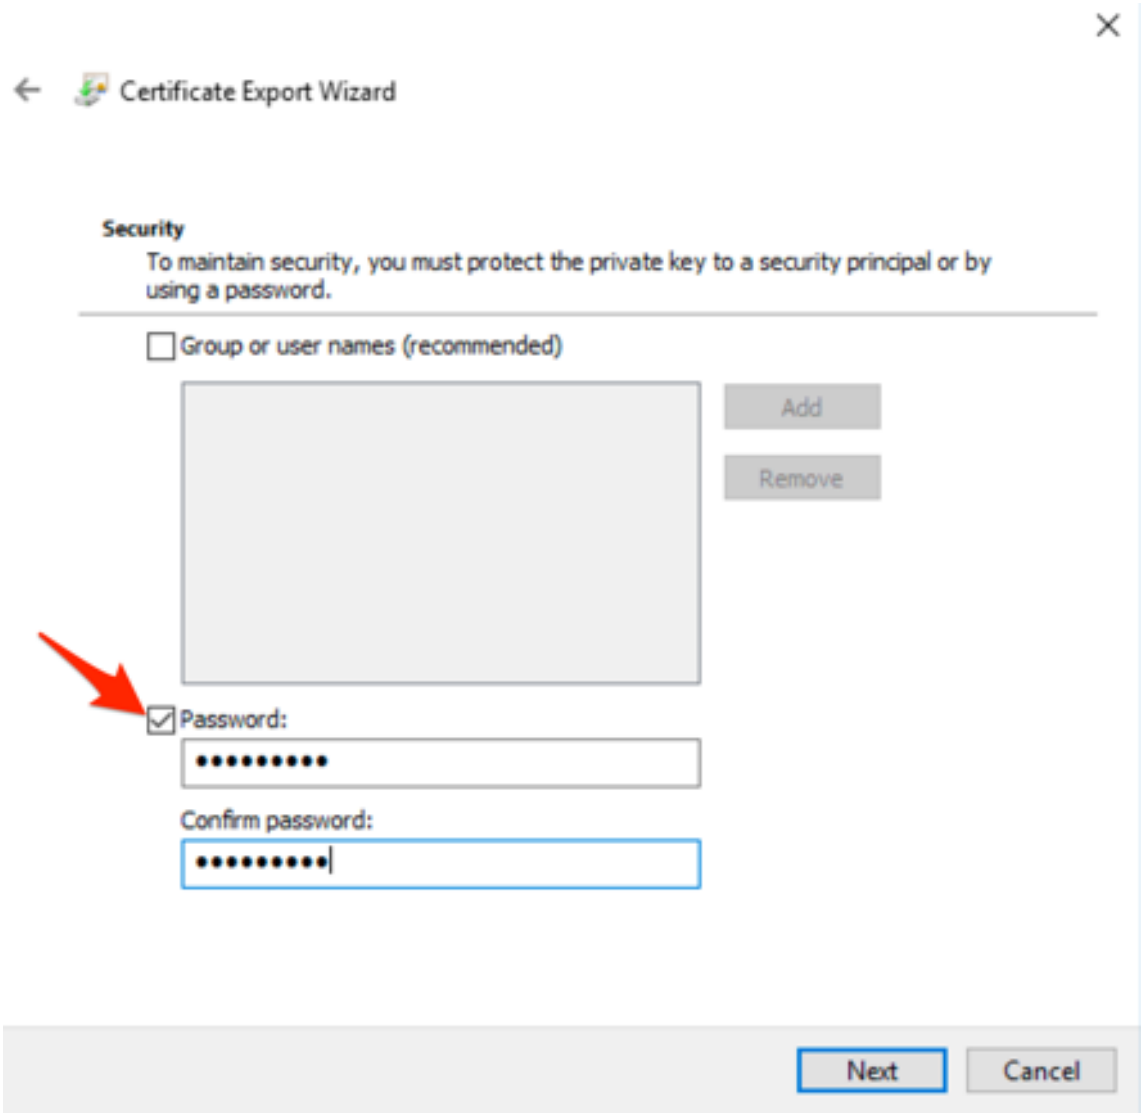
© 1997–2026 Citrix Systems, Inc. All rights reserved.

Export certificate with private key



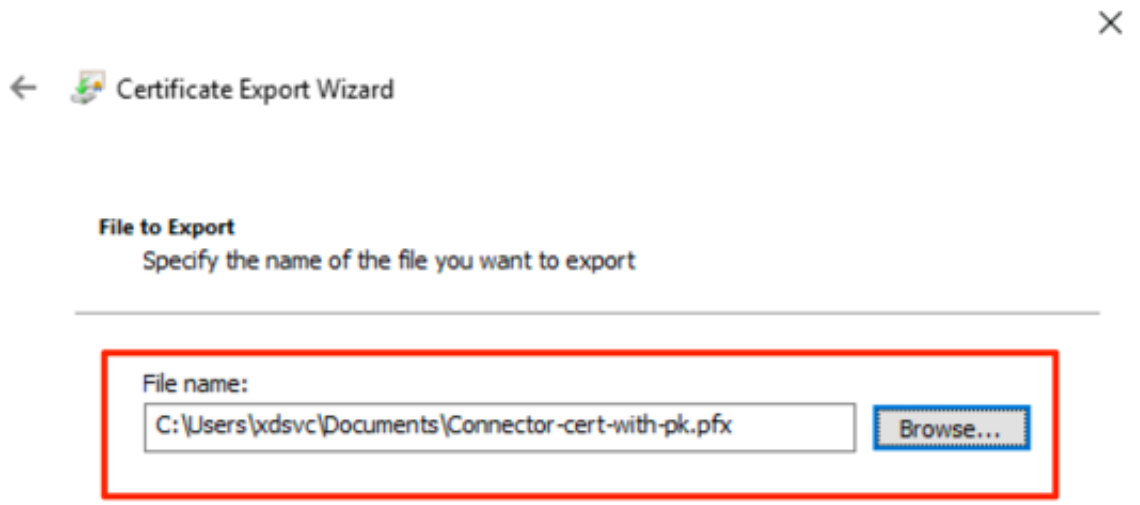
To export a certificate so that you can use it on other servers, you must include the private key.

1. Open the Manage Computer Certificates. Navigate to **Personal** > **Certificates** and select the certificate you wish to export.
2. From he **Action** menu, select **All Tasks** then **Export**.



3. Choose **Yes, export the private key**, then select **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.



4. On the **Security** tab, enter a password then select **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

5. Enter a file name and select **Next**.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

6. Select **Finish**.

Convert certificate to PEM format

By default, Windows exports certificates in PKCS#12 format as a .pfx file in that includes the private key. To use the certificate on a NetScaler® Gateway or license server, you must extract the certificate and private keys into separate files in PEM format. You can do this using openssl.

To export the certificate in PEM format run:

© 1997–2026 Citrix Systems, Inc. All rights reserved.

```
openssl pkcs12 -in name.pfx -clcerts -nokeys -out name.cer
```

It will ask you for the existing password and a new passphrase

To export the key in PEM format run:

```
openssl pkcs12 -in name.pfx -nocerts -out name.key
```

Trusting certificates

- If you use a certificate from a public certificate authority then devices are normally pre-configured with the root certificates.
- If you use an enterprise certificate authority then you must deploy the root certificate into any devices that must trust that certificate. If using Active Directory Certification Services, the root certificates are also deployed to all machines on the domain using Group Policy. You must manually import the root certificate onto non-domain-joined machines such as your NetScaler gateways, or machines on other domains.
- If you are using a self signed certificate then this must be manually installed onto any machine that needs to trust the certificate.

To export a self-signed or trusted root certificate from Windows, see export certificate without private key.

For Windows to trust the certificate, you must import the certificate into the **Trusted Root Certification Authorities** store. If using PowerShell, enter the store **Cert:\LocalMachine\Root**.

For NetScaler to trust the certificate, first convert the certificate to PEM format, then Install the root certificate.

Smart cards

May 13, 2026

Smart cards and equivalent technologies are supported within the guidelines described in this article. To use smart cards with Citrix Virtual Apps or Citrix Virtual Desktops™:

- Understand your organization's security policy concerning the use of smart cards. These policies might, for example, state how smart cards are issued and how users must safeguard them. Some aspects of these policies might need to be reassessed in a Citrix Virtual Apps™ or Citrix Virtual Desktops environment.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Determine which user device types, operating systems, and published applications are to be used with smart cards.
- Familiarize yourself with smart card technology and your selected smart card vendor hardware and software.
- Know how to deploy digital certificates in a distributed environment.

> **Note:**
>
> Smart card enrollment is not supported with fast smart card. Smart card enrollment might work when fast smart card is disabled, but depends on the type of smart card and middleware. Contact your smart card and middleware vendor for information on their integration with Citrix Virtual Apps and Desktops and support for smart card enrollment over virtual sessions.

Types of smart cards

Enterprise and consumer smart cards have the same dimensions, electrical connectors, and fit the same smart card readers.

Smart cards for enterprise use contain digital certificates. These smart cards support Windows Logon, and can also be used with applications for digital signing and encryption of documents and email. Citrix Virtual Apps and Desktops™ support these uses.

Smart cards for consumer use do not contain digital certificates; they contain a shared secret. These smart cards can support payments (such as a chip-and-signature or chip-and-PIN credit card). They do not support Windows Logon or typical Windows applications. Specialized Windows applications and a suitable software infrastructure (including, for example, a connection to a payment card network) are needed for use with these smart cards. Contact your Citrix representative for information on supporting these specialized applications on Citrix Virtual Apps or Citrix Virtual Desktops.

For enterprise smart cards, there are compatible equivalents that can be used in a similar way.

- A smart card-equivalent USB token connects directly to a USB port. These USB tokens are usually the size of a USB flash drive, but can be as small as a SIM card used in a mobile phone. They appear as the combination of a smart card plus a USB smart card reader.
- A virtual smart card using a Windows Trusted Platform Module (TPM) appears as a smart card. These virtual smart cards are supported for Windows 8 and Windows 10, using Citrix Workspace app (minimum version Citrix Receiver 4.3).
    - Versions of Citrix Virtual Apps and Desktops (formerly XenApp and XenDesktop) earlier than XenApp and XenDesktop 7.6 FP3 do not support virtual smart cards.
    - For more information on virtual smart cards, see Virtual Smart Card Overview.

    Note: The term "virtual smart card"is also used to describe a digital certificate stored on the user computer. These digital certificates are not strictly equivalent to smart cards.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Citrix Virtual Apps and Desktops smart card support is based on the Microsoft Personal Computer/Smart Card (PC/SC) standard specifications. A minimum requirement is that smart cards and smart card devices must be supported by the underlying Windows operating system and must be approved by the Microsoft Windows Hardware Quality Labs (WHQL) to be used on computers running qualifying Windows operating systems. See the Microsoft documentation for additional information about hardware PC/SC compliance. Other types of user devices might comply with the PS/SC standard. For more information, refer to the Citrix Ready program.

Usually, a separate device driver is needed for each vendor's smart card or equivalent. However, if smart cards conform to a standard such as the NIST Personal Identity Verification (PIV) standard, it might be possible to use a single device driver for a range of smart cards. The device driver must be installed on both the user device and the Virtual Delivery Agent (VDA). The device driver is often supplied as part of a smart card middleware package available from a Citrix partner; the smart card middleware package offers advanced features. The device driver might also be described as a Cryptographic Service Provider (CSP), Key Storage Provider (KSP), or minidriver.

The following smart card and middleware combinations for Windows systems have been tested by Citrix as representative examples of their type. However, other smart cards and middleware can also be used. For more information about Citrix-compatible smart cards and middleware, see http://www.citrix.com/ready.

Middleware	Matching cards
Gemalto Mini Driver for .NET card	Gemalto .NET v2+

For information about smart card usage with other types of devices, see the Citrix Workspace™ app documentation for that device.

Remote PC Access

Smart cards are supported only for remote access to physical office PCs running Windows 10, Windows 8 or Windows 7.

The following smart cards were tested with Remote PC Access:

Middleware	Matching cards
Gemalto .NET minidriver	Gemalto .NET v2+

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Fast smart card

Fast smart card is an improvement over the existing HDX PC/SC-based smart card redirection. It improves performance when smart cards are used in high-latency WAN situations. When latency is high, the performance improvement can be significant (for example, 15 seconds for a Windows fast smart card logon versus more than 1 minute with the PC/SC-based smart card redirection).

Fast smart card is enabled by default on host machines with currently supported Windows VDAs. To disable Fast Smart Card on the host-side—for example for diagnostic purposes—set the 'Disable Cryptographic Redirection' registry setting to any non-zero value:

```
HKLM\SOFTWARE\Citrix\SmartCard
CryptographicRedirectionDisable (DWORD)
```

On the client side, to enable fast smart card, include the SmartCardCryptographicRedirection ICA parameter in the *default.ica* file of the associated StoreFront site:

```
[WFClient]
SmartCardCryptographicRedirection=On
```

In addition, on the client side, fast smart card can be force enabled or force disabled (for example, for diagnostic purposes) with the following registry settings:

- HKLM\SOFTWARE[\WOW6432Node]\Citrix\ICA Client\SmartCard\ForceEnableCryptographicRedirection (as a non-zero DWORD)

Or

- HKLM\SOFTWARE[\WOW6432Node]\Citrix\ICA Client\SmartCard\ForceDisableCryptographicRedirection (as a non-zero DWORD)

The 32-bit registry hive must be specified (using `WOW6432Node`) if the client machine is 64-bit.

Limitations:

- Only Citrix Workspace app for Windows supports fast smart card. If you configure fast smart cards in the default.ica file, Citrix Workspace apps that are not for Windows still use existing PC/SC Redirection.
- The only double-hop scenarios that fast smart card supports are ICA® > ICA with fast smart card enabled on both hops. Because fast smart card doesn't support ICA > RDP double-hop scenarios, those scenarios don't work.
- Fast smart card doesn't support Cryptography Next Generation. Thus, fast smart card doesn't support Elliptic Curve Cryptography (ECC) smart cards.
- Fast smart card supports only read-only key container operations.
- Fast smart card doesn't support changing the smart card PIN.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Starting with VDA version 2203 and Citrix Workspace app version 2202 for Windows (or later) fast smart card is compatible with Cryptography Next Generation (CNG). In addition, Elliptic Curve Cryptography (ECC) smart cards are supported with the following curves: P-256, P-384, P-521 bits, for both ECDSA and ECDH.

Starting with VDA version 2203, fast smart card adds the ability to cache the smart card PIN between the applications from the same user's logon session. For example, if **Session PIN Caching** is enabled and the end user has previously provided their smart card PIN to Outlook, when Word is then used to sign a document, Word uses the already cached smart card PIN (submitted to Outlook). **Session PIN Caching** helps the user experience by reducing the number of times the user has to enter their smart card PIN. In addition, if the smart card is used to log on to the VDA, the Windows smart card logon PIN can optionally be saved to the **Session PIN Cache**. This can further improve the user experience.

Session PIN Caching is disabled by default. It can be enabled and controlled with the following registry settings on the VDA:

In HKLM\SOFTWARE\Citrix\SmartCard:

- `EnablePinSessionCache` as a DWORD (non-zero to enable)
- `EnableLogonPinSessionCache` as a DWORD (non-zero to enable)
- `PinSessionCacheEntryStaleTimeout` as a DWORD (number of seconds before an entry becomes stale, default is 1 hour)

Types of smart card readers

A smart card reader might be built in to the user device, or be separately attached to the user device (usually via USB or Bluetooth). Contact card readers that comply with the USB Chip/Smart Card Interface Devices (CCID) specification are supported. They contain a slot or swipe into which the user inserts the smart card. The Deutsche Kreditwirtschaft (DK) standard defines four classes of contact card readers.

- Class 1 smart card readers are the most common, and usually contain a slot. Class 1 smart card readers are supported, usually with a standard CCID device driver supplied with the operating system.
- Class 2 smart card readers also contain a secure keypad that cannot be accessed by the user device. Class 2 smart card readers might be built into a keyboard with an integrated secure keypad. For class 2 smart card readers, contact your Citrix representative; a reader-specific device driver might be required to enable the secure keypad capability.
- Class 3 smart card readers also contain a secure display. Class 3 smart card readers are not supported.
- Class 4 smart card readers also contain a secure transaction module. Class 4 smart card readers are not supported.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

> **Note:**
>
> The smart card reader class is unrelated to the USB device class.

Smart card readers must be installed with a corresponding device driver on the user device.

For information about supported smart card readers, see the documentation for the Citrix Workspace app you are using. In the Citrix Workspace app documentation, supported versions are listed in a smart card article or in the system requirements article.

User experience

Smart card support is integrated into Citrix Virtual Apps and Desktops, using a specific ICA/HDX smart card virtual channel that is enabled by default.

Important: Do not use generic USB redirection for smart card readers. This is disabled by default for smart card readers, and is not supported if enabled.

Multiple smart cards and multiple readers can be used on the same user device, but if pass-through authentication is in use, only one smart card must be inserted when the user starts a virtual desktop or application. When a smart card is used within an application (for example, for digital signing or encryption functions), there might be other prompts to insert a smart card or enter a PIN. This can occur if more than one smart card has been inserted at the same time.

- If users are prompted to insert a smart card when the smart card is already in the reader, they must select Cancel.
- If users are prompted for the PIN, they must enter the PIN again.

You can reset PINs using a card management system or vendor utility.

> **Important:**
>
> Within a Citrix Virtual Apps or Citrix Virtual Desktops session, using a smart card with the Microsoft Remote Desktop Connection application is not supported. This is sometimes described as a "double hop"use.

Before deploying smart cards

- Obtain a device driver for the smart card reader and install it on the user device. Many smart card readers can use the CCID device driver supplied by Microsoft.
- Obtain a device driver and cryptographic service provider (CSP) software from your smart card vendor, and install them on both user devices and virtual desktops. The driver and CSP software must be compatible with Citrix Virtual Apps and Desktops; check the vendor documentation for compatibility. For virtual desktops using smart cards that support and use the minidriver

© 1997–2026 Citrix Systems, Inc. All rights reserved.

model, smart card minidrivers download automatically, but you can also obtain them from http://catalog.update.microsoft.com or from your vendor. Also, if PKCS#11 middleware is required, obtain it from the card vendor.

- Important: Citrix recommends that you install and test the drivers and CSP software on a physical computer before installing Citrix software.
- Add the Citrix Receiver™ for Web URL to the Trusted Sites list for users who use smart cards in Internet Explorer with Windows 10. In Windows 10, Internet Explorer does not run in protected mode by default for trusted sites.
- Ensure that your public key infrastructure (PKI) is configured appropriately. This includes ensuring that certificate-to-account mapping is correctly configured for Active Directory environment and that user certificate validation can be performed successfully.
- Ensure that your deployment meets the system requirements of the other Citrix components used with smart cards, including Citrix Workspace app and StoreFront.
- Ensure access to the following servers in your Site:
    - The Active Directory domain controller for the user account that is associated with a logon certificate on the smart card
    - Delivery Controller™
    - Citrix StoreFront
    - Citrix Gateway/Citrix Access Gateway 10.x
    - VDA
    - (Optional for Remote PC Access): Microsoft Exchange Server

Enable smart card use

Step 1. Issue smart cards to users according to your card issuance policy.

Step 2. (Optional) Set up the smart cards to enable users for Remote PC Access.

Step 3. Install and configure the Delivery Controller and StoreFront (if not already installed) for smart card remoting.

Step 4. Enable StoreFront for smart card use. For details, see Configure smart card authentication in the StoreFront documentation.

Step 5. Enable Citrix Gateway/Access Gateway for smart card use. For details, see Configuring Authentication and Authorization and Configuring Smart Card Access with the Web Interface in the NetScaler documentation.

Step 6. Enable VDAs for smart card use.

- Ensure that the VDA has the required applications and updates.
- Install the middleware.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Set up smart card remoting, enabling the communication of smart card data between Citrix Workspace app on a user device and a virtual desktop session.

Step 7. Enable user devices (including domain-joined or non-domain-joined machines) for smart card use. See Configure smart card authentication in the StoreFront documentation for details.

- Import the certificate authority root certificate and the issuing certificate authority certificate into the device's keystore.
- Install your vendor's smart card middleware.
- Install and configure Citrix Workspace app for Windows, being sure to import icaclient.adm using the Group Policy Management Console and enable smart card authentication.

Step 8. Test the deployment. Ensure that the deployment is configured correctly by launching a virtual desktop with a test user's smart card. Test all possible access mechanisms (for example, accessing the desktop through Internet Explorer and Citrix Workspace app).

Track smart card reader insertion count

With smart card remoting, you can track the number of times a smart card has been inserted or removed from a reader using the SCardGetStatusChange function. The function updates an array of SCARD_READERSTATE data structures—one per each reader you monitor. The high word (16 bits) of the dwEventState field of each SCARD_READERSTATE contains the reader count. For more information, see the Microsoft articles SCardGetStatusChangeA function and SCARD_READERSTATEA structure.

The **Reader Insert Count Reporting** setting is disabled by default. To enable tracking, add the following registry key:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\SmartCard

Name: EnableReaderInsertCountReporting

Type: DWORD

Value: Any non-zero value

When the session disconnects, the count resets to zero.

Reader Insert Count Reporting is compatible with third-party smart card middleware.

Smart card deployments

May 13, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

The following types of smart card deployments are supported by this product version and by mixed environments containing this version. Other configurations might work but are not supported.

Type	StoreFront™ connectivity
Local domain-joined computers	Directly connected
Remote access from domain-joined computers	Connected through Citrix Gateway
Non-domain-joined computers	Directly connected
Remote access from non-domain-joined computers	Connected through Citrix Gateway
Non-domain-joined computers and thin clients accessing the Desktop Appliance site	Connected through Desktop Appliance sites
Domain-joined computers and thin clients accessing StoreFront through the XenApp® Services URL	Connected through XenApp Services URLs

The deployment types are defined by the characteristics of the user device to which the smart card reader is connected:

- Whether the device is domain-joined or non-domain-joined.
- How the device is connected to StoreFront.
- What software is used to view virtual desktops and applications.

In addition, smart card-enabled applications such as Microsoft Word, and Microsoft Excel can be used in these deployments. Those applications allow users to digitally sign or encrypt documents.

Bimodal authentication

Where possible in each of these deployments, Receiver supports bimodal authentication by offering the user a choice between using a smart card and entering their user name and password. This is useful if the smart card cannot be used (for example, the user has left it at home or the logon certificate has expired).

Because users of non-domain-joined devices log on to Receiver for Windows directly, you can enable users to fall back to explicit authentication. If you configure bimodal authentication, users are initially prompted to log on using their smart cards and PINs but have the option to select explicit authentication if they experience any issues with their smart cards.

If you deploy Citrix Gateway, users log on to their devices and are prompted by Receiver for Windows to authenticate to Citrix Gateway. This applies to both domain-joined and non-domain-joined devices. Users can log on to Citrix Gateway using either their smart cards and PINs, or with explicit credentials.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

This enables you to provide users with bimodal authentication for Citrix Gateway logons. Configure pass-through authentication from Citrix Gateway to StoreFront and delegate credential validation to Citrix Gateway for smart card users so that users are silently authenticated to StoreFront.

Multiple Active Directory forest considerations

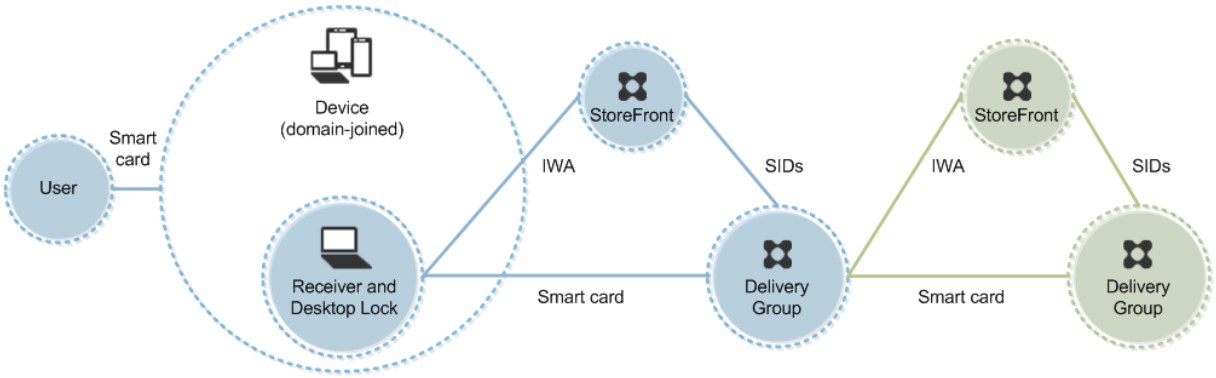
In a Citrix environment, smart cards are supported within a single forest. Smart card logons across forests require a direct two-way forest trust to all user accounts. More complex multi-forest deployments involving smart cards (that is, where trusts are only one-way or of different types) are not supported.

You can use smart cards in a Citrix environment that includes remote desktops. This feature can be installed locally (on the user device that the smart card is connected to) or remotely (on the remote desktop that the user device connects to).

Smart card removal policy

The smart card removal policy set on the product determines what happens if you remove the smart card from the reader during a session. The smart card removal policy is configured through and handled by the Windows operating system.

Policy setting	Desktop behavior
No action	No action.
Lock workstation	The desktop session is disconnected and the virtual desktop is locked.
Force logoff	The user is forced to log off. If the network connection is lost and this setting is enabled, the session may be logged off and the user may lose data.
Disconnect if a remote Terminal Services session	The session is disconnected and the virtual desktop is locked.



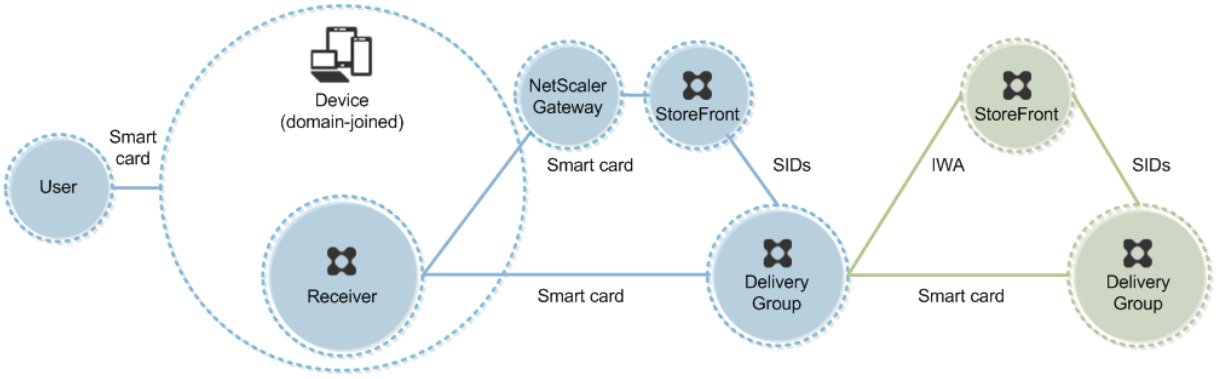
Certificate revocation checking

If certificate revocation checking is enabled and a user inserts a smart card with an invalid certificate into a card reader, the user cannot authenticate or access the desktop or application related to the certificate. For example, if the invalid certificate is used for email decryption, the email remains encrypted. If other certificates on the card, such as ones used for authentication, are still valid, those functions remain active.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Deployment example: domain-joined computers

This deployment involves domain-joined user devices that run the Desktop Viewer and connect directly to StoreFront.



A user logs on to a device using a smart card and PIN. Receiver authenticates the user to a Storefront server using Integrated Windows Authentication (IWA). StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is not prompted for a PIN again because the single sign-on feature is configured on Receiver.

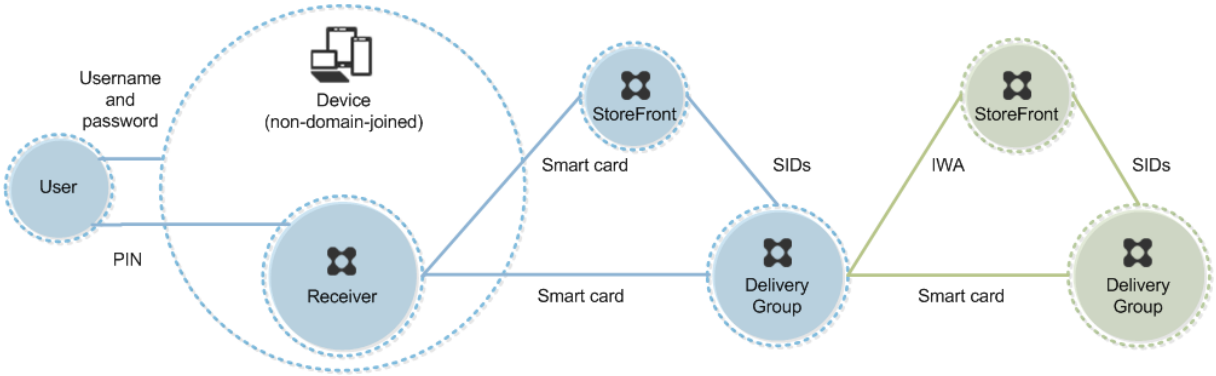
This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

Deployment example: remote access from domain-joined computers

This deployment involves domain-joined user devices that run the Desktop Viewer and connect to StoreFront through Citrix Gateway/Access Gateway.

A user logs on to a device using a smart card and PIN, and then logs on again to Citrix Gateway/Access Gateway. This second logon can be with either the smart card and PIN or a user name and password

© 1997–2026 Citrix Systems, Inc. All rights reserved.



because Receiver allows bimodal authentication in this deployment.

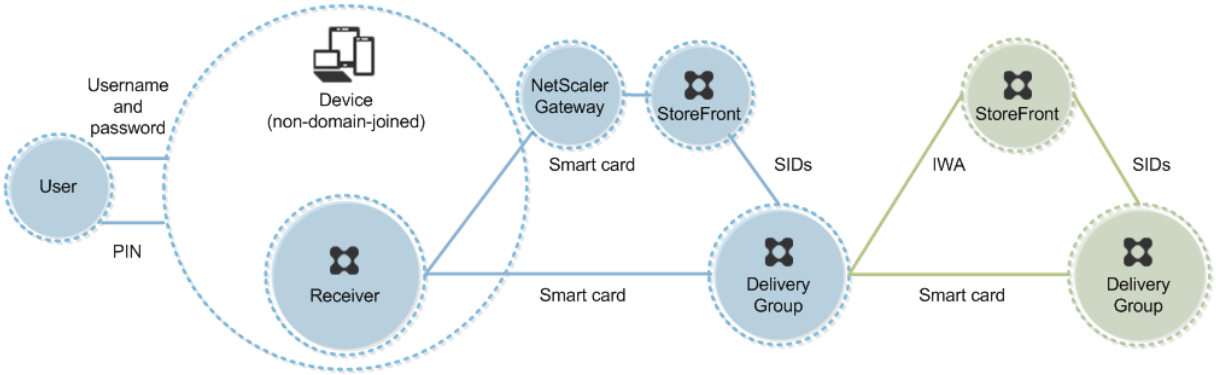
The user is automatically logged on to StoreFront, which passes the user security identifiers (SIDs) to Citrix Virtual Apps™ or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is not prompted again for a PIN because the single sign-on feature is configured on Receiver.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second Store-Front server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

Deployment example: non-domain-joined computers

This deployment involves non-domain-joined user devices that run the Desktop Viewer and connect directly to StoreFront.

A user logs on to a device. Typically, the user enters a user name and password but, since the device is not joined to a domain, credentials for this logon are optional. Because bimodal authentication is possible in this deployment, Receiver prompts the user either for a smart card and PIN or a user name and password. Receiver then authenticates to Storefront.



StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is prompted for a PIN again because the single sign-on feature is not available in this deployment.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second Store-Front server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

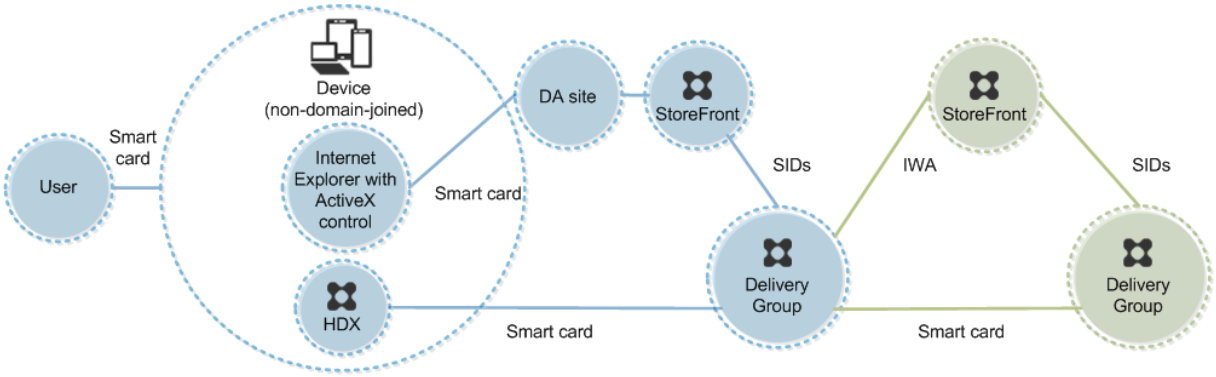
Deployment example: remote access from non-domain-joined computers

This deployment involves non-domain-joined user devices that run the Desktop Viewer and connect directly to StoreFront.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A user logs on to a device. Typically, the user enters a user name and password but, since the device is not joined to a domain, credentials for this logon are optional. Because bimodal authentication is possible in this deployment, Receiver prompts the user either for a smart card and PIN or a user name and password. Receiver then authenticates to Storefront.

StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is prompted for a PIN again because the single sign-on feature is not available in this deployment.



This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

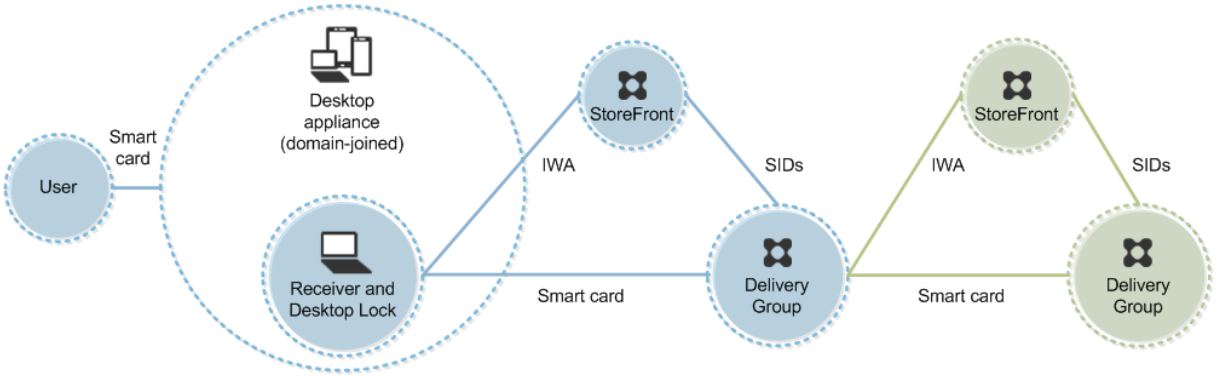
Deployment example: non-domain-joined computers and thin clients accessing the Desktop Appliance site

This deployment involves non-domain-joined user devices that may run the Desktop Lock and connect to StoreFront through Desktop Appliance sites.

The Desktop Lock is a separate component that is released with Citrix Virtual Apps, Citrix Virtual Desktops, and VDI-in-a-Box. It is an alternative to the Desktop Viewer and is designed mainly for repurposed Windows computers and Windows thin clients. The Desktop Lock replaces the Windows shell and Task Manager in these user devices, preventing users from accessing the underlying devices. With the Desktop Lock, users can access Windows Server Machine desktops and Windows Desktop Machine desktops. Installation of Desktop Lock is optional.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A user logs on to a device with a smart card. If Desktop Lock is running on the device, the device is configured to launch a Desktop Appliance site through Internet Explorer running in Kiosk Mode. An ActiveX control on the site prompts the user for a PIN, and sends it to StoreFront. StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. The first available desktop in the alphabetical list in an assigned Desktop Group starts.



This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

Deployment example: domain-joined computers and thin clients accessing StoreFront through the XenApp Services URL

This deployment involves domain-joined user devices that run the Desktop Lock and connect to StoreFront through XenApp Services URLs.

The Desktop Lock is a separate component that is released with Citrix Virtual Apps, Citrix Virtual Desktops, and VDI-in-a-Box. It is an alternative to the Desktop Viewer and is designed mainly for repurposed Windows computers and Windows thin clients. The Desktop Lock replaces the Windows shell and Task Manager in these user devices, preventing users from accessing the underlying devices. With the Desktop Lock, users can access Windows Server Machine desktops and Windows Desktop Machine desktops. Installation of Desktop Lock is optional.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

A user logs on to a device using a smart card and PIN. If Desktop Lock is running on the device, it authenticates the user to a Storefront server using Integrated Windows Authentication (IWA). StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop, the user is not prompted for a PIN again because the single sign-on feature is configured on Receiver.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

Pass-through authentication and single sign-on with smart cards

May 13, 2026

Pass-through authentication

Pass-through authentication with smart cards to virtual desktops is supported on user devices running Windows 10, Windows 8, and Windows 7 SP1 Enterprise and Professional Editions.

Pass-through authentication with smart cards to hosted applications is supported on servers running Windows Server 2012 and Windows Server 2008 R2 SP1.

To use pass-through authentication with smart cards hosted applications, ensure you enable the use of Kerberos when you configure Pass-through with smartcard as the authentication method for the site.

Note: The availability of pass-through authentication with smart cards depends on many factors including, but not limited to:

- Your organization's security policies regarding pass-through authentication.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

- Middleware type and configuration.
- Smart card reader types.
- Middleware PIN caching policy.

Pass-through authentication with smart cards is configured on Citrix StoreFront. See the StoreFront documentation for details.

Single sign-on

Single sign-on is a Citrix feature that implements pass-through authentication with virtual desktop and application launches. You can use this feature in domain-joined, direct-to-StoreFront and domain-joined, NetScaler-to-StoreFront smart card deployments to reduce the number of times that users enter their PIN. To use single sign-on in these deployment types, edit the following parameters in the default.ica file, which is located on the StoreFront server:

- Domain-joined, direct-to-StoreFront smart card deployments —Set DisableCtrlAltDel to Off
- Domain-joined, NetScaler-to-StoreFront smart card deployments —Set UseLocalUserAndPassword to On

For more instructions on setting these parameters, see the StoreFront or Citrix Gateway documentation.

The availability of single sign-on functionality depends on many factors including, but not limited to:

- Your organization's security policies regarding single sign-on.
- Middleware type and configuration.
- Smart card reader types.
- Middleware PIN caching policy.

> **Note:**
>
> When a user logs on to the Virtual Delivery Agent (VDA) on a machine with an attached smart card reader, a Windows tile may appear representing the previous successful mode of authentication, such as smart card or password. As a result, when single sign-on is enabled, the single sign-on tile may appear. To log on, the user must select **Switch Users** to select another tile because the single sign-on tile will not work.

Enable TLS on Delivery Controllers

May 15, 2026

© 1997–2026 Citrix Systems, Inc. All rights reserved.

By default, both HTTP and HTTPS are enabled. HTTPS uses a self-signed certificate using the server's FQDN as the common name, which is not trusted by StoreFront™ or web browsers.

To enable TLS on a delivery controller™, you must:

- Obtain, install, and register a server certificate on all Delivery Controllers. For details, see Requesting and installing a certificate.
- Configure a port with the TLS certificate. For details, see Installing a certificate.
- Enable HTTPS for the monitor service.
- Enforce HTTPS traffic by disabling HTTP. For more details, see Enforce HTTPS traffic onlyEnforce HTTPS traffic only.
- Optionally, you can change the ports the Controller uses to listen for HTTP and HTTPS traffic. For more details, see Change HTTP or HTTPS ports.

Requesting and installing a certificate

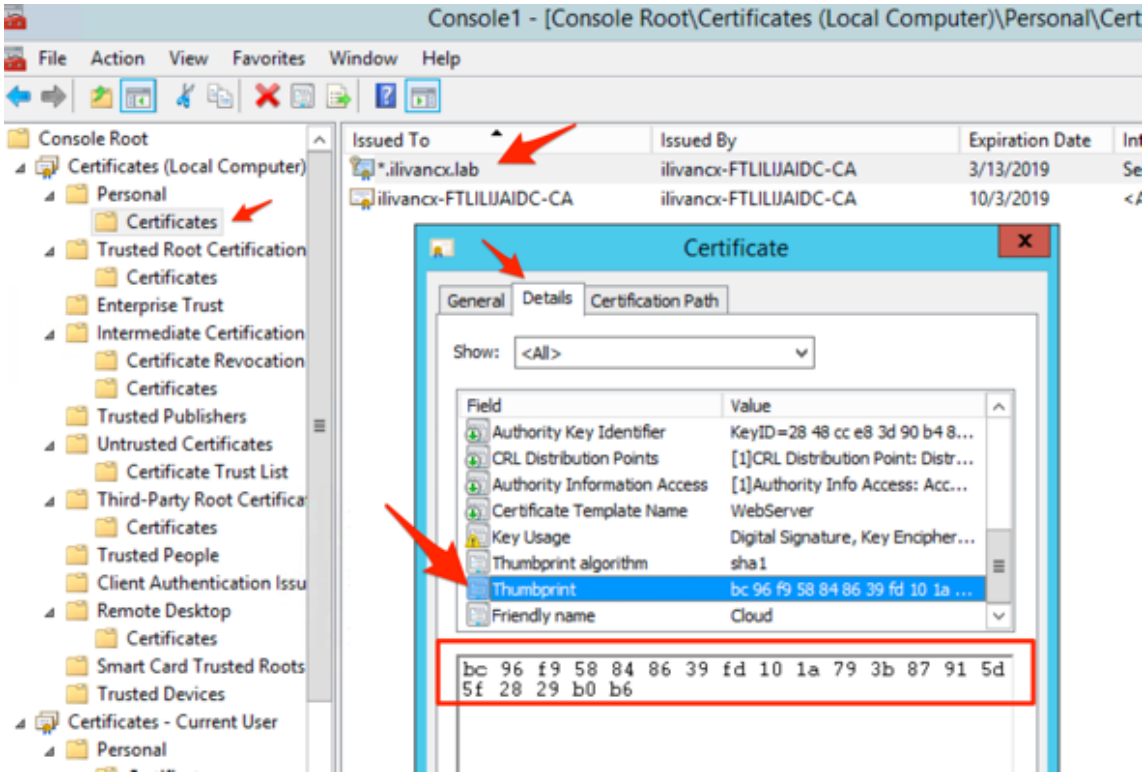
To use TLS, you must install a certificate whose Common Name or Subject Alternative Name matches the server's FQDN. If you are using a load balancer in front of the delivery controllers then include both the server and the load balancer's FQDNs as Subject Alternative Names. For more information, see Certificates. For StoreFront to connect to the delivery controller you must use an RSA digital signature algorithm. StoreFront does not support certificates using the ECDSA algorithm.

Configuring SSL/TLS listener port

If the IIS Windows component is installed on the same server, which is installed as part of Web Studio and Director, you can configure TLS using IIS. For more information, see Enable TLS on Web Studio and Director. Otherwise, to configure the certificate using PowerShell:

1. To check if there is an existing certificate bound, open a command prompt and run `netsh http show sslcert`:

   ```
   1 netsh http show sslcert
   ```



2. If there is an existing binding then delete it.

   ```
   1 netsh http delete sslcert ipport=0.0.0.0:443
   ```

   Replacing `0.0.0.0:443` with a specific IP address and port if there was one specified in the existing binding.

3. Find the thumbprint of the certificate you installed previously. To view the thumbprint, open **Manage computer certificates**, browse to the certificate and open it and go to the **Details** tab.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Alternatively you can use PowerShell. For example the following script looks for a certificate whose common name matches the server's host name and prints the thumbnail:

```
$HostName = ([System.Net.Dns]::GetHostByName(($env:computerName)))
    .Hostname
$Thumbprint = (Get-ChildItem -Path Cert:\LocalMachine\My | Where-
    Object {
 $_.Subject -match ("CN=" + $HostName) }
 ).Thumbprint -join ';'
Write-Host -Object "Certificate Thumbprint for $($HostName): $(
    $Thumbprint)" -Foreground Yellow
```

If the certificate common name does not match the host names then this will fail. If there are multiple certificates for the host name then this returns multiple thumbprints concatenated together and you must choose the appropriate thumbprint.

The following example looks for a certificate by friendly name:

```
$friendlyName = "My certificate name"
$Thumbprint = (Get-ChildItem -Path Cert:\LocalMachine\My | Where-
    Object {
 $_.FriendlyName -eq $friendlyNam }
 ).Thumbprint -join ';'
Write-Host -Object "Certificate Thumbprint for $friendlyName: $(
    $Thumbprint)" -Foreground Yellow
```

If there are multiple certificates with the specified friendly name then this returns multiple

© 1997–2026 Citrix Systems, Inc. All rights reserved.

thumbprints concatenated together and you must choose the appropriate thumbprint.

4. To bind the certificate to the port, use the `netsh http add sslcert` command:

```
netsh http add sslcert ipport=[IP address]:443 certhash=[
    certificate hash] appid=[application GUID] disablelegacytls=
    enable
```

- `ipport`: The IP address and port. Using 0.0.0.0:443 applies this to all IP addresses. You can instead specify a specific IP address.
- `certhash`: The thumbprint of the certificate you identified in the previous step.
- `appid`: The GUID of the Citrix Broker Service.

  > **Note:**
  >
  > When renewing a certificate or rebinding, use the specific `appid` associated with the Broker Service rather than an arbitrary GUID.
  > To find the correct `appid` for the Citrix Broker Service:
  >
  > a) Open a PowerShell command window as an administrator and run the following command:

```
```
Get-WmiObject -Class Win32_Product | Select-String -Pattern "
    broker"
```
```

  a) Locate the IdentifyingNumber (GUID) for the Citrix Broker Service in the output (for example, `{ D333C884-187F-447C-8C67-463F33989C8F }`). Use this GUID for the `appid` parameter.

- `disablelegacytls=enable`: Disables legacy versions of TLS. This parameter is available on Windows 2022 and higher. Windows 2022 it disables TLS 1.0 and 1.1. On Windows 2025 this is unnecessary as TLS 1.0 and 1.1 are disabled by default.

For example, run the following command to bind the certificate with thumbprint `bc96f958848639fd101` to port 443 on all IP addresses:

```
netsh http add sslcert ipport=0.0.0.0:443 certhash=
    bc96f958848639fd101a793b87915d5f2829b0b6 appid={
 91fe7386-e0c2-471b-a252-1e0a805febac }
  disablelegacytls=enable
```

Once HTTPS is enabled, configure any StoreFront deployments and NetScaler Gateways to use HTTPS instead of HTTP to connect to the delivery controller.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

Configure Monitor Service OData API for HTTPS

The monitor service provides OData v3 and v4 APIs to allow Citrix® and third party applications to query data. Director connects to the monitoring service using the OData API V3. To configure the monitor OData APIs for HTTPS complete the following steps:

1. Run the following PowerShell:

```
$serviceGroup = Get-ConfigRegisteredServiceInstance -ServiceType
    Monitor | Select -First 1 ServiceGroupUid
Remove-ConfigServiceGroup -ServiceGroupUid $serviceGroup.
    ServiceGroupUid
& 'C:\Program Files\Citrix\Monitor\Service\citrix.monitor.exe' -
    ConfigureFirewall -RequireODataTls –OdataPort 443 -
    RequireODataSdkTls –OdataSdkPort 443
get-MonitorServiceInstance | register-ConfigServiceInstance
Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-
    MonitorServiceGroupMembership
```

2. Open file `C:\Program Files\Citrix\Monitor\Service\Citrix.Monitor.exe.Config` with a text editor. Find the element `<add key="owin:baseAddress "value="http://localhost/citrix/monitor/odata/v4"/>` and change it to `<add key="owin:baseAddress"value="https://localhost/citrix/monitor/odata/v4"/>`.

Configure cipher suites

The cipher suite order list must include the `TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384`, or `TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256` cipher suites (or both); and these cipher suites must precede any `TLS_DHE_` cipher suites.

1. Using the Microsoft Group Policy Editor, browse to **Computer Configuration > Administrative Templates > Network > SSL Configuration Settings**.
2. Edit the policy "SSL Cipher Suite Order". By default, this policy is set to "Not Configured". Set this policy to Enabled.
3. Arrange suites in the correct order. Remove any cipher suites that you do not want to use.

Ensure that either `TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384`, or `TLS_ECDHE_RSA_WITH_AES_128` precedes any `TLS_DHE_` cipher suites.

On Microsoft Learn, see also Configuring TLS Cipher Suite Order.

Enforce HTTPS traffic only

It is recommended that you configure the XML Service to ignore HTTP traffic.

© 1997–2026 Citrix Systems, Inc. All rights reserved.

1. Run `regedit`
2. Open `HKLM\Software\Citrix\DesktopServer\`
3. Create a new DWORD value with name `XmlServicesEnableNonSsl` and set it to 0.
4. Restart the Broker Service.

There is a corresponding registry DWORD value `XmlServicesEnableSsl` you can create to ignore HTTPS traffic. Ensure that it is not set to 0.

Change HTTP or HTTPS ports

By default, the XML Service on the Controller listens on port 80 for HTTP traffic and port 443 for HTTPS traffic. Although you can use non-default ports, be aware of the security risks of exposing a Controller to untrusted networks. Deploying a standalone StoreFront server is preferable to changing the defaults.

To change the default HTTP or HTTPS ports used by the Controller, run the following command from Studio:

```
BrokerService.exe -StoreFrontPort <http-port> -StoreFrontTlsPort <https
    -port>
```

Where:

- <http-port> is the port number for HTTP traffic
