Citrix Virtual Apps and Desktops 7 2009

September 25, 2020

About this release

This Citrix Virtual Apps and Desktops release includes new versions of the Windows Virtual Delivery Agents (VDAs) and new versions of several core components. You can:

- **Install or upgrade a site**
  
  Use the ISO for this release to install or upgrade core components and VDAs. Installing or upgrading to the latest version allows you to use the latest features.

- **Install or upgrade VDAs in an existing site**
  
  If you already have a deployment, and aren't ready to upgrade your core components, you can still use several of the latest HDX features by installing (or upgrading to) a new VDA. Upgrading only the VDAs can be helpful when you want to test enhancements in a non-production environment.
After upgrading your VDAs to this version (from version 7.9 or later), you do not need to update the machine catalog’s functional level. The 7.9 (or later) value remains the default functional level, and is valid for this release. For more information, see VDA versions and functional levels.

For installation and upgrade instructions:

- If you are building a new site, follow the sequence in Install and configure.
- If you are upgrading a site, see Upgrade a deployment.

Citrix Virtual Apps and Desktops 7 2009

Install and upgrade: Removal of VM optimizer from VDA installers

As of this release, the VDA installers no longer include TargetOSOptimizer.exe. The Features page in the VDA installers’ graphical interface no longer contains the Optimize performance option. In the VDA installers’ CLI, the /optimize option is no longer valid.

In place of the removed item, use Citrix Optimizer. Citrix Optimizer is a standalone tool (not part of the VDA installation). For details, see CTX224676.

Upgrade: New page in graphical interface

When using the full product installer’s graphical interface to upgrade Delivery Controllers, a new page lists the features, platforms, and components that are no longer supported. You can then stop the upgrade to remove unsupported items, if needed, and then restart the upgrade.

Upgrade: Removing unsupported items

As of version 2003, the following technologies and host types are not supported in Citrix Virtual Apps and Desktops 7 Current Release deployments:

- **Personal vDisks (PvD)** for storing data next to users’ VMs. The user personalization layer feature now handles user persistence.

- **AppDisks** for managing applications used in delivery groups.

- **Host types** for connections: Azure Classic, Azure Resource Manager (ARM), Amazon Web Services (AWS), CloudPlatform (the original Citrix product).
  - For information about alternative ways you can continue using ARM and AWS, see CTX270373.
  - For host types supported in this release, see System requirements.

As of version 2006, if your current deployment uses PvDs or AppDisks, or has connections to unsupported host types, you can upgrade your deployment to version 2006 (or later supported versions) only after removing items that use those technologies.
For VDAs, the installation or earlier upgrades might have included PvD and AppDisks components, even if you never used it. You can upgrade VDAs to version 2006 (or later supported versions), only after removing that software. When using the graphical interface, that removal can be done automatically. Or, you can include options when using the CLI.

For details, see Remove PvD, AppDisks, and unsupported hosts.

Support for VMware vSphere 7.0

Citrix Virtual Apps and Desktops adds support for VMware vSphere 7.0. This support includes ESXi 7.0 and VMware vCenter Server 7.0.

Support for Microsoft System Center Virtual Machine Manager 2019

This release includes support for Microsoft System Center Virtual Machine Manager (SCVMM) 2019.

Manage searches during VDA registration

By default, if the Broker Agent cannot locate a specified Controller during its initial search, it initiates an extensive fallback top-down query. You can now use a registry setting to control whether the Broker Agent uses that fallback query. For details, see Controller search during VDA registration.

Virtual Delivery Agents (VDAs) 2009

Version 2009 of the Windows single-session OS and multi-session OS VDAs includes the following enhancements. These items are in addition to the VDA installation and upgrade items listed earlier in this article.

Limit clipboard transfer size

You can specify the maximum amount of clipboard data a user can transfer to and from a virtual session using a single cut-and-paste operation. For more information, see the Limit clipboard client to session transfer size and Limit clipboard session to client transfer size settings in Client clipboard redirection.

Smart card reader insertion count

Smart card remoting now lets you track the number of times a smart card has been inserted or removed from a reader. For more information, see Track smart card reader insertion count.
VDA-based Wake on LAN

This release of Citrix Virtual Apps and Desktops adds support for a new Wake on LAN hosting connection for VDAs. For more information, see Remote PC Access.

Connection timeout

The user now receives an alert message two minutes before the virtual session automatically times out. To enable or update the timer that specifies the maximum duration of an uninterrupted connection, see Session connection timer.

App-V Single Admin HTTP(S) streaming

This version of the VDA includes changes that allow ctxAppVLauncher.exe to publish and launch packages that are streamed from an IIS server over HTTP or HTTPS, as well as from a UNC share. This enhancement supports the publishing of App-V package via HTTP streaming in the Citrix Virtual Apps and Desktops service in Citrix Cloud. The ability to import HTTP streamed packages to the AppLibrary and publish them with Citrix Studio is not available for on-premises sites.

User personalization layer

This version of User personalization layer feature supports custom repository path names. When specifying an explicit repository path, you can include machine environment variables, along with %USERNAME% and %USERDOMAIN% variables.

Active Directory authentication

A new registry entry has been added to avoid unwanted enabling of NTLM authentication in VDAs, which is less secure than Kerberos. For more information, see Deploy in a multiple Active Directory forest environment.

Local authorization and virtual authentication using FIDO2

Support for FIDO2 enables users to take advantage of the local endpoint FIDO2 components in a virtual machine. Users can now authenticate in their virtual session using FIDO2 security keys or integrated biometrics on devices that have TPM 2.0 and Windows Hello. For more information, see FIDO2: WebAuthn & CTAP.
**Keyboard enhancements for Dutch and Italian languages**

This release addresses keyboard issues for Dutch and Italian languages that are present in non-Windows client sessions. The improvements focus on the overall robustness of keyboard interactions in virtual sessions running through Citrix Workspace app. The enhanced Windows VDA keyboard now supports most combinations for Dutch and Italian input and provides a better user experience for customers in different locales.

**Citrix Studio**

**Security key to authenticate StoreFront and Citrix Gateway**

**Note:**

You must use this feature in combination with StoreFront 1912 LTSR CU2 or later. StoreFront 1912 LTSR CU2 has not yet been released.

Starting with this release, you can use a security key to allow only approved StoreFront and Citrix Gateway machines to communicate with the Delivery Controller. After you enable this feature, any requests that do not contain the key are blocked. Use this feature to add an extra layer of security to protect against attacks originating from the internal network. For more information, see Manage security keys.

**Citrix Licensing 11.16.6**

Citrix Licensing 11.16.6 contains new features and fixed and known issues.

**Related components**

For documentation about related components, see:

More information

- For deprecation and removal announcements, see Deprecation.
- For information about product name and version number changes that were introduced in the year 2018, see New names and numbers.

Fixed issues

September 25, 2020

The following issues have been fixed since Citrix Virtual Apps and Desktops 7 2006:

**Citrix Director**

- When you attempt to configure an email server on a standalone server using Citrix Director, this error message might appear:

  **Invalid Email Server.**

  The issue occurs when you configure the email server for alerts and notifications. [CVADHELP-14648]

- In Citrix Director, when you pull the report for a Delivery Group on the **Load Evaluator Index** tab, the details might appear incorrectly. The report displays the details of all Delivery Groups rather than the selected Delivery Group. [CVADHELP-14869]

- In Citrix Director, when you check machine usage for a selected Delivery Group by navigating to **Director console > Trends > Machine Usage**, the value appears as 0 (Zero). The issue occurs when you select a Delivery Group under **Multi-session OS Machines**. The issue occurs only with the **In Use** column. [CVADHELP-15136]

- The integration of NetScaler Management and Analytics System (MAS) with Citrix Director might fail. The issue occurs when the NetScaler MAS logon password contains a special character and the password is passed without encryption. As a result, the command

  `C:\inetpub\wwwroot\Director\bin..\DisplayConfig\HdxInsightPlugin\HdxInsightForUDPluginConfig.xml`

fails with the following exception:

  **Could not perform the logon operation and inner exception: The remote server returned an error: (400) Bad Request.**

  [CVADHELP-15219]
Citrix Provisioning

Citrix Provisioning 2009 documentation provides specific information about the updates in this release.

Citrix Studio

- On the Machine Allocation page, certain checkboxes might be missing. The issue occurs when you are attempting to add machines to a delivery group or a machine catalog that has one or more user-assigned machines. [CVADHELP-15684]

Delivery Controller

- When you generate a License Server report using the `udadmin` command, the report might show that the licenses are issued to the same device multiple times. The issue occurs when different devices with the correct hardware IDs are updated against duplicate names. The issue does not impact the license consumption, but only the report. [CVADHELP-13763]
- When you update machine catalogs using Machine Creation Services, the previous base disk folder might not be deleted from the VMware Storage. [CVADHELP-14264]
- After a VDA reports a full load due to high memory usage, the load index value might remain at 10,000 even if the memory usage drops to a low level. [CVADHELP-14563]
- Attempts to create a Machine Creation Services (MCS) catalog in Azure using PowerShell might fail with this error message:

  Could not locate item with path=Citrix.AzureRmPlugin.InventoryItemPath.

  The issue occurs when you use Shared Azure subscriptions in conjunction with narrow scope service principals. [CVADHELP-14640]
- The `MonitorData.[User]` table present in the Monitoring database might fail to synchronize data with Active Directory. Also, the user name, display name, and the UPN information present in the table become obsolete. [CVADHELP-14700]
- vSAN storage policies might not be applied on a virtual machine created using Machine Creation Services (MCS). The issue occurs when the version of a disk attached to the machine is incorrect. [CVADHELP-14935]
- When you select Machine Catalogs in the Studio navigation pane, Studio might fail to display the list of catalogs. This error message appears:

  You cannot see any catalogs.

  The issue occurs because Studio cannot retrieve the list of objects by using the `Get-ProvSchemeMasterVMImageHistory` PowerShell command. [CVADHELP-15211]
Federated Authentication Service

Federated Authentication Service 2009 documentation provides specific information about the updates in this release.

Licensing

Licensing 2009 documentation provides specific information about the updates in this release.

Linux VDA

Linux VDA 2009 documentation provides specific information about the updates in this release.

Profile Management

Profile Management 2009 documentation provides specific information about the updates in this release.

Session Recording

Session Recording 2009 documentation provides specific information about the updates in this release.

VDA for single-session OS

Installing, Uninstalling, Upgrading

- When you upgrade a VDA, the MaxVideoMemoryBytes registry key might revert to the default value. [CVADHELP-13629]

Session/Connection

- When the Windows Media Player moves from the current track to the next track in the playlist, audio might not play at the beginning of the next track. The issue occurs if Windows Media redirection is enabled. [CVADHELP-11639]

- When audio devices are added to a user session, you cannot hear sounds from any of the devices except the sounds of Skype for Business. This error message appears:

  **Error - no more device slots available - failed to add the device.**

  The issue occurs when more than eight playback or record devices are attached to an endpoint. [CVADHELP-12760]
• Attempts to launch a session might fail. [CVADHELP-13834]

• When you use HDX RealTime Webcam Video Compression, a webcam might show a black image instead of a live image. [CVADHELP-13877]

• Some portions of an application window might become transparent, causing the application to run in the background instead of in the foreground. The issue occurs in seamless mode. [CVADHELP-13903]

• In a site where XenApp and XenDesktop Version 7.15 LTSR Cumulative Update 4 runs on Microsoft Windows Server 2016, when you attempt to launch a published application, the application session might become unresponsive. This error message appears:

  **Please wait for Local Session Manager**

  [CVADHELP-13967]

• During the initial launch of a VDI session on a 4K monitor, the session might display at a lower resolution. Also, a gray border might appear around the session window. The issue occurs with devices using certain third-party graphics cards. [CVADHELP-14401]

• The Citrix software graphics process (Ctxgfx.exe) might constantly consume available memory within a session. [CVADHELP-14509]

• On a VDA, when you reconnect to a single-monitor thin client from a multi-monitor thin client, the monitor layout might not be updated. [CVADHELP-14646]

• Some third-party 32-bit scanning applications might not work on a VDA when they are redirected to the VDA using Generic USB redirection. The issue occurs when the scanning applications on the VDA use TWAIN DSM. The issue can also occur on a Remote PC Access VDA. [CVADHELP-14698]

• When a user uses Remote PC Access to access the office PC, the remote session might be viewed from the office PC. As a result, session activities are exposed. [CVADHELP-14893]

• When you launch a published application in seamless mode, the published application is always on top, appearing over local applications. You cannot bring the local applications to the foreground unless you minimize the published application. [CVADHELP-15134]

• A session might disconnect when you maximize, minimize, or resize the desktop. The issue occurs with VDA for single-session OS Version 1912 CU1 running on Microsoft Windows 10 Version 1809. [CVADHELP-15200]

• When you attempt to reconnect to a new virtual machine, the following Microsoft .NET Framework error message might appear:

  **Error Unhandled exception has occurred in your application**

  [CVADHELP-15267]
### System Exceptions

- The Citrix Audio Redirection Service (CtxAudioSvc) might exit unexpectedly with an Event ID 1000 and an exception code 0x0c0000005. The issue occurs because of the faulting module, CtxVorbisDmo64.dll. [CVADHELP-14898]
- The PicaShell.exe process might exit unexpectedly when there is heap corruption in the clipboard virtual channel DLL. [CVADHELP-14945]
- The Internet Explorer browser add-on (Citrix HDXJsInjector) required for Browser Content Redirection might cause a webpage error when you use the developer tools. The InjectorScript.js intermittently experiences a runtime exception when accessing the HTML document.head. [CVADHELP-14960]

### User Experience

- When certain third-party applications are running within a user session, the mouse pointer might change to a spinning circle. The issue occurs when you drag an object in the session or perform a zoom operation. [CVADHELP-14247]

### VDA for multi-session OS

#### Session/Connection

- When the Windows Media Player moves from the current track to the next track in the playlist, audio might not play at the beginning of the next track. The issue occurs if Windows Media redirection is enabled. [CVADHELP-11639]
- Attempts to launch an application might fail. As a result, session details under Task Manager cannot be found and the following application status in Citrix Studio appears: application not running. When the issue occurs, the VDA might reregister and the following error message appears:

  **Event ID 1048: WCF Failure or Rejection by Broker**

  [CVADHELP-12856]

- When you use HDX RealTime Webcam Video Compression, a webcam might show a black image instead of a live image. [CVADHELP-13877]
- Some portions of an application window might become transparent, causing the application to run in the background instead of in the foreground. The issue occurs in seamless mode. [CVADHELP-13903]
• In a site where XenApp and XenDesktop Version 7.15 LTSR Cumulative Update 4 runs on Microsoft Windows Server 2016, when you attempt to launch a published application, the application session might become unresponsive. This error message appears:

**Please wait for Local Session Manager**

[CVADHELP-13967]

• The Citrix software graphics process (Ctxgfx.exe) might constantly consume available memory within a session. [CVADHELP-14509]

• Microsoft Windows winlogon.exe might exit unexpectedly. The issue occurs when you close a seamless session launched through a server. The issue occurs because of the faulting module, icagfxstack.dll. [CVADHELP-14579]

• Some third-party 32-bit scanning applications might not work on a VDA when they are redirected to the VDA using Generic USB redirection. The issue occurs when the scanning applications on the VDA use TWAIN DSM. The issue can also occur on a Remote PC Access VDA. [CVADHELP-14698]

• When you attempt to reconnect to a new virtual machine, the following Microsoft .NET Framework error message might appear:

**Error Unhandled exception has occurred in your application**

[CVADHELP-15267]

**System Exceptions**

• The Service Host (svchost.exe) process that hosts the Windows audio service might exit unexpectedly within a user session. The issue occurs because of a memory leak. [CVADHELP-13687]

• The wfshe1l.exe process might exit unexpectedly. [CVADHELP-14414]

• On a device that has more than nine monitors, attempts to launch a user session might fail with a fatal exception, displaying a blue screen with bug check code 0x3B. [CVADHELP-14775]

• The Citrix Audio Redirection Service (CtxAudioSvc) might exit unexpectedly with an Event ID 1000 and an exception code 0x0c0000005. The issue occurs because of the faulting module, CtxVorbisDmo64.dll. [CVADHELP-14898]

• The PicaShell.exe process might exit unexpectedly when there is heap corruption in the clipboard virtual channel DLL. [CVADHELP-14945]

• The Internet Explorer browser add-on (Citrix HDXJsInjector) required for Browser Content Redirection might cause a webpage error when you use the developer tools. The InjectorScript.js intermittently experiences a runtime exception when accessing the HTML document.head. [CVADHELP-14960]
Virtual Desktop Components – Other

- After adding published applications to your Favorites, you can open only one application. The issue occurs when those published applications use the same executable name, as indicated by KEYWORDS:prefer="<application_name>". [CVADHELP-14098]
- Attempts to launch an App-V application using a shortcut located within the AppData folder might fail. [CVADHELP-14691]

Known issues

September 17, 2020

The Citrix Virtual Apps and Desktops 7 2009 release contains the following issues. Components and features that are documented separately have their own known issues articles.

This warning applies to any workaround that suggests changing a registry entry:

Warning:
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Install and upgrade

- When you run the Citrix Virtual Apps and Desktops metainstaller, on the Diagnostics page if you click Connect without first selecting Collect diagnostic information, after you close the Connect to Citrix Insight Services dialog the Next button is disabled and you cannot move to next page. To re-enable the Next button, select and immediately deselect Collect diagnostic information. [XAXDINST-572]

General

- If you try to add a protected app to your Favorites, this message might appear, “Your apps are not available at this time…” When you then click OK, this message appears, “Cannot add app.” After you switch to the Favorites screen, the protected app is listed there, but you can’t remove it from Favorites. [WSP-5497]
- In the Chrome browser with browser content redirection in effect, when you click on a link that opens a new tab, the tab might not open. As a workaround, select Always allow pop-ups and redirects in the Pop-ups blocked message. [HDX-23950]
• After installing the Skype for Business Web App Plug-in, webcams might not be enumerated and meeting pages on Firefox might not refresh automatically. [HDX-13288]

• When you start an application from StoreFront, the application might not start in the foreground, or the application is in the foreground but might not have focus. As a workaround, click the icon in the task bar to bring the application to the front or in the application screen to bring it to focus. [HDX-10126]

• When you connect to a new session, disconnect, and then reconnect to the same session, your desktop icons might flicker. As a workaround reset the user profile, log off the session, and log on again. [HDX-15926, UPM-1362]

• When using Windows 10 1809 LTSC, VCLibs dependencies fail to install. [HDX-16754]

• The combo box might not display properly when a user selects a combo box that is already in focus on the host. As a workaround, select another UI element and then select the combo box. [HDX-21671]

• You have enabled Local App Access. If you start a Windows 2012 R2 VDA session, disconnect and reconnect the session, and then start a local application and maximize it, the VDA taskbar might truncate the application. [HDX-21913]

• When you modify an existing VDA installation using the meta installer, you can add MCSIO storage optimization to the installation by selecting the option ‘Enable MCSIO write cache for storage optimization.’ The installation proceeds without installing the MCSIO driver. [HDX-21754]

• When you use generic USB redirection to redirect a composite USB device that contains a mouse as a subdevice into an RDS session, that device might not be available in the session. The most common such device is a Wacom drawing tablet (not Wacom signature pad). As a workaround, manually start icak2meng.exe in the session after logging on. We suggest creating a group policy for Windows Multi-session OS 2016 or 2019 (not needed for Windows 10) that automatically starts C:\Program Files\Citrix\HDX\bin\icak2meng.exe. Create the policy to start the program in each user's session as they log on. Only one instance running in each user's session. The workaround is not needed [HDX-25085]

• When both IPv4 and IPv6 addressing is configured in your network, resources in a delivery group may not be accessible when the delivery group uses a Broker Access Policy rule configured to allow IPv4 address filtering only. To ensure all resource filtering behaves as expected, configure the Broker Access Policy rule to include both client IPv4 and IPv6 addresses. [WADA-7776]

For example, to set rules allowing IPv4 and IPv6 addresses via ‘direct to StoreFront’ and ‘Citrix Gateway’ access, use PowerShell such as:
To confirm a rule, use PowerShell such as:

```
Get-BrokerAccessPolicyRule -Name "Apps_Direct" | Select Name, IncludedClientIPFilterEnabled,IncludedClientIPs
```

This returns the following when the rule is correctly set for IPv4 and IPv6 addresses:

```
Name       IncludedClientIPFilterEnabled IncludedClientIPs
--         ------------------------------ ------------------
Apps_Direct True { 10.0.0.1/32, 2001::3/128 }
```

- When applications from Microsoft Office 365 build 16.0.7967 and later are published as applications from a Windows Server 2019 host, Office license activation fails. This is caused by a Microsoft limitation. [LCM-7637]

- Data masking does not mask the license server if the configuration uses a dedicated license server. [XAXDTELE-1634]

**Director**

- If you configure your on-premises Citrix Virtual Apps and Desktop site with Citrix Analytics for Performance and your subscription expires, you might experience memory spikes from the Monitor Service. As a workaround, use the **Disconnect Site** link on the Analytics tab in your on-premises Director console. [DIR-12625]

- When you try to view the historical utilization of machines on the **Machine Details** page for VDA versions 2003 and 2006, the following error message appears (even after you set **Enable process monitoring** to **Allowed** in Citrix Studio).

**Process data collection is disabled on this machine. Enable process monitoring policy to start collection.**

As a workaround, set the registry value of `HKLM\Software\Citrix\GroupPolicy\SaveRsopToFile` to `1` to view the policy monitoring data in Citrix Director. [DIR-11794]
• The **Console** link on Citrix Director > Machine Details does not launch the Machine Console in the Microsoft Edge 44 and Firefox 68 ESR browsers. [DIR-8160]

• If you have upgraded to Director 7 1903 or later from any previous releases and not cleared the browser cache (not selected the ‘Disable cache’ check box), custom reports previously created are lost and Director displays an “Unexpected Server error” on the Custom Reports tab. Differences in UI design between previous and current versions of Director can cause this issue. Disable cache and perform a hard refresh to view old custom reports and create and view new custom reports. [DIR-7634]

**Graphics**

• Setting the policy **View window contents while dragging** to **Prohibited** does not work on ESXi and Hyper-V. [HDX-22002]

• If you start a video preview using a 64-bit webcam app over Theora compression, the session might crash. [HDX-21443]

• Skype Universal Windows app (UWA) launches with a black background. In some cases, this background occupies the client’s entire screen. [HDX-22088]

• In some cases, an application may launch in the background while another application is currently in focus. As a result, local window ordering is lost. [HDX-21569]

• The XenCenter console might display a blank screen after disconnecting a XenDesktop session. As a workaround, send CTRL+ALT+DEL to the XenCenter console to make the console screen appear. [HDX-17261]

• DPI might not match during a session running on Windows Multi-session OS 2016 or 2019 when the DPI is changed on the client and the session is reconnected. As a workaround, resize the session window to match the DPI. [HDX-17313]

• These issues apply to ADM hardware encoding. [HDX-20476]:
  - Pixelation might occur when using Citrix Workspace app for Windows. As a workaround, make the following registry setting on the client that has Citrix Workspace app for Windows installed:

    HKEY_LOCAL_MACHINE\Software\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\GfxRender (32-bit)
    HKEY_LOCAL_MACHINE\Software\Wow6432Node\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\GfxRender (64-bit)

    Name: MaxNumRefFrames
    Type: DWORD

© 1999-2020 Citrix Systems, Inc. All rights reserved.
Value: 5

- You might see less than optimal performance when using 4k resolution. This issue causes a frame rate of only 7–10 frames per second. Also, encoding time increases.

- Video stutter might occur for the first two to five seconds of the video when using the Selective H.264 graphics mode. RapidFire SDK is not designed for this use case.

**Printing**

- Universal Print Server printers selected on the virtual desktop do not appear in the **Devices and Printers** window in Windows Control Panel. However, when users are working in applications, they can print using those printers. This issue occurs only on the Windows Server 2012, Windows 10 and Windows 8 platforms. For more information, see [CTX213540](##). [HDX-5043, 335153]

- The default printer might not be marked correctly in the printing dialog window. This issue does not affect print jobs sent to the default printer.[HDX-12755]

**App-V**

- App-V applications may fail to start if more than 100 applications are published in a single Delivery Group. To increase this limit, use the MaxReceivedMessageSize property on the appropriate binding element to increase Max Receivable message size. Do this in the configuration of the Delivery Controller and/or the Broker Agent on the VDA. [APPV-11]

**Third-party issues**

- Chrome supports UI Automation only for toolbars, tabs, menus, and buttons around a web page. Because of this Chrome issue, the automatic keyboard display feature might not work in a Chrome browser on touch devices. As a workaround, run `chrome --force-renderer-accessibility` or you can open a new browser tab, type `chrome://accessibility`, and enable **Native accessibility API** support for specific or all pages. In addition, when you publish a seamless app, you can publish Chrome with the `--force-renderer-accessibility` switch. [HDX-20858]

- An issue in Microsoft Windows 10 version 1809 might cause slight erratic behavior when using the Surface Pro and Surface Book pen. [HDX-17649]

- A VDA running on Azure might freeze when using Enlightened Data Transport (EDT), requiring a session reconnect. As a workaround, set `edtMSS=1350` and `OutbufLength=1350` in Azure environments. For more information, see [CTX231821](##). [HDX-12913]

- In browser content redirection, after starting a YouTube video using the YouTube HTML5 video player, full-screen mode might not work. You click the icon in the lower-right corner of the video,
and the video doesn’t resize leaving the black background in the full area of the page. As a workaround, click the full screen button, and then select theater mode. [HDX-11294]

## Deprecation

September 1, 2020

The announcements in this article are intended to give you advanced notice of platforms, Citrix products, and features that are being phased out so that you can make timely business decisions. Citrix monitors customer use and feedback to determine when they are withdrawn. Announcements can change in subsequent releases and might not include every deprecated feature or functionality. For details about product lifecycle support, see the Product Lifecycle Support Policy article. For information about the Long Term Service Release (LTSR) servicing option, see https://support.citrix.com/article/CTX205549.

### Deprecations and removals

The following table shows the platforms, Citrix products, and features that are deprecated or removed.

*Deprecated* items are not removed immediately. Citrix continues to support them in Citrix Virtual Apps and Desktops 7 2009, but they will be removed in a future release.

*Removed* items are either removed, or are no longer supported, in Citrix Virtual Apps and Desktops. Dates in **bold** face indicate changes at this release.

</table>

† At Citrix Virtual Apps and Desktops 7 2003, the Personal vDisk driver was removed from the VDA installer. At Citrix Virtual Apps and Desktops 7 2006, the Personal vDisk driver workflow was removed from Studio.

System requirements

August 11, 2020

Introduction

The system requirements in this document were valid when this product version released. Updates are made periodically. System requirements for components not covered here (such as host systems, Citrix Workspace app, and Citrix Provisioning) are described in their respective documentation.

Review Prepare to install before beginning an installation.

Unless noted, the component installer deploys software prerequisites automatically (such as .NET and C++ packages) if the required versions are not detected on the machine. The Citrix installation media also contains some of this prerequisite software.
The installation media contains several third-party components. Before using the Citrix software, check for security updates from the third party, and install them.

For globalization information, see Knowledge Center article CTX119253.

For components and features that can be installed on Windows Servers, Nano Server installations are not supported, unless noted. Server Core is supported only for Delivery Controllers and Director.

**Hardware requirements**

RAM and disk space values are in addition to requirements for the product image, operating system, and other software on the machine. Your performance will vary, depending on your configuration. This includes the features you use, plus the number of users, and other factors. Using only the minimum can result in slow performance.

The following table lists the minimum requirements for core components.

<table>
<thead>
<tr>
<th>Component</th>
<th>Minimum</th>
</tr>
</thead>
<tbody>
<tr>
<td>All core components and StoreFront on one server, for an evaluation only,</td>
<td>5 GB RAM</td>
</tr>
<tr>
<td>not a production deployment</td>

<td>2 GB RAM, see the StoreFront documentation</td>
</tr>
<tr>
<td>License Server</td>
<td>2 GB RAM; see the Licensing documentation for</td>
</tr>
<tr>
<td>disk recommendations</td>
<td></td>
</tr>
</tbody>
</table>

**Sizing of VMs that deliver desktops and applications**

Specific recommendations cannot be provided because of the complex and dynamic nature of hardware offerings, and every deployment has unique needs. Generally, sizing a Citrix Virtual Apps VM is based on the hardware and not the user workloads. The exception is RAM. You’ll need more RAM for applications that consume more.
For more information:

- Citrix VDI Handbook and Best Practices contains guidance on sizing.
- Citrix Virtual Apps and Desktops Single Server Scalability discusses how many users or VMs can be supported on a single physical host.

**Microsoft Visual C++ 2017 Runtime**

Installing Microsoft Visual C++ 2017 Runtime on a machine that has Microsoft Visual C++ 2015 Runtime installed can result in automatic removal of the Visual C++ 2015 Runtime. This is as designed.

If you’ve already installed Citrix components that automatically install the Visual C++ 2015 Runtime, those components will continue to operate correctly with the Visual C++ 2017 version.

For more information, see the Microsoft article https://developercommunity.visualstudio.com/content/problem/332815/visual-c-redistributable-2017-install-removes-visu.html.

**Delivery Controller**

Supported operating systems:

- Windows Server 2019, Standard and Datacenter Editions, and with the Server Core option
- Windows Server 2016, Standard and Datacenter Editions, and with the Server Core option

Requirements:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.
- Microsoft Internet Information Services (installed automatically, and used by a feature currently in development that is installed by the Citrix Orchestration Service).
- Windows PowerShell 3.0 or later.

**Databases**

Supported Microsoft SQL Server versions for the site configuration, configuration logging, and monitoring databases:

- SQL Server 2019, Express, Standard, and Enterprise Editions.
- SQL Server 2017, Express, Standard, and Enterprise Editions.
  - For new installations: By default, SQL Server Express 2017 with Cumulative Update 16 is installed when installing the Controller, if an existing supported SQL Server installation is not detected.
  - For upgrades, any existing SQL Server Express version is not upgraded.
• SQL Server 2016 SP2, Express, Standard, and Enterprise Editions.

The following database high availability solutions are supported (except for SQL Server Express, which supports only standalone mode):

• SQL Server AlwaysOn Failover Cluster Instances
• SQL Server AlwaysOn Availability Groups (including Basic Availability Groups)
• SQL Server Database Mirroring

Windows authentication is required for connections between the Controller and the SQL Server site database.

**Local Host Cache considerations:** Microsoft SQL Server Express LocalDB is a feature of SQL Server Express that Local Host Cache uses on a standalone basis. Local Host Cache does not require any components of SQL Server Express other than SQL Server Express LocalDB.

• When installing a Controller, Microsoft SQL Server Express LocalDB 2017 with Cumulative Update 16 is installed for use with the Local Host Cache feature. (This installation is separate from the default SQL Server Express installation for the site database.)

• When upgrading a Controller, the existing Microsoft SQL Server Express LocalDB version is not automatically upgraded. For replacement requirements and procedures, see Replace SQL Server Express LocalDB.

**More database information:**

• Databases
• CTX114501 lists the most current supported databases
• Database sizing guidance
• Local Host Cache

**Citrix Studio**

Supported operating systems:

• Windows Server 2019, Standard and Datacenter Editions
• Windows Server 2016, Standard and Datacenter Editions
• Windows 10 (64-bit only)

Requirements:

• Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.
• Microsoft Management Console 3.0 (included with all supported operating systems).
• Windows PowerShell 3.0 or later.
Citrix Director

Supported operating systems:

- Windows Server 2019, Standard and Datacenter Editions, and with the Server Core option
- Windows Server 2016, Standard and Datacenter Editions, and with the Server Core option

Requirements:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.
- Microsoft Internet Information Services (IIS) 7.0 and ASP.NET 2.0. Ensure that the IIS server role has the Static Content role service installed. If this software is not already installed, you are prompted for the Windows Server installation media. Then, that software is installed for you.
- To view the event logs on machines where Citrix Director is installed, you must install Microsoft .NET Framework 2.0.

Citrix User Profile Manager:

- Ensure that the Citrix User Profile Manager and Citrix User Profile Manager WMI Plugin are installed on the VDA (Additional Components page in the installation wizard) and that the Citrix Profile Management Service is running to view the user profile details in Director.

System Center Operations Manager (SCOM) integration requirements:

- Windows Server 2012 R2
- System Center 2012 R2 Operations Manager

Supported browsers for viewing Director:

- Internet Explorer 11. Compatibility mode is not supported for Internet Explorer. Use the recommended browser settings to access Director. When you install Internet Explorer, accept the default to use the recommended security and compatibility settings. If you already installed the browser and chose not to use the recommended settings, go to Tools > Internet Options > Advanced > Reset and follow the instructions.
- Microsoft Edge.
- Firefox ESR (Extended Support Release).
- Chrome.

The recommended optimal screen resolution for viewing Director is 1366 x 1024.

Virtual Delivery Agent (VDA) for single-session OS

Supported operating systems:

- Windows 10 (x64 only), minimum version 1607.
  - For edition support, see Knowledge Center article CTX224843.
For Citrix known issues with version 1709, see Knowledge Center article CTX229052.

Requirements:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.

Remote PC Access uses this VDA, which you install on physical office PCs. This VDA supports Secure Boot for Citrix Virtual Desktops Remote PC Access on Windows 10.

Several multimedia acceleration features (such as HDX MediaStream Windows Media Redirection) require that Microsoft Media Foundation be installed on the machine on which you install the VDA. If the machine does not have Media Foundation installed, the multimedia acceleration features will not be installed and will not work. Do not remove Media Foundation from the machine after installing the Citrix software. Otherwise, users will not be able to log on to the machine. On most supported Windows single-session OS editions, Media Foundation support is already installed and cannot be removed. However, N editions do not include certain media-related technologies; you can obtain that software from Microsoft or a third party. For more information, see Prepare to install.

For Linux VDA information, see the Linux Virtual Delivery Agent articles.

To use the Server VDI feature, you can use the command line interface to install a VDA for Windows single-session OS on a Windows Server 2019 or Windows Server 2016 machine. See Server VDI for guidance.

For information about installing a VDA on a Windows 7 machine, see Earlier operating systems.

Virtual Delivery Agent (VDA) for multi-session OS

Supported operating systems:

- Windows Server 2019, Standard and Datacenter Editions
- Windows Server 2016, Standard and Datacenter Editions

The installer automatically deploys the following requirements, which are also available on the Citrix installation media in the Support folders:

- Microsoft .NET Framework 4.8 is installed automatically if it (or a later version) is not already installed.

The installer automatically installs and enables Remote Desktop Services role services, if they are not already installed and enabled.

Several multimedia acceleration features (such as HDX MediaStream Windows Media Redirection) require that the Microsoft Media Foundation be installed on the machine on which you install the VDA. If
the machine does not have Media Foundation installed, the multimedia acceleration features will not be installed and will not work. Do not remove Media Foundation from the machine after installing the Citrix software; otherwise, users will not be able to log on to the machine. On most Windows Server versions, the Media Foundation feature is installed through the Server Manager. For more information, see Prepare to install.

If Media Foundation is not present on the VDA, these multimedia features do not work:

- Windows Media Redirection
- HTML5 Video Redirection
- HDX Realtime Webcam Redirection

For Linux VDA information, see the Linux Virtual Delivery Agent articles.

For information about installing a VDA on a Windows Server 2008 R2 machine, see Earlier operating systems.

**Hosts / virtualization resources**

Important:

If you’re upgrading, and your current version uses Microsoft Azure, Amazon Web Services, or Citrix CloudPlatform connections, see the requirements in Remove unsupported host items.

The following host/virtualization resources (listed alphabetically) are supported. Where applicable, the major.minor versions are supported, including updates to those versions. Knowledge Center article CTX131239 contains current version information, plus links to known issues.

Some features might not be supported on all host platforms or all platform versions. See the feature documentation for details.

The Remote PC Access Wake on LAN feature requires Microsoft System Center Configuration Manager minimum 2012.

- **Citrix Hypervisor (formerly XenServer)**
  
  CTX131239 contains current version information, plus links to known issues.

  For more information, see Citrix Hypervisor virtualization environments.

- **Microsoft System Center Virtual Machine Manager**

  Includes any version of Hyper-V that can register with the supported System Center Virtual Machine Manager versions.

  CTX131239 contains current version information, plus links to known issues.

  For more information, see Microsoft System Center Virtual Machine Manager virtualization environments.
• **Nutanix Acropolis**

  CTX131239 contains current version information, plus links to known issues.

  For more information, see Nutanix virtualization environments.

• **VMware vSphere (vCenter + ESXi)**

  No support is provided for vSphere vCenter Linked Mode operation.

  CTX131239 contains current version information, plus links to known issues.

  For more information, see VMware virtualization environments.

### Active Directory functional levels

The following functional levels for the Active Directory forest and domain are supported:

- Windows Server 2016
- Windows Server 2012 R2
- Windows Server 2012
- Windows Server 2008 R2
- Windows Server 2008

### HDX

#### Audio

UDP audio for Multi-Stream ICA is supported on Citrix Workspace app for Windows and Citrix Workspace app for Linux 13.

Echo cancellation is supported on Citrix Workspace app for Windows.

See the specific HDX feature support and requirements below. For more information on HDX features and Citrix Workspace apps, see the Feature matrix.

#### HDX Windows Media delivery

The following clients are supported for Windows Media client-side content fetching, Windows Media redirection, and realtime Windows Media multimedia transcoding: Citrix Workspace app for Windows, Citrix Workspace app for iOS, and Citrix Workspace app for Linux.

To use Windows Media client-side content fetching on Windows 8 devices, set the Citrix Multimedia Redirector as a default program: in **Control Panel > Programs > Default Programs > Set your default programs**, select **Citrix Multimedia Redirector** and click either **Set this program as default** or **Choose defaults for this program**. GPU transcoding requires an NVIDIA CUDA-enabled GPU with Compute Capability 1.1 or higher; see [https://developer.nvidia.com/cuda/cuda-gpus](https://developer.nvidia.com/cuda/cuda-gpus).
HDX 3D Pro

The VDA for Windows single-session OS detects the presence of GPU hardware at runtime.

The physical or virtual machine hosting the application can use GPU Passthrough or Virtual GPU (vGPU):

- **GPU Passthrough is available with:**
  - Citrix XenServer
  - Nutanix AHV
  - VMware vSphere and VMware ESX, where it is referred to as virtual Direct Graphics Acceleration (vDGA)
  - Microsoft Hyper-V in Windows Server 2016 where it is referred to as Discrete Device Assignment (DDA).

- **vGPU is available with:**
  - Citrix Hypervisor
  - Nutanix AHV
  - VMware vSphere

Citrix recommends that the host computer have at least 4 GB of RAM and four virtual CPUs with a clock speed of 2.3 GHz or higher.

Graphical Processing Unit (GPU):

- For CPU-based compression (including lossless compression), HDX 3D Pro supports any display adapter on the host computer that is compatible with the application being delivered.
- For virtualized graphics acceleration using the NVIDIA GRID API, you can use HDX 3D Pro with all the NVIDIA GRID GPUs supported by the GRID 10 driver (see NVIDIA GRID). The NVIDIA GRID delivers a high frame rate, resulting in a highly interactive user experience.
- Virtualized graphics acceleration is supported with AMD RapidFire on the AMD FirePro S-series server cards. See [AMD Virtualization Solution](https://www.amd.com).}

User device:

- HDX 3D Pro supports all monitor resolutions that are supported by the GPU on the host computer. However, for optimum performance with the minimum recommended user device and GPU specifications, Citrix recommends a maximum monitor resolution for user devices of 1920 x 1200 pixels for LAN connections, and 1280 x 1024 pixels for WAN connections.
Citrix recommends that user devices have at least 1 GB of RAM and a CPU with a clock speed of 1.6 GHz or higher. Use of the default deep compression codec, which is required on low-bandwidth connections, requires a more powerful CPU unless the decoding is done in hardware. For optimum performance, Citrix recommends that user devices have at least 2 GB of RAM and a dual-core CPU with a clock speed of 3 GHz or higher.

- For multi-monitor access, Citrix recommends user devices with quad-core CPUs.
- User devices do not need a GPU to access desktops or applications delivered with HDX 3D Pro.
- Citrix Workspace app must be installed.

For more information, see the HDX 3D Pro articles and www.citrix.com/xenapp/3d.

### Universal Print Server

The Universal Print Server comprises client and server components. The UpsClient component is included in the VDA installation. You install the UpsServer component on each print server where shared printers reside that you want to provision with the Citrix Universal Print Driver in user sessions.

The UpsServer component is supported on:

- Windows Server 2019
- Windows Server 2016

Requirements:

- Microsoft Visual C++ 2017 Runtimes, x86 and x64
- Microsoft .NET Framework 4.8 (minimum)

For VDAs for Multi-session OS, user authentication during printing operations requires the Universal Print Server to be joined to the same domain as the VDA.

Standalone client and server component packages are also available for download.

For more information, see Provision printers.

### Other

Only Citrix License Server 11.16 and later are supported. For more information, see Licensing.

When using Citrix Provisioning (formerly Provisioning Services) with this release, version 7.x is covered by the XenApp 7.x/XenDesktop 7.x lifecycle and the Citrix Virtual Apps and Desktops lifecycle. See the Product Matrix for more information about version compatibility.

For supported StoreFront versions, see the StoreFront system requirements.

The Microsoft Group Policy Management Console (GPMC) is required if you store Citrix policy information in Active Directory rather than the site configuration database. If you install CitrixGroupPolicyManagement_x64.msi separately (for example, on a machine that does not
have a Citrix Virtual Apps and Desktops core component installed), that machine must have Visual Studio 2015 runtime installed. For more information, see the Microsoft documentation.

If you want to edit domain GPOs using GPMC, enable the Group Policy Management feature (in the Windows Server Manager) on all machines containing Delivery Controllers.

Multiple network interface cards are supported.

By default, the Citrix Workspace app for Windows is not installed when you install a current VDA. For more information, see the Citrix Workspace app for Windows documentation.

See App-V for supported versions of Microsoft App-V.

See Local App Access for supported browser information for that feature.

This version of Citrix Virtual Apps and Desktops requires a minimum of HDX RealTime Connector 2.9 LTSR. For more information, see the HDX RealTime Optimization Pack documentation.

Technical overview

June 26, 2020

Citrix Virtual Apps and Desktops are virtualization solutions that give IT control of virtual machines, applications, licensing, and security while providing anywhere access for any device.

Citrix Virtual Apps and Desktops allow:

- End users to run applications and desktops independently of the device’s operating system and interface.
- Administrators to manage the network and control access from selected devices or from all devices.
- Administrators to manage an entire network from a single data center.

Citrix Virtual Apps and Desktops share a unified architecture called FlexCast Management Architecture (FMA). FMA’s key features are the ability to run multiple versions of Citrix Virtual Apps or Citrix Virtual Desktops from a single site and integrated provisioning.

Learn about product name changes.

Key components

This article is most helpful if you’re new to Citrix Virtual Apps and Desktops. If you currently have a 6.x or earlier XenApp farm, or a XenDesktop 5.6 or earlier site, see Changes in 7.x, too.

This illustration shows the key components in a typical deployment, which is called a site.
**Delivery Controller**

The Delivery Controller is the central management component of a site. Each site has one or more Delivery Controllers. It is installed on at least one server in the data center. For site reliability and availability, install Controllers on more than one server. If your deployment includes a hypervisor or other service, the Controller services communicate with it to:

- Distribute applications and desktops
- Authenticate and manage user access
- Broker connections between users and their desktops and applications
- Optimize use connections
- Load balance these connections.

The Controller’s Broker Service tracks which users are logged on and where, what session resources the users have, and if users need to reconnect to existing applications. The Broker Service executes PowerShell cmdlets and communicates with a broker agent on the VDAs over TCP port 80. It does not have the option to use TCP port 443.

The Monitor Service collects historical data and places it in the monitoring database. This service uses TCP port 80 or 443.

Data from the Controller services is stored in the site database.

The Controller manages the state of desktops, starting and stopping them based on demand and administrative configuration. In some editions, the Controller allows you to install Profile Management to manage user personalization settings in virtualized or physical Windows environments.

**Database**

At least one Microsoft SQL Server database is required for every site to store configuration and session information. This database stores the data collected and managed by the services that make up the
Controller. Install the database within your data center, and ensure it has a persistent connection to the Controller.

The site also uses a configuration logging database and a monitoring database. By default, those databases are installed in the same location as the site database, but you can change this.

**Virtual Delivery Agent (VDA)**

The VDA is installed on each physical or virtual machine in your site that you make available to users. Those machines deliver applications or desktops. The VDA enables the machine to register with the Controller, which in turn allows the machine and the resources it is hosting to be made available to users. VDAs establish and manage the connection between the machine and the user device. VDAs also verify that a Citrix license is available for the user or session, and apply policies that are configured for the session.

The VDA communicates session information to the Broker Service in the Controller through the broker agent in the VDA. The broker agent hosts multiple plug-ins and collects real-time data. It communicates with the Controller over TCP port 80.

The word “VDA” is often used to refer to the agent and the machine on which it is installed.

VDAs are available for Single-session and Multi-session Windows operating systems. VDAs for Multi-session Windows operating systems allow multiple users to connect to the server at one time. VDAs for Single-session Windows operating systems allow only one user to connect to the desktop at a time. Linux VDAs are also available.

**Citrix StoreFront**

StoreFront authenticates users and manages stores of desktops and applications that users access. It can host your enterprise application store, which gives users self-service access to the desktops and applications that you make available to them. It also keeps track of users’ application subscriptions, shortcut names, and other data. This helps ensure that users have a consistent experience across multiple devices.

**Citrix Workspace app**

Installed on user devices and other endpoints (such as virtual desktops), Citrix Workspace app provides users with quick, secure, self-service access to documents, applications, and desktops. Citrix Workspace app provides on-demand access to Windows, Web, and Software as a Service (SaaS) applications. For devices that cannot install the device-specific Citrix Workspace app software, Citrix Workspace app for HTML5 provides a connection through an HTML5-compatible web browser.
**Citrix Studio**

Studio is the management console where you configure and manage your Citrix Virtual Apps and Desktops deployment. Studio eliminates the need for separate management consoles for managing delivery of applications and desktops. Studio provides wizards to guide you through environment setup, creating workloads to host applications and desktops, and assigning applications and desktops to users. You can also use Studio to allocate and track Citrix licenses for your site.

Studio gets the information it displays from the Broker Service in the Controller, communicating over TCP port 80.

Here’s a Studio overview.

---

**Citrix Director**

Director is a web-based tool that enables IT support and help desk teams to monitor an environment, troubleshoot issues before they become system-critical, and perform support tasks for end users. You can use one Director deployment to connect to and monitor multiple Citrix Virtual Apps or Citrix Virtual Desktops sites.

Director displays:
• Real-time session data from the Broker Service in the Controller, which includes data the Broker Service gets from the broker agent in the VDA.

• Historical site data from the Monitor Service in the Controller.

Director uses the ICA performance and heuristics data captured by the Citrix Gateway device to build analytics from the data and then presents it to the administrators.

You can also view and interact with a user’s sessions through Director, using Windows Remote Assistance.

**Citrix License Server**

The License Server manages your Citrix product licenses. It communicates with the Controller to manage licensing for each user’s session and with Studio to allocate license files. A site must have at least one license server to store and manage your license files.

**Hypervisor or other service**

The hypervisor or other service hosts the virtual machines in your site. These can be the VMs you use to host applications and desktops, and VMs you use to host the Citrix Virtual Apps and Desktops components. A hypervisor is installed on a host computer dedicated entirely to running the hypervisor and hosting virtual machines.

Citrix Virtual Apps and Desktops support various hypervisors and other services.

Although many deployments require a hypervisor, you don’t need one to provide Remote PC Access. A hypervisor is also not required when you are using Provisioning Services (PVS) to provision VMs.

For more information, see:

• Network ports.
• Databases.
• Windows services in Citrix Virtual Apps and Desktops components: Configure user rights.
• Supported hypervisors and other services: System requirements.

**Additional components**

The following additional components can also be included in Citrix Virtual Apps and Desktops deployments. For more information, see their documentation.

**Citrix Provisioning**

Citrix Provisioning (formerly Provisioning Services) is an optional component that is available with some editions. It provides an alternative to MCS for provisioning virtual machines. Whereas MCS cre-
ates copies of a master image, PVS streams the master image to user devices. PVS doesn’t require a hypervisor to do this, so you can use it to host physical machines. PVS communicates with the Controller to provide users with resources.

**Citrix Gateway**

When users connect from outside the corporate firewall, Citrix Virtual Apps and Desktops can use Citrix Gateway (formerly Access Gateway and NetScaler Gateway) technology to secure these connections with TLS. The Citrix Gateway or VPX virtual appliance is an SSL VPN appliance that is deployed in the demilitarized zone (DMZ). It provides a single secure point of access through the corporate firewall.

**Citrix SD-WAN**

In deployments where virtual desktops are delivered to users at remote locations such as branch offices, Citrix SD-WAN technology can be employed to optimize performance. Repeaters accelerate performance across wide-area networks. With repeaters in the network, users in the branch office experience LAN-like performance over the WAN. Citrix SD-WAN can prioritize different parts of the user experience so that, for example, the user experience does not degrade in the branch location when a large file or print job is sent over the network. HDX WAN optimization provides tokenized compression and data deduplication, dramatically reducing bandwidth requirements and improving performance.

**How typical deployments work**

A site is made up of machines with dedicated roles that allow for scalability, high availability, and failover, and provide a solution that is secure by design. A site consists of VDA-installed servers and desktop machines, and the Delivery Controller, which manages access.
The VDA enables users to connect to desktops and applications. It is installed on virtual machines in the data center for most delivery methods, but it can also be installed on physical PCs for Remote PC Access.

The Controller is made up of independent Windows services that manage resources, applications, and desktops, and optimize and balance user connections. Each site has one or more Controllers. Because sessions are affected by latency, bandwidth, and network reliability, all Controllers ideally should be on the same LAN.

Users never directly access the Controller. The VDA serves as an intermediary between users and the Controller. When users log on using StoreFront, their credentials pass through to the Broker Service on the Controller. The Broker Service then obtains profiles and available resources based on the policies set for them.

**How user connections are handled**

To start a session, the user connects either through Citrix Workspace app installed on the user’s device, or a StoreFront website.

The user selects the physical or virtual desktop or virtual application that is needed.

The user’s credentials move through this pathway to access the Controller, which determines which resources are needed by communicating with a Broker Service. Citrix recommends that administrators place an SSL certificate on StoreFront to encrypt the credentials coming from Citrix Workspace app.
The Broker Service determines which desktops and applications the user is allowed to access. After the credentials are verified, information about available applications or desktops is sent back to the user through the StoreFront-Citrix Workspace app pathway. When the user selects applications or desktops from this list, that information goes back down the pathway to the Controller. The Controller then determines the proper VDA to host the specific applications or desktop.

The Controller sends a message to the VDA with the user’s credentials, and then sends all the data about the user and the connection to the VDA. The VDA accepts the connection and sends the information back through the same pathways to Citrix Workspace app. A set of required parameters is collected on StoreFront. These parameters are then sent to Citrix Workspace app either as part of the Citrix-Workspace-app-StoreFront protocol conversation, or converted to an Independent Computing Architecture (ICA) file and downloaded. As long as the site was properly set up, the credentials remain encrypted throughout this process.

The ICA file is copied to the user’s device and establishes a direct connection between the device and the ICA stack running on the VDA. This connection bypasses the management infrastructure (Citrix Workspace app, StoreFront, and Controller).

The connection between Citrix Workspace app and the VDA uses the Citrix Gateway Protocol (CGP). If a connection is lost, the Session Reliability feature enables the user to reconnect to the VDA rather than having to relaunch through the management infrastructure. Session Reliability can be enabled or disabled in Citrix policies.

After the client connects to the VDA, the VDA notifies the Controller that the user is logged on. The Controller then sends this information to the site database and starts logging data in the monitoring database.
**How data access works**

Every Citrix Virtual Apps and Desktops session produces data that IT can access through Studio or Director. Using Studio, administrators can access real-time data from the Broker Agent to manage sites. Director accesses the same data plus historical data stored in the monitoring database. It also accesses HDX data from NetScaler Gateway for help desk support and troubleshooting.

Within the Controller, the Broker Service reports session data for every session on the machine providing real-time data. The Monitor Service also tracks the real-time data and stores it as historical data in the monitoring database.

Studio communicates only with the Broker Service. It accesses only real-time data. Director communicates with the Broker Service (through a plug-in in the Broker Agent) to access the site database.

Director can also access Citrix Gateway to get information on the HDX data.

**Deliver desktops and applications**

You set up the machines that deliver applications and desktops with machine catalogs. Then, you create delivery groups that specify the applications and desktops that will be available (using machines in the catalogs), and which users can access them. Optionally, you can then create application groups to manage collections of applications.

**Machine catalogs**

Machine catalogs are collections of virtual or physical machines that you manage as a single entity. These machines, and the application or virtual desktops on them, are the resources you provide to
your users. All the machines in a catalog have the same operating system and the same VDA installed. They also have the same applications or virtual desktops.

Typically, you create a master image and use it to create identical VMs in the catalog. For VMs you can specify the provisioning method for the machines in that catalog: Citrix tools (Citrix Provisioning or MCS) or other tools. Alternatively, you can use your own existing images. In that case, you must manage target devices on an individual basis or collectively using third-party electronic software distribution (ESD) tools.

Valid machine types are:

- **Multi-session OS**: Virtual or physical machines with a multi-session operating system. Used for delivering Citrix Virtual Apps published apps (also known as server-based hosted applications) and Citrix Virtual Apps published desktops (also known as server-hosted desktops). These machines allow multiple users to connect to them at one time.

- **Single-session OS**: Virtual or physical machines with a single-session operating system. Used for delivering VDI desktops (desktops running single-session OSs that can optionally be personalized), VM hosted apps (applications from single-session OSs), and hosted physical desktops. Only one user at a time can connect to each of these desktops.

- **Remote PC Access**: Enables remote users to access their physical office PCs from any device running Citrix Workspace app. The office PCs are managed through the Citrix Virtual Desktops deployment, and require user devices to be specified in an allow list.

For more information, see [Citrix Virtual Apps and Desktops Image Management](#) and [Create machine catalogs](#).

**Delivery groups**

Delivery groups specify which users can access which applications, desktops, or both on which machines. Delivery groups contain machines from your machine catalogs, and Active Directory users who have access to your site. You might assign users to your delivery groups by their Active Directory group, because Active Directory groups and delivery groups are ways to group users with similar requirements.

Each delivery group can contain machines from more than one catalog, and each catalog can contribute machines to more than one delivery group. However, each individual machine can only belong to one delivery group at a time.

You define which resources users in the delivery group can access. For example, to deliver different applications to different users, you might install all of the applications on the master image for one catalog and create enough machines in that catalog to distribute among several delivery groups. You can then configure each delivery group to deliver a different subset of applications that are installed on the machines.
For more information, see Create delivery groups.

**Application groups**

Application groups provide application management and resource control advantages over using more delivery groups. Using the tag restriction feature, you can use your existing machines for more than one publishing task, saving the costs associated with deployment and managing more machines. A tag restriction can be thought of as subdividing (or partitioning) the machines in a delivery group. Application groups can also be helpful when isolating and troubleshooting a subset of machines in a delivery group.

For more information, see Create application groups.

**More information**

Citrix Virtual Apps and Desktops diagrams

**Active Directory**

August 19, 2020

Active Directory is required for authentication and authorization. The Kerberos infrastructure in Active Directory is used to guarantee the authenticity and confidentiality of communications with the Delivery Controllers. For information about Kerberos, see the Microsoft documentation.

The System requirements article lists the supported functional levels for the forest and domain. To use Policy Modeling, the domain controller must be running on Windows Server 2003 to Windows Server 2012 R2. This does not affect the domain functional level.

This product supports:

- **Deployments in which the user accounts and computer accounts exist in domains in a single Active Directory forest.** User and computer accounts can exist in arbitrary domains within a single forest. All domain functional levels and forest functional levels are supported in this type of deployment.

- **Deployments in which user accounts exist in an Active Directory forest that is different from the Active Directory forest containing the computer accounts of the Controllers and virtual desktops.** In this type of deployment, the domains containing the Controller and virtual desktop computer accounts must trust the domains containing user accounts. Forest trusts or external trusts can be used. All domain functional levels and forest functional levels are supported in this type of deployment.
• **Deployments in which the computer accounts for Controllers exist in an Active Directory forest that is different from one or more additional Active Directory forests that contain the computer accounts of the virtual desktops.** In this type of deployment a bi-directional trust must exist between the domains containing the Controller computer accounts and all domains containing the virtual desktop computer accounts. In this type of deployment, all domains containing Controller or virtual desktop computer accounts must be at “Windows 2000 native” functional level or higher. All forest functional levels are supported.

• **Writable domain controllers.** Read-only domain controllers are not supported.

Optionally, Virtual Delivery Agents (VDAs) can use information published in Active Directory to determine which Controllers they can register with (discovery). This method is supported primarily for backward compatibility, and is available only if the VDAs are in the same Active Directory forest as the Controllers. For information about this discovery method see Active Directory OU-based discovery and CTX118976.

**Note:**
Do not change the computer name or the domain membership of a Delivery Controller after the site is configured.

### Deploy in a multiple Active Directory forest environment

This information applies to minimum version XenDesktop 7.1 and XenApp 7.5. It does not apply to earlier versions of XenDesktop or XenApp.

In an Active Directory environment with multiple forests, if one-way or two-way trusts are in place you can use DNS forwarders or conditional forwarders for name lookup and registration. To allow the appropriate Active Directory users to create computer accounts, use the Delegation of Control wizard. See the Microsoft documentation for details about this wizard.

No reverse DNS zones are necessary in the DNS infrastructure if appropriate DNS forwarders are in place between forests.

The **SupportMultipleForest** key is necessary if the VDA and Controller are in separate forests, regardless of whether the Active Directory and NetBIOS names are different. Use the following information to add the registry key to the VDA and the Delivery Controllers:

**Caution:**
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Back up the registry before you edit it.

On the VDA, configure: `HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\SupportMultipleForest`
• Name: SupportMultipleForest
• Type: REG_DWORD
• Data: 0x00000001 (1)

On all Delivery Controllers, configure: HKEY_LOCAL_MACHINE\Software\Citrix\DesktopServer\SupportMultipleForest.

• Name: SupportMultipleForest
• Type: REG_DWORD
• Data: 0x00000001 (1)

You might need reverse DNS configuration if your DNS namespace is different than that of Active Directory.

A registry entry has been added to avoid unwanted enabling of NTLM authentication in VDAs, which is less secure than Kerberos. This entry can be used instead of the SupportMultipleForest entry, which can still be used for backwards compatibility.

On the VDA, configure: HKEY_LOCAL_MACHINE\Software\Policies\Citrix\VirtualDesktopAgent.

• Name: SupportMultipleForestDdcLookup
• Type: REG_DWORD
• Data: 0x00000001 (1)

This registry key performs a DDC lookup in a two-way trust multiple forest environment that allows you to remove NTLM-based authentication during the initial registration process.

If external trusts are in place during setup, the ListOfSIDs registry key is required. The ListOfSIDs registry key is also necessary if the Active Directory FQDN is different than the DNS FQDN, or if the domain containing the Domain Controller has a different NetBIOS name than the Active Directory FQDN. To add the registry key, use the following information:

For the VDA, locate the registry key HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\ListOfSIDs.

• Name: ListOfSIDs
• Type: REG_SZ
• Data: Security Identifier (SID) of the Controllers. (SIDs are included in the results of the Get-BrokerController cmdlet.)

When external trusts are in place, make the following change on the VDA:

1. Locate the file Program Files\Citrix\Virtual Desktop Agent\brokeragent.exe.config.
2. Make a backup copy of the file.
3. Open the file in a text editing program such as Notepad.
4. Locate the text `allowNtlm="false"` and change the text to `allowNtlm="true"`.
5. Save the file.

After adding the `ListofSIDs` registry key and editing the `brokeragent.exe.config` file, restart the Citrix Desktop Service to apply the changes.

The following table lists the supported trust types:

<table>
<thead>
<tr>
<th>Trust type</th>
<th>Transitivity</th>

</tr>
</tbody>
</table>

For more information about complex Active Directory environments, see CTX134971.

Databases

July 10, 2020

A Citrix Virtual Apps or Citrix Virtual Desktops site uses three SQL Server databases:

- **Site:** (also known as site configuration) stores the running site configuration, plus the current session state and connection information.
- **Configuration logging:** (also known as logging) stores information about site configuration changes and administrative activities. This database is used when the configuring logging feature is enabled (default = enabled).
- **Monitoring:** stores data used by Director, such as session and connection information.

Each Delivery Controller communicates with the site database. Windows authentication is required between the Controller and the databases. A Controller can be unplugged or turned off without affecting other Controllers in the site. This means, however, that the site database forms a single point of failure. If the database server fails, existing connections continue to function until a user either logs off or disconnects. For information about connection behavior when the site database becomes unavailable, see Local Host Cache.
Citrix recommends that you back up the databases regularly so that you can restore from the backup if the database server fails. The backup strategy for each database may differ. For instructions, see CTX135207.

If your site contains more than one zone, the primary zone should always contain the site database. Controllers in every zone communicate with that database.

**High availability**

There are several high availability solutions to consider for ensuring automatic failover:

- **AlwaysOn Availability Groups (including Basic Availability Groups):** This enterprise-level high availability and disaster recovery solution introduced in SQL Server 2012 enables you to maximize availability for one or more databases. AlwaysOn Availability Groups requires that the SQL Server instances reside on Windows Server Failover Clustering (WSFC) nodes. For more information, see https://msdn.microsoft.com/en-us/library/hh510230.

- **SQL Server database mirroring:** Mirroring the database ensures that, if you lose the active database server, an automatic failover process happens in a matter of seconds, so that users are generally unaffected. This method is more expensive than other solutions because full SQL Server licenses are required on each database server; you cannot use SQL Server Express edition in a mirrored environment.

- **SQL clustering:** The Microsoft SQL clustering technology can be used to automatically allow one server to take over the tasks and responsibilities of another server that has failed. However, setting up this solution is more complicated, and the automatic failover process is typically slower than alternatives such as SQL mirroring.

- **Using the hypervisor’s high availability features:** With this method, you deploy the database as a virtual machine and use your hypervisor’s high availability features. This solution is less expensive than mirroring because it uses your existing hypervisor software and you can also use SQL Server Express edition. However, the automatic failover process is slower, as it can take time for a new machine to start for the database, which may interrupt the service to users.

The Local Host Cache feature supplements the SQL Server high availability best practices by enabling users to connect and reconnect to applications and desktops even when the site database is not available. For more information, see Local Host Cache.

If all Controllers in a site fail, you can configure the VDAs to operate in high availability mode so that users can continue to access and use their desktops and applications. In high availability mode, the VDA accepts direct ICA connections from users, rather than connections brokered by the Controller. Use this feature only on the rare occasion when communication with all Controllers fails; it is not an alternative to other high availability solutions. For more information, see CTX 127564.

Installing a Controller on a node in an SQL clustering or SQL mirroring installation is not supported.
Install database software

By default, SQL Server Express edition is installed when you install the first Delivery Controller if another SQL Server instance is not detected on that server. That default action is generally sufficient for proof of concept or pilot deployments. However, SQL Server Express does not support Microsoft high availability features.

The default installation uses the default Windows service accounts and permissions. See the Microsoft documentation for details of these defaults, including the addition of Windows service accounts to the sysadmin role. The Controller uses the Network Service account in this configuration. The Controller does not require any additional SQL Server roles or permissions.

If necessary, you can select Hide instance for the database instance. When configuring the address of the database in Studio, enter the instance’s static port number, rather than its name. See the Microsoft documentation for details about hiding an instance of SQL Server Database Engine.

Most production deployments, and any deployment that uses Microsoft high availability features, should use supported non-Express editions of SQL Server installed on machines other than the server where the first Controller is installed. The System requirements article lists the supported SQL Server versions. The databases can reside on one or more machines.

Ensure the SQL Server software is installed before creating a site. You don’t have to create the database, but if you do, it must be empty. Configuring Microsoft high availability technologies is also recommended.

Use Windows Update to keep SQL Server up-to-date.

Set up the databases from the site creation wizard

Specify the database names and addresses (location) on the Databases page in the site creation wizard. (See Database address formats.) To avoid potential errors when Director queries the Monitor Service, do not use whitespace in the name of the monitoring database.

The Databases page offers two options for setting up the databases: automatic and using scripts. Generally, you can use the automatic option if you (the Studio user and Citrix administrator) have the required database privileges. (See Permissions required to set up databases.)

You can change the location of the configuration logging and monitoring database later, after you create the site. See Change database locations.

To configure a site to use a mirror database, complete the following and then proceed with the automatic or scripted setup procedures.

1. Install the SQL Server software on two servers, A and B.
2. On Server A, create the database intended to be used as the principal. Back up the database on Server A and then copy it to server B.
3. On Server B, restore the backup file.
4. Start mirroring on server A.

To verify mirroring after creating the site, run the PowerShell cmdlet `get-configdbconnection` to ensure that the Failover Partner has been set in the connection string to the mirror.

If you later add, move, or remove a Delivery Controller in a mirrored database environment, see Delivery Controllers.

**Automatic setup**

If you have the required database privileges, select the “Create and set up databases from Studio” option on the Databases page of the site creation wizard, and then provide the names and addresses of the principal databases.

If a database exists at an address you specify, it must be empty. If databases don’t exist at a specified address, you are informed that a database cannot be found, and then asked if you want the database to be created for you. When you confirm that action, Studio automatically creates the databases, and then applies the initialization scripts for the principal and replica databases.

**Scripted setup**

If you do not have the required database privileges, someone with those permissions must help, such as a database administrator. Here’s the sequence:

1. In the site creation wizard, select the Generate scripts option. This action generates six scripts: two for each of the three databases (one for each principal database and another for each replica). You can indicate where to store the scripts.
2. Give those scripts to your database administrator. The site creation wizard stops automatically at this point; you’ll be prompted when you return later to continue the site creation.

The database administrator then creates the databases. Each database must have the following characteristics:

- Use a collation that ends with “_CI_AS_KS”. Citrix recommends using a collation that ends with “_100_CI_AS_KS”.
- For optimum performance, enable the SQL Server Read-Committed Snapshot. For details, see CTX 137161.
- Configured high availability features, if desired.
- To configure mirroring, first set the database to use the full recovery model (simple model is the default). Back up the principal database to a file and copy it to the mirror server. On the mirror database, restore the backup file to the mirror server. Then, start mirroring on the principal server.
The database administrator uses the SQLCMD command-line utility or SQL Server Management Studio in SQLCMD mode to run each of the xxx_Replica.sql scripts on the high availability SQL Server database instances (if high availability is configured), and then run each of the xxx_Principal.sql scripts on the principal SQL Server database instances. See the Microsoft documentation for SQLCMD details.

When all the scripts complete successfully, the database administrator gives the Citrix administrator the three principal database addresses.

In Studio, you are prompted to continue the site creation, and are returned to the Databases page. Enter the addresses. If any of the servers hosting a database cannot be contacted, an error message is displayed.

**Permissions required to set up databases**

You must be a local administrator and a domain user to create and initialize the databases (or change the database location). You must also have certain SQL Server permissions. The following permissions can be explicitly configured or acquired by Active Directory group membership. If your Studio user credentials do not include these permissions, you are prompted for SQL Server user credentials.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Purpose</th>
<th>Server role</th>
<th>Database role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a database</td>
<td>Create a suitable empty database</td>
<td>dbcreator</td>
<td></td>
</tr>
<tr>
<td>Create a schema</td>
<td>Create all service-specific schemas and add the first Controller to the site</td>
<td>securityadmin*</td>
<td>db_owner</td>
</tr>
<tr>
<td>Add a Controller</td>
<td>Add a Controller (other than the first) to the site</td>
<td>securityadmin*</td>
<td>db_owner</td>
</tr>
<tr>
<td>Add a Controller (mirror server)</td>
<td>Add a Controller login to the database server currently in the mirror role of a mirrored database</td>
<td>securityadmin*</td>
<td></td>
</tr>
<tr>
<td>Remove Controller</td>
<td>Remove controller from site</td>
<td>**</td>
<td>db_owner</td>
</tr>
<tr>
<td>Update a schema</td>
<td>Apply schema updates or hotfixes</td>
<td>db_owner</td>
<td></td>
</tr>
</tbody>
</table>
* While technically more restrictive, in practice, the securityadmin server role should be treated as equivalent to the sysadmin server role.

** When a controller is removed from a site, either directly through Desktop Studio, or using the scripts generated by Desktop Studio or SDK, the controller logon to the database server is not removed. This is to avoid potentially removing a logon being used by non-XenDesktop services on the same machine. The logon must be removed manually if it is no longer required; this requires securityadmin server role membership.

When using Studio to perform these operations, the Studio user must either have a database server account that is explicitly a member of the appropriate server roles, or be able to provide credentials of an account that is.

**Preferred database rights scripts**

In enterprise environments, database setup includes scripts that must be handled by different teams with different roles (rights): `securityadmin` or `db_owner`.

Using PowerShell, you can now specify the preferred database rights. (This feature is not available in Studio, which supports only a single script containing all tasks.)

Specifying a nondefault value results in separate scripts being created. One script contains tasks that need the `securityadmin` role. The other script requires only `db_owner` rights, and can be run by a Citrix administrator without having to contact a database administrator.

In the `get-*DBSchema` cmdlets, the `-DatabaseRights` option has the following valid values:

- **SA**: Generates a script that creates the databases and the Delivery Controller login. These tasks require `securityadmin` rights.
- **DBO**: Generates a script that creates the user roles in the database, adds the logins, and then creates the database schemas. These tasks require `db_owner` rights.
- **Mixed**: (Default) All tasks in one script, regardless of required rights.

For more information, see the cmdlet help.

**Database address formats**

You can specify a database address in one of the following forms:

- `ServerName`
- `ServerName\InstanceName`
- `ServerName,PortNumber`

For an AlwaysOn Availability Group, specify the group’s listener in the location field.
Change database locations

After you create a site, you can change the location of the configuration logging and monitoring databases. (You cannot change the location of the site database.) When you change the location of a database:

- The data in the previous database is not imported to the new database.
- Logs cannot be aggregated from both databases when retrieving logs.
- The first log entry in the new database indicates that a database change occurred, but it does not identify the previous database.

You cannot change the location of the configuration logging database when mandatory logging is enabled.

To change the location of a database:

1. Ensure a supported version of Microsoft SQL Server is installed on the server where you want the database to reside. Set up high availability features as needed.
2. Select Configuration in the Studio navigation pane.
3. Select the database for which you want to specify a new location and then select Change Database in the Actions pane.
4. Specify the new location and the database name.
5. If you want Studio to create the database and you have the appropriate permissions, click OK. When prompted, click OK, and then Studio creates the database automatically. Studio attempts to access the database using your credentials. If that fails, you are prompted for the database user’s credentials. Studio then uploads the database schema to the database. The credentials are retained only for the database creation time frame.
6. If you do not want Studio to create the database, or you do not have sufficient permissions, click Generate script. The generated scripts include instructions for manually creating the database and a mirror database, if needed. Before uploading the schema, ensure that the database is empty and that at least one user has permission to access and change the database.

Delivery methods

June 26, 2020
Citrix Virtual Apps and Desktops offers various delivery methods. A single delivery method will likely not meet all of your requirements.

Introduction

Choosing the appropriate application delivery method helps improve scalability, management, and user experience.

- **Installed app**: The application is part of the base desktop image. The install process involves dll, exe, and other files copied to the image drive, in addition to registry modifications. For details, see Create machine catalogs.

- **Streamed app (Microsoft App-V)**: The application is profiled and delivered to the desktops across the network on demand. Application files and registry settings are placed in a container on the virtual desktop and isolated from the base operating system and each other. This isolation helps address compatibility issues. For details, see App-V.

- **Layered app (Citrix AppLayering)**: Each layer contains a single application, agent, or operating system. By integrating one OS layer, one platform layer (VDA, Citrix Provisioning agent) and many application layers, an administrator can easily create new, deployable images. Layering simplifies ongoing maintenance, as an OS, agent, and application exists in a single layer. When you update the layer, all deployed images containing that layer are updated. For details, see Citrix AppLayering.

- **Hosted Windows app**: An application installed on a multi-user Citrix Virtual Apps host and deployed as an application and not a desktop. A user accesses the hosted Windows app seamlessly from the VDI desktop or endpoint device, hiding the fact that the app is executing remotely. For details, see Create delivery groups.

- **Local app**: An application deployed on the endpoint device. The application interface appears within the user’s hosted VDI session, even though it executes on the endpoint. For details, see Local App Access and URL redirection.

- **Remote PC Access**: Remote PC Access enables employees to remotely access their physical office PCs. When users access their office PCs, they can access all the applications, data, and resources they need to do their work. Remote PC Access eliminates the need to introduce and provide other tools to accommodate teleworking. For details, see Remote PC Access.

For desktops, consider published desktops or VDI desktops.

**Citrix Virtual Apps published apps and desktops**

Use multi-session OS machines to deliver Citrix Virtual Apps and Desktops published apps and published desktops.

**Use case:**
• You want inexpensive server-based delivery to minimize the cost of delivering applications to many users, while providing a secure, high-definition user experience.
• Your users perform well-defined tasks and do not require personalization or offline access to applications. Users can include task workers such as call center operators and retail workers, or users that share workstations.
• Application types: any application.

Benefits and considerations:
• Manageable and scalable solution within your data center.
• Most cost effective application delivery solution.
• Hosted applications are managed centrally and users cannot modify the application. This provides a user experience that is consistent, safe, and reliable.
• Users must be online to access their applications.

User experience:
• User requests one or more applications from StoreFront, their Start menu, or a URL you provide.
• Applications are delivered virtually and display seamlessly in high definition on user devices.
• Depending on profile settings, user changes are saved when the user’s application session ends. Otherwise, the changes are deleted.

Process, host, and deliver applications:
• Application processing takes place on hosting machines, rather than on the user devices. The hosting machine can be a physical or a virtual machine.
• Applications and desktops reside on a multi-session OS machine.
• Machines become available through machine catalogs.
• Machines from machine catalogs are organized into delivery groups that deliver the same set of applications to groups of users.
• Multi-session OS machines support delivery groups that host either desktops or applications, or both.

Session management and assignment:
• Multi-session OS machines run multiple sessions from a single machine to deliver multiple applications and desktops to multiple, simultaneously connected users. Each user requires a single session from which they can run all their hosted applications.

For example, a user logs on and requests an application. One session on that machine becomes unavailable to other users. A second user logs on and requests an application which that machine hosts. A second session on the same machine is now unavailable. If both users request more applications, no additional sessions are required because a user can run multiple applications using the same session. If two more users log on and request desktops, and two sessions are available on that same machine, that single machine is now using four sessions to host four different users.
• Within the delivery group to which a user is assigned, a machine on the least loaded server is selected. A machine with session availability is randomly assigned to deliver applications to a user when that user logs on.

**VM hosted apps**

Use single-session OS machines to deliver VM hosted applications

**Use case:**

- You want a client-based application delivery solution that is secure, provides centralized management, and supports many users per host server. You want to provide those users with applications that display seamlessly in high definition.
- Your users are internal, external contractors, third-party collaborators, and other provisional team members. Your users do not require offline access to hosted applications.
- Application types: Applications that might not work well with other applications or might interact with the operation system, such as Microsoft .NET Framework. These types of applications are ideal for hosting on virtual machines.

**Benefits and considerations:**

- Applications and desktops on the master image are securely managed, hosted, and run on machines within your data center, providing a more cost-effective application delivery solution.
- On logon, users can be randomly assigned to a machine within a delivery group that is configured to host the same application. You can also statically assign a single machine to deliver an application to a single user each time that user logs on. Statically assigned machines allow users to install and manage their own applications on the virtual machine.
- Running multiple sessions is not supported on single-session OS machines. Therefore, each user consumes a single machine within a delivery group when they log on, and users must be online to access their applications.
- This method can increase the amount of server resources for processing applications and increase the amount of storage for users’ data.

**User experience:**

- The same seamless application experience as hosting shared applications on multi-session OS machines.

**Process, host, and deliver applications:**

- The same as multi-session OS machines except they are virtual single-session OS machines.

**Session management and assignment:**

- Single-session OS machines run a single desktop session from a single machine. When accessing applications only, a single user can use multiple applications (and is not limited to a single application) because the operating system sees each application as a new session.
• Within a delivery group, when users log on they can access either a statically assigned machine (each time the user logs on to the same machine), or a randomly assigned machine that is selected based on session availability.

**VDI desktops**

Use single-session OS machines to deliver Citrix Virtual Apps and Desktops VDI desktops.

VDI desktops are hosted on virtual machines and provide each user with a desktop operating system. VDI desktops require more resources than published desktops, but do not require that applications installed on them support server-based operating systems. Also, depending on the type of VDI desktop you choose, these desktops can be assigned to individual users. This allows users a high level of personalization.

When you create a machine catalog for VDI desktops, you create one of these types of desktops:

- **Random non-persistent desktop, also known as pooled VDI desktop**: Each time a user logs on to one of these desktops, that user connects to a desktop selected from a pool of desktops. That pool is based on a single master image. All changes to the desktop are lost when the machine restarts.

- **Static non-persistent desktop**: During the first logon, a user is assigned a desktop from a pool of desktops. (Each machine in the pool is based on a single master image.) After the first use, each time a user logs on to use a desktop, that user connects to the same desktop that was assigned on first use. All changes to the desktop are lost when the machine restarts.

- **Static persistent desktop**: Unlike other types of VDI desktops, users can fully personalize these desktops. During the first logon, a user is assigned a desktop from a pool of desktops. Subsequent logons from that user connect to the same desktop that was assigned on first use. Changes to the desktop are retained when the machine restarts.

**Network ports**

December 18, 2019

The following tables list the default network ports used by Delivery Controllers, Windows VDAs, Director, and Citrix License Server. When Citrix components are installed, the operating system’s host firewall is also updated, by default, to match these default network ports.

For an overview of communication ports used in other Citrix technologies and components, see [CTX101810](#).

You may need this port information:
• For regulatory compliance purposes.
  • If there is a network firewall between these components and other Citrix products or components, so you can configure that firewall appropriately.
  • If you use a third-party host firewall, such as one provided with an anti-malware package, rather than the operating system’s host firewall.
  • If you alter the configuration of the host firewall on these components (usually Windows Firewall Service).
  • If you reconfigure any features of these components to use a different port or port range, and then want to disable or block ports that are not used in your configuration. Refer to the documentation for the component for details.
  • For port information about other components such as StoreFront and Citrix Provisioning (formerly Provisioning Services), see the component’s current “System requirements” article.

The tables list only incoming ports. Outgoing ports are usually determined by the operating system and use unrelated numbers. Information for outgoing ports is not normally needed for the purposes listed above.

Some of these ports are registered with the Internet Assigned Numbers Authority (IANA). Details about these assignments are available at http://www.iana.org/assignments/port-numbers. However, the descriptive information held by IANA does not always reflect today’s usage.

Additionally, the operating system on the VDA and Delivery Controller require incoming ports for its own use. See the Microsoft Windows documentation for details.

**HDX**

September 18, 2020

**Warning:**

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Citrix HDX represents a broad set of technologies that deliver a high-definition experience to users of centralized applications and desktops, on any device and over any network.
HDX is designed around three technical principles:

- **Intelligent redirection**
- **Adaptive compression**
- **Data de-duplication**

Applied in different combinations, they optimize the IT and user experience, decrease bandwidth consumption, and increase user density per hosting server.

- **Intelligent redirection** - Intelligent redirection examines screen activity, application commands, endpoint device, and network and server capabilities to instantly determine how and where to render an application or desktop activity. Rendering can occur on either the endpoint device or hosting server.

- **Adaptive compression** - Adaptive compression allows rich multimedia displays to be delivered on thin network connections. HDX first evaluates several variables, such as the type of input, device, and display (text, video, voice, and multimedia). It chooses the optimal compression codec and the best proportion of CPU and GPU usage. It then intelligently adapts based on each unique user and basis. This intelligent adaptation is per user, or even per session.
• **Data de-duplication** - De-duplication of network traffic reduces the aggregate data sent between client and server. It does so by taking advantage of repeated patterns in commonly accessed data such as bitmap graphics, documents, print jobs, and streamed media. Caching these patterns allows only the changes to be transmitted across the network, eliminating duplicate traffic. HDX also supports multicasting of multimedia streams, where a single transmission from the source is viewed by multiple subscribers at one location, rather than a one-to-one connection for each user.

For more information, see [Boost productivity with a high-definition user workspace](#).

**At the device**

HDX uses the computing capacity of user devices to enhance and optimize the user experience. HDX technology ensures that users receive a smooth, seamless experience with multimedia content in their virtual desktops or applications. Workspace control enables users to pause virtual desktops and applications and resume working from a different device at the point where they left off.

**On the network**

HDX incorporates advanced optimization and acceleration capabilities to deliver the best performance over any network, including low-bandwidth and high-latency WAN connections.
HDX features adapt to changes in the environment. The features balance performance and bandwidth. They apply the best technologies for each user scenario, whether the desktop or application is accessed locally on the corporate network or remotely from outside the corporate firewall.

In the data center
HDX uses the processing power and scalability of servers to deliver advanced graphical performance, regardless of the client device capabilities.

HDX channel monitoring provided by Citrix Director displays the status of connected HDX channels on user devices.

HDX Insight
HDX Insight is the integration of NetScaler Network Inspector and Performance Manager with Director. It captures data about ICA traffic and provides a dashboard view of real time and historical details. This data includes client-side and server-side ICA session latency, bandwidth use of ICA channels, and the ICA round-trip time value of each session.

You can enable NetScaler to use the HDX Insight virtual channel to move all the required data points in an uncompressed format. If you disable this feature, the NetScaler device decrypts and decompresses the ICA traffic spread across various virtual channels. Using the single virtual channel lessens complexity, enhances scalability, and is more cost effective.

Minimum requirements:
- Citrix Virtual Apps and Desktops 7 v1808
- XenApp and XenDesktop 7.17
- NetScaler version 12.0 Build 57.x
- Citrix Workspace app for Windows 1808
- Citrix Receiver for Windows 4.10
- Citrix Workspace app for Mac 1808
- Citrix Receiver for Mac 12.8

Enable or disable HDX Insight virtual channel
To disable this feature, set the Citrix NetScaler Application Flow service properties to Disabled. To enable, set the service to Automatic. In either case, we recommend that you restart the server machine after changing these properties. By default, this service is enabled (Automatic).
Experience HDX capabilities from your virtual desktop

- To see how browser content redirection, one of four HDX multimedia redirection technologies, accelerates delivery of HTML5 and WebRTC multimedia content:
  1. Download the Chrome browser extension and install it on the virtual desktop.
  2. To experience how browser content redirection accelerates the delivery of multimedia content to virtual desktops, view a video on your desktop from a website containing HTML5 videos, such as YouTube. Users don’t know when browser content redirection is running. To see whether browser content redirection is being used, drag the browser window quickly. You’ll see a delay or out of frame between the viewport and the user interface. You can also right-click on the webpage and look for About HDX Browser Redirection in the menu.

- To see how HDX delivers high definition audio:
  1. Configure your Citrix client for maximum audio quality; see the Citrix Workspace app documentation for details.
  2. Play music files by using a digital audio player (such as iTunes) on your desktop.

HDX provides a superior graphics and video experience for most users by default, and configuration isn’t required. Citrix policy settings that provide the best experience for most use cases are enabled by default.

- HDX automatically selects the best delivery method based on the client, platform, application, and network bandwidth, and then self-tunes based on changing conditions.
- HDX optimizes the performance of 2D and 3D graphics and video.
- HDX enables user devices to stream multimedia files directly from the source provider on the internet or intranet, rather than through the host server. If the requirements for this client-side content fetching are not met, media delivery falls back to server-side content fetching and multimedia redirection. Usually, adjustments to the multimedia redirection feature policies aren’t needed.
• HDX delivers rich server-rendered video content to virtual desktops when multimedia redirection is not available: View a video on a website containing high definition videos, such as http://www.microsoft.com/silverlight/iis-smooth-streaming/demo/.

Good to know:

• For support and requirements information for HDX features, see the System requirements article. Except where otherwise noted, HDX features are available for supported Windows Multi-session OS and Windows Single-session OS machines, plus Remote PC Access desktops.
• This content describes how to optimize the user experience, improve server scalability, or reduce bandwidth requirements. For information about using Citrix policies and policy settings, see the Citrix policies documentation for this release.
• For instructions that include editing the registry, use caution: editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Auto client reconnect and session reliability

When accessing hosted applications or desktops, network interruption might occur. To experience a smoother reconnection, we offer auto client reconnect and session reliability. In a default configuration, session reliability starts and then auto client reconnect follows.

Auto client reconnect:

Auto client reconnect relaunches the client engine to reconnect to a disconnected session. Auto client reconnect closes (or disconnects) the user session after the time specified in the setting. If auto client reconnect is in progress, the system sends application and desktops network interruption notification to the user as follows:

• Desktops. The session window is grayed out and a countdown timer shows the time until the reconnections occur.
• Applications. The session window closes and a dialog appears to the user containing a countdown timer showing the time until the reconnections are attempted.

During auto client reconnect, sessions relaunch expecting network connectivity. User cannot interact with sessions while auto client reconnect is in progress.

On reconnection, the disconnected sessions reconnect using saved connection information. The user can interact with the applications and desktops normally.

Default auto client reconnect settings:

• Auto client reconnect timeout: 120 seconds
• Auto client reconnect: Enabled
• Auto client reconnect authentication: Disabled
• Auto client reconnect Logging: Disabled

For more information, see Auto client reconnect policy settings.

**Session reliability:**

Session reliability reconnects ICA sessions seamlessly across network interruptions. Session reliability closes (or disconnects) the user session after the time specified in the setting. After the session reliability timeout, the auto client reconnect settings take effect, attempting to reconnect the user to the disconnected session. When session reliability is in progress, application and desktops network interruption notification are sent to the user as follows:

• **Desktops.** The session window becomes translucent and a countdown timer shows the time until the reconnections occur.
• **Applications.** The window becomes translucent along with connection interrupted pop ups from the notification area.

While session reliability is active, the user cannot interact with the ICA sessions. However, user actions like keystrokes are buffered for few seconds immediately after the network interruption and retransmitted when the network is available.

On reconnection, the client and the server resume at the same point where they were in their exchange of protocol. The session windows lose translucency and appropriate notification area pop ups are shown for applications.

Default session reliability settings

• Session reliability timeout: 180 seconds
• Reconnection UI opacity level: 80%
• Session reliability connection: Enabled
• Session reliability port number: 2598

For more information, see Session reliability policy settings.

**NetScaler with auto client reconnect and session reliability:**

If Multistream and Multiport policies are enabled on the server and any or all these conditions are true, auto client reconnect does not work:

• Session reliability is disabled on NetScaler Gateway.
• A failover occurs on the NetScaler appliance.
• NetScaler SD-WAN is used with NetScaler Gateway.

**HDX adaptive throughput**

HDX adaptive throughput intelligently fine-tunes the peak throughput of the ICA session by adjusting output buffers. The number of output buffers is initially set at a high value. This high value allows
data to be transmitted to the client more quickly and efficiently, especially in high latency networks. Providing better interactivity, faster file transfers, smoother video playback, higher framerate and resolution results in an enhanced user experience.

Session interactivity is constantly measured to determine whether any data streams within the ICA session are adversely affecting interactivity. If that occurs, the throughput is decreased to reduce the impact of the large data stream on the session and allow interactivity to recover.

Important:

HDX adaptive throughput changes the way that output buffers are set by moving this mechanism from the client to the VDA, and no manual configuration is necessary.

This feature has the following requirements:

- VDA version 1811 or later
- Workspace app for Windows 1811 or later

For deployments that do not meet the minimum requirements, see Optimize HDX bandwidth over high latency connections for information about manual output buffer configuration.

**Improve the image quality sent to user devices**

The following visual display policy settings control the quality of images sent from virtual desktops to user devices.

- **Visual quality.** Controls the visual quality of images displayed on the user device: medium, high, always lossless, build to lossless (default = medium). The actual video quality using the default setting of medium depends on available bandwidth.
- **Target framerate.** Specifies the maximum number of frames per second that are sent from the virtual desktop to the user device (default = 30). For devices that have slower CPUs, specifying a lower value can improve the user experience. The maximum supported frame rate per second is 60.
- **Display memory limit.** Specifies the maximum video buffer size for the session in kilobytes (default = 65536 KB). For connections requiring more color depth and higher resolution, increase the limit. You can calculate the maximum memory required.

**Improve video conference performance**

Several popular video conferencing applications are optimized for delivery from Citrix Virtual Apps and Desktops through multimedia redirection (see, for example, HDX RealTime Optimization Pack). For applications that are not optimized, HDX webcam video compression improves bandwidth efficiency and latency tolerance for webcams during video conferencing in a session. This technology
Citrix Virtual Apps and Desktops 7 2009

streams webcam traffic over a dedicated multimedia virtual channel. This technology uses less bandwidth compared to the isochronous HDX Plug-n-Play USB redirection support, and works well over WAN connections.

Citrix Workspace app users can override the default behavior by choosing the Desktop Viewer Mic & Webcam setting Don’t use my microphone or webcam. To prevent users from switching from HDX webcam video compression, disable USB device redirection by using the policy settings under ICA policy settings > USB Devices policy settings.

HDX webcam video compression requires that the following policy settings be enabled (all are enabled by default).

- Client audio redirection
- Client microphone redirection
- Multimedia conferencing
- Windows Media Redirection

If a webcam supports hardware encoding, HDX video compression uses the hardware encoding by default. Hardware encoding might consume more bandwidth than software encoding. To force software compression, add the following DWORD key value to the registry key: HKCU\Software\Citrix\HdxRealTime: DeepCompress_ForceSWEncode=1.

**Network traffic priorities**

Priorities are assigned to network traffic across multiple connections for a session using Quality of Service supported routers. Four TCP streams and two User Datagram Protocol (UDP) streams are available to carry ICA traffic between the user device and the server:

- TCP streams - real time, interactive, background, and bulk
- UDP streams - voice and Framehawk display remoting

Each virtual channel is associated with a specific priority and transported in the corresponding connection. You can set the channels independently, based on the TCP port number used for the connection.

Multiple channel streaming connections are supported for Virtual Delivery Agents (VDAs) installed on Windows 10, Windows 8, and Windows 7 machines. Work with your network administrator to ensure the Common Gateway Protocol (CGP) ports configured in the Multi-Port Policy setting are assigned correctly on the network routers.

Quality of Service is supported only when multiple session reliability ports, or the CGP ports, are configured.
Warning:

Use transport security when using this feature. Citrix recommends using Internet Protocol Security (IPsec) or Transport Layer Security (TLS). TLS connections are supported only when the connections traverse a NetScaler Gateway that supports multi-stream ICA. On an internal corporate network, multi-stream connections with TLS are not supported.

To set Quality of Service for multiple streaming connections, add the following Citrix policy settings to a policy (see Multi-stream connections policy settings for details):

- Multi-Port policy - This setting specifies ports for ICA traffic across multiple connections, and establishes network priorities.
  - Select a priority from the CGP default port priority list. By default, the primary port (2598) has a High priority.
  - Type more CGP ports in CGP port1, CGP port2, and CGP port3 as needed, and identify priorities for each. Each port must have a unique priority.

Explicitly configure the firewalls on VDAs to allow the additional TCP traffic.

- Multi-Stream computer setting - This setting is disabled by default. If you use Citrix NetScaler SD-WAN with Multi-Stream support in your environment, you do not need to configure this setting. Configure this policy setting when using third-party routers or legacy Branch Repeaters to achieve the desired Quality of Service.

- Multi-Stream user setting - This setting is disabled by default.

For policies containing these settings to take effect, users must log off and then log on to the network.

Show or hide the remote language bar

The language bar displays the preferred input language in an application session. If this feature is enabled (default), you can show or hide the language bar from the Advanced Preferences > Language bar UI in Citrix Workspace app for Windows. By using a registry setting on the VDA side, you can disable client control of the language bar feature. If this feature is disabled, the client UI setting doesn’t take effect, and the per user current setting determines the language bar state. For more information, see Improve the user experience.

To disable client control of the language bar feature from the VDA:

1. In the registry editor, navigate to HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Citrix\wfshell\...
2. Create a DWORD value key, SeamlessFlags, and set it to 0x40000.
Unicode keyboard mapping

Non-Windows Citrix Receivers use the local keyboard layout (Unicode). If a user changes the local keyboard layout and the server keyboard layout (scan code), they might not be in sync and the output is incorrect. For example, User1 changes the local keyboard layout from English to German. User1 then changes the server-side keyboard to German. Even though both keyboard layouts are German, they might not be in sync causing incorrect character output.

Enable or disable Unicode keyboard layout mapping

By default, the feature is disabled on the VDA side. To enable the feature, toggle on the feature by using registry editor regedit on the VDA. Add the following registry key:

```
KEY_LOCAL_MACHINE/SOFTWARE/Citrix/CtxKlMap
Name: EnableKlMap
Type: DWORD
Value: 1
```

To disable this feature, set `EnableKlMap` to 0 or delete the `CtxKlMap` key.

Enable Unicode keyboard layout mapping compatible mode

By default, Unicode keyboard layout mapping automatically hooks some windows API to reload the new Unicode keyboard layout map when you change the keyboard layout on the server side. A few applications cannot be hooked. To keep compatibility, you can change the feature to compatible mode to support these non-hooked applications. Add the following registry key:

```
HKEY_LOCAL_MACHINE/SOFTWARE/Citrix/CtxKlMap
Name: DisableWindowHook
Type: DWORD
Value: 1
```

To use normal Unicode keyboard layout mapping, set `DisableWindowHook` to 0.

Adaptive transport

September 14, 2020
**Introduction**

Adaptive transport is a data transport mechanism for Citrix Virtual Apps and Desktops. It is faster, can scale, improves application interactivity, and is more interactive on challenging long-haul WAN and internet connections. Adaptive transport maintains high server scalability and efficient use of bandwidth. By using adaptive transport, ICA virtual channels automatically respond to changing network conditions. They intelligently switch the underlying protocol between the Citrix protocol called Enlightened Data Transport (EDT) and TCP to deliver the best performance. It improves data throughput for all ICA virtual channels including Thinwire display remoting, file transfer (Client Drive Mapping), printing, and multimedia redirection. The same setting is applicable for both LAN and WAN conditions.

When set to **Preferred**, data transport over EDT is used as primary and fallback to TCP. With the Citrix Workspace app for Windows minimum version 1808 or Citrix Receiver for Windows minimum version 4.10 and session reliability enabled, EDT and TCP are attempted in parallel during the initial connection, session reliability reconnection, and auto client reconnect. Doing so reduces connection time if EDT is **Preferred**, but the required underlying UDP transport is unavailable and TCP must be used. By default, after fallback to TCP, adaptive transport continues to seek EDT every five minutes.

**Important**

EDT and TCP in parallel require:

- Citrix Workspace app for Windows minimum version 1808 and session reliability.
- Citrix Receiver for Windows minimum version 4.10 and session reliability.
- Citrix Workspace app for Mac minimum version 1808 and session reliability.
- Citrix Receiver for Mac minimum version 12.8 and session reliability.
By default, adaptive transport is enabled (Preferred), and EDT is used when possible, with fallback to TCP.

For testing purposes, you can set Diagnostic mode, in which case only EDT is used, and fallback to TCP is disabled.

Interoperability with Citrix SD-WAN WAN optimization

Citrix SD-WAN WAN optimization (WANOP) offers cross-session tokenized compression (data deduplication), including URL-based video caching. WANOP provides significant bandwidth reduction. This occurs if two or more people at the office location watch the same client-fetched video, or transfer or print significant portions of the same file or document. Furthermore, by running the processes for ICA data reduction and print job compression on the branch office appliance, WANOP offers VDA server CPU offload and enables higher Citrix Virtual Apps and Desktops server scalability.

Important

When using the WANOP feature of Citrix SD-WAN, there is no need to disable Adaptive Transport. WANOP will automatically put the HDX session into TCP data transport mode, since WANOP provides equivalent flow control to EDT and adds the benefits described in the previous paragraph. Non-WANOP sessions will use EDT whenever possible. By using TCP flow control and congestion control, WANOP ensures the equivalent interactivity to EDT at high latency and moderate packet loss.

Requirements and considerations

- Citrix Virtual Apps and Desktops: Minimum version 7 1808.
• StoreFront: Minimum version 3.9.
• Citrix Workspace app for Windows minimum version 1808
• Citrix Receiver for Windows: Minimum version 4.7 (EDT and TCP in parallel require minimum version 4.10 and session reliability).
• Citrix Workspace app for Mac minimum version 1808
• Citrix Receiver for Mac: Minimum version 12.5 (EDT and TCP in parallel require minimum version 12.8 and session reliability).
• Citrix Workspace app for iOS minimum version 1808
• Citrix Receiver for iOS: Minimum version 7.2.
• Citrix Workspace app for Linux minimum version 1808
• Citrix Receiver for Linux: Minimum version 13.6 for Direct VDA Connections only and minimum version 13.7 for DTLS support using NetScaler Gateway (or DTLS for direct VDA connections).
• Citrix Workspace app for Android minimum version 1808
• Citrix Receiver for Android: Minimum version 3.12.3 for Direct VDA Connections only.
• IPv4 VDAs only. IPv6 and mixed IPv6 and IPv4 configurations are not supported.
• Citrix Gateway (Citrix ADC): Minimum versions 11.1 build 51.21, 12.0 build 35.6. We recommend minimum versions 11.1 build 55.10 or 12.0 Build 53.6 as these versions include important DTLS fragmentation fixes. For more information on configuration, see Configure Citrix Gateway to support Enlightened Data Transport and HDX Insight.

**Configuration**

1. Install Citrix Virtual Apps and Desktops.
2. Install StoreFront. If you are using Citrix Gateway, verify that session reliability is enabled. Do so in *Studio > StoreFront > Manage NetScaler Gateway > Select your NetScaler > Secure Ticket Authority > Enable Session Reliability*.
3. Install the VDA (for single-session OS or multi-session OS).
4. Install Citrix Workspace app for Windows, Citrix Workspace app for Mac, Citrix Workspace app for iOS, Citrix Workspace app for Android, or Citrix Workspace app for Linux.
5. If you are using Citrix Gateway, enable session reliability in the Studio policy. Also, enable DTLS in the front-end VPN virtual server.
6. In Studio, enable the policy setting, HDX Adaptive Transport (it is enabled by default).
   - To enable the policy setting, set the value to Preferred, then click **OK**.
     - **Preferred.** Adaptive transport over EDT is used when possible, with fallback to TCP.
     - **Diagnostic mode.** EDT is forced on and falls back to TCP is disabled. We recommend this setting only for troubleshooting.
     - **Off.** TCP is forced on, and EDT is disabled.
7. Click Next, and complete the steps in the wizard.
8. The policy takes effect when the user reconnects the ICA session. Though not required, you can run `gpupdate /force` to pull the policy setting to the server, but the user still has to reconnect.
the ICA session.
9. Start a session from a supported Citrix Workspace app to establish a connection using adaptive transport.
10. For secure external access, configure DTLS encryption on Citrix Gateway. For more information, see this article.

To confirm that the policy setting has taken effect:

- Check that the ICA User Datagram Protocol (UDP) services are enabled on a VDA using `netstat -a`.
- Check that the virtual channels are running over EDT using Director or the `CtxSession.exe` command-line utility available on the VDA.

**Director example:**

In Director, **Session Details > Connection Type** displays the policy settings. Look for Connection type **HDX**. If the protocol is **UDP**, EDT is active for the session. If the protocol is **TCP**, the session is in fallback or default mode. If the Connection type is **RDP**, ICA is not in use and the protocol is **n/a**. For more information, see Monitor sessions.
**CtxSession.exe example:**

This example illustrates that EDT over UDP is active for the session. Type CtxSession.exe in the command line.

C:\Program Files (x86)\Citrix\System32>CtxSession

Session 2 Transport Protocols: UDP -> CGP -> ICA
To see verbose statistics, use the -v switch:

>CtxSession -v

**Troubleshoot EDT connections**

**Requirements and considerations**

- Multi-session OS VDA 7.13
- Single-session OS VDA 7.13
- Receiver for Windows 4.7 (4.6 was Experimental)
- Receiver for Linux:
  - 13.6 (direct connections)
  - 13.7 (DTLS supported)
- Receiver for Mac 12.5
- Receiver for iOS 7.2
- Receiver for Android:
  - 3.12.3 (direct connections)
  - 3.13 (DTLS supported)
- StoreFront 3.9
- Citrix Gateway Release 11.1–51.21 / 12.0.53.6 or later

**Parallel Connections**

Receiver for Windows 4.10, Mac 12.8, and iOS 7.5 include code that allows them to attempt an EDT and TCP connection in parallel. EDT is given a 500 milliseconds head-start to favor UDP. Any VDA that supports EDT also supports the parallel connection.

**To troubleshoot EDT connections, refer to the following procedure:**

1. Verify the minimum product/component version requirements. See Requirements and considerations.

2. Check if the HDX adaptive transport policy in Studio is set to Not Configured or set to Preferred.

   **Note:**

   In XenApp and XenDesktop 7.16, HDX adaptive transport is Preferred by default and there is no explicit requirement to configure the Studio policy.

3. Check if the optional Receiver GPO Administrative Templates are used. If so, ensure that the Transport Protocol for Citrix Receiver value is set to Not Configured or Preferred. Receiver for Windows side configurations is optional.
4. Ensure that the UDP sockets are listening on the VDA. Open a command prompt in the VDA and type `netstat -a -p udp`. For details, see How to Confirm HDX Enlightened Data Transport Protocol.

5. Bypass the NetScaler Gateway: The best way to test EDT is to launch an app from the internal network directly to StoreFront, bypassing the NetScaler Gateway. Run `ctxsession` on the VDA command prompt and verify your session is using UDP. If that works, your VDA is also ready for EDT connections from the outside.

6. Launch a session through NetScaler Gateway, but first inspect the ICA file. Ensure there is an entry that reads `HDXoverUDP = Preferred`. If it is set to `Off`, then the HDX adaptive transport is not set to `Preferred` in the Studio policy, or the group policy update has not been applied yet at the VDA. There should also be an entry `CGPSecurityTicket=On`, where CGP is a requirement for EDT to work using the NetScaler Gateway.

7. In the NetScaler Gateway, run `ctxsession` on the VDA command prompt and verify that your session is using UDP. If it is set to TCP, something might be wrong between the Citrix Receiver and the NetScaler Gateway front-end virtual server, and the connection fell back to TCP.

8. Any NetScaler Gateway before 12.0.56.20 requires DTLS to be manually enabled on the front-end VPN virtual server.

9. If you are using a VPN like Cisco AnyConnect or any other solution that alters the MTU in the network, the EDT connections might fail. You must calculate the overhead introduced by the VPN vendor, and then modify the ICA file template in StoreFront to include two more entries. Also, add a Citrix Receiver-side change. For more details, see CTX231821.

**More troubleshooting tools**

- **Wireshark**: To troubleshoot if you can’t identify the problem, use a Wireshark trace on NetScaler Gateway to troubleshoot. Wireshark Dissectors can misinterpret EDT as QUIC. You can use the Decode As feature in Wireshark to decode QUIC as DTLS.
- **NMAP**: Use the `nmap -sU -p 443 <IP Address of your NSG>` to test if UDP packets are reaching the virtual server.
  See a working versus non-working trace:
**Director:** In addition, you can check Citrix Director > Session Details > Protocol > UDP.

**CDF Traces:** You might need to check the EDT logic on XenApp and XenDesktop components, and generate CDF traces while reproducing the issue.

### Server CDF Traces

### Loss tolerant mode

**Important:**
- The feature requires a minimum of Citrix Workspace app 2002 for Windows. This version of
the VDA will support it when it becomes available.

- Loss tolerant mode is not supported on Citrix Gateway or Citrix Gateway Service. This mode is available only with direct connections.

Loss tolerant mode enhances the user experience for users connecting through networks with high latency and packet loss. It accomplishes this by using the EDT Lossy transport protocol.

Initially, sessions are established using EDT. If the latency and packet loss thresholds are reached or surpassed, the applicable virtual channels switch from EDT to EDT Lossy, while leaving the other virtual channels on EDT. If the latency and packet loss decrease below the thresholds, the applicable virtual channels switch back to EDT.

The default thresholds are:

- Packet loss: 5%
- Latency: 300 ms (RTT)

Loss tolerant mode is enabled by default and can be disabled using the loss tolerant mode setting. Adjust the packet loss and latency thresholds using the loss tolerant mode thresholds setting.

Requirements:

- Citrix Virtual Delivery Agent (VDA) 2003
- Citrix Workspace app 2002 for Windows
- Session reliability enabled. For more information about session reliability, see Session reliability policy settings.

**EDT MTU Discovery**

EDT automatically determines the Maximum Transmission Unit (MTU) when establishing a session. Doing so prevents EDT packet fragmentation that might result in performance degradation or failure to establish a session.

**Minimum requirements:**

- VDA minimum version 1912
- Citrix Workspace app 1911 for Windows
- Citrix ADC:
  - 13.0.52.24
  - 12.1.56.22
- Session Reliability must be enabled

If using client platforms or versions that do not support this feature, see the Knowledge Center article CTX231821 for details about how to configure a custom EDT MTU that is appropriate for your environment.
Warning:
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

To enable or disable EDT MTU Discovery on the VDA

1. Set this registry key:
   
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd
   
   Name: MtuDiscovery
   
   Type: DWORD
   
   Data: 00000001
   
2. Restart the VDA and wait for the VDA to register.

To disable EDT MTU Discovery, delete this registry value and restart the VDA.

This setting is machine-wide and affects all sessions connecting from a supported client.

To control EDT MTU Discovery on the client

You can control EDT MTU Discovery selectively on the client by adding the MtuDiscovery parameter in the ICA file. To disable the feature, set the following under the Application section:

MtuDiscovery=Off

To re-enable the feature, remove the MtuDiscovery parameter from the ICA file.

Important:

For this ICA file parameter to work, enable the feature on the VDA. If the feature is not enabled on the VDA, the ICA file parameter has no effect.

Rendezvous protocol

September 15, 2020

In environments that use the Citrix Gateway service, the Rendezvous protocol allows HDX sessions to bypass the Citrix Cloud Connector and connect directly and securely to the Citrix Gateway service.

Requirements:
• Access to environment using Citrix Workspace and Citrix Gateway service.
• Control Plane: Citrix Virtual Apps and Desktops Service (Citrix Cloud)
• VDA: Version 1912 or later.
• Enable the Rendezvous protocol in the Citrix policy. For more information, see Rendezvous protocol policy setting.
• The VDAs must have access to https://*.nssvc.net, including all subdomains. If you can’t add all subdomains to the allow list in that manner, use https://*.c.nssvc.net and https://*.g.nssvc.net instead. For more information, see the Internet Connectivity Requirements section of the Citrix Cloud documentation (under Virtual Apps and Desktop service) and the Knowledge Center article CTX270584.
• Cloud Connectors must obtain the VDAs’ FQDNs when brokering a session. Accomplish this in one of these two ways:
  – Enable DNS resolution for the site. Using the Citrix Virtual Apps and Desktops Remote PowerShell SDK, run the command Set-BrokerSite -DnsResolutionEnabled $true. For more information about the Citrix Virtual Apps and Desktops Remote PowerShell SDK, see SDKs and APIs.
  – DNS Reverse Lookup Zone with PTR records for the VDAs. If you choose this option, we recommend that you configure VDAs to always attempt to register PTR records. To do so, use the Group Policy Editor or Group Policy Object, navigate to Computer Configuration > Administrative Templates > Network > DNS Client, and set Register PTR Records to Enabled and Register.
• On the VDA, configure the SSL Cipher Suite Order. Use the Group Policy Editor or Group Policy Object. Under the Computer Configuration node, go to Administrative Templates > Network > SSL Configuration Settings > SSL Cipher Suite Order.

  Important:

  Rules for SSL Cipher Suite:

  The SSL Cipher Suite order list must be in strict comma delimited format.

  Except for the last string, each string must end with a comma (,).

  Do not add spaces.

  If the VDA machines are non-persistent (that is, provisioned with MCS or PVS), configure the cipher suite order in the master image.

  Select this order:

  TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P384
  TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P256
Important:
The Rendezvous protocol doesn’t support transparent or explicit proxies. To use proxies, continue to use the Cloud Connector for ICA traffic.

If you enable Rendezvous and the VDA can’t reach the Citrix Gateway service directly, the VDA falls back to proxy the HDX session through the Cloud Connector.

If you meet all requirements, follow these steps to validate if Rendezvous is in use:

1. Launch PowerShell or a command prompt within the HDX session.
2. Run `ctxsession.exe -v`.
3. Note the local address. If Rendezvous is in use, the local address is `0.0.0.0` followed by a 5-digit port number (for example, `0.0.0.0:50343`).

This diagram is an overview of the Rendezvous connection flow. Follow the steps to understand the flow.

1. Navigate to Citrix Workspace
2. Enter credentials in Citrix Workspace.
3. If using on-premises Active Directory, the Citrix Virtual Apps and Desktops service authenticates credentials with Active Directory using the Cloud Connector channel.
4. Citrix Workspace displays enumerated resources from the Citrix Virtual Apps and Desktop service.
5. Select resources from Citrix Workspace. The Citrix Virtual Apps and Desktop service sends a message to the VDA to prepare for an incoming session.
6. Citrix Workspace sends an ICA file to the endpoint that contains an STA ticket generated by Citrix Cloud.
7. The endpoint connects to the Citrix Gateway service, provides the ticket to connect to the VDA, and Citrix Cloud validates the ticket.
8. The Citrix Gateway service sends connection information to the Cloud Connector. The Cloud Connector determines if the connection is supposed to be a Rendezvous connection and sends the information to the VDA.
9. The VDA establishes a direct connection to the Citrix Gateway service.
10. If a direct connection between the VDA and the Citrix Gateway service isn’t possible, the VDA proxies its connection the Cloud Connector.
11. The Citrix Gateway service establishes a connection between the endpoint device and the VDA.
12. The VDA verifies its license with the Citrix Virtual Apps and Desktop service through the Cloud Connector.
13. The Citrix Virtual Apps and Desktop service sends session policies to the VDA through the Cloud Connector. Those policies are applied.

**Citrix ICA virtual channels**

September 14, 2020

Warning:
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

**What are ICA virtual channels?**

A large portion of the functionality and communication between the Citrix Workspace app and the Citrix Virtual Apps and Desktops servers occurs over virtual channels. Virtual channels are a necessary part of the remote computing experience with the Citrix Virtual Apps and Desktops servers. Virtual channels are used for:

- Audio
- COM ports
- Disks
- Graphics
- LPT ports
- Printers
- Smart cards
- Third-party custom virtual channels
New virtual channels are sometimes released with new versions of the Citrix Virtual Apps and Desktops servers and Citrix Workspace app products to provide more functionality.

A virtual channel consists of a client-side virtual driver that communicates with a server-side application. Citrix Virtual Apps and Desktops ship with various virtual channels included. They’re designed to allow customers and third-party vendors to create their own virtual channels by using one of the provided Software Development Kits (SDKs).

Virtual channels provide a secure way to accomplish various tasks. For example, an application that is running on a Citrix Virtual Apps server that is communicating with a client-side device or an application that is communicating with the client-side environment.

On the client side, virtual channels correspond to virtual drivers. Each virtual driver provides a specific function. Some are required for normal operation, and others are optional. Virtual drivers operate at the presentation layer protocol level. There can be several protocols active at any time by multiplexing channels that are provided by the Windows Station (WinStation) protocol layer.

The following functions are contained in the VirtualDriver registry value under this registry path:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\Engine\Configuration\Advanced
```
\Modules\ICA 3.0

Or

HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\ICA 3.0 (for 64-bit)

- Thinwire3.0 (Required)
- ClientDrive
- ClientPrinterQueue
- ClientPrinterPort
- Clipboard
- ClientComm
- ClientAudio
- LicenseHandler (Required)
- TWI (Required)
- SmartCard
- ICACTL (Required)
- SSPI
- TwainRdr
- UserEXperience
- Vd3d

Note:
You can disable specific client functionality by removing one or more of these values from the registry key. For example, if you wanted to remove the Client Clipboard, remove the word Clipboard.

This list contains the client virtual driver files and their respective functions. Citrix Virtual Apps and Citrix Workspace app for Windows use these files. They are in the form of Dynamic Link Libraries (user mode), and not Windows drivers (kernel mode) except for Generic USB as described in the Generic USB virtual channel.

- vd3dn.dll – Direct3D virtual channel used for desktop composition redirection
- vdcamN.dll – Bidirectional audio
- vdcdm30n.dll – Client drive mapping
- vdcom30n.dll - Client COM port mapping
- vdcpm30n.dll – Client printer mapping
- vdctlN.dll – ICA controls channel
- vddvc0n.dll – Dynamic virtual channel
- vdeuemn.dll - End user experience monitoring
- vdgusbn.dll – Generic USB virtual channel
- vdkbhook.dll – Transparent key pass-through

© 1999-2020 Citrix Systems, Inc. All rights reserved.
• vdlfpn.dll – Framehawk display channel over UDP like transport
• vdmnn.dll – Multimedia support
• vdmrvc.dll – Mobile Receiver virtual channel
• vdmtnchn.dll - Multi-touch support
• vdscardn.dll – Smartcard support
• vdsens.dll – Sensors virtual channel
• vdspl30n.dll – Client UPD
• vdsspinn.dll – Kerberos
• vdtuin.dll – Transparent UI
• vdtw30n.dll – Client Thinwire
• vdtwin.dll – Seamless
• vdtwn.dll – Twain

Some virtual channels are compiled into other files. For example Clipboard Mapping is available in \wfica32.exe

64-bit compatibility

Citrix Workspace app for Windows is 64-bit compatible. As with most of the binaries compiled for 32 bit, these client files have 64-bit compiled equivalents:

• brapi64.dll
• confmgr.dll
• ctxlogging.dll
• ctxmui.dll
• icaconf.exe
• icaconfs.dll
• icafile.dll
• pnipcn64.dll
• pnsson.dll
• ssoncom.exe
• ssonstub.dll
• vdkbhook64.dll

Generic USB virtual channel

Generic USB virtual channel implementation uses two kernel mode drivers along with the virtual channel driver vdgusbn.dll:

• ctxusbm.sys
• ctxusbr.sys
How ICA virtual channels work

Virtual channels are loaded in multiple ways. The Shell (WfShell for the server and PicaShell for the workstation) load some virtual channels. Some virtual channels are hosted as windows services.

Virtual channel modules loaded by the Shell, for example:

- EUEM
- Twain
- Clipboard
- Multimedia
- Seamless session sharing
- Time Zone

Some are loaded as kernel mode, for example:

- CtxDvcs.sys – Dynamic virtual channel
- Icausbb.sys – Generic USB redirection
- Picadm.sys – Client drive mapping
- Picaser.sys – COM port redirection
- Picapar.sys – LPT port redirection

Graphics virtual channel on the server side

Starting with XenApp 7.0 and XenDesktop 7.0, ctxgfx.exe hosts the graphics virtual channel for both workstation and terminal server based sessions. Ctxgfx hosts platform specific modules that interact with the corresponding driver (Icardd.dll for RDSH and vdod.dll and vidd.dll for workstation).

For XenDesktop 3D Pro deployments an OEM graphics driver is installed for the corresponding GPU on the VDA. Ctxgfx loads specialized adaptor modules to interact with the OEM graphics driver.

Hosting specialized channels in windows services

On Citrix Virtual Apps and Desktops servers, various channels are hosted as windows services. Such hosting provides one-to-many semantics for multiple applications in a session and multiple sessions on the server. Examples of such services include:

- Citrix Device Redirector Service
- Citrix Dynamic Virtual Channel Service
- Citrix End User Experience Monitoring Service
- Citrix Location and Sensor Virtual Channel Service
- Citrix MultiTouch Redirection Service
- Citrix Print Manager Service
- Citrix Smartcard Service
• Citrix Audio Redirection Service (Citrix Virtual Desktops only)

The audio virtual channel on Citrix Virtual Apps is hosted using Windows Audio service.

On the server side, all client virtual channels are routed through the WinStation driver, Wdica.sys. On the client side, the corresponding WinStation driver, built into wfica32.exe, polls the client virtual channels. This image illustrates the virtual channel client-server connection.

This overview contains a client-server data exchange using a virtual channel.

1. The client connects to the Citrix Virtual Apps and Desktops server. The client passes information about the virtual channels it supports to the server.

2. The server-side application starts, obtains a handle to the virtual channel, and optionally queries for additional information about the channel.

3. The client virtual driver and server-side application pass data using the following two methods:
   - If the server application has data to send to the client, the data is sent to the client immediately. When the client receives the data, the WinStation driver de-multiplexes the virtual channel data from the ICA stream and immediately passes it to the client virtual driver.
   - If the client virtual driver has data to send to the server, the data is sent the next time the WinStation driver polls it. When the server receives the data, it is queued until the virtual
channel application reads it. There is no way to alert the server virtual channel application
that data was received.

4. When the server virtual channel application is completed, it closes the virtual channel and frees
any allocated resources.

**Creating your own virtual channel using the Virtual Channel SDK**

Creating a virtual channel using the Virtual Channel SDK requires intermediate programming knowl-
edge. Use this method to provide a major communication path between the client and the server. For
example, if you are implementing usage of a device on the client side, such as a scanner, to be used
with a process in the session.

**Note:**
- The Virtual Channel SDK requires the WFAPI SDK to write the server side of the virtual chan-
  nel.
- Because of enhanced security for Citrix Virtual Apps and Desktops and Citrix Workspace app
  for Windows, you must take an extra step when installing a custom virtual channel.

**Creating your own virtual channel using the ICA Client Object SDK**

Creating a virtual channel using the ICA Client Object (ICO) is easier than using the Virtual Channel
SDK. Use the ICO by creating a named object in your program using the **CreateChannels** method.

**Important:**
- Because of enhanced security starting with the 10.00 version of the Citrix Receiver for Windows
  and later (and Citrix Workspace apps for Windows), you must take an extra step when creating
  an ICO virtual channel.

For more information, see Client Object API Specification Programmer’s Guide.

**Pass-through functionality of virtual channels**

Most virtual channels that Citrix provides operate unmodified when you use the Citrix Workspace app
for Windows within an ICA session (also known as a pass-through session). There are considerations
when using the client in extra hops.

The following functions operate the same way in single or multiple hops:

- Client COM port mapping
- Client drive mapping
- Client printer mapping
• Client UPD
• End user experience monitoring
• Generic USB
• Kerberos
• Multimedia support
• Smartcard support
• Transparent key pass-through
• Twain

As the inherent nature of latency and factors such as compression and decompression and rendering being performed at each hop, performance might be affected with each additional hop that the client undergoes. The affected areas are:

• Bidirectional audio
• File transfers
• Generic USB redirection
• Seamless
• Thinwire

Important:
By default, the client drives mapped by an instance of the client running in a pass-through session are restricted to the client drives of the connecting client.

Pass-through functionality of virtual channels between a Citrix Virtual Desktop session and a Citrix Virtual App session

Most virtual channels provided by Citrix operate unmodified when you use Citrix Workspace app for Windows within an ICA session on a Citrix Virtual Desktops server (also known as a pass-through session).

Specifically, on the Citrix Virtual Desktops server, there is a VDA hook that runs picaPassthruHook. This hook makes the client think it’s running on a CPS server, and placing the client into its traditional pass-through mode.

We support the following traditional virtual channels and their functionality:

• Client
• Client COM port mapping
• Client drive mapping
• Client printer mapping
• Generic USB (limited due to performance)
• Multimedia support
• Smartcard support
• SSON
• Transparent key pass-through

Security and ICA virtual channels

Securing usage is an important part of planning, developing, and implementing virtual channels. There are several references to specific areas of security located throughout this document.

Best practices

Open virtual channels when you Connect and Reconnect. Close virtual channels when you log off and Disconnect.

Keep the following guidelines in mind when you create scripts that use virtual channel functions.

Naming the Virtual Channels:

You can create a maximum of 32 virtual channels. Seventeen of the 32 channels are reserved for special purposes.

• Virtual channel names must not be more than seven characters in length.

• The first three characters are reserved for the vendor name, and the next four for the channel type. For example, CTXAUD represents the Citrix audio virtual channel.

Virtual channels are referred to by a seven-character (or shorter) ASCII name. In some previous versions of the ICA protocol, virtual channels were numbered. The numbers are now assigned dynamically based on the ASCII name, making implementation easier. Users who are developing virtual channel code for internal use only can use any seven-character name that does not conflict with existing virtual channels. Use only numbers and upper and lowercase ASCII. Follow the existing naming convention when adding your own virtual channels. There are several predefined channels. The predefined channels begin with the OEM identifier CTX and are for use only by Citrix.

Double-Hop Support:

## Double hop in Citrix Virtual Apps and Desktops

September 14, 2020

In the context of a Citrix client session, the term “double hop” refers to a Citrix Virtual App session that is running within a Citrix Virtual Desktop session. The following diagram illustrates a double hop.

<table>
<thead>
<tr>
<th>Virtual Channel</th>
<th>Is double hop supported?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control VC</td>
<td>Yes</td>
</tr>
<tr>
<td>HTML5 Video Redirection (v1)</td>
<td>Yes</td>

</tbody>
</table>

### See also
- ICA Virtual Channel SDK
- The Citrix Developer Network is the home for all technical resources and discussions involving the use of Citrix SDKs. In this network, you can find access to SDKs, sample code and scripts, extensions and plug-ins, and SDK documentation. Also included are the Citrix Developer Network forums, where technical discussions take place around each of the Citrix SDKs.
In a double hop scenario, when the user connects to a Citrix Virtual Desktop running on a single-session OS VDA (known as VDI) or a multi-session OS VDA (known as a published desktop), that is considered the first hop. After the user connects to the virtual desktop, the user can launch a Citrix Virtual Apps session. That is considered the second hop.

You can use a double hop deployment model to support various use cases. The case where the Citrix Virtual Desktop and the Citrix Virtual Apps environments are managed by different entities is one common example. This method can also be effective in resolving application compatibility issues.

**System requirements**

All Citrix Virtual Apps and Desktop editions including the Citrix Cloud service support double hop. The first hop must use a supported version of the single-session or multi-session OS VDA and the Citrix Workspace App. The second hop must use a supported version of the multi-session OS VDA. See the Product Matrix page for supported versions.

For best performance and compatibility, Citrix recommends using a Citrix client of the same version or newer than the VDA versions in use.

In environments where the first hop involves a third-party (non-Citrix) virtual desktop solution in combination with a Citrix Virtual Apps session, support is limited to the Citrix Virtual Apps environment. In the event of any issues related to the third-party virtual desktop, including - but not limited to - Citrix Workspace app compatibility, redirection of hardware devices, and session performance, Citrix can provide technical support in a limited capacity. A Citrix Virtual Desktop at the first hop might be required as part of troubleshooting.

**Deployment considerations for HDX in double hop**

In general, each session in a double hop is unique and client-server functions are isolated to a given hop. This section includes areas that require special consideration by Citrix administrators. Citrix recommends that customers conduct thorough testing of required HDX capabilities to ensure user experience and performance is adequate for a given environment configuration.
**Graphics**

Use default graphics settings (selective encoding) on the first and second hops. In the case of **HDX 3D Pro**, Citrix highly recommends that all applications that require graphics acceleration run locally in the first hop with the appropriate GPU resources available to the VDA.

**Latency**

End-to-end latency can impact the overall user experience. Consider the added latency between the first and second hops. This is especially important with redirection of hardware devices.

**Multimedia**

Server-side (in session) rendering of audio and video content performs best in the first hop. Video playback in the second hop requires decoding and re-encoding at the first hop, increasing bandwidth and hardware resource utilization as a result. Audio and video content must be limited to the first hop whenever possible.

**USB device redirection**

HDX includes generic and optimized redirection modes to support a wide array of USB device types. Pay special attention to the mode in use at each hop and use the following table as reference for best results. For more information about generic and optimized redirection modes, see [Generic USB devices](#).

<table>
<thead>
<tr>
<th>First hop (VDI or published desktop)</th>
<th>Second hop (Virtual apps)</th>
<th>Support notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optimized</td>
<td>Optimized</td>
<td>Recommended (based on device support). For example, USB mass storage, TWAIN scanners, Webcam, Audio.</td>
</tr>
<tr>
<td>Generic</td>
<td>Generic</td>
<td>For devices where the optimized option is not available.</td>
</tr>
<tr>
<td>Generic</td>
<td>Optimized</td>
<td>While technically possible, it is recommended to use the optimized mode across both hops when device support is available.</td>
</tr>
</tbody>
</table>
First hop (VDI or published desktop) | Second hop (Virtual apps) | Support notes
--- | --- | ---
Optimized | Generic | Not supported

**Note:**
Due to the inherent chattiness of USB protocols, performance may decrease across hops. Functionality and results vary depending on specific device and application requirements. Validation testing is highly recommended in all cases of device redirection and especially important in double hop scenarios.

**Support exceptions**

Double hop sessions support most HDX features and capabilities except for the following:

- Browser content redirection
- Local App Access
- RealTime Optimization Pack for Skype for Business
- Optimization for Microsoft Teams

**Install and configure**

June 26, 2020

Review the referenced articles before starting each deployment step, to learn about what you see and specify during the deployment.

Use the following sequence to deploy Citrix Virtual Apps and Desktops.

**Prepare**

Review Prepare to install and complete any necessary tasks.

- Where to find information about concepts, features, differences from earlier releases, system requirements, and databases.
- Considerations when deciding where to install core components.
- Permission and Active Directory requirements.
- Information about the available installers, tools, and interfaces.
Install core components

Install the Delivery Controller, Citrix Studio, Citrix Director, and Citrix License Server. You can also install Citrix StoreFront. For details, see Install core components or Install using the command line.

Create a site

After you install the core components and launch Studio, you are automatically guided to create a site.

Install one or more Virtual Delivery Agents (VDAs)

Install a VDA on a machine running a Windows operating system, either on a master image or directly on each machine. See Install VDAs or Install using the command line. Sample scripts are provided if you want to install VDAs through Active Directory.

For machines with a Linux operating system, follow the guidance in Linux Virtual Delivery Agent.

For a Remote PC Access deployment, install a VDA for single-session OS on each office PC. If you need only the core VDA services, use the standalone VDAWorkstationCoreSetup.exe installer and your existing Electronic Software Distribution (ESD) methods. (Prepare to install describes the available VDA installers.)

Install optional components

If you plan to use the Citrix Universal Print Server, install its server component on your print servers. See Install core components or Install using the command line.

To allow StoreFront to use authentication options such as SAML assertions, install the Citrix Federated Authentication Service.

To enable end users to have greater control over their user accounts, install Self-Service Password Reset.

Optionally, integrate more Citrix components into your Citrix Virtual Apps and Desktops deployment.

- Citrix Provisioning is an optional component that provisions machines by streaming a master image to target devices.
- Citrix Gateway is a secure application access solution that provides administrators with granular application-level policy and action controls to secure access to applications and data.
- Citrix SD-WAN is a set of appliances that optimize WAN performance.

Create a machine catalog

After you create a site in Studio, you are guided to create a machine catalog.
A catalog can contain physical or virtual machines (VMs). Virtual machines can be created from a master image. When using a hypervisor or other service to provide VMs, you first create a master image on that host. Then, when you create the catalog, you specify that image, which is used when creating VMs.

**Create a delivery group**

After you create your first machine catalog in Studio, you are guided to create a delivery group. A delivery group specifies which users can access machines in a selected catalog and the applications available to those users.

**Create an application group (optional)**

After you create a delivery group, you can optionally create an application group. You can create application groups for applications that are shared across different delivery groups or used by a subset of users within delivery groups.

**Prepare to install**

June 24, 2020

Deploying Citrix Virtual Apps and Desktops begins with installing the following components. This process prepares for delivery of applications and desktops to users inside your firewall.

- One or more Delivery Controllers
- Citrix Studio
- Citrix Director
- Citrix StoreFront
- Citrix License Server
- One or more Citrix Virtual Delivery Agents (VDAs)
- Optional components and technologies such as the Universal Print Server, the Federated Authentication Service, and Self-Service Password Reset

For users outside your firewall, install and configure an extra component, such as Citrix Gateway. For an introduction, see Integrate Citrix Virtual Apps and Desktops with Citrix Gateway.

You can use the full-product installer on the product ISO to deploy many components and technologies. You can use a standalone VDA installer to install VDAs. The standalone VDA installers are available on the Citrix download site. All installers offer graphical and command line interfaces. See Installers.
The product ISO contains sample scripts that install, upgrade, or remove VDAs for machines in Active Directory. You can also use the scripts to manage master images used by Machine Creation Services (MCS) and Citrix Provisioning (formerly Provisioning Services). For details, see Install VDAs using scripts.

Information to review before installation

- **Technical overview**: If you’re unfamiliar with the product and its components.
- **Security**: When planning your deployment environment.
- **Known issues**: Issues you might encounter in this version.
- **Databases**: Learn about the system databases and how to configure them. During Controller installation, you can install SQL Server Express for use as the site database. You configure most database information when you create a site, after you install the core components.
- **Remote PC Access**: If you’re deploying an environment that enables your users to access their physical machines in the office remotely.
- **Connections and resources**: If you’re using a hypervisor or other service to host or provision VMs for applications and desktops. You can configure the first connection when you create a site (after you install the core components). Set up your virtualization environment before then.
- **Microsoft System Center Configuration Manager**: If you’re using ConfigMgr to manage access to applications and desktops, or if you’re using the Wake on LAN feature with Remote PC Access.

Where to install components

Review the System requirements for supported platforms, operating systems, and versions. Component prerequisites are installed automatically, except as noted. See the Citrix StoreFront and the Citrix License Server documentation for their supported platforms and prerequisites.

You can install the core components on the same server or on different servers.

- Installing all the core components on one server can work for evaluation, test, or small production deployments.
- To accommodate future expansion, consider installing components on different servers. For example, installing Studio on a different machine than the server where you installed the Controller allows you to manage the site remotely.
- For most production deployments, installing core components on separate servers is recommended.
- To install a supported component on a Server CoreOS (such as a Delivery Controller), you must use the command line. That OS type does not offer a graphical interface, so install Studio and other tools elsewhere, and then point them to the Controller server.

You can install both a Delivery Controller and a VDA for multi-session OS on the same server. Launch the installer and select the Delivery Controller (plus any other core components you want on that
machine). Then launch the installer again and select the **Virtual Delivery Agent** for multi-session OS. Ensure that each operating system has the latest updates.

Ensure that all machines have synchronized system clocks. The Kerberos infrastructure that secures communication between the machines requires synchronization.

With Citrix Hypervisors, the virtual machine’s power state might appear as unknown even if it appears registered. To resolve this issue, edit the registry key `HostTime` value to disable time synchronization with the host:

```
HKEY_LOCAL_MACHINE\Software\Citrix\XenTools\HostTime="Local"
HKEY_LOCAL_MACHINE\Software\Wow6432Node\Citrix\XenTools\HostTime="Local"
```

**Tip:**

The default value is `HostTime="UTC"`. Change this value to something other than UTC, for example, `Local`. This change effectively disables time synchronization with the host.

Optimization guidance for Windows 10 single-session machines is available in [CTX216252](#).

Where NOT to install components:

- Do not install any components on an Active Directory domain controller.
- Installing a Controller on a node in a SQL Server clustering installation, SQL Server mirroring installation, or on a server running Hyper-V is not supported.

If you try to install or upgrade a VDA on a Windows OS that this product version does not support, a message guides you to an article describing options.

### Permission and Active Directory requirements

You must be a domain user and a local administrator on the machines where you are installing components.

To use a standalone VDA installer, you must have elevated administrative privileges or use **Run as administrator**.

Configure your Active Directory domain before starting an installation.

- **System requirements** lists the supported Active Directory functional levels. [Active Directory](#) contains more information.
- You must have at least one domain controller running Active Directory Domain Services.
- Do not install any Citrix Virtual Apps and Desktops components on a domain controller.
- Do not use a forward slash (/) when specifying Organizational Unit names in Studio.

The Windows user account used to install the Citrix License Server is automatically configured as a delegated administration full administrator on the license server.
For more information:

- Security best practices
- Delegated administration
- Microsoft documentation for Active Directory configuration

**Installation guidance, considerations, and best practice**

**During installation of any component**

- When installing or upgrading a Delivery Controller, Studio, License Server, or Director from the full-product media, if the Citrix installer detects that a restart is pending from a previous Windows installation on the machine, the installer stops with exit/return code 9. You are prompted to restart the machine.

  This is not a Citrix forced restart. It is due to other components installed earlier on the machine. If this occurs, restart the machine and then launch the Citrix installer again.

  When using the command-line interface, you can prevent the check for the pending restart by including the /no_pending_reboot_check option in the command.

- Usually, if a component has prerequisites, the installer deploys them if they are not present. Some prerequisites might require a machine restart.

- When you create objects before, during, and after installation, specify unique names for each object. For example, provide unique names for networks, groups, catalogs, and resources.

- If a component does not install successfully, the installation stops with an error message. Components that installed successfully are retained. You do not need to reinstall them.

- Citrix Analytics are collected automatically when you install (or upgrade) components. By default, that data is uploaded to Citrix automatically when the installation completes. Also, when you install components, you are automatically enrolled in the Citrix Customer Experience Improvement Program (CEIP), which uploads anonymous data.

  During installation, you can also choose to participate in other Citrix technologies that collect diagnostics for maintenance and troubleshooting. For information about these programs, see [Citrix Insight Services](#).

- Google Analytics are collected (and later uploaded) automatically when you install (or upgrade) Studio. After installing Studio, you can change this setting with the registry key `HKLM\Software \Citrix\DesktopStudio\GAEenabled`. A value of 1 enables collection and upload, 0 disables collection and upload.

- If a VDA installation fails, an MSI analyzer parses the failing MSI log, displaying the exact error code. The analyzer suggests a CTX article, if it’s a known issue. The analyzer also collects
anonymized data about the failure error code. This data is included with other data collected by CEIP. If you end enrollment in CEIP, the collected MSI analyzer data is no longer sent to Citrix.

During VDA installation

- The Citrix Workspace app for Windows is available, but not installed by default when you install a VDA. You or your users can download and install (and upgrade) Citrix Workspace app for Windows and other Citrix Workspace apps from the Citrix website. Alternatively, you can make those Citrix Workspace apps available from your StoreFront server. See the StoreFront documentation.

- The Print Spooler Service is enabled by default on supported Windows servers. If you disable this service, you cannot successfully install a VDA for Windows multi-session OS, so ensure that this service is enabled before installing a VDA.

- Most supported Windows editions come with Microsoft Media Foundation already installed. If the machine does not have Media Foundation (such as N editions), several multimedia features are not installed and will not work.
  - Windows Media Redirection
  - HTML5 Video Redirection
  - HDX RealTime Webcam Redirection

You can acknowledge the limitation, or end the VDA installation and restart it later, after installing Media Foundation. In the graphical interface, this choice is presented in a message. In the command line, you can use the /no_mediafoundation_ack option to acknowledge the limitation.

- When you install the VDA, a new local user group called Direct Access Users is created automatically. On a VDA for single-session OS, this group applies only to RDP connections. On a VDA for multi-session OS, this group applies to ICA and RDP connections.

- The VDA must have valid Controller addresses with which to communicate. Otherwise, sessions cannot be established. You can specify Controller addresses when you install the VDA or later. Remember that it must be done. For more information, see VDA registration.

VDA supportability tools

Each VDA installer includes a supportability MSI that contains Citrix tools for checking the VDA performance, such as its overall health and the quality of connections. Enable or disable installation of this MSI on the Additional Components page of the VDA installer’s graphical interface. From the command line, you can disable installation with the /exclude ”Citrix Supportability Tools” option.
By default, the supportability MSI is installed in `c:\Program Files (x86)\Citrix\Supportability Tools`. You can change this location on the Components page of the VDA installer’s graphical interface, or with the `/installdir` command-line option. Keep in mind that changing the location changes it for all installed VDA components, not just the supportability tools.

Current tools in the supportability MSI:

- Citrix Health Assistant: For details, see CTX207624.
- VDA Cleanup Utility: For details, see CTX209255.

If you do not install the tools when you install the VDA, the CTX article contains a link to the current download package.

**Restarts after and during VDA installation**

A restart is required at the end of the VDA installation. That restart occurs automatically by default.

When you’re upgrading a VDA to version 7.17 (or a later supported version), a restart occurs during the upgrade. This cannot be avoided.

To minimize the number of restarts needed during VDA installation:

- Ensure that a supported .NET Framework version is installed before beginning the VDA installation.
- For Windows multi-session OS machines, install and enable the RDS role services before installing the VDA.

If you do not install those prerequisites before installing the VDA:

- If you are using the graphical interface or the command line interface without the `/noreboot` option, the machine restarts automatically after installing the prerequisite.
- If you are using the command line interface with the `/noreboot` option, you must initiate the restart.

**Note:**

When you’re upgrading a VDA to version 7.17 or a later supported version, a restart occurs during the upgrade. This cannot be avoided.

**Installers**

**Full-product installer**

Using the full-product installer provided in the ISO, you can:

- Install, upgrade, or remove core components: Delivery Controller, Studio, Director, and License Server.
• Install or upgrade StoreFront.
• Install or upgrade Windows VDAs for single-session or multi-session operating systems.
• Install the Universal Print Server UpsServer component on your print servers.
• Install the Federated Authentication Service.
• Install Session Recording.

To deliver a desktop from a multi-session OS for one user (for example, for web development), use the full-product installer’s command-line interface. For details, see Server VDI.

Standalone VDA installers

Standalone VDA installers are available on the Citrix download pages. (They are not available from the product installation media.) The standalone VDA installers are much smaller than the full-product ISO. They more easily accommodate deployments that:
• Use Electronic Software Distribution (ESD) packages that are staged or copied locally
• Have physical machines
• Have remote offices

By default, files in the self-extracting standalone VDAs are extracted to the Temp folder. More disk space is required on the machine when extracting to the Temp folder than when using the full-product installer. However, files extracted to the Temp folder are automatically deleted after the installation completes. Alternatively, you can use the /extract command with an absolute path.

Three standalone VDA installers are available for download.

VDAServerSetup.exe:
Installs a VDA for multi-session OS. It supports all the VDA for multi-session OS options that are available with the full-product installer.

VDAWorkstationSetup.exe:
Installs a VDA for single-session OS. It supports all the VDA for single-session OS options that are available with the full-product installer.

VDAWorkstationCoreSetup.exe:
Installs a VDA for single-session OS that is optimized for Remote PC Access deployments or core VDI installations. Remote PC Access uses physical machines. Core VDI installations are VMs that are not being used as a master image. It installs only the core services necessary for VDA connections such deployments. Therefore, it supports only a subset of the options that are valid with the full-product or VDAWorkstationSetup.exe installers.

This installer does not install or contain the components used for:
• App-V.
Citrix Virtual Apps and Desktops 7 2009

- Profile Management. Excluding Citrix Profile Management from the installation affects Citrix Director displays. For details, see Install VDAs.
- Machine Identity Service.
- Citrix Supportability Tools.
- Citrix Files for Windows.
- Citrix Files for Outlook.

The VDAWorkstationCoreSetup.exe installer does not install or contain a Citrix Workspace app for Windows.

Using VDAWorkstationCoreSetup.exe is equivalent to using the full-product or VDAWorkstationSetup installer to install a single-session OS VDA and either:

- In the graphical interface: Selecting the Remote PC Access option on the Environment page.
- In the command line interface: Specifying the /remotepc option.
- In the command line interface: Specifying /components vda and /exclude "Citrix Personalization for App-V - VDA""Machine Identity Service""Citrix User Profile Manager""Citrix User Profile Manager WMI Plugin""Citrix Supportability Tools""Citrix Files for Windows".

You can install the omitted components/features later by running the full-product installer. That action enables you to install all missing components.

The VDAWorkstationCoreSetup.exe installer automatically installs the Browser Content Redirection MSI. This automatic installation applies to release 2003 and later supported releases.

**Citrix installation return codes**

The installation log contains the result of component installations as a Citrix return code, not a Microsoft value.

- 0 = Success
- 1 = Failed
- 2 = PartialSuccess
- 3 = PartialSuccessAndRebootNeeded
- 4 = FailureAndRebootNeeded
- 5 = UserCanceled
- 6 = MissingCommandLineArgument
- 7 = NewerVersionFound

For example, when using tools such as Microsoft System Center Configuration Manager, a scripted VDA installation might appear to fail when the installation log contains the return code 3. This can occur when the VDA installer is waiting for a restart that you must initiate (for example, after a Remote Desktop Services role prerequisite installation on a server). A VDA installation is considered successful
only after all prerequisites and selected components are installed, and the machine is restarted after
the installation.

Alternatively, you can wrap your installation in CMD scripts (which return Microsoft exit codes) or
change the success codes in your Configuration Manager package.

**Microsoft System Center Virtual Machine Manager virtualization environments**

June 26, 2020

Follow this guidance if you use Hyper-V with Microsoft System Center Virtual Machine Manager (VMM)
to provide virtual machines.

This release supports the VMM versions listed in System requirements.

You can use Citrix Provisioning (formerly Provisioning Services) and Machine Creation Services to pro-
vision:

- Generation 1 supported Desktop or Server OS VMs.
- Generation 2 supported Desktop or Server OS VMs, including Secure Boot support.

**Install and configure a hypervisor**

**Important:**

All Delivery Controllers must be in the same forest as the VMM servers.

1. Install Microsoft Hyper-V server and VMM on your servers.

2. Install the System Center Virtual Machine Manager console on all Controllers. The console ver-
sion must match the management server version. Although an earlier console can connect to
the management server, provisioning VDAs fails if the versions differ.

3. Verify the following account information:

   The account you use to specify hosts in Studio is a VMM administrator or VMM delegated admin-
istrator for the relevant Hyper-V machines. If this account only has the delegated administrator
role in VMM, the storage data is not listed in Studio during the host creation process.

   The user account used for Studio integration must also be a member of the administrators local
security group on each Hyper-V server. This configuration supports VM life cycle management,
such as VM creation, update, and deletion.

   Installing a Controller on a server running Hyper-V is not supported.
Create a master VM

1. Install a VDA on the master VM, and select the option to optimize the desktop to improve performance.
2. Take a snapshot of the master VM to use as a backup.

Create virtual desktops

If you are using MCS to create VMs, when creating a site or a connection:

1. Select the Microsoft virtualization host type.
2. Enter the address as the fully qualified domain name of the host server.
3. Enter the credentials for the administrator account you set up earlier that has permissions to create VMs.
4. In Host Details, select the cluster or standalone host to use when creating VMs.

Browse for and select a cluster or standalone host even if you are using a single Hyper-V host deployment.

MCS on SMB 3 file shares

For machine catalogs created with MCS on SMB 3 file shares for VM storage, ensure that credentials meet the following requirements. These requirements ensure that calls from the Controller’s Hypervisor Communications Library (HCL) connect successfully to SMB storage:

- VMM user credentials must include full read write access to the SMB storage.
- Storage virtual disk operations during VM life cycle events are performed through the Hyper-V server using the VMM user credentials.

When you use SMB storage, enable the Authentication Credential Security Support Provider (CredSSP) from the Controller to individual Hyper-V machines. Use this process for VMM 2012 SP1 with Hyper-V on Windows Server 2012. For more information, see CTX137465.

The HCL uses CredSSP to open a connection to the Hyper-V machine. This feature passes Kerberos-encrypted user credentials to the Hyper-V machine. The PowerShell commands in the session on the remote Hyper-V machine run with the credentials provided. In this case, the credentials of the VMM user, so that communication commands to storage work correctly.

The following tasks use PowerShell scripts that originate in the HCL and are then sent to the Hyper-V machine to act on the SMB 3.0 storage.

- Consolidate master image: A master image creates a MCS provisioning scheme (machine catalog). It clones and flattens the master VM ready for creating VMs from the new disk created (and removes dependency on the original master VM).
ConvertVirtualHardDisk on the root\virtualization\v2 namespace

Example:

```
1 $ims = Get-WmiObject -class $class -namespace "root\virtualization\v2"
2 $result = $ims.ConvertVirtualHardDisk($diskName, $vhdtext)
3 $result
```

• **Create difference disk:** Creates a difference disk from the master image generated by consolidating the master image. The difference disk is then attached to a new VM.

CreateVirtualHardDisk on the root\virtualization\v2 namespace

Example:

```
1 $ims = Get-WmiObject -class $class -namespace "root\virtualization\v2"
2 $result = $ims.CreateVirtualHardDisk($vhdtext);
3 $result
```

• **Upload identity disks:** The HCL cannot directly upload the identity disk to SMB storage. Therefore, the Hyper-V machine must upload and copy the identity disk to the storage. Because the Hyper-V machine cannot read the disk from the Controller, the HCL must first copy the identity disk through the Hyper-V machine as follows.

The HCL uploads the Identity to the Hyper-V machine through the administrator share.

The Hyper-V machine copies the disk to the SMB storage through a PowerShell script running in the PowerShell remote session. A folder is created on the Hyper-V machine and the permissions on that folder are locked for the VMM user only (through the remote PowerShell connection).

The HCL deletes the file from the administrator share.

When the HCL finishes uploading the identity disk to the Hyper-V machine, the remote PowerShell session copies the identity disks to SMB storage. It then deletes it from the Hyper-V machine.

The identity disk folder is recreated if it is deleted so that it is available for reuse.

• **Download identity disks:** As with uploads, the identity disks pass through the Hyper-V machine to the HCL. The following process creates a folder that only has VMM user permissions on the Hyper-V server if it does not exist.

The Hyper-V machine copies the disk from the SMB storage to the local Hyper-V storage through a PowerShell script. This script runs in the PowerShell V3 remote session.
HCL reads the disk from the Hyper-V machine's administrator share into memory.
HCL deletes the file from the administrator share.

Citrix Hypervisor virtualization environments

June 3, 2020

Create a connection to Citrix Hypervisor

When you create a connection to Citrix Hypervisor (formerly XenServer), you must provide the credentials for a VM Power Admin or higher-level user.

Citrix recommends using HTTPS to secure communications with Citrix Hypervisor. To use HTTPS, you must replace the default SSL certificate installed on Citrix Hypervisor; see CTX128656.

You can configure high availability if it is enabled on the Citrix Hypervisor server. Citrix recommends that you select all servers in the pool (from Edit High Availability) to allow communication with the Citrix Hypervisor server if the pool master fails.

You can select a GPU type and group, or pass through, if the Citrix Hypervisor supports vGPU. The display indicates if the selection has dedicated GPU resources.

When using local storage on one or more Citrix Hypervisor hosts for temporary data storage, make sure that each storage location in the pool has a unique name. (To change a name in XenCenter, right-click the storage and edit the name property.)

You can use Citrix Provisioning (formerly Provisioning Services) and Machine Creation Services to provision:

- legacy BIOS for supported Desktop or Server OS VMs.
- UEFI for supported Desktop or Server OS VMs, including Secure Boot.

Use IntelliCache for Citrix Hypervisor connections

Using IntelliCache, hosted VDI deployments are more cost-effective because you can use a combination of shared storage and local storage. This enhances performance and reduces network traffic. The local storage caches the master image from the shared storage, which reduces the number of reads on the shared storage. For shared desktops, writes to the differencing disks are written to local storage on the host and not to shared storage.

- Shared storage must be NFS when using IntelliCache.
- Citrix recommends that you use a high performance local storage device to ensure the fastest possible data transfer.
To use IntelliCache, you must enable it in both this product and Citrix Hypervisor.

- When installing Citrix Hypervisor, select **Enable thin provisioning (Optimized storage for Virtual Desktops)**. Citrix does not support mixed pools of servers that have IntelliCache enabled and servers that do not. For more information, see the Citrix Hypervisor documentation.
- In Citrix Virtual Apps and Desktops, IntelliCache is disabled by default. You can change the setting only when creating a Citrix Hypervisor connection; you cannot disable IntelliCache later. When you add a Citrix Hypervisor connection:
  - Select **Shared** as the storage type.
  - Select the **Use IntelliCache** check box.

**Create a machine catalog using a Citrix Hypervisor connection**

GPU-capable machines require a dedicated master image. Those VMs require video card drivers that support GPUs. Configure GPU-capable machines to allow the VM to operate with software that uses the GPU for operations.

1. In XenCenter, create a VM with standard VGA, networks, and vCPU.
2. Update the VM configuration to enable GPU use (either Passthrough or vGPU).
3. Install a supported operating system and enable RDP.
4. Install Citrix VM Tools and NVIDIA drivers.
5. Clear the Virtual Network Computing (VNC) Admin Console to optimize performance, and then restart the VM.
6. You are prompted to use RDP. Using RDP, install the VDA and then restart the VM.
7. Optionally, create a snapshot for the VM as a baseline template for other GPU master images.
8. Using RDP, install customer-specific applications that are configured in XenCenter and use GPU capabilities.

**More information**

- Connections and resources
- Create machine catalogs

**Microsoft System Center Configuration Manager environments**

June 3, 2020

Sites using Microsoft System Center Configuration Manager (Configuration Manager) to manage access to applications and desktops can extend that use to XenApp or XenDesktop using these options:
• **Citrix Connector 3.1**: Citrix Connector provides a bridge between Configuration Manager and Citrix Virtual Apps and Desktops. The Connector enables you to unify day-to-day operations across the physical environments you manage with Configuration Manager. This support extends to the virtual environments you manage with Citrix Virtual Apps and Desktops. For more information, see Citrix Connector 3.1.

• **Configuration Manager Wake Proxy feature**: The Remote PC Access Wake on LAN feature requires Configuration Manager. For more information, see Remote PC Access.

• **XenApp and XenDesktop properties**: XenApp and XenDesktop properties enable you to identify Citrix Virtual Desktops for management through Configuration Manager. (Configuration Manager uses the former name of Citrix Virtual Apps and Desktops: XenApp and XenDesktop.) These properties are automatically used by the Citrix Connector but can also be manually configured, as described in the following section.

### Properties

Properties are available to Microsoft System Center Configuration Manager to manage virtual desktops.

Boolean properties displayed in Configuration Manager appear as 1 or 0, not true or false.

The properties are available for the Citrix_virtualDesktopInfo class in the Root\Citrix\DesktopInformation namespace. Property names come from the Windows Management Instrumentation (WMI) provider.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AssignmentType</td>
<td>Sets the value of IsAssigned. Valid values are: ClientIP, ClientName, None, and User (sets IsAssigned to True)</td>
</tr>
<tr>
<td>BrokerSiteName</td>
<td>Returns the same value as HostIdentifier</td>
</tr>
<tr>
<td>DesktopCatalogName</td>
<td>Machine catalog associated with the desktop.</td>
</tr>
<tr>
<td>DesktopGroupName</td>
<td>Delivery Group associated with the desktop.</td>
</tr>
<tr>
<td>HostIdentifier</td>
<td>Returns the same value as BrokerSiteName.</td>
</tr>
<tr>
<td>IsAssigned</td>
<td>True to assign the desktop to a user, set to False for a random desktop</td>
</tr>
</tbody>
</table>
### Citrix Virtual Apps and Desktops 7 2009

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsMasterImage</td>
<td>Allows decisions about the environment. For example, install applications on the master image and not on the provisioned machines. Valid values are: True on a VM that is used as a master image. This value is set during installation based on a selection, or cleared on a VM that is provisioned from that image.</td>
</tr>
<tr>
<td>IsVirtualMachine</td>
<td>True for a virtual machine, false for a physical machine.</td>
</tr>
<tr>
<td>OSChangesPersist</td>
<td>False if the desktop operating system image is reset to a clean state every time it is restarted; otherwise, true.</td>
</tr>
<tr>
<td>PersistentDataLocation</td>
<td>The location where Configuration Manager stores persistent data. This is not accessible to users.</td>
</tr>
<tr>
<td>PersonalvDiskDriveLetter</td>
<td>For a desktop with a Personal vDisk, the drive letter you assign to the Personal vDisk.</td>
</tr>
<tr>
<td>BrokerSiteName, DesktopCatalogName, DesktopGroupName, HostIdentifier</td>
<td>Determined when the desktop registers with the Controller. They are null for a desktop that has not fully registered.</td>
</tr>
</tbody>
</table>

To collect the properties, run a hardware inventory in Configuration Manager. To view the properties, use the Configuration Manager Resource Explorer. In these instances, the names include spaces or vary slightly from the property names. For example, *BrokerSiteName* appears as Broker Site Name.

- Configure Configuration Manager to collect Citrix WMI properties from the Citrix VDA
- Create query-based device collections using Citrix WMI properties
- Create global conditions based on Citrix WMI properties
- Use global conditions to define application deployment type requirements

You can also use Microsoft properties in the Microsoft class CCM_DesktopMachine in the Root\ccm_vdi namespace. For more information, see the Microsoft documentation.

**VMware virtualization environments**

June 3, 2020
Follow this guidance if you use VMware to provide virtual machines.

Install vCenter Server and the appropriate management tools. (No support is provided for vSphere vCenter Linked Mode operation.)

If you plan to use MCS, do not disable the Datastore Browser feature in vCenter Server (described in https://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=2101567). When you disable this feature, MCS does not work correctly.

You can use Citrix Provisioning (formerly Provisioning Services) and Machine Creation Services to provision:

- legacy BIOS for supported Desktop or Server OS VMs.
- UEFI for supported Desktop or Server OS VMs, including Secure Boot.

**Required privileges**

Create a VMware user account and one or more VMware roles with privileges listed in the following section. Base the creation of these roles on the specific level of granularly required over the user’s permissions. This process is used to request the various Citrix Virtual Apps and Desktops operations at any time. To grant the user specific permissions at any point, associate them with the respective role, at the data center level at a minimum.

The following tables show the mappings between Citrix Virtual Apps and Desktops operations and the minimum required VMware privileges.

**Add connections and resources**

<table>
<thead>
<tr>
<th>SDK</th>
<th>User interface</th>
</tr>
</thead>
</table>

**Provision machines (Machine Creation Services)**

<table>
<thead>

### Obtain and import a certificate

To protect vSphere communications, Citrix recommends that you use HTTPS rather than HTTP. HTTPS requires digital certificates. Citrix recommends a digital certificate issued from a certificate authority.
in accordance with your organization’s security policy.

If you are unable to use a digital certificate issued from a certificate authority, you can use the VMware-installed self-signed certificate. Only use this method if your organization’s security policy permits it.

Add the VMware vCenter certificate to each Delivery Controller.

1. Add the fully qualified domain name (FQDN) of the computer running vCenter Server to the hosts file on that server, at %SystemRoot%/WINDOWS/system32/Drivers/etc/. This step is required only if the FQDN of the computer running vCenter Server is not already present in the domain name system.

2. Obtain the vCenter certificate using any of the following three methods:

   **From the vCenter server.**
   - a) Copy the file rui.crt from the vCenter server to a location accessible on your Delivery Controllers.
   - b) On the Controller, navigate to the location of the exported certificate and open the rui.crt file.

   **Download the certificate using a web browser.** If you are using Internet Explorer, right-click on Internet Explorer and choose Run as Administrator to download or install the certificate.
   - a) Open your web browser and make a secure web connection to the vCenter server (for example https://server1.domain1.com).
   - b) Accept the security warnings.
   - c) Click the address bar displaying the certificate error.
   - d) View the certificate and click the Details tab.
   - e) Select Copy to file and export in .CER format, providing a name when prompted to do so.
   - f) Save the exported certificate.
   - g) Navigate to the location of the exported certificate and open the .CER file.

   **Import directly from Internet Explorer running as an administrator.**
   - Open your web browser and make a secure web connection to the vCenter server (for example https://server1.domain1.com).
   - Accept the security warnings.
   - Click the address bar displaying the certificate error.
   - View the certificate.

3. Import the certificate into the certificate store on each of your Controllers.
   - a) Click the Install certificate option, select Local Machine, and then click Next.
   - b) Select Place all certificates in the following store, and then click Browse. Select Trusted People and then click OK. Click Next and then click Finish.
If you change the name of the vSphere server after installation, you must generate a new self-signed certificate on that server before importing the new certificate.

Configuration considerations

Create a master VM:

Use a master VM to provide user desktops and applications in a machine catalog. On your hypervisor:

1. Install a VDA on the master VM, selecting the option to optimize the desktop, which improves performance.
2. Take a snapshot of the master VM to use as a back-up.

Create a connection:

In the connection creation wizard:

- Select the VMware connection type.
- Specify the address of the access point for the vCenter SDK.
- Specify the credentials for a VMware user account you set up earlier that has permissions to create VMs. Specify the user name in the form domain/username.

VMware SSL thumbprint

The VMware SSL thumbprint feature addresses a frequently reported error when creating a host connection to a VMware vSphere hypervisor. Previously, administrators had to manually create a trust relationship between the Delivery Controllers in the Site and the hypervisor’s certificate before creating a connection. The VMware SSL thumbprint feature removes that manual requirement: the untrusted certificate’s thumbprint is stored on the Site database. This configuration ensures that the hypervisor can be continuously identified as trusted by Citrix Virtual Apps and Desktops, even if not by the Controllers.

When creating a vSphere host connection in Studio, a dialog box allows you to view the certificate of the machine you are connecting to. You can then choose whether to trust it.

Nutanix virtualization environments

June 3, 2020

Follow this guidance when using Nutanix Acropolis to provide virtual machines in your Citrix Virtual Apps and Desktops deployment. The setup process includes the following tasks:

- Install and register the Nutanix plug-in in your Citrix Virtual Apps and Desktops environment.
Create a connection to the Nutanix Acropolis hypervisor.
Create a machine catalog that uses a snapshot of a master image you created on the Nutanix hypervisor.

For more information, see the Nutanix Acropolis MCS plug-in Installation Guide, available at the Nutanix Support Portal.

Install and register the Nutanix plug-in

After you install the Citrix Virtual Apps and Desktops components, complete the following procedure to install and register the Nutanix plug-in on the Delivery Controllers. Use Studio to create a connection to the Nutanix hypervisor and then create a machine catalog that uses a snapshot of a master image you created in the Nutanix environment.

1. Obtain the Nutanix plug-in from Nutanix, and install it on the Delivery Controllers.
2. Verify that a Nutanix Acropolis folder has been created in C:\Program Files\Common Files\Citrix\HCLPlugins\CitrixMachineCreation\v1.0.0.0.
3. Run C:\\Program Files\\Common Files\\Citrix\\HCLPlugins\\RegisterPlugins.exe -PluginsRoot "C:\Program Files\Common Files\Citrix\HCLPlugins\CitrixMachineCreation\v1.0.0.0".
5. Run the following PowerShell cmdlets to verify that the Nutanix Acropolis plug-in has been registered:

```
1 Add-PSSnapin Citrix\*
2 Get-HypHypervisorPlugin
```

Create a connection to Nutanix

See Create a Site or Connections and resources for complete information about all pages in the wizards that create a connection.

In the Site Setup or Add Connection and Resources wizard, select the Nutanix connection type on the Connection page. Specify the hypervisor address and credentials, plus a name for the connection. On the Network page, select a network for the hosting unit.

Create a machine catalog using a Nutanix snapshot

This information is a supplement to the guidance in the Create machine catalogs article. It describes only the fields that are unique to Nutanix.
The snapshot you select is the template that is used to create the VMs in the catalog. Before creating the catalog, create images and snapshots in Nutanix.

- For information about master images in general, see the Create machine catalogs article.
- For Nutanix procedures for creating images and snapshots, see the Nutanix documentation.

The Operating System and Machine Management pages do not contain Nutanix-specific information. Follow the guidance in the Create machine catalogs article.

On the Container page, which is unique to Nutanix, select the container where the VMs’ disks reside.

On the Master Image page, select the image snapshot. Use the Acropolis console to rename your snapshots, if needed. If you rename snapshots, restart the Create Catalog wizard to see a refreshed list.

On the Virtual Machines page, indicate the number of virtual CPUs and the number of cores per vCPU. The Network Cards, Computer Accounts, and Summary pages do not contain Nutanix-specific information. Follow the guidance in the Create machine catalogs article.

Install core components

June 3, 2020

The core components are the Citrix Delivery Controller, Citrix Studio, Citrix Director, and Citrix License Server.

(In versions before 2003, core components included Citrix StoreFront. You can still install StoreFront by clicking the Citrix StoreFront tile or running the command available on the installation media.)

Before you start an installation, review this article and Prepare to install.

This article describes the installation wizard sequence when installing core components. Command-line equivalents are provided. For more information, see Install using the command line.

**Step 1. Download the product software and launch the wizard**

Use your Citrix account credentials to access the Citrix Virtual Apps and Desktops download page. Download the product ISO file.

Unzip the file. Optionally, burn a DVD of the ISO file.

Log on to the machine where you are installing the core components, using a local administrator account.

Insert the DVD in the drive or mount the ISO file. If the installer does not launch automatically, double-click the AutoSelect application or the mounted drive.
**Step 2. Choose which product to install**

Click **Start** next to the product to install: Virtual Apps or Virtual Apps and Desktops.

(If the machine already has Citrix Virtual Apps and Desktops components installed on it, this page does not appear.)

Command-line option: `/xenapp` to install Citrix Virtual Apps. Citrix Virtual Apps and Desktops is installed if option is omitted.
Step 3. Choose what to install

If you’re just getting started, select **Delivery Controller**. (On a later page, you select the specific components to install on this machine.)

If you’ve already installed a Controller (on this machine or another) and want to install another component, select the component from the **Extend Deployment** section.

Command-line option: `/components`
On the **Licensing Agreement** page, after you read the license agreement, indicate that you have read and accepted it. Then click **Next**.
Step 5. Select the components to install and the installation location

On the Core components page:

- **Location:** By default, components are installed in \C:\Program Files\Citrix. The default is fine for most deployments. If you specify a different location, it must have execute permissions for network service.

- **Components:** By default, the check boxes for all core components are selected. Installing all of the core components on one server is fine for proof of concept, test, or small production deployments. For larger production environments, Citrix recommends installing Director, StoreFront, and the License Server on separate servers.

  Select only the components you want to install on this machine. After you install components on this machine, you can run the installer again on other machines to install other components.

  An icon alerts you when you choose not to install a required core component on this machine. That alert reminds you to install that component, although not necessarily on this machine.

Click **Next**.

Command-line options: \installdir, /components, /exclude
Hardware check

When you install or upgrade a Delivery Controller, the hardware is checked. The installer alerts you if the machine has less than the recommended amount of RAM (5 GB), which can affect site stability. For more information, see Hardware requirements.

Graphical interface: A dialog box appears.

- Recommended: Click Cancel to stop the installation. Add more RAM to the machine and then start the installation again.
- Alternatively, click Next to continue with the installation. The site might have stability issues.

Command-line interface: The install/upgrade ends. The install logs contain a message that describes what was found and the available options.

- Recommended: Add more RAM to the machine and then run the command again.
- Alternatively, run the command again with the /ignore_hw_check_failure option to override the warning. Your site might have stability issues.

When upgrading, you’re also notified if the OS or SQL Server version is no longer supported. See Upgrade a deployment.
Step 6. Enable or disable features

On the **Features** page:

- Choose whether to install Microsoft SQL Server Express for use as the site database. By default, this selection is enabled. If you’re not familiar with the Citrix Virtual Apps and Desktops databases, review Databases.
- When you install Director, Windows Remote Assistance is installed automatically. You choose whether to enable shadowing in Windows Remote Assistance for use with Director user shadowing. Enabling shadowing opens TCP port 3389. By default, this feature is enabled. The default setting is fine for most deployments. This feature appears only when you are installing Director.

Click **Next**.

Command-line options: `/nosql` (to prevent installation), `/no_remote_assistance` (to prevent enabling)
Step 7. Open Windows firewall ports

By default, the ports on the Firewall page are opened automatically if the Windows Firewall Service is running, even if the firewall is not enabled. The default setting is fine for most deployments. For port information, see Network ports.

Click Next.

(The graphic shows the port lists when you install all the core components on this machine. That type of installation is usually for test deployments only.)

Command-line option: /configure_firewall
Step 8. Review prerequisites and confirm installation

The **Summary** page lists what will be installed. Use the **Back** button to return to earlier wizard pages and change selections, if needed.

When you’re ready, click **Install**.

The display shows the progress of the installation:
Step 9. Diagnostics

On the **Diagnostics** page, choose whether to participate in Citrix Call Home.

This page appears when installing a Delivery Controller using the graphical interface. When you install StoreFront (but not a Controller), the wizard displays this page. When you install other core components (but not a Controller or StoreFront), the wizard does not display this page.

During an upgrade, this page does not appear if Call Home is already enabled or if the installer encounters an error related to the Citrix Telemetry Service.

If you choose to participate (the default), click **Connect**. When prompted, enter your Citrix account credentials. You can change your enrollment choice later, after installation.

After your credentials are validated (or if you choose not to participate), click **Next**.

For more information, see **Call Home**.
Step 10. Finish this installation

The Finish page contains green check marks for all prerequisites and components that installed and initialized successfully.

Click Finish.

Step 11. Install remaining core components on other machines

If you installed all the core components on one machine, continue with Next steps. Otherwise, run the installer on other machines to install other components. You can also install more Controllers on other servers.

Next steps

After you install all the required components, use Studio to create a site.

After creating the site, install VDAs.

At any time, you can use the full-product installer to extend your deployment with the following components:
• **Universal Print Server server component:** Launch the installer on your print server.

   1. Select **Universal Print Server** in the **Extend Deployment** section.
   2. Accept the license agreement.
   3. On the **Firewall** page, by default, TCP ports 7229 and 8080 are opened in the firewall if the Windows Firewall Service is running, even if the firewall is not enabled. You can disable that default action if you want to open the ports manually.

To install this component from the command line, see Command-line options for installing a Universal Print Server.

• **Federated Authentication Service.**

• **Session Recording.**

### Install VDAs

**August 25, 2020**

**Important:**

If you’re upgrading, and your current version has the Personal vDisk or AppDisks software installed, see Removing PVD, AppDisks, and unsupported hosts.

There are two types of VDAs for Windows machines: VDA for multi-session OS and VDA for single-session OS. (For information about VDAs for Linux machines, see the Linux Virtual Delivery Agent documentation.)

Before starting an installation, review Prepare to install and complete all preparation tasks.

Before installing VDAs, you should have already installed the core components. You can also create the site before installing VDAs.

This article describes the installation wizard sequence when installing a VDA. Command-line equivalents are provided. For details, see Install using the command line.

### Step 1. Download the product software and launch the wizard

If you’re using the full-product installer:

1. If you haven’t downloaded the product ISO yet:

   • Use your Citrix account credentials to access the Citrix Virtual Apps and Desktops download page. Download the product ISO file.
   • Unzip the file. Optionally, burn a DVD of the ISO file.
2. Use a local administrator account on the image or machine where you're installing the VDA. Insert the DVD in the drive or mount the ISO file. If the installer does not launch automatically, double-click the AutoSelect application or the mounted drive.

The installation wizard launches.

If you're using a standalone package:

1. Use your Citrix account credentials to access the Citrix Virtual Apps and Desktops download page. Download the appropriate package:
   - VDAServerSetup.exe: Multi-session OS VDA version
   - VDAWorkstationSetup.exe: Single-session OS VDA version
   - VDAWorkstationCoreSetup.exe: Single-session OS Core Services VDA version

2. Right-click the package and choose Run as administrator.

The installation wizard launches.

**Step 2. Choose which product to install**

![Image of起义 deliver applications and desktops to any user, anywhere, on any device.](image)

Click **Start** next to the product to install: Citrix Virtual Apps or Citrix Virtual Desktops. (If the machine already has a Citrix Virtual Apps or Citrix Virtual Desktops component installed, this page does not appear.)

Command-line option: `/xenapp` to install Citrix Virtual Apps. Citrix Virtual Desktops is installed if option is omitted.
Step 3. Select the VDA

Select the Virtual Delivery Agent entry. The installer knows whether it’s running on a single-session or multi-session OS, so it offers only the appropriate VDA type.

For example, when you run the installer on a Windows Server 2016 machine, the VDA for multi-session OS option is available. The VDA for single-session OS option is not offered.

If you try to install (or upgrade to) a Windows VDA on an OS that is not supported for this Citrix Virtual Apps and Desktops version, a message guides you to information that describes your options.

Step 4. Specify how the VDA will be used

On the Environment page, specify how you plan to use the VDA, indicating whether you’ll use this machine as a master image to provision additional machines.
The option you choose affects which Citrix provisioning tools are installed automatically (if any), and the default values on the Additional Components page of the VDA installer.

Several MSIs (provisioning and other) are installed automatically when you install a VDA. The only way to prevent their installation is with the `/exclude` option in a command-line installation.

Choose one of the following:

- **Create a master MCS image**: Select this option to install a VDA on a VM master image, if you plan to use Machine Creation Services to provision VMs. This option installs the Machine Identity Service. This is the default option.
  
  Command-line option: `/mastermcsimage` or `/masterimage`

- **Create a master image using Citrix Provisioning or third-party provisioning tools**: Select this option to install a VDA on a VM master image, if you plan to use either Citrix Provisioning or third-party provisioning tools (such as Microsoft System Center Configuration Manager) to provision VMs.
  
  Command-line option: `/masterpvsimage`

- **(Appears only on multi-session OS machines) Enable brokered connections to a server**: Select this option to install a VDA on a physical or virtual machine that will not be used as a master image to provision other machines.
  
  Command-line option: `/remotepc`

- **(Appears only on single-session OS machines) Enable Remote PC Access**: Select this option to install a VDA on a physical machine for use with Remote PC Access.
  
  Command-line option: `/remotepc`

Click **Next**.

This page does not appear:

- If you're upgrading a VDA
- If you are using the `VDAWorkstationCoreSetup.exe` installer
Step 5. Select the components to install and the installation location

<table>
<thead>
<tr>
<th>Environment</th>
<th>Core Components</th>
<th>Additional Components</th>
<th>Delivery Controller</th>
<th>Features</th>
<th>Firewall</th>
<th>Summary</th>
<th>Install</th>
<th>Diagnostics</th>
<th>Finish</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Location:</td>
<td>By default, components are installed in C:\Program Files\Citrix. This default is fine for most deployments. If you specify a different location, that location must have execute permissions for network service.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Components:</td>
<td>By default, Citrix Workspace app for Windows is not installed with the VDA. If you are using the VDAWorkstationCoreSetup.exe installer, Citrix Workspace app for Windows is never installed, so this check box is not displayed.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Click Next.

Command-line options: /installdir,/components vda plugin to install the VDA and the Citrix Workspace app for Windows
Step 6. Install additional components

The **Additional Components** page contains check boxes to enable or disable installation of other features and technologies with the VDA. In a command-line installation, you can use the `/exclude` or `/includeadditional` option to expressly omit or include one or more available components.

The following table indicates the default setting of items on this page. The default setting depends on the option you selected on the Environment page.

<table>
<thead>
<tr>
<th>Additional Components page</th>
<th>Environment page: “Master image with MCS” or “Master image with Citrix Provisioning” selected</th>
<th>Environment page: “Enable brokered connections to server” (for multi-session OS) or “Remote PC Access” (for single-session OS) selected</th>

### Additional Components page

<table>
<thead>
<tr>
<th>Environment page</th>
<th>Environment page: “Enable brokered connections to server” (for multi-session OS) or “Remote PC Access” (for single-session OS) selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Components page</td>
<td>Environment page: “Master image with MCS” or “Master image with Citrix Provisioning” selected</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Citrix Files for Windows</th>
<th>Not selected</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citrix Files for Outlook</td>
<td>Not selected</td>
</tr>
</tbody>
</table>

This page does not appear if:

- You are using the `VDAWorkstationCoreSetup.exe` installer. Also, the command-line options for the additional components are not valid with that installer.
- You are upgrading a VDA and all the additional components are already installed. If some of the additional components are already installed, the page lists only components that are not installed.

Select or clear the following check boxes:

- **Citrix Personalization for App-V**: Install this component if you use applications from Microsoft App-V packages. For details, see [App-V](#).
  

- **User Personalization Layer**: Installs the MSI for the user personalization layer. For details, see [User personalization layer](#).
  
  This component appears only when installing a VDA on a single-session Windows 10 machine.
  
  Command-line option: `/includeadditional "User Personalization Layer"` to enable component installation, `/exclude "User Personalization Layer"` to prevent component installation

- **Citrix Supportability Tools** Installs the MSI that contains Citrix supportability tools, such as the Citrix Health Assistant.
  
  Command-line option: `/includeadditional "Citrix Supportability Tools"` to enable component installation, `/exclude "Citrix Supportability Tools"` to prevent component installation

- **Citrix User Profile Manager**: This component manages user personalization settings in user profiles. For details, see [Profile Management](#)

  Excluding Citrix Profile Management from the installation affects the monitoring and troubleshooting of VDAs with Citrix Director. On the **User details** and **End Point** pages, the...
Personalization panel and the Logon Duration panel fail. On the Dashboard and Trends pages, the Average Logon Duration panel display data only for machines that have Profile Management installed.

Even if you are using a third-party user profile management solution, Citrix recommends that you install and run the Citrix Profile Management Service. Enabling the Citrix Profile Management Service is not required.

Command-line option: `/includeadditional "Citrix User Profile Manager"` to enable component installation, `/exclude "Citrix User Profile Manager"` to prevent component installation

- **Citrix User Profile Manager WMI Plugin:** This plug-in provides Profile Management runtime information in WMI (Windows Management Instrumentation) objects (for example, profile provider, profile type, size, and disk usage). WMI objects provide session information to Director.

  Command-line option: `/includeadditional "Citrix User Profile Manager WMI Plugin"` to enable component installation, `/exclude "Citrix User Profile Manager WMI Plugin"` to prevent component installation

- **Citrix Files for Windows:** This component enables users to connect to their Citrix Files account. They can then interact with Citrix Files through a mapped drive in the Windows file system (without requiring a full sync of their content). For more information, see Content Collaboration.

  Command-line options: `/includeadditional "Citrix Files for Windows"` to enable component installation, `/exclude "Citrix Files for Windows"` to prevent component installation

- **Citrix Files for Outlook:** Citrix Files for Outlook allows you to bypass file size restrictions and add security to your attachments or emails by sending them through Citrix Files. You can provide a secure file upload request for co-workers, customers, and partners directly in your email. For more information, see Content Collaboration.

  Command-line options: `/includeadditional "Citrix Files for Outlook"` to enable component installation, `/exclude "Citrix Files for Outlook"` to prevent component installation
Step 7. Delivery Controller addresses

On the Delivery Controller page, choose how you want to enter the addresses of installed Controllers. Citrix recommends that you specify the addresses while you’re installing the VDA (Do it manually). The VDA cannot register with a Controller until it has this information. If a VDA cannot register, users cannot access applications and desktops on that VDA.

- **Do it manually:** (default) Enter the FQDN of an installed Controller and then click Add. If you’ve installed more Controllers, add their addresses.
- **Do it later (Advanced):** If you choose this option, the wizard asks you to confirm that’s what you want to do before continuing. To specify addresses later, you can either rerun the installer or use Citrix Group Policy. The wizard also reminds you on the Summary page.
- **Choose locations from Active Directory:** Valid only when the machine is joined to a domain and the user is a domain user.
- **Let Machine Creation Services do it automatically:** Valid only when using MCS to provision machines.

Click Next. If you selected Do it later (Advanced), you are prompted to confirm that you will specify Controller addresses later.

Other considerations:

- The address cannot contain non-alphanumeric characters.
- If you specify addresses during VDA installation and in Group Policy, the policy settings override settings provided during installation.
- Successful VDA registration requires that the firewall ports used to communicate with the Controller are open. That action is enabled by default on the Firewall page of the wizard.
- After you specify Controller locations (during or after VDA installation), you can use the auto-update feature to update the VDAs when Controllers are added or removed. For details about how VDAs discover and register with Controllers, see VDA registration.
Step 8. Enable or disable features

On the **Features** page, use the check boxes to enable or disable features you want to use.

- **Use Windows Remote Assistance:** When this feature is enabled, Windows Remote Assistance is used with the user shadowing feature of Director. Windows Remote Assistance opens the dynamic ports in the firewall. (Default = disabled)
  
  Command-line option: `/enable_remote_assistance`

- **Use Real-Time Audio Transport for audio:** Enable this feature if voice-over-IP is widely used in your network. The feature reduces latency and improves audio resilience over lossy networks. It allows audio data to be transmitted using RTP over UDP transport. (Default = disabled)
  
  Command-line option: `/enable_real_time_transport`

- **MCSI/O:** Valid only when using MCS to provision VMs. When selected, the MCSIO write caching driver is installed. For more information, see [Storage shared by hypervisors](#) and [Configure cache for temporary data](#).
  
  Command-line option: `/install_mcsio_driver`

Click Next.
Step 9. Firewall ports

On the **Firewall** page, by default, the ports are opened automatically if the Windows Firewall Service is running, even if the firewall is not enabled. This default setting is fine for most deployments. For port information, see [Network ports](#).

Click **Next**.

Command-line option: `/enable_hdx_ports`
**Step 10. Review prerequisites and confirm installation**

The **Summary** page lists what will be installed. Use the **Back** button to return to earlier wizard pages and change selections.

When you’re ready, click **Install**.

If prerequisites aren’t already installed/enabled, the machine might restart once or more times. See [Prepare to install](#).

---

**Step 11. Diagnostics**

On the **Diagnostics** page, choose whether to participate in Citrix Call Home. If you choose to partici-
pate (the default), click **Connect**. When prompted, enter your Citrix account credentials.

After your credentials are validated (or if you choose not to participate), click **Next**.

For more information, see **Call Home**.

**Step 12. Complete this installation**

![Finish Installation](image)

The **Finish** page contains green check marks for all prerequisites and components that installed and initialized successfully.

Click **Finish**. By default, the machine restarts automatically. Although you can disable this automatic restart, the VDA cannot be used until the machine restarts.

**Next steps**

Repeat the procedure above to install VDAs on other machines or images, if needed.

After you install all VDAs, launch Studio. If you haven’t created a site yet, Studio automatically guides you to that task. After that’s done, Studio guides you to create a machine catalog and then a delivery group. See:

- Create a site
- Create machine catalogs
- Create delivery groups

**Customize a VDA**

To customize an installed VDA:

1. From the Windows feature for removing or changing programs, select **Citrix Virtual Delivery Agent** or **Citrix Remote PC Access/VDI Core Services VDA**. Then right-click and select **Change**.
2. Select **Customize Virtual Delivery Agent Settings**. When the installer launches, you can change:

- Controller addresses
- TCP/IP port to register with the Controller (default = 80)
- Whether to open Windows Firewall ports automatically

**Troubleshoot**

- For information about how Citrix reports the result of component installations, see **Citrix installation return codes**.

- In the Studio display for a delivery group, the **Installed VDA version** entry in the **Details** pane might not be the version installed on the machines. The machine’s Windows Programs and Features display shows the actual VDA version.

- After a VDA is installed, it cannot deliver apps or a desktop to users until it registers with a Delivery Controller.

  To learn about VDA registration methods and how to troubleshoot registration issues, see **VDA registration**.

**Install using the command line**

**August 25, 2020**

**Important:**

If you’re upgrading, and your current version uses or has the Personal vDisk or AppDisks software installed, see **Removing Pvd, AppDisks, and unsupported hosts**.

**Introduction**

This article applies to installing components on machines with Windows operating systems. For information about VDAs for Linux operating systems, see **Linux Virtual Delivery Agents**.

This article describes how to issue product installation commands. Before beginning any installation, review **Prepare to install**. That article includes descriptions of the available installers.

To see command execution progress and return values, you must be the original administrator or use **Run as administrator**. For more information, see the Microsoft command documentation.
As a complement to using the installation commands directly, sample scripts are provided on the product ISO that install, upgrade, or remove VDAs on machines in Active Directory. For details, see Install VDAs using scripts.

If you attempt to install or upgrade on a Windows OS version that is not supported for this Citrix Virtual Apps and Desktops version, a message guides you to information about your options. See Earlier operating systems.

For information about how Citrix reports the result of component installations, see Citrix installation return codes.

### Use the full-product installer

To access the full product installer’s command-line interface:

1. Download the product package from Citrix. Citrix account credentials are required to access the download site.
3. Log on to the server where you are installing the components, using a local administrator account.
4. Insert the DVD in the drive or mount the ISO file.
5. From the \x64\XenDesktop Setup directory on the media, run the appropriate command.

   **To install core components**: Run XenDesktopServerSetup.exe, with the options listed in Command-line options for installing core components.

   **To install a VDA**: Run XenDesktopVDASetup.exe with the options listed in Command-line options for installing a VDA.

   **To install StoreFront**: Run CitrixStoreFront-x64.exe in the x64 > StoreFront folder on the installation media.

   **To install the Universal Print Server**: Follow the guidance in Command-line options for installing a Universal Print Server.

   **To install the Federated Authentication Service**: Citrix recommends using the graphical interface.

   **To install Session Recording**: Follow the guidance in Session Recording.

### Use a standalone VDA installer

Citrix account credentials are required to access the download site. You must either have elevated administrative privileges before starting the installation, or use Run as administrator.
1. Download the appropriate package from Citrix:
   - Multi-session OS Virtual Delivery Agent: VDAServerSetup.exe
   - Single-session OS Virtual Delivery Agent: VDAWorkstationSetup.exe
   - Single-session OS Core Services Virtual Delivery Agent: VDAWorkstationCoreSetup.exe

2. Either extract the files from the package to an existing directory first and then run the installation command, or simply run the package.
   To extract the files before installing them, use /extract with the absolute path, for example \.\VDAWorkstationCoreSetup.exe /extract %temp%\CitrixVDAInstallMedia. The directory must exist. Otherwise, the extract fails. Then in a separate command, run the appropriate command below, using the valid options listed in this article.

   - For VDAServerSetup_XXXX.exe, run <extract folder>\Extract\Image-Full\x64\XenDesktop Setup\XenDesktopVDASetup.exe
   - For VDAWorkstationCoreSetup_XXXX.exe, run <extract folder>\Extract\Image-Full\x64\XenDesktop Setup\XenDesktopRemotePCSetup.exe
   - For VDAWorkstationSetup_XXXX.exe, run <extract folder>\Extract\Image-Full\x64\XenDesktop Setup\XenDesktopVDASetup.exe

   To run the downloaded package, run its name: VDAServerSetup.exe, VDAWorkstationSetup.exe, or VDAWorkstationCoreSetup.exe. Use the valid options listed in this article.

If you are familiar with the full product installer:

   - Run the standalone VDAServerSetup.exe or VDAWorkstationSetup.exe installer as if it was the XenDesktopVdaSetup.exe command in everything except its name.

   - The VDAWorkstationCoreSetup.exe installer is different, because it supports a subset of the options available to the other installers.

**Command-line options for installing core components**

The following options are valid when installing core components with the XenDesktopServerSetup.exe command. For more detail about options, see Install core components.

   - /components component [,component] ...

      Comma-separated list of components to install or remove. Valid values are:
      - CONTROLLER: Controller
      - DESKTOPSTUDIO: Studio
      - DESKTOPDIRECTOR: Director
      - LICENSESERVER: Citrix License Server
If this option is omitted, all components are installed (or removed, if the `/remove` option is also specified).

(In releases before 2003, valid values included StoreFront. For version 2003 and later, use the dedicated StoreFront installation command noted in Use the full-product installer).

- **/configure_firewall**
  Opens all ports in the Windows firewall used by the components being installed, if the Windows Firewall Service is running, even if the firewall is not enabled. If you are using a third-party firewall or no firewall, you must manually open the ports.

- **/disableexperiencemetrics**
  Prevents automatic upload of analytics collected during installation, upgrade, or removal to Citrix.

- **/exclude "feature","feature"**
  Prevents installation of one or more comma-separated features, services, or technologies, each enclosed in straight quotation marks. Valid values are:
  - "Local Host Cache Storage (LocalDB)" prevents installation of the database used for Local Host Cache. This option has no effect on whether SQL Server Express is installed for use as the site database.

- **/help or /h**
  Displays command help.

- **/ignore_hw_check_failure**
  Allows the Delivery Controller installation or upgrade to continue, even if the hardware checks fail (for example, due to insufficient RAM). For more information, see Hardware check.

- **/ignore_site_test_failure**
  Valid only during Controller upgrade. In most cases, any site test failures are ignored and the upgrade proceeds. If omitted (or set to false), any site test failure causes the installer to fail, without performing the upgrade. Default = false

  During an upgrade, this option is ignored if an unsupported SQL Server version is detected. For details, see SQL Server version check.

- **/installdir directory**
  Existing empty directory where components will be installed. Default = c:\Program Files\Citrix.

- **/logpath path**
  Log file location. The specified folder must exist. The installer does not create it. Default = TEMP %\Citrix\XenDesktop Installer
• /no_pending_reboot_check
  When installing or upgrading core components, prevents checking for a pending restart from a
  previous Windows installation on the machine.

• /no_remote_assistance
  Valid only when installing Director. Disables the user shadowing feature that uses Windows Remote Assistance.

• /noreboot
  Prevents a restart after installation. (For most core components, a restart is not enabled by default.)

• /noresume
  By default, when a machine restart is needed during an installation, the installer resumes automatically after the restart completes. To override the default, specify /noresume. This can be helpful if you must remount the media or want to capture information during an automated installation.

• /nosql
  Prevents installation of Microsoft SQL Server Express on the server where you are installing the Controller. If this option is omitted, SQL Server Express is installed for use as the site database.
  This option has no effect on the installation of SQL Server Express LocalDB used for Local Host Cache.

• /quiet or /passive
  No user interface appears during the installation. The only evidence of the installation process is in Windows Task Manager. If this option is omitted, the graphical interface launches.

• /remove
  Removes the core components specified with the /components option.

• /removeall
  Removes all installed core components.

• /sendexperiencemetrics
  Automatically sends analytics collected during the installation, upgrade, or removal to Citrix. If this option is omitted (or /disableexperiencemetrics is specified), the analytics are collected locally, but not sent automatically.

• /tempdir directory
  Directory that holds temporary files during installation. Default = c:\Windows\Temp.
Examples of installing core components

The following command installs a Delivery Controller, Studio, Citrix Licensing, and SQL Server Express on a server. Firewall ports required for component communications are opened automatically.

\x64\XenDesktop Setup\XenDesktopServerSetup.exe /components controller, desktopstudio, licenseserver /configure_firewall

The following command installs a Citrix Virtual Apps Controller, Studio, and SQL Server Express on the server. Firewall ports required for component communication are opened automatically.

\x64\XenDesktop Setup\XenDesktopServerSetup.exe /xenapp /components controller, desktopstudio /configure_firewall

Command-line options for installing a VDA

The following options are valid with one or more of the following commands (installers): XenDesktopVDASetup.exe, VDAWorkstationSetup.exe, and VDAWorkstationCoreSetup.exe.

For more detail about options, see Install VDAs.

- **/components component[,component]**
  
  Comma-separated list of components to install or remove. Valid values are:
  
  - **VDA**: Virtual Delivery Agent
  - **PLUGINS**: Citrix Workspace app for Windows

  To install the VDA and Citrix Workspace app for Windows, specify /components vda plugins.

  If this option is omitted, only the VDA is installed (not Citrix Workspace app).

  This option is not valid when using the VDAWorkstationCoreSetup.exe installer. That installer cannot install Citrix Workspace app.

- **/controllers “controller [controller]”**

  Space-separated FQDNs of Controllers with which the VDA can communicate, enclosed in straight quotation marks. Do not specify both the /site_guid and /controllers options.

- **/disableexperiencemetrics**

  Prevents the automatic upload of analytics collected during installation, upgrade, or removal to Citrix.
- **/enable_hdx_ports**
  Opens ports in the Windows firewall required by the VDA and enabled features (except Windows Remote Assistance), if the Windows Firewall Service is detected, even if the firewall is not enabled. If you are using a different firewall or no firewall, you must configure the firewall manually. For port information, see Network ports.

  To open the UDP ports that HDX adaptive transport uses, specify the **/enable_hdx_udp_ports** option, in addition to this **/enable_hdx_ports** option.

- **/enable_hdx_udp_ports**
  Opens UDP ports in the Windows firewall that HDX adaptive transport uses, if the Windows Firewall Service is detected, even if the firewall is not enabled. If you are using a different firewall or no firewall, you must configure the firewall manually. For port information, see Network ports.

  To open extra ports that the VDA uses, specify the **/enable_hdx_ports** option, in addition to this **/enable_hdx_udp_ports** option.

- **/enable_real_time_transport**
  Enables or disables use of UDP for audio packets (RealTime Audio Transport for audio). Enabling this feature can improve audio performance. Include the **/enable_hdx_ports** option if you want the UDP ports opened automatically when the Windows Firewall Service is detected.

- **/enable_remote_assistance**
  Enables the shadowing feature in Windows Remote Assistance for use with Director. If you specify this option, Windows Remote Assistance opens the dynamic ports in the firewall.

- **/exclude “component”[,”component”]**
  Prevents installation of one or more comma-separated optional components, each enclosed in straight quotation marks. For example, installing or upgrading a VDA on an image that is not managed by MCS does not require the Machine Identity Service component. Valid values are:

  - Machine Identity Service (includes TargetOSOptimizer.exe)
  - Citrix User Profile Manager
  - Citrix User Profile Manager WMI Plugin
  - Citrix Universal Print Client
  - Citrix Telemetry Service
  - Citrix Personalization for App-V - VDA
  - Citrix Supportability Tools
  - Citrix Files for Windows
  - Citrix Files for Outlook
  - User personalization layer
Excluding Citrix Profile Management from the installation (/exclude "Citrix User Profile Manager") affects monitoring and troubleshooting of VDAs with Citrix Director. On the User details and EndPoint pages, the Personalization panel and the Logon Duration panel fail. On the Dashboard and Trends pages, the Average Logon Duration panel displays data only for machines that have Profile Management installed.

Even if you are using a third-party user profile management solution, Citrix recommends that you install and run the Citrix Profile Management Service. Enabling the Citrix Profile Management Service is not required.

If you plan to use MCS to provision VMs, do not exclude the Machine Identity Service. Excluding that service also excludes installation of TargetOSOptimizer.exe.

If you specify both /exclude and /includeadditional with the same component name, that component is not installed.

This option is not valid when using the VDAWorkstationCoreSetup.exe installer. That installer automatically excludes many of these items.

- /h or /help
  Displays command help.

- /includeadditional "component"","component"
  Includes installation of one or more comma-separated optional components, each enclosed in straight quotation marks. This option can be helpful when you are creating a Remote PC Access deployment, and want to install other components that are not included by default. Valid values are:

  - Citrix User Profile Manager
  - Citrix User Profile Manager WMI Plugin
  - Citrix Universal Print Client
  - Citrix Telemetry Service
  - Citrix Personalization for App-V - VDA
  - Citrix Supportability Tools
  - Citrix Files for Windows
  - Citrix Files for Outlook
  - User personalization layer

If you specify both /exclude and /includeadditional with the same component name, that component is not installed.

- /installdir directory
  Existing empty directory where components will be installed. Default = c:\Program Files\Citrix.

- /install_mcsio_driver
Enables MCS I/O write cache for storage optimization.

- **/logpath path**

  Log file location. The specified folder must exist. The installer does not create it. Default = “%TEMP%\Citrix\XenDesktop Installer”

  This option is not available in the graphical interface.

- **/masterimage**

  Valid only when installing a VDA on a VM. Sets up the VDA as a master image. This option is equivalent to /mastermcsimage.

  This option is not valid when using the VDAWorkstationCoreSetup.exe installer.

- **/mastermcsimage**

  Specifies that this machine will be used as a master image with Machine Creation Services. This option is equivalent to /masterimage.

- **/masterpvsimage**

  Specifies that this machine will be used as a master image with either Citrix Provisioning or a third-party provisioning tool (such as Microsoft System Center Configuration Manager) to provision VMs.

- **/no_mediafoundation_ack**

  Acknowledges that Microsoft Media Foundation is not installed, and several HDX multimedia features will not be installed and will not work. If this option is omitted and Media Foundation is not installed, the VDA installation fails. Most supported Windows editions come with Media Foundation already installed, except N editions.

- **/nodesktopexperience**

  The Enhanced Desktop Experience feature is no longer available. This option (and policy setting) is ignored, if specified.

  Valid only when installing a VDA for multi-session OS. Prevents enabling of the Enhanced Desktop Experience feature. This feature is also controlled with the Enhanced Desktop Experience Citrix policy setting.

- **/noreboot**

  Prevents a restart after installation. The VDA cannot be used until after a restart.

- **/noresume**

  By default, when a machine restart is needed during an installation, the installer resumes automatically after the restart completes. To override the default, specify /noresume. This can
be helpful if you must remount the media or want to capture information during an automated installation.

• `/portnumber port`
  Valid only when the `/reconfig` option is specified. Port number to enable for communications between the VDA and the Controller. The previously configured port is disabled, unless it is port 80.

• `/quiet` or `/passive`
  No user interface appears during the installation. The only evidence of the installation and configuration process is in Windows Task Manager. If this option is omitted, the graphical interface launches.

• `/reconfigure`
  Customizes previously configured VDA settings when used with the `/portnumber`, `/controllers`, or `/enable_hdx_ports` options. If you specify this option without also specifying the `/quiet` option, the graphical interface for customizing the VDA launches.

• `/remotecp`
  Valid only for Remote PC Access deployments (single-session OS) or brokered connections (multi-session OS). Excludes installation of the following components on a single-session OS:
  - Citrix Personalization for App-V
  - Citrix User Profile Manager
  - Citrix User Profile Manager WMI Plugin
  - Machine Identity Service (includes TargetOSOptimizer.exe)
  - Citrix Supportability Tools
  - Citrix Files for Windows
  - Citrix Files for Outlook
  - User personalization layer

  This option is not valid when using the `VDAWorkstationCoreSetup.exe` installer. That installer automatically excludes installation of these components.

• `/remove`
  Removes the components specified with the `/components` option.

• `/removeall`
  Removes all installed VDA components.

• `/sendexperiencemetrics`
  Automatically sends analytics collected during the installation, upgrade, or removal to Citrix. If this option is omitted (or the `/disableexperiencemetrics` option is specified), analytics are collected locally, but not sent automatically.
• **/servervdi**
  
  Installs a VDA for single-session OS on a supported Windows multi-session machine. Omit this option when installing a VDA for multi-session OS on a Windows multi-session machine.

  Before using this option, see [Server VDI](#).

  Use this option only with the full-product VDA installer. This option is not available in the graphical interface.

• **/site_guid guid**

  Globally Unique Identifier of the site Active Directory Organizational Unit (OU). This associates a virtual desktop with a site when you are using Active Directory for discovery (auto-update is the recommended and default discovery method). The site GUID is a site property displayed in Studio. Do not specify both the /site_guid and /controllers options.

• **/tempdir directory**

  Directory to hold temporary files during installation. Default = c:\Windows\Temp.

  This option is not available in the graphical interface.

• **/virtualmachine**

  Valid only when installing a VDA on a VM. Overrides detection by the installer of a physical machine, where BIOS information passed to VMs makes them appear as physical machines.

  This option is not available in the graphical interface.

### Examples of installing a VDA

**Install a VDA with the full-product installer:**

The following command installs a VDA for single-session OS and Citrix Workspace app to the default location on a VM. This VDA will be used as a master image and use MCS to provision VMs. The VDA will register initially with the Controller on the server named Contr-Main in the domain mydomain. The VDA will use user personalization layer and Windows Remote Assistance.

```
x64\XenDesktop_Setup\XenDesktopVdaSetup.exe /quiet /components vda,plugins /controllers "Contr-Main.mydomain.local"/enable_hdx_ports /includeadditional "user personalization layer"/mastermcsimage /enable_remote_assistance
```

**Install a single-session OS VDA with the VDAWorkstationCoreSetup standalone installer:**

The following command installs a Core Services VDA on a single-session OS for use in a Remote PC Access or VDI deployment. Citrix Workspace app and other non-core services are not installed. The address of a Controller is specified, and ports in the Windows Firewall Service will be opened automatically. The administrator will handle restarts.
VDAWorkstationCoreSetup.exe /quiet /controllers "Contr-East.domain.com"/enable_hdx_ports /noreboot

Customize a VDA

After you install a VDA, you can customize several settings. From the \x64\XenDesktop Setup directory on the product media, run XenDesktopVdaSetup.exe, using one or more of the following options, which are described in Command-line options for installing a VDA.

- /reconfigure (required when customizing a VDA)
- /h or /help
- /quiet
- /noreboot
- /controllers
- /portnumber port
- /enable_hdx_ports

Troubleshoot VDAs

- In the Studio display for a delivery group, the Installed VDA version entry in the Details pane might not be the version installed on the machines. The machine’s Windows Programs and Features display shows the actual VDA version.

- After a VDA is installed, it cannot deliver apps or a desktop to users until it registers with a Delivery Controller.

To learn about VDA registration methods and how to troubleshoot registration issues, see VDA registration.

Command-line options for installing a Universal Print Server

The following option is valid with the XenDesktopPrintServerSetup.exe command.

- /enable_upssserver_port

<table>

Software Folder Filename
Universal Print Server server component x64 > Universal Print Server UpsServer_x64.msi

When this option is not specified, the installer displays the Firewall page from the graphical interface. Select Automatically to have the installer automatically add the Windows firewall rules, or Manually to let the administrator manually configure the firewall.

After installing the software on your print servers, configure the Universal Print Server using the guidance in Provision printers.

More information
For information about how Citrix reports the result of component installations, see Citrix installation return codes.

Install VDAs using scripts

June 26, 2020
This article applies to installing VDAs on machines with Windows operating systems. For information about VDAs for Linux operating systems, see the Linux Virtual Delivery Agent documentation.

The installation media contains sample scripts that install, upgrade, or remove Virtual Delivery Agents (VDAs) for machines in Active Directory. You can also use the scripts to maintain master images used by Machine Creation Services and Citrix Provisioning (formerly Provisioning Services).

Required access:

- The scripts need Everyone Read access to the network share where the VDA installation command is located. The installation command is XenDesktopVdaSetup.exe in the full product ISO, or VDAWorkstationSetup.exe or VDAServerSetup.exe in a standalone installer.
- Logging details are stored on each local machine. To log results centrally for review and analysis, the scripts need Everyone Read and Write access to the appropriate network share.

To check the results of running a script, examine the central log share. Captured logs include the script log, the installer log, and the MSI installation logs. Each installation or removal attempt is recorded in a time-stamped folder. The folder title indicates the operation result with the prefix PASS or FAIL. You can use standard directory search tools to find a failed installation or removal in the central log share. Those tools offer an alternative to searching locally on the target machines.

Before beginning any installation, read and complete the tasks in Prepare to install.
Install or upgrade VDAs using the script

1. Obtain the sample script **InstallVDA.bat** from `\Support\AdDeploy\` on the installation media. Citrix recommends that you make a backup of the original script before customizing it.

2. Edit the script:
   - Specify the version of the VDA to install: `SET DESIREDVERSION`. For example, version 7 can be specified as 7.0. The full value can be found on the installation media in the ProductVersion.txt file. However, a complete match is not required.
   - Specify the network share where the installer will be invoked. Point to the root of the layout (the highest point of the tree). The appropriate version of the installer (32-bit or 64-bit) is called automatically when the script runs. For example: `SET DEPLOYSHARE=\\fileserv1\share1`.
   - Optionally, specify a network share location for storing centralized logs. For example: `SET LOGSHARE=\\fileserv1\log1`.
   - Specify VDA configuration options as described in Install using the command line. The `/quiet` and `/noreboot` options are included by default in the script and are required: `SET COMMANDLINEOPTIONS=/QUIET /NOREBOOT`.

3. Using Group Policy Startup Scripts, assign the script to the OU containing your machines. This OU should contain only machines on which you want to install the VDA. When the machines in that OU are restarted, the script runs on all of them. A VDA is installed on each machine that has a supported operating system.

Remove VDAs using the script

1. Obtain the sample script **UninstallVDA.bat** from `\Support\AdDeploy\` on the installation media. Citrix recommends that you make a backup of the original script before customizing it.

2. Edit the script:
   - Specify the version of the VDA to remove: `SET CHECK\_VDA\_VERSION`. For example, version 7 can be specified as 7.0. The full value can be found on the installation media in the ProductVersion.txt file (such as 7.0.0.3018). However, a complete match is not required.
   - Optionally, specify a network share location for storing centralized logs.

3. Using Group Policy Startup Scripts, assign the script to the OU containing your machines. This OU should contain only machines from which you want to remove the VDA. When the machines in the OU are restarted, the script runs on all of them. The VDA is removed from each machine.

Troubleshoot

- The script generates internal log files that describe script execution progress. The script copies a `Kickoff_VDA_Startup_Script` log to the central log share within seconds of starting the deployment. You can verify that the overall process is working. If this log is not copied to the
central log share as expected, troubleshoot further by inspecting the local machine. The script places two debugging log files in the %temp% folder on each machine:

- Kickoff_VDA_Startup_Script_<DateTimeStamp>.log
- VDA_INSTALL_ProcessLog_<DateTimeStamp>.log

Review these logs to ensure that the script is:

- Running as expected.
- Properly detecting the target operating system.
- Correctly configured to point to the ROOT of the DEPLOYSHARE share (contains the file named AutoSelect.exe).
- Capable of authenticating to both the DEPLOYSHARE and LOG shares.

• For information about how Citrix reports the result of component installations, see Citrix installation return codes.

• In the Studio display for a delivery group, the Installed VDA version entry in the Details pane might not be the version installed on the machines. The machine’s programs and features display shows the actual VDA version.

• After a VDA is installed, it cannot deliver apps or a desktop to users until it registers with a Delivery Controller.

To learn about VDA registration methods and how to troubleshoot registration issues, see VDA registration.

Install VDAs using SCCM

August 25, 2020

Overview

VDA installation has two phases:

• Install prerequisites
• Install the VDA

To successfully deploy the VDA using Microsoft System Center Configuration Manager (SCCM) or similar software distribution tools, Citrix recommends addressing the phases separately. In other words, instead of using the VDA installer to install both the prerequisites and the VDA, we recommend that you first install the prerequisites using the prerequisites’ installers, and then install the VDA using a VDA installer.
Identify requirements and task sequence

Prerequisites must be installed on the machine before the VDA is installed. VDA prerequisites vary, depending on the VDA version. For guidance, see the system requirements for the VDA version you’re installing:

- Citrix Virtual Apps and Desktops Current Release
- Citrix Virtual Apps and Desktops 1912 LTSR
- XenApp and XenDesktop 7.15 LTSR

Similarly, the need to install these prerequisites can vary between environments (for example, based on the target machines’ operating system, and what the machines already have installed). Before creating scripts or task sequences, it is important to understand your environment’s specific requirements (such as which prerequisites need to be installed). Then, you can properly define the task sequence.

Tip: A good way to collect this information is by manually installing the VDA in one of the machines in the environment. This process reveals which prerequisites are identified as needed and installed throughout the VDA installation process.

The installation files for the VDA’s prerequisites are included in the installation media for the Citrix Virtual Apps and Desktops (or XenApp and XenDesktop) release under the **Support** folder. Use those files to ensure that you’re installing the correct prerequisite versions.

**Restarts**

The required number of restarts during the installation of prerequisites and the VDA depends on the environment. For example, a restart might be required for pending updates or restarts from earlier software installations. Also, files previously locked by other processes might need updates.

- During the manual installation, identify which prerequisites trigger a restart.
- Some optional components in the VDA installer (such as Citrix User Profile Manager, Citrix Files) might require a restart. During the manual installation, identify which component installations trigger a restart.

**Define the task sequence**

After identifying all prerequisites and restarts, use the SCCM Task Sequencer to complete the following:

1. Create separate SCCM jobs for installing each prerequisite. This helps isolate any issues or failures that occur during the deployment, which facilitates troubleshooting.
2. Create the VDA installation job. Do not execute this job until all prerequisites are successfully installed. This can be accomplished one of two ways:
• Have the SCCM client monitor the prerequisites’ GUIDs to determine whether they are present.
• Make the VDA installation job dependent on the prerequisites’ jobs.

SCCM installation sequence example

The following is an example SCCM installation sequence. Remember: Your prerequisite versions may differ, depending on which VDA version you’re installing.

1. SCCM JOB1: Microsoft .NET Framework 4.8
2. SCCM JOB2: Microsoft Visual C++ 2017 Runtime (32-bit and 64-bit)
3. SCCM JOB3: VDA installation
   a) Use the appropriate VDA installer command, based on requirements. Add the /quiet, /noreboot, and /noresume options. (The /noresume option removes the dependency on the interactive login to continue the install, thus allowing SCCM to drive the installation process.)
   b) Watch for return codes.
      • 0: success, installation complete, restart required.
      • 3: success, installation is not complete, restart required.
      • 8: success, installation complete, restart required.
   c) Restart the machine.
   d) If the return code was 3, repeat step 3a.

For more information about return codes see Citrix installation return codes.

VDA installation command examples

The available installation options vary, depending on which installer is used. See the following articles for command line option details. (Links are provided to Citrix Virtual Apps and Desktops Current Release locations. If you’re using an LTSR product version, see the equivalent LTSR articles.)

• Install VDAs
• Install using the command line

Installation commands for Remote PC Access

• The following command uses the single-session core VDA installer (standalone VDAWorkstationCoreSetup.exe):

  VDAWorkstationCoreSetup.exe /quiet /controllers “control.domain.com” /enable_hdx_ports /noresume /noreboot
The following command uses the single-session full VDA installer (standalone VDAWorkstationSetup.exe):

```
VDAWorkstationSetup.exe /quiet /remotecp /controllers "control.domain.com" /enable_hdx_ports /noresume /noreboot
```

**Installation command for dedicated VDI**

The following command uses the single-session full VDA installer (standalone VDAWorkstationSetup.exe):

```
VDAWorkstationSetup.exe /quiet /components vda /controllers "control.domain.com" /enable_hdx_ports /enable_remote_assistance /noresume /noreboot
```

**Create a site**

**June 26, 2020**

A site is the name you give to a Citrix Virtual Apps and Desktops deployment. It comprises the Delivery Controllers and other core components, Virtual Delivery Agents (VDAs), connections to hosts, machine catalogs, and delivery groups. You create the site after you install the core components and before creating the first machine catalog and delivery group.

If your Controller is installed on Server Core, use PowerShell cmdlets in the Citrix Virtual Apps and Desktops SDK to create a site.

When you create a site, you are automatically enrolled in the Citrix Customer Experience Improvement Program (CEIP). CEIP collects anonymous statistics and usage information, and then sends it to Citrix. The first data package is sent to Citrix approximately seven days after you create the site. You can change your enrollment at any time after site creation. Select **Configuration** in the Studio navigation pane, then the **Product Support** tab, and follow the guidance. For details, see [http://more.citrix.com/XD-CEIP](http://more.citrix.com/XD-CEIP).

The user who creates a site becomes a full administrator; for more information, see [Delegated administration](#).

Review this article before you create the site, so you know what to expect.

**Step 1. Open Studio and start the site creation wizard**

Open Studio if it is not already open. You are automatically guided to the action that starts the site creation wizard. Select that action.
Step 2. Site type and name

On the Introduction page, choose a site type:

- **Application and desktop delivery Site.** When you create an application and desktop delivery site, you can further choose to create a full deployment site (recommended) or an empty site. An empty site is only partially configured, and is usually created by advanced administrators.
- **Remote PC Access Site.** A Remote PC Access site allows designated users to remotely access their office PCs through a secure connection.

If you create an application and desktop delivery deployment now, you can add a Remote PC Access deployment later. Conversely, if you create a Remote PC Access deployment now, you can add a full deployment later.

Type a name for the site. After the site is created, its name appears at the top of the Studio navigation pane: *Citrix Studio* *(site-name)*.

Step 3. Databases

The Databases page contains selections for setting up the site, monitoring, and configuration logging databases. For details about database setup choices and requirements, see Databases.

If you choose to install SQL Server Express for use as the site database (the default), a restart occurs after that software is installed. That restart does not occur if you choose not to install the SQL Server Express software for use as the site database.

If you are not using the default SQL Server Express, ensure that the SQL Server software is installed on the machines before creating a site. System requirements lists the supported versions.

If you want to add more Delivery Controllers to the site, and have already installed the Controller software on other servers, you can add those Controllers from this page. If you also plan to generate scripts that set up the databases, add the Controllers before generating the scripts.

Step 4. Licensing

On the Licensing page, specify the License Server address and then indicate which license to use (install).

- Specify the License Server address in the form `name:[port]`. The `name` must be an FQDN, NetBIOS, or IP address. FQDN is recommended. If you omit the port number, the default is 27000. Click Connect. You cannot proceed to the next page until a successful connection is made to the License Server.

- When a connection is made, **Use an existing license** is selected by default. The display lists the compatible products that this product can be configured as, based on currently installed licenses.
- If you want to configure this product as one of the listed products (for example, Citrix Virtual Apps Premium or Citrix Virtual Desktops Premium), using one of those licenses, select that entry.

- If you already allocated and downloaded a license (using the Citrix Manage Licenses Tool) to use with this product, but haven’t installed the license yet:
  * Click **Browse for license file**.
  * In the file explorer, locate and select the license you downloaded. The associated products now appear on the **Licensing** page of the site creation wizard. Select the entry you want to use.

- If the product you want is not displayed, or if you have no allocated and downloaded licenses, you can allocate, download, and install a license. To do this, the License Server must have internet access. You must have a License Access Code for the product you want. Citrix emails that code to you.
  * Click **Allocate and download**.
  * In the **Allocate Licenses** dialog, enter the License Access Code sent by Citrix. Click **Allocate licenses**.
  * The products associated with the new license appear on the **Licensing** page of the site creation wizard. Select the entry you want to use.

Alternatively, select **Use the free 30-day trial**, and install licenses later. For details, see the **Licensing documentation**.

**Step 5. Power management (Remote PC Access only)**

**Step 6. Host connection, network, and storage**

If you are using VMs on a hypervisor or other service to deliver applications and desktops, you can optionally create the first connection to that host. You can also specify storage and network resources for that connection. After creating the site, you can modify this connection and resources, and create more connections. For details, see **Connections and resources**.

* For information specified on the **Connection** page, see **Connections and resources**.
  - If you are not using VMs on a hypervisor or other service (or if you use Studio to manage desktops on dedicated blade PCs), select the connection type **None**.
  - If you are configuring a Remote PC Access site and plan to use the Wake on LAN feature, select the **Microsoft System Center Configuration Manager** type.
In addition to the connection type, specify whether you will use Citrix tools (such as Machine Creation Services) or other tools to create VMs.

- For information specified on the Storage and Network pages, see Host storage, Storage management, and Storage selection.

**Step 7. Additional Features**

On the Additional Features page, you can select features to customize your site. When you select the check box for an item that requires information, a configuration box appears.

- **App-V Publishing**: Select this feature if you use applications from Microsoft App-V packages on App-V servers. Provide the URL of the App-V management server and the URL and port number of the App-V publishing server.

  If you use applications from App-V packages on network share locations only, you do not need to select this feature.

  You can also enable/disable and configure this feature later in Studio. For more information, see App-V.

**Step 8. Remote PC Access**

For information about Remote PC Access deployments, see Remote PC Access.

If you use the Wake on LAN feature, complete the configuration steps on the Microsoft System Center Configuration Manager before creating the site. For details, see Configuration Manager and Remote PC Access Wake on LAN.

When you create a Remote PC Access site:

- If you’re using the Wake on LAN feature, specify the Microsoft System Center Configuration Manager address, credentials, and connection information on the Power Management page.

- Specify users or user groups on the Users page. There is no default action that automatically adds all users. Also, specify machine accounts (domain and OU) information on the Machine Accounts page.

  To add user information, click Add Users. Select users and user groups, and then click Add users.

  To add machine accounts information, click Add machine accounts. Select the machine accounts, and then click Add machine accounts. Click Add OUs. Select the domain and Organizational Units, and indicate whether to include items in subfolders. Click Add OUs.

A machine catalog named Remote PC User Machine Accounts is created automatically. The catalog contains all the machine accounts you added in the site creation wizard. A delivery group named...
Remote PC User Desktops is created automatically. The group contains all the users and user groups you added.

**Step 9. Summary**

The Summary page lists the information you specified. Use the Back button if you want to change anything. When you’re finished, click Create and the site creation begins.

**Test a site configuration**

To run the tests after you create the site, select Citrix Studio (Site site-name) at the top of the navigation pane. Then click Test site in the center pane. You can view an HTML report of the site test results.

The site test functionality might fail for a Controller installed on Windows Server 2016. The failure occurs when a local SQL Server Express is used for the site database and the SQL Server Browser service is not started. To avoid this failure, complete the following tasks.

1. Enable the SQL Server Browser service (if necessary) and then start it.
2. Restart the SQL Server (SQLEXPRESS) service.

Site tests run automatically when you upgrade an earlier deployment. For details, see Preliminary site tests.

**Troubleshoot**

After configuring the site, you can install Studio and add it through the MMC as a snap-in on a remote machine. If you later attempt to remove that snap-in, the MMC might stop responding. As a workaround, restart the MMC.

**Create machine catalogs**

September 18, 2020

**Important:**

As of Citrix Virtual Apps and Desktops 7 2006, if your current deployment uses any of the following technologies or host types, you can upgrade your deployment to the current release only after removing items that use those technologies.

- Personal vDisks (PvDs)
- AppDisks
• Public cloud host types: Amazon Web Services (AWS), Citrix CloudPlatform, Microsoft Azure Classic, Microsoft Azure Resource Manager

For details, see Remove PVD, AppDisks, and unsupported hosts.

Introduction

Collections of physical or virtual machines are managed as a single entity called a machine catalog. Machines in a catalog have the same type of operating system: multi-session OS or single-session OS. A catalog containing multi-session OS machines can contain either Windows or Linux machines, not both.

Citrix Studio guides you to create the first machine catalog after you create the site. After you create the first catalog, Studio guides you to create the first delivery group. Later, you can change the catalog you created, and create more catalogs.

Tip:

Upgrading an existing deployment enables the Machine Creation Services (MCS) storage optimization (MCS I/O) feature, no additional configuration is required. The Virtual Delivery Agent (VDA) and the Delivery Controller upgrade handle the MCS I/O upgrade.

Overview

When you create a catalog of VMs, you specify how to provision those VMs. You can use Citrix tools such as Machine Creation Services (MCS) or Citrix Provisioning (formerly Provisioning Services). Or, you can use your own tools to provide machines.

Consider:

• MCS supports a single system disk from the virtual machine image. It ignores the rest of the data disks attached to that image.

• If you use Citrix Provisioning to create machines, see the Citrix Provisioning documentation for instructions.

• If you use MCS to provision VMs, you provide a master image (or snapshot of an image) to create identical VMs in the catalog. Before you create the catalog, you first use tools to create and configure the master image. This process includes installing a Virtual Delivery Agent (VDA) on the image. Then you create the machine catalog in Studio. You select that image (or snapshot), specify the number of VMs to create in the catalog, and configure additional information.

• If your machines are already available, you must still create one or more machine catalogs for those machines.

• If you are creating a catalog using the PowerShell SDK directly, you can specify a hypervisor template (VMTemplates), rather than an image or a snapshot.
• Using a template to provision a catalog is considered an experimental feature. When using this method, virtual machine preparation might fail. As a result, the catalog cannot be published using the template.

When using MCS or Citrix Provisioning to create the first catalog, you use the host connection that you configured when you created the site. Later (after you create your first catalog and delivery group), you can change information about that connection or create more connections.

After you complete the catalog creation wizard, tests run automatically to ensure that it is configured correctly. When the tests complete, you can view a test report. Run the tests at any time from Studio.

Note:
MCS does not support Windows 10 IoT Core and Windows 10 IoT Enterprise. Refer to the Microsoft site for more information.

For technical details about the Citrix Provisioning tools, see Citrix Virtual Apps and Desktops Image Management.

RDS license check

Citrix Studio currently does not perform the check for valid Microsoft RDS licenses while creating a machine catalog that contains Windows multi-session OS machines. To view the status of the Microsoft RDS license for a Windows multi-session OS machine, go to Citrix Director. View the status of the Microsoft RDS license in the Machine Details panel. This panel is located in the Machine Details and the User Details page. For more information, see Microsoft RDS license health.

VDA registration

A VDA must be registered with a Delivery Controller when launching brokered sessions. Unregistered VDAs can result in underutilization of otherwise available resources. There are various reasons a VDA might not be registered, many of which an administrator can troubleshoot. Studio provides troubleshooting information in the catalog creation wizard, and after you add machines from a catalog to a delivery group.

After you add existing machines using the wizard, the list of computer account names indicates whether each machine is suitable for adding to the catalog. Hover over the icon next to each machine to display an informative message about that machine.

If the message identifies a problematic machine, either remove that machine, or add the machine. For example, if a message indicates that information might not be obtained about a machine, add the machine anyway.

For more information, see:

•CTX136668 for VDA registration troubleshooting guidance
• VDA versions and functional levels
• VDA registration methods

MCS catalog creation summary

Here’s a brief overview of default MCS actions after you provide information in the catalog creation wizard.

• If you selected a master image (rather than a snapshot), MCS creates a snapshot.
• MCS creates a full copy of the snapshot and places the copy on each storage location defined in the host connection.
• MCS adds the machines to Active Directory, which creates unique identities.
• MCS creates the number of VMs specified in the wizard, with two disks defined for each VM. In addition to the two disks per VM, a master is also stored in the same storage location. If you have multiple storage locations defined, each gets the following disk types:
  – The full copy of the snapshot which is read-only and shared across the just-created VMs.
  – A unique 16 MB identity disk that gives each VM a unique identity. Each VM gets an identity disk.
  – A unique difference disk to store writes made to the VM. This disk is thin provisioned (if supported by the host storage) and increases to the maximum size of the master image, if necessary. Each VM gets a difference disk. The difference disk holds changes made during sessions. It is permanent for dedicated desktops. For pooled desktops, it is deleted and a new one created after each restart via the delivery controller.

Alternatively, when creating VMs to deliver static desktops, you can specify (on the Machines page of the catalog creation wizard) thick (full copy) VM clones. Full clones do not require retention of the master image on every data store. Each VM has its own file.

MCS storage considerations

There are many factors when deciding on storage solutions, configurations, and capacities for MCS. The following information provides proper considerations for storage capacity:

Capacity considerations:

• Disks

  The Delta or Differencing (Diff) Disks consume the largest amount of space in most MCS deployments for each VM. Each VM created by MCS is given at minimum 2 disks upon creation.
  – Disk0 = Diff Disk: contains the OS when copied from the Master Base Image.
  – Disk1 = Identity Disk: 16 MB - contains Active Directory data for each VM.

As the product evolves, you might have to add more disks to satisfy certain use cases and feature consumption. For example:
- **MCS Storage Optimization** creates a write cache style disk for each VM.
- MCS added the ability to use **full clones** as opposed to the Delta disk scenario described in the previous section.

Hypervisor features might also enter into the equation. For example:

- **Citrix Hypervisor IntelliCache** creates a Read Disk on local storage for each Citrix Hypervisor. This option saves on IOPS against the master image which might be held on the shared storage location.

**Hypervisor overhead**

Different hypervisors utilize specific files that create overhead for VMs. Hypervisors also use storage for management and general logging operations. Calculate space to include overhead for:

- **Log files**
- **Hypervisor specific files.** For example:
  - VMware adds more files to the **VM storage** folder. See [VMware Best Practices](#).
  - Calculate your total virtual machine size requirements. Consider a virtual machine containing 20 GB for the virtual disk, 16 GB for the swap file, and 100 MB for log files consuming 36.1 GB total.
- **Snapshots for XenServer; Snapshots for VMware.**

**Process overhead**

Creating a catalog, adding a machine, and updating a catalog have unique storage implications. For example:

- **Initial catalog creation** requires a copy of the base disk to be copied to each storage location.
  - It also requires you to create a **Preparation VM** temporarily.
- **Adding a machine** to a catalog does not require copying of the base disk to each storage location. Catalog creation varies based on the features selected.
- **Updating the catalog** to create an extra base disk on each storage location. Catalog updates also experience a temporary storage peak where each VM in the catalog has 2 Diff disks for a certain amount of time.

**More considerations:**

- **RAM sizing:** Affects the size of certain hypervisor files and disks, including I/O optimization disks, write cache, and snapshot files.
- **Thin / Thick provisioning:** NFS storage is preferred due to the thin provisioning capabilities.

**Machine Creation Services (MCS) storage optimization**

With the Machine Creation Services (MCS) storage optimization feature, referred to as MCS I/O:
• The write cache container is file-based, the same functionality found in Citrix Provisioning. For example, the Citrix Provisioning write cache file name is D:\vdiskdif.vhdx and the MCS I/O write cache file name is D:\mcsdif.vhdx.
• Achieve diagnostic improvements by including support for a Windows crash dump file written to the write cache disk.
• MCS I/O retains the technology cache in RAM with overflow to hard disk to provide the most optimal multi-tier write cache solution. This functionality allows an administrator to balance between the cost in each tier, RAM and disk, and performance to meet the desired workload expectation.

Updating the write cache method from disk-based to file-based requires the following changes:

1. MCS I/O no longer supports RAM only cache. Specify a disk size in Citrix Studio during machine catalog creation.
2. The VM write cache disk is created and formatted automatically when booting a VM for the first time. Once the VM is up, the write cache file mcsdif.vhdx is written into the formatted volume MCSWCDisk.
3. The pagefile is redirected to this formatted volume, MCSWCDisk. As a result, this disk size considers the total amount of disk space. It includes the delta between the disk size and the generated workload plus the pagefile size. This is typically associated with VM RAM size.

Enabling MCS storage optimization updates

To enable MCS I/O storage optimization functionality, upgrade the Delivery Controller and the VDA to the latest version of Citrix Virtual Apps and Desktops.

Note:
If you upgrade an existing deployment which has MCS I/O enabled, no additional configuration is required. The VDA and the Delivery Controller upgrade handle the MCS I/O upgrade.

When enabling the MCS storage optimization update, consider the following:

• When creating a machine catalog, the administrator can configure the RAM and disk size.
• Updating an existing machine catalog to a new VM snapshot containing a VDA configured for version 1903 results in the following behavior: the new snapshot continues to use the existing catalog’s MCS I/O setting for RAM and disk size. The existing raw disk is formatted.

**Important:**

MCS storage optimization changed with Citrix Virtual Apps and Desktops version 1903. This release supports file-based write cache technology, providing better performance and stability. The new functionality provided by MCS I/O might require a higher write cache storage requirement compared to previous Citrix Virtual Apps and Desktops releases. Citrix recommends that you reevaluate the disk size to ensure that it has sufficient disk space for the allocated workflow and extra pagefile size. The pagefile size is typically related to the amount of system RAM. If the existing catalog disk size is insufficient, create a machine catalog and allocate a larger write cache disk.

**Using PowerShell to create a catalog with persistent write-back cache disk**

To configure a catalog with persistent write-back cache disk, use the PowerShell parameter `New-ProvScheme CustomProperties`. This parameter supports an extra property, `PersistWBC`, used to determine how the write-back cache disk persists for MCS provisioned machines. The `PersistWBC` property is only used when the `UseWriteBackCache` parameter is specified, and when
the `WriteBackCacheDiskSize` parameter is set to indicate that a disk is created.

Examples of properties found in the `CustomProperties` parameter before supporting `PersistWBC` include:

```xml
  <Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true" />
  <Property xsi:type="StringProperty" Name="StorageAccountType" Value="Premium_LRS" />
  <Property xsi:type="StringProperty" Name="ResourceGroups" Value="benvaldev5RG3" />
  <Property xsi:type="StringProperty" Name="PersistWBC" Value="true" />
</CustomProperties>
```

When using these properties, consider that they contain default values if the properties are omitted from the `CustomProperties` parameter. The `PersistWBC` property has two possible values: `true` or `false`.

Setting the `PersistWBC` property to `true` does not delete the write-back cache disk when the Citrix Virtual Apps and Desktops administrator shuts down the machine using Citrix Studio.

Setting the `PersistWBC` property to `false` deletes the write-back cache disk when the Citrix Virtual Apps and Desktops administrator shuts down the machine using Citrix Studio.

**Note:**
If the `PersistWBC` property is omitted, the property defaults to `false` and the write-back cache is deleted when the machine is shutdown using Citrix Studio.

For example, using the `CustomProperties` parameter to set `PersistWBC` to `true`:

```xml
  <Property xsi:type="StringProperty" Name="UseManagedDisks" Value="true" />
  <Property xsi:type="StringProperty" Name="StorageAccountType" Value="Premium_LRS" />
  <Property xsi:type="StringProperty" Name="ResourceGroups" Value="benvaldev5RG3" />
  <Property xsi:type="StringProperty" Name="PersistWBC" Value="true" />
</CustomProperties>
```
Important:

The PersistWBC property can only be set using the New-ProvScheme PowerShell cmdlet. Attempting to alter the CustomProperties of a provisioning scheme after creation has no impact on the machine catalog and the persistence of the write-back cache disk when a machine is shut down.

For example, set New-ProvScheme to use the write-back cache while setting the PersistWBC property to true:

```bash
New-ProvScheme
-CleanOnBoot
-HostingUnitName "adSubnetScale1"
-IdentityPoolName "BV-WBC1-CAT1"
-MasterImageVM "XDHyp:\HostingUnits\adSubnetScale1\image.folder\GoldImages.resourcegroup\W10MCSIO-01_OsDisk_1_a940e6f5bab349019d57cc6f065d2c7e3.manageddisk"
-NetworkMapping @$
-UseWriteBackCache
-WriteBackCacheDiskSize 127
-WriteBackCacheMemorySize 256
```

Prepare a master image

For information about creating connections hosts, see Connections and resources.

The master image contains the operating system, non-virtualized applications, VDA, and other software.

© 1999-2020 Citrix Systems, Inc. All rights reserved.
Good to know:

- A master image might also be known as a clone image, golden image, base VM, or base image. Host vendors use different terms.
- When using Citrix Provisioning, you can use a master image or a physical computer as the master target device. Citrix Provisioning uses different terminology than MCS to refer to images. See the Citrix Provisioning documentation for details.
- Ensure that the host has enough processors, memory, and storage to accommodate the number of machines created.
- Configure the correct amount of hard disk space needed for desktops and applications. That value cannot be changed later or in the machine catalog.
- Remote PC Access machine catalogs do not use master images.
- Microsoft KMS activation considerations when using MCS: If your deployment includes 7.x VDAs with a XenServer 6.1 or 6.2, vSphere, or Microsoft System Center Virtual Machine Manager host, you do not need to manually rearm Microsoft Windows or Microsoft Office.

Install and configure the following software on the master image:

- Integration tools for your hypervisor (such as Citrix VM Tools, Hyper-V Integration Services, or VMware tools). If you omit this step, applications and desktops might not function correctly.
- A VDA. Citrix recommends installing the latest version to allow access to the newest features. Failure to install a VDA on the master image causes the catalog creation to fail.
- Third-party tools as needed, such as antivirus software or electronic software distribution agents. Configure services with settings that are appropriate for users and the machine type (such as updating features).
- Third-party applications that you are not virtualizing. Citrix recommends virtualizing applications. Virtualizing reduces costs by eliminating having to update the master image after adding or reconfiguring an application. Also, fewer installed applications reduce the size of the master image hard disks, which saves storage costs.
- App-V clients with the recommended settings, if you plan to publish App-V applications. The App-V client is available from Microsoft.
- When using MCS, if you localize Microsoft Windows, install the locales and language packs. During provisioning, when a snapshot is created, the provisioned VMs use the installed locales and language packs.

Important:

If you are using Citrix Provisioning or MCS, do not run Sysprep on master images.

To prepare a master image:

1. Using your hypervisor’s management tool, create a master image and then install the operating system, plus all service packs and updates. Specify the number of vCPUs. You can also specify the vCPU value if you create the machine catalog using PowerShell. You cannot specify the num-
ber of vCPUs when creating a catalog using Studio. Configure the amount of hard disk space needed for desktops and applications. That value cannot be changed later or in the catalog.

2. Ensure that the hard disk is attached at device location 0. Most standard master image templates configure this location by default, but some custom templates might not.

3. Install and configure the software listed above on the master image.

4. When using Citrix Provisioning, create a VHD file for the virtual disk from your master target device before you join the master target device to a domain. See the Citrix Provisioning documentation for details.

5. If you are not using MCS, join the master image to the domain where applications and desktops are members. Ensure that the master image is available on the host where the machines are created. If you are using MCS, joining the master image to a domain is not required. The provisioned machines are joined to the domain specified in the catalog creation wizard.

6. Citrix recommends that you create and name a snapshot of your master image. If you specify a master image rather than a snapshot when creating a catalog, Studio creates a snapshot. You cannot name it.

Create a machine catalog using Studio

Before starting the catalog creation wizard, review this section.

If you are using a master image, ensure that you have installed a VDA on the image before creating the catalog.

From Studio:

• If you already created a site but haven’t yet created a machine catalog, Studio guides you to the correct starting place to create a catalog.
• If you already created a catalog and want to create another, select **Machine Catalogs** in the **Studio** navigation pane. Then select **Create Machine Catalog** in the **Actions** pane.

The wizard walks you through the following items. The wizard pages you see differ, depending on the selections you make.

Operating system

Each catalog contains machines of only one type. Select one.

• **Multi-session OS**: A multi-session OS catalog provides hosted shared desktops. The machines can be running supported versions of the Windows or Linux operating systems, but the catalog cannot contain both. (See the Linux VDA documentation for details about that OS.)

• **Single-session OS**: A single-session OS catalog provides VDI desktops that you can assign to various different users.
• **Remote PC Access:** A Remote PC Access catalog provides users with remote access to their physical office desktop machines. Remote PC Access does not require a VPN to provide security.

### Machine management

This page does not appear when you are creating Remote PC Access catalogs.

The **Machine Management** page indicates how machines are managed and which tool you use to deploy machines.

Choose whether machines in the catalog are power managed through Studio.

- Machines are power managed through Studio, for example, VMs or blade PCs. This option is available only if you already configured a connection to a host.
- Machines are not power managed through Studio, for example, physical machines.

If you indicated that machines are power managed through Studio, choose which tool to use to create VMs.

- **Citrix Machine Creation Services (MCS):** Uses a master image to create and manage virtual machines. MCS is not available for physical machines.
- **Citrix Provisioning:** (Formerly Provisioning Services.) Manages target devices as a device collection. A Citrix Provisioning virtual disk imaged from a master target device delivers desktops and applications.
- **Other:** A tool that manages machines already in the data center. Citrix recommends that you use Microsoft System Center Configuration Manager or another third-party application to ensure that the machines in the catalog are consistent.

### Desktop types (desktop experience)

This page appears only when you are creating a catalog containing single-session OS machines.

The **Desktop Experience** page determines what occurs each time a user logs on. Select one of:

- Users connect to a new (random) desktop each time they log on.
- Users connect to the same (static) desktop each time they log on.

If you choose the second option and are using Citrix Provisioning to provision the machines, you can configure how user changes to the desktop are handled:

- Save user changes to the desktop on the local disk.
- Discard user changes and clear the virtual desktop when the user logs off. Select this option if you are using user personalization layer.
**Master image**

This page appears only when you are using MCS to create VMs.

On the **Master image** page, select the connection to the host, and then select the snapshot or VM created earlier. If you are creating the first catalog, the only available connection is the one you configured when you created the site.

Remember:

- When you are using MCS or Citrix Provisioning, do not run Sysprep on master images.
- If you specify a master image rather than a snapshot, Studio creates a snapshot, but you cannot name it.

To enable use of the latest product features, ensure the master image has the latest VDA version installed. Do not change the default minimum VDA selection. However, if you must use an earlier VDA version, see VDA versions and functional levels.

An error message appears if you select a snapshot or VM that is not compatible with the machine management technology you selected earlier in the wizard.

**Device Collection**

This page appears only when using Citrix Provisioning to create VMs.

The **Device Collection** page displays the device collections and the devices that have not already been added to catalogs.

Select the device collections to use.

**Machines**

This page does not appear when you are creating Remote PC Access catalogs.

The title of this page depends on what you selected on the **Machine Management** page: **Machines, Virtual Machines**, or **VMs and users**.

**When using MCS:**

- Specify how many virtual machines to create.
- Choose the amount of memory (in MB) each VM has.
- Each created VM has a hard disk. Its size is set in the master image. You cannot change the hard disk size in the catalog.
- If your deployment contains more than one zone, you can select a zone for the catalog.
- If you are creating static desktop VMs, select a virtual machine copy mode. See Virtual machine copy mode.
If you are creating random desktop VMs that do not use vDisks, you can configure a cache to be used for temporary data on each machine. See Configure cache for temporary data.

**When using Citrix Provisioning:**

The **Devices** page lists the machines in the device collection that you selected on the previous wizard page. You cannot add or remove machines on this page.

**When using other tools:**

Add (or import a list of) Active Directory machine account names. You can change the Active Directory account name for a VM after you add/import it. If you specified static machines on the **Desktop Experience** page, you can optionally specify the Active Directory user name for each VM you add.

After you add or import names, you can use the **Remove** button to delete names from the list, while you are still on this page.

**When using Citrix Provisioning or other tools (but not MCS):**

An icon and tooltip for each machine added (or imported, or from a Citrix Provisioning device collection) help identify machines that might not be eligible to add to the catalog, or be unable to register with a Delivery Controller. For details, see VDA versions and functional levels.

### Virtual machine copy mode

The copy mode you specify on the **Machines** page determines whether MCS creates thin (fast copy) or thick (full copy) clones from the master image. (Default = thin clones)

- Use fast copy clones for more efficient storage use and faster machine creation.
- Use full copy clones for better data recovery and migration support, with potentially reduced IOPS after the machines are created.

### VDA versions and functional levels

A catalog's functional level controls which product features are available to machines in the catalog. Using features introduced in new product versions require a new VDA. Setting a functional level makes all features introduced in that version (and later, if the functional level does not change) available to machines in the catalog. However, machines in that catalog with an earlier VDA version cannot register.

A menu near the bottom of the **Machines** (or **Devices**) page allows you to select the minimum VDA level. This sets the catalog's minimum functional level. By default, the most current functional level is selected for on-premises deployments. If you follow the Citrix recommendation to always install and upgrade VDAs and core components to the latest version, you don’t need to change this selection. However, if you must continue using older VDA versions, select the correct value.
A Citrix Virtual Apps and Desktops release might not include a new VDA version, or the new VDA does not impact the functional level. In such cases, the functional level might indicate a VDA version that is earlier than the installed or upgraded components. For example, although version 7.17 contains a 7.17 VDA, the default functional level (“7.9 or later”) remains the most current. Therefore, after installing or upgrading components 7.9–7.16 to 7.17, you do not need to change the default functional level. Each release’s What’s new article indicates any change in the default functional level.

The selected functional level affects the list of machines above it. In the list, a tooltip next to each entry indicates whether the machine’s VDA is compatible with the catalog at that functional level.

Messages are posted on the page if the VDA on each machine does not meet or exceed the minimum functional level selected. You can continue with the wizard. Those machines will likely not be able to register with a Controller later. Alternatively, you can:

- Remove the machines containing older VDAs from the list, upgrade their VDAs and then add them back to the catalog.
- Choose a lower functional level that prevents access to the latest product features.

A message is also posted if a machine was not be added to the catalog because it is the wrong machine type. Examples include attempting to add a server to a single-session OS catalog, or adding a single-session OS machine originally created for random allocation to a catalog of static machines.

Important:

At release 1811, an extra functional level was added: 1811 (or newer). That level is intended for use with future Citrix Virtual Apps and Desktops features. The 7.9 (or newer) selection remains the default. That default is valid for all deployments now.

If you select 1811 (or newer), any earlier VDA versions in that catalog are unable to register with a Controller or Cloud Connector. However, if the catalog contains only VDAs at version 1811 or later supported versions, they are all eligible to register. This includes catalogs containing VDAs configured for later Citrix Virtual Apps and Desktops releases, including version 1903 and other 19XX releases prior to the current release.

Configure cache for temporary data

Caching temporary data locally on the VM is optional. You can enable use of the temporary data cache on the machine when you use MCS to manage pooled (not dedicated) machines in a catalog. If the catalog uses a connection that specifies storage for temporary data, you can enable and configure the temporary data cache information when you create the catalog.

Important:

This feature requires a current MCS I/O driver. Installing this driver is an option when you install or upgrade a VDA. By default, that driver is not installed.
You specify whether temporary data uses shared or local storage when you create the connection that the catalog uses. For more information, see Connections and resources. To configure a cache for temporary data on each machine, you can use the following two options: **Memory allocated to cache (MB)** and **Disk cache size (GB)**. By default, the two options are cleared. To enable the Memory allocated to cache (MB) option, select the Disk cache size (GB) check box. If the **Disk cache size** check box is not selected, the Memory allocated to cache option is grayed out. Depending on the connection type, the default values for these options might differ. Generally, the default values are sufficient for most cases. However, take into account the space needed for:

- Temporary data files created by Windows itself, including the Windows page file.
- User profile data.
- ShareFile data that is synced to users’ sessions.
- Data that might be created or copied by a session user or any applications users might install inside the session.

Windows will not allow a session to use a cache disk that is larger than the amount of free space on the original master image from which machines in the machine catalog are provisioned. For example, there is no benefit specifying a 20 GB cache disk if there is only 10 GB of free space on the master image.

To configure a cache for temporary data on each machine, be aware of the following three scenarios:

- If you don’t select the Disk cache size check box and the Memory allocated to cache check box, temporary data is not cached. It is directly written to the difference disk (located in the OS storage) for each VM. (This is the provisioning action in version 7.8 and earlier.)
- If you select the Disk cache size check box and don’t select the Memory allocated to cache check box, temporary data is directly written to the cache disk, using a minimal amount of memory.
cache.

- If you select the Disk cache size check box and the Memory allocated to cache check box, temporary data is initially written to the memory cache. When the memory cache reaches its configured limit (the Memory allocated to cache value), the oldest data is moved to the temporary data cache disk.

**Important:**

- If the disk cache runs out of space, the user’s session becomes unusable.
- This feature is not available when using a Nutanix host connection.
- You cannot change the cache values in a machine catalog after the machine is created.

**Note:**

- The memory cache is part of the total amount of memory on each machine. Therefore, if you enable the Memory allocated to cache option, consider increasing the total amount of memory on each machine.
- Changing the Disk cache size from its default value can affect performance. The size must match user requirements and the load placed on the machine.

### Network Interface Cards (NICs)

This page does not appear when you are creating Remote PC Access catalogs.

On the **Network Interface Cards** page, if you plan to use multiple NICs, associate a virtual network with each card. For example, you can assign one card to access a specific secure network, and another card to access a more commonly used network. You can also add or remove NICs from this page.

### Machine accounts

This page appears only when creating Remote PC Access catalogs.

On the **Machine Accounts** page, specify the Active Directory machine accounts or Organizational Units (OUs) to add that correspond to users or user groups. Do not use a forward slash (/) in an OU name.

You can choose a previously configured power management connection or elect not to use power management. If you want to use power management but a suitable connection hasn’t been configured yet, you can create that connection later and then edit the machine catalog to update the power management settings.

### Computer accounts

This page appears only when using MCS to create VMs.
Each machine in the catalog must have a corresponding Active Directory computer account. On the Computer Accounts page, indicate whether to create accounts or use existing accounts, and the location for those accounts.

- If you create accounts, you must have access to a domain administrator account for the domain where the machines reside.

  Specify the account naming scheme for the machine, using hash marks to indicate where sequential numbers or letters appear. Do not use a forward slash (/) in an OU name. A name cannot begin with a number. For example, a naming scheme of PC-Sales-## (with 0-9 selected) results in computer accounts named PC-Sales-01, PC-Sales-02, PC-Sales-03, and so on.

- If you use existing accounts, either browse to the accounts or click Import and specify a .csv file containing account names. The imported file content must use the format:

  ```
  [ADComputerAccount]
  ADcomputeraccountname.domain
  ...
  ```

Ensure that there are enough accounts for all the machines you’re adding. Studio manages these accounts, so either allow Studio to reset the passwords for all the accounts or specify the account password, which must be the same for all accounts.

For catalogs containing physical machines or existing machines, select or import existing accounts. Assign each machine to both an Active Directory computer account and to a user account.

For machines created with Citrix Provisioning, computer accounts for target devices are managed differently; see the Citrix Provisioning documentation.

**Summary, name, and description**

On the Summary page, review the settings you specified. Enter a name and description for the catalog. This information appears in Studio.

When you’re done, click Finish to start the catalog creation.

**Troubleshoot**

- **Important:**

  After creating the machine catalog using Citrix Studio, you can no longer use the Get-ProvTask PowerShell command to retrieve the tasks associated with machine catalog creation. This re-
Citrix recommends collecting logs to help the Support team provide solutions. When using Citrix Provisioning, use the following procedure to generate log files:

1. On the master image, create the following registry key with the value of 1 (as a DWORD (32-bit) value): HKLM\Software\Citrix\MachineIdentityServiceAgent\LOGGING.
2. Shut down the master image and create a snapshot.
3. On the Delivery Controller, run the following PowerShell command: `Set-ProvServiceConfigurationData -Name ImageManagementPrep_NoAutoShutdown -Value $True`.
4. Create a catalog based on that snapshot.
5. When the preparation VM is created on the hypervisor, log in and extract the following files from the root of C:\: Image-prep.log and PvsVmAgentLog.txt.
6. Shut down the machine, at which point it reports the failure.
7. Run the following PowerShell command to re-enable auto shutdown of the image preparation machines: `Remove-ProvServiceConfigurationData -Name ImageManagementPrep_NoAutoShutdown`.

Where to go next

If this is the first catalog created, Studio guides you to create a delivery group.

Manage machine catalogs

September 14, 2020

Introduction

You can add or remove machines from a machine catalog, rename, change the description, or manage a catalog’s Active Directory computer accounts.

Maintaining catalogs can also include making sure each machine has the latest OS updates. Including antivirus updates, operating system upgrades, or configuration changes.

- Catalogs containing pooled random machines created using Machine Creation Services (MCS) maintain machines by updating the master image used in the catalog and then updating the machines. This method enables you to efficiently update large numbers of user machines.
For machines created using Citrix Provisioning, updates to machines are propagated through the virtual disk. See the Citrix Provisioning documentation for details.

For catalogs containing static, permanently assigned machines, and for Remote PC Access Machine catalogs, you manage updates to users’ machines outside of Studio. Perform this task either individually or collectively using third-party software distribution tools.

For information about creating and managing connections to host hypervisors, see Connections and resources.

Note:
MCS does not support Windows 10 IoT Core and Windows 10 IoT Enterprise. Refer to the Microsoft site for more information.

About persistent instances

When updating an MCS catalog created using persistent, or dedicated instances, any new machines created for the catalog use the updated image. Pre-existing instances continue to use the original instance. The process of updating an image is done the same way for any other type of catalog. Consider the following:

- With persistent disk catalogs, the pre-existing machines are not updated to the new image, but any new machines added to the catalog use the new image.
- For non-persistent disk catalogs, the machine image is updated the next time the machine is reset.
- With persistent machine catalogs, updating the image also updates the catalog instances that use it.
- For catalogs that do not persist, if you want different images for different machines, the images must reside in separate catalogs.

Add machines to a catalog

Before you start:

- Make sure the virtualization host has sufficient processors, memory, and storage to accommodate the additional machines.
- Make sure that you have enough unused Active Directory computer accounts. If you are using existing accounts, the number of machines you can add is limited by the number of accounts available.
- If you use Studio to create Active Directory computer accounts for the additional machines, you must have appropriate domain administrator permission.

To add machines to a catalog:

1. Select Machine Catalogs in the Studio navigation pane.
2. Select a machine catalog and then select **Add machines** in the **Actions** pane.
3. Select the number of virtual machines to add.
4. If there are insufficient existing Active Directory accounts for the number of VMs you are adding, select the domain and location where the accounts are created. Specify an account naming scheme, using hash marks to indicate where sequential numbers or letters appear. Do not use a forward slash (/) in an OU name. A name cannot begin with a number. For example, a naming scheme of PC-Sales-## (with 0-9 selected) results in computer accounts named PC-Sales-01, PC-Sales-02, PC-Sales-03, and so on.

5. If you use existing Active Directory accounts, either browse to the accounts or click **Import** and specify a .csv file containing account names. Make sure that there are enough accounts for all the machines you’re adding. Studio manages these accounts. Either allow Studio to reset the passwords for all the accounts, or specify the account password, which must be the same for all accounts.

The machines are created as a background process, and can take much time when creating many machines. Machine creation continues even if you close Studio.

**Delete machines from a catalog**

After you delete a machine from a machine catalog, users can no longer access it, so before deleting a machine, ensure that:

- User data is backed up or no longer required.
- All users are logged off. Turning on maintenance mode stops new connections from being made to a machine.
- Machines are powered off.

To delete machines from a catalog:

1. Select **Machine Catalogs** in the **Studio** navigation pane.
2. Select a catalog and then select **View Machines** in the **Actions** pane.
3. Select one or more machines and then select **Delete** in the **Actions** pane.

Choose whether to delete the machines being removed. If you choose to delete the machines, indicate if the Active Directory accounts for those machines are retained, disabled, or deleted.

**Change a catalog description or change Remote PC Access settings**

1. Select **Machine Catalogs** in the **Studio** navigation pane.
2. Select a catalog and then select **Edit Machine Catalog** in the **Actions** pane.
3. For Remote PC Access catalog, use the **Power Management** page to change the power management settings and select a power management connection. On the **Organizational Units** page, add or remove Active Directory OUs.
4. On the **Description** page, change the catalog description.

**Rename a catalog**

1. Select **Machine Catalogs** in the **Studio** navigation pane.
2. Select a catalog and then select **Rename Machine Catalog** in the **Actions** pane.
3. Enter the new name.

**Move a catalog to a different zone**

If your deployment has more than one zone, you can move a catalog from one zone to another.

Moving a catalog to a different zone, other than the hypervisor containing the VMs in that catalog, affects performance.

1. Select **Machine Catalogs** in the **Studio** navigation pane.
2. Select a catalog and then select **Move** in the **Actions** pane.
3. Select the zone where you want to move the catalog.

**Delete a catalog**

Before deleting a catalog, ensure that:

- All users are logged off and that no disconnected sessions are running.
- Maintenance mode is turned on for all machines in the catalog so that new connections cannot be made.
- All machines in the catalog are powered off.
- The catalog is not associated a delivery group. In other words, the delivery group does not contain machines from the catalog.

To delete a catalog:

1. Select **Machine Catalogs** in the **Studio** navigation pane.
2. Select a catalog and then select **Delete Machine Catalog** in the **Actions** pane.
3. Indicate whether the machines in the catalog are deleted. If you choose to delete the machines, indicate whether the Active Directory computer accounts for those machines are retained, disabled, or deleted.

**Manage Active Directory computer accounts in a catalog**

To manage Active Directory accounts in a machine catalog, you can:

- Free unused machine accounts by removing Active Directory computer accounts from single-session OS and multi-session OS catalogs. Those accounts can then be used for other machines.
• Add accounts so that when more machines are added to the catalog, the computer accounts are already in place. Do not use a forward slash (/) in an OU name.

To manage Active Directory accounts:

1. Select **Machine Catalogs** in the **Studio** navigation pane.

2. Select a catalog and then select **Manage AD accounts** in the **Actions** pane.

3. Choose whether to add or delete computer accounts. If you add accounts, specify what to do with the account passwords: either reset them all or enter a password that applies to all accounts.

   You might reset passwords if you do not know the current account passwords; you must have permission to perform a password reset. When entering a password, the password is changed on the accounts as they are imported. When deleting an account, choose whether the account in Active Directory is kept, disabled, or deleted.

Indicate if Active Directory accounts are retained, disabled, or deleted when you remove machines from a catalog or delete a catalog.

**Update a catalog**

Citrix recommends that you save copies or snapshots of master images before updating the machines in the catalog. The database keeps a historical record of the master images used with each machine catalog. Roll back, or revert, machines in a catalog to use the previous version of the master image. Perform this task if users encounter problems with updates you deployed to their desktops. This minimizes user downtime. Do not delete, move, or rename master images. You cannot revert a catalog to use them.

For catalogs that use Citrix Provisioning (formerly Provisioning Services), you must publish a new virtual disk to apply changes to the catalog. For details, see the Citrix Provisioning documentation.

After a machine is updated, it restarts automatically.

**Update or create a master image**

Before you update the machine catalog, either update an existing master image or create a one on your host hypervisor.

1. On your hypervisor, take a snapshot of the current VM and give the snapshot a meaningful name. This snapshot can be used to revert (roll back) machines in the catalog, if needed.

2. If necessary, power on the master image, and log on.

3. Install updates or make any required changes to the master image.

4. Power off the VM.
5. Take a snapshot of the VM. Give it a meaningful name that is recognized when the catalog is 
updated in Studio. Although Studio can create a snapshot, Citrix recommends that you create 
it using the hypervisor management console. Then select that snapshot in Studio. This process 
enables you to provide a meaningful name and description rather than an automatically gener-
ated name. For GPU master images, you can change the master image only through the Citrix 
Hypervisor console.

Update the catalog

To prepare and roll out the update to all machines in a catalog:

1. Select Machine Catalogs in the Studio navigation pane.
2. Select a catalog and then select Update Machines in the Actions pane.
3. On the Master Image page, select the host and the image you want to roll out.
4. On the Rollout Strategy page, choose when the machines in the machine catalog are updated 
with the new master image: on the next shutdown or immediately.
5. Verify the information on the Summary page and then click Finish. Each machine restarts au-
tomatically after it is updated.

When updating a catalog using PowerShell SDK directly, rather than Studio, specify a hypervisor tem-
plate (VMTemplates). Use this as an alternative to an image or a snapshot of an image.

Rollout strategy:

Updating the image on next shutdown will immediately affect any machines not currently in use, that 
is, machines that do not have an active user session. A system that is in use receives the update when 
the current active session ends. Consider the following:

- New sessions cannot be launched until the update has completed on applicable machines.
- For desktop OS machines, machines are immediately updated when the machine is not in use, 
or when users are not logged in.
- For a server OS with child machines, reboots do not occur automatically. They must be manu-
ally shut down and restarted.

Tip:

Limit the number of machines being rebooted by using the advanced settings for a host connec-
tion. Use these settings to modify the actions taken for a given catalog; advanced settings vary 
depending on the hypervisor.

If you choose to update the image immediately, configure a distribution time and notifications.

- **Distribution time:** Choose to update all machines at the same time, or specify the total length 
of time to begin updating all machines in the catalog. An internal algorithm determines when 
each machine is updated and restarted during that interval.
• **Notification:** In the left notification drop-down menu, choose whether to display a notification message on the machines before an update begins. By default, no message is displayed. Choose to display a message 15 minutes before the update begins. Or, choose to repeat the message every five minutes after the initial message. By default, the message is not repeated. Unless you choose to update all machines at the same time, the notification message displays on each machine at the appropriate time before the update begins.

**Roll back an update**

After you roll out an updated/new master image, you can roll it back. This process might be necessary if issues occur with the newly updated machines. When you roll back, machines in the catalog are rolled back to the last working image. Any new features that require the newer image are no longer available. As with the rollout, rolling back a machine includes a restart.

1. Select **Machine Catalogs** in the **Studio** navigation pane.
2. Select the catalog and then select **Rollback machine update** in the **Actions** pane.
3. Specify when to apply the earlier master image to machines, as described in the preceding section for the rollout operation.

The rollback is applied only to machines that need to be reverted. Machines that have not been updated with the new/updated master image do not receive notification messages and are not forced to log off.

**Upgrade a catalog or revert an upgrade**

Upgrade the machine catalog after you upgrade the VDAs on the machines to a newer version. Citrix recommends upgrading all VDAs to the latest version to enable access to all the newest features.

Before upgrading a catalog:

- If you’re using Citrix Provisioning, upgrade the VDA version in the Citrix Provisioning console.
- Start the upgraded machines so that they register with the Controller. This process lets Studio determine that the machines in the catalog need upgrading.

To upgrade a catalog:

1. Select **Machine Catalogs** in the **Studio** navigation pane.
2. Select the catalog. The **Details** tab in the lower pane displays version information.
3. Select **Upgrade Catalog.** If Studio detects that the catalog needs upgrading, it displays a message. Follow the prompts. If one or more machines cannot be upgraded, a message explains why. Citrix recommends you resolve machine issues before upgrading the catalog to ensure that all machines function properly.

After the catalog upgrade completes, you can revert the machines to their previous VDA versions by selecting the catalog and then selecting **Undo** in the **Actions** pane.
Troubleshoot

For machines with “Power State Unknown” status, see CTX131267 for guidance.

Create delivery groups

June 26, 2020

A delivery group is a collection of machines selected from one or more machine catalogs. The delivery group specifies which users can use those machines, plus the applications and desktops available to those users.

Creating a delivery group is the next step in configuring your deployment after creating a site and creating a machine catalog. Later, you can change the initial settings in the first delivery group and create other delivery groups. There are also features and settings you can configure only when editing a delivery group, not when creating it.

For Remote PC Access, when you create a site, a delivery group named “Remote PC Access Desktops” is automatically created.

To create a delivery group:

1. If you have created a site and a machine catalog, without a delivery group, Studio guides you to the correct starting place to create one. If you have already created a delivery group and want to create another, select Delivery Groups. Select Create Delivery Group in the Actions pane.

2. The wizard launches with an Introduction page, which you can remove from future launches of this wizard.

3. The wizard then guides you through the pages described in the following section. When you are done with each page, click Next until you reach the final page.

Step 1. Machines

On the Machines page, select a catalog and select the number of machines you want to use from that catalog.

Good to know:

- At least one machine must remain unused in a selected catalog.
- A catalog can be specified in more than one delivery group. A machine can be used in only one delivery group.
- A delivery group can use machines from more than one catalog; however, those catalogs must contain the same machine types (multi-session OS, single-session OS, or Remote PC Access). In
other words, you cannot mix machine types in a delivery group. Similarly, if your deployment
has catalogs of Windows machines and catalogs of Linux machines, a delivery group can contain
machines from either OS type, but not both.

- Citrix recommends that you install or upgrade all machines with the most recent VDA version.
  Upgrade catalogs and delivery groups as needed. When creating a delivery group, if you se-
  lect machines that have different VDA versions installed, the delivery group is compatible with
  the earliest VDA version. This is called the group’s functional level. For example, if one of the
  machines has VDA version 7.1 and other machines have the current version, all machines in the
  group can use only those features that were supported in VDA 7.1. This means that some features
  that require later VDA versions might not be available in that delivery group.

- Each machine in a Remote PC Access catalog is automatically associated with a delivery group.
  When you create a Remote PC Access site, a catalog named “Remote PC Access Machines” and
  a delivery group named “Remote PC Access Desktops” are created automatically.

**Step 2. Delivery type**

This page appears only if you chose a catalog containing static (assigned) single-session OS machines.

On the **Delivery Type** page, choose either **Applications** or **Desktops**. You cannot enable both.

If you selected machines from a multi-session OS or single-session OS random (pooled) catalog, the
delivery type is assumed to be applications and desktops: you can deliver applications, desktops, or
both.

**Step 3. Users**

Specify the users and user groups who can use the applications and desktops in the delivery group.

**Where user lists are specified**

Active Directory user lists are specified when you create or edit the following:

- A site’s user access list, which is not configured through Studio. By default, the application enti-
  tlement policy rule includes everyone. See the PowerShell SDK BrokerAppEntitlementPolicyRule
  cmdlets for details.
- Application groups (if configured).
- Delivery groups.
- Applications.

The list of users who can access an application through StoreFront is formed by the intersection of
the above user lists. For example, to configure the use of application A to a particular department,
without unduly restricting access to other groups:
• Use the default application entitlement policy rule that includes everyone.
• Configure the delivery group user list to allow all headquarters users to use any of the applications specified in the delivery group.
• (If application groups are configured) Configure the application group user list to allow members of the Administration and Finance business unit to access applications A through L.
• Configure application A’s properties to restrict its visibility to only Accounts Receivable staff in Administration and Finance.

Authenticated and unauthenticated users

There are two types of users: authenticated and unauthenticated (unauthenticated is also called anonymous). You can configure one or both types in a delivery group.

• **Authenticated:** To access applications and desktops, the users and group members you specify by name must present credentials such as smart card or user name and password to StoreFront or Citrix Workspace app. For delivery groups containing single-session OS machines, you can import user data (a list of users) later by editing the delivery group.

• **Unauthenticated (anonymous):** For delivery groups containing multi-session OS machines, you can allow users to access applications and desktops without presenting credentials to StoreFront or Citrix Workspace app. For example, at kiosks, the application might require credentials, but the Citrix access portal and tools do not. An Anonymous Users Group is created when you install the first Delivery Controller.

To grant access to unauthenticated users, each machine in the delivery group must have a VDA for Windows Server OS (minimum version 7.6) installed. When unauthenticated users are enabled, you must have an unauthenticated StoreFront store.

Unauthenticated user accounts are created on demand when a session is launched, and are named AnonXYZ, in which XYZ is a unique three-digit value.

Unauthenticated user sessions have a default idle timeout of 10 minutes, and are logged off automatically when the client disconnects. Reconnection, roaming between clients, and Workspace Control are not supported.

The following table describes your choices on the **Users** page:

<table>
<thead>
<tr>
<th>Enable access for</th>
<th>Add/assign users and user groups?</th>
<th>Enable the “Give access to unauthenticated users” check box?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only authenticated users</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Only unauthenticated users</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Enable access for | Add/assign users and user groups? | Enable the “Give access to unauthenticated users” check box?  
---|---|---  
Both authenticated and unauthenticated users | Yes | Yes

**Step 4. Applications**

Good to know:

- You cannot add applications to Remote PC Access delivery groups.
- By default, new applications you add are placed in a folder named Applications. You can specify a different folder. For details, see the Manage Applications article.
- You can change the properties for an application when you add it to a delivery group, or later. For details, see the Manage Applications article.
- If you try to add an application and one with the same name exists in that folder, you are prompted to rename the application you are adding. If you decline, the application is added with a suffix that makes it unique within that application folder.
- When you add an application to more than one delivery group, a visibility issue can occur if you do not have sufficient permission to view the application in all of those delivery groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the delivery groups to which the application was added.
- If you publish two applications with the same name to the same users, change the Application name (for user) property in Studio; otherwise, users see duplicate names in Citrix Workspace app.

Click **Add** to display the application sources.

- **From Start menu:** Applications that are discovered on a machine created from the master image in the selected catalog. When you select this source, a new page launches with a list of discovered applications; select those you want to add and then click **OK**.
- **Manually defined:** Applications located in the site or elsewhere in your network. Selecting this source launches a new page where you type the path to the executable, working directory, optional command line arguments, and display names for administrators and users. After entering this information, click **OK**.
- **Existing:** Applications previously added to the site, perhaps in another delivery group. When you select this source, a new page launches with a list of discovered applications. Add the applications and click **OK**.
- **App-V:** Applications in App-V packages. When you select this source, a new page launches where you select the App-V server or the Application Library. Select the applications you want
to add from the resulting display and then click OK. For more information, see App-V.

If an application source or application is not available or valid, it is either not visible or cannot be selected. For example, the Existing source is not available if no applications have been added to the site. Or, an application might not be compatible with the supported session types on machines in the selected catalog.

**Step 5. Desktops**

The title of this page depends on the catalog you chose on the Machines page:

- If you chose a catalog containing pooled machines, this page is titled Desktops.
- If you chose a catalog containing assigned machines and specified “Desktops” on the Delivery Type page, this page is titled Desktop User Assignments.
- If you chose a catalog containing assigned machines and specified “Applications” on the Delivery Type page, this page is titled Application Machine User Assignments.

Click Add. In the dialog box:

- In the Display name and Description fields, type the information to be displayed in Citrix Workspace app.
- To add a tag restriction to a desktop, select Restrict launches to machines with this tag and then select the tag from the drop-down list. For more information, see Tags.
- Use the radio buttons to launch a desktop or to assign a machine when launching the desktop. The users can be either everyone who can access this delivery group, or specific users and user groups.
- If the group contains assigned machines, specify the maximum number of desktops per user. This must be a value of one or greater.
- Enable or disable the desktop (for pooled machines) or desktop assignment rule (for assigned machines). Disabling a desktop stops desktop delivery. Disabling a desktop assignment rule stops desktop auto-assignment to users.
- When you are finished with the dialog box, click OK.

**Maximum instances of a desktop in a site (PowerShell only)**

To configure the maximum instances of a desktop in the site (PowerShell only):

- In PowerShell, use the appropriate BrokerEntitlementPolicyRule cmdlet with the MaxPerEntitlementInstances parameter. For example, the following cmdlet modifies the tsvda-desktop rule to set the maximum concurrent instances of a desktop allowed in the site to two. When there are two desktop instances running, an error occurs if a third subscriber attempts to start a desktop.
Set-BrokerEntitlementPolicyRule -Name tsvda-desktop -MaxPerEntitlementInstances 2

- For guidance, use the Get-Help cmdlet. For example, Get-Help Set-BrokerEntitlementPolicyRule -Parameter MaxPerEntitlementInstances.

**Step 6. Summary**

Enter a name for the delivery group. You can also (optionally) enter a description, which appears in the Citrix Workspace app and in Studio.

Review the summary information and then click **Finish**.

**Manage delivery groups**

September 14, 2020

**Introduction**

This article describes procedures for managing delivery groups from the management console. In addition to changing settings specified when creating the group, you can configure other settings that are not available when you create a delivery group.

Procedure categories include: general, users, machines, and sessions. Some tasks span more than one category. For example, “Prevent users from connecting to machines” is described in the machines category, but it also affects users. If you can’t find a task in one category, check a related category.

Other articles also contain related information:

- Applications contain information about managing applications in delivery groups.
- Managing delivery groups requires the Delivery Group Administrator built-in role permissions. For details, see Delegated administration.

**General**

- Change the delivery type
- Change StoreFront addresses
- Upgrade a delivery group
- Manage Remote PC Access delivery groups
**Change the delivery type of a delivery group**

The delivery type indicates what the group can deliver: applications, desktops, or both.

Before changing an application only or desktops and applications type to the desktops only type, delete all applications from the group.

1. Select Delivery Groups in the navigation pane.
2. Select a group and then click Edit Delivery Group in the Actions pane.
3. On the Delivery Type page, select the delivery type you want.
4. Click Apply to apply any changes you made and keep the window open. Or, click OK to apply changes and close the window.

**Change StoreFront addresses**

1. Select Delivery Groups in the navigation pane.
2. Select a group and then click Edit Delivery Group in the Actions pane.
3. On the StoreFront page, select or add StoreFront URLs. These URLs are used by the Citrix Workspace app, which is installed on each machine in the delivery group.
4. Click Apply to apply any changes you made and keep the window open. Or, click OK to apply changes and close the window.

You can also specify StoreFront server addresses by selecting Configuration > StoreFront in the navigation pane.

**Upgrade a delivery group or revert an upgrade**

Upgrade a delivery group after you upgrade the Virtual Delivery Agents (VDAs) on its machines and the machine catalogs containing the machines used in the delivery group.

Before you start the delivery group upgrade:

- If you use Citrix Provisioning (formerly Provisioning Services), upgrade the VDA version in the Citrix Provisioning console.
- Start the machines containing the upgraded VDA so that they can register with a Delivery Controller. This process tells the console about what needs upgrading in the delivery group.
- If you continue to use earlier VDA versions, newer product features are not available. For more information, see the upgrade documentation.

To upgrade a delivery group:

1. Select Delivery Groups in the navigation pane.
2. Select a group and then click Upgrade Delivery Group in the Actions pane. The Upgrade Delivery Group action appears only if upgraded VDAs are detected.
The display indicates you which, if any, machines cannot be upgraded and why. You can then cancel the upgrade, resolve the machine issues, and then start the upgrade again.

After the upgrade completes, you can revert the machines to their previous states by selecting the delivery group and then clicking **Undo** in the **Actions** pane.

**Manage Remote PC Access delivery groups**

If a machine in a Remote PC Access machine catalog is not assigned, the machine is temporarily assigned to a delivery group associated with that catalog. This temporary assignment enables the machine to be assigned to a user later.

The delivery group-to-machine catalog association has a priority value. Priority determines the machine’s assigned delivery group when it registers with the system or when a user needs a machine assignment. The lower the value, the higher the priority. If a Remote PC Access machine catalog has multiple delivery group assignments, the software selects the match with the highest priority. Use the PowerShell SDK to set this priority value.

When first created, Remote PC Access machine catalogs are associated with a delivery group. Machine accounts or Organizational Units added to the catalog later can be added to the delivery group. This association can be switched off or on.

To add or remove a Remote PC Access machine catalog association with a delivery group:

1. Select **Delivery Groups** in the navigation pane.
2. Select a Remote PC Access group.
3. In the **Details** section, click the **Machine Catalogs** tab and then select a Remote PC Access catalog.
4. To add or restore an association, click **Add Desktops**. To remove an association, click **Remove Association**.

**Users**

- Change user settings
- Add or remove users

**Change user settings in a delivery group**

The name of this page appears as either **User Settings** or **Basic Settings**.

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **Edit Delivery Group** in the Actions pane.
3. On the **User Settings** (or **Basic Settings**) page, change any of the settings in the following table.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **OK** to apply changes and close the window.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The text that Citrix Workspace (or StoreFront) uses and that users see.</td>
</tr>
<tr>
<td>Enable delivery group</td>
<td>Whether the delivery group is enabled.</td>
</tr>
<tr>
<td>Time zone</td>
<td></td>
</tr>
<tr>
<td>Enable Secure ICA</td>
<td>Secures communications to and from machines in the delivery group using SecureICA, which encrypts the ICA protocol. The default level is 128-bit. The level can be changed using the SDK. Citrix recommends using more encryption methods such as TLS encryption when traversing public networks. Also, SecureICA does not check data integrity.</td>
</tr>
</tbody>
</table>

**Add or remove users in a delivery group**

For detailed information about users, see [Users](#).

1. Select **Delivery Groups** in the navigation pane.

2. Select a group and then click **Edit Delivery Group** in the Actions pane.

3. On the **Users** page:

   - To add users, click **Add**, and then specify the users you want to add.
   - To remove users, select one or more users and then click **Remove**.
   - Select or clear the check box to allow access by unauthenticated users.

4. Click **Apply** to apply any changes you made and keep the window open. Or, click **OK** to apply changes and close the window.

**Import or export user lists**

For delivery groups containing physical single-session OS machines, you can import user information from a .csv file after you create the delivery group. You can also export user information to a .csv file. The .csv file can contain data from a previous product version.

The first line in the .csv file must contain comma-separated column headings (in any order), which can include: **ADComputerAccount**, **AssignedUser**, **VirtualMachine**, and **HostId**. Subsequent lines
in the file contain comma-separated data. The ADComputerAccount entries can be common names, IP addresses, distinguished names, or domain and computer name pairs.

To import or export user information:

1. Select Delivery Groups in the navigation pane.
2. Select a group and then click Edit Delivery Group in the Actions pane.
3. On the Machine Allocation page, select Import list or Export list, and then browse to the file location.
4. Click Apply to apply any changes you made and keep the window open. Or, click OK to apply changes and close the window.

**Machines**

- Change assignments of machines to users
- Change the maximum number of machines per user
- Update a machine
- Add, change, or remove a tag restriction for a desktop
- Remove a machine
- Restrict access to machines
- Prevent users from connecting to a machine (maintenance mode)
- Shut down and restart machines
- Create and manage restart schedules for machines
- Load managed machines
- Power managed machines

**Change assignments of machines to users in a delivery group**

You can change the assignments of single-session OS machines provisioned with MCS. You cannot change assignments for multi-session OS machines or machines provisioned with Citrix Provisioning.

1. Select Delivery Groups in the navigation pane.
2. Select a group and then click Edit Delivery Group in the Actions pane.
3. On the Desktops or Desktop Assignment Rules page (the page title depends on the type of machine catalog the delivery group uses), specify the new users.
4. Click Apply to apply any changes you made and keep the window open. Or, click OK to apply changes and close the window.

**Change the maximum number of machines per user in a delivery group**

1. Select Delivery Groups in the navigation pane.
2. Select a group and then click Edit Delivery Group in the Actions pane.
3. On the **Desktop Assignment Rules** page, set the maximum desktops per user value.
4. Click **Apply** to apply any changes you made and keep the window open. Or, click **OK** to apply changes and close the window.

**Update a machine in a delivery group**

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **View Machines** in the Actions pane.
3. Select a machine and then click **Update Machines** in the Actions pane.

To choose a different master image, select **Master image** and then select a snapshot.

To apply changes and notify machine users, select **Rollout notification to end-users**. Then specify:

- When to update the master image: now or on the next restart
- The restart distribution time (the total time to begin updating all machines in the group)
- Whether users are notified of the restart
- The message users receive

**Add, change, or remove a tag restriction for a desktop**

Adding, changing, and removing tag restrictions can have unanticipated effects on which desktops are considered for launch. Review the considerations and cautions in **Tags**.

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **Edit Delivery Group** in the Actions pane.
3. On the **Desktops** page, select the desktop and click **Edit**.
4. To add a tag restriction, select **Restrict launches to machines with the tag** and then select the tag.
5. To change or remove a tag restriction, either:
   - Select a different tag.
   - Remove the tag restriction by clearing **Restrict launches to machines with this tag**.
6. Click **Apply** to apply any changes you made and keep the window open. Or, click **OK** to apply changes and close the window.

**Remove a machine from a delivery group**

Removing a machine deletes it from a delivery group. It does not delete it from the machine catalog that the delivery group uses. Therefore, that machine is available for assignment to another delivery group.
Machines must be shut down before they can be removed. To temporarily stop users from connecting to a machine while you are removing it, put the machine into maintenance mode before shutting it down.

Machines might contain personal data, so use caution before allocating the machine to another user. Consider reimaging the machine.

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **View Machines** in the Actions pane.
3. Ensure that the machine is shut down.
4. Select the machine and then click **Remove from Delivery Group** in the Actions pane.

You can also remove a machine from a delivery group through the **connection** the machine uses.

**Restrict access to machines in a delivery group**

Any changes you make to restrict access to machines in a delivery group supersede previous settings, regardless of the method you use. You can:

- **Restrict access for administrators using delegated administration scopes**: Create and assign a scope that permits administrators to access all applications, and another scope that provides access to only certain applications. For details, see [Delegated administration](#).

- **Restrict access for users through SmartAccess policy expressions**: Use policy expressions to filter user connections made through Citrix Gateway.
  1. Select **Delivery Groups** in the navigation pane.
  2. Select a group and then click **Edit Delivery Group** in the Actions pane.
  3. On the **Access Policy** page, select **Connections through NetScaler Gateway**.
  4. To choose a subset of those connections, select **Connections meeting any of the following filters**. Then define the Citrix Gateway site, and add, edit, or remove the SmartAccess policy expressions for the allowed user access scenarios. For details, see the Citrix Gateway documentation.
  5. Click **Apply** to apply any changes you made and keep the window open. Or, click **OK** to apply changes and close the window.

- **Restrict access for users through exclusion filters**: Use exclusion filters on access policies that you set in the SDK. Access policies are applied to delivery groups to refine connections. For example, you can restrict machine access to a subset of users, and you can specify allowed user devices. Exclusion filters further refine access policies. For example, for security, you can deny access to a subset of users or devices. By default, exclusion filters are disabled.

  For example, a teaching lab on a corporate network subnet which prevents access from that lab to a particular delivery group. Regardless of who is using the machines in the
lab, use the command:  

```bash
Set-BrokerAccessPolicy -Name VPDesktops_Direct -ExcludedClientIPFilterEnabled $True
```

Use the asterisk (*) wildcard to match all tags that start with the same policy expression. For example, if you add the tag `VPDesktops_Direct` to one machine and `VPDesktops_Test` to another, setting the tag in the `Set-BrokerAccessPolicy` script to `VPDesktops_*` applies the filter to both machines.

If you are connected using a web browser or with the Citrix Workspace app user experience feature enabled in the store, you cannot use a client name exclusion filter.

**Prevent users from connecting to a machine (maintenance mode) in a delivery group**

When you need to temporarily stop new connections to machines, you can turn on maintenance mode for one or all machines in a delivery group. You might do this before applying patches or using management tools.

- When a multi-session OS machine is in maintenance mode, users can connect to existing sessions, but cannot start new sessions.
- When a single-session OS machine (or a PC using Remote PC Access) is in maintenance mode, users cannot connect or reconnect. Current connections remain connected until they disconnect or log off.

To turn maintenance mode on or off:

1. Select **Delivery Groups** in the navigation pane.

2. Select a group.

3. To turn on maintenance mode for all machines in the delivery group, click **Turn On Maintenance Mode** in the Actions pane.

   To turn on maintenance mode for one machine, click **View Machines** in the Actions pane. Select a machine, and then click **Turn On Maintenance Mode** in the Actions pane.

4. To turn maintenance mode off for one or all machines in a delivery group, follow the previous instructions, but click **Turn Off Maintenance Mode** in the Actions pane.

Windows Remote Desktop Connection (RDC) settings also affect whether a multi-session OS machine is in maintenance mode. Maintenance mode is on when any of the following occur:

- Maintenance mode is set to on, as described earlier.
- RDC is set to **Don’t allow connections to this computer**.
- RDC is not set to **Don’t allow connections to this computer**. The **Remote Host Configuration User Logon Mode** setting is either **Allow reconnections, but prevent new logons** or **Allow reconnections, but prevent new logons until the server is restarted**.

You can also turn maintenance mode on or off for:
• A connection, which affects the machines using that connection.
• A machine catalog, which affects the machines in that catalog.

**Shut down and restart machines in a delivery group**

This procedure is not supported for Remote PC Access machines.

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **View Machines** in the Actions pane.
3. Select the machine and then click one of the following entries in the Actions pane:
   - **Force shut down**: Forcibly powers off the machine and refreshes the list of machines.
   - **Restart**: Requests the operating system to shut down and then start the machine again.
     If the operating system cannot comply, the machine remains in its current state.
   - **Force restart**: Forcibly shuts down the operating system and then restarts the machine.
   - **Suspend**: Pauses the machine without shutting it down, and refreshes the list of machines.
   - **Shut down**: Requests the operating system to shut down.

For non-force actions, if the machine does not shut down within 10 minutes, it is powered off. If Windows attempts to install updates during the shutdown, there is a risk that the machine is powered off before the updates finish.

Citrix recommends that you prevent single-session OS machine users from selecting **Shut down** within a session. See the Microsoft policy documentation for details.

You can also shut down and restart machines on a **connection**.

**Create and manage restart schedules for machines in a delivery group**

A restart schedule specifies when machines in a delivery group are periodically restarted. You can create one or more schedules for a delivery group. A schedule can affect either:

• All of the machines in the group.
• One or more (but not all) machines in the group. The machines are identified by a tag that you apply to the machine. This is called a tag restriction, because the tag restricts an action to only items that have the tag.

For example, let’s say all of your machines are in one delivery group. You want every machine restarted once every week, and you want the machines used by the accounting team restarted daily. To accomplish this, set up one schedule for all machines, and another schedule for only the machines in accounting.

A schedule includes the day and time the restart begins, and the duration. The duration is either “start all affected machines at the same time” or an interval it takes to restart all affected machines.
You can enable or disable a schedule. Disabling a schedule can be helpful when testing, during special intervals, or when preparing schedules before you need them.

You cannot use schedules for automated power-on or shutdown from the management console, only to restart.

**Schedule overlap**

Multiple schedules can overlap. In the example above, both schedules affect the accounting machines. Those machines might be restarted twice on Sunday. The scheduling code is designed to avoid restarting the same machine more often than intended, but it cannot be guaranteed.

- If the schedules coincide precisely in start and duration times, it is more likely that the machines are restarted only once.
- The more the schedules differ in start and duration times, it’s more likely that multiple restarts occur.
- The number of machines affected by a schedule also affects the chance of an overlap. In the example, the weekly schedule that affects all machines might initiate restarts faster than the daily schedule for accounting machines, depending on the duration specified for each.

For an in-depth look at restart schedules, see [Reboot schedule internals](#).

**View restart schedules**

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **Edit Delivery Group** in the Actions pane.
3. Select the **Restart Schedule** page.

The **Restart Schedule** page contains the following information for each configured schedule:

- Schedule name.
- Tag restriction used, if any.
- How often the machine restarts occur.
- Whether machine users receive a notification.
- Whether the schedule is enabled. Disabling a schedule can be helpful when testing, during special intervals, or when preparing schedules before you need them.

**Add (apply) tags**

When you configure a restart schedule that uses a tag restriction, ensure that the tag has been added to the machines that the schedule affects. In the example above, each of the machines used by the accounting team has a tag applied. For details, see [Tags](#).

Although you can apply more than one tag to a machine, a restart schedule can specify only one tag.
1. Select **Delivery Groups** in the navigation pane.
2. Select the group containing the machines controlled by the schedule.
3. Click **View Machines** and then select the machines you want to add a tag to.
4. Click **Manage Tags** in the Actions pane.
5. If the tag exists, enable the check box next to the tag name. If the tag does not exist, click **Create** and then specify the name for the tag. After the tag is created, enable the check box next to the newly created tag name.
6. Click **Save** in the **Manage Tags** dialog.

**Create a restart schedule**

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **Edit Delivery Group** in the Actions pane.
3. On the **Restart Schedule** page, click **Add**.
4. On the **Add Restart Schedule** page:
   • Type a schedule name and description.
   • If you’re using a tag restriction, select the tag.
   • **In Restart frequency**, select how often the restart occurs: daily, weekdays, weekend days, or a specific day each week.
   • Using the 24-hour clock, specify the time of day to begin the restart.
   • **For Restart duration**, choose whether all machines are restarted at the same time, or the total length of time to begin restarting all of the affected machines. An internal algorithm determines when each machine is restarted during that interval.
   • **In Send notification to users**, choose whether to display a notification message on the affected machines before a restart begins. By default, no message is displayed.
   • If you choose to display a message 15 minutes before the restart begins, you can choose (in Notification frequency) to repeat the message every five minutes after the initial message. By default, the message is not repeated.
   • Enter the notification title and text. There is no default text.

   If you want the message to include the number of minutes before restart, include the variable %m%. For example: “Warning: Your computer is automatically restarted in %m% minutes.” The value decrements by five minutes in each repeated message. Unless you chose to restart all machines at the same time, the message displays on each machine at the appropriate time before the restart, calculated by the internal algorithm.
   • To enable the schedule, select the check box. To disable the schedule, clear the check box.
5. Click **Apply** to apply the changes you made and keep the window open. Or, click **OK** to apply changes and close the window.

**Edit, remove, enable, or disable a restart schedule**

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **Edit Delivery Group** in the Actions pane.
3. On the **Restart Schedule** page, select the check box for a schedule.
   - To edit a schedule, click **Edit**. Update the schedule configuration, using the guidance in Create a restart schedule.
   - To enable or disable a schedule, click **Edit**. Select or clear the **Enable restart schedule** check box.
   - To remove a schedule, click **Remove**. Confirm the removal. Removing a schedule does not affect any tags applied to machines in the affected machines.

**Scheduled restarts delayed due to database outage**

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>This feature is available only through PowerShell.</td>
</tr>
</tbody>
</table>

If a site database outage occurs before a scheduled restart begins for machines (VDAs) in a delivery group, the restarts begin when the outage ends. This can have unintended results.

For example, let's say you've scheduled a delivery group's restarts to occur during off-production hours (beginning at 03:00). A site database outage occurs one hour before a scheduled restart begins (02:00). The outage lasts six hours (until 08:00). The restart schedule begins when the connection between the Delivery Controller and the site database is restored. The VDA restarts now begin five hours after their original schedule, resulting in VDAs restarting during production hours.

To help avoid this situation, you can use the **MaxOvertimeStartMins** parameter for the **New-BrokerRebootScheduleV2** and **Set-BrokerRebootScheduleV2** cmdlets. The value specifies the maximum number of minutes beyond the scheduled start time that a restart schedule can begin. If the database connection is restored within that time (scheduled time + **MaxOvertimeStartMins**), the VDA restarts begin.

If the database connection is not restored within that time, the VDA restarts do not begin.

If this parameter is omitted, the scheduled restart begins when the connection to the database is restored, regardless of the outage duration.

For more information, see the cmdlet help. This feature is available only in PowerShell. You cannot set this value when configuring a restart schedule in Studio.
Scheduled restarts for machines in maintenance mode

**Note:**
This feature is available only in PowerShell.

To indicate whether a restart schedule affects machines that are in maintenance mode, use the IgnoreMaintenanceMode option with BrokerRebootScheduleV2 cmdlets.

For example, the following cmdlet creates a schedule that restarts machines that are in maintenance mode (in addition to machines that aren’t in maintenance mode).

```
New-Brokerrebootschedulev2 rebootSchedule1 -DesktopGroupName <myDesktopGroup> -IgnoreMaintenanceMode $true
```

The following cmdlet modifies an existing restart schedule.

```
Set-Brokerrebootschedulev2 rebootSchedule1 -IgnoreMaintenanceMode $true
```

For more information, see the cmdlet help. This feature is available only in PowerShell.

Load managed machines in delivery groups

You can load manage multi-session OS machines only.

Load management measures the server load and determines which server to select under the current environment conditions. This selection is based on:

- **Server maintenance mode status**: A multi-session OS machine is considered for load balancing only when maintenance mode is off.

- **Server load index**: Determines how likely a server delivering multi-session OS machines is to receive connections. The index is a combination of load evaluators: the number of sessions and the settings for performance metrics such as CPU, disk, and memory use. Load evaluators are specified in load management policy settings.

A server load index of 10000 indicates that the server is fully loaded. If no other servers are available, users might receive a message that the desktop or application is unavailable when they launch a session.

You can monitor the load index in Director (Monitor), Studio (Manage) search, and the SDK.

In console displays, to display the Server Load Index column (which is hidden by default), select a machine, right-click a column heading, and then select Select Column. In the Machine category, select Load Index.

In the SDK, use the Get-BrokerMachine cmdlet. For details, seeCTX202150.

- **Concurrent logon tolerance policy setting**: The maximum number of concurrent requests to log on to the server. (This setting is equivalent to load throttling in XenApp 6.x versions.)
When all servers are at or higher than the concurrent logon tolerance setting, the next logon request is assigned to the server with the lowest pending logons. If more than one server meets these criteria, the server with the lowest load index is selected.

**Power managed machines in a delivery group**

You can power manage only virtual single-session OS machines, not physical machines (including Remote PC Access machines). Single-session OS machines with GPU capabilities cannot be suspended, so power-off operations fail. For multi-session OS machines, you can create a restart schedule.

In delivery groups containing pooled machines, virtual single-session OS machines can be in one of the following states:

- Randomly allocated and in use
- Unallocated and unconnected

In delivery groups containing static machines, virtual single-session OS machines can be:

- Permanently allocated and in use
- Permanently allocated and unconnected (but ready)
- Unallocated and unconnected

During normal use, static delivery groups typically contain both permanently allocated and unallocated machines. Initially, all machines are unallocated, except for manually allocated ones when the delivery group was created. As users connect, machines become permanently allocated. You can fully power manage the unallocated machines in those delivery groups, but only partially manage the permanently allocated machines.

- **Pools and buffers**: For pooled delivery groups and static delivery groups with unallocated machines, a pool (in this instance) is a set of unallocated or temporarily allocated machines that are kept in a powered-on state, ready for users to connect. A user gets a machine immediately after logon. The pool size (the number of machines kept powered-on) is configurable by time of day. For static delivery groups, use the SDK to configure the pool.

  A buffer is an extra standby set of unallocated machines that are turned on when the number of machines in the pool falls below a threshold. The threshold is a percentage of the delivery group size. For large delivery groups, a significant number of machines might be turned on when the threshold is exceeded. So, plan delivery group sizes carefully or use the SDK to adjust the default buffer size.

- **Power state timers**: You can use power state timers to suspend machines after users have disconnected for a specified amount of time. For example, machines suspend automatically outside of office hours if users are disconnected for at least 10 minutes.

  You can configure timers for weekdays and weekends, and for peak and nonpeak intervals.
- **Partial power management of permanently allocated machines:** For permanently allocated machines, you can set power state timers, but not pools or buffers. The machines are turned on at the start of each peak period, and turned off at the start of each off-peak period. You do not have the fine control that you have with unallocated machines over the number of machines that become available to compensate for machines that are consumed.

**Power manage virtual single-session OS machines**

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **Edit Delivery Group** in the Actions pane.
3. On the **Power Management** page, select **Weekdays** in **Power manage machines**. By default, weekdays are Monday to Friday.
4. For random Delivery groups, in **Machines to be powered on**, click **Edit** and then specify the pool size during weekdays. Then, select the number of machines to power on.
5. In **Peak hours**, set the peak and off-peak hours for each day.
6. Set the power state timers for peak and non-peak hours during weekdays: In **During peak hours > When disconnected**, specify the delay (in minutes) before suspending any disconnected machine in the delivery group, and then select **Suspend**. In **During off-peak hours > When disconnected**, specify the delay before turning off any logged-off machine in the delivery group, and then select **Shutdown**. This timer is not available for delivery groups with random machines.
7. Select **Weekend** in **Power manage machines**, and then configure the peak hours and power state timers for weekends.
8. Click **Apply** to apply any changes you made and keep the window open. Or, click **OK** to apply changes and close the window.

Use the SDK to:

- Shut down, rather than suspend, machines in response to power state timers, or if you want the timers to be based on logoffs, rather than disconnections.
- Change the default weekday and weekend definitions.
- Disable power management. See CTX217289.

**Power manage VDI machines transitioning to a different time period with disconnected sessions**

**Important:**

This enhancement applies only to VDI machines with disconnected sessions. It does not apply to VDI machines with logged off sessions.

In earlier releases, a VDI machine transitioning to a time period where an action (disconnect action="Suspend" or "Shutdown") was required remained powered on. This scenario occurred if the
machine disconnected during a time period (peak or off-peak times) where no action (disconnect action=“Nothing”) was required.

Starting with Citrix Virtual Apps and Desktops 7 2009, the machine is suspended or powered off when the specified disconnection time elapses, depending on the disconnect action configured for the destination time period.

For example, you configure the following power policies for a VDI delivery group:

- Set **PeakDisconnectAction** to “Nothing”
- Set **OffPeakDisconnectAction** to “Shutdown”
- Set **OffPeakDisconnectTimeout** to “10”

**Note:**

In earlier releases, a VDI machine with a session disconnected during peak times remained powered on when it transitioned from peak to off-peak. Starting with Citrix Virtual Apps and Desktops 7 2009, the **OffPeakDisconnectAction** and the **OffPeakDisconnectTimeout** policy actions are applied to the VDI machine on period transition. As a result, the machine is powered off 10 minutes after it transitions to off-peak.

If you want to revert to the previous behavior (that is, take no action on machines that transition from peak to off-peak or off-peak to peak with disconnected sessions), do one of the following:

- Set the “LegacyPeakTransitionDisconnectedBehaviour” registry value to 1, the equivalent of true which enables the previous behavior. By default, the value is 0, or false, which triggers disconnect power policy actions on period transition.
  - Path: HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\DesktopServer
  - Name: LegacyPeakTransitionDisconnectedBehaviour
  - Type: REG_DWORD
  - Data: 0x00000001 (1)
- Configure the setting by using the Set-BrokerServiceConfigurationData PowerShell command. For example:
  ```powershell
  PS C:\> Set-BrokerServiceConfigurationData HostingManagement.
  LegacyPeakTransitionDisconnectedBehaviour -SettingValue $true
  ```

A machine must meet the following criteria before power policy actions can be applied to it on period transition:

- Has a disconnected session.
- Has no pending power actions.
Citrix Virtual Apps and Desktops 7 2009

- Belongs to a VDI (single session) delivery group that transitions to a different time period.
- Has a session that disconnects during a certain time period (peak or off-peak times) and transitions to a period where a power action is assigned.

**Change the percentage of VDAs in a powered state for catalogs**

1. Adjust the peak hours for the delivery group from the Power management section for the delivery group.

2. Make a note of the Desktop Group name.

3. With administrator privileges, start PowerShell and run the following commands. Replace “Desktop Group Name” with the name of your desktop group that has a changed percentage of the VDAs running.

   ```powershell
   asnp Citrix*
   # Set-BrokerDesktopGroup ”Desktop Group Name”-PeakBufferSizePercent 100
   ```

   A value of 100 means that 100% of the VDAs are in the ready state.

4. Verify the solution by running:

   ```powershell
   #Get-BrokerDesktopGroup ”Desktop Group Name”
   ```
It can take up to an hour for changes to take effect.

To shut down the VDAs after the user logs off, enter:

```powershell
Set-BrokerDesktopGroup "Desktop Group Name"-ShutDownDesktopsAfterUse $True
```

To restart VDAs during peak hours, so that they’re ready for users after they log off, enter:

```powershell
Set-BrokerDesktopGroup "Desktop Group Name"-AutomaticPowerOnForAssignedDuringPeak $True
```

**Sessions**

- Log off or disconnect a session, or send a message to users
- Configure session prelaunch and session linger
Log off or disconnect a session

1. In the Studio navigation pane, select Delivery Groups.
2. Select a delivery group and then select View Machines in the Actions pane.
3. In the middle pane, select the machine, select View Sessions in the Actions pane, and then select a session.
   • Alternatively, in the middle pane, select the Session tab and then select a session.
4. To log off from a session, select Log off in the Actions pane. The session closes and the user is logged out. The machine becomes available to other users unless it is allocated to a specific user.
5. To disconnect a session, select Disconnect in the Actions pane. Applications continue to run in the session and the machine remains allocated to that user. The user can reconnect to the same machine.

You can configure power state timers for single-session OS machines to automatically handle unused sessions. For details, see Power managed machines.

Send a message to a delivery group

1. In the Studio navigation pane, select Delivery Groups.
2. Select a delivery group and then select View Machines in the Actions pane.
3. In the middle pane, select a machine to which you want to send a message.
4. In the Actions pane, select View Sessions.
5. In the middle pane, select all sessions and then select Send Message in the Actions pane.
6. Type your message and click OK. You can specify the level of severity if needed. Options include Critical, Question, Warning, and Information.

Alternatively, you can send a message by using Citrix Director. For more information, see Send messages to users.

Configure session prelaunch and session linger in a delivery group

These features are supported only on multi-session OS machines.

The session prelaunch and session linger features help specified users access applications quickly, by starting sessions before they are requested (session prelaunch) and keeping application sessions active after a user closes all applications (session linger).

By default, session prelaunch and session linger are not used. A session starts (launches) when a user starts an application, and remains active until the last open application in the session closes.

Considerations:

• The delivery group must support applications, and the machines must be running a VDA for multi-session OS, minimum version 7.6.
• These features are supported only when using Citrix Workspace app for Windows, and also require extra Citrix Workspace app configuration. For instructions, search for session prelaunch in the product documentation for your Citrix Workspace app for Windows version.
• Citrix Workspace app for HTML5 is not supported.
• When using session prelaunch, if a user’s machine is put into suspend or hibernate mode, prelaunch does not work (regardless of session prelaunch settings). Users can lock their machines/sessions. However, if a user logs off from Citrix Workspace app, the session is ended and prelaunch no longer applies.
• When using session prelaunch, physical client machines cannot use the suspend or hibernate power management functions. Client machine users can lock their sessions but should not log off.
• Prelaunched and lingering sessions consume a concurrent license, but only when connected. If using a user/device license, the license lasts 90 days. Unused prelaunched and lingering sessions disconnect after 15 minutes by default. This value can be configured in PowerShell (New/Set-BrokerSessionPreLaunch cmdlet).
• Careful planning and monitoring of your users’ activity patterns are essential to tailoring these features to complement each other. Optimal configuration balances the benefits of earlier application availability for users against the cost of keeping licenses in use and resources allocated.
• You can also configure session prelaunch for a scheduled time of day in Citrix Workspace app.

How long unused prelaunched and lingering sessions remain active

There are several ways to specify how long an unused session remains active if the user does not start an application: a configured timeout and server load thresholds. You can configure all of them. The event that occurs first causes the unused session to end.

• **Timeout:** A configured timeout specifies the number of minutes, hours, or days an unused prelaunched or lingering session remains active. If you configure too short a timeout, prelaunched sessions end before they provide the user benefit of quicker application access. If you configure too long a timeout, incoming user connections might be denied because the server doesn’t have enough resources.

You can enable this timeout from the SDK only (New/Set-BrokerSessionPreLaunch cmdlet), not from the management console. If you disable the timeout, it does not appear in the console display for that delivery group or in the Edit Delivery Group pages.

• **Thresholds:** Automatically ending prelaunched and lingering sessions based on server load ensures that sessions remain open as long as possible, assuming that server resources are available. Unused prelaunched and lingering sessions do not cause denied connections because they are ended automatically when resources are needed for new user sessions.

You can configure two thresholds: the average percentage load of all servers in the delivery group, and the maximum percentage load of a single server in the group. When a threshold is
exceeded, the sessions that have been in the prelaunch or lingering state for the longest time are ended. Sessions are ended one-by-one at minute intervals until the load falls below the threshold. While the threshold is exceeded, no new prelaunch sessions are started.

Servers with VDAs that have not registered with a Controller and servers in maintenance mode are considered fully loaded. An unplanned outage causes prelaunch and lingering sessions to end automatically to free capacity.

**To enable session prelaunch**

1. Select **Delivery Groups** in the navigation pane.
2. Select a group and then click **Edit Delivery Group** in the Actions pane.
3. On the **Application Prelaunch** page, enable session prelaunch by choosing when sessions launch:
   - When a user starts an application. This is the default setting. Session prelaunch is disabled.
   - When any user in the delivery group logs on to Citrix Workspace app for Windows.
   - When anyone in a list of users and user groups logs on to Citrix Workspace app for Windows. Be sure to also specify users or user groups if you choose this option.
4. A prelaunched session is replaced with a regular session when the user starts an application. If the user does not start an application (the prelaunched session is unused), the following settings affect how long that session remains active.

- When a specified time interval elapses. You can change the time interval (1–99 days, 1–2376 hours, or 1–142,560 minutes).
- When the average load on all machines in the delivery group exceeds a specified percentage (1–99%).
- When the load on any machine in the delivery group exceeds a specified percentage (1–99%).

Recap: A prelaunched session remains active until one of the following events occurs: a user starts an application, the specified time elapses, or a specified load threshold is exceeded.

To enable session linger

1. Select Delivery Groups in the navigation pane.
2. Select a group and then click Edit Delivery Group in the Actions pane.
3. On the Application Linger page, enable session linger by selecting Keep sessions active until.

![Edit Delivery Group](image)

© 1999-2020 Citrix Systems, Inc. All rights reserved.
4. Several settings affect how long a lingering session remains active if the user does not start another application.
   - When a specified time interval elapses. You can change the time interval: 1–99 days, 1–2376 hours, or 1–142,560 minutes.
   - When the average load on all machines in the delivery group exceeds a specified percentage: 1–99%.
   - When the load on any machine in the delivery group exceeds a specified percentage: 1–99%.

Recap: A lingering session remains active until one of the following events occurs: a user starts an application, the specified time elapses, or a specified load threshold is exceeded.

Troubleshoot

- VDAs that are not registered with a Delivery Controller are not considered when launching brokered sessions. This results in underutilization of otherwise available resources. There are various reasons a VDA might not be registered, many of which an administrator can troubleshoot. The details display provides troubleshooting information in the catalog creation wizard, and after you add a catalog to a delivery group.

After you create a delivery group, the details pane for a delivery group indicates the number of machines that can be registered but are not. For example, one or more machines are powered on and not in maintenance mode, but are not currently registered with a Controller. When viewing a “not registered, but should be” machine, review the Troubleshoot tab in the details pane for possible causes and recommended corrective actions.

For messages about functional level, see VDA versions and functional levels.

For information about VDA registration troubleshooting, see CTX136668.

- In the display for a delivery group, the Installed VDA version in the details pane might differ from the actual version installed on the machines. The machine’s Windows Programs and Features display shows the actual VDA version.

- For machines with Power State Unknown status, see CTX131267 for guidance.

Create application groups

June 26, 2020
Introduction

Application groups let you manage collections of applications. Create application groups for applications shared across different delivery groups. Or, applications used by a subset of users within delivery groups. Application groups are optional; they offer an alternative to adding the same applications to multiple delivery groups. Associate delivery groups with more than one application group, and associate an application group with more than one delivery group.

Using application groups can provide application management and resource control advantages over using more delivery groups:

- The logical grouping of applications and their settings lets you manage those applications as a single unit. For example, you don’t have to add (publish) the same application to individual delivery groups one at a time.
- Session sharing between application groups can conserve resource consumption. In other cases, disabling session sharing between application groups can be beneficial.
- You can use the tag restriction feature to publish applications from an application group, considering only a subset of the machines in selected delivery groups. With tag restrictions, you can use your existing machines for more than one publishing task, saving the costs associated with deploying and managing extra machines. A tag restriction can be thought of as subdividing (or partitioning) the machines in a delivery group. Using an application group or desktops with a tag restriction can be helpful when isolating and troubleshooting a subset of machines in a delivery group.

Example configurations

Example 1:

The following graphic shows a Citrix Virtual Apps and Desktops deployment that includes application groups:
In this configuration, applications are added to the application groups, not the delivery groups. The delivery groups specify which machines are used. (Although not shown, the machines are in machine catalogs.)

Application group 1 is associated with delivery group 1. Access the applications in application group 1 by the users specified in application group 1. These groups only appear as long as they are also in the user list for delivery group 1. This configuration follows the guidance that the user list for an application group is a subset (a restriction) of the user lists for the associated delivery groups. The settings in application group 1 (such as application session sharing between application groups, associated delivery groups) apply to applications and users in that group. The settings in delivery group 1 apply to users in application groups 1 and 2, because those application groups have been associated with that delivery group.

Application group 2 is associated with two delivery groups: 1 and 2. Each of those delivery groups is assigned a priority in application group 2, indicating the order in which the delivery groups are checked when an application is launched. Delivery groups with equal priority are load balanced. Access the applications in application group 2 by the users specified in application group 2. However, they must also appear in the user lists for delivery group 1 and delivery group 2.

**Example 2:**

This simple layout uses tag restrictions to limit which machines are considered for certain desktop
and application launches. The site has one shared delivery group, one published desktop, and one application group configured with two applications.

Tags have been added to each of the three machines (VDA 101–103).

The application group was created with the “Orange” tag restriction. Each of its applications is launched only on machines in that delivery group that have the tag “Orange,” VDA 102 and 103.

For more comprehensive examples and guidance for using tag restrictions in application groups (and for desktops), see Tags.

**Guidance and considerations**

Citrix recommends adding applications to either application groups or delivery groups, but not both. Otherwise, the additional complexity of having applications in two group types can make it more difficult to manage.

By default, an application group is enabled. After you create an application group, you can edit the group to change this setting. See Manage application groups.

By default, application session sharing between application groups is enabled. See Session sharing between application groups.

Citrix recommends upgrading your delivery groups to the current version. This process requires:

1. Upgrading VDAs on the machines used in the delivery group.
2. Upgrading the machine catalogs containing those machines.
3. Upgrading the delivery group.

For details, see Manage delivery groups.

To use application groups, your core components must be minimum version 7.9.

Creating application groups requires the delegated administration permission of the Delivery Group Administrator built-in role. See Delegated administration for details.
This article refers to “associating” an application with more than one application group. It differentiates that action from adding instances of that application from an available source. Similarly, delivery groups are associated with application groups, rather than being additions or components of one another.

**Session sharing with application groups**

When application session sharing is enabled, all applications launch in the same application session. This saves the costs associated with launching more application sessions, and allows the use of application features that involve the clipboard, such as copy-paste operations. However, in some situations you can clear session sharing.

When you use application groups you can configure application session sharing in the following three ways which extend the standard session sharing behavior available when you are using only delivery groups:

- Session sharing enabled between application groups.
- Session sharing enabled only between applications in the same application group.
- Session sharing disabled.

**Session sharing between application groups**

You can enable application session sharing between application groups, or you can disable it to limit application session sharing only to applications in the same application group.

- **An example when enabling session sharing between application groups is helpful:**

  Application group 1 contains Microsoft Office applications such as Word and Excel. Application group 2 contains other applications such as Notepad and Calculator, and both application groups are attached to the same delivery group. A user who has access to both application groups starts an application session by launching Word, and then launches Notepad. If the controller finds that the user’s existing session running Word is suitable for running Notepad then Notepad is started within the existing session. If Notepad cannot be run from the existing session—for example if the tag restriction excludes the machine that the session is running on—then a new session on a suitable machine is created rather than using session sharing.

- **An example when disabling session sharing between application groups is helpful:**

  A configuration with a set of applications that do not interoperate well with other applications that are installed on the same machines. Such as two different versions of the same software suite or two different versions of the same web browser. You prefer not to allow a user to launch both versions in the same session.
Create an application group for each version of the software suite, and add the applications for each version of the software suite to the corresponding application group. If session sharing between groups is disabled for each of those application groups, a user specified in those groups can run applications of the same version in the same session. The user can still run other applications at the same time, but not in the same session. When launching one of the different-versioned applications, or any application that is not contained in an application group, that application is launched in a new session.

This session sharing between application groups feature is not a security sandboxing feature. It is not foolproof, and it cannot prevent users from launching applications into their sessions through other means (for example, through Windows Explorer).

If a machine is at capacity, new sessions are not started on it. New applications are started in existing sessions on the machine as needed using session sharing.

You can only make prelaunched sessions available to application groups which have application session sharing allowed. (Sessions which use the session linger feature are available to all application groups.) These features must be enabled and configured in each of the delivery groups associated with the application group. You cannot configure them in the application groups.

By default, application session sharing between application groups is enabled when you create an application group. You cannot change this when you create the group. After you create an application group, you can edit the group to change this setting. See Manage application groups.

**Disable session sharing within an application group**

You can prevent application session sharing between applications which are in the same application group.

- **An example when disabling session sharing within application groups is helpful:**

  You want your users to access multiple simultaneous full screen sessions of an application on separate monitors.

  You create an application group and add the applications to it.

By default, application session sharing is enabled when you create an application group. You cannot change this setting when you create the group. After you create an application group, you can edit the group to change this setting. See Manage application groups.

**Create an application group**

To create an application group:

1. Select Applications in the Studio navigation pane, and then select Create Application Group in the Actions pane.
2. The wizard launches with an **Introduction** page, which you can remove from future launches of this wizard.

3. The wizard guides you through the pages described in the following section. When you are done with each page, click **Next** until you reach the Summary page.

**Step 1. Delivery Groups**

The **Delivery Groups** page lists all delivery groups, with the number of machines each group contains.

- The **Compatible Delivery Groups** list contains delivery groups you can select. Compatible delivery groups contain random (not permanently or statically assigned) multi-session or single-session OS machines.
- The **Incompatible Delivery Groups** list contains delivery groups you cannot select. Each entry explains why it is not compatible, such as containing statically assigned machines.

An application group can be associated with delivery groups containing shared (not private) machines that can deliver applications.

You can also select delivery groups containing shared machines that deliver only desktops, if both of the following conditions are met:

- The delivery group contains shared machines and was created with a XenDesktop version earlier than 7.9.
- You have Edit Delivery Group permission.

The delivery group type is automatically converted to “desktops and applications” when the application group creation wizard is committed.

Although you can create an application group that has no associated delivery groups (perhaps to organize applications or to serve as storage for applications not currently used) the application group cannot be used to deliver applications until it specifies at least one delivery group. Also, you cannot add applications to the application group from the **From Start** menu source if there are no delivery groups specified.

The delivery groups you select specify the machines that are used to deliver applications. Select the check boxes next to the delivery groups you want to associate with the application group.

To add a tag restriction, select **Restrict launches to machines with the tag** and then select the tag from the drop-down list.

**Step 2. Users**

Specify application users in the application group. Either allow all users and user groups in the delivery groups you selected on the previous page, or select specific users and user groups from those delivery groups. If you restrict use to specified users, then only the users specified in the delivery
group, the application group can access the applications in this group. Essentially, the user list in the application group provides a filter on the user lists in the delivery groups.

Enabling or disabling application use by unauthenticated users is available only in delivery groups, not in application groups.

For information about where user lists are specified in a deployment, see Where user lists are specified.

**Step 3. Applications**

Good to know:

- By default, new applications you add are placed in a folder named **Applications**. You can specify a different folder. If you try to add an application and one with the same name exists in that folder, you are prompted to rename the application you are adding. If you agree with the suggested unique name, the application is added with that new name. Otherwise, you must rename it yourself before it can be added. For details, see Manage application folders.
- You can change an application’s properties (settings) when you add it, or later. See Change application properties. If you publish two applications with the same name to the same users, change the **Application name (for user)** property in Studio. Otherwise, users see duplicate names in Citrix Workspace app.
- When you add an application to more than one application group, a visibility issue can occur if you do not have sufficient permission to view the application in all of those groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the groups to which the application was added.

Click the **Add** from the drop-down menu to display the application sources.

- **From Start menu**: Applications that are discovered on a machine in the selected delivery groups. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add, and then click **OK**.

  This source cannot be selected if you selected any of the following:
  - Application groups that have no associated delivery groups.
  - Application groups with associated delivery groups that contain no machines.
  - A delivery group containing no machines.

- **Manually defined**: Applications located in the site or elsewhere in your network. When you select this source, a new page launches where you type the path to the executable, working directory, optional command line arguments, and display names for administrators and users. After entering this information, click **OK**.

- **Existing**: Applications previously added to the site. When you select this source, a new page
launches with a list of discovered applications. Select the check boxes of applications to add and then click OK. This source cannot be selected if the site has no applications.

- **App-V**: Applications in App-V packages. When you select this source, a new page launches where you select the App-V server or the Application Library. From the resulting display, select the check boxes of applications to add, and then click OK. For more information, see App-V. This source cannot be selected (or might not appear) if App-V is not configured for the site.

As noted, certain entries in the **Add** drop-down menu are not selectable if there is no valid source of that type. Sources that are incompatible are not listed at all (for example, you cannot add application groups to application groups, so that source is not listed when you create an application group).

**Step 4. Scopes**

This page appears only if you have previously created a custom scope. By default, the **All** scope is selected. For more information, see Delegated administration.

**Step 5. Summary**

Enter a name for the application group. You can also (optionally) enter a description.

Review the summary information and then click Finish.

**Manage application groups**

August 20, 2020

**Introduction**

This article describes how to manage the application groups you created.

See Applications for information about managing applications in application groups or delivery groups, including how to:

- Add or remove applications in an application group.
- Change application group associations.

Managing application groups requires the delegated administration permissions of the Delivery Group Administrator built-in role. See Delegated administration for details.
Enable or disable an application group

When an application group is enabled, it can deliver the applications that have been added to it. Disabling an application group disables each application in that group. However, if those applications are also associated with other enabled application groups, they can be delivered from those other groups. If the application was explicitly added to delivery groups associated with the application group, disabling the application group does not affect the applications in those delivery groups.

An application group is enabled when you create it. You cannot change this configuration when you create the group.

1. Select **Applications** in the Studio navigation pane.
2. Select an application group in the middle pane and then select **Edit Application Group** in the Actions pane.
3. On the **Settings** page, select or clear the **Enable Application Group** check box.
4. Click **Apply** to keep the window open, or click **OK** to apply changes and close the window.

Enable or disable application session sharing between application groups

Session sharing between application groups is enabled when you create an application group. You cannot change this configuration when you create the group. For more information, see Session sharing with application groups.

1. Select **Applications** in the Studio navigation pane.
2. Select an application group in the middle pane and then select **Edit Application Group** in the Actions pane.
3. On the **Settings** page, select or clear the **Enable application session sharing between Application Groups** check box.
4. Click **Apply** to keep the window open, or click **OK** to apply changes and close the window.

Disable application session sharing within an application group

Session sharing between applications in the same application group is enabled by default when you create an application group. If you disable application session sharing between application groups, session sharing between applications in the same application group remains enabled.

You can use the PowerShell SDK to configure application groups with application session sharing disabled between the applications they contain. In some circumstances this option is desirable. For example, you might want users to start non-seamless applications in full-size application windows on separate monitors.

When you disable application session sharing within an application group, each application in that group launches in a new application session. If a suitable disconnected session is available which is
running the same application, it is reconnected. For example, when launching Notepad with a discon-
nected session with Notepad running, that session is reconnected instead of creating a one. When
multiple suitable disconnected sessions are available, one of the sessions is chosen to reconnect to,
in a random but deterministic manner. When the situation reoccurs in the same circumstances, the
same session is chosen, but the session is not necessarily predictable otherwise.

Use the PowerShell SDK either to disable application session sharing for all applications in an existing
application group, or to create a group with application session sharing disabled.

**PowerShell cmdlet examples**

To disable session sharing, use the Broker PowerShell cmdlets `New-BrokerApplicationGroup` or
`Set-BrokerApplicationGroup` with the parameter `SessionSharingEnabled` set to `False` and
the parameter `SingleAppPerSession` set to `True`.

- For example, to create an application group with application session sharing disabled for all
  applications in the group:

  ```powershell
  New-BrokerApplicationGroup AppGr1 -SessionSharingEnabled $False -
  SingleAppPerSession $True
  ```

- For example, to disable application session sharing between all applications in an existing ap-
  plication group:

  ```powershell
  Set-BrokerApplicationGroup AppGr1 -SessionSharingEnabled $False -
  SingleAppPerSession $True
  ```

**Considerations**

- To enable the `SingleAppPerSession` property you must set the `SessionSharingEnabled`
  property to `False`. The two properties must not be enabled at the same time. The `SessionSharingEnabled`
  parameter refers to sharing sessions between application
  groups.

- Application session sharing works only for applications that are associated with application
  groups but are not associated with delivery groups. All applications associated directly with
  a delivery group share sessions by default.

- If an application is assigned to multiple application groups, make sure that the groups do not
  have conflicting settings. For example, one group with the option set to `True`, and another
  group's option set to `False` results in unpredictable behavior.

**Rename an application group**

1. Select **Applications** in the Studio navigation pane.
2. Select an application group in the middle pane and then select Rename Application Group in the Actions pane.
3. Specify the new unique name and then click OK.

Add, remove, or change the priority of delivery group associations with an application group

An application group can be associated with delivery groups containing shared (not private) machines that can deliver applications.

You can also select delivery groups containing shared machines that deliver only desktops, if both of the following conditions are met:

- The delivery group contains shared machines and was created with a version earlier than 7.9.
- You have Edit Delivery Group permission.

The delivery group type is automatically converted to “desktops and applications” when the Edit Application Group dialog is committed.

1. Select Applications in the Studio navigation pane.
2. Select an application group in the middle pane and then select Edit Application Group in the Actions pane.
3. Select the Delivery Groups page.
4. To add delivery groups, click Add. Select the check boxes of available delivery groups. (Incompatible delivery groups cannot be selected.) When you finish your selections, click OK.
5. To remove delivery groups, select the check boxes of the groups you want to remove and then click Remove. Confirm the deletion when prompted.
6. To change the priority of delivery groups, select the check box of the delivery group and then click Edit Priority. Enter the priority (0 = highest) and then click OK.
7. Click Apply to apply any changes you made and keep the window open, or click OK to apply changes and close the window.

Add, change, or remove a tag restriction in an application group

Adding, changing, and removing tag restrictions can have unanticipated effects on which machines are considered for application launch. Review the considerations and cautions in Tags.

1. Select Applications in the Studio navigation pane.
2. Select an application group in the middle pane and then select Edit Application Group in the Actions pane.
3. Select the Delivery Groups page.
4. To add a tag restriction, select Restrict launches to machines with the tag and then select the tag from the drop-down list.
5. To change or remove a tag restriction, select a different tag or remove the tag restriction entirely by clearing **Restrict launches to machines with this tag**.
6. Click **Apply** to apply any changes you made and keep the window open, or click **OK** to apply changes and close the window.

**Add or remove users in an application group**

For detailed information about users, see **Create application groups**.

1. Select **Applications** in the Studio navigation pane.
2. Select an application group in the middle pane and then select **Edit Application Group** in the Actions pane.
3. Select the **Users** page. Indicate whether you want to allow all users in the associated delivery groups to use applications in the application group, or only specific users and groups. To add users, click **Add**, and then specify the users you want to add. To remove users, select one or more users and then click **Remove**.
4. Click **Apply** to apply any changes you made and keep the window open, or click **OK** to apply changes and close the window.

**Change scopes in an application group**

You can change a scope only if you have created a scope (you cannot edit the All scope). For more information, see **Delegated administration**.

1. Select **Applications** in the Studio navigation pane.
2. Select an application group in the middle pane and then select **Edit Application Group** in the Actions pane.
3. Select the **Scopes** page. Select or clear the check box next to a scope.
4. Click **Apply** to apply any changes you made and keep the window open, or click **OK** to apply changes and close the window.

**Delete an application group**

An application must be associated with at least one delivery group or application group. If deleting an application group results in one or more applications no longer belonging to a group, you are warned that deleting that group also removes those applications. You can then confirm or cancel the deletion. Deleting an application does not delete it from its original source. However, if you want to make it available again, you must add it again.

1. Select **Applications** in the Studio navigation pane.
2. Select an application group in the middle pane and then select **Delete Group** in the Actions pane.
Remote PC Access

September 16, 2020

Remote PC Access is a feature of Citrix Virtual Apps and Desktops that enables organizations to easily allow their employees to access corporate resources remotely in a secure manner. The Citrix platform makes this secure access possible by giving users access to their physical office PCs. If users can access their office PCs, they can access all the applications, data, and resources they need to do their work. Remote PC Access eliminates the need to introduce and provide other tools to accommodate teleworking. For example, virtual desktops or applications and their associated infrastructure.

Remote PC Access uses the same Citrix Virtual Apps and Desktops components that deliver virtual desktops and applications. As a result, the requirements and process of deploying and configuring Remote PC Access are the same as those required for deploying Citrix Virtual Apps and Desktops for the delivery of virtual resources. This uniformity provides a consistent and unified administrative experience. Users receive the best user experience by using Citrix HDX to deliver their office PC session.

The feature consists of a machine catalog of type Remote PC Access that provides this functionality:

- Ability to add machines by specifying OUs. This ability facilitates the addition of PCs in bulk.
- Automatic user assignment based on the user that logs into the office Windows PC. We support single user and multiple users assignments.

Citrix Virtual Apps and Desktops can accommodate more use cases for physical PCs by using other types of machine catalogs. These use cases include:

- Physical Linux PCs
- Pooled physical PCs (that is, randomly assigned, not dedicated)

Notes:

For details on the supported OS versions, see the system requirements for the VDA for single-session OS and Linux VDA.

For on-premises deployments, Remote PC Access is valid only for Citrix Virtual Apps and Desktops Advanced or Premium licenses. Sessions consume licenses in the same way as other Citrix Virtual Desktops sessions. For Citrix Cloud, Remote PC Access is valid for the Citrix Virtual Apps and Desktops Service and Workspace Premium Plus.
Considerations

While all the technical requirements and considerations that apply to Citrix Virtual Apps and Desktops in general also apply to Remote PC Access, some might be more relevant or exclusive to the physical PC use case.

Deployment considerations

While planning the deployment of Remote PC Access, make a few general decisions.

- You can add Remote PC Access to an existing Citrix Virtual Apps and Desktops deployment. Before choosing this option, consider the following:
  - Are the current Delivery Controllers or Cloud Connectors appropriately sized to support the additional load associated with the Remote PC Access VDAs?
  - Are the on-premises site databases and database servers appropriately sized to support the additional load associated with the Remote PC Access VDAs?
  - Will the existing VDAs and the new Remote PC Access VDAs exceed the number of maximum supported VDAs per site?
- You must deploy the VDA to office PCs through an automated process. The following are the available options:
  - Electronic Software Distribution (ESD) tools such as SCCM: Install VDAs using SCCM.
  - Deployment scripts: Install VDAs using scripts.
- Review the Remote PC Access security considerations.

Machine catalog considerations

The type of machine catalog required depends on the use case:

- Remote PC Access
  - Windows dedicated PCs
  - Windows dedicated multi-user PCs
- Single-session OS
  - Static - Dedicated Linux PCs
  - Random - Pooled Windows and Linux PCs

Once you identify the type of machine catalog, consider the following:

- A machine can be assigned to only one machine catalog at a time.
- To facilitate delegated administration, consider creating machine catalogs based on geographic location, department, or any other grouping that eases delegating administration of each catalog to the appropriate administrators.
- When choosing the OUs in which the machine accounts reside, select lower-level OUs for greater granularity. If such granularity is not required, you can choose higher-level OUs. For example,
in the case of Bank/Officers/Tellers, select **Tellers** for greater granularity. Otherwise, you can select **Officers** or **Bank** based on the requirement.

- Moving or deleting OUs after being assigned to a Remote PC Access machine catalog affects VDA associations and causes issues with future assignments. Therefore, make sure to plan accordingly so that OU assignment updates for machine catalogs are accounted for in the Active Directory change plan.
- If it is not easy to choose OUs to add machines to the machine catalog because of the OU structure, you don’t have to select any OUs. You can use PowerShell to add machines to the catalog afterward. User auto-assignments continue to work if the desktop assignment is configured correctly in the Delivery Group. A sample script to add machines to the machine catalog along with user assignments is available in [GitHub](https://github.com).
- Integrated Wake on LAN is available only with the **Remote PC Access** type machine catalog.

**Linux VDA considerations**

These considerations are specific to the Linux VDA:

- Use the Linux VDA on physical machines only in non-3D mode. Due to limitations on NVIDIA's driver, the local screen of the PC cannot be blacked out and displays the activities of the session when HDX 3D mode is enabled. Showing this screen is a security risk.
- Use machine catalogs of type single-session OS for physical Linux machines.
- The integrated Wake on LAN functionality is not available for Linux machines.

**Technical requirements and considerations**

This section contains the technical requirements and considerations for physical PCs.

- The following are not supported:
  - KVM switches or other components that can disconnect a session.
  - Hybrid PCs, including All-in-One and NVIDIA Optimus laptops and PCs.
- Connect the keyboard and mouse directly to the PC. Connecting to the monitor or other components that can be turned off or disconnected, can make these peripherals unavailable. If you must connect the input devices to components such as monitors, do not turn those components off.
- The PCs must be joined to an Active Directory Domain Services domain.
- Secure Boot is supported on Windows 10 only.
- The PC must have an active network connection. A wired connection is preferred for greater reliability and bandwidth.
- If using Wi-Fi, do the following:
1. Set the power settings to leave the wireless adapter turned on.
2. Configure the wireless adapter and network profile to allow automatic connection to the wireless network before the user logs on. Otherwise, the VDA does not register until the user logs on. The PC isn’t available for remote access until a user has logged on.
3. Ensure that the Delivery Controllers or Cloud Connectors can be reached from the Wi-Fi network.

- You can use Remote PC Access on laptop computers. Ensure the laptop is connected to a power source instead of running on the battery. Configure the laptop power options to match the options of a desktop PC. For example:
  1. Disable the hibernate feature.
  2. Disable the sleep feature.
  3. Set the close lid action to **Do Nothing**.
  4. Set the “press the power button” action to **Shut Down**.
  5. Disable video card and NIC energy-saving features.

- Remote PC Access is supported on Surface Pro devices with Windows 10. Follow the same guidelines for laptops mentioned previously.

- If using a docking station, you can undock and redock laptops. When you undock the laptop, the VDA reregisters with the Delivery Controllers or Cloud Connectors over Wi-Fi. However, when you redock the laptop, the VDA doesn’t switch to use the wired connection unless you disconnect the wireless adapter. Some devices provide built-in functionality to disconnect the wireless adapter upon establishing a wired connection. The other devices require custom solutions or third-party utilities to disconnect the wireless adapter. Review the Wi-Fi considerations mentioned previously.

Do the following to enable docking and undocking for Remote PC Access devices:

1. In the **Start** menu, select **Settings > System > Power & Sleep**, and set **Sleep** to **Never**.
2. Under the **Device Manager > Network adapters > Ethernet adapter** go to **Power Management** and clear **Allow the computer to turn off this device to save power**. Ensure that **Allow this device to wake the computer** is checked.

- Multiple users with access to the same office PC see the same icon in Citrix Workspace. When a user logs on to Citrix Workspace, that resource appears as unavailable if already in use by another user.

- Install the Citrix Workspace app on each client device (for example, a home PC) that accesses the office PC.
Configuration sequence

This section contains an overview of how to configure Remote PC Access when using the Remote PC Access type machine catalog. For information on how to create other types of machine catalogs, see the Create machine catalogs.

1. On-premises site only - To use the integrated Wake on LAN feature, configure the prerequisites outlined in Wake on LAN.

2. If a new Citrix Virtual Apps and Desktops site was created for Remote PC Access:
   a) Select the Remote PC Access Site type.
   b) On the Power Management page, choose to enable or disable power management for the default Remote PC Access machine catalog. You can change this setting later by editing the machine catalog properties. For details on configuring Wake on LAN, see Wake on LAN.
   c) Complete the information on the Users and Machine Accounts pages.

Completing these steps creates a machine catalog named Remote PC Access Machines and a Delivery Group named Remote PC Access Desktops.

3. If adding to an existing Citrix Virtual Apps and Desktops site:
   a) Create a machine catalog of type Remote PC Access (Operating System page of the wizard). For details on how to create a machine catalog, see Create machine catalogs. Make sure to assign the correct OU so that the target PCs are made available for use with Remote PC Access.
   b) Create a Delivery Group to provide users access to the PCs in the machine catalog. For details on how to create a Delivery Group, see Create Delivery Groups. Make sure to assign the Delivery Group to an Active Directory group that contains the users that require access to their PCs.

4. Deploy the VDA to the office PCs.
   • We recommend using the single-session OS core VDA installer (VDAWorkstationCore-Setup.exe).
   • You can also use the single-session full VDA installer (VDAWorkstationSetup.exe) with the /remotecpc option, which achieves the same outcome as using the core VDA installer.
   • Consider enabling Windows Remote Assistance to allow help desk teams to provide remote support through Citrix Director. To do so, use the /enable_remote_assistance option. For details, see Install using the command line.
   • To be able to see logon duration information in Director, you must use the single-session full VDA installer and include the Citrix User Profile Manager WMI Plugin component. Include this component by using the /includeadditional option. For details, see Install using the command line.
   • For information about deploying the VDA using SCCM, see Install VDAs using SCCM.
• For information about deploying the VDA through deployment scripts, see Install VDAs using scripts.

After you successfully complete steps 2–4, users are automatically assigned to their own machines when they log in locally on the PCs.

5. Instruct users to download and install Citrix Workspace app on each client device that they use to access the office PC remotely. Citrix Workspace app is available from https://www.citrix.com/downloads/ or the application stores for supported mobile devices.

Features managed through the registry

Caution:

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Disable multiple user auto-assignments

On each Delivery Controller, add the following registry setting:

HKEY_LOCAL_MACHINE\Software\Citrix\DesktopServer

• Name: AllowMultipleRemotePCAssignments
• Type: DWORD
• Data: 0

Sleep mode (minimum version 7.16)

To allow a Remote PC Access machine to go into a sleep state, add this registry setting on the VDA, and then restart the machine. After the restart, the operating system power saving settings are respected. The machine goes into sleep mode after the preconfigured idle timer passes. After the machine wakes up, it reregisters with the Delivery Controller.

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA

• Name: DisableRemotePCSleepPreventer
• Type: DWORD
• Data: 1
Session management

By default, a remote user’s session is automatically disconnected when a local user initiates a session on that machine (by pressing CTRL+ALT+DEL). To prevent this automatic action, add the following registry entry on the office PC, and then restart the machine.

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA\RemotePC

- Name: SasNotification
- Type: DWORD
- Data: 1

By default, the remote user has preference over the local user when the connection message is not acknowledged within the timeout period. To configure the behavior, use this setting:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA\RemotePC

- Name: RpcaMode
- Type: DWORD
- Data:
  - 1 - The remote user always has preference if he or she does not respond to the messaging UI in the specified timeout period. This behavior is the default if this setting is not configured.
  - 2 - The local user has preference.

The timeout for enforcing the Remote PC Access mode is 30 seconds by default. You can configure this timeout but do not set it lower than 30 seconds. To configure the timeout, use this registry setting:

HKLM\SOFTWARE\Citrix\PortICA\RemotePC

- Name: RpcaTimeout
- Type: DWORD
- Data: number of seconds for timeout in decimal values

When a user wants to forcibly get the console access: The local user can press Ctrl+Alt+Del twice in a gap of 10 seconds to get local control over a remote session and force a disconnect event.

After the registry change and machine restart, if a local user presses Ctrl+Alt+Del to log on to that PC while it is in use by a remote user, the remote user receives a prompt. The prompt asks whether to allow or deny the local user’s connection. Allowing the connection disconnects the remote user’s session.

Wake on LAN

Remote PC Access supports Wake on LAN, which gives users the ability to turn on physical PCs remotely. This feature enables users to keep their office PCs turned off when not in use to save energy costs. It also enables remote access when a machine has been turned off inadvertently.
With the Wake on LAN feature, the magic packets are sent directly from the VDA running on the PC to the subnet in which the PC resides when instructed by the delivery controller. This allows the feature to work without dependencies on additional infrastructure components or third-party solutions for delivery of magic packets.

The Wake on LAN feature differs from the legacy SCCM-based Wake on LAN feature. For information on the SCCM-based Wake on LAN, see Wake on LAN – SCCM-integrated.

System requirements

The following are the system requirements for using the Wake on LAN feature:

- **Control plane:**
  - Citrix Virtual Apps and Desktops Service
  - Citrix Virtual Apps and Desktops 2009 or later
- **Physical PCs:**
  - VDA version 2009 or later
  - Windows 10. For supportability details, see the VDA system requirements.
  - Wake on LAN enabled in BIOS/UEFI
  - Wake on LAN enabled in network adapter’s properties within Windows configuration

Configure Wake on LAN

Currently, the configuration of integrated Wake on LAN is only supported using PowerShell.

To configure Wake on LAN:

1. Create the Remote PC Access machine catalog if you do not have one already.

2. Create the Wake on LAN host connection if you do not have one already.

   **Note:**
   
   To use the Wake on LAN feature, if you have a host connection of the “Microsoft Configuration Manager Wake on LAN” type, create a new host connection.

3. Retrieve the Wake on LAN host connection’s unique identifier.

4. Associate the Wake on LAN host connection with a machine catalog.

To create the Wake on LAN host connection:

```bash
# Load Citrix SnapIns
Add-PSSnapIn -Name ”*citrix*”

# Provide the name of the Wake on LAN host connection
```
When the host connection is ready, run the following commands to retrieve the host connection's unique identifier:

```
$bhc = Get-BrokerHypervisorConnection -Name "<WoL Connection Name>"
$hypUid = $bhc.Uid
```

After you retrieve the connection's unique identifier, run the following commands to associate the connection with the Remote PC Access machine catalog:

```
Get-BrokerCatalog -Name "<Catalog Name>" | Set-BrokerCatalog -RemotePCHypervisorConnectionUid $hypUid
```

**Design considerations**

When you are planning to use Wake on LAN with Remote PC Access, consider the following:
Multiple machine catalogs can use the same Wake on LAN host connection. For a PC to wake up another PC, both PCs must be in the same subnet and use the same Wake on LAN host connection. It does not matter if the PCs are in the same or different machine catalogs. Host connections are assigned to specific zones. If your deployment contains more than one zone, you need a Wake on LAN host connection in each zone. The same applies to machine catalogs. Magic packets are broadcasted using the global broadcast address 255.255.255.255. Ensure that the address is not blocked. There must be at least one PC turned on in the subnet - for every Wake on LAN connection - to be able to wake up machines in that subnet.

**Operational considerations**

The following are considerations for using the Wake on LAN feature:

- The VDA must register at least once before the PC can be woken up using the integrated Wake on LAN feature.
- Wake on LAN can only be used to wake up PCs. It does not support other power actions, such as restart or shut down.
- After the Wake on LAN connection is created, it is visible in Studio. However, editing its properties within Studio is currently not supported.
- Magic packets are sent in one of the two ways:
  1. When a user tries to launch a session to their PC and the VDA is unregistered
  2. When an administrator manually sends a power on command from Studio or PowerShell
- Because the delivery controller is unaware of a PC’s power state, Studio displays **Not Supported** under power state. The delivery controller uses the VDA registration state to determine whether a PC is on or off.

**Wake on LAN – SCCM-integrated**

SCCM-integrated Wake on LAN is an alternative Wake on LAN option for Remote PC Access that is only available with on-premises Citrix Virtual Apps and Desktops.

**System requirements**

The following are the system requirements for using the SCCM-integrated Wake on LAN feature:

- Citrix Virtual Apps and Desktops 1912 or later
- Physical PCs:
  - VDA version 1912 or later
  - Windows 10. For supportability details, see the [VDA system requirements](#).
- Wake on LAN enabled in BIOS/UEFI
- Wake on LAN enabled in network adapter’s properties within Windows configuration
- System Center Configuration Manager (SCCM) 2012 R2 or later

**Configure SCCM-integrated Wake on LAN**

Complete the following prerequisites:

1. Configure SCCM 2012 R2, 2016, or 2019 within the organization. Then deploy the SCCM client to all Remote PC Access machines, allowing time for the scheduled SCCM inventory cycle to run, or force one manually, if necessary.
2. For Wake Proxy support, enable the option in SCCM. For each subnet in the organization that contains PCs that use the Remote PC Access Wake on LAN feature, ensure that three or more machines can serve as sentinel machines.
3. For magic packet support, configure network routers and firewalls to allow magic packets to be sent, using either a subnet-directed broadcast or unicast.
4. Configure Wake on LAN in each PC’s BIOS/UEFI settings.
5. Deploy the VDA to the physical PCs if you haven’t done it already.

After you address the prerequisites, complete the following steps to allow the Delivery Controller to communicate with SCCM:

1. Create a host connection for SCCM. For more information, see Connections and resources.
   - Select Microsoft Configuration Manager Wake on LAN as the connection type.
   - The credentials entered must have access to the collections in the scope and must have the Remote Tools Operator role.
2. Select the connection in Studio, then select Edit Connection, and click Advanced.
3. Select the appropriate option for handling Wake on LAN:
   - If you are using Wake-up proxy, select the first option: Microsoft System Center Configuration Manager Wake-up proxy.
   - If you are using magic packets, select the second option: Wake on LAN packets transmitted by the Delivery Controller.
     - Select the appropriate transmission method: subnet-directed broadcasts or unicast.

After you create the host connection, associate the connection with a Remote PC Access catalog:

- If you are creating a new Remote PC Access catalog, in the Operating System page of the catalog creation wizard, select Remote PC Access as the catalog type and choose the appropriate connection from the drop-down list.
- To add Wake on LAN to an existing Remote PC Access catalog:
  1. Go to the Machine Catalogs node in Studio, select the machine catalog, and then select Edit Machine Catalog.
2. Select the **Power Management** tab and choose **Yes** to enable power management for the machine catalog.

3. Select the appropriate connection from the drop-down list and click **OK**.

**Troubleshoot**

**Monitor blanking not working**

If the Windows PC’s local monitor is not blank while there is an active HDX session (the local monitor displays what’s happening in the session) it is likely due to issues with the GPU vendor’s driver. To resolve the issue, give the Citrix Indirect Display driver (IDD) higher priority than the graphic card’s vendor driver by setting the following registry value:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Graphics\AdapterMerits
```

- Name: CitrixIDD
- Type: DWORD
- Data: 3

For more details about display adapter priorities and monitor creation, see the Knowledge Center article [CTX237608](https://support.citrix.com).  

**Session disconnects when you select Ctrl+Alt+Del on the machine that has session management notification enabled**

The session management notification controlled by the **SasNotification** registry value only works when Remote PC Access mode is enabled on the VDA. If the physical PC has the Hyper-V role or any virtualization-based security features enabled, the PC reports as a virtual machine. If the VDA detects that it is running on a virtual machine, it automatically disables Remote PC Access mode. To enable Remote PC Access mode, add the following registry value:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA
```

- Name: ForceEnableRemotePC
- Type: DWORD
- Data: 1

Restart the PC for the setting to take effect.

**Diagnostic information**

Diagnostic information about Remote PC Access is written to the Windows Application Event log. Informational messages are not throttled. Error messages are throttled by discarding duplicate messages.

- 3300 (informational): Machine added to catalog
- 3301 (informational): Machine added to delivery group
- 3302 (informational): Machine assigned to user
- 3303 (error): Exception

**Power management**

If power management for Remote PC Access is enabled, subnet-directed broadcasts might fail to start machines that are on a different subnet from the Controller. If you need power management across subnets using subnet-directed broadcasts, and AMT support is not available, try the Wake-up proxy or Unicast method. Ensure those settings are enabled in the advanced properties for the power management connection.

**The active remote session records the local touchscreen input**

When the VDA enables Remote PC Access mode, the machine ignores the local touchscreen input during an active session. If the physical PC has the Hyper-V role or any virtualization-based security features enabled, the PC reports as a virtual machine. If the VDA detects that it is running on a virtual machine, it automatically disables Remote PC Access mode. To enable Remote PC Access mode, add the following registry setting:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\PortICA
```

- Name: ForceEnableRemotePC
- Type: DWORD
- Data: 1

Restart the PC for the setting to take effect.

**App-V**

September 14, 2020
Using App-V with Citrix Virtual Apps and Desktops

Microsoft Application Virtualization (App-V) lets you deploy, update, and support applications as services. Users access applications without installing them on their own devices. App-V and Microsoft User State Virtualization (USV) provide access to applications and data, regardless of location and connection to the internet.

The following table lists supported versions.

<table>
<thead>
<tr>
<th>App-V</th>
<th>Citrix Virtual Apps and Desktops Delivery Controller</th>
<th>Citrix Virtual Apps and Desktops VDA</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0 and 5.0 SP1</td>
<td>XenDesktop 7 through current, XenApp 7.5 through current</td>
<td>7.0 through current</td>
</tr>
<tr>
<td>5.0 SP2</td>
<td>XenDesktop 7 through current, XenApp 7.5 through current</td>
<td>7.1 through current</td>
</tr>
<tr>
<td>5.0 SP3 and 5.1</td>
<td>XenDesktop 7.6 through current, XenApp 7.6 through current</td>
<td>7.6.300 through current</td>
</tr>
<tr>
<td>App-V in Windows Server 2016</td>
<td>XenDesktop 7.12 through current, XenApp 7.12 through current</td>
<td>7.12 through current</td>
</tr>
</tbody>
</table>

The App-V client does not support offline access to applications. App-V integration support includes using SMB shares for applications. The HTTP protocol is not supported.

If you’re not familiar with App-V, see the Microsoft documentation. Here’s a recap of the App-V components mentioned in this article:

- **Management server.** Provides a centralized console to manage App-V infrastructure and delivers virtual applications to both the App-V Desktop Client and a Remote Desktop Services Client. The App-V management server authenticates, requests, and provides the security, metering, monitoring, and data gathering required by the administrator. The server uses Active Directory and supporting tools to manage users and applications.
- **Publishing server.** Provides App-V clients with applications for specific users, and hosts the virtual application package for streaming. It fetches the packages from the management server.
- **Client.** Retrieves virtual applications, publishes the applications on the client, and automatically sets up and manages virtual environments at runtime on Windows devices. You install the App-V client on the VDA, where it stores user-specific virtual application settings such as registry
Applications are available seamlessly without any pre-configuration or changes to operating system settings. You can launch App-V applications from Server OS and Desktop OS Delivery Groups:

- Through Citrix Workspace app
- Through the App-V client and Citrix Workspace app
- Simultaneously by multiple users on multiple devices
- Through Citrix StoreFront

Modified App-V application properties are implemented when the application is started. For example, for applications with a modified display name or customized icon, the modification appears when users start the application. Application customizations saved in dynamic configuration files are also applied when the application is launched.

Management methods

You can use App-V packages and dynamic configuration files created with the App-V sequencer and then located on either App-V servers or network shares.

- **App-V servers:** Using applications from packages on App-V servers requires ongoing communication between Studio and the App-V servers for discovery, configuration, and downloading to the VDAs. This incurs hardware, infrastructure, and administration overhead. Studio and the App-V servers must remain synchronized, particularly for user permissions.

  This is called the *dual admin* management method because App-V package and application access requires both Studio and the App-V server consoles. This method works best in closely coupled App-V and Citrix deployments. In this method, the management server handles the dynamic configuration files. When you use the dual admin management method, the Citrix App-V components manage the registration of the appropriate publishing server required for an application launch. This ensures that the publishing server is synchronized for the user at the appropriate time. The publishing server maintains other aspects of the package lifecycle (like refresh on logon and connection groups) using the settings that it is configured with.

- **Network share:** Packages and XML deployment configuration files placed on a network share remove Studio’s dependence on the App-V server and database infrastructure, reducing overhead. (You must install the Microsoft App-V client on each VDA.)

  This is called the *single admin* management method because App-V package and application use only needs the Studio console. You browse to the network share and add one or more App-V packages from that location to the Site-level Application Library [1]. In this method, the Citrix App-V components process the Deployment Configuration Files when the application is launched. (User Configuration Files are not supported.) When you use the single admin management method, the Citrix App-V components manage all aspects of the Package’s lifecycle on
the host machine. Packages are added to the machine at broker startup, or when a configuration change is detected (which can also be at session launch time). Packages are first published to individual users on demand ‘just in time’ when a launch request is received from the Citrix Workspace app.

Single Admin also manages the lifecycle of connection groups required to meet the Isolation Group configuration definitions made in Studio.

[1] Application Library is a Citrix term for a caching repository that stores information about App-V packages. The Application Library also stores information about other Citrix application delivery technologies.

In both management methods, if the VDA is configured to discard user data, the publishing (or synchronizing) must be redone at the next session launch.

You can use one or both management methods simultaneously. In other words, when you add applications to Delivery Groups, the applications can come from App-V packages located on App-V servers or on a network share.

Note: If you are using both management methods simultaneously, and the App-V package has a dynamic configuration file in both locations, the file in the App-V server (dual management) is used.

When you select Configuration > App-V Publishing in the Studio navigation pane, the display shows App-V package names and sources. The source column indicates whether the packages are located on the App-V server or cached in the Application Library. When you select a package, the details pane lists the applications and shortcuts in the package.

Dynamic configuration files

Overview

App-V packages can be customized using dynamic configuration files, that when applied to the package, can be used to change its characteristics. For example, you can use them to define extra application shortcuts and behaviors. Citrix App-V supports both types of dynamic configuration file. File settings are applied when the application is launched:

- Deployment Configuration Files provide machine-wide configuration for all users. These files are expected to be named <packageFileName>_DeploymentConfig.xml and located in the same folder as the App-V package they apply to. Supported by single and dual admin management.
- User Configuration Files provide user-specific configuration which supports per-user customizations to the package. Single Admin supports user config files named in the following format: <packageFileName>_[UserSID | Username | GroupSID | GroupName]_UserConfig.xml and located in the same folder as the App-V package they apply to.
When multiple user config files exist for a particular package, they are applied with the following priority:

1. User SID
2. Username
3. AD Group SID (First found wins)
4. AD Group Name (First found wins)
5. Default

For example

1. MyAppVPackage_S-1-5-21-000000001-000000001-000000001-001_UserConfig.xml
2. MyAppVPackage_joeblogs_UserConfig.xml
3. MyAppVPackage_S-1-5-32-547_UserConfig.xml
4. MyAppVPackage_PowerUsers_UserConfig.xml
5. MyAppVPackage_UserConfig.xml

Note:
The user-specific portion of the file name can also optionally occur at the end (for example MyAppVPackage_UserConfig_joeblogs.xml).

Dynamic configuration file location

In single admin management, the Citrix App-V components only process dynamic configuration files which are found in the same folder as their App-V package. When applications in the package are launched, any changes to the corresponding dynamic configuration files are reapplied. If your dynamic configuration files are located in a different location to their packages, use a mapping file to map packages to their deployment configuration files.

To create a mapping file

1. Open a new text file.
2. For each dynamic configuration file, add a line which specifies the path to the package using the format <PackageGuid> : path.
   For example:
   F1f4fd78ef044176aad9082073a0c780 : c:\windows\file\packagedeploy.xml
3. Save the file as ctxAppVDynamicConfigurations.cfg in the same folder as the package. The entire directory hierarchy on the same UNC share as the App-V package is searched recursively upwards for this file every time an application in the package is launched.

Note:
You cannot apply changes to Dynamic Deployment Configuration when there are user sessions with an application in the package open. You can apply changes to Dynamic User Configuration files if other users but not the current user have the an application from the package open.

**Configuring IIS to use dynamic configuration files**

The Citrix App-V components on the VDA can make use of App-V Deployment Configuration Files and User Configuration Files placed next to the package, according to the same rules that UNC hosted packages use.

In order to do this the VDA components need permission to browse the IIS directory structure to determine which file to use. Unlike UNC hosted packages, the VDA must first download the configuration files from the server to a temporary location on the host machine before they can be used in the publishing. This is an optional feature and, if directory browsing is not enabled, the dynamic configuration files are ignored.

Perform the following steps to enable directory browsing for your site:

1. In the IIS Manager console, select the web site node and double-click **Directory Browsing** in the central pane.
2. Click **Enable** in the right-hand pane and select **Time**, **Size**, **Extension** and **Date**. (Do not select **Long date**.) This allows Citrix App-V components on the VDA to tell whether they have the latest versions of the configuration files applied or if they need updating.

**Isolation groups**

When you use the App-V single admin method, creating isolation groups allow you to specify interdependent groups of applications that must run in the sandbox. This feature is similar, but not identical to, App-V connection groups. Instead of the mandatory and optional package terminology used by the App-V management server, Citrix uses automatic and explicit for package deployment options.

- When a user launches an App-V application (the primary application), the isolation groups are searched for other application packages that are marked for automatic inclusion. Those packages are downloaded and included in the isolation group automatically. You do not need to add them to the Delivery Group that contains the primary application.
- An application package in the isolation group that is marked for explicit inclusion is downloaded only if you have explicitly added that application to the same Delivery Group that contains the primary application.
This allows you to create isolation groups containing a mix of automatically included applications that are available globally to all users. Plus, the group can contain a set of plug-ins and other applications (that might have specific licensing constraints), which you can limit to a certain set of users (identified through Delivery Groups) without having to create more isolation groups.

For example, application “app-a” requires JRE 1.7 to run. You can create an isolation group containing app-a (with an explicit deployment type) and JRE 1.7 (with an automatic deployment type). Then, add those App-V packages to one or more Delivery Groups. When a user launches app-a, JRE 1.7 is automatically deployed with it.

You can add an application to more than one App-V isolation group. However, when a user launches that application, the first isolation group to which that application was added is always used. You cannot order or prioritize other isolation groups containing that application.

**Load balancing App-V servers**

Load balancing management and publishing servers using DNS Round-Robin is supported if you are using the dual admin management method. Load balancing the management server behind Netscaler, F5 (or similar) Virtual IP is not supported because of the way Studio needs to communicate with the Management Server via remote PowerShell. For more information, see this Citrix blog article.

**Configuring IIS to host and stream App-V packages**

To enable your IIS server to host and stream App-V packages, perform the following steps:

1. Open the IIS Manager console. See [https://docs.microsoft.com/en-us/previous-versions/iis/6.0-sdk/ms525920(v%3Dv.90)](https://docs.microsoft.com/en-us/previous-versions/iis/6.0-sdk/ms525920(v%3Dv.90)) for instructions.
2. Right-click on the website instance you want to use and select **Add Virtual directory**.
3. Type an alias name and the path to where your packages are physically stored on your network.
4. Double-click on **MIME Types** in the central pane, and then right-click anywhere in the window and select **Add**.
5. For file name extension type .appv, select MIME Type **application/app-v**, then click **OK**.

**Importing HTTP streamed App-V packages to Citrix Virtual Apps and Desktops service**

**Note:**

This feature is only supported on version 2009 and later Virtual Delivery Agents (VDAs). If applications in App-V packages with HTTP(S) paths are added to delivery groups with a functional level of 2003 or later, they are published to Citrix Virtual Apps and Desktops service but users cannot launch them from Citrix Cloud unless the VDA is version 2009 or later. Delivery group functional
level is explained in Create delivery groups.

1. Download and install/unzip the latest versions of the CVAD Remote PowerShell SDK and Citrix App-V Package Discovery module. See the Citrix Virtual Apps and Desktops service SDKs and APIs.

2. Use the Package Discovery Module to import the App-V package from your IIS server to your Citrix Virtual Apps and Desktops service. For example:

   ```powershell
   1 Import-Module <Download Directory>\Citrix.Cloud.AppLibrary.Admin.v1.psm1
   2 Import-AppVPackageToCloud
   3 -PackagePath "https://My.AppVServer.net/Packages/Notepad++.appv"
   ```

3. Log in to your Citrix Cloud account.

4. The package downloads to a temporary location on your machine from where the relevant information is extracted and uploaded to the Application Library in your Citrix Virtual Apps and Desktops service instance.

**Setup**

The following table summarizes the sequence of setup tasks for using App-V in Citrix Virtual Apps and Desktops using single- and dual admin management methods.

<table>
<thead>
<tr>
<th>Single admin</th>
<th>Dual admin</th>
<th>Task</th>

</table>
Deploy Microsoft App-V

For App-V deployment instructions, see https://docs.microsoft.com/en-us/microsoft-desktop-optimization-pack/.

Optionally, change App-V publishing server settings. Citrix recommends using the SDK cmdlets on the Controller. See the SDK documentation for details.

- To view publishing server settings, enter `Get-CtxAppvServerSetting -AppVPublishingServer <pubServer>`.
- To ensure that App-V applications launch properly, enter `Set-CtxAppvServerSetting -UserRefreshonLogon 0`.

If you previously used GPO policy settings to manage publishing server settings, the GPO settings override any App-V integration settings, including cmdlet settings. This can result in App-V application launch failure. Citrix recommends that you remove all GPO policy settings and then use the SDK to configure those settings.

Packaging and placement

For either management method, create application packages using the App-V sequencer. See the Microsoft documentation for details.

- For single admin management, make the packages, and their corresponding dynamic configuration files, available on a UNC or SMB shared network location. Ensure that the Studio administrator who adds applications to Delivery Groups has at least read access to that location.
- For dual admin management, publish the packages on the App-V management server from a UNC path. (Publishing from HTTP URLs is not supported.)

Regardless of whether packages are on the App-V server or on a network share, ensure the packages have appropriate security permissions to allow the Studio administrator to access them. Network shares must be shared with “Authenticated users” to ensure that both the VDA and Studio have read access by default.

Configure App-V server addresses in Studio

Important:

Citrix recommends using the PowerShell cmdlets on the Controller to specify App-V server addresses if those servers use nondefault property values. See the SDK documentation for details. If you change App-V server addresses in Studio, some server connection properties you specify might be reset to default values. These properties are used on the VDAs to connect to App-V publishing servers. If this happens, reconfigure the nondefault values for any reset properties on the servers.
This procedure is valid only for the dual admin management method.

Specify App-V management and publishing server addresses for the dual admin management method either during or after Site creation. You can do this during or after creating the Site.

During Site creation:

- On the App-V page of the wizard, enter the URL of the Microsoft App-V management server, and the URL and port number of the App-V publishing server.
- Test the connection before continuing with the wizard. If the test fails, see the Troubleshoot section below.

After Site creation:

2. If you have not previously specified App-V server addresses, select Add Microsoft Server in the Actions pane.
3. To change App-V server addresses, select Edit Microsoft Server in the Actions pane.
4. Enter the URL of the Microsoft App-V management server, and the URL and port number of the App-V publishing server.
5. Test the connection to those servers before closing the dialog box. If the test fails, see the Troubleshoot section below.

Later, if you want to remove all links to the App-V management and publishing servers and stop Studio from discovering App-V packages from those servers, select Remove Microsoft Server in the Actions pane. This action is allowed only if no applications in packages on those servers are currently published in any Delivery Groups. If they are, you must remove those applications from the Delivery Groups before you can remove the App-V servers.

**Install software on VDA machines**

Machines containing VDAs must have two sets of software installed to support App-V: one from Microsoft and the other from Citrix.

**Microsoft App-V client**

This software retrieves virtual applications, publishes the applications on the client, and automatically sets up and manages virtual environments at runtime on Windows devices. The App-V client stores user-specific virtual application settings, such as registry and file changes in each user’s profile.

The App-V client is available from Microsoft. Install a client on each machine containing a VDA, or on the master image that is used in a machine catalog to create VMs. **Note:** Windows 10 (1607 or greater) and Windows Server 2016 already include the App-V client. On those OSs only, enable the

Tip:
After you install the App-V client, with Administrator permissions, run the PowerShell `Get-AppvClientConfiguration` cmdlet, and ensure that `EnablePackageScripts` is set to 1. If it is not set to 1, run `Set-AppvClientConfiguration -EnablePackageScripts $true`.

Citrix App-V components
The Citrix App-V component software is excluded by default when you install a VDA.

You can control this default behavior during VDA installation. In the graphical interface, select the `Citrix Personalization for App-V - VDA` check box on the Additional Components page. In the command line interface, use the `/includeadditional “Citrix Personalization for App-V – VDA”` option.

If you do not include the Citrix App-V components during VDA installation, but later want to use App-V applications: In the Windows machine’s Programs and Features list, right-click the Citrix Virtual Delivery Agent entry and then select Change. A wizard launches. In the wizard, enable the option that installs and enables App-V publishing components.

Add or remove App-V packages in the Application Library
These procedures are valid only for the single admin management method.

You must have at least read access to the network share containing the App-V packages.

Add an App-V package to the Application Library

2. Select Add Packages in the Actions pane.
3. Browse to the share containing the App-V packages and select one or more packages.
4. Click Add.

Remove an App-V package from the Application Library
Removing an App-V package from the Application Library removes it from the Studio App-V Publishing node display. However, it does not remove its applications from Delivery Groups, and those applications can still be launched. The package remains in its physical network location. (This effect differs from removing an App-V application from a Delivery Group.)

2. Select one or more packages to be removed.
3. Select Remove Package in the Actions pane.
Add, edit, or remove App-V isolation groups

Add an App-V isolation group

2. Select Add Isolation Group in the Actions pane.
3. In the Add Isolation Group Settings dialog box, type a name and description for the isolation group.
4. From the Available Packages list, select the applications you want to add to the isolation group, and then click the right arrow. The selected applications should now appear in the Packages in Isolation Group list. In the Deployment drop-down next to each application, select either Explicit or Automatic. You can also use the up and down arrows to change the order of applications in the list.
5. When you are done, click OK.

Edit an App-V isolation group

2. Select the Isolation Groups tab in the middle pane and then select the isolation group you want to edit.
3. Select Edit Isolation Group in the Actions pane.
4. In the Edit Isolation Group Settings dialog box, change the isolation group name or description, add or remove applications, change their deployment type, or change the application order.
5. When you are done, click OK.

Remove an App-V isolation group

Removing an isolation group does not remove the application packages. It removes only the grouping.

2. Select the Isolation Groups tab in the middle pane and then select the isolation group you want to remove.
3. Select Remove Isolation Group from the Actions pane.
4. Confirm the removal.

Add App-V applications to Delivery Groups

The following procedure focuses on how to add App-V applications to Delivery Groups. For complete details about creating a Delivery Group, see Create Delivery Groups.

Step 1: Choose whether you want to create a new Delivery Group or add App-V applications to an existing Delivery Group:
To create a Delivery Group containing App-V applications:

1. Select **Delivery Groups** in the Studio navigation pane.
2. Select **Create Delivery Group** in the Actions pane.
3. On successive pages of the wizard, specify a machine catalog and users.

To add App-V applications to existing Delivery Groups:

1. Select **Applications** in the Studio navigation pane.
2. Select **Add Applications** in the Actions pane.
3. Select one or more Delivery Groups where the App-V applications will be added.

**Step 2:** On the **Applications** page of the wizard, click the **Add** drop-down to display application sources. Select **App-V**.

**Step 3:** On the **Add App-V Applications** page, choose the App-V source: the App-V server or the Application Library. The resulting display includes the application names plus their package names and package versions. Select the check boxes next to the applications or application shortcuts you want to add. Then click **OK**.

**Step 4:** Complete the wizard.

**Good to know:**

- If you change an App-V application’s properties when adding them to a Delivery Group, the changes are made when the application is started. For example, if you modify an application’s display name or icon when adding it to the group, the change appears when a user starts the application.
- If you use dynamic configuration files to customize the properties of an App-V application, those properties override any changes you made when adding them to a Delivery Group.
- If you later edit a Delivery Group containing App-V applications, there is no change in App-V application performance if you change the group’s delivery type from desktops and applications to applications only.
- When you remove a previously published (single admin) App-V package from a Delivery Group, Citrix App-V client components attempt to clean up, unpublish, and remove any packages that are no longer in use by the single admin management method.
- If you are using a hybrid deployment—with packages delivered by the single admin management method and an App-V publishing server, managed either by dual admin or by another mechanism (such as Group policy)—it is not possible to determine which (now potentially redundant) packages came from which source. In this case, cleanup is not attempted.
- If you publish more than 100 App-V applications in a single Delivery Group, applications may not launch. If so, use the MaxReceivedMessageSize property on the appropriate binding element to increase Max Receivable message size in the configuration of the Delivery Controller and/or the Broker Agent on the VDA.
Troubleshoot

Issues that can occur only when using the dual admin method are marked (DUAL).

(DUAL) There is a PowerShell connection error when you select Configuration > App-V Publishing in the Studio navigation pane.

- Is the Studio administrator also an App-V server administrator? The Studio administrator must belong to the “administrators” group on the App-V management server so that they can communicate with it.

(DUAL) The Test connection operation returns an error when you specify App-V server addresses in Studio.

- Is the App-V server powered on? Either send a Ping command or check the IIS Manager; each App-V server should be in a Started and Running state.

- Is the Studio administrator also an App-V server administrator? The Studio administrator must belong to the administrators group on the App-V management server so that they can communicate with it.

- Is file sharing enabled on the App-V server? Enter \<App-V server FQDN> in Windows Explorer or with the Run command.

- Does the App-V server have the same file sharing permissions as the App-V administrator? On the App-V server, add an entry for \<App-V server FQDN> in Stored User Names and Passwords, specifying the credentials of the user who has administrator privileges on the App-V server. For guidance, see http://support.microsoft.com/kb/306541.

- Is the App-V server in Active Directory?

If the Studio machine and the App-V server are in different Active Directory domains that do not have a trust relationship, from the PowerShell console on the Studio machine, run `winrm set winrm/Config/client @(TrustedHosts="<App-V server FQDN>")`.

If TrustedHosts is managed by GPO, the following error message displays: “The config setting TrustedHosts cannot be changed because use is controlled by policies. The policy would need to be set to Not Configured to change the config setting.” In this case, add an entry for the App-V server name to the TrustedHosts policy in GPO (Administrative Templates > Windows Components > Windows Remote Management (WinRM) > WinRM Client).

(DUAL) Discovery fails when adding an App-V application to a Delivery Group.

- Is the Studio administrator also an App-V management server administrator? The Studio administrator must belong to the administrators group on the App-V management server so that they can communicate with it.
- Is the App-V management server running? Either send a Ping command or check the IIS Manager; each App-V server should be in a Started and Running state.
- Is PowerShell remoting enabled on both App-V servers? If not, see [https://docs.microsoft.com/en-us/previous-versions/technet-magazine/ff700227(v=msdn.10)](https://docs.microsoft.com/en-us/previous-versions/technet-magazine/ff700227(v=msdn.10)).
- Do packages have the appropriate security permissions for the Studio administrator to access?

App-V applications only launch in one browser version.

- If you publish multiple sequenced versions of the same browser app, only one version of the app is able to launch at a time per user on the VDA. The same thing occurs even if Citrix components are not involved and the user starts the sequenced apps from desktop shortcuts which point to different paths.

Whenever browser version a user launches first, determines the browser version which runs subsequently for them. When Firefox detects a second launch of itself, it prefers to create an instance of the already running process, rather than create a new process. Other browsers may behave in the same way.

You can make the application launch in the intended Firefox browser version, by adding the command line parameter `-no-remote` to the shortcut's launch command. Other browsers offer the same or similar facility.

**Note:**
You must be using XenApp 7.17 or higher to take advantage of the shortcut enumeration feature. You must also change the package in both versions of the app to get this bi-directional behavior.

App-V applications do not launch.

- (DUAL) Is the publishing server running?
- (DUAL) Do the App-V packages have appropriate security permissions so that users can access them?
- (DUAL) On the VDA, ensure that Temp is pointing to the correct location, and that there is enough space available in the Temp directory.
- (DUAL) On the App-V publishing server, run `Get-AppvPublishingServer` \* to display the list of publishing servers.
- (DUAL) On the App-V publishing server, ensure that UserRefreshOnLogon is set to False.
- Is a supported version of the App-V client installed on the VDA? Does the VDA have the enable package scripts setting enabled?
- On the machine containing the App-V client and VDA, from the Registry editor (regedit), go to HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\AppV. Ensure that the AppVServers key has the following value format: AppVManagementServer+metadata;PublishingServer (for
example:  http://xmas-demo-appv.blrstrm.com+0+0+0+1+1+1+0+1;http://xmas-demo-appv.blrstrm.com:8082).

- On the machine or master image containing the App-V client and VDA, check that the PowerShell ExecutionPolicy is set to RemoteSigned. The App-V client provided by Microsoft is not signed, and this ExecutionPolicy allows PowerShell to run unsigned local scripts and cmdlets. Use one of the following two methods to set the ExecutionPolicy: (1) As an administrator, enter the cmdlet: Set-ExecutionPolicy RemoteSigned, or (2) From Group Policy settings, go to Computer Configuration > Policies > Administrative Templates > Windows Components > Windows PowerShell> Turn on Script Execution.

- If the error “RegistrationManager.AttemptRegistrationWithSingleDdc: Failed to register” appears, use the MaxReceivedMessageSize property on the appropriate binding element to increase Max Receivable message size in the configuration of the Delivery Controller and/or the Broker Agent on the VDA.

If these steps do not resolve the issues, enable and examine the logs.

Logs

App-V configuration-related logs are located at C:\CtxAppvLogs. The application launch logs are located at: %LOCALAPPDATA%\Citrix\CtxAppvLogs. LOCALAPPDATA resolves to the local folder for the logged-on user. Check the local folder of the user for whom the application launch failed.

To enable Studio and VDA logs used for App-V, you must have administrator privileges. You will also need a text editor such as Notepad.

To enable Studio logs:

1. Create the folder C:\CtxAppvLogs.
2. Go to C:\Program Files\Citrix\StudioAppVIntegration\SnapIn\Citrix.Appv.Admin.V1. Open CtxAppvCommon.dll.config in a text editor and uncomment the line: <add key="LogFileFileName" value="C:\CtxAppvLogs\log.txt"/>
3. Restart the Broker service to start logging.

To enable VDA logs:

1. Create the folder C:\CtxAppvLogs.
2. Go to C:\Program Files\Citrix\Virtual Desktop Agent. Open CtxAppvCommon.dll.config in a text editor and uncomment the following line: <add key="LogFileFileName" value="C:\CtxAppvLogs\log.txt"/>
3. Uncomment the line and set the value field to 1: <add key="EnableLauncherLogs" value="1"/>
4. Restart the machine to start logging.
Virtual Apps Secure Browser

December 18, 2019

As applications are ported to the web, users must rely on multiple browser vendors and versions in order to achieve compatibility with web-based apps. If the application is an internally hosted application, organizations are often required to install and configure complex VPN solutions in order to provide access to remote users. Typical VPN solutions require a client-side agent that must also be maintained across numerous operating systems.

With the Secure Browser, users can have a seamless web-based application experience where a hosted web-based application simply appears within the user’s preferred local browser. For example, a user’s preferred browser is Mozilla Firefox but the application is compatible with only Microsoft Internet Explorer. Secure Browser displays the Internet Explorer-compatible application as a tab within the Firefox browser.

Deploying Virtual Apps Secure Browser Edition

1. Download the Citrix Virtual Apps Secure Browser Edition ISO from the Citrix download site.
2. Follow the installation instructions for various components of Citrix Virtual Apps.
3. Configure the edition and license mode for the Secure Browser edition after installation, by performing the following additional steps:
   a) On the Delivery Controller, start a PowerShell session by clicking the blue icon on the taskbar, or by browsing to Start > All Programs > Accessories > Windows PowerShell > Windows PowerShell.
      On 64-bit systems, this starts the 64-bit version. Both the 32-bit or 64-bit versions are supported.
   b) Type asnp Citrix* and press Enter to load the Citrix-specific PowerShell modules. (asnp represents Add-PSSnapin.)
   c) Check the current site settings and license mode: run Get-ConfigSite.
   d) Set the license mode to Virtual Apps Secure Browser edition: run Set-ConfigSite -ProductCode XDT -ProductEdition BAS.
   e) Confirm that the Virtual Apps Secure Browser edition and license mode is set correctly: run Get-BrokerSite.

After completing the installation, further optimize your environment for web app delivery by using the configuration steps specified in the XenApp Secure Browser Deployment Guide.
Publish content

July 23, 2020

You can publish an application that is simply a URL or UNC path to a resource, such as a Microsoft Word document or a web link. This feature is known as published content. The ability to publish content adds flexibility to how you deliver content to users. You benefit from the existing access control and management of applications. You can also specify whether to use local or published applications to open the content.

The published content appears just like other applications in StoreFront and Citrix Workspace app. Users access it in the same way they access applications. On the client, the resource opens as usual.

- If a locally installed application is appropriate, it is launched to open the resource.
- If a File Type Association has been defined, a published application launches to open the resource.

You publish content using the PowerShell SDK. You cannot use Studio to publish content. However, you can use Studio to edit application properties later, after they are published.

Configuration overview and preparation

Publishing content uses the New-BrokerApplication cmdlet with the following key properties. (See the cmdlet help for descriptions of all cmdlet properties.)

```powershell
New-BrokerApplication -ApplicationType PublishedContent -CommandLineExecutable location -Name app-name -DesktopGroup delivery-group-name
```

The ApplicationType property must be PublishedContent.

The CommandLineExecutable property specifies the location of the published content. The following formats are supported, with a limit of 255 characters.

- HTML website address (for example, `http://www.citrix.com`)
- Document file on a web server (for example, `https://www.citrix.com/press/pressrelease.doc`)
- Directory on an FTP server (for example, `ftp://ftp.citrix.com/code`)
- Document file on an FTP server (for example, `ftp://ftp.citrix.com/code/Readme.txt`)
- UNC directory path (for example, `\myServer\myShare\myFile.asf` or `\\myServer\myShare\myFile.asf`)
- UNC file path (for example, `file://myServer/myShare/myFile.asf` or `\\myServer\myShare\myFile.asf`)

© 1999-2020 Citrix Systems, Inc. All rights reserved.
Ensure that you have the correct SDK.

- For Citrix Virtual Apps and Desktops service deployments, download and install the Citrix Virtual Apps and Desktops Remote PowerShell SDK.
- For on-premises Citrix Virtual Apps and Desktops deployments, use the PowerShell SDK that is installed with the Delivery Controller. Adding a published content application requires a minimum version 7.11 Delivery Controller.

The following procedures use examples. In the examples:

- A machine catalog has been created.
- A delivery group named PublishedContentApps has been created. The group uses a multi-session OS machine from the catalog. The WordPad application has been added to the group.
- Assignments are made for the delivery group name, the CommandLineExecutable location, and the application name.

### Get started

On the machine containing the PowerShell SDK, open PowerShell.

The following cmdlet adds the appropriate PowerShell SDK snap-in, and assigns the returned delivery group record.

```powershell
Add-PsSnapin Citrix\* $dg = Get-BrokerDesktopGroup -Name PublishedContentApps
```

If you are using the Citrix Virtual Apps and Desktops service, authenticate by entering your Citrix Cloud credentials. If there is more than one customer, choose one.

### Publish a URL

After assigning the location and application name, the following cmdlet publishes the Citrix home page as an application.

```powershell
$citrixUrl = "https://www.citrix.com/"
$appName = "Citrix Home Page"

New-BrokerApplication -ApplicationType PublishedContent -CommandLineExecutable $citrixURL -Name $appName -DesktopGroup $dg.Uid
```

Verify success:
Open StoreFront and log on as a user who can access applications in the PublishedContentApps delivery group. The display includes the newly created application with the default icon. To learn about customizing the icon, see https://www.citrix.com/blogs/2013/08/21/xd-tipster-changing-delivery-group-icons-revisited-xd7/.

Click the Citrix Home Page application. The URL launches in a new tab in a locally running instance of your default browser.

Publish resources located at UNC paths

In this example, the administrator has already created a share named PublishedResources. After assigning the locations and application names, the following cmdlets publish an RTF and a DOCX file in that share as a resource.

```powershell
$rtfUNC = "\\GMSXJ-EDGE0.xd.local\\PublishedResources\\PublishedRTF.rtf"
$rtfAppName = "PublishedRTF"
New-BrokerApplication -ApplicationType PublishedContent
-CommandLineExecutable $rtfUNC -Name $rtfAppName
-DesktopGroup $dg.Uid

$docxUNC = "\\GMSXJ-EDGE0.xd.local\\PublishedResources\\PublishedDOCX.docx"
$docxAppName = "PublishedDOCX"
New-BrokerApplication -ApplicationType PublishedContent
-CommandLineExecutable $docxUNC -Name $docxAppName
-DesktopGroup $dg.Uid
```

Verify success:

- Refresh your StoreFront window to see the newly published documents.
- Click the PublishedRTF and PublishedDOCX applications. Each document opens in a locally running WordPad.

View and edit PublishedContent applications

You manage published content using the same methods that you use for other application types. The published content items appear in the Applications list in Studio and can be edited in Studio.

Application properties (such as user visibility, group association, and shortcut) apply to the published content. However, you cannot change the command-line argument or working directory properties.
on the **Location** page. To change the resource, modify the **Path to the executable file** field on that page.

To use a published application to open a **PublishedContent** application (rather than a local application), edit the published application’s **File Type Association** property. In this example, the published WordPad application was edited to create a File Type Association for .rtf files.

Turn on maintenance mode for the delivery group before editing the File Type Association. Remember to turn off maintenance mode when you’re done.
Refresh StoreFront to load the File Type Association changes, and then click the **PublishedRTF** and **PublishedDOCX** applications. Notice the difference. **PublishedDOCX** still opens in the local WordPad. However, **PublishedRTF** now opens in the published WordPad due to the file type association.
For more information

- Create machine catalogs
- Create delivery groups
- Change application properties

Server VDI

June 19, 2020

Use the Server VDI (Virtual Desktop Infrastructure) feature to deliver a desktop from a server operating system for a single user.

- Enterprise administrators can deliver server operating systems as VDI desktops, which can be valuable for users such as engineers and designers.
- Service Providers can offer desktops from the cloud. Those desktops comply with the Microsoft Services Provider License Agreement (SPLA).

The following features cannot be used with Server VDI:

- Hosted applications
- Local App Access
- Direct (non-brokered) desktop connections
- Remote PC Access

In Citrix Virtual Apps and Desktops 7 deployments, Server VDI is supported on Windows Server 2019 and Windows Server 2016.

In Citrix Virtual Apps and Desktops service deployments, server VDI is supported on Windows Server 2019, Windows Server 2016, and Windows 10 Enterprise for Virtual Desktops.

All Server VDI deployments support the user personalization layer technology.

For Server VDI to work with TWAIN devices such as scanners, the Windows Server Desktop Experience feature must be installed.

Install and configure Server VDI

1. Prepare the Windows server for installation.
   - Use Windows Server Manager to ensure that the Remote Desktop Services role services are not installed. If they were previously installed, remove them. The VDA installation fails if these role services are installed.
• Ensure that the **Restrict each user to a single session** property is enabled. On the Windows server, edit the registry for the Terminal Server setting:

```
HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\TerminalServer
```

DWORD **fSingleSessionPerUser** = 1

2. Use the Citrix Virtual Apps and Desktops installer’s command line interface to install a VDA on a supported server or server master image, specifying the /quiet and /servervdi options. (By default, the installer’s graphical interface blocks the Windows single-session OS VDA on a server operating system. Using the command line overrides this behavior.) Use one of the following commands:

- Citrix Virtual Apps and Desktops deployments:
  - XenDesktopVdaSetup.exe /quiet /servervdi
  - VDAWorkstationSetup.exe /quiet /servervdi
- Citrix Virtual Apps and Desktops service deployments:
  - VDAWorkstationSetup.exe /quiet /servervdi

Other options:

- Use /controllers to specify Delivery Controllers or Cloud Connectors.
- Use /enable_hdx_ports to open ports in the firewall, unless the firewall is to be configured manually.
- Use /mastermcsimage (or /masterimage) if you are installing the VDA on an image, and will use MCS to create server VMs from that image.
- For all option details, see **Install using the command line**.

3. Create a machine catalog for Server VDI. In the catalog creation wizard:

- On the **Operating System** page, select **Single-session OS**.
- On the **Summary** page, specify a machine catalog name and description for administrators that clearly identifies it as Server VDI. This is the only indicator in Studio that the catalog supports Server VDI.

When using search in Studio, the Server VDI catalog is displayed on the **Single-session OS Machines** tab, even though the VDA is installed on a server.

4. Create a Delivery Group and select the Server VDI catalog you created.

If you did not specify Delivery Controllers or Cloud Connectors during VDA installation, remember to specify them afterward. For details, see **VDA registration**.
User personalization layer

September 24, 2020

The user personalization layer feature for Citrix Virtual Apps and Desktops extends the capabilities of non-persistent machine catalogs. User personalization layers preserve users' data and locally installed applications across sessions. Powered by Citrix App Layering, this feature replaces Personal vDisk (PvD).

Like PvD, the user personalization layer feature supports Citrix Provisioning and Machine Creation Services (MCS) in a non-persistent machine catalog. You install the feature components alongside the Virtual Delivery Agent within the master image.

A VHD file stores any applications that the user installs locally. The VHD, which is mounted on the image, acts as the user's own user layer virtual hard drive.

This document includes instructions for deploying and configuring the user personalization layer feature. It describes the requirements for successful deployment, limitations, and known issues.

To use the User personalization layer feature, you must first deploy it using the steps detailed in the article. Until then, the feature is not available for you to use.

Application support

Aside from the following exceptions, all applications that a user installs locally on the desktop are supported in the user personalization layer.

Exceptions

The following applications are the exception and are not supported on the user personalization layer:

- Enterprise applications, such as MS Office and Visual Studio.
- Applications that modify the network stack or hardware. Example: a VPN client.
- Applications that have boot level drivers. Example: a virus scanner.
- Applications with drivers that use the driver store. Example: a printer driver.

Note:

You can make printers available using Windows Group Policy Objects (GPOs).

Do not allow users to install any unsupported applications locally. Rather, install these applications directly on the master image.
Applications that require a local user or administrator account

When a user installs an application locally, the app goes into their user layer. If the user then adds or edits a local user or group, the changes do not persist beyond the session.

Important:
Add any required local user or group in the master image.

Requirements

The user personalization layer feature requires the following components:

- Citrix Virtual Apps and Desktops 7 1909 or later
- Virtual Delivery Agent (VDA), version 1912
- Citrix Provisioning, version 1909 or later
- Windows File Share (SMB), or Azure Files with on-prem AD authentication enabled

You can deploy the User personalization layer feature on the following Windows versions when the OS is deployed as single session. Support is limited to a single user on a single session.

- Windows 10 Enterprise x64, version 1607 or later
- Windows 10 Multi-Session (Azure Files supported)
- Windows Server 2016 (Azure Files supported)
- Windows Server 2019 (Azure Files supported)

For Citrix Virtual Apps and Desktops 7, use of Azure Files with User personalization layers is supported on Windows Server 2019, Windows Server 2016v, and Windows 10 client.

Note:
User personalization layer is only supported as a Server VDI deployment. For deployment details, see the Server VDI article.

If you installed the preview version of the user personalization layer feature, uninstall the software and reboot the master image before installing this release.

Set up your file share

The user personalization layer feature requires Windows Server Message Block (SMB) storage. To create a Windows file share, follow the usual steps for the Windows operating system that you are on.

For more about using Azure Files with Azure-based catalogs, see Set up Azure Files storage for User personalization layers.
Recommendations

Follow the recommendations in this section for a successful user personalization layer deployment.

Profile Management solution

User personalization layer stores all changes the user makes for a single machine catalog image. To add enhanced capabilities such as roaming profile data across multiple catalog images, Citrix recommends also using Profile Management. Refer to the Profile Management documentation for more details.

When using Profile Management with the user personalization layer feature, clear deletion of the user’s information on logoff. You can clear deletion using a Group Policy Object (GPO) or the policy on the Delivery Controller (DDC).

For details about available Profile Management policies, see Profile Management policy descriptions and defaults.

Microsoft System Center Configuration Manager (SCCM)

If you are using SCCM with the user personalization layer feature, follow the Microsoft guidelines for preparing your image in a VDI environment. Refer to this Microsoft TechNet article for more information.

User layer size

A user layer is a thin-provisioned disk that expands as space on the disk is used. The default size allowed for a user layer is 10 GB, the minimum we recommend.

Note:

During installation, if the value is set to zero (0), the default user layer size is set to 10 GB.

If you want to change the user layer size, you can enter a different value for the User Layer Size Studio policy. See Step 5: Create delivery group custom policies, under Optional: Click Select next to User Layer Size in GB.

Tools for overriding the User Layer Size (Optional)

You can override the User Layer Size by using a Windows tool to define a quota on the user layer file share.

Use one of the following Microsoft quota tools to set a hard quota on the user layer directory named Users:
• File Server Resource Manager (FSRM)
• Quota Manager

Note:
Increasing the quota affects new user layers and expands existing ones. Decreasing the quota only affects new user layers. Existing user layers never decrease in size.

Deploy a User personalization layer

When deploying the user personalization feature, you define the policies within Studio. You then assign the policies to the delivery group bound to the machine catalog, where the feature is deployed.

If you leave the master image with no user personalization layer configuration, the services remain idle and do not interfere with authoring activities.

If you set the policies in the master image, the services attempt to run and mount a user layer within the master image. The master image would exhibit unexpected behaviors and instability.

To deploy the user personalization layer feature, complete the following steps in this order:

• Step 1: Verify availability of a Citrix Virtual Apps and Desktops environment.
• Step 2: Prepare your master image.
• Step 3: Create a machine catalog.
• Step 4: Create a delivery group.
• Step 5: Create delivery group custom policies.

Step 1: Verify that the Citrix Virtual Apps and Desktops environment is available

Be sure that your Citrix Virtual Apps and Desktops environment is available to use with this new feature. For setup details, see Install and configure Citrix Virtual Apps and Desktops.

Step 2: Prepare your master image

To prepare your master image:

1. Locate the master image. Install your organization’s enterprise applications and any other apps your users generally find useful.

2. If you are deploying Server VDI, follow the steps in the Server VDI article. Be sure to include the optional component, the User personalization layer. For details, see the Command-line options for installing a VDA.

3. If you are using Windows 10, install Virtual Delivery Agent (VDA) 1912. If an older version of the VDA is already installed, uninstall the old version first. When installing the new version, be sure to select and install the optional component, the Citrix User Personalization Layer, as follows:
a) Click the tile, **Virtual Delivery Agent for Windows Desktop OS:**

![Citrix Virtual Apps and Desktops interface](image)

a) **Environment:** Select either Create a master MCS image or Create a master image using Citrix Provisioning or third-party provisioning tools.
a) **Core Components:** Click **Next**.

b) **Additional Components:** Check **Citrix User Personalization Layer**.
a) Click through the remaining installation screens, configuring the VDA as needed, and click Install. The image reboots one or more times during installation.

4. Leave Windows updates disabled. The user personalization layer installer disables Windows updates on the image. Leave the updates disabled.

The image is ready for you to upload into Studio.

**Step 3: Create a machine catalog**

In Studio, follow the steps to create a machine catalog. Use the following options during catalog creation:

1. Select **Operating System** and set it to **Single session OS**.

2. Select **Machine Management** and set it to **Machines that are power managed**. For example, virtual machines or blade PCs.

3. Select **Desktop Experience** and set it to either **pooled-random** or **pooled-static** catalog type, as in the following examples:
   - **Pooled-random**:
- **Pooled-static**: If you select pooled-static, configure desktops to discard all changes and clear virtual desktops when the user logs off, as shown in the following screenshot:
Note:
User personalization layer does not support pooled-static catalogs configured to use Citrix Personal vDisk or assigned as dedicated virtual machines.

4. If you are using MCS, select **Master Image** and the snapshot for the image created in the previous section.

5. Configure the remaining catalog properties as needed for your environment.

**Step 4: Create a delivery group**

Create and configure a **delivery group**, including machines from the machine catalog you created. For details, see the [Create Delivery Groups](#).

**Step 5: Create delivery group custom policies**

To enable mounting of user layers within the Virtual Delivery Agents, you use the configuration parameters to specify:

- Where on the network to access the user layers.
- How large to permit the user layer disks to grow.

To define the parameters as custom Citrix policies in Studio and assign them to your delivery group.
1. In Studio, select Policies in the navigation pane:

2. Select Create Policy in the Actions pane. The Create Policy window appears.

3. Type ‘user layer’ into the search field. The following two policies appear in the list of available policies:
   - User Layer Repository Path
   - User Layer Size GB

   **Note:**
   Increasing the size affects new user layers and expands existing user layers. Decreasing the size only affects new user layers. Existing user layers never decrease in size.

4. Click **Select** next to User Layer Repository Path. The Edit Setting window appears.
5. Enter a path in the Value field, and click **OK**:

- **Path format**: `\server-name-or-address\share-name\folder`
- **Path example**: `\Server\Share\UPLUsers`
- **Resulting paths example**:
  For a user named **Alex** in **CoolCompanyDomain**, the path would be: `\Server\Share\UPLUsers\Users\CoolCompanyDomain_Alex\A_OK`
You can customize the path using the variables, `%USERNAME%`, `%USERDOMAIN%`, and also machine environment variables. When expanded, these variables result in explicit paths.

- **Path format:** `\Server-name-or-address\share-name\folder-with-environment-variables`
- **Path example:** `\Server\Share\UPLUserLayers\%USERNAME%\%USERDOMAIN%`
- **Resulting paths example:** For a user named Alex in CoolCompanyDomain, the path would be: `\Server\Share\UPLUserLayers\Alex\CoolCompanyDomain\A_OK`
6. Optional: Click **Select** next to User Layer Size in GB:
The Edit Settings window appears.

7. Optional: Change the default value of ‘0’ to the maximum size (in GB) that the user layer can grow. Click OK.

   **Note:**
   If you keep the default user layer size of 0 GB, user layers are set to 10 GB, which is the minimum we recommend. A user layer is a thin-provisioned disk that expands to the set size as space on the disk is used. Existing user layers never decrease in size.

8. Click **Next** to configure Users and Machines. Click the Delivery Group Assign link highlighted in this image:
9. In the Delivery Group menu, select the delivery group created in the previous section. Click OK.
10. Enter a name for the policy. Click the check box to enable the policy, and click Finish.
Configure security settings on the user layer folder

As a domain administrator, you can specify more than one storage location for your user layers. Create a `\Users` subfolder for each storage location (including the default location). Secure each location using the following settings.

<table>
<thead>
<tr>
<th>Setting name</th>
<th>Value</th>
<th>Apply to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creator Owner</td>
<td>Modify</td>
<td>Subfolders and Files only</td>
</tr>
<tr>
<td>Owner Rights</td>
<td>Modify</td>
<td>Subfolders and Files only</td>
</tr>
<tr>
<td>Users or group:</td>
<td>Create Folder/Append Data; Traverse Folder/Execute File; List Folder/Read Data; Read Attributes</td>
<td>Selected Folder Only</td>
</tr>
<tr>
<td>System</td>
<td>Full Control</td>
<td>Selected Folder, Subfolders, and Files</td>
</tr>
</tbody>
</table>
User layer messages

When a user is unable to access their user layer, they receive one of these notification messages.

- **User Layer In Use**
  
  We were unable to attach your user layer because it is in use. Any changes you make to application settings or data will not be saved. Be sure to save any work to a shared network location.

- **User Layer Unavailable**
  
  We were unable to attach your user layer. Any changes you make to application settings or data will not be saved. Be sure to save any work to a shared network location.

- **System not reset after user sign-out**
  
  This system was not shut down properly. Please log off immediately and contact your system administrator.

Log files to use when troubleshooting

The log file, ulayersvc.log, contains the output of the user personalization layer software where changes are logged.

```
C:\ProgramData\Unidesk\Logs\ulayersvc.log
```

Limitations

Keep the following limitations in mind when installing and using the user personalization layer feature.

- Do not attempt to deploy the user personalization layer software on a layer within App Layering. Either deploy user personalization layers in Citrix Virtual Apps and Desktops, or enable user layers in an App Layering image template, not both. Either process produces the user layers you need.
• Do not configure the user personalization layer feature with persistent machine catalogs.

• Do not use Session hosts.

• Do not update the machine catalog with an image running a new OS install (even the same version of Windows 10). Best practice is to apply updates to the OS within the same master image used when creating the machine catalog.

• Do not use boot-time drivers, nor any other early boot personalization.

• Do not migrate PvD data to the user personalization layer feature.

• Do not migrate existing user layers from the full App Layering product to the user personalization layer feature.

• Do not change the user layer SMB path to access user layers created using a different master OS image.

• Do not enable Secure Boot within User personalization layer virtual machines, as it is not currently supported.

• When a user logs out of a session and then logs in again, the new session runs on a different machine in the pool. In a VDI environment, Microsoft Software Center lists an application as Installed on the first machine, but shows it as Unavailable on the second machine.

  To find out the true status of the application, instruct the user to select the application in the Software Center and click Install. SCCM then updates the status to the true value.

• Software Center occasionally stops immediately after launching within a VDA that has the user personalization layer feature enabled. To avoid this issue, follow Microsoft’s recommendations for Implementing SCCM in a XenDesktop VDI environment. Also, make sure that the ccmexec service is running before you start the Software Center.

• In Group Policies (Computer Settings), User layer settings override settings applied to the master image. Therefore, the changes you make in Computer Settings using a GPO are not always present for the user on the next session login.

  To get around this issue, create a User Logon Script that issues the command:

  `gpupdate /force`

  For example, one customer set the following command to run at each user login:

  `gpupdate /Target:Computer /force`

  For best results, apply changes to Computer Settings directly on the user layer, after the user has logged in.
Remove components

December 18, 2019

To remove components, Citrix recommends using the Windows feature for removing or changing programs. Alternatively, you can remove components using the command line, or a script on the installation media.

When you remove components, prerequisites are not removed, and firewall settings are not changed. For example, when you remove a Delivery Controller, the SQL Server software and the databases are not removed.

If you upgraded a Controller from an earlier deployment that included Web Interface, you must remove the Web Interface component separately. You cannot use the installer to remove Web Interface.

For information about removing features not mentioned below, see the feature’s documentation.

Preparation

Before removing a Controller, remove it from the Site. For details, see Remove a Controller.

Close Studio and Director before removing them.

Remove components using the Windows feature for removing or changing programs

From the Windows feature for removing or changing programs:

- To remove a Controller, Studio, Director, License Server, or StoreFront, right-click Citrix Virtual Apps version or Citrix Virtual Desktops version and select Uninstall. The installer launches. Select the components to be removed.
  Alternatively, you can remove StoreFront by right-clicking Citrix StoreFront and selecting Uninstall.

- To remove a VDA, right-click Citrix Virtual Delivery Agent version and select Uninstall. The installer launches and you can select the components to be removed. The machine restarts automatically after the removal, by default.

- To remove the Universal Print Server, right-click Citrix Universal Print Server and select Uninstall.

Remove core components using the command line

From the \x64\XenDesktop Setup directory on the installation media, run the XenDesktopServerSetup.exe command.
To remove one or more components, specify the `remove` and `components` options.
To remove all components, specify the `removeall` option.

For command and parameter details, see Install using the command line.

For example, the following command removes Studio.

```
x64\XenDesktop Setup\XenDesktopServerSetup.exe /remove /components studio
```

### Remove VDAs using the command line

From the `\x64\XenDesktop Setup` directory on the installation media, run the `XenDesktopVdaSetup.exe` command.

- To remove one or more components, use the `remove` and `components` options.
- To remove all components, use the `removeall` option.

For command and parameter details, see Install using the command line.

The machine restarts automatically after the removal, by default.

For example, the following command removes the VDA and Citrix Workspace app.

```
x64\XenDesktop Setup\XenDesktopVdaSetup.exe /removeall
```

To remove VDAs using a script in Active Directory; see Install or remove VDAs using scripts.

### Upgrade and migrate

May 21, 2020

### Introduction

Upgrading changes your deployment to the Citrix Virtual Apps and Desktops 7 Current Release (CR) without having to set up new machines or sites. This is known as an in-place upgrade.

Upgrading gives you access to the latest features and technologies that you’re eligible for. Upgrades can also contain fixes, clarifications, and enhancements from earlier versions.

### Upgrade overview

1. Review the Upgrade a deployment article before beginning the upgrade. This is the primary information source for learning how to prepare for and implement an upgrade.
2. Complete the preparation guidance.
3. Run installers to upgrade core components.
4. Upgrade the system databases and the site.
5. Upgrade VDAs on master images (or directly on machines).
6. Upgrade other components.

Each preparation and upgrade step is detailed in Upgrade a deployment.

Versions you can upgrade

The Citrix Upgrade Guide lists the Citrix Virtual Apps and Desktops (and XenApp and XenDesktops) versions you can upgrade from.

Frequently asked questions

This section answers some commonly asked questions about upgrading Citrix Virtual Apps and Desktops.

- **What is the correct order to upgrade my Virtual Apps and Desktops environment?**
  The VDA can be upgraded at any time, in any order. Upgrade half of the Controllers before upgrading your site. Then upgrade the remaining Controllers after the site upgrade. For more information, see Upgrade sequence and Upgrade procedure.

- **My site has several Delivery Controllers (in different zones). What happens if I upgrade only some of them? Am I required to upgrade every Controller in the site during the same maintenance window?**
  The best practice is to upgrade all Delivery Controllers during the same maintenance window, as various services on each Controller communicate with each other. Keeping different versions might cause issues. During a maintenance window, we recommend you upgrade half of the Controllers, upgrade the site, and then upgrade the remaining Controllers. (For details, see the Upgrade procedure.)

- **Can I go directly to the latest version, or do I have to do incremental upgrades?**
  You can almost always upgrade to the latest version and skip intermediate releases, unless explicitly stated in the What’s new article for the version you’re upgrading to. See the Upgrade Guide.

- **Can a customer upgrade from a Long Term Service Release (LTSR) environment to a Current Release?**
  Yes. Customers are not required to remain on a Long Term Service Release for an extended period. Customers can move an LTSR environment to a Current Release, based on business requirements and features.

- **Are mixed versions of components allowed?**
Within each site, Citrix recommends upgrading all components to the same version. Although you can use earlier versions of some components, all features in the latest version might not be available. For more information, see Mixed environment considerations.

- **How often must a Current Release be upgraded?**

  Current Releases reach End of Maintenance (EOM) 6 months after the release date. Citrix recommends customers adopt the latest Current Release. Current Releases reach End of Life (EOL) 18 months after the release date. For more information, see Current Release Lifecycle.

- **What is recommended: upgrade to LTSR or CR?**

  Current Releases (CRs) deliver the latest and most innovative app, desktop, and server virtualization features and functionality. This allows you to stay on leading-edge technology and ahead of your competition.

  Long Term Service Releases (LTSRs) are ideal for large enterprise production environments that prefer to retain the same base version for an extended period.

  For details, see Servicing Options.

- **Do I need to upgrade my licenses?**

  Ensure that the current license date has not expired, and is valid for the release you are upgrading to. See CTX111618. For information about renewal, see Customer Success Services renewal licenses.

- **How long does an upgrade take?**

  The time required to upgrade a deployment varies, depending on the infrastructure and network. So, we can’t provide an exact time.

- **What are the best practices?**

  Ensure that you understand and follow the preparation guidance.

- **Which operating systems are supported?**

  The System requirements article for the version you’re upgrading to lists the supported OSs.

  If your current deployment uses operating systems that are no longer supported, see Earlier operating systems.

- **Which versions of VMware vSphere (vCenter + ESXi) are supported?**

  CTX131239 lists the supported hosts and versions, plus links to known issues.

- **When does my version go EOL?**

  Check the Product Matrix.

- **What are the known issues with the latest release?**
More information

Long Term Service Release (LTSR) deployment updates use Cumulative Updates (CUs). A CU updates baseline components of the LTSR, and each CU includes its own metainstaller.

Each CU has dedicated documentation. For example, for the 7.15 LTSR, check the link on that LTSR's What's new page for the latest CU. Each CU page includes supported version information, instructions, and a link to the CU download package.

Migrate

Migrating moves data from an earlier deployment to a newer version. The process includes installing newer components and creating a new site, exporting data from the older farm, and then importing the data to the new site.

There are no supported tools or scripts for migrating XenApp and XenDesktop versions, or migrating earlier Citrix Virtual Apps and Desktops versions. Upgrading is supported for the Citrix Virtual Apps and Desktops versions listed in the Citrix Upgrade Guide, and described in this product documentation.

For earlier XenApp 6.x migration content, see the following. Neither the scripts nor the articles are supported or maintained.

- Open source migration scripts for XenApp 6.x versions are available at https://github.com/citrix/xaa65migrationtool. Citrix does not support or maintain these migration scripts
- Changes in 7.x
- Upgrade a XenApp 6.5 worker to a new VDA
- Migrate XenApp 6.x

Upgrade a deployment

August 19, 2020
Introduction

You can upgrade certain deployments to newer versions without having to first set up new machines or sites. This is called an in-place upgrade. To learn which Citrix Virtual Apps and Desktops versions you can upgrade, see the Citrix Upgrade Guide.

To start an upgrade, you run the installer from the new version to upgrade previously installed core components, VDAs, and certain other components. Then you upgrade the databases and the site.

You can upgrade any component that can be installed with the full-product installer (and the standalone VDA installers), if there is a newer version provided. For other components that are not installed with the full-product installer (such as Citrix Provisioning and Profile Management), see that component's documentation for guidance. For host upgrades, see the appropriate documentation.

Review all the information in this article before beginning an upgrade.

Upgrade sequence

The following diagram shows the steps the upgrade sequence. Upgrade procedure contains details of each step in the diagram.

Upgrade procedure

Most of the main product components can be upgraded by running the product installer on the machine containing the component.
If one machine contains more than one component (for example, Studio and License Server), all components on that machine are upgraded, if the product media contains newer versions of their software.

To use the installers:

• To run the full product installer’s graphical interface, log on to the machine and then insert the media or mount the ISO drive for the new release. Double-click AutoSelect.
• To use the command-line interface, issue the appropriate command. See Install using the command line.

**Step 1: Prepare**

Before you begin an upgrade, make sure you’re ready. Read and complete any necessary tasks:

• Remove PVD, App Disks, and unsupported hosts
• VDAs that have Pvd or AppDisk components
• Limitations
• Mixed environment considerations
• Earlier operating systems
• Preparation
• Preliminary site tests
• SQL Server version check

**Step 2: Upgrade License Server**

If the installation has a new version of the Citrix License Server software, upgrade this component first before any other components.

If you have not yet determined whether your License Server is compatible with the new version, it is essential that you run the installer on the License Server before upgrading any other core components.

**Step 3: Upgrade StoreFront**

If the installation media contains a new version of the StoreFront software, run the installer on the machine containing the StoreFront server.

• In the graphical interface, choose **Citrix StoreFront** from the **Extend deployment** section.
• From the command line, run `CitrixStoreFront-x64.exe`, which is available in the Citrix Virtual Apps and Desktops installation media’s `x64` folder.
Step 4: Upgrade Director

If the installation media contains a new version of the Director software, run the installer on the machine containing Director.

Step 5: Upgrade Citrix Provisioning

The Citrix Provisioning installation media is available separately from the Citrix Virtual Apps and Desktops installation media. To learn how to install and upgrade Citrix Provisioning server and target device software, see the Citrix Provisioning product documentation.

Step 6: Upgrade half of Delivery Controllers

For example, if your site has four Controllers, run the installer on two of them.

Leaving half of the Controllers active allows users to access the site. VDAs can register with the remaining Controllers. There might be times when the site has reduced capacity because fewer Controllers are available. The upgrade causes only a brief interruption in establishing new client connections during the final database upgrade steps. The upgraded Controllers cannot process requests until the entire site is upgraded.

If your site has only one Controller, it is inoperable during the upgrade.

Preliminary site tests run on the first Controller, before the actual upgrade starts. For details, see Preliminary site tests.

Step 7: Upgrade Studio

If you haven’t already upgraded Studio (because it was on the same machine as another component), run the installer on the machine containing Studio.

Step 8: Restart Studio

 Restart the upgraded Studio. The upgrade process automatically resumes.

Step 9: Upgrade database and site

Check Preparation for the permissions required to update the schema of the SQL Server databases.

- If you have sufficient permission to update the SQL Server database schema, you can initiate an automatic database upgrade. Continue with Upgrade the database and site automatically.
If you do not have sufficient database permissions, you can initiate a manual upgrade that uses scripts, and proceed with the help of your database administrator (someone who has the required permissions). For a manual upgrade, the Studio user generates the scripts and then runs the scripts that enable and disable services. The database administrator runs other scripts that update the database schema, using either the SQLCMD utility or the SQL Server Management Studio in SQLCMD mode. Continue with Upgrade the database and site manually.

Citrix strongly recommends that you back up the database before upgrading. SeeCTX135207. During a database upgrade, product services are disabled. During that time, Controllers cannot broker new connections for the site, so plan carefully.

**Upgrade the database and site automatically**

1. Start the newly upgraded Studio.
2. Indicate that you want to start the site upgrade automatically and confirm that you are ready.

The database and site upgrade proceeds.

**Upgrade the database and site manually**

1. Start the newly upgraded Studio.
2. Indicate that you want to upgrade the site manually. The wizard checks for License Server compatibility and requests confirmation.
3. Confirm that you have backed up the database.

   The wizard generates and displays the scripts and a checklist of upgrade steps. If a database’s schema has not changed since the product version being upgraded, that script is not generated. For example, if the logging database schema does not change, the `UpgradeLoggingDatabase.sql` script is not generated.
4. Run the following scripts in the order shown.
   - **DisableServices.ps1**: The Studio user runs this PowerShell script on a Controller to disable product services.
   - **UpgradeSiteDatabase.sql**: The database administrator runs this SQL script on the server containing the Site database
   - **UpgradeMonitorDatabase.sql**: The database administrator runs this SQL script on the server containing the Monitor database.
   - **UpgradeLoggingDatabase.sql**: The database administrator runs this SQL script on the server containing the Configuration Logging database. Run this script only if this database changes (for example, after applying a hotfix).
   - **EnableServices.ps1**: The Studio user runs this PowerShell script on a Controller to enable product services.
After the database upgrade completes and product services are enabled, Studio automatically tests the environment and configuration, and then generates an HTML report. If problems are identified, you can restore the database backup. After resolving issues, you can upgrade the database again.

5. After completing the checklist tasks, click **Finish upgrade**.

**Step 10: Upgrade remaining Delivery Controllers**

From the newly upgraded Studio, select **Citrix Studio site-name** in the navigation pane. On the **Common Tasks** tab, select **Upgrade remaining Delivery Controllers**.

After completing the upgrade and confirming completion, close and then reopen Studio. Studio might prompt for an extra site upgrade to register the Controller’s services to the site, or to create a zone ID if it does not exist.

**Step 11: UpgradeVDAs**

**Important:**

If you’re upgrading a VDA to version 1912 or later, see Upgrading VDAs to 1912 or later.

Run the product installer on machines containing VDAs.

If you used Machine Creation Services and a master image to create machines, go to your host and upgrade the VDA on the master image. You can use any of the available VDA installers.

- For graphic interface guidance, see Install VDAs.
- For command line guidance, see Install using the command line.

If you used Citrix Provisioning to create machines, see the Citrix Provisioning product documentation for guidance about upgrading.

**Watch this video to learn more:**
Step 12: Update machine catalogs and Delivery Groups

- Update catalogs that use machines with upgraded VDAs.
- Upgrade catalogs that use machines with upgraded VDAs.
- Upgrade Delivery Groups that use machines with upgraded VDAs.

Step 13: After the upgrade

After completing an upgrade, you can test the newly upgraded site. From Studio, select **Citrix Studio site-name** in the navigation pane. On the **Common Tasks** tab, select **Test Site**. These tests run automatically after you upgrade the database, but you can run them again at any time.

The tests might fail for a Controller on Windows Server 2016 when a local Microsoft SQL Server Express is used for the site database, if the SQL Server Browser Service is not started. To avoid this:

- Enable the SQL Server Browser Service (if necessary) and then start it.
- Restart the SQL Server (SQLEXPRESS) service.

Upgrade other components in your deployment. For guidance, see the following product documentation:

- StoreFront
- AppDNA
- Citrix App Layering
- HDX RealTime Optimization Pack
If you need to replace the Microsoft SQL Server Express LocalDB software with a later version, see Replace SQL Server Express LocalDB.

Remove PvD, AppDisks, and unsupported hosts

The following technologies and host types are not supported in Citrix Virtual Apps and Desktops 7 Current Release deployments:

- **Personal vDisks (PvD)** for storing data next to users’ VMs in catalogs. The user personalization layer feature now handles user persistence.

- **AppDisks** for managing applications used in Delivery Groups.

- **Host types:** Azure Classic, Azure Resource Manager (ARM), Amazon Web Services (AWS), Cloud-Platform (the original Citrix product).
  - For host types supported in this release, see System requirements.
  - For information about alternative ways you can continue using ARM and AWS, see CTX270373.

If your current deployment uses PvDs or AppDisks, or has connections to unsupported host types, you can upgrade to version 2006 (or later supported versions) only after removing items that use those technologies.

When the installer detects one or more of the unsupported technologies or host types, the upgrade pauses or stops, and an explanatory message appears. The installer logs contain details.

To help ensure a successful upgrade, review and follow the applicable guidance for removing the unsupported items.

- Remove PvD
- Remove AppDisks
- Remove unsupported host items

Even if you did not use PvD or AppDisks in your deployment, related MSIs might have been included in an earlier VDA installation or upgrade. Before you can upgrade your VDAs to version 2006 (or a later supported version), you must remove that software, even if you never used it. When using the graphical interface, that removal can be done for you, or you can include removal options when using the CLI. For details, see Upgrading VDAs that have PvD or AppDisks components.
Remove PvD

A deployment upgrade cannot succeed until you remove all machines that are configured to use PvD. This affects catalogs and Delivery Groups.

To remove PvD from groups and catalogs:

1. From Studio, if a Delivery Group contains machines from a catalog that uses PvD, remove those machines from the group.
2. From Studio, delete all catalogs containing machines that use PvD.

VDA upgrades: The deployment upgrade does not detect whether VDAs have the AppDisk or PvD components installed. However, the VDA installers do. For details, see VDAs that have PvD or AppDisks components.

If you plan to use App Layering instead of PvD, see Migrating PvD to App Layering for information about moving data.

Remove AppDisks

A deployment upgrade cannot proceed until you remove AppDisks from all Delivery Groups that use them, and then remove the AppDisks themselves.

1. Select Delivery Groups in the Studio navigation pane.
2. Select a group and then click Manage AppDisks in the Action pane.
3. Click the action that removes the AppDisk from the group.
4. Repeat steps 2 and 3 for each Delivery Group that uses AppDisks.
5. Select AppDisks in the Studio navigation pane.
6. Select an AppDisk and click the action that deletes the AppDisk.
7. Repeat steps 5 and 6 for each AppDisk.

VDA upgrades: The deployment upgrade does not detect whether VDAs have the AppDisk or PvD components installed. However, the VDA installers do. For details, see VDAs that have PvD or AppDisks components.

Remove unsupported host items

A deployment upgrade to version 2006 (or later supported version) cannot proceed if the site has connections to unsupported host types, such as Azure or AWS. Complete the following tasks before attempting an upgrade.

From Studio:

- Delete all connections to unsupported hosts.
- If a Delivery Group contains machines from a catalog created with a master image from an unsupported host, remove those machines from the group.
- Delete all catalogs that were created using a master image from an unsupported host.

**VDAs that have Pvd or AppDisks components**

If the components that enable Pvd and AppDisks technologies are installed on a VDA, that VDA cannot be upgraded until those components are removed.

**Note:**
When upgrading to version 1912, you had to uninstall the current VDA and then install the new VDA. In this version, you’re asked if you want Citrix to remove the component and then continue the upgrade.

The AppDisk and Pvd components might have been installed in earlier VDA versions, even if you never used those technologies:

- Graphical interface: In the VDA installers, the Additional Components page contained the Citrix AppDisk / Personal vDisk option. The 7.15 LTSR and earlier 7.x releases enabled this option by default. So, if you accepted the defaults (or explicitly enabled the option in any release that offered it), that component was installed.
- CLI: Specifying the /baseimage option installed the component.

**What to do**

If the VDA installer does not detect the AppDisks or Pvd components in the currently installed VDA, the upgrade proceeds as usual.

If the installer detects AppDisks or Pvd components in the currently installed VDA:

- Graphical interface: The upgrade pauses. A message asks if you want the unsupported components removed automatically. If you click OK, the components are removed automatically and the upgrade proceeds.
- CLI: To avoid command failure, include the following options in the command:
  - /remove_appdisk_ack
  - /remove_pvd_ack

**Limitations**

The following limitations apply to upgrades:

- **Selective component install:** If you install or upgrade any components to the new version but choose not to upgrade other components (on different machines) that require upgrade, Studio reminds you. For example, let’s say an upgrade includes new versions of the Controller and
Studio. You upgrade the Controller but you do not run the installer on the machine where Studio is installed. Studio will not let you continue to manage the site until you upgrade Studio.

You do not have to upgrade VDAs, but Citrix recommends upgrading all VDAs to enable you to use all available features.

- **Early Release or Technology Preview versions**: You cannot upgrade from an Early Release, Technology Preview, or preview version.

- **Components on earlier operating systems**: You cannot install current VDAs on operating systems that are no longer supported by Microsoft or Citrix. For more information, see Earlier operating systems.

- **Mixed environments/sites**: If you must continue to run earlier version sites and current version sites, see Mixed environment considerations.

- **Product selection**: When you upgrade from an earlier version, you do not choose or specify the product (Citrix Virtual Apps or Citrix Virtual Apps and Desktops) that was set during the installation.

**Mixed environment considerations**

When you upgrade, Citrix recommends that you upgrade all components and VDAs so that you can access all the new and enhanced features in your edition and version.

For example, although you can use current VDAs in deployments containing earlier Controller versions, new features in the current release might not be available. VDA registration issues can also occur when using non-current versions.

In some environments, you might not be able to upgrade all VDAs to the most current version. In that case, when you create a machine catalog, you can specify the VDA version installed on the machines. (This is called the functional level.) By default, this setting specifies the minimum recommended VDA version. The default value is sufficient for most deployments. Consider changing the setting to an earlier version only if the catalog contains VDAs earlier than the default. Mixing VDA versions in a machine catalog is not recommended.

If a catalog is created with the default minimum VDA version setting, and one or more machines has a VDA earlier than the default version, those machines cannot register with the Controller, and will not work.

For more information, see VDA versions and functional levels.

**Multiple sites with different versions**

When your environment contains sites with different product versions (for example, a XenDesktop 7.18 site and a Citrix Virtual Apps and Desktops 1909 site), Citrix recommends using StoreFront to ag-
aggregate applications and desktops from different product versions. For details, see the StoreFront documentation.

In a mixed environment, continue using the Studio and Director versions for each release, but ensure that different versions are installed on separate machines.

**Earlier operating systems**

Let’s say you installed an earlier version of a component on a machine that was running a supported operating system (OS) version. Now, you want to use a newer component version, but that OS is no longer supported for the current version of the component.

For example, assume that you installed a server VDA on a Windows Server 2008 R2 machine. Now you want to upgrade that VDA to the current release, but Windows Server 2008 R2 is not supported in the current release you’re upgrading to.

If you try to install or upgrade a component on an operating system that is no longer allowed, an error message displays, such as “Cannot be installed on this operating system”.

These considerations apply to upgrading Current Release and Long Term Service Release versions. (It does not affect applying CU to an LTSR version.)

Follow the links to learn which OSs are supported:

- Citrix Virtual Apps and Desktops (Current Release):
  - Delivery Controller, Studio, Director, VDAs, Universal Print Server
  - Federated Authentication Service
  - For StoreFront, Self-Service Password Reset, and Session Recording, see the system requirements article for the current release.

- For LTSRs, see the components lists for your LTSR version and CU. (Select your LTSR version from the main Citrix Virtual Apps and Desktops product documentation page.)

**Invalid operating systems**

The following table lists the earlier operating systems that are not valid for installing/upgrading components in the current release. It indicates the latest valid component version supported for each listed OS, and the component version when installation and upgrade became invalid.

The operating systems in the table include service packs and updates.
## Operating system Component/feature Latest valid version

</table>

Windows XP and Windows Vista are not valid for any 7.x components or technologies.

* Applies to Delivery Controller, Studio, Director, and VDAs.

### What you can do

You have choices. You can:

- Continue with the current OS
- Reimage or upgrade the machine
- Add new machines and then remove old machines

### Continue with the current OS
These methods are feasible for VDAs. If you want to continue using machines with the earlier OS, you can choose one of the following:

- Continue using the installed component version.
- Download the latest valid component version and then upgrade the component to that version.
  (This assumes that the latest valid component version isn’t already installed.)

For example, you have a 7.14 VDA on a Windows 7 SP1 machine. The latest valid VDA version on Windows 7 OS machines is XenApp and XenDesktop 7.15 LTSR. You can either continue using 7.14, or download a 7.15 LTSR VDA and then upgrade your VDA to that version. Those earlier VDA versions work in deployments containing Delivery Controllers with newer versions. For example, a 7.15 LTSR VDA can connect to a Citrix Virtual Apps and Desktops 7 1808 Controller.

Reimage or upgrade the machine

These methods are feasible for VDAs and other machines that do not have core components (such as Delivery Controllers) installed. Choose one of the following:

- After taking the machine out of service (turning on maintenance mode and allowing all sessions to close), you can reimage it to a supported Windows OS version, and then install the latest version of the component.
- To upgrade the OS without reimagining, uninstall the Citrix software before upgrading the OS. Otherwise, the Citrix software will be in an unsupported state. Then, install the new component.

Add new machines and then remove old machines

This method is feasible if you must upgrade the OS on machines containing a Delivery Controller or other core component.

Citrix recommends that all Controllers in a site have the same OS. The following upgrade sequence minimizes the interval when different Controllers have different OSs.

1. Take a snapshot of all Delivery Controllers in the site and then back up the site database.
2. Install new Delivery Controllers on clean servers with supported operating systems. For example, install a Controller on two Windows Server 2016 machines.
3. Add the new Controllers to the site.
4. Remove the Controllers that are running on operating systems that are not valid for the current release. For example, remove two Controllers on two Windows Server 2008 R2 machines. Follow the recommendations for removing Controllers in Delivery Controllers.

Preparation

Before beginning an upgrade, review the following information and complete necessary tasks.
Choose an installer and interface

Use the full-product installer from the product ISO to upgrade components. You can upgrade VDAs using the full-product installer or one of the standalone VDA installers. All installers offer graphical and command line interfaces.

For more information, see Installers.

Installation specifics: After you complete any preparation work and are ready to start the installer, the installation article shows you what you will see (if you’re using the graphical interface) or what to type (if you’re using the command-line interface).

- Install/upgrad core components using the graphical interface
- Install/upgrad core components using the command line
- Install/upgrad VDAs using the graphical interface
- Install/upgrad VDAs using the command line

If you originally installed a single-session VDA with the VDAWorkstationCoreSetup.exe installer, Citrix recommends using that installer to upgrade it. If you use the full-product VDA installer or the VDAWorkstationSetup.exe installer to upgrade the VDA, the components that were originally excluded might be installed, unless you expressly omit/exclude them from the upgrade.

When upgrading a VDA to the current release, a machine restart occurs during the upgrade process. (This requirement started with the 7.17 release.) This cannot be avoided. The upgrade resumes automatically after the restart (unless you specify /noresume on the command line).

Database actions

Back up the site, monitoring, and configuration logging databases. Follow the instructions in CTX135207. If any issues are discovered after the upgrade, you can restore the backup.

For information about upgrading SQL Server versions that are no longer supported, see SQL Server version check. (This refers to the SQL Server that is used for the site, monitor, and configuration logging databases.)

Microsoft SQL Server Express LocalDB is installed automatically, for use with Local Host Cache. If you need to replace an earlier version, the new version must be at least SQL Server Express 2017 LocalDB CU16. For details about replacing SQL Server Express LocalDB with a new version after you upgrade the components and the site, see Replace SQL Server Express LocalDB.

Ensure that your Citrix licensing is up-to-date

For a comprehensive look at managing Citrix Licensing, see Activate, upgrade, and manage Citrix licenses.
You can use the full-product installer to upgrade the License Server. Or, you can download and upgrade the license components separately. See Upgrade.

Before upgrading, be sure your Customer Success Services / Software Maintenance / Subscription Advantage date is valid for the new product version. If you are upgrading from an earlier 7.x product version, the date must be at least 2020.08.15.

Ensure that your Citrix License Server is compatible

Ensure that your Citrix License Server is compatible with the new version. There are two ways to do this:

- Before upgrading any other Citrix components, run the XenDesktopServerSetup.exe installer from the ISO layout on the machine containing a Delivery Controller. If there are any incompatibility issues, the installer reports it with recommended steps to resolve the issues.

- From the XenDesktop Setup directory on the installation media, run the command: .\LicServVerify.exe -h <license-server-fqdn> -p 27000 -v. The display indicates whether the License Server is compatible. If the License Server is incompatible, upgrade the license server.

Close applications and consoles

Before starting an upgrade, close all programs that might potentially cause file locks, including administration consoles and PowerShell sessions.

Restarting the machine ensures that any file locks are cleared, and that there are no Windows updates pending.

Before starting an upgrade, stop and disable any third-party monitoring agent services.

Ensure that you have proper permissions

In addition to being a domain user, you must be a local administrator on the machines where you are upgrading product components.

The site database and the site can be upgraded automatically or manually. For an automatic database upgrade, the Studio user’s permissions must include the ability to update the SQL Server database schema (for example, the db_securityadmin or db_owner database role). For details, see Databases.

If the Studio user does not have those permissions, initiating a manual database upgrade generates scripts. The Studio user runs some of the scripts from Studio. The database administrator runs other scripts, using a tool such as SQL Server Management Studio.
Other preparation tasks

- Back up templates and upgrade hypervisors, if needed
- Complete any other preparation tasks dictated by your business continuity plan.

Preliminary site tests

When you upgrade Delivery Controllers and a site, preliminary site tests run before the actual upgrade begins. These tests verify:

- The site database can be reached and has been backed up
- Connections to essential Citrix services are working correctly
- The Citrix License Server address is available
- The configuration logging database can be reached

After the tests run, you can view a report of the results. You can then fix any issues that were detected, and run the tests again. Failure to run the preliminary site tests and then resolve any issues can impact how your site works.

The report containing the test results is an HTML file (PreliminarySiteTestResult.html) in the same directory as the installation logs. That file is created if it does not exist. If the file exists, its content is overwritten.

Run the tests

- When you’re using the installer’s graphical interface to upgrade, the wizard includes a page where you can start the tests and then display the report. After the tests run and you have viewed the report and resolved any issues that were found, you can rerun the tests. When the tests complete successfully, click Next to continue with the wizard.
- When you’re using the command-line interface to upgrade, the tests run automatically. By default, if a test fails, the upgrade is not performed. After you view the report and resolve issues, rerun the command.

Citrix recommends always running the preliminary site tests and then resolving any issues before you continue the Controller and site upgrade. The potential benefit is well worth the few moments to run the tests. However, you can override this recommended action.

- When upgrading with the graphical interface, you can choose to skip the tests and continue with the upgrade.
- When upgrading from the command line, you cannot skip the tests. By default, a failed site test causes the installer to fail, without performing the upgrade. In most cases, if you include the /ignore_site_test_failure option, any test failures are ignored and the upgrade proceeds. (See SQL Server version check for exceptions.)
**When upgrading multiple Controllers**

When you start an upgrade on one Controller, and then start an upgrade of another Controller in the same site (before the first upgrade completes):

- If the preliminary site tests have completed on the first Controller, the preliminary site tests page does not appear in the wizard on the other Controller.
- If the tests on the first Controller are ongoing when you start the upgrade on the other Controller, the site tests page appears in the wizard on the other Controller. However, if the tests on the first Controller finish, only the test results from the first Controller are retained.

**Test failures not related to the site’s health**

- If the preliminary site tests fail due to insufficient memory, make more memory available and then rerun the tests.
- If you have permission to upgrade, but not run site tests, the preliminary site tests fail. To resolve this, rerun the installer with a user account that has permission to run the tests.

**SQL Server version check**

A successful Citrix Virtual Apps and Desktops deployment requires a supported version of Microsoft SQL Server for the site, monitor, and configuration logging databases. Upgrading a Citrix deployment with a SQL Server version that's no longer supported can result in functionality issues, and the site will be unsupported.

To learn which SQL Server versions are supported for the Citrix release you’re upgrading to, see the [System requirements](#) article for that release.

When upgrading a Controller, the Citrix installer checks the currently installed SQL Server version used for the site, monitor, and configuration logging databases.

- If the check determines that the currently installed SQL Server version is not a supported version in the Citrix release you’re upgrading to:
  - Graphical interface: The upgrade halts with a message. Click **I understand** and then click **Cancel** to close the Citrix installer. (You cannot continue with the upgrade.)
  - Command-line interface: the command fails (even if you included the `/ignore_db_check_failure` option with the command).

Upgrade the SQL Server version, and then start the Citrix upgrade again.

- If the check cannot determine which SQL Server version is currently installed, see if your currently installed version is supported in the version you’re upgrading to ([System requirements](#)).
  - Graphical interface: The upgrade halts with a message.
If the currently installed SQL Server version is supported, click **I understand** to close the message, and then click **Next** to continue with the Citrix upgrade.

If the currently installed SQL Server version is not supported, click **I understand** to close the message, and then click **Cancel** to end the Citrix upgrade. Upgrade your SQL Server to a supported version and then start the Citrix upgrade again.

- Command-line interface: The command fails with a message. After closing the message:
  - If the currently installed SQL Server version is supported, run the command again with the `/ignore_db_check_failure` option.
  - If the currently installed SQL Server version is not supported, upgrade your SQL Server to a supported version. Run the command again to start the Citrix upgrade.

**Upgrading SQL Server**

If you bring up new SQL Server servers and migrate the site database, then connection strings must be updated.

If the site currently uses SQL Server Express (that Citrix installed automatically during site creation):

1. Install the latest SQL Server Express version.
2. Detach the database.
3. Attach the database to the new SQL Server Express.
4. Migrate connection strings.

For more information, see *Configuring connection strings* and the Microsoft SQL Server product documentation.

**Replace SQL Server Express LocalDB**

Microsoft SQL Server Express LocalDB is a feature of SQL Server Express that Local Host Cache uses on a standalone basis. Local Host Cache does not require any components of SQL Server Express other than SQL Server Express LocalDB.

If you installed a Delivery Controller version earlier than 1912 and then upgrade your deployment to version 1912 or later, Citrix does not automatically upgrade the SQL Server Express LocalDB version. Why not? Because you might have non-Citrix components that rely on SQL Server Express LocalDB.

If you have non-Citrix components that are using SQL Server Express LocalDB, ensure that upgrading SQL Server Express LocalDB does not disrupt those components. To upgrade (replace) the SQL Server Express LocalDB version, follow the guidance in this section.

- **When upgrading Delivery Controllers to Citrix Virtual Apps and Desktops version 1912 or 2003**: Upgrading SQL Server Express LocalDB is optional. Local Host Cache works properly, with no loss of functionality, regardless of whether you upgrade SQL Server Express LocalDB.
We added the option to move to a newer version of SQL Server Express LocalDB in case there are concerns about end of support from Microsoft for SQL Server Express LocalDB 2014.

- **When upgrading Delivery Controllers to Citrix Virtual Apps and Desktops versions newer than 2003:** The minimum supported version is SQL Server Express 2017 LocalDB Cumulative Update (CU) 16. If you originally installed a Delivery Controller earlier than version 1912, and have not replaced SQL Server Express LocalDB with a newer version since then, you must replace that database software now. Otherwise, Local Host Cache will not work.

What you need:

- The Citrix Virtual Apps and Desktops installation media (for the version you’ve upgraded to). The media contains a copy of Microsoft SQL Server Express LocalDB 2017 CU 16.
- A Windows Sysinternals tool that you download from Microsoft.

Procedure:

1. Complete the upgrade of your Citrix Virtual Apps and Desktops components, databases, and site. (Those database upgrades affect the site, monitoring, and configuration logging databases. They do not affect the Local Host Cache database that uses SQL Server Express LocalDB.)

2. On the Delivery Controller, download PsExec from Microsoft. See the Microsoft document PsExec v2.2.

3. Stop the Citrix High Availability Service.

4. From the command prompt, run **PsExec** and switch to the Network Service account.
   ```cmd
   psexec -i -u "NT AUTHORITY\NETWORK SERVICE" cmd
   ```
   Optionally, you can use **whoami** to confirm that the command prompt is running as the Network Service account.
   ```cmd
   whoami
   ```
   ```cmd
   nt authority\network service
   ```

5. Move to the folder containing SqlLocalDB.
   ```cmd
   cd "C:\Program Files\Microsoft SQL Server\120\Tools\Binn"
   ```

6. Stop and delete **CitrixHA (LocalDB)**.
   ```cmd
   SqlLocalDB stop CitrixHA
   SqlLocalDB delete CitrixHA
   ```

7. Remove the related files in **C:\Windows\ServiceProfiles\NetworkService**.
Tip: Your deployment might not have HAIImportDatabaseName.* and HAIImportDatabaseName_log.*

8. Uninstall SQL Server Express LocalDB 2014 from the server, using the Windows feature for removing programs.

9. Install SQL Server Express LocalDB 2017. In the Support > SQLLocalDB folder on the Citrix Virtual Apps and Desktops installation media, double-click sqllocaldb.msi. A restart might be requested to complete the installation. (The new SQLLocalDB resides in C:\Program Files\Microsoft SQL Server\140\Tools\Binn.)

10. Start the Citrix High Availability Service.

11. Ensure that the Local Host Cache database was created on each Delivery Controller. This confirms that the High Availability Service (secondary broker) can take over, if needed.

   - On the Controller server, browse to C:\Windows\ServiceProfiles\NetworkService.
   - Verify that HaDatabaseName.mdf and HaDatabaseName_log.ldf are created.

## Secure

June 24, 2020

Citrix Virtual Apps and Desktops offers a secure-by-design solution that allows you to tailor your environment to your security needs.

One security concern IT faces with mobile workers is lost or stolen data. By hosting applications and desktops, Citrix Virtual Apps and Desktops securely separates sensitive data and intellectual property from end-point devices by keeping all data in a data center. When policies are enabled to allow data transfer, all data is encrypted.

The Citrix Virtual Apps and Desktops data centers also make incident response easier with a centralized monitoring and management service. Director allows IT to monitor and analyze data that is being accessed around the network, and Studio allows IT to patch and remedy most vulnerabilities in the data center instead of fixing the problems locally on each end-user device.

Citrix Virtual Apps and Desktops also simplify audits and regulatory compliance because investigators can use a centralized audit trail to determine who accessed what applications and data. Director gath-
Citrix Virtual Apps and Desktops give administrators granular control over users by applying policies at different levels of the network - from the local level to the Organizational Unit level. This control of policies determines if a user, device, or groups of users and devices can connect, print, copy/paste, or map local drives, which can minimize security concerns with third-party contingency workers. Administrators can also use the Desktop Lock feature so end users can only use the virtual desktop while preventing any access to the local operating system of the end-user device.

Administrators can increase security on Citrix Virtual Apps or Citrix Virtual Desktops by configuring the Site to use the Transport Layer Security (TLS) protocol of the Controller or between end users and Virtual Delivery Agents (VDA). The protocol can also be enabled on a Site to provide server authentication, data stream encryption, and message integrity checks for a TCP/IP connection.

Citrix Virtual Apps and Desktops also support multifactor authentication for Windows or a specific application. Multifactor authentication can also be used to manage all resources delivered by Citrix Virtual Apps and Desktops. These methods include:

- Tokens
- Smart cards
- RADIUS
- Kerberos
- Biometrics

Citrix Virtual Desktops can be integrated with many third-party security solutions, ranging from identity management to antivirus software. A list of supported products can be found at http://www.citrix.com/ready.

Select releases of Citrix Virtual Apps and Desktops are certified for Common Criteria standard. For a list of those standards, go to https://www.commoncriteriaportal.org/cc/.

Security considerations and best practices

June 16, 2020
Note:
Your organization may need to meet specific security standards to satisfy regulatory requirements. This document does not cover this subject, because such security standards change over time. For up-to-date information on security standards and Citrix products, consult http://www.citrix.com/security/.

Security best practices

Keep all machines in your environment up to date with security patches. One advantage is that you can use thin clients as terminals, which simplifies this task.

Protect all machines in your environment with antivirus software.

Consider using platform-specific anti-malware software.

Protect all machines in your environment with perimeter firewalls, including at enclave boundaries as appropriate.

If you are migrating a conventional environment to this release, you may need to reposition an existing perimeter firewall or add new perimeter firewalls. For example, suppose there is a perimeter firewall between a conventional client and database server in the data center. When this release is used, that perimeter firewall must be placed so that the virtual desktop and user device are on one side, and the database servers and Delivery Controllers in the data center are on the other side. Therefore, consider creating an enclave within your data center to contain the database servers and Controllers. Also consider having protection between the user device and the virtual desktop.

All machines in your environment should be protected by a personal firewall. When you install core components and VDAs, you can choose to have the ports required for component and feature communication opened automatically if the Windows Firewall Service is detected (even if the firewall is not enabled). You can also choose to configure those firewall ports manually. If you use a different firewall, you must configure the firewall manually.

Note:
TCP ports 1494 and 2598 are used for ICA and CGP and are therefore likely to be open at firewalls so that users outside the data center can access them. Citrix recommends that you do not use these ports for anything else, to avoid the possibility of inadvertently leaving administrative interfaces open to attack. Ports 1494 and 2598 are officially registered with the Internet Assigned Number Authority (http://www.iana.org/).

All network communications should be appropriately secured and encrypted to match your security policy. You can secure all communication between Microsoft Windows computers using IPSec; refer to your operating system documentation for details about how to do this. In addition, communication
between user devices and desktops is secured through Citrix SecureICA, which is configured by default to 128-bit encryption. You can configure SecureICA when you are creating or updating a Delivery Group.

Apply Windows best practice for account management. Do not create an account on a template or image before it is duplicated by Machine Creation Services or Provisioning Services. Do not schedule tasks using stored privileged domain accounts. Do not manually create shared Active Directory machine accounts. These practices will help prevent a machine attack from obtaining local persistent account passwords and then using them to log on to MCS/PVS shared images belonging to others.

**Application security**

To prevent non-admin users from performing malicious actions, we recommend that you configure Windows AppLocker rules for installers, applications, executables and scripts on the VDA host and on the local Windows client.

**Manage user privileges**

Grant users only the capabilities they require. Microsoft Windows privileges continue to be applied to desktops in the usual way: configure privileges through User Rights Assignment and group memberships through Group Policy. One advantage of this release is that it is possible to grant a user administrative rights to a desktop without also granting physical control over the computer on which the desktop is stored.

Note the following when planning for desktop privileges:

- By default, when non-privileged users connect to a desktop, they see the time zone of the system running the desktop instead of the time zone of their own user device. For information on how to allow users to see their local time when using desktops, see the Manage Delivery Groups article.
- A user who is an administrator on a desktop has full control over that desktop. If a desktop is a pooled desktop rather than a dedicated desktop, the user must be trusted in respect of all other users of that desktop, including future users. All users of the desktop need to be aware of the potential permanent risk to their data security posed by this situation. This consideration does not apply to dedicated desktops, which have only a single user; that user should not be an administrator on any other desktop.
- A user who is an administrator on a desktop can generally install software on that desktop, including potentially malicious software. The user can also potentially monitor or control traffic on any network connected to the desktop.
Manage logon rights

Logon rights are required for both user accounts and computer accounts. As with Microsoft Windows privileges, logon rights continue to be applied to desktops in the usual way: configure logon rights through User Rights Assignment and group memberships through Group Policy.

The Windows logon rights are: log on locally, log on through Remote Desktop Services, log on over the network (access this computer from the network), log on as a batch job, and log on as a service.

For computer accounts, grant computers only the logon rights they require. The logon right “Access this computer from the network” is required:

- At VDAs, for the computer accounts of Delivery Controllers
- At Delivery Controllers, for the computer accounts of VDAs. See Active Directory OU-based Controller discovery.
- At StoreFront servers, for the computer accounts of other servers in the same StoreFront server group

For user accounts, grant users only the logon rights they require.

According to Microsoft, by default the group Remote Desktop Users is granted the logon right “Allow log on through Remote Desktop Services” (except on domain controllers).

Your organization’s security policy may state explicitly that this group should be removed from that logon right. Consider the following approach:

- The Virtual Delivery Agent (VDA) for Multi-session OS uses Microsoft Remote Desktop Services. You can configure the Remote Desktop Users group as a restricted group, and control membership of the group via Active Directory group policies. Refer to Microsoft documentation for more information.
- For other components of Citrix Virtual Apps and Desktops, including the VDA for Single-session OS, the group Remote Desktop Users is not required. So, for those components, the group Remote Desktop Users does not require the logon right “Allow log on through Remote Desktop Services”; you can remove it. Additionally:
  - If you administer those computers via Remote Desktop Services, ensure that all such administrators are already members of the Administrators group.
  - If you do not administer those computers via Remote Desktop Services, consider disabling Remote Desktop Services itself on those computers.

Although it is possible to add users and groups to the login right “Deny logon through Remote Desktop Services”, the use of deny logon rights is not generally recommended. Refer to Microsoft documentation for more information.

Configure user rights

Delivery Controller installation creates the following Windows services:
• Citrix AD Identity Service (NT SERVICE\CitrixADIdentityService): Manages Microsoft Active Directory computer accounts for VMs.
• Citrix Analytics (NT SERVICE\CitrixAnalytics): Collects site configuration usage information for use by Citrix, if this collection been approved by the site administrator. It then submits this information to Citrix, to help improve the product.
• Citrix App Library (NT SERVICE\CitrixAppLibrary): Supports management and provisioning of AppDisks, AppDNA integration, and management of App-V.
• Citrix Broker Service (NT SERVICE\CitrixBrokerService): Selects the virtual desktops or applications that are available to users.
• Citrix Configuration Logging Service (NT SERVICE\CitrixConfigurationLogging): Records all configuration changes and other state changes made by administrators to the site.
• Citrix Configuration Service (NT SERVICE\CitrixConfigurationService): Site-wide repository for shared configuration.
• Citrix Delegated Administration Service (NT SERVICE\CitrixDelegatedAdmin): Manages the permissions granted to administrators.
• Citrix Environment Test Service (NT SERVICE\CitrixEnvTest): Manages self-tests of the other Delivery Controller services.
• Citrix Host Service (NT SERVICE\CitrixHostService): Stores information about the hypervisor infrastructures used in a Citrix Virtual Apps or Citrix Virtual Desktops deployment, and also offers functionality used by the console to enumerate resources in a hypervisor pool.
• Citrix Machine Creation Service (NT SERVICE\CitrixMachineCreationService): Orchestrates the creation of desktop VMs.
• Citrix Monitor Service (NT SERVICE\CitrixMonitor): Collects metrics for Citrix Virtual Apps or Citrix Virtual Desktops, stores historical information, and provides a query interface for troubleshooting and reporting tools.
• Citrix Storefront Service (NT SERVICE\CitrixStorefront): Supports management of StoreFront. (It is not part of the StoreFront component itself.)
• Citrix Storefront Privileged Administration Service (NT SERVICE\CitrixPrivilegedService): Supports privileged management operations of StoreFront. (It is not part of the StoreFront component itself.)
• Citrix Config Synchronizer Service (NT SERVICE\CitrixConfigSyncService): Propagates configuration data from the main site database to the Local Host Cache.
• Citrix High Availability Service (NT SERVICE\CitrixHighAvailabilityService): Selects the virtual desktops or applications that are available to users, when the main site database is unavailable.

Delivery Controller installation also creates the following Windows services. These are also created when installed with other Citrix components:

• Citrix Diagnostic Facility COM Server (NT SERVICE\CdfSvc): Supports the collection of diagnostic information for use by Citrix Support.
• Citrix Telemetry Service (NT SERVICE\CitrixTelemetryService): Collects diagnostic information
for analysis by Citrix, such that the analysis results and recommendations can be viewed by administrators to help diagnose issues with the site.

Delivery Controller installation also creates the following Windows service. This is not currently used. If it has been enabled, disable it.

- Citrix Remote Broker Provider (NT SERVICE\XaXdCloudProxy)

Delivery Controller installation also creates these following Windows services. These are not currently used, but must be enabled. Do not disable them.

- Citrix Orchestration Service (NT SERVICE\CitrixOrchestration)
- Citrix Trust Service (NT SERVICE\CitrixTrust)

Except for the Citrix Storefront Privileged Administration Service, these services are granted the logon right Log on as a service and the privileges Adjust memory quotas for a process, Generate security audits, and Replace a process level token. You do not need to change these user rights. These privileges are not used by the Delivery Controller and are automatically disabled.

**Configure service settings**

Except for the Citrix Storefront Privileged Administration service and the Citrix Telemetry Service, the Delivery Controller Windows services listed above in the Configure user rights section are configured to log on as the NETWORK SERVICE identity. Do not alter these service settings.

The Citrix Storefront Privileged Administration service is configured to log on Local System (NT AUTHORITY\SYSTEM). This is required for Delivery Controller StoreFront operations that are not normally available to services (including creating Microsoft IIS sites). Do not alter its service settings.

The Citrix Telemetry Service is configured to log on as its own service-specific identity.

You can disable the Citrix Telemetry Service. Apart from this service, and services that are already disabled, do not disable any other of these Delivery Controller Windows services.

**Configure registry settings**

It is no longer necessary to enable creation of 8.3 file names and folders on the VDA file system. The registry key NtfsDisable8dot3NameCreation can be configured to disable creation of 8.3 file names and folders. You can also configure this using the fsutil.exe behavior set disable8dot3 command.

**Deployment scenario security implications**

Your user environment can contain either user devices that are unmanaged by your organization and completely under the control of the user, or user devices that are managed and administered by your organization. The security considerations for these two environments are generally different.
Managed user devices

Managed user devices are under administrative control; they are either under your own control, or the control of another organization that you trust. You may configure and supply user devices directly to users; alternatively, you may provide terminals on which a single desktop runs in full-screen-only mode. Follow the general security best practices described above for all managed user devices. This release has the advantage that minimal software is required on a user device.

A managed user device can be configured to be used in full-screen-only mode or in window mode:

- Full-screen-only mode: Users log on to it with the usual Log On To Windows screen. The same user credentials are then used to log on automatically to this release.
- Users see their desktop in a window: Users first log on to the user device, then log on to this release through a web site supplied with the release.

Unmanaged user devices

User devices that are not managed and administered by a trusted organization cannot be assumed to be under administrative control. For example, you might permit users to obtain and configure their own devices, but users might not follow the general security best practices described above. This release has the advantage that it is possible to deliver desktops securely to unmanaged user devices. These devices should still have basic antivirus protection that will defeat keylogger and similar input attacks.

Data storage considerations

When using this release, you can prevent users from storing data on user devices that are under their physical control. However, you must still consider the implications of users storing data on desktops. It is not good practice for users to store data on desktops; data should be held on file servers, database servers, or other repositories where it can be appropriately protected.

Your desktop environment may consist of various types of desktops, such as pooled and dedicated desktops. Users should never store data on desktops that are shared amongst users, such as pooled desktops. If users store data on dedicated desktops, that data should be removed if the desktop is later made available to other users.

Mixed-version environments

Mixed-version environments are inevitable during some upgrades. Follow best-practice and minimize the time that Citrix components of different versions co-exist. In mixed-version environments, security policy, for example, may not be uniformly enforced.
The following scenario describes a security issue that can occur in a specific mixed-version Citrix environment. When Citrix Receiver 1.7 is used to connect to a virtual desktop running the VDA in XenApp and XenDesktop 7.6 Feature Pack 2, the policy setting *Allow file transfer between desktop and client* is enabled in the Site but cannot be disabled by a Delivery Controller running XenApp and XenDesktop 7.1. It does not recognize the policy setting, which was released in the later version of the product. This policy setting allows users to upload and download files to their virtual desktop, which is the security issue. To work around this, upgrade the Delivery Controller (or a standalone instance of Studio) to version 7.6 Feature Pack 2 and then use Group Policy to disable the policy setting. Alternatively, use local policy on all affected virtual desktops.

**Remote PC Access security considerations**

Remote PC Access implements the following security features:

- Smart card use is supported.
- When a remote session connects, the office PC’s monitor appears as blank.
- Remote PC Access redirects all keyboard and mouse input to the remote session, except CTRL+ALT+DEL and USB-enabled smart cards and biometric devices.
- Smooth Roaming is supported for a single user only.
- When a user has a remote session connected to an office PC, only that user can resume local access of the office PC. To resume local access, the user presses Ctrl-Alt-Del on the local PC and then logs on with the same credentials used by the remote session. The user can also resume local access by inserting a smart card or leveraging biometrics, if your system has appropriate third-party Credential Provider integration. This default behavior can be overridden by enabling Fast User Switching via Group Policy Objects (GPOs) or by editing the registry.

**Note:**

Citrix recommends that you do not assign VDA administrator privileges to general session users.

**Automatic assignments**

By default, Remote PC Access supports automatic assignment of multiple users to a VDA. In XenDesktop 5.6 Feature Pack 1, administrators could override this behavior using the RemotePCAccess.ps1 PowerShell script. This release uses a registry entry to allow or prohibit multiple automatic remote PC assignments; this setting applies to the entire Site.
Caution:
Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

To restrict automatic assignments to a single user:

On each Controller in the Site, set the following registry entry:

```
1 HKEY_LOCAL_MACHINE\Software\Citrix\DesktopServer
2 Name: AllowMultipleRemotePCAssignments
3 Type: REG_DWORD
4 Data: 0 = Disable multiple user assignment, 1 = (Default) Enable multiple user assignment.
```

If there are any existing user assignments, remove them using SDK commands for the VDA to subsequently be eligible for a single automatic assignment.

- Remove all assigned users from the VDA: `$machine.AssociatedUserNames | %{ Remove-BrokerUser-Name $_ -Machine $machine}
- Remove the VDA from the Delivery Group: `$machine | Remove-BrokerMachine -DesktopGroup $desktopGroup

Restart the physical office PC.

XML trust

The XML trust setting applies to deployments that use:

- An on-premises StoreFront.
- A subscriber (user) authentication technology that does not require passwords. Examples of such technologies are domain pass-through, smart cards, SAML, and Veridium solutions.

Enabling the XML trust setting allows users to successfully authenticate and then start applications. The Delivery Controller trusts the credentials sent from StoreFront. Enable this setting only when you have secured communications between your Delivery Controllers and StoreFront (using firewalls, IPsec, or other security recommendations).

This setting is disabled by default.

Use the Citrix Virtual Apps and Desktops PowerShell SDK to check, enable, or disable the XML trust setting.
To check the XML trust setting’s current value, run `Get-BrokerSite` and inspect the value of `TrustRequestsSentToTheXMLServicePort`.

To enable XML trust, run `Set-BrokerSite -TrustRequestsSentToTheXmlServicePort $true`.

To disable XML trust, run `Set-BrokerSite -TrustRequestsSentToTheXmlServicePort $false`.

**Integrate Citrix Virtual Apps and Desktops with Citrix Gateway**

December 18, 2019

StoreFront servers are deployed and configured to manage access to published resources and data. For remote access, adding Citrix Gateway in front of StoreFront is recommended.

**Note:**

For detailed configuration steps on how to integrate Citrix Virtual Apps and Desktops with Citrix Gateway, see the StoreFront documentation.

The following diagram illustrates an example of a simplified Citrix deployment that includes Citrix Gateway. Citrix Gateway communicates with StoreFront to protect apps and data delivered by Citrix Virtual Apps and Desktops. The user devices run Citrix Workspace app to create a secure connection and access their apps, desktops, and files.

![Citrix deployment diagram](image)

Users log on and authenticate using Citrix Gateway. Citrix Gateway is deployed and secured in the DMZ. Two-factor authentication is configured. Based on the user credentials, users are provided with the relevant resources and applications. Applications and data are on appropriate servers (not shown on the diagram). Separate servers used for security sensitive applications and data.
Delegated administration

June 24, 2020

The delegated administration model offers the flexibility to match how your organization wants to delegate administration activities, using role and object-based control. Delegated administration accommodates deployments of all sizes, and allows you to configure more permission granularity as your deployment grows in complexity. Delegated administration uses three concepts: administrators, roles, and scopes.

- **Administrators:** An administrator represents an individual person or a group of people identified by their Active Directory account. Each administrator is associated with one or more role and scope pairs.

- **Roles:** A role represents a job function, and has defined permissions associated with it. For example, the Delivery Group Administrator role has permissions such as 'Create Delivery Group' and 'Remove Desktop from Delivery Group.' An administrator can have multiple roles for a site, so a person can be a Delivery Group Administrator and a Machine Catalog Administrator. Roles can be built-in or custom.

The built-in roles are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full Administrator</td>
<td>Can perform all tasks and operations. A Full Administrator is always combined with the All scope.</td>
</tr>
<tr>
<td>Read Only Administrator</td>
<td>Can see all objects in specified scopes in addition to global information, but cannot change anything. For example, a Read Only Administrator with Scope=London can see all global objects (such as Configuration Logging) and any London-scoped objects (for example, London Delivery Groups). However, that administrator cannot see objects in the New York scope (assuming that the London and New York scopes do not overlap).</td>
</tr>
<tr>
<td>Role</td>
<td>Permissions</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Help Desk Administrator</td>
<td>Can view Delivery Groups, and manage the sessions and machines associated with those groups. Can see the Machine Catalog and host information for the Delivery Groups being monitored. Can also perform session management and machine power management operations for the machines in those Delivery Groups.</td>
</tr>
<tr>
<td>Machine Catalog Administrator</td>
<td>Can create and manage Machine Catalogs and provision the machines into them. Can build Machine Catalogs from the virtualization infrastructure, Provisioning Services, and physical machines. This role can manage base images and install software, but cannot assign applications or desktops to users.</td>
</tr>
<tr>
<td>Delivery Group Administrator</td>
<td>Can deliver applications, desktops, and machines; can also manage the associated sessions. Can also manage application and desktop configurations such as policies and power management settings.</td>
</tr>
<tr>
<td>Host Administrator</td>
<td>Can manage host connections and their associated resource settings. Cannot deliver machines, applications, or desktops to users.</td>
</tr>
</tbody>
</table>

In certain product editions, you can create custom roles to match the requirements of your organization, and delegate permissions with more detail. You can use custom roles to allocate permissions at the granularity of an action or task in a console.

- **Scopes**: A scope represents a collection of objects. Scopes are used to group objects in a way that is relevant to your organization (for example, the set of Delivery Groups used by the Sales team). Objects can be in more than one scope; you can think of objects being labeled with one or more scopes. There is one built-in scope: ‘All,’ which contains all objects. The Full Administrator role is always paired with the All scope.
Example

Company XYZ decided to manage applications and desktops based on their department (Accounts, Sales, and Warehouse) and their desktop operating system (Windows 7 or Windows 8). The administrator created five scopes, then labeled each Delivery Group with two scopes: one for the department where they are used and one for the operating system they use.

The following administrators were created:

<table>
<thead>
<tr>
<th>Administrator</th>
<th>Roles</th>
<th>Scopes</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain/fred</td>
<td>Full Administrator</td>
<td>All (the Full Administrator role always has the All scope)</td>
</tr>
<tr>
<td>domain/rob</td>
<td>Read Only Administrator</td>
<td>All</td>
</tr>
<tr>
<td>domain/heidi</td>
<td>Read Only Administrator, Help Desk Administrator</td>
<td>All Sales</td>
</tr>
<tr>
<td>domain/warehouseadmin</td>
<td>Help Desk Administrator</td>
<td>Warehouse</td>
</tr>
<tr>
<td>domain/peter</td>
<td>Delivery Group Administrator, Machine Catalog Administrator</td>
<td>Win7</td>
</tr>
</tbody>
</table>

- Fred is a Full Administrator and can view, edit, and delete all objects in the system.
- Rob can view all objects in the site but cannot edit or delete them.
- Heidi can view all objects and can perform help desk tasks on Delivery Groups in the Sales scope. This allows her to manage the sessions and machines associated with those groups; she cannot make changes to the Delivery Group, such as adding or removing machines.
- Anyone who is a member of the warehouseadmin Active Directory security group can view and perform help desk tasks on machines in the Warehouse scope.
- Peter is a Windows 7 specialist and can manage all Windows 7 Machine Catalogs and can deliver Windows 7 applications, desktops, and machines, regardless of which department scope they are in. The administrator considered making Peter a Full Administrator for the Win7 scope. However, she decided against this, because a Full Administrator also has full rights over all objects that are not scoped, such as ‘Site’ and ‘Administrator’.

How to use delegated administration

Generally, the number of administrators and the granularity of their permissions depends on the size and complexity of the deployment.

- In small or proof-of-concept deployments, one or a few administrators do everything. There is no delegation. In this case, create each administrator with the built-in Full Administrator role,
which has the All scope.

- In larger deployments with more machines, applications, and desktops, more delegation is needed. Several administrators might have more specific functional responsibilities (roles). For example, two are Full Administrators, and others are Help Desk Administrators. Also, an administrator might manage only certain groups of objects (scopes), such as machine catalogs. In this case, create new scopes, plus administrators with one of the built-in roles and the appropriate scopes.

- Even larger deployments might require more (or more specific) scopes, plus different administrators with unconventional roles. In this case, edit or create more scopes, create custom roles, and create each administrator with a built-in or custom role, plus existing and new scopes.

For flexibility and ease of configuration, you can create scopes when you create an administrator. You can also specify scopes when creating or editing Machine Catalogs or connections.

Create and manage administrators

When you create a site as a local administrator, your user account automatically becomes a Full Administrator with full permissions over all objects. After a site is created, local administrators have no special privileges.

The Full Administrator role always has the All scope; you cannot change this.

By default, an administrator is enabled. Disabling an administrator might be necessary if you are creating the administrator now, but that person won’t start administration duties until later. For existing enabled administrators, you might want to disable several of them while you are reorganizing your object/scopes, then re-enable them when you are ready to go live with the updated configuration. You cannot disable a Full Administrator if it would result in there being no enabled Full Administrator. The enable/disable check box is available when you create, copy, or edit an administrator.

When you delete a role/scope pair while copying, editing, or deleting an administrator, it deletes only the relationship between the role and the scope for that administrator. It does not delete either the role or the scope. It also does not affect any other administrator who is configured with that role/scope pair.

To manage administrators, click Configuration > Administrators in the Studio navigation pane, and then click the Administrators tab in the upper middle pane.

- **Create an administrator:** Click Create new Administrator in the Actions pane. Type or browse to the user account name, select or create a scope, and select a role. The new administrator is enabled by default; you can change this.

- **Copy an administrator:** Select the administrator in the middle pane and then click Copy Administrator in the Actions pane. Type or browse to the user account name. You can select and then edit or delete any of the role/scope pairs, and add new ones. The new administrator is enabled by default; you can change this.
Citrix Virtual Apps and Desktops 7 2009

- **Edit an administrator**: Select the administrator in the middle pane and then click **Edit Administrator** in the Actions pane. You can edit or delete any of the role/scope pairs, and add new ones.

- **Delete an administrator**: Select the administrator in the middle pane and then click **Delete Administrator** in the Actions pane. You cannot delete a Full Administrator if it would result in there being no enabled Full Administrator.

The upper pane displays the administrators that you created. Select an administrator to view its details in the lower pane. The **Warnings** column indicates whether the role and scope pairs associated with the administrator contain unusable roles or scopes. The following warning message appears if an associated role and scope pair contains unusable roles or scopes:

- Associated role or scope not usable
  - Remove the role and scope pair from the administrator.

**Important:**
A warning message appears only when an associated role and scope pair contains unusable roles or scopes or both.

To remove the role and scope pair from the administrator, complete one of the following steps:

- Delete the role and scope pair.
  1. In the **Actions** pane, click **Edit Administrator**.
  2. In the **Edit Administrator** window, select the role and scope pair and then click **Delete**.
  3. Click **OK** to exit.

- Delete the administrator.
  1. In the **Actions** pane, click **Delete Administrator**.
  2. In the **Studio** window, Click **Delete**.

**Create and manage roles**

When administrators create or edit a role, they can enable only the permissions that they themselves have. This prevents administrators from creating a role with more permissions than they currently have and then assigning it to themselves (or editing a role that they are already assigned).

Role names can contain up to 64 Unicode characters; they cannot contain: backslash, forward slash, semicolon, colon, pound sign, comma, asterisk, question mark, equal sign, left or right arrow, pipe, left or right bracket, left or right parenthesis, quotation marks, or apostrophe. Descriptions can contain up to 256 Unicode characters.

You cannot edit or delete a built-in role. You cannot delete a custom role if any administrator is using it.

© 1999-2020 Citrix Systems, Inc. All rights reserved. 340
Note:

Only certain product editions support custom roles. Only editions that support custom roles have related entries in the Actions pane.

To manage roles, click Configuration > Administrators in the Studio navigation pane, and then click the Roles tab in the upper middle pane.

- **View role details:** Select the role in the middle pane. The lower portion of the middle pane lists the object types and associated permissions for the role. Click the Administrators tab in the lower pane to display a list of administrators who currently have this role.

- **Create a custom role:** Click Create new Role in the Actions pane. Enter a name and description. Select the object types and permissions.

- **Copy a role:** Select the role in the middle pane and then click Copy Role in the Actions pane. Change the name, description, object types, and permissions, as needed.

- **Edit a custom role:** Select the role in the middle pane and then click Edit Role in the Actions pane. Change the name, description, object types, and permissions, as needed.

- **Delete a custom role:** Select the role in the middle pane and then click Delete Role in the Actions pane. When prompted, confirm the deletion.

**Create and manage scopes**

When you create a site, the only available scope is the ‘All’ scope, which cannot be deleted.

You can create scopes using the following procedure. You can also create scopes when you create an administrator; each administrator must be associated with at least one role and scope pair. When you are creating or editing desktops, machine catalogs, applications, or hosts, you can add them to an existing scope. If you do not add them to a scope, they remain part of the ‘All’ scope.

Site creation cannot be scoped, nor can delegated administration objects (scopes and roles). However, objects you cannot scope are included in the ‘All’ scope. (Full Administrators always have the All scope.) Machines, power actions, desktops, and sessions are not directly scoped. Administrators can be allocated permissions over these objects through the associated machine catalogs or Delivery Groups.

Scope names can contain up to 64 Unicode characters. Scope names cannot include: backslash, forward slash, semicolon, colon, pound sign, comma, asterisk, question mark, equal sign, left arrow, right arrow, pipe, left or right bracket, left or right parenthesis, quotation marks, or apostrophe. Descriptions can contain up to 256 Unicode characters.

When you copy or edit a scope, keep in mind that removing objects from the scope can make those objects inaccessible to the administrator. If the edited scope is paired with one or more roles, ensure that the scope updates do not make any role/scpe pair unusable.
To manage scopes, click **Configuration > Administrators** in the Studio navigation pane, and then click the **Scopes** tab in the upper middle pane.

- **Create a scope:** Click **Create new Scope** in the Actions pane. Enter a name and description. To include all objects of a particular type (for example, Delivery Groups), select the object type. To include specific objects, expand the type and then select individual objects (for example, Delivery Groups used by the Sales team).

- **Copy a scope:** Select the scope in the middle pane and then click **Copy Scope** in the Actions pane. Enter a name and description. Change the object types and objects, as needed.

- **Edit a scope:** Select the scope in the middle pane and then click **Edit Scope** in the Actions pane. Change the name, description, object types, and objects, as needed.

- **Delete a scope:** Select the scope in the middle pane and then click **Delete Scope** in the Actions pane. When prompted, confirm the deletion.

**Create reports**

You can create two types of delegated administration reports:

- An HTML report that lists the role/scope pairs associated with an administrator, plus the individual permissions for each type of object (for example, Delivery Groups and Machine Catalogs). You generate this report from Studio.

  To create this report, click **Configuration > Administrators** in the Studio navigation pane. Select an administrator in the middle pane and then click **Create Report** in the Actions pane.

  You can also request this report when creating, copying, or editing an administrator.

- An HTML or CSV report that maps all built-in and custom roles to permissions. You generate this report by running a PowerShell script named `OutputPermissionMapping.ps1`.

  To run this script, you must be a Full Administrator, a Read Only Administrator, or a custom administrator with permission to read roles. The script is located in: Program Files\Citrix\DelegatedAdmin\SnapIn\Citrix.DelegatedAdmin.Admin.V1\Scripts.

  Syntax:

  ```bash
  OutputPermissionMapping.ps1 [-Help] [-Csv] [-Path string] [-AdminAddress string] [-Show] [CommonParameters]
  ```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-Help</code></td>
<td>Displays script help.</td>
</tr>
<tr>
<td><code>-Csv</code></td>
<td>Specifies CSV output. Default = HTML</td>
</tr>
<tr>
<td><code>-Path string</code></td>
<td>Where to write the output. Default = stdout</td>
</tr>
</tbody>
</table>
Parameter Description

- **AdminAddress string**
  IP address or host name of the Delivery Controller to connect to. Default = localhost

- **Show**
  (Valid only when the -Path parameter is also specified) When you write the output to a file, -Show causes the output to be opened in an appropriate program, such as a web browser.

**CommonParameters**

- **Verbose, Debug, ErrorAction, ErrorVariable, WarningAction, WarningVariable, OutBuffer, and OutVariable.** For details, see the Microsoft documentation.

The following example writes an HTML table to a file named Roles.html and opens the table in a web browser.

```powershell
& "$env:ProgramFiles\Citrix\DelegatedAdmin\SnapIn\Citrix.DelegatedAdmin.Admin.V1\Scripts\OutputPermissionMapping.ps1" -Path Roles.html - Show
```

The following example writes a CSV table to a file named Roles.csv. The table is not displayed.

```powershell
& "$env:ProgramFiles\Citrix\DelegatedAdmin\SnapIn\Citrix.DelegatedAdmin.Admin.V1\Scripts\OutputPermissionMapping.ps1" -CSV -Path Roles.csv
```

From a Windows command prompt, the preceding example command is:

```powershell
powershell -command "$env:ProgramFiles\Citrix\DelegatedAdmin\SnapIn\Citrix.DelegatedAdmin.Admin.V1\Scripts\OutputPermissionMapping.ps1" -CSV -Path Roles.csv"
```
## Smart cards

September 3, 2020

Smart cards and equivalent technologies are supported within the guidelines described in this article. To use smart cards with Citrix Virtual Apps or Citrix Virtual Desktops:

- Understand your organization's security policy concerning the use of smart cards. These policies might, for example, state how smart cards are issued and how users should safeguard them. Some aspects of these policies might need to be reassessed in a Citrix Virtual Apps or Citrix Virtual Desktops environment.
- Determine which user device types, operating systems, and published applications are to be used with smart cards.
- Familiarize yourself with smart card technology and your selected smart card vendor hardware and software.
- Know how to deploy digital certificates in a distributed environment.

### Types of smart cards

Enterprise and consumer smart cards have the same dimensions, electrical connectors, and fit the same smart card readers.

Smart cards for enterprise use contain digital certificates. These smart cards support Windows Logon, and can also be used with applications for digital signing and encryption of documents and email. Citrix Virtual Apps and Desktops support these uses.

Smart cards for consumer use do not contain digital certificates; they contain a shared secret. These smart cards can support payments (such as a chip-and-signature or chip-and-PIN credit card). They do not support Windows Logon or typical Windows applications. Specialized Windows applications and a suitable software infrastructure (including, for example, a connection to a payment card network) are needed for use with these smart cards. Contact your Citrix representative for information on supporting these specialized applications on Citrix Virtual Apps or Citrix Virtual Desktops.

For enterprise smart cards, there are compatible equivalents that can be used in a similar way.

- A smart card-equivalent USB token connects directly to a USB port. These USB tokens are usually the size of a USB flash drive, but can be as small as a SIM card used in a mobile phone. They appear as the combination of a smart card plus a USB smart card reader.
- A virtual smart card using a Windows Trusted Platform Module (TPM) appears as a smart card. These virtual smart cards are supported for Windows 8 and Windows 10, using Citrix Workspace app (minimum version Citrix Receiver 4.3).
Versions of Citrix Virtual Apps and Desktops (formerly XenApp and XenDesktop) earlier than XenApp and XenDesktop 7.6 FP3 do not support virtual smart cards.

For more information on virtual smart cards, see Virtual Smart Card Overview.

**Note:** The term “virtual smart card” is also used to describe a digital certificate stored on the user computer. These digital certificates are not strictly equivalent to smart cards.

Citrix Virtual Apps and Desktops smart card support is based on the Microsoft Personal Computer/Smart Card (PC/SC) standard specifications. A minimum requirement is that smart cards and smart card devices must be supported by the underlying Windows operating system and must be approved by the Microsoft Windows Hardware Quality Labs (WHQL) to be used on computers running qualifying Windows operating systems. See the Microsoft documentation for additional information about hardware PC/SC compliance. Other types of user devices may comply with the PS/SC standard. For more information, refer to the Citrix Ready program.

Usually, a separate device driver is needed for each vendor’s smart card or equivalent. However, if smart cards conform to a standard such as the NIST Personal Identity Verification (PIV) standard, it may be possible to use a single device driver for a range of smart cards. The device driver must be installed on both the user device and the Virtual Delivery Agent (VDA). The device driver is often supplied as part of a smart card middleware package available from a Citrix partner; the smart card middleware package will offer advanced features. The device driver may also be described as a Cryptographic Service Provider (CSP), Key Storage Provider (KSP), or minidriver.

The following smart card and middleware combinations for Windows systems have been tested by Citrix as representative examples of their type. However, other smart cards and middleware can also be used. For more information about Citrix-compatible smart cards and middleware, see [http://www.citrix.com/ready](http://www.citrix.com/ready).

<table>
<thead>
<tr>
<th>Middleware</th>
<th>Matching cards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gemalto Mini Driver for .NET card</td>
<td>Gemalto .NET v2+</td>
</tr>
</tbody>
</table>

For information about smart card usage with other types of devices, see the Citrix Workspace app documentation for that device.

**Remote PC Access**

Smart cards are supported only for remote access to physical office PCs running Windows 10, Windows 8 or Windows 7.

The following smart cards were tested with Remote PC Access:
Fast smart card

Fast smart card is an improvement over the existing HDX PC/SC-based smart card redirection. It improves performance when smart cards are used in high-latency WAN situations.

Fast smart card is enabled by default on host machines with currently supported Windows VDAs. To disable Fast Smart Card on the host-side—for example for diagnostic purposes—set the ‘Disable Cryptographic Redirection’ registry setting to any non-zero value:

1 HKLM\SOFTWARE\Citrix\SmartCard
2 CryptographicRedirectionDisable (DWORD)

On the client side, to enable fast smart card, include the SmartCardCryptographicRedirection ICA parameter in the default.ica file of the associated StoreFront site:

1 [WFClient]
2 SmartCardCryptographicRedirection=On

Limitations:

- Only Citrix Receiver for Windows supports fast smart card. If you configure fast smart cards in the default.ica file, Citrix Receivers that are not for Windows still work with existing PC/SC Redirection.
- The only double-hop scenarios that fast smart card supports are ICA > ICA with fast smart card enabled on both hops. Because fast smart card doesn’t support ICA > RDP double-hop scenarios, those scenarios don’t work.
- Fast smart card doesn’t support Cryptography Next Generation. Thus, fast smart card doesn’t support Elliptic Curve Cryptography (ECC) smart cards.
- Fast smart card supports only read-only key container operations. For example, a smart card cannot be enrolled with fast smart card.
- Fast smart card doesn’t support changing the smart card PIN.
Types of smart card readers

A smart card reader may be built in to the user device, or be separately attached to the user device (usually via USB or Bluetooth). Contact card readers that comply with the USB Chip/Smart Card Interface Devices (CCID) specification are supported. They contain a slot or swipe into which the user inserts the smart card. The Deutsche Kreditwirtschaft (DK) standard defines four classes of contact card readers.

- Class 1 smart card readers are the most common, and usually just contain a slot. Class 1 smart card readers are supported, usually with a standard CCID device driver supplied with the operating system.
- Class 2 smart card readers also contain a secure keypad that cannot be accessed by the user device. Class 2 smart card readers may be built into a keyboard with an integrated secure keypad. For class 2 smart card readers, contact your Citrix representative; a reader-specific device driver may be required to enable the secure keypad capability.
- Class 3 smart card readers also contain a secure display. Class 3 smart card readers are not supported.
- Class 4 smart card readers also contain a secure transaction module. Class 4 smart card readers are not supported.

Note:
The smart card reader class is unrelated to the USB device class.

Smart card readers must be installed with a corresponding device driver on the user device.

For information about supported smart card readers, see the documentation for the Citrix Workspace app you are using. In the Citrix Workspace app documentation, supported versions are usually listed in a smart card article or in the system requirements article.

User experience

Smart card support is integrated into Citrix Virtual Apps and Desktops, using a specific ICA/HDX smart card virtual channel that is enabled by default.

Important: Do not use generic USB redirection for smart card readers. This is disabled by default for smart card readers, and is not supported if enabled.

Multiple smart cards and multiple readers can be used on the same user device, but if pass-through authentication is in use, only one smart card must be inserted when the user starts a virtual desktop or application. When a smart card is used within an application (for example, for digital signing or encryption functions), there might be additional prompts to insert a smart card or enter a PIN. This can occur if more than one smart card has been inserted at the same time.

- If users are prompted to insert a smart card when the smart card is already in the reader, they should select Cancel.
• If users are prompted for the PIN, they should enter the PIN again.

You can reset PINs using a card management system or vendor utility.

Important:
Within a Citrix Virtual Apps or Citrix Virtual Desktops session, using a smart card with the Microsoft Remote Desktop Connection application is not supported. This is sometimes described as a “double hop” use.

Before deploying smart cards

• Obtain a device driver for the smart card reader and install it on the user device. Many smart card readers can use the CCID device driver supplied by Microsoft.
• Obtain a device driver and cryptographic service provider (CSP) software from your smart card vendor, and install them on both user devices and virtual desktops. The driver and CSP software must be compatible with Citrix Virtual Apps and Desktops; check the vendor documentation for compatibility. For virtual desktops using smart cards that support and use the minidriver model, smart card minidrivers should download automatically, but you can obtain them from http://catalog.update.microsoft.com or from your vendor. Also, if PKCS#11 middleware is required, obtain it from the card vendor.
• Important: Citrix recommends that you install and test the drivers and CSP software on a physical computer before installing Citrix software.
• Add the Citrix Receiver for Web URL to the Trusted Sites list for users who work with smart cards in Internet Explorer with Windows 10. In Windows 10, Internet Explorer does not run in protected mode by default for trusted sites.
• Ensure that your public key infrastructure (PKI) is configured appropriately. This includes ensuring that certificate-to-account mapping is correctly configured for Active Directory environment and that user certificate validation can be performed successfully.
• Ensure your deployment meets the system requirements of the other Citrix components used with smart cards, including Citrix Workspace app and StoreFront.
• Ensure access to the following servers in your Site:
  – The Active Directory domain controller for the user account that is associated with a logon certificate on the smart card
  – Delivery Controller
  – Citrix StoreFront
  – Citrix Gateway/Citrix Access Gateway 10.x
  – VDA
  – (Optional for Remote PC Access): Microsoft Exchange Server
Enable smart card use

**Step 1.** Issue smart cards to users according to your card issuance policy.

**Step 2.** (Optional) Set up the smart cards to enable users for Remote PC Access.

**Step 3.** Install and configure the Delivery Controller and StoreFront (if not already installed) for smart card remoting.

**Step 4.** Enable StoreFront for smart card use. For details, see Configure smart card authentication in the StoreFront documentation.

**Step 5.** Enable Citrix Gateway/Access Gateway for smart card use. For details, see Configuring Authentication and Authorization and Configuring Smart Card Access with the Web Interface in the NetScaler documentation.

**Step 6.** Enable VDAs for smart card use.

- Ensure the VDA has the required applications and updates.
- Install the middleware.
- Set up smart card remoting, enabling the communication of smart card data between Citrix Workspace app on a user device and a virtual desktop session.

**Step 7.** Enable user devices (including domain-joined or non-domain-joined machines) for smart card use. See Configure smart card authentication in the StoreFront documentation for details.

- Import the certificate authority root certificate and the issuing certificate authority certificate into the device’s keystore.
- Install your vendor’s smart card middleware.
- Install and configure Citrix Workspace app for Windows, being sure to import icaclient.adm using the Group Policy Management Console and enable smart card authentication.

**Step 8.** Test the deployment. Ensure that the deployment is configured correctly by launching a virtual desktop with a test user’s smart card. Test all possible access mechanisms (for example, accessing the desktop through Internet Explorer and Citrix Workspace app).

Track smart card reader insertion count

With smart card remoting, you can track the number of times a smart card has been inserted or removed from a reader using the  SCardGetStatusChange function. The function updates an array of SCARD_READERSTATE data structures—one per each reader you monitor. The high word (16 bits) of the dwEventState field of each SCARD_READERSTATE contains the reader count. For more information, see the Microsoft articles  SCardGetStatusChangeA function and SCARD_READERSTATEA structure.

The **Reader Insert Count Reporting** setting is disabled by default. To enable tracking, add the following registry key:
Citrix Virtual Apps andDesktops 7 2009

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\SmartCard
Name: EnableReaderInsertCountReporting
Type: DWORD
Value: Any non-zero value

When the session disconnects, the count resets to zero.

**Reader Insert Count Reporting** is compatible with third-party smart card middleware.

**Smart card deployments**

December 18, 2019

The following types of smart card deployments are supported by this product version and by mixed environments containing this version. Other configurations might work but are not supported.

<table>
<thead>
<tr>
<th>Type</th>
<th>StoreFront connectivity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local domain-joined computers</td>
<td>Directly connected</td>
</tr>
<tr>
<td>Remote access from domain-joined computers</td>
<td>Connected through Citrix Gateway</td>
</tr>
<tr>
<td>Non-domain-joined computers</td>
<td>Directly connected</td>
</tr>
<tr>
<td>Remote access from non-domain-joined computers</td>
<td>Connected through Citrix Gateway</td>
</tr>
<tr>
<td>Non-domain-joined computers and thin clients accessing the Desktop Appliance site</td>
<td>Connected through Desktop Appliance sites</td>
</tr>
<tr>
<td>Domain-joined computers and thin clients accessing StoreFront through the XenApp Services URL</td>
<td>Connected through XenApp Services URLs</td>
</tr>
</tbody>
</table>

The deployment types are defined by the characteristics of the user device to which the smart card reader is connected:

- Whether the device is domain-joined or non-domain-joined.
- How the device is connected to StoreFront.
- What software is used to view virtual desktops and applications.

In addition, smart card-enabled applications such as Microsoft Word, and Microsoft Excel can be used in these deployments. Those applications allow users to digitally sign or encrypt documents.

© 1999-2020 Citrix Systems, Inc. All rights reserved.
**Bimodal authentication**

Where possible in each of these deployments, Receiver supports bimodal authentication by offering the user a choice between using a smart card and entering their user name and password. This is useful if the smart card cannot be used (for example, the user has left it at home or the logon certificate has expired).

Because users of non-domain-joined devices log on to Receiver for Windows directly, you can enable users to fall back to explicit authentication. If you configure bimodal authentication, users are initially prompted to log on using their smart cards and PINs but have the option to select explicit authentication if they experience any issues with their smart cards.

If you deploy Citrix Gateway, users log on to their devices and are prompted by Receiver for Windows to authenticate to Citrix Gateway. This applies to both domain-joined and non-domain-joined devices. Users can log on to Citrix Gateway using either their smart cards and PINs, or with explicit credentials. This enables you to provide users with bimodal authentication for Citrix Gateway logons. Configure pass-through authentication from Citrix Gateway to StoreFront and delegate credential validation to Citrix Gateway for smart card users so that users are silently authenticated to StoreFront.

**Multiple Active Directory forest considerations**

In a Citrix environment, smart cards are supported within a single forest. Smart card logons across forests require a direct two-way forest trust to all user accounts. More complex multi-forest deployments involving smart cards (that is, where trusts are only one-way or of different types) are not supported.

You can use smart cards in a Citrix environment that includes remote desktops. This feature can be installed locally (on the user device that the smart card is connected to) or remotely (on the remote desktop that the user device connects to).

**Smart card removal policy**

The smart card removal policy set on the product determines what happens if you remove the smart card from the reader during a session. The smart card removal policy is configured through and handled by the Windows operating system.

<table>
<thead>
<tr>
<th>Policy setting</th>
<th>Desktop behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>No action</td>
<td>No action.</td>
</tr>
<tr>
<td>Lock workstation</td>
<td>The desktop session is disconnected and the virtual desktop is locked.</td>
</tr>
</tbody>
</table>
Policy setting | Desktop behavior
--- | ---
Force logoff | The user is forced to log off. If the network connection is lost and this setting is enabled, the session may be logged off and the user may lose data.
Disconnect if a remote Terminal Services session | The session is disconnected and the virtual desktop is locked.

**Certificate revocation checking**

If certificate revocation checking is enabled and a user inserts a smart card with an invalid certificate into a card reader, the user cannot authenticate or access the desktop or application related to the certificate. For example, if the invalid certificate is used for email decryption, the email remains encrypted. If other certificates on the card, such as ones used for authentication, are still valid, those functions remain active.

**Deployment example: domain-joined computers**

This deployment involves domain-joined user devices that run the Desktop Viewer and connect directly to StoreFront.

A user logs on to a device using a smart card and PIN. Receiver authenticates the user to a Storefront server using Integrated Windows Authentication (IWA). StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is not prompted for a PIN again because the single sign-on feature is configured on Receiver.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration...
shown for the first hop can be reused in the second hop or used in the second hop only.

**Deployment example: remote access from domain-joined computers**

This deployment involves domain-joined user devices that run the Desktop Viewer and connect to StoreFront through Citrix Gateway/Access Gateway.

A user logs on to a device using a smart card and PIN, and then logs on again to Citrix Gateway/Access Gateway. This second logon can be with either the smart card and PIN or a user name and password because Receiver allows bimodal authentication in this deployment.

The user is automatically logged on to StoreFront, which passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is not prompted again for a PIN because the single sign-on feature is configured on Receiver.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

**Deployment example: non-domain-joined computers**

This deployment involves non-domain-joined user devices that run the Desktop Viewer and connect directly to StoreFront.
A user logs on to a device. Typically, the user enters a user name and password but, since the device is not joined to a domain, credentials for this logon are optional. Because bimodal authentication is possible in this deployment, Receiver prompts the user either for a smart card and PIN or a user name and password. Receiver then authenticates to Storefront.

StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is prompted for a PIN again because the single sign-on feature is not available in this deployment.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

**Deployment example: remote access from non-domain-joined computers**

This deployment involves non-domain-joined user devices that run the Desktop Viewer and connect directly to StoreFront.

A user logs on to a device. Typically, the user enters a user name and password but, since the device is not joined to a domain, credentials for this logon are optional. Because bimodal authentication is possible in this deployment, Receiver prompts the user either for a smart card and PIN or a user name and password. Receiver then authenticates to Storefront.

StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop or application, the user is prompted for a PIN again because the single sign-on feature is not available in this deployment.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.
**Deployment example: non-domain-joined computers and thin clients accessing the Desktop Appliance site**

This deployment involves non-domain-joined user devices that may run the Desktop Lock and connect to StoreFront through Desktop Appliance sites.

The Desktop Lock is a separate component that is released with Citrix Virtual Apps, Citrix Virtual Desktops, and VDI-in-a-Box. It is an alternative to the Desktop Viewer and is designed mainly for repurposed Windows computers and Windows thin clients. The Desktop Lock replaces the Windows shell and Task Manager in these user devices, preventing users from accessing the underlying devices. With the Desktop Lock, users can access Windows Server Machine desktops and Windows Desktop Machine desktops. Installation of Desktop Lock is optional.

A user logs on to a device with a smart card. If Desktop Lock is running on the device, the device is configured to launch a Desktop Appliance site through Internet Explorer running in Kiosk Mode. An ActiveX control on the site prompts the user for a PIN, and sends it to StoreFront. StoreFront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. The first available desktop in the alphabetical list in an assigned Desktop Group starts.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

**Deployment example: domain-joined computers and thin clients accessing StoreFront through the XenApp Services URL**

This deployment involves domain-joined user devices that run the Desktop Lock and connect to StoreFront through XenApp Services URLs.

The Desktop Lock is a separate component that is released with Citrix Virtual Apps, Citrix Virtual Desktops, and VDI-in-a-Box. It is an alternative to the Desktop Viewer and is designed mainly for repurposed Windows computers and Windows thin clients. The Desktop Lock replaces the Windows shell and Task Manager in these user devices, preventing users from accessing the underlying devices. With
the Desktop Lock, users can access Windows Server Machine desktops and Windows Desktop Machine desktops. Installation of Desktop Lock is optional.

A user logs on to a device using a smart card and PIN. If Desktop Lock is running on the device, it authenticates the user to a Storefront server using Integrated Windows Authentication (IWA). Storefront passes the user security identifiers (SIDs) to Citrix Virtual Apps or Citrix Virtual Desktops. When the user starts a virtual desktop, the user is not prompted for a PIN again because the single sign-on feature is configured on Receiver.

This deployment can be extended to a double-hop with the addition of a second StoreFront server and a server hosting applications. A Receiver from the virtual desktop authenticates to the second StoreFront server. Any authentication method can be used for this second connection. The configuration shown for the first hop can be reused in the second hop or used in the second hop only.

Pass-through authentication and single sign-on with smart cards

June 3, 2020

Pass-through authentication

Pass-through authentication with smart cards to virtual desktops is supported on user devices running Windows 10, Windows 8, and Windows 7 SP1 Enterprise and Professional Editions.

To use pass-through authentication with smart cards hosted applications, ensure you enable the use of Kerberos when you configure Pass-through with smartcard as the authentication method for the site.

Note: The availability of pass-through authentication with smart cards depends on many factors including, but not limited to:
• Your organization's security policies regarding pass-through authentication.
• Middleware type and configuration.
• Smart card reader types.
• Middleware PIN caching policy.

Pass-through authentication with smart cards is configured on Citrix StoreFront. See the StoreFront documentation for details.

**Single sign-on**

Single sign-on is a Citrix feature that implements pass-through authentication with virtual desktop and application launches. You can use this feature in domain-joined, direct-to-StoreFront and domain-joined, NetScaler-to-StoreFront smart card deployments to reduce the number of times that users enter their PIN. To use single sign-on in these deployment types, edit the following parameters in the default.ica file, which is located on the StoreFront server:

• Domain-joined, direct-to-StoreFront smart card deployments — Set DisableCtrlAltDel to Off
• Domain-joined, NetScaler-to-StoreFront smart card deployments — Set UseLocalUserAndPassword to On

For more instructions on setting these parameters, see the StoreFront or Citrix Gateway documentation.

The availability of single sign-on functionality depends on many factors including, but not limited to:

• Your organization's security policies regarding single sign-on.
• Middleware type and configuration.
• Smart card reader types.
• Middleware PIN caching policy.

**Note:**

When a user logs on to the Virtual Delivery Agent (VDA) on a machine with an attached smart card reader, a Windows tile may appear representing the previous successful mode of authentication, such as smart card or password. As a result, when single sign-on is enabled, the single sign-on tile may appear. To log on, the user must select **Switch Users** to select another tile because the single sign-on tile will not work.

**App protection**

September 23, 2020
App protection is an add-on feature for the Citrix Workspace app that provides enhanced security when using Citrix Virtual Apps and Desktops published resources.

Two policies provide anti-keylogging and anti-screen-capturing capabilities for a Citrix HDX session. The policies along with a minimum of Citrix Workspace app 1912 for Windows or Citrix Workspace app 2001 for Mac can help protect data from keyloggers and screen scrapers.

Anti-keylogging when enabled:
- A keylogger sees encrypted keystrokes.
- This feature is active only when a protected window is in focus.

Anti-screen-capturing when enabled:
- Screen capture is a blank screen on Windows OS. On macOS, only the content of the protected window is blank.
- This feature is active when a protected window is visible (not minimized).

You configure the policies through PowerShell only. There is no GUI administration capability. This configuration is required only to enable or disable functionality for a specific delivery group.

After purchasing this feature, ensure you enable the app protection license.

Disclaimer:
App protection policies work by filtering access to required functions of the underlying operating system (specific API calls required to capture screens or keyboard presses). Doing so means that app protection policies can provide protection even against custom and purpose-built hacker tools. However, as operating systems evolve, new ways of capturing screens and logging keys can emerge. While we continue to identify and address them, we cannot guarantee full protection in specific configurations and deployments.

Limitations
These limitations exist by design:
- No anti-keylogging support inside HDX or RDP sessions. Endpoint protection is still active. This limitation applies to double-hop scenarios only.
- No feature support when using an unsupported version of the Citrix Workspace app or Citrix Receiver. In that case, resources are hidden.
- No feature support for Citrix Cloud services. App protection is supported only for on-premises Citrix Virtual Apps and Desktops deployments.
- No feature support for StoreFront web stores.
**Expected behavior**

The expected behaviors depend on how you access the StoreFront store that contains protected resources. You can access the resources using a supported native Citrix Workspace app client.

- **Behavior on StoreWeb** - Applications with app protection policies are not enumerated on StoreFront web stores.
- **Behavior on unsupported Citrix Receivers or Citrix Workspace apps** - Applications with app protection policies are not enumerated.
- **Behavior on supported Citrix Workspace app versions** - Protected resources enumerate and start properly.

Protection is applied under the following conditions:

- **Anti screen capture** – enabled if any protected window is visible on the screen. To disable protection, minimize all protected windows.
- **Anti-keylogging** – enabled if a protected window is in focus. To disable protection, change focus to another window.

**What does app protection protect?**

To capture the screenshot of any non-Citrix Workspace app window, users must first minimize the protected window.

By default, app protection protects the following Citrix windows:

- **Citrix logon windows** - Citrix Workspace authentication dialogs are protected only on Windows operating systems.
- Citrix Workspace app HDX session windows (example, managed desktop)

- Self-Service (Store) windows
What doesn't app protection protect?

The items under the Citrix Workspace apps icon in the navigation bar:

- Connections Center
- All links under Advanced Preferences
- Personalize
- Check for Updates
- Sign Out

System requirements

Minimum versions of Citrix components:

- Citrix Workspace app 1912 for Windows Long Term Service Release
- Citrix Workspace app 2002 for Windows
- Citrix Workspace app 2001 for Mac
- StoreFront 1912
- Delivery Controller 1912
- Valid Citrix licenses
  - App protection add-on license
  - Citrix Virtual Apps and Desktops 1912

Operating system platforms:

These operating systems are supported on the endpoint. The VDA supports all operating systems.

- Windows 10
- Windows 8.1
- Windows 7
- macOS High Sierra (10.13) and higher

Configure

After purchasing the app protection, follow these steps to fully configure and enable the feature:

1. Import the app protection license.
2. Configure the Workspace app.
3. Enable the app protection policies on the Delivery Controllers.

1. Licensing

App protection requires that you install an add-on license on the Citrix License Server. A minimum Citrix Virtual Desktops 1912 version license must be present. Contact a Citrix Sales Representative to purchase the app protection add-on license.
1. Download the license file and import it into the Citrix License Server alongside an existing Citrix Virtual Desktops license.

2. Use the Citrix Licensing Manager to import the license file (preferred method) or copy the license file to \Program Files (x86)\Citrix\Licensing\MyFiles on the License Server and restart the Citrix Licensing service. For more information, see Install licenses.

2. Citrix Workspace app

Configure app protection on the Citrix Workspace app.

**Citrix Workspace app for Windows:**

You can include the app protection component with the Citrix Workspace app using the following methods:

- During Citrix Workspace app installation.
- Using the command-line interface after the Citrix Workspace app installation.

Ensure the Citrix Workspace app was installed with the `/includeappprotection` switch enabled.

For more information, see App protection.

**Citrix Workspace app for Mac:**

App protection requires no specific configuration on the Citrix Workspace app for Mac.

3. Delivery Groups

Enable the following properties for the app protection Delivery Group using the PowerShell SDK on any installed Delivery Controller machine or on a machine with a stand-alone Studio installed that has the FMA PowerShell snap-ins installed.

- `AppProtectionKeyLoggingRequired`: True
- `AppProtectionScreenCaptureRequired`: True

You can enable each of these policies individually per Delivery Group. For example, you can configure keylogging protection only for DG1, and screen capture protection only for DG2. You can enable both policies for DG3.

**Example:**

To enable both policies for a Delivery Group named **DG3**, run the following command on any Delivery Controller in the site:

```
Set-BrokerDesktopGroup -Name DG3 -AppProtectionKeyLoggingRequired $true -AppProtectionScreenCaptureRequired $true
```

To validate the settings, run this cmdlet:
Get-BrokerDesktopGroup -Property Name, AppProtectionKeyLoggingRequired, AppProtectionScreenCaptureRequired | Format-Table -AutoSize

In addition, enable XML trust:

Set-BrokerSite -TrustRequestsSentToTheXmlServicePort $true

Ensure that you secure the network between the StoreFront and the Broker. For more information, see Knowledge Center articles CTX236929 and Securing the XenApp and XenDesktop XML Service.

**Recommendation**

App protection policies are primarily focused on enhancing the security and protection of an endpoint. Review all other security recommendations and policies for your environment. You can use a Security and Control policy template for a recommended configuration in environments with low tolerance to risk. For more information, see Policy templates.

**Troubleshoot**

**Applications are not enumerating or not starting:**

- Confirm the affected user is using a supported version of the Citrix Workspace app.
- Ensure the feature is enabled on the StoreFront server.
- Ensure the Delivery Group has the proper features enabled.

**App protection policies are not applying properly:**

- Ensure the feature is enabled on StoreFront.
- Ensure the Delivery Group has the proper features enabled.
- Ensure the feature is installed on the endpoint.
- Ensure the affected user is using a supported Citrix Workspace app version.
- Ensure the Citrix Workspace app was installed with the /includeappprotection switch enabled.

**Screenshots not working on non-Citrix windows:**

- Minimize or close the protected Citrix windows.

**Transport Layer Security (TLS)**

August 27, 2020

Citrix Virtual Apps and Desktops support the Transport Layer Security (TLS) protocol for TCP-based connections between components. Citrix Virtual Apps and Desktops also support the Datagram Transport Layer Security (DTLS) protocol for UDP-based ICA/HDX connections, using adaptive transport.
TLS and DTLS are similar, and support the same digital certificates. Configuring a Citrix Virtual Apps or Citrix Virtual Desktops Site to use TLS also configures it to use DTLS. Use the following procedures; the steps are common to both TLS and DTLS except where noted:

- Obtain, install, and register a server certificate on all Delivery Controllers, and configure a port with the TLS certificate. For details, see Install TLS server certificates on Controllers.
  Optionally, you can change the ports the Controller uses to listen for HTTP and HTTPS traffic.
- Enable TLS connections between Citrix Workspace app and Virtual Delivery Agents (VDAs) by completing the following tasks:
  - Configure TLS on the machines where the VDAs are installed. (For convenience, further references to machines where VDAs are installed are simply called “VDAs.”) For general information, see TLS settings on VDAs. It is highly recommended that you use the Citrix supplied PowerShell script to configure TLS/DTLS. For details, see Configure TLS on a VDA using the PowerShell script. However, if you want to configure TLS/DTLS manually, see Manually configure TLS on a VDA.
  - Configure TLS in the Delivery Groups containing the VDAs by running a set of PowerShell cmdlets in Studio. For details, see Configure TLS on Delivery Groups.

Requirements and considerations:

- Enabling TLS connections between users and VDAs is valid only for XenApp 7.6 and XenDesktop 7.6 Sites, plus later supported releases.
- Configure TLS in the Delivery Groups and on the VDAs after you install components, create a Site, create machine catalogs, and create Delivery Groups.
- To configure TLS in the Delivery Groups, you must have permission to change Controller access rules. A Full Administrator has this permission.
- To configure TLS on the VDAs, you must be a Windows administrator on the machine where the VDA is installed.
- On pooled VDAs that are provisioned by Machine Creation Services or Provisioning Services, the VDA machine image is reset on restart, causing previous TLS settings to be lost. Run the PowerShell script each time the VDA is restarted to reconfigure the TLS settings.

Warning:

For tasks that include working in the Windows registry—editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

For information about enabling TLS to the Site database, see CTX137556.
Install TLS server certificates on Controllers

For HTTPS, the XML Service supports TLS features by using server certificates, not client certificates. This section describes acquiring and installing TLS certificates in Delivery Controllers. The same steps can be applied to Cloud Connectors to encrypt STA and XML traffic.

Although there are various different types of certificate authorities and methods of requesting certificate from them, this article describes the Microsoft Certificate Authority. The Microsoft Certificate Authority needs to have a certificate template published with a purpose of Server Authentication.

If the Microsoft Certificate Authority is integrated into an Active Directory domain or into the trusted forest the Delivery Controllers are joined to, you can acquire a certificate from the Certificates MMC snap-in Certificate Enrollment wizard.

Requesting and installing a certificate

1. On the Delivery Controller, open the MMC console and add the Certificates snap-in. When prompted select Computer account.

2. Expand Personal > Certificates, then use the All Tasks > Request New Certificate context menu command.

3. Click Next to begin, and Next to confirm that you are acquiring the certificate from Active Directory enrollment.

4. Select the template for Server Authentication certificate. If the template has been set up to automatically provide the values for Subject you can click Enroll without providing more details.
5. To provide more details for the certificate template, click the **Details** arrow button and configure the following:

**Subject name**: select Common Name and add the FQDN of the Delivery Controller.

**Alternative name**: select DNS and add the FQDN of the Delivery Controller.

### Configuring SSL/TLS listener port

1. Open a PowerShell command window as an administrator of the machine.

2. Run the following commands to get Broker Service Application GUID:
3. Run the following commands on the same PowerShell window to get the Thumbprint of the certificate you installed previously:

```powershell
$HostName = ([System.Net.Dns]::GetHostByName($env:computerName)).Hostname

$Thumbprint = (Get-ChildItem -Path Cert:\LocalMachine\My | Where-Object {$_.Subject -match "^CN=\" + $HostName + \"$"}).Thumbprint -join ';'

Write-Host "Certificate Thumbprint for $($HostName): $( $Thumbprint)” -ForegroundColor Yellow
```

4. Run the following commands on the same PowerShell window to configure the Broker Service SSL/TLS port and use the certificate for encryption:
When correctly configured, the output from the last command `.netsh http show sslcert` shows that the listener is using the correct IP:port, and that Application ID matches the Broker Service Application GUID.

Providing the servers trust the certificate installed on the Delivery Controllers, you can now configure StoreFront Delivery Controllers and Citrix Gateway STA bindings to use HTTPS instead of HTTP.

**Note:**

If the Controller is installed on Windows Server 2016, and StoreFront is installed on Windows Server 2012 R2, a configuration change is needed at the Controller, to change the order of TLS cipher suites. This configuration change is not needed for Controller and StoreFront with other combinations of Windows Server versions.

The cipher suite order list must include the `TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384`, or `TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256` cipher suites (or both); and these cipher suites must precede any `TLS_DHE` cipher suites.

1. Using the Microsoft Group Policy Editor, browse to Computer Configuration > Administrative Templates > Network > SSL Configuration Settings.
2. Edit the policy “SSL Cipher Suite Order”. By default, this policy is set to “Not Configured”. Set this policy to Enabled.
3. Arrange suites in the correct order; remove any cipher suites you do not want to use.

Ensure that either `TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384`, or `TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256` precedes any `TLS_DHE` cipher suites.

On Microsoft MSDN, see also Prioritizing Schannel Cipher Suites.

**Change HTTP or HTTPS ports**

By default, the XML Service on the Controller listens on port 80 for HTTP traffic and port 443 for HTTPS traffic. Although you can use non-default ports, be aware of the security risks of exposing a Controller to untrusted networks. Deploying a standalone StoreFront server is preferable to changing the defaults.

To change the default HTTP or HTTPS ports used by the Controller, run the following command from Studio:

```
BrokerService.exe -WIPORT <http-port> -WISSLPORT <https-port>
```

where `<http-port>` is the port number for HTTP traffic and `<https-port>` is the port number for HTTPS traffic.

**Note:**

After changing a port, Studio might display a message about license compatibility and upgrading. To resolve the issue, re-register service instances using the following PowerShell cmdlet sequence:

```
1 Get-ConfigRegisteredServiceInstance -ServiceType Broker -Binding XML_HTTPS |
2 Unregister-ConfigRegisteredServiceInstance
3 Get-BrokerServiceInstance | where Binding -eq "XML_HTTPS" |
4 Register-ConfigServiceInstance
```

**Enforce HTTPS traffic only**

If you want the XML Service to ignore HTTP traffic, create the following registry setting in HKLM\Software\Citrix\DesktopServer\ on the Controller and then restart the Broker Service.

To ignore HTTP traffic, create DWORD XmlServicesEnableNonSsl and set it to 0.

There is a corresponding registry DWORD value you can create to ignore HTTPS traffic: DWORD XmlServicesEnableSsl. Ensure that it is not set to 0.

**TLS settings on VDAs**

A Delivery Group cannot have a mixture of some VDAs with TLS configured and some VDAs without TLS configured. Before you configure TLS for a Delivery Group, ensure that you have already configured TLS for all the VDAs in that Delivery Group.

When you configure TLS on VDAs, permissions on the installed TLS certificate are changed, giving the ICA Service read access to the certificate’s private key, and informing the ICA Service of the following:
• **Which certificate in the certificate store to use for TLS.**

• **Which TCP port number to use for TLS connections.**

  The Windows Firewall (if enabled) must be configured to allow incoming connection on this TCP port. This configuration is done for you when you use the PowerShell script.

• **Which versions of the TLS protocol to allow.**

  Important:

  Citrix recommends that you review your use of SSLv3, and reconfigure those deployments to remove support for SSLv3 where appropriate. See CTX200238.

  The supported TLS protocol versions follow a hierarchy (lowest to highest): SSL 3.0, TLS 1.0, TLS 1.1, and TLS 1.2. Specify the minimum allowed version; all protocol connections using that version or a higher version are allowed.

  For example, if you specify TLS 1.1 as the minimum version, then TLS 1.1 and TLS 1.2 protocol connections are allowed. If you specify SSL 3.0 as the minimum version, then connections for all the supported versions are allowed. If you specify TLS 1.2 as the minimum version, only TLS 1.2 connections are allowed.

  DTLS 1.0 corresponds to TLS 1.1, and DTLS 1.2 corresponds to TLS 1.2.

• **Which TLS cipher suites to allow.**

  A cipher suite selects the encryption that is used for a connection. Clients and VDAs can support different sets of cipher suites. When a client (Citrix Workspace app or StoreFront) connects and sends a list of supported TLS cipher suites, the VDA matches one of the client’s cipher suites with one of the cipher suites in its own list of configured cipher suites, and accepts the connection. If there is no matching cipher suite, the VDA rejects the connection.

  The VDA supports three sets of cipher suites (also known as compliance modes): GOV(ernment), COM(ercial), and ALL. The acceptable cipher suites also depend on the Windows FIPS mode; see [http://support.microsoft.com/kb/811833](http://support.microsoft.com/kb/811833) for information about Windows FIPS mode. The following table lists the cipher suites in each set:

<table>
<thead>
<tr>
<th>TLS/DTLS cipher suite</th>
<th>ALL</th>
<th>COM</th>
<th>GOV</th>
<th>ALL</th>
<th>COM</th>
<th>GOV</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>FIPS Mode</strong></td>
<td>Off</td>
<td>Off</td>
<td>Off</td>
<td>On</td>
<td>On</td>
<td>On</td>
</tr>
<tr>
<td>TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384*</td>
<td>X</td>
<td></td>
<td></td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TLS_ECDHE_RSA_1</td>
<td>X</td>
<td></td>
<td></td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA</td>
<td>X</td>
<td></td>

<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA256</td>
<td>X</td>
<td></td>
<td></td>
<td>X</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

© 1999-2020 Citrix Systems, Inc. All rights reserved.
* Not supported in Windows Server 2012 R2.

Note:
The VDA does not support DHE ciphersuites (for example, TLS_DHE_RSA_WITH_AES_256_GCM_SHA384, TLS_DHE_RSA_WITH_AES_256_CBC_SHA, TLS_DHE_RSA_WITH_AES_128_GCM_SHA256, and TLS_DHE_RSA_WITH_AES_128_CBC_SHA.) If selected by Windows, they may not be used by Receiver.

If you are using a Citrix Gateway, refer to the Citrix ADC documentation for information on cipher suite support for back-end communication. For information on TLS cipher suite support, see Ciphers available on the Citrix ADC appliances. For information on DTLS cipher suite support, see DTLS cipher support.

Configure TLS on a VDA using the PowerShell script

Install the TLS Certificate in the Local Computer > Personal > Certificates area of the certificate store. If more than one certificate resides in that location, supply the thumbprint of the certificate to the PowerShell script.

Note:
Starting with XenApp and XenDesktop 7.16 LTSR, the PowerShell script finds the correct certificate based on the FQDN of the VDA. You do not need to supply the thumbprint when only a single certificate is present for the VDA FQDN.

The Enable-VdaSSL.ps1 script enables or disables the TLS listener on a VDA. This script is available in the Support > Tools > SslSupport folder on the installation media.

When you enable TLS, DHE cipher suites are disabled. ECDHE cipher suites are not affected.

When you enable TLS, the script disables all existing Windows Firewall rules for the specified TCP port. It then adds a new rule that allows the ICA Service to accept incoming connections only on the TLS TCP and UDP ports. It also disables the Windows Firewall rules for:

- Citrix ICA (default: 1494)
- Citrix CGP (default: 2598)
- Citrix WebSocket (default: 8008)

The effect is that users can only connect using TLS or DTLS. They cannot use ICA/HDX, ICA/HDX with Session Reliability, or HDX over WebSocket, without TLS or DTLS.

Note:
DTLS is not supported with ICA/HDX Audio over UDP Real-time Transport, or with ICA/HDX Framehawk.

See Network ports.
The script contains the following syntax descriptions, plus extra examples; you can use a tool such as Notepad++ to review this information.

**Important:**
Specify either the Enable or Disable parameter, and the CertificateThumbPrint parameter. The other parameters are optional.

**Syntax**

```
Enable-VdaSSL { -Enable | -Disable } -CertificateThumbPrint "<thumbprint>" 
[-SSLPort <port>] [-SSLMinVersion "<min-ssl-version>"] [-SSLCipherSuite"<suite>"]
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>Installs and enables the TLS listener on the VDA. Either this parameter or the Disable parameter is required.</td>
</tr>
<tr>
<td>Disable</td>
<td>Disables the TLS listener on the VDA. Either this parameter or the Enable parameter is required. If you specify this parameter, no other parameters are valid.</td>
</tr>
<tr>
<td>CertificateThumbPrint &quot;&lt;thumbprint&gt;&quot;</td>
<td>Thumbprint of the TLS certificate in the certificate store, enclosed in quotation marks. The script uses the specified thumbprint to select the certificate you want to use. If this parameter is omitted, an incorrect certificate is selected.</td>
</tr>
<tr>
<td>SSLPort &lt;port&gt;</td>
<td>TLS port. Default: 443</td>
</tr>
<tr>
<td>SSLMinVersion &quot;&lt;version&gt;&quot;</td>
<td>Minimum TLS protocol version, enclosed in quotation marks. Valid values: “TLS_1.0” (default), “TLS_1.1”, and “TLS_1.2”.</td>
</tr>
<tr>
<td>SS LCipherSuite &quot;&lt;suite&gt;&quot;</td>
<td>TLS cipher suite, enclosed in quotation marks. Valid values: “GOV”, “COM”, and “ALL” (default).</td>
</tr>
</tbody>
</table>

**Examples**

The following script installs and enables the TLS protocol version value. The thumbprint (represented as “12345678987654321” in this example) is used to select the certificate to use.
The following script installs and enables the TLS listener, and specifies TLS port 400, the GOV cipher suite, and a minimum TLS 1.2 protocol value. The thumbprint (represented as “12345678987654321” in this example) is used to select the certificate to use.

```
Enable-VdaSSL -Enable -CertificateThumbPrint "12345678987654321"
```

The following script disables the TLS listener on the VDA.

```
Enable-VdaSSL -Disable
```

**Manually configure TLS on a VDA**

When configuring TLS on a VDA manually, you grant generic read access to the private key of the TLS certificate for the appropriate service on each VDA: NT SERVICE\PorticaService for a VDA for Windows Single-session OS, or NT SERVICE\TermService for a VDA for Windows Multi-session OS. On the machine where the VDA is installed:

**STEP 1.** Launch the Microsoft management console (MMC): Start > Run > mmc.exe.

**STEP 2.** Add the Certificates snap-in to the MMC:

1. Select File > Add/Remove Snap-in.
2. Select Certificates and then click Add.
3. When prompted with “This snap-in will always manage certificates for:” choose “Computer account” and then click Next.
4. When prompted with “Select the computer you want this snap-in to manage” choose “Local computer” and then click Finish.

**STEP 3.** Under Certificates (Local Computer) > Personal > Certificates, right-click the certificate and then select All Tasks > Manage Private Keys.

**STEP 4.** The Access Control List Editor displays “Permissions for (FriendlyName) private keys” where (FriendlyName) is the name of your TLS certificate. Add one of the following services and give it Read access:
For a VDA for Windows Single-session OS, “PORTICASERVICE”
For a VDA for Windows Multi-session OS, “TERMSERVICE”

**STEP 5.** Double-click the installed TLS certificate. In the certificate dialog, select the Details tab and then scroll to the bottom. Click Thumbprint.

**STEP 6.** Run regedit and go to HKLM\SYSTEM\CurrentControlSet\Control\Terminal Server\Wds\icawd.

1. Edit the SSL Thumbprint key and copy the value of the TLS certificate’s thumbprint into this binary value. You can safely ignore unknown items in the Edit Binary Value dialog box (such as ‘0000’ and special characters).

2. Edit the SSLEnabled key and change the DWORD value to 1. (To disable SSL later, change the DWORD value to 0.)

3. If you want to change the default settings (optional), use the following in the same registry path:
   
   SSLPort DWORD – SSL port number. Default: 443.
   
   SSLMinVersion DWORD – 1 = SSL 3.0, 2 = TLS 1.2, 3 = TLS 1.1, 4 = TLS 1.2. Default: 2 (TLS 1.2).
   
   SSLCipherSuite DWORD – 1 = GOV, 2 = COM, 3 = ALL. Default: 3 (ALL).

**STEP 7.** Ensure that the TLS TCP and UDP ports are open in the Windows Firewall if they are not the default 443. (When you create the inbound rule in Windows Firewall, ensure its properties have the “Allow the connection” and “Enabled” entries selected.)

**STEP 8.** Ensure that no other applications or services (such as IIS) are using the TLS TCP port.

**STEP 9.** For VDAs for Windows Multi-session OS, restart the machine for the changes to take effect. (You do not need to restart machines containing VDAs for Windows Single-session OS.)

---

**Important:**

An extra step is necessary when the VDA is on Windows Server 2012 R2, Windows Server 2016, or Windows 10 Anniversary Edition or later supported release. This affects connections from Citrix Receiver for Windows (version 4.6 through 4.9), Citrix Workspace app for HTML5, and Citrix Workspace app for Chrome. This also includes connections using Citrix Gateway.

This step is also required for all connections using Citrix Gateway, for all VDA versions, if TLS between the Citrix Gateway and the VDA is configured. This affects all Citrix Receiver versions.

On the VDA (Windows Server 2012 R2, Windows Server 2016, or Windows 10 Anniversary Edition or later), using the Group Policy Editor, go to Computer Configuration > Policies > Administrative Templates > Network > SSL Configuration Settings > SSL Cipher Suite Order. Select the following order:

1. **TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P384**
2. **TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P256**
When this Group Policy setting is configured, the VDA selects a cipher suite only if it appears in both lists: the Group Policy list and the list for the selected compliance mode (COM, GOV, or ALL). The cipher suite must also appear in the list sent by the client (Citrix Workspace app or StoreFront).

This Group Policy configuration also affects other TLS applications and services on the VDA. If your applications require specific cipher suites, you may need to add them to this Group Policy list.

**Important:**

Even though Group Policy changes are shown when they are applied, Group Policy changes for TLS configuration only take effect after an operating system restart. Therefore, for pooled desktops, apply the Group Policy changes for TLS configuration to the base image.

**Configure TLS on Delivery Groups**

Complete this procedure for each Delivery Group that containsVDAs you have configured for TLS connections.

1. From Studio, open the PowerShell console.
2. Run `asnp Citrix.*` to load the Citrix product cmdlets.
4. Run `Set-BrokerSite -DnsResolutionEnabled $true`.

**Troubleshooting**

If a connection error occurs, check the system event log on the VDA.

When using Citrix Workspace app for Windows, if you receive a connection error that indicates a TLS error, disable Desktop Viewer and then try connecting again. Although the connection still fails an explanation of the underlying TLS issue might be provided. For example, you specified an incorrect template when requesting a certificate from the certificate authority.

Most configurations that use HDX Adaptive Transport work successfully with DTLS, including those using the latest versions of Citrix Workspace app, Citrix Gateway, and the VDA. Some configurations
which use DTLS between Citrix Workspace app and Citrix Gateway, and which use DTLS between Citrix Gateway and the VDA, require additional action.

Additional action is needed if:

- the Citrix Receiver version supports HDX Adaptive Transport and DTLS: Receiver for Windows (4.7, 4.8, 4.9), Receiver for Mac (12.5, 12.6, 12.7), Receiver for iOS (7.2, 7.3.x) or Receiver for Linux (13.7)

and either of the following also applies:

- the Citrix Gateway version supports DTLS to the VDA, but the VDA version does not support DTLS (version 7.15 or earlier),
- the VDA version supports DTLS (version 7.16 or later), but the Citrix Gateway version does not support DTLS to the VDA.

To avoid connections from Citrix Receiver failing, do one of the following:

- update Citrix Receiver, to Receiver for Windows version 4.10 or later, Receiver for Mac 12.8 or later, or Receiver for iOS version 7.5 or later; or,
- update the Citrix Gateway to a version that supports DTLS to the VDA; or,
- update the VDA, to version 7.16 or later; or,
- disable DTLS at the VDA; or,
- disable HDX Adaptive Transport.

**Note:**

A suitable update for Receiver for Linux is not yet available. Receiver for Android (version 3.12.3) does not support HDX Adaptive Transport and DTLS via Citrix Gateway, and is therefore not affected.

To disable DTLS at the VDA, modify the VDA firewall configuration to disable UDP port 443. See Network ports.

**Communication between Controller and VDA**

Windows Communication Framework (WCF) message-level protection secures communication between the Controller and the VDA. Extra transport-level protection using TLS is not required. The WCF configuration uses Kerberos for mutual authentication between the Controller and VDA. Encryption uses AES in CBC mode with a 256-bit key. Message integrity uses SHA-1.

According to Microsoft, the Security protocols used by WCF conform to standards from OASIS (Organization for the Advancement of Structured Information Standards), including WS-SecurityPolicy 1.2. Additionally, Microsoft states that WCF supports all algorithm suites listed in Security Policy 1.2.

Communication between the Controller and VDA uses the basic256 algorithm suite, whose algorithms are as stated above.
**TLS and HTML5 video redirection, and browser content redirection**

You can use HTML5 video redirection and browser content redirection to redirect HTTPS websites. The JavaScript injected into those websites must establish a TLS connection to the Citrix HDX HTML5 Video Redirection Service running on the VDA. To achieve this, the HTML5 Video Redirection Service generates two custom certificates in the certificate store on the VDA. Stopping the service removes the certificates.

The HTML5 video redirection policy is disabled by default.

The browser content redirection is enabled by default.

For more information on HTML5 video redirection, see [Multimedia policy settings](Multimediapolicysettings).

**Transport Layer Security (TLS) on Universal Print Server**

December 18, 2019

The Transport Layer Security (TLS) protocol is supported for TCP-based connections between the Virtual Delivery Agent (VDA) and the Universal Print Server.

**Warning:**

For tasks that include working in the Windows registry—editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

**Types of printing connections between the VDA and Universal Print Server**

**Cleartext connections**

The following connections related to printing originate from the VDA and connect to ports on the Universal Print Server. These connections are made only when the **SSL enabled** policy setting is set to **Disabled** (the default).

- Cleartext print web service connections (TCP port 8080)
- Cleartext print data stream (CGP) connections (TCP port 7229)

The Microsoft support article [Service overview and network port requirements for Windows](ServiceoverviewandnetworkportrequirementsforWindows) describes the ports used by the Microsoft Windows Print Spooler Service. The SSL/TLS settings in this document do not apply to the NETBIOS and RPC connections made by the Windows Print Spooler service. The VDA uses the Windows Network Print Provider (win32spl.dll) as a fallback if the Universal Print Server **enable** policy setting is set to **Enabled with fallback to Windows’ native remote printing**.
**Encrypted connections**

These SSL/TLS connections related to printing originate from the VDA and connect to ports on the Universal Print Server. These connections are made only when the **SSL enabled** policy setting is set to **Enabled**.

- Encrypted print web service connections (TCP port 8443)
- Encrypted print data stream (CGP) connections (TCP port 443)
SSL/TLS client configuration

The VDA functions as the SSL/TLS client.

Use Microsoft Group Policy and the registry to configure Microsoft SCHANNEL SSP for encrypted print web service connections (TCP port 8443). The Microsoft support article [TLS Registry Settings](#) describes the registry settings for Microsoft SCHANNEL SSP.

Using the Group Policy Editor on the VDA (Windows Server 2016 or Windows 10), go to **Computer Configuration > Administrative Templates > Network > SSL Configuration Settings > SSL Cipher Suite Order**. Select the following order:

- TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P384
- TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384_P256
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384_P384
- TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384_P256
**TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA_P384**  
**TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA_P256**

**Note:**
When this Group Policy setting is configured, the VDA selects a cipher suite for encrypted print web service connections (default port: 8443) only if the connections appears in both SSL cipher suite lists:
- Group Policy SSL cipher suite order list
- List corresponding to the selected SSL Cipher Suite policy setting (COM, GOV, or ALL)

This Group Policy configuration also affects other TLS applications and services on the VDA. If your applications require specific cipher suites, you might need to add them to this Group Policy Cipher Suite Order list.

**Important:**
Group Policy changes for TLS configuration take effect only after an operating system restart.

Use a Citrix policy to configure SSL/TLS settings for encrypted print data stream (CGP) connections (TCP port 443).

**SSL/TLS server configuration**

The Universal Print Server functions as the SSL/TLS server.

Use the `Enable-UpsSsl.ps1` PowerShell script to configure SSL/TLS settings.

**Install the TLS server certificate on the Universal Print Server**

For HTTPS, the Universal Print Server supports TLS features by using server certificates. Client certificates are not used. Use Microsoft Active Directory Certificate Services or another certification authority to request a certificate for the Universal Print Server.

Keep in mind the following considerations when enrolling/requesting a certificate using Microsoft Active Directory Certificate Services:

1. Place the certificate in the Local Computer **Personal** certificate store.
2. Set the **Common Name** attribute of the Subject Distinguished Name (Subject DN) of the certificate to the fully qualified domain name (FQDN) of the Universal Print Server. Specify this in the certificate template.
3. Set the Cryptographic Service Provider (CSP) used to generate the certificate request and private key to **Microsoft Enhanced RSA and AES Cryptographic Provider (Encryption)**. Specify this in the certificate template.
4. Set the Key Size to at least 2048 bits. Specify this in the certificate template.
Configuring SSL on the Universal Print Server

The XTE Service on the Universal Print Server listens for incoming connections. It functions as an SSL server when SSL is enabled. The incoming connections have two types: print web service connections, which contain printing commands, and print data stream connections, which contain print jobs. SSL can be enabled on these connections. SSL protects the confidentiality and integrity of these connections. By default, SSL is disabled.

The PowerShell script used to configure SSL is on the installation media and has this file name: `\Support\Tools\SslSupport\Enable-UpsSsl.ps1`.

Configuring listening port numbers on the Universal Print Server

These are default ports for the XTE Service:

- Cleartext print web service (HTTP) TCP port: 8080
- Cleartext print data stream (CGP) TCP port: 7229
- Encrypted print web service (HTTPS) TCP port: 8443
- Encrypted print data stream (CGP) TCP port: 443

To change the ports used by the XTE Service on the Universal Print Server, run the following commands in PowerShell as administrator (see the later section for notes on the usage of the `Enable-UpsSsl.ps1` PowerShell script):

1. `Stop-Service CitrixXTEServer, UpSvc`
2. `Enable-UpsSsl.ps1 -Enable -HTTPSPort <port> -CGPSSLPort <port>` or `Enable-UpsSsl.ps1 -Disable -HTTPSPort <port> -CGPPort <port>`
3. `Start-Service CitrixXTEServer`

TLS settings on Universal Print Server

If you have multiple Universal Print Servers in a load-balanced configuration, ensure that the TLS settings are configured consistently across all Universal Print Servers.

When you configure TLS on Universal Print Server, permissions on the installed TLS certificate are changed, giving the Universal Printing Service read access to the certificate’s private key, and informing the Universal Printing Service of the following:

- Which certificate in the certificate store to use for TLS.
- Which TCP port numbers to use for TLS connections.

The Windows Firewall (if enabled) must be configured to allow incoming connections on these TCP ports. This configuration is done for you when you use the `Enable-UpsSsl.ps1` PowerShell script.

- Which versions of the TLS protocol to allow.
Universal Print Server supports TLS protocol versions 1.2, 1.1 and 1.0. Specify the minimum allowed version.

The default TLS protocol version is 1.2.

- Which TLS cipher suites to allow.

A cipher suite selects the cryptographic algorithms that are used for a connection. VDAs and Universal Print Server can support different sets of cipher suites. When a VDA connects and sends a list of supported TLS cipher suites, the Universal Print Server matches one of the client’s cipher suites with one of the cipher suites in its own list of configured cipher suites, and accepts the connection. If there is no matching cipher suite, the Universal Print Server rejects the connection.

The Universal Print Server supports the following sets of cipher suites named GOV(ernment), COM(mercial), and ALL for the OPEN, FIPS and SP800-52 native Crypto Kit modes. The acceptable cipher suites also depend on the SSL FIPS Mode policy setting and on the Windows FIPS Mode. See this Microsoft support article for information about Windows FIPS mode.

<table>
<thead>
<tr>
<th>Cipher suite (in decreasing priority order)</th>
<th>OPEN ALL</th>
<th>OPEN COM</th>
<th>OPEN GOV</th>
<th>FIPS ALL</th>

Configure TLS on a Universal Print Server using the PowerShell script

Install the TLS Certificate in the Local Computer > Personal > Certificates area of the certificate store. If more than one certificate resides in that location, supply the thumbprint of the certificate to the Enable-UpsSsl.ps1 PowerShell script.

Note:

The PowerShell script finds the correct certificate based on the FQDN of the Universal Print Server.
The `Enable-UpsSsl.ps1` script enables or disables TLS connections originating from the VDA to the Universal Print Server. This script is available in the **Support > Tools > SslSupport** folder on the installation media.

When you enable TLS, the script disables all existing Windows Firewall rules for the Universal Print Server’s TCP ports. It then adds new rules that allow the XTE Service to accept incoming connections only on the TLS TCP and UDP ports. It also disables the Windows Firewall rules for:

- Cleartext print web service connections (default: 8080)
- Cleartext print data stream (CGP) connections (default: 7229)

The effect is that the VDA can make these connections only when using TLS.

**Note:**

Enabling TLS does not affect Windows Print Spooler RPC/SMB connections originating from the VDA and going to the Universal Print Server.

**Important:**

Specify either **Enable** or **Disable** as the first parameter. The **CertificateThumbprint** parameter is optional if only one certificate in the Local Computer Personal certificate store has the Universal Print Server’s FQDN. The other parameters are optional.

### Syntax

```
2    Enable-UpsSsl.ps1 -Disable [-HTTPPort <portnum>] [-CGPPort <portnum>]
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>Enables SSL/TLS on the XTE Server. Either this parameter or the Disable parameter is required.</td>
</tr>
<tr>
<td>Disable</td>
<td>Disables SSL/TLS on the XTE Server. Either this parameter or the Enable parameter is required.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CertificateThumbprint &quot;&lt;thumbprint&gt;&quot;</td>
<td>Thumbprint of the TLS certificate in the Local Computer Personal certificate store, enclosed in quotation marks. The script uses the specified thumbprint to select the certificate you want to use.</td>
</tr>
<tr>
<td>HTTPPort &lt;port&gt;</td>
<td>Cleartext print web service (HTTP/SOAP) port. Default: 8080</td>
</tr>
<tr>
<td>CGPPort &lt;port&gt;</td>
<td>Cleartext print data stream (CGP) port. Default: 7229</td>
</tr>
<tr>
<td>HTTPSPort &lt;port&gt;</td>
<td>Encrypted print web service (HTTPS/SOAP) port. Default: 8443</td>
</tr>
<tr>
<td>CGPSSLPort &lt;port&gt;</td>
<td>Encrypted print data stream (CGP) port. Default: 443</td>
</tr>
<tr>
<td>SSLMinVersion &quot;&lt;version&gt;&quot;</td>
<td>Minimum TLS protocol version, enclosed in quotation marks. Valid values: “TLS_1.0”, “TLS_1.1”, and “TLS_1.2”. Default: TLS_1.2.</td>
</tr>
<tr>
<td>SSLCipherSuite &quot;&lt;name&gt;&quot;</td>
<td>Name of TLS cipher suite package, enclosed in quotation marks. Valid values: “GOV”, “COM”, and “ALL” (default).</td>
</tr>
<tr>
<td>FIPSMode &lt;Boolean&gt;</td>
<td>Enables or disables FIPS 140 mode in the XTE Server. Valid values: $true to enable FIPS 140 mode, $false to disable FIPS 140 mode.</td>
</tr>
</tbody>
</table>

**Examples**

The following script enables TLS. The thumbprint (represented as “12345678987654321” in this example) is used to select the certificate to use.

```powershell
Enable-UpsSsl.ps1 -Enable -CertificateThumbprint "12345678987654321"
```

The following script disables TLS.

```powershell
Enable-UpsSsl.ps1 -Disable
```

**Configuring FIPS mode**

Enabling US Federal Information Processing Standards (FIPS) mode ensures that only FIPS 140 compliant cryptography is used for Universal Print Server encrypted connections.
Configure FIPS mode on the server before configuring FIPS mode on the client.
Consult Microsoft’s documentation site for enabling/disabling Windows FIPS mode.

**Enabling FIPS mode on the client**

On the Delivery Controller, run Citrix Studio and set the SSL FIPS Mode Citrix policy setting to Enabled. Enable the Citrix policy.

Do this on each VDA:
1. Enable Windows FIPS mode.
2. Restart the VDA.

**Enabling FIPS mode on the server**

Do this on each Universal Print Server:
1. Enable Windows FIPS mode.
2. Run this PowerShell command as Administrator: `stop-service CitrixXTEServer, UpSvc`
3. Run the Enable-UpsSsl.ps1 script with the `-Enable -FIPSMode $true` parameters.
4. Restart the Universal Print Server.

**Disabling FIPS mode on the client**

On the Delivery Controller, run Citrix Studio and set the SSL FIPS Mode Citrix policy setting to Disabled. Enable the Citrix policy. You can also delete the SSL FIPS Mode Citrix policy setting.

Do this on each VDA:
1. Disable Windows FIPS mode.
2. Restart the VDA.

**Disabling FIPS mode on the server**

Do this on each Universal Print Server:
1. Disable Windows FIPS mode.
2. Run this PowerShell command as Administrator: `stop-service CitrixXTEServer, UpSvc`
3. Run the Enable-UpsSsl.ps1 script with the `-Enable -FIPSMode $false` parameters.
4. Restart the Universal Print Server.
Configuring SSL/TLS protocol version

The default SSL/TLS protocol version is TLS 1.2. TLS 1.2 is the only recommended SSL/TLS protocol version for production use. For troubleshooting, it might be necessary to temporarily change the SSL/TLS protocol version in a non-production environment.

SSL 2.0 and SSL 3.0 are not supported on the Universal Print Server.

Setting SSL/TLS protocol version on the server

Do this on each Universal Print Server:

1. Run this PowerShell command as Administrator: `stop-service CitrixXTEServer, UpSvc`
2. Run the `Enable-UpsSsl.ps1` script with the `-Enable -SSLMinVersion` version parameters. Remember to set this back to TLS 1.2 when you are done testing.
3. Restart the Universal Print Server.

Setting SSL/TLS protocol version on the client

Do this on each VDA:

1. On the Delivery Controller, set the SSL Protocol Version policy setting to the desired protocol version and enable the policy.
2. The Microsoft support article TLS Registry Settings describes the registry settings for Microsoft SCHannel SSP. Enable the client-side TLS 1.0, TLS 1.1 or TLS 1.2 using the registry settings.

   **Important:**
   
   Remember to restore the registry settings to their original values when you are done testing.

3. Restart the VDA.

Troubleshooting

If a connection error occurs, check the C:\Program Files (x86)\Citrix\XTE\logs\error.log log file on the Universal Print Server.

The error message SSL handshake from client failed appears in this log file if the SSL/TLS handshake fails. Such failures can occur if the SSL/TLS protocol version on the VDA and the Universal Print Server do not match.

Use the Universal Print Server FQDN in the following policy settings that contain Universal Print Server host names:

- Session printers
• Printer assignments
• Universal Print Servers for load balancing

Ensure that the system clock (date, time, and time zone) are correct on the Universal Print Servers and the VDAs.

Manage security keys

August 27, 2020

Note:
You must use this feature in combination with StoreFront 1912 LTSR CU2 or later. StoreFront 1912 LTSR CU2 has not yet been released.

This feature lets you allow only approved StoreFront and Citrix Gateway machines to communicate with the Delivery Controller. After you enable this feature, any requests that do not contain the key are blocked. Use this feature to add an extra layer of security to protect against attacks originating from the internal network.

By default, this feature is disabled. To enable it, perform these steps:

1. On the machine where the Citrix Studio console is running, open a PowerShell window.
2. Run the following commands:
   • `asnp Citrix*`
   • `Set-ConfigSiteMetadata -Name "Citrix_DesktopStudio_SecurityKeyManagementEnabled" -Value "True"

To verify that the feature is enabled, navigate to the Citrix Studio console and click Configuration in the Studio navigation pane. If this feature is enabled, the Manage Security Key option appears in the Configuration pane. You might need to click Refresh for the option to appear.

The Manage Security Key window appears after you click Manage Security Key.
There are two keys available for use. Select a key and then click the refresh icon to generate your key.

**Important:**
- Use only one key at a time. The unused key is used only for key rotation.
- Do not click the refresh icon to update the key already in use. If you do, service interruption will occur.

**Require key for communications over XML port (StoreFront only).** Indicates whether to require a key to authenticate communications over the XML port. StoreFront communicates with the Delivery Controller over this port. For information about changing the XML port, see Knowledge Center article CTX127945.

**Require key for communications over STA port.** Indicates whether to require a key to authenticate communications over the STA port. Citrix Gateway and StoreFront communicate with the Delivery Controller over this port. For information about changing the STA port, see Knowledge Center article CTX101988.

After applying your changes, click **Close** to exit the **Manage Security Key** window.

You now have successfully completed the configuration in Citrix Studio. You also need to configure settings in StoreFront. Make sure that you use StoreFront 1912 LTSR CU2 or later.

To use the key to authenticate communications over the XML port:
1. Copy the key you generated in Studio.

2. Select **Validate XML Service endpoint** when adding the delivery controller to the store.

3. Paste the key into the **Shared secret** field.

To use the key to authenticate communications over the STA port:

1. Copy the key you generated in Studio.

2. Select **Enable STA endpoint validation** when adding the Secure Ticket Authority.
3. Paste the key into the **Shared secret** field.

For more information about XML and STA authentication, see the [StoreFront documentation](#).

**Devices**

June 3, 2020

HDX provides a high-definition user experience on any device, at any location. The articles in the Devices section describe these devices:

- Generic USB device
- Mobile and touch screen devices
- Serial devices
- Specialty keyboards
- TWAIN devices
- Webcams
Optimized vs. generic USB device

An optimized USB device is one for which Citrix Workspace app has specific support. For example, the ability to redirect webcams using the HDX Multimedia virtual channel. A generic device is a USB device for which there is no specific support in Citrix Workspace app.

By default, generic USB redirection can’t redirect USB devices with optimized virtual channel support unless put into Generic mode.

In general, you get better performance for USB devices in Optimized mode than in Generic mode. However, there are cases where a USB device doesn’t have full functionality in Optimized mode. It might be necessary to switch to Generic mode to gain full access to its features.

With USB mass storage devices, you can use either client drive mapping or generic USB redirection, or both, controlled by Citrix polices. The main differences are:

- Both generic USB redirection and the client drive mapping policies are enabled.
- A device is configured for automatic redirection.
- A mass storage device is inserted either before or after a session starts.

When these conditions are true, the mass storage device is redirected using generic USB redirection:

For more information, see http://support.citrix.com/article/CTX123015.

<td>Yes, if encryption is unlocked before the device is accessed on the virtual session.</td>
<td>Citrix Virtual Desktops only</td>
</tr>
</tbody>
</table>

Mixed DPIs with multi-monitors

Citrix Virtual Apps and Desktops environments do not support the use of different DPIs between monitors. You can verify the DPI (% scaling) using Windows Control Panel > Display options. If using a Windows 8.1 or Windows 10 client device, enabling the Let me choose one scaling level for all my displays option in the Windows Control Panel > Display options configures the monitors appropriately. For more information, see Knowledge Center articleCTX201696.
Mapped client drives

As a security precaution, when a user logs on to Citrix Virtual Apps and Desktops, by default, the server maps client drives without user run permission. To enable users to run executable files residing on mapped client drives, override this default by editing the registry on the server.

Important:

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

To allow access, edit the following registry key (create CDMSettings if it doesn’t exist):

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\CDMSettings

Name: ExecuteFromMappedDrive

Type: DWORD

Value: 1 to allow permission and 0 to deny permission on mapped drives

The change takes effect for sessions connected after the registry edit.

Citrix Virtual Apps and Desktops 7 2006 is the first version to contain this registry location. Earlier versions of Citrix Virtual Apps and Desktops used a different registry location.

Generic USB devices

December 18, 2019

HDX technology provides **optimized support** for most popular USB devices. These devices include:

- Monitors
- Mice
- Keyboards
- Voice over Internet Protocol phones
- Headsets
- Webcams
- Scanners
- Cameras
- Printers
- Drives
- Smart card readers
• Drawing tablets
• Signature pads

Optimized support offers an improved user experience with better performance and bandwidth efficiency over a WAN. Optimized support is usually the best option, especially in high latency or security-sensitive environments.

HDX technology provides **generic USB redirection** for specialty devices that don’t have optimized support or where it is unsuitable. For more information about generic USB redirection, see [Generic USB redirection](#).

For more information about USB devices and Citrix Workspace app for Windows, see [Configuring composite USB device redirection](#) and [Configuring USB support](#).

---

**Mobile and touch screen devices**

**September 14, 2020**

**Tablet mode for touch screen devices using Windows Continuum**

Continuum is a Windows 10 feature that adapts to the way the client device is used. This version of Continuum support, including dynamic change of modes, is available starting at VDA version 7.16 and Citrix Receiver for Windows version 4.10.

Windows 10 VDA detects the presence of a keyboard or mouse on a touch enabled client and puts the client in to desktop mode. If a keyboard or mouse is not present, Windows 10 VDA puts the client in to tablet/mobile mode. This detection occurs on connection and reconnection. It also occurs at dynamic attachment or detachment of the keyboard or mouse.

The feature is enabled by default. To disable this version of the feature, edit the **Tablet mode toggle policy settings** in the ICA policy settings article.

For the feature version included in XenApp 7.14 and 7.15 LTSR and XenDesktop 7.14 and 7.15 LTSR, use the registry settings to disable the feature. For more information, see [Tablet mode for touch screen devices](#).

The **tablet mode** offers a user interface that is better suited to touch screens:

• Slightly larger buttons.
• The Start screen and any apps you start open in a full screen.
• Taskbar contains a back button.
• Icons deleted from the task bar.
You have access to the File Explorer.

The **desktop mode** offers the traditional user interface where you interact in the same manner as using PC and a keyboard and mouse.

Tablet mode requires a minimum of version XenServer 7.2. XenServer 7.2 integrates with the Citrix Virtual Desktops VDA, changing the hypervisor to enable the virtual firmware settings for 2-in-1 devices. Windows 10 loads the GPIO driver on the target virtual machine based on this updated BIOS. It is used for toggling between tablet and desktop modes within the virtual machine. For more information, see the [XenServer 7.2 release notes](#).

Citrix Workspace app for HTML5 (the light version) does not support Windows Continuum features.

---

Run the XenServer CLI command to allow laptop/tablet switching:

```
xe vm-param-set uuid=<VM_UUID> platform:acpi_laptop_slate=1
```

**Important:**

Updating the base image for an existing machine catalog after changing the metadata setting doesn’t affect any previously provisioned VMs. After changing the XenServer VM base image, create a catalog, choose the base image, and provision a new Machine Creation Services (MCS) machine.

**Before starting a session:**

We recommend that you navigate to **Settings > System > Tablet Mode** on the VDA before starting a session and set the following options from the drop-down menus:

- Use the appropriate mode for my hardware
- Don’t ask me and always switch

If you don’t set these options before starting the session, set the options after you start the session and restart the VDA.
Tablet mode

When I sign in

- Use the appropriate mode for my hardware

When this device automatically switches tablet mode on or off

- Don’t ask me and always switch

Microsoft Surface Pro and Surface Book pens

We support standard pen functionality with Windows Ink-based applications. This functionality requires a Virtual Delivery Agent running on a minimum of Microsoft Windows 10 version 1809 and client devices using a minimum of Citrix Workspace app for Windows version 1902. Support includes pointing, erasing, pen pressure, Bluetooth signals, and other features depending on the operating system firmware and pen model. For example, pen pressure can be up to 4096 levels. This feature is enabled by default.

For a demonstration of Windows Ink and the pen functionality, click this graphic:

![Showcasing Windows Ink in a Virtual Environment](image)

System requirements

- Citrix Virtual Apps and Desktops minimum version 1903
- Citrix Workspace app for Windows minimum version 1902
• Microsoft Windows 10 minimum version 1809

Disable or enable

To disable or enable this feature, set the following registry:

HKEY_LOCAL_MACHINE\Software\Citrix\Citrix Virtual Desktop Agent\PenApi

Name: DisablePen
Type: DWORD
Value:
1 - disables
0 - enables

Serial ports

Most new PCs don’t have built-in serial (COM) ports. The ports are easy to add by using USB converters. Applications suited for serial ports often involve sensors, controllers, old check readers, pads, and so forth. Some USB virtual COM-port devices use vendor-specific drivers in place of the Windows-provided drivers (usbser.sys). These drivers allow you to force the virtual COM port of the USB device so that it doesn’t change even if connected to different USB sockets. This might be done from the Device Manager > Ports (COM & LPT) > Properties or from the application that controls the device.

Client COM port mapping allows devices attached to the COM ports on the user’s endpoint to be used during virtual sessions. You can use these mappings like any other network mappings.

For each COM port, a driver in the operating system assigns a symbolic link name such as COM1 and COM2. The applications then use the link to access the port.

Important:

Because a device can attach to the endpoint by using USB directly, doesn’t mean it can be redirected using generic USB redirection. Some USB devices function as virtual COM ports, which applications can access in the same way as physical serial port. The operating system can abstract COM ports and treat them like fileshares. Two common protocols for virtual COM are CDC ACM or MCT. When connected through an RS-485 port, applications might not work at all. Get an RS-485-to-RS232 converter to use RS-485 as a COM port.

Important:
Some applications recognize the device (for example, a signature pad) consistently only if it is connected to COM1 or COM2 on the client workstation.

**Map a client COM port to a server COM port**

You can map client COM ports to a Citrix session in three ways:

- Studio policies. For more information about policies, see [Port redirection policy settings](#).
- VDA command prompt.
- Remote Desktop (Terminal Services) configuration tool.

1. Enable the **Client COM port redirection** and the **Auto connect client COM ports Studio** policies. After applied, some information is available in HDX Monitor.

2. If **Auto connect client COM ports** failed to map the port, you can map the port manually or use logon scripts. Log on to the VDA, and at a command prompt window, type:

   ```
   NET USE COMX:\\CLIENT\COMZ:
   
   Or

   NET USE COMX:\\CLIENT\CLIENTPORT:COMZ:
   
   X is the number of the COM port on the VDA (ports 1 through 9 are available for mapping). Z is the number of the client COM port you want to map.
   
   To confirm that the operation was successful, type **NET USE** at a VDA command prompt. The list that appears contains mapped drives, LPT ports, and mapped COM ports.
3. To use this COM port in a virtual desktop or application, install your user device application and point it to the mapped COM port name. For example, if you map COM1 on the client to COM3 on the server, install your COM port device application in the VDA and point it to COM3 during the session. Use this mapped COM port as you would a COM port on the user device.

**Important:**

COM port mapping is not TAPI-compatible. You can’t map Windows Telephony Application Programming Interface (TAPI) devices to client COM ports. TAPI defines a standard way for applications to control telephone functions for data, fax, and voice calls. TAPI manages signaling, including dialing, answering, and ending calls. Also, supplemental services such as holding, transferring, and conference calls.

**Troubleshoot**

1. Ensure you can access the device directly from the endpoint, bypassing Citrix. While the port is not mapped to the VDA, you are not connected to a Citrix session. Follow any troubleshooting instructions that came with the device and verify that it works locally first.

When a device is connected to a serial COM port, a registry key is created on the hive shown here:

You can also find this information from the command prompt by running `chgport /query`.

© 1999-2020 Citrix Systems, Inc. All rights reserved.
If troubleshooting instructions for the device aren’t available, try opening a PuTTY session. Choose **Session** and in **Serial line** specify your COM Port.
You can run **MODE** in a local command window. The output might display the COM port in use and the Baud/Parity/Data Bits/Stop Bits, which you need in your PuTTY session. If the PuTTY connection is successful, press **Enter** to see feedback from the device. Whatever characters you type might be repeated on the screen, or responded to. If this step is unsuccessful, you can’t access the device from a virtual session.

2. Map the local COM port to the VDA (using policies or **NET USE COMX: \\CLIENT\COMZ:**) and repeat the same PuTTY procedures in the previous step, but this time from the VDA PuTTY. If PuTTY fails to show the error **Unable to open connection to COM1. Unable to open serial port**, another device might be using COM1.

3. Run **chgport /query.** If the built-in Windows serial driver on the VDA is auto-assigning \Device\Serial0 to a COM1 port of your VDA, do the following:
   A. Open CMD on the VDA and type **NET USE.**
   B. Delete any existing mapping (for example, COM1) on the VDA.

   **NET USE COM1 /DELETE**

   C. Map the device to the VDA.

   **NET USE COM1: \\CLIENT\COM3:**

   D. Point your application on the VDA to COM3.

   Lastly, try to map your local COM port (for example, COM3) to a different COM port on the VDA (other than COM1, for example COM3). Ensure that your application is pointing to it:

   **NET USE COM3: \\CLIENT\COM3**

4. If now you do see the port mapped, PuTTY is working but no data passing, it might be a race condition. The application might connect and open the port before it is mapped, locking it from being mapped. Try one of the following:
   - Open a second application published on the same server. Wait a few seconds for the port to be mapped, and then open the real application that tries to use the port.
Enable the COM port redirection policies from the Group Policy Editor in Active Directory instead of Studio. Those policies are **Client COM port redirection** and **Auto connect client COM ports**. Policies applied this way might be processed before the Studio policies, guaranteeing that the COM port is mapped. Citrix policies are pushed to the VDA and stored in: 
\HKL\SOFTWARE\Policies\Citrix \<user session ID>\>

- Use this logon script for the user or instead of publishing the application, publish a .bat script that first deletes any mapping on the VDA, remaps the virtual COM port, and then starts the application:

```bash
@echo off
NET USE COM1 /delete
NET USE COM2 /delete
NET USE COM1: \CLIENT\COM1:
NET USE COM2: \CLIENT\COM2:
MODE COM1: BAUD=1200 (or whatever value needed)
MODE COM2: BAUD=9600 PARITY=N Data=8 Stop=1 (or whatever value needed)
START C:\Program Files\<Your Software Path>\<your_software.exe>
```

5. Process Monitor from Sysinternals is the tool of last resort. When running the tool on the VDA, find and filter objects like COM3, picaser.sys, CdmRedirector, but especially <your_app>.exe. Any errors might appear as Access Denied or similar.

### Specialty keyboards

September 14, 2020

**Bloomberg keyboards**

**Warning:**

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Citrix Virtual Apps and Desktops support the Bloomberg model 4 Starboard keyboard (and earlier model 3). This keyboard enables customers in the financial sector to use the special features of the keyboard to access financial market data and perform trading quickly.

This keyboard is compatible with the KVM switch boxes and can work in two modes:

- **PC** (One USB cable with no KVM)
• KVM mode (Two USB Cables with one routed through KVM)

**Important:**

We recommend that you use the Bloomberg keyboard with only one session. We don’t recommend using the keyboard with multiple concurrent sessions (one client to multiple sessions).

The Bloomberg keyboard 4 is a USB composite device comprising four USB devices in one physical shell:

• Keyboard.
• Fingerprint reader.
• Audio device with keys to increase and decrease volume and mute the speaker and the microphone. This device includes onboard speaker, microphone, and jack for the microphone and headset.
• USB hub to connect all of these devices to the system.

**Requirements:**

• The session to which Citrix Workspace app for Windows is connecting must support USB devices.
• Minimum of Citrix Workspace app 1808 for Windows or Citrix Receiver for Windows 4.8 to support Bloomberg keyboard model 3 and 4.
• Minimum of Citrix Workspace app 1808 for Windows or Citrix Receiver for Windows 4.12 to use KVM mode (two USB cables with one routed through KVM) for Model 4.

For information about configuring Bloomberg keyboards on Citrix Workspace app for Windows, see [Configuring Bloomberg keyboards](#).

**Enable Bloomberg keyboard support:**

By default, the support for the enhanced Bloomberg keyboard is disabled. Enable this support by editing this registry entry on the client machine before you start a connection.

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICAClient\GenericUSB

Name: EnableBloombergHID

Type: DWORD

Value: 0 = Disable, 1 = Enable

**Verify support:**

To determine if Bloomberg keyboard support is enabled in Citrix Workspace app, check if the Desktop Viewer correctly reports the Bloomberg keyboard’s devices.

Desktop scenario:

Open the Desktop Viewer. If support for Bloomberg keyboard is enabled, the Desktop Viewer shows see three devices under the USB icon:
• Bloomberg Fingerprint Scanner
• Bloomberg Keyboard Features
• Bloomberg LP Keyboard 2013

Seamless Application only scenario:

Open the Connection Center menu from the Citrix Workspace app notification area icon. If support for the Bloomberg keyboard is enabled, the three devices appear in the Devices menu.

The check mark against each of these devices indicates that they are remoted to the session.

**TWAIN devices**

December 18, 2019

**Requirements**

- The scanner must be TWAIN compliant.
- Install the TWAIN drivers on the local device. They are not required on the server.
- Attach the scanner locally (for example, through USB).
- Ensure that the scanner is using the local TWAIN driver and not the Windows Image Acquisition service.
- Ensure that there is no policy applied to the user account that is used for the test, and which is limiting the bandwidth within the ICA session. For example, client USB redirection bandwidth limit.

For information about policy settings, see TWAIN devices policy settings.

**Webcams**

August 21, 2020

**High definition webcam streaming**

Webcams can be used by video conferencing applications running within the virtual session. The application on the server selects the webcam format and resolution based on the supported format types. When a session starts, the client sends the webcam information to the server. Choose a webcam from the video conferencing application. When the webcam and the application both support
high-definition rendering, the application uses high-definition resolution. We support webcam resolutions up to 1920x1080.

This feature requires the Citrix Receiver for Windows, minimum version 4.10. For a list of Citrix Workspace app platforms that support HDX webcam redirection, see Citrix Workspace app feature matrix.

For more information about high definition webcam streaming, see HDX video conferencing and webcam video compression.

Warning:
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back up the registry before you edit it.

You can use a registry key to disable and enable the feature. The default resolution of 352x288 is used:

HKEY_LOCAL_MACHINE\Software\Citrix\HDXRealTime
Name: Enable_HighDefWebcam
Type: REG_DWORD
Data:
0 = Disable the high definition webcam streaming
1 = Enable the high definition webcam streaming

You can use registry keys on the client to configure a specific resolution. Ensure that the camera supports the specified resolution:

HKEY_CURRENT_USER\Software\Citrix\HDXRealTime
Name: DefaultWidth
Type: REG_DWORD
Data (decimal): desired width (for example 1280)
Name: DefaultHeight
Type: REG_DWORD
Data (decimal): desired height (for example 720)

Graphics

August 20, 2020
Citrix HDX graphics include an extensive set of graphics acceleration and encoding technologies that optimizes the delivery of rich graphics applications from Citrix Virtual Apps and Desktops. The graphic technologies provide the same experience as using a physical desktop when working remotely with virtual applications that are graphics intensive.

You can use software or hardware for graphics rendering. Software rendering requires a third-party library called software rasterizer. For example, Windows includes the WARP rasterizer for DirectX based graphics. Sometimes, you might want to use an alternative software renderer. Hardware rendering (hardware acceleration) requires a graphics processor (GPU).

HDX Graphics offers a default encoding configuration that is optimized for the most common use cases. By using Citrix policies, IT administrators can also configure various graphics-related settings to meet different requirements and provide the desired user experience.

**Thinwire**

Thinwire is the Citrix default display remoting technology used in Citrix Virtual Apps and Desktops. Display remoting technology allows graphics generated on one machine to be transmitted, typically across a network, to another machine for display. Graphics are generated as a result of user input, for example, keystrokes or mouse actions.

**HDX 3D Pro**

The HDX 3D Pro capabilities in Citrix Virtual Apps and Desktops enable you to deliver desktops and applications that perform best using a graphics processing unit (GPU) for hardware acceleration. These applications include 3D professional graphics applications based on OpenGL and DirectX. The standard VDA supports GPU acceleration of DirectX only.

**GPU acceleration for Windows Single-session OS**

By using HDX 3D Pro, you can deliver graphically intensive applications as part of hosted desktops or applications on Single-session OS machines. HDX 3D Pro supports physical host computers (including desktop, blade, and rack workstations) and GPU Passthrough and GPU virtualization technologies offered by XenServer, vSphere, and Hyper-V (passthrough only) hypervisors.

Using GPU Passthrough, you can create VMs that have exclusive access to dedicated graphics processing hardware. You can install multiple GPUs on the hypervisor and assign VMs to each of these GPUs on a one-to-one basis.

Using GPU virtualization, multiple virtual machines can directly access the graphics processing power of a single physical GPU.

**GPU acceleration for Windows Multi-session OS**

HDX 3D Pro allows graphics-heavy applications running in Windows Multi-session OS sessions to render on the server graphics processing unit (GPU). By moving OpenGL, DirectX, Direct3D, and Windows Presentation Foundation (WPF) rendering to the server GPU, graphics rendering doesn't slow down
the server CPU. Also, the server is able to process more graphics because the workload is split among the CPU and GPU.

**Framehawk**

**Important:**

As of Citrix Virtual Apps and Desktops 7 1903, Framehawk is no longer supported. Instead, use Thinwire with adaptive transport enabled.

Framehawk is a display remoting technology for mobile workers on broadband wireless connections (Wi-Fi and 4G/LTE cellular networks). Framehawk overcomes the challenges of spectral interference and multipath propagation and delivers a fluid and interactive user experience to users of virtual apps and desktops.

**Text-based session watermark**

Text-based session watermarks help to deter and enable tracking data theft. This traceable information appears on the session desktop as a deterrent to those using photographs and screen captures to steal data. You can specify a watermark that is a layer of text. The watermark can display over the entire session screen without changing the content of the original document. Text-based session watermarks require VDA support.

**Related information**

- HDX 3D Pro
- GPU acceleration for Windows Single-session OS
- GPU acceleration for Windows Multi-session OS
- Framehawk
- Thinwire
- Text-based session watermark

**HDX 3D Pro**

July 8, 2020

The HDX 3D Pro capabilities of Citrix Virtual Apps and Desktops enable you to deliver desktops and applications that perform best using a graphics processing unit (GPU) for hardware acceleration. These applications include 3D professional graphics applications based on OpenGL and DirectX. The standard VDA supports GPU acceleration of DirectX only.

For the HDX 3D Pro policy settings, see Optimize for 3D graphics workload.
All supported Citrix Workspace apps can be used with 3D graphics. For best performance with complex 3D workloads, high-resolution monitors, multi-monitor configurations, and high frame rate applications, we recommend the latest versions of Citrix Workspace app for Windows and Citrix Workspace app for Linux. For more information on supported versions of Citrix Workspace app, see Lifecycle Milestones for Citrix Workspace app.

Examples of 3D professional applications include:

- Computer-aided design, manufacturing, and engineering (CAD/CAM/CAE) applications
- Geographical Information System (GIS) software
- Picture Archiving Communication System (PACS) for medical imaging
- Applications using the latest OpenGL, DirectX, NVIDIA CUDA, and OpenCL and WebGL versions
- Computationally intensive non-graphical applications that use NVIDIA Compute Unified Device Architecture (CUDA) GPUs for parallel computing

HDX 3D Pro provides the best user experience over any bandwidth:

- On WAN connections: Deliver an interactive user experience over WAN connections with bandwidths as low as 1.5 Mbps.
- On LAN connections: Deliver a user experience equivalent to that of a local desktop on LAN connections.

You can replace complex and expensive workstations with simpler user devices by moving the graphics processing into the data center for centralized management.

HDX 3D Pro provides GPU acceleration for Windows single-session OS machines and Windows multi-session OS machines. For more information, see GPU acceleration for Windows single-session OS and GPU acceleration for Windows multi-session OS.

HDX 3D Pro is compatible with GPU passthrough and GPU virtualization technologies offered by the following hypervisors, in addition to bare metal:

- Citrix Hypervisor
  - GPU passthrough with NVIDIA GRID, AMD, and Intel GVT-d
  - GPU virtualization with NVIDIA GRID, AMD, and Intel GVT-g
  - See hardware compatibility at Hypervisor Hardware Compatibility List.

Use the HDX Monitor tool to validate the operation and configuration of HDX visualization technologies and to diagnose and troubleshoot HDX issues. To download the tool and learn more about it, see https://taas.citrix.com/hdx/download/.

**GPU acceleration for Windows multi-session OS**

June 24, 2020
HDX 3D Pro allows graphics-heavy applications running in Windows Multi-session OS sessions to render on the server’s graphics processing unit (GPU). By moving OpenGL, DirectX, Direct3D, and Windows Presentation Foundation (WPF) rendering to the server’s GPU, graphics rendering does not slow the server’s CPU. Also, the server is able to process more graphics because the workload is split between the CPU and GPU.

Since Windows Server is a multi-user operating system, multiple users can share a GPU accessed by Citrix Virtual Apps without the need for GPU virtualization (vGPU).

For procedures that involve editing the registry, use caution: Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

**GPU sharing**

GPU Sharing enables GPU hardware rendering of OpenGL and DirectX applications in remote desktop sessions. It has the following characteristics:

- Can be used on bare metal or virtual machines to increase application scalability and performance.
- Enables multiple concurrent sessions to share GPU resources (most users do not require the rendering performance of a dedicated GPU).
- Requires no special settings.

A GPU can be assigned to the Windows Server virtual machine in either full pass-through or virtual GPU (vGPU) modes following Hypervisor and GPU vendor requirements. Bare-metal deployments on physical Windows Server machines are also supported.

GPU Sharing does not depend on any specific graphics card.

- For virtual machines, select a graphics card that is compatible with the Hypervisor in use. For a Citrix Hypervisor hardware compatibility list, see Hypervisor Hardware Compatibility List.
- When running on bare metal, it is recommended to have a single display adapter enabled by the operating system. If multiple GPUs are installed on the hardware, disable all but one of them using Device Manager.

Scalability using GPU Sharing depends on several factors:

- The applications being run
- The amount of video RAM they consume
- The graphics card’s processing power

Some applications handle video RAM shortages better than others. If the hardware becomes overloaded, instability or a crash of the graphics card driver might occur. Limit the number of concurrent users to avoid such issues.
To confirm that GPU acceleration is occurring, use a third-party tool such as GPU-Z. GPU-Z is available at http://www.techpowerup.com/gpuz/.

- Access to a high-performance video encoder for NVIDIA GPUs and Intel Iris Pro graphics processors. A policy setting (enabled by default) controls this feature and allows the use of hardware encoding for H.264 encoding (where available). If such hardware is not available, the VDA falls back to CPU-based encoding using the software video codec. For more information, see Graphics policy settings.

**DirectX, Direct3D, and WPF rendering**

DirectX, Direct3D, and WPF rendering are only available on servers with a GPU that supports a display driver interface (DDI) version of 9ex, 10, or 11.

- On Windows Server 2008 R2, DirectX and Direct3D require no special settings to use a single GPU.
- On Windows Server 2016 and Windows Server 2012, Remote Desktop Services (RDS) sessions on the RD Session Host server use the Microsoft Basic Render Driver as the default adapter. To use the GPU in RDS sessions on Windows Server 2012, enable the **Use the hardware default graphics adapter for all Remote Desktop Services sessions** setting in the group policy **Local Computer Policy > Computer Configuration > Administrative Templates > Windows Components > Remote Desktop Services > Remote Desktop Session Host > Remote Session Environment**.
- To enable WPF applications to render using the server's GPU, create the following settings in the registry of the server running Windows Multi-session OS sessions:
  - `[HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\CtxHook\AppInit_DLLs\Multiple Monitor Hook] “EnableWPFFhook”=dword:00000001
  - `[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\CtxHook\AppInit_DLLs\Multiple Monitor Hook] “EnableWPFFhook”=dword:00000001

**GPU acceleration for CUDA or OpenCL applications**

GPU acceleration of CUDA and OpenCL applications running in a user session is disabled by default.

To use the CUDA acceleration POC features, enable the following registry settings:

- `[HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\CtxHook\AppInit_DLLs\Graphics Helper] “CUDA”=dword:00000001
- `[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\CtxHook\AppInit_DLLs\Graphics Helper] “CUDA”=dword:00000001
To use the OpenCL acceleration POC features, enable the following registry settings:

- `[HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\CtxHook\AppInit_DLLs\Graphics Helper] “OpenCL”=dword:00000001
• [HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\CtxHook\ApplInit_Dlls\Graphics Helper] "OpenCL"=dword:00000001

GPU acceleration for Windows single-session OS

June 25, 2020

With HDX 3D Pro, you can deliver graphically intensive applications as part of hosted desktops or applications on Single-session OS machines. HDX 3D Pro supports physical host computers (including desktop, blade, and rack workstations) and GPU Passthrough and GPU virtualization technologies offered by XenServer, vSphere, and Hyper-V (passthrough only) hypervisors.

HDX 3D Pro offers the following features:

• Adaptive H.264-based or H.265-based deep compression for optimal WAN and wireless performance. HDX 3D Pro uses CPU-based full-screen H.264 compression as the default compression technique for encoding. Hardware encoding with H.264 is used with NVIDIA, Intel, and AMD cards that support NVENC. Hardware encoding with H.265 is used with NVIDIA cards that support NVENC.

• Lossless compression option for specialized use cases. HDX 3D Pro also offers a CPU-based lossless codec to support applications where pixel-perfect graphics are required, such as medical imaging. True lossless compression is recommended only for specialized use cases because it consumes more network and processing resources.

When using lossless compression:

- The lossless indicator, a notification area icon, notifies the user if the screen displayed is a lossy frame or a lossless frame. This icon helps when the Visual Quality policy setting specifies Build to lossless. The lossless indicator turns green when the frames sent are lossless.

- The lossless switch enables the user to change to Always Lossless mode anytime within the session. To select or deselect Lossless anytime within a session, right-click the icon or use the shortcut ALT+SHIFT+1.

  For lossless compression: HDX 3D Pro uses the lossless codec for compression regardless of the codec selected through policy.

  For lossy compression: HDX 3D Pro uses the original codec, either the default or the one selected through policy.

  Lossless switch settings are not retained for subsequent sessions. To use a lossless codec for every connection, select Always lossless in the Visual quality policy setting.
• You can override the default shortcut, ALT+SHIFT+1, to select or deselect Lossless within a session. Configure a new registry setting at HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\HDX3D\LLIndicator.
  – Name: HKEY_LOCAL_MACHINE_HotKey, Type: String

<table>
<thead>
<tr>
<th>The format to configure a shortcut combination is</th>
<th>1, A=0</th>
<th>1, S=0</th>
<th>1, W=0</th>
<th>1, K=val. Keys must be comma “,” separated. The order of the keys does not matter.</th>
</tr>
</thead>
</table>

– A, C, S, W and K are keys, where C=Control, A=ALT, S=SHIFT, W=Win, and K=a valid key. Allowed values for K are 0–9, a–z, and any virtual key code.
– For example:
  * For F10, set K=0x79
  * For Ctrl + F10, set C=1, K=0x79
  * For Alt + A, set A=1, K=a or A=1, K=A or K=A, A=1
  * For Ctrl + Alt + 5, set C=1, A=1, K=5 or A=1, K=5, C=1
  * For Ctrl + Shift + F5, set A=1, S=1, K=0x74

Caution:
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

• Multiple and high resolution monitor support. For Single-session OS machines, HDX 3D Pro supports user devices with up to four monitors. Users can arrange their monitors in any configuration and can mix monitors with different resolutions and orientations. The number of monitors is limited by the capabilities of the host computer GPU, the user device, and the available bandwidth. HDX 3D Pro supports all monitor resolutions and is limited only by the capabilities of the GPU on the host computer.

HDX 3D Pro also provides limited support for dual-monitor access to Windows XP desktops. For more information about this support, see VDAs on machines running Windows XP or Windows Vista.

• Dynamic resolution. You can resize the virtual desktop or application window to any resolution. **Note:** The only supported method to change the resolution is by resizing the VDA session win-
Changing resolution from within the VDA session (using Control Panel > Appearance and Personalization > Display > Screen Resolution) is not supported.

- Support for NVIDIA GRID architecture. HDX 3D Pro supports NVIDIA GRID cards (see NVIDIA GRID) for GPU passthrough and GPU sharing. NVIDIA GRID vGPU enables multiple VMs to have simultaneous, direct access to a single physical GPU, using the same NVIDIA graphics drivers that are deployed on non-virtualized operating systems.

- Support for VMware vSphere and VMware ESX using Virtual Direct Graphics Acceleration (vDGA).
  - You can use HDX 3D Pro with vDGA for both RDS and VDI workloads.

- Support for VMware vSphere/ESX using NVIDIA GRID vGPU and AMD MxGPU.

- Support for Data Center Graphics with Intel Xeon Processor E3 Family. HDX 3D Pro supports multi-monitors (up to 3), console blanking, custom resolution, and high frame-rate with the supported family of Intel processors. For more information, see http://www.citrix.com/intel and http://www.intel.com/content/www/us/en/servers/data-center-graphics.html.

- Support for AMD RapidFire on the AMD FirePro S-series server cards. HDX 3D Pro supports multi-monitors (up to 6), console blanking, custom resolution, and high frame-rate. Note: HDX 3D Pro support for AMD MxGPU (GPU virtualization) works with VMware vSphere vGPUs only. XenServer and Hyper-V are supported with GPU passthrough. For more information, see AMD Virtualization Solution.

- Access to a high-performance video encoder for NVIDIA GPUs, AMD GPUs, and Intel Iris Pro graphics processors. A policy setting (enabled by default) controls this feature. The feature allows the use of hardware encoding for H.264 encoding (where available). If such hardware is not available, the VDA falls back to CPU-based encoding using the software video codec. For more information, see Graphics policy settings.

As shown in the following figure:

- When a user logs on to Citrix Workspace app and accesses the virtual application or desktop, the Controller authenticates the user. The Controller then contacts the VDA for HDX 3D Pro to broker a connection to the computer hosting the graphical application.

The VDA for HDX 3D Pro uses the appropriate hardware on the host to compress views of the complete desktop or of just the graphical application.

- The desktop or application views and the user interactions with them are transmitted between the host computer and the user device. This transmission is done through a direct HDX connection between Citrix Workspace app and the VDA for HDX 3D Pro.
Install and upgrade NVIDIA drivers

Note:

The NVIDIA GRID API is not the default graphics capture mechanism, but you can enable GRID API for graphics capture. This section applies only when you enable GRID API for graphics capture.

The NVIDIA GRID API provides direct access to the frame buffer of the GPU. This connection provides the fastest possible frame rate for a smooth and interactive user experience. If you install NVIDIA drivers before you install a VDA with HDX 3D Pro, NVIDIA GRID is enabled by default.

To enable NVIDIA GRID on a VM, disable Microsoft Basic Display Adapter from the Device Manager. Run the following command and then restart the VDA: `NVFBCEnable.exe -enable -noreset`

If you install NVIDIA drivers after you install a VDA with HDX 3D Pro, NVIDIA GRID is disabled. Enable NVIDIA GRID by using the NVFBCEnable tool provided by NVIDIA.

To disable NVIDIA GRID, run the following command and then restart the VDA: `NVFBCEnable.exe -disable -noreset`
Install Intel graphics drivers

You can install the Intel graphics drivers before installing the VDA. The following step is required if you install Intel drivers after you install a VDA with HDX 3D Pro. The step is also required if the Intel driver has been updated.

To enable the Intel drivers required for multi-monitor support, run the following command using the IntelVirtualDisplayTool.exe, then restart the VDA: `IntelVirtualDisplayTool.exe -vd enable`

IntelVirtualDisplayTool.exe is included with the VDA installer. The IntelVirtualDisplayTool.exe is in C:\Program Files\Citrix\ICAServices.

Note:

Uninstalling NVIDIA, AMD, or Intel drivers within ICA sessions is not supported.

Optimize the HDX 3D Pro user experience

To use HDX 3D Pro with multiple monitors, ensure that the host computer is configured with at least as many monitors as are attached to user devices. The monitors attached to the host computer can be either physical or virtual.

Do not attach a monitor (either physical or virtual) to a host computer while a user is connected to the virtual desktop or application providing the graphical application. Doing so can cause instability during a user's session.

Let your users know that changes to the desktop resolution (by them or an application) are not supported while a graphical application session is running. After closing the application session, a user can change the resolution of the Desktop Viewer window in the Citrix Workspace app - Desktop Viewer Preferences.

When multiple users share a connection with limited bandwidth (for example, at a branch office), we recommend that you use the Overallsession bandwidth limit policy setting to limit the bandwidth available to each user. Using this setting ensures that the available bandwidth does not fluctuate widely as users log on and off. Because HDX 3D Pro automatically adjusts to use all the available bandwidth, large variations in the available bandwidth over the course of user sessions can negatively impact performance.

For example, if 20 users share a 60 Mbps connection, the bandwidth available to each user can vary between 3 Mbps and 60 Mbps, depending on the number of concurrent users. To optimize the user experience in this scenario, determine the bandwidth required per user at peak periods and limit users to this amount always.

For users of a 3D mouse, we recommend that you increase the priority of the Generic USB Redirection virtual channel to 0. For information about changing the virtual channel priority, see the Knowledge Center article CTX128190.
Thinwire

February 12, 2020

Introduction

Thinwire, a part of Citrix HDX technology, is the Citrix default display remoting technology used in Citrix Virtual Apps and Desktops.

Display remoting technology allows graphics generated on one machine to be transmitted, typically across a network, to another machine for display.

A successful display remoting solution provides a highly interactive user experience that is similar to that of a local PC. Thinwire achieves this experience by using a range of complex and efficient image analysis and compression techniques. Thinwire maximizes server scalability and consumes less bandwidth than other display remoting technologies.

Because of this balance, Thinwire meets most general business use cases and is used as the default display remoting technology in Citrix Virtual Apps and Desktops.

HDX 3D Pro

In its default configuration, Thinwire can deliver 3D or highly interactive graphics and use a graphics processing unit (GPU), if present. However, we recommend enabling HDX 3D Pro mode using the Optimize for 3D graphics workload or Visual quality > Build to lossless policies for scenarios when GPUs are present. These policies configure Thinwire to use a video codec (H.264 or H.265) to encode the entire screen using hardware acceleration if a GPU is present. Doing so provides a more fluid experience for 3D professional graphics. For more information, see H.264 Build to lossless, HDX 3D Pro, and GPU acceleration for Windows Single-session OS.

Requirements

Thinwire is optimized for modern operating systems, including Windows Server 2012 R2, Windows Server 2016, Windows Server 2019, Windows 7, and Windows 10. For Windows Server 2008 R2, legacy graphics mode is recommended. Use the built-in Citrix policy templates, High Server Scalability-Legacy OS and Optimized for WAN-Legacy OS to deliver the Citrix recommended combinations of policy settings for these use cases.

Note:

We do not support legacy graphics mode in this release. It is included for backward compatibility when using XenApp 7.15 LTSR, XenDesktop 7.15 LTSR, and previous VDA releases with Windows 7.
Citrix Virtual Apps and Desktops 7 2009

...and Windows 2008 R2.

- The policy setting which drives the behavior of Thinwire, **Use video codec for compression**, is available on VDA versions in Citrix Virtual Apps and Desktops 7 1808 or later and XenApp and XenDesktop 7.6 FP3 and later. The **Use video codec when preferred** option is the default setting on VDA versions Citrix Virtual Apps and Desktops 7 1808 or later and XenApp and XenDesktop 7.9 and later.
- All Citrix Workspace apps support Thinwire. Some Citrix Workspace apps might support features of Thinwire that others do not, for example, 8-bit or 16-bit graphics for reduced bandwidth usage. Support for such features is automatically negotiated by Citrix Workspace app.
- Thinwire uses more server resources (CPU, memory) in multi-monitor and high-resolution scenarios. It is possible to tune the amount of resources Thinwire uses, however, bandwidth usage might increase as a result.
- In low bandwidth or high latency scenarios, consider enabling 8-bit or 16-bit graphics to improve interactivity. Visual quality might be affected, especially at 8-bit color depth.

**Encoding methods**

Thinwire can operate in two different encoding modes depending on policy and client capabilities:

- Thinwire full screen H.264 or H.265
- Thinwire with selective H.264 or H.265

Legacy GDI remoting uses the XPDM remoting driver and not a Thinwire bitmap encoder.

**Configuration**

Thinwire is the default display remoting technology.

The following Graphics policy setting sets the default and provides alternatives for different use cases:

- **Use video codec for compression**
  - **Use video codec when preferred**. This is the default setting. No additional configuration is required. Keeping this setting as the default ensures that Thinwire is selected for all Citrix connections, and is optimized for scalability, bandwidth, and superior image quality for typical desktop workloads. This is functionally equivalent to **For actively changing regions**.
  - Other options in this policy setting continue to use Thinwire with other technologies for different use cases. For example:
    - **For actively changing regions**. The adaptive display technology in Thinwire identifies moving images (video, 3D in motion) and uses H.264 or H.265 only in the part of the screen where the image is moving.

© 1999-2020 Citrix Systems, Inc. All rights reserved.
- **For the entire screen.** Delivers Thinwire with full-screen H.264 or H.265 to optimize for improved user experience and bandwidth in cases with heavy use of 3D graphics. In the case of H.264 4:2:0 (the **Visually lossless** policy is disabled), the final image is not pixel perfect (lossless) and might not be suitable for certain scenarios. In such cases, consider using **H.264 Build to lossless** instead.

Various other policy settings, including the following Visual display policy settings can be used to fine tune the performance of display remoting technology. Thinwire supports them all.

- Preferred color depth for simple graphics
- Target frame rate
- Visual quality

To get the Citrix recommended combinations of policy settings for different business use cases, use the built-in **Citrix Policy templates**. The **High Server Scalability** and **Very High Definition User Experience** templates both use Thinwire with the optimum combinations of policy settings for your organization’s priorities and your users’ expectations.
Monitoring Thinwire

You can monitor the use and performance of Thinwire from Citrix Director. The HDX virtual channel details view contains useful information for troubleshooting and monitoring Thinwire in any session.

To view Thinwire-related metrics:

1. In Director, search for a user, machine or endpoint, open an active session and click Details. Or, you can select Filters > Sessions > All Sessions, open an active session and click Details.

2. Scroll down to the HDX panel.

Lossless compression codec (MDRLE)

In a typical desktop session, most of the imagery is simple graphics or text regions. Thinwire determines where these regions are and selects these areas for lossless encoding using the 2DRLE codec. At the Citrix Workspace app client side, these elements are decoded using the Citrix Workspace app-side 2DRLE decoder for session display.

In XenApp and XenDesktop 7.17, we added a higher compression ratio MDRLE codec that consumes less bandwidth in typical desktop sessions than the 2DRLE codec. This new codec does not impact server scalability.

Lower bandwidth usually means improved session interactivity (especially on shared or constrained links) and reduced costs. For example, the expected bandwidth consumption when using the MDRLE codec is approximately 10–15% less compared with XenApp and XenDesktop 7.15 LTSR for typical Office-like workloads.

Configuration isn’t required for the MDRLE codec. If Citrix Workspace app supports MDRLE decoding, the VDA uses the VDA MDRLE encoding and the Citrix Workspace app MDRLE decoding. If Citrix Workspace app doesn’t support MDRLE decoding, the VDA automatically falls back to 2DRLE encoding.

MDRLE Requirements:

- Citrix Virtual Apps and Desktops minimum version 7 1808 VDAs
- XenApp and XenDesktop minimum version 7.17 VDAs
- Citrix Workspace app for Windows minimum version 1808
Progressive Mode

Citrix Virtual Apps and Desktops 1808 introduced progressive mode and enabled it by default. In constrained network conditions (default: bandwidth < 2 Mbps, or latency > 200 ms), Thinwire increased the compression of text and static imagery to improve interactivity during screen activity. The heavily compressed text and images are then progressively sharpened, in a random block fashion, when screen activity stopped. While compressing and sharpening this way improves overall interactivity, it reduces cache efficiency and increases bandwidth usage.

As of Citrix Virtual Apps and Desktops 1906, progressive mode is disabled by default. We now use a different approach. The quality of still images is now based on network conditions and floats between a pre-defined minimum and maximum value for each Visual quality setting. Because there is no explicit sharpening step, Thinwire optimizes image delivery and maintains cache efficiency, while providing nearly all of the benefits of progressive mode.

Changing progressive mode behavior

Important:

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

You can change the progressive mode state with the following registry key:

HKEY_LOCAL_MACHINE\Software\Citrix\Graphics\n
Type: REG_DWORD

Name: ProgressiveDisplay

Values:

0 = Always off (Disables progressive mode. This value is the default.)
1 = Automatic (Toggle based on network conditions.)
2 = Always on

H.264 Build to lossless

Build to lossless is a special Thinwire configuration that optimizes graphics delivery for interactivity and final image quality. You can enable this setting by setting the Visual quality policy to Build to lossless.
Build to lossless compresses the screen using H.264 (or H.265) during screen activity and sharpens to pixel perfect (lossless) when activity stops. The H.264 (or H.265) image quality adapts to available resources to maintain the best possible frame rate. The sharpening step is performed gradually, giving an immediate response if the user begins screen activity shortly after sharpening starts. For example, selecting a model and rotating it.

H.264 Build to lossless offers all the advantages of full screen H.264 or H.265, including hardware acceleration, but with the added benefit of a final, guaranteed lossless screen. This is critical for 3D-type workloads that require a final pixel-perfect image. For example, manipulating medical imagery. Also, H.264 Build to lossless uses fewer resources than full screen H.264 4:4:4. As a result, using Build to lossless usually results in a higher frame rate than Visually lossless H.264 4:4:4.

**Note:**
In addition to the Visual quality policy, set the Use video codec policy to Use when preferred (default) or For actively changing regions. You can revert to non-H.264 Build to lossless by setting the Use video codec policy to Do not use video codec. This results in moving images being encoded with JPEG instead of H.264 (or H.265).

---

**Text-based session watermark**

September 14, 2020

Text-based session watermarks help to deter and enable tracking data theft. This traceable information appears on the session desktop as a deterrent to those using photographs and screen captures to steal data. You can specify a watermark that is a layer of text, which displays over the entire session screen without changing the content of the original document. Text-based session watermarks require VDA support.

**Important:**
Text-based session watermarking is not a security feature. The solution does not prevent data theft completely, but it provides some level of deterrent and traceability. Although we do not guarantee complete information traceability when using this feature, we recommend that you combine this feature with other security solutions as applicable.

The session watermark is text and is applied to the session that is delivered to the user. The session watermark carries information for tracking data theft. The most important data is the identity of the logon user of the current session in which the screen image was taken. To trace the data leakage more effectively, include other information such as server or client internet protocol address and a connect time.
To adjust the user experience, use the Session Watermark policy settings to configure the placement and watermark appearance on the screen.

Requirements:

Virtual Delivery Agents:

Multi-session OS 7.17
Single-session OS 7.17

Limitations:

- Session watermarks are not supported in sessions where Local App Access, Windows media redirection, MediaStream, browser content redirection, and HTML5 video redirection are used. To use session watermark, ensure that these features are disabled.

- Session watermark is not supported and doesn’t appear if the session is running in full-screen hardware accelerated modes (full-screen H.264 or H.265 encoding).

- If you set these HDX policies, watermark settings don’t take effect and a watermark isn’t displayed in the session display.

Use hardware encoding for video codec to Enabled

Use video codec for compression to For the entire screen

- If you set these HDX policies, the behavior is undetermined and the watermark might not display.

  Use hardware encoding for video codec to Enabled
  Use video codec for compression to Use video codec when preferred

To ensure the watermark displays, set Use hardware encoding for video codec to Disabled, or set Use video codec for compression to For actively changing regions or Do not use video codec.

- Session watermark supports only Thinwire and not the Framehawk or Desktop Composition Redirection (DCR) graphic modes.

- If you use Session Recording, the recorded session doesn’t include the watermark.

- If you use Windows remote assistance, the watermark is not shown.

- If a user presses the Print Screen key to capture the screen, the screen captured at the VDA side doesn’t include the watermarks. We recommend that you take measures to avoid the captured image being copied.
Multimedia

January 10, 2020

The HDX technology stack supports the delivery of multimedia applications through two complementary approaches:

- Server-side rendering multimedia delivery
- Client-side rendering multimedia redirection

This strategy ensures that you can deliver a full range of multimedia formats, with a great user experience, while maximizing server scalability to reduce the cost-per-user.

With server-rendered multimedia delivery, audio and video content is decoded and rendered on the Citrix Virtual Apps and Desktops server by the application. The content is then compressed and delivered using ICA protocol to Citrix Workspace app on the user device. This method provides the highest rate of compatibility with various applications and media formats. Because video processing is compute-intensive, server-rendered multimedia delivery benefits greatly from the onboard hardware acceleration. For example, support for DirectX Video Acceleration (DXVA) offloads the CPU by performing H.264 decoding in separate hardware. Intel Quick Sync, AMD RapidFire, and NVIDIA NVENC technologies provide hardware-accelerated H.264 encoding.

Because most servers do not offer any hardware acceleration for video compression, server scalability is negatively impacted if all video processing is done on the server CPU. You can maintain high server scalability, by redirecting many multimedia formats to the user device for local rendering.

- Windows Media redirection offloads the server for a wide variety of media formats typically associated with the Windows Media Player.
- HTML5 video has become popular, and Citrix introduced a redirection technology for this type of content. We recommend the browser content redirection for websites using HTML5, HLS, DASH, or WebRTC.
- You can apply the general contact redirection technologies Host-to-client redirection and Local App Access to the multimedia content.

Putting these technologies together, if you don’t configure redirection, HDX does Server-Side Rendering.

If you configure redirection, HDX uses either Server Fetch and Client Render or Client Fetch and Client Render. If those methods fail, HDX falls back to Server-Side Rendering as needed and is subject to the Fallback Prevention Policy.
Example scenarios

1. Server Fetch & Server Render

   1. The server fetches the media file from its source, decodes, and then presents the content to an audio device or display device.
   2. The server extracts the presented image or sound from the display device or audio device respectively.
   3. The server optionally compresses it, and then transmits it to the client.

   This approach incurs a high CPU cost, high bandwidth cost (if the extracted image/sound isn’t compressed efficiently), and has low server scalability.

   Thinwire and Audio virtual channels handle this approach. The advantage of this approach is that it reduces the hardware and software requirements for the clients. Using this approach the decoding happens on the server and it works for a wider variety of devices and formats.

2. Server Fetch & Client Render

   This approach relies on being able to intercept the media content before it is decoded and presented to the audio or display device. The compressed audio/video content is instead sent to the client where it is then decoded and presented locally. The advantage of this approach is that the are offloaded to the client devices, saving CPU cycles on the server.

   However, it also introduces some additional hardware and software requirements for the client. The

Scenario 1. (Server Fetch and Server Rendering):

1. The server fetches the media file from its source, decodes, and then presents the content to an audio device or display device.
2. The server extracts the presented image or sound from the display device or audio device respectively.
3. The server optionally compresses it, and then transmits it to the client.

This approach incurs a high CPU cost, high bandwidth cost (if the extracted image/sound isn’t compressed efficiently), and has low server scalability.

Thinwire and Audio virtual channels handle this approach. The advantage of this approach is that it reduces the hardware and software requirements for the clients. Using this approach the decoding happens on the server and it works for a wider variety of devices and formats.

Scenario 2. (Server Fetch and Client Render):

This approach relies on being able to intercept the media content before it is decoded and presented to the audio or display device. The compressed audio/video content is instead sent to the client where it is then decoded and presented locally. The advantage of this approach is that the are offloaded to the client devices, saving CPU cycles on the server.

However, it also introduces some additional hardware and software requirements for the client. The
client must be able to decode each format that it might receive.

**Scenario 3. (Client Fetching and Client Rendering):**

This approach relies on being able to intercept the media content URL before it’s fetched from the source. The URL is sent to the client where the media content is fetched, decoded, and presented locally. This approach is conceptually simple. Its advantage is that it saves both CPU cycles on the server and bandwidth because the server sends only control commands. However, the media content is not always accessible to the clients.

**Framework and platform:**

Single-session operating systems (Windows, Mac OS X, and Linux) provide multimedia frameworks that enable the faster development of multimedia applications. This table lists some of the more popular multimedia frameworks. Each framework divides media processing into several stages and uses a pipelined-based architecture.

<table>
<thead>
<tr>
<th>Framework</th>

**Audio features**

September 14, 2020
You can configure and add the following Citrix policy settings to a policy that optimizes HDX audio features. For usage details plus relationships and dependencies with other policy settings, see Audio policy settings and Bandwidth policy settings and Multi-stream connections policy settings.

**Important:**

We recommend delivering audio using User Datagram Protocol (UDP) rather than TCP, but UDP audio encryption using DTLS is available only between Citrix Gateway and Citrix Workspace app. Therefore, sometimes it might be preferable to use TCP transport. TCP supports end-to-end TLS encryption from the Virtual Delivery Agent (VDA) to Citrix Workspace app.

**Audio quality**

In general, higher sound quality consumes more bandwidth and server CPU utilization by sending more audio data to user devices. Sound compression allows you to balance sound quality against overall session performance; use Citrix policy settings to configure the compression levels to apply to sound files.

By default, the **Audio quality policy** setting is set to High - high definition audio when TCP transport is used. The policy is set to Medium - optimized-for-speech when UDP transport (recommended) is used. The **High Definition audio** setting provides high fidelity stereo audio, but consumes more bandwidth than other quality settings. Do not use this audio quality for non-optimized voice chat or video chat applications (such as softphones). The reason being that it might introduce latency into the audio path that is not suitable for real-time communications. We recommend the optimized for speech policy setting for real-time audio, regardless of the selected transport protocol.

When the bandwidth is limited, for example satellite or dial-up connections, reducing audio quality to Low consumes the least possible bandwidth. In this situation, create separate policies for users on low-bandwidth connections so that users on high-bandwidth connections are not adversely impacted.

For setting details, see **Audio policy settings**. Remember to enable Client audio settings on the user device.

**Bandwidth guidelines for audio playback and recording:**

- **High quality (default)**
  - Bitrate: ~100 kbps (min 75, max 175 kbps) for playback / ~70 kbps for microphone capture
  - Number of Channels: 2 (Stereo) for playback, 1 (mono) for microphone capture
  - Frequency: 44100 Hz
  - Bit-depth: 16-bit
- **Medium quality (recommended for VoIP)**
  - Bitrate: ~16 kbps (min 20, max 40 kbps) for playback, ~16 kbps for microphone capture
  - Number of Channels: 1 (Mono) for both playback and capture
- Frequency: 16000 Hz (wideband)
- Bit-depth: 16-bit

- Low quality
  - Bitrate: ~11 kbps (min 10; max 25 kbps) for playback, ~11 kbps for microphone capture
  - Number of Channels: 1 (Mono) for both playback and capture
  - Frequency: 8000 Hz (narrowband)
  - Bit-depth: 16-bit

**Client audio redirection**

To allow users to receive audio from an application on a server through speakers or other sound devices on the user device, leave the **Client audio redirection** setting at **Allowed**. This is the default.

Client audio mapping puts extra load on the servers and the network. However, prohibiting client audio redirection disables all HDX audio functionality.

For setting details, see **Audio policy settings**. Remember to enable client audio settings on the user device.

**Client microphone redirection**

To allow users to record audio using input devices such as microphones on the user device, leave the **Client microphone redirection** setting at its default (Allowed).

For security, user devices alert their users when servers they don’t trust try to access microphones. Users can choose to accept or reject access before using the microphone. Users can disable this alert on Citrix Workspace app.

For setting details, see **Audio policy settings**. Remember to enable Client audio settings on the user device.

**Audio Plug N Play**

The Audio Plug N Play policy setting allows or prevents the use of multiple audio devices to record and play sound. This setting is **Enabled** by default. Audio Plug N Play enables audio devices to be recognized. The devices are recognized even if they are not plugged in until after the user session has started.

This setting applies only to Windows Multi-session OS machines.

For setting details, see **Audio policy settings**.
Audio redirection bandwidth limit and audio redirection bandwidth limit percent

The Audio redirection bandwidth limit policy setting specifies the maximum bandwidth (in kilobits per second) for a playing and recording audio in a session.

The Audio redirection bandwidth limit percent setting specifies the maximum bandwidth for audio redirection as a percentage of the total available bandwidth.

By default, zero (no maximum) is specified for both settings. If both settings are configured, the one with the lowest bandwidth limit is used.

For setting details, see Bandwidth policy settings. Remember to enable Client audio settings on the user device.

Audio over UDP Real-time Transport and Audio UDP port range

By default, Audio over User Datagram Protocol (UDP) Real-time Transport is allowed (when selected at the time of installation). It opens up a UDP port on the server for connections that use Audio over UDP Real-time Transport. If there is network congestion or packet loss, we recommend configuring UDP/RTP for audio to ensure the best possible user experience. For any real time audio such as softphone applications, UDP audio is preferred to EDT. UDP allows for packet loss without retransmission, ensuring that no latency is added on connections with high packet loss.

Important:

When Citrix Gateway is not in the path, audio data transmitted with UDP is not encrypted. If Citrix Gateway is configured to access Citrix Virtual Apps and Desktops resources, then audio traffic between the endpoint device and Citrix Gateway is secured using DTLS protocol.

The Audio UDP port range specifies the range of port numbers that the VDA uses to exchange audio packet data with the user device.

By default, the range is 16500 through 16509.

For setting details about Audio over UDP Real-time Transport, see Audio policy settings. For details about Audio UDP port range, see Multi-stream connections policy settings. Remember to enable Client audio settings on the user device.

Audio setting policies for user devices

1. Load the group policy templates by following Configuring the Group Policy Object administrative template.
2. In the Group Policy Editor, expand Administrative Templates > Citrix Components > Citrix Workspace > User Experience.
3. For Client audio settings, select Not Configured, Enabled, or Disabled.
• Not Configured. By default, Audio Redirection is enabled using high quality audio or the previously configured custom audio settings.
• Enabled. Enables audio redirection using the selected options.
• Disabled. Disables audio redirection.

4. If you select Enabled, choose a sound quality. For UDP audio, use Medium (default).

5. For UDP audio only, select Enable Real-Time Transport and then set the range of incoming ports to open in the local Windows firewall.

6. To use UDP Audio with Citrix Gateway, select Allow Real-Time Transport Through gateway. Configure Citrix Gateway with DTLS. For more information, see this article.

As an Administrator, if you do not have control on endpoint devices to make these changes, use the default.ica attributes from StoreFront to enable UDP Audio. For example, for bring your own devices or home computers.

1. On the StoreFront machine, open C:\inetpub\wwwroot\Citrix\<Store Name>\App_Data\default.ica with an editor such as notepad.

2. Make the following entries under the [Application] section.

   ; This text enables Real-Time Transport
   EnableRtpAudio=true

   ; This text allows Real-Time Transport Through gateway
   EnableUDPThroughGateway=true

   ; This text sets audio quality to Medium
   AudioBandwidthLimit=1

   ; UDP Port range
   RtpAudioLowestPort=16500
   RtpAudioHighestPort=16509

If you enable User Datagram Protocol (UDP) audio by editing default.ica, then UDP audio is enabled for all users who are using that store.

Avoid echo during multimedia conferences

Users in audio or video conferences might hear an echo. Echoes usually occur when speakers and microphones are too close to each other. For that reason, we recommend the use of headsets for audio and video conferences.

HDX provides an echo cancellation option (enabled by default) that minimizes any echo. The effectiveness of echo cancellation is sensitive to the distance between the speakers and the microphone. Ensure that the devices aren’t too close or too far away from each other.
You can change a registry setting to disable echo cancellation.

Warning:
Editing the Registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

1. Using the Registry Editor on the user device, navigate to one of the following:
   - 32-bit computers: HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\ClientAudio\EchoCancellation
   - 64-bit computers: HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\ICA Client\Engine\Configuration\Advanced\Modules\ClientAudio\EchoCancellation
2. Change the Value data field to FALSE.

Softphones
A softphone is software acting as a phone interface. You use a softphone to make calls over the internet from a computer or other smart device. By using a softphone, you can dial phone numbers and carry out other phone-related functions using a screen.

Citrix Virtual Apps and Desktops support several alternatives for delivering softphones.

- **Control mode.** The hosted softphone controls a physical telephone set. In this mode, no audio traffic goes through the Citrix Virtual Apps and Desktops server.

- **HDX RealTime optimized softphone support (recommended).** The media engine runs on user device, and Voice over Internet Protocol traffic flows peer-to-peer. For examples, see:
  - HDX Optimization for Microsoft Teams
  - HDX RealTime Optimization Pack, which optimizes the delivery of Microsoft Skype for Business
  - Cisco Jabber Softphone for VDI (formerly known as VXME)
  - Cisco Webex Meetings for VDI
  - Avaya VDI Equinox (formerly known as VDI Communicator)
  - Zoom VDI Plugin
  - Genesys PureEngage Cloud
  - Nuance Dragon PowerMic dictation device

- **Local App Access.** A Citrix Virtual Apps and Desktops feature that allows an application such as a softphone to run locally on the Windows user device yet appear seamlessly integrated with their virtual/published desktop. This feature offloads all audio processing to the user device. For more information, see Local App Access and URL redirection.

- **HDX RealTime generic softphone support.** Voice over Internet Protocol-over-ICA.
**Generic softphone support**

Generic softphone support, enables you to host an unmodified softphone on XenApp or XenDesktop in the data center. The audio traffic goes over the Citrix ICA protocol (preferably using UDP/RTP) to the user device running the Citrix Workspace app.

Generic softphone support is a feature of HDX RealTime. This approach to softphone delivery is especially useful when:

- An optimized solution for delivering the softphone is not available and the user is not on a Windows device where Local App Access can be used.
- The media engine that is needed for optimized delivery of the softphone isn’t installed on the user device or isn’t available for the operating system version running on the user device. In this scenario, Generic HDX RealTime provides a valuable fallback solution.

There are two softphone delivery considerations using Citrix Virtual Apps and Desktops:

- How the softphone application is delivered to the virtual/published desktop.
- How the audio is delivered to and from the user headset, microphone, and speakers, or USB telephone set.

Citrix Virtual Apps and Desktops include numerous technologies to support generic softphone delivery:

- Optimized-for-Speech codec for fast encode of the real-time audio and bandwidth efficiency.
- Low latency audio stack.
- Server-side jitter buffer to smooth out the audio when the network latency fluctuates.
- Packet tagging (DSCP and WMM) for Quality of Service.
  - DSCP tagging for RTP packets (Layer 3)
  - WMM tagging for Wi-Fi

The Citrix Workspace app versions for Windows, Linux, Chrome, and Mac also are Voice over Internet Protocol capable. Citrix Workspace app for Windows offers these features:

- Client-side jitter buffer - Ensures smooth audio even when the network latency fluctuates.
- Echo cancellation - Allows for greater variation in the distance between microphone and speakers for workers who do not use a headset.
- Audio plug-n-play - Audio devices do not need to be plugged in before starting a session. They can be plugged in at any time.
- Audio device routing - Users can direct ringtone to speakers but the voice path to their headset.
- Multi-stream ICA - Enables flexible Quality of Service-based routing over the network.
- ICA supports four TCP and two UDP streams. One of the UDP streams supports the real-time audio over RTP.

For a summary of Citrix Workspace app capabilities, see [Citrix Receiver Feature Matrix](#).

**System configuration recommendations**
**Client Hardware and Software:**
For optimal audio quality, we recommend the latest version of Citrix Workspace app and a good quality headset that has acoustic echo cancellation (AEC). Citrix Workspace app versions for Windows, Linux, and Mac support Voice over Internet Protocol. Also, Dell Wyse offers Voice over Internet Protocol support for ThinOS (WTOS).

**CPU Considerations:**
Monitor CPU usage on the VDA to determine if it is necessary to assign two virtual CPUs to each virtual machine. Real-time voice and video are data intensive. Configuring two virtual CPUs reduces the thread switching latency. Therefore, we recommend that you configure two vCPUs in a Citrix Virtual Desktops VDI environment.

Having two virtual CPUs does not necessarily mean doubling the number of physical CPUs, because physical CPUs can be shared across sessions.

Citrix Gateway Protocol (CGP), which is used for the Session Reliability feature, also increases CPU consumption. On high-quality network connections, you can disable this feature to reduce CPU consumption on the VDA. Neither of the preceding steps might be necessary on a powerful server.

**UDP Audio:**
Audio over UDP provides excellent tolerance of network congestion and packet loss. We recommend it instead of TCP when available.

**LAN/WAN configuration:**
Proper configuration of the network is critical for good real-time audio quality. Typically, you must configure virtual LANs (VLANs) because excessive broadcast packets can introduce jitter. IPv6-enabled devices might generate many broadcast packets. If IPv6 support is not needed, you can disable IPv6 on those devices. Configure to support Quality of Service.

**Settings for use WAN connections:**
You can use voice chat over LAN and WAN connections. On a WAN connection, audio quality depends on the latency, packet loss, and jitter on the connection. If delivering softphones to users on a WAN connection, we recommend using the NetScaler SD-WAN between the data center and the remote office. Doing so maintains a high Quality of Service. NetScaler SD-WAN supports Multi-Stream ICA, including UDP. Also, for a single TCP stream, it's possible to distinguish the priorities of various ICA virtual channels to ensure that high priority real-time audio data receives preferential treatment.

Use Director or the **HDX Monitor** to validate your HDX configuration.

**Remote user connections:**
Citrix Gateway supports DTLS to deliver UDP/RTP traffic natively (without encapsulation in TCP).
Open firewalls bidirectionally for UDP traffic over Port 443.

**Codec selection and bandwidth consumption:**
Between the user device and the VDA in the data center, we recommend using the **Optimized-for-**
Speech codec setting, also known as Medium Quality audio. Between the VDA platform and the IP-PBX, the softphone uses whatever codec is configured or negotiated. For example:

- G711 provides good voice quality but has a bandwidth requirement of from 80 kilobits per second through 100 kilobits per second per call (depending on Network Layer 2 overheads).
- G729 provides good voice quality and has a low bandwidth requirement of from 30 kilobits per second through 40 kilobits per second per call (depending on Network Layer 2 overheads).

Delivering softphone applications to the virtual desktop

There are two methods by which you can deliver a softphone to the XenDesktop virtual desktop:

- The application can be installed in the virtual desktop image.
- The application can be streamed to the virtual desktop using Microsoft App-V. This approach has manageability advantages because the virtual desktop image is kept uncluttered. After being streamed to the virtual desktop, the application runs in that environment as if it was installed in the usual manner. Not all applications are compatible with App-V.

Delivering audio to and from the user device

Generic HDX RealTime supports two methods of delivering audio to and from the user device:

- Citrix Audio Virtual Channel. We generally recommend the Citrix Audio Virtual Channel because it’s designed specifically for audio transport.
- Generic USB Redirection. Supports audio devices having buttons or a display (or both), human interface device (HID), if the user device is on a LAN or LAN-like connection back to the Citrix Virtual Apps and Desktops server.

Citrix audio virtual channel

The bidirectional Citrix Audio Virtual Channel (CTXCAM) enables audio to be delivered efficiently over the network. Generic HDX RealTime takes the audio from the user headset or microphone and compresses it. Then, it sends it over ICA to the softphone application on the virtual desktop. Likewise, the audio output of the softphone is compressed and sent in the other direction to the user headset or speakers. This compression is independent of the compression used by the softphone itself (such as G.729 or G.711). It is done using the Optimized-for-Speech codec (Medium Quality). Its characteristics are ideal for Voice over Internet Protocol. It features quick encode time, and it consumes only approximately 56 Kilobits per second of network bandwidth (28 Kbps in each direction), peak. This codec must be explicitly selected in the Studio console because it is not the default audio codec. The default is the HD Audio codec (High Quality). This codec is excellent for high fidelity stereo soundtracks but is slower to encode compared to the Optimized-for-Speech codec.

Generic USB Redirection

Citrix Generic USB Redirection technology (CTXGUSB virtual channel) provides a generic means of remotelying USB devices, including composite devices (audio plus HID) and isochronous USB devices. This
approach is limited to LAN-connected users. This reason being that the USB protocol tends to be sen-
sitive to network latency and requires considerable network bandwidth. Isochronous USB redirection
works well when using some softphones. This redirection provides excellent voice quality and low la-
tency. However, Citrix Audio Virtual Channel is preferred because it is optimized for audio traffic. The
primary exception is when you’re using an audio device with buttons. For example, a USB telephone
attached to the user device that is LAN-connected to the data center. In this case, Generic USB Redi-
tection supports buttons on the phone set or headset that control features by sending a signal back
to the softphone. There isn’t an issue with buttons that work locally on the device.

**Limitation**

**Warning:**

Editing the Registry incorrectly can cause serious problems that might require you to reinstall
your operating system. Citrix cannot guarantee that problems resulting from the incorrect use
of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the
registry before you edit it.

You install an audio device on your client, enable the audio redirection, and start an RDS session. The
audio files might fail to play and an error message appears.

As a workaround, add this registry key on the RDS machine, and then restart the machine:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SCMConfig
```

Name: EnableSvchostMitigationPolicy

Type: REG_DWORD

Data: 0

**Browser content redirection**

September 14, 2020

Browser content redirection prevents the rendering of webpages in the allow list on the VDA side. This
feature uses Citrix Workspace app to instantiate a corresponding rendering engine on the client side,
which fetches the HTTP and HTTPS content from the URL.

**Note:**

You can specify that webpages be redirected to the VDA side (and not redirected on the client
side) by using a block list.

This overlay web layout engine runs on the endpoint device instead of on the VDA and uses the end-
point CPU, GPU, RAM, and Network.
Only the browser viewport is redirected. The viewport is the rectangular area in your browser where content displays. The viewport doesn’t include things like the Address Bar, Favorites Toolbar, Status Bar. Those items are in the user interface, which are still running on the browser in the VDA.

1. Configure a Studio policy that specifies an Access Control List containing the URLs in the allow list for redirection or the block list that disables redirection for specific URL paths. For the browser on the VDA to detect that the URL that the user is navigating to matches the allow list or does not match a block list, a browser extension performs the comparison. The browser extension (BHO) for Internet Explorer 11 is included in the installation media and is installed automatically. For Chrome, the browser extension is available in the Chrome Web Store, and you can deploy it using the Group Policies and ADMX files. Chrome extensions are installed on a per-user basis. Updating a golden image to add or remove an extension is not required.

2. If a match is found in the allow list (for example https://www.mycompany.com/), and there is no match to a URL in the block list (for example https://www.mycompany.com/engineering), a virtual channel (CTXCSB) instructs the Citrix Workspace app that a redirection is required and relays the URL. Citrix Workspace app then instantiates a local rendering engine and displays the website.

3. Citrix Workspace app then blends back the website into the virtual desktop browser content area seamlessly.

The color of the logo specifies the status of the Chrome extension. It is one of these three colors:

- Green: Active and connected.
- Gray: Not active/idle on the current tab.
• Red: Broken/Not working.

You can debug logging by using **Options** in the extensions menu.

Here are scenarios of how the Citrix Workspace app fetches content:

- **Server fetch and server render**: There is no redirection because you didn’t add the site to the allow list or the redirection failed. We fall back to rendering the webpage on the VDA and use Thinwire to remote the graphics. Use policies to control the fallback behavior. High CPU, RAM, and bandwidth consumption on the VDA.

- **Server fetch and client render**: Citrix Workspace app contacts and fetches content from the web server through the VDA using a virtual channel (CTXPFWD). This option is useful when the client doesn’t have internet access (for example, thin clients). Low CPU and RAM consumption on the VDA, but bandwidth is consumed on the ICA virtual channel.

There are three modes of operation for this scenario. The term proxy refers to a proxy device that the VDA accesses to gain Internet access.

Which policy option to choose:

- Explicit Proxy - If you have a single explicit proxy in your Datacenter.
- Direct or Transparent - If you do not have proxies, or if you use transparent proxies.
- PAC files - If you rely on PAC files so browsers in the VDA can automatically choose the appropriate proxy server for fetching a specified URL.
• **Client fetch and client render**: Because the Citrix Workspace app contacts the web server directly, it requires internet access. This scenario offloads all the network, CPU, and RAM usage from your XenApp and XenDesktop Site.

**Redirection scenarios**

**Server Fetch & Server Render**

**Server Fetch & Client Render**

**Client Fetch & Client Render**

**Benefits**
- Better and user experience (Adaptive Bit Rate [ABR])
- Reduced VDA resource usage (CPU/RAM/Io)
- Reduced bandwidth consumption

**Fallback mechanism:**

There might be times when client redirection fails. For example, if the client machine does not have direct internet access, an error response might go back to the VDA. In such cases, the browser on the VDA can then reload and render the page on the server.
You can suppress server rendering of video elements by using the existing Windows media fallback prevention policy. Set this policy to Play all content only on client or Play only client-accessible content on client. These settings block video elements from playing on the server if there are failures in client redirection. This policy takes effect only when you enable browser content redirection and the Access Control List policy contains the URL that falls back. The URL can’t be in the block list policy.

**System Requirements:**

**Windows endpoints:**
- Windows 7, 8.x, or 10
- Citrix Workspace app 1808 or later
- Citrix Receiver for Windows 4.10 or later

**Linux endpoints:**
- Citrix Workspace app 1808 for Linux or later
- Citrix Receiver for Linux 13.9 or later
- Thin client terminals must include WebKitGTK+

**Citrix Virtual Apps and Desktops 7 1808 and XenApp and XenDesktop 7.15 CU5, 7.18, 7.17, 7.16:**
- Browser on the VDA:
  - Google Chrome v66 or higher (Chrome requires Citrix Workspace app 1809 for Windows on the user endpoint, Citrix Virtual Apps and Desktops 7 1808 VDA, and the browser content redirection extension)
  - Internet Explorer 11 and configure these options:
    - Clear Enhanced Protected Mode under: Internet Options > Advanced > Security
    - Check Enable third-party browser extensions under: Internet Options > Advanced > Browsing

**Troubleshooting**

For troubleshooting information, see the Knowledge Center article [https://support.citrix.com/article/CTX230052](https://support.citrix.com/article/CTX230052)

**Browser content redirection Chrome extension**

To use browser content redirection with Chrome, add the browser content redirection extension from the Chrome Web Store. Click Add to Chrome in the Citrix Virtual App and Desktop environment.
Important

The extension is not required on the user’s client machine – only in the VDA.

System requirements

- Chrome v66 or higher
- Browser content redirection extension
- Citrix Virtual Apps and Desktops 7 1808 or higher
- Citrix Workspace app 1809 for Windows or higher

This method works for individual users. To deploy the extension to a large group of users in your organization, deploy the extension using Group Policy.

Deploy the extension using Group Policy

1. Import the Google Chrome ADMX files into your environment. For information about downloading policy templates and installing and configuring the templates into your Group Policy Editor, see https://support.google.com/chrome/a/answer/187202?hl=en.

2. Open your Group Policy Management console and go to User Configuration \ Administrative Templates\Classic Administrative Templates (ADM) \ Google \ Google Chrome \ Extensions. Enable the Configure the list of force-installed apps and extensions setting.
3. Click **Show** and type the following string, which corresponds to the extension ID. Update the URL for the browser content redirection extension.

```
hdppkjifljbdpckfajcmlblbchhledln; https://clients2.google.com/service/update2/crx
```
4. Apply the setting and after a `gpupdate` refresh, the user automatically receives the extension. If you launch the Chrome browser in the user’s session, the extension is already applied and they cannot remove it.

Any updates to the extension are automatically installed on the users’ machines through the update URL that you specified in the setting.

If the Configure the list of force-installed apps and extensions setting is set to Disabled, the extension is automatically removed from Chrome for all users.

Browser content redirection Edge Chromium extension

To install the browser content redirection extension in Edge, make sure you have version `83.0.478.37` or higher of the Edge browser installed.

1. Click the Extensions option in the menu and turn on Allow extensions from other stores.
2. Click the Chrome Web Store link and the extension appears at the bar on the top right. For more info on Microsoft Edge extensions, see Extensions.

![Chrome Web Store](image)

**Browser content redirection and DPI**

**Warning:**

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

When using browser content redirection with the DPI (scaling) set to anything over 100% on the user’s machine, the redirected browser content screen displays incorrectly. To avoid this issue, do not set the DPI when using browser content redirection. Another way to avoid the issue is by disabling browser content redirection GPU acceleration for Chrome by creating the following register key on the user’s machine:

\HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Citrix\HdxMediaStream

**Name:** GPU

**Type:** DWORD

**Data:** 0

**HDX video conferencing and webcam video compression**

August 24, 2020

**Warning:**

Editing the Registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the
Webcams can be used by applications running within the virtual session by using HDX webcam video compression or HDX plug-n-play generic USB redirection. UseCitrix Workspace app > Preferences > Devices to switch between modes.

Citrix recommends you always use HDX webcam video compression if possible. To prevent users from switching from HDX webcam video compression, disable USB device redirection by using the policy settings underICA policy settings > USB Devices policy settings. Citrix Workspace app users can override the default behavior by choosing theDesktop Viewer Mic & Webcam setting Don’t use my microphone or webcam.

**HDX webcam video compression**

HDX webcam video compression is also called Optimized webcam mode. This type of webcam video compression uses the multimedia framework technology that is part of the client operating system to intercept video from capture devices and transcode and compress it. Manufacturers of capture devices supply drivers that plug into the OS kernel streaming architecture.

The client handles communication with the webcam. The client then sends the video only to the server that can display it properly. The server doesn’t deal directly with the webcam, but it’s integrated giving you the same experience in your desktop. Workspace app compresses the video to save bandwidth and provide better resiliency on WAN scenarios.

HDX webcam video compression requires that the following policy settings be enabled (all are enabled by default).

- Multimedia conferencing
- Windows Media Redirection

If a webcam supports hardware encoding, HDX video compression uses the hardware encoding by default. Hardware encoding might consume more bandwidth than software encoding. To force software compression, add the following DWORD key value to the registry key:

HKEY_CURRENT_USER\Software\Citrix\HdxRealTime:
DeepCompress_ForceSWEncode=1

**HDX webcam video compression requirements**

Supported clients: Citrix Workspace app for Windows, Citrix Workspace app for Mac, Citrix Workspace app for Chrome, and Citrix Workspace app for Linux.

**Note:**

Only Citrix Workspace app for Windows, Citrix Workspace app for Chrome, and Citrix Workspace app for Mac 2006 or later support webcam redirection for 64-bit apps.

Supported video conferencing applications (32 bit and 64 bit):

- Adobe Connect
- Cisco Webex and Webex for Teams
- GoToMeeting
- Google Hangouts and Hangouts Meet
- IBM Sametime
- Microsoft Skype for Business 2015
- Microsoft Lync 2010 and 2013
- Microsoft Skype 7 or higher
- Media Foundation-based video applications on Windows 8.x or higher and Windows Server 2012 R2 and higher

To use Skype on a Windows client, edit the registry on the client and the server:

- Client registry key HKEY_CURRENT_USER\Software\Citrix\HdxRealTime
  
  Name: DefaultHeight
  
  Type: REG_DWORD
  
  Data: 240

- Name: DefaultWidth, Type: REG_DWORD
  
  Data: 320

- Server registry key HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Vd3d\Compatibility
  
  Name: skype.exe,
  
  Type: REG_DWORD
  
  Data: Set to 0

Other user device requirements:

- Appropriate hardware to produce sound.
DirectShow-compatible webcam (use the webcam default settings). Webcams that are hardware encoding capable reduces client-side CPU usage.

For HDX webcam video compression, install webcam drivers on the client, obtained from the camera manufacturer, if possible.

**High definition webcam streaming**

The video conferencing application on the server selects the webcam format and resolution based on the supported format types. When a session starts, the client sends the webcam information to the server. Choose a webcam from the application. When the webcam and the application support high definition rendering, the application uses high definition resolution. We support webcam resolutions up to 1920x1080.

This feature requires the Citrix Workspace app for Windows, minimum version 1808 or Citrix Receiver for Windows, minimum version 4.10.

You can use a registry key to disable and enable the feature. The default resolution of 352x288 is used:

HKEY_LOCAL_MACHINE\Software\Citrix\HDXRealTime

Name: Enable_HighDefWebcam

Type: REG_DWORD

Data:

0 = Disable the high definition webcam streaming

1 = Enable the high definition webcam streaming

You can use registry keys on the client to configure a specific resolution. Ensure that the camera supports the specified resolution:

HKEY_CURRENT_USER\Software\Citrix\HDXRealTime

Name: DefaultWidth

Type: REG_DWORD

Data (decimal): desired width (for example 1280)

Name: DefaultHeight

Type: REG_DWORD

Data (decimal): desired height (for example 720)

**HDX plug-n-play generic USB redirection**

HDX plug-n-play generic USB redirection (isochronous) is also called **Generic** webcam mode. The benefit of HDX Plug-n-Play Generic USB Redirection is that you don’t have to install drivers on your
thin client/endpoint. The USB stack is virtualized such that anything you plug into the local client is sent to the remote VM. The remote desktop acts as if you plugged it natively. The Windows desktop handles all the interaction with the hardware and runs through the plug-n-play logic to find the correct drivers. Most webcams work if the drivers exist and can work over ICA. Generic webcam mode uses significantly more bandwidth (many Megabits per second) because you are sending uncompressed video down with USB protocol over the network.

**HTML5 multimedia redirection**

August 21, 2020

HTML5 multimedia redirection extends the multimedia redirection features of HDX MediaStream to include HTML5 audio and video. Because of growth in online distribution of multimedia content, especially to mobile devices, the browser industry has developed more efficient ways to present audio and video.

Flash has been the standard, but it requires a plug-in, doesn’t work on all devices, and has higher battery usage in mobile devices. Companies like YouTube, NetFlix.com, and newer browsers versions of Mozilla, Google, and Microsoft are moving to HTML5 making it the new standard.

HTML5-based multimedia has many advantages over proprietary plug-ins, including:

- Company-independent standards (W3C)
- Simplified digital rights management (DRM) workflow
- Better performance without the security issues raised by plug-ins

**HTTP progressive downloads**

HTTP progressive download is an HTTP-based pseudo-streaming method that supports HTML5. In a progressive download, the browser plays back a single file (encoded at a single quality) while it is being downloaded from an HTTP web server. The video is stored on the drive as it’s received and is played from the drive. If you rewatch the video, the browser can load the video from cache.

For an example of a progressive download, see the [HTML5 video redirection test page](http://example.com). To inspect the video elements in the webpage and find the sources (mp4 container format) in HTML5 video tags, use the developer tools in your browser:

**Comparing HTML5 and Flash**
Citrix Virtual Apps and Desktops 7 2009

</table>

**Requirements**

We support only redirection for progressive downloads in mp4 format. We don't support WebM and Adaptive bitrate streaming technologies like DASH/HLS.

We support the following, and use policies to control them. For more information, see Multimedia policy settings.

- Server side render
- Server fetch client render
- Client side fetching and rendering

Minimum versions of Citrix Workspace app and Citrix Receiver:

- Citrix Workspace app 1808 for Windows
- Citrix Receiver for Windows 4.5
- Citrix Workspace app 1808 for Linux
- Citrix Receiver for Linux 13.5

Components of the HTML5 video redirection solution

- **WebSocket SSL Certificates**
  - For the CA (root): Citrix XenApp/XenDesktop HDX In-Product CA (C = US; S = Florida; L = Fort Lauderdale; O = Citrix Systems, Inc.; OU = XenApp/XenDesktop Engineering; CN = Citrix XenApp/XenDesktop HDX In-Product CA)
  - Location: Certificates (Local Computer) > Trusted Root Certification Authorities > Certificates.
  - For the end-entity (leaf): Citrix XenApp/XenDesktop HDX Service (C = US; S = Florida; L = Fort Lauderdale; O = Citrix Systems, Inc.; OU = XenApp/XenDesktop Engineering; CN = Citrix XenApp/XenDesktop HDX Service)
  - Location: Certificates (Local Computer) > Personal > Certificates.
- **WebSocketService.exe** - Runs on the local system and performs SSL termination and user session mapping. TLS Secure WebSocket listening on 127.0.0.1 port 9001.
- **WebSocketAgent.exe** - Runs on the user session and renders the video as instructed from WebSocketService commands.

How do I enable HTML5 video redirection?

In this release, this feature is available for controlled webpages only. It requires the addition of the HdxVideo.js JavaScript (included in the Citrix Virtual Apps and Desktops Installation media) to the webpages where the HTML5 multimedia content is available. For example, videos on an internal training site.

Websites like youtube.com, which are based on Adaptive Bitrate technologies (for example, HTTP Live Streaming (HLS) and Dynamic Adaptive Streaming over HTTP (DASH)), are not supported.

For more information, see [Multimedia policy settings](#).

Troubleshooting Tips

Errors might occur when the webpage tries to run HdxVideo.js. If the JavaScript fails to load, the HTML5 redirection mechanism fails. Ensure that there are no errors related to HdxVideo.js by inspect-
Optimization for Microsoft Teams

October 5, 2020

**Important:**

The WebRTC media engine in Workspace app for Windows 2009.6 is and Linux 2009 renamed from HdxTeams.exe to HdxRtcEngine.exe

Citrix delivers optimization for desktop-based Microsoft Teams (1.2.00.31357 or higher) using Citrix Virtual Apps and Desktops and Citrix Workspace app. By default, we bundle all the necessary components into the Citrix Workspace app and the Virtual Delivery Agent (VDA).

Our optimization for Microsoft Teams contains VDA-side HDX services and API to interface with the Microsoft Teams hosted app to receive commands. These components open a control virtual channel (CTXMTOP) to the Citrix Workspace app-side media engine. The endpoint decodes and renders the multimedia locally. Reverse seamless snaps-in the local Citrix Workspace app window back into the hosted Microsoft Teams app.

Authentication and signaling occurs natively on the Microsoft Teams-hosted app, just like the other Microsoft Teams services (for example chat or collaboration). Audio/video redirection doesn’t affect them.

**CTXMTOP** is a command and control virtual channel. That means that media is not exchanged between the Citrix Workspace app and the VDA.

Only Client-fetch/client-render is available.

This video demo gives you an idea of how Microsoft Teams works in a Citrix virtual environment.
Microsoft Teams installation

Note:

We recommend installing the VDA before installing Teams in the golden image. This installation order is necessary for the ALLUSER=1 flag to take effect. If the virtual machine had Teams installed before the VDA was installed, uninstall and reinstall Teams. If you are using App Layering, see the App Layering instructions at the end of this section for more details.

We recommend you follow the Microsoft Teams machine-wide installation guidelines and avoid using the .exe installer that installs Teams in AppData. Instead, install in C:\Program Files (x86)\Microsoft\Teams by using the ALLUSER=1 flag from the command line.

msiexec /i <path_to_msi> /l*v <install_logfile_name> ALLUSER=1 ALLUSERS=1

This example also uses the ALLUSERS=1 parameter. When you set this parameter, the Teams Machine-Wide Installer appears in Programs and Features in the Control Panel and in Apps & features in Windows Settings for all users of the computer. All users can then uninstall Teams if they have administrator credentials. It’s important to understand the difference between ALLUSERS=1 and ALLUSER=1. You can use the ALLUSERS=1 parameter in non-VDI and VDI environments. Use the ALLUSER=1 parameter only in VDI environments to specify a per-machine installation.

In ALLUSER=1 mode, the Teams application doesn’t auto-update whenever there is a new version. We recommend this mode for non-persistent environments. For example, hosted shared apps or desktops out of a Windows Server or Windows 10 random/pooled catalogs. For more information, see Install Microsoft Teams using MSI (VDI Installation section).

You have Windows 10 dedicated persistent VDI environments. You want the Teams application to auto-
update and would prefer Teams to install per-user under Appdata/Local, use the .exe installer or the MSI without ALLUSER=1.

For App Layering:

Warning:

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Create an empty registry key named PortICA (leave the default Name, Type, and Data).

If using Citrix App Layering to manage VDA and Microsoft Teams installations in different layers, deploy this registry key on Windows before installing Teams with ALLUSER=1:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix

Or

HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Citrix

Profile Management recommendations

We recommend using the machine-wide installer for Windows Server and Pooled VDI Windows 10 environments.

When the ALLUSER=1 flag is passed to the MSI from the command line (the machine-wide installer), the Teams app installs under C:\Program Files (x86) (~300 MB). The app uses AppData\Local\Microsoft\TeamsMeetingAddin for logs and AppData\Roaming\Microsoft\Teams (~600–700 MB) for user specific configurations, caching of elements in the user interface, and so forth.

Machine wide installer

The following is an example of folders, desktop shortcuts, and registries created by installing Teams machine-wide installer on a Windows Server 2016 64-bit VM:

Folder:

- C:\Program Files (x86)\Microsoft\Teams
- C:\Users\<username>\AppData\Roaming\Microsoft\Teams

Desktop Shortcut:

C:\Program Files (x86)\Microsoft\Teams\current\Teams.exe

Registry:
Citrix Virtual Apps and Desktops 7 2009

- HKEY_LOCAL_MACHINE \SOFTWARE\WOW6432Node\Microsoft\Windows\CurrentVersion\Run
- HKEY_LOCAL_MACHINE \SOFTWARE\Microsoft\Windows\CurrentVersion\Run
- HKEY_CURRENT_USER \SOFTWARE\Microsoft\Windows\CurrentVersion\Run

Recommendations

- We recommend disabling auto-start by deleting the Teams registry keys. Doing so prevents “8AM logon storms” from spiking up the VM’s CPU.
- If the Virtual Desktop does not have a GPU/vGPU, we recommend setting Disable GPU hardware acceleration in the Teams Settings to improve performance. This setting ("disableGpu": true) is stored in %Appdata%\Microsoft\Teams inside the desktop-config.json file. You can use a logon script to edit that file and set the value to true.
- If using Citrix Workspace Environment Management (WEM), enable CPU Spikes Protection to manage processor consumption for Teams.

Important:
If you don’t pass the ALLUSER=1 flag, the MSI places the Teams.exe installer and setup.json under C:\Program Files (x86)\Teams Installer.
A registry key (TeamsMachineInstaller) is added under:
HKEY_LOCAL_MACHINE \SOFTWARE\WOW6432Node\Microsoft\Windows\CurrentVersion\Run
A subsequent user logon triggers the final installation in AppData instead.

Per-user installer

When using the .exe installer, the installation process changes significantly, and all the files are placed in AppData.

Folder:
- C:\Users\<username>\AppData\Local\Microsoft\Teams
- C:\Users\<username>\AppData\Local\Microsoft\TeamsMeetingAddin
- C:\Users\<username>\AppData\Local\SquirrelTemp
- C:\Users\<username>\AppData\Roaming\Microsoft\Teams

Desktop Shortcut:
C:\Users\<username>\AppData\Local\Microsoft\Teams\Update.exe --processStart "Teams.exe"

Registry:
HKEY_CURRENT_USER \SOFTWARE\Microsoft\Windows\CurrentVersion\Run
Best Practices

The best practice recommendations are based on the use case scenarios. Using Teams with a non-persistent setup requires a profile caching manager for efficient Teams runtime data synchronization. Having a profile caching manager ensures that the appropriate user-specific information (for example, user data, profile, and settings) is cached during the user session. Make sure you synchronize the data in these two folders:

- `C:\Users\<username>\AppData\Local\Microsoft\IdentityCache`
- `C:\Users\<username>\AppData\Roaming\Microsoft\Teams`

Teams cached content exclusion list for non-persistent setup:

Exclude the following items from the Teams caching folder, `%AppData%/Microsoft/Teams`. Excluding these items helps reduce the user caching size to further optimize your non-persistent setup.

Exclusion list – directories

- `Roaming\Microsoft Teams\Logs`
- `Roaming\Microsoft\Teams*.txt`
- `Roaming\Microsoft\Teams\media-stack`
- `Roaming\Microsoft\Teams\Service Worker\CacheStorage`
- `Roaming\Microsoft\Teams\Application Cache`
- `Roaming\Microsoft\Teams\Cache`
- `Roaming\Microsoft\Teams\GPUCache`
- `Roaming\Microsoft\Teams\meeting-addin\Cache` (Critical for issues where the Add-in is missing in Outlook)

Use case: single session scenario:

In this scenario, the end user uses Microsoft Teams in one location at a time. There is no need to run Teams in two different Windows sessions simultaneously. For instance, in a common virtual desktop deployment, each user is assigned to one desktop, Teams is deployed inside the virtual desktop as one application.

We recommend enabling the Citrix Profile container and redirect the previously mentioned per-user directories into the container.

1. Deploy the Microsoft Teams machine wide installer (`ALLUSER=1`) in the golden image.
2. Enable Citrix Profile Management and set up the user profile store with the proper permissions.
3. Enable the following Profile Management policy setting: **File system > Synchronization > Profile container** – **List of folders to be contained in profile disk**.
List all the previously mentioned folders into this configuration. Alternatively, you can also configure these settings using the Citrix Workspace Environment Management (WEM) service.

4. Apply the settings to the correct Delivery Group.

5. Log in to validate the deployment.

System requirements

Minimum recommended version - Delivery Controller (DDCs) 1906.2 (If you’re using an earlier version, see Enable optimization of Microsoft Teams):

Supported operating systems:

- Windows Server 2019, 2016, 2012R2 Standard and Datacenter Editions, and with the Server Core option

Minimum version - Virtual Delivery Agents (VDAs) 1906.2:
Supported operating systems:

- Windows 10 64-bit, versions 1607 and higher.

Requirements:

- BCR_x64.msi - the MSI that contains the Microsoft Teams optimization code and starts automatically from the GUI. If you’re using the command line interface for the VDA installation, don’t exclude it.

**Recommended version – Citrix Workspace app for Windows latest CR and Minimum version - Citrix Workspace app 1907 for Windows:**

- Windows 8 and 10 (32-bit and 64-bit editions, including Embedded editions) (Support for Windows 7 has been stopped from Version 2006 onwards)
- Windows 10 IoT Enterprise 2016 LTSC (v1607) and 2019 LTSC (v1809)
- Processor (CPU) architectures supported: x86 and x64 (ARM is not supported)
- Endpoint requirement: Approximately 2.2–2.4 GHz dual core CPU that can support 720p HD resolution during a peer-to-peer video conference call.
- Dual or quad-core CPUs with lower base speeds (~1.5 GHz) equipped with Intel Turbo Boost or AMD Turbo Core that can boost up to at least 2.4 GHz.
- HP Thin Clients verified: t630/t640, t730/t740, mt44/mt45.
- Dell Thin Clients verified: 5070, 5470 Mobile TC.
- 10ZiG Thin Clients verified: 4510 and 5810q.
- For a complete list of verified endpoints, see Thin Clients.
- Citrix Workspace app requires a minimum of 600 MB free disk space and 1 GB RAM.
- Microsoft .NET Framework minimum requirement is version 4.6.2. Citrix Workspace app automatically downloads and installs .NET Framework if it is not present in the system.

**Minimum version - Citrix Workspace app 2006 for Linux:**

For more information, see Optimization for Microsoft Teams in What’s new in 2006.

Software:

- GStreamer 1.0 or later or Cairo 2
- libc++-9.0 or later
- libgd3 3.22 or later
- OpenSSL 1.1.1d
- x64 Linux distribution

Hardware:

- Minimum 1.8 GHz dual-core CPU that can support 720p HD resolution during a peer-to-peer video conference call.
• Dual or quad-core CPU with a base speed of 1.8 GHz and a high Intel Turbo Boost speed of at least 2.9 GHz.
• For a complete list of verified endpoints, see Thin Clients.

For more information, see Prerequisites to install Citrix Workspace app.

You can disable Teams optimization updating the value of field VDWEBRTC to Off in file /opt/Citrix/ICAClient/config/module.ini
The default is VDWEBRTC=On. After performing the update, restart the Session. (Root permission is required).

Minimum version - Citrix Workspace app 2009 for Mac (Preview):

Supported operating systems
• macOS Catalina (10.15)
• Big Sur Beta 8 in test environments only. Do not use in production environments.

Features supported:
• Audio
• Video
• Incoming screensharing optimization

Outgoing screensharing is not currently supported, so the screensharing button is not visible.

Note that Teams optimization works by default if the user has Citrix Workspace app 2009 and macOS 10.15.

If you want to disable Teams optimization, run this command in terminal and restart Workspace app:

defaults write com.citrix.receiver.nomas mtopEnabled -bool NO

Enable optimization of Microsoft Teams

To enable optimization for Microsoft Teams, use the Studio policy described in Microsoft Teams redirection policy (it is ON by default). In addition to this policy being enabled, HDX checks to verify that the version of the Citrix Workspace app is equal to or greater than the minimum required version. If you enabled the policy and the Citrix Workspace app version is supported, the HKEY_CURRENT_USER\Software\Citrix\HDXMediaStream\MSTeamsRedirSupport registry key is set to 1 automatically on the VDA. The Microsoft Teams application reads the key to load in VDI mode.

Note:
If you are using version 1906.2 VDAs or higher with older Controller versions (for example, version 7.15), which do not have the policy available in Studio, you can still be optimized because HDX optimization for Microsoft Teams is enabled by default in the VDA.

If you click About > Version, the Citrix HDX Optimized legend displays:
If you see **Citrix HDX Not Connected** instead, the Citrix API is loaded in Teams (which is the first step towards redirection), but there was an error in the subsequent parts of the stack. The error is most likely in the VDA services or the Citrix Workspace app).

If you don’t see any legend, Teams failed to load the Citrix API. Exit Teams by right-clicking on the notification area icon and restart. Make sure the Studio policy is not set to **Prohibited**, and that the Citrix Workspace app version is supported.

### Network requirements

Microsoft Teams relies on Media Processor servers in Office 365 for meetings or multiparty calls. Microsoft Teams relies on Office 365 Transport Relays for these scenarios:

- Two peers in a point-to-point call do not have direct connectivity
- A participant does not have direct connectivity to the media processor.

Therefore, the network health between the peer and the Office 365 cloud determines the performance of the call.

We recommend evaluating your environment to identify any risks and requirements that can influence your overall cloud voice and video deployment.

Use the [Skype for Business Network Assessment Tool](#) to test if your network is ready for Microsoft Teams. For support information, see Support.

### Summary of key network recommendations for Real Time Protocol (RTP) traffic:

- Connect to the Office 365 network as directly as possible from the branch office.
- If you must use any of the following at the branch office, ensure that RTP/UDP Teams traffic is unhindered. Workspace app WebRTC media engine doesn’t honor explicit proxies (or pac files) configured on the endpoint.
  - Bypass proxy servers
  - Network SSL intercept
  - Deep packet inspection devices
  - VPN hairpins (use split tunneling if possible)
- Plan and provide sufficient bandwidth.
- Check each branch office for network connectivity and quality.
The WebRTC media engine in the Workspace app (HdxTeams.exe or HdxRtcEngine.exe) uses the Secure Real-time Transport Protocol (SRTP) for multimedia streams that are offloaded to the client. SRTP provides confidentiality and authentication to RTP by using symmetric keys (128 bit) to encrypt media and control messages, and uses the AES encryption cipher in counter mode.

The following metrics are recommended for guaranteeing a positive user experience:

<table>
<thead>
<tr>
<th>Metric</th>
<th>Endpoint to Office 365</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latency (one way)</td>
<td>&lt; 50 msec</td>
</tr>
<tr>
<td>Latency (RTT)</td>
<td>&lt; 100 msec</td>
</tr>
<tr>
<td>Packet Loss</td>
<td>&lt; 1% during any 15s interval</td>
</tr>
<tr>
<td>Packet inter-arrival jitter</td>
<td>&lt; 30ms during any 15s interval</td>
</tr>
</tbody>
</table>

For more information, see [Prepare your organization’s network for Microsoft Teams](#).

In terms of bandwidth requirements, optimization for Microsoft Teams can use a wide variety of codecs for audio (OPUS/G.722/PCM G711) and video (H264/VP9).

The peers negotiate these codecs during the call establishment process using the Session Description Protocol (SDP) Offer/Answer.

Citrix minimum recommendations are:

<table>
<thead>
<tr>
<th>Type</th>
<th>Bandwidth</th>
<th>Codec</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audio (each way)</td>
<td>~ 90 kbps</td>
<td>G.722</td>
</tr>
<tr>
<td>Audio (each way)</td>
<td>~ 60 kbps</td>
<td>Opus*</td>
</tr>
<tr>
<td>Video (each way)</td>
<td>~ 700 kbps</td>
<td>H264 360p @ 30 fps 16:9</td>
</tr>
<tr>
<td>Video (each way)</td>
<td>~ 2,500 kbps</td>
<td>VP9 720p @ 30 fps 16:9</td>
</tr>
<tr>
<td>Screen sharing</td>
<td>~ 300 kbps</td>
<td>H264 1080p @ 15 fps</td>
</tr>
</tbody>
</table>

* Opus supports constant and variable bitrate encoding from 6 kbps up to 510 kbps.

Opus and VP9 are the preferred codecs for peer-to-peer calls between two optimized VDI users. G.722 and H264 are the preferred codecs for a VDI user joining a meeting.
Call establishment and media flow paths

When possible, the HDX WebRTC media engine in the Citrix Workspace app (HdxTeams.exe or HdxRtccEngine.exe) tries to establish a direct network Secure Real-time Transport Protocol (SRTP) connection over User Datagram Protocol (UDP) in a peer-to-peer call. If the UDP ports are blocked, the media engine falls back to TCP 443.

The HDX media engine supports ICE, Session Traversal Utilities for NAT (STUN), and Traversal Using Relays around NAT (TURN) for candidate discovery and connection establishment.

If there is no direct path between the two peers or between a peer and a conference server (if the user is joining a multi-party call or meeting), the media engine uses a Microsoft Teams transport relay server in Office 365 to reach the other peer or the media processor (where meetings are hosted). The user’s client machine must have access to two Office 365 subnet IP address ranges and 4 UDP ports. For more information, see the Architecture diagram in the “Call setup” section further down and Office 365 URLs and IP address ranges ID 11.

<table>
<thead>
<tr>
<th>ID</th>
<th>Category</th>
<th>Addresses</th>
<th>Destination Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>Optimize required</td>
<td>13.107.64.0/18,</td>
<td><strong>UDP</strong>: 3478, 3479,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>52.112.0.0/14,</td>
<td>3480, 3481, <strong>TCP</strong>: 443</td>
</tr>
<tr>
<td></td>
<td></td>
<td>52.120.0.0/14</td>
<td>(fallback)</td>
</tr>
</tbody>
</table>

These ranges contain both Transport Relays and media processors. The Teams Transport Relays provide STUN and TURN functionality, but they are not ICE endpoints. Also, the Teams Transport Relays do not terminate media nor perform any transcoding. They can bridge TCP (if media engine uses TCP) to UDP when they forward traffic to other peers or media processors.

Workspace app WebRTC media engine contacts the closest Microsoft Teams Transport Relay in the Office 365 cloud. The media engine uses anycast IP and port 3478–3481 UDP (different UDP ports per workload, though multiplexing can happen) or 443 TCP TLSv1.2 for fallbacks. Call quality depends on the underlying network protocol. Because UDP is always recommended over TCP, we advise you to design your networks to accommodate UDP traffic in the branch office.

If Teams loaded in optimized mode and Workspace app WebRTC media engine is running on the endpoint, Interactive Connectivity Establishment (ICE) failures might cause a call setup failure or one-way-only audio/video. When a call cannot be completed or media streams are not full duplex, check the **Wireshark trace** on the endpoint first. For more information about the ICE candidate gathering process, see “Collecting logs” in the Support section.
Note:
If the endpoints don’t have internet access, it might still be possible for the user to make a peer-to-peer call only if they are on the same LAN. Meetings fail. In this case, there is a 30 second timeout before the call setup begins.

Call setup

Use this architecture diagram as a visual reference for the call flow sequence. The corresponding steps are indicated in the diagram.

Architecture:
1. Launch Microsoft Teams.

2. Teams authenticates to O365. Tenant policies are pushed down to the Teams client, and relevant TURN and signaling channel information is relayed to the app.

3. Teams detects that it is running in a VDA and makes API calls to the Citrix JavaScript API.

4. Citrix JavaScript in Teams opens a secure WebSocket connection to WebSocketService.exe running on the VDA (127.0.0.1:9002), which spawns WebSocketAgent.exe inside the user session.

5. WebSocketAgent.exe instantiates a generic virtual channel by calling into the Citrix HDX Teams Redirection Service (CtxSvcHost.exe).
6. Citrix Workspace app’s wfica32.exe (HDX engine) spawns a new process called HdxTeams.exe or HdxRtcEngine.exe, which is the new WebRTC engine used for Teams optimization.

7. Citrix media engine and Teams.exe have a 2-way virtual channel path and can start processing multimedia requests.

—–User calls—–

8. **Peer A** clicks the **call** button. Teams.exe communicates with the Teams services in Office 365 establishing an end-to-end signaling path with **Peer B**. Teams asks the Citrix Workspace app media engine for a series of supported call parameters (codecs, resolutions, and so forth, which is known as a Session Description Protocol (SDP) offer). These call parameters are then relayed using the signaling path to the Teams services in Office 365 and from there to the other peer.

9. The SDP offer/answer (single-pass negotiation) takes place through the signaling channel, and the ICE connectivity checks (NAT and Firewall traversal using Session Traversal Utilities for NAT (STUN) bind requests) complete. Then, Secure Real-time Transport Protocol (SRTP) media flows directly between HdxTeams.exe and the other peer (or Office 365 conference servers if it is a meeting).

**Microsoft Phone System**

Phone System is Microsoft’s technology that enables call control and PBX capabilities in the Office 365 cloud with Microsoft Teams. Optimization for Microsoft Teams supports Phone System, using Office 365 Calling Plans or Direct Routing. With Direct Routing, you connect your own supported session border controller to the Microsoft Phone System directly without any additional on-premises software.

**Firewall considerations**

When users initiate an optimized call using the Microsoft Teams client for the first time, they might notice a warning with the **Windows firewall** settings. The warning asks for users to allow communication for HdxTeams.exe or HdxRtcEngine.exe (HDX Overlay Teams).
The following four entries are added under **Inbound Rules** in the **Windows Defender Firewall > Advanced Security** console. You can apply more restrictive rules if desired.

---

**Microsoft Teams and Skype for Business Coexistence**

You can deploy Microsoft Teams and Skype for Business side by side, as two separate solutions with overlapping capabilities.

For more information, see [Understand Microsoft Teams and Skype for Business coexistence and interoperability](#).

Citrix RealTime Optimization Pack and HDX optimization for Teams multimedia engines then honor whatever configuration is set in your environment (for example, island modes, Skype for Business with Teams collaboration, Skype for Business with Teams collaboration and meetings).

Peripheral access can be granted only to a single application at the time. For example, webcam access by the RealTime Media Engine during a call locks the imaging device during a call. When the device is released, it becomes available for Teams.

---

**Deployment Strategies: Skype and Teams Coexistence**

![Diagram showing deployment strategies for Skype and Teams coexistence](image_url)
Optimal audio and video quality require a network connection to the Office 365 cloud that has low latency, low jitter, and low packet loss. Backhauling of Microsoft Teams audio-video RTP traffic from Citrix Workspace app users at branch office locations to a data center before going to the internet can add excessive latency and might also cause congestion on WAN links. Citrix SD-WAN optimizes connectivity for Microsoft Teams following Microsoft Office 365 network connectivity principles. Citrix SD-WAN uses the Microsoft REST-based Office 365 IP address and web service and proximate DNS to identify, categorize, and steer Microsoft Teams traffic.

Business broadband internet connections in many areas suffer from intermittent packet loss, periods of excessive jitter, and outages.

Citrix SD-WAN offers two solutions to preserve Microsoft Teams audio-video quality when network health is variable or degraded.

- If you use Microsoft Azure, a Citrix SD-WAN virtual appliance (VPX) deployed in the Azure VNET provides advanced connectivity optimizations. These optimizations include seamless link failover and audio packet racing.
- Alternatively, Citrix SD-WAN customers can connect to Office 365 through the Citrix Cloud Direct service. This service provides reliable and secure delivery for all internet-bound traffic.

If the quality of the branch office internet connection is not a concern, it might be sufficient to minimize latency by steering Microsoft Teams traffic directly from the Citrix SD-WAN branch appliance to the nearest Office 365 front door. For more information, see Citrix SD-WAN Office 365 optimization.
**Gallery view and active speakers in Microsoft Teams**

Only a single incoming video stream is supported in meetings or group calls. When there are multiple participants sending their video, only the dominant speaker’s video is shown at any time. There might be one- or two-seconds delay between the time a speaker is detected as active and the time the video feed displays.

**Screen sharing in Microsoft Teams**

Microsoft Teams relies on video-based screen sharing (VBSS), effectively encoding the desktop being shared with video codecs like H264 and creating a high-definition stream. With HDX optimization, incoming screen sharing is treated as a video stream. Therefore, if you are in the middle of a video call and the other peer starts to share the desktop, that original camera video feed is paused. Instead, the screen sharing video feed displays. The peer must then manually resume the camera sharing.

Outgoing screen sharing is also optimized and offloaded to Citrix Workspace app (version 1907 or higher). In this case, the media engine captures and transmits only the Citrix Desktop Viewer (CD-Viewer.exe) window. If you want to share a local application running in your client machine, you can overlay it on top of CDViewer and it is also captured.

Citrix Workspace app 2009.6 for Windows does native bitmap capturing of the window, so no overlapping window is captured.

Multi-monitor: In cases where CDViewer is in full screen mode and spanning across multi-monitor setups, only the primary monitor is shared. Users must drag the application of interest inside the virtual desktop to the primary monitor for the other peer on the call to see it.

---

**Note:**

If you are publishing Teams as a stand-alone seamless application, screen sharing captures the local desktop of your physical endpoint in Citrix Workspace app minimum version 1909.
**Peripherals in Microsoft Teams**

When optimization for Microsoft Teams is active, the Citrix Workspace app accesses the peripherals (headset, microphone, cameras, speakers, and so forth). Then the peripherals are properly enumerated in the Microsoft Teams UI (**Settings > Devices**).

Microsoft Teams does not access the devices directly. Instead, it relies on Workspace app WebRTC media engine for acquiring, capturing, and processing the media. Microsoft Teams lists the devices for the user to select.

**Recommendations:**

- **Microsoft Teams certified headsets** with built-in echo cancellation. In setups with multiple peripherals, where microphone and speakers are on separate devices an echo might be present. For example, a webcam with a built-in microphone, and a monitor with speakers. When using external speakers, place them as far as possible from the microphone and from any surface that might refract the sound into the microphone.
- **Microsoft Teams certified cameras**, although Skype for Business certified peripherals are compatible with Microsoft Teams.
- **Citrix Workspace app media engine** cannot take advantage of CPU offloading with webcams that perform on-board H.264 encoding -UVC 1.1 and 1.5.

**Note:**

Workspace app 2009.6 for Windows can now acquire peripherals with audio formats with 24-bit or with frequencies above 96kHz.

HdxTeams.exe (in Workspace app for Windows 2009 or older) supports only these specific audio device formats (channels, bit depth, and sample rate):

- **Playback Devices**: up to 2 channels, 16 bit, frequencies up to 96,000 Hz
Recording Devices: up to 4 channels, 16 bit, frequencies up to 96,000 Hz

Even if one speaker or microphone does not match the expected settings, device enumeration in Teams fails and None displays under Settings > Devices.

Webrpc logs in HdxTeams.exe show this type of information:

Mar 27 20:58:22.885 webrtcapi.WebRTCEngine Info: init. initializing...
Mar 27 20:58:23.190 webrtcapi.WebRTCEngine Error: init. couldn't create audio module!

As a workaround, open the Sound Control Panel (mmsys.cpl), select the playback or recording device, go to Properties > Advanced and change the settings to a supported mode. Alternatively, disable the specific device.

Fallback mode

If Microsoft Teams fails to load in optimized VDI mode (“Citrix HDX Not Connected” in Teams/About/Version), the VDA falls back to legacy HDX technologies like Webcam redirection and client audio and microphone redirection. Note that if you are using a Workspace app version/platform OS that does not support Teams optimization, fallback registry keys do not apply.

In fallback mode, the peripherals are mapped to the VDA. The peripherals appear to the Microsoft Teams app as if they were locally attached to the virtual desktop.

You can now granularly control the fallback mechanism by setting one of the following registry DWORD values in the VDA:

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Teams\DisableFallback
HKEY_CURRENT_USER\SOFTWARE\Microsoft\Office\Teams\DisableFallback

To disable fallback mode, set the value to 1. To enable audio only, set the value to 2. If the value isn’t present or is set to 0, fallback mode is enabled. This feature requires Teams version 1.3.0.13565 or later.

To determine if you are in optimized or unoptimized mode when looking at the Settings > Devices tab in Teams, the most significant difference is the camera name. If Microsoft Teams loaded in unoptimized mode, legacy HDX technologies launch. The webcam name has the Citrix HDX suffix as shown in the following graphic. The speaker and microphone device names might be slightly different (or truncated) when compared to the optimized mode.
When legacy HDX technologies are used, Microsoft Teams doesn’t offload audio, video, and screen sharing processing to the endpoint's Citrix Workspace app WebRTC media engine. Instead, HDX technologies use server-side rendering. Expect high CPU consumption on the VDA when you turn on video. Real time audio performance might not be optimal.

**Known limitations**

<table>

## Monitor, troubleshoot, and support Microsoft Teams

October 5, 2020

### Monitor Teams

This section provides guidelines for monitoring Microsoft Teams optimization with HDX.

If the user is running in optimized mode and `HdxTeams.exe` or `HdxRtcEngine.exe` is running on the client machine, there is a process on the VDA called `WebSocketAgent.exe` running in the session. Use the **Activity Manager** in Director to see the application.
With the VDA minimum version 1912, you can monitor active Teams calls using the Citrix HDX Monitor (minimum version 3.11). The Citrix Virtual Apps and Desktops product ISO contains the latest hdxmonitor.msi in the folder layout\image-full\Support\HDX Monitor.

For more information, see Monitoring in the Knowledge Center article CTX253754.

Troubleshoot

This section provides troubleshooting tips for issues that you might encounter when using optimization for Microsoft Teams. For more information, see CTX253754.

On the Virtual Delivery Agent

There are four services installed by BCR_x64.msi. Only two are responsible for Microsoft Teams redirection in the VDA.

- **Citrix HDX Teams Redirection Service** establishes the virtual channel used in Microsoft Teams. The service relies on CtxSvcHost.exe.

- **Citrix HDX HTML5 Video Redirection Service** runs as WebSocketService.exe listening on 127.0.0.1:9002 TCP. WebSocketService.exe performs two main functions:
i. **TLS termination for secure WebSockets** receives a secure WebSocket connection from vdiCitrixPeerConnection.js, which is a component inside the Microsoft Teams app. You can track it with the Process Monitor. For more information about certificates, see the section “TLS and HTML5 video redirection, and browser content redirection” under **Communication between Controller and VDA**.

Some antivirus and desktop security software interferes with the proper functioning of WebSocketService.exe and its certificates. While the Citrix HDX HTML5 Video Redirection service might be running in the services.msc console, the localhost 127.0.0.1:9002 TCP socket is never in listening mode as seen in netstat. Trying to restart the service causes it to hang ("Stopping..."). Ensure you apply the proper exclusions for the WebSocketService.exe process.

ii. **User session mapping.** When the Microsoft Teams application starts, WebSocketService.exe starts the WebSocketAgent.exe process in the user’s session in the VDA. WebSocketService.exe runs in Session 0 as a LocalSystem account.

You can use **netstat** to check if the WebSocketService.exe service is in an active listening state in the VDA.

Run `netstat -anob -p tcp` from an elevated command prompt window:

![Netstat Output](image)

On a successful connection, the state changes to ESTABLISHED:

![Established States](image)

**Important:**

WebSocketService.exe listens in two TCP sockets, 127.0.0.1:9001 and 127.0.0.1:9002. Port 9001 is used for browser content redirection and HTML5 video redirection. Port 9002 is used for Microsoft Teams redirection. Ensure that you don’t have any proxy configurations in the Windows
OS of the VDA that can prevent a direct communication between Teams.exe and WebSocketService.exe. Sometimes, when you configure an explicit proxy in Internet Explorer 11 (Internet Options > Connections > LAN settings > Proxy Server), connections might flow through an assigned proxy server. Verify that Bypass proxy server for local addresses is checked when using a manual and explicit proxy setting.

Services locations and descriptions

</tbody>
</table>
Citrix Workspace app

On the user’s endpoint, the Citrix Workspace app for Windows instantiates a new service called HdxTeams.exe or HdxRtcEngine.exe. It does so when Microsoft Teams launches in the VDA and the user tries to call or access peripherals in self-preview. If you don’t see this service, check the following:

1. Ensure that you installed as a minimum the Workspace App version 1905 for Windows. Do you see HdxTeams.exe or HdxRtcEngine.exe and the webrpc.dll binaries in the Workspace app installation path?
2. If you validated step 1, do the following to check if HdxTeams.exe or HdxRtcEngine.exe is getting launched.
   a) Exit Microsoft Teams on the VDA.
   b) Start services.msc on VDA.
   c) Stop the Citrix HDX Teams Redirection Service.
   d) Disconnect the ICA session.
   e) Connect the ICA session.
   f) Start the Citrix HDX Teams Redirection Service.
   g) Restart the Citrix HDX HTML5 Video Redirection Service.
   h) Launch Microsoft Teams on the VDA.
3. If you still don’t see HdxTeams.exe or HdxRtcEngine.exe being launched on the client endpoint, do the following:
   a) Restart the VDA.
   b) Restart the client endpoint.

Support

Citrix and Microsoft jointly support the delivery of Microsoft Teams from Citrix Virtual Apps and Desktops using optimization for Microsoft Teams. This joint support is the result of close collaboration between the two companies. If you have valid support contracts and you experience an issue with this solution, open a support ticket with the vendor whose code you suspect to be causing the issue. That is, Microsoft for Teams or Citrix for the optimization components.

Citrix or Microsoft receives the ticket, triages the issue, and escalates as appropriate. There is no need for you to contact each company’s support team.

When you have a problem, we recommend you click Help > Report a Problem in the Teams UI. VDA-side logs are automatically shared between Citrix and Microsoft to resolve technical issues faster.

Collecting logs

HDXTeams.exe logs can be found on the user’s machine at %TEMP% inside the HDXTeams folder (AppData/Local/Temp/HDXTeams or AppData/Local/Temp/HdxRtcEngine). Look for a .txt file called we-
When establishing a call, these four ICE phases are required:

- Candidate gathering
- Candidate exchange
- Connectivity checks (STUN bind requests)
- Candidate promotion

In the HdxTeams.exe/HdxRtcEngine.exe logs, the following entries are the relevant Interactive Connectivity Establishment (ICE) entries. These entries must be there for a call set-up to succeed (see this sample snippet for the gathering stage):

```
1  RPCStubs Info: -> device id = \?\display#int3470#4&1835d135&0&uid13424#
2  65e8773d-8f56-11d0-a3b9-00a0c9223196 }
3  \{
4  bf89b5a5-61f7-4127-a279-e187013d7caf }
5  label = Microsoft Camera Front groupId =
6  
7  webrtcapi.RTCConnection Info: createOffer. audio = 1 video = 1
8  webrtcapi.RTCConnection Info: setLocalDescription.
9  >>> begin:sdp
10  [...]
12  webrtcapi.RTCConnection Info: OnSignalingChange. signaling state =
13  HaveLocalOffer
14  webrtcapi.RTCConnection Info: OnIceGatheringChange. state =
15  Gathering
16  [...]
17  >>> begin:sdp
18  candidate:840548147 1 udp 2122194687 10.108.124.215 56927 typ host
generation 0 ufrag oVk6 network-id 1
19  <<< end:sdp
20  [...]
21  >>> begin:sdp
22  candidate:1938109490 1 udp 24911871 52.114.xxx.xxx 52786 typ relay
raddr 73.205.xxx.x rport 25651 generation 0 ufrag dDML network-id 1
23  network-cost 10
24  <<< end:sdp
25  [...]
>>> begin:sdp
```
If there are multiple ICE candidates, the order of preference is:

1. host
2. peer reflexive
3. server reflexive
4. transport relay

If you encounter an issue and can reproduce it consistently, we recommend clicking Help > Report a problem in Teams. Logs are shared between Citrix and Microsoft to resolve technical issues if you opened a case with Microsoft.

Capturing CDF traces before contacting Citrix Support is also beneficial. For more information, see the Knowledge Center article CDFcontrol.

For recommendations for collecting CDF Traces, see the Knowledge Center article Recommendations for Collecting the CDF Traces.

**VDA side CDF traces - Enable the following CDF trace providers:**
Workspace App side CDF traces - Enable the following CDF trace providers:

Windows Media redirection

December 18, 2019

Windows Media redirection controls and optimizes the way servers deliver streaming audio and video to users. By playing the media run-time files on the client device rather than the server, Windows Media redirection reduces the bandwidth requirements for playing multimedia files. Windows Media redirection improves the performance of Windows Media Player and compatible players running on
virtual Windows desktops.

If the requirements for Windows Media client-side content fetching are not met, media delivery automatically uses server-side fetching. This method is transparent to users. You can use the Citrix Scout to perform a Citrix Diagnosis Facility (CDF) trace from HostMMTransport.dll to determine the method used. For more information see, Citrix Scout.

Windows Media redirection intercepts the media pipeline at the host server, captures the media data in its native compressed format, and redirects the content to the client device. The client device then recreates the media pipeline to decompress and render the media data received from the host server. Windows Media redirection works well on client devices running a Windows operating system. Those devices have the multimedia framework required to rebuild the media pipeline as it existed on the host server. Linux clients use similar open-source media frameworks to rebuild the media pipeline.

The policy setting Windows Media Redirection controls this feature and is Allowed by default. Usually, this setting increases audio and video quality rendered from the server to a level that is comparable to content played locally on a client device. In the rare cases, media playing using Windows Media redirection appears worse than media rendered using basic ICA compression and regular audio. You can disable this feature by adding the Windows Media Redirection setting to a policy and setting its value to Prohibited.

For more information about the policy settings, see Multimedia policy settings.

Limitation:

When you’re using Windows Media Player and Remote Audio & Video Extensions (RAVE) enabled inside a session, a black screen might appear. This black screen might appear if you right-click on the video content and select Always show Now Playing on top.

General content redirection

December 18, 2019

Content redirection allows you to control whether users access information by using applications published on servers or by using applications running locally on user devices.

Client folder redirection

Client folder redirection changes the way client-side files are accessible on the host-side session.

- When you enable only client drive mapping on the server, client-side full volumes are automatically mapped to the sessions as Universal Naming Convention (UNC) links.
- When you enable client folder redirection on the server and the user configures it on the Windows desktop device, the portion of the local volume specified by the user is redirected.
Host to client redirection

Consider using host to client redirection for specific uncommon use cases. Normally, other forms of content redirection might be better. We support this type of redirection only on Multi-session OS VDAs and not on Single-session OS VDAs.

Local App Access and URL redirection

Local App Access seamlessly integrates locally installed Windows applications into a hosted desktop environment. It does so without changing from one computer to another.

HDX technology provides generic USB redirection for specialty devices that don’t have any optimized support or where it is unsuitable.

Client folder redirection

December 18, 2019

Client folder redirection changes the way client-side files are accessible on the host-side session. If you enable only client drive mapping on the server, client-side full volumes are automatically mapped as Universal Naming Convention (UNC) links to the sessions. When you enable client folder redirection on the server and the user configures it on the user device, the portion of the local volume specified by the user is redirected.

Only the user-specified folders appear as UNC links inside sessions. That is, instead of the complete file system on the user device. If you disable UNC links through the registry, client folders appear as mapped drives inside the session.

Client folder redirection is supported on Windows Single-session OS machines only.

Client folder redirection for an external USB drive is not saved on detaching and reattaching the device.

Enable client folder direction on the server. Then, on the client device, specify which folders to redirect. The application you use to specify the client folder options is included with the Citrix Workspace app supplied with this release.

Requirements:

For servers:

- Windows Server 2019, Standard and Datacenter Editions
- Windows Server 2016, Standard and Datacenter Editions
- Windows Server 2012 R2, Standard and Datacenter Editions

For Clients:

- Windows 10, 32-bit and 64-bit editions (minimum version 1607)
• Windows 8.1, 32-bit and 64-bit editions (including Embedded edition)
• Windows 7, 32-bit and 64-bit editions (including Embedded edition)

Warning
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

1. On the server:
   a) Create a key: HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\Client Folder Redirection.
   b) Create a REG_DWORD value.
      • Name: CFROnlyModeAvailable
      • Type: REG_DWORD
      • Data: Set to 1

2. On the user device:
   a) Ensure that the latest version of Citrix Workspace app is installed.
   b) From the Citrix Workspace app installation directory, start CtxCFRUI.exe.
   c) Choose the Custom radio button and add, edit, or remove folders.
   d) Disconnect and reconnect your sessions for the setting to take effect.

Host to client redirection

September 14, 2020

Content redirection allows you to control how users access information. You can control whether users access information by using applications published on servers or applications running locally on user devices.

Host to client redirection is one type of content redirection. It is supported only on Multi-session OS VDAs (not Single-session OS VDAs).

• When host to client redirection is enabled, URLs are intercepted at the server VDA and sent to the user device. The web browser or multimedia player on the user device opens these URLs.
• If you enable host to client redirection and the user device fails to connect to a URL, the URL is redirected back to the server VDA.
• When host to client redirection is disabled, users open the URLs using web browsers or multimedia players on the server VDA.
• When host to client redirection is enabled, users cannot disable it.

Host to client redirection was previously known as server to client redirection.
When to use host to client redirection

You might consider using host to client redirection in specific but uncommon cases, for performance, compatibility, or compliance. Normally, other forms of content redirection are better.

Performance:

You can use host to client redirection for performance. Whenever an application is installed on the user device, it is used in preference to an application on the VDA.

Host to client redirection improves performance only under specific conditions, because the VDA already optimizes Adobe Flash and other types of multimedia content. First, consider using the other approaches (policy settings) noted in the tables in this article, rather than host to client redirection. Those settings offer more flexibility and usually give a better user experience, particularly for less-powerful user devices.

Compatibility:

You can use host to client redirection for compatibility in the following use cases:

- You use content types other than HTML or multimedia (for example, a custom URL type).
- You use a legacy media format (such as Real Media) that the VDA multimedia player using multimedia redirection doesn’t support.
- The application for the content type is used by only a few users who already have the application installed on their user device.
- The VDA cannot access certain websites (for example, websites internal to another organization).

Compliance:

You can use host to client redirection for compliance in the following use cases:

- The application or content licensing agreement does not permit publishing via the VDA.
- Organizational policy does not permit a document being uploaded to the VDA.

Some situations are more likely in complex environments, and also if the user device and the VDA belong to different organizations.

User device considerations

Environments can have many different types of user devices.

<table>
<thead>
<tr>
<th>User device</th>
<th>Situation or environment</th>
<th>Content redirection approach</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tablet</td>
<td>-</td>
<td>Any approach (see next table)</td>
</tr>

</tr>
<tr>
<td>A document</td>
<td>The VDA does not have an application for that document type.</td>
<td>Host to client redirection</td>
</tr>
<tr>
<td>A document</td>
<td>Do not download the document to the user device.</td>
<td>No redirection</td>
</tr>
<tr>
<td>A document</td>
<td>Do not upload the document to the VDA.</td>
<td>Host to client redirection</td>
</tr>
<tr>
<td>A custom URL type</td>
<td>The VDA does not have an application for that custom URL type.</td>
<td>Host to client redirection</td>
</tr>
</tbody>
</table>
These Citrix Workspace apps support Host to client redirection:

- Citrix Workspace app for Windows
- Citrix Workspace app for Mac
- Citrix Workspace app for Linux
- Citrix Workspace app for HTML5
- Citrix Workspace app for Chrome

To use host to client redirection, the user device must have a web browser, multimedia player, or other application that is suitable for the content. If the user device is one of the following, confirm it has suitable applications and power.

- Thin client
- Zero client

User devices enabled for Local App Access use a different mechanism for content redirection, and do not require host to client content redirection.

You can use Citrix policies to prevent host to client content redirection for unsuitable devices.

**How users experience host to client redirection**

Host to client redirection is used when URLs are:

- Embedded as hyperlinks in an application (for example, in an email message or document).
- Selected through VDA application menus or dialogs, if the application uses the Windows ShellExecuteEx API.
- Typed in the Windows Run dialog.

Host to client redirection is not used for URLs in a web browse. That is, either in a webpage or typed in the address bar of the web browser.

**Note:**

If users change their default web browser on the VDA, that change can interfere with host to client redirection for applications. An example of changing the default web browser is using Set Default Programs.

When host to client content redirection is enabled, the app that opens the URL uses the user device configuration for the URL type and the content type. For example:

- An HTTP URL that has an HTML content type opens in the default web browser.
- An HTTP URL that has a PDF content type might open in the default web browser, or it might open in another application.

Host to client content redirection doesn’t control this user device configuration. If you do not control the configuration of the user device, consider using multimedia redirection, rather than host to client content redirection.
The following URL types are opened locally through user devices when host to client redirection is enabled:

- HTTP
- HTTPS
- RTSP
- RTSPU
- PNM
- MMS

To delete and add URL types, you can change the list of URL types for host to client redirection. URL types include custom types.

**Enable host to client redirection**

Enabling host to client redirection starts by enabling a Citrix policy setting.

The Host to client redirection policy setting is located in the File Redirection policy settings section. By default, this setting is disabled.

In addition, you might need to set registry keys and Group Policy for the server VDAs, depending on the VDA OS.

- If the server VDA is Windows Server 2008 R2 SP1, you do not need to set registry keys or Group Policy.
- If the server VDA is Windows Server 2012, Windows Server 2012 R2, or Windows Server 2016, you must set registry keys and Group Policy.

**Warning:**

Using Registry Editor incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

**Registry changes**

1. Copy the text between “Reg file start” and “Reg file end” in the example, and paste it in Notepad.
2. Save the Notepad file using “Save As” and the type All Files and the name ServerFTA.reg.
3. Distribute the ServerFTA.reg file to the servers using Active Directory Group Policy.
Windows Registry Editor Version 5.00
[HKEY_CLASSES_ROOT\ServerFTAHTML\shell\open\command]
@=""\C:\Program Files (x86)\Citrix\HDX\bin\iexplore.exe" %1"
[HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ServerFTA]
@="ServerFTA"
[HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ServerFTA\Capabilities]
 "ApplicationDescription"="Server FTA URL."
 "ApplicationIcon"="C:\Program Files (x86)\Citrix\HDX\bin\iexplore.exe,0"
 "ApplicationName"="ServerFTA"
[HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ServerFTA\Capabilities\URLAssociations]
 "http"="ServerFTAHTML"
 "https"="ServerFTAHTML"
[HKEY_LOCAL_MACHINE\SOFTWARE\RegisteredApplications]
 "Citrix.ServerFTA"="SOFTWARE\Citrix\ServerFTA\Capabilities"
-- Reg file end --

Group Policy changes
Create an XML file. Copy the text between “xml file start” and “xml file end” the example, paste it in the XML file, and then save the file as ServerFTAdefaultPolicy.xml.

-- xml file start --
<?xml version="1.0" encoding="UTF-8"?>
<DefaultAssociations>
 <Association Identifier="http" ProgId="ServerFTAHTML" ApplicationName="ServerFTA" />
-- xml file end --
<Association Identifier="https" ProgId="ServerFTAHTML" ApplicationName="ServerFTA" />
</DefaultAssociations>
-- xml file end --

From the current Group Policy management console, navigate to: **Computer configuration > Administrative Templates > Windows Components > File Explorer > Set a default associations configuration file**, and provide the ServerFTAdefaultPolicy.xml file you created.

**Change the list of URL types for host to client redirection**

To change the list of URL types for host to client redirection, set the following registry key on the server VDA.

**Key**: HKLM\Software\Wow6432Node\Citrix\SFTA

To delete URL types from the list, set DisableServerFTA and NoRedirectClasses:

**Name**: DisableServerFTA  
**Type**: REG_DWORD  
**Data**: 1

**Name**: NoRedirectClasses  
**Type**: REG_MULTI_SZ  
**Data**: Specify any combination of the values: http, https, rtsp, rtspu, pnm, or mms. Type multiple values on separate lines. For example:

http  
https  
rtsp

To add URL types to the list, set ExtraURLProtocols:

**Name**: ExtraURLProtocols  
**Type**: REG_MULTI_SZ  
**Data**: Specify any combination of URL types. Each URL type must include the :// suffix; separate multiple values by using semicolons. For example:

customtype1://;customtype2://
Enable host to client redirection for a specific set of websites

To enable host to client redirection for a specific set of websites, set the following registry key on the server VDA.

Key: HKLM\Software\Wow6432Node\Citrix\SFTA
Name: ValidSites
Type: REG_MULTI_SZ
Data: Specify any combination of fully qualified domain names (FQDNs). Type multiple FQDNs on separate lines. An FQDN can include a wildcard in the leftmost position only. This wildcard matches a single level of domain, which is consistent with the rules in RFC 6125. For example:

www.example.com
\*.example.com

Local App Access and URL redirection

August 21, 2020

Introduction

Local App Access seamlessly integrates locally installed Windows applications into a hosted desktop environment without switching from one desktop to another. With Local App Access, you can:

• Access applications installed locally on a physical laptop, PC, or other device directly from the virtual desktop.
• Provide a flexible application delivery solution. If users have local applications that you cannot virtualize or that IT does not maintain, those applications still behave as though they are installed on a virtual desktop.
• Eliminate the double-hop latency when applications are hosted separately from the virtual desktop. Do so by putting a shortcut to the published application on the user’s Windows device.
• Use applications such as:
  – Video conferencing software such as GoToMeeting.
  – Specialty or niche applications that are not yet virtualized.
  – Applications and peripherals that would otherwise transfer large amounts of data from a user device to a server and back to the user device. For example, DVD burners and TV tuners.
In Citrix Virtual Apps and Desktops, hosted desktop sessions use URL redirection to start Local App Access applications. URL redirection makes the application available under more than one URL address. It launches a local browser (based on the browser’s URL block list) by selecting embedded links within a browser in a desktop session. If you navigate to a URL that is not present in the block list, the URL is opened in the desktop session again.

URL redirection works only for desktop sessions, not application sessions. The only redirection feature you can use for application sessions is host-to-client content redirection, which is a type of server FTA (File Type Association) redirection. This FTA redirects certain protocols to the client, such as HTTP, HTTPS, RTSP, or MMS. For example, if you only open embedded links with HTTP, the links directly open with the client application. There is no URL block list or allow list support.

When Local App Access is enabled, URLs that are displayed to users as links from locally running applications, from user-hosted applications, or as shortcuts on the desktop are redirected in one of the following ways:

- From the user’s computer to the hosted desktop
- From the Citrix Virtual Apps and Desktops server to the user’s computer
- Rendered in the environment in which they are started (not redirected)

To specify the redirection path of content from specific websites, configure the URL allow list and URL block list on the Virtual Delivery Agent. Those lists contain multi-string registry keys that specify the URL redirection policy settings. For more information, see the Local App Access policy settings.

URLs can be rendered on the VDA with the following exceptions:

- Geo/Locale information — Websites that require locale information, such as msn.com or news.google.com (opens a country specific page based on the Geo). For example, if the VDA is provisioned from a data center in the UK and the client is connecting from India, the user expects to see in.msn.com. Instead, the user sees uk.msn.com.
- Multimedia content — Websites containing rich media content, when rendered on the client device, give the end users a native experience and also save bandwidth even in high latency networks. This feature redirects sites with other media types such as Silverlight. This process is in a secure environment. That is, the URLs that the administrator approves are run on the client while the rest of the URLs are redirected to the VDA.

In addition to URL redirection, you can use FTA redirection. FTA starts local applications when a file is encountered in the session. If the local app is started, the local app must have access to the file to open it. Therefore, you can only open files that reside on network shares or on client drives (using client drive mapping) using local applications. For example, when opening a PDF file, if a PDF reader is a local app, then the file opens using that PDF reader. Because the local app can access the file directly, there is no network transfer of the file through ICA to open the file.
Requirements, considerations, and limitations

We support Local App Access on the valid operating systems for VDAs for Windows Multi-session OS and for VDAs for Windows Single-session OS. Local App Access requires Citrix Workspace app for Windows version 4.1 (minimum). The following browsers are supported:

- Internet Explorer 11. You can use Internet Explorer 8, 9, or 10, but Microsoft supports (and Citrix recommends using) version 11.
- Firefox 3.5 through 21.0
- Chrome 10

Review the following considerations and limitations when using Local App Access and URL redirection.

- Local App Access is designed for full-screen, virtual desktops spanning all monitors:
  - The user experience can be confusing if you use Local App Access with a virtual desktop that runs in windowed mode or does not cover all monitors.
  - Multiple monitors — When one monitor is maximized, it becomes the default desktop for all applications started in that session. This default occurs even if the subsequent applications typically start on another monitor.
  - The feature supports one VDA. There is no integration with multiple concurrent VDAs.

- Some applications can behave unexpectedly, affecting users:
  - The drive letters might confuse users, such as local C: rather than virtual desktop C: drive.
  - Available printers in the virtual desktop are not available to local applications.
  - Applications that require elevated permissions cannot be started as client-hosted applications.
  - There is no special handling for single-instance applications (such as Windows Media Player).
  - Local applications appear with the Windows theme of the local machine.
  - Full-screen applications are not supported. These applications include applications that open to a full screen, such as PowerPoint slide shows or photo viewers that cover the entire desktop.
  - Local App Access copies the properties of the local application (such as the shortcuts on the client’s desktop and Start menu) on the VDA. However, it does not copy other properties such as shortcut keys and read-only attributes.
  - Applications that customize how overlapping window order is handled can have unpredictable results. For example, some windows might be hidden.
  - Shortcuts are not supported, including My Computer, Recycle Bin, Control Panel, Network Drive shortcuts, and folder shortcuts.
  - The following file types and files are not supported: custom file types, files with no associated programs, zip files, and hidden files.
  - Taskbar grouping is not supported for mixed 32-bit and 64-bit client-hosted or VDA applications. That is, grouping 32-bit local applications with 64-bit VDA applications.
Applications cannot be started using COM. For example, if you click an embedded Office document from within an Office application, the process start cannot be detected, and the local application integration fails.

- Double-hop scenarios, where a user is starting a virtual desktop from within another virtual desktop session, are not supported.
- URL redirection supports only explicit URLs (that is, URLs appearing in the browser’s address bar or found using the in-browser navigation, depending on the browser).
- URL redirection works only with desktop sessions, not with application sessions.
- The local desktop folder in a VDA session does not allow users to create files.
- Multiple instances of a locally running application behave according to the taskbar settings established for the virtual desktop. However, shortcuts to locally running applications are not grouped with running instances of those applications. They are also not grouped with running instances of hosted applications or pinned shortcuts to hosted applications. Users can close only windows of locally running applications from the Taskbar. Although users can pin local application windows to the desktop Taskbar and Start menu, the applications might not start consistently when using these shortcuts.

**Interaction with Windows**

The Local App Access interaction with Windows includes the following behaviors.

- Windows 8 and Windows Server 2012 shortcut behavior
  - Windows Store applications installed on the client are not enumerated as part of Local App Access shortcuts.
  - Image and video files are opened by default using Windows store applications. However, Local App Access enumerates the Windows store applications and opens shortcuts with desktop applications.

- Local Programs
  - For Windows 7, the folder is available in the Start menu.
  - For Windows 8, Local Programs is available only when the user chooses All Apps as a category from the Start screen. Not all subfolders are displayed in Local Programs.

- Windows 8 graphics features for applications
  - Desktop applications are restricted to the desktop area and are covered by the Start screen and Windows 8 style applications.
  - Local App Access applications do not behave like desktop applications in multi-monitor mode. In multi-monitor mode, the Start screen and the desktop display on different monitors.

- Windows 8 and Local App Access URL Redirection
  - Because Windows 8 Internet Explorer has no add-ons enabled, use desktop Internet Explorer to enable URL redirection.
– In Windows Server 2012, Internet Explorer disables add-ons by default. To implement URL Redirection, disable the Internet Explorer enhanced configuration. Then reset the Internet Explorer options and restart to ensure that add-ons are enabled for standard users.

**Configure Local App Access and URL redirection**

To use Local App Access and URL redirection with Citrix Workspace app:

- Install the Citrix Workspace app on the local client machine. You can enable both features during the Citrix Workspace app installation or you can enable Local App Access template using the Group Policy editor.
- Set the **Allow local app access** policy setting to **Enabled**. You can also configure URL allow list and block list policy settings for URL redirection. For more information, see [Local App Access policy settings](#).

**Enable Local App Access and URL redirection**

To enable Local App Access for all local applications, follow these steps:

1. Start Citrix Studio.
   - For on-premises deployments, open [Citrix Studio](#) from the **Start menu**.
   - For Cloud service deployments, go to [Citrix Cloud > Virtual Apps and Desktops service > Manage](#) tab.
2. In the Studio navigation pane, click **Policies**.
3. In the Actions pane, click **Create Policy**.
4. In the Create Policy window, type “Allow Local App Access” in the search box and then click **Select**.
5. In the Edit Setting window, select **Allowed**. By default, the **Allow local app access** policy is prohibited. When this setting is allowed, the VDA allows the end-user to decide whether published applications and Local App Access shortcuts are enabled in the session. (When this setting is prohibited, both published applications and Local App Access shortcuts do not work for the VDA.) This policy setting applies to the entire machine and the URL redirection policy.
6. In the Create Policy window, type “URL redirection white list” in the search box and then click **Select**. The URL redirection allow list specifies URLs to open in the default browser of the remote session.
7. In the Edit Setting window, click **Add** to add the URLs and then click **OK**.
8. In the Create Policy window, type “URL redirection black list” in the search box and then click **Select**. The URL redirection block list specifies URLs that are redirected to the default browser running on the endpoint.
9. In the Edit Setting window, click **Add** to add the URLs and then click **OK**.
10. On the Settings page, click **Next**.
11. On the Users and Machines page, assign the policy to the applicable Delivery Groups and then click Next.
12. On the Summary page, review the settings and then click Finish.

To enable URL redirection for all local applications during Citrix Workspace app installation, follow these steps:

1. Enable URL redirection when you install the Citrix Workspace app for all users on a machine. Doing so also registers the browser add-ons required for URL redirection.
2. From the command prompt, run the appropriate command to install the Citrix Workspace app using one of the following options:
   - For CitrixReceiver.exe, use \ALWAYS_CLIENTHOSTEDAPPSURL\1.
   - For CitrixReceiverWeb.exe, use \ALWAYS_CLIENTHOSTEDAPPSURL\1.

Enable the Local App Access template using the Group Policy editor

**Note:**

- Before you enable the Local App Access template using the Group Policy editor, add the receiver.admx/adml template files to the local GPO. For more information, see Configuring the Group Policy Object administrative template.
- Citrix Workspace app for Windows template files are available in the local GPO in Administrative Templates > Citrix Components > Citrix Workspace folder only when you add the CitrixBase.admx/CitrixBase.adml to the %systemroot%\policyDefinitions folder.

To enable the Local App Access template using the Group Policy editor, follow these steps:

1. Run gedit.msc.
3. Click Local App Access settings.
4. Select Enabled and then select Allow URL Redirection. For URL redirection, register browser add-ons using the command line described in the Register browser add-ons section further down in this article.

Provide access only to published applications

You can provide access to published applications using one of the following two ways:

Use the Registry Editor.

1. On the server where Citrix Studio is installed, run regedit.exe.
2. Navigate to \HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\DesktopStudio.
3. Add the REG_DWORD entry ClientHostedAppsEnabled and a value of 1. (A 0 value disables Local App Access.)
Use the PowerShell SDK.

1. Open PowerShell on the machine where the Delivery Controller is running.
2. Enter the following command: `set-configsitemetadata -name "studio_clientHostedAppsEnabled" -value "true"`

To have access to **Add Local App Access Application** in a Cloud service deployment, use the Citrix Virtual Apps and Desktops Remote PowerShell SDK. For more information, see *Citrix Virtual Apps and Desktops Remote PowerShell SDK*.

1. Download the installer:

   [https://download.apps.cloud.com/CitrixPoshSdk.exe](https://download.apps.cloud.com/CitrixPoshSdk.exe)

2. Run these commands:
   a) `asnp citrix.*`
   b) `Get-XdAuthentication`

3. Enter the following command: `set-configsitemetadata -name "studio_clientHostedAppsEnabled" -value "true"`

After you complete the applicable preceding steps, follow these steps to continue.

1. Open **Citrix Studio** from the **Start** menu.
2. In the Studio navigation pane, click **Applications**.
3. In the upper middle pane, right-click the blank area and select **Add Local App Access Application** from the context menu. You can also click **Add Local App Access Application** in the Actions pane. To display the Add Local App Access Application option in the Actions pane, click **Refresh**.
4. Publish Local App Access application.
   • The Local Application Access wizard launches with an Introduction page, which you can remove from future launches of the wizard.
   • The wizard guides you through the Groups, Location, Identification, Delivery, and Summary pages described below. When you are finished with each page, click **Next** until you reach the Summary page.
   • On the Groups page, select one or more Delivery Groups where the new applications will be added, and then click **Next**.
   • On the Location page, type the full executable path of the application on the user’s local machine, and type the path to the folder where the application is located. Citrix recommends that you use the system environment variable path; for example, `%ProgramFiles(x86)%\Internet Explorer\iexplore.exe`.
   • On the Identification page, accept the default values or type the information that you want and then click **Next**.
• On the Delivery page, configure how this application is delivered to users and then click **Next**. You can specify the icon for the selected application. You can also specify whether the shortcut to the local application on the virtual desktop is visible on the Start menu, the desktop, or both.

• On the Summary page, review the settings and then click **Finish** to exit the Local Application Access wizard.

**Register browser add-ons**

**Note:**

The browser add-ons required for URL redirection are registered automatically when you install the Citrix Workspace app from the command line using the `/ALLOW_CLIENTHOSTEDAPPSURL=1` option.

You can use the following commands to register and unregister one or all add-ons:

- To register add-ons on a client device: `<client-installation-folder>\redirector.exe /reg<browser>`
- To unregister add-ons on a client device: `<client-installation-folder>\redirector.exe /unreg<browser>`
- To register add-ons on a VDA: `<VDAinstallation-folder>\VDARedirector.exe /reg<browser>`
- To unregister add-ons on a VDA: `<VDAinstallation-folder>\VDARedirector.exe /unreg<browser>`

Where `<browser>` is Internet Explorer, Firefox, Chrome, or All.

For example, the following command registers Internet Explorer add-ons on a device running the Citrix Workspace app.

C:\Program Files\Citrix\ICA Client\redirector.exe/regIE

The following command registers all add-ons on a Windows Multi-session OS VDA.

C:\Program Files (x86)\Citrix\System32\VDARedirector.exe /regAll

**URL interception across browsers**

- By default, Internet Explorer redirects the specified URL. If the URL is not in the blacklist but the browser or website redirects it to another URL, the final URL is not redirected. It is not redirected even if it is on the block list.

For URL redirection to work correctly, enable the add-on when prompted by the browser. If the add-ons that are using Internet options or the add-ons in the prompt are disabled, URL redirection does not work correctly.

- The Firefox add-ons always redirect the URLs.
When an add-on is installed, Firefox prompts to allow or prevent installing the add-on on a new tab page. Allow the add-on for the feature to work.

- The Chrome add-on always redirects the final URL that is navigated, and not the entered URLs. The extensions have been installed externally. When you disable the extension, the URL redirection feature does not work in Chrome. If the URL redirection is required in Incognito mode, allow the extension to run in that mode in the browser settings.

**Configure local application behavior on logoff and disconnect**

Note:
If you do not follow these steps to configure the settings, by default, local applications continue to run when a user logs off or disconnects from the virtual desktop. After reconnection, local applications are reintegrated if they are available on the virtual desktop.

1. On the hosted desktop, run **regedit.msc**.
2. Navigate to \HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Client Hosted Apps\Policies\Session State. For a 64-bit system, navigate to \HKEY_LOCAL_MACHINE\SOFTWARE\wow6432node\Citrix\Client Hosted Apps\Policies\Session State.
3. Add the REG_DWORD entry **Terminate** and one of the values:
   - 1 - Local applications continue to run when a user logs off or disconnects from the virtual desktop. Upon reconnection, local applications are reintegrated if they are available in the virtual desktop.
   - 3 - Local applications close when a user logs off or disconnects from the virtual desktop.

**Generic USB redirection and client drive considerations**

August 21, 2020

HDX technology provides **optimized support** for most popular USB devices. Optimized support offers an improved user experience with better performance and bandwidth efficiency over a WAN. Optimized support is usually the best option, especially in high latency or security-sensitive environments.

HDX technology provides **generic USB redirection** for specialty devices that don’t have optimized support or where it is unsuitable, for example:

- The USB device has more advanced features that are not part of optimized support, such as a mouse or webcam having more buttons.
Users need functions which are not part of optimized support.

The USB device is a specialized device, such as test and measurement equipment or an industrial controller.

An application requires direct access to the device as a USB device.

The USB device only has a Windows driver available. For example, a smart card reader might not have a driver available for the Citrix Workspace app for Android.

The version of the Citrix Workspace app does not provide any optimized support for this type of USB device.

With generic USB redirection:

- Users do not need to install device drivers on the user device.
- USB client drivers are installed on the VDA machine.

**Important:**

- Generic USB redirection can be used together with optimized support. If you enable generic USB redirection, configure Citrix [USB devices policy settings](#) for both generic USB redirection and optimized support.
- The Citrix policy setting in [Client USB device optimization rules](#) is a specific setting for generic USB redirection, for a particular USB device. It doesn’t apply to optimized support as described here.

**Performance considerations for USB devices**

Network latency and bandwidth can affect user experience and USB device operation when using generic USB redirection for some types of USB devices. For example, timing-sensitive devices might not operate correctly over high-latency low-bandwidth links. Use optimized support instead where possible.

Some USB devices require high bandwidth to be usable, for example a 3D mouse (used with 3D apps that also typically require high bandwidth). If bandwidth cannot be increased, you might be able to mitigate the issue by tuning bandwidth usage of other components using the bandwidth policy settings. For more information, see [Bandwidth policy settings](#) for Client USB device redirection, and [Multi-stream connection policy settings](#).

**Security considerations for USB devices**

Some USB devices are security-sensitive by nature, for example, smart card readers, fingerprint readers, and signature pads. Other USB devices such as USB storage devices can be used to transmit data that might be sensitive.

USB devices are often used to distribute malware. Configuration of Citrix Workspace app and Citrix Virtual Apps and Desktops can reduce, but not eliminate, risk from these USB devices. This situation
applies whether generic USB redirection or optimized support is used.

Important:
For security-sensitive devices and data, always secure the HDX connection using either TLS or IPsec.

Only enable support for the USB devices that you need. Configure both generic USB redirection and optimized support to meet this need.

Provide guidance to users for safe use of USB devices:
- Use only USB devices that have been obtained from a trustworthy source.
- Don’t leave USB devices unattended in open environments - for example, a flash drive in an internet cafe.
- Explain the risks of using a USB device on more than one computer.

Compatibility with generic USB redirection

Generic USB redirection is supported for USB 2.0 and earlier devices. Generic USB redirection is also supported for USB 3.0 devices connected to a USB 2.0 or USB 3.0 port. Generic USB redirection does not support USB features introduced in USB 3.0, such as super speed.

These Citrix Workspace apps support generic USB redirection:
- Citrix Workspace app for Windows, see Configuring application delivery.
- Citrix Workspace app for Mac, see Citrix Workspace app for Mac.
- Citrix Workspace app for Linux, see Optimize.
- Citrix Workspace app for Chrome OS, see Citrix Workspace app for Chrome.

For Citrix Workspace app versions, see the Citrix Workspace app feature matrix.

If you are using earlier versions of the Citrix Workspace app, see the Citrix Workspace app documentation to confirm that generic USB redirection is supported. See Citrix Workspace app documentation for any restrictions on USB device types that are supported.

Generic USB redirection is supported for desktop sessions from VDA for Single-session OS version 7.6 through current.

Generic USB redirection is supported for desktop sessions from VDA for Multi-session OS version 7.6 through current, with these restrictions:
- The VDA must be running Windows Server 2012 R2 or Windows Server 2016.
- The USB device drivers must be fully compatible with the Remote Desktop Session Host (RDSH) for the VDA OS (Windows 2012 R2), including full virtualization support.

Some types of USB devices are not supported for generic USB redirection because it would not be useful to redirect them:
• USB modems.
• USB network adapters.
• USB hubs. The USB devices connected to USB hubs are handled individually.
• USB virtual COM ports. Use COM port redirection rather than generic USB Redirection.

For information on USB devices that have been tested with generic USB redirection, see Citrix Ready Marketplace. Some USB devices do not operate correctly with generic USB redirection.

Configure generic USB redirection

You can control, and separately configure, which types of USB devices use generic USB redirection:

• On the VDA, using Citrix policy settings. For more information, see Redirection of client drives and user devices and USB devices policy settings in the Policy settings reference
• In Citrix Workspace app, using Citrix Workspace app-dependent mechanisms. For example, an Administrative Template controls registry settings that configure Citrix Workspace app for Windows. By default, USB redirection is allowed for certain classes of USB devices and denied for others. For more information, see Configure in the Citrix Workspace app for Windows documentation.

This separate configuration provides flexibility. For example:

• If two different organizations or departments are responsible for the Citrix Workspace app and VDA, they can enforce control separately. This configuration applies when a user in one organization accesses an application in another organization.
• Citrix policy settings can control USB devices that are allowed only for certain users or for users connecting only over a LAN (rather than by using Citrix Gateway).

Enable generic USB redirection

To enable generic USB Redirection, and not require manual redirection by the user, configure both Citrix policy settings and Citrix Workspace app connections preferences.

In Citrix policy settings:

1. Add the Client USB device redirection to a policy and set its value to Allowed.
2. (Optional) To update the list of USB devices available for redirection, add the **Client USB device redirection rules** setting to a policy and specify the USB policy rules.

In Citrix Workspace app:

3. Specify that devices are connected automatically without manual redirection. You can do this using an Administrative template or in the Citrix Workspace app for **Windows > Preferences > Connections**.
If you specified the USB policy rules for the VDA in the previous step, specify those same policy rules for the Citrix Workspace app.

For thin clients, consult the manufacturer for details of USB support and any required configuration.

**Configuring the types of USB devices available for generic USB redirection**

USB devices are automatically redirected when USB support is enabled and the USB user preference settings are set to connect USB devices automatically. USB devices are also automatically redirected when the connection bar is not present.

Users can explicitly redirect devices that are not automatically redirected by selecting the devices from the USB device list. For more information, the Citrix Workspace app for Windows user help article, [Display your devices in the Desktop Viewer](#).
To use generic USB redirection rather than optimized support, you can either:

- In the Citrix Workspace app, manually select the USB device to use generic USB redirection, choose **Switch to generic** from the Devices tab of the Preferences dialog box.
- Automatically select the USB device to use generic USB redirection, by configuring autoredirection for the USB device type (for example, AutoRedirectStorage=1) and set USB user preference settings to automatically connect USB devices. For more information, see Configure automatic redirection of USB devices.

**Note:**

Only configure generic USB redirection for use with a webcam if the webcam is found to be incompatible with HDX multimedia redirection.

To prevent USB devices from ever being listed or redirected, you can specify device rules for the Citrix Workspace app and the VDA.

For generic USB redirection, you need to know at least the USB device class and subclass. Not all USB devices use their obvious USB device class and subclass. For example:
Pens use the mouse device class.
Smart card readers can use the vendor-defined or HID device class.

For more precise control, you need to know the Vendor ID, Product ID, and Release ID. You can get this information from the device vendor.

**Important:**
Malicious USB devices might present USB device characteristics that do not match their intended usage. Device rules are not intended to prevent this behavior.

You control the USB devices available for generic USB redirection by specifying USB device redirection rules for both VDA and Citrix Workspace app, to override the default USB policy rules.

**For the VDA:**
- Edit the administrator override rules for the Multi-session OS machines through group policy rules. The Group Policy Management Console is included on the installation media:
  - For x64: dvd root \os\lang\x64\Citrix Policy\CitrixGroupPolicyManagement_x64.msi
  - For x86: dvd root \os\lang\x86\Citrix Policy\CitrixGroupPolicyManagement_x86.msi

**At Citrix Workspace app for Windows:**
- Edit the user device registry. An Administrative template (ADM file) is included on the installation media so you can change the user device through the Active Directory Group Policy:
  dvd root \os\lang\Support\Configuration\icaclient_usb.adm

**Warning:**
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

The product default rules are stored in HKLM\SOFTWARE\Citrix\PortICA\GenericUSB\DeviceRules. Do not edit these product default rules. Instead, use them as a guide for creating administrator override rules, which is explained later in this article. The GPO overrides are evaluated before the product default rules.

The administrator override rules are stored in HKLM\SOFTWARE\Policies\Citrix\PortICA\GenericUSB\DeviceRules. GPO policy rules take the format `{Allow: | Deny:} followed by a set of tag=value expressions separated by white space.

The following tags are supported:

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VID</td>
<td>Vendor ID from the device descriptor</td>
</tr>
</tbody>
</table>
### Citrix Virtual Apps and Desktops 7 2009

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PID</td>
<td>Product ID from the device descriptor</td>
</tr>
<tr>
<td>REL</td>
<td>Release ID from the device descriptor</td>
</tr>
<tr>
<td>Class</td>
<td>Class from either the device descriptor or an interface descriptor; see the USB website at <a href="http://www.usb.org/">http://www.usb.org/</a> for available USB Class Codes</td>
</tr>
<tr>
<td>SubClass</td>
<td>Subclass from either the device descriptor or an interface descriptor</td>
</tr>
<tr>
<td>Prot</td>
<td>Protocol from either the device descriptor or an interface descriptor</td>
</tr>
</tbody>
</table>

When creating policy rules, note the following:

- Rules are case-insensitive.
- Rules can have an optional comment at the end, introduced by `##`. A delimiter is not required, and the comment is ignored for matching purposes.
- Blank and pure comment lines are ignored.
- White space is used as a separator, but cannot appear in the middle of a number or identifier.
  
  For example, `Deny: Class = 08 SubClass=05` is a valid rule, but `Deny: Class=0 Sub Class=05` is not.
- Tags must use the matching operator `=`. For example, `VID=1230`.
- Each rule must start on a new line or form part of a semicolon-separated list.

**Note:**

If you are using the ADM template file, you must create rules on a single line, as a semicolon-separated list.

**Examples:**

- The following example shows an administrator-defined USB policy rule for vendor and product identifiers:

  ```
  Allow: VID=046D PID=C626 ## Allow Logitech SpaceNavigator 3D Mouse
  Deny: VID=046D ## Deny all Logitech products
  ```

- The following example shows an administrator-defined USB policy rule for a defined class, subclass, and protocol:

  ```
  Deny: Class=EF SubClass=01 Prot=01 ## Deny MS Active Sync devices
  Allow: Class=EF SubClass=01 ## Allow Sync devices
  Allow: Class=EF ## Allow
  ```
all USB-Miscellaneous devices

Use and remove USB devices

Users can connect a USB device before or after starting a virtual session.

When using Citrix Workspace app for Windows, the following apply:

- Devices connected after a session begins appear immediately in the USB menu of the Desktop Viewer.
- If a USB device is not redirecting properly, you can try to resolve the problem by waiting to connect the device until after the virtual session starts.
- To avoid data loss, use the Windows “Safely Remove Hardware” icon before removing the USB device.

Security controls for USB mass storage devices

Optimized support is provided for USB mass storage devices. This support is part of Citrix Virtual Apps and Desktops client drive mapping. Drives on the user device are automatically mapped to drive letters on the virtual desktop when users log on. The drives are displayed as shared folders that have mapped drive letters. To configure client drive mapping, use the Client removable drives setting. This setting is in the File Redirection policy settings section of the ICA policy settings.

With USB mass storage devices you can use either Client drive mapping or generic USB redirection, or both. Control them using Citrix policies. The main differences are:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Client drive mapping</th>
<th>Generic USB redirection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled by default</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Read-only access, configurable</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Encrypted device access</td>
<td>Yes, if encryption is unlocked before the device is accessed</td>
<td>Yes</td>
</tr>
<tr>
<td>BitLocker To Go devices</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Safe to delete device during a session</td>
<td>No</td>
<td>Yes, provided users follow operating system recommendations for safe removal</td>
</tr>
</tbody>
</table>

If both generic USB redirection and the client drive mapping policies are enabled and a mass storage
device is inserted either before or after a session starts, it is redirected using client drive mapping. When both generic USB redirection and the client drive mapping policies are enabled and a device is configured for automatic redirection and a mass storage device is inserted either before or after a session starts, it is redirected using generic USB redirection. For more information, see Knowledge Center article CTX123015.

Note:
USB redirection is supported over lower bandwidth connections, for example 50 Kbps. However, copying large files doesn’t work.

Control file access with client drive mapping

You can control whether users can copy files from their virtual environments to their user devices. By default, files and folders on mapped client-drives are available in read/write mode from within the session.

To prevent users from adding or changing files and folders on mapped client-devices, enable the Read-only client drive access policy setting. When adding this setting to a policy, ensure that the Client drive redirection setting is set to Allowed and is also added to the policy.

Print

September 14, 2020

Managing printers in your environment is a multistage process:

1. Become familiar with printing concepts, if you are not already.
2. Plan your printing architecture. This includes analyzing your business needs, your existing printing infrastructure, how your users and applications interact with printing today, and which printing management model best applies to your environment.
3. Configure your printing environment by selecting a printer provisioning method and then creating policies to deploy your printing design. Update policies when new employees or servers are added.
4. Test a pilot printing configuration before deploying it to users.
5. Maintain your Citrix printing environment by managing printer drivers and optimizing printing performance.
6. Troubleshoot issues that may arise.
**Printing concepts**

Before you begin planning your deployment, make sure that you understand these core concepts for printing:

- The types of printer provisioning available
- How print jobs are routed
- The basics of printer driver management

Printing concepts build on Windows printing concepts. To configure and successfully manage printing in your environment, you must understand how Windows network and client printing works and how this translates into printing behavior in this environment.

**Print process**

In this environment, all printing is initiated (by the user) on machines hosting applications. Print jobs are redirected through the network print server or user device to the printing device.

There is no persistent workspace for users of virtual desktops and applications. When a session ends the user’s workspace is deleted, thus all settings need to be rebuilt at the beginning of each session. As a result, each time a user starts a new session, the system must rebuild the user’s workspace.

When a user prints:

- Determines what printers to provide to the user. This is known as printer provisioning.
- Restores the user’s printing preferences.
- Determines which printer is the default for the session.

You can customize how to perform these tasks by configuring options for printer provisioning, print job routing, printer property retention, and driver management. Be sure to evaluate how the various option settings might change the performance of printing in your environment and the user experience.

**Printer provisioning**

The process that makes printers available in a session is known as provisioning. Printer provisioning is typically handled dynamically. That is, the printers that appear in a session are not predetermined and stored. Instead, the printers are assembled, based on policies, as the session is built during log on and reconnection. As a result, the printers can change according to policy, user location, and network changes, provided they are reflected in policies. Thus, users who roam to a different location might see changes to their workspace.

The system also monitors client-side printers and dynamically adjusts in-session auto-created printers based on additions, deletions, and changes to the client-side printers. This dynamic printer discovery benefits mobile users as they connect from various devices.
The most common methods of printer provisioning are:

- **Universal Print Server** - The Citrix Universal Print Server provides universal printing support for network printers. The Universal Print Server uses the Universal print driver. This solution enables you to use a single driver on a Multi-session OS machine to allow network printing from any device.

Citrix recommends the Citrix Universal Print Server for remote print server scenarios. The Universal Print Server transfers the print job over the network in an optimized and compressed format, thus minimizing network use and improving the user experience.

The Universal Print Server feature comprises:

A client component, **UPClient** - Enable the UPClient on each Multi-session OS machine that provisions session network printers and uses the Universal print driver.

A server component, **UPServer** - Install UPServer on each print server that provisions session network printers and uses the Universal print driver for the session printers (whether or not the session printers are centrally provisioned).

For Universal Print Server requirements and setup details, refer to the system requirements and installation articles.

The following illustration shows the typical workflow for a network based printer in an environment that uses Universal Print Server.
When you enable the Citrix Universal Print Server, all connected network printers leverage it automatically through auto-discovery.

**Note:**

The Universal Print Server is also supported for VDI-in-a-Box 5.3. For information about installing Universal Print Server with VDI-in-a-Box, refer to the VDI-in-a-Box documentation.

- **Autocreation** - *Autocreation* refers to printers automatically created at the beginning of each session. Both remote network printers and locally attached client printers can be auto-created. Consider auto-creating only the default client printer for environments with a large number of printers per user. Auto-creating a smaller number of printers uses less overhead (memory and CPU) on Multi-session OS machines. Minimizing auto-created printers can also reduce user logon times.

Auto-created printers are based on:

- The printers installed on the user device.
- Any policies that apply to the session.

Autocreation policy settings enable you to limit the number or type of printers that are auto-created. By default, the printers are available in sessions when configuring all printers on the user device automatically, including locally attached and network printers.

After the user ends the session, the printers for that session are deleted.

Client and network printer autocreation has associated maintenance. For example, adding a printer requires that you:

- Update the Session printers policy setting.
- Add the driver to all Multi-session OS machines using the Printer driver mapping and compatibility policy setting.

**Print job routing**

The term printing pathway encompasses both the path by which print jobs are routed and the location where print jobs are spooled. Both aspects of this concept are important. Routing affects network traffic. Spooling affects utilization of local resources on the device that processes the job.

In this environment, print jobs can take two paths to a printing device: through the client or through a network print server. Those paths are referred to as the client printing pathway and the network printing pathway. Which path is chosen by default depends on the kind of printer used.
Locally attached printers

The system routes jobs to locally attached printers from the Multi-session OS machine, through the client, and then to the print device. The ICA protocol optimizes and compresses the print job traffic. When a printing device is attached locally to the user device, print jobs are routed over the ICA virtual channel.

Network-based printers

By default, all print jobs destined for network printers route from the Multi-session OS machine, across the network, and directly to the print server. However, print jobs are automatically routed over the ICA connection in the following situations:

- If the virtual desktop or application cannot contact the print server.
- If the native printer driver is not available on the Multi-session OS machine.

If the Universal Print Server is not enabled, configuring the client printing pathway for network printing is useful for low bandwidth connections, such as wide area networks, that can benefit from the optimization and traffic compression that results from sending jobs over the ICA connection.

The client printing pathway also lets you limit traffic or restrict bandwidth allocated for print jobs. If routing jobs through the user device is not possible, such as for thin clients without printing capabilities, Quality of Service should be configured to prioritize ICA/HDX traffic and ensure a good in-session user experience.
Print driver management

The Citrix Universal Printer Driver (UPD) is a device-independent print driver, which is compatible with most printers. The Citrix UPD consists of two components:

Server component. The Citrix UPD is installed as part of the Citrix Virtual Apps and Desktops VDA installation. The VDA installs the following drivers with Citrix UPD: “Citrix Universal Printer” (EMF driver) and the “Citrix XPS Universal Printer” (XPS driver).

<table>
<thead>
<tr>
<th>Name</th>
<th>Processor</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citrix Universal Printer</td>
<td>x64</td>
<td>Type 3 - User Mode</td>
</tr>
<tr>
<td>Citrix XPS Universal Printer</td>
<td>x64</td>
<td>Type 3 - User Mode</td>
</tr>
</tbody>
</table>

The VDA installers no longer offer options to control Universal Print Server PDF printer driver installation. The PDF printer driver is now always installed automatically. When you upgrade to the 7.17 VDA (or a later supported version), any previously installed Citrix PDF printer driver is automatically removed and replaced with the latest version.

When a print job is initiated the driver records the output of the application and sends it, without any modification to the end-point device.

Client component. The Citrix UPD is installed as part of the Citrix Workspace app installation. It fetches the incoming print stream for the Citrix Virtual Apps and Desktops session. It then forwards the print stream to the local printing subsystem where the print job is rendered using the device specific printer drivers.

The Citrix UPD supports the following print formats:

- Enhanced Metafile Format (**EMF**), default. EMF is the 32-bit version of the Windows Metafile (WMF) format. The EMF driver can only be used by Windows-based clients.
• XML Paper Specification (**XPS**). The XPS driver uses XML to create a platform-independent “electronic paper” similar to Adobe PDF format.

• Printer Command Language (**PCL5c** and **PCL4**). PCL is a printing protocol developed originally by Hewlett-Packard for inkjet printers. It is used for printing basic text and graphics and is widely supported on HP LaserJet and multifunction peripherals.

• PostScript (**PS**). PostScript is a computer language that can be used for printing text and vector graphics. The driver is widely used in low-cost printers and multifunction peripherals.

The PCL and PS drivers are best suited when using non-Windows based devices such as a Mac or UNIX client. The order in which Citrix UPD attempts to use the drivers can be changed using the **Universal driver preference** policy setting.

The Citrix UPD (EMF and XPS drivers) supports advanced printing features such as stapling and paper source selection. These features are available if the native driver makes them available using the Microsoft Print Capability technology. The native driver should use the standardized Print Schema Keywords in the Print Capabilities XML. If non-standard keywords are used, the advanced printing features are not available using Citrix Universal print driver.

The following illustration shows the Universal print driver components and a typical workflow for a printer locally attached to a device.

When planning your driver management strategy, determine if you will support the Universal print driver, device-specific drivers, or both. If you support standard drivers, you must determine:

During printer autocreation, if the system detects a new local printer connected to a user device, it checks the Multi-session OS machine for the required printer driver. By default, if a Windows-native driver is not available, the system uses the Universal print driver.

The printer driver on the Multi-session OS machine and the driver on the user device must match for
printing to succeed. The illustration that follows shows how a printer driver is used in two places for client printing.

- The types of drivers to support.
- Whether to install printer drivers automatically when they are missing from Multi-session OS machines.
- Whether to create driver compatibility lists.

Related content

- Printing configuration example
- Best practices, security considerations, and default operations
- Print policies and preferences
- Provision printers
- Maintain the printing environment
Choosing the most appropriate printing configuration options for your needs and environment can simplify administration. Although the default print configuration enables users to print in most environments, the defaults might not provide the expected user experience or the optimum network usage and management overhead for your environment.

Your printing configuration depends upon:

- Your business needs and your existing printing infrastructure.
  
  Design your printing configuration around the needs of your organization. Your existing printing implementation (whether users can add printers, which users have access to what printers, and so on) might be a useful guide when defining your printing configuration.

- Whether your organization has security policies that reserve printers for certain users (for example, printers for Human Resources or payroll).

- Whether users need to print while away from their primary work location, such as workers who move between workstations or travel on business.

When designing your printing configuration, try to give users the same experience in a session as they have when printing from local user devices.

Example print deployment

The following illustration shows the print deployment for these use cases:

- **Branch A** - A small overseas branch office with a few Windows workstations. Every user workstation has a locally attached, private printer.

- **Branch B** - A large branch office with thin clients and Windows-based workstations. For increased efficiency, the users of this branch share network-based printers (one per floor). Windows-based print servers located within the branch manage the print queues.

- **Home office** - A home office with a Mac OS-based user device that accesses the company’s Citrix infrastructure. The user device has a locally attached printer.
The following sections describe the configurations which minimize the complexity of the environment and simplify its management.

**Auto-created client printers and Citrix Universal printer driver**

In Branch A, all users work on Windows-based workstations, therefore auto-created client printers and the Universal printer driver are used. Those technologies provide these benefits:

- **Performance** - Print jobs are delivered over the ICA printing channel, thus the print data can be compressed to save bandwidth.

  To ensure that a single user printing a large document cannot degrade the session performance of other users, a Citrix policy is configured to specify the maximum printing bandwidth.

  An alternative solution is to leverage a multi-stream ICA connection, in which the print traffic is transferred within a separate low priority TCP connection. Multi-stream ICA is an option when Quality of Service (QoS) is not implemented on the WAN connection.
• Flexibility - Use of the Citrix Universal printer driver ensures that all printers connected to a client can also be used from a virtual desktop or application session without integrating a new printer driver in the data center.

**Citrix Universal Print Server**

In Branch B, all printers are network-based and their queues are managed on a Windows print server, thus the Citrix Universal Print Server is the most efficient configuration.

All required printer drivers are installed and managed on the print server by local administrators. Mapping the printers into the virtual desktop or application session works as follows:

• For Windows-based workstations - The local IT team helps users connect the appropriate network-based printer to their Windows workstations. This enables users to print from locally-installed applications.

  During a virtual desktop or application session, the printers configured locally are enumerated through autocreation. The virtual desktop or application then connects to the print server as a direct network connection if possible.

  The Citrix Universal Print Server components are installed and enabled, thus native printer drivers are not required. If a driver is updated or a printer queue is modified, no additional configuration is required in the data center.

• For thin clients - For thin client users, printers must be connected within the virtual desktop or application session. To provide users with the simplest printing experience, administrators configure a single Citrix Session Printer policy per floor to connect a floor’s printer as the default printer.

  To ensure the correct printer is connected even if users roam between floors, the policies are filtered based on the subnet or the name of the thin client. That configuration, referred to as proximity printing, allows for local printer driver maintenance (according to the delegated administration model).

  If a printer queue needs to be modified or added, Citrix administrators must modify the respective Session printer policy within the environment.

Because the network printing traffic will be sent outside the ICA virtual channel, QoS is implemented. Inbound and outbound network traffic on ports used by ICA/HDX traffic are prioritized over all other network traffic. That configuration ensures that user sessions are not impacted by large print jobs.

**Auto-created client printers and Citrix Universal printer driver**

For home offices where users work on non-standard workstations and use non-managed print devices, the simplest approach is to use auto-created client printers and the Universal printer driver.
Deployment summary

In summary, the sample deployment is configured as follows:

- No printer drivers are installed on Multi-session OS machines. Only the Citrix Universal printer driver is used. Fallback to native printing and the automatic installation of printer drivers are disabled.
- A policy is configured to auto-create all client printers for all users. Multi-session OS machines will directly connect to the print servers by default. The only configuration required is to enable the Universal Print Server components.
- A session printer policy is configured for every floor of Branch B and applied to all thin clients of the respective floor.
- QoS is implemented for Branch B to ensure excellent user experience.

Best practices, security considerations, and default operations

December 18, 2019

Best practices

Many factors determine the best printing solution for a particular environment. Some of these best practices might not apply to your Site.

- Use the Citrix Universal Print Server.
- Use the Universal printer driver or Windows-native drivers.
- Minimize the number of printer drivers installed on Multi-session OS machines.
- Use driver mapping to native drivers.
- Never install untested printer drivers on a production site.
- Avoid updating a driver. Always attempt to uninstall a driver, restart the print server, and then install the replacement driver.
- Uninstall unused drivers or use the Printer driver mapping and compatibility policy to prevent printers from being created with the driver.
- Try to avoid using version 2 kernel-mode drivers.
- To determine if a printer model is supported, contact the manufacturer or see the Citrix Ready product guide at www.citrix.com/ready.

In general, all of the Microsoft-supplied printer drivers are tested with Terminal Services and guaranteed to work with Citrix. However, before using a third-party printer driver, consult your
printer driver vendor so that the driver is certified for Terminal Services by the Windows Hardware Quality Labs (WHQL) program. Citrix does not certify printer drivers.

Security considerations

Citrix printing solutions are secure by design.

- The Citrix Print Manager Service constantly monitors and responds to session events such as logon and logoff, disconnect, reconnect, and session termination. It handles service requests by impersonating the actual session user.
- Citrix printing assigns each printer a unique namespace in a session.
- Citrix printing sets the default security descriptor for auto-created printers to ensure that client printers auto-created in one session are inaccessible to users running in other sessions. By default, administrative users cannot accidentally print to another session's client printer, even though they can see and manually adjust permissions for any client printer.

Default print operations

By default, if you do not configure any policy rules, printing behavior is as follows:

- The Universal Print Server is disabled.
- All printers configured on the user device are created automatically at the beginning of each session.

This behavior is equivalent to configuring the Citrix policy setting Auto-create client printers with the Auto-create all client printers option.

- The system routes all print jobs queued to printers locally attached to user devices as client print jobs (that is, over the ICA channel and through the user device).
- The system routes all print jobs queued to network printers directly from Multi-session OS machines. If the system cannot route the jobs over the network, it will route them through the user device as a redirected client print job.

This behavior is equivalent to disabling the Citrix policy setting Direct connection to print servers.

- The system attempts to store printing properties, a combination of the user's printing preferences and printing device-specific settings, on the user device. If the client does not support this operation, the system stores printing properties in user profiles on the Multi-session OS machine.

This behavior is equivalent to configuring the Citrix policy setting Printer properties retention with the Held in profile only if not saved on client option.
In VDAs version 7.16 and later, the Citrix policy setting “Automatic installation of inbox printer drivers” does not have any effect on Windows 8 and later Windows operating systems versions because V3 in-box printer drivers are not included in the operating system.

In VDAs earlier than 7.16, the system uses the Windows version of the printer driver if it is available on the Multi-session OS machine. If the printer driver is not available, the system attempts to install the driver from the Windows operating system. If the driver is not available in Windows, it uses a Citrix Universal print driver.

This behavior is equivalent to enabling the Citrix policy setting “Automatic installation of in-box printer drivers” and configuring the Universal printing setting with the “Use universal printing only if requested driver is unavailable”.

Enabling “Automatic installation of in-box printer drivers” might result in the installation of a large number of native printer drivers.

**Note:**
If you are unsure about what the shipping defaults are for printing, display them by creating a new policy and setting all printing policy rules to Enabled. The option that appears is the default.

**Always-On logging**

An Always-On logging feature is available for the print server and printing subsystem on the VDA.

To collate the logs as a ZIP for emailing, or to automatically upload logs to Citrix Insight Services, use the `Start-TelemetryUpload` PowerShell cmdlet.

**Printing policies and preferences**

December 18, 2019

When users access printers from published applications, you can configure Citrix policies to specify:

- How printers are provisioned (or added to sessions)
- How print jobs are routed
- How printer drivers are managed

You can have different printing configurations for different user devices, users, or any other objects on which policies are filtered.

Most printing functions are configured through the Citrix Printing policy settings. Printing settings follow standard Citrix policy behavior.
The system can write printer settings to the printer object at the end of a session or to a client printing device, provided the user’s network account has sufficient permissions. By default, Citrix Workspace app uses the settings stored in the printer object in the session, before looking in other locations for settings and preferences.

By default, the system stores, or retains, printer properties on the user device (if supported by the device) or in the user profile on the Multi-session OS machine. When a user changes printer properties during a session, those changes are updated in the user profile on the machine. The next time the user logs on or reconnects, the user device inherits those retained settings. That is, printer property changes on the user device do not impact the current session until after the user logs off and then logs on again.

**Printing preference locations**

In Windows printing environments, changes made to printing preferences can be stored on the local computer or in a document. In this environment, when users modify printing settings, the settings are stored in these locations:

- **On the user device itself** - Windows users can change device settings on the user device by right-clicking the printer in the Control Panel and selecting Printing Preferences. For example, if Landscape is selected as page orientation, landscape is saved as the default page orientation preference for that printer.

- **Inside of a document** - In word-processing and desktop-publishing programs, document settings, such as page orientation, are often stored inside documents. For example, when you queue a document to print, Microsoft Word typically stores the printing preferences you specified, such as page orientation and the printer name, inside the document. These settings appear by default the next time you print that document.

- **From changes a user made during a session** - The system keeps only changes to the printing settings of an auto-created printer if the change was made in the Control Panel in the session; that is, on the Multi-session OS machine.

- **On the Multi-session OS machine** - These are the default settings associated with a particular printer driver on the machine.

The settings preserved in any Windows-based environment vary according to where the user made the changes. This also means that the printing settings that appear in one place, such as in a spreadsheet program, can be different than those in others, such as documents. As result, printing settings applied to a specific printer can change throughout a session.

**Hierarchy of user printing preferences**

Because printing preferences can be stored in multiple places, the system processes them according to a specific priority. Also, it is important to note that device settings are treated distinctly from, and
usually take precedence over, document settings.

By default, the system always applies any printing settings a user modified during a session (that is, the retained settings) before considering any other settings. When the user prints, the system merges and applies the default printer settings stored on the Multi-session OS machine with any retained or client printer settings.

Saving user printing preferences

Citrix recommends that you do not change where the printer properties are stored. The default setting, which saves the printer properties on the user device, is the easiest way to ensure consistent printing properties. If the system is unable to save properties on the user device, it automatically falls back to the user profile on the Multi-session OS machine.

Review the Printer properties retention policy setting if these scenarios apply:

- If you use legacy plug-ins that do not allow users to store printer properties on a user device.
- If you use mandatory profiles on your Windows network and want to retain the user’s printer properties.

Provision printers

December 18, 2019

Citrix Universal Print Server

When determining the best print solution for your environment, consider the following:

- The Universal Print Server provides features not available for the Windows Print Provider: Image and font caching, advanced compression, optimization, and QoS support.
- The Universal print driver supports the public device-independent settings defined by Microsoft. If users need access to device settings that are specific to a print driver manufacturer, the Universal Print Server paired with a Windows-native driver might be the best solution. With that configuration, you retain the benefits of the Universal Print Server while providing users access to specialized printer functionality. A trade-off to consider is that Windows-native drivers require maintenance.
- The Citrix Universal Print Server provides universal printing support for network printers. The Universal Print Server uses the Universal print driver, a single driver on the Multi-session OS machine that allows local or network printing from any device, including thin clients and tablets.

To use the Universal Print Server with a Windows-native driver, enable the Universal Print Server. By default, if the Windows-native driver is available, it is used. Otherwise, the Universal print driver is
used. To specify changes to that behavior, such as to use only the Windows-native driver or only the Universal print driver, update the Universal print driver usage policy setting.

**Install the Universal Print Server**

To use the Universal Print Server, install the UpsServer component on your print servers, as described in the installation documents, and configure it. For more information, see Install core components and Install using the command line.

For environments where you want to deploy the UPClient component separately, for example with **XenApp 6.5**:

1. Download the Citrix Virtual Apps and Desktops Virtual Delivery Agent (VDA) standalone package for Windows Single-session OS or Windows Multi-session OS.
2. Extract the VDA using the command line instructions described in Install using the command line.
3. Install the pre-requisites from the \Image-Full\Support\VcRedist_2013_RTM
   - Vcredist_x64 / vcredist_x86
     - Run x86 for 32-bit only, and both for 64-bit deployments
4. Install the cdf prerequisite from the \Image-Full\x64\Virtual Desktop Components or \Image-Full\x86\Virtual Desktop Components.
   - Cdf_x64 / Cdf_x86
     - x86 for 32-bit, x64 for 64-bit
5. Find the UPClient component in \Image-Full\x64\Virtual Desktop Components or \Image-Full\x86\Virtual Desktop Components.
6. Install the UPClient component by extracting and then launching the component’s MSI.
7. A restart is required after installing the UPClient component.

**Opt out of CEIP for the Universal Print Server**

You are automatically enrolled in the Citrix Customer Experience Improvement Program (CEIP) when you install the Universal Print Server. The first upload of data occurs after seven days from the date and time of installation.

To opt out of CEIP, edit the registry key HKLM\Software\Citrix\Universal Print Server\CEIEnabled and set the DWORD value to 0.

To opt back in, set the DWORD value to 1.

**Caution:** Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.
Configure the Universal Print Server

Use the following Citrix policy settings to configure the Universal Print Server. For more information, refer to the on-screen policy settings help.

- **Universal Print Server enable.** Universal Print Server is disabled by default. When you enable Universal Print Server, you choose whether to use the Windows Print Provider if the Universal Print Server is unavailable. After you enable the Universal Print Server, a user can add and enumerate network printers through the Windows Print Provider and Citrix Provider interfaces.

- **Universal Print Server print data stream (CGP) port.** Specifies the TCP port number used by the Universal Print Server print data stream CGP (Common Gateway Protocol) listener. Defaults to 7229.

- **Universal Print Server web service (HTTP/SOAP) port.** Specifies the TCP port number used by the Universal Print Server listener for incoming HTTP/SOAP requests. Defaults to 8080.

To change the default port of HTTP 8080 for Universal Print Server communication to Citrix Virtual Apps and Desktops VDAs, the following registry must also be created and the port number value modified on the Universal Print Server computer(s):

```
HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\PrintingPolicies
"UpsHttpPort"=DWORD:<portnumber>
```

This port number must match the HDX Policy, Universal Print Server web service (HTTP/SOAP) port, in Studio.

- **Universal Print Server print stream input bandwidth limit (kbps).** Specifies the upper bound (in kilobits-per-second) for the transfer rate of print data delivered from each print job to the Universal Print Server using CGP. Defaults to 0 (unlimited).

- **Universal Print Servers for load balancing.** This setting lists the Universal Print Servers to be used to load balance printer connections established at session launch, after evaluating other Citrix printing policy settings. To optimize printer creation time, Citrix recommends that all print servers have the same set of shared printers.
• **Universal Print Servers out-of-service threshold.** Specifies how long the load balancer should wait for an unavailable print server to recover before it determines that the server is permanently offline and redistributes its load to other available print servers. Default is 180 (seconds).

Once the printing policies are modified on the Delivery Controller, it can take a few minutes for the policy changes to be applied to the VDAs.

**Interactions with other policy settings** - The Universal Print Server honors other Citrix printing policy settings and interacts with them as noted in the following table. The information provided assumes that the Universal Print Server policy setting is enabled, the Universal Print Server components are installed, and the policy settings are applied.

<table>
<thead>
<tr>
<th>Policy setting</th>
<th>Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client printer redirection, Auto-create client printers</td>
<td>After the Universal Print Server is enabled, client network printers are created using the Universal print driver instead of the native drivers. Users see the same printer name as before.</td>
</tr>
<tr>
<td>Session printers</td>
<td>When you use the Citrix Universal Print Server solution, Universal print driver policy settings are honored.</td>

</table>
Direct connections to print server | When the Universal Print Server is enabled and the Universal print driver usage policy setting is configured to use universal printing only, a direct network printer connection can be created to the print server, using the Universal print driver.

| UPD preference | Supports EMF and XPS drivers. |

**Effects on user interfaces** - The Citrix Universal print driver used by the Universal Print Server disables the following user interface controls:

- In the Printer Properties dialog box, the Local Printer Settings button
- In the Document Properties dialog box, the Local Printer Settings and Preview on client buttons

The Citrix Universal print driver (EMF and XPS drivers) supports advanced printing features such as stapling and paper source. The user can select Stapling or Paper Source options from the custom UPD print dialog if the client or network printers which are mapped to the UPD in the session support these features.
To set non-standard printer settings such as stapling and secure PIN, select **Local Settings** in the customer UPD print dialog for any client mapped printers that use either the Citrix UPD EMF or XPS drivers. The **Printing Preferences** dialog of the mapped printer is displayed outside the session on the client, allowing the user to change any printer option, and the modified printer settings are used in the active session when printing that document.

These features are available if the native driver makes them available using the Microsoft Print Capability technology. The native driver should use the standardized Print Schema Keywords in the Print Capabilities XML. If non-standard keywords are used, the advanced printing features will not be available using Citrix Universal print driver.

When using the Universal Print Server, the Add Printer Wizard for the Citrix Print Provider is the same as the Add Printer Wizard for the Windows Print Provider, with the following exceptions:

- When adding a printer by name or address, you can provide an HTTP/SOAP port number for the print server. That port number becomes a part of the printer name and appears in displays.
If the Citrix Universal print driver usage policy setting specifies that universal printing must be used, the Universal print driver name appears when selecting a printer. The Windows Print Provider cannot use the Universal print driver.

The Citrix Print Provider does not support client-side rendering.

For more information about the Universal Print Server, see CTX200328.

**Auto-created client printers**

These universal printing solutions are provided for client printers:

- **Citrix Universal Printer** - A generic printer created at the beginning of sessions that is not tied to a printing device. The Citrix Universal Printer is not required to enumerate the available client printers during logon, which can greatly reduce resource usage and decrease user logon times. The Universal Printer can print to any client-side printing device.

The Citrix Universal Printer might not work for all user devices or Citrix Workspace apps in your environment. The Citrix Universal Printer requires a Windows environment and does not support the Citrix Offline Plug-in or applications that are streamed to the client. Consider using auto-created client printers and the Universal print driver for such environments.

To use a universal printing solution for non-Windows Citrix Workspace apps, use one of the other Universal print drivers that are based on postscript/PCL and installed automatically.

- **Citrix Universal print drivers** - A device-independent printer driver. If you configure a Citrix Universal print driver, the system uses the EMF-based Universal print driver by default.

The Citrix Universal print driver might create smaller print jobs than older or less advanced printer drivers. However, a device-specific driver might be needed to optimize print jobs for a specialized printer.

**Configure universal printing** - Use the following Citrix policy settings to configure universal printing.

For more information, refer to the on-screen policy settings help.

- Universal print driver usage. Specifies when to use universal printing.
- Auto-create generic universal printer. Enables or disables auto-creation of the generic Citrix Universal Printer object for sessions when a user device compatible with Universal Printing is in use. By default, the generic Universal Printer object is not auto-created.
- Universal driver preference. Specifies the order in which the system attempts to use Universal print drivers, beginning with the first entry in the list. You can add, edit, or remove drivers and change the order of the drivers in the list.
- Universal printing preview preference. Specifies whether to use the print preview function for auto-created or generic universal printers.
• Universal printing EMF processing mode. Controls the method of processing the EMF spool file on the Windows user device. By default, EMF records are spooled directly to the printer. Spooling directly to the printer allows the spooler to process the records faster and uses fewer CPU resources.

For more policies, see Optimize printing performance. To change the defaults for settings such as paper size, print quality, color, duplex, and the number of copies, see CTX113148.

**Auto-create printers from the user device** - At the start of a session, the system auto-creates all printers on the user device by default. You can control what, if any, types of printers are provisioned to users and prevent autocreation.

Use the Citrix policy setting Auto-create client printers to control autocreation. You can specify that:

• All printers visible to the user device, including network and locally attached printers, are created automatically at the start of each session (default)
• All local printers physically attached to the user device is created automatically
• Only the default printer for the user device is created automatically
• Autocreation is disabled for all client printers

The Auto-create client printers setting requires that the Client printer redirection setting is Allowed (the default).

**Assign network printers to users**

By default, network printers on the user device are created automatically at the beginning of sessions. The system enables you to reduce the number of network printers that are enumerated and mapped by specifying the network printers to be created within each session. Such printers are referred to as session printers.

You can filter session printer policies by IP address to provide proximity printing. Proximity printing enables users within a specified IP address range to automatically access the network printing devices that exist within that same range. Proximity printing is provided by the Citrix Universal Print Server and does not require the configuration described in this section.

Proximity printing might involve the following scenario:

• The internal company network operates with a DHCP server which automatically designates IP addresses to users.
• All departments within the company have unique designated IP address ranges.
• Network printers exist within each department’s IP address range.

When proximity printing is configured and an employee travels from one department to another, no additional printing device configuration is required. Once the user device is recognized within the new department’s IP address range, it will have access to all network printers within that range.
**Configure specific printers to be redirected in sessions** - To create administrator-assigned printers, configure the Citrix policy setting Session printers. Add a network printer to that policy using one of the following methods:

- Enter the printer UNC path using the format `\servername\printername`.
- Browse to a printer location on the network.
- Browse for printers on a specific server. Enter the server name using the format `\servername` and click Browse.

Important: The server merges all enabled session printer settings for all applied policies, starting from the highest to lowest priorities. When a printer is configured in multiple policy objects, custom default settings are taken from only the highest priority policy object in which that printer is configured.

Network printers created with the Session printers setting can vary according to where the session was initiated by filtering on objects such as subnets.

**Specify a default network printer for a session** - By default, the user's main printer is used as the default printer for the session. Use the Citrix policy setting Default printer to change how the default printer on the user device is established in a session.

1. On the Default printer settings page, select a setting for Choose client's default printer:
   - Network printer name. Printers added with the Session printers policy setting appear in this menu. Select the network printer to use as the default for this policy.
   - Do not adjust the user's default printer. Uses the current Terminal Services or Windows user profile setting for the default printer. For more information, refer to the on-screen policy settings help.
2. Apply the policy to the group of users (or other filtered objects) you want to affect.

**Configure proximity printing** - Proximity printing is also provided by the Citrix Universal Print Server, which does not require the configuration described here.

1. Create a separate policy for each subnet (or to correspond with printer location).
2. In each policy, add the printers in that subnet’s geographic location to the Session printers setting.
3. Set the Default printer setting to Do not adjust the user's default printer.
4. Filter the policies by client IP address. Be sure to update these policies to reflect changes to the DHCP IP address ranges.

**Maintain the printing environment**

December 18, 2019

Maintaining the printing environment includes:
• Managing printer drivers
• Optimizing printing performance
• Displaying printer and managing print queues

Manage printer drivers

To minimize administrative overhead and the potential for print driver issues, Citrix recommends use of the Citrix Universal print driver.

If auto-creation fails, by default, the system installs a Windows-native printer driver provided with Windows. If a driver is not available, the system falls back to the Universal print driver. For more information about printer driver defaults, refer to Best practices, security considerations, and default operations.

If the Citrix Universal print driver is not an option for all scenarios, map printer drivers to minimize the amount of drivers installed on Multi-session OS machines. In addition, mapping printer drivers enables you to:

• Allow specified printers to use only the Citrix Universal print driver
• Allow or prevent printers to be created with a specified driver
• Substitute good printer drivers for outdated or corrupted drivers
• Substitute a driver that is available on Windows server for a client driver name

Prevent the automatic installation of printer drivers - The automatic installation of print drivers should be disabled to ensure consistency across Multi-session OS machines. This can be achieved through Citrix policies, Microsoft policies, or both. To prevent the automatic installation of Windows-native printer drivers, disable the Citrix policy setting Automatic installation of in-box printer drivers.

Map client printer drivers - Each client provides information about client-side printers during logon, including the printer driver name. During client printer autocreation, Windows server printer driver names are selected that correspond to the printer model names provided by the client. The autocreation process then uses the identified, available printer drivers to construct redirected client print queues.

Here is the general process for defining driver substitution rules and editing print settings for mapped client printer drivers:

1. To specify driver substitution rules for auto-created client printers, configure the Citrix policy setting Printer driver mapping and compatibility by adding the client printer driver name and selecting the server driver that you want to substitute for the client printer driver from the Find printer driver menu. You can use wildcards in this setting. For example, to force all HP printers to use a specific driver, specify HP* in the policy setting.
2. To ban a printer driver, select the driver name and choose the Do not create setting.
3. As needed, edit an existing mapping, remove a mapping, or change the order of driver entries in the list.
4. To edit the printing settings for mapped client printer drivers, select the printer driver, click Settings, and specify settings such as print quality, orientation, and color. If you specify a printing option that the printer driver does not support, that option has no effect. This setting overrides retained printer settings the user set during a previous session.
5. Citrix recommends testing the behavior of the printers in detail after mapping drivers, since some printer functionality can be available only with a specific driver.

When users log on the system checks the client printer driver compatibility list before it sets up the client printers.

**Optimize printing performance**

To optimize printing performance, use the Universal Print Server and Universal print driver. The following policies control printing optimization and compression:

- **Universal printing optimization defaults.** Specifies default settings for the Universal Printer when it is created for a session:
  - Desired image quality specifies the default image compression limit applied to universal printing. By default, Standard Quality is enabled, meaning that users can only print images using standard or reduced quality compression.
  - Enable heavyweight compression enables or disables reducing bandwidth beyond the compression level set by Desired image quality, without losing image quality. By default, heavyweight compression is disabled.
  - Image and Font Caching settings specify whether or not to cache images and fonts that appear multiple times in the print stream, ensuring each unique image or font is sent to the printer only once. By default, embedded images and fonts are cached.
  - Allow non-administrators to modify these settings specifies whether or not users can change the default print optimization settings within a session. By default, users are not allowed to change the default print optimization settings.

- **Universal printing image compression limit.** Defines the maximum quality and the minimum compression level available for images printed with the Universal print driver. By default, the image compression limit is set to Best Quality (lossless compression).

- **Universal printing print quality limit.** Specifies the maximum dots per inch (dpi) available for generating printed output in the session. By default, no limit is specified.

By default, all print jobs destined for network printers route from the Multi-session OS machine, across the network, and directly to the print server. Consider routing print jobs over the ICA connection if the network has substantial latency or limited bandwidth. To do that, disable the Citrix policy setting Direct connections to print servers. Data sent over the ICA connection is compressed, so less bandwidth is consumed as the data travels across the WAN.
**Improve session performance by limiting printing bandwidth** - While printing files from Multi-session OS machines to user printers, other virtual channels (such as video) may experience decreased performance due to competition for bandwidth especially if users access servers through slower networks. To prevent such degradation, you can limit the bandwidth used by user printing. By limiting the data transmission rate for printing, you make more bandwidth available in the HDX data stream for transmission of video, keystrokes, and mouse data.

**Important:**
The printer bandwidth limit is always enforced, even when no other channels are in use.

Use the following Citrix policy bandwidth printer settings to configure printing bandwidth session limits. To set the limits for the site, perform this task using Studio. To set the limits for individual servers, perform this task using the Group Policy Management Console in Windows locally on each Multi-session OS machine.

- The Printer redirection bandwidth limit setting specifies the bandwidth available for printing in kilobits per second (kbps).
- The Printer redirection bandwidth limit percent setting limits the bandwidth available for printing to a percentage of the overall bandwidth available.

Note: To specify bandwidth as a percentage using the Printer redirection bandwidth limit percent setting, enable the Overall session bandwidth limit as well.

If you enter values for both settings, the most restrictive setting (the lower value) is applied.

To obtain real-time information about printing bandwidth, use Citrix Director.

**Load balance Universal Print Servers**

The Universal Print Server solution can scale by adding more print servers into the load balance solution. There is no single point of failure as each VDA has its own load balancer to distribute the printing load to all print servers.

Use the policy settings, **Universal Print Servers for load balancing** and **Universal Print Servers out-of-service threshold**, to distribute the printing load across all the print servers in the load balance solution.

If there is an unforeseen failure of a print server, the failover mechanism of the load balancer in each VDA automatically redistributes the printer connections allocated on the failed print servers to the other available print servers such that all existing and incoming sessions function normally without affecting the user experience and without requiring the immediate administrator intervention.

Administrators can monitor the activity of the load balanced print servers using a set of performance counters to track the following on the VDA:
- List of load balanced print servers on the VDA and their state (available, unavailable)
- Number of printer connections accepted by each print server
- Number of printer connections failed on each print server
- Number of active printer connection on each print server
- Number of pending printer connections on each print server

**Display and manage print queues**

The following table summarizes where you can display printers and manage print queues in your environment.

<table>
<thead>
<tr>
<th>Printing Pathway</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client printers (Printers attached to the user device)</td>
<td>Client printing pathway UAC Enabled On: Print Management snap-in located in the Microsoft Management Console; UAC Enabled Off: Pre-Windows 8: Control Panel, Windows 8: Print Management snap-in</td>
</tr>
<tr>
<td>Network printers (Printers on a network print server)</td>
<td>Network printing pathway UAC Enabled On: Print Server &gt; Print Management snap-in located in the Microsoft Management Console; UAC Enabled Off: Print Server &gt; Control Panel</td>
</tr>
<tr>
<td>Local network server printers (Printers from a network print server that are added to a Multi-session OS machine)</td>
<td>Network printing pathway UAC Enabled On: Print Server &gt; Control Panel; UAC Enabled Off: Print Server &gt; Control Panel</td>
</tr>
</tbody>
</table>
Note:
Print queues for network printers that use the network printing pathway are private and cannot be managed through the system.

Policies

December 18, 2019

Policies are a collection of settings that define how sessions, bandwidth, and security are managed for a group of users, devices, or connection types.

You can apply policy settings to physical and virtual machines or to users. You can apply settings to individual users at the local level or in security groups in Active Directory. The configurations define specific criteria and rules. If you don’t specifically assign the policies, the settings are applied to all connections.

You can apply policies on different levels of the network. Policy settings placed at the Organizational Unit GPO level take the highest precedence on the network. Policies at the Domain GPO level override policies on the Site Group Policy Object level, which override any conflicting policies on both the Microsoft and Citrix Local Policies levels.

All Citrix Local Policies are created and managed in the Citrix Studio console and stored in the Site Database. Group Policies are created and managed by using the Microsoft Group Policy Management Console (GPMC) and stored in Active Directory. Microsoft Local Policies are created in the Windows Operating System and are stored in the registry.
Studio uses a Modeling Wizard to help administrators compare configuration settings within templates and policies to help eliminate conflicting and redundant settings. Administrators can set GPOs using the GPMC to configure settings and apply them to a target set of users at different levels of the network.

These GPOs are saved in Active Directory, and access to the management of these settings is restricted for most of IT for security.

Settings are merged according to priority and their condition. Any disabled setting overrides a lower-ranked enabled setting. Unconfigured policy settings are ignored and do not override lower-ranked settings.

Local policies can also have conflicts with group policies in the Active Directory, which might override each other depending on the situation.

All policies are processed in the following order:

1. The end user logs on to a machine using domain credentials.
2. Credentials are sent to the domain controller.
3. Active Directory applies all policies (end user, endpoint, organizational unit, and domain).
4. The end user logs on to Citrix Workspace app and accesses an application or desktop.
5. Citrix and Microsoft policies are processed for the end user and machine hosting the resource.
6. Active Directory determines precedence for policy settings. It then applies them to the registries of the endpoint device and to the machine hosting the resource.
7. The end user logs off from the resource. Citrix policies for the end user and endpoint device are no longer active.
8. The end user logs off the user device, which releases the GPO user policies.
9. The end user turns off the device, which releases the GPO machine policies.

When creating policies for groups of users, devices, and machines, some members might have different requirements and would need exceptions to some policy settings. Exceptions are made by way of filters in Studio and the GPMC that determine who or what the policy affects.

**Note:**

We do not support mixing Windows and Citrix policies in the same GPO.

## Work with policies

**September 14, 2020**

Configure Citrix policies to control user access and session environments. Citrix policies are the most efficient method of controlling connection, security, and bandwidth settings. You can create policies for specific groups of users, devices, or connection types. Each policy can contain multiple settings.
Tools for working with Citrix policies

You can use the following tools to work with Citrix policies.

- **Studio** - If you are a Citrix administrator without permission to manage group policy, use Studio to create policies for your site. Policies created using Studio are stored in the site database and updates are pushed to the virtual desktop either when that virtual desktop registers with the broker or when a user connects to that virtual desktop.

- **Local Group Policy Editor** (Microsoft Management Console snap-in) - If your network environment uses Active Directory and you have permission to manage group policy, you can use the Local Group Policy Editor to create policies for your site. The settings you configure affect the Group Policy Objects (GPOs) you specify in the Group Policy Management Console.

  **Important:**

  You must use the Local Group Policy Editor to configure some policy settings, including those related to registering VDAs with a Controller and those related to Microsoft App-V servers.

Policy processing order and precedence

Group policy settings are processed in the following order:

1. Local GPO
2. XenApp or XenDesktop Site GPO (stored in the Site database)
3. Site-level GPOs
4. Domain-level GPOs
5. Organizational Units

However, if a conflict occurs, policy settings that are processed last can overwrite those that are processed earlier. This means that policy settings take precedence in the following order:

1. Organizational Units
2. Domain-level GPOs
3. Site-level GPOs
4. XenApp or XenDesktop Site GPO (stored in the Site database)
5. Local GPO

For example, a Citrix administrator uses Studio to create a policy (Policy A) that enables client file redirection for the company's sales employees. Meanwhile, another administrator uses the Group Policy Editor to create a policy (Policy B) that disables client file redirection for sales employees. When the sales employees log on to the virtual desktops, Policy B is applied and Policy A is ignored because Policy B was processed at the domain level and Policy A was processed at the XenApp or XenDesktop Site GPO level.
However, when a user launches an ICA or Remote Desktop Protocol (RDP) session, Citrix session settings override the same settings configured in an Active Directory policy or using Remote Desktop Session Host Configuration. This includes settings that are related to typical RDP client connection settings such as Desktop wallpaper, Menu animation, and View window contents while dragging.

When using multiple policies, you can prioritize policies that contain conflicting settings; see Compare, prioritize, model, and troubleshoot policies for details.

**Workflow for Citrix policies**

The process for configuring policies is as follows:

1. Create the policy.
2. Configure policy settings.
3. Assign the policy to machine and user objects.
4. Prioritize the policy.
5. Verify the effective policy by running the Citrix Group Policy Modeling wizard.

**Navigate Citrix policies and settings**

In the Local Group Policy Editor, policies and settings appear in two categories: Computer Configuration and User Configuration. Each category has a Citrix Policies node. See the Microsoft documentation for details about navigating and using this snap-in.

In Studio, policy settings are sorted into categories based on the functionality or feature they affect. For example, the Profile management section contains policy settings for Profile management.

- Computer settings (policy settings applying to machines) define the behavior of virtual desktops and are applied when a virtual desktop starts. These settings apply even when there are no active user sessions on the virtual desktop. User settings define the user experience when connecting using ICA. User policies are applied when a user connects or reconnects using ICA. User policies are not applied if a user connects using RDP or logs on directly to the console.

To access policies, settings, or templates, select Policies in the Studio navigation pane.

- **The Policies** tab lists all policies. When you select a policy, tabs to the right display: Overview (name, priority, enabled/disabled status, and description), Settings (list of configured settings), and Assigned to (user and machine objects to which the policy is currently assigned). For more information, see Create policies.
- **The Templates** tab lists Citrix-provided and custom templates you created. When you select a template, tabs to the right display: Description (why you might want to use the template) and Settings (list of configured settings). For more information, see Policy templates.
- The Comparison tab enables you to compare the settings in a policy or template with those in other policies or templates. For example, you might want to verify setting values to ensure compliance with best practices. For more information, see Compare, prioritize, model, and troubleshoot policies.

- From the Modelling tab, you can simulate connection scenarios with Citrix policies. For more information, see Compare, prioritize, model, and troubleshoot policies.

To search for a setting in a policy or template:

1. Select the policy or template.
2. Select Edit policy or Edit Template in the Actions pane.
3. On the Settings page, begin to type the name of the setting.

You can refine your search by selecting a specific product version, selecting a category (for example, Bandwidth), or by selecting the View selected only check box or selecting to search only the settings that have been added to the selected policy. For an unfiltered search, select All Settings.

- To search for a setting within a policy:
  1. Select the policy.
  2. Select the Settings tab, begin to type the name of the setting.

You can refine your search by selecting a specific product version or by selecting a category. For an unfiltered search, select All Settings.

A policy, once created, is completely independent of the template used. You can use the Description field on a new policy to keep track of the source template used.

In Studio, policies and templates are displayed in a single list regardless of whether they contain user, computer or both types of settings and can be applied using both user and computer filters.

In Group Policy Editor, Computer and User settings must be applied separately, even if created from a template that contains both types of settings. In this example choosing to use Very High Definition User Experience in Computer Configuration:

- Legacy Graphics mode is a Computer setting that will be used in a policy created from this template.
- The User settings, grayed out, will not be used in a policy created from this template.
Policy templates

June 24, 2020

Templates are a source for creating policies from a predefined starting point. Built-in Citrix templates, optimized for specific environments or network conditions, can be used as:

- A source for creating your own policies and templates to share between sites.
- A reference for easier comparison of results between deployments as you are able to quote the results, for example, “...when using Citrix template x or y...”.
- A method for communicating policies with Citrix Support or trusted third parties by importing or exporting templates.

Policy templates can be imported and exported.

For considerations when using templates to create policies, see the Knowledge Center article CTX202330.

Built-in Citrix templates

The following policy templates are available:
• **Very High Definition User Experience.** This template enforces default settings that maximize the user experience. Use this template in scenarios where multiple policies are processed in order of precedence.

• **High Server Scalability.** Apply this template to economize on server resources. This template balances user experience and server scalability. It offers a good user experience while increasing the number of users you can host on a single server. This template does not use a video codec for compression of graphics and prevents server side multimedia rendering.

• **High Server Scalability-Legacy OS.** This High Server Scalability template applies only to VDAs running Windows Server 2008 R2 or Windows 7 and earlier. This template relies on the Legacy graphics mode which is more efficient for those operating systems.

• **Optimized for NetScaler SD-WAN.** Apply this template for users working from branch offices with NetScaler SD-WAN for optimizing delivery of Citrix Virtual Desktops. (NetScaler SD-WAN is the new name for CloudBridge).

• **Optimized for WAN.** This template is intended for task workers in branch offices using a shared WAN connection or remote locations with low bandwidth connections accessing applications with graphically simple user interfaces and little multimedia content. This template trades off video playback experience and some server scalability for optimized bandwidth efficiency.

• **Optimized for WAN-Legacy OS.** This Optimized for WAN template applies only to VDAs running Windows Server 2008 R2 or Windows 7 and earlier. This template relies on the Legacy graphics mode which is more efficient for those operating systems.

• **Security and Control.** Use this template in environments with low tolerance to risk, to minimize the features enabled by default in Citrix Virtual Apps and Desktops. This template includes settings that disable access to printing, clipboard, peripheral devices, drive mapping, port redirection, and Flash acceleration on user devices. Applying this template might use more bandwidth and reduce user density per server.

While we recommend using the built-in Citrix templates with their default settings, there are settings that do not have a specific recommended value. For example, **Overall session bandwidth limit**, included in the Optimized for WAN templates. In this case, the template exposes the setting so the administrator understands this setting is likely to apply to the scenario.
If you are working with a deployment (policy management and VDAs) earlier than XenApp and Xen-Desktop 7.6 FP3, and require High Server Scalability and Optimized for WAN templates, use the Legacy OS versions of these templates when they apply.

**Note:**
Citrix creates and updates built-in templates. You cannot modify or delete these templates.

**Create and manage templates using Studio**

To create a template based on a template:

1. Select **Policies** in the Studio navigation pane.
2. Select the **Templates** tab and then select the template from which you will create the template.
3. Select **Create Template** in the Actions pane.
4. Select and configure the policy settings to include in the template. Remove any existing settings that don’t belong. Enter a name for the template.

After you click **Finish**, the new template appears on the **Templates** tab.

To create a template based on a policy:

1. Select **Policies** in the Studio navigation pane.
2. Select the **Policies** tab and then select the policy from which you will create the template.
3. Select **Save as Template** in the Actions pane.
4. Select and configure any new policy settings to include in the template. Remove any existing settings that don’t belong. Enter a name and description for the template, and then click **Finish**.

To import a template:

1. Select **Policies** in the Studio navigation pane.
2. Select the **Templates** tab and then select **Import Template**.
3. Select the template file to import and then click **Open**. If you import a template with the same name as an existing template, you can choose to overwrite the existing template or save the template with a different name that is generated automatically.

To export a template:

1. Select **Policies** in the Studio navigation pane.
2. Select the **Templates** tab and then select **Export Template**.
3. Select the location where you want to save the template and then click **Save**.

A .gpt file is created in the specified location.

**Create and manage templates using the Group Policy Editor**

From the Group Policy Editor, expand Computer Configuration or User Configuration. Expand the **Policies** node and then select **Citrix Policies**. Choose the appropriate action.

**Templates and delegated administration**

Policy templates are stored on the machine where the policy management package was installed. This machine is either the Delivery Controller machine or the Group Policy Objects management machine - not the Citrix Virtual Apps and Desktops Site’s database. This means that the Windows administrative permissions control the policy template files rather than site’s delegated administration roles and scopes.

As a result, an administrator with read-only permission in the Site can, for example, create templates. However, because templates are local files, no changes are made to your environment.

Custom templates are only visible to the user account that creates them and stored in the user’s Windows profile. To expose a custom template further, create a policy from it or export it to a shared location.

**Create policies**

June 3, 2020

Before creating a policy, decide which group of users or devices it should affect. You may want to create a policy based on user job function, connection type, user device, or geographic location. Alternatively, you can use the same criteria that you use for Windows Active Directory group policies.

If you already created a policy that applies to a group, consider editing that policy and configuring the appropriate settings, instead of creating another policy. Avoid creating a new policy solely to enable a specific setting or to exclude the policy from applying to certain users.

When you create a new policy, you can base it on settings in a policy template and customize settings as needed, or you can create it without using a template and add all the settings you need.

In Citrix Studio, new policies created are set to Disabled unless the Enable policy checkbox is explicitly checked.

**Policy settings**

Policy settings can be enabled, disabled, or not configured. By default, policy settings are not configured, which means they are not added to a policy. Settings are applied only when they are added to
a policy.

Some policy settings can be in one of the following states:

- **Allowed or Prohibited** allows or prevents the action controlled by the setting. In some cases, users are allowed or prevented from managing the setting’s action in a session. For example, if the Menu animation setting is set to Allowed, users can control menu animations in their client environment.
- **Enabled or Disabled** turns the setting on or off. If you disable a setting, it is not enabled in lower-ranked policies.

In addition, some settings control the effectiveness of dependent settings. For example, Client drive redirection controls whether or not users are allowed to access the drives on their devices. To allow users to access their network drives, both this setting and the Client network drives setting must be added to the policy. If the Client drive redirection setting is disabled, users cannot access their network drives, even if the Client network drives setting is enabled.

In general, policy setting changes that impact machines go into effect either when the virtual desktop restarts or when a user logs on. Policy setting changes that impact users go into effect the next time users log on. If you are using Active Directory, policy settings are updated when Active Directory reevaluates policies at 90-minute intervals and applied either when the virtual desktop restarts or when a user logs on.

For some policy settings, you can enter or select a value when you add the setting to a policy. You can limit configuration of the setting by selecting Use default value. This disables configuration of the setting and allows only the setting’s default value to be used when the policy is applied, regardless of the value that was entered before selecting Use default value.

As best practice:

- **Assign policies to groups rather than individual users.** If you assign policies to groups, assignments are updated automatically when you add or remove users from the group.
- **Do not enable conflicting or overlapping settings in Remote Desktop Session Host Configuration.** In some cases, Remote Desktop Session Host Configuration provides similar functionality to Citrix policy settings. When possible, keep all settings consistent (enabled or disabled) for ease of troubleshooting.
- **Disable unused policies.** Policies with no settings added create unnecessary processing.

**Policy assignments**

When creating a policy, you assign it to certain user and machine objects; that policy is applied to connections according to specific criteria or rules. In general, you can add as many assignments as you want to a policy, based on a combination of criteria. If you specify no assignments, the policy is applied to all connections.
The following table lists the available assignments:

<table>
<thead>
<tr>
<th>Assignment name</th>
<th>Applies a policy based on</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control</td>
<td>Access control conditions through which a client is connecting. <strong>Connection type</strong> - Whether to apply the policy to connections made with or without NetScaler Gateway. <strong>NetScaler Gateway farm name</strong> - Name of the NetScaler Gateway virtual server. <strong>Access condition</strong> - Name of the end point analysis policy or session policy to use.</td>
</tr>
<tr>
<td>Netscaler SD-WAN</td>
<td>Whether or not a user session is launched through Netscaler SD-WAN. Note: You can add only one Netscaler SD-WAN assignment to a policy.</td>
</tr>
<tr>
<td>Client IP Address</td>
<td>IP address of the user device used to connect to the session: IPv4 examples: 12.0.0.0, 12.0.0.*, 12.0.0.1-12.0.0.70, 12.0.0.1/24; IPv6 examples: 2001:0db8:3c4d:0015:0:0:abcd:ef12, 2001:0db8:3c4d:0015::/54</td>
</tr>
<tr>
<td>Client Name</td>
<td>Name of the user device. Exact match: ClientABCName. Using wildcard: Client*Name.</td>
</tr>
<tr>
<td>Delivery Group</td>
<td>Delivery Group membership.</td>
</tr>
<tr>
<td>Delivery Group type</td>
<td>Type of desktop or application: private desktop, shared desktop, private application, or shared application. <strong>Note:</strong> Private desktop and shared desktop filter options are available only for Citrix Virtual Apps and Desktops 7.x. For more information, see CTX219153.</td>
</tr>
<tr>
<td>Organizational Unit (OU)</td>
<td>Organizational unit.</td>
</tr>
<tr>
<td>Tag</td>
<td>Tags. <strong>Note:</strong> Apply this policy to all tagged machines. Note that application tags are not included.</td>
</tr>
<tr>
<td>User or Group</td>
<td>User or group name.</td>
</tr>
</tbody>
</table>
policies are sorted into priority order and multiple instances of any setting are compared. Each setting is applied according to the priority ranking of the policy. Any policy setting that is disabled takes precedence over a lower-ranked setting that is enabled. Policy settings that are not configured are ignored.

Important:
When configuring both Active Directory and Citrix policies using the Group Policy Management Console, assignments and settings may not be applied as expected. For more information, see CTX127461

A policy named “Unfiltered” is provided by default.

- If you use Studio to manage Citrix policies, settings you add to the Unfiltered policy are applied to all servers, desktops, and connections in a Site.
- If you use the Local Group Policy Editor to manage Citrix policies, settings you add to the Unfiltered policy are applied to all Sites and connections that are within the scope of the Group Policy Objects (GPOs) that contain the policy. For example, the Sales OU contains a GPO called Sales-US that includes all members of the US sales team. The Sales-US GPO is configured with an Unfiltered policy that includes several user policy settings. When the US Sales manager logs on to the Site, the settings in the Unfiltered policy are automatically applied to the session because the user is a member of the Sales-US GPO.

An assignment’s mode determines if the policy is applied only to connections that match all the assignment criteria. If the mode is set to Allow (the default), the policy is applied only to connections that match the assignment criteria. If the mode is set to Deny, the policy is applied if the connection does not match the assignment criteria. The following examples illustrate how assignment modes affect Citrix policies when multiple assignments are present.

- **Example: Assignments of like type with differing modes** - In policies with two assignments of the same type, one set to Allow and one set to Deny, the assignment set to Deny takes precedence, provided the connection satisfies both assignments. For example:

  Policy 1 includes the following assignments:
  - Assignment A specifies the Sales group; the mode is set to Allow
  - Assignment B specifies the Sales manager’s account; the mode is set to Deny

  Because the mode for Assignment B is set to Deny, the policy is not applied when the Sales manager logs on to the Site, even though the user is a member of the Sales group.

- **Example: Assignments of differing type with like modes** - In policies with two or more assignments of differing types, set to Allow, the connection must satisfy at least one assignment of each type in order for the policy to be applied. For example:

  Policy 2 includes the following assignments:
  - Assignment C is a User assignment that specifies the Sales group; the mode is set to Allow
Assignment D is a Client IP Address assignment that specifies 10.8.169.* (the corporate network); the mode is set to Allow.

When the Sales manager logs on to the Site from the office, the policy is applied because the connection satisfies both assignments.

Policy 3 includes the following assignments:

- Assignment E is a User assignment that specifies the Sales group; the mode is set to Allow
- Assignment F is an Access Control assignment that specifies NetScaler Gateway connection conditions; the mode is set to Allow

When the Sales manager logs on to the Site from the office, the policy is not applied because the connection does not satisfy Assignment F.

Create a new policy based on a template, using Studio

1. Select Policies in the Studio navigation pane.
2. Select the Templates tab and select a template.
3. Select Create Policy from Template in the Actions pane.
4. By default, the new policy uses all the default settings in the template (the Use template default settings radio button is selected). If you want to change settings, select the Modify defaults and add more settings radio button, and then add or remove settings.
5. Specify how to apply the policy by selecting one of the following:

   - Assign to selected user and machine objects and then select the user and machine objects to which the policy will apply.
   - Assign to all objects in a site to apply the policy to all user and machine objects in the Site.

6. Enter a name for the policy (or accept the default); consider naming the policy according to who or what it affects, for example Accounting Department or Remote Users. Optionally, add a description.

   The policy is enabled by default; you can disable it. Enabling the policy allows it to be applied immediately to users logging on. Disabling prevents the policy from being applied. If you need to prioritize the policy or add settings later, consider disabling the policy until you are ready to apply it.

Create a new policy using Studio

1. Select Policies in the Studio navigation pane.
2. Select the Policies tab.
3. Select Create Policy in the Actions pane.

4. Add and configure policy settings.

5. Specify how to apply the policy by choosing one of the following:
   - Assign to selected user and machine objects and then select the user and machine objects to which the policy will apply.
   - Assign to all objects in a site to apply the policy to all user and machine objects in the Site.

6. Enter a name for the policy (or accept the default); consider naming the policy according to who or what it affects, for example Accounting Department or Remote Users. Optionally, add a description.

   The policy is enabled by default; you can disable it. Enabling the policy allows it to be applied immediately to users logging on. Disabling prevents the policy from being applied. If you need to prioritize the policy or add settings later, consider disabling the policy until you are ready to apply it.

### Create and manage policies using the Group Policy Editor

From the Group Policy Editor, expand Computer Configuration or User Configuration. Expand the Policies node and then select Citrix Policies. Choose the appropriate action below.

<table>
<thead>
<tr>
<th>Task</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a new policy</td>
<td>On the Policies tab, click New.</td>
</tr>
<tr>
<td>Edit an existing policy</td>
<td>On the Policies tab, select the policy and then click Edit.</td>
</tr>
<tr>
<td>Change the priority of an existing policy</td>
<td>On the Policies tab, select the policy and then click either Higher or Lower.</td>
</tr>
<tr>
<td>View summary information about a policy</td>
<td>On the Policies tab, select the policy and then click the Summary tab.</td>
</tr>
<tr>
<td>View and amend policy settings</td>
<td>On the Policies tab, select the policy and then click the Settings tab.</td>
</tr>
<tr>
<td>View and amend policy filters</td>
<td>On the Policies tab, select the policy and then click the Filters tab. When you add more than one filter to a policy, all the filter conditions must be met for the policy to be applied.</td>
</tr>
<tr>
<td>Enable or disable a policy</td>
<td>On the Policies tab, select the policy and then select either Actions &gt; Enable or Actions &gt; Disable.</td>
</tr>
</tbody>
</table>
### Task Instruction

Create a new policy from an existing template

On the Templates tab, select the template and then click New Policy.

---

**Compare, prioritize, model, and troubleshoot policies**

December 18, 2019

You can use multiple policies to customize your environment to meet users’ needs based on their job functions, geographic locations, or connection types. For example, for security you may need to place restrictions on user groups who regularly work with sensitive data. You can create a policy that prevents users from saving sensitive files on their local client drives. However, if some people in the user group do need access to their local drives, you can create another policy for only those users. You then rank or prioritize the two policies to control which one takes precedence.

When using multiple policies, you must determine how to prioritize them, how to create exceptions, and how to view the effective policy when policies conflict.

In general, policies override similar settings configured for the entire Site, for specific Delivery Controllers, or on the user device. The exception to this principle is security. The highest encryption setting in your environment, including the operating system and the most restrictive shadowing setting, always overrides other settings and policies.

Citrix policies interact with policies you set in your operating system. In a Citrix environment, Citrix settings override the same settings configured in an Active Directory policy or using Remote Desktop Session Host Configuration. This includes settings that are related to typical Remote Desktop Protocol (RDP) client connection settings such as Desktop wallpaper, Menu animation, and View window contents while dragging. For some policy settings, such as Secure ICA, the settings in policies must match the settings in the operating system. If a higher priority encryption level is set elsewhere, the Secure ICA policy settings that you specify in the policy or when you are delivering application and desktops can be overridden.

For example, the encryption settings that you specify when creating Delivery Groups should be at the same level as the encryption settings you specified throughout your environment.

Note: In the second hop of double-hop scenarios, when a Single-session OS VDA connects to Multi-session OS VDA, Citrix policies act on the Single-session OS VDA as if it were the user device. For example, if policies are set to cache images on the user device, the images cached for the second hop in a double-hop scenario are cached on the Single-session OS VDA machine.
Compare policies and templates

You can compare settings in a policy or template with those in other policies or templates. For example, you might need to verify setting values to ensure compliance with best practices. You might also want to compare settings in a policy or template with the default settings provided by Citrix.

1. Select Policies in the Studio navigation pane.
2. Click the Comparison tab and then click Select.
3. Choose the policies or templates to compare. To include default values in the comparison, select the Compare to default settings check box.
4. After you click Compare, the configured settings are displayed in columns.
5. To see all settings, select Show All Settings. To return to the default view, select Show Common Settings.

Prioritize policies

Prioritizing policies allows you to define the precedence of policies when they contain conflicting settings. When a user logs on, all policies that match the assignments for the connection are identified. Those policies are sorted into priority order and multiple instances of any setting are compared. Each setting is applied according to the priority ranking of the policy.

You prioritize policies by giving them different priority numbers in Studio. By default, new policies are given the lowest priority. If policy settings conflict, a policy with a higher priority (a priority number of 1 is the highest) overrides a policy with a lower priority. Settings are merged according to priority and the setting’s condition; for example, whether the setting is disabled or enabled. Any disabled setting overrides a lower-ranked setting that is enabled. Policy settings that are not configured are ignored and do not override the settings of lower-ranked settings.

1. Select Policies in the Studio navigation pane. Make sure the Policies tab is selected.
2. Select a policy.
3. Select Lower Priority or Higher Priority in the Actions pane.

Exceptions

When you create policies for groups of users, user devices, or machines, you may find that some members of the group require exceptions to some policy settings. You can create exceptions by:

- Creating a policy only for those group members who need the exceptions and then ranking the policy higher than the policy for the entire group
- Using the Deny mode for an assignment added to the policy

An assignment with the mode set to Deny applies a policy only to connections that do not match the assignment criteria. For example, a policy contains the following assignments:
- Assignment A is a client IP address assignment that specifies the range 208.77.88.*; the mode is set to Allow
- Assignment B is a user assignment that specifies a particular user account; the mode is set to Deny

The policy is applied to all users who log on to the Site with IP addresses in the range specified in Assignment A. However, the policy is not applied to the user logging on to the Site with the user account specified in Assignment B, even though the user’s computer is assigned an IP address in the range specified in Assignment A.

**Determine which policies apply to a connection**

Sometimes a connection does not respond as expected because multiple policies apply. If a higher priority policy applies to a connection, it can override the settings you configure in the original policy. You can determine how final policy settings are merged for a connection by calculating the Resultant Set of Policy.

You can calculate the Resultant Set of Policy in the following ways:

- Use the Citrix Group Policy Modeling Wizard to simulate a connection scenario and discern how Citrix policies might be applied. You can specify conditions for a connection scenario such as domain controller, users, Citrix policy assignment evidence values, and simulated environment settings such as slow network connection. The report that the wizard produces lists the Citrix policies that would likely take effect in the scenario. If you are logged on to the Controller as a domain user, the wizard calculates the Resultant Set of Policy using both site policy settings and Active Directory Group Policy Objects (GPOs).
- Use Group Policy Results to produce a report describing the Citrix policies in effect for a given user and controller. The Group Policy Results tool helps you evaluate the current state of GPOs in your environment and generates a report that describes how these objects, including Citrix policies, are currently being applied to a particular user and controller.

You can launch the Citrix Group Policy Modeling Wizard from the Actions pane in Studio. You can launch either tool from the Group Policy Management Console in Windows.

If you run the Citrix Group Policy Modeling Wizard or Group Policy Results tool from the Group Policy Management Console, site policy settings created using Studio are not included in the Resultant Set of Policy.

To ensure you obtain the most comprehensive Resultant Set of Policy, Citrix recommends launching the Citrix Group Policy Modeling wizard from Studio, unless you create policies using only the Group Policy Management Console.
**Use the Citrix Group Policy Modeling Wizard**

Open the Citrix Group Policy Modeling Wizard using one of the following:

- Select Policies in the Studio navigation pane, select the Modeling tab, and then select Launch Modeling Wizard in the Actions pane.
- Launch the Group Policy Management Console (gpmc.msc), right-click Citrix Group Policy Modeling in the tree pane, and then select Citrix Group Policy Modeling Wizard.

Follow the wizard instructions to select the domain controller, users, computers, environment settings, and Citrix assignment criteria to use in the simulation. After you click Finish, the wizard produces a report of the modeling results. In Studio, the report appears in the middle pane under the Modeling tab.

To view the report, select View Modeling Report.

**Troubleshoot policies**

Users, IP addresses, and other assigned objects can have multiple policies that apply simultaneously. This can result in conflicts where a policy may not behave as expected. When you run the Citrix Group Policy Modeling Wizard or the Group Policy Results tool, you might discover that no policies are applied to user connections. When this happens, users connecting to their applications and desktops under conditions that match the policy evaluation criteria are not affected by any policy settings. This occurs when:

- No policies have assignments that match the policy evaluation criteria.
- Policies that match the assignment do not have any settings configured.
- Policies that match the assignment are disabled.

If you want to apply policy settings to the connections that meet the specified criteria, make sure:

- The policies you want to apply to those connections are enabled.
- The policies you want to apply have the appropriate settings configured.

**Default policy settings**

September 24, 2020

The following tables list policy settings, their default, and the Virtual Delivery Agent (VDA) versions to which they apply.

**ICA**
<table>
<thead>
<tr>
<th>Name</th>

### Virtual Delivery Agent/HDX 3D Pro
Name | Default setting | VDA
--- | --- | ---
Enable lossless | Enabled | VDA 5.5, 5.6 FP1
HDX 3D Pro quality settings | VDA 5.5, 5.6 FP1

**Virtual Delivery Agent/Monitoring**

Name | Default setting | VDA
--- | --- | ---
Enable process monitoring | Disabled | VDA 7.11 through current
Enable resource monitoring | Enabled | VDA 7.11 through current

**Virtual IP**

Name | Default setting | VDA
--- | --- | ---
Virtual IP loopback support | Disabled | VDA 7.6 through current
Virtual IP virtual loopback programs list | None | VDA 7.6 through current

**Policy settings reference**

September 14, 2020

Policies contain settings that are applied when the policy is enforced. Descriptions in this section also indicate if more settings are required to enable a feature or are similar to a setting.

**Quick reference**

The following tables list the settings you can configure within a policy. Find the task you want to complete in the left column, then locate its corresponding setting in the right column.

A full listing of all policy settings is available in .CHM (Compiled HTML) format and .CSV format. These files are available in the `\program files\citrix\grouppolicy` folder on the server where the broker (delivery controller) is installed. You can also download the latest version of the policy settings by clicking here.
## Audio

<table>
<thead>
<tr>
<th>For this task</th>
<th>Use this policy setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control whether to allow the use of multiple audio devices</td>
<td>Audio Plug N Play</td>
</tr>
<tr>
<td>Control whether to allow audio input from microphones on the user device</td>
<td>Client microphone redirection</td>
</tr>
<tr>
<td>Control audio quality on the user device</td>
<td>Audio quality</td>
</tr>
<tr>
<td>Control audio mapping to speakers on the user device</td>
<td>Client audio redirection</td>
</tr>
</tbody>
</table>

## Bandwidth for user devices

<table>
<thead>
<tr>
<th>To limit bandwidth used for</th>
<th>Use this policy setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client audio mapping</td>
<td>Audio redirection bandwidth limit or Audio redirection bandwidth limit percent</td>
</tr>
<tr>
<td>Cut-and-paste using local clipboard</td>
<td>Clipboard redirection bandwidth limit or Clipboard redirection bandwidth limit percent</td>
</tr>
<tr>
<td>Access in a session to local client drives</td>
<td>File redirection bandwidth limit or File redirection bandwidth limit percent</td>
</tr>
<tr>
<td>HDX MediaStream Multimedia Acceleration</td>
<td>HDX MediaStream Multimedia Acceleration bandwidth limit or HDX MediaStream Multimedia Acceleration bandwidth limit percent</td>
</tr>
<tr>
<td>Client session</td>
<td>Overall session bandwidth limit</td>
</tr>
<tr>
<td>Printing</td>
<td>Printer redirection bandwidth limit or Printer redirection bandwidth limit percent</td>
</tr>
<tr>
<td>TWAIN devices (such as a camera or scanner)</td>
<td>TWAIN device redirection bandwidth limit or TWAIN device redirection bandwidth limit percent</td>
</tr>
<tr>
<td>USB devices</td>
<td>Client USB device redirection bandwidth limit or Client USB device redirection bandwidth limit percent</td>
</tr>
</tbody>
</table>

## Redirection of client drives and user devices

© 1999-2020 Citrix Systems, Inc. All rights reserved.
For this task | Use this policy setting
--- | ---
Control whether or not drives on the user device are connected when users log on to the server | Auto connect client drives
Control cut-and-paste data transfer between the server and the local clipboard | Client clipboard redirection
Control how drives map from the user device | Client drive redirection
Control whether users' local hard drives are available in a session | Client fixed drives and Client drive redirection
Control whether users' local floppy drives are available in a session | Client floppy drives and Client drive redirection
Control whether users' network drives are available in a session | Client network drives and Client drive redirection
Control whether users' local CD, DVD, or Blu-ray drives are available in a session | Client optical drives and Client drive redirection
Control whether users' local removable drives are available in a session | Client removable drives and Client drive redirection
Control whether users' TWAIN devices, such as scanners and cameras, are available in a session and control compression of image data transfers | Client TWAIN device redirection; TWAIN compression redirection
Control whether USB devices are available in a session | Client USB device redirection and Client USB device redirection rules
Improve the speed of writing and copying files to a client disk over a WAN | Use asynchronous writes

**Content redirection**

For this task | Use this policy setting
--- | ---
Control whether to use content redirection from the server to the user device | Host to client redirection

**Desktop UI**
For this task | Use this policy setting
--- | ---
Control whether or not Desktop wallpaper is used in users’ sessions | Desktop wallpaper
View window contents while a window is dragged | View window contents while dragging

**Graphics and multimedia**

**Important:**
The Flash policy remains only to allow customers with older VDAst to use newer controllers (for example, version 1912 controllers) and still use Flash. This VDA version does not support Flash.

For this task | Use this policy setting
--- | ---
Control the maximum number of frames per second sent to user devices from virtual desktops | Target frame rate
Control the visual quality of images displayed on the user device | Visual quality
Control whether websites can display Flash content when accessed in sessions | Flash server-side content fetching URL list; Flash URL compatibility list; Flash video fallback prevention policy setting; Flash video fallback prevention error *.swf
Control compression of server-rendered video | Use video codec for compression; Use hardware encoding for video codec
Control the delivery of HTML5 multimedia web content to users | HTML5 video redirection

**Prioritize Multi-Stream network traffic**

For this task | Use this policy setting
--- | ---
Specify ports for ICA traffic across multiple connections and establish network priorities | Multi-Port policy
Enable support for multi-stream connections among servers and user devices | Multi-Stream (computer and user settings)
Print

<table>
<thead>
<tr>
<th>For this task</th>
<th>Use this policy setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control creation of client printers on the user device</td>
<td>Auto-create client printers and Client printer redirection</td>
</tr>
<tr>
<td>Control the location where printer properties are stored</td>
<td>Printer properties retention</td>
</tr>
<tr>
<td>Control whether the client or the server processes the print requests</td>
<td>Direct connections to print servers</td>
</tr>
<tr>
<td>Control whether users can access printers connected to their user devices</td>
<td>Client printer redirection</td>
</tr>
<tr>
<td>Control installation of native Windows drivers when automatically creating client and network printers</td>
<td>Automatic installation of in-box printer drivers</td>
</tr>
<tr>
<td>Control when to use the Universal Printer Driver</td>
<td>Universal print driver usage</td>
</tr>
<tr>
<td>Choose a printer based on a roaming user session information</td>
<td>Default printer</td>
</tr>
<tr>
<td>Load balance and set failover threshold for Universal Print Servers</td>
<td>Universal Print Servers for load balancing; Universal Print Servers out-of-service threshold</td>
</tr>
</tbody>
</table>

Note:

Policies cannot be used to enable a screen saver in a desktop or application session. For users who require screen savers, the screen saver can be implemented on the user device.

ICA policy settings

July 28, 2020

Adaptive transport

This setting allows or prevents data transport over EDT as primary and fallback to TCP.

By default, adaptive transport is enabled (Preferred), and EDT is used when possible, with fallback to TCP. If it’s been disabled and you want to enable it, follow this procedure.
1. In Studio, enable the policy setting, HDX adaptive transport. We also recommend that you do not enable this feature as a universal policy for all objects in the Site.

2. To enable the policy setting, set the value to Preferred, then click OK.

**Preferred.** Adaptive transport over EDT is used when possible, with fallback to TCP.

**Diagnostic mode.** EDT is forced on and fallback to TCP is disabled. We recommend this setting only for troubleshooting.

**Off.** TCP is forced on, and EDT is disabled.

For more information, see Adaptive transport.

**Application launch wait timeout**

This setting specifies the wait timeout value in milliseconds for a session to wait for the first application to start. If the start of the application exceeds this time period, the session ends.

You can choose the default time (10,000 milliseconds) or specify a number in milliseconds.

**Client clipboard redirection**

This setting allows or prevents the clipboard on the user device being mapped to the clipboard on the server.

By default, clipboard redirection is allowed.

To prevent cut-and-paste data transfer between a session and the local clipboard, select Prohibit. Users can still cut and paste data between applications running in sessions.

After allowing this setting, configure the maximum allowed bandwidth the clipboard can consume in a client connection. Use the **Clipboard redirection bandwidth limit** or the **Clipboard redirection bandwidth limit percent** settings.

**Client clipboard write allowed formats**

When the Restrict client clipboard write setting is Enabled, host clipboard data cannot be shared with the client endpoint. You can use this setting to allow specific data formats to be shared with the client endpoint clipboard. To use this setting, enable it and add the specific formats to be allowed.

The following clipboard formats are system defined:

- CF_TEXT
- CF_BITMAP
- CF_METAFILEPICT
- CF_SYLK
The following custom formats are predefined in XenApp and XenDesktop and Citrix Virtual Apps and Desktops:

- CFX_RICHTEXT
- CFX_OfficeDrawingShape
- CFX_BIFF8

HTML format is disabled by default. To enable this feature:

- Ensure that **Client clipboard redirection** is set to **Allowed**.
- Ensure that **Restrict client clipboard write** is set to **Enabled**.
- Add an entry for **CF_HTML** (and any other formats you want supported) in **Client clipboard write allowed formats**.

You can add more custom formats. The custom format name must match the formats to be registered with the system. Format names are case-sensitive.

This setting does not apply if either **Client clipboard redirection** or **Restrict client clipboard write** is set to **Prohibited**.

**Note**

Enabling HTML format clipboard copy support (CF_HTML) copies any scripts from the source of the copied content to the destination. Check that you trust the source before proceeding to copy.
If you do copy content containing scripts, they are live only if you save the destination file as an
HTML file and execute it.

**Limit clipboard client to session transfer size**

This setting specifies the maximum size of clipboard data a user can transfer from a client endpoint
to a virtual session during a single cut-and-paste operation.

To limit clipboard transfer size, enable the **Limit clipboard client to session transfer size** setting.
Then, in the **Size Limit** field, enter a value in kilobytes to define the size of data transfer between the
local clipboard and a session.

By default, this setting is disabled and there is no limit on client to session transfers.

**Limit clipboard session to client transfer size**

This setting specifies the maximum size of clipboard data a user can transfer from a virtual session to
a client endpoint during a single cut-and-paste operation.

To limit clipboard transfer size, enable the **Limit clipboard session to client transfer size** setting.
Then, in the **Size Limit** field, enter a value in kilobytes to define the size of data transfer between a
session and the local clipboard.

By default, this setting is disabled and there is no limit on session to client transfers.

**Restrict client clipboard write**

If this setting is **Allowed**, host clipboard data cannot be shared with the client endpoint. You can allow
specific formats by enabling the **Client clipboard write allowed formats** setting.

By default, this setting is Prohibited.

**Restrict session clipboard write**

When this setting is **Allowed**, client clipboard data cannot be shared within the user session. You can
allow specific formats by enabling the **Session clipboard write allowed formats** setting.

By default, this setting is Prohibited.

**Session clipboard write allowed formats**

When the **Restrict session clipboard write** setting is **Allowed**, client clipboard data cannot be shared
with session applications. You can use this setting to allow specific data formats to be shared with the
session clipboard.
The following clipboard formats are system defined:

- CF_TEXT
- CF_BITMAP
- CF_METAFILEPICT
- CF_SYLK
- CF_DIF
- CF_TIFF
- CF_OEMTEXT
- CF_DIB
- CF_PALETTE
- CF_PENDATA
- CF_RIFF
- CF_WAVE
- CF_UNICODETEXT
- CF_ENHMETAFILE
- CF_HDROP
- CF_LOCALE
- CF_DIBV5
- CF_OWNERDISPLAY
- CF_DSPTEXT
- CF_DSPBITMAP
- CF_DSPMETAFILEPICT
- CF_DISPENHMETAFILE
- CF_HTML

The following custom formats are pre-defined in XenApp and XenDesktop and Citrix Virtual Apps and Desktops:

- CFX_RICHTEXT
- CFX_OfficeDrawingShape
- CFX_BIFF8

HTML format is disabled by default. To enable this feature:

- Ensure that Client clipboard redirection is set to Allowed.
- Ensure that Restrict session clipboard write is set to Enabled.
- Add an entry for CF_HTML (and any other formats you want supported) in Session clipboard write allowed formats.

You can add more custom formats. The custom format name must match the formats to be registered with the system. Format names are case-sensitive.

This setting does not apply if either the Client clipboard redirection setting or Restrict session clip-
board write setting is set to Prohibited.

Note

Enabling HTML format clipboard copy support (CF_HTML) copies any scripts from the source of the copied content to the destination. Check that you trust the source before proceeding to copy. If you do copy content containing scripts, they are live only if you save the destination file as an HTML file and execute it.

Desktop starts

This setting allows or prevents connections to a session on that VDA using an ICA connection by non-administrative users in a VDA Direct Access Users group.

By default, non-administrative users cannot connect to these sessions.

This setting doesn’t affect non-administrative users in a VDA Direct Access Users group who are using an RDP connection. These users can connect to the VDA whether this setting is enabled or disabled.

This setting doesn’t affect non-administrative users who are not in a VDA Direct Access Users group. These users cannot connect to the VDA whether this setting is enabled or disabled.

ICA listener connection timeout

This setting specifies the maximum wait time for a connection using the ICA protocol to be completed.

By default, the maximum wait time is 120,000 milliseconds, or two minutes.

ICA listener port number

This setting specifies the TCP/IP port number used by the ICA protocol on the server.

By default, the port number is set to 1494.

Valid port numbers must be in the range of 0-65535 and must not conflict with other well-known port numbers. If you change the port number, restart the server for the new value to take effect. If you change the port number on the server, you must also change it on every Citrix Workspace app or plugin that connects to the server.

Keyboard and Input Method Editor (IME)

This setting enables or disables dynamic keyboard layout synchronization, Input Method Editor (IME), Unicode keyboard layout mapping, and hides or shows the keyboard layout switch notification dialog message.

1. In Studio, select Keyboard and IME.
2. Select **Client keyboard layout synchronization and IME improvement** to control the dynamic keyboard layout synchronization and generic client Input Method Editor (IME) features in the VDA. You can configure:

   **Disabled** - dynamic keyboard layout synchronization and generic client Input Method Editor (IME).

   **Support dynamic client keyboard layout synchronization** - enables dynamic keyboard layout synchronization.

   **Support dynamic client keyboard layout synchronization and IME improvement** - enables both dynamic keyboard layout synchronization and generic client Input Method Editor (IME).

3. Select **Enable Unicode keyboard layout mapping** to enable or disable Unicode keyboard mapping.

4. Select **Hide keyboard layout switch pop-up message box** to allow or prohibit whether a message displays that the keyboard layout is synchronizing when the user changes the client keyboard layout.

**Default settings:**

- **Client keyboard layout synchronization and IME improvement**

- **Disable Unicode keyboard layout mapping**

- **Show keyboard layout switch pop-up message box**

This policy replaces the registry settings that are listed in the **Description** section of the policy settings.

### Logoff checker startup delay

This setting specifies the duration to delay the logoff checker startup. Use this policy to set the time (in seconds) that a client session waits before disconnecting the session.

This setting also increases the time it takes for a user to log off from the server.

### Loss tolerant mode

**Important:**

- The feature requires a minimum of Citrix Workspace app 2002 for Windows. This version of the VDA will support it when it becomes available.
• Loss tolerant mode is not supported on Citrix Gateway or Citrix Gateway Service. This mode is available only with direct connections.

This setting enables or disables loss tolerant mode.

By default, loss tolerant mode is Allowed.

When allowed, the mode is entered when the packet loss and latency are above a threshold. You can set the thresholds using the loss tolerant thresholds policy.

For more information, see Loss tolerant mode.

**Loss tolerant thresholds**

When the loss tolerant mode is available, this setting specifies the network metrics thresholds at which the session switches to loss tolerant mode.

The default thresholds are:

- Packet loss: 5%
- Latency: 300 ms (RTT)

For more information, see Loss tolerant mode.

**Rendezvous protocol**

This setting changes how HDX sessions are proxied when using the Citrix Gateway Service. When enabled, HDX traffic no longer flows through the Citrix Cloud Connector. Instead, the VDA establishes an outbound connection directly to the Citrix Gateway Service (enhancing Cloud Connector scalability).

**Important:**

This feature is controlled by a feature toggle in Citrix Cloud and an HDX policy setting. The Citrix Cloud feature toggle is enabled by default while the HDX setting is disabled by default. The HDX setting affects only HDX sessions established through the Citrix Gateway Service. This setting does not affect sessions established directly between client and VDA or through an on-premises Citrix Gateway.

For information, see Rendezvous protocol.

**Starting of non-published programs during client connection**

This setting specifies whether to allow starting initial applications through RDP on the server.

By default, starting initial applications through RDP on the server is not allowed.
Tablet mode toggle policy settings

Tablet mode toggle optimizes the look and behavior of Store apps, Win32 apps, and the Windows shell on the VDA. It does so by automatically toggling the virtual desktop to Tablet mode when connecting from small form factor devices like phones and tablets, or any touch enabled device.

If this policy is disabled, the VDA is in the mode the user sets it to and maintains the same mode throughout, irrespective of the type of client.

Auto client reconnect policy settings

August 29, 2018

The auto client reconnect section contains policy settings for controlling the automatic reconnection of sessions.

Auto client reconnect

This setting allows or prevents automatic reconnection by the same client after a connection has been interrupted.

For Citrix Receiver for Windows 4.7 and later and Citrix Workspace app 1808 and later, auto client reconnect uses only the policy settings from Citrix Studio. Updates to these policies in Studio synchronize auto client reconnect from server to client. With older versions of Citrix Receiver for Windows, to configure auto client reconnect, use a Studio policy and change the registry or the default.ica file.

Allowing automatic client reconnect allows users to resume working where they were interrupted when a connection was broken. Automatic reconnection detects broken connections and then reconnects the users to their sessions.

If the Citrix Workspace app cookie containing the key to the session ID and credentials isn’t used, automatic reconnection might result in a new session being started. That is, instead of reconnecting to an existing session. The cookie is not used if it has expired, for example, because of a delay in reconnection, or if credentials must be reentered. If users intentionally disconnect, auto client reconnect is not triggered.

A session window is grayed out when a reconnection is in progress. A countdown timer displays the time remaining before the session is reconnected. When a session times out, it is disconnected.

For application sessions, when automatic reconnect is allowed, a countdown timer appears in the notification area specifying the time remaining before the session is reconnected. Citrix Workspace app tries to reconnect to the session until there is a successful reconnection or the user cancels the reconnection attempts.
For user sessions, when automatic reconnect is allowed, Citrix Workspace app tries to reconnect to the session for a specified period, unless there is a successful reconnection or the user cancels the reconnection attempts. By default, this period is two minutes. To change this period, edit the policy.

By default, automatic client reconnect is allowed.

To disable auto client reconnect:

1. Start Citrix Studio.
2. Open the Auto client reconnect policy.
3. Set the policy to Prohibited.

**Auto client reconnect authentication**

This setting requires authentication for automatic client reconnections.

When a user initially logs on, the credentials are encrypted, stored in memory, and a cookie is created containing the encryption key. The cookie is sent to Citrix Workspace app. When this setting is configured, cookies are not used. Instead, a dialog box is displayed to users requesting credentials when Citrix Workspace app attempts to reconnect automatically.

By default, authentication is not required.
To change auto client reconnect authentication:

1. Start Citrix Studio.
2. Open the **Auto client reconnect authentication** policy.
3. Enable or disable authentication.
4. Choose OK.

**Auto client reconnect logging**

This setting enables or disables the recording of auto client reconnections in the event log.

When logging is enabled, the server System Log captures information about successful and failed automatic reconnection events. A site does not provide a combined log of reconnection events for all servers.

By default, logging is disabled.

To change auto client reconnect logging:

1. Start Citrix Studio.
2. Open the **Auto client reconnect logging** policy.
3. Enable or disable logging.
4. Choose OK.

**Auto client reconnect timeout**

By default, auto client reconnect timeout is set to 120 seconds, the maximum configurable value for an auto client reconnect timeout is 300 seconds.

To change auto client reconnect timeout:

1. Start Citrix Studio.
2. Open the **Auto client reconnect timeout** policy.
3. Edit the timeout value.
4. Choose OK.

**Reconnect UI transparency level**

You can use Studio policy to configure the opacity level applied to the XenApp or XenDesktop session window during session reliability reconnection time.

By default, Reconnect UI transparency is set to 80%.

To change the reconnect user interface opacity level:

1. Start Citrix Studio.
2. Open the Reconnect UI transparency level policy.
3. Edit the value.
4. Choose OK.

Audio policy settings

December 10, 2019

The Audio section contains policy settings that permit user devices to send and receive audio in sessions without reducing performance.

Audio over UDP real-time transport

This setting allows or prevents the transmission and receipt of audio between the VDA and user device over RTP using the User Datagram Protocol (UDP). When this setting is disabled, audio is sent and received over TCP.

By default, audio over UDP is allowed.

Audio Plug N Play

This setting allows or prevents the use of multiple audio devices to record and play sound.

By default, the use of multiple audio devices is allowed.

This setting applies only to Windows Multi-session OS machines.

Audio quality

This setting specifies the quality level of sound received in user sessions.

By default, sound quality is set to High - high definition audio.

To control sound quality, choose one of the following options:

- Select Low - for low speed connections for low-bandwidth connections. Sounds sent to the user device are compressed up to 16 Kbps. This compression results in a significant decrease in the quality of the sound but allows reasonable performance for a low-bandwidth connection.

- Select Medium - optimized for speech to deliver Voice over Internet Protocol applications, to deliver media applications in challenging network connections with lines less than 512 Kbps, or significant congestion and packet loss. This codec offers fast encode time, making it ideal for use with softphones and Unified Communications applications when you require server-side media processing.
Audio sent to the user device is compressed up to 64 Kbps. This compression results in a moderate decrease in the quality of the audio played on the user device, while providing low latency and consuming low bandwidth. If Voice over Internet Protocol quality is unsatisfactory, ensure that the Audio over UDP Real-time Transport policy setting is set to Allowed.

Now, Real-time Transport (RTP) over UDP is only supported when this audio quality is selected. Use this audio quality even for delivering media applications for challenging network connections like low (fewer than 512 Kbps) lines and when there is congestion and packet loss in the network.

- Select High - high definition audio for connections where bandwidth is plentiful and sound quality is important. Clients can play sound at its native rate. Sounds are compressed at a high quality level maintaining up to CD quality, and using up to 112 Kbps of bandwidth. Transmitting this amount of data can result in increased CPU usage and network congestion.

Bandwidth is consumed only while audio is recording or playing. If both occur at the same time, the bandwidth consumption doubles.

To specify the maximum amount of bandwidth, configure the Audio redirection bandwidth limit or the Audio redirection bandwidth limit percent settings.

**Client audio redirection**

This setting specifies whether applications hosted on the server can play sounds through a sound device installed on the user device. This setting also specifies whether users can record audio input.

By default, audio redirection is allowed.

After allowing this setting, you can limit the bandwidth consumed by playing or recording audio. Limiting the amount of bandwidth consumed by audio can improve application performance but might also degrade audio quality. Bandwidth is consumed only while audio is recording or playing. If both occur at the same time, the bandwidth consumption doubles. To specify the maximum amount of bandwidth, configure the Audio redirection bandwidth limit or the Audio redirection bandwidth limit percent settings.

On Windows Multi-session OS machines, ensure that the Audio Plug N Play setting is Enabled to support multiple audio devices.

Important: Prohibiting Client audio redirection disables all HDX audio functionality.

**Client microphone redirection**

This setting enables or disables client microphone redirection. When enabled, users can use microphones to record audio input in a session.

By default, microphone redirection is allowed.
For security, users are alerted when servers that are not trusted by their devices try to access microphones. Users can choose to accept or not accept access. Users can disable the alert on Citrix Workspace app.

On Windows Multi-session OS machines, ensure that the Audio Plug N Play setting is Enabled to support multiple audio devices.

If the Client audio redirection setting is disabled on the user device, this rule has no effect.

### Bandwidth policy settings

December 11, 2018

The Bandwidth section contains policy settings to avoid performance problems related to client session bandwidth use.

Important: Using these policy settings with the Multi-Stream policy settings might produce unexpected results. If you use Multi-Stream settings in a policy, ensure these bandwidth limit policy settings are not included.

#### Audio redirection bandwidth limit

This setting specifies the maximum allowed bandwidth, in kilobits per second, for playing or recording audio in a user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Audio redirection bandwidth limit percent setting, the most restrictive setting (lower value) is applied.

#### Audio redirection bandwidth limit percent

This setting specifies the maximum allowed bandwidth limit for playing or recording audio as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Audio redirection bandwidth limit percent setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.
**Client USB device redirection bandwidth limit**

This setting specifies the maximum allowed bandwidth, in kilobits per second, for the redirection of USB devices to and from the client.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Client USB device redirection bandwidth limit percent setting, the most restrictive setting (the lower value) is applied.

**Client USB device redirection bandwidth limit percent**

This setting specifies the maximum allowed bandwidth for the redirection of USB devices to and from the client as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Client USB device redirection bandwidth limit setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.

**Clipboard redirection bandwidth limit**

This setting specifies the maximum allowed bandwidth, in kilobits per second, for data transfer between a session and the local clipboard.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Clipboard redirection bandwidth limit percent setting, the most restrictive setting (the lower value) is applied.

**Clipboard redirection bandwidth limit percent**

This setting specifies the maximum allowed bandwidth for data transfer between a session and the local clipboard as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Clipboard redirection bandwidth limit setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.
**COM port redirection bandwidth limit**

Note: For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth in kilobits per second for accessing a COM port in a client connection. If you enter a value for this setting and a value for the COM port redirection bandwidth limit percent setting, the most restrictive setting (the lower value) is applied.

**COM port redirection bandwidth limit percent**

Note: For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth for accessing COM ports in a client connection as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the COM port redirection bandwidth limit setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.

**File redirection bandwidth limit**

This setting specifies the maximum allowed bandwidth, in kilobits per second, for accessing a client drive in a user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the File redirection bandwidth limit percent setting, the most restrictive setting (the lower value) takes effect.

**File redirection bandwidth limit percent**

This setting specifies the maximum allowed bandwidth limit for accessing client drives as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the File redirection bandwidth limit setting, the most restrictive setting (the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.
**HDX MediaStream Multimedia Acceleration bandwidth limit**

This setting specifies the maximum allowed bandwidth limit, in kilobits per second, for delivering streaming audio and video using HDX MediaStream Multimedia Acceleration.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the HDX MediaStream Multimedia Acceleration bandwidth limit percent setting, the most restrictive setting (the lower value) takes effect.

**HDX MediaStream Multimedia Acceleration bandwidth limit percent**

This setting specifies the maximum allowed bandwidth for delivering streaming audio and video using HDX MediaStream Multimedia Acceleration as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the HDX MediaStream Multimedia Acceleration bandwidth limit setting, the most restrictive setting (the lower value) takes effect.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.

**LPT port redirection bandwidth limit**

Note: For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the maximum allowed bandwidth, in kilobits per second, for print jobs using an LPT port in a single user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the LPT port redirection bandwidth limit percent setting, the most restrictive setting (the lower value) is applied.

**LPT port redirection bandwidth limit percent**

Note: For the Virtual Delivery Agent 7.0 through 7.8, configure this setting using the registry; see Configure COM Port and LPT Port Redirection settings using the registry.

This setting specifies the bandwidth limit for print jobs using an LPT port in a single client session as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the LPT port redirection bandwidth limit setting, the most restrictive setting (the lower value) is applied.
If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.

**Overall session bandwidth limit**

This setting specifies the total amount of bandwidth available, in kilobits per second, for user sessions.

The maximum enforceable bandwidth cap is 10 Mbps (10,000 Kbps). By default, no maximum (zero) is specified.

Limiting the amount of bandwidth consumed by a client connection can improve performance when other applications outside the client connection are competing for limited bandwidth.

**Printer redirection bandwidth limit**

This setting specifies the maximum allowed bandwidth, in kilobits per second, for accessing client printers in a user session.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Printer redirection bandwidth limit percent setting, the most restrictive setting (the lower value) is applied.

**Printer redirection bandwidth limit percent**

This setting specifies the maximum allowed bandwidth for accessing client printers as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the Printer redirection bandwidth limit setting, the most restrictive setting (with the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.

**TWAIN device redirection bandwidth limit**

This setting specifies the maximum allowed bandwidth, in kilobits per second, for controlling TWAIN imaging devices from published applications.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the TWAIN device redirection bandwidth limit percent setting, the most restrictive setting (the lower value) is applied.
**TWAIN device redirection bandwidth limit percent**

This setting specifies the maximum allowed bandwidth for controlling TWAIN imaging devices from published applications as a percentage of the total session bandwidth.

By default, no maximum (zero) is specified.

If you enter a value for this setting and a value for the TWAIN device redirection bandwidth limit setting, the most restrictive setting (having the lower value) is applied.

If you configure this setting, you must also configure the Overall session bandwidth limit setting, which specifies the total amount of bandwidth available for client sessions.

**Bidirectional content redirection policy settings**

December 10, 2019

The bidirectional content redirection section contains policy settings to enable or disable the client to host and host to client URL redirection. Server policies are set in Studio, and client policies are set from the Citrix Workspace app Group Policy Object administration template.

Though Citrix also offers host to client redirection and Local App Access for client to URL redirection, we recommend that you use bidirectional content redirection for domain-joined Windows clients.

Bidirectional content redirection requires Citrix Virtual Apps and Desktops 1808 or XenApp or XenDesktop 7.13 and later plus Citrix Workspace app 1808 or later or Citrix Receiver for Windows 4.7 and later.

**Important**

- Ensure that redirection rules don’t result in a looping configuration. For example, client rules at the VDA are set to https://www.citrix.com, and VDA rules at the client are set to the same URL possibly resulting in infinite looping.
- We support only domain joined endpoints.
- URL redirection supports only explicit URLs (URLs displayed in the browser address bar or found using the in-browser navigation, depending on the browser). We don’t support link shorteners.
- Bidirectional content redirection supports only Internet Explorer 8 through 11. Internet Explorer must be used on both the user device and the VDA.
- The Internet Explorer browser add-on is required for Bidirectional Content Redirection. For more information, see Register browser add-ons.
- No fallback mechanism is present if redirection fails due to session start issues.
- If two applications with the same display name are configured with multiple StoreFront
accounts, one display name in the primary StoreFront account is used to start.

- Supports only Citrix Workspace app for Windows.
- A new browser window appears only when the URL is redirected to the client. When the URL is redirected to the VDA and the browser is already open, the redirected URL opens in a new tab.
- Supports embedded links in files including documents, emails, and PDFs.
- This feature works on both desktop sessions and application sessions, unlike Local App Access URL redirection, which works only on desktop sessions.
- If Local App Access is enabled for URL redirection (either at the VDA or client), bidirectional content redirection does not take effect.

**Host to client and host to host redirection**

Use Studio to configure the host to client (client) and host to host (VDA) redirection policies.

By default, bidirectional content redirection is **Prohibited**.

**To enable bidirectional content redirection**

When you include URLs, you can specify one URL or a semi-colon delimited list of URLs. You can use an asterisk (*) as a wildcard in the domain name. For example:

http://*.citrix.com; http://www.google.com

1. Start Citrix Studio.
2. Open the **Bidirectional Content Redirection** policy.
3. Select **Allow Bidirectional Content Redirection**, choose **Allowed**, and **OK**. If you do not allow this option, you are unable to complete this procedure.
4. Select **Allowed URLs to be redirected to Client** and specify a URL, a list of URLs, or choose the default value.
5. Select **Allowed URLs to be redirected to VDA** and specify a URL, a list of URLs, or choose the default value.
For information about the client-side bidirectional content redirection configuration on the Citrix Workspace app, see [Bidirectional content redirection](#) in the Citrix Workspace app for Windows documentation.

**Copy and paste between session and client**

To configure copy and paste functionality from a session to client, set the following policies:

- Client Clipboard redirection to allowed.
- Restrict Client Clipboard Write to restrict pasting all formats from clipboard to the client.
- Client Clipboard Write Allowed Formats to make an exception for pasting files from clipboard to the client (Use format CFX_FILE to allow the feature).
- Restrict Session Clipboard Write to restrict pasting all formats from the clipboard into the VDA session.
- Session Clipboard Write Allowed Formats to make an exception for pasting files from clipboard to the VDA (Use format CFX_FILE to allow the feature).
Register browser add-ons

The Internet Explorer browser add-on is required for bidirectional content redirection.

You can use the following commands to register and unregister the Internet Explorer add-on:

- To register the Internet Explorer add-on on a client device: `<client-installation-folder>\redirector.exe /regIE`
- To unregister the Internet Explorer add-on on a client device: `<client-installation-folder>\redirector.exe /unregIE`
- To register the Internet Explorer add-on on a VDA: `<VDAinstallation-folder>\VDARedirector.exe /regIE`
- To unregister the Internet Explorer add-on on a VDA: `<VDAinstallation-folder>\VDARedirector.exe /unregIE`

For example, the following command registers the Internet Explorer add-on on a device running Citrix Workspace app.

C:\Program Files\Citrix\ICA Client\redirector.exe/regIE

The following command registers the Internet Explorer add-on on a Windows Multi-session OS VDA.

C:\Program Files (x86)\Citrix\System32\VDARedirector.exe /regIE

Browser content redirection policy settings

September 8, 2020

The browser content redirection section contains policy settings to configure this feature.

Browser content redirection controls and optimizes the way Citrix Virtual Apps and Desktops deliver any web browser content (for example, HTML5) to users. Only the visible area of the browser where content is displayed is redirected.

HTML5 video redirection and browser content redirection are independent features. The HTML5 video redirection policies are not needed for this feature to work, but the Citrix HDX HTML5 Video Redirection Service is used for browser content redirection. For more information, see Browser content redirection.

Policy settings:

The following policy settings are available for the browser content redirection feature in Citrix Studio. These policies can be overridden with registry keys on the VDA, but registry keys are optional.
**TLS and browser content redirection**

You can use browser content redirection to redirect HTTPS websites. The JavaScript injected into those websites must establish a TLS connection to the Citrix HDX HTML5 Video Redirection Service (WebSocketService.exe) running on the VDA. To achieve this redirection and maintain the TLS integrity of the webpage, the Citrix HDX HTML5 Video Redirection Service generates two custom certificates in the certificate store on the VDA.

HdxVideo.js uses Secure Websockets to communicate with WebSocketService.exe running on the VDA. This process runs on the Local System, and performs SSL termination and user session mapping. WebSocketService.exe is listening on 127.0.0.1 port 9001.

**Browser content redirection**

By default, Citrix Workspace app tries client fetch and client render. If client fetch client and render fails, server-side rendering is tried. If you also enable the browser content redirection proxy configuration policy, Citrix Workspace app tries only server fetch and client render.

By default, this setting is Allowed.
**Browser content redirection Access Control List (ACL) policy settings**

Use this setting to configure an Access Control List (ACL) of URLs that can use browser content redirection or are denied access to browser content redirection.

Authorized URLs are the URLs in the allow list whose content is redirected to the client.

The wildcard * is permitted, but it isn’t permitted within the protocol or the domain address part of the URL.

**Not allowed:**  http://*.xyz.com/

You can achieve better granularity by specifying paths in the URL. For example, if you specify https://www.xyz.com/sports/index.html, only the index.html page is redirected.

By default, this setting is set to https://www.youtube.com/*

For more information, see the Knowledge Center article CTX238236.

**Browser content redirection authentication sites**

Use this setting to configure a list of URLs. Sites redirected by using browser content redirection use the list to authenticate a user. The setting specifies the URLs for which browser content redirection remains active (redirected) when navigating away from a URL in the allow list.

A classic scenario is a website that relies on an Identity Provider (IdP) for authentication. For example, website www.xyz.com must be redirected to the endpoint, but a third party IdP, like Okta (www.xyz.okta.com) handles the authentication portion. The administrator uses the browser content redirection ACL configuration policy to add www.xyz.com to the allow list, and then uses browser content redirection authentication sites to add www.xyz.okta.com to the allow list.

For more information, see the Knowledge Center article CTX238236.

**Browser content redirection blacklist setting**

This setting works along with the browser content redirection ACL configuration setting. If URLs are present in the browser content redirection ACL configuration setting and the blacklist configuration setting, the blacklist configuration takes precedence and the browser content of the URL isn’t redirected.

**Unauthorized URLs:**  Specifies the blacklisted URLs whose browser content isn’t redirected to the client, but rendered on the server.

The wildcard * is permitted, but it isn’t permitted within the protocol or the domain address part of the URL.

Not allowed:  http://*.xyz.com/

You can achieve better granularity by specifying paths in the URL. For example, if you specify https://www.xyz.com/sports/index.html, only index.html is blacklisted.

**Browser content redirection proxy setting**

This setting provides configuration options for proxy settings on the VDA for browser content redirection. If enabled with a valid proxy address and port number, PAC / WPAD URL, or Direct/Transparent setting, Citrix Workspace app tries only server fetch and client rendering.

If disabled or not configured and using a default value, Citrix Workspace app tries client fetch and client rendering.

By default, this setting is Prohibited.

**Allowed pattern for an explicit proxy:**

http://\<hostname/ip_address\>:\<port\>

**Example:**

http://proxy.example.citrix.com:80
http://10.10.10.10:8080

**Allowed patterns for PAC/WPAD files:**

http://\<hostname/ip_address\>:\<port\>/\<path\>/\<Proxy.pac\>

**Example:** http://wpad.myproxy.com:30/configuration/pac/Proxy.pac

https://\<hostname/ip_address\>:\<port\>/\<path\>/\<wpad.dat\>

**Example:** http://10.10.10.10/configuration/pac/wpad.dat

**Allowed patterns for direct or transparent proxies:**

Type the word DIRECT in the policy text box.

**Browser content redirection registry key overrides**

**Warning**

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.
Registry override options for policy settings:
\HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\HdxMediastream

HDXVideo.js insertion for browser content redirection

HDXVideo.js is injected on the webpage by using the browser content redirection Chrome extension or the Internet Explorer Browser Helper Object (BHO). The BHO is a plug-in model for Internet Explorer. It provides hooks for browser APIs and allows the plug-in to access the Document Object Model (DOM) of the page to control navigation.

The BHO decides whether to inject HDXVideo.js on a given page. The decision is based on the administrative policies shown in the previous flow chart.

After it decides to inject the JavaScript and redirect browser content to the client, the webpage on the Internet Explorer browser on the VDA is blanked out. Setting the `document.body.innerHTML` to empty removes the entire body of the webpage on the VDA. The page is ready to be sent to the client to be displayed on the overlay browser (Hdxbrowser.exe) on the client.
Client sensors policy settings

November 27, 2018

The Client Sensors section contains policy settings for controlling how mobile device sensor information is handled in a user session.

Allow applications to use the physical location of the client device

This setting determines whether applications running in a session on a mobile device are allowed to use the physical location of the user device.

By default, the use of location information is prohibited

When this setting is prohibited, attempts by an application to retrieve location information return a “permission denied” value.

When this setting is allowed, a user can prohibit use of location information by denying a Citrix Workspace app request to access the location. Android and iOS devices prompt at the first request for location information in each session.

When developing hosted applications that use the Allow applications to use the physical location of the client device setting, consider the following:

- Ensure a location-enabled application doesn’t rely on location information being available because:
  - A user might not allow access to location information.
  - The location might not be available or might change while the application is running.
  - A user might connect to the application session from a different device that does not support location information.

- A location-enabled application must:
  - Have the location feature off by default.
  - Provide a user option to allow or disallow the feature while the application is running.
  - Provide a user option to clear location data that the application caches. (Citrix Workspace app does not cache location data.)

- A location-enabled application must manage the granularity of the location information so that the data acquired is appropriate to the purpose of the application and conforms to regulations in all relevant jurisdictions.

- Enforce a secure connection (for example, using TLS or a VPN) when using location services. Connect Citrix Workspace app to trusted servers.

- Consider obtaining legal advice regarding the use of location services.
Desktop UI policy settings

August 29, 2018

The Desktop UI section contains policy settings that control visual effects such as desktop wallpaper, menu animations, and drag-and-drop images, to manage the bandwidth used in client connections. You can improve application performance on a WAN by limiting bandwidth usage.

**Important**

We do not support legacy graphics mode and Desktop Composition Redirection (DCR) in this release. This policy is included only for backward compatibility when using XenApp 7.15 LTSR, XenDesktop 7.15 LTSR, and previous VDA releases with Windows 7 and Windows 2008 R2.

**Desktop Composition Redirection**

This setting specifies whether to use the processing capabilities of the graphics processing unit (GPU) or integrated graphics processor (IGP) on the user device for local DirectX graphics rendering to provide users with a more fluid Windows desktop experience. When enabled, Desktop Composition Redirection delivers a highly responsive Windows experience while maintaining high scalability on the server.

By default, Desktop Composition Redirection is disabled.

To deselect Desktop Composition Redirection and reduce the bandwidth required in user sessions, select Disabled when adding this setting to a policy.

**Desktop Composition Redirection graphics quality**

This setting specifies the quality of graphics used for Desktop Composition Redirection.

The default is High.

Choose from High, Medium, Low, or Lossless quality.

**Desktop wallpaper**

This setting allows or prevents wallpaper showing in user sessions.

By default, user sessions can show wallpaper.

To deselect desktop wallpaper and reduce the bandwidth required in user sessions, select Prohibited when adding this setting to a policy.
Menu animation

This setting allows or prevents menu animation in user sessions.

By default, menu animation is allowed.

Menu animation is a Microsoft personal preference setting for ease of access. When enabled, it causes a menu to appear after a short delay, either by scrolling or fading in. An arrow icon appears at the bottom of the menu. The menu appears when you point to that arrow.

Menu animation is enabled on a desktop if this policy setting is set to Allowed and the menu animation Microsoft personal preference setting is enabled.

Note: Changes to the menu animation Microsoft personal preference setting are changes to the desktop. If the desktop is set to discard changes when the session ends, a user who has enabled menu animations in a session might not have menu animation available in subsequent sessions on the desktop. For users who require menu animation, enable the Microsoft setting in the master image for the desktop or ensure that the desktop retains user changes.

View window contents while dragging

This setting allows or prevents the display of window contents when dragging a window across the screen.

By default, viewing window contents is allowed.

When set to Allowed, the entire window appears to move when you drag it. When set to Prohibited, only the window outline appears to move until you drop it.

End user monitoring policy settings

August 29, 2018

The End User Monitoring section contains policy settings for measuring session traffic.

ICA round trip calculation

This setting determines whether ICA round trip calculations are performed for active connections.

By default, calculations for active connections are enabled.

By default, each ICA round trip measurement initiation is delayed until some traffic occurs that indicates user interaction. This delay can be indefinite in length and is designed to prevent the ICA round trip measurement being the sole reason for ICA traffic.
ICA round trip calculation interval

This setting specifies the frequency, in seconds, at which ICA round trip calculations are performed. By default, ICA round trip is calculated every 15 seconds.

ICA round trip calculations for idle connections

This setting determines whether ICA round trip calculations are performed for idle connections. By default, calculations are not performed for idle connections. By default, each ICA round trip measurement initiation is delayed until some traffic occurs that indicates user interaction. This delay can be indefinite in length and is designed to prevent the ICA round trip measurement being the sole reason for ICA traffic.

Enhanced desktop experience policy setting

August 29, 2018

The Enhanced Desktop Experience policy setting sessions running on server operating systems to look like local Windows 7 desktops, providing users with an enhanced desktop experience. By default, this setting is allowed. If a user profile with Windows Classic theme exists on the virtual desktop, enabling this policy does not provide an enhanced desktop experience for that user. If a user with a Windows 7 theme user profile logs on to a virtual desktop running Windows Server 2012 for which this policy is either not configured or disabled, that user sees an error message indicating failure to apply the theme. In both cases, resetting the user profile resolves the issue. If the policy changes from enabled to disabled on a virtual desktop with active user sessions, the look and feel of those sessions is inconsistent with both the Windows 7 and Windows Classic desktop experience. To avoid this inconsistency, ensure you restart the virtual desktop after changing this policy setting. You must also delete any roaming profiles on the virtual desktop. Citrix also recommends deleting any other user profiles on the virtual desktop to avoid inconsistencies between profiles. If you are using roaming user profiles in your environment, ensure the Enhanced Desktop Experience feature is enabled or disabled for all virtual desktops that share a profile. Citrix does not recommend sharing roaming profiles between virtual desktops running server operating systems and client operating systems. Profiles for client and server operating systems differ and sharing roaming profiles across both types can lead to inconsistencies in profile properties when a user moves between the two.
File Redirection policy settings

December 5, 2018

The File Redirection section contains policy settings relating to client drive mapping and client drive optimization.

Auto connect client drives

This setting allows or prevents automatic connection of client drives when users log on.

By default, automatic connection is allowed.

When adding this setting to a policy, ensure to enable the settings for the drive types you want automatically connected. For example, to allow automatic connection of users’ CD-ROM drives, configure this setting and the Client optical drives setting.

The following policy settings are related:

- Client drive redirection
- Client floppy drives
- Client optical drives
- Client fixed drives
- Client network drives
- Client removable drives

Client drive redirection

This setting enables or disables file redirection to and from drives on the user device.

By default, file redirection is enabled.

Note:

Client drive redirection policy settings do not apply to drives mapped to sessions using generic USB redirection.

When enabled, users can save files to all their client drives. When disabled, all file redirection is prevented, regardless of the state of the individual file redirection settings such as Client floppy drives and Client network drives.

The following policy settings are related:

- Client floppy drives
- Client optical drives
- Client fixed drives
• Client network drives
• Client removable drives

**Client fixed drives**

This setting allows or prevents users from accessing or saving files to fixed drives on the user device. By default, accessing client fixed drives is allowed.

When adding this setting to a policy, ensure that the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client fixed drives are not mapped and users cannot access these drives manually, regardless of the state of the Client fixed drives setting.

To ensure that fixed drives are automatically connected when users log on, configure the Auto connect client drives setting.

**Client floppy drives**

This setting allows or prevents users from accessing or saving files to floppy drives on the user device. By default, accessing client floppy drives is allowed.

When adding this setting to a policy, ensure that the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client floppy drives are not mapped and users cannot access these drives manually, regardless of the state of the Client floppy drives setting.

To ensure that floppy drives are automatically connected when users log on, configure the Auto connect client drives setting.

**Client network drives**

This setting allows or prevents users from accessing and saving files to network (remote) drives through the user device. By default, accessing client network drives is allowed.

When adding this setting to a policy, ensure that the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client network drives are not mapped and users cannot access these drives manually, regardless of the state of the Client network drives setting.

To ensure that network drives are automatically connected when users log on, configure the Auto connect client drives setting.
Client optical drives

This setting allows or prevents users from accessing or saving files to CD-ROM, DVD-ROM, and BD-ROM drives on the user device.

By default, accessing client optical drives is allowed.

When adding this setting to a policy, ensure that the Client drive redirection setting is present and set to Allowed. If these settings are disabled, client optical drives are not mapped and users cannot access these drives manually, regardless of the state of the Client optical drives setting.

To ensure that optical drives are automatically connected when users log on, configure the Auto connect client drives setting.

Client removable drives

This setting allows or prevents users from accessing or saving files to USB drives on the user device.

By default, accessing client removable drives is allowed.

When adding this setting to a policy, ensure that the Client driver redirection setting is present and set to Allowed. If these settings are disabled, client removable drives are not mapped and users cannot access these drives manually, regardless of the state of the Client removable drives setting.

To ensure that removable drives are automatically connected when users log on, configure the Auto connect client drives setting.

Host to client redirection

This setting enables or disables file type associations for URLs and some media content to be opened on the user device. When disabled, content opens on the server.

By default, file type association is disabled.

These URL types are opened locally when you enable this setting:

- Hypertext Transfer Protocol (HTTP)
- Secure Hypertext Transfer Protocol (HTTPS)
- Real Player and QuickTime (RTSP)
- Real Player and QuickTime (RTSPU)
- Legacy Real Player (PNM)
- Microsoft Media Server (MMS)

Preserve client drive letters

This setting enables or disables mapping of client drives to the same drive letter in the session.
By default, client drive letters are not preserved.

When adding this setting to a policy, ensure that the Client drive redirection setting is present and set to Allowed.

**Read-only client drive access**

This setting allows or prevents users and applications from creating or changing files or folders on mapped client drives.

By default, files and folders on mapped client drives can be changed.

If set to Enabled, files and folders are accessible with read-only permissions.

When adding this setting to a policy, ensure the Client drive redirection setting is present and set to Allowed.

**Special folder redirection**

This setting allows or prevents Citrix Workspace app and Web Interface users to see their local Documents and Desktop special folders from a session.

By default, special folder redirection is allowed.

This setting prevents any objects filtered through a policy from having special folder redirection, regardless of settings that exist elsewhere. When this setting is prohibited, any related settings specified for StoreFront, Web Interface, or Citrix Workspace app are ignored.

To define which users can have special folder redirection, select Allowed and include this setting in a policy filtered on the users you want to have this feature. This setting overrides all other special folder redirection settings.

Because special folder redirection must interact with the user device, policy settings that prevent users from accessing or saving files to their local hard drives also prevent special folder redirection from working.

When adding this setting to a policy, ensure that the Client fixed drives setting is present and set to Allowed.

**Use asynchronous writes**

This setting enables or disables asynchronous disk writes.

By default, asynchronous writes are disabled.
Asynchronous disk writes can improve the speed of file transfers and writing to client disks over WANs, which relatively high bandwidth and high latency typically characterize. However, if there is a connection or disk fault, the client file or files being written might end in an undefined state. If this undefined state occurs, a pop-up window informs the user of the files affected. The user can then take remedial action such as restarting an interrupted file transfer on reconnection or when the disk fault is corrected.

We recommend enabling asynchronous disk writes only for users requiring remote connectivity having good file access speed and who can easily recover files or data lost if there is a connection or disk failure.

When adding this setting to a policy, ensure that the Client drive redirection setting is present and set to Allowed. If this setting is disabled, asynchronous writes don’t occur.

**Graphics policy settings**

August 7, 2020

The Graphics section contains policy settings for controlling how images are handled in user sessions.

**Allow visually lossless compression**

This setting allows visually lossless compression to be used instead of true lossless compression for graphics. Visually lossless improves performance over true lossless, but has minor loss that is unnoticeable by sight. This setting changes the way the values of the Visual quality setting are used.

By default this setting is disabled.

**Graphics status indicator**

This setting configures the graphics status indicator to run in the user session. This indicator allows the user to see details on the graphics mode in use, including graphics provider, encoder, hardware encoding, image quality, progressive display status, and lossless text.

By default the graphics status indicator is disabled. This setting replaces the lossless indicator. Previous releases of Citrix Virtual Apps and Desktops enable the lossless indicator instead.

**Limitation due to Microsoft quiet time:**

After enabling the graphics status indicator, there might be an issue the first time a user logs on to Citrix Virtual Apps and Desktops. Four hours elapse before the status indicator icon appears in the notification area.
Display memory limit

This setting specifies the maximum video buffer size in kilobytes for the session.

By default, the display memory limit is 65,536 kilobytes.

Specifies the maximum video buffer size in kilobytes for the session. Specify an amount in kilobytes from 128 to 4,194,303. The maximum value of 4,194,303 does not limit the display memory. By default, the display memory is 65,536 kilobytes. Using more color depth and higher resolution for connections requires more memory. In legacy graphics mode, if the memory limit is reached, the display degrades according to the “Display mode degrade preference” setting.

For connections requiring more color depth and higher resolution, increase the limit. Calculate the maximum memory required using the equation:

\[
\text{Memory depth in bytes} = \left(\frac{\text{color-depth-in-bits-per-pixel}}{8}\right) \times (\text{vertical-resolution-in-pixels}) \times (\text{horizontal-resolution-in-pixels}).
\]

For example, with a color depth of 32, vertical resolution of 600, and a horizontal resolution of 800, the maximum memory required is \((32 / 8) \times 600 \times 800 = 1920000\) bytes, which yields a display memory limit of 1920 KB.

Color depths other than 32-bit are available only if the Legacy graphics mode policy setting is enabled.

HDX allocates only the amount of display memory needed for each session. So, if only some users require more than the default, there is no negative impact on scalability by increasing the display memory limit.

Display mode degrade preference

Note:

For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting specifies whether color depth or resolution degrades first when the session display memory limit is reached.

By default, color depth is degraded first.

When the session memory limit is reached, you can reduce the quality of displayed images by choosing whether color depth or resolution is degraded first. When color depth is degraded first, displayed images use fewer colors. When resolution is degraded first, displayed images use fewer pixels per inch.

To notify users when either color depth or resolution is degraded, configure the Notify user when display mode is degraded setting.
Dynamic windows preview

This setting enables or disables the display of seamless windows in:

- Flip-
- Flip 3D
- Taskbar preview
- Windows peek

<table>
<thead>
<tr>
<th>Windows Aero preview option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Taskbar Preview</td>
<td>When the user hovers over a window’s taskbar icon, an image of that window appears above the taskbar.</td>
</tr>
<tr>
<td>Windows Peek</td>
<td>When the user hovers over a taskbar preview image, a full-sized image of the window appears on the screen.</td>
</tr>
<tr>
<td>Flip</td>
<td>When the user presses ALT+TAB, small preview icons are shown for each open window.</td>
</tr>
<tr>
<td>Flip 3D</td>
<td>When the user presses the TAB+Windows logo key, large images of the open windows cascade across the screen.</td>
</tr>
</tbody>
</table>

By default, this setting is enabled.

Image caching

Note:
For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting enables or disables the caching and retrieving of sections of images in sessions. Caching images in sections and retrieving these sections when needed makes scrolling smoother, reduces the amount of data transmitted over the network, and reduces the processing required on the user device.

By default, the image caching setting is enabled.

Note:
The image caching setting controls how images are cached and retrieved. The setting does not control whether images are cached. Images are cached if the Legacy graphics mode setting is enabled.
Legacy graphics mode - not supported. For backward compatibility only

Important:

We do not support legacy graphics mode and Desktop Composition Redirection (DCR) in this release. This policy is included only for backward compatibility when using XenApp 7.15 LTSR, XenDesktop 7.15 LTSR, and previous VDA releases with Windows 7 and Windows 2008 R2.

This setting disables the rich graphics experience. Use this setting to revert to the legacy graphics experience, reducing bandwidth consumption over a WAN or mobile connection. Bandwidth reductions introduced in XenApp and XenDesktop 7.13 make this mode obsolete.

By default, this setting is disabled and users are provided with the rich graphics experience.

Legacy graphics mode is supported with Windows 7 and Windows Server 2008 R2 VDAs.

Legacy graphics mode is not supported on Windows 8.x, 10 or Windows Server 2012, 2012 R2, and 2016.

See CTX202687 for more on optimizing graphics modes and policies in XenApp and XenDesktop 7.6 FP3 or higher.

Maximum allowed color depth

Note:

For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting specifies the maximum color depth allowed for a session.

By default, the maximum allowed color depth is 32 bits per pixel.

This setting applies only to Thinwire drivers and connections. It does not apply to VDAs that have a non-ThinWire driver as the primary display driver, such as VDAs that use a Windows Display Driver Model (WDDM) driver as the primary display driver. For Single-session OS VDAs using a WDDM driver as the primary display driver, such as Windows 8, this setting has no effect. For Windows Multi-session OS VDAs using a WDDM driver, such as Windows Server 2012 R2, this setting might prevent users from connecting to the VDA.

Setting a high color depth requires more memory. To degrade color depth when the memory limit is reached, configure the Display mode degrade preference setting. When color depth is degraded, displayed images use fewer colors.

Notify user when display mode is degraded

Note:

For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode
This policy setting is enabled. This setting displays a brief explanation to the user when the color depth or resolution is degraded. By default, notifying users is disabled.

**Optimize for 3D graphics workload**

This setting configures the appropriate default settings that best suit graphically intense workloads. Enable this setting for users whose workload focuses on graphically intense applications. Apply this policy only in cases where a GPU is available to the session. Any other settings that explicitly override the default settings set by this policy take precedence.

By default, optimize for 3D graphics workload is disabled.

**Queuing and tossing**

*Note:* For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting discards queued images that another image replaces. By default, queuing and tossing is enabled. This setting improves response when graphics are sent to the user device. Configuring this setting can cause animations to become choppy because of dropped frames.

**Use video codec for compression**

Allows use of a video codec to compress graphics when video decoding is available on the endpoint. When **For the entire screen** is chosen the video codec is applied as the default codec for all. When **For actively changing regions** is selected the video codec is used for areas where there is constant change on the screen, other data uses still image compression and bitmap caching. When video decoding is not available on the endpoint, or when you specify **Do not use video codec**, a combination of still image compression and bitmap caching is used. When **Use when preferred** is selected, the system chooses, based on various factors. The results might vary between versions as the selection method is enhanced.

Select **Use when preferred** to allow the system to make its best effort to choose appropriate settings for the current scenario.

Select **For the entire screen** to optimize for improved user experience and bandwidth, especially in cases with heavy use of server-rendered video and 3D graphics.
Select **For actively changing regions** to optimize for improved video performance, especially in low bandwidth, while maintaining scalability for static and slowly changing content. This setting is supported in multi-monitor deployments.

Select **Do not use video codec** to optimize for server CPU load and for cases that do not have numerous server-rendered videos or other graphically intense applications.

The default is **Use when preferred**.

**Use hardware encoding for video**

This setting allows the use of graphics hardware, if available, to compress screen elements with the video codec. If such hardware is not available, the VDA falls back to CPU-based encoding using the software video codec.

The default option for this policy setting is **Enabled**.

Multiple monitors are supported.

Any Citrix Workspace app that supports video decoding can be used with hardware encoding.

**NVIDIA**

For NVIDIA GRID GPUs, hardware encoding is supported with VDAs for Multi-session OS and Single-session OS.

NVIDIA GPUs must support NVENC hardware encoding. See [NVIDIA video codec SDK](#) for a list of supported GPUs.

NVIDIA GRID requires driver version 3.1 or higher. NVIDIA Quadro requires driver version 362.56 or higher. Citrix recommends drivers from the NVIDIA Release R361 branch.

Lossless text is not compatible with NVENC hardware encoding. If you enabled lossless text, lossless text takes priority over NVENC hardware encoding.

Selective use of the H.264 hardware codec for actively changing regions is supported.

Visually lossless (YUV 4:4:4) compression is supported. Visually lossless (graphics policy setting, **Allow visually lossless compression**) requires Citrix Workspace app 1808 or higher or Citrix Receiver for Windows 4.5 or higher.

**Intel**

For Intel Iris Pro graphics processors, hardware encoding is supported with VDAs for Single-session OS and Multi-session OS.
Intel Iris Pro graphics processors in the Intel Broadwell processor family and later are supported. Intel Remote Displays SDK version 1.0 is required and can be downloaded from the Intel website: Remote Displays SDK.

Lossless text is supported only when the Video codec policy is set for the entire screen and the Optimize for 3D graphics workload policy is disabled.

Visually lossless (YUV 4:4:4) is not supported.

The Intel encoder provides a good user experience for up to eight encoding sessions (for example one user using eight monitors or eight users using a monitor each). If more than eight encoding sessions are required, check how many monitors the virtual machine connects with. To maintain a good user experience, the administrator can decide to configure this policy setting on a per user or per machine basis.

AMD

For AMD, hardware encoding is supported with VDAs for Single-session OS.

AMD GPUs must support the RapidFire SDK. For example, the AMD Radeon Pro or FirePro GPUs.

For encoding to work, install the latest AMD drivers. You can download those drivers from https://www.amd.com/en/support.

Lossless text is not compatible with AMD hardware encoding. If you enabled lossless text, lossless text takes priority over AMD hardware encoding.

Selective use of the H.264 hardware codec for actively changing regions is supported.

Caching policy settings

November 27, 2018

The Caching section contains policy settings that enable caching image data on user devices when client connections are limited in bandwidth.

Persistent cache threshold

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting caches bitmaps on the hard drive of the user device. This enables re-use of large, frequently-used images from previous sessions.

By default, the threshold is 3000000 bits per second.
The threshold value represents the point below which the Persistent Cache feature will take effect. For example, using the default value, bitmaps are cached on the hard drive of the user device when bandwidth falls below 3000000 bps.

**Framehawk policy settings**

**August 7, 2020**

**Important:**

As of Citrix Virtual Apps and Desktops 7 1903, Framehawk is no longer supported. Instead, use Thinwire with adaptive transport enabled.

The Framehawk section contains policy settings that enable and configure the Framehawk display channel on the server.

**Framehawk display channel**

When enabled, the server attempts to use the Framehawk display channel for the user’s graphics and input remoting. That display channel uses UDP to provide a better user experience on networks with high loss and latency characteristics. However, it can also use more server resources and bandwidth than other graphics modes.

By default, the Framehawk display channel is disabled.

**Framehawk display channel port range**

This policy setting specifies the range of UDP port numbers (in the form lowest port number, highest port number) the VDA uses to exchange Framehawk display channel data with the user device. The VDA attempts to use each port, starting with the lowest port number and incrementing for each subsequent attempt. The port handles inbound and outbound traffic.

By default, the port range is 3224,3324.

**Keep alive policy settings**

**August 29, 2018**

The Keep Alive section contains policy settings for managing ICA keep-alive messages.
ICA keep alive timeout

This setting specifies the number of seconds between successive ICA keep-alive messages.

By default, the interval between keep-alive messages is 60 seconds.

Specify an interval between 1-3600 seconds in which to send ICA keep-alive messages. Do not configure this setting if your network monitoring software is responsible for closing inactive connections.

ICA keep alives

This setting enables or disables sending ICA keep-alive messages periodically.

By default, keep-alive messages are not sent.

Enabling this setting prevents broken connections from being disconnected. If the server detects no activity, this setting prevents Remote Desktop Services (RDS) from disconnecting the session. The server sends keep-alive messages every few seconds to detect if the session is active. If the session is no longer active, the server marks the session as disconnected.

ICA keep-alive does not work if you are using session reliability. Configure ICA keep-alive only for connections that are not using Session Reliability.

Related policy settings: Session reliability connections.

Local App Access policy settings

October 5, 2020

The Local App Access section contains policy settings that manage the integration of users’ locally installed applications with hosted applications in a hosted desktop environment.

Allow local app access

This setting allows or prevents the integration of users’ locally installed applications with hosted applications within a hosted desktop environment.

When a user starts a locally installed application, that application appears to run within their virtual desktop, even though it is actually running locally.

When Local App Access is enabled in a session, the client-side notification area battery status does not appear in desktop sessions.

By default, local app access is prohibited.
**URL redirection black list**

This setting specifies websites that are redirected to and started in the local Web browser. These websites might include websites requiring locale information, such as msn.com or news.google.com, or websites containing rich media content that are better rendered on the user device.

By default, no sites are specified.

**URL redirection white list**

This setting specifies websites that are rendered in the environment in which they are started.

By default, no sites are specified.

**Mobile experience policy settings**

September 27, 2018

The Mobile Experience section contains policy settings for handling the Citrix Mobility Pack.

**Automatic keyboard display**

This setting enables or disables the automatic display of the keyboard on mobile device screens.

By default, the automatic display of the keyboard is disabled.

**Launch touch-optimized desktop**

This setting is disabled and not available for Windows 10 or Windows Server 2016 machines.

This setting determines the overall Citrix Workspace app interface behavior by allowing or prohibiting a touch-friendly interface that is optimized for tablet devices.

By default, a touch-friendly interface is used.

To use only the Windows interface, set this policy setting to Prohibited.

**Remote the combo box**

This setting determines the types of combo boxes you can display in sessions on mobile devices. To display the device-native combo box control, set this policy setting to Allowed. When this setting is allowed, a user can change a Citrix Workspace app for iOS session setting to use the Windows combo box.

By default, the Remote the combo box feature is prohibited.
Multimedia policy settings

August 7, 2020

The Multimedia section contains policy settings for managing streaming HTML5 and Windows audio and video in user sessions.

Warning
Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Multimedia policies

By default, all multimedia policies set on the Delivery Controller are stored in these registries:

Machine policies:
HKEY_LOCAL_MACHINE\Software\Policies\Citrix\MultimediaPolicies

User policies:
HKEY_LOCAL_MACHINE\Software\Policies\Citrix\User Session ID\User\MultimediaPolicies

To locate the current user session ID, issue the qwinsta command on the Windows command line.

HTML5 video redirection

Controls and optimizes the way Citrix Virtual Apps and Desktops servers deliver HTML5 multimedia web content to users.

By default, this setting is disabled.
In this release, this feature is available for controlled webpages only. It requires the addition of JavaScript to the webpages where the HTML5 multimedia content is available, for example, videos on an internal training site.

To configure HTML5 video redirection:

1. Copy the file, `HdxVideo.js`, from `%Program Files%/Citrix/ICA Service/HTML5 Video Redirection` on the VDA install to the location of your internal webpage.
2. Insert this line into your webpage (if your webpage has other scripts, include `HdxVideo.js` before those scripts):
   ```html
   <script src="HdxVideo.js" type="text/javascript"></script>
   ```

**Note:** If `HdxVideo.js` is not in the same location as your webpage, use the `src` attribute to specify the full path to it.

If the JavaScript has not been added to your controlled webpages and the user plays an HTML5 video, Citrix Virtual Apps and Desktops default to server side rendering.

For redirection of HTML5 videos to work, allow *Windows Media Redirection*. This policy is mandatory for Server Fetch Client Render, and necessary for Client Side Fetching (which in turn also requires *Windows Media client-side content fetching* to be Allowed).

Microsoft Edge doesn’t support this feature.

`HdxVideo.js` replaces the browser HTML5 Player controls with its own. To check that the HTML5 video redirection policy is in effect on a certain website, compare the player controls to a scenario where the HTML5 video redirection policy is Prohibited:

(Citrix custom controls when the policy is Allowed)
The following video controls are supported:

- play
- pause
- seek
- repeat
- audio
- full screen

You can view an HTML5 video redirection test page at https://www.citrix.com/virtualization/hdx/html5-redirect.html.

**TLS, HTML5 video redirection, and browser content redirection**

You can use HTML5 video redirection to redirect videos from HTTPS websites or browser content redirection to redirect the entire website. The JavaScript injected into those websites must establish a TLS connection to the Citrix HDX HTML5 Video Redirection Service (WebSocketService.exe) running on the VDA. To achieve this redirection and maintain the TLS integrity of the webpage, two custom certificates are generated by the Citrix HDX HTML5 Video Redirection Service in the certificate store on the VDA.

HdxVideo.js uses Secure WebSockets to communicate with WebSocketService.exe running on the VDA. This process runs as a Local System account, and performs SSL termination and user session mapping.

WebSocketService.exe is listening on 127.0.0.1 port 9001.

**Limit video quality**

This setting applies only to Windows Media and not to HTML5. It requires you enable **Optimization for Windows Media multimedia redirection over WAN**.

This setting specifies the maximum video quality level allowed for an HDX connection. When configured, maximum video quality is limited to the specified value, ensuring that multimedia Quality of Service (QoS) is maintained within an environment.

By default, this setting is not configured.
To limit the maximum video quality level allowed, choose one of the following options:

- 1080p/8.5mbps
- 720p/4.0mbps
- 480p/720kbps
- 380p/400kbps
- 240p/200kbps

Playing multiple videos simultaneously on the same server consumes large amounts of resources and can impact server scalability.

**Microsoft Teams redirection**

This setting enables optimization of Microsoft Teams, based on the HDX technology.

If this policy is enabled, and you’re using a supported version of Citrix Workspace app, this registry key is set to 1 on the VDA. The Microsoft Teams application reads the key to load in VDI mode.
Note it is not required to set the registry key manually.

HKEY_CURRENT_USER\Software\Citrix\HDXMediaStream

Name: MSTeamsRedirSupport

Value: DWORD (1 - on, 0 - off)

Note:
If you are using version 1906.2 VDAs or later with older versions of the Controller (for example, version 7.15), which do not have the policy available in Studio, HDX optimization is enabled by default on the VDA. If the Workspace app version is 1907 or later, Teams launches in optimized mode. For information about caveats in mixing 7.15 LTSR Controllers and CR VDAs, see Knowledge Center article CTX205549.

In this case, to disable the feature for specific users, you can override the registry setting by using a group policy to apply a logon script to the user’s organizational unit.

By default, Microsoft Teams redirection is enabled.

**Multimedia conferencing**

This setting allows or prevents the use of optimized webcam redirection technology by video conferencing applications.

By default, video conferencing support is allowed.

When adding this setting to a policy, ensure that the Windows Media redirection setting is present and set to Allowed (the default).

When using multimedia conferencing, ensure that the following conditions are met:

- Manufacturer-supplied drivers for the webcam used for multimedia conferencing are installed on the client.
- Connect the webcam to the user device before initiating a video conferencing session. The server uses only one installed webcam at any given time. If multiple webcams are installed on the user device, the server attempts to use each webcam in succession until a video conferencing session is created successfully.

This policy is not needed when redirecting the web cam using Generic USB redirection. In that case, install the webcam drivers on the VDA.

**Optimization for Windows Media multimedia redirection over WAN**

This setting applies only to Windows Media and not to HTML5. The setting enables real-time multimedia transcoding, allowing audio and video media streaming to mobile devices over degraded net-
works, and enhancing the user experience by improving how Windows Media content is delivered over a WAN.

By default, the delivery of Windows Media content over the WAN is optimized. When adding this setting to a policy, make sure the **Windows Media Redirection** setting is present and set to **Allowed**.

When this setting is enabled, real-time multimedia transcoding is deployed automatically as needed to enable media streaming, providing a seamless user experience even in extreme network conditions.

### Use GPU for optimizing Windows Media multimedia redirection over WAN

This setting applies only to Windows Media and enables real-time multimedia transcoding to be done in the Graphics Processing Unit (GPU) on the Virtual Delivery Agent (VDA). It improves server scalability. GPU transcoding is available only if the VDA has a supported GPU for hardware acceleration. Otherwise, transcoding falls back to the CPU.

**Note:** GPU transcoding is supported only on NVIDIA GPUs.

By default, using the GPU on the VDA to optimize the delivery of Windows Media content over the WAN is prohibited.

When adding this setting to a policy, make sure the Windows Media Redirection and Optimization for Windows Media multimedia redirection over WAN settings are present and set to **Allowed**.

### Windows Media fallback prevention

This setting applies to browser content redirection, HTML5, and Windows Media. For it to support HTML5, set the **HTML5 video redirection** policy to **Allowed**.

Administrators can use the Windows Media fallback prevention policy setting to specify the methods that is attempted to deliver streamed content to users.

By default, this setting is not configured. When the setting is set to Not Configured, the behavior is the same as **Play all content**.

To configure this setting, choose one of the following options:

- **Play all content**. Attempt client-side content fetching, then Windows Media Redirection. If unsuccessful, play content on the server.
- **Play all content only on client**. Attempt client-side fetching, then Windows Media Redirection. If unsuccessful, the content does not play.
- **Play only client-accessible content on client**. Attempt only client-side fetching. If unsuccessful, the content does not play.
When the content does not play, the error message “Company has blocked video because of lack of resources” displays in the player window (for a default duration of 5 seconds).

The duration of this error message can be customized with the following registry key on the VDA. If the registry entry does not exist, the duration defaults to 5 seconds.

The registry path varies depending on the architecture of the VDA:

\HKLM\SOFTWARE\Wow6432Node\Citrix\HdxMediastream
Or
\HKLM\SOFTWARE\Citrix\HdxMediastream

Registry key:
Name: VideoLoadManagementErrDuration
Type: DWORD
Range: 1 - up to DWORD limit (default = 5)
Unit: seconds

**Windows Media client-side content fetching**

This setting applies to both HTML5 and Windows Media. The setting enables a user device to stream multimedia files directly from the source provider on the internet or intranet, rather than through the XenApp or XenDesktop host server.

By default, this setting is **Allowed**. Allowing this setting improves network usage and server scalability by moving any processing on the media from the host server to the user device. It also removes the
requirement that an advanced multimedia framework such as Microsoft DirectShow or Media Foundation be installed on the user device. The user device requires only the ability to play a file from a URL.

When adding this setting to a policy, make sure the Windows Media Redirection setting is present and set to Allowed. If Windows Media Redirection is disabled, the streaming of multimedia files to the user device direct from the source provider is also disabled.

**Windows Media redirection**

This setting applies to both HTML5 and Windows Media and controls and optimizes the way servers deliver streaming audio and video to users.

By default, this setting is Allowed. For HTML5, this setting doesn’t take effect if the policy HTML5 video redirection is Prohibited.

Allowing this setting increases the quality of audio and video rendered from the server to a level that compares with audio and video played locally on a user device. The server streams multimedia to the client in the original, compressed form and allows the user device to decompress and render the media.

Windows Media redirection optimizes multimedia files that are encoded with codecs that adhere to Microsoft DirectShow, DirectX Media Objects (DMO), and Media Foundation standards. To play back a given multimedia file, a codec compatible with the encoding format of the multimedia file must be present on the user device.

By default, audio is disabled on Citrix Workspace app. To allow users to run multimedia applications in ICA sessions, turn on audio or give users permission to turn on audio in their Citrix Workspace app interface.

Select Prohibited only if playing media using Windows Media redirection appears worse than when rendered using basic ICA compression and regular audio. This is rare but can happen under low bandwidth conditions, for example, with media with a low frequency of key frames.

**Windows Media Redirection buffer size**

This setting is a legacy and does not apply to HTML5.

This setting specifies a buffer size from 1 to 10 seconds for multimedia acceleration.

By default, the buffer size is 5 seconds.

**Windows Media Redirection buffer size use**

This setting is a legacy and does not apply to HTML5.
This setting enables or disables using the buffer size specified in the **Windows Media Redirection buffer size** setting.

By default, the buffer size specified is not used.

If this setting is disabled or if the Windows Media Redirection buffer size setting is not configured, the server uses the default buffer size value (five seconds).

---

**Multi-stream connections policy settings**

March 23, 2020

The Multi-Stream Connections section contains policy settings for managing Quality of Service prioritization for multiple ICA connections in a session.

**Audio over UDP**

This setting allows or prevents audio over UDP on the server.

By default, audio over UDP is allowed on the server.

When enabled, this setting opens a UDP port on the server to support all connections configured to use Audio over UDP Realtime Transport.

**Audio UDP port range**

This setting specifies the range of port numbers (lowest port number, highest port number) used by the Virtual Delivery Agent (VDA) to exchange audio packet data with the user device. The VDA attempts to use each UDP port pair to exchange data with the user device, starting with the lowest and incrementing by two for each subsequent attempt. Each port handles both inbound and outbound traffic.

By default, this range is set to 16500,16509.

**Multi-Port policy**

This setting specifies the TCP ports to be used for ICA traffic and establishes the network priority for each port.

By default, the primary port (2598) has a High priority.

When you configure ports, you can assign the following priorities:

- **Very High** - for real-time activities, such as webcam conferences
- **High** - for interactive elements, such as screen, keyboard, and mouse
• Medium - for bulk processes, such as client drive mapping
• Low - for background activities, such as printing

Each port must have a unique priority. For example, you cannot assign a Very High priority to both CGP port 1 and CGP port 3.

To remove a port from prioritization, set the port number to 0. You cannot remove the primary port and you cannot change its priority level.

When configuring this setting, restart the server. This setting takes effect only when the Multi-Stream computer setting policy setting is enabled.

**Multi-Stream computer setting**

This setting enables or disables Multi-Stream on the server.

By default, Multi-Stream is disabled.

If you use Citrix SD-WAN with Multi-Stream support in your environment, you do not need to configure this setting. Configure this policy setting when using third-party routers or legacy Branch Repeaters to achieve the desired Quality of Service.

When configuring this setting, reboot the server to ensure that changes take effect.

**Important:**

Using this policy setting with bandwidth limit policy settings such as Overall session bandwidth limit might produce unexpected results. When including this setting in a policy, ensure that bandwidth limit settings are not included.

**Multi-Stream user setting**

This setting enables or disables Multi-Stream on the user device.

By default, Multi-Stream is disabled for all users.

This setting takes effect only on hosts where the Multi-Stream computer setting policy setting is enabled.

**Important:**

Using this policy setting with bandwidth limit policy settings such as Overall session bandwidth limit might produce unexpected results. When including this setting in a policy, ensure that bandwidth limit settings are not included.
Multi-Stream virtual channel assignment settings

This setting specifies the ICA stream the virtual channels are assigned to when multi-stream is used.

If you do not configure these settings, virtual channels are kept in their default stream. To assign a virtual channel to an ICA stream, select the desired stream number (0, 1, 2, 3) from the Stream Number list next to the virtual channel name.

If there is a custom virtual channel in use in the environment, click Add, specify the virtual channel name in the text box under Virtual Channels, and select the desired stream number from the Stream Number list next to it. The name you specify must be the actual virtual channel name and not a friendly name. For example, CTXSBR instead of Citrix Browser Acceleration.

These settings take effect only when you’ve enabled the multi-stream computer setting.

By default, the virtual channels and their stream assignments are:

- App Flow: 2
- Audio: 0
- Browser Content Redirection: 2
- Client COM Port Mapping: 3
- Client Drive Mapping: 2
- Client Printer Mapping: 3
- Clipboard: 2
- CTXDND: 1 (Note: We have added CTXDND for customers evaluating the new drag and drop feature. For more information, see “Drag and then drop files between a Citrix session and a local endpoint (for evaluation only)” in What’s new.)
- DVC Plugins (Static VC name auto-generated from DVC Plugin Friendly Name, or admin-assigned): 2
- End User Experience Monitoring: 1
- File Transfer (HTML5 Receiver): 2
- Generic Data Transfer: 2
- ICA Control: 1
- Input Method Editor: 1
- Legacy Client Printer Mapping (COM1): 1, 3
- Legacy Client Printer Mapping (COM2): 2, 3
- Legacy Client Printer Mapping (LPT1): 1, 3
- Legacy Client Printer Mapping (LPT2): 2, 3
- License Management: 1
- Microsoft Teams/WebRTC Redirection: 1
- Mobile Receiver: 1
- MultiTouch: 1
- Port Forwarding: 2
Remote Audio and Video Extensions (RAVE): 2
• Seamless (Transparent Window Integration): 1
• Sensor and Location: 1
• Smart Card: 1
• Thinwire Graphics: 1
• Transparent UI Integration/Logon Status: 2
• TWAIN Redirection: 2
• USB: 2
• Zero Latency Font and Keyboard: 2
• Zero Latency Data Channel: 2

For more information on virtual channel assignments and priorities, see the Knowledge Center article CTX131001.

**Port redirection policy settings**

August 29, 2018

The Port Redirection section contains policy settings for client LPT and COM port mapping.

For Virtual Delivery Agent versions earlier than 7.0, use the following policy settings to configure port redirection. For VDA versions 7.0 through 7.8, configure these settings using the registry; see Configure COM Port and LPT Port Redirection settings using the registry. For VDA version 7.9, use the following policy settings.

**Auto connect client COM ports**

This setting enables or disables automatic connection of COM ports on user devices when users log on to a site.

By default, client COM ports are not automatically connected.

**Auto connect client LPT ports**

This setting enables or disables automatic connection of LPT ports on user devices when users log on to a site.

By default, client LPT ports are not connected automatically.

**Client COM port redirection**

This setting allows or prevents access to COM ports on the user device.
By default, COM port redirection is prohibited.

The following policy settings are related:

• COM port redirection bandwidth limit
• COM port redirection bandwidth limit percent

Client LPT port redirection

This setting allows or prevents access to LPT ports on the user device.

By default, LPT port redirection is prohibited.

LPT ports are used only by legacy applications that send print jobs to the LPT ports and not to the print objects on the user device. Most applications today can send print jobs to printer objects. This policy setting is necessary only for servers that host legacy applications that print to LPT ports.

Note, although Client COM port redirection is bi-directional, LPT port redirection is output only and limited to \client\LPT1 and \client\LPT2 within an ICA session.

The following policy settings are related:

• LPT port redirection bandwidth limit
• LPT port redirection bandwidth limit percent

Printing policy settings

September 14, 2020

The Printing section contains policy settings for managing client printing.

Client printer redirection

This setting controls whether client printers are mapped to a server when a user logs on to a session.

By default, client printer mapping is allowed. If this setting is disabled, the PDF printer for the session is not auto-created.

Related policy settings: auto-create client printers

Default printer

This setting specifies how the default printer on the user device is established in a session.

By default, the user’s current printer is used as the default printer for the session.
To use the current Remote Desktop Services or Windows user profile setting for the default printer, select Do not adjust the user’s default printer. If you choose this option, the default printer is not saved in the profile and it does not change according to other session or client properties. The default printer in a session is the first printer auto-created in the session, which is either:

- The first printer added locally to the Windows server in **Control Panel > Devices** and **Printers**.
- The first auto-created printer, if there are no printers added locally to the server.

You can use this option to present users with the nearest printer through profile settings (known as proximity printing).

**Printer assignments**

This setting provides an alternative to the Default printer and Session printers settings. Use the individual Default printer and Session printers settings to configure behaviors for a site, large group, or organizational unit. Use the **Printer assignments** setting to assign a large group of printers to multiple users.

This setting specifies how the default printer on the listed user devices is established in a session.

By default, the user’s current printer is used as the default printer for the session.

It also specifies the network printers to be auto-created in a session for each user device. By default, no printers are specified.

- **When setting the default printer value:**

  To use the current default printer for the user device, select **Do not adjust**.

  To use the current Remote Desktop Services or Windows user profile setting for the default printer, select **Do no adjust**. If you choose this option, the default printer is not saved in the profile and it does not change according to other session or client properties. The default printer in a session is the first printer auto-created in the session, which is either:

  - The first printer added locally to the Windows server in **Control Panel > Devices** and Printers.
  - The first auto-created printer, if there are no printers added locally to the server.

- **When setting the session printers value:** to add printers, type the UNC path of the printer you want to auto-create. After adding the printer, you can apply customized settings for the current session at every logon.

**Printer auto-creation event log preference**

This setting specifies the events that are logged during the printer auto-creation process. You can choose to log no errors or warnings, only errors, or errors and warnings.
By default, errors and warnings are logged.

An example of a warning is an event in which a printer’s native driver cannot be installed and the Universal print driver is installed instead. To use the Universal print driver in this scenario, configure the Universal print driver usage setting to Use universal printing only or Use universal printing only if the requested driver is unavailable.

**Session printers**

This setting specifies the network printers to be auto-created in a session. Inside the ICA/HDX session, the Citrix Print Manager service (CpSvc.exe) creates a network printer connection during the session logon for each network printer specified in the **Session Printer** policy setting. It deletes the printers during the session logoff. By default, no printers are specified.

In the **Session Printer** policy setting, the network printers can reside on a Windows Print Server or a Citrix Universal Print Server.

- **Windows Print Server**: Shares one or more network printers. It also has the native printer drivers required to use the network printers.
- **Universal Print Server**: A Windows Print Server where the Citrix Universal Print Server software has been installed.

When using a Windows Print Server, the Citrix Print Manager service creates the network printer connections using native printer drivers. The Citrix Virtual Apps server must have the native printer drivers installed on it.

When using a Citrix Universal Print Server, the Citrix Print Manager service creates the network printer connections using either native printer drivers, Citrix Universal Printer Driver, or Citrix Universal XPS Printer Driver. The driver that you use is controlled by the Universal Print Driver usage policy setting.

All Windows printer drivers currently fall within either the v3 or v4 driver version. For more information, see [Support for the Microsoft V3 and V4 Printer Driver Architectures](#).

To add session printers and verify if they appear in the sessions, complete the following procedure:

1. In Citrix Studio, navigate to the **Policies** tab.
2. Enable the session printing policy in the **Edit Policy** dialog box.
3. In the policy, add the session printer. To add printers, type the UNC path of the printer you want to auto-create. After adding the printer, you can apply customized settings for the current session at every logon. The session printer must display in the list.
4. After the policy has been set, the published application might not display session printers. This issue might occur because the printer driver is missing from the Citrix Virtual Apps server or the policy has been created but not enabled.
Note:
If the printer driver has not been installed on the Citrix Virtual Apps server, you might experience the most common mistake with session printers where administrators forget to install the printer driver on the Citrix Virtual Apps server.

5. Start the published desktop and manually add the session printer in Devices and Printers > Control Panel.

6. If this fails, investigate the communication between the Citrix Virtual Apps server and the print server. Consider running a test with RDP.

Wait for printers to be created
Enable this feature differently depending on whether it’s for Citrix Virtual Desktops or Citrix Virtual Apps. Use the policy on the Delivery Controller to enable the feature on Citrix Virtual Desktops. Use a PowerShell cmdlet on the Delivery Controller to enable the feature on Citrix Virtual Apps.

Wait for printers to be created (Server Desktop):
This setting allows a delay in connecting to a session so that client-redirected printers can be auto-created.

By default, a connection delay does not occur.

Wait for printers to be created (Citrix Virtual Apps):
Setting the following PowerShell cmdlet allows a delay in connecting to virtual apps created on server desktops so that client-redirected printers can be auto-created.

Set-BrokerApplication -Name <VirtualAppName> -WaitForPrinterCreation $true

By default, a connection delay does not occur.

Client printers policy settings

June 9, 2020

The Client Printers section contains policy settings for client printers, including settings to auto-create client printers, retain printer properties, and connect to print servers.

Auto-create client printers
This setting specifies the client printers that are auto-created. This setting overrides default client printer auto-creation settings.
By default, all client printers are auto-created.

This setting takes effect only if the Client printer redirection setting is present and set to Allowed.

When adding this setting to a policy, select an option:

- **Auto-create all client printers** automatically creates all printers on a user device.
- **Auto-create the client’s default printer only** automatically creates only the printer selected as the default printer on the user device.
- **Auto-create local (non-network) client printers only** automatically creates only printers directly connected to the user device through an LPT, COM, USB, TCP/IP, or other local port.
- **Do not auto-create client printers** turns off autocreation for all client printers when users log on. Choosing this option causes the Remote Desktop Services (RDS) settings for autocreating client printers to override this setting in lower priority policies.

**Auto-create generic universal printer**

Note: Hotfixes that address the issues with this policy setting are available as Knowledge Center articles CTX141565 and CTX141566.

This setting enables or disables auto-creation of the generic Citrix Universal Printer object for sessions where a user device compatible with Universal Printing is in use.

By default, the generic Universal Printer object is not auto-created.

The following policy settings are related:

- Universal print driver usage
- Universal driver preference

**Auto-create PDF universal printer**

This setting enables or disables auto-creation of the Citrix PDF printer for sessions using Citrix Workspace app for Windows (starting from VDA 7.19), Citrix Workspace app for HTML5, or Citrix Workspace app for Chrome.

By default, the Citrix PDF printer is not auto-created.

**Client printer names**

This setting selects the naming convention for auto-created client printers.

By default, standard printer names are used.

Select **Standard printer names** to use printer names such as “HPLaserJet 4 from client name in session 3.”
Select **Legacy printer names** to use old-style client printer names and preserve backward compatibility for users or groups using MetaFrame Presentation Server 3.0 or earlier. An example of a legacy printer name is “Client/clientname#/HPLaserJet 4.” This option is less secure.

Note: This option is provided for backwards compatibility with legacy versions of XenApp and XenDesktop. You can use it with newer versions of Citrix Virtual Apps and Desktops.

**Direct connections to print servers**

This setting enables or disables direct connections from the virtual desktop or server hosting applications to a print server for client printers hosted on an accessible network share.

By default, direct connections are enabled.

Enable direct connections if the network print server is not across a WAN from the virtual desktop or server hosting applications. Direct communication results in faster printing if the network print server and the virtual desktop or server hosting applications are on the same LAN.

Disable direct connections if the network is across a WAN or has substantial latency or limited bandwidth. Print jobs are routed through the user device where they are redirected to the network print server. Data sent to the user device is compressed, so less bandwidth is consumed as the data travels across the WAN.

If two network printers have the same name, the printer on the same network as the user device is used.

**Printer driver mapping and compatibility**

This setting specifies the driver substitution rules for auto-created client printers.

This setting is configured to exclude Microsoft OneNote and XPS Document Writer from the auto-created client printers list.

When you define driver substitution rules, you can allow or prevent printers to be created with the specified driver. Also, you can allow created printers to use only universal print drivers. Driver substitution overrides or maps printer driver names the user device provides, substituting an equivalent driver on the server. This gives server applications access to client printers that have the same drivers as the server, but different driver names.

You can add a driver mapping, edit an existing mapping, override custom settings for a mapping, remove a mapping, or change the order of driver entries in the list. When adding a mapping, enter the client printer driver name and then select the server driver you want to substitute.
Printer properties retention

This setting specifies whether to store printer properties and where to store them.

By default, the system determines if printer properties are stored on the user device, if available, or in the user profile.

When adding this setting to a policy, select an option:

- Saved on the client device only is for user devices that have a mandatory or roaming profile that is not saved. Choose this option only if all the servers in your farm are running XenApp 5 and above and your users are using Citrix online plug-in versions 9 through 12.x, or Citrix Receiver 3.x.
- Retained in user profile only is for user devices constrained by bandwidth (this option reduces network traffic) and logon speed or for users with legacy plug-ins. This option stores printer properties in the user profile on the server and prevents any properties exchange with the user device. Use this option with MetaFrame Presentation Server 3.0 or earlier and MetaFrame Presentation Server Client 8.x or earlier. Note that this is applicable only if a Remote Desktop Services (RDS) roaming profile is used.
- Held in profile only if not saved on client allows the system to determine where printer properties are stored. Printer properties are stored either on the user device, if available, or in the user profile. Although this option is the most flexible, it can also slow logon time and use extra bandwidth for system-checking.
- Do not retain printer properties prevents storing printer properties.

Retained and restored client printers

This setting enables or disables the retention and re-creation of printers on the user device. By default, client printers are auto-retained and auto-restored.

Retained printers are user-created printers that are created again, or remembered, at the start of the next session. When Citrix Virtual Apps recreates a retained printer, it considers all policy settings except the Auto-create client printers setting.

Restored printers are printers fully customized by an administrator, with a saved state that is permanently attached to a client port.

Citrix PDF Universal Printer driver

The Citrix PDF Universal Printer driver enables users to print documents opened with hosted applications or applications running on virtual desktops delivered by Citrix Virtual Apps and Desktops. When a user selects the Citrix PDF Printer option, the driver converts the file to PDF and transfers the PDF to the local device. The PDF is then opened for viewing and printing from a locally attached printer.
PDF is one of the formats supported with Citrix Universal Printing (in addition to EMF and XPS). The PDF printer can be enabled, configured, and set as default using a Citrix Policy. The **Citrix PDF Printer** option is available to users of the Citrix Workspace app for Windows, Chrome, and HTML5.

**Note:**
A PDF viewer is required for Windows endpoints. The client must have an application that has file type association registered on Windows to open PDF files.

## Drivers policy settings

August 29, 2018

The Drivers section contains policy settings related to printer drivers.

### Automatic installation of in-box printer drivers

**Note**
This policy does not support VDAs in this release.

This setting enables or disables the automatic installation of printer drivers from the Windows in-box driver set or from driver packages staged on the host using pnputil.exe /a.

By default, these drivers are installed as needed.

### Universal driver preference

This setting specifies the order in which universal printer drivers are used, beginning with the first entry in the list.

By default, the preference order is:

- EMF
- XPS
- PCL5c
- PCL4
- PS

You can add, edit, or remove drivers, and change the order of drivers in the list.

### Universal print driver usage

This setting specifies when to use universal printing.
By default, universal printing is used only if the requested driver is unavailable.

Universal printing employs generic printer drivers instead of standard model-specific drivers, potentially simplifying the burden of driver management on host computers. The availability of universal print drivers depends on the capabilities of the user device, host, and print server software. In certain configurations, universal printing might not be available.

When adding this setting to a policy, select an option:

- Use only printer model specific drivers specifies that the client printer uses only the standard model-specific drivers that are auto-created at logon. If the requested driver is unavailable, the client printer cannot be auto-created.
- Use universal printing only specifies that no standard model-specific drivers are used. Only universal print drivers are used to create printers.
- Use universal printing only if requested driver is unavailable uses standard model-specific drivers for printer creation if they are available. If the driver is not available on the server, the client printer is created automatically with the appropriate universal driver.
- Use printer model specific drivers only if universal printing is unavailable uses the universal print driver if it is available. If the driver is not available on the server, the client printer is created automatically with the appropriate model-specific printer driver.

Universal Print Server policy settings

April 11, 2019

The Universal Print Server section contains policy settings for handling the Universal Print Server.

SSL cipher suite

This setting specifies the set of SSL/TLS cipher suites used by the Universal Print Client for encrypted print data stream (CGP) connections.

To control the cipher suite package used by the Universal Print Client for encrypted print web service (HTTPS/SOAP) connections, see [SCHANNEL].

Default value: ALL

This setting has the following values: ALL, COM or GOV.

The cipher suites corresponding to each value are listed below:

**ALL:**

```
TLS_ECDHE_RSA_AES256_GCM_SHA384
```
TLS_ECDHE_RSA_AES256_CBC_SHA384
TLS_ECDHE_RSA_AES128_CBC_SHA

**COM:**
TLS_ECDHE_RSA_AES128_CBC_SHA

**GOV:**
TLS_ECDHE_RSA_AES256_GCM_SHA384
TLS_ECDHE_RSA_AES256_CBC_SHA384

**SSL compliance mode**

This setting specifies the level of compliance with NIST Special Publication 800-52 that is used by the Universal Print Client for encrypted print data stream (CGP) connections.

Default value: None.

This setting has the following values:

**None.**
The encrypted print data stream (CGP) connections use the default compliance mode.

**SP800-52.**
The encrypted print data stream (CGP) connections use the NIST Special Publication 800-52 compliance mode.

**SSL enabled**

This setting specifies whether SSL/TLS is used by the Universal Print Client for print data stream (CGP) connections and for web service (HTTP/SOAP) connections.

When you set **Universal Print Server enable** to **Enabled with fallback to Windows’ native remote printing**, fallback connections are made by the Microsoft Windows Network Print Provider. This setting does not affect these fallback connections.

Default value: Disabled

This setting has the following values:

**Enabled.**
The Universal Print Client uses SSL/TLS to connect to the Universal Print Server.

**Disabled.**
The Universal Print Client uses SSL/TLS to connect to the Universal Print Server.
SSL FIPS mode

This setting specifies whether the SSL/TLS cryptographic module used by the Universal Print Client for print data stream (CGP) connections will run in FIPS mode.

Default value: Disabled

This setting has the following values:

**Enabled.**

FIPS mode is on.

**Disabled.**

FIPS mode is off.

SSL protocol version

This setting specifies the SSL/TLS protocol version used by the Universal Print Client.

Default value: ALL

This setting has the following values:

**ALL.**

Use TLS versions 1.0, 1.1 or 1.2.

**TLSv1.**

Use TLS version 1.0.

**TLSv1.1.**

Use TLS version 1.1.

**TLSv1.2.**

Use TLS version 1.2.

SSL Universal Print Server encrypted print data stream (CGP) port

This setting specifies the TCP port number of the Universal Print Server encrypted print data stream (CGP) port. This port receives data for print jobs.

Default value: 443
**SSL Universal Print Server encrypted web service (HTTPS/SOAP) port**

This setting specifies the TCP port number of the Universal Print Server encrypted web service (HTTPS/SOAP) port. This port receives data for print commands.

Default value: 8443

**Universal Print Server enable**

This setting enables or disables the Universal Print Server feature on the virtual desktop or the server hosting applications. Apply this policy setting to Organizational Units (OUs) containing the virtual desktop or server hosting applications.

By default, the Universal Print Server is disabled.

When adding this setting to a policy, select one of the following options:

- **Enabled with fallback to Windows native remote printing.** Network printer connections are serviced by the Universal Print Server, if possible. If the Universal Print Server is not available, the Windows Print Provider is used. The Windows Print Provider continues to handle all printers previously created with the Windows Print Provider.

- **Enabled with no fallback to Windows native remote printing.** Network printer connections are serviced by the Universal Print Server exclusively. If the Universal Print Server is unavailable, the network printer connection fails. This setting effectively disables network printing through the Windows Print Provider. Printers previously created with the Windows Print Provider are not created while a policy containing this setting is active.

- **Disabled.** The Universal Print Server feature is disabled. No attempt is made to connect with the Universal Print Server when connecting to a network printer with a UNC name. Connections to remote printers continue to use the Windows native remote printing facility.

**Universal Print Server print data stream (CGP) port**

This setting specifies the TCP port number used by the Universal Print Server print data stream Common Gateway Protocol (CGP) listener. Apply this policy setting only to OUs containing the print server.

By default, the port number is set to 7229.

Valid port numbers must be in the range of 1 to 65535.

**Universal Print Server print stream input bandwidth limit (kbps)**

This setting specifies the upper boundary (in kilobits per second) for the transfer rate of print data delivered from each print job to the Universal Print Server using CGP. Apply this policy setting to OUs containing the virtual desktop or server hosting applications.
By default, the value is 0, which specifies no upper boundary.

**Universal Print Server web service (HTTP/SOAP) port**

This setting specifies the TCP port number used by the Universal Print Server’s web service (HTTP/SOAP) listener. The Universal Print Server is an optional component that enables the use of Citrix universal print drivers for network printing scenarios. When the Universal Print Server is used, printing commands are sent from Citrix Virtual Apps and Desktops hosts to the Universal Print Server via SOAP over HTTP. This setting modifies the default TCP port on which the Universal Print Server listens for incoming HTTP/SOAP requests.

You must configure both host and print server HTTP port identically. If you do not configure the ports identically, the host software will not connect to the Universal Print Server. This setting changes the VDA on Citrix Virtual Apps and Desktops. In addition, you must change the default port on the Universal Print Server.

By default, the port number is set to 8080.

Valid port numbers must be in the range of 0 to 65535.

**Universal Print Servers for load balancing**

This setting lists the Universal Print Servers to be used to load balance printer connections established at session launch, after evaluating other Citrix printing policy settings. To optimize printer creation time, Citrix recommends that all print servers have the same set of shared printers. There is no upper limit to the number of print servers which can be added for load balancing.

This setting also implements print server failover detection and printer connections recovery. The print servers are checked periodically for availability. If a server failure is detected, that server is removed from the load balancing scheme, and printer connections on that server are redistributed among other available print servers. When the failed print server recovers, it is returned to the load balancing scheme.

Click Validate Servers to check that each server is a print server, that the server list doesn’t contain duplicate server names, and that all servers have an identical set of shared printers installed. This operation may take some time.

**Universal Print Servers out-of-service threshold**

This setting specifies how long the load balancer should wait for an unavailable print server to recover before it determines that the server is permanently offline and redistributes its load to other available print servers.

By default, the threshold value is set to 180 (seconds).
Universal printing policy settings

November 27, 2018

The Universal Printing section contains policy settings for managing universal printing.

Universal printing EMF processing mode

This setting controls the method of processing the EMF spool file on the Windows user device.

By default, EMF records are spooled directly to the printer.

When adding this setting to a policy, select an option:

- Reprocess EMFs for printer forces the EMF spool file to be reprocessed and sent through the GDI subsystem on the user device. You can use this setting for drivers that require EMF reprocessing but that might not be selected automatically in a session.
- Spool directly to printer, when used with the Citrix Universal print driver, ensures the EMF records are spooled and delivered to the user device for processing. Typically, these EMF spool files are injected directly to the client’s spool queue. For printers and drivers that are compatible with the EMF format, this is the fastest printing method.

Universal printing image compression limit

This setting specifies the maximum quality and the minimum compression level available for images printed with the Citrix Universal print driver.

By default, the image compression limit is set to Best quality (lossless compression).

If No Compression is selected, compression is disabled for EMF printing only.

When adding this setting to a policy, select an option:

- No compression
- Best quality (lossless compression)
- High quality
- Standard quality
- Reduced quality (maximum compression)

When adding this setting to a policy that includes the Universal printing optimization defaults setting, be aware of the following:

- If the compression level in the Universal printing image compression limit setting is lower than the level defined in the Universal printing optimization defaults setting, images are compressed at the level defined in the Universal printing image compression limits setting.
- If compression is disabled, the Desired image quality and Enable heavyweight compression options of the Universal printing optimization defaults setting have no effect in the policy.

**Universal printing optimization defaults**

This setting specifies the default values for printing optimization when the universal print driver is created for a session.

- Desired image quality specifies the default image compression limit applied to universal printing. By default, Standard Quality is enabled, meaning that users can only print images using standard or reduced quality compression.
- Enable heavyweight compression enables or disables reducing bandwidth beyond the compression level set by Desired image quality, without losing image quality. By default, heavyweight compression is disabled.
- Image and Font Caching settings specify whether or not to cache images and fonts that appear multiple times in the print stream, ensuring each unique image or font is sent to the printer only once. By default, embedded images and fonts are cached. Note that these settings apply only if the user device supports this behavior.
- Allow non-administrators to modify these settings specifies whether or not users can change the default print optimization settings within a session. By default, users are not allowed to change the default print optimization settings.

Note: All of these options are supported for EMF printing. For XPS printing, only the Desired image quality option is supported.

When adding this setting to a policy that includes the Universal printing image compression limit setting, be aware of the following:

- If the compression level in the Universal printing image compression limit setting is lower than the level defined in the Universal printing optimization defaults setting, images are compressed at the level defined in the Universal printing image compression limits setting.
- If compression is disabled, the Desired image quality and Enable heavyweight compression options of the Universal printing optimization defaults setting have no effect in the policy.

**Universal printing preview preference**

This setting specifies whether or not to use the print preview function for auto-created or generic universal printers.

By default, print preview is not used for auto-created or generic universal printers.

When adding this setting to a policy, select an option:

- Do not use print preview for auto-created or generic universal printers
• Use print preview for auto-created printers only
• Use print preview for generic universal printers only
• Use print preview for both auto-created and generic universal printers

**Universal printing print quality limit**

This setting specifies the maximum dots per inch (dpi) available for generating printed output in a session.

By default, No Limit is enabled, meaning users can select the maximum print quality allowed by the printer to which they connect.

If this setting is configured, it limits the maximum print quality available to users in terms of output resolution. Both the print quality itself and the print quality capabilities of the printer to which the user connects are restricted to the configured setting. For example, if configured to Medium Resolution (600 DPI), users are restricted to printing output with a maximum quality of 600 DPI and the Print Quality setting on the Advanced tab of the Universal Printer dialog box shows resolution settings only up to and including Medium Quality (600 DPI).

When adding this setting to a policy, select an option:

• Draft (150 DPI)
• Low Resolution (300 DPI)
• Medium Resolution (600 DPI)
• High Resolution (1200 DPI)
• No Limit

**Security policy settings**

August 7, 2020

The Security section contains the policy setting for configuring session encryption and encryption of logon data.

**SecureICA minimum encryption level**

This setting specifies the minimum level at which to encrypt session data sent between the server and a user device.

**Important:** For the Virtual Delivery Agent 7.x, this policy setting can be used only to enable the encryption of the logon data with RC5 128-bit encryption. Other settings are provided only for backwards compatibility with legacy versions of Citrix Virtual Apps and Desktops.
For the VDA 7.x, encryption of session data is set using the basic settings of the VDA’s Delivery Group. If Enable Secure ICA is selected for the Delivery Group, session data is encrypted using RC5 (128 bit) encryption. If Enable Secure ICA is not selected for the Delivery Group, session data is encrypted with Basic encryption.

When adding this setting to a policy, select an option:

- Basic encrypts the client connection using a non-RC5 algorithm. It protects the data stream from being read directly, but it can be decrypted. By default, the server uses Basic encryption for client-server traffic.
- RC5 (128 bit) logon only encrypts the logon data using RC5 128-bit encryption and the client connection using Basic encryption.
- RC5 (40 bit) encrypts the client connection using RC5 40-bit encryption.
- RC5 (56 bit) encrypts the client connection using RC5 56-bit encryption.
- RC5 (128 bit) encrypts the client connection using RC5 128-bit encryption.

The settings you specify for client-server encryption can interact with any other encryption settings in your environment and your Windows operating system. If a higher priority encryption level is set on either a server or user device, the settings you specify for published resources can be overridden.

You can raise encryption levels to further secure communications and message integrity for certain users. If a policy requires a higher encryption level, Citrix Receivers using a lower encryption level are denied connection.

SecureICA does not perform authentication or check data integrity. To provide end-to-end encryption for your site, use SecureICA with TLS encryption.

SecureICA does not use FIPS-compliant algorithms. If this is an issue, configure the server and Citrix Receivers to avoid using SecureICA.

SecureICA uses the RC5 block cipher as described in RFC 2040 for confidentiality. The block size is 64 bits (a multiple of 32-bit word units). The key length is 128 bits. The number of rounds is 12.

**Server limits policy settings**

December 10, 2019

The Server Limits section contains the policy setting for controlling idle connections.

**Server idle timer interval**

This setting determines, in milliseconds, how long an uninterrupted user session is maintained if there is no input from the user.
By default, idle connections are not disconnected (server idle timer interval = 0). Citrix recommends setting this value to a minimum of 60000 milliseconds (60 seconds).

To display the policy, select Multiple Versions, clear the Single-session OS versions, and then select Server Limits.

Note
When this policy setting is used, an “Idle timer expired” dialog box might appear to users when the session has been idle for the specified time. Citrix policy settings don’t control this Microsoft dialog box message. For more information, see http://support.citrix.com/article/CTX118618.

Session limits policy settings

October 8, 2019

The Session Limits section contains policy settings that control how long sessions remain connected before they are forced to log off.

Important:
The settings described in this article do not apply to Windows Server VDAs. For more information about configuring session time limits for Server VDAs, see Microsoft KB - Session Time Limits.

Disconnected session timer

This setting enables or disables a timer that specifies how long a disconnected, locked desktop remains locked before the session is logged off. If this timer is enabled, the disconnected session is logged off when the timer expires.

By default, disconnected sessions are not logged off.

Disconnected session timer interval

This setting specifies how many minutes a disconnected, locked desktop can remain locked before the session is logged off.

By default, the time period is 1,440 minutes (24 hours).

Session connection timer

This setting enables or disables a timer that specifies the maximum duration of an uninterrupted connection between a user device and a desktop. If this timer is enabled, the session is disconnected or
logged off when the timer expires. The Microsoft **End session when time limits are reached** setting determines the next state for the session.

By default, this timer is disabled.

**Session connection timer interval**

This setting specifies the maximum number of minutes for an uninterrupted connection between a user device and a desktop.

By default, the maximum duration is 1,440 minutes (24 hours).

**Session idle timer**

This setting enables or disables a timer that specifies how long an uninterrupted user device connection to a desktop is maintained if the user supplies no input. When this timer expires, the session is placed in the disconnected state and the **Disconnected session timer** applies. If the **Disconnected session timer** is disabled, the session is not logged off.

By default, this timer is enabled.

**Session idle timer interval**

This setting specifies how many minutes an uninterrupted user device connection to a desktop is maintained if there is no input from the user.

By default, idle connections are maintained for 1,440 minutes (24 hours).

**Session reliability policy settings**

**August 7, 2020**

The session reliability section contains policy settings for managing session reliability connections.

**Session reliability connections**

This setting allows or prevents sessions to remain open during a loss of network connectivity. Session reliability, along with auto client reconnection, allows users to reconnect automatically to their Citrix Workspace app sessions after recovering from network disruptions. By default, session reliability is Allowed.
For Citrix Workspace app 1808 and later and Citrix Receiver for Windows 4.7 and later, the settings in Studio are enforced on the client. Citrix Receiver Group Policy Object on the clients is overridden by Studio policy. Updates to these policies in Studio synchronize session reliability from server to client.

Note:

- Citrix Receiver for Windows 4.7 and later and Citrix Workspace apps for Windows - Set the policy in Studio.
- Citrix Receivers for Windows earlier than 4.7 - Set policies in Studio and the Citrix Receiver Group Policy Object template on the client for consistent behavior.

Session reliability keeps sessions active and on the user’s screen when network connectivity is interrupted. Users continue to see the application that they are using until network connectivity resumes.

By using session reliability, the session remains active on the server. To indicate that connectivity is lost, the user display becomes opaque. The user might see a frozen session during the interruption and can resume interacting with the application when the network connection is restored. Session reliability reconnects users without reauthentication prompts.

If you use both session reliability and auto client reconnect, the two features work in sequence. Session reliability closes (or disconnects) the user session after the amount of time specified in the session reliability timeout setting. After that, the auto client reconnect settings take effect, attempting to reconnect the user to the disconnected session.

By default, session reliability is Allowed.

To disable session reliability:

1. Start Citrix Studio.
2. Open the Session Reliability connections policy.
3. Set the policy to Prohibited.
Session reliability port number

This setting specifies the TCP port number for incoming session reliability connections.

By default, the port number is set to 2598.

To change the session reliability port number:

1. Start Citrix Studio.
2. Open the **Session reliability port number** policy.
3. Edit the port number.
4. Click **OK**.

Session reliability timeout

This setting specifies the length of time, in seconds, the session reliability proxy waits for a user to reconnect before allowing the session to be disconnected.

Although you can extend the amount of time a session is kept open, this feature is a convenience and doesn’t prompt the user for reauthentication. The longer a session is open, the chances increase that
a user might leave the device unattended and potentially accessible to unauthorized users.

By default, the timeout is set to 180 seconds, or three minutes.

To change session reliability timeout:

1. Start Citrix Studio.
2. Open the **Session reliability timeout** policy.
3. Edit the timeout value.
4. Click **OK**.

### Session watermark policy settings

**August 7, 2020**

The session watermark section contains policy settings to configure this feature. Enabling this feature causes a significant rise in the network bandwidth and CPU usage by the VDA machine. We recommend that you configure the session watermark for selected VDA machines based on your available hardware resources.

**Important**

Enable session watermark for the other watermark policy settings to be effective. To achieve a better user experience, don’t enable more than two watermark text items.

**Enable session watermark**

When you enable this setting, the session display has an opaque textual watermark displaying session-specific information. The other watermark settings depend on this one being enabled.

By default, the session watermark is disabled.

**Include client IP address**

When you enable this setting, the session displays the current client IP address as a watermark.

By default, Include client IP address is disabled.

**Include connection time**

When you enable this setting, the session watermark displays a connect time. The format is `yyyy/mm/dd hh:mm`. The time displayed is based on the system clock and time zone.

By default, Include connection time is disabled.
Include logon user name

When you enable this setting, the session displays the current logon user name as a watermark. The display format is USERNAME@DOMAINNAME. We recommend that the user name is a maximum of 20 characters. When a user name is more than 20 characters, excessively small character fonts or truncation might occur and lessen the watermark effectiveness.

By default, Include logon user name is enabled.

Include VDA host name

When you enable this setting, the session displays the VDA host name of the current ICA session as a watermark.

By default, Include VDA host name is enabled.

Include VDA IP address

When you enable this setting, the session displays the VDA IP address of the current ICA session as a watermark.

By default, VDA IP address is disabled.

Session watermark style

This setting controls whether you display a single watermark text label or multiple labels. Choose Multiple or Single from the Value drop-down menu.

Multiple displays five watermark labels in the session. One in the center and four in the corners.

Single displays a single watermark label in the center of the session.

By default, Session watermark style is Multiple.

Watermark custom text

This setting specifies a custom text string (for example, the corporate name) to display in the session watermark. When you configure a non-empty string, it displays the text in a new line appending other information enabled in the watermark.

The watermark custom text maximum is 25 Unicode characters. If you configure a longer string, it is truncated to 25 characters.

There is no default text.
**Watermark transparency**

You can specify watermark opacity from 0 through 100. The larger the value specified, the more opaque the watermark.

By default, the value is 17.

**Time zone control policy settings**

December 10, 2019

The Time Zone Control section contains policy settings related to using local time in sessions.

**Estimate local time for legacy clients**

This setting enables or disables estimating the local time zone of user devices that send inaccurate time zone information to the server.

By default, the server estimates the local time zone when necessary.

This setting is intended for use with legacy Citrix Receivers or ICA clients that do not send detailed time zone information to the server. When used with Citrix Receivers that send detailed time zone information to the server, such as supported versions of Citrix Receiver for Windows, this setting has no effect.

**Restore desktop OS time zone on session disconnect or logoff**

This setting determines whether or not the time zone setting for a Single-session OS VDA is restored to the machine's original time zone when the user disconnects or logs off. If you enable this setting, the VDA restores the machine's time zone to its original setting when the user disconnects or logs off.

For this setting to take effect, set the **Use local time of client** to **Use client time zone**.

By default, this setting is enabled.

**Use local time of client**

This setting determines the time zone setting of the user session. The choices are the time zone of the user session (server time zone) or the time zone of the user device (client time zone).

By default, the time zone of the user session is used.

For this setting to take effect, enable the **Allow time zone redirection** setting in the Group Policy Editor. The setting is in **Local Computer Policy > Computer Configuration > Administrative Templates**.
If the VDA is a Single-session OS VDA running on a Multi-session OS, configure the local user right Change the time zone to Everyone. This user right can be found in the Local Computer Policy > Computer Configuration > Windows Settings > Security Settings > Local Policies > User Rights Assignment.

Note:
In a Single-session OS, Users are included in the User Rights Assignment Change the time zone, though not in a Multi-session OS. In a Multi-session OS, the time zone synchronizes using the following group policy: Computer Configuration\Administrative Templates\Windows Components\Remote Desktop Services\Remote Desktop Session Host\Device and Resource Redirection\Allow timezone redirection. This policy doesn’t apply when the Server is not a Remote Desktop Session Host in the Multi-session OS VDA (installed with the /ServerVDI command). In a Multi-session OS, by default and by design, users don’t have the local right to change the time zone.

**TWAIN devices policy settings**

August 29, 2018

The TWAIN devices section contains policy settings related to mapping client TWAIN devices, such as digital cameras or scanners, and optimizing image transfers from server to client.

Note

TWAIN 2.0 is supported with Citrix Receiver for Windows 4.5.

**Client TWAIN device redirection**

This setting allows or prevents users from accessing TWAIN devices on the user device from image processing applications hosted on servers. By default, TWAIN device redirection is allowed.

The following policy settings are related:

- TWAIN compression level
- TWAIN device redirection bandwidth limit
- TWAIN device redirection bandwidth limit percent
**TWAIN compression level**

This setting specifies the level of compression of image transfers from client to server. Use Low for best image quality, Medium for good image quality, or High for low image quality. By default, medium compression is applied.

**USB devices policy settings**

September 14, 2020

The **USB devices** section contains policy settings for managing file redirection for USB devices.

**Client USB device optimization rules**

Client USB device optimization rules can be applied to devices to disable optimization, or to change the optimization mode.

When a user plugs in a USB input device, the host checks if the **USB policy** settings allow the device. If the device is allowed, the host then checks the **Client USB device optimization rules** for the device. If no rule is specified, then the device is not optimized. Capture mode (04) is the recommended mode for signature devices. For other devices which have degraded performance over higher latency, administrators can enable Interactive mode (02). See descriptions of the available modes in the table in this article.

**Good to know**

- For the use of Wacom signature pads and tablets, we recommend that you disable the screen saver. Steps on how to disable the screen saver are at the end of this section.
- Support for the optimization of Wacom STU signature pads and tablets series of products has been preconfigured in the installation of Citrix Virtual Apps and Desktops policies.
- Signature devices work across Citrix Virtual Apps and Desktops and do not require a driver to be used as a signature device. Wacom has more software that can be installed to customize the device further. See [http://www.wacom.com/](http://www.wacom.com/).
- Drawing tablets. Certain drawing input devices might present as an HID device on PCI/ACPI buses and are not supported. Attach these devices on a USB host controller on the client to be redirected inside a Citrix Virtual Desktops session.

Policy rules take the format of tag=value expressions separated by whitespace. The following tags are supported:
The optimization mode is supported for input devices for class=03. Supported modes are: No optimization - value 01. Interactive mode - value 02. Recommended for devices such as pen tablets and 3D Pro mice. Capture mode - value 04. Preferred for devices such as signature pads.

<table>
<thead>
<tr>
<th>Tag Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>The optimization mode is supported for input devices for class=03. Supported modes are: No optimization - value 01. Interactive mode - value 02. Recommended for devices such as pen tablets and 3D Pro mice. Capture mode - value 04. Preferred for devices such as signature pads.</td>
</tr>
<tr>
<td>VID</td>
<td>Vendor ID from the device descriptor, as a four digit hexadecimal number.</td>
</tr>
<tr>
<td>PID</td>
<td>Product ID from the device descriptor, as a four digit hexadecimal number.</td>
</tr>
<tr>
<td>REV</td>
<td>Revision ID from the device descriptor, as a four digit hexadecimal number.</td>
</tr>
<tr>
<td>Class</td>
<td>Class from either the device descriptor or an interface descriptor.</td>
</tr>
<tr>
<td>SubClass</td>
<td>Subclass from either the device descriptor or an interface descriptor.</td>
</tr>
<tr>
<td>Prot</td>
<td>Protocol from either the device descriptor or an interface descriptor.</td>
</tr>
</tbody>
</table>

**Examples**

Mode=00000004 VID=067B PID=1230 class=03 #Input device operating in capture mode

Mode=00000002 VID=067B PID=1230 class=03 #Input device operating in interactive mode (default)

Mode=00000001 VID=067B PID=1230 class=03 #Input device operating without any optimization

Mode=00000100 VID=067B PID=1230 # Device setup optimization disabled (default)

Mode=00000200 VID=067B PID=1230 # Device setup optimization enabled

**Disabling the screen saver for Wacom signature pad devices**

For the use of Wacom signature pads and tablets, Citrix recommends that you disable the screen saver as follows:

1. Install the Wacom-STU-Driver after redirecting the device.
2. Install Wacom-STU-Display MSI to gain access to the signature pad control panel.
3. Go to Control Panel > Wacom STU Display > STU430 or STU530, and select the tab for your model.
4. Choose Change, then select Yes when the UAC security window pops up.
5. Select Disable slideshow, then Apply.

After the setting is set for one signature pad model, it is applied to all models.

**Client USB device redirection**

This setting allows or prevents redirection of USB devices to and from the user device.

By default, USB devices are not redirected.

**Client USB device redirection rules**

This setting specifies redirection rules for USB devices.

By default, no rules are specified.

When a user plugs in a USB device, the host device checks it against each policy rule in turn until a match is found. The first match for any device is considered definitive. If the first match is an Allow rule, the device is remoted to the virtual desktop. If the first match is a Deny rule, the device is available only to the local desktop. If no match is found, default rules are used.

Policy rules take the format `{Allow: | Deny:} ` followed by a set of `tag=value` expressions separated by whitespace. The following tags are supported:

<table>
<thead>
<tr>
<th>Tag Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VID</td>
<td>Vendor ID from the device descriptor</td>
</tr>
<tr>
<td>PID</td>
<td>Product ID from the device descriptor</td>
</tr>
<tr>
<td>REL</td>
<td>Release ID from the device descriptor</td>
</tr>
<tr>
<td>Class</td>
<td>Class from either the device descriptor or an interface descriptor</td>
</tr>
<tr>
<td>SubClass</td>
<td>Subclass from either the device descriptor or an interface descriptor</td>
</tr>
<tr>
<td>Prot</td>
<td>Protocol from either the device descriptor or an interface descriptor</td>
</tr>
</tbody>
</table>

When creating policy rules, remember:

- Rules are case-insensitive.
• Rules can have an optional comment at the end, introduced by #.
• Blank and pure comment lines are ignored.
• Tags must use the matching operator = (for example, VID=067B_.
• Each rule must start on a new line or form part of a semicolon-separated list.
• See the USB class codes available from the USB Implementers Forum, Inc. website.

Examples of administrator-defined USB policy rules:

- Allow: VID=067BPID=0007 # Another Industries, Another Flash Drive
- Deny: Class=08 subclass=05 # Mass Storage
- To create a rule that denies all USB devices, use “DENY:” without other tags.

**Client USB plug and play device redirection**

This setting allows or prevents plug-and-play devices such as cameras or point-of-sale (POS) devices to be used in a client session.

By default, plug-and-play device redirection is allowed. When set to Allowed, all plug-and-play devices for a specific user or group are redirected. When set to Prohibited, no devices are redirected.

**Configure automatic redirection of USB devices**

USB devices are automatically redirected when USB support is enabled, and the USB user preference settings are set to automatically connect USB devices.

**Note:**

In Receiver for Windows 4.2, USB devices are also automatically redirected when operating in Desktop Appliance mode, and the connection bar is not present. In earlier versions of Citrix Receiver for Windows, USB devices are also automatically redirected when operating in a desktop appliance mode or with virtual machine (VM) hosted applications.

It is not always best to redirect all USB devices. Users can explicitly redirect devices from the USB device list that is not automatically redirected. To prevent USB devices from being listed or redirected, use DeviceRules on either the client endpoint or the Virtual Desktop Agent (VDA). See Administration Guides for further details.

**Caution:**

Using Registry Editor incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.
User preferences settings for auto redirection of USB devices

Policy:

1. Open Local Group Policy Editor and go to Administrative Templates > Citrix Components > Citrix Receiver > Remoting client devices > Generic USB Remoting.
2. Open New USB Devices, select Enabled, and click OK.
3. Open Existing USB Devices, select Enabled, and click OK.

Citrix Receiver:

1. Go to Citrix Receiver Preferences > Connections.
2. Ensure that the following options are selected:
   • When a session starts, connect devices automatically
   • When a new device is connected while a session is running, connect the device automatically.
3. Click OK.

All the registry keys and the policy changes are applied to the Windows client device.

Plain USB printers redirection

The best solution for plain USB printers is to use the dedicated Universal Printer Driver and virtual channel to perform printing. By default, plain USB printers are not automatically redirected.

Plain printers are detected using heuristics, and it is expected that advanced printers with scanning functions for example, might need to be redirected using USB support to work completely.

Use this registry to configure whether plain printers are automatically redirected:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectPrinters
Type: DWORD
Data: 00000000

The default value is 0 (does not automatically redirect). Changing the value to any number greater than zero enables USB support to redirect plain USB printers.

You can also deploy Active Directory policies to this registry key and override the non-policy value if both are present:

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectAudio
Type: DWORD
Data: 00000000
Plain audio devices redirection

Like plain printers, the best user experience is achieved using the dedicated audio virtual channel of ICA to send audio data from plain audio devices. However, you might need to redirect some specialty devices using USB support. Heuristics are used to determine which devices are plain audio devices.

Use this registry to configure whether plain audio devices are automatically redirected:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices
Name: AutoRedirectAudio
Type: DWORD
Data: 00000000

The default is set to 0 (does not automatically redirect). Changing the value to non-zero, redirects plain USB audio devices with USB support.

You can use Active Directory policies to deploy this value to the registry key and override the non-policy value if both are present:

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices
Name: AutoRedirectAudio
Type: DWORD
Data: 00000000

Plain storage devices (mass storage device) redirection

For plain storage devices, you achieve the best user experience using the dedicated virtual channel, such as client drive mapping that also performs optimization. In addition to simple reading or writing files, to perform certain special tasks like burning a CD/DVD or accessing encrypted file systems devices, the device might still need to be redirected using generic USB support.

Heuristics are used to determine which devices are plain storage devices. Use this registry key to configure whether plain storage devices are automatically redirected:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices
Name: AutoRedirectStorage
Type: DWORD
Data: 00000000

The default is set to 0 (does not automatically redirect). Changing the value to non-zero, redirects plain USB storage devices using generic USB support.
You can also use Active Directory policies to deploy this value to the following registry key and override the non-policy value if both are present:

HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices

Name: AutoRedirectStorage

Type: DWORD

Data: 00000000

Note:
Read only access to the plain storage device is not configurable if you are using generic USB support, while it is configurable if using CDM.

**USB flash drives with hardware encryption redirection**

USB flash drives with hardware encryption typically consist of an encrypted storage partition and a second *utility* partition that contains a utility for unlocking the encrypted partition. For USB Flash Drive devices, achieve the best user experience using the dedicated client drive mapping/dynamic thumbdrive mapping HDX virtual channel that also performs optimization.

Generic USB redirection is necessary for non-Windows clients (for example, Linux clients) and clients where the customer has restricted (locked down) user access to local functions on the client. Generic USB redirection can redirect any USB storage device without hardware encryption into both Single-session OS and Multi-session OS VDA sessions.

Before Citrix Virtual Apps and Desktop 7 1808, USB flash drives with hardware encryption could not be redirected in any useful way into Single-session OS or Multi-session OS VDA sessions. A new feature enhancement introduced in Citrix Virtual Apps and Desktop 7 1808 supports generic USB redirection of USB flash drives with hardware encryption into Single-session OS and Multi-session OS VDA sessions. After the device is redirected, none of its drives appear on the local client. So, if unlocking the drive is required, perform it in the session. This feature requires Windows update KB4074590.

**Plain still image devices (scanners and digital cameras)**

For plain still image devices, achieve the best user experience using the dedicated virtual channel (such as the TWAIN virtual channel) that also performs optimization. These devices must adhere to industry standards. If a device is non-compliant or if it is not used according to the original intentions, generic USB redirection might be the only way to use the device. Heuristics are used to determine which devices are plain still image devices.

Use this registry key to configure whether plain still image devices are automatically redirected:

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices
Name: AutoRedirectImage
Type: DWORD
Data: 00000000
The default is set to 0 (does not automatically redirect). Changing the value to non-zero, redirects plain USB still image devices with generic USB.
You can also use Active Directory policies to deploy this value to this registry key and override the non-policy value if both are present:
HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices
Name: AutoRedirectImage
Type: DWORD
Data: 00000000

**Device specific settings**

The heuristics used to select Citrix optimizable devices (such as printers, audio, video, storage, and still image devices) do not always match what you want. You might want to control automatic redirection of devices that are not listed above. You can control automatic redirection on a device specific basis.

As an example, the DemoTech 2,000 bar code reader doesn’t need to be redirected using USB support. It has a vendor identifier of 12AB and a product identifier of 5678. These hexadecimal numbers can be found in Device Manager.

To prevent this being automatically redirected, create this device specific registry key:
HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\ICA Client\GenericUSB\Devices\VID12AB PID5678
Name: AutoRedirect
Type: DWORD
Data: 00000000
A value of 0 prevents the device from being automatically redirected. A non-zero value indicates that the device must be considered for automatic redirection (subject to user preferences). There is a single space character between the vendor and product identifiers.
You can also deploy this value using Active Directory policies to this registry key. It overrides the non-policy value if both are present:
HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Citrix\ICA Client\GenericUSB\Devices\VID12AB PID5678
Name: AutoRedirect
Type: DWORD
Device specific AutoRedirect settings take precedence over the more general AutoRedirectXXX values explained above. The default heuristics for Citrix optimized devices might misinterpret a device as generic. Therefore, set the device specific AutoRedirect value to 1 to redirect it automatically.

**Virtual channel allow list policy settings**

June 15, 2020

This setting enables the use of an allow list that specifies which virtual channels are allowed to be opened in an ICA session.

When disabled, all virtual channels are allowed.

When enabled, only Citrix virtual channels are allowed.

To use custom or third-party virtual channels, add the virtual channels to the list. To add a virtual channel to the list, enter the virtual channel name followed by a comma, and then the path to the process that accesses the virtual channel. More executable paths can be listed, and the paths are separated by commas.

For example,

- `CTXVC1,C:\VC1\vchost.exe`
- `CTXVC2,C:\VC2\vchost.exe,C:\Program Files\Third Party\vcaccess.exe`

By default, virtual channel allow lists are disabled.

**Note:**

If you’re using the HDX RealTime Optimization Pack for Skype for Business, add the virtual channel to the allow list. For more information, see the [HDX RealTime Optimization Pack documentation](#).

For more information about virtual channels, see [ICA virtual channels](#).

**Visual display policy settings**

September 7, 2018

The Visual Display section contains policy settings for controlling the quality of images sent from virtual desktops to the user device.
Preferred color depth for simple graphics

This policy setting is available in VDA versions 7.6 FP3 and later. The 8-bit option is available in VDA versions 7.12 and later.

This setting makes it possible to lower color depth at which simple graphics are sent over the network. Lowering to 8-bit or 16-bit per pixel potentially improves responsiveness over low bandwidth connections, at the cost of a slight degradation in image quality. The 8-bit color depth is not supported when the Use video codec for compression policy setting is set to For the entire screen.

The default preferred color depth is 24-bits per pixel.

VDAs fall back to 24-bit (default) color depth if the 8-bit setting is applied on VDA version 7.11 and earlier.

Target frame rate

This setting specifies the maximum number of frames per second sent from the virtual desktop to the user device.

By default, the maximum is 30 frames per second.

Setting a high number of frames per second (for example, 30) improves the user experience, but requires more bandwidth. Decreasing the number of frames per second (for example, 10) maximizes server scalability at the expense of user experience. For user devices with slower CPUs, specify a lower value to improve the user experience.

The maximum supported frame rate per second is 60.

Visual quality

This setting specifies the desired visual quality for images displayed on the user device.

By default, this setting is Medium.

To specify the quality of images, choose one of the following options:

- **Low** - Recommended for bandwidth-constrained networks where visual quality can be sacrificed for interactivity
- **Medium** - Offers the best performance and bandwidth efficiency in most use cases
- **High** - Recommended if you require visually lossless image quality
- **Build to lossless** - Sends lossy images to the user device during periods of high network activity and lossless images after network activity reduces. This setting improves performance over bandwidth-constrained network connections
- **Always lossless** - When preserving image data is vital, select Always lossless to ensure lossy data is never sent to the user device. For example, when displaying X-ray images where no loss of quality is acceptable.
Moving images policy settings

November 27, 2018

The Moving Images section contains settings that enable you to remove or alter compression for dynamic images.

Minimum image quality

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting specifies the minimum acceptable image quality for Adaptive Display. The less compression used, the higher the quality of images displayed. Choose from Ultra High, Very High, High, Normal, or Low compression.

By default, this is set to Normal.

Moving image compression

This setting specifies whether or not Adaptive Display is enabled. Adaptive Display automatically adjusts the image quality of videos and transitional slides in slide shows based on available bandwidth. With Adaptive Display enabled, users should see smooth-running presentations with no reduction in quality.

By default, Adaptive Display is enabled.

For VDA versions 7.0 through 7.6, this setting applies only when Legacy graphics mode is enabled. For VDA versions 7.6 FP1 and later, this setting applies when Legacy graphics mode is enabled, or when the legacy graphics mode is disabled and a video codec is not used to compress graphics.

When legacy graphics mode is enabled, the session must be restarted before policy changes take effect. Adaptive Display is mutually exclusive with Progressive Display; enabling Adaptive Display disables Progressive Display and vice versa. However, both Progressive Display and Adaptive Display can be disabled at the same time. Progressive Display, as a legacy feature, is not recommended for XenApp or XenDesktop. Setting Progressive threshold Level will disable Adaptive Display.

Progressive compression level

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting provides a less detailed but faster initial display of images.
By default, no progressive compression is applied.

The more detailed image, defined by the normal lossy compression setting, appears when it becomes available. Use Very High or Ultra High compression for improved viewing of bandwidth-intensive graphics such as photographs.

For progressive compression to be effective, its compression level must be higher than the Lossy compression level setting.

Note: The increased level of compression associated with progressive compression also enhances the interactivity of dynamic images over client connections. The quality of a dynamic image, such as a rotating three-dimensional model, is temporarily decreased until the image stops moving, at which time the normal lossy compression setting is applied.

The following policy settings are related:

- Progressive compression threshold value
- Progressive heavyweight compression

**Progressive compression threshold value**

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting represents the maximum bandwidth in kilobits per second for a connection to which progressive compression is applied. This is applied only to client connections under this bandwidth.

By default, the threshold value is 2147483647 kilobits per second.

The following policy settings are related:

- Progressive compression threshold value
- Progressive heavyweight compression

**Target minimum frame rate**

This setting specifies the minimum frame rate per second the system attempts to maintain, for dynamic images, under low bandwidth conditions.

By default, this is set to 10fps.

For VDA versions 7.0 through 7.6, this setting applies only when Legacy graphics mode is enabled. For VDA versions 7.6 FP1 and later, this setting applies when the Legacy graphics mode is disabled or enabled.
Still images policy settings

November 27, 2018

The Still Images section contains settings that enable you to remove or alter compression for static images.

**Extra color compression**

This setting enables or disables the use of extra color compression on images delivered over client connections that are limited in bandwidth, improving responsiveness by reducing the quality of displayed images.

By default, extra color compression is disabled.

When enabled, extra color compression is applied only when the client connection bandwidth is below the Extra color compression threshold value. When the client connection bandwidth is above the threshold value or Disabled is selected, extra color compression is not applied.

**Extra color compression threshold**

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting represents the maximum bandwidth in kilobits per second for a connection below which extra color compression is applied. If the client connection bandwidth drops below the set value, extra color compression, if enabled, is applied.

By default, the threshold value is 8192 kilobits per second.

**Heavyweight compression**

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting enables or disables reducing bandwidth beyond progressive compression without losing image quality by using a more advanced, but more CPU-intensive, graphical algorithm.

By default, heavyweight compression is disabled.

If enabled, heavyweight compression applies to all lossy compression settings. It is supported on Citrix Workspace app but has no effect on other plug-ins.

The following policy settings are related:

- Progressive compression level
- Progressive compression threshold value

**Lossy compression level**

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting controls the degree of lossy compression used on images delivered over client connections that are limited in bandwidth. In such cases, displaying images without compression can be slow.

By default, medium compression is selected.

For improved responsiveness with bandwidth-intensive images, use high compression. Where preserving image data is vital; for example, when displaying X-ray images where no loss of quality is acceptable, you may not want to use lossy compression.

Related policy setting: Lossy compression threshold value

**Lossy compression threshold value**

Note: For the Virtual Delivery Agent 7.x, this policy setting applies only when the Legacy graphics mode policy setting is enabled.

This setting represents the maximum bandwidth in kilobits per second for a connection to which lossy compression is applied.

By default, the threshold value is 2147483647 kilobits per second.

Adding the Lossy compression level setting to a policy and including no specified threshold can improve the display speed of high-detail bitmaps, such as photographs, over a LAN.

Related policy setting: Lossy compression level

**WebSockets policy settings**

June 15, 2020

The WebSockets section contains policy settings for accessing virtual desktops and hosted applications using the Citrix Workspace app for HTML5. The WebSockets feature increases security and reduces overhead by conducting two-way communication between browser-based applications and servers. The feature does so without opening multiple HTTP connections.
**WebSockets connections**

This setting allows or prohibits WebSockets connections.

By default, WebSocket connections are prohibited.

**WebSockets port number**

This setting identifies the port for incoming WebSocket connections.

By default, the value is 8008.

**WebSockets trusted origin server list**

This setting provides a comma-separated list of trusted origin servers, usually the Citrix Workspace app for Web, expressed as URLs. The server accepts only WebSockets connections originating from one of these addresses.

By default, the wildcard * is used to trust all Citrix Workspace app for Web URLs.

If you choose to type an address in the list, use this syntax:

<protocol>://<Fully qualified domain name of host>:[port]

The protocol must be HTTP or HTTPS. If the port is not specified, port 80 is used for HTTP and port 443 is used for HTTPS.

The wildcard * can be used within the URL, except as part of an IP address (10.105.)

**Load management policy settings**

December 18, 2019

The Load Management section contains policy settings for enabling and configuring load management between servers delivering Windows Multi-session OS machines.

For information about calculating the load evaluator index, see CTX202150.

**Concurrent logon tolerance**

This setting specifies the maximum number of concurrent logons a server can accept.

By default, this is set to 2.

When this setting is enabled, load balancing tries to avoid having more than the specified number of logons active on a Server VDA at the same time. However, the limit is not strictly enforced. To enforce
the limit (and cause concurrent logons that exceed the specified number to fail), create the following registry key:

```
HKLM\Software\Citrix\DesktopServer\LogonToleranceIsHardLimit
Type: DWORD
Value: 1
```

**CPU usage**

This setting specifies the level of CPU usage, as a percentage, at which the server reports a full load. When enabled, the default value at which the server reports a full load is 90%.

By default, this setting is disabled and CPU usage is excluded from load calculations.

**CPU usage excluded process priority**

This setting specifies the priority level at which a process’ CPU usage is excluded from the CPU Usage load index.

By default, this is set to Below Normal or Low.

**Disk usage**

This setting specifies the disk queue length at which the server reports a 75% full load. When enabled, the default value for disk queue length is 8.

By default, this setting is disabled and disk usage is excluded from load calculations.

**Maximum number of sessions**

This setting specifies the maximum number of sessions a server can host. When enabled, the default setting for maximum number of sessions a server can host is 250.

By default, this setting is enabled.

**Memory usage**

This setting specifies the level of memory usage, as a percentage, at which the server reports a full load. When enabled, the default value at which the server reports a full load is 90%.

By default, this setting is disabled and memory usage is excluded from load calculations.
Memory usage base load

This setting specifies an approximation of the base operating system’s memory usage and defines, in MB, the memory usage below which a server is considered to have zero load.

By default, this is set to 768 MB.

Profile management policy settings

December 18, 2019

The Profile Management section contains policy settings for enabling Profile Management and specifying which groups to include in and exclude from Profile Management processing.

Other information (such as the names of the equivalent .ini file settings and which version of Profile Management is required for a policy setting) is available in Profile Management policies.

Advanced policy settings

June 3, 2020

Enable multi-session write-back for FSLogix Profile Container

Profile Management provides a solution to save changes in multi-session scenarios for FSLogix Profile Container. If the same user launches multiple sessions on different machines, changes made in each session are synchronized and saved to FSLogix Profile Container. You can use the multi-session write-back feature by implementing the Enable multi-session write-back for FSLogix Profile Container policy. If the policy is not configured here or in the .ini file, the default value (Disabled) is used.

Number of retries when accessing locked files

Sets the number of retries when accessing locked files.

If this policy is disabled, the default value of five retries is used. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, the default value is used.
**Process Internet cookie files on logoff**

Some deployments leave extra Internet cookies that are not referenced by the file Index.dat. The extra cookies left in the file system after sustained browsing can lead to profile bloat. Enable this policy to force processing of Index.dat and remove the extra cookies. The policy increases logoff times, so only enable it if you experience this issue.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no processing of Index.dat takes place.

**Disable automatic configuration**

Profile Management examines any Citrix Virtual Desktops environment, for example for the presence of personal vDisks, and configures Group Policy accordingly. Only Profile Management policies in the Not Configured state are adjusted, so any customizations you have made are preserved. This feature speeds up deployment and simplifies optimization. No configuration of the feature is necessary, but you can disable automatic configuration when upgrading (to retain settings from earlier versions) or when troubleshooting. Automatic configuration does not work in Citrix Virtual Apps or other environments.

You can regard automatic configuration as a dynamic configuration checker that automatically configures the default policy settings according to environments at runtime. It eliminates the need to configure the settings manually. Runtime environments include:

- Windows OS
- Windows OS versions
- Presence of Citrix Virtual Desktops
- Presence of personal vDisks

Automatic configuration might change the following policies if the environment changes:

- Active write back
- Always cache
- Delete locally cached profiles on logoff
- Delay before deleting cached profiles
- Profile streaming

See the following table for the default status of the policies above on different OSs:

<table>
<thead>
<tr>
<th></th>
<th>Multi-session OS</th>
<th>Single-session OS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active write back</td>
<td>Enabled</td>
<td>Disabled if personal vDisk is in use; otherwise, enabled.</td>
</tr>
<tr>
<td>Always cache</td>
<td>Disabled</td>
<td>Disabled if personal vDisk is in use; otherwise, enabled.</td>
</tr>
<tr>
<td></td>
<td>Multi-session OS</td>
<td>Single-session OS</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>Delete locally cached profiles on logoff</td>
<td>Enabled</td>
<td>Disabled if personal vDisk is in use or if Citrix Virtual Desktops is assigned or if Citrix Virtual Desktops is not installed; otherwise, enabled.</td>
</tr>
<tr>
<td>Delay before deleting cached profiles</td>
<td>0 seconds</td>
<td>60 seconds if user changes are not persistent; otherwise, 0 seconds.</td>
</tr>
<tr>
<td>Profile streaming</td>
<td>Enabled</td>
<td>Disabled if personal vDisk is in use; otherwise, enabled.</td>
</tr>
</tbody>
</table>

However, with automatic configuration disabled, all policies above default to **Disabled**.

**Important:**

Personal vDisk is deprecated. For details, see [Remove PVD, AppDisks, and unsupported hosts](#).

Starting with Profile Management 1909, you can have an improved experience with the Start menu on Windows 10 (version 1607 and later) and Windows Server 2016 and later. This is achieved through automatic configuration of the following policies:

- Add “Appdata\Local\Microsoft\Windows\Caches” and “Appdata\Local\Packages” to “Folders to Mirror”
- Add “Appdata\Local\Microsoft\Windows\UsrClass.Dat*” to “Files to synchronize”

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, automatic configuration is turned on so Profile Management settings might change if the environment changes.

**Log off user if a problem is encountered**

If this policy is disabled or not configured, users are given a temporary profile if a problem is encountered (for example, the user store is unavailable). If it is enabled, an error message is displayed and users are logged off. This setup can simplify troubleshooting of the problem.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, a temporary profile is provided.
Customer Experience Improvement Program

By default, the Customer Experience Improvement Program is enabled to help improve the quality and performance of Citrix products by sending anonymous statistics and usage information. If this setting is not configured here, the value from the .ini file is used.

Enable search index roaming for Outlook

Allow user-based Outlook search experience by automatically roaming Outlook search data along with user profile. This requires extra spaces in the user store to store search index for Outlook. You must log off and then log on again for this policy to take effect.

Outlook search index database – backup and restore

This setting configures what Profile Management does during logon when the Enable search index roaming for Outlook is enabled.

If this setting is enabled, Profile Management saves a backup of the search index database each time the database is mounted successfully on logon. Profile Management treats the backup as the good copy of the search index database. When an attempt to mount the search index database fails because the database becomes corrupted, Profile Management automatically reverts the search index database to the last known good copy.

Note: Profile Management deletes the previously saved backup after a new backup is saved successfully. The backup consumes the available storage space of the VHDX files.

Basic policy settings

December 18, 2019

The Basic settings section contains policy settings relating to the basic configuration of Profile Management.

Enable Profile Management

By default, to facilitate deployment, Profile Management does not process logons or logoffs. Enable Profile Management only after carrying out all other setup tasks and testing how Citrix user profiles perform in your environment.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, Profile Management does not process Windows user profiles in any way.
**Processed groups**

Both computer local groups and domain groups (local, global, and universal) can be used. Domain groups should be specified in the format: DOMAIN NAME\GROUP NAME.

If this policy is configured here, Profile Management processes only members of these user groups. If this policy is disabled, Profile Management processes all users. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, members of all user groups are processed.

**Excluded groups**

You can use computer local groups and domain groups (local, global, and universal) to prevent particular user profiles from being processed. Specify domain groups in the form DOMAIN NAME\GROUP NAME.

If this setting is configured here, Profile Management excludes members of these user groups. If this setting is disabled, Profile Management does not exclude any users. If this setting is not configured here, the value from the .ini file is used. If this setting is not configured here or in the .ini file, no members of any groups are excluded.

**Process logons of local administrators**

Specifies whether logons of members of the BUILTIN\Administrators group are processed. If this policy is disabled or not configured on multi-session operating systems (such as Citrix Virtual Apps environments), Profile Management assumes that logons by domain users, but not local administrators, must be processed. On single-session operating systems (such as Citrix Virtual Desktops environments), local administrator logons are processed. This policy allows domain users with local administrator rights, typically Citrix Virtual Desktops users with assigned virtual desktops, to bypass any processing, log on, and troubleshoot the desktop experiencing problems with Profile Management.

Note: Domain users’ logons may be subject to restrictions imposed by group membership, typically to ensure compliance with product licensing.

If this policy is disabled, Profile Management does not process logons by local administrators. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, administrators are not processed.

**Path to user store**

Sets the path to the directory (the user store) in which the user settings (registry changes and synchronized files) are saved.

The path can be:
A relative path. It must be relative to the home directory (which is typically configured as the #homeDirectory# attribute for a user in Active Directory).

- A UNC path. It typically specifies a server share or a DFS namespace.
- Disabled or unconfigured. In this case, a value of #homeDirectory#\Windows is assumed.

The following types of variables can be used for this policy:

- System environment variables enclosed in percent signs (for example, %ProfVer%). System environment variables generally require extra setup.
- Attributes of the Active Directory user object enclosed in hashes (for example, #sAMAccountName#).
- Profile Management variables. For more information, see the Profile Management variables product document.

User environment variables cannot be used, except for %username% and %userdomain%. You can also create custom attributes to define organizational variables such as location or users fully. Attributes are case-sensitive.

Examples:

- \server\share#sAMAccountName# stores the user settings to the UNC path \server\share\JohnSmith (if #sAMAccountName# resolves to JohnSmith for the current user)
- \server\profiles$\%USERNAME%.%USERDOMAIN%\CTX_OSNAME!\CTX_OSBITNESS! might expand to \server\profiles$\JohnSmith.DOMAINCONTROLLER\Win8x64

Important: Whichever attributes or variables you use, check that this policy expands to the folder one level higher than the folder containing NTUSER.DAT. For example, if this file is contained in \server\profiles$\JohnSmith.Finance\Win8x64\UPM_Profile, set the path to the user store as \server\profiles$\JohnSmith.Finance\Win8x64 (not the \UPM_Profile subfolder).

For more information on using variables when specifying the path to the user store, see the following topics:

- Share Citrix user profiles on multiple file servers
- Administer profiles within and across OUs
- High availability and disaster recovery with Profile Management

If Path to user store is disabled, the user settings are saved in the Windows subdirectory of the home directory.

If this policy is disabled, the user settings are saved in the Windows subdirectory of the home directory. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, the Windows directory on the home drive is used.
**Migrate user store**

Specifies the path to the folder where the user settings (registry changes and synchronized files) were previously saved (the user store path that you previously used).

If this setting is configured, the user settings stored in the previous user store are migrated to the current user store specified in the “Path to user store” policy.

The path can be an absolute UNC path or a path relative to the home directory.

In both cases, you can use the following types of variables: system environment variables enclosed in percent signs and attributes of the Active Directory user object enclosed in hash signs.

Examples:

- The folder `Windows\%ProfileVer%` stores the user settings in a subfolder called `Windows\W2K3` of the user store (if `%ProfileVer%` is a system environment variable that resolves to W2K3).
- `\server\share##SAMAccountName##` stores the user settings to the UNC path `\server\share\<JohnSmith>` (if `##SAMAccountName##` resolves to JohnSmith for the current user).

In the path, you can use user environment variables except `%username%` and `%userdomain%`.

If this setting is disabled, the user settings are saved in the current user store.

If this setting is not configured here, the corresponding setting from the .ini file is used.

If this setting is not configured here or in the .ini file, the user settings are saved in the current user store.

**Active write back**

Files and folders (but not registry entries) that are modified can be synchronized to the user store in the middle of a session, before logoff.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, it is enabled.

**Offline profile support**

This policy allows profiles to synchronize with the user store at the earliest possible opportunity. It is aimed at laptop or mobile device users who roam. When a network disconnection occurs, profiles remain intact on the laptop or device even after rebooting or hibernating. As mobile users work, their profiles are updated locally and are eventually synchronized with the user store when the network connection is re-established.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, offline profiles are disabled.
Active write back registry

Use this policy along with “Active write back.” Registry entries that are modified can be synchronized to the user store in the middle of a session.

If you do not configure this setting here, the value from the .ini file is used.

If you do not configure this setting here or in the .ini file, active write back registry is disabled.

Offline profile support

Enables the offline profiles feature. This is intended for computers that are commonly removed from networks, typically laptops or mobile devices not servers or desktops.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, offline profile support is disabled.

Cross-platform policy settings

December 18, 2019

The Cross-Platform section contains policy settings relating to configuring the Profile Management cross-platform settings feature.

Enable cross-platform settings

By default, to facilitate deployment, cross-platform settings are disabled. Turn on processing by enabling this policy but only after thorough planning and testing of this feature.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no cross-platform settings are applied.

Cross-platform settings user groups

Enter one or more Windows user groups. For example, you might use this policy to process only the profiles from a test user group. If this policy is configured, the cross-platform settings feature of Profile Management processes only members of these user groups. If this policy is disabled, the feature processes all of the users specified by the Processed groups policy.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, all user groups are processed.
**Path to cross-platform definitions**

Identifies the network location of the definition files that you copied from the download package. This path must be a UNC path. Users must have read access to this location, and administrators must have write access to it. The location must be a Server Message Block (SMB) or Common Internet File System (CIFS) file share.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no cross-platform settings are applied.

**Path to cross-platform settings store**

Sets the path to the cross-platform settings store, the folder in which users’ cross-platform settings are saved. Users must have write access to this area. The path can be an absolute UNC path or a path relative to the home directory.

This area is the common area of the user store where profile data shared by multiple platforms is located. Users must have write access to this area. The path can be an absolute UNC path or a path relative to the home directory. You can use the same variables as for Path to user store.

If this policy is disabled, the path Windows\PM_CP is used. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, the default value is used.

**Source for creating cross-platform settings**

Specifies a platform as the base platform if this policy is enabled in that platform’s OU. This policy migrates data from the base platform’s profiles to the cross-platform settings store.

Each platform’s own set of profiles are stored in a separate OU. You must decide which platform’s profile data to use to seed the cross-platform settings store. It is referred to as the base platform. If the cross-platform settings store contains a definition file with no data, or the cached data in a single-platform profile is newer than the definition’s data in the store, Profile Management migrates the data from the single-platform profile to the store unless you disable this policy.

**Important:**

If this policy is enabled in multiple OUs, or multiple user or machine objects, the platform that the first user logs on to becomes the base profile.

By default this policy is Enabled.
File system policy settings

December 18, 2019

The File System section contains policy settings for configuring which files and directories in a user's profile are synchronized between the system where the profile is installed and the user store.

Exclusions policy settings

August 7, 2020

The Exclusions section contains policy settings for configuring which files and directories in a user's profile are excluded from the synchronization process.

Exclusion list - files

List of files that are ignored during synchronization. File names must be paths relative to the user profile (%USERPROFILE%). Wildcards are allowed and are applied recursively.

Examples:

- Desktop\Desktop.ini ignores the file Desktop.ini in the Desktop folder
- %USERPROFILE%*.tmp ignores all files with the extension .tmp in the entire profile
- AppData\Roaming\MyApp*.tmp ignores all files with the extension .tmp in one part of the profile

If this policy is disabled, no files are excluded. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no files are excluded.

Enable Default Exclusion List - directories

Default list of directories ignored during synchronization. Use this policy to specify GPO exclusion directories without having to fill them in manually.

If you disable this policy, Profile Management does not exclude any directories by default. If you do not configure this policy here, Profile Management uses the value from the .ini file. If you do not configure this policy here or in the .ini file, Profile Management does not exclude any directories by default.

Exclusion list - directories

List of folders that are ignored during synchronization. Folder names must be specified as paths relative to the user profile (%USERPROFILE%).
Example:

- Desktop ignores the Desktop folder in the user profile

If this policy is disabled, no folders are excluded. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no folders are excluded.

**Logon Exclusion Check**

This setting configures what Profile Management does if a profile in the user store contains excluded files or folders.

If this setting is disabled or set to the default value of “Synchronize excluded files or folders on logon,” Profile Management synchronizes these excluded files or folders from the user store to local profile when a user logs on.

If this setting is set to “Ignore excluded files or folders on logon,” Profile Management ignores the excluded files or folders in the user store when a user logs on.

If this setting is set to “Delete excluded files or folder on logon,” Profile Management deletes the excluded files or folders in the user store when a user logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the excluded files or folders are synchronized from the user store to a local profile when a user logs on.

**Large File Handling - Files to be created as symbolic links**

To improve logon performance and to process large-size files, a symbolic link is created instead of copying files in this list.

You can use wildcards in policies that refer to files; for example, !ctx_localappdata!\Microsoft\Outlook\*.OST.

To process the offline folder file (*.ost) of Microsoft Outlook, make sure that the Outlook folder is not excluded for Profile Management.

Those files cannot be accessed in multiple sessions simultaneously.

**Synchronization policy settings**

December 18, 2019

The Synchronization section contains policy settings for specifying which files and folders in a users profile are synchronized between the system on which the profile is installed and the user store.
**Directories to synchronize**

Profile Management synchronizes each user’s entire profile between the system it is installed on and the user store. It is not necessary to include subfolders of the user profile by adding them to this list.

Paths on this list must be relative to the user profile.

Example:

- `Desktop\exclude\include` ensures that the subfolder called `include` is synchronized even if the folder called `Desktop\exclude` is not.

Disabling this policy has the same effect as enabling it and configuring an empty list.

If this policy is not configured here, the value from the `.ini` file is used. If this policy is not configured here or in the `.ini` file, only non-excluded folders in the user profile are synchronized.

**Files to synchronize**

Profile Management synchronizes each user’s entire profile between the system it is installed on and the user store. It is not necessary to include files in the user profile by adding them to this list.

This policy can be used to include files below excluded folders. Paths on this list must be relative to the user profile. Wildcards can be used but are only allowed for file names. Wildcards cannot be nested and are applied recursively.

Examples:

- `AppData\Local\Microsoft\Office\Access.qat` specifies a file below a folder that is excluded in the default configuration.
- `AppData\Local\MyApp*.cfg` specifies all files with the extension `.cfg` in the profile folder `AppData\Local\MyApp` and its subfolders.

Disabling this policy has the same effect as enabling it and configuring an empty list.

If this policy is not configured here, the value from the `.ini` file is used. If this policy is not configured here or in the `.ini` file, only non-excluded files in the user profile are synchronized.

**Folders to mirror**

This policy can help solve issues involving any transactional folder (also known as a referential folder). That folder contains interdependent files, where one file references others. Mirroring folders allows Profile Management to process a transactional folder and its contents as a single entity, avoiding profile bloat. For example, you can mirror the Internet Explorer cookies folder so that `Index.dat` is synchronized with the cookies that it indexes. In these situations the “last write wins.” So files in mirrored folders that have been modified in more than one session are overwritten by the last update, resulting in loss of profile changes.
For example, consider how Index.dat references cookies while a user browses the Internet. If a user has two Internet Explorer sessions, each on a different server, and they visit different sites in each session, cookies from each site are added to the appropriate server. When the user logs off from the first session (or in the middle of a session, if the active write back feature is configured), the cookies from the second session must replace those cookies from the first session. However, instead they are merged, and the references to the cookies in Index.dat become out of date. Further browsing in new sessions results in repeated merging and a bloated cookie folder.

Mirroring the cookie folder solves the issue by overwriting the cookies with those cookies from the last session each time the user logs off. So Index.dat stays up-to-date.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no folders are mirrored.

**Profile container**

A profile container is a VHDX-based profile solution that lets you specify the folders to be contained in the profile disk. The profile container attaches the profile disk containing those folders, thus eliminating the need to save a copy of the folders to the local profile. Doing so decreases logon times.

To use a profile container, enable this policy and add the relative paths of the folders to the list. We recommend that you include the folders containing large cache files to the list. For example, add the Citrix Files content cache folder to the list: AppData\Local\Citrix\Citrix Files\PartCache.

There are two scenarios to be aware of:

- Profile container does not support simultaneous access by multiple sessions.
- Profile container does not support containing the entire profile.

If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, it is disabled.

**Folder redirection policy settings**

December 18, 2019

The Folder Redirection section contains policy settings that specify whether to redirect folders that commonly appear in profiles to a shared network location.

**Grant administrator access**

This setting enables an administrator to access the contents of a user’s redirected folders.
Note:
This setting grants permissions to administrators who have complete and unrestricted access to the domain.

By default, this setting is disabled and users are granted exclusive access to the contents of their redirected folders.

Include domain name
This setting enables the inclusion of the %userdomain% environment variable as part of the UNC path specified for redirected folders.

By default, this setting is disabled and the %userdomain% environment variable is not included as part of the UNC path specified for redirected folders.

AppData(Roaming) policy settings

December 18, 2019
The AppData(Roaming) section contains policy settings for specifying whether to redirect the contents the AppData(Roaming) folder to a shared network location.

AppData(Roaming) path
This setting specifies the network location to which the contents of the AppData(Roaming) folder are redirected.

By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile management does not redirect the specified folder.

Redirection settings for AppData(Roaming)
This setting specifies how to redirect the contents of the AppData(Roaming) folder.

By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile management does not redirect the specified folder.
Contacts policy settings

December 18, 2019

The Contacts section contains policy settings for specifying whether to redirect the contents the Contacts folder to a shared network location.

Contacts path

This setting specifies the network location to which the contents of the Contacts folder are redirected. By default, this setting is disabled and no location is specified. If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Contacts

This setting specifies how to redirect the contents of the Contacts folder. By default, contents are redirected to a UNC path. If this setting is not configured here, Profile Management does not redirect the specified folder.

Desktop policy settings

December 18, 2019

The Desktop section contains policy settings for specifying whether to redirect the contents the Desktop folder to a shared network location.

Desktop path

This setting specifies the network location to which the contents of the Desktop folder are redirected. By default, this setting is disabled and no location is specified. If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Desktop

This setting specifies how to redirect the contents of the Desktop folder. By default, contents are redirected to a UNC path. If this setting is not configured here, Profile Management does not redirect the specified folder.
Documents policy settings

December 18, 2019

The Documents section contains policy settings for specifying whether to redirect the contents the Documents folder to a shared network location.

Documents path

This setting specifies the network location to which files in the Documents folder are redirected. By default, this setting is disabled and no location is specified. If this setting is not configured here, Profile Management does not redirect the specified folder.

The Documents path setting must be enabled not only to redirect files to the Documents folder, but also to redirect files to the Music, Pictures, and Videos folders.

Redirection settings for Documents

This setting specifies how to redirect the contents of the Documents folder. By default, contents are redirected to a UNC path.

To control how to redirect the contents of the Documents folder, choose one of the following options:

• Redirect to the following UNC path. Redirects content to the UNC path specified in the Documents path policy setting.
• Redirect to the users home directory. Redirects content to the users home directory, typically configured as the #homeDirectory# attribute for a user in Active Directory.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Downloads policy settings

December 18, 2019

The Downloads section contains policy settings that specify whether to redirect the contents the Downloads folder to a shared network location.

Downloads path

This setting specifies the network location to which files in the Downloads folder are redirected.
By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Downloads
This setting specifies how to redirect the contents of the Downloads folder.
By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile Management does not redirect the specified folder.

Favorites policy settings

December 18, 2019
The Favorites section contains policy settings that specify whether to redirect the contents the Favorites folder to a shared network location.

Favorites path
This setting specifies the network location to which the contents of the Favorites folder are redirected.
By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Favorites
This setting specifies how to redirect the contents of the Favorites folder.
By default, contents are redirected to a UNC path.
If this setting is not configured here, Profile Management does not redirect the specified folder.

Links policy settings

December 18, 2019
The Links section contains policy settings that specify whether to redirect the contents the Links folder to a shared network location.
Links path

This setting specifies the network location to which the contents of the Links folder are redirected. By default, this setting is disabled and no location is specified. If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Links

This setting specifies how to redirect the contents of the Links folder. By default, contents are redirected to a UNC path. If this setting is not configured here, Profile Management does not redirect the specified folder.

Music policy settings

August 29, 2018

The Music section contains policy settings that specify whether to redirect the contents the Music folder to a shared network location.

Music path

This setting specifies the network location to which the contents of the Music folder are redirected. By default, this setting is disabled and no location is specified. If this setting is not configured here, Profile Management does not redirect the specified folder.

Redirection settings for Music

This setting specifies how to redirect the contents of the Music folder. By default, contents are redirected to a UNC path.

To control how to redirect the contents of the Music folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Music path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.
To redirect content to a folder relative to the Documents folder, the Documents path setting must be enabled.
If this setting is not configured here, Profile Management does not redirect the specified folder.

**Pictures policy settings**

August 29, 2018
The Pictures section contains policy settings that specify whether to redirect the contents the Pictures folder to a shared network location.

**Pictures path**
This setting specifies the network location to which the contents of the Pictures folder are redirected. By default, this setting is disabled and no location is specified.
If this setting is not configured here, Profile Management does not redirect the specified folder.

**Redirection settings for Pictures**
This setting specifies how to redirect the contents of the Pictures folder.
By default, contents are redirected to a UNC path.
To control how to redirect the contents of the Pictures folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Pictures path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.

To redirect content to a folder relative to the Documents folder, the Documents path setting must be enabled.
If this setting is not configured here, Profile Management does not redirect the specified folder.

**Saved Games policy settings**

August 29, 2018
The Saved Games section contains policy settings that specify whether to redirect the contents the Saved Games folder to a shared network location.
**Redirection settings for Saved Games**

This setting specifies how to redirect the contents of the Saved Games folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

**Saved Games path**

This setting specifies the network location to which the contents of the Saved Games folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

---

**Start menu policy settings**

August 29, 2018

The Start Menu section contains policy settings that specify whether to redirect the contents the Start Menu folder to a shared network location.

**Redirection settings for Start Menu**

This setting specifies how to redirect the contents of the Start Menu folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

**Start Menu path**

This setting specifies the network location to which the contents of the Start Menu folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.
Searches policy settings

August 29, 2018

The Searches section contains policy settings that specify whether to redirect the contents the Searches folder to a shared network location.

Redirection settings for Searches

This setting specifies how to redirect the contents of the Searches folder.

By default, contents are redirected to a UNC path.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Searches path

This setting specifies the network location to which the contents of the Searches folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

Video policy settings

August 29, 2018

The Video section contains policy settings that specify whether to redirect the contents the Video folder to a shared network location.

Redirection settings for Video

This setting specifies how to redirect the contents of the Video folder.

By default, contents are redirected to a UNC path.

To control how to redirect the contents of the Video folder, choose one of the following options:

- Redirect to the following UNC path. Redirects content to the UNC path specified in the Video path policy setting.
- Redirect relative to Documents folder. Redirects content to a folder relative to the Documents folder.
To redirect content to a folder relative to the Documents folder, the Documents path setting must be enabled.

If this setting is not configured here, Profile Management does not redirect the specified folder.

**Video path**

This setting specifies the network location to which the contents of the Video folder are redirected.

By default, this setting is disabled and no location is specified.

If this setting is not configured here, Profile Management does not redirect the specified folder.

**Log policy settings**

December 18, 2019

The Log section contains policy settings that configure Profile Management logging.

**Active Directory actions**

This setting enables or disables verbose logging of actions performed in Active Directory.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

**Common information**

This setting enables or disables verbose logging of common information.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.
**Common warnings**

This setting enables or disables verbose logging of common warnings.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

**Enable logging**

This settings enables or disables Profile management logging in debug (verbose logging) mode.

In debug mode, extensive status information is logged in the log files located in “%SystemRoot%\System32\Logfiles\UserProfileManager”.

By default, this setting is disabled and only errors are logged.

Citrix recommends enabling this setting only if you are troubleshooting Profile management.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, only errors are logged.

**File system actions**

This setting enables or disables verbose logging of actions performed in the file system.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

**File system notifications**

This setting enables or disables verbose logging of file systems notifications.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.
Logoff

This setting enables or disables verbose logging of user logoffs.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Logon

This setting enables or disables verbose logging of user logons.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

Maximum size of the log file

This setting specifies the maximum permitted size for the Profile Management log file, in bytes.

By default, this is set to 1048576 bytes (1MB).

Citrix recommends increasing the size of this file to 5 MB or more, if you have sufficient disk space. If the log file grows beyond the maximum size, an existing backup of the file (.bak) is deleted, the log file is renamed to .bak, and a new log file is created.

The log file is created in %SystemRoot%\System32\Logfiles\UserProfileManager.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value is used.

Path to log file

This setting specifies an alternative path to save the Profile Management log file.

By default, this setting is disabled and log files are saved in the default location: %SystemRoot%\System32\Logfiles\UserProfileManager.

The path can point to a local drive or a remote network-based drive (UNC path). Remote paths can be useful in large distributed environments but they may create significant network traffic, which may be inappropriate for log files. For provisioned, virtual machines with a persistent hard drive, set a
local path to that drive. This ensures log files are preserved when the machine restarts. For virtual machines without a persistent hard drive, setting a UNC path allows you to retain the log files, but the system account for the machines must have write access to the UNC share. Use a local path for any laptops managed by the offline profiles feature.

If a UNC path is used for log files, Citrix recommends that an appropriate access control list is applied to the log file folder to ensure that only authorized user or computer accounts can access the stored files.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default location %SystemRoot%\System32\Logfiles\UserProfileManager is used.

**Personalized user information**

This setting enables or disables verbose logging of personalized user information.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

**Policy values at logon and logoff**

This setting enables or disables verbose logging of policy values when a user logs on and off.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.

**Registry actions**

This setting enables or disables verbose logging of actions performed in the registry.

By default, this setting is disabled.

When enabling this setting, make sure the Enable logging setting is also enabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, errors and general information are logged.
Registry differences at logoff

This setting enables or disables verbose logging of any differences in the registry when a user logs off. By default, this setting is disabled. When enabling this setting, make sure the Enable logging setting is also enabled. If this setting is not configured here, the value from the .ini file is used. If this setting is not configured here or in the .ini file, errors and general information are logged.

Profile handling policy settings

December 18, 2019

The Profile handling section contains policy settings that specify how Profile Management handles user profiles.

Delay before deleting cached profiles

This setting specifies an optional extension to the delay, in minutes, before Profile Management deletes locally cached profiles at logoff. A value of 0 deletes the profiles immediately at the end of the logoff process. Profile Management checks for logoffs every minute, so a value of 60 ensures that profiles are deleted between one and two minutes after users log off (depending on when the last check occurred). Extending the delay is useful if you know that a process keeps files or the user registry hive open during logoff. With large profiles, this can also speed up logoff. By default, this is set to 0 and Profile Management deletes locally cached profiles immediately. When enabling this setting, ensure the Delete locally cached profiles on logoff is also enabled. If this setting is not configured here, the value from the .ini file is used. If this setting is not configured here or in the .ini file, profiles are deleted immediately.

Delete locally cached profiles on logoff

This setting specifies whether locally cached profiles are deleted after a user logs off. When this setting is enabled, a user’s local profile cache is deleted after they have logged off. Citrix recommends enabling this setting for terminal servers. By default, this setting is disabled and a user’s local profile cache is retained after they log off.
If this setting is not configured here, the value from the .ini file is used. If this setting is not configured here or in the .ini file, cached profiles are not deleted.

**Local profile conflict handling**

This setting configures how Profile Management behaves if a user profile exists both in the user store and as a local Windows user profile (not a Citrix user profile).

By default, Profile Management uses the local Windows profile, but does not change it in any way.

To control how Profile Management behaves, choose one of the following options:

- **Use local profile.** Profile Management uses the local profile, but does not change it in any way.
- **Delete local profile.** Profile Management deletes the local Windows user profile, and then imports the Citrix user profile from the user store.
- **Rename local profile.** Profile Management renames the local Windows user profile (for backup purposes) and then imports the Citrix user profile from the user store.

If this setting is not configured here, the value from the .ini file is used. If this setting is not configured here or in the .ini file, existing local profiles are used.

**Migration of existing profiles**

This setting specifies the types of profile migrated to the user store during logon if a user has no current profile in the user store.

Profile Management can migrate existing profiles “on the fly” during logon if a user has no profile in the user store. After this, the user store profile is used by Profile Management in both the current session and any other session configured with the path to the same user store.

By default, both local and roaming profiles are migrated to the user store during logon.

To specify the types of profile migrated to the user store during logon, choose one of the following options:

- **Local and roaming profiles**
- **Local**
- **Roaming**
- **None (Disabled)**

If you select None, the system uses the existing Windows mechanism to create new profiles, as if in an environment where Profile Management is not installed.

If this setting is not configured here, the value from the .ini file is used. If this setting is not configured here or in the .ini file, existing local and roaming profiles are migrated.
Automatic migration of existing application profiles

This setting enables or disables the automatic migration of existing application profiles across different operating systems. The application profiles include both the application data in the AppData folder and the registry entries under HKEY_CURRENT_USER\SOFTWARE. This setting can be useful in cases where you want to migrate your application profiles across different operating systems.

For example, suppose you upgrade your operating system (OS) from Windows 10 version 1803 to Windows 10 version 1809. If this setting is enabled, Profile Management automatically migrates the existing application settings to Windows 10 version 1809 the first time each user logs on. As a result, the application data in the AppData folder and the registry entries under HKEY_CURRENT_USER\SOFTWARE are migrated.

If there are multiple existing application profiles, Profile Management performs the migration in the following order of priority:

1. Profiles of the same OS type (single-session OS to single-session OS and multi-session OS to multi-session OS).
2. Profiles of the same Windows OS family; for example, Windows 10 to Windows 10, or Windows Server 2016 to Windows Server 2016).
3. Profiles of an earlier version of the OS; for example, Windows 7 to Windows 10, or Windows Server 2012 to Windows 2016.
4. Profiles of the closest OS.

Note: You must specify the short name of the OS by including the variable “!CTX_OSNAME!” in the user store path. Doing so lets Profile Management locate the existing application profiles.

If this setting is not configured here, the setting from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled by default.

Path to the template profile

This setting specifies the path to the profile you want Profile Management to use as a template to create new user profiles.

The specified path must be the full path to the folder containing the NTUSER.DAT registry file and any other folders and files required for the template profile.

Note: Do not include NTUSER.DAT in the path. For example, with the file \myservername\myprofiles\template\ntuser.dat, set the location as \myservername\myprofiles\template.

Use absolute paths, which can be either UNC paths or paths on the local machine. Use the latter, for example, to specify a template profile permanently on a Citrix Provisioning Services image. Relative paths are not supported.
Note: This setting does not support expansion of Active Directory attributes, system environment variables, or the %USERNAME% and %USERDOMAIN% variables.

By default, this setting is disabled and new user profiles are created from the default user profile on the device where a user first logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

**Template profile overrides local profile**

This setting enables the template profile to override the local profile when creating new user profiles.

If a user has no Citrix user profile, but a local Windows user profile exists, by default the local profile is used (and migrated to the user store, if this is not disabled). Enabling this policy setting allows the template profile to override the local profile used when creating new user profiles.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

**Template profile overrides roaming profile**

This setting enables the template profile to override a roaming profile when creating new user profiles.

If a user has no Citrix user profile, but a roaming Windows user profile exists, by default the roaming profile is used (and migrated to the user store, if this is not disabled). Enabling this policy setting allows the template profile to override the roaming profile used when creating new user profiles.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.

**Template profile used as a Citrix mandatory profile for all logons**

This setting enables Profile Management to use the template profile as the default profile for creating all new user profiles.

By default, this setting is disabled and new user profiles are created from the default user profile on the device where a user first logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, no template is used.
Registry policy settings

December 18, 2019

The Registry section contains policy settings that specify which registry keys are included or excluded from Profile Management processing.

Exclusion list

List of registry keys in the HKCU hive which are ignored during logoff.

Example: Software\Policies

If this policy is disabled, no registry keys are excluded. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, no registry keys are excluded.

Inclusion list

List of registry keys in the HKCU hive that are processed during logoff.

Example: Software\Adobe.

If this policy is enabled, only keys on this list are processed. If this policy is disabled, the complete HKCU hive is processed. If this policy is not configured here, the value from the .ini file is used. If this policy is not configured here or in the .ini file, all of HKCU is processed.

Enable Default Exclusion List - Profile Management 5.5

Default list of registry keys in the HKCU hive that are not synchronized to the user’s profile. Use this policy to specify GPO exclusion files without having to fill them in manually.

If you disable this policy, Profile Management does not exclude any registry keys by default. If you do not configure this policy here, Profile Management uses the value from the .ini file. If you do not configure this policy here or in the .ini file, Profile Management does not exclude any registry keys by default.

NTUSER.DAT backup

Enables a backup of the last known good copy of NTUSER.DAT and rollback in case of corruption.

If you do not configure this policy here, Profile Management uses the value from the .ini file. If you do not configure this policy here or in the .ini file, Profile Management does not back up NTUSER.DAT.
**Streamed user profiles policy settings**

December 18, 2019

The Streamed user profiles section contains policy settings that specify how Profile Management processes streamed user profiles.

**Always cache**

This setting specifies whether or not Profile Management caches streamed files as soon as possible after a user logs on. Caching files after a user logs on saves network bandwidth, enhancing the user experience.

Use this setting with the Profile streaming setting.

By default, this setting is disabled and streamed files are not cached as soon as possible after a user logs on.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled.

**Always cache size**

This setting specifies a lower limit, in megabytes, on the size of files that are streamed. Profile Management caches any files this size or larger as soon as possible after a user logs on.

By default, this is set to 0 (zero) and the cache entire profile feature is used. When the cache entire profile feature is enabled, Profile Management fetches all profile contents in the user store, after a user logs on, as a background task.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled.

**Profile streaming**

This setting enables and disables the Citrix streamed user profiles feature. When enabled, files and folders contained in a profile are fetched from the user store to the local computer only when they are accessed by users after they have logged on. Registry entries and files in the pending area are fetched immediately.

By default, profile streaming is disabled.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, it is disabled.
Streamed user profile groups

This setting specifies which user profiles within an OU are streamed, based on Windows user groups.

When enabled, only user profiles within the specified user groups are streamed. All other user profiles are processed normally.

By default, this setting is disabled and all user profiles within an OU are processed normally.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, all user profiles are processed.

To enable profile streaming exclusion

When profile streaming exclusion is enabled, Profile Management does not stream folders in the exclusion list, and all the folders are fetched immediately from the user store to the local computer when a user logs on.

For more information, see Stream user profiles.

Timeout for pending area lock files

This setting specifies the number of days after which users' files are written back to the user store from the pending area, in the event that the user store remains locked when a server becomes unresponsive. This prevents bloat in the pending area and ensures the user store always contains the most up-to-date files.

By default, this is set to 1 (one) day.

If this setting is not configured here, the value from the .ini file is used.

If this setting is not configured here or in the .ini file, the default value is used.

User personalization layer policy settings

September 24, 2020

To enable mounting of user layers within the Virtual Delivery Agents, use configuration parameters to specify:

- Where on the network to access the user layers.
- How large any new user layer disks can grow.

To do so, these two policies appear in the list of available policies:
• User Layer Repository Path - Enter a path in the format ‘\servernameoraddress\foldername’ in the Value field.
• User Layer Size GB - If you keep the default user layer size of 0 GB, user layers are set to 10 GB, which is the minimum we recommend. A user layer is a thin-provisioned disk that expands to the set size as space on the disk is used. Existing user layers never decrease in size.

**Note:**
Increasing the User Layer Size affects new user layers and expands existing ones. Decreasing the layer size only affects new user layers. Existing user layers never decrease in size.

For more information, see [User personalization layer](#).

**Virtual Delivery Agent policy settings**

December 18, 2019

The Virtual Delivery Agent (VDA) section contains policy settings that control communication between the VDA and controllers for a site.

**Important:** The VDA requires information provided by these settings to register with a Delivery Controller, if you are not using the auto-update feature. Because this information is required for registration, you must configure the following settings using the Group Policy Editor, unless you provide this information during the VDA installation:

• Controller registration IPv6 netmask
• Controller registration port
• Controller SIDs
• Controllers
• Only use IPv6 controller registration
• Site GUID

**Controller registration IPv6 netmask**

This policy setting allows administrators to restrict the VDA to only a preferred subnet (rather than a global IP, if one is registered). This setting specifies the IPv6 address and network where the VDA will register. The VDA will register only on the first address that matches the specified netmask. This setting is valid only if the Only use IPv6 controller registration policy setting is enabled.

By default this setting is blank.
**Controller registration port**

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies the TCP/IP port number the VDA uses to register with a Controller when using registry-based registration.

By default, the port number is set to 80.

**Controller SIDs**

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies a space-separated list of controller Security Identifiers (SIDs) the VDA uses to register with a Controller when using registry-based registration. This is an optional setting which may be used with the Controllers setting to restrict the list of Controllers used for registration.

By default, this setting is blank.

**Controllers**

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies a space-separated list of controller Fully Qualified Domain Names (FQDNs) the VDA uses to register with a Controller when using registry-based registration. This is an optional setting that may be used with the Controller SIDs setting.

By default, this setting is blank.

**Enable auto update of controllers**

This setting enables the VDA to register with a Controller automatically after installation.

After the VDA registers, the Controller with which it registered sends a list of the current controller FQDNs and SIDs to the VDA. The VDA writes this list to persistent storage. Each Controller also checks the Site database every 90 minutes for Controller information; if a Controller has been added or removed since the last check, or if a policy change has occurred, the Controller sends updated lists to its registered VDAs. The VDA will accept connections from all the Controllers in the most recent list it received.

By default, this setting is enabled.

**Only use IPv6 controller registration**

This setting controls which form of address the VDA uses to register with the Controller:
• When enabled, the VDA registers with the Controller using the machine’s IPv6 address. When the VDA communicates with the Controller, it uses the following address order: global IP address, Unique Local Address (ULA), link-local address (if no other IPv6 addresses are available).
• When disabled, the VDA registers and communicates with the Controller using the machine’s IPv4 address.

By default, this is setting is disabled.

Site GUID

Use this setting only if the Enable auto update of controllers setting is disabled.

This setting specifies the Globally Unique Identifier (GUID) of the site the VDA uses to register with a Controller when using Active Directory-based registration.

By default, this setting is blank.

HDX 3D Pro policy settings

August 29, 2018

The HDX 3D Pro section contains policy settings for enabling and configuring the image quality configuration tool for users. The tool enables users to optimize use of available bandwidth by adjusting in real time the balance between image quality and responsiveness.

Enable lossless

This setting specifies whether or not users can enable and disable lossless compression using the image quality configuration tool. By default, users are not given the option to enable lossless compression.

When a user enables lossless compression, the image quality is automatically set to the maximum value available in the image configuration tool. By default, either GPU or CPU-based compression can be used, according to the capabilities of the user device and the host computer.

HDX 3D Pro quality settings

This setting specifies the minimum and maximum values that define the range of image quality adjustment available to users in the image quality configuration tool.

Specify image quality values of between 0 and 100, inclusive. The maximum value must be greater than or equal to the minimum value.
Monitoring policy settings

December 10, 2019

The Monitoring section contains policy settings for process, resource monitoring, and application failure monitoring.

The scope of these policies can be defined based on the Site, Delivery Group, type of Delivery Group, organizational unit, and tags.

Policies for process and resource monitoring

Each data point for CPU, memory, and processes is collected from the VDA and stored on the Monitoring database. Sending the data points from the VDA consumes network bandwidth and storing them consumes considerable space on the monitoring database. If you do not want to monitor either resource data or process data or both for a specific scope (for example, a specific delivery group or organizational unit), it is recommended to disable the policy.

Enable process monitoring

Enable this setting to allow monitoring of processes running on machines with VDAs. Statistics such as CPU and memory use are sent to the Monitoring Service. The statistics are used for real-time notifications and historical reporting in Director.

The default for this setting is Disabled.

Enable resource monitoring

Enable this setting to allow monitoring of critical performance counters on machines with VDAs. Statistics (such as CPU and memory use, IOPS and disk latency data) are sent to the Monitoring Service. The statistics are used for real-time notification and historical reporting in Director.

The default for this setting is Enabled.

Scalability

The CPU and memory data is pushed to the database from each VDA at 5-minute intervals; process data (if enabled) is pushed to the database at 10-minute intervals. IOPS and disk latency data is pushed to the database at 1-hour intervals.
**CPU and memory data**

CPU and memory data is **enabled** by default. The data retention values are as follows (Platinum license):

<table>
<thead>
<tr>
<th>Data granularity</th>
<th>Number of Days</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 Minute Data</td>
<td>1 Day</td>
</tr>
<tr>
<td>10 Minute Data</td>
<td>7 Days</td>
</tr>
<tr>
<td>Hourly Data</td>
<td>30 Days</td>
</tr>
<tr>
<td>Daily Data</td>
<td>90 Days</td>
</tr>
</tbody>
</table>

**IOPS and disk latency data**

IOPS and disk latency data is **enabled** by default. The data retention values are as follows (Platinum license):

<table>
<thead>
<tr>
<th>Data granularity</th>
<th>Number of Days</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hourly Data</td>
<td>3 Days</td>
</tr>
<tr>
<td>Daily Data</td>
<td>90 Days</td>
</tr>
</tbody>
</table>

With the data retention settings as above, approximately 276 KB of disk space is required to store the CPU, memory, IOPS and disk latency data for one VDA over a period of one year.

<table>
<thead>
<tr>
<th>Number of machines</th>
<th>Approximate storage required</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>276 KB</td>
</tr>
<tr>
<td>1K</td>
<td>270 MB</td>
</tr>
<tr>
<td>40K</td>
<td>10.6 GB</td>
</tr>
</tbody>
</table>

**Process data**

Process data is **disabled** by default. It is recommended to enable process data on a subset of machines on a need basis. The default data retention settings for the process data is as follows:
If process data is enabled, with the default retention settings, process data would consume approximately 1.5 MB per VDA and 3 MB per Terminal Services VDA (TS VDA) over a period of one year.

<table>
<thead>
<tr>
<th>Number of machines</th>
<th>Approximate storage required VDA</th>
<th>Approximate storage required TS VDA</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1.5 MB</td>
<td>3 MB</td>
</tr>
<tr>
<td>1K</td>
<td>1.5 GB</td>
<td>3 GB</td>
</tr>
</tbody>
</table>

Note
The above numbers do not include the Index space. And all the above calculations are approximate and may vary depending on the deployment.

Optional Configurations
You can modify the default retention settings to suit your needs. However, this consumes extra storage. By enabling the settings below you can gain more accuracy in the process utilization data. The configurations which can be enabled are:

EnableMinuteLevelGranularityProcessUtilization
EnableDayLevelGranularityProcessUtilization

These Configurations can be enabled from the Monitoring Powershell cmdlet: Set-MonitorConfiguration

Policies for application failure monitoring
The Application Failure tab, by default, displays only application faults from Multi-session OS VDAs. Settings of Application failure monitoring can be modified with the following Monitoring policies:

Enable monitoring of application failures
Use this setting to configure application failure monitoring to monitor either application errors or faults (crashes and unhandled exceptions), or both.
Disable application failure monitoring by setting the **Value** to **None**. The default for this setting is Application faults only.

**Enable monitoring of application failures on Single-session OS VDAs**

By default, failures only from applications hosted on the Multi-session OS VDAs are monitored. To monitor Single-session OS VDAs, set the policy to **Allowed**. The default for this setting is **Prohibited**.

**List of applications excluded from failure monitoring**

Specify a list of applications that are not to be monitored for failure. By default this list is empty.

**Storage planning tips**

**Group policy.** If you are not interested in monitoring the Resource Data or Process Data, either or both can be turned off using the group policy. For more information, see the Group Policy section of Create policies.

**Data grooming.** The default data retention settings can be modified to groom the data early and free up storage space. For more information on grooming settings, see Data granularity and retention in Accessing data using the API.

**Virtual IP policy settings**

January 6, 2020

**Important:**

Windows 10 Enterprise multi-session doesn’t support Remote Desktop IP Virtualization (Virtual IP) and we don’t support Virtual IP nor virtual loopback on Windows 10 Enterprise multi-session.

The Virtual IP section contains policy settings that control whether sessions have their own virtual loopback address.

**Virtual IP loopback support**

When this setting is enabled, each session has its own virtual loopback address. When disabled, sessions do not have individual loopback addresses.

By default, this setting is disabled.
Virtual IP virtual loopback programs list

This setting specifies the application executables that can use virtual loopback addresses. When adding programs to the list, specify only the executable name; you do not need to specify the entire path.

By default, no executables are specified.

Configure COM Port and LPT Port Redirection settings using the registry

December 18, 2019

In VDA versions 7.0 through 7.8, COM Port and LPT Port settings are only configurable using the registry. For VDA versions earlier than 7.0 and for VDA versions 7.9 and later, these settings are configurable in Studio. For more information, see Port redirection policy settings and Bandwidth policy settings.

Policy settings for COM Port and LPT Port Redirection are located under HKLM\Software\Citrix\GroupPolicy\Defaults\Deprecated on the VDA image or machine.

To enable COM port and LPT port redirection, add new registry keys of type REG_DWORD, as follows:

Caution: Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

<table>
<thead>
<tr>
<th>Registry key</th>
<th>Description</th>
<th>Permitted values</th>
</tr>
</thead>
<tbody>
<tr>
<td>AllowComPortRedirection</td>
<td>Allow or prohibit COM port redirection</td>
<td>1 (Allow) or 0 (Prohibit)</td>
</tr>
<tr>
<td>LimitComBw</td>
<td>Bandwidth limit for COM port redirection channel</td>
<td>Numeric value</td>
</tr>
<tr>
<td>LimitComBWPercent</td>
<td>Bandwidth limit for COM port redirection channel as a percentage of total session bandwidth</td>
<td>Numeric value between 0 and 100</td>
</tr>
<tr>
<td>AutoConnectClientComPorts</td>
<td>Automatically connect COM ports from the user device</td>
<td>1 (Allow) or 0 (Prohibit)</td>
</tr>
<tr>
<td>AllowLptPortRedirection</td>
<td>Allow or prohibit LPT port redirection</td>
<td>1 (Allow) or 0 (Prohibit)</td>
</tr>
<tr>
<td>Registry key</td>
<td>Description</td>
<td>Permitted values</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------</td>
<td>--------------------------------------</td>
</tr>
<tr>
<td>LimitLptBw</td>
<td>Bandwidth limit for LPT port redirection channel</td>
<td>Numeric value</td>
</tr>
<tr>
<td>LimitLptBwPercent</td>
<td>Bandwidth limit for LPT port redirection channel as a percentage of total session bandwidth</td>
<td>Numeric value between 0 and 100</td>
</tr>
<tr>
<td>AutoConnectClientLptPorts</td>
<td>Automatically connect LPT ports from the user device</td>
<td>1 (Allow) or 0 (Prohibit)</td>
</tr>
</tbody>
</table>

After configuring these settings, change your machine catalogs to use the new master image or updated physical machine. Desktops are updated with the new settings the next time users log off.

**Connector for Configuration Manager 2012 policy settings**

December 18, 2019

The Connector for Configuration Manager 2012 section contains policy settings for configuring the Citrix Connector 7.5 agent.

Important: Warning, logoff, and reboot message policies apply only to deployments to Multi-session OS machine catalogs that are managed manually or by Provisioning Services. For those machine catalogs, the Connector service alerts users when there are pending application installs or software updates.

For catalogs managed by MCS, use Studio to notify users. For manually managed Single-session OS catalogs, use Configuration Manager to notify users. For Single-session OS catalogs managed by Provisioning Services, use Provisioning Services to notify users.

**Advance warning frequency interval**

This setting defines the interval between appearances of the advance warning message to users.

Intervals are set using the format ddd.hh:mm:ss, where:

- ddd is days, an optional parameter, with a range of 0 to 999.
- hh is hours with a range of 0 to 23.
- mm is minutes with a range of 0 to 59.
- ss is seconds with a range of 0 to 59.
By default, the interval setting is 1 hour (01:00:00).

**Advance warning message box body text**

This setting contains the editable text of the message to users notifying them of upcoming software updates or maintenance that requires them to log off.

By default, the message is: {TIMESTAMP} Please save your work. The server will go offline for maintenance in {TIMELEFT}

**Advance warning message box title**

This setting contains the editable text of the title bar of the advance warning message to users.

By default, the title is: Upcoming Maintenance

**Advance warning time period**

This setting defines how far before maintenance the advance warning message first appears.

The time is set using the format ddd.hh:mm:ss, where:

- ddd is days, an optional parameter, with a range of 0 to 999.
- hh is hours with a range of 0 to 23.
- mm is minutes with a range of 0 to 59.
- ss is seconds with a range of 0 to 59.

By default, the setting is 16 hours (16:00:00), indicating that the first advance warning message appears approximately 16 hours before maintenance.

**Final force logoff message box body text**

This setting contains the editable text of the message alerting users that a forced logoff has begun.

By default, the message is: The server is currently going offline for maintenance

**Final force logoff message box title**

This setting contains the editable text of the title bar of the final force logoff message.

By default, the title is: Notification From IT Staff
**Force logoff grace period**

This setting defines the period of time between notifying users to log off and the implementation of the forced logoff to process the pending maintenance.

The time is set using the format ddd.hh:mm:ss, where:

- ddd is days, an optional parameter, with a range of 0 to 999.
- hh is hours with a range of 0 to 23.
- mm is minutes with a range of 0 to 59.
- ss is seconds with a range of 0 to 59.

By default, the force logoff grace period setting is 5 minutes (00:05:00).

**Force logoff message box body text**

This setting contains the editable text of the message telling users to save their work and log off prior to the start of a forced logoff.

By default, the message contains the following: {TIMESTAMP} Please save your work and log off. The server will go offline for maintenance in {TIMELEFT}

**Force logoff message box title**

This setting contains the editable text of the title bar of the force logoff message.

By default, the title is: Notification From IT Staff

**Image-managed mode**

The Connector agent automatically detects if it is running on a machine clone managed by Provisioning Services or MCS. The agent blocks Configuration Manager updates on image-managed clones and automatically installs the updates on the master image of the catalog.

After a master image is updated, use Studio to orchestrate the reboot of MCS catalog clones. The Connector Agent automatically orchestrates the reboot of PVS catalog clones during Configuration Manager maintenance windows. To override this behavior so that software is installed on catalog clones by Configuration Manager, change Image-managed mode to Disabled.

**Reboot message box body text**

This setting contains the editable text of the message notifying users when the server is about to be restarted.

By default, the message is: The server is currently going offline for maintenance
Regular time interval at which the agent task is to run

This setting determines how frequently the Citrix Connector agent task runs.

The time is set using the format ddd.hh:mm:ss, where:

- ddd is days, an optional parameter, with a range of 0 to 999.
- hh is hours with a range of 0 to 23.
- mm is minutes with a range of 0 to 59.
- ss is seconds with a range of 0 to 59.

By default, the regular time interval setting is 5 minutes (00:05:00).

Manage

June 3, 2020

Managing a Citrix Virtual Apps and Desktops site covers various items and tasks.

Licensing

A valid connection to the Citrix License Server is required when you create a site. Later, you can complete several licensing tasks from Studio, including adding licenses, changing license types or models, and managing license administrators. You can also access the License Administration Console from Studio.

Applications

Manage applications in Delivery Groups and optionally, Application Groups.

Zones

In a geographically disperse deployment, you can use zones to keep applications and desktops closer to end users, which can improve performance. When you install and configure a site, all Controllers, machine catalogs, and host connections are in one primary zone. Later, you can use Studio to create satellite zones containing those items. After your site has more than one zone, you will be able to indicate in which zone any newly created machine catalogs, host connections, or added Controllers will be placed. You can also move items between zones.

Connections and resources

If you are using a hypervisor or other service to host machines that deliver applications and desktops to users, you create your first connection to that hypervisor or other service when you create a site. The storage and network details for that connection form its resources. Later, you can change that connection and its resources, and create more connections. You can also manage the machines that use a configured connection.
Local Host Cache

Local Host Cache allows connection brokering operations in a site to continue when the connection between a Delivery Controller and the site database fails.

Virtual IP and virtual loopback

The Microsoft virtual IP address feature provides a published application with a unique dynamically assigned IP address for each session. The Citrix virtual loopback feature allows you to configure applications that depend on communications with localhost to use a unique virtual loopback address in the localhost range.

Delivery Controllers

This article contains considerations and procedures when adding and removing Controllers from a site. It also describes how to move Controllers to another zone or site, and how to move a VDA to another site.

VDA registration with Controllers

Before a VDA can help deliver applications and desktops, it must register (establish communication) with a Controller. Controller addresses can be specified in several ways, which are described in this article. It is critical that VDAs have current information as Controllers are added, moved, and removed in the site.

Sessions

Maintaining session activity is critical to providing the best user experience. Several features can optimize the reliability of sessions, reduce inconvenience, downtime, and loss of productivity.

- Session reliability
- Auto Client Reconnect
- ICA Keep-Alive
- Workspace control
- Session roaming

Use search in Studio

When you want to view information about machines, sessions, machine catalogs, applications, or Delivery Groups in Studio, use the flexible search feature.

Tags

Use tags to identify items such as machines, applications, groups, and policies. You can then tailor certain operations to apply on to items with a specific tag.

IPv4/IPv6

Citrix Virtual Apps and Desktops supports pure IPv4, pure IPv6, and dual-stack deployments that use overlapping IPv4 and IPv6 networks. This article describes and illustrates these deployments. It also describes the Citrix policy settings that control the use of IPv4 or IPv6.
User profiles

By default, Citrix Profile Management is installed automatically when you install a VDA. If you use this profile solution, review this article for general information. See the Profile Management documentation for details.

Collect Citrix Diagnostic Facility (CDF) traces

The CDFControl utility is an event tracing controller or consumer for capturing Citrix Diagnostic Facility (CDF) trace messages displayed from various Citrix tracing providers. It is made to troubleshoot complex Citrix related issues, parse filter support, and collect performance data.

Citrix Insight Services

Citrix Insight Services (CIS) is a Citrix platform for instrumentation, telemetry, and business insight generation.

Citrix Scout

Citrix Scout collects diagnostics and runs health checks. You can use the results for proactive maintenance in your Citrix Virtual Apps and Desktops deployment. Citrix offers comprehensive, automated analysis of diagnostics collections through Citrix Insight Services. You can also use Scout to troubleshoot issues, on your own or with Citrix Support guidance.

Licensing

June 24, 2020

Note:

Studio and Director do not support Citrix License Server VPX.

From Studio, you can manage and track licensing, if the license server is in the same domain as Studio or in a trusted domain. For information about other licensing tasks, see the licensing documentation and Multi-type licensing.

You must be a full license administrator to complete the tasks described in this article, except for viewing license information. To view license information in Studio, an administrator must have at least the Read Licensing delegated administration permission; the built-in Full Administrator and Read-Only Administrator roles have that permission.

The following table lists the supported editions and license models:
Citrix Virtual Apps and Desktops 7 2009

<table>
<thead>
<tr>

**Important:**

We no longer support License Server for Windows versions older than 11.14.0.1 Build 22103 (MSI
View license information

Select Configuration > Licensing in the Studio navigation pane. A summary of license usage and settings for the Site is displayed with a list of all the licenses currently installed on the specified license server.

Ensure that the licensing settings for the site, which include the product type, license edition, and licensing model, match the licenses your configured License Server uses. If not, you might have to download or allocate your exiting licenses to match the site's license settings.

Download and install a license from Citrix using Studio

1. Select Configuration > Licensing in the Studio navigation pane.
2. Select Allocate Licenses in the Actions pane.
3. Type the License Access Code, which is supplied in an email from Citrix after licenses are purchased or renewed.
4. Select a product and choose Allocate Licenses. All the licenses available for that product are allocated and downloaded. After you allocate and download all the licenses for a specific License Access Code, you cannot use that License Access Code again. To perform other transactions with that code, log on to My Account.

Add licenses that are stored on your local computer or on the network

1. Select Configuration > Licensing in the Studio navigation pane.
2. Select Add Licenses in the Actions pane.
3. Browse to a license file and add it to the license server.

Change the license server

1. Select Configuration > Licensing in the Studio navigation pane.
2. Select Change License Server in the Actions pane.
3. Type the address of the license server in the form name:port, where the name is a DNS, NetBIOS, or IP address. If you do not specify a port number, the default port (27000) is used.

Select the type of license to use

- When configuring the Site, after you specify the license server, you are prompted to select the type of license to use. If there are no licenses on the server, the option to use the product for a 30-day trial period without a license is automatically selected.
• If there are licenses on the server, their details are displayed and you can select one of them. Or, you can add a license file to the server and then select that one.

Change the product edition and licensing model

1. Select Configuration > Licensing in the Studio navigation pane.
3. Update the appropriate options.

To access the License Administration Console, in the Actions pane, select License Administration Console. The console either appears immediately, or if the dashboard is configured as password-protected, you are prompted for License Administration Console credentials. For details about how to use the console, see the licensing documentation.

Add a licensing administrator

1. Select Configuration > Licensing in the Studio navigation pane.
2. Select the Licensing Administrators tab in the middle pane.
3. Select Add licensing administrator in the Actions pane.
4. Browse to the user you want to add as an administrator and choose permissions.

Change a licensing administrator’s permissions or delete a licensing administrator

1. Select Configuration > Licensing in the Studio navigation pane.
2. Select the Licensing Administrators tab in the middle pane and then select the administrator.
3. Select either Edit licensing administrator or Delete licensing administrator in the Actions pane.

Add a licensing administrator group

1. Select Configuration > Licensing in the Studio navigation pane.
2. Select the Licensing Administrators tab in the middle pane.
3. Select Add licensing administrator group in the Actions pane.
4. Browse to the group you want to act as licensing administrators and choose permissions. Adding an Active Directory Group gives licensing administrator permissions to the users within that group.

Change a licensing administrator group’s permissions or delete a licensing administrator group

1. Select Configuration > Licensing in the Studio navigation pane.
2. Select the Licensing Administrators tab in the middle pane and then select the administrator group.
3. Select either **Edit licensing administrator group** or **Delete licensing administrator group** in the Actions pane.

**Multi-type licensing**

September 14, 2020

Multi-type licensing supports consumption of different license types for delivery groups on a single Citrix Virtual Apps and Desktops site. **Type** is a single combination of Product ID (XDT or MPS) and Model (UserDevice or Concurrent). The delivery groups must use the same Product Edition (PLT/Premium or ENT/Advanced) as configured at the site level. Be aware of the **special considerations** at the end of this article when looking to configure multi-type licensing for your Citrix Virtual Apps and Desktops deployments.

If multi-type licensing is not configured, different license types can be used only when configured for separate sites. The delivery groups use the site license. For important notification limitations when multi-type licensing is configured, see **Special considerations**.

To determine the delivery groups that consume the different types of licenses, use these Broker PowerShell cmdlets:

- **New-BrokerDesktopGroup**
- **Set-BrokerDesktopGroup**
- Get-BrokerDesktopGroup

To install licenses, use:

- Citrix Studio
- Citrix Licensing Manager
- citrix.com

Customer Success Services dates are specific to each license file and to each product and model. Delivery groups set differently might have different Customer Success Services dates than each other.

License compatibility matrix

This table details old product names, new product names, and the associated feature names. The four compatibility columns specify which product and license model combinations are compatible for multi-type licensing. For example, all types with an X under column 1 are compatible. CCU and CCS stand for concurrent licenses and UD is user/device licenses.

<table>

Broker PowerShell SDK

The DesktopGroup object has these two properties you can manipulate using the associated New-BrokerDesktopGroup and Set-BrokerDesktopGroup cmdlets.
New-BrokerDesktopGroup

Creates a desktop group for managing the brokering of groups of desktops. For more information on this cmdlet, see [https://citrix.github.io/delivery-controller-sdk/Broker/New-BrokerDesktopGroup/](https://citrix.github.io/delivery-controller-sdk/Broker/New-BrokerDesktopGroup/).

Set-BrokerDesktopGroup

Disables or enables an existing broker desktop group or alters its settings. For more information on this cmdlet, see [https://citrix.github.io/delivery-controller-sdk/Broker/Set-BrokerDesktopGroup/](https://citrix.github.io/delivery-controller-sdk/Broker/Set-BrokerDesktopGroup/).

Get-BrokerDesktopGroup

Retrieves desktop groups matching the specified criteria. The output of the Get-BrokerDesktopGroup cmdlet includes the ProductCode and LicenseModel properties of the group. If the properties have not been set using New-BrokerDesktopGroup or Set-BrokerDesktopGroup, null values are returned. If null, the site-wide license model and product code are used. For more information on this cmdlet, see [https://citrix.github.io/delivery-controller-sdk/Broker/Get-BrokerDesktopGroup/](https://citrix.github.io/delivery-controller-sdk/Broker/Get-BrokerDesktopGroup/).

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>LicenseModel</td>
<td>A parameter (Concurrent or UserDevice) specifying the licensing model for the group. If none is specified, the site-wide license model is used.</td>
<td>If the feature toggle is disabled, attempting to set a property fails.</td>
</tr>
<tr>
<td>ProductCode</td>
<td>A text string of XDT (for Citrix Virtual Desktops) or MPS (for Citrix Virtual Apps) specifying the licensing Product ID for the group. If none is specified, the site-wide product code is used.</td>
<td>If the feature toggle is disabled, attempting to set a property fails.</td>
</tr>
</tbody>
</table>

For more information about the LicenseModel and ProductCode, see [about_Broker_Licensing](https://citrix.github.io/delivery-controller-sdk/Broker/).
Configure different license products and models per delivery group

1. Open PowerShell with Administrative rights and add the Citrix snap-in.

2. Run the command `Get-BrokerDesktopGroup -Name “DeliveryGroupName”` to view the current license configuration. Find the parameters `LicenseModel` and `ProductCode`. If you haven’t configured these parameters before, they might be blank.

   Note:
   If a delivery group does not have license information set, it defaults to **Site level Site license**.
3. Change the license model by running the command: `Set-BrokerDesktopGroup -Name “DeliveryGroupName” -LicenseModel LicenseModel`. 

5. Enter the command **Get-BrokerDesktopGroup** –Name “DeliveryGroupName” to validate the changes.

**Note:**

You cannot mix and match editions in the same site. For example, Premium and Advanced licenses. Multiple sites are required if you have licenses with different editions.
6. Remove the license configuration by running the same `Set-BrokerDesktopGroup` commands as described in previous steps, and set the value to `$null`.

Note:

Studio doesn’t display the license configuration for each delivery group. Use PowerShell to view the current configuration.
Example

This PowerShell cmdlet example illustrates setting multi-type licensing for two existing delivery groups and creates and sets a third delivery group.

To see the license product and license model associated with a delivery group, use the Get-BrokerDesktopGroup PowerShell cmdlet.

1. We set the first delivery group for XenApp and Concurrent.

   Set-BrokerDesktopGroup -Name “Delivery group for Citrix Virtual Apps Premium Concurrent” -ProductCode MPS -LicenseModel Concurrent

2. We set the second delivery group for XenDesktop and Concurrent.

   Set-BrokerDesktopGroup -Name “Delivery group for Citrix Virtual Desktops Premium Concurrent” -ProductCode XDT -LicenseModel Concurrent
3. We create and set the third delivery group for XenDesktop and UserDevice.

   New-BrokerDesktopGroup -Name “Delivery group for Citrix Virtual Desktops Premium UserDevice” -PublishedName “MyDesktop” -DesktopKind Private -ProductCode XDT -LicenseModel UserDevice

Special considerations

Multi-type licensing has different functionality than regular Citrix Virtual Apps and Desktops licensing. There are no alerts and notifications from Director or Studio for delivery groups configured to use a type that differs from the site configuration:

- No information when nearing license limits or the trigger or expiry of the supplemental grace period.
- No notification when a specific group has a problem.

Delivery groups configured for multi-type licenses consume ONLY that license type and don’t fall back to the site configuration when fully consumed.

Though Citrix Virtual Apps Standard and Citrix Virtual Desktops Standard license edition names indicate that they are both Standard, they are not the same edition. Multi-type licensing is not available with Citrix Virtual Apps Standard and Citrix Virtual Desktop Standard licenses.

FAQ for licensing

August 21, 2020

Note:

- For business continuity resources related to the COVID-19 pandemic, see CTX27055.
- For general information about maintaining business continuity, see Business continuity — on demand.
- For more information about the current Citrix License Server, see Licensing.

Citrix licensing

How can I get my license file?

We send the license access code in an email. There are three ways to generate license files using the license access code:

- The Manage Licenses toolbox from your My Account page on citrix.com
• Citrix Studio to allocate your purchase and the license file automatically installs on your Citrix License Server.
• Citrix Licensing Manager within the Citrix License Server to allocate your purchase and install your license file.

For more information, see Licensing in the Citrix Licensing documentation and Licensing in the Citrix Virtual Apps and Desktop documentation.

**What TCP ports does Citrix licensing use?**

• License Server port number is 27000
• Vendor daemon port number is 7279
• Management console web port is 8082
• Web Service for Licensing port is 8083

**What is the Citrix License Server?**

The Citrix License Server is a system that allows licenses to be shared across the network. For more information, see Licensing operations overview.

**Can I virtualize or cluster the Citrix License Server?**

Yes. You can virtualize or cluster the Citrix License Server. For more information, see Clustered License Servers.

**What benefits are available to me if I virtualize the Citrix License Server?**

Virtualizing the Citrix License Server provides a redundant solution. That solution allows for mobility between multiple physical servers without the need for downtime.

**Are there any limitations to consider if I virtualize the Citrix License Server?**

No.

**Does the Citrix License Server manage all the licenses for my Citrix Virtual Apps and Desktop deployment?**

The Citrix License Server manages all licenses you receive for Citrix Virtual Apps and Desktop, except licenses in the Premium Edition used with Citrix Gateway. License servers built into the network appliances as required for those security-oriented network devices manage those licenses.
What is the Citrix Licensing Manager?

The Citrix Licensing Manager enables downloading and allocation of license files from the License Server on which you installed the Citrix Licensing Manager. The Citrix Licensing Manager is the recommended License Server management method, which enables the following:

- Short code registration of the License Server to Citrix Cloud and easy removal of registration.
- Configure user and group accounts.
- Use the dashboard to display installed, in-use, expired and available licenses, and Customer Success Services dates.
- Export license use data for use in reporting.
- Configure the historical use data retention period. Default data retention period is 180 days.
- Simplified installation of license files on the License Server using a license access code or downloaded file.
- Enable and disable the supplemental grace period.
- Configure Customer Experience Improvement Program (CEIP) and Call Home.
- Automatically or manually checks for Customer Success Services renewal licenses and notifies you or installs the licenses if found.
- Notifies you of the License Server state - Missing startup license, time issues, uploader failures.
- Modify these ports:
  - License Server (default 27000)
  - Vendor Daemon (default 7279)
  - Web Services for Licensing (default 8083)

For more information, see Citrix Licensing Manager.

Where is the Citrix License Administration Console?

The License Administration Console is no longer supported and was removed from the License Server version 11.16.6. We recommend you use the Citrix Licensing Manager.

You can use Studio to manage and track licensing, provided the License Server is in the same domain as Studio, or in a trusted domain.

For more information, see Citrix Licensing Manager.

What is the license assignment period?

The license assignment period is the term that a Citrix Virtual Apps and Desktops license is assigned to a user or device. The default license assignment period is 90 days.
How do I know how many licenses my organization has purchased?

All purchased licenses are available to review and access at any time (24x7) from your secure Manage Licenses toolbox on your My Account page on https://www.citrix.com.

How do I know how many licenses are in use at any time?

The Citrix Licensing Manager and Studio provide details on real time license use.

License Server disaster recovery and maintenance

For information about disaster recovery and maintenance of your License Server, see Disaster recovery and maintenance in the Citrix Licensing documentation.

Citrix Virtual Apps and Desktops licensing

How is Citrix Virtual Apps and Desktops licensed?

The Citrix Virtual Apps and Desktops licensing offers user/device and concurrent license models.

User/device:

The flexible user/device model aligns with:

- Enterprise-wide desktop usage.
- Underlying Microsoft desktop virtualization licensing.
- Concurrent licensing for customers with users needing only occasional access to their virtual desktops and apps.

User/device licensing gives users access to their virtual desktops and apps from an unlimited number of devices. Device licenses give an unlimited number of user’s access to their virtual desktops and apps from a single device. This approach provides you with maximum flexibility and improves alignment with Microsoft desktop virtualization licensing.

Important:

You can’t manually allocate licenses to a user or device. The License Server or cloud service assigns licenses. With user/device licensing, once a license is assigned it can’t be assigned to another user until after 90 days of inactivity.

Concurrent:

Concurrent licenses allow one connection to an unlimited number of virtual apps and desktops for any user and any device. A license is consumed only during an active session. If the session disconnects or is terminated, the license is checked back into the pool.
For more information about user/device licensing, see User/device licenses and concurrent licenses see, Concurrent licenses.

Is it possible to try Citrix Virtual Apps and Desktops before purchasing licenses?

Yes. You can download the Citrix Virtual Apps and Desktops software and run it in trial mode. Trial mode lets you use Citrix Virtual Apps and Desktops on-premises for 30 days, for 10 connections, without a license.

Citrix Virtual Apps and Desktops Services for Citrix Cloud is available for trial service based on approval. Check with your Citrix representative for further details.

How does Citrix define concurrency for Citrix Virtual Apps and Desktops?

The Citrix Virtual Apps and Desktops concurrent model allows one connection to an unlimited number of virtual apps and desktops for any user and any device. A license is consumed only during an active session. If the session disconnects or is terminated, the license is checked back into the pool for reissue.

Can I deploy multiple editions of Citrix Virtual Apps and Desktops licenses on a common License Server?

Yes. The License Server manages licenses for both Citrix Virtual Apps and Desktops simultaneously. We recommend that you install the latest License Server version. If you are unsure if your License Server version is current, verify it by comparing your version with the number on the Citrix downloads site.

Can a single site use both Citrix Virtual Apps and Citrix Virtual Apps and Desktops licenses?

Depending on the version, a single Citrix Virtual Apps or Citrix Virtual Apps and Desktops site can support both licensing models - user/device or concurrent. A single Citrix Virtual Apps or Citrix Virtual Apps and Desktops site can support only one edition. For more information, see Multi-type licensing.

The minimum versions that support multi-type licensing are XenApp and XenDesktop 7.15 Long Term Service Release (LTSR) and Citrix Virtual Apps and Desktops 7 1808.

Can I select Citrix Virtual Apps concurrent as a product model if I have Citrix Virtual Apps and Desktops user/device or Citrix Virtual Apps and Desktops concurrent licenses installed on the License Server?

If you use Citrix Virtual Apps as a feature of Citrix Virtual Apps and Desktops Advanced or Premium Edition, your Citrix Virtual Apps license model is the same as your Advanced or Premium Edition of Citrix.
Virtual Apps and Desktops. If you have purchased Citrix Virtual Apps and Desktops, configure your licensing as Citrix Virtual Apps and Desktops even if you plan to use only the Citrix Virtual Apps functionality. Select Citrix Virtual Apps as a product model only if you have Citrix Virtual Apps concurrent standalone licenses installed on the License Server.

**What product components are included with each Citrix Virtual Apps and Citrix Virtual Apps and Desktops edition?**

For a full feature matrix by edition, see [Citrix Virtual Apps and Desktops features](#).

**How do I license Citrix Virtual Desktops environments in compliance with the Citrix Virtual Apps and Desktops EULA?**

To deploy Citrix Virtual Apps and Desktops under the user/device or the concurrent license model in compliance with the Citrix Virtual Apps and Desktops EULA, apply the license files to your License Server. The License Server then controls and monitors license compliance. We recommend that you configure your product based on what you purchased. For example, if you purchase Citrix Virtual Apps and Desktops Premium but only want to use the Citrix Virtual Apps feature, configure the product to Citrix Virtual Apps and Desktops to meet compliance. For more information, see the [Product License Compliance Center](#).

**How do I license Citrix Virtual Apps environments in compliance with the Citrix Virtual Apps EULA?**

To deploy Citrix Virtual Apps under the concurrent license model in compliance with the Citrix Virtual Apps EULA, apply the license files to your License Server. The License Server then controls and monitors license compliance.

**Is there a licensing requirement for Citrix Virtual Apps and Desktops Servicing Options: Long Term Service Release (LTSR) or Current Release (CR)?**

Citrix Virtual Apps and Desktops Servicing Options, such as Long-Term Service Release, are a benefit of the Customer Success Services program. You must have active Customer Success Services to qualify for the benefits of LTSR. For more information, see [Citrix Virtual Apps, Citrix Virtual Apps and Desktops, and Citrix Hypervisor Servicing Options](#).

**How do the Secure Browser Standard Service pooled hours work?**

When you purchase a minimum of 25 users of the service, you receive 5000 of hours of rights to use the service, pooled across all users. Subsequent purchases of user rights don’t increase the pooled
hours entitlement. To increase the entitlement of service hours, buy add-on packs.

**Can I use Remote PC Access with CCU licenses?**

Yes.

For information about Remote PC Access, see [Remote PC Access](#).

**User or device licenses**

**How does Citrix allocate licenses to users in the user/device licensing model?**

With the user/device license model, the License Server assigns the license to a unique user ID. It allows that single user unlimited connections from unlimited devices. If a user connects to a desktop or device, the user requires one license assigned to that user to access a virtual desktop or application. The License Server or cloud service assigns the license. You can’t assign these licenses manually. The license is assigned to the user, not the shared device. Once a license is assigned, it can’t be assigned to another user until after 90 days of inactivity.

**How does Citrix define a licensed device in the user/device licensing model?**

A licensed device requires a unique endpoint device ID. Under the user/device model, a device is any piece of equipment that you authorized for use by any individuals to access instances of Citrix Virtual Apps and Desktops. For a shared device, a single Citrix Virtual Apps and Desktops user/device license can support multiple users that share the device. For example, a shared device can be a classroom workstation or a clinical workstation in a hospital.

**Can I convert my Citrix Virtual Desktops Standard Edition concurrent licenses to the user/device model?**

If you have Citrix Virtual Desktops Standard Edition concurrent licenses and you want the user/device license model, upgrade to either Citrix Virtual Apps and Desktops Advanced or Premium Edition.
### From To Standard concurrent To Standard user/device To Advanced user/device To Premium user/device

<table>
<thead>
<tr>
<th>Citrix Virtual Desktops Standard Edition concurrent licenses</th>
<th>N/A</th>
<th>Concurrent to user/device conversion NOT allowed</th>
<th>You cannot convert license models, but you can upgrade to Citrix Virtual Apps and Desktops Advanced or Premium Edition.</th>
<th>You cannot convert license models, but you can upgrade to Citrix Virtual Apps and Desktops Advanced or Premium Edition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citrix Virtual Desktops Standard Edition user/device licenses</td>
<td>User/device to concurrent conversion NOT allowed</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**How does concurrent licensing work differently from user/device licensing?**

We base concurrent licensing on concurrent device connections. A concurrent license is in use only when a device has established an active connection. Once the connection ends, the concurrent license returns to the license pool for immediate use. We recommend this licensing model for occasional usage. User/device licenses are leased for a period and are not available for other users until the lease expires.

**Under the user/device model, can we allocate licenses to both users and devices in the same enterprise?**

Yes. Both types can be present in the same enterprise. The License Server optimally assigns licenses to users or devices based on usage. You can’t assign these licenses manually.

**How do I decide how many users or devices to license?**

Assess the use case requirements to determine the appropriate number of licenses. User/device licensing enables unlimited access to unlimited virtual desktops and virtual apps from an unlimited number of devices. Concurrent licensing enables unlimited access to unlimited virtual desktops and virtual apps from a single device that an unlimited number of users can use. Consider the following formula:
Under the user/device model, what is the maximum number of devices a licensed user can use to connect to my environment?

Each licensed user is entitled to use an unlimited number of connected or offline devices.

Under the user/device model, what is the maximum number of users who can access a licensed device?

Each licensed device can service an unlimited number of users within an organization.

Under the user/device model, what is the maximum number of virtual desktops or Secure Browser web applications a licensed user can consume at any given time?

Each licensed user can connect to an unlimited number of virtual desktops or web applications.

Can I purchase Citrix Virtual Apps and Desktops licenses to increase the number of licensed users/devices in my existing Citrix Virtual Apps and Desktop environment?

Yes. You can purchase Citrix Virtual Apps and Desktop licenses to increase the number of licensed users/devices in your existing Citrix Virtual Apps and Desktop environment.

How do I release an authorized user/device license?

To release the assignment of an authorized user/device, use the udadmin utility in accordance with the EULA terms. The License Server then assigns the license to the next appropriate user/device.
What happens if I exceed my purchased user/device license count?

User/device licenses include a 10% overdraft, which is included when licenses are generated. The overdraft is also included in the installed license count. If the usage spike exceeds the installed count including overdraft, access for more users is denied. Purchase and deploy a new license to enable access for more users.

If all licenses are in use, including the license overdraft, the supplemental grace period enables unlimited connections to a product. The supplemental grace period gives you time to determine why you exceeded the maximum license count and to purchase more licenses without disrupting your users. This period lasts until 15 days elapses or you install more retail licenses, whichever comes first. For more information, see Supplemental grace period.

Director displays the grace period states. For more information, see Panels on the Director Dashboard.

What is the maximum number of virtual applications a licensed user can consume at any given time?

Each licensed user can connect to an unlimited number of virtual applications.

What happens if a licensed user leaves my organization?

When an existing licensed user leaves your organization, you can release the departing user’s license without notifying Citrix. Use the udadmin utility to release the license. If you don’t release the license, the License Server automatically releases any license after 90 days of inactivity. This information is subject to the terms specified in the EULA.

What happens if a licensed user is absent for a protracted period?

If an existing licensed user is absent for a protracted period, you can release the license without notifying Citrix, so that it becomes available for reassignment. Use the udadmin utility to release the license.

What happens if we replace a licensed device in my organization?

If you replace an existing licensed device, you can release the license without notifying Citrix so that it becomes available for reassignment. Use the udadmin utility to release the license.

What happens if a licensed device is out of service for an extended period?

When an existing licensed device is out of service for an extended period, you can release the license without notifying Citrix, so that it becomes available for reassignment. Use the udadmin utility to...
release the licenses. If you don’t release the license, the License Server automatically releases any license after 90 days of inactivity. This information is subject to the terms specified in the EULA.

**Can I switch user licenses to device licenses and conversely after I’ve assigned the licenses to a device or user?**

Yes. This change happens automatically. The License Server assigns licenses to either users or devices based on usage patterns. If usage patterns change, the License Server might switch the assignment based on the new usage. The License Server always assigns licenses in the most economical fashion for the customer. Also, the License Server monitors licenses to identify *unused* licenses after their 90-day assignment period. You can reassign licenses identified as unused after the 90-day assignment period to other users or devices.

**Concurrent licenses**

**Under the concurrent model, what is the maximum number of virtual desktops a Citrix Virtual Apps and Desktops licensed user can consume at any given time?**

An endpoint can service many users and allows for unlimited connections.

**Can I deploy concurrent licenses from a previous version of Citrix Virtual Apps and Desktops and new user/device or concurrent licenses to a single License Server?**

Yes. You can continue to use the same License Server to support user/device or concurrent licensed deployments.

**Can I deploy concurrent licenses and user/device or concurrent licenses to a single License Server?**

Yes. You can continue to use the same License Server to support concurrent and user/device or concurrent licensed deployments.

**Do Citrix Virtual Apps and Desktops Advanced and Premium editions include Citrix Virtual Apps concurrent licenses?**

Citrix Virtual Apps and Desktops Advanced and Premium user/device licenses include concurrent Citrix Virtual Apps licenses for compatibility only. These concurrent licenses are for use only with earlier product versions that are incompatible with user/device licenses. Use of the concurrent compatibility licenses included with user/device licenses is permissible only with these versions - XenApp versions earlier than 6.5 and XenDesktop versions earlier than 5.0 Service Pack 1.
What happens if I exceed my purchased concurrent license count?

If all licenses are in use, the supplemental grace period enables unlimited connections to a product. The supplemental grace period gives you time to determine why you exceeded the maximum license count and to purchase more licenses without disrupting your users. This period lasts until 15 days elapses or you install more retail licenses, whichever comes first. For more information, see Supplemental grace period.

Director displays the grace period states. For more information, see Panels on the Director Dashboard.

Overdraft licenses

How do I get overdraft licenses?

License overdraft is included in all user/device licenses. When you purchase user/device licenses, you receive a 10% overdraft. The overdraft becomes available after you allocate all your purchased and evaluation licenses. We offer the overdraft feature as a convenience, not as a license entitlement. If you use the overdraft licenses often, we suggest you purchase more licenses.

How can I identify a license overdraft?

You can view usage information, including the number of licenses in overdraft in the Citrix Licensing Manager. Studio also contains overdraft usage information.

What happens when an overdraft license is consumed?

A license is assigned from your installed licenses to enable access to your Citrix Virtual Apps and Desktops environment. This overdraft license provides as much access and functionality as your other licenses.

Can I get an alert when my overdraft licenses are consumed?

Currently, there are no specific alerts provided when overdraft licenses are consumed.

How long can an overdraft license be consumed?

Purchase any overdraft licenses used within 30 days of the first use.

- Citrix ADC
- Citrix Cloud
Applications

October 6, 2020

Introduction

If your deployment uses only delivery groups (and not application groups), you add applications to the delivery groups. If you also have application groups, generally you add applications to the application groups instead. This guidance provides easier administration. An application must always belong to at least one delivery group or application group.

In the Add Applications wizard, you can select one or more delivery groups, or one or more application groups, but not both. Although you can later change an application's group association (for example, moving an application from an application group to a delivery group), best practice discourages adding that complexity. Keep your applications in one type of group.

When you associate an application with more than one group, a visibility issue can occur if you do not have sufficient permission to view the application in all of those groups. In such cases, either consult an administrator with greater permissions or have your scope extended to include all the groups with which the application is associated.

If you publish two applications with the same name (perhaps from different groups) to the same users, change the Application name (for user) property in Studio. Otherwise, users see duplicate names in Citrix Workspace app.

You can change an application's properties (settings) when you add it, or later. You can also change the application folder where the application is placed, either when you add the application, or later.

For details, see:

- Create delivery groups
- Create application groups
- Tags
**Add applications**

You can add applications when you create a delivery group or application group. Those procedures are detailed in [Create delivery groups](#) and [Create application groups](#). The following procedure describes how to add applications after you create a group.

Good to know:

- You cannot add applications to Remote PC Access delivery groups.
- You cannot use the Add Application wizard to remove applications from delivery groups or application groups. That is a separate operation.

To add one or more applications:

1. Select **Applications** in the Studio navigation pane and then select **Add Applications** in the Actions pane.
2. The Add Applications wizard launches with an **Introduction** page, which you can remove from future launches of this wizard.
3. The wizard guides you through the **Groups**, **Applications**, and **Summary** pages. When you are done with each page, click **Next** until you reach the **Summary** page.

Alternatives to step 1 if you want to add applications to a single delivery group or application group:

- **To add applications to only one delivery group**: In step 1, select **Delivery Groups** in the Studio navigation pane, select a delivery group in the middle pane, and then select **Add Applications** in the Actions pane. The wizard does not display the **Groups** page.
- **To add applications to only one application group**: In step 1, select **Applications** in the Studio navigation pane, select an application group in the middle pane, and then select the **Add Applications** entry under the application group's name in the Actions pane. The wizard does not display the **Groups** page.

**Groups page**

This page lists all the delivery groups in the site. If you have also created application groups, the page lists the application groups and delivery groups. You can choose from either group, but not from both groups. In other words, you cannot add applications to an application group and a delivery group at the same time. Generally, if you are using application groups, add applications to application groups, rather than delivery groups.

When adding an application, select the check box next to at least one delivery group (or application group, if available). Every application must always be associated with at least one group.

**Applications page**

Click **Add** to display the application sources.
• **From Start menu:** Applications that are discovered on a machine in the selected delivery groups. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add, and then click **OK**.

This source cannot be selected if you (1) selected application groups with no associated delivery groups, (2) selected application groups with associated delivery groups that contain no machines, or (3) selected a delivery group containing no machines.

• **Manually defined:** Applications located in the site or elsewhere in your network. When you select this source, a new page launches. Enter the path to the executable, working directory, optional command line arguments, and display names for administrators and users. After entering this information, click **OK**.

• **Existing:** Applications previously added to the site. When you select this source, a new page launches with a list of discovered applications. Select the check boxes of applications to add and then click **OK**.

This source cannot be selected if the site has no applications.

• **App-V:** Applications in App-V packages. When you select this source, a new page launches where you select the App-V server or the Application Library. From the resulting display, select the check boxes of applications to add, and then click **OK**. For more information, see App-V.

This source cannot be selected if App-V is not configured for the site.

• **Application Group:** Application groups. When you select this source, a new page launches with a list of application groups. (Although the display also lists the applications in each group, you can select only the group, not individual applications.) All current and future applications in the selected groups are added. Select the check boxes of application groups to add, and then click **OK**.

This source cannot be selected if (1) there are no application groups, or (2) if the selected delivery groups do not support application groups (for example, delivery groups with statically assigned machines).

As noted in the table, some sources in the **Add** list cannot be selected if there is no valid source of that type. Sources that are incompatible (for example, you cannot add application groups to application groups) are not included in the list. Applications that are already added to the groups you chose cannot be selected.

You can change an application’s properties (settings) from this page, or later.

By default, added applications are placed in the application folder named **Applications**. You can change the application from this page, or later. If you try to add an application and one with the same name exists in the same folder, you are prompted to rename the application you’re adding. You can accept the new name offered, or decline and then rename the application or select a different
folder. For example, if \( \text{app} \) already exists in the \textbf{Applications} folder, and you attempt to add another application named \( \text{app} \) to that folder, the new name \( \text{app}_1 \) is offered.

\textbf{Summary page}

If you are adding 10 or fewer applications, their names are listed in \textbf{Applications to add}. If you are adding more than 10 applications, the total number is specified.

Review the summary information and then click \textbf{Finish}.

\textbf{Change an application’s group association}

After adding an application, you can change the delivery groups and application groups with which the application is associated.

You can drag an application to an additional group. This is an alternative to using commands in the \textit{Actions} pane.

If an application is associated with more than one delivery or application group, group priority can be used to specify the order in which multiple groups are checked to find applications. By default, all groups are priority 0 (the highest). Groups at the same priority are load balanced.

An application can be associated with delivery groups containing shared (not private) machines that can deliver applications. You can also select delivery groups containing shared machines that deliver desktops only, if (1) the delivery group contains shared machines and was created with a XenDesktop 7.x version earlier than 7.9, and (2) you have \textit{Edit delivery group} permission. The delivery group type is automatically converted to \textit{desktops and applications} when the properties dialog is committed.

1. Select \textbf{Applications} in the Studio navigation pane and then select the application in the middle pane.
2. Select \textbf{Properties} in the Actions pane.
3. Select the \textbf{Groups} page.
   - To add a group, click \textit{Add} and select \textit{Application Groups} or \textit{Delivery Groups}. (If you have not created any application groups, the only entry is \textit{Delivery Groups}.) Then select one or more available groups. Groups that are incompatible with the application, or that are already associated with the application, cannot be selected.
   - To remove a group, select one or more groups and then click \textit{Remove}. If removing group association would result in the application no longer being associated with any group, you are alerted that the application will be deleted.
   - To change the priority of a group, select the group and then click \textit{Edit Priority}. Select a priority value and then click \textit{OK}. 

© 1999-2020 Citrix Systems, Inc. All rights reserved. 757
4. When you are finished, click **Apply** to apply the changes and leave the window open, or click **OK** to apply the changes and close the window.

**Duplicate, enable or disable, rename, or delete an application**

The following actions are available:

- **Duplicate**: You might want to duplicate an application to create a different version with different parameters or properties. When you duplicate an application, it is automatically renamed with a unique suffix and placed next to the original. You might also want to duplicate an application and then add it to a different group. (After duplicating, the easiest way to move an application is dragging it.)

- **Enable or disable**: Enabling and disabling an application is a different action than enabling and disabling a delivery group or application group.

- **Rename**: You can rename only one application at a time. If you try to rename an application and one with the same name exists in the same folder or group, you are prompted to specify a different name.

- **Delete**: Deleting an application removes it from the delivery groups and application groups with which it was associated, but not from the source that was used to add the application originally. Deleting an application is a different action than removing it from a delivery group or application group.

To duplicate, enable, disable, rename, or delete an application:

1. Select **Applications** in the Studio navigation pane.
2. Select one or more applications in the middle pane and then select the appropriate task in the Actions pane.
3. Confirm the action, when prompted.

**Remove applications from a delivery group**

An application must be associated (belong) with at least one delivery group or application group. If you attempt to remove an application from a delivery group that would remove that application’s association with any delivery group or application group, you are notified that the application will be deleted if you continue. When that happens, if you want to deliver that application, you must add it again from a valid source.

1. Select **Delivery Groups** in the Studio navigation pane.
2. Select a delivery group. In the lower middle pane, on the **Applications** tab, select the application you want to remove.
3. Select **Remove Application** from the Actions pane.
4. Confirm the removal.
**Remove applications from an application group**

An application must belong to at least one delivery group or application group. If you attempt to remove an application from an application group that will result in that application no longer belonging to any group, you are notified that the application will no longer belong to any group, you are notified that the application will be deleted if you continue. When that happens, if you want to deliver that application, you must add it again from a valid source.

1. Select **Applications** in the Studio navigation pane.
2. Select the application group in the middle pane, and then select one or more applications.
3. Select **Remove from Application Group** in the Actions pane.
4. Confirm the removal.

**Change application properties**

You can change the properties of only one application at a time.

To change the properties of an application:

1. Select **Applications** in the Studio navigation pane.
2. Select an application and then select **Edit Application Properties** in the Actions pane.
3. Select the page containing the property you want to change.
4. When you are finished, click **Apply** to apply any changes you made and keep the window open, or click **OK** to apply changes and close the window.

In the following list, the page is shown in parentheses.

<table>
<thead>
<tr>
<th>Property</th>
<th>Page</th>
</tr>
</thead>

<td>Delivery</td>
</tr>
</tbody>
</table>
Application changes might not take effect for current application users until they log off from their sessions.

**Configure application limits**

Configure application limits to help manage application use. For example, you can use application limits to manage the number of users accessing an application simultaneously. Similarly, application limits can be used to manage the number of simultaneous instances of resource-intensive applications. That limit can help maintain server performance and prevent deterioration in service.

This feature limits the number of application launches that are brokered by the Controller (for example, from Citrix Workspace app and StoreFront), and not the number of running applications that can be launched by other methods. This means that application limits assist administrators when managing concurrent usage, but do not provide enforcement in all scenarios. For example, application limits cannot be applied when the Controller is in outage mode.

By default, there is no limit on how many application instances can run at the same time. There are several application limit settings. You can configure any or all of them.

- The maximum number of concurrent instances of the application by all users in the delivery group.
- One instance of the application per user in the delivery group.
- The maximum number of concurrent instances of the application per machine (PowerShell only).

If a limit is configured, an error message is generated when a user attempts to launch an instance of the application that will exceed the configured limit. If more than one limit is configured, an error is
Examples using application limits:

- **Maximum number of simultaneous instances limit:** In a delivery group, you configure the maximum number of simultaneous instances of application **Alpha** to 15. Later, users in that delivery group have 15 instances of that application running at the same time. If any user in that delivery group now attempts to launch **Alpha**, an error message is generated. **Alpha** is not launched because it would exceed the configured simultaneous application instance limit (15).

- **One-instance-per-user application limit:** In another delivery group, you enable the one-instance-per-user option for application **Beta**. User Tony launches application **Beta** successfully. Later in the day, while that application is still running in Tony’s session, he attempts to launch another instance of **Beta**. An error message is generated and **Beta** is not launched because it would exceed the one-instance-per-user limit.

- **Maximum number of simultaneous instances and one-instance-per-user limits:** In another delivery group, you configure a maximum number of simultaneous instances of 10 and enable the one-instance-per-user option for application **Delta**. Later, when 10 users in that delivery group each have an instance of **Delta** running, any other user in that delivery group who tries to launch **Delta** will receive an error message. **Delta** is not launched. If any of the 10 current **Delta** users attempt to launch a second instance of that application, they will receive an error message and the second instance will not be launched.

- **Maximum number of simultaneous instances per machine, and using tag restrictions:** Application **Charlie** has licensing and performance requirements that dictate how many instances can be running at the same time on a specific server. Those requirements also dictate how many instances can be running simultaneously across all servers in the site.

  The application instances-per-machine limit affects any server in the site (not just machines in a particular delivery group). Let’s say your site has three servers. For application **Charlie**, you configure the app instances per machine limit to 2. So, no more than six instances of application **Charlie** are allowed to launch site-wide. (That’s a limit of two instances of Charlie on each of the three servers.)

  To restrict an application’s usage to only certain machines within a delivery group (in addition to limiting the instances on all machines site-wide):

  - Use the tagging functionality for those machines.
  - Configure the maximum number of instances per machine limit for that application.

If applications are launched by methods other than Controller brokering (for example, while a Controller is in outage mode) and configured limits are exceeded, users cannot launch more instances until they close enough instances to no longer exceed the limits. The instances that exceeded the limit are not forcibly shut down. They will be allowed to continue until their users close them.
If you disable session roaming, then disable the one-instance-per-user application limit. If you enable the one-instance-per-user application limit, do not configure either of the two values that allow new sessions on new devices. For information about roaming, see Sessions.

To configure the maximum instances per delivery group limit, and the one-instance-per-user limit:

1. Select Applications in the Studio navigation pane and then select an application.
2. Select the Edit Application Properties in the Actions pane.
3. On the Delivery page, choose one of the following options.
   - **Allow unlimited use of the application.** There is no limit to the number of instances running at the same time. This is the default.
   - **Set limits for the application.** There are two limit types; specify either or both.
     - Specify the maximum number of instances that can run concurrently
     - Limit to one instance of the application per user
4. Click OK to apply the change and close the dialog box, or Apply to apply the change and leave the dialog box open.

To configure the maximum instances per machine limit (PowerShell only):

- In PowerShell (using the Remote PowerShell SDK for Citrix Cloud deployments, or the PowerShell SDK for on-premises deployments), enter the appropriate BrokerApplication cmdlet with the MaxPerMachineInstances parameter.
- For guidance, use the Get-Help cmdlet. For example:
  
  ```powershell
  Get-Help Set-BrokerApplication -Parameter MaxPerMachineInstances
  ```

**Pass parameters to published applications**

Use the Location page of an application’s properties to enter the command line and pass parameters to published applications.

When you associate a published application with file types, the symbols “%*” (percent and star symbols enclosed in double quotation marks) are appended to the end of the command line for the application. These symbols act as a placeholder for parameters passed to user devices.

If a published application does not launch when expected, verify that its command line contains the correct symbols. By default, parameters supplied by user devices are validated when the symbols “%*” are appended. For published applications that use customized parameters supplied by the user device, the symbols “%**” are appended to the command line to bypass command-line validation. If you do not see these symbols in a command line for the application, add them manually.

If the path to the executable file includes directory names with spaces (such as “C:\Program Files”), enclose the command line for the application in double quotation marks to indicate that the space
belongs in the command line. To do this, add double quotation marks around the path, and another
set of double quotation marks around the %* symbols. Be sure to include a space between the closing
quotation mark for the path and the opening quotation mark for the %* symbols.

For example, the command line for the published application Windows Media Player is:

"C:\Program Files\Windows Media Player\mplayer1.exe"  "%*"  

Manage application folders

By default, new applications you add to delivery groups are placed in a folder named Applications.
You can specify a different folder when you create the delivery group, when you add an application,
or later.

Good to know:

• You cannot rename or delete the Applications folder, but you can move all the applications it
contains to other folders you create.
• A folder name can contain 1-64 characters. Spaces are permitted.
• Folders can be nested up to five levels.
• Folders do not have to contain applications. Empty folders are allowed.
• Folders are listed alphabetically in Studio unless you move them or specify a different location
when you create them.
• You can have more than one folder with the same name, as long as each has a different parent
folder. Similarly, you can have more than one application with the same name, as long as each
is in a different folder.
• You must have View Applications permission to see the applications in folders, and you
must have Edit Application Properties permission for all applications in the folder to
remove, rename, or delete a folder that contains applications.
• Most of the following procedures request actions using the Actions pane in Studio. Alternatively,
you can use right-click menus or drag the item. For example, if you create or move a folder in a
location you did not intend, you can drag/drop it to the correct location.

To manage application folders, select Applications in the Studio navigation pane. Use the following
list for guidance.

• To view all folders (excluding nested folders): Click Show all above the folder list.
• To create a folder at the highest level (not nested): Select the Applications folder. To place
the new folder under an existing folder other than Applications, select that folder. Then, select
Create Folder in the Actions pane. Enter a name.
• To move a folder: Select the folder and then select Move Folder in the Actions pane. You can
move only one folder at a time unless the folder contains nested folders. (The easiest way to
move a folder is to drag it.)
To rename a folder: Select the folder, and then select Rename Folder in the Actions pane. Enter a name.

To delete a folder: Select the folder, and then select Delete Folder in the Actions pane. When you delete a folder that contains applications and other folders, those objects are also deleted. Deleting an application removes the application assignment from the delivery group. It does not remove it from the machine.

To move applications into a folder: Select one or more applications. Then, select Move Application in the Actions pane. Select the folder.

You can also place applications you are adding in a folder on the Application page when creating a delivery group or an application group. By default, added applications go in the Applications folder. Click Change to select or create a folder.

Control local launch of applications on published desktops

When users launch a published application from within a published desktop, you can control whether the application is launched in that desktop session or as a published application in the same delivery group. By default, the application in the published desktop session is launched. In PowerShell (using the Remote PowerShell SDK in Citrix Cloud deployments or the PowerShell SDK in on-premises deployments), you can change this action.

In the New-BrokerApplication or Set-BrokerApplication cmdlet, use the LocalLaunchDisabled option. For example:

Set-BrokerApplication -LocalLaunchDisabled <Boolean>

By default, this option's value is false (-LocalLaunchDisabled $false). When launching a published application from within a published desktop, the application is launched in that desktop session.

If you set the option's value to true (-LocalLaunchDisabled $true), the published application is launched. This creates a separate, additional session from the published desktop (using Citrix Workspace app for Windows) to the published application.

Requirements and limits:

- The application's ApplicationType value must be HostedOnDesktop.
- This option is available only through the appropriate PowerShell SDK. It is not currently available in the Studio graphical interface.
- This option requires minimum: StoreFront 3.14, Citrix Receiver for Windows 4.11, and Delivery Controller 7.17.
Universal Windows Platform Apps

December 18, 2019

Citrix Virtual Apps and Desktops supports the use of Universal Windows Platform (UWP) apps with VDAs on Windows 10 and Windows Server 2016 machines. For information about UWP apps, see the following Microsoft documentation:

- What is a Universal Windows Platform (UWP) app?
- Distribute offline apps
- Guide to Universal Windows Platform (UWP) apps

The term Universal Apps is used throughout this article to refer to UWP apps.

Requirements and limitations

Universal Apps are supported for VDAs on Windows 10 and Windows Server 2016 machines.

VDAs must be minimum version 7.11.

The following Citrix Virtual Apps and Desktops features are either not supported or limited when using Universal Apps:

- File type association is not supported.
- Local App Access is not supported.
- Dynamic preview: If apps running in the session overlap, the preview shows the default icon. The Win32 APIs used for Dynamic Preview are not supported in Universal Apps.
- Action Center remoting: Universal Apps can use the Action Center for displaying the messages in the session. Redirect these messages to the endpoint to display them to the user.

Launching Universal apps and non-Universal apps from same server is not supported for Windows 10 VDAs. For Windows Server 2016, Universal apps and non-Universal apps should be in separate Delivery Groups or Application Groups.

All Universal Apps installed on the machine are enumerated; therefore, Citrix recommends disabling user access to the Windows Store. This prevents the Universal Apps installed by one user from being accessed by a different user.

During sideloading, the Universal App is installed on the machine and is available for use for other users. When any other user launches the app, the app is installed. The OS then updates its AppX database to indicate “as installed” for the user launching the app.

Graceful logoffs from a published Universal App that was launched in a seamless or fixed window might result in the session not closing, and the user being logged off. In such cases, several processes remaining in the session prevent the session from closing properly. To resolve this, determine which...
process is preventing the session from closing, and then add it to the “LogoffCheckSysModules” reg-
istry key value, following the guidance in CTX891671.

Application Display Names and Descriptions for Universal Apps might not have correct names. Edit
and correct these properties when adding the applications to the Delivery Group.

Check Known issues for any additional issues.

Currently, several Universal Apps have white icons with transparency enabled, which results in
the icon not being visible against the white background of the StoreFront display. To avoid this
issue, you can change the background. For example, on the StoreFront machine, edit the file
C:\inetpub\wwwroot\Citrix\StoreWeb\custom\style.css. At the end of the file, add .storeapp-icon
{ background-image: radial-gradient( circle at top right, yellow, red ); }.
The graphic below illustrates the before-and-after for this example.

![Before and After](image)

On Windows Server 2016, the Server Manager might also launch when a Universal App is launched. To
prevent this from occurring, you can disable Server Manager from auto-starting during logon with
the HKLM\Software\Microsoft\ServerManager\DoNotOpenServerManagerAtLogon registry key. For
details, see https://blogs.technet.microsoft.com/rmilne/2014/05/30/how-to-hide-server-manager-
at-logon/.

Install and publish Universal Apps

Support for Universal Apps is enabled by default.

To disable the use of Universal Apps on a VDA, add the registry setting EnableUWASeamlessSupport
in HKLM\Software\Citrix\VirtualDesktopAgent\FeatureToggle and set to 0.

To install one or more Universal Apps on VDAs (or a master image), use one of the following methods:

- Complete an offline install from the Windows Store for Business, using a tool such as Deploy-
  ment Image Servicing and Management (DISM) to deploy the apps to the desktop image. For
  more information, see https://technet.microsoft.com/en-us/itpro/windows/manage/
distribute-offline-apps.
• Sideload the apps. For more information, see https://technet.microsoft.com/en-us/itpro/windows/deploy/sideload-apps-in-windows-10.

To add (publish) one or more Universal Apps in Citrix Virtual Apps or Citrix Virtual Desktops:

1. After the Universal Apps are installed on the machine, add the Universal Apps to a Delivery Group or Application Group. You can do this when you create a group, or later. On the Applications page, in the Add menu, select From Start menu.

2. When the applications list appears, select the Universal Apps you want to publish.

3. Continue with the wizard or close the edit dialog.

Uninstall Universal Apps

When you uninstall a Universal App with a command such as Remove-AppXPackage, the item is uninstalled only for administrators. To remove the app from the machines of users who may have launched and used the app, you must run the removal command on each machine. You cannot uninstall the AppX package from all users’ machines with one command.

Zones

June 24, 2020

Deployments that span widely dispersed locations connected by a WAN can face challenges due to network latency and reliability. There are two options that mitigate those challenges:

• Deploy multiple sites, each with their own SQL Server site database.

  This option is recommended for large enterprise deployments. Multiple sites are managed separately, and each requires its own SQL Server site database. Each site is a separate Citrix Virtual Apps deployment.

• Configure multiple zones within a single site.

  Configuring zones can help users in remote regions connect to resources without necessarily forcing their connections to traverse large segments of the WAN. Using zones allows effective site management from a single Citrix Studio console, Citrix Director, and the site database. This saves the costs of deploying, staffing, licensing, and operating more sites containing separate databases in remote locations.

  Zones can be helpful in deployments of all sizes. You can use zones to keep applications and desktops closer to end users, which improves performance. A zone can have one or more Controllers installed locally for redundancy and resiliency, but it is not required.
The number of Controllers configured in the site can affect the performance of some operations, such as adding new Controllers to the site itself. To avoid this, we recommend that you limit the number of zones in your Citrix Virtual Apps or Citrix Virtual Desktops site to no more than 50.

When the network latency of your zones is more than 250 ms RTT, we recommend that you deploy multiple sites instead of zones.

Throughout this article the term local refers to the zone being discussed. For example, “A VDA registers with a local Controller” means that a VDA registers with a Controller in the zone where the VDA is located.

Zones in this release are similar, but not identical to zones in XenApp version 6.5 and earlier. For example, in this implementation of zones, there are no data collectors. All Controllers in the site communicate with one site database in the primary zone. Also, failover and preferred zones work differently in this release.

**Zone types**

A site always has one primary zone. It can also optionally have one or more satellite zones. Satellite zones can be used for disaster recovery, geographically distant data centers, branch offices, a cloud, or an availability zone in a cloud.

**Primary zone:**

The primary zone has the default name “Primary”. This zone contains the SQL Server site database (and high availability SQL servers, if used), Studio, Director, Citrix StoreFront, Citrix License Server, and Citrix Gateway. Always keep the site database in the primary zone.

The primary zone should have at least two Controllers for redundancy. The primary zone can have VDAs with applications that are tightly coupled with the database and infrastructure.

**Satellite zone:**

A satellite zone contains one or more VDAs, Controllers, StoreFront servers, and Citrix Gateway servers. Under normal operations, Controllers in a satellite zone communicate directly with the database in the primary zone.

A satellite zone, particularly a large one, might also contain a hypervisor that is used to provision and store machines for that zone. When you configure a satellite zone, you can associate a hypervisor or other service connection with it. (Be sure any catalogs that use that connection are in the same zone.)

A site can have satellite zones of different configurations, based on your unique needs and environment. The following figure illustrates a primary zone and examples of satellite zones.
In the illustration:

- **Primary zone**: Contains two Controllers, Studio, Director, StoreFront, License Server, and the site database (plus high availability SQL Server deployments). The Primary zone also contains several VDAs and a Citrix Gateway.

- **Satellite zone 1: VDAs with Controller**: Satellite zone 1 contains a Controller, VDAs, and a StoreFront server. VDAs in this satellite zone register with the local Controller. The local Controller communicates with the site database and license server in the primary zone.

  If the WAN fails, the Local Host Cache feature allows the Controller in the satellite zone to continue brokering connections to VDAs in that zone. Such a deployment can be effective in an office where workers use a local StoreFront site and the local Controller to access their local resources.

- **Satellite zone 2: VDAs with redundant Controllers**: Satellite zone 2 contains two Controllers, VDAs, and a StoreFront server. This is the most resilient zone type, offering protection against a simultaneous failure of the WAN and one of the local Controllers.

### Where VDAs register and where Controllers fail over

In a site containing primary and satellite zones, with VDAs at minimum version 7.7:
• A VDA in the primary zone registers with a Controller in the primary zone. A VDA in the primary zone never attempts to register with a Controller in a satellite zone.

• A VDA in a satellite zone registers with a local Controller, if possible. (This is considered the preferred Controller.) If no local Controllers are available (for example, because they cannot accept more VDA registrations or they have failed), the VDA will attempt to register with a Controller in the primary zone. In this case, the VDA stays registered in the primary zone, even if a Controller in a satellite zone becomes available again. A VDA in a satellite zone never attempts to register with a Controller in another satellite zone.

• When auto-update is enabled for VDA discovery of Controllers, and you specify a list of Controller addresses during VDA installation, a Controller is randomly selected from that list for initial registration (regardless of which zone the Controller resides in). After the machine with that VDA is restarted, the VDA will start to prefer registering with a Controller in its local zone.

• If a Controller in a satellite zone fails, it fails over to another local Controller, if possible. If no local Controllers are available, it fails over to a Controller in the primary zone.

• If you move a Controller in or out of a zone, and auto-update is enabled, VDAs in both zones receive updated lists indicating which Controllers are local and which are in the primary zone, so they know with whom they can register and accept connections from.

• If you move a catalog to another zone, the VDAs in that catalog re-register with Controllers in the zone where you moved the catalog. (When you move a catalog to another zone, make sure this zone and the zone with the associated host connection are well connected. If there is limited bandwidth or high-latency, move the host connection to the same zone containing the associated machine catalog.)

If all Controllers in the primary zone fail:

• Studio cannot connect to the site.

• Connections to VDAs in the primary zone cannot be made.

• Site performance degrades until the Controllers in the primary zone become available.

For sites containing VDA versions earlier than 7.7:

• A VDA in a satellite zone accepts requests from Controllers in their local zone and the primary zone. (VDAs at minimum version 7.7 can accept Controller requests from other satellite zones.)

• A VDA in a satellite zone registers with a Controller in the primary zone or the local zone at random. (VDAs at minimum version 7.7 prefer the local zone.)

Zone preference

To use the zone preference feature, you must be using minimum StoreFront 3.7 and Citrix Gateway 11.0-65.x.

In a multi-zone site, the zone preference feature offers the administrator more flexibility to control which VDA is used to launch an application or desktop.
How zone preference works

There are three forms of zone preference. You might prefer to use a VDA in a particular zone, based on:

- Where the application's data is stored. This is referred to as the application home.
- The location of the user’s home data, such as a profile or home share. This is referred to as the user home.
- The user’s current location (where the Citrix Workspace app is running). This is referred to as the user location.

The following graphic shows an example multi-zone configuration.

In this example, VDAs are spread among three satellite zones, but they are all in the same Delivery Group. Therefore, the broker might have a choice which VDA to use for a user launch request. This example indicates there are several locations where users can be running their Citrix Workspace app endpoints:

- User A is using a device with Citrix Workspace app in satellite zone 1.
- User B is using a device in satellite zone 2.
- A user’s documents can be stored in various locations.
  - Users A and B use a share based in satellite zone 1.
– User C uses a share from satellite zone C.
– One of the published applications uses a database located in satellite zone 1.

You associate a user or application with a zone by configuring a home zone for the user or application. The broker in the Delivery Controller then uses those associations to help select the zone where a session will be launched, if resources are available. You can:

• Configure the home zone for a user by adding a user to a zone.
• Configure the home zone for an application by editing the application properties.

A user or an application can have only one home zone at a time. (An exception for users can occur when multiple zone memberships occur because of user group membership; see the “Other considerations” section. However, even in this case, the broker uses only one home zone.)

Although zone preferences for users and applications can be configured, the broker selects only one preferred zone for a launch. The default priority order for selecting the preferred zone is application home > user home > user location. You can restrict the sequence; see Tailoring zone preference. When a user launches an application:

• If that application has a configured zone association (an application home), then the preferred zone is the home zone for that application.
• If the application does not have a configured zone association, but the user has a configured zone association (a user home), then the preferred zone is the home zone for that user.
• If neither the application nor the user has a configured zone association, then the preferred zone is the zone where the user is running a Citrix Workspace app instance (the user location). If that zone is not defined, a random VDA and zone selection is used. Load balancing is applied to all VDAs in the preferred zone. If there is no preferred zone, load balancing is applied to all VDAs in the Delivery Group.

**Tailoring zone preference**

When you configure (or remove) a home zone for a user or an application, you can also further restrict how zone preference is used.

• **Mandatory user home zone use:** In a Delivery Group, you can specify that a sessions launch in the user's home zone (if configured), with no failover to another zone if the home zone doesn’t have available resources. This restriction is helpful when you must avoid the risk of copying large profiles or data files between zones. In other words, you would rather deny a session launch than to launch the session in a different zone.

• **Mandatory application home zone use:** Similarly, when you configure a home zone for an application, you can indicate that the application be launched only in that zone, with no failover to a different zone if resources are not available in the application’s home zone.

• **No application home zone, and ignore configured user home zone:** If you do not specify a home zone for an application, you can also indicate that no configured user zones be considered
when launching that application. For example, you might prefer that users run an application on a VDA near their device, using the user location zone preference, even though some users might have a different home zone.

**How preferred zones affect session use**

When a user launches an application or desktop, the broker prefers using the preferred zone rather than using an existing session.

If the user launching an application or desktop already has a session that is suitable for the resource being launched (for example, that can use session sharing for an application, or a session that is already running the resource being launched), but that session is running on a VDA in a zone other than the preferred zone for the user/application, then the system might create a new session. This satisfies launching in the correct zone (if it has available capacity), ahead of reconnecting to a session in a less-preferred zone for that user’s session requirements.

To prevent an orphan session that can no longer be reached, reconnection is allowed to existing disconnected sessions, even if they are in a non-preferred zone.

The order of desirability for sessions to satisfy a launch is:

1. Reconnect to an existing session in the preferred zone.
2. Reconnect to an existing disconnected session in a zone other than the preferred zone.
3. Start a new session in the preferred zone.
4. Reconnect to a connected existing session in a zone other than the preferred zone.
5. Start a new session in a zone other than the preferred zone.

**Other zone preference considerations**

- If you configure a home zone for a user group (such as a security group), that group’s users (through direct or indirect membership) are associated with the specified zone. However, a user can be a member of multiple security groups, and therefore might have a different home zone configured through other group membership. In such cases, determination of that user’s home zone can be ambiguous.

If a user has a configured home zone that was not acquired through group membership, that zone is used for zone preference. Any zone associations acquired through group membership are ignored.

If the user has multiple different zone associations acquired solely through group membership, the broker chooses among the zones randomly. Once the broker makes this choice, that zone is used for subsequent session launches, until the user’s group membership changes.

- The user location zone preference requires detection of Citrix Workspace app on the endpoint device by the Citrix Gateway through which that device is connecting. The Citrix Gateway must
be configured to associate ranges of IP addresses with particular zones, and discovered zone identity must be passed through StoreFront to the Controller.

For more information about zone preference, see Zone preference internals.

Considerations, requirements, and best practice

- You can place the following items in a zone: Controllers, machine catalogs, host connections, users, and applications. If a catalog uses a host connection, be sure the catalog and the connection are in the same zone. (However, with a low-latency high-bandwidth connection available, they can be in different zones.)

- When you place items in a satellite zone it affects how the site interacts with them and with other objects related to them:
  - When Controllers are placed into a satellite zone, it is assumed that those machines have good (local) connectivity to hypervisors and VDAs in the same zone. Controllers in that satellite zone are then used in preference to Controllers in the primary zone for handling those hypervisors and VDA machines.
  - When a hypervisor connection is placed into a satellite zone, it is assumed that all the hypervisors managed via that hypervisor connection also reside in that satellite zone. Controllers in that satellite zone are then used in preference to Controllers in the primary zone when communicating with that hypervisor connection.
  - When a machine catalog is placed into a satellite zone, it is assumed that all the VDA machines in that catalog are in the satellite zone. Local Controllers are used in preference to Controllers in the primary zone when attempting to register with the site, after the Controller list auto-update mechanism has activated after the first registration of each VDA.
  - Citrix Gateway instances can also be associated with zones. This is done as part of the StoreFront Optimal HDX Routing configuration rather than, as for the other elements described here, as part of the site configuration. When a Citrix Gateway is associated with a zone, it is preferred to be used when HDX connections to VDA machines in that zone are used.

- When you create a production site and then create the first catalog and Delivery Group, all items are in the primary zone – you cannot create satellite zones until after you complete that initial setup. (If you create an empty site, the primary zone will initially contain only a Controller. You can create satellite zones before or after creating a catalog and Delivery Group.)

- When you create the first satellite zone containing one or more items, all other items in your site remain in the primary zone.

- The primary zone is named ‘Primary’ by default; you can change that name. Although the Studio display indicates which zone is the primary zone, it is best practice to use an easily identifiable
name for the primary zone. You can reassign the primary zone (that is, make another zone the primary zone), but it should always contain the site database and any high availability servers.

- Always keep the site database in the primary zone.
- After you create a zone, you can later move items from one zone to another. This flexibility allows you to potentially separate items that work best in close proximity. For example, moving a catalog to a different zone than the connection (host) that creates the machines in the catalog, can affect performance. Consider potential unintended effects before moving items between zones. Keep a catalog and the host connection it uses in the same zone, or in zones which are well connected (for example, via a low-latency and high-bandwidth network).
- For optimal performance, install Studio and Director only in the primary zone. If you want another Studio instance in a satellite zone (for example, a satellite zone containing Controllers to use as failover if the primary zone becomes inaccessible), run Studio as a locally published application. You can also access Director from a satellite zone because it is a web application.
- Ideally, Citrix Gateway in a satellite zone is used for user connections coming into that zone from other zones or external locations, although you can use it for connections within the zone.
- Remember: To use the zone preference feature, you must be using minimum StoreFront 3.7 and Citrix Gateway 11.0-65.x.

Connection quality limits

The Controllers in the satellite zone perform SQL interactions directly with the site database. This imposes some limits on the quality of the link between the satellite zone and the primary zone containing the site database. The specific limits are relative to the number of VDAs and user sessions on those VDAs that are deployed in the satellite zone. So satellite zones with only a few VDAs and sessions can function with a poorer-quality connection to the database than satellite zones with large numbers of VDAs and sessions.

For more information, see Latency and SQL Blocking Query Improvements.

The impact of latency on brokering performance

Although zones allow users to be on higher-latency links, providing that there is a local broker, the additional latency inevitably impacts end-user experience. For most work that users do, they experience slowness caused by round trips between Controllers in the satellite zone and the site database.

For launching applications, extra delays occur while the session brokering process identifies suitable VDAs to send session launch requests to.
Create and manage zones

A Full Administrator can perform all zone creation and management tasks. However, you can also create a custom role that allows you to create, edit, or delete a zone. Moving items between zones does not require zone-related permissions (except zone read permission); however, you must have edit permission for the items you are moving. For example, to move a catalog from one zone to another, you must have edit permission for that catalog. For more information, see Delegated administration.

If you use Citrix Provisioning: The Citrix Provisioning console is not aware of zones, so Citrix recommends using Studio to create catalogs for satellite zones. Create the catalog in Studio, specifying the correct satellite zone. Then use the Citrix Provisioning console to provision machines in that catalog. (If you create the catalog using the Citrix Provisioning wizard, the catalog is placed in the primary zone. You will have to use Studio to move it to the satellite zone later.)

Create a zone

1. Select Configuration > Zones in the Studio navigation pane.
2. Select Create Zone in the Actions pane.
3. Enter a name for the zone, and a description (optional). The name must be unique within the site.
4. Select the items to place in the new zone. You can filter or search the list of items from which you can select. You can also create an empty zone; simply do not select any items.
5. Click Save.

As an alternative to this method, you can select one or more items in Studio and then select Create Zone in the Actions pane.

Change a zone name or description

1. Select Configuration > Zones in the Studio navigation pane.
2. Select a zone in the middle pane and then select Edit Zone in the Actions pane.
3. Change the zone name, description, or both. If you change the name of the primary zone, make sure the zone remains easily identifiable as the primary zone.
4. Click OK or Apply.

Move items from one zone to another zone

1. Select Configuration > Zones in the Studio navigation pane.
2. Select a zone in the middle pane, and then select one or more items.
3. Either drag the items to the destination zone or select Move Items in the Actions pane and then specify which zone to move them to.
A confirmation message lists the items you selected and asks if you are sure you want to move all of them.

**Remember:** When a catalog uses a host connection to a hypervisor or other service, place both the catalog and the connection in the same zone. Otherwise, performance can be affected. If you move one, move the other, too.

**Delete a zone**

A zone must be empty before it can be deleted. You cannot delete the primary zone.

1. Select **Configuration > Zones** in the Studio navigation pane.
2. Select a zone in the middle pane.
3. Select **Delete Zone** from the Actions pane. If the zone is not empty (it contains items), you are asked to choose the zone where those items will be moved.
4. Confirm the deletion.

**Add a home zone for a user**

Configuring a home zone for a user is also known as adding a user to a zone.

1. Select **Configuration > Zones** in the Studio navigation pane and then select a zone in the middle pane.
2. Select **Add Users to Zone** in the Actions pane.
3. In the **Add Users to Zone** dialog box, click **Add** and then select the users and user groups to add to the zone. If you specify users who already have a home zone, a message offers two choices: **Yes** = add only those users you specified who do not have a home zone; **No** = return to the user selection dialog.
4. Click **OK**.

For users with a configured home zone, you can require that sessions launch only from their home zone:

1. Create or edit a Delivery Group.
2. On the **Users** page, select the **Sessions must launch in a user’s home zone, if configured** check box.

All sessions launched by a user in that Delivery Group must launch from machines in that user’s home zone. If a user in the Delivery Group does not have a configured home zone, this setting has no effect.

**Remove a home zone for a user**

This procedure is also known as removing a user from a zone.
1. Select **Configuration > Zones** in the Studio navigation pane and then select a zone in the middle pane.
2. Select **Remove Users from Zone** in the Actions pane.
3. In the **Add Users to Zone** dialog box, click **Remove** and then select the users and groups to remove from the zone. This action removes the users only from the zone; those users remain in the Delivery Groups and Application Groups to which they belong.
4. Confirm the removal when prompted.

**Manage home zones for applications**

Configuring a home zone for an application is also known as adding an application to a zone. By default, in a multi-zone environment, an application does not have a home zone.

An application's home zone is specified in the application's properties. You can configure application properties when you add the application to a group or later.

- When creating a Delivery Group, creating an Application Group, or adding applications to existing groups, select **Properties** on the **Applications** page of the wizard.
- To change an application's properties after the application is added, select **Applications** in the Studio navigation pane. Select an application and then select **Edit Application Properties** in the Actions pane.

On the **Zones** page of the application’s properties/settings:

- If you want the application to have a home zone:
  - Select **Use the selected zone to decide** radio button and then select the zone.
  - If you want the application to launch only from the selected zone (and not from any other zone), select the check box under the zone selection.
- If you do not want the application to have a home zone:
  - Select the **Do not configure a home zone** radio button.
  - If you do not want the broker to consider any configured user zones when launching this application, select the check box under the radio button. In this case, neither application or user home zones are used to determine where to launch this application.

**Other actions that include specifying zones**

After you create at least one satellite zone, you can specify a zone when you add a host connection or create a catalog.

Usually, the primary zone is the default. When using Machine Creation Services to create a catalog, the zone that is configured for the host connection is automatically selected.

If the site contains no satellite zones, the primary zone is assumed and the zone selection box does not appear.
Connections and resources

June 24, 2020

Important:
As of Citrix Virtual Apps and Desktops 7 2006, if your current deployment uses any of the following technologies or host types, you can upgrade your deployment to the current release only after removing items that use those technologies.

- Personal vDisks (PvDs)
- AppDisks
- Public cloud host types: Amazon Web Services (AWS), Citrix CloudPlatform, Microsoft Azure Classic, Microsoft Azure Resource Manager

For details, see Remove PVD, AppDisks, and unsupported hosts.

Introduction
You can optionally create your first connection to hosting resources when you create a Site. Later, you can change that connection and create other connections. Configuring a connection includes selecting the connection type from among the supported hypervisors. The storage and network you select from the resources for that connection.

Read Only Administrators can view connection and resource details. You must be a Full Administrator to perform connection and resource management tasks. For details, see Delegated administration.

Where to find information about connection types
You can use the supported virtualization platforms to host and manage machines in your Citrix Virtual Apps or Citrix Virtual Desktops environment. The System requirements article lists the supported types.

For details, see the following information sources:

- **Citrix Hypervisor (formerly XenServer):**
  - Citrix Hypervisor virtualization environments.
  - Citrix Hypervisor documentation.

- **Nutanix Acropolis:**
  - Nutanix virtualization environments.
  - Nutanix documentation.

- **VMware:**
- VMware virtualization environments.
- VMware product documentation.

- **Microsoft Hyper-V:**
  - Microsoft System Center Virtual Machine Manager virtualization environments article.
  - Microsoft documentation.

### Host storage

A storage product is supported when managed by a supported hypervisor. Citrix Support assists those storage product vendors in troubleshooting and resolving issues, and document those issues in the knowledge center, as needed.

When provisioning machines, data is classified by type:

- Operating system (OS) data, which includes master images.
- Temporary data. This data includes all non-persistent data written to MCS-provisioned machines, Windows page files, user profile data, and any data that is synchronized with ShareFile. This data is discarded each time a machine restarts.

Providing separate storage for each data type can reduce load and improve performance on each storage device, making best use of the host’s available resources. It also enables appropriate storage to be used for the different data types – persistence and resilience is more important for some data than others.

Storage can be shared (located centrally, separate from any host, used by all hosts) or local to a hypervisor. For example, central shared storage can be one or more Windows Server 2012 clustered storage volumes (with or without attached storage), or an appliance from a storage vendor. The central storage might also provide its own optimizations such as hypervisor storage control paths and direct access through partner plug-ins.

Storing temporary data locally avoids having to traverse the network to access shared storage. It also reduces load on the shared storage device. Shared storage can be more costly, so storing data locally can lower expenses. These benefits must be weighed against the availability of sufficient storage on the hypervisor servers.

When you create a connection, you choose one of two storage management methods: storage shared by hypervisors, or storage local to the hypervisor.

When using local storage on one or more Citrix Hypervisor hosts for temporary data storage, make sure that each storage location in the pool has a unique name. (To change a name in XenCenter, right-click the storage and edit the name property.)
Storage shared by hypervisors

The storage shared by hypervisors method stores data that needs longer-term persistence centrally, providing centralized backup, and management. That storage holds the OS disks.

When you select this method, you can choose whether to use local storage (on servers in the same hypervisor pool) for temporary machine data. This method does not require persistence or as much resilience as the data in the shared storage, referred to as the temporary data cache. The local disk helps reduce traffic to the main OS storage. This disk is cleared after every machine restart. The disk is accessed through a write-through memory cache. If you use local storage for temporary data, the provisioned VDA is tied to a specific hypervisor host. If that host fails, the VM cannot start.

Exception: Microsoft System Center Virtual Machine Manager does not allow temporary data cache disks on local storage when using Clustered Storage Volumes (CSV).

Create a connection to store temporary data locally, then enable and configure nondefault values for each VM’s cache disk size and memory size. The default values are tailored to the connection type, and are sufficient for most cases. For details, see Create Machine Catalogs.

The hypervisor can also provide optimization technologies through read caching of the disk images locally. For example, Citrix Hypervisor offers IntelliCache, which reduces network traffic to the central storage.

Storage local to the hypervisor

The storage local to the hypervisor method stores data locally on the hypervisor. With this method, master images and other OS data are transferred to the hypervisors in the Site. This process occurs for initial machine creation and future image updates. This process results in significant traffic on the management network. Image transfers are also time-consuming, and the images become available to each host at a different time.

Create a connection and resources

You can optionally create the first connection when you create the Site. The Site creation wizard contains the connection-related pages described in the following sections.

If you are creating a connection after you create the Site, start with step 1.

<table>
<thead>
<tr>
<th>Important</th>
</tr>
</thead>
<tbody>
<tr>
<td>The host resources (storage and network) must be available before you create a connection.</td>
</tr>
</tbody>
</table>

1. Select Configuration > Hosting in the Studio navigation pane.
2. Select Add Connections and Resources in the Actions pane.
3. The wizard guides you through the following pages (specific page content depends on the selected connection type). After completing each page, click **Next** until you reach the **Summary** page.

**Connection**

On the **Connection** page:

- To create a connection select **Create a new Connection**. To create a connection based on the same host configuration as an existing connection, select **Use an existing Connection** and then choose the relevant connection.
- Select the hypervisor you are using in the **Connection type** field.
- The connection address and credentials fields differ, depending on the selected connection type. Enter the requested information.
- Enter a connection name. This name appears in Studio.
- Choose the tool you use to create virtual machines: Studio tools (such as Machine Creation Services or Citrix Provisioning) or other tools.
Storage management

For information about storage management types and methods, see Host storage.

If you are configuring a connection to a Hyper-V or VMware host, browse to and then select a cluster name. Other connection types do not request a cluster name.

Select a storage management method: storage shared by hypervisors or storage local to the hypervisor.

- If you choose storage shared by hypervisors, indicate if you want to keep temporary data on available local storage. (You can specify nondefault temporary storage sizes in the Machine Catalogs that use this connection.) **Exception:** When using Clustered Storage Volumes (CSV), Microsoft System Center Virtual Machine Manager does not allow temporary data cache disks on local storage. Configuring that storage management setup in Studio fails.

If you use shared storage in a Citrix Hypervisor pool, indicate if you want to use IntelliCache to reduce the load on the shared storage device. See **Use IntelliCache for Citrix Hypervisor connections.**
For more information about storage selection, see Host storage.

Select at least one host storage device for each available data type. The storage management method you selected on the previous page affects which data types are available for selection on this page. Select at least one storage device for each supported data type before you can proceed to the next page in the wizard.

The lower portion of the Storage Selection page contains more configuration options if you selected either of the following on the previous page.

- If you chose storage shared by hypervisors and enabled the Optimize temporary data on available local storage check box, you can select which local storage devices to use for temporary data.

The number of currently selected storage devices is shown (in the preceding graphic, “1 storage device selected”). When you hover over that entry, the selected device names appear.

1. Click Select to change the storage devices to use.
2. In the Select Storage dialog box, select or clear the storage device check boxes, and then click OK.
Network

On the Network page, enter a name for the resources. This name appears in Studio to identify the storage and network combination associated with the connection.

Select one or more networks that the VMs use.

Summary

On the Summary page, review your selections. When you’re done, click Finish.

Remember: Storing temporary data locally allows you to configure nondefault values for temporary data storage when you create the Machine Catalog containing machines using this connection. See Create Machine Catalogs.

Edit connection settings

Do not use this procedure to rename a connection or to create a connection. Those connections are different operations. Change the address only if the current host machine has a new address. Entering an address to a different machine breaks the connection’s Machine Catalogs.

You cannot change the GPU settings for a connection, because Machine Catalogs accessing this resource must use an appropriate GPU-specific master image. Create a connection.

1. Select Configuration > Hosting in the Studio navigation pane.
2. Select the connection and then select Edit Connection in the Actions pane.
3. Follow the guidance for the settings available when you edit a connection.
4. When you are finished, click Apply to apply any changes you made and keep the window open, or click OK to apply changes and close the window.

Connection Properties page:

- To change the connection address and credentials, select Edit settings and then enter the new information.
- To specify the high-availability servers for a Citrix Hypervisor connection, select Edit HA servers. Citrix recommends that you select all servers in the pool to allow communication with Citrix Hypervisor if the pool master fails.

Advanced page:

- For a Microsoft System Center Configuration Manager (ConfMgr) Wake on LAN connection type, which is used with Remote PC Access, enter ConfMgr Wake Proxy, magic packets, and packet transmission information.
- The throttling threshold settings enable you to specify a maximum number of power actions allowed on a connection. These settings can help when power management settings allow too
many or too few machines to start at the same time. Each connection type has specific default values that are appropriate for most cases and should not be changed.

- The **Simultaneous actions (all types)** setting specifies two values: a maximum absolute number that can occur simultaneously on this connection, and a maximum percentage of all machines that use this connection. You must specify both absolute and percentage values. The actual limit applied is the lower of the values.

  For example, in a deployment with 34 machines, if **Simultaneous actions (all types)** is set to an absolute value of 10 and a percentage value of 10, the actual limit applied is 3 (that is, 10 percent of 34 rounded to the nearest whole number, which is less than the absolute value of 10 machines).

- The **Maximum new actions per minute** is an absolute number. There is no percentage value.

- Enter information in the **Connection options** field only under the guidance of a Citrix Support representative or explicit documentation instructions.

**Turn maintenance mode on or off for a connection**

Turning on maintenance mode for a connection prevents any new power action from affecting any machine stored on the connection. Users cannot connect to a machine when it is in maintenance mode. If users are already connected, maintenance mode takes effect when they log off.

1. Select **Configuration > Hosting** in the **Studio** navigation pane.
2. Select the connection. To turn maintenance mode on, select **Turn On Maintenance Mode** in the **Actions** pane. To turn maintenance mode off, select **Turn Off Maintenance Mode**.

You can also turn maintenance mode on or off for individual machines. Also, you can turn maintenance mode on or off for machines in Machine Catalogs or Delivery Groups.

**Delete a connection**

Deleting a connection can result in the deletion of large numbers of machines and loss of data. Ensure that user data on affected machines is backed up or no longer required.

Before deleting a connection, ensure that:

- All users are logged off from the machines stored on the connection.
- No disconnected user sessions are running.
- Maintenance mode is turned on for pooled and dedicated machines.
- All machines in Machine Catalogs used by the connection are powered off.

A Machine Catalog becomes unusable when you delete a connection that is referenced by that catalog. If this connection is referenced by a catalog, you have the option to delete the catalog. Before you delete a catalog, make sure it is not used by other connections.
1. Select **Configuration > Hosting** in the **Studio** navigation pane.
2. Select the connection and then select **Delete Connection** in the **Actions** pane.
3. If this connection has machines stored on it, you are asked whether the machines should be deleted. If they are to be deleted, specify what should be done with the associated Active Directory computer accounts.

### Rename or test a connection

1. Select **Configuration > Hosting** in the **Studio** navigation pane.
2. Select the connection and then select **Rename Connection** or **Test Connection** in the **Actions** pane.

### View machine details on a connection

1. Select **Configuration > Hosting** in the **Studio** navigation pane.
2. Select the connection and then select **View Machines** in the **Actions** pane.

   The upper pane lists the machines accessed through the connection. Select a machine to view its details in the lower pane. Session details are also provided for open sessions.

   Use the search feature to find machines quickly. Either select a saved search from the list at the top of the window, or create a search. You can either search by typing all or part of the machine name, or you can build an expression to use for an advanced search. To build an expression, click **Unfold**, and then select from the lists of properties and operators.

### Manage machines on a connection

1. Select **Configuration > Hosting** in the **Studio** navigation pane.
2. Select a connection and then select **View Machines** in the **Actions** pane.
3. Select one of the following in the **Actions** pane. Some actions are not available, depending on the machine state and the connection host type.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start</td>
<td>Starts the machine if it is powered off or suspended.</td>
</tr>
<tr>
<td>Suspend</td>
<td>Pauses the machine without shutting it down, and refreshes the list of machines.</td>
</tr>
<tr>
<td>Shut down</td>
<td>Requests the operating system to shut down.</td>
</tr>
<tr>
<td>Force shut down</td>
<td>Forcibly powers off the machine, and refreshes the list of machines.</td>
</tr>
</tbody>
</table>
### Action Description

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restart</td>
<td>Requests the operating system to shut down and then start the machine again. If the operating system cannot comply, the desktop remains in its current state.</td>
</tr>
<tr>
<td>Enable maintenance mode</td>
<td>Temporarily stops connections to a machine. Users cannot connect to a machine in this state. If users are connected, maintenance mode takes effect when they log off. (You can also turn maintenance mode on or off for all machines accessed through a connection, as described above.)</td>
</tr>
<tr>
<td>Remove from Delivery Group</td>
<td>Removing a machine from a Delivery Group does not delete it from the Machine Catalog that the Delivery Group uses. You can remove a machine only when no user is connected to it. Turn on maintenance mode to temporarily prevent users from connecting while you are removing the machine.</td>
</tr>
<tr>
<td>Delete</td>
<td>When you delete a machine, users no longer have access to it, and the machine is deleted from the Machine Catalog. Before deleting a machine, ensure that all user data is backed up or no longer required. You can delete a machine only when no user is connected to it. Turn on maintenance mode to temporarily stop users from connecting while you are deleting the machine.</td>
</tr>
</tbody>
</table>

For actions that involve machine shutdown, if the machine does not shut down within 10 minutes, it is powered off. If Windows attempts to install updates during shutdown, there is a risk that the machine is powered off before the updates are complete.

**Edit storage**

You can display the status of servers that are used to store operating system and temporary data for VMs that use a connection. You can also specify which servers to use for storage of each data type.
1. Select **Configuration > Hosting** in the **Studio** navigation pane.
2. Select the connection and then select **Edit Storage** in the **Actions** pane.
3. In the left pane, select the data type: operating system, or temporary.
4. Select or clear the checkboxes for one or more storage devices for the selected data type.
5. Click **OK**.

Each storage device in the list includes its name and storage status. Valid storage status values are:

- **In use**: The storage is being used for creating machines.
- **Superseded**: The storage is being used only for existing machines. No new machines are added in this storage.
- **Not in use**: The storage is not being used for creating machines.

If you clear the check box for a device that is currently **In use**, its status changes to **Superseded**. Existing machines will continue to use that storage device (and can write data to it), so it is possible for that location to become full even after it stops being used for creating machines.

**Delete, rename, or test resources**

1. Select **Configuration > Hosting** in the **Studio** navigation pane.
2. Select the resource and then select the appropriate entry in the **Actions** pane: **Delete Resources**, **Rename Resources**, or **Test Resources**.

**Connection timers**

You can use policy settings to configure three connection timers:

- **Maximum connection timer**: Determines the maximum duration of an uninterrupted connection between a user device and a virtual desktop. Use the **Session connection timer** and **Session connection timer interval** policy settings.
- **Connection idle timer**: Determines how long an uninterrupted user device connection to a virtual desktop is maintained if there is no input from the user. Use the **Session idle timer** and **Session idle timer interval** policy settings.
- **Disconnect timer**: Determines how long a disconnected, locked virtual desktop can remain locked before the session is logged off. Use the **Disconnected session timer** and **Disconnected session timer interval** policy settings.

When you update any of these settings, ensure they are consistent across your deployment.

See the policy settings documentation for more information.
Local Host Cache

August 27, 2020

To ensure that the Citrix Virtual Apps and Desktops site database is always available, Citrix recommends starting with a fault-tolerant SQL Server deployment, by following high availability best practices from Microsoft. (For supported SQL Server high availability features, see Databases.) However, network issues and interruptions can result in users not being able to connect to their applications or desktops.

The Local Host Cache feature allows connection brokering operations in a site to continue when an outage occurs. An outage occurs when the connection between a Delivery Controller and the site database fails in an on-premises Citrix environment.

As of XenApp and XenDesktop 7.16, the connection leasing feature (a predecessor high availability feature in earlier releases) was removed from the product, and is no longer available.

Data content

Local Host Cache includes the following information, which is a subset of the information in the main database:

- Identities of users and groups who are assigned rights to resources published from the site.
- Identities of users who are currently using, or who have recently used, published resources from the site.
- Identities of VDA machines (including Remote PC Access machines) configured in the site.
- Identities (names and IP addresses) of client Citrix Receiver machines being actively used to connect to published resources.

It also contains information for currently active connections that were established while the main database was unavailable:

- Results of any client machine endpoint analysis performed by Citrix Receiver.
- Identities of infrastructure machines (such as NetScaler Gateway and StoreFront servers) involved with the site.
- Dates and times and types of recent activity by users.

How it works

The following graphic illustrates the Local Host Cache components and communication paths during normal operations.
During normal operations

- The principal broker (Citrix Broker Service) on a Controller accepts connection requests from StoreFront. The broker communicates with the site database to connect users with VDAs that are registered with the Controller.

- The Citrix Config Synchronizer Service (CSS) checks with the broker approximately every minute to see if any changes were made. Those changes can be administrator-initiated (such as changing a delivery group property) or system actions (such as machine assignments).

- If a configuration change occurred since the previous check, the CSS synchronizes (copies) information to a secondary broker on the Controller. (The secondary broker is also known as the High Availability Service.)

All configuration data is copied, not just items that changed since the previous check. The CSS imports the configuration data into a Microsoft SQL Server Express LocalDB database on the Controller. This database is referred to as the Local Host Cache database. The CSS ensures that the information in the Local Host Cache database matches the information in the site database. The Local Host Cache database is re-created each time synchronization occurs.

Microsoft SQL Server Express LocalDB (used by the Local Host Cache database) is installed automatically when you install a Controller. (You can prohibit this installed when installing a Controller from the command line.) The Local Host Cache database cannot be shared across Controllers. You do not need to back up the Local Host Cache database. It is recreated every time a configuration change is detected.
If no changes have occurred since the last check, no data is copied.

The following graphic illustrates the changes in communications paths if the principal broker loses contact with the site database (an outage begins).

During an outage

When an outage begins:

- The secondary broker starts listening for and processing connection requests.
- When the outage begins, the secondary broker does not have current VDA registration data, but when a VDA communicates with it, a registration process is triggered. During that process, the secondary broker also gets current session information about that VDA.
- While the secondary broker is handling connections, the Brokering Principal continues to monitor the connection. When the connection is restored, the Brokering Principal instructs the secondary broker to stop listening for connection information, and the Brokering Principal resumes brokering operations. The next time a VDA communicates with the Brokering Principal, a registration process is triggered. The secondary broker removes any remaining VDA registrations from the previous outage. The CSS resumes synchronizing information when it learns that configuration changes have occurred in Citrix Cloud.

In the unlikely event that an outage begins during a synchronization, the current import is discarded and the last known configuration is used.

The event log provides information about synchronizations and outages.
There is no time limit imposed for operating in outage mode.

The transition between normal and outage mode does not affect existing sessions. It affects only the launching of new sessions.

You can also intentionally trigger an outage. See Force an outage for details about why and how to do this.

**Sites with multiple Controllers**

Among its other tasks, the CSS routinely provides the secondary broker with information about all Controllers in the zone. (If your deployment does not contain multiple zones, this action affects all Controllers in the site.) Having that information, each secondary broker knows about all peer secondary brokers running on other Controllers in the zone.

The secondary brokers communicate with each other on a separate channel. Those brokers use an alphabetical list of FQDN names of the machines they’re running on to determine (elect) which secondary broker will be broker operations in the zone if an outage occurs. During the outage, all VDAs register with the elected secondary broker. The non-elected secondary brokers in the zone actively reject incoming connection and VDA registration requests.

If an elected secondary broker fails during an outage, another secondary broker is elected to take over, and VDAs register with the newly elected secondary broker.

During an outage, if a Controller is restarted:

- If that Controller is not the elected broker, the restart has no impact.
- If that Controller is the elected broker, a different Controller is elected, causing VDAs to register. After the restarted Controller powers on, it automatically takes over brokering, which causes VDAs to register again. In this scenario, performance can be affected during the registrations.

If you power off a Controller during normal operations and then power it on during an outage, Local Host Cache cannot be used on that Controller if it is elected as the broker.

The event logs provide information about elections.

**What is unavailable during an outage, and other differences**

There is no time limit imposed for operating in outage mode. However, Citrix recommends restoring connectivity as quickly as possible.

During an outage

- You cannot use Studio or run PowerShell cmdlets.
- Hypervisor credentials cannot be obtained from the Host Service. All machines are in the unknown power state, and no power operations can be issued. However, VMs on the host that are powered-on can be used for connection requests.
An assigned machine can be used only if the assignment occurred during normal operations. New assignments cannot be made during an outage. Automatic enrollment and configuration of Remote PC Access machines is not possible. However, machines that were enrolled and configured during normal operation are usable. Server-hosted applications and desktop users might use more sessions than their configured session limits, if the resources are in different zones. Users can launch applications and desktops only from registered VDAs in the zone containing the currently active/elected secondary broker. Launches across zones (from a secondary broker in one zone to a VDA in a different zone) are not supported during an outage. If a site database outage occurs before a scheduled restart begins for VDAs in a delivery group, the restarts begin when the outage ends. This can have unintended results. For more information, see Scheduled restarts delayed due to database outage.

Application and desktop support

Local Host Cache supports server-hosted applications and desktops, and static (assigned) desktops. Local Host Cache supports desktop VDAs in pooled delivery groups, as follows:

- By default, power-managed desktop VDAs in pooled delivery groups (created by MCS or Citrix Provisioning) that have the ShutdownDesktopsAfterUse property enabled are placed into maintenance mode when an outage occurs. You can change this default, to allow those desktops to be used during an outage.

  However, you cannot rely on the power management during the outage. (Power management resumes after normal operations resume.) Also, those desktops might contain data from the previous user, because they have not been restarted.

- To override the default behavior, it must be enabled site-wide and for each affected delivery group. Run the following PowerShell cmdlets.

  Site-wide:

  ```powershell
  Set-BrokerSite -ReuseMachinesWithoutShutdownInOutageAllowed $true
  ```

  For each affected delivery group, run the following PowerShell command:

  ```powershell
  Set-BrokerDesktopGroup -Name "name"-ReuseMachinesWithoutShutdownInOutage $true
  ```

  Enabling this feature in the site and the delivery groups does not affect how the configured ShutdownDesktopsAfterUse property works during normal operations.
**RAM size considerations**

The LocalDB service can use approximately 1.2 GB of RAM (up to 1 GB for the database cache, plus 200 MB for running SQL Server Express LocalDB). The secondary broker can use up to 1 GB of RAM if an outage lasts for an extended interval with many logons occurring (for example, 12 hours with 10K users). These memory requirements are in addition to the normal RAM requirements for the Controller, so you might need to increase the total amount of RAM capacity.

If you use a SQL Server Express installation for the site database, the server will have two sqlserver.exe processes.

**CPU core and socket configuration considerations**

A Controller’s CPU configuration, particularly the number of cores available to the SQL Server Express LocalDB, directly affects Local Host Cache performance, even more than memory allocation. This CPU overhead is observed only during the outage period when the database is unreachable and the secondary broker is active.

While LocalDB can use multiple cores (up to 4), it’s limited to only a single socket. Adding more sockets will not improve the performance (for example, having 4 sockets with 1 core each). Instead, Citrix recommends using multiple sockets with multiple cores. In Citrix testing, a 2x3 (2 sockets, 3 cores) configuration provided better performance than 4x1 and 6x1 configurations.

**Storage considerations**

As users access resources during an outage, the LocalDB grows. For example, during a logon/logoff test running at 10 logons per second, the database grew by 1 MB every 2-3 minutes. When normal operation resumes, the local database is recreated and the space is returned. However, sufficient space must be available on the drive where the LocalDB is installed to allow for the database growth during an outage. Local Host Cache also incurs more I/O during an outage: approximately 3 MB of writes per second, with several hundred thousand reads.

**Performance considerations**

During an outage, one secondary broker handles all the connections, so in sites (or zones) that load balance among multiple Controllers during normal operations, the elected secondary broker might need to handle many more requests than normal during an outage. Therefore, CPU demands will be higher. Every secondary broker in the site (zone) must be able to handle the additional load imposed by the Local Host Cache database and all of the affected VDAs, because the secondary broker elected during an outage can change.

VDI limits:
• In a single-zone VDI deployment, up to 10,000 VDAs can be handled effectively during an outage.
• In a multi-zone VDI deployment, up to 10,000 VDAs in each zone can be handled effectively during an outage, to a maximum of 40,000 VDAs in the site. For example, each of the following sites can be handled effectively during an outage:
  – A site with four zones, each containing 10,000 VDAs.
  – A site with seven zones, one containing 10,000 VDAs, and six containing 5,000 VDAs each.

During an outage, load management within the site can be affected. Load evaluators (and especially, session count rules) can be exceeded.

During the time it takes all VDAs to register with a secondary broker, that service might not have complete information about current sessions. So, a user connection request during that interval can result in a new session being launched, even though reconnection to an existing session was possible. This interval (while the “new” secondary broker acquires session information from all VDAs during re-registration) is unavoidable. Sessions that are connected when an outage starts are not impacted during the transition interval, but new sessions and session reconnections might be.

This interval occurs whenever VDAs must register:

• An outage starts: When migrating from a principal broker to a secondary broker.
• Secondary broker failure during an outage: When migrating from a secondary broker that failed to a newly elected secondary broker.
• Recovery from an outage: When normal operations resume, and the principal broker resumes control.

You can decrease the interval by lowering the Citrix Broker Protocol's HeartbeatPeriodMs registry value (default = 600000 ms, which is 10 minutes). This heartbeat value is double the interval the VDA uses for pings, so the default value results in a ping every 5 minutes.

For example, the following command changes the heartbeat to five minutes (300000 milliseconds), which results in a ping every 2.5 minutes:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\DesktopServer -Name HeartbeatPeriodMs -PropertyType DWORD -Value 300000
```

Use caution when changing the heartbeat value. Increasing the frequency results in greater load on the Controllers during both normal and outage modes.

The interval cannot be eliminated entirely, no matter how quickly the VDAs register.

The time it takes to synchronize between secondary brokers increases with the number of objects (such as VDAs, applications, groups). For example, synchronizing 5000 VDAs might take 10 minutes or more to complete. See Monitor for information about synchronization entries in the event log.
Differences from XenApp 6.x releases

Although this Local Host Cache implementation shares the name of the Local Host Cache feature in XenApp 6.x and earlier XenApp releases, there are significant improvements. This implementation is more robust and immune to corruption. Maintenance requirements are minimized, such as eliminating the need for periodic dsmaint commands. This Local Host Cache is an entirely different implementation technically.

Manage Local Host Cache

For Local Host Cache to work correctly, the PowerShell execution policy on each Controller must be set to RemoteSigned, Unrestricted, or Bypass.

SQL Server Express LocalDB

The Microsoft SQL Server Express LocalDB software that Local Host Cache uses is installed automatically when you install a Controller or upgrade a Controller from a version earlier than 7.9. Only the secondary broker communicates with this database. You cannot use PowerShell cmdlets to change anything about this database. The LocalDB cannot be shared across Controllers.

The SQL Server Express LocalDB database software is installed regardless of whether Local Host Cache is enabled.

To prevent its installation, install or upgrade the Controller using the XenDesktopServerSetup.exe command, and include the /exclude ”Local Host Cache Storage (LocalDB)” option. However, keep in mind that the Local Host Cache feature will not work without the database, and you cannot use a different database with the secondary broker.

Installation of this LocalDB database has no effect on whether you install SQL Server Express for use as the site database.

For information about replacing an earlier SQL Server Express LocalDB version with a newer version, see Replace SQL Server Express LocalDB.

Default settings after product installation and upgrade

During a new installation of Citrix Virtual Apps and Desktops (minimum version 7.16), Local Host Cache is enabled.

After an upgrade (to version 7.16 or later), Local Host Cache is enabled if there are fewer than 10,000 VDAs in the entire deployment.
Enable and disable Local Host Cache

- To enable Local Host Cache, enter:

  ```powershell
  Set-BrokerSite -LocalHostCacheEnabled $true
  ```

  To determine whether Local Host Cache is enabled, enter `Get-BrokerSite`. Check that the `LocalHostCacheEnabled` property is `True`.

- To disable Local Host Cache, enter:

  ```powershell
  Set-BrokerSite -LocalHostCacheEnabled $false
  ```

Remember: As of XenApp and XenDesktop 7.16, connection leasing (the feature that preceded Local Host Cache beginning with version 7.6) was removed from the product, and is no longer available.

Verify that Local Host Cache is working

To verify that Local Host Cache is set up and working correctly:

- Ensure that synchronization imports complete successfully. Check the event logs.
- Ensure that the SQL Server Express LocalDB database was created on each Delivery Controller. This confirms that the secondary broker can take over, if needed.
  - On the Delivery Controller server, browse to `C:\Windows\ServiceProfiles\NetworkService`.
  - Verify that `HaDatabaseName.mdf` and `HaDatabaseName_log.ldf` are created.
- Force an outage on the Delivery Controllers. After you’ve verified that Local Host Cache works, remember to place all the Controllers back into normal mode. This can take approximately 15 minutes.

Event logs

Event logs indicate when synchronizations and outages occur. In event viewer logs, outage mode is referred to as **HA mode**.

Config Synchronizer Service:

During normal operations, the following events can occur when the CSS imports the configuration data into the Local Host Cache database using the Local Host Cache broker.

- 503: The Citrix Config Sync Service received an updated configuration. This event indicates the start of the synchronization process.
- 504: The Citrix Config Sync Service imported an updated configuration. The configuration import completed successfully.
- 505: The Citrix Config Sync Service failed an import. The configuration import did not complete successfully. If a previous successful configuration is available, it is used if an outage occurs.
However, it will be out-of-date from the current configuration. If there is no previous configuration available, the service cannot participate in session brokering during an outage. In this case, see the Troubleshoot section, and contact Citrix Support.

507: The Citrix Config Sync Service abandoned an import because the system is in outage mode and the Local Host Cache broker is being used for brokering. The service received a new configuration, but the import was abandoned because an outage occurred. This is expected behavior.

**High Availability Service:**

This service is also known as the Local Host Cache broker.

- 3502: An outage occurred and the Local Host Cache broker is performing brokering operations.
- 3503: An outage was resolved and normal operations have resumed.
- 3504: Indicates which Local Host Cache broker is elected, plus other Local Host Cache brokers involved in the election.

**Force an outage**

You might want to deliberately force an outage.

- If your network is going up and down repeatedly. Forcing an outage until the network issues are resolved prevents continuous transition between normal and outage modes (and the resulting frequent VDA registration storms).
- To test a disaster recovery plan.
- To help ensure that Local Host Cache is working correctly.
- While replacing or servicing the site database server.

To force an outage, edit the registry of each server containing a Delivery Controller. In HKLM\Software\Citrix\DesktopServer\LHC, create and set OutageModeForced as REG_DWORD to 1. This setting instructs the Local Host Cache broker to enter outage mode, regardless of the state of the database. Setting the value to 0 takes the Local Host Cache broker out of outage mode.

To verify events, monitor the Current_HighAvailabilityService log file in C:\ProgramData\Citrix\WorkspaceCloud\Logs\Plugins\HighAvailabilityService.

**Troubleshoot**

Several troubleshooting tools are available when a synchronization import to the Local Host Cache database fails and a 505 event is posted.

**CDF tracing:** Contains options for the ConfigSyncServer and BrokerLHC modules. Those options, along with other broker modules, will likely identify the problem.

**Report:** If a synchronization import fails, you can generate a report. This report stops at the object causing the error. This report feature affects synchronization speed, so Citrix recommends disabling
it when not in use.

To enable and produce a CSS trace report, enter the following command:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\DesktopServer\LHC -Name EnableCssTraceMode -PropertyType DWORD -Value 1
```

The HTML report is posted at `C:\Windows\ServiceProfiles\NetworkService\AppData\Local\Temp\CitrixBrokerConfigSyncReport.html`

After the report is generated, enter the following command to disable the reporting feature:

```
Set-ItemProperty -Path HKLM:\SOFTWARE\Citrix\DesktopServer\LHC -Name EnableCssTraceMode -Value 0
```

**Export the broker configuration:** Provides the exact configuration for debugging purposes.

```
Export-BrokerConfiguration | Out-File <file-pathname>
```

For example, `Export-BrokerConfiguration | Out-File C:\BrokerConfig.xml`.

**Virtual IP and virtual loopback**

January 6, 2020

**Important:**

Windows 10 Enterprise multi-session doesn't support Remote Desktop IP Virtualization (Virtual IP) and we don't support Virtual IP nor virtual loopback on Windows 10 Enterprise multi-session.

These features are valid only for supported Windows server machines. They do not apply to Windows desktop OS machines.

The Microsoft virtual IP address feature provides a published application with a unique dynamically-assigned IP address for each session. The Citrix virtual loopback feature allows you to configure applications that depend on communications with localhost (127.0.0.1 by default) to use a unique virtual loopback address in the local host range (127.*).

Certain applications, such as CRM and Computer Telephony Integration (CTI), use an IP address for addressing, licensing, identification, or other purposes and thus require a unique IP address or a loopback address in sessions. Other applications may bind to a static port, so attempts to launch additional instances of an application in a multiuser environment will fail because the port is already in use. For such applications to function correctly in a Citrix Virtual Apps environment, a unique IP address is required for each device.

Virtual IP and virtual loopback are independent features. You can use either or both.

Administrator action synopsis:
• To use Microsoft virtual IP, enable and configure it on the Windows server. (Citrix policy settings are not needed.)
• To use Citrix virtual loopback, configure two settings in a Citrix policy.

**Virtual IP**

When virtual IP is enabled and configured on the Windows server, each configured application running in a session appears to have a unique address. Users access these applications on a Citrix Virtual Apps server in the same way they access any other published application. A process requires virtual IP in either of the following cases:

• The process uses a hard-coded TCP port number
• The process uses Windows sockets and requires a unique IP address or a specified TCP port number

To determine if an application needs to use virtual IP addresses:

1. Obtain the TCPView tool from Microsoft. This tool lists all applications that bind specific IP addresses and ports.
2. Disable the Resolve IP Addresses feature so that you see the addresses instead of host names.
3. Launch the application and use TCPView to see which IP addresses and ports are opened by the application and which process names are opening these ports.
4. Configure any processes that open the IP address of the server, 0.0.0.0, or 127.0.0.1.
5. To ensure that an application does not open the same IP address on a different port, launch an additional instance of the application.

**How Microsoft Remote Desktop (RD) IP virtualization works**

• Virtual IP addressing must be enabled on the Microsoft server.

For example, in a Windows Server 2008 R2 environment, from Server Manager, expand Remote Desktop Services > RD Session Host Connections to enable the RD IP Virtualization feature and configure the settings to dynamically assign IP addresses using the Dynamic Host Configuration Protocol (DHCP) server on a per-session or per-program basis. See the Microsoft documentation for instructions.

• After the feature is enabled, at session start-up, the server requests dynamically-assigned IP addresses from the DHCP server.

• The RD IP Virtualization feature assigns IP addresses to remote desktop connections per-session or per-program. If you assign IP addresses for multiple programs, they share a per-session IP address.

• After an address is assigned to a session, the session uses the virtual address rather than the primary IP address for the system whenever the following calls are made:
When using the Microsoft IP virtualization feature within the Remote Desktop session hosting configuration, applications are bound to specific IP addresses by inserting a “filter” component between the application and Winsock function calls. The application then sees only the IP address it should use. Any attempt by the application to listen for TCP or UDP communications is bound to its allocated virtual IP address (or loopback address) automatically, and any originating connections opened by the application originate from the IP address bound to the application.

In functions that return an address (such as GetAddrInfo(), which is controlled by a Windows policy), if the local host IP address is requested, virtual IP looks at the returned IP address and changes it to the virtual IP address of the session. Applications that attempt to get the IP address of the local server through such name functions see only the unique virtual IP address assigned to that session. This IP address is often used in subsequent socket calls, such as bind or connect. For more information about Windows policies, see RDS IP Virtualization in Windows Server.

Often, an application requests to bind to a port for listening on the address 0.0.0.0. When an application does this and uses a static port, you cannot launch more than one instance of the application. The virtual IP address feature also looks for 0.0.0.0 in these call types and changes the call to listen on the specific virtual IP address, which enables more than one application to listen on the same port on the same computer because they are all listening on different addresses. The call is changed only if it is in an ICA session and the virtual IP address feature is enabled. For example, if two instances of an application running in different sessions both try to bind to all interfaces (0.0.0.0) and a specific port (such as 9000), they are bound to VIPAddress1:9000 and VIPAddress2:9000 and there is no conflict.

Virtual loopback

Enabling the Citrix virtual IP loopback policy settings allows each session to have its own loopback address for communication. When an application uses the localhost address (default = 127.0.0.1) in a Winsock call, the virtual loopback feature simply replaces 127.0.0.1 with 127.X.X.X, where X.X.X is a representation of the session ID + 1. For example, a session ID of 7 is 127.0.1.0. In the unlikely event that the session ID exceeds the fourth octet (more than 255), the address rolls over to the next octet (127.0.1.0), to the maximum of 127.255.255.255.

A process requires virtual loopback in either of the following cases:

- The process uses the Windows socket loopback (localhost) address (127.0.0.1)
- The process uses a hard-coded TCP port number

Use the virtual loopback policy settings for applications that use a loopback address for interprocess communication. No additional configuration is required. Virtual loopback has no dependency on Virtual IP, so you do not have to configure the Microsoft server.
• Virtual IP loopback support. When enabled, this policy setting allows each session to have its own virtual loopback address. This setting is disabled by default. The feature applies only to applications specified with the Virtual IP virtual loopback programs list policy setting.
• Virtual IP virtual loopback programs list. This policy setting specifies the applications that use the virtual IP loopback feature. This setting applies only when the Virtual IP loopback support policy setting is enabled.

Related feature
You can use the following registry settings to ensure that virtual loopback is given preference over virtual IP; this is called preferred loopback. However, proceed with caution:

• Use preferred loopback only if both Virtual IP and virtual loopback are enabled; otherwise, you may have unintended results.
• Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Run regedit on the servers where the applications reside.

• HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\VIP
  • Name: PreferLoopback, Type: REG_DWORD, Data: 1
  • Name: PreferLoopbackProcesses, Type: REG_MULTI_SZ, Data: <list of processes>

Delivery Controllers

September 14, 2020

The Delivery Controller is the server-side component that is responsible for managing user access, plus brokering and optimizing connections. Controllers also provide the Machine Creation Services that create desktop and server images.

A Site must have at least one Controller. After you install the initial Controller, you can add more Controllers when you create a Site, or later. There are two primary benefits from having more than one Controller in a Site.

• Redundancy: As best practice, a production Site should always have at least two Controllers on different physical servers. If one Controller fails, the others can manage connections and administer the Site.
- **Scalability**: As Site activity grows, so does CPU utilization on the Controller and database activity. Additional Controllers provide the ability to handle more users and more applications and desktop requests, and can improve overall responsiveness.

Each Controller communicates directly with the Site database. In a Site with more than one zone, the Controllers in every zone communicate with the Site database in the primary zone.

**Important:**
Do not change the computer name or the domain membership of a Controller after the site is configured.

**How VDA register with Controllers**

Before a VDA can be used, it must register (establish communication) with a Delivery Controller in the Site. For information about VDA registration, see [VDA registration with Controllers](#).

**Add, remove, or move Controllers**

To add, remove, or move a Controller, you must have the server role and database role permissions listed in the [Databases](#) article.

Installing a Controller on a node in an SQL clustering or SQL mirroring installation is not supported.

When you add a Delivery Controller to a site, be sure to add logon credentials for that machine to any replica SQL Servers that you use for high availability.

If your deployment uses database mirroring:

- Before adding, removing, or moving a Controller, ensure that the principal and mirrored databases are both running. In addition, if you are using scripts with SQL Server Management Studio, enable SQLCMD mode before executing the scripts.
- To verify mirroring after adding, removing, or moving a Controller, run the PowerShell Get-ConfigDBconnection cmdlet to ensure that the Failover Partner has been set in the connection string to the mirror.

After you add, remove, or move a Controller:

- If auto-update is enabled, the VDAs will receive an updated list of Controllers within 90 minutes.
- If auto-update is not enabled, ensure that the Controller policy setting orListOfDDCs registry key are updated for all VDAs. After moving a Controller to another Site, update the policy setting or registry key on both Sites.
Add a Controller

You can add Controllers when you create a Site and later. You cannot add Controllers installed with an earlier version of this software to a Site that was created with this version.

1. Run the installer on a server containing a supported operating system. Install the Delivery Controller component and any other core components you want. Complete the installation wizard.

2. If you have not yet created a Site, launch Studio; you are prompted to create a Site. On the Databases page in the Site creation wizard, click the Select button and then add the address of the server where you installed the additional Controller.

   If you plan to generate scripts that will initialize the databases, add the Controllers before you generate the scripts.

3. If you have already created a Site, point Studio to the server where you installed the additional Controller. Click Scale your deployment and enter the Site address.

Remove a Controller

Removing a Controller from a Site does not uninstall the Citrix software or any other component; it removes the Controller from the database so that it can no longer be used to broker connections and perform other tasks. If you remove a Controller, you can later add it back to the same Site or to another Site. A Site requires at least one Controller, so you cannot remove the last one listed in Studio.

When you remove a Controller from a Site, the Controller logon to the database server is not removed. This avoids potentially removing a logon that is used by other products’ services on the same machine. The logon must be removed manually if it is no longer required; the securityadmin server role permission is needed to remove the logon.

Important:

Do not remove the Controller from Active Directory until after you remove it from the Site.

1. Make sure the Controller is powered on so that Studio loads in less than one hour. Once Studio loads the Controller you want to remove, power off the Controller when prompted to do so.

2. Select Configuration > Controllers in the Studio navigation pane and then select the Controller you want to remove.

3. Select Remove Controller in the Actions pane. If you do not have the correct database roles and permissions, you are offered the option of generating a script that allows your database administrator to remove the Controller for you.

4. You might need to remove the Controller’s machine account from the database server. Before doing this, check that another service is not using the account.

After using Studio to remove a Controller, traffic to that Controller might linger for a short amount of time to ensure proper completion of current tasks. If you want to force the removal of a Controller
in a very short time, Citrix recommends you shut down the server where it was installed, or remove that server from Active Directory. Then, restart the other Controllers on the Site to ensure no further communication with the removed Controller.

**Move a Controller to another zone**

If your Site contains more than one zone, you can move a Controller to a different zone. See the Zones article for information about how this can affect VDA registration and other operations.

1. Select **Configuration > Controllers** in the Studio navigation pane and then select the Controller you want to move.
2. Select **Move** in the Actions pane.
3. Specify the zone where you want to move the Controller.

**Move a Controller to another Site**

You cannot move a Controller to a Site that was created with an earlier version of this software.

1. On the Site where the Controller is currently located (the old Site), select **Configuration > Controllers** in the Studio navigation pane and then select the Controller you want to move.
2. Select **Remove Controller** in the Actions pane. If you do not have the correct database roles and permissions, you are offered the option of generating a script that allows someone with those permissions (such as a database administrator) to remove the Controller for you. A Site requires at least one Controller, so you cannot remove the last one listed in Studio.
3. On the Controller you are moving, open Studio, reset the services when prompted, select **Join existing site**, and enter the address of the new Site.

**Move a VDA to another Site**

If a VDA was provisioned using Citrix Provisioning or is an existing image, you can move a VDA to another Site (from Site 1 to Site 2) when upgrading, or when moving a VDA image that was created in a test Site to a production Site. VDAs provisioned using Machine Creation Services (MCS) cannot be moved from one Site to another because MCS does not support changing the ListOfDDCs a VDA checks to register with a Controller; VDAs provisioned using MCS always check the ListOfDDCs associated with the Site in which they were created.

There are two ways to move a VDA to another Site: using the installer or Citrix policies.

**Installer**

Run the installer and add a Controller, specifying the FQDN (DNS entry) of a Controller in Site 2.

Specify Controllers in the installer only when the Controllers policy setting is not used.
Group Policy Editor

The following example moves multiple VDAs between Sites.

1. Create a policy in Site 1 that contains the following settings, then filter the policy to the Delivery Group level to initiate a staged VDA migration between the Sites.
   - Controllers: Containing FQDNs (DNS entries) of one or more Controllers in Site 2.
   - Enable auto update of Controllers: set to disabled.

2. Each VDA in the Delivery Group is alerted within 90 minutes of the new policy. The VDA ignores the list of Controllers it receives (because auto-update is disabled); it selects one of the Controllers specified in the policy, which lists the Controllers in Site 2.

3. When the VDA successfully registers with a Controller in Site 2, it receives the Site 2 ListOfDDCs and policy information, which has auto-update enabled by default. Since the Controller with which the VDA was registered in Site 1 is not on the list sent by the Controller in Site 2, the VDA re-registers, choosing among the Controllers in the Site 2 list. From then on, the VDA is automatically updated with information from Site 2.

VDA registration

August 25, 2020

Introduction

Note:

In an on-premises environment, VDAs register with a Delivery Controller. In a Citrix Cloud service environment, VDAs register with a Cloud Connector. In a hybrid environment, some VDAs register with a Delivery Controller while others register with a Cloud Connector.

Before a VDA can be used, it must register (establish communication) with one or more Controllers or Cloud Connectors on the site. The VDA finds a Controller or Connector by checking a list called the ListOfDDCs. The ListOfDDCs on a VDA contains DNS entries that point that VDA to Controllers or Cloud Connectors on the site. For load balancing, the VDA automatically distributes connections across all Controllers or Cloud Connectors in the list.

Why is VDA registration so important?

- From a security perspective, registration is a sensitive operation. You’re establishing a connection between the Controller or Cloud Connector and the VDA. For such a sensitive operation, the expected behavior is to reject the connection if everything is not in perfect shape. You are
effectively establishing two separate communication channels: VDA to Controller or Cloud Connector, and Controller or Cloud Connector to VDA. The connection uses Kerberos, so time synchronization and domain membership issues are unforgiving. Kerberos uses Service Principal Names (SPNs), so you cannot use load balanced IP\hostname.

- If a VDA does not have accurate and current Controller or Cloud Connector information as you add and remove Controllers or Cloud Connectors, the VDA might reject session launches that are brokered by an unlisted Controller or Cloud Connector. Invalid entries can delay the startup of the virtual desktop system software. A VDA won’t accept a connection from an unknown and untrusted Controller or Cloud Connector.

In addition to the ListOfDDCs, the ListOfSIDs (Security IDs) indicates which machines in the ListOfDDCs are trusted. The ListOfSIDs can be used to decrease the load on Active Directory or to avoid possible security threats from a compromised DNS server. For more information, see ListOfSIDs.

If a ListOfDDCs specifies more than one Controller or Cloud Connector, the VDA attempts to connect to them in random order. In an on-premises deployment, the ListOfDDCs can also contain Controller groups. The VDA attempts to connect to each Controller in a group before moving to other entries in the ListOfDDCs.

Citrix Virtual Apps and Desktops automatically tests the connectivity to configured Controllers or Cloud Connectors during VDA installation. Errors are displayed if a Controller or Cloud Connector cannot be reached. If you ignore a warning that a Controller or Cloud Connector cannot be contacted (or when you do not specify Controller or Cloud Connector addresses during VDA installation), messages remind you.

**Methods for configuring Controller or Cloud Connector addresses**

The administrator chooses the configuration method to use when the VDA registers for the first time (the initial registration). During the initial registration, a persistent cache is created on the VDA. During subsequent registrations, the VDA retrieves the list of Controllers or Cloud Connectors from this local cache, unless a configuration change is detected.

The easiest way to retrieve that list during subsequent registrations is by using the auto-update feature. Auto-update is enabled by default. For more information, see Auto-update.

There are several methods for configuring Controller or Cloud Connector addresses on a VDA.

- Policy-based (LGPO or GPO)
- Registry-based (manual, Group Policy Preferences (GPP), specified during VDA installation)
- Active Directory OU-based (legacy OU discovery)
- MCS-based (personality.ini)

You specify the initial registration method when you install a VDA. (If you disable auto-update, the method you select during VDA installation is used for subsequent registrations.)
The following graphic shows the Delivery Controller page of the VDA installation wizard.

Policy-based (LGPO\GPO)

Citrix recommends using GPO for initial VDA registration. It has the highest priority. (Although auto-update is listed as the highest priority, auto-update is used only after the initial registration.) Policy-based registration offers the centralizing advantages of using Group Policy for configuration.

To specify this method, complete both of the following steps:

- On the Delivery Controller page in the VDA installation wizard, select Do it later (advanced). The wizard reminds you several times to specify Controller addresses, even though you’re not specifying them during VDA installation. (VDA registration is that important.)
- Enable or disable policy-based VDA registration through Citrix policy with the Virtual Delivery Agent Settings > Controllers setting. (If security is your top priority, use the Virtual Delivery Agent Settings > Controller SIDs setting.)

This setting is stored under HKLM\Software\Policies\Citrix\VirtualDesktopAgent (ListOfDDCs).
Registry-based

To specify this method, complete one of the following steps:

- On the Delivery Controller page in the VDA installation wizard, select Do it manually. Then, enter the FQDN of an installed Controller and then click Add. If you’ve installed more Controllers, add their addresses.
- For a command-line VDA installation, use the /controllers option and specify the FQDNs of the installed Controllers or Cloud Connectors.

This information is stored in registry value `ListOfDDCs` under registry key `HKLM\Software\Citrix\VirtualDesktopAgent` or `HKLM\Software\Wow6432Node\Citrix\VirtualDesktopAgent`. You can also configure this registry key manually or use Group Policy Preferences (GPP). This method might be preferable to the policy-based method (for example, if you want conditional processing of different Controllers or Cloud Connectors, such as: use XDC-001 for computer names that begin with XDW-001-).

Update the `ListOfDDCs` registry key, which lists the FQDNs of all the Controllers or Cloud Connectors in the site. (This key is the equivalent of the Active Directory site OU.)

HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\ListOfDDCs (REG_SZ)

If the HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent registry location contains both the `ListOfDDCs` and `FarmGUID` keys, `ListOfDDCs` is used for Controller or Cloud Connector discovery. `FarmGUID` is present if a site OU was specified during VDA installation. (This might be used in legacy deployments.)

Optionally, update the `ListOfSIDs` registry key (for more information, see ListOfSIDs:

HKEY_LOCAL_MACHINE\Software\Citrix\VirtualDesktopAgent\ListOfSIDs (REG_SZ)

Remember: If you also enable policy-based VDA registration through Citrix policy, that overrides settings you specify during VDA installation, because it is a higher-priority method.

Active Directory OU-based (legacy)

This method is supported primarily for backward compatibility and is not recommended. If you’re still using it, Citrix suggests changing to another method.

To specify this method, complete both of the following steps:

- On the Delivery Controller page in the VDA installation wizard, select Choose locations from Active Directory.
- Use the `Set-ADControllerDiscovery.ps1` script (available on every Controller). Also, configure the `FarmGuid` registry entry on each VDA to point to the right OU. This setting can be configured using Group Policy.
For details, see Active Directory OU-based discovery.

**MCS-based**

If you plan to use only MCS to provision VMs, you can instruct MCS to set up the list of Controllers or Cloud Connectors. This feature works with auto-update. When creating the catalog, MCS injects the list of Controllers or Cloud Connectors into the `Personality.ini` file during initial provisioning. Auto-update keeps the list current.

This method is not recommended for use in large environments. You can use this method if you:

- Have a small environment
- Will not move VDAs between sites
- Use only MCS to provision VMs
- Don’t want to use Group Policy

To specify this method, on the **Delivery Controller** page in the VDA installation wizard, select **Let Machine Creation Services do it**.

**Recommendations**

As best practice:

- Use the Group Policy registration method for initial registration.
- Use auto-update (enabled by default) to keep your list of Controllers up-to-date.
- In a multi-zone deployment, use Group Policy for initial configuration (with at least two Controllers or Cloud Connectors). Point VDAs to Controllers or Cloud Connectors local to (in) their zone. Use auto-update to keep them up-to-date. Auto-update automatically optimizes the ListOfDDCs for VDAs in satellite zones.
- List more than one controller on the ListOfDDCs registry key, separated by a space, to prevent registration issues if a Controller is not available. For example:

```
1  DDC7x.xd.local  DDC7xHA.xd.local
2
3  32-bit: HKEY_LOCAL_MACHINE \Software\Citrix\VirtualDesktopAgent\ListOfDDCs
4
5  HKEY_LOCAL_MACHINE \Software\Citrix\VirtualDesktopAgent\ListOfDDCs (REG_SZ)
```

- Ensure all values listed under ListOfDDCs map to a valid fully qualified domain name to prevent startup registration delays.
**Auto-update**

Auto-update (introduced in XenApp and XenDesktop 7.6) is enabled by default. It is the most efficient method for keeping your VDA registrations up-to-date. Although not used for initial registration, the auto-update software downloads and stores the ListOfDDCs in a persistent cache on the VDA when initial registration occurs. This process is done for each VDA. The cache also holds machine policy information, which ensures that policy settings are retained across restarts.

Auto-update is supported when using MCS or Citrix Provisioning to provision machines, except for Citrix Provisioning server-side cache. Server-side cache is not a common scenario because there is no persistent storage for auto-update cache.

To specify this method:

- Enable or disable auto-update through a Citrix policy containing the setting **Virtual Delivery Agent Settings** > **Enable auto update of Controllers**. This setting is enabled by default.

How it works:

- Each time a VDA re-registers (for example, after a machine restart), the cache is updated. Each Controller or Cloud Connector also checks the site database every 90 minutes. If a Controller or Cloud Connector has been added or removed since the last check, or if a policy change occurred that affects VDA registration, the Controller or Cloud Connector sends an updated list to its registered VDAs and the cache is updated. The VDA accepts connections from all the Controllers or Cloud Connectors in its most recently cached list.
- If a VDA receives a list that does not include the Controller or Cloud Connector it is registered with (in other words, that Controller or Cloud Connector was removed from the site), the VDA re-registers, choosing among the Controllers or Cloud Connectors in the ListOfDDCs.

Example:

- A deployment has three Controllers: A, B, and C. A VDA registers with Controller B (which was specified during VDA installation).
- Later, two Controllers (D and E) are added to the site. Within 90 minutes, VDAs receive updated lists and then accept connections from Controllers A, B, C, D, and E. (The load is not spread equally to all Controllers until the VDAs are restarted.)
- Later still, Controller B is moved to another site. Within 90 minutes, VDAs in the original site receive updated lists because there has been a Controller change since the last check. The VDA that originally registered with Controller B (which is no longer on the list) re-registers, choosing among the Controllers in the current list (A, C, D, and E).

In a multi-zone deployment, auto-update in a satellite zone automatically caches all local Controllers first. All Controllers in the primary zone are cached in a backup group. If no local Controllers in the satellite zone are available, registration is attempted with Controllers in the primary zone.
As shown in the following example, the cache file contains hostnames and a list of Security IDs (ListOfSIDs). The VDA does not query SIDs, which reduces the Active Directory load.

You can retrieve the cache file with a WMI call. However, it is stored in a location that’s readable only by the SYSTEM account.

Important:
This information is provided only for information purposes. DO NOT MODIFY THIS FILE. Any modifications to this file or folder results in an unsupported configuration.

Get-WmiObject -Namespace "Root\Citrix\DesktopInformation" -Class "Citrix_VirtualDesktopInfo" -Property "PersistentDataLocation"

If you need to manually configure the ListOfSIDs for security reasons (as distinct from reducing Active Directory load), you cannot use the auto-update feature. For details, see ListOfSIDs.

**Exception to auto-update priority**

Although auto-update usually has the highest priority of all VDA registration methods and overrides settings for other methods, there is an exception. The NonAutoListOfDDCs elements in the cache specify the initial VDA configuration method. Auto-update monitors this information. If the initial registration method changes, the registration process skips auto-update, and uses the next-highest configured priority method. This process can be helpful when you move a VDA to another site (for example, during disaster recovery).

**Configuration considerations**

Consider the following when configuring items that can affect VDA registration.

**Controller or Cloud Connector addresses**

Regardless of which method you use to specify Controllers or Cloud Connectors, Citrix recommends using an FQDN address. An IP address is not considered a trusted configuration, because it’s easier to
compromise an IP than a DNS record. If you populate the ListOfSIDs manually, you can use an IP in a ListOfDDCs. However, FQDN is still recommended.

**Load balancing**

As noted earlier, the VDA automatically distributes connections across all Controllers or Cloud Connectors in the ListOfDDCs. Failover and load balancing functionality is built into the Citrix Brokering Protocol (CBP). If you specify multiple Controllers or Cloud Connectors in your configuration, registration automatically fails over between them, if needed. With auto-update, automatic failover occurs automatically for all VDAs.

For security reasons, you cannot use a network load balancer, such as Citrix ADC. VDA registration uses Kerberos mutual authentication, where the client (VDA) must prove its identity to the service (Controller). However, the Controller or Cloud Connector must prove its identity to the VDA. This means that the VDA and the Controller or Cloud Connector are acting as server and client at the same time. As noted at the beginning of this article, there are two communications channels: VDA to Controller/Cloud Connector and Controller/Cloud Connector to VDA.

A component in this process is called Service Principal Name (SPN), which stored as a property in an Active Directory computer object. When your VDA connects to a Controller or Cloud Connector, it must specify “who” it wants to communicate with. This address is an SPN. If you use a load-balanced IP, mutual Kerberos authentication correctly recognizes that the IP does not belong to the expected Controller or Cloud Connector.

For more information, see:

- Introduction to Kerberos
- Mutual authentication using Kerberos

**Auto-update replaces CNAME**

The auto-update feature replaces the CNAME (DNS alias) function from XenApp and XenDesktop versions earlier than 7.x. CNAME functionality is disabled, beginning with XenApp and XenDesktop 7. Use auto-update instead of CNAME. (If you must use CNAME, see CTX137960. For DNS aliasing to work consistently, do not use both auto-update and CNAME at the same time.)

**Controller/Cloud Connector groups**

In certain scenarios, you might want to process Controllers or Cloud Connectors in groups, with one group being preferred and the other group used for a failover if all Controllers/Cloud Connectors fail. Remember that Controllers or Cloud Connectors are randomly selected from the list, so grouping can help enforce preferential use.
These groups are intended for use within a single site (not multiple sites).

Use parentheses to specify groups of Controllers/Cloud Connectors. For example, with four Controllers (two primary and two backups), a grouping might be:

\((XDC-001.cdz.lan\ XDC-002.cdz.lan)\)\((XDC-003.cdz.lan\ XDC-004.cdz.lan)\)

In this example, the Controllers in the first group (001 and 002) are processed first. If both fail, Controllers in the second group (003 and 004) are processed.

For XenDesktop 7.0 or higher, there is an extra step you need to perform to use Registration Groups feature. You need to Prohibit the Enable Auto Update of Controller policy from Citrix Studio.

**ListOfSIDs**

The list of Controllers that a VDA can contact for registration is the ListOfDDCs. A VDA must also know which Controllers to trust; VDAs do not automatically trust the Controllers in the ListOfDDCs. The ListOfSIDs (Security IDs) identify the trusted Controllers. VDAs attempt to register only with trusted Controllers.

In most environments, the ListOfSIDs is generated automatically from the ListOfDDCs. You can use a CDF trace to read the ListOfSIDs.

Generally, there is no need to manually modify the ListOfSIDs. There are several exceptions. The first two exceptions are no longer valid because newer technologies are available.

- **Separate roles for Controllers:** Before zones were introduced in XenApp and XenDesktop 7.7, the ListOfSIDs was manually configured when only a subset of Controllers was used for registration. For example, if you were using XDC-001 and XDC-002 as XML brokers, and XDC-003 and XDC-004 for VDA registration, you specified all Controllers in the ListOfSIDs, and XDC-003 and XDC-004 in the ListOfDDCs. This is not a typical or recommended configuration. Do not use it in newer environments. Instead, use zones.

- **Reducing Active Directory load:** Before the auto-update feature was introduced in XenApp and XenDesktop 7.6, the ListOfSIDs was used to reduce the load on domain controllers. By pre-populating the ListOfSIDs, the resolution from DNS names to SIDs can be skipped. However, the auto-update feature removes the need for this work, because this persistent cache contains SIDs. Citrix recommends keeping the auto-update feature enabled.

- **Security:** In some highly secured environments, the SIDs of trusted Controllers were manually configured to avoid possible security threats from a compromised DNS server. However, if you do this, you must also disable the auto-update feature. Otherwise, the configuration from persistent cache is used.

So, unless you have a specific reason, do not modify the ListOfSIDs.

If you must modify the ListOfSIDs, create a registry key named `ListOfSIDs (REG_SZ)` under `HKLM\Software\Citrix\VirtualDesktopAgent`. The value is a list of trusted SIDs, separated by spaces.
if you have more than one.

In the following example, one Controller is used for VDA registration (ListOfDDCs), but two Controllers are used for brokering (ListOfSIDs).

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Default]</td>
<td>REG_SZ</td>
<td>(value not set)</td>
</tr>
<tr>
<td>AppControllerRegist...</td>
<td>REG_SZ</td>
<td>0</td>
</tr>
<tr>
<td>AppModeComputertime</td>
<td>REG_SZ</td>
<td>0</td>
</tr>
<tr>
<td>ListOfDDCs</td>
<td>REG_SZ</td>
<td>CTX-XXX-001.dcd.svc</td>
</tr>
<tr>
<td>ListOfSIDs</td>
<td>REG_SZ</td>
<td>0</td>
</tr>
<tr>
<td>ProductInstalled</td>
<td>REG_DWORD</td>
<td>0x0000000000 (0)</td>
</tr>
<tr>
<td>RegistryOverride</td>
<td>REG_DWORD</td>
<td>0x0000000001 (1)</td>

</tr>
<tr>
<td>StartMenuScanMem</td>
<td>REG_SZ</td>
<td>C:\Program Files\Citrix\VirtualDesktopAgent\StartMenuScan.exe</td>
</tr>
</tbody>
</table>

**Controller search during VDA registration**

When a VDA tries to register, the Broker Agent first performs a DNS lookup in the local domain to ensure that the specified Controller can be reached.

If that initial lookup doesn’t find the Controller, the Broker Agent can start a fallback top-down query in AD. That query searches all domains, and repeats frequently. If the Controller address is invalid (for example, the administrator entered an incorrect FQDN when installing the VDA), that query’s activity can potentially lead to a distributed denial of service (DDoS) condition on the domain controller.

The following registry key controls whether the Broker Agent uses the fallback top-down query when it cannot locate a Controller during the initial search.

```
HKEY_LOCAL_MACHINE\Software\Policies\Citrix\VirtualDesktopAgent
Name: DisableDdcWildcardNameLookup
Type: DWORD
Value: 1 (default) or 0
```

When set to 1, the fallback search is disabled. If the initial search for the Controller fails, the Broker Agent stops looking. This is the default setting.

When set to 0, the fallback search is enabled. If the initial search for the Controller fails, the fallback top-down search is started.

**Troubleshoot VDA registration issues**

As noted previously, a VDA must be registered with a Delivery Controller or Cloud Connector to be considered when launching brokered sessions. Unregistered VDAs can result in underutilization of otherwise available resources. There are various reasons a VDA might not be registered, many of which an
administrator can troubleshoot. Studio provides troubleshooting information in the catalog creation wizard, and after you create a Delivery Group.

• **Identifying issues during machine catalog creation:** In the catalog creation wizard, after you add existing machines, the list of computer account names indicates whether each machine is suitable for adding to the catalog. Hover over the icon next to each machine to display an informative message about that machine.

  If the message identifies a problematic machine, you can either remove that machine (using the **Remove** button), or add the machine. For example, if a message indicates that information was not obtained about a machine (perhaps because it had never registered), you might choose to add the machine anyway.

  A catalog’s functional level controls which product features are available to machines in the catalog. Using features introduced in new product versions might require a new VDA. Setting a functional level makes all features introduced in that version (and later, if the functional level does not change) available to machines in the catalog. However, machines in that catalog with an earlier VDA version will not be able to register.

• **Identifying issues after creating Delivery Groups:** After you create a Delivery Group, Studio displays details about machines associated with that group.

  The details pane for a Delivery Group indicates the number of machines that should be registered but are not. In other words, there might be one or more machines that are powered on and not in maintenance mode, but are not currently registered with a Controller. When viewing a “not registered, but should be” machine, review the **Troubleshoot** tab in the details pane for possible causes and recommended corrective actions.

**More information about troubleshooting VDA registration**

• For more information about functional levels, see [VDA versions and functional levels](#).

• For more information about VDA registration troubleshooting, see [CTX136668](#).

• You can also use the Citrix Health Assistant to troubleshoot VDA registration and session launch. For details, see [CTX207624](#).

**Sessions**

June 30, 2020

Maintaining session activity is critical to providing the best user experience. Losing connectivity due to unreliable networks, highly variable network latency, and range limitations of wireless devices can
lead to user frustration. Being able to move quickly between workstations and access the same set of applications each time they log on is a priority for many mobile workers such as health-care workers in a hospital.

The features described in this article optimize the reliability of sessions, reduce inconvenience, downtime, and loss of productivity; using these features, mobile users can roam quickly and easily between devices.

You can also log a user off of a session, disconnect a session, and configure session prelaunch and linger; see Manage Delivery Groups.

**Session reliability**

Session Reliability keeps sessions active and on the user’s screen when network connectivity is interrupted. Users continue to see the application they are using until network connectivity resumes.

This feature is especially useful for mobile users with wireless connections. For example, a user with a wireless connection enters a railroad tunnel and momentarily loses connectivity. Ordinarily, the session is disconnected and disappears from the user’s screen, and the user has to reconnect to the disconnected session. With Session Reliability, the session remains active on the machine. To indicate that connectivity is lost, the user’s display freezes and the cursor changes to a spinning hourglass until connectivity resumes on the other side of the tunnel. The user continues to access the display during the interruption and can resume interacting with the application when the network connection is restored. Session Reliability reconnects users without reauthentication prompts.

Citrix Workspace app users cannot override the Controller setting.

You can use Session Reliability with Transport Layer Security (TLS). TLS encrypts only the data sent between the user device and Citrix Gateway.

Enable and configure Session Reliability with the following policy settings:

- The Session reliability connections policy setting allows or prevents session reliability.
- The Session reliability timeout policy setting has a default of 180 seconds, or three minutes. Although you can extend the amount of time Session Reliability keeps a session open, this feature is designed for user convenience and therefore does not prompt the user for reauthentication. As you extend the amount of time a session is kept open, chances increase that a user may get distracted and walk away from the user device, potentially leaving the session accessible to unauthorized users.
- Incoming session reliability connections use port 2598, unless you change the port number in the Session reliability port number policy setting.
- If you do not want users to be able to reconnect to interrupted sessions without having to reauthenticate, use the Auto Client Reconnect feature. You can configure the Auto client reconnect...
authentication policy setting to prompt users to reauthenticate when reconnecting to interrupted sessions.

If you use both Session Reliability and Auto Client Reconnect, the two features work in sequence. Session Reliability closes, or disconnects, the user session after the amount of time you specify in the Session reliability timeout policy setting. After that, the Auto Client Reconnect policy settings take effect, attempting to reconnect the user to the disconnected session.

**Auto Client Reconnect**

With the Auto Client Reconnect feature, Citrix Workspace app can detect unintended disconnections of ICA sessions and reconnect users to the affected sessions automatically. When this feature is enabled on the server, users do not have to reconnect manually to continue working.

For application sessions, Citrix Workspace app attempts to reconnect to the session until there is a successful reconnection or the user cancels the reconnection attempts.

For desktop sessions, Citrix Workspace app attempts to reconnect to the session for a specified period of time, unless there is a successful reconnection or the user cancels the reconnection attempts. By default, this period of time is five minutes. To change this period of time, edit this registry on the user device:

```
HKLM\Software\Citrix\ICA Client\TransportReconnectRetryMaxTimeSeconds; DWORD;<seconds>
```

where **seconds** is the number of seconds after which no more attempts are made to reconnect the session.

Enable and configure Auto Client Reconnect with the following policy settings:

- **Auto client reconnect**: Enables or disables automatic reconnection by Citrix Workspace app after a connection has been interrupted.
- **Auto client reconnect authentication**: Enables or disables the requirement for user authentication after automatic reconnection.
- **Auto client reconnect logging**: Enables or disables logging of reconnection events in the event log. Logging is disabled by default. When enabled, the server’s system log captures information about successful and failed automatic reconnection events. Each server stores information about reconnection events in its own system log; the site does not provide a combined log of reconnection events for all servers.

Auto Client Reconnect incorporates an authentication mechanism based on encrypted user credentials. When a user initially logs on, the server encrypts and stores the user credentials in memory, and creates and sends a cookie containing the encryption key to Citrix Workspace app. Citrix Workspace app submits the key to the server for reconnection. The server decrypts the credentials and submits
them to Windows logon for authentication. When cookies expire, users must reauthenticate to reconnect to sessions.

Cookies are not used if you enable the auto client reconnection authentication setting. Instead, users are presented with a dialog box to users requesting credentials when Citrix Workspace app attempts to reconnect automatically.

For maximum protection of user credentials and sessions, use encryption for all communication between clients and the Site.

Disable Auto Client Reconnect on Citrix Workspace app for Windows by using the icaclient.adm file. For more information, see the documentation for your Citrix Workspace app for Windows version.

Settings for connections also affect Auto Client Reconnect:

- By default, Auto Client Reconnect is enabled through policy settings at the Site level, as described above. User reauthentication is not required. However, if a server’s ICA TCP connection is configured to reset sessions with a broken communication link, automatic reconnection does not occur. Auto Client Reconnect works only if the server disconnects sessions when there is a broken or timed out connection. In this context, the ICA TCP connection refers to a server’s virtual port (rather than an actual network connection) that is used for sessions on TCP/IP networks.
- By default, the ICA TCP connection on a server is set to disconnect sessions with broken or timed out connections. Disconnected sessions remain intact in system memory and are available for reconnection by Citrix Workspace app.
- The connection can be configured to reset or log off sessions with broken or timed-out connections. When a session is reset, attempting to reconnect initiates a new session; rather than restoring a user to the same place in the application in use, the application is restarted.
- If the server is configured to reset sessions, Auto Client Reconnect creates a new session. This process requires users to enter their credentials to log on to the server.
- Automatic reconnection can fail if Citrix Workspace app or the plug-in submits incorrect authentication information, which might occur during an attack or the server determines that too much time has elapsed since it detected the broken connection.

ICA Keep-Alive

Enabling the ICA Keep-Alive feature prevents broken connections from being disconnected. When enabled, if the server detects no activity (for example, no clock change, no mouse movement, no screen updates), this feature prevents Remote Desktop Services from disconnecting that session. The server sends keep-alive packets every few seconds to detect if the session is active. If the session is no longer active, the server marks the session as disconnected.
ICA Keep-Alive works only if you are not using Session Reliability. Session Reliability has its own mechanisms to prevent broken connections from being disconnected. Configure ICA Keep-Alive only for connections that do not use Session Reliability.

ICA Keep-Alive settings override keep-alive settings that are configured in Microsoft Windows Group Policy.

Enable and configure ICA Keep-Alive with the following policy settings:

- **ICA keep alive timeout**: Specifies the interval (1-3600 seconds) used to send ICA keep-alive messages. Do not configure this option if you want your network monitoring software to close inactive connections in environments where broken connections are so infrequent that allowing users to reconnect to sessions is not a concern.

  The default interval is 60 seconds: ICA Keep-Alive packets are sent to user devices every 60 seconds. If a user device does not respond in 60 seconds, the status of the ICA sessions changes to disconnected.

- **ICA keep alives**: Sends or prevents sending ICA keep-alive messages.

**Workspace control**

Workspace control lets desktops and applications follow a user from one device to another. This ability to roam enables a user to access all desktops or open applications from anywhere simply by logging on, without having to restart the desktops or applications on each device. For example, workspace control can assist health-care workers in a hospital who need to move quickly among different workstations and access the same set of applications each time they log on. If you configure workspace control options to allow it, these workers can disconnect from multiple applications at one client device and then reconnect to open the same applications at a different client device.

Workspace control affects the following activities:

- **Logging on**: By default, workspace control enables users to reconnect automatically to all running desktops and applications when logging on, bypassing the need to reopen them manually. Through workspace control, users can open disconnected desktops or applications, as well as any that are active on another client device. Disconnecting from a desktop or application leaves it running on the server. If you have roaming users who need to keep some desktops or applications running on one client device while they reconnect to a subset of their desktops or applications on another client device, you can configure the logon reconnection behavior to open only the desktops or applications that the user disconnected from previously.

- **Reconnecting**: After logging on to the server, users can reconnect to all of their desktops or applications at any time by clicking Reconnect. By default, Reconnect opens desktops or applications that are disconnected, plus any that are currently running on another client device.
You can configure Reconnect to open only those desktops or applications that the user disconnected from previously.

- **Logging off**: For users opening desktops or applications through StoreFront, you can configure the Log Off command to log the user off from StoreFront and all active sessions together, or log off from StoreFront only.

- **Disconnecting**: Users can disconnect from all running desktops and applications at once, without needing to disconnect from each individually.

Workspace control is available only for Citrix Workspace app users who access desktops and applications through a Citrix StoreFront connection. By default, workspace control is disabled for virtual desktop sessions, but is enabled for hosted applications. Session sharing does not occur by default between published desktops and any published applications running inside those desktops.

User policies, client drive mappings, and printer configurations change appropriately when a user moves to a new client device. Policies and mappings are applied according to the client device where the user is currently logged on to the session. For example, if a health care worker logs off from a client device in the emergency room of a hospital and then logs on to a workstation in the hospital’s x-ray laboratory, the policies, printer mappings, and client drive mappings appropriate for the session in the x-ray laboratory go into effect at the session startup.

You can customize which printers appear to users when they change locations. You can also control whether users can print to local printers, how much bandwidth is consumed when users connect remotely, and other aspects of their printing experiences.

For information about enabling and configuring workspace control for users, see the StoreFront documentation.

### Session roaming

By default, sessions roam between client devices with the user. When the user launches a session and then moves to another device, the same session is used and applications are available on both devices. The applications follow, regardless of the device or whether current sessions exist. In many cases, printers and other resources assigned to the application also follow.

While this default behavior offers many advantages, it might not be ideal in all cases. You can prevent session roaming using the PowerShell SDK.

Example 1: A medical professional is using two devices, completing an insurance form on a desktop PC, and looking at patient information on a tablet.

- If session roaming is enabled, both applications appear on both devices (an application launched on one device is visible on all devices in use). This might not meet security requirements.
• If session roaming is disabled, the patient record does not appear on the desktop PC, and the insurance form does not appear on the tablet.

Example 2: A production manager launches an application on the PC in his office. The device name and location determine which printers and other resources are available for that session. Later in the day, he goes to an office in the next building for a meeting that will require him to use a printer.

• If session roaming is enabled, the production manager would probably be unable to access the printers near the meeting room, because the applications he launched earlier in his office resulted in the assignment of printers and other resources near that location.

• If session roaming is disabled, when he logs on to a different machine (using the same credentials), a new session is started, and nearby printers and resources will be available.

**Configure session roaming**

To configure session roaming, use the following entitlement policy rule cmdlets with the “SessionReconnection” property. Optionally, you can also specify the “LeasingBehavior” property.

For desktop sessions:

```powershell
Set-BrokerEntitlementPolicyRule <Delivery-Group-name> -SessionReconnection <value> -LeasingBehavior Allowed|Disallowed
```

For application sessions:

```powershell
Set-BrokerAppEntitlementPolicyRule <Delivery-Group-name> -SessionReconnection <value> -LeasingBehavior Allowed|Disallowed
```

Where `value` can be one of the following:

- **Always**: Sessions always roam, regardless of the client device and whether the session is connected or disconnected. This is the default value.

- **DisconnectedOnly**: Reconnect only to sessions that are already disconnected; otherwise, launch a new session. (Sessions can roam between client devices by first disconnecting them, or using Workspace Control to explicitly roam them.) An active connected session from another client device is never used; instead, a new session is launched.

- **SameEndpointOnly**: A user gets a unique session for each client device they use. This completely disables roaming. Users can reconnect only to the same device that was previously used in the session.

The “LeasingBehavior” property is described below.

**Effects from other setting:**

Disabling session roaming is affected by the application limit “Allow only one instance of the application per user” in the application’s properties in the Delivery Group.

- If you disable session roaming, then disable the “Allow only one instance …” application limit.
If you enable the “Allow only one instance ...” application limit, do not configure either of the two values that allow new sessions on new devices.

**Logon interval**

If a virtual machine containing a desktop VDA closes before the logon process completes, you can allocate more time to the process. The default for 7.6 and later versions is 180 seconds (the default for 7.0-7.5 is 90 seconds).

On the machine (or the master image used in a machine catalog), set the following registry key:

**Key:** `HKLM\SOFTWARE\Citrix\PortICA`

- **Value:** `AutoLogonTimeout`
- **Type:** DWORD
- **Specify a decimal time in seconds, in the range 0-3600.**

If you change a master image, update the catalog.

This setting applies only to VMs with desktop (workstation) VDAs. Microsoft controls the logon timeout on machines with server VDAs.

**Use Search in Studio**

December 18, 2019

Use the Search feature to view information about specific machines, sessions, machine catalogs, applications, or Delivery Groups.

1. Select **Search** in the Studio navigation pane.
   
   You cannot search within the machine catalogs or Delivery Groups tabs using the Search box. Use the Search node in the navigation pane.
   
   To display additional search criteria in the display, click the plus sign next to the Search dropdown fields. Remove search criteria by clicking the minus button.

2. Enter the name or use the drop-down list to select another search option for the item you want to find.

3. Optionally, save your search by selecting **Save as**. The search appears in the **Saved searches** list.

Alternatively, click the **Expand Search** icon (dual downward angle brackets) to display a menu of search properties. You can perform an advanced search by building an expression from the properties in the menu.
Tips to enhance a search:

- To display additional characteristics to include in the display on which you can search and sort, right click any column and select Select columns.
- To locate a user device connected to a machine, use Client (IP) and Is, and enter the device IP address.
- To locate active sessions, use Session State, Is, and Connected.
- To list all of the machines in a Delivery Group, select Delivery Groups in the navigation pane, then select the group, and then select View Machines in the Actions pane.

**Tags**

January 14, 2020

**Introduction**

Tags are strings that identify items such as machines, applications, desktops, Delivery Groups, Application Groups, and policies. After creating a tag and adding it to an item, you can tailor certain operations to apply to only items that have a specified tag.

- Tailor search displays in Studio.

  For example, to display only applications that have been optimized for testers, create a tag named “test” and then add (apply) it to those applications. You can now filter the Studio search with the tag “test”.

- Publish applications from an Application Group or specific desktops from a Delivery Group, considering only a subset of the machines in selected Delivery Groups. This is called a tag restriction.

With tag restrictions, you can use your existing machines for more than one publishing task, saving the costs associated with deploying and managing additional machines. A tag restriction can be thought of as subdividing (or partitioning) the machines in a Delivery Group. Its functionality is similar, but not identical, to worker groups in XenApp releases earlier than 7.x.

Using an Application Group or desktops with a tag restriction or can be helpful when isolating and troubleshooting a subset of machines in a Delivery Group.

- Schedule periodic restarts for a subset of machines in a Delivery Group.

Using a tag restriction for machines enables you to use new PowerShell cmdlets to configure multiple restart schedules for subsets of machines in a Delivery Group. For examples and details, see Manage Delivery Groups.
• Tailor the application (assignment) of Citrix policies to a subset of machines in Delivery Groups, Delivery Group types, or OUs that have (or do not have) a specified tag.

For example, if you want to apply a Citrix policy only to the more powerful workstations, add a tag named “high power” to those machines. Then, on the Assign Policy page of the Create Policy wizard, select that tag and also the Enable checkbox. You can also add a tag to a Delivery Group and then apply a Citrix policy to that group. For details, see Create policies and this blog post. (The Studio interface for adding a tag to a machine has changed since the blog post was published.)

You can apply tags to:

• Machines
• Applications
• Machine catalogs (PowerShell only; see Tags on machine catalogs)
• Delivery Groups
• Application Groups

You can configure a tag restriction can be configured when creating or editing the following in Studio:

• A desktop in a shared Delivery Group
• An Application Group

**Tag restrictions for a desktop or an Application Group**

A tag restriction involves several steps:

• Create the tag and then add (apply) it to machines.
• Create or edit a group with the tag restriction (in other words, “restrict launches to machines with tag x”).

A tag restriction extends the broker’s machine selection process. The broker selects a machine from an associated Delivery Group subject to access policy, configured user lists, zone preference, and launch readiness, plus the tag restriction (if present). For applications, the broker falls back to other Delivery Groups in priority order, applying the same machine selection rules for each considered Delivery Group.

**Example 1: Simple layout**

This example introduces a simple layout that uses tag restrictions to limit which machines will be considered for certain desktop and application launches. The site has one shared Delivery Group, one published desktop, and one Application Group configured with two applications.
• Tags have been added to each of the three machines (VDA 101-103).
• The desktop in the shared Delivery Group was created with a tag restriction named “Red,” so that desktop can be launched only on machines in that Delivery Group that have the tag “Red”: VDA 101 and 102.
• The Application Group was created with the “Orange” tag restriction, so each of its applications (Calculator and Notepad) can be launched only on machines in that Delivery Group that have the tag “Orange”: VDA 102 and 103.

Machine VDA 102 has both tags (Red and Orange), so it can be considered for launching the applications and the desktop.

**Example 2: More complex layout**

This example contains several Application Groups that were created with tag restrictions. This results in the ability to deliver more applications with fewer machines than would otherwise be needed if you used only Delivery Groups.

How to configure example 2 shows the steps used to create and apply the tags, and then configure the tag restrictions in this example.
This example uses ten machines (VDA 101-110), one Delivery Group (D01), and three Application Groups (A100, A200, A300). By applying tags to each machine and then specifying tag restrictions when creating each Application Group:

- Accounting users in the group can access the apps they need on five machines (VDA 101–105)
- CAD designers in the group can access the apps they need on five machines (VDA 106-110)
- Users in the group who need Office applications can access the Office apps on ten machines (VDA 101-110)

Only ten machines are used, with only one Delivery Group. Using Delivery Groups alone (without Application Groups) would require twice as many machines, because a machine can belong to only one Delivery Group.

**Manage tags and tag restrictions**

Tags are created, added (applied), edited, and deleted from selected items through the Manage Tags action in Studio.

(Exception: Tags used for policy assignments are created, edited, and deleted through the Manage Tags action in Studio; however, tags are applied (assigned) when you create the policy. See Create policies for details.)
Tag restrictions are configured when you create or edit desktops in Delivery Groups, and when you create and edit Application Groups.

**Use the Manage Tags dialogs in Studio**

In Studio, select the items you want to apply a tag to (one or more machines, applications, a desktop, a Delivery Group, or an Application Group) and then select **Manage Tags** in the Actions pane. The Manage Tags dialog box lists all the tags that have been created in the Site, not just for the items you selected.

- A check box containing a check mark indicates that tag has already been added to the selected items. (In the screen capture below, the selected machine has the tag named “Tag1” applied.)
- If you selected more than one item, a check box containing a hyphen indicates that some, but not all selected items have that tag added.

![Manage Tags Dialog Box](https://example.com/monitor.png)
The following actions are available from the Manage Tags dialog box. Be sure to review Cautions when working with tags.

- **To create a tag:**
  Click Create. Enter a name and description. Tag names must be unique and are not case-sensitive. Then click OK. (Creating a tag does not automatically apply it to any items you have selected. Use the check boxes to apply the tag.)

- **To add (apply) one or more tags:**
  Enable the check box next to the tag name. If you selected multiple items and the check box next to a tag contains a hyphen (indicating that some, but not all selected items already have the tag applied), changing it to a check mark affects all of the selected machines.
  If you attempt to add a tag to one or more machines, and that tag is currently used as a restriction in an Application Group, you are warned that the action can result in making those machines available for launch. If that’s what you intended, proceed.

- **To remove one or more tags:**
  Clear the checkbox next to the tag name. If you selected multiple items and the checkbox next to a tag contains a hyphen (indicating that some, but not all selected items already have the tag applied), clearing the checkbox removes the tag from all of the selected machines.
  If you attempt to remove a tag from a machine that is using that tag as a restriction, you are warned that the action can affect which machines are considered for launch. If that’s what you intended, proceed.

- **To edit a tag:**
  Select a tag and then click Edit. Enter a new name and/or description. You can edit only one tag at a time.

- **To delete one or more tags:**
  Select the tags and then click Delete. The Delete Tag dialog box indicates how many items currently use the selected tags (for example “2 machines”). Click an item to display more information. For example, clicking a “2 machines” item displays the names of the two machines that have that tag applied. Confirm whether you want to delete the tags.
  You cannot use Studio to delete a tag that is used as a restriction. You must first edit the Application Group and remove the tag restriction or select a different tag.

When you’re done in the Manage Tags dialog box, click Save.

To see if a machine has any tags applied: Select Delivery Groups in the navigation pane. Select a Delivery Group in the middle pane and then select View Machines in the Actions pane. Select a machine in the middle pane and then select the Tags tab on the Details pane below.
Manage tag restrictions

Configuring a tag restriction is a multi-step process: You first create the tag and add/apply it to machines. Then, you add the restriction to the Application Group or the desktop.

- **Create and apply the tag:**
  
  Create the tag and then add (apply) it to the machines that will be affected by the tag restriction, using the Manage Tags actions described above.

- **To add a tag restriction to an Application Group:**
  
  Create or edit the Application Group. On the Delivery Groups page, select Restrict launches to machines with the tag and then select the tag from the dropdown.

- **To change or remove the tag restriction on an Application Group:**
  
  Edit the group. On the Delivery Groups page, either select a different tag from the dropdown or remove the tag restriction entirely by clearing Restrict launches to machines with the tag.

- **To add a tag restriction to a desktop:**
  
  Create or edit a Delivery Group. Click Add or Edit on the Desktops page. In the Add Desktop dialog box, select Restrict launches to machines with the tag and then select the tag from the menu.

- **To change or remove the tag restriction on a Delivery Group:**
  
  Edit the group. On the Desktops page, click Edit. In the dialog box, either select a different tag from the dropdown or remove the tag restriction entirely by clearing Restrict launches to machines with the tag.

Cautions when working with tags

A tag applied to an item can be used for different purposes, so keep in mind that adding, removing, and deleting a tag can have unintended effects. You can use a tag to sort machine displays in the Studio search field. You can use the same tag as a restriction when configuring an Application Group or a desktop, which will limit launch consideration to only machines in specified Delivery Groups that have that tag.

If you attempt to add a tag to one or more machines after that tag has been configured as a tag restriction for a desktop or an Application Group, Studio warns you that adding that tag might make the machines available for launching additional applications or desktops. If that is what you intended, proceed. If not, you can cancel the operation.

For example, let’s say you create an Application Group with the “Red” tag restriction. Later, you add several other machines in the same Delivery Groups used by that Application Group. If you then attempt to add the “Red” tag to those machines, Studio will display a message similar to: “The tag "Red"
is used as a restriction on the following Application Groups. Adding this tag might make the selected machines available to launch applications in this Application Group.” You can then confirm or cancel adding that tag to those additional machines.

Similarly, if a tag is being used in an Application Group to restrict launches, Studio warns that you cannot delete the tag until you remove it as a restriction by editing the group. (If you were allowed to delete a tag that’s used as a restriction in an Application Group, that could result in allowing applications to launch on all machines in the Delivery Groups associated with the Application Group.) The same prohibition against deleting a tag applies if the tag is currently being used as a restriction for desktop launches. After you edit the Application Group or desktops in the Delivery Group to remove that tag restriction, you can delete the tag.

All machines may not have the same sets of applications. A user may belong to more than one Application Group, each with a different tag restriction and different or overlapping sets of machines from Delivery Groups. The following table lists how machine considerations are decided.

<table>
<thead>
<tr>
<th>When an application has been added to</th>
<th>These machines in the selected Delivery Groups are considered for launch</th>
</tr>
</thead>
<tbody>
<tr>
<td>One Application Group with no tag restriction</td>
<td>Any machine</td>
</tr>
<tr>
<td>One Application Group with tag restriction A</td>
<td>Machines that have tag A applied</td>
</tr>
<tr>
<td>Two Application Groups, one with tag restriction A and the other with tag restriction B</td>
<td>Machines that have tag A and tag B; if none are available, then machines that have tag A or tag B</td>
</tr>
<tr>
<td>Two Application Groups, one with tag restriction A and the other with no tag restriction</td>
<td>Machines that have tag A; if none are available, then any machine</td>
</tr>
</tbody>
</table>

If you used a tag restriction in a machine restart schedule, any changes you make that affect tag applications or restrictions affect the next machine restart cycle. It does not affect any restart cycles that is in progress while the changes are being made.

**How to configure example 2**

The following sequence shows the steps to create and apply tags, and then configure tag restrictions for the Application Groups illustrated in the second example above.

VDAs and applications have already been installed on the machines and the Delivery Group has been created.

Create and apply tags to the machines:
1. In Studio, select Delivery Group D01 and then select View Machines in the Action pane.
2. Select machines VDA 101-105 and then select Manage Tags in the Actions pane.
3. In the Manage Tags dialog box, click Create and then create a tag named CADApps. Click OK.
4. Click Create again and create a tag named OfficeApps. Click OK.
5. While still in the Manage Tags dialog box, add (apply) the newly-created tags to the selected machines by enabling the check boxes next to each tag’s name (CADApps and OfficeApps), and then close the dialog box.
6. Select Delivery Group D01, select View Machines in the Action pane.
7. Select machines VDA 106-110 and then select Manage Tags in the Actions pane.
8. In the Manage Tags dialog box, click Create and then create a tag named AcctgApps. Click OK.
9. Apply the newly-created AcctgApps tag and the OfficeApps tag to the selected machines by clicking the check boxes next to each tag’s name, and then close the dialog box.

Create the Application Groups with tag restrictions.

1. In Studio, select Applications in the navigation pane and then select Create Application Group in the Actions pane. The Create Application Group wizard launches.
2. On the Delivery Groups page of the wizard, select Delivery Group D01. Select Restrict launches to machines with tag and then select the AcctgApps tag from the dropdown.
3. Complete the wizard, specifying the accounting users and the accounting applications. (When adding the application, choose the “From Start menu” source, which will search for the application on the machines that have the AcctgApps tag.) On the Summary page, name the group A100.
4. Repeat the preceding steps to create Application Group A200, specifying machines that have the CADApps tag, plus the appropriate users and applications.
5. Repeat steps to create Application Group A300, specifying machines that have the OfficeApps tag, plus the appropriate users and applications.

Tags on machine catalogs

You can use tags on machine catalogs. The overall sequence of creating a tag and then applying it to a catalog is the same as described previously. However, applying tags to catalogs is supported only through the PowerShell interface. You cannot use Studio to apply a tag to a catalog or remove a tag from a catalog. Catalog displays in Studio do not indicate if a tag is applied.

Summary: You can use Studio or PowerShell to create or delete a tag for use on a catalog. You must use PowerShell to apply the tag to the catalog.

Here are some examples of using tags with catalogs:

- A Delivery Group has machines from several catalogs, but you want an operation (such as a restart schedule) to affect only the machines in a specific catalog. Applying a tag to that catalog accomplishes that.
• In an Application Group, you want to limit application sessions to machines in a specific catalog. Applying a tag to that catalog accomplishes that.

Affected PowerShell cmdlets:

• You can pass catalog objects to cmdlets such as Add-BrokerTag and Remove-BrokerTag.
• Get-BrokerTagUsage shows how many catalogs contain tags.
• Get-BrokerCatalog has a property named Tags.

For example, the following cmdlets add a tag named fy2018 to the catalog named acctg:
Get-BrokerCatalog -Name acctg | Add-BrokerTag fy2018. (The tag was previously created using either Studio or PowerShell.)

See the PowerShell cmdlet help for additional guidance and syntax.

More information

Blog post: How to assign desktops to specific servers.

IPv4/IPv6 support

July 23, 2020

This release supports pure IPv4, pure IPv6, and dual-stack deployments that use overlapping IPv4 and IPv6 networks.

The following components support only IPv4. All others support IPv4 and IPv6.

• Citrix Provisioning
• Citrix Hypervisor
• Virtual Delivery Agents (VDAs) not controlled by the **Only use IPv6 Controller registration** policy setting

IPv6 communications are controlled with two VDA connection-related Citrix policy settings.

• **Primary setting that enforces the use of IPv6:** Only use IPv6 Controller registration.

  This policy setting controls which form of address the VDA uses to register with the Delivery Controller.

  When enabled, the VDA registers and communicates with the Controller using a single IPv6 address chosen in the following precedence: global IP address, Unique Local Address (ULA), link-local address (only if no other IPv6 addresses are available).

  When disabled, the VDA registers and communicates with the Controller using the machine's IPv4 address. This is the default value.
If a team frequently uses an IPv6 network, publish the desktops and applications for those users based on an image or Organizational Unit (OU) that has the **Only use IPv6 Controller registration** policy setting enabled.

If a team frequently uses an IPv4 network, publish the desktops and applications for those users based on an image or OU that has the **Only use IPv6 Controller registration** policy setting disabled.

- **Dependent setting that defines an IPv6 netmask:** Controller registration IPv6 netmask.

  A machine can have multiple IPv6 addresses. This policy setting allows administrators to restrict the VDA to only a preferred subnet, rather than a global IP, if one is registered. This setting specifies the network where the VDA registers. The VDA registers only on the first address that matches the specified netmask.

  This setting is valid only when the *Only use IPv6 Controller registration policy setting is enabled.*

  Default = Empty string

**Deployment considerations**

If your environment contains both IPv4 and IPv6 networks, create separate delivery group configurations for IPv4-only clients and for the clients who can access the IPv6 network. Consider using naming, manual Active Directory group assignment, or SmartAccess filters to differentiate users.

Session reconnection might fail if the connection starts on an IPv6 network, and then you try to connect again from a client that has only IPv4 access.

**User profiles**

July 23, 2020

By default, Citrix Profile Management is installed silently on master images when you install the Virtual Delivery Agent, but you do not have to use Profile Management as a profile solution.

To suit your users’ varying needs, you can use Citrix Virtual Apps and Desktops policies to apply different profile behavior to the machines in each Delivery Group. For example, one Delivery Group might require Citrix mandatory profiles, whose template is stored in one network location, while another Delivery Group requires Citrix roaming profiles stored in another location with several redirected folders.

- If other administrators in your organization are responsible for Citrix Virtual Apps and Desktops policies, work with them to ensure that they set any profile-related policies across your Delivery Groups.
Profile Management policies can also be set in Group Policy, in the Profile Management .ini file, and locally on individual virtual machines. These multiple ways of defining profile behavior are read in the following order:

1. Group Policy (.adm or .admx files)
2. Citrix Virtual Apps and Desktops policies in the Policy node
3. Local policies on the virtual machine that the user connects to
4. Profile Management .ini file

For example, if you configure the same policy in both Group Policy and the Policy node, the system reads the policy setting in Group Policy and ignores the Citrix Virtual Apps and Desktops policy setting.

Whichever profile solution you choose, Director administrators can access diagnostic information and troubleshoot user profiles. For more information, see the Director documentation.

**Automatic configuration**

The desktop type is automatically detected, based on the Virtual Delivery Agent installation and, in addition to the configuration choices you make in Studio, sets Profile Management defaults accordingly.

The policies that Profile Management adjusts are shown in the following table. Any non-default policy settings are preserved and are not overwritten by this feature. Consult the Profile Management documentation for information about each policy. The types of machines that create profiles affect the policies that are adjusted. The primary factors are whether machines are persistent or provisioned, and whether they are shared by multiple users or dedicated to just one user.

Persistent systems have some type of local storage, the contents of which can be expected to persist when the system turns off. Persistent systems might employ storage technology such as SANs to provide local disk mimicking. In contrast, provisioned systems are created “on the fly” from a base disk and some type of identity disk. Local storage is usually mimicked by a RAM disk or network disk, the latter often provided by a SAN with a high speed link. The provisioning technology is generally Citrix Provisioning or Machine Creation Services (or a third-party equivalent). Sometimes provisioned systems have persistent local storage. These are classed as persistent.

Together, these two factors define the following machine types:

- **Both persistent and dedicated** – Examples are single-session OS machines with a static assignment and persistent local storage that are created with Machine Creation Services, desktops with persistent storage that are created with VDI-in-a-Box, physical workstations, and laptops
- **Both persistent and shared** – Examples are Multi-session OS machines that are created with Machine Creation Services
• **Both provisioned and dedicated** – Examples are Single-session OS machines with a static assignment but without persistent storage that are created with Citrix Provisioning

• **Both provisioned and shared** – Examples are Single-session OS machines with a random assignment that are created with Citrix Provisioning and desktops without persistent storage that are created with VDI-in-a-Box

The following Profile Management policy settings are suggested guidelines for the different machine types. They work well in most cases, but you might want to deviate from them as your deployment requires.

**Important:**

**Delete locally cached profiles on logoff, Profile streaming, and Always cache** are enforced by the auto-configuration feature. Adjust the other policies manually.

### Persistent machines

<table>
<thead>
<tr>
<th>Policy</th>
<th>Both persistent and dedicated</th>
<th>Both persistent and shared</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete locally cached profiles on logoff</td>
<td>Disabled</td>
<td>Enabled</td>
</tr>
<tr>
<td>Profile streaming</td>
<td>Disabled</td>
<td>Enabled</td>
</tr>
<tr>
<td>Always cache</td>
<td>Enabled (note 1)</td>
<td>Disabled (note 2)</td>
</tr>
<tr>
<td>Active write back</td>
<td>Disabled</td>
<td>Disabled (note 3)</td>
</tr>
<tr>
<td>Process logons of local administrators</td>
<td>Enabled</td>
<td>Disabled (note 4)</td>
</tr>
</tbody>
</table>

### Provisioned machines

<table>
<thead>
<tr>
<th>Policy</th>
<th>Both provisioned and dedicated</th>
<th>Both provisioned and shared</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete locally cached profiles on logoff</td>
<td>Disabled (note 5)</td>
<td>Enabled</td>
</tr>
<tr>
<td>Profile streaming</td>
<td>Enabled</td>
<td>Enabled</td>
</tr>
<tr>
<td>Always cache</td>
<td>Disabled (note 6)</td>
<td>Disabled</td>
</tr>
<tr>
<td>Active write back</td>
<td>Enabled</td>
<td>Enabled</td>
</tr>
<tr>
<td>Process logons of local administrators</td>
<td>Enabled</td>
<td>Enabled (note 7)</td>
</tr>
</tbody>
</table>
1. Because **Profile streaming** is disabled for this machine type, the **Always cache** setting is always ignored.

2. Disable **Always cache**. However, you can ensure that large files are loaded into profiles as soon as possible after logon by enabling this policy and using it to define a file size limit (in MB). Any file this size or larger is cached locally as soon as possible.

3. Disable **Active write back** except to save changes in profiles of users who roam between Citrix Virtual Apps servers. In this case, enable this policy.

4. Disable **Process logons of local administrators** except for Hosted Shared Desktops. In this case, enable this policy.

5. Disable **Delete locally cached profiles on logoff**. This setting retains locally cached profiles. Because the machines are reset at logoff but are assigned to individual users, logons are faster if their profiles are cached.

6. Disable **Always cache**. However, you can ensure that large files are loaded into profiles as soon as possible after logon by enabling this policy and using it to define a file size limit (in MB). Any file this size or larger is cached locally as soon as possible.

7. Enable **Process logons of local administrators** except for profiles of users who roam between Citrix Virtual Apps and Desktops servers. In this case, disable this policy.

**Folder redirection**

Folder redirection lets you store user data on network shares other than the location where the profiles are stored. Folder redirection reduces profile size and load time but it might impact network bandwidth. Folder redirection does not require that Citrix user profiles are employed. You can choose to manage user profiles on your own, and still redirect folders.

Configure folder redirection using Citrix policies in Studio.

- Ensure that the network locations used to store the contents of redirected folders are available and have the correct permissions. The location properties are validated.
- Redirected folders are set up on the network and their contents populated from users’ virtual desktops at logon.

Configure folder redirection using only Citrix Policies or Active Directory Group Policy Objects, not both. Configuring folder redirection using both policy engines might result in unpredictable behavior.

**Advanced folder redirection**

In deployments with multiple operating systems (OSs), you might want some of a user’s profile to be shared by each OS. The rest of the profile is not shared and is used only by one OS. To ensure a consistent user experience across the OSs, you need a different configuration for each OS, that is, advanced folder redirection. For example, different versions of an application running on two OSs might need to read or edit a shared file, so you decide to redirect it to a single network location where both versions
can access it. Alternatively, because the Start Menu folder contents are structured differently in two OSs, you decide to redirect only one folder, not both. This approach separates the Start Menu folder and its contents on each OS, ensuring a consistent experience for users.

If your deployment requires advanced folder redirection, you must understand the structure of your users' profile data and determine which parts of it can be shared between OSs. Unpredictable behavior can result unless folder redirection is used correctly.

To redirect folders in advanced deployments:

- Use a separate Delivery Group for each OS.
- Understand where your virtual applications, including those on virtual desktops, store user data and settings, and understand how the data is structured.
- For shared profile data that can safely roam (because it is structured identically in each OS), redirect the containing folders in each Delivery Group.
- For non-shared profile data that cannot roam, redirect the containing folder in only one of the Desktop Groups, typically the one with the most used OS or the one where the data is most relevant. Alternatively, for non-shared data that cannot roam between OSs, redirect the containing folders on both systems to separate network locations.

Example advanced deployment

The deployment has applications, including versions of Microsoft Outlook and Internet Explorer, running on Windows 10 desktops and applications, including other versions of Outlook and Internet Explorer, delivered by Windows Server 2019. You have already set up two Delivery Groups for the two OSs. Users want to access the same set of Contacts and Favorites in both versions of the two applications.

Important: The following decisions and advice are valid for the OSs and deployment described. In your organization, the folders you choose to redirect and whether your decide to share them depend on various factors that are unique to your specific deployment.

- Using policies applied to the Delivery Groups, you choose the following folders to redirect.

<table>
<thead>
<tr>
<th>Folder</th>
<th>Redirected in Windows 10?</th>
<th>Redirected in Windows Server 2019?</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Documents</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Application Data</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Contacts</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Desktop</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Downloads</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>
For the shared, redirected folders:

- After analyzing the structure of the data saved by the different versions of Outlook and Internet Explorer, you decide it is safe to share the Contacts and Favorites folders.
- You know the structure of the My Documents, My Music, My Pictures, and My Videos folders is standard across OSs. So it is safe to store these folders in the same network location for each Delivery Group.

For the non-shared, redirected folders:

- You do not redirect the Desktop, Links, Searches, or Start Menu folder in the Windows Server Delivery Group because data in these folders is organized differently in the two OSs. It therefore cannot be shared.
- To ensure predictable behavior of this non-shared data, you redirect it only in the Windows 10 Delivery Group. Windows 10 are used more often by users in their day-to-day work. Users only occasionally access the applications delivered by the Windows Server. Also, in this case the non-shared data is more relevant to a desktop environment rather than an application environment. For example, desktop shortcuts are stored in the Desktop folder and might be useful if they originate from a Windows 10 machine but not from a Windows Server machine.

For the non-redistributed folders:

- You do not want to clutter your servers with users' downloaded files, so you choose not to redirect the Downloads folder
- Data from individual applications can cause compatibility and performance issues, so you decide not to redirect the Application Data folder
Folder redirection and exclusions

In Citrix Profile Management (but not in Studio), a performance enhancement allows you to prevent folders from being processed using exclusions. If you use this feature, do not exclude any redirected folders. The folder redirection and exclusion features work together. Ensuring no redirected folders are excluded allows Profile Management to move them back into the profile folder structure and preserves data integrity if you later decide not to redirect them. For more information on exclusions, see Include and exclude items.

Collect a Citrix Diagnostic Facility (CDF) trace at system startup

December 18, 2019

The CDFControl utility is an event tracing controller or consumer for capturing Citrix Diagnostic Facility (CDF) trace messages displayed from various Citrix tracing providers. It is made to troubleshoot complex Citrix related issues, parse filter support, and collect performance data. To download the CDFControl utility, see CTX111961.

Use the Local System account

To use the Local System account for the CDF COM server service, complete the following steps:

1. Click **Run** from the **Start** menu.
2. Type **services.msc** in the dialog box and click **OK**.
3. Select the **Citrix Diagnostics Facility COM Server** service and choose **Properties**.
4. Click the **Log On** tab and enable the **Local System** account. Then click **OK**.
5. Restart the service.

**Collect a trace at system startup**

To collect a CDF trace at system startup, refer to the procedure:

1. Start **CDFControl** and select **Options** from the **Tools** menu.
2. Specify the trace file path in the **Startup trace file path for capturing startup trace** section. Then click **Save**.
3. Select the **Trace Categories** as recommended by Citrix Technical Support. In this example, **Citrix Policies** is selected.

The **Citrix Policies** selection below is shown only as an example of startup tracing. We recommend that you enable the providers for the specific issue you are troubleshooting.
4. With administrator privileges, select **Startup Tracing** and click **Enable** from the **Tools** menu. After selecting **Enable**, the animated bar starts scrolling. This does not affect the procedure. Continue to Step 5.

5. Close the **CDFControl utility** and restart the system after the **Startup Tracing** is enabled.

6. Start the **CDFControl** utility. After the system restarts and the error appears, disable the **Startup Tracing** option by selecting **Disable**.

    Disable the **Startup Tracing** option by selecting Startup Tracing from the **Tools** menu and clicking **Disable** as described in Steps 4 and 5.

7. Stop the **Citrix Diagnostics Facility COM** server service.

8. Collect the trace log file (.etl) for analysis in the specified file path by following the Steps 1 and 2.

9. Start the **Citrix Diagnostics Facility COM** server service.

### Citrix Insight Services

December 18, 2019

Citrix Insight Services (CIS) is a Citrix platform for instrumentation, telemetry, and business insight generation. Its instrumentation and telemetry capabilities enable technical users (customers, part-
ners, and engineers) to self-diagnose and fix problems and optimize their environments. For details and the latest information about CIS and how it works, see https://cis.citrix.com (Citrix account credentials required).

All information uploaded to Citrix is used for troubleshooting and diagnostic purposes, and improving the quality, reliability, and performance of products, subject to:

- Citrix Insight Services Policy at https://cis.citrix.com/legal
- Citrix Privacy Policy at https://www.citrix.com/about/legal/privacy.html

This Citrix Virtual Apps and Desktops release supports the following technologies.

- Citrix Virtual Apps and Desktops install and upgrade analytics
- Citrix Customer Experience Improvement Program (CEIP)
- Citrix Call Home
- Citrix Scout

In addition to (and separate from) CIS and Citrix Analytics: Google Analytics are collected (and later uploaded) automatically when you install (or upgrade) Studio. After installing Studio, you can change this setting with the registry key HKLM\Software\Citrix\DesktopStudio\GAEnabled. A value of 1 enables collection and upload, 0 disables collection and upload.

**Install and upgrade analytics**

When you use the full-product installer to deploy or upgrade Citrix Virtual Apps and Desktops components, anonymous information about the installation process is gathered and stored on the machine where you are installing/upgrading the component. This data is used to help Citrix improve its customers’ installation experiences. For more information, see https://more.citrix.com/XD-INSTALLER.

The information is stored locally under %ProgramData%\Citrix\CTQs.

Automatic upload of this data is enabled by default in both the graphical and command line interfaces of the full-product installer.

- You can change the default value in a registry setting. If you change the registry setting before installing/upgrading, that value is used when you use the full-product installer.
- You can override the default setting if you install/upgrade with the command line interface by specifying an option with the command.

**Control automatic uploads:**

- Registry setting that controls automatic upload of install/upgrade analytics (default = 1):
  - Location: HKLM\Software\Citrix\MetaInstall
  - Name: SendExperienceMetrics
  - Value: 0 = disabled, 1 = enabled
• Using PowerShell, the following cmdlet disables automatic upload of install/upgrade analytics:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\MetaInstall -Name SendExperienceMetrics -PropertyType DWORD -Value 0
```

• To disable automatic uploads with the XenDesktopServerSetup.exe or XenDesktopVDASetup.exe command, include the `/disableexperiencemetrics` option.

To enable automatic uploads with the XenDesktopServerSetup.exe or XenDesktopVDASetup.exe command, include the `/sendexperiencemetrics` option.

### Citrix Customer Experience Improvement Program

When you participate in the Citrix Customer Experience Improvement Program (CEIP), anonymous statistics and usage information are sent to Citrix to help Citrix improve the quality and performance of Citrix products. For more information, see [https://more.citrix.com/XD-CEIP](https://more.citrix.com/XD-CEIP).

### Enrollment during Site creation or upgrade

You are automatically enrolled in CEIP when you create a Site (after you install the first Delivery Controller). The first upload of data occurs approximately seven days after you create the Site. You can stop your participation at any time after creating the Site. Select the **Configuration** node in the Studio navigation pane (**Product Support** tab) and follow the guidance.

When you upgrade a Citrix Virtual Apps and Desktops deployment:

- If you upgrade from a version that did not support CEIP, you are asked if you want to participate.
- If you upgrade from a version that supported CEIP, and participation was enabled, CEIP is enabled in the upgraded Site.
- If you upgrade from a version that supported CEIP, and participation was disabled, CEIP is disabled in the upgraded Site.
- If you upgrade from a version that supported CEIP, and participation is unknown, you are asked if you want to participate.

The collected information is anonymous, so it cannot be viewed after it is uploaded to Citrix Insight Services.

### Enrollment when installing a VDA

By default, you are automatically enrolled in CEIP when you install a Windows VDA. You can change this default in a registry setting. If you change the registry setting before installing the VDA, that value is used.
Registry setting that controls automatic enrolment in CEIP (default = 1):

Location: HKLM:\Software\Citrix\Telemetry\CEIP
Name: Enabled
Value: 0 = disabled, 1 = enabled

By default, the Enabled property is hidden in the registry. When it remains unspecified, the automatic upload feature is enabled.

Using PowerShell, the following cmdlet disables enrollment in CEIP:

```
1 New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\Telemetry\CEIP -Name Enabled -PropertyType DWORD -Value 0
```

The collected runtime datapoints are periodically written as files to an output folder (default %programdata%/Citrix/VdaCeip).

The first upload of data occurs approximately seven days after you install the VDA.

**Enrollment when installing other products and components**

You can also participate in CEIP when you install related Citrix products, components, and technologies, such as Citrix Provisioning, AppDNA, Citrix License Server, Citrix Workspace app for Windows, Universal Print Server, and Session Recording. See their documentation for details about installation and participation default values.

**Citrix Call Home**

When you install certain components and features in Citrix Virtual Apps and Desktops, you are offered the opportunity to participate in Citrix Call Home. Call Home collects diagnostic data and then periodically uploads telemetry packages containing that data directly to Citrix Insight Services (via HTTPS on default port 443) for analysis and troubleshooting.

In Citrix Virtual Apps and Desktops, Call Home runs as a background service under the name Citrix Telemetry Service. For more information, see [https://more.citrix.com/XD-CALLHOME](https://more.citrix.com/XD-CALLHOME).

The Call Home scheduling functionality is also available in Citrix Scout. For details, see [Citrix Scout](https://more.citrix.com/XD-CALLHOME).

**What is collected**

Citrix Diagnostic Facility (CDF) tracing logs information that can be useful for troubleshooting. Call Home collects a subset of CDF traces that can be helpful when troubleshooting common failures, for
example, VDA registrations and application/desktop launches. This technology is known as always-on tracing (AOT). AOT logs are saved to disk at C:\Users\CitrixTelemetryService\Appdata\Local\CitrixAOT.

Call Home does not collect any other Event Tracing for Windows (ETW) information, nor can it be configured to do so.

Call Home also collects other information, such as:

- Registries created by Citrix Virtual Apps and Desktops under HKEY_LOCAL_MACHINE\SOFTWARE\Citrix.
- Windows Management Instrumentation (WMI) information under the Citrix namespace.
- List of processes running.
- Crash dumps of Citrix processes that are stored in %PROGRAM/Data%\Citrix\CDF.
- Installation and upgrade information. This can include the full product metainstaller log, failing MSI logs, output from the MSI log analyzer, StoreFront logs, Licensing compatibility check logs, and results from preliminary site upgrade tests.

The trace information is compressed as it is collected. The Citrix Telemetry Service retains a maximum of 10 MB of compressed recent trace information, with a maximum time limit of eight days.

- Compressing data allows Call Home to maintain a small footprint on the VDA.
- Traces are held in memory to avoid IOPs on provisioned machines.
- The trace buffer uses a circular mechanism to retain traces in memory.

Call Home collects the key datapoints listed in Call Home key datapoints.

Configure and manage summary

You can enroll in Call Home when using the full-product installation wizard or later, using PowerShell cmdlets. When you enroll, by default, diagnostics are collected and uploaded to Citrix every Sunday at approximately 3:00 AM, local time. The upload is randomized with a two hour interval from the specified time. This means an upload using the default schedule occurs between 3:00 AM and 5:00 AM.

If you do not want to upload diagnostic information on a scheduled basis (or if you want to change a schedule), you can use PowerShell cmdlets to manually collect and upload diagnostics or store them locally.

When you enroll in scheduled Call Home uploads and when you manually upload diagnostic information to Citrix, you provide Citrix account or Citrix Cloud credentials. Citrix exchanges the credentials for an upload token that is used to identify the customer and upload the data. The credentials are not saved.

When an upload occurs, a notification is emailed to the address associated with the Citrix account.

If you enable Call Home when you install a component, you can disable it later.
Prerequisites

- The machine must be running PowerShell 3.0 or later.
- The Citrix Telemetry Service must be running on the machine.
- The system variable `PSModulePath` must be set to Telemetry's install path, for example, C:\Program Files\Citrix\Telemetry Service\.

Enable Call Home during component installation

**During VDA installation or upgrade:** When you install or upgrade a Virtual Delivery Agent using the graphical interface in the full-product installer, you are asked if you want to participate in Call Home. There are two options:

- Participate in Call Home.
- Do not participate in Call Home.

If you’re upgrading a VDA and previously enrolled in Call Home, that wizard page does not appear.

**During Controller installation or upgrade:** When you install or upgrade a Delivery Controller using the graphical interface, you are asked if you want to participate in Call Home. There are three options:

When you’re installing a Controller, you cannot configure information on the Call Home page in the installation wizard if that server has an Active Directory GPO with the policy setting “Log on as a service” applied. For details, see CTX218094.

If you’re upgrading a Controller and previously enrolled in Call Home, you’re not asked about participating.

PowerShell cmdlets

The PowerShell help provides comprehensive syntax, including descriptions of cmdlets and parameters that are not used in these common use cases.

To use a proxy server for uploads, see Configure a proxy server.

- **Enable scheduled uploads:** Diagnostic collections are automatically uploaded to Citrix. If you do not enter additional cmdlets for a custom schedule, the default schedule is used.

```
1 $cred = Get-Credential
2 Enable-CitrixCallHome -Credential $cred
```

To confirm that scheduled uploads are enabled, enter `Get-CitrixCallHomeGet-CitrixCallHome`. If enabled, the return is `IsEnabled=True` and `IsMasterImage=False`. 

© 1999-2020 Citrix Systems, Inc. All rights reserved.
• **Enable scheduled uploads for machines created from a master image:** Enabling scheduled uploads in a master image eliminates having to configure each machine that is created in the machine catalog.

    Enable-CitrixCallHome -Credential $cred -MasterImage

    To confirm that scheduled uploads are enabled, enter **Get-CitrixCallHome**. If enabled, the return is **IsEnabled=True** and **IsMasterImage=True**.

• **Create a custom schedule:** Create a daily or weekly schedule for diagnostic collections and uploads.

    $timespan = New-TimeSpan -Hours hours -Minutes minutes
    Set-CitrixCallHomeSchedule -TimeOfDay $timespan -DayOfWeek day -UploadFrequency { Daily|Weekly }

    **Examples:**

    The following cmdlet creates a schedule to bundle and upload data at 10:20 every evening. The Hours parameter uses a 24-hour clock. When the **UploadFrequency** parameter value is Daily, the **DayOfWeek** parameter is ignored, if specified.

    $timespan = New-TimeSpan -Hours 22 -Minutes 20
    Set-CitrixCallHomeSchedule -TimeOfDay $timespan -UploadFrequency Daily

    To confirm the schedule, enter **Get-CitrixCallHomeSchedule**. In the preceding example, it returns **StartTime=22:20:00**, **DayOfWeek=Sunday** (ignored), **Upload Frequency=Daily**.

    The following cmdlet creates a schedule to bundle and upload data at 10:20 every Wednesday evening.

    $timespan = New-TimeSpan -Hours 22 -Minutes 20
    Set-CitrixCallHomeSchedule -TimeOfDay $timespan -DayOfWeek Wed -UploadFrequency Weekly

    To confirm the schedule, enter **Get-CitrixCallHomeSchedule**. In the preceding example, it returns **StartTime=22:20:00**, **DayOfWeek=Wednesday**, **Upload Frequency=Weekly**.

**Disable Call Home**

You can disable Call Home using a PowerShell cmdlet or through Citrix Scout.
AOT logs are collected and saved to disk, even when Call Home scheduled uploads are disabled. (When scheduled uploads are disabled, AOT logs are not automatically uploaded to Citrix.) You can disable the collection and local storage of AOT logs.

Disable Call Home with PowerShell

After running the following cmdlet, diagnostic data will not be uploaded to Citrix automatically. (You can still upload diagnostic data using Citrix Scout or telemetry PowerShell cmdlets.)

`Disable-CitrixCallHome`

To confirm that Call Home is disabled, enter `Get-CitrixCallHome`. If disabled, the return is `IsEnabled=False` and `IsMasterImage=False`.

Disable a collection schedule using Citrix Scout

To disable a diagnostic collection schedule using Citrix Scout, follow the guidance in Schedule collections. In step 3, click Off to cancel the schedule for the selected machines.

Disable collection of AOT logs

After running the following cmdlet (with the Enabled field set to false), AOT logs will not be collected.

`Enable-CitrixTrace -Listen '{ "trace":{ "enabled":false, "persistDirectory":"C:\Users\Public"," maxSizeBytes":1000000, "sliceDurationSeconds":300 } }`.

The Listen parameter contains arguments in JSON format.

Configure a proxy server for Call Home uploads

Complete the following tasks on the machine where Call Home is enabled. Example diagrams in the following procedure contain server address and port 10.158.139.37:3128. Your information will differ.

1. Add proxy server information in your browser. In Internet Explorer, select Internet Options > Connections > LAN settings. Select Use a proxy server for your LAN” and enter the proxy server address and port number.

2. In PowerShell, run `netsh winhttp import proxy source=ie`.
3. Using a text editor, edit the TelemetryService.exe config file, which is located in C:\Program Files\Citrix\Telemetry Service. Add the information shown in the red box.

```xml
<startup>
  <supportedRuntime version="v4.0" sku=".NETFramework,Version=v4.5.1" />
</startup>
</runtime>
<assemblyBinding xmlns="urn:schemas-microsoft-com:asm.v1">
  <dependentAssembly>
    <assemblyIdentity name="Newtonsoft.Json" culture="neutral" publicKeyToken="397523f3b008b61a" />
    <bindingRedirect oldVersion="0.0.0-0.0.0.0" newVersion="0.0.0.0" />
  </dependentAssembly>
  <probing privatePaths="TelemetryModule" />
</assemblyBinding>
</runtime>
</configuration>
```

4. Restart the Telemetry Service.
Run the Call Home cmdlets in PowerShell.

**Manually collect and upload diagnostic information**

You can use the CIS website to upload a diagnostic information bundle to CIS. You can also use PowerShell cmdlets to collect and upload diagnostic information to CIS.

To upload a bundle using the CIS website:

1. Log on to Citrix Insight Services using your Citrix account credentials.
2. Select **My Workspace**.
3. Select **Healthcheck** and then navigate to the location of your data.

CIS supports several PowerShell cmdlets that manage data uploads. This documentation covers the cmdlets for two common cases:

- Use the **Start-CitrixCallHomeUpload** cmdlet to manually collect and upload a diagnostic information bundle to CIS. (The bundle is not saved locally.)
- Use the **Start-CitrixCallHomeUpload** cmdlet to manually collect data and store a diagnostic information bundle locally. This allows you to preview the data. Later, use the **Send-CitrixCallHomeBundle** cmdlet to manually upload a copy of that bundle to CIS. (The data you originally saved remains locally.)

The PowerShell help provides comprehensive syntax, including descriptions of cmdlets and parameters that are not used in these common use cases.
When you enter a cmdlet to upload data to CIS, you are prompted to confirm the upload. If the cmdlet times out before the upload completes, check the status of the upload in the system event log. The upload request might be rejected if the service is already performing an upload.

**Collect data and upload bundle to CIS:**

```bash
```

**Collect data and save it locally:**

```bash
1 Start-CitrixCallHomeUpload -OutputPath <String> [-InputPath string] [-Description string] [-IncidentTime string] [-SRNumber string] [-Name string] [-UploaderHeader string] [-AppendHeaders string] [-Collect strings] [<>CommonParameters>]
```

The following parameters are valid:

- **Credential**: Directs the upload to CIS.
- **InputPath**: Location of zip file to include in the bundle. This might be an additional file that Citrix Support requests. Be sure to include the .zip extension.
- **OutputPath**: Location where the diagnostic information is saved. This parameter is required when saving Call Home data locally.
- **Description and Incident Time**: Free form information about the upload.
- **SRNumber**: Citrix Technical Support incident number.
- **Name**: Name that identifies the bundle.
- **UploaderHeader**: JSON-formatted string specifying the upload headers uploaded to CIS.
- **AppendHeaders**: JSON-formatted string specifying the appended headers uploaded to CIS.
- **Collect**: JSON-formatted string specifying which data to collect or omit, in the form `{‘collector’:{‘enabled’:Boolean}}, where Boolean is true or false.
  Valid collector values are:
  - ‘wmi’
  - ‘process’
  - ‘registry’
  - ‘crashreport’
– ‘trace’
– ‘file’
– ‘msi’
– ‘locaadata’
– ‘sitedata’
– ‘sfb’

By default, all collectors except ‘sfb’ are enabled.

The ‘sfb’ collector is designed to be used on demand to diagnose Skype for Business issues. In addition to the ‘enabled’ parameter, the ‘sfb’ collector supports the ‘account’ and ‘accounts’ parameters to specify target users. Use one of the forms:

- “-Collect {‘sfb’:{‘account’:‘domain\user1’}}”
- “-Collect {‘sfb’:{‘accounts':[‘domain\user1’, ‘domain\user2’]}}”

• **Common Parameters**: See the PowerShell help.

**Upload data that was previously saved locally:**

Send-CitrixCallHomeBundle -Credential <PSCredential> -Path string [CommonParameters ]

The **Path** parameter specifies the location of the previously saved bundle.

**Examples:**

The following cmdlet requests an upload of Call Home data (excluding data from the WMI collector) to CIS. This data relates to registration failures of Citrix Provisioning VDAs, which were noted at 2:30 PM for Citrix Support case 123456. In addition to the Call Home data, the file “c:\Diagnostics\ExtraData.zip” is incorporated into the uploaded bundle.

```powershell
C:\PS>Start-CitrixCallHomeUpload -InputPath "c:\Diagnostics\ExtraData.zip" -Description "Registration failures with Citrix Provisioning VDAs" -IncidentTime "14:30" -SRNumber 123456 -Name "RegistrationFailure-021812016" -Collect '{
  'wmi':{
    'enabled':false
  }
} 
-UploadHeader 
"-key1':'value1' 
-AppendHeaders "
" -key2':'value2'
}"
```
The following cmdlet saves Call Home data related to Citrix Support case 223344, noted at 8:15 AM. The data saved in the file mydata.zip on a network share. In addition to the Call Home data, the file “c:\Diagnostics\ExtraData.zip” will be incorporated into the saved bundle.

```powershell
1 C:\PS>Start-CitrixCallHomeUpload -OutputPath \mynetwork\myshare\mydata.zip -InputPath "c:\Diagnostics\ExtraData.zip" -Description "Diagnostics for incident number 223344" -IncidentTime "8:15" -SRNumber 223344
```

The following cmdlet uploads the data bundle you saved earlier.

```powershell
1 $cred=Get-Credential
2 C:\PS>Send-CitrixCallHomeBundle -Credential $cred -Path \mynetwork\myshare\mydata.zip
```

**Citrix Scout**

August 20, 2020

**Introduction**

Citrix Scout collects diagnostics and runs health checks. You can use the results to maintain your Citrix Virtual Apps and Desktops deployment. Citrix offers comprehensive, automated analysis of diagnostics collections through Citrix Insight Services. You can also use Scout to troubleshoot issues, on your own or with Citrix Support guidance.

You can upload collection files to Citrix for analysis and guidance from Citrix Support. Or, you can save a collection locally for your own review, and then later upload the collection file to Citrix for analysis.

Scout offers the following procedures:

- **Collect:** Runs a one-time diagnostics collection on machines you select in a site. You can then either upload the file to Citrix or save it locally.
- **Trace & Reproduce:** Starts a manual trace on the machines you select. Then you re-create issues on those machines. After re-creating the issue, the trace is stopped. Scout then collects other diagnostics and uploads the file to Citrix, or saves the file locally.
- **Schedule:** Schedules diagnostics collections to occur daily or weekly at a specified time on the machines you select. The file is automatically uploaded to Citrix.
• **Health Check:** Runs checks that gauge the health and availability of the site and its components. You can run health checks for Delivery Controllers, Virtual Delivery Agents (VDAs), StoreFront servers, and Citrix License Servers. If issues are found during the checks, Scout provides a detailed report. Each time Scout starts, it checks for updated health check scripts. If new versions are available, Scout downloads them automatically, for use the next time health checks are run.

**Note:**
The Trace & Reproduce, Schedule, and Health Check procedures are currently not available for Linux VDA.

The graphical interface described in this article is the primary way to use Scout. Alternatively, you can use PowerShell to configure one-time or scheduled diagnostic collections and uploads. See **Call Home**.

**Where to run Scout:**

- In an on-premises deployment, run Scout from a Delivery Controller to capture diagnostics or run checks on one or more Virtual DeliveryAgents (VDAs), Delivery Controllers, StoreFront servers, and License Servers. You can also run Scout from a VDA to collect local diagnostics.
- In a Citrix Cloud environment that uses the Citrix Virtual Apps and Desktops service, run Scout from a VDA to collect local diagnostics.

The log for the Scout application is stored in `C:\ProgramData\Citrix\TelemetryService\ScoutUI.log`. This file can be used for troubleshooting.

**What is collected**

The diagnostics collected by Scout include Citrix Diagnostic Facility (CDF) trace log files. A subset of CDF traces called Always-on Tracing (AOT) is also included. AOT information can be helpful when troubleshooting common issues such as VDA registrations and application/desktop launches. No other Event Tracing for Windows (ETW) information is collected.

The collection includes:

- Registry entries created by Citrix Virtual Apps and Desktops under `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix`.
- Windows Management Instrumentation (WMI) information under the **Citrix namespace**.
- Processes that are running.
- Crash dumps of Citrix processes that are stored in `%PROGRAMDATA%\Citrix\CDF`.
- Citrix policy information, in CSV format.
- Installation and upgrade information. The collection can include the full product metainstaller log, failing MSI logs, output from the MSI log analyzer, StoreFront logs, Licensing compatibility check logs, and results from preliminary site upgrade tests.
About trace information:

- The trace information is compressed as it is collected, keeping a small footprint on the machine.
- On each machine, the Citrix Telemetry Service keeps compressed recent trace information for a maximum of eight days.
- Beginning with Citrix Virtual Apps and Desktops 7 1808, AOT traces are saved to the local disk by default. (In earlier versions, traces were held in memory.) Default path = C:\Users\CitrixTelemetryService\AppData\Local\CitrixAOT.
- Beginning with Citrix Virtual Apps and Desktops 7 1811, AOT traces saved to network shares are collected with other diagnostics.
- You can modify the maximum size (default = 10 MB) and slice duration, using the `Enable-CitrixTrace` cmdlet or the `HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\Telemetry\DefaultListen` registry string.
- Traces append to the file until the file reaches 10% of `MaxSize`.

For a list of the datapoints that Scout collects, see Call Home key datapoints.

Scout configuration

Scout can be configured to work on Linux VDAs. For more information on Linux VDA and telemetry, see Integrate with the Citrix Telemetry Service.

The Linux VDA might automatically change the `ctxtelemetry` socket port or the port for telemetry service. If so, you must configure the port manually.

1. Navigate to C:\Program Files\Citrix\Telemetry Service
2. Open the ScoutUI.exe.config file.
3. Change the value for `LinuxVDA TelemetryServicePort` or `LinuxVDA TelemetryWakeupPort` to what was configured on the Linux VDA:
   - `<add key="LinuxVDA TelemetryServicePort" value="7502"/>
   - `<add key="LinuxVDA TelemetryWakeupPort" value="7503"/>

1. Save the changes and close the file.
2. Open Scout again to ensure it loads the latest configuration.

About health checks

Health check data is stored in folders under C:\ProgramData\Citrix\TelemetryService.

Site health checks

Site health checks are included in the Environment Test Service, which provides a comprehensive evaluation of the FlexCast Management Architecture (FMA) services. In addition to checking for service
availability, these checks look for other health indicators such as database connections.

Site health checks run on Delivery Controllers. Depending on your site's size, these checks can take up to an hour to complete.

**Delivery Controller configuration checks**

As part of the site health checks, Delivery Controller configuration checks verify whether the following issues exist, based on Citrix recommendations for Virtual Apps and Desktops sites:

- One or more Delivery Controllers are in a failed state.
- There is only one Delivery Controller in the site.
- Delivery Controllers are of different versions.

In addition to meeting the permissions and requirements for health checks, Delivery Controller configuration checks require:

- At least one Controller powered on.
- The Broker Service running on a Controller.
- A working connection from the Controller to the site database.

**VDA health checks**

VDA health checks identify possible causes for common VDA registration, session launch, and time zone redirection issues.

For registration on the VDA, Scout checks:

- VDA software installation
- VDA machine domain membership
- VDA communication port availability
- VDA service status
- Windows firewall configuration
- Communication with Controller
- Time sync with Controller
- VDA registration status

For session launch on VDAs, Scout checks:

- Session launch communication port availability
- Session launch services status
- Session launch Windows firewall configuration
- VDA Remote Desktop Services Client Access Licenses
- VDA application launch path

For time zone redirection on VDAs, Scout checks:
• Windows hotfix installation
• Citrix hotfix installation
• Microsoft group policy settings
• Citrix group policy settings

For Profile Management on VDAs, Scout checks:

• Hypervisor detection
• Provisioning detection
• Citrix Virtual Apps and Desktops
• Personal vDisk configuration
• User store
• Profile Management Service status detection
• Winlogon.exe hooking test

To run checks on Profile Management, you must install and enable Profile Management on the VDA. For more information on Profile Management configuration checks, see Knowledge Center article CTX132805.

**StoreFront health checks**

StoreFront checks verify:

• Citrix Default Domain service is running
• Citrix Credential Wallet service is running
• Connection from the StoreFront server to Active Directory port 88
• Connection from the StoreFront server to Active Directory port 389
• Base URL has a valid FQDN
• Correct IP address from the base URL can be retrieved
• IIS application pool is using .NET 4.0
• Whether the certificate is bound to the SSL port for the host URL
• Whether the certificate chain is complete
• Whether the certificates have expired
• Whether a certificate is expiring soon (within 30 days)

**License Server checks**

License Server checks verify:

• License Server connection from the Delivery Controller
• License Server firewall remote access status
• Citrix Licensing service status
• License Server grace period state
License Server ports connection
- Whether the Citrix vendor daemon (CITRIX) is running
- Whether system clocks are synchronized
- Whether the Citrix Licensing service is running under the Local Service account
- Presence of the CITRIX.opt file
- Customer Success Services eligibility date
- Citrix License Server Update
- Whether the License Server certificate is in the Delivery Controller’s trusted root store

In addition to meeting the permissions and requirements for health checks, the License Server must be joined to a domain. Otherwise, the License Server is not discovered.

Run health checks

The Health Check procedure comprises selecting machines, starting the checking, and then reviewing the results report.

1. Launch Scout. From the machine’s Start menu, select Citrix > Citrix Scout. On the opening page, click Health Check.

2. Select machines. Click Find machine to discover machines. The Select machines page lists all the VDAs, Delivery Controllers, and License Servers discovered in the site. You can filter the display by machine name. Select the check box next to each machine you want to collect diagnostics from, and then click Continue.

To add other component types (such as StoreFront servers and VDA machines), see Add machines manually and Import VDA machines. You cannot manually add Citrix Provisioning Servers or License Servers.

Scout automatically launches verification tests on each selected machine, making sure it meets the criteria listed in Verification tests. If verification fails, a message is posted in the Status column, and that machine’s check box is cleared. You can either:

- Resolve the issue and then select the machine’s check box again. This triggers a retry of the verification tests.
- Skip that machine (leave its check box unselected). Health checks are not run for that machine.

When the verification tests complete, click Continue.

3. Run the health checks on the selected machines. The summary lists the machines where the tests run (the machines you selected that passed the verification tests). Click Start Checking.

During and after checking:

- The Status column indicates the current checking state for a machine.
• To stop all in-progress checks, click Stop Checking in the lower right corner of the page. (You can’t cancel a single machine’s health check, only all selected machines. Information from machines that have completed the checks is kept.
• When the checks complete for all selected machines, the Stop Checking button in the lower right corner changes to Done.
• If a check fails, you can click Retry in the Action column.
• If a check completes with no issues found, the Action column is empty.
• If a check finds issues, click View Details to show the results.
• After the check completes for all selected machines, don’t click Back. (If you do, the check results are lost.)

4. When the checks complete, click Done to return to the Scout opening page.

Health check results

For report-generating Citrix checks, the reports contain:
• Time and date when the results report was generated
• Machines that were checked
• Conditions that the check looked for on the targeted machines

Permissions and requirements

Permissions:
• To collect diagnostics:
  – You must be a local administrator and domain user for each machine from which you’re collecting diagnostics.
  – You must have permission to write to the LocalAppData directory on each machine.
• To run health checks:
  – You must be a member of the domain users group.
  – You must be either a full administrator or have a custom role with read-only and Run Environment Tests permissions for the site.
  – Set the script execution policy to at least RemoteSigned to allow the scripts to run. For example: Set-ExecutionPolicy RemoteSigned. Note: other script execution privileges can work as well.
• Use Run as administrator when launching Scout.

For each machine from which you collect diagnostics or run health checks:
• Scout must be able to communicate with the machine.
• File and printer sharing must be turned on.
• PSRemoting and WinRM must be enabled. The machine must also be running PowerShell 3.0 or later.
• The Citrix Telemetry Service must be running on the machine.
• Windows Management Infrastructure (WMI) access must be enabled on the machine.
• To set a schedule for diagnostic collection, the machine must be running a compatible Scout version.

Do not use the dollar sign ($) in user names specified in pathnames. It prevents the collection of diagnostic information.

Scout runs verification tests on the machines you select, to make sure these requirements are met.

The Telemetry Service for Windows runs on Network Service.

The AOT Trace Folder is saved in C:\ProgramData\Citrix\TelemetryService\CitrixAOT.

Only users in the Administrator group, System, and Telemetry Service SID have permission to access the HKEYLOCALMACHINE:SOFTWARE\Citrix\Telemetry registry.
The Telemetry Service SID remains in the Performance Log Users group after uninstalling Telemetry Service, but you can remove it manually.
Veriﬁcation tests

Before a diagnostic collection or health check starts, veriﬁcation tests run automatically for each selected machine. These tests make sure that the requirements are met. If a test fails for a machine, Scout displays a message, with suggested corrective actions.

- **Scout cannot reach this machine** - Ensure that:
  - The machine is powered-on.
  - The network connection is working properly. (This can include verifying that your ﬁrewall is properly conﬁgured.)
  - File and printer sharing is turned on. See the Microsoft documentation for instructions.

- **Enable PSRemoting and WinRM** - You can enable PowerShell remoting and WinRM at the same time. Using Run as administrator, run the Enable-PSRemoting cmdlet. For details, see the Microsoft help for the cmdlet.

- **Scout requires PowerShell 3.0 (minimum)** - Install PowerShell 3.0 (or later) on the machine, and then enable PowerShell remoting.
• **Unable to access LocalAppData directory on this machine** - Ensure that account has permission to write to the LocalAppData directory on the machine.

• **Cannot locate Citrix Telemetry Service** - Ensure that the Citrix Telemetry Service is installed and started on the machine.

• **Cannot get schedule** - Upgrade the machine to (minimum) XenApp and XenDesktop 7.14.

• **WMI is not running on the machine** - Ensure that Windows Management Instrumentation (WMI) access is enabled.

• **WMI connections blocked** - Enable WMI in the Windows Firewall service.

• **Newer version of Citrix Telemetry Service required** - (Version is checked only for Collect and Trace & Reproduce.) Upgrade the Telemetry Service version on the machine (see Install and upgrade). If you do not upgrade the service, that machine is not included in the Collect or Trace & Reproduce actions.

• **Scout cannot connect to the systemd socket on this machine** - Ensure that:
  - Port 7503 is open. Verify that the systemd ctxtelemetry.socket is listening on port 7503 on the machine. The port might be different if the ctxtelemetry.socket port has been changed. See Scout configuration to adjust ports.
  - The network connection is working properly. (This might include verifying that your firewall is properly configured.)

• **The Linux VDA Telemetry Service is not started on this machine** - Ensure that:
  - Port 7502 is open. Verify that the Linux VDA Telemetry Service is installed and started on the machine. The port might be different if the telemetry service port has been changed. See Scout configuration to adjust ports.
  - The network connection is working properly. (This might include verifying that your firewall is properly configured.)

**Version compatibility**

This version of Scout (3.x) is intended to be run on Citrix Virtual Apps and Desktops (or minimum XenApp and XenDesktop 7.14) Controllers and VDAs.

An earlier version of Scout is provided with XenApp and XenDesktop versions earlier than 7.14. For information about that earlier version, see CTX130147.

If you upgrade a Controller or VDA earlier than 7.14 to version 7.14 (or a later supported version), the earlier version of Scout is replaced with the current version.

Install and upgrade

By default, Scout is installed or upgraded automatically as part of the Citrix Telemetry Service when you install or upgrade a VDA or a Controller.

If you omit the Citrix Telemetry Service when you install a VDA, or remove the service later, run TelemetryServiceInstaller_xx.msi from the x64\Virtual Desktop Components or x86\Virtual Desktop Components folder on the Citrix Virtual Apps and Desktops installation media.

When you select the Collect or Trace & Reproduce action, you’re notified if a machine is running an older version of the Citrix Telemetry Service. Citrix recommends using the latest supported version. If you don’t upgrade the Telemetry Service on that machine, it is not included in the Collect or Trace & Reproduce actions. To upgrade the Telemetry Service, use the same procedure as installing it.

Upload authorization

If you plan to upload diagnostic collections to Citrix, you must have a Citrix or Citrix Cloud account. (These are the credentials you use to access Citrix downloads or access the Citrix Cloud Control Center.) After your account credentials are validated, a token is issued.

- If you authenticate with a Citrix account, the token-issuing process isn’t visible. You simply enter your account credentials. After Citrix validates the credentials, you can then continue in the Scout wizard.
- If you authenticate with a Citrix Cloud account, you click a link to access Citrix Cloud using HTTPS with your default browser. After you enter your Citrix Cloud credentials, the token is displayed. Copy the token and then paste it into Scout. You can then continue in the Scout wizard.

The token is stored locally on the machine where you’re running Scout. To enable use of that token the next time you run Collect or Trace & Reproduce, select the Store token and skip this step in the future check box.

You must reauthorize each time you select Schedule on the Scout opening page. You cannot use a stored token when creating or changing a schedule.

Use a proxy for uploads

If you want to use a proxy server to upload collections to Citrix, you can instruct Scout to use the proxy settings configured for your browser’s Internet Properties. Alternatively, you can specify the proxy server’s IP address and port number.
Find machine

For the **Collect, Trace & Reproduce**, and **Schedule** procedures, Scout lists the Controllers and VDAs it discovers automatically.

When you run Scout Health Check from Delivery Controller, click **Find machine** to discover machines, including delivery controllers, VDAs, license servers, and StoreFront servers.

When you run Scout Health Check from a domain-joined machine which is not Delivery Controller, Scout cannot discover machines automatically. You need to add machines manually or import VDA machines.

Add machines manually

After Scout lists the Controllers and VDAs it discovers, you can manually add other machines in the deployment, such as StoreFront servers, License Servers, and Citrix Provisioning servers.

When running health checks:

- Citrix License Servers in the domain are discovered automatically. You cannot add License Servers manually.
- Health checks do not currently support Citrix Provisioning servers.

On any Scout page that lists the discovered machines, click **+ Add machine**. Type the FQDN of the machine you want to add, and then click **Continue**. Repeat to add other machines, as needed. (Although entering a DNS alias instead of an FQDN can appear valid, the health checks might fail.)

Manually added machines always appear at the top of the machines list, above the discovered machines.

An easy way to identify a manually added machine is the red delete button on the right end of the row. Only manually added machines have that button. Discovered machines don’t.

To remove a manually added machine, click the red button on the right end of the row. Confirm the deletion. Repeat to delete other manually added machines.

Scout remembers manually added machines until you remove them. When you close and then reopen Scout, the manually added machines are still listed at the top of the list.

CDF traces are not collected when using **Trace & Reproduce** on StoreFront servers. However, all other trace information is collected.

Import VDA machines

You can import VDA machines in the deployment when running health checks.
1. On Delivery Controller or Connector, generate the machine list file with the PowerShell command. On Connector, you must input Citrix credentials and select the customer in the pop-up dialog.

```powershell
Get-BrokerMachine | foreach { $_.DnsName } | out-file C:\machineList.txt
```

2. Copy the machineList.txt file to the domain-joined machine you want to launch Scout Health Check.

3. On the Scout Health Check page, click **Add Machine**.

4. Select the **Windows VDA** machine type.

5. Click **Import VDA machines**.

7. Click **Open**.

The imported VDA machines are listed on the Scout Health Check page.

---

**Collect diagnostics**

The **Collect** procedure comprises selecting machines, starting the diagnostics collection, and then uploading the file containing the collection to Citrix or saving it locally.

1. Launch Scout. From the machine’s **Start** menu, select **Citrix > Citrix Scout**. On the opening page, click **Collect**.

2. Select machines. The **Select machines** page lists all the VDAs and Controllers in the site. You can filter the display by machine name. Select the check box next to each machine you want to collect diagnostics from, and then click **Continue**.

To add other machines manually (such as StoreFront or Citrix Provisioning servers), see Add machines manually.
Scout automatically launches verification tests on each selected machine, ensuring it meets the criteria listed in Verification tests. If verification fails, a message is posted in the Status column, and that machine’s check box is unselected. You can either:

- Resolve the issue and then select the machine’s check box again. This triggers a retry of the verification tests.
- Skip that machine (leave its check box unselected). Diagnostics won’t be collected from that machine.

When the verification tests complete, click Continue.

3. Collect diagnostics. The summary lists all the machines from which diagnostics are collected (the machines you selected that passed the verification tests). Click Start Collecting.

During collection:

- The Status column indicates the current collection state for a machine.
- To stop an in-progress collection on a single machine, click Cancel in the Action column for that machine.
- To stop all in-progress collections, click Stop Collection in the lower right corner of the page. Diagnostics from machines that have completed collection are kept. To resume the collection, click Retry in the Action column for each machine.
- When the collection completes for all selected machines, the Stop Collection button in the lower right corner changes to Continue.
- To collect diagnostics again, click Collect Again in that machine’s Action column. The newer collection overwrites the earlier.
- If a collection fails, you can click Retry in the Action column. Only successful collections are uploaded or saved.
- After the collection completes for all selected machines, don’t click Back. (If you click it, the collection is lost.)

When the collection completes, click Continue.

4. Save or upload the collection. Choose whether to upload the file to Citrix, or save it on the local machine.

If you choose to upload the file now, continue with Step 5.

If you choose to save the file locally:

- A Windows Save dialog box appears. Navigate to the desired location.
- When the local save completes, the pathname of the file is displayed and linked. You can view the file. You can upload the file later to Citrix. SeeCTX136396.

Click Done to return to the Scout opening page. You don’t need to complete any further steps in this procedure.
5. Authenticate for uploads and optionally specify a proxy. For details, see Upload authorization.
   • If you haven’t authenticated through Scout, continue with this step.
   • If you have authenticated through Scout, the stored authorization token is used by default. If this is what you want to do, select this option and click Continue. You aren’t prompted for credentials for this collection. Continue with Step 6.
   • If you authenticated previously, but want to reauthorize and get a new token, click Change/Reauthorize and continue with this step.

Choose whether you want to use Citrix credentials or Citrix Cloud credentials to authenticate the upload. Click Continue. The credentials page appears only if you’re not using a stored token.

On the credentials page:
   • If you want to use a proxy server for the file upload, click Configure proxy. You can instruct Scout to use the proxy settings configured for your browser’s internet properties. Or, you can enter the proxy server’s IP address and port number. Close the proxy dialog box.
   • For a Citrix Cloud account, click Generate token. Your default browser launches to a Citrix Cloud page where a token is displayed. Copy the token, and then paste it on the Scout page.
   • For a Citrix account, enter your credentials.

When you’re done, click Continue.

6. Enter information about the upload.
   • The name field contains the default name for the file for the collected diagnostics. This suffices for most collections, although you can change the name. (If you delete the default name and leave the name field empty, the default name is used.)
   • Optionally, specify an 8-digit Citrix Support case number.
   • In the optional Description field, describe the issue and indicate when the issue occurred, if applicable.

When you’re done, click Start Upload.

During the upload, the lower left portion of the page approximates the percentage of the upload that has completed. To cancel an in-progress upload, click Stop Upload.

When the upload completes, the URL of its location is displayed and linked. You can follow the link to the Citrix location to view the analysis of the upload, or you can copy the link.

Click Done to return to the Scout opening page.

Trace and reproduce

The Trace and Reproduce procedure comprises selecting machines, starting a trace, reproducing issues, completing the diagnostics collection, and then uploading the file to Citrix, or saving it locally.
This procedure is similar to the standard Collect procedure. However, it allows you to start a trace on machines and then re-create issues on those machines. All diagnostics collections include AOT trace information. This procedure adds CDF traces to help troubleshooting.

1. Launch Scout. From the machine’s Start menu, select Citrix > Citrix Scout. On the opening page, click Trace & Reproduce.

2. Select machines. The Select machines page lists all the VDAs and Controllers in the site. You can filter the display by machine name. Select the check box next to each machine you want to collect traces and diagnostics from. Then click Continue.

To add other machines manually (such as StoreFront or Citrix Provisioning servers), see Add machines manually.

Scout automatically launches verification tests on each selected machine, making sure it meets the criteria listed in Verification tests. If verification fails for a machine, a message is posted in the Status column, and that machine’s check box is unselected. You can either:

- Resolve the issue and then select the machine’s check box again. This triggers a retry of the verification tests.
- Skip that machine (leave its check box unselected). Diagnostics and traces are not collected from that machine.

When the verification tests complete, click Continue.

3. Start the trace. The summary lists all the machines from which traces are collected. Click Start Tracing.

On one or more of the selected machines, reproduce the issues you experienced. Trace collection continues while you’re doing that. When you’re done reproducing the issue, click Continue in Scout. That stops the trace.

After you stop the trace, indicate whether you reproduced the issue during the trace.

4. Collect diagnostics from machines. Click Start Collecting. During collection:

- The Status column indicates the current collection state for a machine.
- To stop an in-progress collection on a single machine, click Cancel in the Action column for that machine.
- To stop all in-progress collections, click Stop Collection in the lower right corner of the page. Diagnostics from machines that have completed collection are kept. To resume the collection, click Retry in the Action column for each machine.
- When the collection completes for all selected machines, the Stop Collection button in the lower right corner changes to Continue.
- To collect diagnostics again from a machine, click Collect Again in that machine’s Action column. The newer collection overwrites the earlier.
• If a collection fails, you can click Retry in the Action column. Only successful collections are uploaded or saved.
• After the collection completes for all selected machines, don’t click Back. (If you do, the collection is lost.)

When the collection completes, click Continue.

5. Save or upload the collection. Choose whether to upload the file to Citrix or save it locally.

If you choose to upload the file now, continue with Step 6.

If you choose to save the file locally:

• A Windows Save dialog box appears. Select the desired location.
• When the local save completes, the pathname of the file is displayed and linked. You can view the file. Remember: You can upload the file later from Citrix; see CTX136396 for Citrix Insight Services.

Click Done to return to the Scout opening page. You don’t need to complete any further steps in this procedure.

• If you haven’t authenticated through Scout, continue with this step.
• If you authenticated through Scout, the stored authorization token is used by default. If this what you want to do, choose this option and click Continue. You aren’t prompted for credentials for this collection. Continue with Step 7.
• If you previously authenticated, but want to reauthorize and get a new token, click Change/Reauthorize and continue with this step.

Choose whether you want to use Citrix credentials or Citrix Cloud credentials to authenticate the upload. Click Continue. The credentials page appears only if you’re not using a stored token.

On the credentials page:

• If you want to use a proxy server for the file upload, click Configure proxy. You can instruct Scout to use the proxy settings configured for your browser’s Internet Properties. Or, you can enter the proxy server’s IP address and port number. Close the proxy dialog box.
• For a Citrix Cloud account, click Generate token. Your default browser launch to a Citrix Cloud page where a token is displayed. Copy the token, and then paste it on the Scout page.
• For a Citrix account, enter your credentials.

When you’re done, click Continue.

7. Provide information about the upload.

Enter upload details:
• The name field contains the default name for the file for the collected diagnostics. This suffices for most collections, although you can change the name. (If you delete the default name and leave the name field empty, the default name is used.)
• Optionally, specify an 8-digit Citrix Support case number.
• In the optional Description field, describe the issue and indicate when the issue occurred, if applicable.

When you’re done, click **Start Upload**.

During the upload, the lower left portion of the page approximates what percentage of the upload has completed. To cancel an in-progress upload, click **Stop Upload**.

When the upload completes, the URL of its location is displayed and linked. You can follow the link to the Citrix location to view the analysis of the upload, or you can copy the link.

Click **Done** to return to the Scout opening page.

**Schedule collections**

**Note:**

You can currently schedule collections, but not health checks.

The Schedule procedure comprises selecting machines and then setting or canceling the schedule. Scheduled collections are automatically uploaded to Citrix. (You can save scheduled collections locally using the PowerShell interface. See **Citrix Call Home**.)

1. Launch Scout. From the machine’s Start menu, select **Citrix > Citrix Scout**. On the opening page, click **Schedule**.

2. Select machines. All the VDAs and Controllers in the site are listed. You can filter the display by machine name.

When you installed VDAs and Controllers using the graphical interface, if you set a Call Home schedule (see **Citrix Call Home**), Scout displays those settings, by default. You can use this version of Scout to start scheduled collections for the first time, or change a previously configured schedule.

Although you enabled/disabled Call Home on a per-machine basis during component installation, a schedule configured in Scout affects all the machines you select.

Select the check box next to each machine you want to collect diagnostics from, and then click **Continue**.

To add other machines manually (such as StoreFront or Citrix Provisioning servers), see Add machines manually.
Scout automatically launches verification tests on each of the selected machines, making sure it meets the criteria in Verification tests. If verification fails for a machine, a message is posted in the **Status** column, and that machine’s check box is unselected. You can either:

- Resolve the issue and then select the machine’s check box again. This triggers a retry of the verification tests.
- Skip that machine (leave its check box unselected). Diagnostics (or traces) are not collected from that machine.

When the verification tests complete, click **Continue**.

The summary page lists the machines to which schedules are applied. Click **Continue**.

3. Set the schedule. Indicate when you want diagnostics to be collected. Remember: The schedule affects all selected machines.

- To configure a weekly schedule for the selected machines, click **Weekly**. Choose the day of the week. Enter the time of day (24-hour clock) for the collection to begin.
- To configure a daily schedule for the selected machines, click **Daily**. Enter the time of day (24-hour clock) for the collection to begin.
- To cancel an existing schedule for the selected machines (and not replace it with another), click **Off**. This cancels any schedule that was previously configured for those machines.

Click **Continue**.

Choose whether you want to use Citrix credentials or Citrix Cloud credentials to authenticate the upload. Click **Continue**.

On the credentials page:

- If you want to use a proxy server for the file upload, click **Configure proxy**. You can instruct Scout to use the proxy settings configured for your browser’s Internet Properties. Or, you can enter the proxy server’s IP address and port number. Close the proxy dialog box.
- For a Citrix Cloud account, click **Generate token**. Your default browser launches to a Citrix Cloud page where a token is displayed. Copy the token, and then paste it on the Scout page.
- For a Citrix account, enter your credentials.

When you’re done, click **Continue**.

Review the configured schedule. Click **Done** to return to the Scout opening page.

During a collection, each selected machine’s Windows application log contains entries about the collection and upload.
Data masking

The diagnostic information collected using Citrix Scout might contain security-sensitive information. The Citrix Scout data masking feature allows you to mask sensitive data in diagnostics files before uploading them to Citrix.

Scout data masking is configured to mask the IP address, machine names, domain names, user names, hypervisor names, Delivery Group names, catalog names, application names, and SIDs.

Note:
CDF traces are encrypted and cannot be masked.
Linux VDA logs are compressed to .tar.gz2 format and cannot be masked.

Collect new diagnostics and perform data masking

To use the Citrix Scout data masking feature, launch Scout from the command line.

1. In Windows, open the command prompt as an administrator.
2. Go to the directory where Scout is installed: cd C:\Program Files\Citrix\Telemetry Service.
3. Launch Scout: ScoutUI.exe datamasking.
4. Click Collect or Trace & Reproduce to collect diagnostics.
5. After the collection completes, select Enable data masking. This option is enabled by default.
6. Configure the data mask. You can use the default rules or customize the rules.
7. Select whether to upload or save the diagnostics collection.
   • If you select Upload the diagnostics collection to Citrix, masked diagnostics files are uploaded to Citrix.
   • If you select Save the diagnostics collection on your local machine, both the original and masked diagnostics are saved to the specified location.

Perform data masking on existing diagnostics

1. In Windows, open the command prompt as an administrator.
2. Go to the directory where Scout is installed: cd C:\Program Files\Citrix\Telemetry Service.
3. Launch Scout directly in data masking mode: ScoutUI.exe datamasking filePath.
4. Select “Enable data masking” to continue. This option is enabled by default.
5. Configure the data mask. You can run data masking with the default rules or customize the rules.
6. Select whether to upload or save the diagnostics collection.
   • If you select Upload the diagnostics collection to Citrix, masked diagnostics files are uploaded to Citrix.
• If you select **Save the diagnostics collection on your local machine**, both the original and masked diagnostics are saved to the specified location.

**Masked data file and mapping file locations**

After you have uploaded or saved the diagnostics collection, click the link to open the original and masked diagnostics, and open the mapping information file.

**Usage data collection**

When you use Scout, Citrix uses Google Analytics to collect anonymous usage data to be used for future product features and improvements. Data collection is enabled by default.

To change usage data collection and upload, click the **Settings** gear in the Scout UI. You can then choose whether to send the information by selecting **Yes** or **No** and then clicking **Save**.

---

**Monitor**

December 18, 2019

Administrators and help desk personnel can monitor Citrix Virtual Apps and Desktops Sites using a variety of features and tools. Using these tools, you can monitor:

• User sessions and session use
• Logon performance
• Connections and machines, including failures
Citrix Director

Director is a real-time web tool that you can use to monitor and troubleshoot, and to perform support tasks for end users.

For details, see the Director articles.

Configuration Logging

Configuration Logging allows administrators to keep track of administrative changes to a Site. Configuration Logging can help administrators diagnose and troubleshoot problems after configuration changes are made, assist change management and track configurations, and report administration activity.

You can view and generate reports about logged information from Studio. You can also view logged items in Director with the Trend View to provide notifications of configuration changes. This feature is useful for administrators who do not have access to Studio.

The Trends View gives historical data of configuration changes over a period of time so administrators can assess what changes were made to the Site, when they were made, and who made them to find the cause of an issue. This view sorts configuration information into three categories:

- Connection Failures
- Failed Single-session Machines
- Failed Multi-session Machines

For details about how to enable and configure Configuration Logging, see Configuration Logging. The Director articles describe how to view logged information from that tool.

Event logs

Services within Citrix Virtual Apps and Desktops log events that occur. Event logs can be used to monitor and troubleshoot operations.

For details, see Event logs. Individual feature articles might also contain event information.

Configuration logging

June 26, 2020
Configuration logging captures site configuration changes and administrative activities to the database. You can use the logged content to:

- Diagnose and troubleshoot problems after configuration changes are made; the log provides a breadcrumb trail
- Assist change management and track configurations
- Report administration activity

You set configuration logging preferences, display configuration logs, and generate HTML and CSV reports from Citrix Studio. You can filter configuration log displays by date ranges and full text search results. Mandatory logging, when enabled, prevents configuration changes from being made unless they can be logged. With appropriate permission, you can delete entries from the configuration log. You cannot use the configuration logging feature to edit log content.

Configuration logging uses a PowerShell SDK and the Configuration Logging Service. The Configuration Logging Service runs on every Controller in the site. If one Controller fails, the service on another Controller automatically handles logging requests.

By default, the configuration logging feature is enabled, and uses the database that is created when you create the site (the site configuration database). You can specify a different location for the database. The configuration logging Database supports the same high availability features as the site configuration Database.

Access to configuration logging is controlled through delegated administration, with the Edit Logging Preferences and View Configuration Logs permissions.

Configuration logs are localized when they are created. For example, a log created in English is read in English, regardless of the locale of the reader.

What is logged

Configuration changes and administrative activities initiated from Studio, Director, and PowerShell scripts are logged. Examples of logged configuration changes include working with (creating, editing, deleting assigning):

- Machine catalogs
- Delivery groups (including changing power management settings)
- Administrator roles and scopes
- Host resources and connections
- Citrix policies through Studio

Examples of logged administrative changes include:

- Power management of a virtual machine or a user desktop
- Studio or Director sending a message to a user
The following operations are not logged:

- Autonomic operations such as pool management power-on of virtual machines.
- Policy actions implemented through the Group Policy Management Console (GPMC); use Microsoft tools to view logs of those actions.
- Changes made through the registry, direct access of the database, or from sources other than Studio, Director, or PowerShell.
- When the deployment is initialized, configuration logging becomes available when the first Configuration Logging Service instance registers with the Configuration Service. Therefore, the very early stages of configuration are not logged (for example, when the database schema is obtained and applied, when a hypervisor is initialized).

**Manage configuration logging**

By default, configuration logging uses the database that is created when you create a site (also known as the site configuration database). Citrix recommends that you use a separate location for the configuration logging database (and the monitoring database) for the following reasons:

- The backup strategy for the configuration logging database is likely to differ from the backup strategy for the site configuration database.
- The volume of data collected for configuration logging (and the Monitoring Service) might adversely affect the space available to the site configuration database.
- It splits the single point of failure for the three databases.

Product editions that do not support configuration logging do not have a Logging node in Studio.

**Enable and disable configuration logging and mandatory logging**

By default, configuration logging is enabled, and mandatory logging is disabled.

1. Select **Logging** in the Studio navigation pane.

2. Select **Preferences** in the Actions pane. The configuration logging dialog box contains database information and indicates whether configuration logging and mandatory logging are enabled or disabled.

3. Select the desired action:

   To enable configuration logging, select **Enable**. This is the default setting. If the database cannot be written to, the logging information is discarded, but the operation continues.

   To disable configuration logging, select **Disable**. If logging was previously enabled, existing logs remain readable with the PowerShell SDK.

   To enable mandatory logging, select **Prevent changes to the site configuration when the database is not available**. No configuration change or administrative activity that is normally
logged is allowed unless it can be written in the configuration logging database. You can enable mandatory logging only when configuration logging is enabled (when **Enable** is selected). If the Configuration Logging Service fails, and high availability is not in use, mandatory logging is assumed. In such cases, operations that would normally be logged are not performed.

To disable mandatory logging, select **Allow changes when to the site configuration when the database is not available**. Configuration changes and administrative activities are allowed, even if the configuration logging database cannot be accessed. This is the default setting.

**Change the configuration logging database location**

You cannot change the database location when mandatory logging is enabled, because the location change includes a brief disconnect interval that cannot be logged.

1. Create a database server, using a supported SQL Server version.
2. Select **Logging** in the Studio navigation pane.
3. Select **Preferences** in the Actions pane.
4. In the Logging Preferences dialog box, select **Change logging database**.
5. In the Change Logging Database dialog box, specify the location of the server containing the new database server. See **Database address formats** for valid formats.
6. To allow Studio to create the database, click **OK**. When prompted, click **OK**, and the database is created automatically. Studio attempts to access the database using the current Studio user’s credentials. If that fails, you are prompted for the database user’s credentials. Studio then uploads the database schema to the database. (The credentials are retained only during database creation.)
7. To create the database manually, click **Generate database script**. The generated script includes instructions for manually creating the database. Ensure that the database is empty and that at least one user has permission to access and change the database before uploading the schema.

The configuration logging data in the previous database is not imported to the new database. Logs cannot be aggregated from both databases when retrieving logs. The first log entry in the new configuration logging database indicates that a database change occurred, but it does not identify the previous database.

**Display configuration log content**

When initiating configuration changes and administrative activities, the high level operations created by Studio and Director are listed in the upper middle pane in Studio. A high level operation results in one or more service and SDK calls, which are low level operations. When you select a high level operation in the upper pane, the lower pane displays the low level operations.

If an operation fails before completion, the log operation might not be completed in the database. For example, a start record will have no corresponding stop record. In such cases, the log indicates that...
there is missing information. When you display logs based on time ranges, incomplete logs are shown if the data in the logs matches the criteria. For example, if all logs for the last five days are requested and a log exists with a start time in the last five days but has no end time, it is included.

When using a script that calls PowerShell cmdlets, if you create a low level operation without specifying a parent high level operation, configuration logging creates a surrogate high level operation.

To display configuration log content, select **Logging** in the Studio navigation pane. By default, the center pane lists the log content chronologically (newest entries first), separated by date. You can:

- Sort the display by column heading.
- Filter the display by specifying a day interval, or entering text in the **Search** box. To return to the standard display after using search, clear the text in the **Search** box.

**Generate reports**

You can generate CSV and HTML reports containing configuration log data.

- The CSV report contains all the logging data from a specified time interval. The hierarchical data in the database is flattened into a single CSV table. No aspect of the data has precedence in the file. No formatting is used and no human readability is assumed. The file (named MyReport) contains the data in a universally consumable format. CSV files are often used for archiving data or as a data source for a reporting or data manipulation tool such as Microsoft Excel.
- The HTML report provides a human-readable form of the logging data for a specified time interval. It provides a structured, navigable view for reviewing changes. An HTML report comprises two files, named Summary and Details. Summary lists high level operations: when each operation occurred, by whom, and the outcome. Clicking a Details link next to each operation takes you to the low level operations in the Details file, which provides additional information.

To generate a configuration log report, select **Logging** in the Studio navigation pane, and then select **Create custom report** in the Actions pane.

- Select the date range for the report.
- Select the report format: CSV, HTML, or both.
- Browse to the location where the report should be saved.

**Delete configuration log content**

To delete the configuration log, you must have certain delegated administration and SQL Server database permissions.

- **Delegated administration:** You must have a delegated administration role that allows the deployment configuration to be read. The Full administrator role has this permission. A custom role must have Read Only or Manage selected in the Other permissions category.
To create a backup of the configuration logging data before deleting it, the custom role must also have Read Only or Manage selected in the Logging Permissions category.

- **SQL Server database:** You must have a SQL server login with permission to delete records from the database. There are two ways to do this:
  - Use a SQL Server database login with a sysadmin server role, which allows you to perform any activity on the database server. Alternatively, the serveradmin or setupadmin server roles allow you to perform deletion operations.
  - If your deployment requires additional security, use a non-sysadmin database login mapped to a database user who has permission to delete records from the database.
    1. In SQL Server Management Studio, create a SQL Server login with a server role other than ‘sysadmin.’
    2. Map the login to a user in the database. SQL Server automatically creates a user in the database with the same name as the login.
    3. In Database role membership, specify at least one of the role members for the database user: ConfigurationLoggingSchema_ROLE or dboowner.

For more information, see the SQL Server Management Studio documentation.

To delete the configuration logs:

1. Select **Logging** in the Studio navigation pane.
2. Select **Delete logs** in the Actions pane.
3. You are asked if you want to create a backup of the logs before they are deleted. If you choose to create a backup, browse to the location where the backup archive is saved. The backup is created as a CSV file.

After the configuration logs are cleared, the log deletion is the first activity posted to the empty log. That entry provides details about who deleted the logs, and when.

**Event logs**

December 18, 2019

The following articles list and describe events that can be logged by services within Citrix Virtual Apps and Desktops.

This information is not comprehensive. Readers should check individual feature articles for additional event information.

- Citrix Broker Service events
- Citrix FMA Service SDK events
Director

September 14, 2020

Director is a monitoring and troubleshooting console for Citrix Virtual Apps and Desktops.

Director can access:

- Real-time data from the Broker Agent using a unified console integrated with Analytics, Performance Manager, and Network Inspector. The following analytics are powered by Citrix ADM to identify bottlenecks due to the network in your Citrix Virtual Apps or Desktops environment:
  - Performance management for health and capacity assurance
  - Historical trending and network analysis
- Historical data stored in the Monitor database to access the Configuration Logging database.
- ICA data from the Citrix Gateway using Citrix ADM.
  - Gain visibility into the end-user experience for virtual applications, desktops, and users for Citrix Virtual Apps or Desktops.
- Correlate network data with application data and real-time metrics for effective troubleshooting.
- Integrate with Citrix Virtual Desktop 7 Director monitoring tool.

Director uses a troubleshooting dashboard that provides real-time and historical health monitoring of the Citrix Virtual Apps or Desktops Site. This feature allows you to see failures in real time, providing a better idea of what the end users are experiencing.

For more information regarding the compatibility of Director features with Delivery Controller (DC), VDA and any other dependent components, see Feature compatibility matrix.

**Note:**

With the disclosure of the Meltdown and Spectre speculative execution side-channel vulnerabilities, Citrix recommends that you install relevant mitigation patches. These patches might impact SQL Server performance. For more information, see the Microsoft support article, Protect SQL Server from attacks on Spectre and Meltdown side-channel vulnerabilities. Citrix recommends that you test the scale and plan your workloads before rolling out the patches in your production environments.

Director is installed by default as a website on the Delivery Controller. For prerequisites and other details, see the System requirements documentation for this release. For specific information on the installation and configuration of Director, see Install and configure Director.

**Log on to Director**

The Director website is at https or http://<Server FQDN>/Director.

If one of the Sites in a multi-site deployment is down, the logon takes a little longer while it attempts to connect to the Site that is down.

**Use Director with PIV smart card authentication**

Director now supports Personal Identity Verification (PIV) based smart card authentication to log on. This feature is useful for organizations and government agencies that use smart card based authentication for access control.

Smart card authentication requires specific configuration on the Director server and in the Active Directory. The configuration steps are detailed in Configure PIV smart card authentication.

**Note:**

Smart card authentication is supported only for users from the same Active Directory domain.

After performing the required configuration, you can log on to Director using a smart card:

1. Insert your smart card into the smart card reader.
2. Open a browser and go to the Director URL, \texttt{https://<directorfqdn>/Director}.

3. Select a valid user certificate from the displayed list.

4. Enter your smart card token.

5. After you are authenticated, you can access Director without keying extra credentials on the Director logon page.

\textbf{Use Director with Integrated Windows Authentication}

With Integrated Windows Authentication (IWA), domain-joined users gain direct access to Director without rekeying their credentials on the Director logon page. The prerequisites for working with Integrated Windows Authentication and Director are:

- Enable Integrated Windows Authentication on the IIS website that hosts Director. When you install Director, Anonymous and Forms Authentications are enabled. To support Integrated Windows Authentication and Director, disable Anonymous Authentication and enable Windows Authentication. Forms Authentication must remain set to Enabled for authentication of non-domain users.

  1. Start IIS manager.
  2. Go to \textit{Sites > Default Web Site > Director}.
  3. Select \textit{Authentication}.
  4. Right-click \textit{Anonymous Authentication}, and select \textit{Disable}.
  5. Right-click \textit{Windows Authentication}, and select \textit{Enable}. 

© 1999-2020 Citrix Systems, Inc. All rights reserved.
Configure Active Directory delegation permission for the Director machine. Configuration is only required if Director and the Delivery Controller are installed on separate machines.

1. On the Active Directory machine, open the Active Directory Management Console.
2. In the Active Directory Management Console navigate to Domain Name > Computers. Select the Director machine.
3. Right-click and select Properties.
5. Select the option, Trust this computer for delegation to any service (Kerberos only).

The browser that is used to access Director must support Integrated Windows Authentication. Additional configuration steps might be required in Firefox and Chrome. For more information, refer to the browser documentation.

The Monitoring Service must be running Microsoft .NET Framework 4.5.1 or a later supported version listed in the System Requirements for Director. For more information, see System Requirements.

When a user logs off Director or if the session times out, the logon page is displayed. From the logon page, the user can set the Authentication type to Automatic logon or User credentials.

Interface views

Director provides different views of the interface tailored to particular administrators. Product permissions determine what is displayed and the commands available.

For example, help desk administrators see an interface tailored to help desk tasks. Director allows help desk administrators to search for the user reporting an issue and display activity associated with that user. For example, status of the user’s applications and processes. They can resolve issues quickly by performing actions such as ending an unresponsive application or process, shadowing operations on the user’s machine, restarting the machine, or resetting the user profile.

In contrast, full administrators see and manage the entire Site and can perform commands for multiple users and machines. The Dashboard provides an overview of the key aspects of a deployment, such as the status of sessions, user logons, and the Site infrastructure. Information is updated every minute. If issues occur, details appear automatically about the number and type of failures that have occurred.
For more information about the various roles and their permissions in Director, see Delegated Administration and Director.

Usage data collection by Google Analytics

The Director Service starts using Google Analytics to collect usage data anonymously after Director is installed. Statistics regarding the usage of the Trends pages and OData API call analytics are collected. Analytics collection complies with the Citrix Privacy Policy. Data collection is enabled by default when you install Director.

To opt out of the Google Analytics data collection, edit the registry key on the machine where Director is installed. If the registry key doesn’t exist, create and set it to the desired value. Refresh the Director instance after changing the registry key value.

Caution: Using the Registry Editor incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Citrix recommends that you back up Windows Registry before changing it.

Location: HKEY_LOCAL_MACHINE\Software\Citrix\Director
Name: DisableGoogleAnalytics
Value: 0 = enabled (default), 1 = disabled

You can use the following PowerShell cmdlet to disable data collection by Google Analytics:

```
1 New-Item HKLM:\SOFTWARE\Citrix -Name Director
2 New-ItemProperty HKLM:\SOFTWARE\Citrix\Director -Name DisableGoogleAnalytics -PropertyType DWORD -Value 1
```

New features guide

Director has an in-product guide that gives an insight into the new features released in the current version of Director. The quick overview coupled with appropriate in-product messages helps you understand what’s new in the product.

To opt out of this feature, edit the registry key, as described below on the machine where Director is installed. If the registry key doesn’t already exist, create and set it to the desired value. Refresh the Director instance after changing the registry key value.
Caution:
Using the Registry Editor incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Citrix recommends that you back up Windows Registry before changing it.

Location: HKEY_LOCAL_MACHINE\Software\Citrix\Director

Name: DisableGuidedHelp
Value: 0 = enabled (default), 1 = disabled

You can use the following PowerShell cmdlet to disable the in-product guide:

```
1 New-Item HKLM:\SOFTWARE\Citrix -Name Director
2 New-ItemProperty HKLM:\SOFTWARE\Citrix\Director -Name DisableGuidedHelp
   -PropertyType DWORD -Value 1
```

Install and configure

September 14, 2020

Install Director

Install Director using the full product ISO Installer for Citrix Virtual Apps and Desktops, which checks for prerequisites, installs any missing components, sets up the Director website, and performs basic configuration. For prerequisites and other details, see the System requirements documentation for this release. This release of Director is not compatible with Virtual Apps deployments earlier than 6.5 or Virtual Desktops deployments earlier than 7.

The default configuration provided by the ISO installer handles typical deployments. If Director was not included during installation, use the ISO installer to add Director. To add any additional components, rerun the ISO installer and select the components to install. For information on using the ISO installer, see Install core components in the installation documentation. Citrix recommends that you install using the full product ISO installer only, not the .MSI file.

When Director is installed on the Controller, it is automatically configured with localhost as the server address, and Director communicates with the local Controller by default. To install Director on a dedicated server that is remote from a Controller, you are prompted to enter the FQDN or IP address of a Controller.
Note:
Click Add to add the Controller to be monitored.

Director communicates with that specified Controller by default. Specify only one Controller address for each site that you monitor. Director automatically discovers all other Controllers in the same site and falls back to those other Controllers if the Controller you specified fails.

Note:
Director does not load balance among Controllers.

To secure the communications between the browser and the Web server, Citrix recommends that you implement TLS on the IIS website hosting Director. Refer to the Microsoft IIS documentation for instructions. Director configuration is not required to enable TLS.

**Deploy and configure Director**

When Director is used in an environment containing more than one site, be sure to synchronize the system clocks on all the servers where Controllers, Director, and other core components are installed. Otherwise, the sites might not display correctly in Director.
Important:

To protect the security of user names and passwords sent using plain text through the network, allow Director connections using only HTTPS, and not HTTP. Certain tools are able to read plain text user names and passwords in HTTP (unencrypted) network packets, which can create a potential security risk for users.

Configure permissions

To log on to Director, administrators with permissions for Director must be Active Directory domain users and must have the following rights:

- Read rights in all Active Directory forests to be searched (see Advanced configuration).
- Configured Delegated Administrator roles (see delegated administration and Director).
- To shadow users, administrators must be configured using a Microsoft group policy for Windows Remote Assistance. In addition:
  - When installing VDAs, ensure that the Windows Remote Assistance feature is enabled on all user devices (selected by default).
  - When you install Director on a server, ensure that Windows Remote Assistance is installed (selected by default). However, it is disabled on the server by default. The feature does not need to be enabled for Director to provide assistance to end users. Citrix recommends leaving the feature disabled to improve security on the server.
  - To enable administrators to initiate Windows Remote Assistance, grant them the required permissions by using the appropriate Microsoft Group Policy settings for Remote Assistance. For information, see CTX127388: How to Enable Remote Assistance for Desktop Director.

Advanced configuration

September 14, 2020

Director can support multi-forest environments spanning a forest configuration where users, Delivery Controllers (DCs), VDAs, and Directors are located in different forests. This requires proper setup of trust relationships among the forests and configuration settings.

Recommended configuration in a multi-forest environment

The recommended configuration requires creation of outgoing and incoming forest trust relationships among the forests with domain-wide authentication.
The trust relationship from the Director enables you to troubleshoot issues in user sessions, VDAs, and Delivery Controllers located in different forests.

Advanced configuration required for Director to support multiple forests is controlled through settings defined in Internet Information Services (IIS) Manager.

Important:
When you change a setting in IIS, the Director service automatically restarts and logs off users.

To configure advanced settings using IIS:

1. Open the Internet Information Services (IIS) Manager console.
2. Go to the Director website under the Default website.
3. Double-click Application Settings.
4. Double-click a setting to edit it.
5. Click Add to add a new setting.

Director uses Active Directory to search for users and to look up more user and machine information. By default, Director searches the domain or forest in which:

- The administrator’s account is a member.
- The Director web server is a member (if different).

Director attempts to perform searches at the forest level using the Active Directory global catalog. If you do not have permissions to search at the forest level, only the domain is searched.

Searching or looking up data from another Active Directory domain or forest requires that you explicitly set the domains or forests to be searched. Configure the following Applications setting to the Director website in the IIS Manager:
The value attributes user and server represent the domains of the Director user (the administrator) and Director server, respectively.

To enable searches from an extra domain or forest, add the name of the domain to the list, as shown in this example:

```
Connector.ActiveDirectory.Domains = (user),(server),\<domain1\>,\<domain2\>
```

For each domain in the list, Director attempts to perform searches at the forest level. If you do not have permissions to search at the forest level, only the domain is searched.

**Domain local group configuration**

Most Citrix Service Providers (CSPs) have similar environment set-ups consisting of the VDAs, DCs, and Director in the Infrastructure forest. The users or user-group records belong to the Customer forest. A one-way outgoing trust exists from the Infrastructure forest to the Customer forest.

CSP administrators typically create a domain local group in the Infrastructure forest and add the users or user groups in the Customer forest to this domain local group.

Director can support a multi-forest set-up like this and monitor the sessions of users configured using domain local groups.

1. Add the following Applications settings to the Director website in IIS Manager:

```
Connector.ActiveDirectory.DomainLocalGroupSearch = true
Connector.ActiveDirectory
```
<domain1>,<domain2> are names of the forests in which the domain local group exists.

2. Assign the domain local group to delivery groups in Citrix Studio.

3. Restart IIS and log on to Director again for the changes to take effect. Now, Director can monitor and show the sessions of these users.

Add sites to Director

If Director is already installed, configure it to work with multiple sites. To do this, use the IIS Manager Console on each Director server to update the list of server addresses in the application settings.

Add an address of a Controller from each site to the following setting:

```
1  Service.AutoDiscoveryAddresses = SiteAController,SiteBController
```

SiteAController and SiteBController are the addresses of Delivery Controllers from two different sites.

Disable the visibility of running applications in the Activity Manager

By default, the Activity Manager in Director displays a list of all running applications for a user's session. This information is viewed by all administrators that have access to the Activity Manager feature in Director. For Delegated Administrator roles, this includes Full Administrator, delivery group Administrator, and Help Desk Administrator.

To protect the privacy of users and the applications they are running, you can disable the Applications tab to list running applications.

Warning:

Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix does not guarantee that problems resulting from the incorrect use of the Registry Editor can be solved. Use the Registry Editor at your own risk. Be sure to back up the registry before you edit it.

1. On the VDA, modify the registry key at HKEY_LOCAL_MACHINE\Software\Citrix\Director\TaskManagerDataDisplayed.

   By default, the key is set to 1. Change the value to 0, which means the information is not collected from the VDA and hence not displayed in the Activity Manager.

2. On the server with Director installed, modify the setting that controls the visibility of running applications. By default, the value is “true” which allows visibility of running applications in the
Applications tab. Change the value to “false” which disables visibility. This option affects only the Activity Manager in Director, not the VDA.
Modify the value of the following setting:
UI.TaskManager.EnableApplications = false

**Important:**
To disable the view of running applications, make both changes to ensure that the data is not displayed in the Activity Manager.

### Configure PIV smart card authentication

September 14, 2020
This article lists the configuration required on the Director Server and in Active Directory to enable the smart card authentication feature.

**Note:**
Smart card authentication is supported only for users from the same Active Directory domain.

### Director server configuration

Perform the following configuration steps on the Director server:

2. Disable Forms Authentication on the Director site.
   
   Start IIS Manager.
   
   Go to Sites > Default Web Site > Director.
   
   Select Authentication.
   
   Right-click Forms Authentication, and select Disable.
3. Configure the Director URL for the more secure https protocol (instead of HTTP) for client certificate authentication.
   a) Start IIS Manager.
   b) Go to Sites > Default Web Site > Director.
   c) Select SSL Settings.
   d) Select Require SSL and Client certificates > Require.

4. Update web.config. Open the web.config file (available in c:\inetpub\wwwroot\Director) using a text editor.
Under the `<system.webServer>` parent element, add the following snippet as the first child element:

```xml
<defaultDocument>
    <files>
        <add value="LogOn.aspx"/>
    </files>
</defaultDocument>
```

**Active Directory configuration**

By default, Director application runs with the **Application Pool** identity property. Smart card authentication requires delegation for which the Director application identity must have Trusted Computing Base (TCB) privileges on the service host.

Citrix recommends that, you create a separate service account for Application Pool identity. Create the service account and assign TCB privileges as per the instructions in the MSDN Microsoft article, *Protocol Transition with Constrained Delegation Technical Supplement*.

Assign the newly created service account to the Director application pool. The following figure shows the properties dialog of a sample service account, Domain Pool.
Configure the following services for this account:

- Delivery Controller: HOST, HTTP
- Director: HOST, HTTP
- Active Directory: GC, LDAP

To configure,

1. In the user account properties dialog, click **Add**.
2. In the **Add Services** dialog, click Users or Computers.
3. Select the Delivery Controller host name.
4. From the **Available services** list, select HOST and HTTP **Service Type**.
Similarly, add Service Types for **Director** and **Active Directory** hosts.

**Firefox browser configuration**

To use the Firefox browser, install the PIV driver available at [OpenSC 0.17.0](https://opensc.org). For installation and configuration instructions, see [Installing OpenSC PKCS#11 Module in Firefox, Step by Step](https://opensc.org). For information on the usage of the smart card authentication feature in Director, see the **Use Director with PIV based smart card authentication** section in the Director article.

**Configure network analysis**

June 21, 2020

---

**Note:**

The availability of this feature depends on your organization's license and your administrator permissions.

Director integrates with Citrix ADM to provide network analysis and performance management:

- Network analysis uses HDX Insight reports from Citrix ADM to provide an application and desktop contextual view of the network. With this feature, Director provides advanced analytics of
ICA traffic in your deployment.
- Performance management provides historical retention and trend reporting. With historical retention of data versus the real-time assessment, you can create Trend reports, including capacity and health trending.

After you enable this feature in Director, HDX Insight reports provide Director with additional information:
- The Network tab in the Trends page shows latency and bandwidth effects for applications, desktops, and users across your entire deployment.
- The User Details page shows latency and bandwidth information specific to a particular user session.

**Limitations:**
- In the Trends view, HDX connection logon data is not collected for VDAsearlier than 7. For earlier VDAs, the chart data is displayed as 0.

To enable network analysis, you must install and configure Citrix ADM in Director. Director requires Citrix ADM Version 11.1 Build 49.16 or later. MAS is a virtual appliance that run on the Citrix XenServer. Using network analysis, Director communicates and gathers the information that is related to your deployment.

For more information, see the Citrix ADM documentation.

**Note:**
Citrix NetScaler Insight Center has reached its End of Maintenance date as of 15 May 2018. See the Citrix Product Matrix. Integrate Director with Citrix ADM for network analysis. To migrate your NetScaler Insight Center to Citrix ADM, see Migrate from NetScaler Insight Center to Citrix ADM.

1. On the server where Director is installed, locate the DirectorConfig command line tool in C:\inetpub\wwwroot\Director\tools, and run it with parameter /confignetscaler from a command prompt.
2. When prompted, enter the Citrix ADM machine name (FQDN or IP address), the user name, password, HTTPS connection type (preferred over HTTP), and choose Citrix ADM integration.
3. To verify the changes, log off and log back on.

**Delegated administration and Director**

July 10, 2020

Delegated administration uses three concepts: administrators, roles, and scopes. Permissions are based on an administrator’s role and the scope of this role. For example, an administrator might be
assigned a Help Desk administrator role where the scope involves responsibility for end-users at one site only.

For information about creating delegated administrators, see the main delegated administration article.

Administrative permissions determine the Director interface presented to administrators and the tasks they can perform. Permissions determine:

- The views the administrator can access, collectively referred to as a view.
- The desktops, machines, and sessions that the administrator can view and interact with.
- The commands the administrator can perform, such as shadowing a user’s session or enabling maintenance mode.

The built-in roles and permissions also determine how administrators use Director:

<table>
<thead>
<tr>
<th>Administrator Role</th>
<th>Permissions in Director</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full Administrator</td>
<td>Full access to all views and can perform all commands, including shadowing a user’s session, enabling maintenance mode, and exporting trends data.</td>
</tr>
<tr>
<td>Delivery group Administrator</td>
<td>Full access to all views and can perform all commands, including shadowing a user’s session, enabling maintenance mode, and exporting trends data.</td>
</tr>
<tr>
<td>Read Only Administrator</td>
<td>Can access all views and see all objects in specified scopes and global information. Can download reports from HDX channels and can export Trends data using the Export option in the Trends view. Cannot perform any other commands or change anything in the views.</td>
</tr>
</tbody>
</table>
### Administrator Role Permissions in Director

<table>
<thead>
<tr>
<th>Administrator Role</th>
<th>Permissions in Director</th>
</tr>
</thead>
<tbody>
<tr>
<td>Help Desk Administrator</td>
<td>Can access only the Help Desk and User Details views and can view only objects that the administrator is delegated to manage. Can shadow a user’s session and perform commands for that user. Can perform maintenance mode operations. Can use power control options for Single-session OS Machines. Cannot access the Dashboard, Trends, Alerts, or Filters views. Cannot use power control options for Multi-session OS machines.</td>
</tr>
<tr>
<td>Machine catalog administrator</td>
<td>Can access only the Machine Details page (Machine-based search).</td>
</tr>
<tr>
<td>Host Administrator</td>
<td>No access. This administrator is not supported for Director and cannot view data.</td>
</tr>
</tbody>
</table>

**Configure custom roles for Director administrators**

In Studio, you can also configure Director-specific, custom roles to more closely match the requirements of your organization and delegate permissions more flexibly. For example, you can restrict the built-in Help Desk administrator role so that this administrator cannot log off sessions.

If you create a custom role with Director permissions, you must also give that role other generic permissions:

- Delivery Controller permission to log on to Director - at least read only access in Administrator node
- Permissions to delivery groups to view the data related to those delivery groups in Director - at least read only access

Alternatively, you can create a custom role by copying an existing role and include extra permissions for different views. For example, you can copy the Help Desk role and include permissions to view the Dashboard or Filters pages.

Select the Director permissions for the custom role, which include:

- Perform Kill Application running on a machine
- Perform Kill Process running on a machine
- Perform Remote Assistance on a machine
- Reset user profiles
- View Client Details page
- View Dashboard page
- View Filters page
- View Machine Details page
- View Trends page
- View User Details page

In this example, Shadowing (Perform Remote Assistance on a machine) is turned off.

A permission can have dependencies on other permissions to become applicable on the UI. For example, selecting the Perform Kill Application running on a machine permission enables the End Application functionality only in those panels to which the role has permission. You can select the following panel permissions:

- View Filters page
- View User Details page
- View Machine Details page
- View Client Details page

In addition, from the list of permissions for other components, consider these permissions from delivery groups:

- Enable/disable maintenance mode of a machine using delivery group membership.
- Perform power operations on Windows Desktop machines using delivery group membership.
- Perform session management on machines using delivery group membership.
Secure Director deployment

September 14, 2020

This article highlights areas that might have an impact on system security when deploying and configuring Director.

Configure Microsoft Internet Information Services (IIS)

You can configure Director with a restricted IIS configuration.

File name extensions

You can disallow unlisted file name extensions. 

Director requires these file name extensions in Request Filtering:

- .aspx
- .css
- .html
- .js
- .png
- .svc
- .png
- .json
- .woff
- .woff2
- .ttf

Director requires the following HTTP verbs in Request Filtering. You can disallow unlisted verbs.

- GET
- POST
- HEAD

Director does not require:

- ISAPI filters
- ISAPI extensions
- CGI programs
- FastCGI programs
**Important:**

- Director requires Full Trust. Do not set the global .NET trust level to High or lower.
- Director maintains a separate application pool. To modify the Director settings, select the Director site and modify.

**Configure user rights**

When Director is installed, its application pools are granted the following:

- **Log on as a service** logon right
- **Adjust memory quotas for a process, Generate security audits**, and **Replace a process level token** privileges

The rights and privileges mentioned are normal installation behavior when application pools are created.

You do not need to change these user rights. These privileges are not used by Director and are automatically disabled.

**Director communications**

In a production environment, use the Internet Protocol security (IPsec) or HTTPS protocols to secure the data passing between Director and your servers.

IPsec is a set of standard extensions to the Internet Protocol that provides authenticated and encrypted communications with data integrity and replay protection. Since IPsec is a network-layer protocol set, higher level protocols can use it without modification. HTTPS uses the Transport Layer Security (TLS) protocols to provide strong data encryption.

**Note:**

- Citrix strongly recommends that you do not enable unsecured connections to Director in a production environment.
- Secure communications from Director require configuration for each connection separately.
- The SSL protocol is not recommended. Use the more secure TLS protocol instead.
- Secure your communications with Citrix ADC using TLS, not IPsec.

To secure communications between Director and Citrix Virtual Apps and Desktops servers (for monitoring and reports), refer to **Data Access Security**.

To secure communications between Director and Citrix ADC (for Citrix Insight), refer to **Configure network analysis**.
To secure communications between Director and License server, refer to Secure the License Administration Console.

Director security separation

You can deploy any web applications in the same web domain (domain name and port) as Director. However, any security risks in those web applications can potentially reduce the security of your Director deployment. Where a greater degree of security separation is required, Citrix recommends that you deploy Director in a separate web domain.

Configuring on-premises sites with Citrix Analytics for Performance

September 11, 2020

Citrix Analytics for Performance (Performance Analytics) is the comprehensive performance monitoring solution from the Citrix Analytics Cloud Service. Performance analytics provides advanced insights and analytics built on performance metrics. Performance Analytics helps you monitor and view the usage and performance metrics of one or more Citrix Virtual Apps and Desktops sites in your organization.

For more information about Performance Analytics, see the Performance Analytics article.

You can send performance data from your site to Citrix Analytics for Performance on Citrix Cloud to leverage its advanced performance analytics capabilities. To view and use Performance Analytics, you must first configure your on-premises sites with Citrix Analytics for Performance from the Analytics tab in Director.
Performance Analytics accesses data in a secure manner and no data is transferred from Citrix Cloud to the on-premises environment.

**Prerequisites**

To configure Performance Analytics from Director, no new components need to be installed. Ensure that the following requirements are met:

- You must have a subscription for Citrix Analytics for Performance. This subscription can be either as a stand-alone offering or bundled along with Citrix Analytics for Security. To subscribe to Citrix Analytics for Performance, see [Citrix Analytics for Performance](#).
- Your Delivery Controller and Director are on version 1909 or later. For more information, see [Feature compatibility matrix](#).
- Access to the **Analytics** tab to perform this configuration is available for full administrators only.
- For Performance Analytics to access performance metrics, outbound internet access is available on all Delivery Controllers and the machines on which Director is installed. Specifically, ensure accessibility to the following URLs:
  - Citrix Key Registration: [https://*.citrixnetworkapi.net/](https://*.citrixnetworkapi.net/)
  - Citrix Cloud: [https://*.citrixworkspacesapi.net/](https://*.citrixworkspacesapi.net/)
  - Citrix Analytics: [https://*.cloud.com/](https://*.cloud.com/)
  - Microsoft Azure: [https://*.windows.net/](https://*.windows.net/)
Note:
In case, Delivery Controllers and Director machines are within an intranet and outbound internet access is via a proxy server, the `usedefaultproxy` field in the config file controls the outbound access of Director and Monitor Service.

Configuration and communication with Performance Analytics requires the `usedefaultproxy` field to be set to `true`. Also, the proxy server must whitelist the preceding list of URLs. It is possible the policies in effect set this field to false. In this case, you must manually set the field to true on the Director machine, in the Director web.config file. And on the Delivery Controller, in the Citrix.Monitor.exe.config file.

Take a backup of the config files before you make the changes. Restart the Monitoring service on the Delivery Controller for the changes to be affected.

- You have an active Citrix Cloud entitlement for Performance Analytics.
- Your Citrix Cloud account is an Administrator account with rights to the Product Registration Experience. For more information about administrator permissions, see Modify Administrator Permissions.

Configuration steps

After you have verified the prerequisites, do the following:

1. Log on to Director as a full administrator and select the site which you want to configure with Performance Analytics.
2. Click the Analytics tab. The Configuration page is displayed.
3. Review the steps, select the terms of service, and then click Get Started.
4. Review the prerequisites and ensure that they are met. Review the site Details.
5. Click **Connect Site** to start the configuration process.

6. A unique 8-digit registration code is generated to be used to register this site with Citrix Cloud.

7. Click **Copy Code** to copy the code and then click **Register on Citrix Cloud**.

8. You are redirected to the Registration URL in Citrix Cloud. Log in with your Citrix Cloud credentials and select your customer.

9. Paste the copied registration code in the Product Registrations page in Citrix Cloud. Click **Continue** to register. Review the registration details and click **Register**.
10. Your on-premises site registers with Citrix Cloud. Now, from Director, click Go to Analytics in the Analytics tab.

11. Performance Analytics is opened on a new tab in your browser.
If your Citrix Cloud session has expired, you might be redirected to the Citrix.com or My Citrix account logon page.

12. To register multiple sites with Performance Analytics, repeat the preceding configuration steps for each site from Director. Metrics for all configured sites are displayed on the Performance Analytics dashboard.

In case you have more than one Director instance running per site, configure from any one Director instance. All other Director instances connected to the site are updated at the next refresh after the configuration process.

13. To disconnect your site from Citrix Cloud, click Disconnect Site. This option deletes the existing configuration.

Notes:

The first time you configure a site, events from the site might take some time (approximately an hour) to be processed; causing a delay in the display of metrics on the Performance Analytics dashboard. Thereafter, events refresh at regular intervals.

Upon disconnect, data transmission from the old account continues for some time until the events from the new account are transmitted. For approximately one hour after data transmission stops, analytics related to the old account remain displayed on the Performance Analytics Dashboard.

Upon expiry of entitlement to the Citrix Analytics service, it takes up to a day to stop sending the site metrics to Performance Analytics.

Site Analytics

September 14, 2020
With full administrator permission, when you open Director, the Dashboard provides a centralized location to monitor the health and usage of a site.

If there are currently no failures and no failures have occurred in the past 60 minutes, panels stay collapsed. When there are failures, the specific failure panel automatically appears.

**Note:**
Depending on your organization’s license and your Administrator privileges, some options or features might not be available.

### Panels on the Director Dashboard

#### User Connection Failures

Connection failures over the last 60 minutes. Click the categories next to the total number to view metrics for that type of failure. In the adjacent table, that number is broken out by delivery groups. Connection failures include failures caused by application limits being reached. For more information on application limits, see [Applications](#).

#### Failed Single-session OS Machines or Failed Multi-session OS Machines

Total failures in the last 60 minutes broken out by delivery groups. Failures broken out by types, including failed to start, stuck on boot, and unregistered. For Multi-session OS machines, failures also include machines reaching maximum load.

#### Licensing Status

License Server alerts display alerts sent by the License Server and the actions required to resolve the alerts. Requires License Server Version 11.12.1 or later. Delivery Controller alerts display the details of the licensing state as seen by the Controller and are sent by the Controller. Requires Controller for
XenApp 7.6 or XenDesktop 7.6 or later. You can set the threshold for alerts in Studio. Licensing status displayed in Delivery Controllers > Details > Product Editions > PLT indicates Premium and not Platinum.

**Grace State**

Director displays one of the following grace states. This information is fetched from the Delivery Controller.

1. **Not Active**: Not in any type of grace period. Normal licensing limits apply.
2. **Out of Box Grace**: 10 connections for the first 30 days after a new installation when pointing to a license server with no licenses.
3. **Supplemental Grace**: When all licenses are consumed, a 15 day grace period is provided for business continuity until new licenses are added, or consumption is reduced. Unlimited connections are allowed during the supplemental grace period. Users are not affected. Warnings shown in Director cannot be dismissed until the supplemental grace period expires or is reset.
4. **Emergency Grace**: Comes into effect when the license server is unreachable or the license information cannot be fetched while brokering a connection. Emergency grace is valid for 30 days. Users are not affected. Errors shown in Director cannot be dismissed until the license server is reachable.
5. **Grace Expired**: Emergency Grace or the supplemental grace period has expired.

For more information, see License overdraft and Supplemental grace period.

**Sessions Connected**

Connected sessions across all delivery groups for the last 60 minutes.

**Average Logon Duration**

Logon data for the last 60 minutes. The large number on the left is the average logon duration across the hour. Logon data for VDAs earlier than XenDesktop 7.0 is not included in this average. For more information, see Diagnose user logon issues.

**Infrastructure**

Lists your site’s infrastructure - hosts and Controllers. For infrastructure from Citrix Hypervisor or VMware, you can view performance alerts. For example, you can configure XenCenter to generate performance alerts when CPU, network I/O, or disk I/O usage go over a specified threshold on a managed server or virtual machine. By default, the alert repeat interval is 60 minutes, but you can configure
this as well. For details, see the XenCenter Performance Alerts section in the Citrix Hypervisor product documentation.

**Note:**
If no icon appears for a particular metric, this indicates that this metric is not supported by the type of host you are using. For example, no health information is available for System Center Virtual Machine Manager (SCVMM) hosts, AWS and CloudStack.

Continue to troubleshoot issues using these options (which are documented in the following sections):

- Control user machine power
- Prevent connections to machines

### Monitor sessions

If a session becomes disconnected, it is still active and its applications continue to run, but the user device is no longer communicating with the server.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View a user’s currently connected machine or session</td>
<td>From the Activity Manager and User Details views, view the user’s currently connected machine or session and a list of all machines and sessions to which this user has access. To access this list, click the session switcher icon in the user title bar. For more information, see Restore sessions.</td>
</tr>
<tr>
<td>View the total number of connected sessions across all delivery groups</td>
<td>From the Dashboard, in the <strong>Sessions Connected</strong> pane, view the total number of connected sessions across all delivery groups for the last 60 minutes. Then click the large total number, which opens the Filters view, where you can display graphical session data based on selected delivery groups and ranges and usage across delivery groups.</td>
</tr>
</tbody>
</table>
## Action Description

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>End idle sessions</td>
<td>The Sessions Filters view displays data related to all active sessions. Filter the sessions based on Associated User, delivery group, Session State, and Idle Time greater than a threshold time period. From the filtered list, select sessions to log off or disconnect. For more information, see Troubleshoot applications.</td>
</tr>
<tr>
<td>View data over a longer period of time</td>
<td>On the Trends view, select the Sessions tab to drill down to more specific usage data for connected and disconnected sessions over a longer period of time (that is, session totals from earlier than the last 60 minutes). To view this information, click View historical trends.</td>
</tr>
</tbody>
</table>

### Note:

If the user device is running a legacy Virtual Delivery Agent (VDA), such as a VDA earlier than version 7, or a Linux VDA, Director cannot display complete information about the session. Instead, it displays a message that the information is not available.

### Desktop Assignment Rules limitation:

Citrix Studio allows assignment of multiple Desktop Assignment Rules (DAR) for different users or user groups to a single VDA in the delivery group. StoreFront displays the assigned desktop with the corresponding **Display Name** as per the DAR for the logged in user. However, Director does not support DARs and displays the assigned desktop using the delivery group name regardless of the logged in user. As a result, you cannot map a specific desktop to a machine in Director.

You can map the assigned desktop displayed in StoreFront to the delivery group name displayed in Director using the following PowerShell command:

```powershell
Get-BrokerDesktopGroup | Where-Object {
    $_.Uid -eq (Get-BrokerAssignmentPolicyRule | Where-Object {
        $_.PublishedName -eq "\<Name on StoreFront\>" 
    }).DesktopGroupUid
} | Select-Object -Property Name, Uid
```
Session transport protocol

View the transport protocol in use for the HDX connection type for the current session in the Session Details panel. This information is available for sessions launched on VDAs Version 7.13 or later.

<table>
<thead>
<tr>
<th>ID</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session State</td>
<td>Active</td>
</tr>
<tr>
<td>Application State</td>
<td>Desktop</td>
</tr>
<tr>
<td>Anonymous</td>
<td>No</td>
</tr>
<tr>
<td>Time in state</td>
<td>0 minutes</td>
</tr>
<tr>
<td>Endpoint name</td>
<td>9H5T6Y8PA</td>
</tr>
<tr>
<td>Endpoint IP</td>
<td>192.168.1.27</td>
</tr>
<tr>
<td>Connection type</td>
<td>HDX</td>
</tr>
<tr>
<td>Protocol</td>
<td>TCP</td>
</tr>
<tr>
<td>Citrix Workspace App Version</td>
<td>18.12.0.12</td>
</tr>
<tr>
<td>ICA RTT</td>
<td>n/a</td>
</tr>
<tr>
<td>ICA Latency</td>
<td>284 ms</td>
</tr>
<tr>
<td>Launched via</td>
<td>n/a</td>
</tr>
<tr>
<td>Connected via</td>
<td>WAP.10.18.37.78</td>
</tr>
</tbody>
</table>

- For HDX Connection type,
  - The Protocol is displayed as **UDP**, if EDT is used for the HDX connection.
  - The Protocol is displayed as **TCP**, if TCP is used for the HDX connection.
For **RDP** Connection type, the Protocol is displayed as **n/a**.

When adaptive transport is configured, the session transport protocol dynamically switches between EDT (over UDP) and TCP, based on the network conditions. If the HDX session cannot be established using EDT, it falls back to the TCP protocol.

For more information about adaptive transport configuration, see **Adaptive Transport**.

**Export reports**

You can export trends data to generate regular usage and capacity management reports. Export supports PDF, Excel, and CSV report formats. Reports in PDF and Excel formats contain trends represented as graphs and tables. CSV format reports contain tabular data that can be processed to generate views or can be archived.

To export a report:

1. Go to the **Trends** tab.
2. Set filter criteria and time period and click **Apply**. The trend graph and table are populated with data.
3. Click **Export** and enter name and format of the report.

Director generates the report based on the filter criteria you select. If you change the filter criteria, click **Apply** before you click **Export**.

**Note:**

Export of a large amount of data causes a significant increase in memory and CPU consumption on the Director server, the Delivery Controller, and the SQL servers. The supported number of concurrent export operations and the amount of data that can be exported is set to default limits to achieve optimal export performance.

**Supported export limits**

Exported PDF and Excel reports contain complete graphical charts for the selected filter criteria. However, tabular data in all report formats is truncated beyond the default limits on the number of rows or records in the table. The default number of records supported is defined based on the report format.

You can change the default limit by configuring the Director Application Settings in Internet Information Services (IIS).

<table>
<thead>
<tr>
<th>Report format</th>
<th>Default number of records supported</th>
<th>Fields in Director Application Settings</th>
<th>Max number of records supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDF</td>
<td>500</td>
<td>UI.ExportPdfDrilldownl</td>
<td>5000</td>
</tr>
<tr>
<td>Report format</td>
<td>Default number of records supported</td>
<td>Fields in Director Application Settings</td>
<td>Max number of records supported</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------</td>
<td>----------------------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>Excel</td>
<td>100,000</td>
<td>UI.ExportExcelDrilldownLimit: 100,000</td>
<td></td>
</tr>
<tr>
<td>CSV</td>
<td>100,000 (10,000,000 in Sessions tab)</td>
<td>UI.ExportCsvDrilldownLimit: 100,000</td>
<td></td>
</tr>
</tbody>
</table>

To change the limit of the number of records you can export:

1. Open the IIS Manager console.
2. Go to the Director website under the Default website.
3. Double-click **Application Settings**.
4. Edit or add a setting for the fields UI.ExportPdfDrilldownLimit, UI.ExportExcelDrilldownLimit, or UI.ExportCsvDrilldownLimit as required.

Adding these field values in Application Settings overrides the default values.

**Warning:**

Setting field values greater than the max number of records supported can impact the performance of Export and is not supported.

**Error Handling**

This section gives you information on dealing with errors that you might encounter during Export operation.

- **Director has timed out**

This error can occur due to network issues or high resource usage on the Director server or with the Monitor Service.

The default timeout duration is 100 seconds. To increase the timeout duration of the Director Service, set the value of `Connector.DataServiceContext.Timeout` field in Director Application Settings in Internet Information Services (IIS):

1. Open the IIS Manager console.
2. Go to the Director website under the Default website.
3. Double-click **Application Settings**.
4. Edit the value `Connector.DataServiceContext.Timeout`.

- **Monitor has timed out**
This error can occur due to network issues or high resource usage with the Monitor Service or on the SQL server.

To increase the timeout duration of the Monitor Service, run the following PowerShell commands on the Delivery Controller:

```powershell
1. asnp Citrix.*
2. Get-MonitorConfiguration
3. Set-MonitorConfiguration -MonitorQueryTimeoutSeconds <timeout value>
```

- **Max concurrent Export or Preview operations ongoing**

Director supports one instance of Export or Preview. If you get the Max concurrent Export or Preview operations ongoing error, try the next Export operation again later.

It is possible to increase the number of concurrent Export or Preview operations, however this can impact the performance of Director and is not supported:

1. Open the IIS Manager console.
2. Go to the Director website under the Default website.
3. Double-click Application Settings.
4. Edit the value UI.ConcurrentExportLimit.

- **Insufficient disk space in Director**

Each Export operation requires a maximum of 2 GB hard disk space in the Windows Temp folder. Retry Export after clearing space or adding more hard disk space on the Director server.

**Monitor hotfixes**

To view the hotfixes installed on a specific machine VDA (physical or VM), choose the Machine Details view.

**Control user machine power states**

To control the state of the machines that you select in Director, use the Power Control options. These options are available for Single-session OS machines, but might not be available for Multi-session OS machines.

**Note:**

This functionality is not available for physical machines or machines using Remote PC Access.
<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restart</td>
<td>Performs an orderly (soft) shutdown of the VM and all running processes are halted individually before restarting the VM. For example, select machines that appear in Director as “failed to start,” and use this command to restart them.</td>
</tr>
<tr>
<td>Force Restart</td>
<td>Restarts the VM without first performing any shut-down procedure. This command works in the same way as unplugging a physical server and then plugging it back in and turning it back on.</td>
</tr>
<tr>
<td>Shut Down</td>
<td>Performs an orderly (soft) shutdown of the VM. All running processes are halted individually.</td>
</tr>
<tr>
<td>Force Shutdown</td>
<td>Shuts down the VM without first performing any shut-down procedure. This command works in the same way as unplugging a physical server. It might not always shut down all running processes, and you risk losing data if you shut down a VM in this way.</td>
</tr>
<tr>
<td>Suspend</td>
<td>Suspends a running VM in its current state and stores that state in a file on the default storage repository. This option allows you to shut down the VM’s host server and later, after rebooting it, resume the VM, returning it to its original running state.</td>
</tr>
<tr>
<td>Resume</td>
<td>Resumes a suspended VM and restores its original running state.</td>
</tr>
<tr>
<td>Start</td>
<td>Starts a VM when it is off (also called a cold start).</td>
</tr>
</tbody>
</table>

If power control actions fail, hover the mouse over the alert, and a pop-up message appears with details about the failure.
Prevent connections to machines

Use maintenance mode to prevent new connections temporarily while the appropriate administrator performs maintenance tasks on the image.

When you enable maintenance mode on machines, no new connections are allowed until you disable it. If users are currently logged on, maintenance mode takes effect as soon as all users are logged off. For users who do not log off, send a message informing them that machines will be shut down at a certain time, and use the power controls to force the machines to shut down.

1. Select the machine, such as from the User Details view, or a group of machines in the Filters view.
2. Select Maintenance Mode, and turn on the option.

If a user tries to connect to an assigned desktop while it is in maintenance mode, a message appears indicating that the desktop is unavailable. No new connections can be made until you disable maintenance mode.

Application Analytics

The Applications tab displays application-based analytics in a single, consolidated view to help analyze and manage application performance efficiently. You can gain valuable insight into the health and usage information of all applications published on the site. It shows metrics such as the probe results, number of instances per application, and faults and errors associated with the published applications. For more information, see the Application Analytics section in Troubleshooting Applications.

Alerts and notifications

September 14, 2020

Alerts are displayed in Director on the dashboard and other high level views with warning and critical alert symbols. Alerts are available for Premium licensed sites. Alerts update automatically every minute; you can also update alerts on demand.
A warning alert (amber triangle) indicates that the warning threshold of a condition has been reached or exceeded.

A critical alert (red circle) shows that the critical threshold of a condition has been reached or exceeded.

You can view more detailed information on alerts by selecting an alert from the sidebar, clicking the Go to Alerts link at the bottom of the sidebar or by selecting Alerts from the top of the Director page.

In the Alerts view, you can filter and export alerts. For example, Failed Multi-session OS machines for a specific Delivery Group over the last month, or all alerts for a specific user. For more information, see Export reports.

Citrix alerts

Citrix alerts are alerts monitored in Director that originate from Citrix components. You can configure Citrix alerts within Director in Alerts > Citrix Alerts Policy. As part of the configuration, you can set notifications to be sent by email to individuals and groups when alerts exceed the thresholds you have set up. For more information on setting up Citrix Alerts, see Create alerts policies.
Smart alert policies

A set of built-in alert policies with predefined threshold values is available for Delivery Groups and Multi-session OS VDA scope. This feature requires Delivery Controller(s) version 7.18 or later. You can modify the threshold parameters of the built-in alert policies in Alerts > Citrix Alerts Policy. These policies are created when there is at least one alert target - a Delivery Group or a Multi-session OS VDA defined in your site. Additionally, these built-in alerts are automatically added to a new delivery group or a Multi-session OS VDA.

In case you upgrade Director and your site, the alert policies from your previous Director instance are carried over. Built-in alert policies are created only if no corresponding alert rules exist in the Monitor database.

For the threshold values of the built-in alert policies, see the Alerts policies conditions section.

SCOM alerts

SCOM alerts display alert information from Microsoft System Center 2012 Operations Manager (SCOM) to provide a more comprehensive indication of data center health and performance within Director. For more information, see the Configure SCOM alerts integration section.

The number of alerts displayed next to the alerts icons before you expand the sidebar are the combined sum of Citrix and SCOM alerts.
To create a new alerts policy, for example, to generate an alert when a specific set of session count criteria is met:

1. Go to Alerts > Citrix Alerts Policy and select, for example, Multi-session OS Policy.
2. Click Create.
3. Name and describe the policy, then set the conditions that have to be met for the alert to be triggered. For example, specify Warning and Critical counts for Peak Connected Sessions, Peak Disconnected Sessions, and Peak Concurrent Total Sessions. Warning values must not be greater than Critical values. For more information, see alerts policies conditions.
4. Set the Re-alert interval. If the conditions for the alert are still met, the alert is triggered again at this time interval and, if set up in the alert policy, an email notification is generated. A dismissed alert does not generate an email notification at the re-alert interval.
5. Set the Scope. For example, set for a specific Delivery Group.
6. In Notification preferences, specify who should be notified by email when the alert is triggered. You have to specify an email server on the Email Server Configuration tab in order to set email Notification preferences in Alerts Policies.
7. Click Save.

Creating a policy with 20 or more Delivery Groups defined in the Scope might take approximately 30 seconds to complete the configuration. A spinner is displayed during this time.

Creating more than 50 policies for up to 20 unique Delivery Groups (1000 Delivery Group targets in total) might result in an increase in response time (over 5 seconds).

Moving a machine containing active sessions from one Delivery Group to another might trigger erroneous Delivery Group alerts that are defined using machine parameters.
Alerts policies conditions

Find below the alert categories, recommended actions to mitigate the alert, and built-in policy conditions if defined. The built-in alert policies are defined for alert and realert intervals of 60 minutes.

Peak Connected Sessions

• Check Director Session Trends view for peak connected sessions.
• Check to ensure that there is enough capacity to accommodate the session load.
• Add new machines if needed

Peak Disconnected Sessions

• Check Director Session Trends view for peak disconnected sessions.
• Check to ensure that there is enough capacity to accommodate session load.
• Add new machines if needed.
• Log off disconnected sessions if needed

Peak Concurrent Total Sessions

• Check Director Session Trends view in Director for peak concurrent sessions.
• Check to ensure that there is enough capacity to accommodate session load.
• Add new machines if needed.
• Log off disconnected sessions if needed

CPU

Percentage of CPU usage indicates the overall CPU consumption on the VDA, including that of the processes. You can get more insight into the CPU utilization by individual processes from the Machine details page of the corresponding VDA.

• Go to Machine Details > View Historical Utilization > Top 10 Processes, identify the processes consuming CPU. Ensure that process monitoring policy is enabled to initiate collection of process level resource usage statistics.
• End the process if necessary.
• Ending the process causes unsaved data to be lost.
• If all is working as expected, add additional CPU resources in the future.

Note:
The policy setting, Enable resource monitoring is allowed by default for the monitoring
of CPU and memory performance counters on machines with VDAs. If this policy setting is disabled, alerts with CPU and memory conditions are not triggered. For more information, see Monitoring policy settings.

**Smart policy conditions:**

- **Scope:** Delivery Group, Multi-session OS scope
- **Threshold values:** Warning - 80%, Critical - 90%

**Memory**

Percentage of Memory usage indicates the overall memory consumption on the VDA, including that of the processes. You can get more insight into the memory usage by individual processes from the **Machine details** page of the corresponding VDA.

- Go to **Machine Details > View Historical Utilization > Top 10 Processes**, identify the processes consuming memory. Ensure that process monitoring policy is enabled to initiate collection of process level resource usage statistics.
- End the process if necessary.
- Ending the process causes unsaved data to be lost.
- If all is working as expected, add additional memory in the future.

**Note:**

The policy setting, **Enable resource monitoring**, is allowed by default for the monitoring of CPU and memory performance counters on machines with VDAs. If this policy setting is disabled, alerts with CPU and memory conditions are not triggered. For more information, see Monitoring policy settings.

**Smart policy conditions:**

- **Scope:** Delivery Group, Multi-session OS scope
- **Threshold values:** Warning - 80%, Critical - 90%

**Connection Failure Rate**

Percentage of connection failures over the last hour.

- Calculated based on the total failures to total connections attempted.
- Check Director Connection Failures Trends view for events logged from the Configuration log.
- Determine if applications or desktops are reachable.
Connection Failure Count

Number of connection failures over the last hour.

- Check Director Connection Failures Trends view for events logged from the Configuration log.
- Determine if applications or desktops are reachable.

ICA RTT (Average)

Average ICA round-trip time.

- Check Citrix ADM for a breakdown of the ICA RTT to determine the root cause. For more information, see Citrix ADM documentation.
- If Citrix ADM is not available, check the Director User Details view for the ICA RTT and Latency, and determine if it is a network problem or an issue with applications or desktops.

ICA RTT (No. of Sessions)

Number of sessions that exceed the threshold ICA round-trip time.

- Check Citrix ADM for the number of sessions with high ICA RTT. For more information, see Citrix ADM documentation.
- If Citrix ADM is not available, work with the network team to determine the root cause.

Smart policy conditions:

- **Scope**: Delivery Group, Multi-session OS scope
- **Threshold values**: Warning - 300 ms for 5 or more sessions, Critical - 400 ms for 10 or more sessions

ICA RTT (% of Sessions)

Percentage of sessions that exceed the average ICA round-trip time.

- Check Citrix ADM for the number of sessions with high ICA RTT. For more information, see Citrix ADM documentation.
- If Citrix ADM is not available, work with the network team to determine the root cause.

ICA RTT (User)

ICA round-trip time that is applied to sessions launched by the specified user. The alert is triggered if ICA RTT is greater than the threshold in at least one session.
Failed Machines (Single-session OS)

Number of failed Single-session OS machines. Failures can occur for various reasons as shown in the Director Dashboard and Filters views.

- Run Citrix Scout diagnostics to determine the root cause. For more information, see Troubleshoot user issues.

**Smart policy conditions:**
- **Scope:** Delivery Group scope
- **Threshold values:** Warning - 1, Critical - 2

Failed Machines (Multi-session OS)

Number of failed Multi-session OS machines. Failures can occur for various reasons as shown in the Director Dashboard and Filters views.

- Run Citrix Scout diagnostics to determine the root cause.

**Smart policy conditions:**
- **Scope:** Delivery Group, Multi-session OS scope
- **Threshold values:** Warning - 1, Critical - 2

Average Logon Duration

Average logon duration for logons that occurred over the last hour.

- Check the Director Dashboard to get up-to-date metrics regarding the logon duration. A large number of users logging in during a short timeframe can increase the logon duration.
- Check the baseline and break down of the logons to narrow down the cause. For more information, see Diagnose user logon issues

**Smart policy conditions:**
- **Scope:** Delivery Group, Multi-session OS scope
- **Threshold values:** Warning - 45 seconds, Critical - 60 seconds

Logon Duration (User)

Logon duration for logons for the specified user that occurred over the last hour.

Load Evaluator Index

Value of the Load Evaluator Index over the last 5 minutes.
• Check Director for Multi-session OS Machines that might have a peak load (Max load). View both Dashboard (failures) and Trends Load Evaluator Index report.

**Smart policy conditions:**
- **Scope:** Delivery Group, Multi-session OS scope
- **Threshold values:** Warning - 80%, Critical - 90%

### Hypervisor Alerts Monitoring

Director displays alerts to monitor hypervisor health. Alerts from Citrix Hypervisor and VMware vSphere help monitor hypervisor parameters and states. The connection status to the hypervisor is also monitored to provide an alert if the cluster or pool of hosts is rebooted or unavailable.

To receive hypervisor alerts, ensure that a hosting connection is created in Citrix Studio. For more information, see [Connections and resources](#). Only these connections are monitored for hypervisor alerts. The following table describes the various parameters and states of Hypervisor alerts.

<table>
<thead>
<tr>
<th>Alert</th>
<th>Supported Hypervisors</th>
<th>Triggered by</th>
<th>Condition</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU usage</td>
<td>Citrix Hypervisor, VMware vSphere</td>
<td>Hypervisor</td>
<td>CPU usage alert threshold is reached or exceeded</td>
<td>Alert thresholds must be configured in the Hypervisor.</td>
</tr>
<tr>
<td>Memory usage</td>
<td>Citrix Hypervisor, VMware vSphere</td>
<td>Hypervisor</td>
<td>Memory usage alert threshold is reached or exceeded</td>
<td>Alert thresholds must be configured in the Hypervisor.</td>
</tr>
<tr>
<td>Network usage</td>
<td>Citrix Hypervisor, VMware vSphere</td>
<td>Hypervisor</td>
<td>Network usage alert threshold is reached or exceeded</td>
<td>Alert thresholds must be configured in the Hypervisor.</td>
</tr>
<tr>
<td>Disk usage</td>
<td>VMware vSphere</td>
<td>Hypervisor</td>
<td>Disk usage alert threshold is reached or exceeded</td>
<td>Alert thresholds must be configured in the Hypervisor.</td>
</tr>
</tbody>
</table>
### Alert Summary

<table>
<thead>
<tr>
<th>Alert Description</th>
<th>Supported Hypervisors</th>
<th>Triggered by</th>
<th>Condition</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host connection or power state</td>
<td>VMware vSphere</td>
<td>Hypervisor</td>
<td>Hypervisor Host has been rebooted or is unavailable</td>
<td>Alerts are prebuilt in VMware vSphere. No additional configurations are needed.</td>
</tr>
<tr>
<td>Hypervisor connection unavailable</td>
<td>Citrix Hypervisor, VMware vSphere</td>
<td>Delivery Controller</td>
<td>Connection to the hypervisor (pool or cluster) is lost or powered down or rebooted. This alert is generated every hour as long as the connection is unavailable.</td>
<td>Alerts are prebuilt with the Delivery Controller. No additional configurations are needed.</td>
</tr>
</tbody>
</table>

---

**Note:**
For more information about configuring alerts, see [Citrix XenCenter Alerts](#) or [VMware vCenter Alerts](#).

Email notification preference can be configured under **Citrix Alerts Policy > site Policy > Hypervisor Health**. The threshold conditions for Hypervisor alert policies can be configured, edited, disabled, or deleted from the hypervisor only and not from Director. However, modifying email preferences and dismissing an alert can be done in Director.

**Important:**
- Alerts triggered by the Hypervisor are fetched and displayed in Director. However, changes in the life cycle/state of the Hypervisor alerts are not reflected in Director.
- Alerts that are healthy or dismissed or disabled in the Hypervisor console continues to appear in Director and have to be dismissed explicitly.
- Alerts that are dismissed in Director are not dismissed automatically in the Hypervisor console.

---
A new Alert category called **Hypervisor Health** has been added to enable filtering only the hypervisor alerts. These alerts are displayed once the thresholds are reached or exceeded. Hypervisor alerts can be:

- **Critical**—critical threshold of the hypervisor alarm policy reached or exceeded
- **Warning**—warning threshold of the hypervisor alarm policy reached or exceeded
- **Dismissed**—alert no longer displayed as an active alert

This feature requires Delivery Controller version 7 1811 or later. If you are using an older version of Director with sites 7 1811 or later, only the hypervisor alert count is displayed. To view the alerts, you must upgrade Director.

**Configure SCOM alerts integration**

SCOM integration with Director lets you view alert information from SCOM on the Dashboard and in other high-level views in Director.

SCOM alerts are displayed on-screen alongside Citrix alerts. You can access and drill down into SCOM alerts from SCOM tab in the side bar.

You can view historical alerts up to one month old, sort, filter, and export the filtered information to CSV, Excel, and PDF report formats. For more information, see [Export reports](#).

SCOM integration uses remote PowerShell 3.0 or later to query data from the SCOM Management Server and it maintains a persistent runspace connection in the user’s Director session. Director and SCOM server must have the same PowerShell version.
The requirements for SCOM integration are:

- Windows Server 2012 R2
- System Center 2012 R2 Operations Manager
- PowerShell 3.0 or later (PowerShell version on Director and the SCOM server must match)
- Quad Core CPU with 16 GB RAM (recommended)
- A primary Management Server for SCOM must be configured in the Director web.config file. You can do this using the DirectorConfig tool.

Citrix recommends that the Director administrator account is configured as a SCOM Operator role so that full alert information can be retrieved in Director. If this is not possible, a SCOM administrator account can be configured in the web.config file using the DirectorConfig tool.

Citrix further recommends that you do not configure more than 10 Director administrators per SCOM Management Server to ensure optimal performance.

On the Director server:

1. Type **Enable-PSRemoting** to enable PowerShell remoting.

2. Add the SCOM Management Server to the TrustedHosts list. Open a PowerShell prompt and execute the following command(s):  
   - Get the current list of TrustedHosts
     
     ```powershell
     Get-Item WSMAN:\localhost\Client\TrustedHosts
     ```
   - Add the FQDN of the SCOM Management Server to the list of TrustedHosts. `<Old Values>` represents the existing set of entries returned from Get-Item cmdlet.
     
     ```powershell
     Set-Item WSMAN:\localhost\Client\TrustedHosts -Value "<FQDN SCOM Management Server>,<Old Values>"
     ```

3. Configure SCOM using the DirectorConfig tool.

   ```powershell
   C:\inetpub\wwwroot\Director\tools\DirectorConfig.exe /configscom```
On the SCOM Management server:

1. Assign Director administrators to a SCOM administrator role.
   a) Open the SCOM Management console and go to Administration > Security > User Roles.
   b) In User Roles, you can create a new User Role or modify an existing one. There are four categories of SCOM operator roles that define the nature of access to SCOM data. For example, a Read-Only role does not see the Administration pane and cannot discover or manage rules, machines or accounts. An Operator role is a full administrator role.

   Note:
   The following operations are not available if the Director administrator is assigned to a non-operator role:
   • If there are multiple management servers configured and the primary management server is not available, the Director administrator cannot connect to the secondary management server. The primary management server is the server configured in the Director web.config file, that is the same server as the one specified with the DirectorConfig tool in step 3 above. The secondary management servers are peer management servers of the primary server.
   • While filtering alerts, the Director administrator cannot search for the alert source. This requires an operator level permission.
   c) To modify any User Role, right-click on the role, then click Properties.
   d) In the User Role Properties dialog, you can add or remove Director administrators from the specified user role.

2. Add Director administrators to the Remote Management Users group on the SCOM Management server. This allows the Director administrators to establish a remote PowerShell connection.

3. Type `Enable-PSRemoting` to enable PowerShell remoting.

4. Set the WS-Management properties limits:
   a) Modify MaxConcurrentUsers:
      In CLI:
      ```bash
      winrm set winrm/config/winrs @{ MaxConcurrentUsers = "20" }
      ```
      In PS:
      ```powershell
      Set-Item WSMAN:\localhost\Shell\MaxConcurrentUsers 20
      ```
   b) Modify MaxShellsPerUser:
      In CLI:
      ```bash
      winrm set winrm/config/winrs @{ MaxShellsPerUser="20" }
      ```
In PS:
```
Set-Item WSMan:\localhost\Shell\MaxShellsPerUser 20
```

   a) Modify MaxMemoryPerShellMB:

   In CLI:

   ```
   winrm set winrm/config/winrs @{ MaxMemoryPerShellMB="1024"}
   ```

   In PS:

   ```
   Set-Item WSMan:\localhost\Shell\MaxMemoryPerShellMB 1024
   ```

5. To ensure that SCOM integration works in mixed domain environments, set the following registry entry.

Path: `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System`

Key: `LocalAccountTokenFilterPolicy`

Type: DWord

Value: 1

**Caution:** Editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

Once SCOM integration is set up you might see the message “Cannot get the latest SCOM alerts. View the Director server event logs for more information”. The server event logs help identify and correct the problem. Causes can include:

- Loss of network connectivity at the Director or SCOM machine.
- The SCOM service is not available or too busy to respond.
- Failed authorization due to a change in permissions for the configured user.
- An error in Director while processing the SCOM data.
- PowerShell version mismatch between Director and SCOM server.

**Filter data to troubleshoot failures**

July 10, 2020

When you click numbers on the Dashboard or select a predefined filter from the Filters menu, the Filters view opens to display data based on the selected machine or failure type.
Predefined filters cannot be edited, but you can save a predefined filter as a custom filter and then modify it. Also, you can create custom filtered views of machines, connections, sessions, and application instances across all delivery groups.

1. Select a view:
   - **Machines.** Select Single-session OS Machines or Multi-session OS Machines. These views show the number of configured machines. The Multi-session OS Machines tab also includes the load evaluator index, which indicates the distribution of performance counters and tool tips of the session count if you hover over the link.
   - **Sessions.** You can also see the session count from the Sessions view. Use the idle time measurements to identify sessions that are idle beyond a threshold time period.
   - **Connections.** Filter connections by different time periods, including last 60 minutes, last 24 hours, or last 7 days.
   - **Application Instances.** This view displays the properties of all application instances on VDAs of Server and Single-session OS. The session idle time measurements are available for Application instances on VDAs of Multi-session OS.

   **Note:**
   If you have launched Desktop sessions on VDAs installed on a Windows 10 1809 computer, the Activity Manager in Director might sometimes display Microsoft Edge and Office as actively running applications while they are actually running only in the background.

2. For **Filter by**, select the criteria.

3. Use the additional tabs for each view, as needed, to complete the filter.

4. Select extra columns, as needed, to troubleshoot further.

5. Save and name your filter.

6. To access filters from multiple Director servers, store the filters on a shared folder accessible from those servers:
   - The shared folder must have modify permissions for accounts on the Director server.
   - The Director servers must be configured to access the shared folder. To configure, run **IIS Manager.** In `Sites > Default Web Site > Director\ > Application Settings`, modify the `Service.UserSettingsPath` setting to reflect the UNC path of the shared folder.

7. To open the filter later, from the **Filters** menu, select the filter type (Machines, Sessions, Connections, or Application Instances), and then select the saved filter.

8. Click **Export** to export the data to CSV format files. Data of up to 100,000 records can be exported. This feature is available in Delivery Controller version 1808 and later.

9. If needed, for **Machines** or **Connections** views, use power controls for all the machines you
select in the filtered list. For the Sessions view, use the session controls or option to send messages.

10. In the **Machines** and **Connections** views, click the **Failure Reason** of a failed machine or connection to get a detailed description of the failure and actions recommended to troubleshoot the failure. The failure reasons and the recommended actions for Machine and Connection failures are available in the [Citrix Director 7.12 Failure Reasons Troubleshooting Guide](https://support.citrix.com/discussions/).  

11. In the **Machines** view, click a machine name link to go to the corresponding **Machine Details** page. This page displays the details of the machine, provides power controls, displays the CPU, memory, disk monitoring, and GPU monitoring graphs. Also, click **View Historical Utilization** to see the resource utilization trends for the machine. For more information, see [Troubleshoot machines](https://support.citrix.com/discussions/).

12. In the **Application Instances** view, sort or filter based on **Idle Time** greater than a threshold time period. Select the idle application instances to end. Log off or Disconnect of an application instance ends all active application instances in the same session. For more information, see [Troubleshoot applications](https://support.citrix.com/discussions/). The Application Instances filter page and idle time measurements in the Sessions filter pages are available if Director, Delivery Controllers, and VDAs are version 7.13 or later.

**Note:**
Citrix Studio allows assignment of multiple Desktop Assignment Rules (DAR) for different users or user groups to a single VDA in the delivery group. StoreFront displays the assigned desktop with the corresponding Display Name as per the DAR for the logged in user. However, Director does not support DARs and displays the assigned desktop using the delivery group name regardless of the logged in user. As a result, you cannot map a specific desktop to a machine in Director. To map the assigned desktop displayed in StoreFront to the delivery group name displayed in Director, use the following PowerShell command:

```powershell
Get-BrokerDesktopGroup | Where-Object {
    $_.Uid -eq (Get-BrokerAssignmentPolicyRule | Where-Object {
        $_.PublishedName -eq "\<Name on StoreFront\>" }
    ).DesktopGroupUid }
| Select-Object -Property Name, Uid
```

**Monitor historical trends across a site**

September 14, 2020

The Trends view accesses historical trend information of each site for the following parameters:
sessions
• connection failures
• machine failures
• logon performance
• load evaluation
• capacity management
• machine usage
• resource utilization
• network analysis for each site.

To locate this information, click the **Trends** menu.

The zoom-in drill down feature lets you navigate through trend charts by zooming in on a time period (clicking a data point in the graph) and drilling down to see the details associated with the trend. This feature enables you to better understand the details of who or what is affected by the trends being displayed.

To change the default scope of each graph, apply a different filter to the data.

Choose a time period for which you require the historical trend information. Time period availability depends on your Director deployment as follows:

• Trend reports of up to Last year (365 days) are available in Premium licensed sites.
• Trend reports of up to Last month (31 days) are available in Advanced licensed sites.
• Trend reports of up to Last 7 days in non-Premium and non-Advanced licensed sites.

**Note:**

• In all Director deployments, sessions, failures, and logon performance trend information are available as graphs and tables when the time period is set to Last month (Ending now) or shorter. When the time period is chosen as Last month with a custom ending date or as Last year, the trend information is available as graphs but not as tables.
• Grooming retention values of the Monitor Service control the trends data availability. The default values are available in **Data granularity and retention**. Customers on Premium licensed sites can change the grooming retention to their desired number of retention days.
• The following parameters in IIS Manager control the range of custom ending dates available for selection and can be customized. However, the data availability for selected dates depends on the grooming retention setting for the specific metric being measured.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default values</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI.TrendsLast2HoursRange</td>
<td>3</td>
</tr>
<tr>
<td>UI.TrendsLast24HoursRange</td>
<td>32</td>
</tr>
<tr>
<td>UI.TrendsLast7DaysRange</td>
<td>32</td>
</tr>
</tbody>
</table>
Available trends

View trends for sessions: From the Sessions tab, select the Delivery Group and time period to view more detailed information about the concurrent session count.

The Session Auto Reconnect column displays the number of auto reconnects in a session. Auto reconnect is enabled when the Session Reliability or the Auto Client Reconnect policies are in effect. When there is a network interruption on the endpoint, the following policies come into effect:

- Session reliability comes into effect (by default for 3 minutes) where the Citrix Receiver or Citrix Workspace app tries to connect to the VDA.
- Auto client reconnect comes into effect between 3 and 5 minutes where the client tries to connect to the VDA.

Both reconnects are captured and displayed to the user. This information can take a maximum time of 5 minutes to appear on the Director UI after the reconnect has occurred.

The auto reconnect information helps you view and troubleshoot network connections having interruptions, and also analyze networks having a seamless experience. You can view the number of reconnects for a specific Delivery Group or time period selected in the Filters. A drilldown provides additional information like Session Reliability or Auto Client Reconnect, time stamps, Endpoint IP, and Endpoint Name of the machine where Workspace app is installed.

By default, logs are sorted by the event time stamps in descending order. This feature is available for Citrix Workspace app for Windows, Citrix Workspace app for Mac, Citrix Receiver for Windows, and Citrix Receiver for Mac. This feature requires Delivery Controller version 7 1906 or later, and VDAs 1906 or later.

For more information about session reconnections, see Sessions.

For more information about policies, see Auto client reconnect policy settings and Session reliability policy settings.

Sometimes, the auto reconnect data might not appear in Director for the following reasons:

- Workspace app is not sending auto reconnect data to VDA.
- VDA is not sending data to the monitor service.
- Delivery Controllers discard VDA payloads as they might not have the corresponding sessions.
Note:
Sometimes, the client IP address might not be obtained correctly if certain Citrix Gateway policies are set.

**View trends for connection failures:** From the Failures tab, select the connection, machine type, failure type, Delivery Group, and time period to view a graph containing more detailed information about the user connection failures across your site.

**View trends for machine failures:** From the Single-session OS Machine Failures tab or Multi-session OS Machines tab, select the failure type, Delivery Group, and time period to view a graph containing more detailed information about the machine failures across your site.

**View trends for logon performance:** From the Logon Performance tab, select the Delivery Group and time period to view a graph containing more detailed information about the duration of user logon times across your site and whether the number of logons affects the performance. This view also shows the average duration of the logon phases, such as brokering duration and VM start time. This data is specifically for user logons and does not include users trying to reconnect from disconnected sessions.

The table below the graph shows Logon Duration by User Session. You can choose the columns to display and sort the report by any of the columns.

For more information, see Diagnose user logon issues

**View trends for load evaluation:** From the Load Evaluator Index tab, view a graph containing more detailed information about the load that is distributed among Multi-session OS machines. The filter options for this graph include the Delivery Group or Multi-session OS machine in a Delivery Group, Multi-session OS machine (available only if the Multi-session OS machine in a Delivery Group was selected), and range.

**View hosted applications usage:** The availability of this feature depends on your organization’s license.

From the Capacity Management tab, select the Hosted Applications Usage tab, select the Delivery Group and time period to view a graph displaying peak concurrent usage and a table displaying application based usage. From the Application Based Usage table, you can choose a specific application to see details and a list of users who are using, or have used, the application.

**View Single-session and Multi-session OS usage:** The Trends view shows the usage of Single-session OS by site and by Delivery Group. When you select Site, usage is shown per Delivery Group. When you select Delivery Group, usage is shown per User.

The Trends view also shows the usage of Multi-session OS by site, by Delivery Group, and by Machine. When you select Site, usage is shown per Delivery Group. When you select Delivery Group, usage is shown per Machine and per User. When Machine is selected usage is shown per User.

**View virtual machine usage:** From the Machine Usage tab, select Single-session OS Machines or Multi-session OS Machines to obtain a real-time view of your VM usage, enabling you to quickly as-
sess your site's capacity needs.

Single-session OS availability - displays the current state of Single-session OS machines (VDIs) by availability for the entire site or a specific Delivery Group.

Multi-session OS availability - displays the current state of Multi-session OS machines by availability for the entire site or a specific Delivery Group.

Note:
The number of machines displayed in Available Counter includes machines in maintenance mode.

View resource utilization: From the Resource Utilization tab, select Single-session OS Machines or Multi-session OS Machines to obtain insight into historical trends data for CPU and memory usage, and IOPS and disk latency for each VDI machine for better capacity planning.

This feature requires Delivery Controllers and VDAs version 7.11 or later.

Graphs show data for average CPU, average memory, average IOPS, disk latency, and peak concurrent sessions. You can drill down to the machine, and view data and charts for the top 10 processes consuming CPU. Filter by Delivery Group and Time period. CPU, memory usage, and peak concurrent sessions graphs are available for the last 2 hours, 24 hours, 7 days, month, and year. The average IOPS and disk latency graphs are available for the last 24 hours, month, and year.

Note:
• The Monitoring policy setting, Enable Process Monitoring, must be set to Allowed to collect and display data in the Top 10 Processes table on the Historic Machine Utilization page. The policy is set to Prohibited by default. All resource utilization data is collected by default. This can be disabled using the Enable Resource Monitoring policy setting. The table below the graphs shows the resource utilization data per machine. For more information, see Monitoring policy settings.
• Average IOPS shows the daily averages. Peak IOPS is calculated as the highest of the IOPS averages for the selected time range. (An IOPS average is the hourly average of IOPS collected during the hour on the VDA).

View network analysis data: The availability of this feature depends on your organization's license and your administrator permissions. This feature requires Delivery Controllers version 7.11 or later.

From the Network tab, monitor your network analysis, which provides a user, application, and desktop contextual view of the network. With this feature, Director provides advanced analytics of ICA traffic in your deployment through HDX Insight reports from Citrix ADM. For more information, see Configure network analysis.

View application failures: The Application Failures tab displays failures associated with the published applications on the VDAs.

This feature requires Delivery Controllers and VDAs version 7.15 or later. Single-session OS VDAs running Windows Vista and later, and Multi-session OS VDAs running Windows Server 2008 and later are...
supported.
For more information, see Historical application failure monitoring.

By default, only application faults from Multi-session OS VDAs are displayed. You can set the monitoring of application failures by using Monitoring policies. For more information, see Monitoring policy settings.

**View application probe results:** The Application Probe Results tab displays the results of probe for applications that have been configured for probing in the Configuration page. Here, the stage of launch during which the application launch failure occurred is recorded.

This feature requires Delivery Controller(s) and VDAs version 7.18 or later. For more information see Application probing.

**Create customized reports:** The Custom Reports tab provides a user interface for generating Custom Reports containing real-time and historical data from the Monitoring database in tabular format.

This feature requires Delivery Controller(s) version 7.12 or later.

From the list of previously saved Custom Report queries, you can click Run and download to export the report in CSV format, click Copy OData to copy and share the corresponding OData query, or click Edit to edit the query.

You can create a new Custom Report query based on machines, connections, sessions, or application instances. Specify filter conditions based on fields such as machine, Delivery Group, or time period. Specify additional columns required in your Custom Report. Preview displays a sample of the report data. Saving the Custom Report query adds it to the list of saved queries.

You can create a new Custom Report query based on a copied OData query. To do this, select the OData Query option and paste the copied OData query. You can save the resultant query for execution later.

**Note:**
The column names in Preview and Export report generated using OData queries are not localized, but appear in English.

The flag icons on the graph indicate significant events or actions for that specific time range. Hover the mouse over the flag and click to list events or actions.

**Note:**
- HDX connection logon data is not collected for VDAs earlier than 7. For earlier VDAs, the chart data is displayed as 0.
- Delivery Groups deleted in Citrix Studio are available for selection in the Director Trends filters until data related to them are groomed out. Selecting a deleted Delivery Group displays graphs for available data until retention. However, the tables don’t show data.
- Moving a machine containing active sessions from one Delivery Group to another causes the Resource Utilization and Load Evaluator Index tables of the new Delivery Group to
display metrics consolidated from the old and new Delivery Groups.

**Troubleshoot deployments**

June 21, 2020

As a help desk administrator, you can search for the user reporting an issue and display details of sessions or applications associated with that user. Similarly, search for machines or endpoints where issues are reported. Resolve issues quickly by monitoring the relevant metrics and performing suitable actions.

Available actions include:

- Ending an unresponsive application or process
- Shadowing operations on the user's machine
- Logging off an unresponsive session
- Restarting the machine
- Putting a machine into maintenance mode
- Resetting the user profile

**Troubleshoot applications**

July 10, 2020

**Application Analytics**

The **Applications** view displays application-based analytics in a single, consolidated view to help analyze and manage application performance efficiently. You can gain valuable insight into the health and usage information of all applications published on the site. The default view helps identify the top running applications.

This feature requires Delivery Controllers Version 7.16 or later and VDAs Version 7.15 or later.
The **Probe Result** column displays the result of application probing run in the last 24 hours. Click the probe result link to see more details in the **Trends > Application Probe Results** page. For more details on how to configure application probes, see Application Probing.

The **Instances** column displays usage of the applications. It indicates the number of application instances currently running (both connected and disconnected instances). To troubleshoot further, click the **Instances** field to see the corresponding **Application Instances** filters page. Here, you can select application instances to log off or disconnect.

**Note:**
For custom scope administrators, Director does not display application instances created under application groups. To view all application instances, you must be a full administrator. For more information, see Knowledge Center article CTX256001.

Monitor the health of published applications in your site with the **Application Faults** and the **Application Errors** columns. These columns display the aggregated number of faults and errors that have occurred while launching the corresponding application in the last one hour. Click the **Application Faults** or **Application Errors** field to see failure details on the **Trends > Application Failures** page corresponding to the selected application.

The application failure policy settings govern the availability and display of faults and errors. For more information about the policies and how to modify them, see Policies for application failure monitoring in Monitoring policy settings.

**Real-time application monitoring**

You can troubleshoot applications and sessions by using the idle time metric to identify instances that are idle beyond a specific time limit.

Typical use cases for application-based troubleshooting are in the healthcare sector, where employees share application licenses. There, you must end idle sessions and application instances to purge
the Citrix Virtual Apps and Desktops environment, to reconfigure poorly performing servers, or to maintain and upgrade applications.

The **Application Instances** filter page lists all application instances on VDAs of Server and Single-session OS. The associated idle time measurements are displayed for application instances on VDAs of Multi-session OS that have been idle for at least 10 minutes.

**Note:**
The Application Instances metrics are available on sites of all license editions.

Use this information to identify the application instances that are idle beyond a specific time period and log off or disconnect them as appropriate. To do this, select **Filters > Application Instances** and select a pre-saved filter or choose **All Application Instances** and create your own filter.

An example of a filter would be as follows. As **Filter by** criteria, choose **Published Name** (of the application) and **Idle Time**. Then, set **Idle Time** to **greater than or equal to** a specific time limit and save the filter for reuse. From the filtered list, select the application instances. Select option to send messages or from the **Session Control** drop-down, choose **Logoff** or **Disconnect** to end the instances.

**Note:**
Logging off or disconnecting an application instance logs off or disconnects the current session, thereby ending all application instances that belong to the same session.

You can identify idle sessions from the **Sessions** filter page using the session state and the session idle time metric. Sort by the **Idle Time** column or define a filter to identify sessions that are idle beyond a specific time limit. Idle time is listed for sessions on VDAs of Multi-session OS that have been idle for at least 10 minutes.
The idle time is displayed as N/A when the session or application instance

• has not been idle for more than 10 minutes,
• is launched on a VDA of Single-session OS, or
• is launched on a VDA running Version 7.12 or earlier.

Historical application failure monitoring

The Trends -> Application Failures tab displays failures associated with the published applications on the VDAs.

Application failure trends are available for the last 2 hours, 24 hours, 7 days, and month for Premium and Advanced licensed sites. They are available for the last 2 hours, 24 hours, and 7 days for other license types. The application failures that are logged to the Event Viewer with source “Application Errors” are monitored. Click Export to generate reports in CSV, Excel, or PDF formats.

The grooming retention settings for application failure monitoring, GroomApplicationErrorsRetentionDays and GroomApplicationFaultsRetentionDays are set to one day by default for both Premium and non-Premium licensed sites. You can change this setting using the PowerShell command:

PowerShell command Set-MonitorConfiguration -\<setting name\> \<value\>
The failures are displayed as **Application Faults** or **Application Errors** based on their severity. The Application Faults tab displays failures associated with loss of functionality or data. Application Errors indicate problems that are not immediately relevant; they signify conditions that might cause future problems.

You can filter the failures based on **Published Application Name**, **Process Name** or **Delivery Group**, and **Time Period**. The table displays the fault or error code and a brief description of the failure. The detailed failure description is displayed as a tooltip.

**Note:**

The published application name is displayed as “Unknown” when the corresponding application name cannot be derived. This typically occurs when a launched application fails in a desktop session or when it fails due to an unhandled exception caused by a dependent executable.

By default, only faults of applications hosted on Multi-session OS VDAs are monitored. You can modify the monitoring settings through the Monitoring Group Policies: Enable monitoring of application failures, Enable monitoring of application failures on Single-session OS VDAs, and List of applications excluded from failure monitoring. For more information, see Policies for application failure monitoring in Monitoring policy settings.

The **Trends > Application Probe Results** page displays the results of application probing run in the site for the last 24 hours and 7 days. For more details on how to configure application probes, see Application Probing.
Application probing

July 10, 2020

Application probing automates the process of checking the health of Citrix Virtual Apps that are published in a site. The results of application probing are available in Director.

Requirements:

- Delivery Controller runs version 7.18 or later.
- Endpoint machines running probe agents are Windows machines with Citrix Receiver for Windows Version 4.8 or later, or Citrix Workspace app for Windows (formerly Citrix Receiver for Windows) Version 1808 or later. Workspace app for Unified Windows Platform (UWP) is not supported.
- Director and StoreFront support the default form-based authentication.

User accounts/permissions required to run Application Probing:

- A unique StoreFront user to probe on each endpoint machine. The StoreFront user need not be an administrator; the probes can run in a non-admin context.
- User accounts with Windows administrator permissions to install and configure the Citrix Probe Agent on the endpoint machines
- A full administrator user account or a custom role with the following permissions. Reusing existing user accounts for application probing might log off from the users’ active sessions.
  - Delivery group permissions:
    - Read-only
  - Director permissions:
    - Create\Edit\Remove Alert Email Server Configuration - if the email server is not already configured
    - Create\Edit\Remove Probe Configurations
    - View Configurations page
    - View Trends page

Configure Application Probing

You can schedule your application probes to run during off-peak hours across multiple geographies. The comprehensive probe results can help to troubleshoot issues related to the applications, hosting machine or connection before the users experience them.

Step 1: Install and configure the Citrix Probe Agent

The Citrix Probe Agent is a Windows executable that simulates the actual application launch by the user through StoreFront. It tests application launches as configured in Director and reports back the
results to Director.

1. Identify endpoint machines from where you want to run application probing.

3. Start the agent and configure your StoreFront Receiver for Web credentials. Configure a unique StoreFront user on each endpoint machine. The credentials are encrypted and stored securely.

4. In the **Configure To Display Probe Result** tab, enter your Director credentials, and click **Validate**.

**Note:**
To access the site to be probed from outside the network, type the login URL for Citrix Gateway in the StoreFront URL field. Citrix Gateway automatically routes the request to the corresponding site StoreFront URL. This feature is available for Citrix Gateway version 12.1 and later (RfWebUI theme), and Delivery Controllers 1811 and later.
5. Select your site and click **Next**.

**Step 2: Configure Application Probing in Director**

1. Go to **Configuration > Application Probe Configuration**.

2. Create a probe and choose:
   - the applications to be probed,
   - the endpoint machines on which the probe must run,
   - the email addresses to which the failure probe results are sent (configure your email server in **Alerts > Email Server Configuration**), and
   - the time of the day at which the probe must run (as per the local time zone of the endpoint machine).

After configuration in Director, the agent takes 10 minutes before it is ready to start probing. Then, it runs configured probes starting the next hour.
Step 3: Probe execution

The agent runs application probing as per the probe configuration it fetches from Director periodically. It launches selected applications serially using StoreFront. The agent reports the results back to Director via the Monitor database. Failures are reported in five specific stages:

- **StoreFront Reachability** - configured StoreFront URL is not reachable.
- **StoreFront Authentication** - configured StoreFront credentials are invalid.
- **StoreFront Enumeration** - StoreFront Enumerate applications list does not contain the application to be probed.
- **ICA download** - the ICA file is not available.
- **Application launch** – the application cannot be launched.

Step 4: View probe results

You can view the latest probe results in the **Applications** page.
To troubleshoot further, click the probe result link to see more details on the **Trends > Application Probe Results** page.

The consolidated probe results data is available for the last 24 hours or last 7 days time periods on this page. You can see the stage in which the probe failed. You can filter the table for a specific application, probe failure stage, or endpoint machine.

**Desktop probing**

September 14, 2020

Desktop probing automates the process of checking the health of Citrix Virtual Desktops that are published in a site. The results of desktop probing are available in Director.

In Director’s Configuration page, configure the desktops to be probed, the endpoint machines to run the probe on, and the probe time. The agent tests the launch of selected desktops using StoreFront and reports the results back to Director. The probe results are displayed in the Director UI – the last
24-hours’ data on the Applications page and historical probe data on the Trends > Probe Results > Desktop Probe Results page. Here, you can see the stage when the probe failure occurred - StoreFront Reachability, StoreFront Authentication, StoreFront Enumeration, ICA download, or Desktop launch. The failure report is sent to the configured email addresses. You can schedule your desktop probes to run during off-peak hours across multiple geographies. The comprehensive results can help to proactively troubleshoot issues related to provisioned desktops, hosting machines or connections before the users experience them. Desktop probing is available for Premium licensed sites. This feature requires Delivery Controllers version 7 1906 or later and Probe Agent 1903 or later.

Requirements:

- Delivery Controller runs version 1906 or later.
- Endpoint machines running probe agents are Windows machines with Citrix Receiver for Windows Version 4.8 or later, or Citrix Workspace app for Windows (formerly Citrix Receiver for Windows) Version 1906 or later. Workspace app for Unified Windows Platform (UWP) is not supported.
- Director and StoreFront support the default form-based authentication.

User accounts or permissions required to run Desktop probing:

- A unique StoreFront user to probe on each endpoint machine. The StoreFront user need not be an administrator; the probes can run in a non-admin context.
- User accounts with Windows administrator permissions to install and configure the Citrix Probe Agent on the endpoint machines
- A full administrator user account or a custom role with the following permissions. Reusing normal user accounts for desktop probing might log off from the users’ active sessions.
  - Delivery group permissions:
    - Read-only
  - Director permissions:
    - Create, Edit, Remove Alert Email Server Configuration - if the email server is not already configured
    - Create, Edit, Remove Probe Configurations
    - View Configurations page
    - View Trends page

**Configure desktop probing**

You can schedule your desktop probes to run during off-peak hours across multiple geographies. The comprehensive probe results can help to troubleshoot issues related to the desktops, hosting machine or connection before the users experience them.
Step 1: Install and configure the Citrix Probe Agent

The Citrix Probe Agent is a Windows executable that simulates the actual desktop launch by the user through StoreFront. It tests desktop launches as configured in Director and reports back the results to Director.

1. Identify endpoint machines from where you want to run desktop probing.

3. Start the agent and configure your StoreFront Receiver for Web credentials. Configure a unique StoreFront user on each endpoint machine. The credentials are encrypted and stored securely.

4. In the Configure To Display Probe Result tab, enter your Director credentials, and click Validate.

Note:
To access the site to be probed from outside the network, type the Citrix Gateway login page URL in the StoreFront URL field. Citrix Gateway automatically routes the request to the corresponding site StoreFront URL. This feature is available for Citrix Gateway version 12.1 or later, and Delivery Controllers 1811 or later.
5. Select your site and click Next.

Step 2: Configure desktop probing in Director

1. Go to Configuration > Desktop Probe Configuration.
2. To create a probe, enter the details and click Save.

Note:
Configure your email server in Alerts > Email Server Configuration.

After the desktop probing configuration is complete, the agent takes 10 minutes before it is ready to start probing. Then, it runs configured probes starting the next hour.
Step 3: Probe execution

The agent runs desktop probing as per the probe configuration it fetches from Director periodically. It launches selected desktops serially using StoreFront. The agent reports the results back to Director via the Monitor database. Failures are reported in five specific stages:

- **StoreFront Reachability** - the configured StoreFront URL is not reachable.
- **StoreFront Authentication** - the configured StoreFront credentials are invalid.
- **StoreFront Enumeration** - StoreFront Enumerate desktops list does not contain the desktop to be probed.
- **ICA download** - the ICA file is not available.
- **Desktop launch** – the desktop cannot be launched.

Step 4: View probe results

You can view the latest probe results in the Desktops page.

To troubleshoot further, click the probe result link to see more details on the Trends >Probe Results > Desktop Probe Results page.
The consolidated probe results data is available for the last 24 hours or last 7 days' time periods on this page. You can see the stage in which the probe failed. You can filter the table for a specific desktop, probe failure stage, or endpoint machine.

**Troubleshoot machines**

July 10, 2020

**Note:**

Citrix Health Assistant is a tool to troubleshoot configuration issues in unregistered VDAs. The tool automates several health checks to identify possible root causes for VDA registration failures and issues in session launch and time zone redirection configuration. The Knowledge Center article, [Citrix Health Assistant - Troubleshoot VDA Registration and Session Launch](#), contains the Citrix Health Assistant tool download and usage instructions.

The Filters > Machines view in the Director console displays the machines configured in the site. The Multi-session OS Machines tab includes the load evaluator index, which indicates the distribution of performance counters and tooltips of the session count if you hover over the link.

Click the Failure Reason column of a failed machine to get a detailed description of the failure and actions recommended to troubleshoot the failure. The failure reasons and the recommended actions for machine and connection failures are available in the [Citrix Director 7.12 Failure Reasons Troubleshooting Guide](#).

Click the machine name link to go to the Machine Details page.

The Machine Details page lists the machine details, infrastructure details, and details of the hotfixes applied on the machine.
Machine-based real-time resource utilization

The **Machine Utilization** panel displays graphs showing real-time utilization of CPU and memory. In addition, disk and GPU monitoring graphs are available for sites with Delivery Controllers and VDA versions **7.14** or later.

Disk monitoring graphs, average IOPS, and disk latency are important performance measurements that help you monitor and troubleshoot issues related to VDA disks. The Average IOPS graph displays the average number of reads and writes to a disk. Select **Disk Latency** to see a graph of the delay between a request for data and its return from the disk, measured in milliseconds.

![Machine Utilization Panel](image)

Select **GPU Utilization** to see percentage utilization of the GPU, the GPU memory, and of the Encoder and the Decoder to troubleshoot GPU-related issues on Server or Single-session OS VDAs. The GPU Utilization graphs are available only for VDAs running 64-bit Windows with NVIDIA Tesla M60 GPUs, and running Display Driver version 369.17 or later.

The VDAs must have HDX 3D Pro enabled to provide GPU acceleration. For more information, see GPU acceleration for Windows Single-session OS and GPU acceleration for Windows Multi-session OS.

When a VDA accesses more than one GPU, the utilization graph displays the average of the GPU metrics collected from the individual GPUs. The GPU metrics are collected for the entire VDA and not for individual processes.

Machine-based historical resource utilization

In the **Machine Utilization** panel, click **View Historical Utilization** to view the historical usage of resources on the selected machine.
The utilization graphs include critical performance counters of CPU, memory, peak concurrent sessions, average IOPS, and disk latency.

**Note:**
The Monitoring policy setting, **Enable Process Monitoring**, must be set to Allowed to collect, and display data in the Top 10 Processes table on the Historic Machine Utilization page. The collection is prohibited by default.

The CPU and memory utilization, average IOPS, and disk latency data is collected by default. You can disable the collection by using the **Enable Resource Monitoring** policy setting.
1. From the Machine Utilization panel in the Machine Details view, select View Historical Utilization.

2. In the Historical Machine Utilization page, set Time Period to view usage for the last 2 hours, 24 hours, 7 days, month, or year.

   Note:
   Average IOPS and disk latency usage data are available only for the last 24 hours, month, and year ending now. Custom end time is not supported.

3. Click Apply and select the required graphs.

4. Hover over different sections of the graph to view more information for the selected time period.

   For example, if you select Last 2 hours, the baseline period is the 2 hours prior to the selected time range. View the CPU, memory, and session trend over the last 2 hours and the baseline time. If you select Last month, the baseline period is the previous month. Select to view the Average IOPS and disk latency over the last month and the baseline time.

   1. Click Export to export the resource utilization data for the selected period. For more information, see Export reports section in Monitor Deployments.
2. Below the graphs, the table lists the top 10 processes based on CPU or memory utilization. You can sort by any of the columns, which show Application Name, User Name, Session ID, Average CPU, Peak CPU, Average Memory, and Peak Memory over the selected time range. The IOPS and Disk Latency columns cannot be sorted.

Note:
The session ID for system processes is displayed as “0000”.

3. To view the historical trend on the resource consumption of a particular process, drill into any of the Top 10 processes.

**Machine Console access**

You can access the consoles of Single-session and Multi-session OS machines hosted on XenServer Version 7.3 and later directly from Director. This way, you don’t require XenCenter to troubleshoot issues on XenServer hosted VDAs. For this feature to be available:

- Delivery Controller of Version 7.16 or later is required.
- The XenServer hosting the machine must be of Version 7.3 or later and must be accessible from the Director UI.

To troubleshoot a machine, click the **Console** link in the corresponding Machine Details panel. After authentication of the host credentials you provide, the machine console opens in a separate tab using noVNC, a web-based VNC client. You now have keyboard and mouse access the console.
Note:

- This feature is not supported on Internet Explorer 11.
- If the mouse pointer on the machine console is misaligned, see CTX230727 for steps to fix the issue.
- Director launches console access in a new tab, ensure that your browser settings allow pop-ups.
- For security reasons, Citrix recommends that you install SSL certificates on your browser.

Microsoft RDS license health

You can view the status of Microsoft RDS license in the Machine Details panel in the Machine Details and the User Details page for Multi-session OS machines.
One of the following messages is displayed:

- License available
- Not configured properly (warning)
- License error (error)
- Incompatible VDA version (error)

Note:
The RDS license health status for machines under grace period with valid license displays a License available message in green. Renew your license before they expire.

For warning and error messages, hover over the info icon to view additional information as given in
the following table.

<table>
<thead>
<tr>
<th>Message Type</th>
<th>Messages in Director</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Available for VDAs version 7.16 and later.</td>
</tr>
<tr>
<td>Error</td>
<td>New RDS connections are not allowed.</td>
</tr>
<tr>
<td>Error</td>
<td>RDS licensing has exceeded its grace period.</td>
</tr>
<tr>
<td>Error</td>
<td>A License Server is not configured for the required OS level with the Per Device Client Access licensing type.</td>
</tr>
<tr>

<tr>
<td>Warning</td>
<td>Remote Desktop for Administration is not a valid licensing type in a Citrix Virtual Apps and Desktops deployment.</td>
</tr>
<tr>
<td>Warning</td>
<td>An RDS licensing type is not configured.</td>
</tr>
<tr>
<td>Warning</td>
<td>The Domain Controller or License Server is unreachable with the Per User Client Access RDS licensing type.</td>
</tr>
<tr>
<td>Warning</td>
<td>With the Per Device Client Access licensing type, the Client Device license cannot be determined since the license server for the required OS level is unreachable.</td>
</tr>
</tbody>
</table>

**Note:**
This feature is applicable only for Microsoft RDS CAL (Client Access License).

**Troubleshoot user issues**

June 21, 2020

Use the Director’s Help Desk view (Activity Manager page) to view information about the user:
• Check for details about the user’s logon, connection, and applications.
• Shadow the user’s machine.
• Record the ICA session.
• Troubleshoot the issue with the recommended actions in the following table, and, if needed, escalate the issue to the appropriate administrator.

Troubleshooting tips

Note:
To make sure that the machine is not in maintenance mode, from the User Details view, review the Machine Details panel.

Search tips

When you type the user’s name in a Search field, Director searches for users in the Active Directory for users across all sites configured to support Director.

When you type a multiuser machine name in a Search field, Director displays the Machine Details for the specified machine.

When you type an endpoint name in a Search field, Director uses the unauthenticated (anonymous) and authenticated sessions that are connected to a specific endpoint, which enables troubleshooting unauthenticated sessions. Ensure that endpoint names are unique to enable troubleshooting of unauthenticated sessions.

The search results also include users who are not currently using or assigned to a machine.

• Searches are not case-sensitive.
Partial entries produce a list of possible matches.

After you type a few letters of a two-part name (user name, family name and first name, or display name), separated by a space, the results include matches for both strings. For example, if you type jo rob, the results might include strings such as “John Robertson” or Robert, Jones.

To return to the landing page, click the Director logo.

Access Citrix Insight Services

You can access Citrix Insight Services (CIS) from the User drop-down list in Director to access extra diagnostic insights. The data available in CIS comes from sources including Call Home and Citrix Scout.

Upload troubleshooting information to Citrix Technical Support

Run Citrix Scout from a single Delivery Controller or VDA to capture key data points and Citrix Diagnostics Facility (CDF) traces to troubleshoot selected computers. Scout offers the ability to securely upload the data to the CIS platform to assist Citrix Technical Support on troubleshooting. Citrix Technical Support uses the CIS platform to reduce the time to resolve customer-reported issues.

Scout is installed with Citrix Virtual Apps and Desktops components. Depending on the version of Windows, Scout appears in the Windows Start menu or Start Screen when you install or upgrade to Citrix Virtual Apps and Desktops.

To start Scout, from the Start menu or Start Screen, select Citrix > Citrix Scout.

For information on using and configuring Scout, and for FAQ, see CTX130147.

Diagnose session startup issues

September 14, 2020

In addition to the logon process phases mentioned in the Diagnose user logon issues section, Director displays the session startup duration. This is divided into Workspace App Session Startup and VDA Session Startup duration on the User Details page and Machine Details pages. These two durations further contain individual phases whose startup durations are also displayed. This data helps you to understand and troubleshoot high session startup duration. Further, the time duration for each phase involved in the session startup helps in troubleshooting issues associated with individual phases. For example, if the Drive Mapping time is high, you can check to see whether all the valid drives are mapped correctly in the GPO or script. This feature is available on Delivery Controller version 7 1906 and later and VDAs 1903 and later.
**Prerequisites**

Ensure that the following prerequisites are met for session startup duration data to be displayed:

- Delivery Controller 7 1906 or later.
- VDA 1903 or later.
- Citrix End User Experience Monitoring (EUEM) service must be running on the VDA.

**Limitations**

The following limitations apply when Director displays the session startup duration data.

- Session startup duration is available only for HDX sessions.
- For session launches from iOS and Android OS, only VDA Startup Duration is available.
- IFDCD is available only when Workspace App is detected while launching from a browser.
- For session launches from macOS, IFDCD is available for Workspace App 1902 or later only.
- For session launches from Windows OS, IFDCD is available for Workspace app 1902 and later. For earlier versions, IFDCD is displayed for only app launches from the browser with Workspace app detected.

**Notes:**

- If you face issues in the sessions startup duration display after the prerequisites are met, view the Director server and VDA logs as described in CTX130320.
- For shared sessions (multiple applications launched in the same session), the Workspace App Startup metrics are displayed for the latest connection or the latest application launch.
- Some metrics in VDA Session Startup are not applicable on reconnects. In such cases, a message is displayed.
Workspace App session startup phases

Session Startup Client Duration (SSCD)

When this metric is high, it indicates a client-side issue that is causing long start times. Review subsequent metrics to determine the probable root cause of the issue. SSCD starts as close as possible to the time of the request (mouse click). It ends when the ICA connection between the client device and VDA has been established. In the case of a shared session, this duration is much smaller, as much of the setup costs associated with the creation of a new connection to the server are not incurred. At the following level down, there are several detailed metrics available.

ICA File Download Duration (IFDCD)

This is the time taken for the client to download the ICA file from the server. The overall process is as follows:

1. The user clicks a resource (application or desktop) in the Workspace Application.
2. A request from the user is sent to the StoreFront through the Citrix Gateway (if configured), which sends the request to the Delivery Controller.
3. The Delivery Controller finds an available machine for the request and sends the machine information and other details to StoreFront. Also, StoreFront requests and receives a one-time ticket from the Secure Ticket Authority.
4. StoreFront generates an ICA File and sends it to the user via Citrix Gateway (if configured).

IFDCD represents the time it takes for the complete process (steps 1–4). The IFDCD duration stops counting when the client receives the ICA file.

LPWD is the StoreFront component of the process.

If IFDCD is high (but LPWD is normal), the server-side processing of the launch was successful, but there were communication issues between the client device and the StoreFront. This results from network issues between the two machines. So you can troubleshoot potential network issues first.

Launch Page Web Server Duration (LPWD)

This is the time taken to process the launch page (launch.aspx) on the StoreFront. If LPWD is high, there might be a bottleneck on the StoreFront.

Possible causes include:

- High load on the StoreFront. Try to identify the cause of the slowdown by checking the Internet Information Services (IIS) logs and monitoring tools, Task Manager, Performance Monitor and so on.
• StoreFront is having issues communicating with other components such as the Delivery Controller. Check if the network connection between StoreFront and Delivery Controller is slow or some Delivery Controllers are down or overloaded.

**Name Resolution Web Server Duration (NRWD)**

This is the time taken by the Delivery Controller to resolve the name of a published application/desktop to a VDA Machine IP Address.

When this metric is high, it indicates that the Delivery Controller is taking a long time to resolve the name of a published application to an IP address.

Possible causes include a problem on the client, issues with the Delivery Controller, such as the Delivery Controller being overloaded, or a problem with the network link between them.

**Ticket Response Web Server Duration (TRWD)**

This duration indicates the time it takes to get a ticket (if necessary) from the Secure Ticket Authority (STA) Server or Delivery Controller. When this duration is high, it indicates that the STA server or the Delivery Controller are overloaded.

**Session Look-up Client Duration (SLCD)**

This duration represents the time taken to query every session to host the requested published application. The check is performed on the client to determine whether an existing session can handle the application launch request. The method used depends on whether the session is new or shared.

**Session Creation Client Duration (SCCD)**

This duration represents the time taken to create a session, from the moment wfica32.exe (or a similar equivalent file) is launched to the time when the connection is established.

**VDA session startup phases**

**Session Startup VDA Duration (SSVD)**

This duration is the high-level server-side connection start-up metric that encompasses the time VDA takes to perform the entire start-up operation. When this metric is high, it indicates that there is a VDA issue increasing session start times. This includes the time spent on the VDA performing the entire start-up operation.
**Credentials Obtention VDA Duration (COVD)**

The time taken for the VDA to obtain the user credentials.

This duration can increase artificially if a user fails to provide credentials in a timely manner. So, it is not included in the VDA Startup Duration. This time is likely to be a significant only if manual login is being used and the server side credentials dialog is displayed (or if a legal notice is displayed before login commences).

**Credentials Authentication VDA Duration (CAVD)**

This is the time taken by the VDA to authenticate the user’s credentials against the authentication provider. They can be Kerberos, Active Directory, or a Security Support Provider Interface (SSPI).

**Group Policy VDA Duration (GPVD)**

This duration is the time taken to apply group policy objects during logon.

**Login Script Execution VDA Duration (LSVD)**

This is the time taken by the VDA to run the user’s login scripts.

Consider making asynchronous the user or group’s login scripts. Consider optimizing any application compatibility scripts or use environment variables instead.

**Profile Load VDA Duration (PLVD)**

This is the time taken by the VDA to load the user’s profile.

If this duration is high, consider your User Profile configuration. Roaming profile size and location contribute to slow session starts. When a user logs on to a session where Terminal Services roaming profiles and home folders are enabled, the roaming profile contents and access to that folder are mapped during the logon. This takes extra resources. Sometimes, this can consume significant amount of the CPU usage. Consider using the **Terminal Services home** folders with redirected personal folders to mitigate this problem. In general, consider using Citrix Profile Management to manage user profiles in Citrix environments. If you are using Citrix Profile Management and have slow logon times, check if your antivirus software is blocking the Citrix Profile Management tool.

**Printer Creation VDA Duration (PCVD)**

This is the time taken for the VDA to map the user’s client printers synchronously. If the configuration is set for printer creation to be performed asynchronously, the value is not recorded for PCVD as it does not impact completion of the session startup.
Excessive time spent in mapping printers is often the result of the printer auto creation policy settings. The number of printers added locally on the users' client devices and your printing configuration can directly affect your session start times. When a session starts, Citrix Virtual Apps and Desktops have to create every locally mapped printer on the client device. Consider reconfiguring your printing policies to reduce the number of printers that get created, specifically when users have many local printers. To do this, edit the Printer Auto creation policy in Delivery Controller and Citrix Virtual Apps and Desktops.

**Drive Mapping VDA Duration (DMVD)**

This is the time taken by the VDA to map the user's client drives, devices, and ports.

Ensure that your base policies include settings to disable unused virtual channels. For example, audio or COM port mapping, to optimize the ICA protocol and improve overall session performance.

**Application/Desktop Launch VDA Duration (ALVD/DLVD)**

This phase is a combination of Userinit and Shell duration. When a user logs on to a Windows machine, winlogon runs userinit.exe. Userinit.exe runs logon scripts, re-establishes network connections, and then starts Explorer.exe. Userinit represents the duration between the start of userinit.exe to the start of the user interface for the virtual desktop or application. The Shell duration is the time between the initialization of the user interface to the time the user receives keyboard and mouse control.

**Session Creation VDA Duration (SCVD)**

This time includes any miscellaneous delay in session creation time on VDA.

**Diagnose user logon issues**

September 14, 2020

Use Logon Duration data to troubleshoot user logon issues.

Logon duration is measured only for initial connections to a desktop or app using HDX. This data does not include users trying to connect with Remote Desktop Protocol or reconnect from disconnected sessions. Specifically, logon duration is not measured when a user initially connects using a non-HDX protocol and reconnects using HDX.

In the User Details view, the duration is displayed as a number value. Below this number, the time the logon occurred is displayed and a graph of the phases of the logon process.
As users logon to Citrix Virtual Apps and Desktops, the Monitor Service tracks the phases of the logon process. The phases begin from the time the user connects from Citrix Workspace app to the time when the desktop is ready to use.

The large number on the left is the total logon time. This is calculated by combining the time spent establishing the connection and obtaining a desktop from the Delivery Controller with the time spent to authenticate and log on to a virtual desktop. The duration information is presented in seconds (or fractions of seconds).

**Prerequisites**

Ensure that the following prerequisites are met for logon duration data and drilldowns to appear:

1. Install **Citrix User Profile Manager** and **Citrix User Profile Manager WMI Plugin** on the VDA.
2. Ensure that the Citrix Profile Management Service is running.
3. For XenApp and XenDesktop sites 7.15 and earlier, disable the GPO setting, **Do not process the legacy run list**.
4. Audit process tracking must be enabled for Interactive Session drilldown.
5. For GPO drilldown, increase the size of Group Policy operational logs.

**Notes:**

- Logon duration is supported only on the default Windows shell (explorer.exe) and not on custom shells.
- Logon duration for Remote PC Access is available only when **Citrix User Profile Manager** and the **Citrix User Profile Manager WMI Plugin** are installed as extra components during Remote PC Access installation. For more information, see Step 4 in **Remote PC Access configuration and sequence considerations**.

**Steps to troubleshoot user logon issues**

1. From the **User Details** view, troubleshoot the logon state using the Logon Duration panel.
   - If the user is logging on, the view reflects the process of logging on.
   - If the user is logged on, the Logon Duration panel displays the time it took for the user to log on to the current session.
2. Examine the phases of the logon process.

**Logon process phases**

**Brokering**

Time taken to decide which desktop to assign to the user.
**VM start**

If the session requires a machine start, VM start is the time taken to start the virtual machine.

**HDX connection**

Time taken to complete the steps required in setting up the HDX connection from the client to the virtual machine.

**Authentication**

Time taken to complete authentication to the remote session.

**GPOs**

If Group Policy settings are enabled on the virtual machines, this is the time taken to apply group policy objects during logon. The drill-down of the time taken to apply each policy as per the CSEs (Clients-Side Extension) is available as a tooltip when you hover on the GPO bar.

Click **Detailed Drilldown** to see a table with the policy status, and the corresponding GPO name. The time durations in the drilldown represent the CSE processing time only and do not add up to the total GPO time. You can copy the drill-down table for further troubleshooting or use in reports. The GPO time for the policies is retrieved from Event Viewer logs. The logs can get overwritten depending on the memory allocated for the operational logs (default size is 4 MB). For more information about increasing the log size for the operational logs, see the Microsoft TechNet article **Configuring the Event Logs**.
Logon scripts

If logon scripts are configured for the session, this is the time taken for the logon scripts to be run.

Profile load

If profile settings are configured for the user or the virtual machine, this is the time taken for the profile to load.

If Citrix Profile Management is configured, the Profile Load bar includes the time taken by Citrix Profile Management to process user profiles. This information helps administrators to troubleshoot high profile processing duration issues. When Profile Management is configured, the Profile Load bar displays an increased duration. This increase is caused by this enhancement and does not reflect a performance degradation. This enhancement is available on VDAs 1903 or later.

Hovering over the Profile Load bar displays a tooltip showing the user profile details for the current session.

Click Detailed Drilldown to drilldown further into each individual folder in the profile root folder (for instance, C:/Users/username), its size, and the number of files (including files inside nested folders).
Profile drilldown is available on Delivery Controller version 7 1811 or later and VDAs 1811 or later. Using the profile drilldown information, you can resolve issues involving a high profile load time. You can:

- Reset the user profile
- Optimize the profile by removing unwanted large files
- Reduce the number of files to reduce the network load
- Use profile streaming

By default, all folders in the profile root are displayed in the drilldown. To hide folder visibility, edit the following registry value on the VDA machine:

**Warning:**

Adding and editing the registry incorrectly can cause serious problems that might require you to reinstall your operating system. Citrix does not guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

1. On the VDA, add a new registry value `ProfileFoldersNameHidden` at `HKEY_LOCAL_MACHINE\Software\Citrix\Director`.
2. Set the value to 1. This value must be a DWORD (32-bit) value. Folder names visibility is now disabled.
3. To make the folder names visible again, set the value to 0.

**Note:**

You can use GPO or PowerShell commands to apply the registry value change on multiple machines. For more information about using GPO to deploy registry changes, see the [blog](#).

**Additional information**
• Profile drilldown does not consider redirected folders.
• The NTUser.dat files in the root folder might not be visible to end users. However, they are included in the profile drilldown and displayed in the list of files in Root Folder.
• Certain hidden files in the AppData folder are not included in Profile drilldown.
• Number of files and profile size data might not match with the data in the Personalization panel due to certain Windows limitations.

Interactive Session

This is the time taken to “hand off” keyboard and mouse control to the user after the user profile has been loaded. It is normally the longest duration out of all the phases of the logon process and is calculated as Interactive Session duration = Desktop Ready Event Timestamp (EventId 1000 on VDA) - User Profile Loaded Event Timestamp (EventId 2 on VDA). Interactive Session has three subphases: Pre-userinit, Userinit, and Shell. Hover over Interactive Session to see a tooltip showing the following:

• subphases
• time taken for each subphase
• total cumulative time delay between these subphases
• link to documentation.

Note:

This feature is available on VDAs 1811 and later. If you have launched sessions on sites earlier than 7.18 and then upgraded to 7.18 or later, a ‘Drilldown unavailable due to server error’ message is displayed. However, if you have launched sessions after upgrading, no error message is displayed.

To view the time duration of each subphase, enable Audit process tracking on the VM (VDA). When the Audit process tracking is disabled (default), the time duration of Pre-userinit and the combined time duration of Userinit and Shell are displayed. You can enable Audit process tracking through a Group Policy Object (GPO) as follows:

1. Create a GPO and edit it using the GPO editor.
3. On the right pane, double-click Audit process tracking.
4. Select Success and click OK.
5. Apply this GPO to the required VDAs or Group.

For more information about Audit process tracking and enabling or disabling it, see Audit process tracking in the Microsoft documentation.
Logon Duration panel in the User Details view.

- **Interactive Session – Pre-userinit**: The segment of Interactive Session which overlaps with Group Policy Objects and scripts. This subphase can be reduced by optimizing the GPOs and scripts.

- **Interactive Session – Userinit**: When a user logs on to a Windows machine, Winlogon runs userinit.exe. Userinit.exe runs logon scripts, re-establishes network connections, and then starts Explorer.exe, the Windows user interface. This subphase of Interactive Session represents the duration between the start of Userinit.exe to the start of the user interface for the virtual desktop or application.

- **Interactive Session – Shell**: In the previous phase, Userinit starts the initialization of Windows user interface. The Shell subphase captures the duration between the initialization of the user interface to the time user receives keyboard and mouse control.

- **Delay**: This is the cumulative time delay between the Pre-userinit and Userinit subphases and the Userinit and Shell subphases.

The total logon time is not an exact sum of these phases. For example, some phases occur in parallel, and in some phases, more processing occurs that can result in a longer logon duration than the sum. The total logon time does not include the ICA idle time that is the time between the ICA file download and the ICA file launch for an application.

To enable the automatic opening of ICA file upon application launch, configure your browser for automatic ICA file launch upon download of an ICA file. For more information, see CTX804493.

**Note:**
The Logon Duration graph shows the logon phases in seconds. Any duration values below one second are displayed as subsecond values. The values above one second are rounded to the nearest 0.5 second. The graph has been designed to show the highest y-axis value as 200 seconds. Any value greater than 200 seconds is shown with the actual value displayed above the bar.

**Troubleshooting tips**

To identify unusual or unexpected values in the graph, compare the amount of time taken in each phase of the current session with the average duration for this user for the last seven days, and the average duration for all users in this delivery group for the last seven days.
Escalate as needed. For example, if the VM startup is slow, the issue might be in the hypervisor, so you can escalate it to the hypervisor administrator. Or, if the brokering time is slow, you can escalate the issue to the site administrator to check the load balancing on the Delivery Controller.

Examine unusual differences, including:

- Missing (current) logon bars
- Major discrepancy between the current duration and this user’s average duration. Causes include:
  - A new application was installed.
  - An operating system update occurred.
  - Configuration changes were made.
  - Profile size of the user is high. In this case, the Profile Load is high.
- Major discrepancy between the user’s logon numbers (current and average duration) and the delivery group average duration.

If needed, click Restart to observe the user’s logon process to troubleshoot issues, such as VM Start or Brokering.

**Shadow users**

July 10, 2020

From Director, use the shadow user feature to view or work directly on a user’s virtual machine or session. You can shadow both Windows or and Linux VDAs. The user must be connected to the machine that you want to shadow. Verify this by checking the machine name listed in the user title bar.

Director launches shadowing in a new tab, update your browser settings to allow pop-ups from the Director URL.

Access the shadowing feature from the User Details view. Select the user session, and click Shadow in the Activity Manager view or the Session Details panel.

**Shadowing Linux VDAs**

Shadowing is available for Linux VDAs Version 7.16 or and later running the RHEL7.3 or Ubuntu Version 16.04 Linux distributions.

**Note:**

- The VDA must be accessible from the Director UI for shadowing to work. Hence, shadowing is possible only for Linux VDAs in the same intranet as the Director client.
- Director uses FQDN to connect to the target Linux VDA. Ensure that the Director client can...
resolve the FQDN of the Linux VDA.

- The VDA must have the python websockify and x11vnc packages installed.
- noVNC connection to the VDA uses the WebSocket protocol. By default, ws:// WebSocket protocol is used. For security reasons, Citrix recommends that you use the secure wss:// protocol. Install SSL certificates on each Director client and Linux VDA.

Follow the instructions in Session Shadowing to configure your VDA for shadowing.

1. After you click Shadow, the shadowing connection initializes and a confirmation prompt appears on the user device.
2. Instruct the user to click Yes to start the machine or session sharing.
3. The administrator can only view the shadowed session.

Shadowing Windows VDAs

Windows VDA sessions are shadowed using Windows Remote Assistance. Enable the User Windows Remote Assistance feature while installing the VDA. For more information, see Enable or Disable features.

1. After you click Shadow, the shadowing connection initializes and a dialog box prompts you to open or save the .msrc incident file.
2. Open the incident file with the Remote Assistance Viewer, if not already selected by default. A confirmation prompt appears on the user device.
3. Instruct the user to click Yes to start the machine or session sharing.
4. For more control, ask the user to share keyboard and mouse control.

Streamline Microsoft Internet Explorer browsers for shadowing

Configure your Microsoft Internet Explorer browser to automatically open the downloaded Microsoft Remote Assistance (.msra) file with the Remote Assistance client.

To do this, you must enable the Automatic prompting for file downloads setting in the Group Policy editor:

Computer Configuration > Administrative Templates > Windows Components > Internet Explorer > Internet Control Panel > Security Page > Internet Zone > Automatic prompting for file downloads.

By default, this option is enabled for sites in the Local intranet zone. If the Director site is not in the Local intranet zone, consider manually adding the site to this zone.

Send messages to users

June 21, 2020
From Director, send a message to a user who is connected to one or more machines. Use this feature to send immediate notices about administrative actions such as impending desktop maintenance, machine logoffs and restarts, and profile resets.

1. In the Activity Manager view, select the user and click Details.
2. In the User Details view, locate the Session Details panel and click Send Message.
3. Type your message information in the Subject and Message fields, and click Send.

If the message is sent successfully, a confirmation message appears in Director. The message appears in the user’s machine.

If the message is not sent successfully, an error message appears in Director. Troubleshoot the problem according to the error message. When you have finished, type the subject and message text again and click Try again.

Resolve application failures

June 21, 2020

In the Activity Manager view, click the Applications tab. You can view all the applications on all machines to which this user has access, including local and hosted applications for the currently connected machine, and the status of each.

Note:
If the Applications tab is grayed out, contact an administrator with the permission to enable the tab.

The list includes only those applications that were launched within the session.

For Multi-session OS machines and Single-session OS machines, applications are listed for each disconnected session. If the user is not connected, no applications are displayed.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>End the application that is not responding</td>
<td>Choose the application that is not responding and click End Application. Once the application is terminated, ask the user to launch it again.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>End processes that are not responding</td>
<td>If you have the required permission, click the Processes tab. Select a process that is related to the application or using a high amount of CPU resources or memory, and click End Process. However, if you do not have the required permission to terminate the process, attempting to end a process fails.</td>
</tr>
<tr>
<td>Restart the user’s machine</td>
<td>For Single-session OS machines only, for the selected session, click Restart. Alternatively, from the Machine Details view, use the power controls to restart or shut down the machine. Instruct the user to log on again so that you can recheck the application. For Multi-session OS machines, the restart option is not available. Instead, log off from the user and let the user log on again.</td>
</tr>
<tr>
<td>Put the machine into maintenance mode</td>
<td>If the machine’s image needs maintenance, such as a patch or other updates, put the machine into maintenance mode. From the Machine Details view, click Details and turn on the maintenance mode option. Escalate to the appropriate administrator.</td>
</tr>
</tbody>
</table>

### Restore desktop connections

June 21, 2020

From Director, check the user’s connection status for the current machine in the user title bar.

If the desktop connection failed, the error that caused failure is displayed and can help you decide how to troubleshoot.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ensure that the machine is not in maintenance mode</td>
<td>On the User Details page, make sure maintenance mode is turned off.</td>
</tr>
</tbody>
</table>
Citrix Virtual Apps and Desktops 7 2009

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restart the user’s machine</td>
<td>Select the machine and click <strong>Restart</strong>. Use this option if the user’s machine is unresponsive or unable to connect. For example, when the machine is using an unusually high amount of CPU resources, which can make the CPU unusable.</td>
</tr>
</tbody>
</table>

**Restore sessions**

June 21, 2020

If a session becomes disconnected, it is still active and its applications continue to run, but the user device is no longer communicating with the server.

In the User Details view, troubleshoot session failures in the **Session Details** panel. You can view the details of the current session, indicated by the session ID.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>End applications or processes that are not responding</td>
<td>Click the <strong>Applications</strong> tab. Select any application that is not responding and click <strong>End Application</strong>. Similarly, select any corresponding process that is not responding and click <strong>End Process</strong>. Also, end processes that are consuming an unusually high amount of memory or CPU resources, which can make the CPU unusable.</td>
</tr>
<tr>
<td>Disconnect the Windows session</td>
<td>Click <strong>Session Control</strong> and then select <strong>Disconnect</strong>. This option is available only for brokered Multi-session OS machines. For non-brokered sessions, the option is disabled.</td>
</tr>
<tr>
<td>Log off from the user’s session</td>
<td>Click <strong>Session Control</strong> and then select <strong>Log Off</strong>.</td>
</tr>
</tbody>
</table>

To test the session, the user can attempt to log back on to it. You can also shadow the user to more closely monitor this session.
Run HDX channel system reports

July 1, 2020

In the **User Details** view, check the status of the HDX channels on the user’s machine in the **HDX** panel. This panel is available only if the user machine is connected using HDX.

If a message appears indicating that the information is not currently available, wait for one minute for the page to refresh, or select the **Refresh** button. HDX data takes a little longer to update than other data.

Click an error or warning icon for more information.

**Tip:**
You can view information about other channels in the same dialog box by clicking the left and right arrows in the left corner of the title bar.

HDX channel system reports are used mainly by Citrix Support to troubleshoot further.

1. In the HDX panel, click **Download System Report**.
2. You can view or save the .xml report file.
   - To view the .xml file, click Open. The .xml file appears in the same window as the Director application.
   - To save the .xml file, click Save. The Save As window appears, prompting you for a location on the Director machine to download the file to.

Reset a user profile

June 21, 2020

**Caution:**

When a profile is reset, the user's folders and files are saved and copied to the new profile. However, most user profile data is deleted (for example, the registry is reset and application settings might be deleted).

1. From Director, search for the user whose profile you want to reset and select this user's session.
2. Click **Reset Profile**.
3. Instruct the user to log off from all sessions.
4. Instruct the user to log back on. The folders and files that were saved from the user’s profile are copied to the new profile.
**Important:**

If the user has profiles on multiple platforms (such as Windows 8 and Windows 7), instruct the user to log back on first to the same desktop or app that the user reported as a problem. This ensures that the correct profile is reset. If the profile is a Citrix user profile, the profile is already reset by the time the user’s desktop appears. If the profile is a Microsoft roaming profile, the folder restoration might still be in progress for a brief time. The user must stay logged on until the restoration is complete.

The preceding steps assume you are using Citrix Virtual Desktops (Desktop VDA). If you are using Citrix Virtual Desktops (Server VDA) you need to be logged on to perform the profile reset. The user then needs to log off, and log back on to complete the profile reset.

If the profile is not successfully reset (for example, the user cannot successfully log back on to the machine or some of the files are missing), you must manually restore the original profile.

The folders (and their files) from the user’s profile are saved and copied to the new profile. They are copied in the listed order:

- Desktop
- Cookies
- Favorites
- Documents
- Pictures
- Music
- Videos

**Note:**

In Windows 8 and later, cookies are not copied when profiles are reset.

**How reset profiles are processed**

Any Citrix user profile or Microsoft roaming profile can be reset. After the user logs off and you select the reset command (either in Director or using the PowerShell SDK), Director first identifies the user profile in use and issues an appropriate reset command. Director receives the information through Profile Management, including information about the profile size, type, and logon timings.

This diagram illustrates the process following the user logon, when a user profile is reset.
The reset command issued by Director specifies the profile type. The Profile Management service then attempts to reset a profile of that type and looks for the appropriate network share (user store). If the user is processed by Profile Management, but receives a roaming profile command, it is rejected (or the opposite way).

1. If a local profile is present, it is deleted.
2. The network profile is renamed.
3. The next action depends on whether the profile being reset is a Citrix user profile or a Microsoft roaming profile.
For Citrix user profiles, the new profile is created using the Profile Management import rules. The folders are copied back to the network profile, and the user can log on normally. If a roaming profile is used for the reset, any registry settings in the roaming profile are preserved in the reset profile. You can configure Profile Management so that a template profile overrides the roaming profile, if necessary.

For Microsoft roaming profiles, Windows creates a new profile, and when the user logs on, the folders are copied back to the user device. When the user logs off again, the new profile is copied to the network store.

**To manually restore a profile after a failed reset**

1. Instruct the user to log off from all sessions.
2. Delete the local profile if one exists.
3. Locate the archived folder on the network share that contains the date and time appended to the folder name, the folder with a .upm_datestamp extension.
4. Delete the current profile name. That is, the one without the upm_datestamp extension.
5. Rename the archived folder using the original profile name. That is, remove the date and time extension. You have returned the profile to its original, pre-reset state.

**To reset a profile using PowerShell SDK**

You can reset a profile using the Broker PowerShell SDK.

**New-BrokerMachineCommand**

Creates a command queued for delivery to a specific user, session, or machine. For more information about this cmdlet, see https://citrix.github.io/delivery-controller-sdk/Broker/New-BrokerMachineCommand/.

**Examples**

See the following examples for details about how to use the PowerShell cmdlets to reset a profile:

Reset a Profile Management profile

- Suppose you want to reset the profile for user1. Use the New-BrokerMachineCommand PowerShell command. For example:
  - New-BrokerMachineCommand -Category UserProfileManager -CommandName "ResetUpmProfile" -DesktopGroups 1 -CommandData $byteArray -SendTrigger logon -user domain1\user1
Important:
The CommandData $byteArray must be in the following format: <SID>[<backup path>].
If you do not provide the backup path, Profile Management generates a backup folder named by
current date and time.

Reset a Windows roaming profile

- Suppose you want to reset the roaming profile for user1. Use the New-BrokerMachineCommand
  PowerShell command. For example:
  - New-BrokerMachineCommand -Category UserProfileManager -CommandName
    ”ResetRoamingProfile”-DesktopGroups 1 -CommandData $byteArray -
    SendTrigger logon -user domain1\user1

Record sessions

July 10, 2020

You can record ICA sessions using the Session Recording controls from the User Details and Machine
Details screen in Director. This feature is available for customers on Premium sites.

To configure Session Recording on Director using the DirectorConfig tool, see the Configure Director
to use the Session Recording Server section in Create and activate recording policies.

The Session Recording controls are available in Director only if the logged in user has the permission
to modify the Session Recording policies. This permission can be set on the Session Recording Author-
ization console as described in Create and activate recording policies.

Note:
Changes made to the Session Recording settings through Director or the Session Recording Pol-
icy console take effect starting from the subsequent ICA session.

Session Recording controls in Director

You can enable Session Recording for a specific user on the Activity Manager or the User Details
screen. Subsequent sessions are recorded for the specific user on all supported servers.

You can:

- Turn ON (with notification) - the user is notified about the session being recorded on logging on
to the ICA session.
- Turn ON (without notification) - the session is recorded silently without notifying the user.
- Turn OFF - disable recording of sessions for the user.
The Policies Panel displays the name of the active Session Recording policy.

You can enable Session Recording for a specific machine from the Machine Details page. Subsequent sessions on the machine are recorded. The Machine Details panel displays the status of the Session Recording policy for the machine.

Feature compatibility matrix

September 14, 2020

Citrix Director 7 2009 is compatible with:

- Citrix Virtual Apps and Desktops 7 2006 and later
- Citrix Virtual Apps and Desktops 7 1912 LTSR
Within each site, although you can use Director with earlier versions of Delivery Controller, all the features in the latest version of Director might not be available. Citrix recommends having Director, Delivery Controller, and the VDAs at the same version.

Note:
After you upgrade a Delivery Controller, you are prompted to upgrade the site when you open Studio. For more information, see the Upgrade Sequence section in Upgrade a deployment.

The first time you log in after a Director upgrade, a version check is performed on the configured sites. If any site is running a version of the Controller earlier than that of Director, a message appears on the Director console, recommending a site upgrade. Additionally, as long as the version of the site is older than that of Director, a note remains displayed on the Director Dashboard indicating this mismatch.

Specific Director features with the minimum version of Delivery Controller (DC), VDA and other dependent components required along with License Edition are listed below.

**Data granularity and retention**

July 10, 2020

**Aggregation of data values**

The Monitor Service collects various data, including user session usage, user logon performance details, session load balancing details, and connection and machine failure information. Data is aggregated differently depending on its category. Understanding the aggregation of data values presented using the OData Method APIs is critical to interpreting the data. For example:

- Connected Sessions and Machine Failures occur over a period. Therefore, they are exposed as maximums over a time period.
- LogOn Duration is a measure of the length of time, therefore is exposed as an average over a time period.
- LogOn Count and Connection Failures are counts of occurrences over a period, therefore are exposed as sums over a time period.

**Concurrent data evaluation**

Sessions must be overlapping to be considered concurrent. However, when the time interval is 1 minute, all sessions in that minute (whether they overlap) are considered concurrent. The size of the interval is so small that the performance overhead involved in calculating the precision is not worth
the value added. If the sessions occur in the same hour, but not in the same minute, they are not considered to overlap.

**Correlation of summary tables with raw data**

The data model represents metrics in two different ways:

- The summary tables represent aggregate views of the metrics in per minute, hour, and day time granularities.
- The raw data represents individual events or current state tracked in the session, connection, application, and other objects.

When attempting to correlate data across API calls or within the data model itself, it is important to understand the following concepts and limitations:

- **No summary data for partial intervals.** Metrics summaries are designed to meet the needs of historical trends over long periods of time. These metrics are aggregated into the summary table for complete intervals. There are no summary data for a partial interval at the beginning (oldest available data) or at the end. When viewing aggregations of a day (Interval=1440), this means that the first and most recent incomplete days do not have any data. Although raw data might exist for those partial intervals, it is never summarized. You can determine the earliest and latest aggregate interval for a particular data granularity by pulling the min and max SummaryDate from a particular summary table. The SummaryDate column represents the start of the interval. The Granularity column represents the length of the interval for the aggregate data.

- **Correlating by time.** Metrics are aggregated into the summary table for complete intervals as described in the preceding section. They can be used for historical trends, but raw events might be more current in the state than what has been summarized for trend analysis. Any time-based comparison of summary to raw data must consider that there are no summary data for partial intervals that might occur or for the beginning and ending of the time period.

- **Missed and latent events.** Metrics that are aggregated into the summary table might be slightly inaccurate if events are missed or latent to the aggregation period. Although the Monitor Service attempts to maintain an accurate current state, it does not go back in time to recompute aggregation in the summary tables for missed or latent events.

- **Connection High Availability.** During connection HA, there will be gaps in the summary data counts of current connections, but the session instances will still be running in the raw data.

- **Data retention periods.** Data in the summary tables is retained on a different grooming schedule from the schedule for raw event data. Data might be missing because it has been groomed away from summary or raw tables. Retention periods might also differ for different granularities of summary data. Lower granularity data (minutes) is groomed more quickly than higher granularity data (days). If data is missing from one granularity due to grooming, it might be found in a higher granularity. Since the API calls only return the specific granularity requested, receiving
no data for one granularity does not mean that the data doesn’t exist for a higher granularity for the same time period.

- **Time zones.** Metrics are stored with UTC time stamps. Summary tables are aggregated on hourly time zone boundaries. For time zones that don’t fall on hourly boundaries, there might be some discrepancy as to where data is aggregated.

**Granularity and retention**

The granularity of aggregated data retrieved by Director is a function of the time (T) span requested. The rules are as follows:

- $0 < T \leq 1$ hour uses per-minute granularity
- $0 < T \leq 30$ days uses per-hour granularity
- $T > 31$ days uses per-day granularity

Requested data that does not come from aggregated data comes from the raw Session and Connection information. This data tends to grow fast, and therefore has its own grooming setting. Grooming ensures that only relevant data is kept long term. This ensures better performance while maintaining the granularity required for reporting. Customers on Premium licensed sites can change the grooming retention to their desired number of retention days, otherwise the default is used.

To access the settings, run the following PowerShell commands on the Delivery Controller:

```
1 asnp Citrix.*
2 Get-MonitorConfiguration
3 Set-MonitorConfiguration -<setting name> <value>
```

</table>

**Caution:**

Modifying values on the Monitor Service database requires restarting the service for the new values to take effect. You are advised to make changes to the Monitor Service database only under the direction of Citrix Support.

The settings GroomProcessUsageRawDataRetentionDays, GroomResourceUsageRawDataRetentionDays, and GroomSessionMetricsDataRetentionDays are limited to their default values of 1, while GroomProcessUsageMinuteDataRetentionDays is limited to its default value of 3. The PowerShell commands to set these values have been disabled, as the process usage data tends to grow quickly. Also, license based retention settings are as follows:

- **Premium licensed sites** - you can update the grooming retention settings above to any number of days.
- **Advanced licensed sites** - the grooming retention for all settings is limited to 31 days.
- **All other sites** - the grooming retention for all settings is limited to 7 days.

**Exceptions:**

- GroomApplicationInstanceRetentionDays can be set only in Premium licensed sites.
- GroomApplicationErrorsRetentionDays and GroomApplicationFaultsRetentionDays are limited to 31 days in Premium licensed sites.

Retaining data for long periods will have the following implications on table sizes:

- **Hourly data.** If hourly data is allowed to stay in the database for up to two years, a site of 1000 delivery groups can cause the database to grow as follows:
1000 delivery groups x 24 hours/day x 365 days/year x 2 years = 17,520,000 rows of data. The performance impact of such a large amount of data in the aggregation tables is significant. Given that the dashboard data is drawn from this table, the requirements on the database server might be large. Excessively large amounts of data might have a dramatic impact on performance.

- **Session and event data.** This is the data that is collected every time a session is started and a connection/reconnection is made. For a large site (100 K users), this data grows fast. For example, two years’ worth of these tables would gather more than a TB of data, requiring a high-end enterprise-level database.

## SDKs and APIs

December 18, 2019

Several SDKs and APIs are available with this release. For details, see Developer Documentation. From there, you can access programming information for:

- Delivery Controller
- Monitor Service OData
- StoreFront

The Citrix Group Policy SDK allows you to display and configure Group Policy settings and filters. It uses a PowerShell provider to create a virtual drive that corresponds to the machine and user settings and filters. The provider appears as an extension to New-PSDrive. To use the Group Policy SDK, either Studio or the Citrix Virtual Apps and Desktops SDK must be installed. See Group Policy SDK for more information.

### Delivery Controller SDK

The SDK comprises several PowerShell snap-ins that are installed automatically when you install a Delivery Controller or Studio.

Permissions: You must run the shell or script using an identity that has Citrix administration rights. Although members of the local administrators group on the Controller automatically have full administrative privileges to allow Citrix Virtual Apps or Citrix Virtual Desktops to be installed, Citrix recommends that for normal operation, you create Citrix administrators with the appropriate rights, rather than use the local administrators account.

To access and run the cmdlets:

1. Start a shell in PowerShell: Open Studio, select the PowerShell tab, and then click Launch PowerShell.
2. To use SDK cmdlets within scripts, set the execution policy in PowerShell. For more information about PowerShell execution policy, see the Microsoft documentation.

Note:
The current SDK installs as both a PowerShell snap-in and a PowerShell module.
With the addition of the module functionality, you can use this SDK's cmdlets without a preceding `Add-PSSnapin` (or `asnp`) cmdlet.
For associated components’ SDKs (such as Citrix Licensing, Citrix Provisioning, and StoreFront) that install only as a snap-in, using their cmdlets still requires a preceding `Add-PSSnapin` (or `asnp`).
If you want to use this SDK through the snap-in, continue with the next step.

3. Add the snap-ins you require into the PowerShell environment using the `Add-PSSnapin` cmdlet in the Windows PowerShell console.

   V1 and V2 denote the version of the snap-in. XenDesktop 5 snap-ins are version 1. Citrix Virtual Apps and Desktops, and earlier XenDesktop 7 version snap-ins are version 2. For example, to install Citrix Virtual Apps and Desktops snap-ins, type `Add-PSSnapin Citrix.ADIdentity.Admin.V2`. To import all of the cmdlets, type: `Add-PSSnapin Citrix.*.Admin.V*`

After adding the snap-ins, you can access the cmdlets and their associated help.

To see the current Citrix Virtual Apps and Desktops PowerShell cmdlet help:

1. From the PowerShell console, add the Citrix snap-ins: `Add -PSSnapin Citrix.*.Admin.V*`.
2. Follow the instructions in The Windows PowerShell ISE.

Group Policy SDK

To use the Group Policy SDK, either Studio or the Citrix Virtual Apps and Desktops SDK must be installed.

To add the Group Policy SDK, type `Add-PSSnapin citrix.common.grouppolicy`. (To access help, type: `help New-PSDrive -path localgpo:`)

To create a virtual drive and load it with settings, type `New-PSDrive <Standard Parameters> [-PSProvider] CitrixGroupPolicy -Controller <string>` where the Controller string is the fully qualified domain name of a Controller in the Site you want to connect to and load settings from.

Monitor Service OData

The Monitor API allows access to the Monitor Service data using Version 3 or 4 of the OData API. You can create customized monitoring and reporting dashboards based on data queried from the Monitor
Service data. OData V.4 is based on the ASP.NET Web API and supports aggregation queries. For more information, see the Monitor Service OData API.
