DNS name of the hypervisor that is hosting the machine if managed.

-- HypervisorConnectionName (System.String)

The name of the hypervisor connection that the machine has been assigned to, if managed.

-- HypervisorConnectionUid (System.Int32?)

The UID of the hypervisor connection that the machine's hosting server is accessed through.

-- HypHypervisorConnectionUid (System.Guid?)

The UUID of the hypervisor connection that the machine's hosting server is accessed through

-- IconUid (System.Int32?)

The UID of the machines's icon that is displayed in StoreFront.

-- ImageOutOfDate (System.Boolean?)

Denotes if the VM image for a hosted machine is out of date.

-- InMaintenanceMode (System.Boolean)

Denotes if the machine is in maintenance mode.

-- IPAddress (System.String)

The IP address of the machine.

-- IsAssigned (System.Boolean)

Denotes whether a private desktop has been assigned to a user/users, or a client name/address. Users can be assigned explicitly or by assigning on first use of the machine.

-- IsPhysical (System.Boolean)

This value is true if the machine is physical (ie not power managed by the Citrix Broker service, and false otherwise.

-- LastConnectionFailure (Citrix.Broker.Admin.SDK.ConnectionFailureReason)

The reason for the last failed connection between a client and the machine.

-- LastConnectionTime (System.DateTime?)

Time of the last detected connection attempt that either failed or succeeded.

-- LastConnectionUser (System.String)

The SAM name (in the form DOMAIN\user) of the user that last attempted a connection with the machine. If the SAM name is not available, the SID is used.

-- LastDeregistrationReason (Citrix.Broker.Admin.SDK.DeregistrationReason?)

The reason for the last deregistration of the machine with the broker. Possible values are:

AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

-- LastDeregistrationTime (System.DateTime?)

Time of the last deregistration of the machine from the controller.

-- LastErrorReason (System.String)

The reason for the last error detected in the machine.

-- LastErrorTime (System.DateTime?)

The time of the last detected error.

-- LastHostingUpdateTime (System.DateTime?)

Time of last update to any hosting data (such as power states) for this machine reported by the hypervisor connection.

-- LoadIndex (System.Int32?)

Gives current effective load index for multi-session machines.

-- LoadIndexes (System.String[])

Gives the last reported individual load indexes that were used in the calculation of the LoadIndex value. Note that the LoadIndex value may have been subsequently adjusted due to session brokering operations. This value is only set for multi-session machines.

-- MachineInternalState (Citrix.Broker.Admin.SDK.MachineInternalState)

The internal state of the machine; reported while the machine is registered to a controller, plus some private Citrix Broker Service states while the machine is not registered.

-- MachineName (System.String)

DNS host name of the machine.

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

Any metadata that is associated with the machine.

-- OSType (System.String)

A string that can be used to identify the operating system that is running on the machine.

-- OSVersion (System.String)

A string that can be used to identify the version of the operating system running on the machine, if known.

-- PersistUserChanges (Citrix.Broker.Admin.SDK.PersistUserChanges)

Describes if and how user changes are persisted. Possible values are:

o OnLocal - Persist the user changes on the local disk of the machine.

o Discard - Discard user changes.

o OnPvd - Persist user changes on the Citrix Personal vDisk.

-- PowerActionPending (System.Boolean)

Indicates if there are any pending power actions for the machine.

-- PowerState (Citrix.Broker.Admin.SDK.PowerState)

The current power state of the machine. Possible values are: Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, resuming.

-- ProvisioningType (Citrix.Broker.Admin.SDK.ProvisioningType)

Describes how the machine was provisioned, possible values are:

o Manual: No automated provisioning.

o PVS: Machine provisioned by PVS (may be physical, blade, VM,...)

o MCS: Machine provisioned by MCS (machine must be VM)

-- PublishedApplications (System.String[])

List of applications published by the machine (displayed as browser names).

-- PublishedName (System.String)

The name of the machine that is displayed in StoreFront, if the machine has been published.

-- PvdStage (Citrix.Broker.Admin.SDK.PvdStage)

For a machine supporting Personal vDisk technology (PvD), indicates the stage of the PvD image preparation.

-- RegistrationState (Citrix.Broker.Admin.SDK.RegistrationState)

Indicates the registration state of the machine. Possible values are: Unregistered, Initializing, Registered, AgentError.

-- ScheduledReboot (Citrix.Broker.Admin.SDK.ScheduledReboot)

Indicates the state of any scheduled reboot operation for a machine. Possible values:

o None: No reboot is scheduled.

o Pending: Machine is awaiting reboot but is available for use.

o Draining: Machine is awaiting reboot and is unavailable for new sessions; reconnections to existing connections are still allowed, however.

o InProgress: Machine is actively undergoing a scheduled reboot. o Natural: Natural reboot in progress. Machine is awaiting a restart.

-- SecureIcaRequired (System.Boolean?)

Flag indicating whether SecureICA is required or not when starting a session on the machine.

-- SessionAutonomouslyBrokered (System.Boolean?)

Session property indicating if the current session was started without the use of the broker.

Session properties are always null for multi-session machines.

-- SessionClientAddress (System.String)

Session property indicating the IP address of the client connected to the machine.

Session properties are always null for multi-session machines.

-- SessionClientName (System.String)

Session property indicating the host name of the client connected to the machine.

Session properties are always null for multi-session machines.

-- SessionClientVersion (System.String)

Session property indicating the host name of the client connected to the machine.

Session properties are always null for multi-session machine.

-- SessionConnectedViaHostName (System.String)

Session property indicating the host name of the connection gateway, router or client.

Session properties are always null for multi-session machines.

-- SessionConnectedViaIP (System.String)

Session property indicating the IP address of the connection gateway, router or client.

Session properties are always null for multi-session machines.

-- SessionCount (System.Int32)

Count of number of sessions on the machine.

-- SessionDeviceId (System.String)

Session property indicating a unique identifier for the client device that has most recently been associated with the current session.

Session properties are always null for multi-session machines.

-- SessionHardwareId (System.String)

Session property indicating a unique identifier for the client hardware that has been most recently associated with the current session.

Session properties are always null for multi-sesison machines.

-- SessionHidden (System.Boolean?)

Session parameter that indicates if a session is hidden.

Session parameters are always null for multi-session machines.

-- SessionKey (System.Guid?)

Session property indicating the key of the current session.

Session properties are always null for multi-session machines.

-- SessionLaunchedViaHostName (System.String)

Session property that denotes the host name of the StoreFront server used to launch the current brokered session.

Session properties are always null for multi-session machines.

-- SessionLaunchedViaIP (System.String)

Session property that denotes the IP address of the StoreFront server used to launch the current brokered session.

Session properties are always null for multi-session machines.

-- SessionProtocol (System.String)

Session property that denotes the protocol that the current session is using, can be either "HDX" or "RDP".

Session properties are always null for multi-session machines.

-- SessionSecureIcaActive (System.Boolean?)

Session property that indicates whether SecureICA is active on the current session or not.

Session properties are always null for multi-session machines.

-- SessionsEstablished (System.Int32)

Number of established sessions on this machine. For multi-session machines this excludes established sessions which have not yet completed their logon processing.

-- SessionSmartAccessTags (System.String[])

Session property that indicates the Smart Access tags for the current session.

Session properties are always null on multi-session machines.

-- SessionsPending (System.Int32)

Number of pending (brokered but not yet established) sessions on this machine. For multi-session machines this also includes established sessions which have not yet completed their logon processing.

-- SessionStartTime (System.DateTime?)

Session property that indicates the start time of the current session.

Session properties are always null on multi-session machines.

-- SessionState (Citrix.Broker.Admin.SDK.SessionState?)

Session property indicating the state of the current session, possible values are:

Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession and Unknown. Session properties are always null for multi-session machines.

-- SessionStateChangeTime (System.DateTime?)

Session property indicating the time of the last state change of the current session.

Session properties are always null for multi-session machines.

-- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport)

Indicates the session support of the machine.

Possible values:

o SingleSession: Single-session only machine.

o MultiSession: Multi-session capable machine.

-- SessionUid (System.Int64?)

Session property indicating the UID of the current session.

Session properties are always null for multi-session machines.

-- SessionUserName (System.String)

Session property indicates the name of the current sessions' user (in the form DOMAIN\user).

Session properties are always null for multi-session machines.

-- SessionUserSID (System.String)

Session property indicates the SID of the current sessions' user.

Session properties are always null for multi-session machines.

-- SID (System.String)

The SID of the machine.

-- SummaryState (Citrix.Broker.Admin.SDK.DesktopSummaryState)

Indicates the overall state of the desktop associated with the machine. The overall state is a result of other more specific states such as session state, registration state and power state. Possible values: Off, Unregistered, Available, Disconnected, InUse, Preparing.

-- SupportedPowerActions (System.String[])

A list of power actions supported by this machine

-- Tags (System.String[])

A list of tags for the machine.

-- Uid (System.Int32)

UID of the machine object.

-- UUID (System.Guid)

UUID of the machine object.

-- VMToolsState (Citrix.Broker.Admin.SDK.VMToolsState)

State of the hypervisor tools present on the VM (if any).

Possible values are:

NotPresent, Unknown, NotStarted, Running.

-- WillShutdownAfterUse (System.Boolean)

Flag indicating if this machine is tainted and will be shut down after all sessions on the machine have ended. This flag is only ever true on power-managed, single-session machines.

Note: The machine will not shut down if it is in maintenance mode; it will shut down only after it is taken out of maintenance mode.

-- WindowsConnectionSetting (Citrix.Broker.Admin.SDK.WindowsConnectionSetting?)

The logon mode reported by Windows itself (multi-session machines only). For single-session machines the value is always hardwired to LogonEnabled.

Possible values are:

LogonEnabled, Draining, DrainingUntilRestart and LogonDisabled.

Group-BrokerMachine

Parameters

-Uid<Int32>

Gets a machine with a specific UID.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Gets machines with a specific machine name (in the form domain\machine).

Required?	false
Default Value	
Accept Pipeline Input?	false

-AgentVersion<String>

Gets machines with a specific Citrix Virtual Delivery Agent version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AllocationType<AllocationType>

Gets machines from catalogs with the specified allocation type.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ApplicationInUse<String>

Gets machines running a specified published application (identified by browser name).

String comparisons are case-insensitive.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedClientName<String>

Gets machines that have been assigned to the specific client name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedIPAddress<String>

Gets machines that have been assigned to the specific IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserFullName<String>

Gets machines with an associated user identified by their full name (usually 'first-name last-name').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserName<String>

Gets machines with an associated user identified by their user name (in the form 'domain\user').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserSID<String>

Gets machines with an associated user identified by their Windows SID.

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserUPN<String>

Gets machiness with an associated user identified by their User Principle Name (in the form 'user@domain').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogName<String>

Gets machines from the catalog with the specific name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogUid<Int32>

Gets machines from the catalog with the specific UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogUUID<Guid>

Gets machines from the catalog with the specific UUID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Gets machines configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ControllerDNSName<String>

Gets machines with a specific DNS name of the controller they are registered with.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DeliveryType<DeliveryType>

Gets machines of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Gets machines with a specific description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopCondition<String>

Gets machines with an outstanding desktop condition.

Valid values are:

o CPU: Indicates the machine has high CPU usage

o ICALatency: Indicates the network latency is high

o UPMLogonTime: Indicates that the profile load time was high

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupName<String>

Gets machines from a desktop group with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets machines from a desktop group with a specific UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUUID<Guid>

Gets machines from a desktop group with a specific UUID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopKind<DesktopKind>

Deprecated: Use AllocationType parameter.

Gets machines of a particular kind.

Valid values are Private, Shared.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopUid<Int32>

Gets the machine that corresponds to the desktop with the specific UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DNSName<String>

Gets machines with the specific DNS name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-FaultState<MachineFaultState>

Gets machines currently in the specified fault state.

Required?	false
Default Value	
Accept Pipeline Input?	false

-FunctionalLevel<FunctionalLevel>

Gets machines with a specific FunctionalLevel.

Valid values are L5, L7

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineId<String>

Gets machines with the specific machine ID known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineName<String>

Gets machines with the specific machine name known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostingServerName<String>

Gets machines by the name of the hosting hypervisor server.

Required?	false
Default Value	

Accept Pipeline Input?	false

-HypervisorConnectionName<String>

Gets machines with the specific name of the hypervisor connection hosting them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionUid<Int32>

Gets machines with the specific UID of the hypervisor connection hosting them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypHypervisorConnectionUid<Guid>

Gets machines with the specific UUID of the hypervisor connection hosting them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Gets machines by configured icon. Note that machines with a null IconUid use the icon of the desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ImageOutOfDate<Boolean>

Gets machines depending on whether their disk image is out of date or not (for machines provisioned using MCS only).

Required?	false
Default Value	

Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Gets machines by whether they are in maintenance mode or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IPAddress<String>

Gets machines with a specific IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsAssigned<Boolean>

Gets machines according to whether they are assigned or not. Machines may be assigned to one or more users or groups, a client IP address or a client endpoint name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsPhysical<Boolean>

Gets machines according to whether they can be power managed by XenDesktop or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionFailure<ConnectionFailureReason>

Gets machines with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the desktop yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionTime<DateTime>

Gets machines on which a user session connection occurred at a specific time. This is the time at which the broker detected that the connection attempt either succeeded or failed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionUser<String>

Gets machines where a specific user name last attempted a connection (in the form 'domain\user').

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationReason<DeregistrationReason>

Gets machines whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationTime<DateTime>

Gets machines by the time that they were last deregistered.

Required?	false

Default Value	
Accept Pipeline Input?	false

-LastErrorReason<String>

Gets machines with the specified last error reason.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastErrorTime<DateTime>

Gets machines with the specified last error time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastHostingUpdateTime<DateTime>

Gets machines with a specific time that the hosting information was last updated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoadIndex<Int32>

Gets machines by their current load index.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineInternalState<MachineInternalState>

Gets machines with the specified internal state.

Required?	false

Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSType<String>

Gets machines by the type of operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSVersion<String>

Gets machines by the version of the operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PersistUserChanges<PersistUserChanges>

Gets machines by the location where the user changes are persisted.

o OnLocal - User changes are persisted locally.

o Discard - User changes are discarded.

o OnPvd - User changes are persisted on the Pvd.

Required?	false
Default Value	

Accept Pipeline Input?	false

-PowerActionPending<Boolean>

Gets machines depending on whether a power action is pending or not.

Valid values are $true or $false.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PowerState<PowerState>

Gets machines with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProvisioningType<ProvisioningType>

Gets machines that are in a catalog with a particular provisioning type. Values can be:

o Manual - No provisioning.

o PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).

o MCS - Machine provisioned by MCS (machine must be VM).

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedApplication<String>

Gets machines with a specific application published to them (identified by its browser name).

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Gets desktops with a specific published name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PvdStage<PvdStage>

Gets machines at a specific personal vDisk stage.

Valid values are None, Requested, PoweringOn and Working.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RegistrationState<RegistrationState>

Gets machines in a specific registration state.

Valid values are Unregistered, Initializing, Registered, and AgentError.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScheduledReboot<ScheduledReboot>

Gets machines according to their current status with respect to any scheduled reboots (for either scheduled desktop group reboots or image rollout purposes). Valid values are:

o None - No reboot currently scheduled.

o Pending - Reboot scheduled but machine still available for use.

o Draining - Reboot scheduled. New logons are disabled, but reconnections to existing sessions are allowed.

o InProgress - Machine is actively being rebooted. o Natural - Natural reboot in progress. Machine is awaiting a restart.

Required?	false
Default Value	

Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Gets machines configured with a particular SecureIcaRequired setting. Note that the machine setting of $null indicates that the desktop group value is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionAutonomouslyBrokered<Boolean>

Gets machines with the autonomously brokered session flag.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionClientAddress<String>

Gets machines with a specific client IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionClientName<String>

Gets machines with a specific client name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionClientVersion<String>

Gets machines with a specific client version.

Required?	false

Default Value	
Accept Pipeline Input?	false

-SessionConnectedViaHostName<String>

Gets machines with a specific incoming connection host name. This is usually a proxy or Citrix Access Gateway server.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionConnectedViaIP<String>

Gets machines with a specific incoming connection IP address.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionCount<Int32>

Gets machines according to the total number of both pending and established user sessions on the machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionDeviceId<String>

Gets machines with a specific client device ID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionHardwareId<String>

Gets machines with a specific client hardware ID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionHidden<Boolean>

Gets machines depending on whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions using XenDesktop; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionKey<Guid>

Gets machine running the session with a specified unique key.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionLaunchedViaHostName<String>

Gets machines with a specific host name of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionLaunchedViaIP<String>

Gets machines with a specific IP address of the StoreFront server from which the user launched the session.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionProtocol<String>

Gets machines with connections using a specific protocol, for example 'HDX', or 'RDP'.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSecureIcaActive<Boolean>

Gets machines depending on whether the current session uses SecureICA or not.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionsEstablished<Int32>

Gets machines according to the number of established user sessions present on the machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSmartAccessTag<String>

Gets machines where the session has the specific SmartAccess tag.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionsPending<Int32>

Get machines according to the number of pending user sessions for the machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionStartTime<DateTime>

Gets machines with a specific session start time.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionState<SessionState>

Gets machines with a specific session state.

Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionStateChangeTime<DateTime>

Gets machines whose sessions last changed state at a specific time.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSupport<SessionSupport>

Gets machines that have the specified session capability. Values can be:

o SingleSession - Single-session only machine.

o MultiSession - Multi-session capable machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUid<Int64>

Gets machines with a specific session UID ($null for no session).

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUserName<String>

Gets machines with a specific user name for the current session (in the form 'domain\user').

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUserSID<String>

Gets machines with a specific SID of the current session user.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SID<String>

Gets machines with a specific machine SID.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SummaryState<DesktopSummaryState>

Gets machines with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, and InUse.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SupportedPowerActions<String[]>

A list of power actions supported by this machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Tag<String>

Gets machines where the session has the given SmartAccess tag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-UUID<Guid>

Gets machines with the specified value of UUID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-VMToolsState<VMToolsState>

Gets machines with a specific VM tools state.

Valid values are NotPresent, Unknown, NotStarted, and Running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WillShutdownAfterUse<Boolean>

Gets machines depending on whether they shut down after use or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WindowsConnectionSetting<WindowsConnectionSetting>

Gets machines according to their current Windows connection setting (logon mode). Valid values are:

o LogonEnabled - All logons are enabled.

o Draining - New logons are disabled, but reconnections to existing sessions are allowed.

o DrainingUntilRestart - Same as Draining, but setting reverts to LogonEnabled when machine next restarts.

o LogonDisabled - All logons and reconnections are disabled.

This is a Windows setting and is not controlled by XenDesktop. It applies only to multi-session machines; for single-session machines its value is always LogonEnabled.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedUserSID<String>

Gets machines with the specific SID of the user to whom the desktop is assigned.

Required?	false
Default Value	

Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Machine

Get-BrokerMachine returns an object for each matching desktop.

Notes

It is generally better to compare dates and times using -Filter and relative comparisons. See about_Broker_Filtering and the examples in this topic for more information.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-BrokerMachine -PowerState Suspended
C:\PS> Get-BrokerMachine -Filter { PowerState -eq 'Suspended' }
```

These commands return all suspended machines. The second form uses advanced filtering (see about_Broker_Filtering).

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerMachine -DNSName '*.mydomain.mycompany.com'
This command returns all machines belonging to the DNS domain mydomain.mycompany.com.

---------- EXAMPLE 3 ----------

C:\PS> Get-BrokerMachine -Filter { RegistrationState -eq 'Registered' -and HypervisorConnectionUid -eq 5 }
This command returns all registered machines running on the specified hypervisor connection.

---------- EXAMPLE 4 ----------

C:\PS> Get-BrokerMachine -MachineName 'MyDomain\X*' | Remove-BrokerDesktopGroup -DesktopGroup 2
This command finds all of the machines in MyDomain with names beginning with X and removes them from the specified desktop group.

---------- EXAMPLE 5 ----------

C:\PS> Get-BrokerMachine -Filter { DesktopGroupUid -ne $null }
This command gets all desktops in a site. Use this instead of the deprecated Get-BrokerDesktop command.

Get-BrokerMachineCommand

Apr 15, 2014

Get the list of commands queued for delivery to a desktop.

Syntax

Get-BrokerMachineCommand -Uid <Int64> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerMachineCommand [-Category <String>] [-CommandName <String>] [-CompletionTime <DateTime>] [-MachineName <String>] [-MachineUid <Int32>] [-Metadata <String>] [-RequestTime <DateTime>] [-SendDeadline <TimeSpan>] [-SendDeadlineTime <DateTime>] [-SendTrigger <MachineCommandTrigger>] [-SessionUid <Int64>] [-State <MachineCommandState>] [-User <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Get the list of commands queued for delivery to a desktop. Commands are batched and can be configured to be delivered at various times during a desktop session's lifetime. Normally commands are sent within a few minutes of being queued, but it is also possible to queue a command for a user who is not currently logged on or a desktop that is currently switched off.

See about_Broker_Filtering for information about advanced filtering options.

---------- BrokerMachineCommand Object

The command object returned represents a command handled by a specific service on a desktop as determined by the Category property.

-- Category (System.String)

Category of the command.

-- CommandData (System.Byte[])

Additional binary data included when the command is sent.

-- CommandName (System.String)

Name of the command.

-- CompletionTime (System.DateTime?)

Time at which the command was sent, expired or canceled.

-- DesktopGroupNames (System.String[])

List of desktop group names that the command was restricted to.

-- MachineName (System.String)

Name of the machine this command is targeted at.

-- MachineUid (System.Int32?)

Unique ID of the machine this command is targeted at.

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

Metadata for this command.

-- RequestTime (System.DateTime)

Time at which this command was created.

-- SendDeadline (System.TimeSpan)

Duration after which this command expires if it has not been sent yet.

-- SendDeadlineTime (System.DateTime?)

Time at which this command expires if it has not been sent yet.

-- SendTrigger (Citrix.Broker.Admin.SDK.MachineCommandTrigger?)

Event that triggers the sending of the command. Valid values are NextContact, Broker, LogOn, Logoff, Disconnect and Reconnect.

-- SessionUid (System.Int64?)

Unique ID of the session this command is targeted at.

-- State (Citrix.Broker.Admin.SDK.MachineCommandState)

Indicates whether the command is pending, sent, expired or canceled.

-- Synchronous (System.Boolean)

Flag that indicates if this is a synchronous command.

-- Uid (System.Int64)

Unique identifier of this machine command.

-- User (System.String)

Name of the user this command is targeted at.

Related topics

New-BrokerMachineCommand

Remove-BrokerMachineCommand

Parameters

-Uid<Int64>

Get only the command with the specified unique identifier.

Required?	true

Default Value	
Accept Pipeline Input?	false

-Category<String>

Get only commands targeted to the specified service category.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CommandName<String>

Get only commands with the specified command name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CompletionTime<DateTime>

Get only commands that entered the Sent, Failed, Canceled or Expired state at the specified time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Get only commands targeted to the specified machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineUid<Int32>

Get only commands targeted to the specified machine.

Required?	false

Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-RequestTime<DateTime>

Get only commands that were requested at the specified time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SendDeadline<TimeSpan>

Get only commands that expire after the specified time span.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SendDeadlineTime<DateTime>

Get only commands that have the specified deadline time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SendTrigger<MachineCommandTrigger>

Get only commands that are due to be sent when the specified trigger occurs. Valid values are NextContact, Broker, LogOn,

Logoff, Disconnect and Reconnect.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUid<Int64>

Get only commands targeted to the specified session.

Required?	false
Default Value	
Accept Pipeline Input?	false

-State<MachineCommandState>

Get only commands in the specified state. Valid values are Pending, Sent, Failed, Canceled and Expired.

Required?	false
Default Value	
Accept Pipeline Input?	false

-User<String>

Get only commands targeted to the specified user.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None No parameter is accepted from the input pipeline.

Return Values

Citrix.Broker.Admin.SDK.MachineCommand

Returns Command objects matching all specified selection criteria.

Examples

---------- EXAMPLE 1 ----------

```
Get-BrokerMachineCommand
```

Returns all pending, canceled, expired and sent commands.

---------- EXAMPLE 2 ----------

```
Get-BrokerMachineCommand -State Pending
```

Returns all queued commands.

Get-BrokerMachineConfiguration

Apr 15, 2014

Gets machine configurations defined for this site.

Syntax

Get-BrokerMachineConfiguration [-Uid] <Int32> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerMachineConfiguration [[-Name] <String>] [-LeafName <String>] [-Metadata <String>] [-DesktopGroupUid <Int32>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves machine configurations matching the specified criteria. If no parameters are specified this cmdlet enumerates all machine configurations.

Machine configurations contain binary arrays of settings data that are managed using SDK snap-ins. Each machine configuration is associated with a configuration slot and referenced by Name. The configuration slot restricts the settings that can be held by the machine configuration. For example, only configurations for Citrix User Profile Manager can be associated with the "User Profile Manager" slot.

See about_Broker_Filtering for information about advanced filtering options.

---------- BrokerMachineConfiguration Object

The machine configuration object returned represents a named collection of related settings values that are applied to a desktop group.

-- ConfigurationSlotUid (System.Int32)

Uid of the associated configuration slot.

-- Description (System.String)

Optional description of the machine configuration.

-- DesktopGroupUids (System.Int32[])

List of desktop group Uids that this machine configuration has been added to.

-- LeafName (System.String)

Name of this machine configuration.

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

Map of metadata associated with this machine configuration.

-- Name (System.String)

Unique "SlotName\MachineConfigurationName" for this machine configuration.

-- Policy (System.Byte[])

A binary array of encoded settings.

-- Uid (System.Int32)

Uid of this machine configuration.

Related topics

New-BrokerMachineConfiguration

Set-BrokerMachineConfiguration

Rename-BrokerMachineConfiguration

Remove-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Parameters

-Uid<Int32>

Get only the machine configuration with the specified unique identifier.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Name<String>

Get only the machine configuration with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LeafName<String>

Get only the machine configurations that have the specified leaf name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Get only the machine configurations that have been assigned to the specified desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false

Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.MachineConfiguration

Get-BrokerMachineConfiguration returns an object for each matching machine configuration.

Examples

---------- EXAMPLE 1 ----------

```
Get-BrokerMachineConfiguration
```

Retrieves a list of every defined machine configuration.

---------- EXAMPLE 2 ----------

```
Get-BrokerMachineConfiguration -Name Receiver\Engineering
```

Retrieves the machine configuration named "Receiver\Engineering".

---------- EXAMPLE 3 ----------

```
Get-BrokerMachineConfiguration -Name UPM\*
```

Retrieves a list of every machine configuration associated with the configuration slot named "UPM".

---------- EXAMPLE 4 ----------

```
Get-BrokerMachineConfiguration -LeafName "Dept*"
```

Retrieves a list of every machine configuration with a LeafName that starts with "Dept", regardless of the associated configuration slot.

Get-BrokerMachineStartMenuShortcutIcon

Apr 15, 2014

Retrieves a Start Menu Shortcut icon from the specified machine.

Syntax

Get-BrokerMachineStartMenuShortcutIcon [-MachineName] <String> [-Path] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves the icon associated with a particular shortcut on a particular machine. This icon is usually used to help create a published application to access the shortcut.

Related topics

Get-BrokerMachine

New-BrokerIcon

Parameters

-MachineName<String>

Specify the name of the machine to use for icon retrieval for the specified shortcut path. The machine can be identified by DNS name, short name, SID, or name of the form domain\machine.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Path<String>

The location of the shortcut in the specified machine whose icon is being fetched.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

System.String

Get-BrokerMachineStartMenuShortcutIcon generates a Base64 encoded string containing the icon for the specified shortcut. This can be used as input to New-BrokerIcon cmdlet.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $shortcuts =  Get-BrokerMachineStartMenuShortcuts -MachineName 'MyDomain\MyMachine'
C:\PS> $encodedIconData =  Get-BrokerMachineStartMenuShortcutIcon -MachineName 'MyDomain\MyMachine' -Path $shortcuts[0].ShortcutPath
C:\PS> $brokerIcon = New-BrokerIcon -EncodedIconData $encodedIconData
C:\PS> Set-BrokerApplication 'Notepad' -IconUid $brokerIcon.Uid
```

This example retrieves all Start Menu Shortcuts from 'MyDomain\MyMachine', and then the icon for the first shortcut from the returned list. The icon is then associated with a published application called 'Notepad'.

Get-BrokerMachineStartMenuShortcuts

Apr 15, 2014

Retrieves the Start Menu Shortcuts from the specified machine.

Syntax

Get-BrokerMachineStartMenuShortcuts [-MachineName] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves the shortcuts defined for all the start menu items on a particular machine. The shortcuts obtained are from the 'All users' start menu; user-specific shortcuts are not found.

Related topics

Parameters

-MachineName<String>

Specify the name of the machine to use for shortcut retrieval. The machine can be identified by DNS name, short name, SID, or name of the form domain\machine.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

None or Citrix.Broker.Admin.SDK.StartMenuShorcut

Get-BrokerMachineStartMenuShortcuts generates an array of Citrix.Broker.Admin.SDK.StartMenuShortcut objects.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $shortcuts = Get-BrokerMachineStartMenuShortcuts -MachineName 'MyDomain\MyMachine'
```

This example retrieves all Start Menu Shortcuts from 'MyDomain\MyMachine'.

Get-BrokerPowerTimeScheme

Apr 15, 2014

Gets power management time schemes for desktop groups.

Syntax

Get-BrokerPowerTimeScheme [-Uid] <Int32> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerPowerTimeScheme [[-Name] <String>] [-DesktopGroupUid <Int32>] [-Metadata <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Finds power time schemes matching the specified search criteria. Each desktop group in the site can have a number of power time schemes associated with it, and these time schemes control how the power states of machines in the group are managed.

If no search criteria are specified all power time schemes for all desktop groups are obtained.

Each power time scheme covers one or more days of the week, and defines which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For any day of the week not covered by any power time scheme, it is assumed that all hours are off-peak and no pool size management is required for any of the hours.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

---------- BrokerPowerTimeScheme Object

The BrokerPowerTimeScheme object represents a power time scheme, defining peak/off-peak hours and idle pool sizes for desktop groups. It contains the following properties:

-- DaysOfWeek (Citrix.Broker.Admin.SDK.TimeSchemeDays)

The days of the week for which this scheme applies to (Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Weekdays, Weekend).

-- DesktopGroupUid (System.Int32)

The desktop group that this time scheme is for.

-- DisplayName (System.String)

The name of this time scheme, as displayed in the Studio console.

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

Metadata for this power time scheme.

-- Name (System.String)

The unique name of this time scheme.

-- PeakHours (System.Boolean[])

A set of 24 boolean flag values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag is $true it means that the associated hour of the day is considered a peak time; if it is $false it means that it is considered off-peak.

-- PoolSize (System.Int32[])

A set of 24 integer values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. The value defines the number of machines (either as an absolute number or a percentage of the machines in the desktop group) that are to be maintained in a running state, whether they are in use or not. A value of -1 has special meaning: pool size management does not apply during such hours.

-- PoolUsingPercentage (System.Boolean?)

A boolean flag to indicate whether the integer values in the pool size array are to be treated as absolute values (if this value is $false) or as percentages of the number of machines in the desktop group (if this value is $true).

-- Uid (System.Int32)

Unique internal identifier of a time scheme.

Related topics

New-BrokerPowerTimeScheme

Set-BrokerPowerTimeScheme

Remove-BrokerPowerTimeScheme

Rename-BrokerPowerTimeScheme

Parameters

-Uid<Int32>

Gets only the power time scheme with the specified Uid.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Name<String>

Gets only power time schemes with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets only the power time schemes associated with the specified desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.PowerTimeScheme

Get-BrokerPowerTimeScheme returns all power time schemes that match the specified selection criteria.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerPowerTimeScheme
Fetches all known power time schemes for all desktop groups in the site.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerPowerTimeScheme -DesktopGroupUid (Get-BrokerDesktopGroup 'Sales Desktops').Uid
Fetches all the power time schemes for the desktop group called 'Sales Desktops'.

Get-BrokerPrivateDesktop

Apr 15, 2014

Get private desktops configured for this site.

Syntax

Get-BrokerPrivateDesktop [-Uid] <Int32> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerPrivateDesktop [[-MachineName] <String>] [-AgentVersion <String>] [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-ColorDepth <ColorDepth>] [-ControllerDNSName <String>] [-Description <String>] [-DesktopGroupUid <Int32>] [-DNSName <String>] [-HostedMachineId <String>] [-HostedMachineName <String>] [-HostingServerName <String>] [-HypervisorConnectionUid <Int32>] [-IconUid <Int32>] [-InMaintenanceMode <Boolean>] [-IPAddress <String>] [-IsAssigned <Boolean>] [-LastDeregistrationReason <DeregistrationReason>] [-LastDeregistrationTime <DateTime>] [-LastHostingUpdateTime <DateTime>] [-OSType <String>] [-OSVersion <String>] [-PowerState <PowerState>] [-PublishedName <String>] [-RegistrationState <RegistrationState>] [-SecureIcaRequired <Boolean>] [-SID <String>] [-Tag <String>] [-WillShutdownAfterUse <Boolean>] [-AssignedUserSID <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet is deprecated, please use the Get-BrokerMachine cmdlet instead.

Retrieve private desktops matching the specified criteria. If no parameters are specified, this cmdlet enumerates all private desktops.

Get-BrokerPrivateDesktop returns configuration information only for private desktops (a DesktopKind of 'Private'). For more state information about desktops, or other types of desktop, use the Get-BrokerMachine cmdlet instead.

For information about advanced filtering options, see about_Broker_Filtering; for more information about desktops, see about_Broker_Desktops.

---------- BrokerPrivateDesktop Object

Private desktops are machines that have been configured with a DesktopKind of 'Private'. They are allocated to either a user/users or a client name/address (but cannot be allocated to both).

-- AgentVersion (System.String)

Version of the Citrix Virtual Delivery Agent (VDA) installed on the desktop.

-- AssignedClientName (System.String)

Client name the desktop has been assigned to.

-- AssignedIPAddress (System.String)

IP Address the desktop has been assigned to.

-- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth?)

The color depth setting configured on the desktop, possible values are:

$null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

-- ControllerDNSName (System.String)

The DNS host name of the controller that the desktop is registered to.

-- Description (System.String)

Description of the private desktop.

-- DesktopGroupUid (System.Int32)

Uid of the desktop group the desktop has been assigned to.

-- DNSName (System.String)

The DNS host name of the desktop.

-- HostedMachineId (System.String)

Unique ID within the hosting unit of the target managed desktop.

-- HostedMachineName (System.String)

The friendly name of a hosted desktop as used by its hypervisor. This is not necessarily the DNS name of the desktop.

-- HostingServerName (System.String)

DNS name of the hypervisor that is hosting the desktop if managed.

-- HypervisorConnectionUid (System.Int32?)

The UID of the hypervisor connection that the desktop has been assigned to, if managed.

-- IconUid (System.Int32?)

The UID of the desktop's icon that is displayed in StoreFront. If this is $null then the desktop will use the icon specified by the desktop group.

-- InMaintenanceMode (System.Boolean)

Denotes whether the desktop is in maintentance mode.

-- IPAddress (System.String)

The IP address of the desktop.

-- IsAssigned (System.Boolean)

Denotes whether a private desktop has been assigned to a user/users, or a client name/address. Users can be assigned explictitly or by assigning on first use of the desktop.

-- LastDeregistrationReason (Citrix.Broker.Admin.SDK.DeregistrationReason?)

The reason for the last deregistration of the desktop with the broker. Possible values are:

AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

-- LastDeregistrationTime (System.DateTime?)

Time of the last deregistration of the desktop from the controller.

-- LastHostingUpdateTime (System.DateTime?)

Time of last update to any hosting data for this desktop reported by the hypervisor connection.

-- MachineName (System.String)

DNS host name of the machine associated with the desktop.

-- OSType (System.String)

A string that can be used to identify the operating system that is running on the desktop.

-- OSVersion (System.String)

A string that can be used to identify the version of the operating system running on the desktop, if known.

-- PowerState (Citrix.Broker.Admin.SDK.PowerState)

The current power state of the desktop. Possible values are: Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, Resuming.

-- PublishedName (System.String)

The name of the desktop that is displayed in StoreFront, if the desktop is published.

-- RegistrationState (Citrix.Broker.Admin.SDK.RegistrationState)

Indicates the registration state of the desktop. Possible values are: Unregistered, Initializing, Registered, AgentError.

-- SecureIcaRequired (System.Boolean?)

Flag indicating whether SecureICA is required or not when starting a session on the desktop.

-- SID (System.String)

Security identifier of the private desktop.

-- Uid (System.Int32)

Unique identifier of the private desktop.

-- WillShutdownAfterUse (System.Boolean)

Flag indicating whether this desktop is tainted and will be shutdown after all sessions on the desktop have ended. This flag should only ever be true on power managed, single-session desktops.

Note: The desktop will not shut down if it is in maintenance mode, but will shut down after the desktop is taken out of maintenance mode.

Set-BrokerPrivateDesktop

Parameters

-Uid<Int32>

Gets desktops by Uid.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Gets desktops by machine name (in the form 'domain\machine').

Required?	false
Default Value	
Accept Pipeline Input?	false

-AgentVersion<String>

Gets desktops with a specific Citrix Virtual Delivery Agent (VDA) version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedClientName<String>

Gets desktops assigned to a specific client name.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AssignedIPAddress<String>

Gets desktops assigned to a specific IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Gets desktops configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ControllerDNSName<String>

Gets desktops by the DNS name of the controller they are registered with.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Gets desktops by description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets desktops from a desktop group with a specific Uid.

Required?	false

Default Value	
Accept Pipeline Input?	false

-DNSName<String>

Gets desktops by DNS name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineId<String>

Gets desktops by the machine id known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineName<String>

Gets desktops by the machine name known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostingServerName<String>

Gets desktops by the name of the hosting hypervisor server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionUid<Int32>

Gets desktops by the uid of the hosting hypervisor connection.

Required?	false

Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Gets desktops by configured icon. Note that desktops with a $null IconUid use the icon of the desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Gets desktops by the InMaintenanceMode setting.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IPAddress<String>

Get desktops by their IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsAssigned<Boolean>

Gets desktops depending on whether they are assigned or not. Private desktops can be assigned to either a user/users or client names/addresses.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationReason<DeregistrationReason>

Gets desktops whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion,

AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationTime<DateTime>

Gets desktops by the time that they were last deregistered.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastHostingUpdateTime<DateTime>

Gets desktops by the time that the hosting information was last updated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSType<String>

Gets desktops by the type of operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSVersion<String>

Gets desktops by the version of the operating system they are running.

Required?	false

Default Value	
Accept Pipeline Input?	false

-PowerState<PowerState>

Gets desktops by power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Gets desktops by published name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RegistrationState<RegistrationState>

Gets desktops by registration state.

Valid values are Registered, Unregistered, and AgentError.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Gets desktops configured with a particular SecureIcaRequired setting. Note that the desktop setting of $null indicates that the desktop group value is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SID<String>

Gets desktops by machine SID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Tag<String>

Gets desktops tagged with the given tag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WillShutdownAfterUse<Boolean>

Gets desktops depending on whether they will be automatically shut down when the current session ends or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedUserSID<String>

Gets desktops with the given assigned user (specified by SID).

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.PrivateDesktop

Get-BrokerPrivateDesktop returns an object for each matching private desktop.

Notes

To compare dates/times, use -Filter and relative comparisons. See about_Broker_Filtering for details.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $list = 'Unmanaged','On','TurningOn','Resuming'
C:\PS> Get-BrokerPrivateDesktop -Filter { PowerState -in $list } | ft -a DNSName,PowerState
```

Get all private desktops that are turned on, or are turning on (assuming unmanaged desktops are powered on).

---------- EXAMPLE 2 ----------

```
C:\PS> Get-BrokerPrivateDesktop -Tag TestTag
```

Retrieve all private desktops tagged with the 'TestTag' tag.

Get-BrokerRebootCycle

Apr 15, 2014

Gets one or more reboot cycles.

Syntax

Get-BrokerRebootCycle -Uid <Int64> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerRebootCycle [-CatalogName <String>] [-CatalogUid <Int32>] [-DesktopGroupName <String>] [-DesktopGroupUid <Int32>] [-EndTime <DateTime>] [-MachinesCompleted <Int32>] [-MachinesFailed <Int32>] [-MachinesInProgress <Int32>] [-MachinesPending <Int32>] [-MachinesSkipped <Int32>] [-Metadata <String>] [-RebootDuration <Int32>] [-StartTime <DateTime>] [-State <RebootCycleState>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-BrokerRebootCycle cmdlet is used to enumerate reboot cycles that match all of the supplied criteria.

See about_Broker_Filtering for information about advanced filtering options.

---------- BrokerRebootCycle Object

The reboot cycle object returned represents a single occurrence of the process of rebooting a portion (or all) of the machines in a desktop group.

-- CatalogName (System.String)

Name of the catalog whose machines are rebooted by this cycle if the cycle is associated with a catalog.

-- CatalogUid (System.Int32?)

Uid of the catalog whose machines are rebooted by this cycle if the cycle is associated with a catalog.

-- DesktopGroupName (System.String)

Name of the desktop group whose machines are rebooted by this cycle.

-- DesktopGroupUid (System.Int32)

Uid of the desktop group whose machines are rebooted by this cycle.

-- EndTime (System.DateTime?)

Time at which this cycle was completed, canceled or abandoned.

-- MachinesCompleted (System.Int32)

Number of machines successfully rebooted by this cycle.

-- MachinesFailed (System.Int32)

Number of machines issued with reboot requests where either the request failed or the operation did not complete within

the allowed time.

-- MachinesInProgress (System.Int32)

Number of machines issued with reboot requests but which have not yet completed the operation.

-- MachinesPending (System.Int32)

Number of outstanding machines to be rebooted during the cycle but on which processing has not yet started.

-- MachinesSkipped (System.Int32)

Number of machines scheduled for reboot during the cycle but which were not processed either because the cycle was canceled or abandoned or because the machine was unavailable for reboot processing throughout the cycle.

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

Map of metadata associated with this cycle.

-- RebootDuration (System.Int32)

Approximate maximum number of minutes over which the reboot cycle runs.

-- StartTime (System.DateTime)

Time of day at which this reboot cycle was started.

-- State (Citrix.Broker.Admin.SDK.RebootCycleState)

The execution state of this cycle.

-- Uid (System.Int64)

Unique ID of this reboot cycle.

-- WarningDuration (System.Int32)

Number of minutes to display the warning message for.

-- WarningMessage (System.String)

Warning message to display to users in active sessions prior to rebooting the machine.

-- WarningTitle (System.String)

Title of the warning message dialog.

Related topics

Start-BrokerRebootCycle

Stop-BrokerRebootCycle

Parameters

-Uid<Int64>

Gets reboot cycles that have the specified Uid.

Required?	true
Default Value	
Accept Pipeline Input?	false

-CatalogName<String>

Gets reboot cycles that relate to the named catalog.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogUid<Int32>

Gets reboot cycles that relate to the catalog with a particular Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupName<String>

Gets reboot cycles that relate to the named desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets reboot cycles that relate to the desktop group with a particular Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-EndTime<DateTime>

Gets reboot cycles that have the specified time at which the reboot cycle was completed, canceled or abandoned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesCompleted<Int32>

Gets reboot cycles that have the specified count of machines successfully rebooted during the cycle.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesFailed<Int32>

Gets reboot cycles that have the specified count of machines issued with reboot requests where either the request failed or the operation did not complete within the allowed time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesInProgress<Int32>

Gets reboot cycles that have the specified count of machines issued with reboot requests but which have not yet completed the operation.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesPending<Int32>

Gets reboot cycles that have the specified count of outstanding machines to be rebooted during the cycle but on which processing has not yet started.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesSkipped<Int32>

Gets reboot cycles that have the specified count of machines scheduled for reboot during the cycle but which were not processed either because the cycle was canceled or abandoned or because the machine was unavailable for reboot processing throughout the cycle.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-RebootDuration<Int32>

Gets reboot cycles that have the specified approximate maximum duration in minutes over which the reboot cycle runs.

Required?	false
Default Value	
Accept Pipeline Input?	false

-StartTime<DateTime>

Gets reboot cycles that have the specified time at which the reboot cycle started.

Required?	false
Default Value	
Accept Pipeline Input?	false

-State<RebootCycleState>

Gets reboot cycles that have the specified overall state of the reboot cycle. Valid values are Initializing, Active, Completed, Canceled, and Abandoned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.

Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.RebootCycle

Returns matching reboot cycles.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-BrokerRebootCycle
```
Enumerate all reboot cycles.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerRebootCycle -State Completed
Enumerates all reboot cycles that have successfully completed.

---------- EXAMPLE 3 ----------

C:\PS> Get-BrokerRebootCycle -DesktopGroupName CallCenter
Enumerates all reboot cycles related to the desktop group named CallCenter.

Get-BrokerRebootSchedule

Apr 15, 2014

Gets one or more reboot schedules.

Syntax

Get-BrokerRebootSchedule [-DesktopGroupUid] <Int32> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerRebootSchedule [[-DesktopGroupName] <String>] [-Active <Boolean>] [-Day <RebootScheduleDays>] [-Enabled <Boolean>] [-Frequency <RebootScheduleFrequency>] [-RebootDuration <Int32>] [-StartTime <TimeSpan>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-BrokerRebootSchedule cmdlet is used to enumerate desktop group reboot schedules that match all of the supplied criteria.

A reboot schedule can be configured to cause all of the machines in a desktop group to be rebooted at a particular time each day or each week, with the reboot of the individual machines spread out over the duration of the whole reboot cycle. A specific warning message can be configured to be displayed to users who are running sessions on the machines being rebooted. Note that each desktop group can only have a single reboot schedule configured.

See about_Broker_Filtering for information about advanced filtering options.

---------- BrokerRebootSchedule Object

The reboot schedule object returned represents a regularly scheduled reboot of machines in a desktop group.

-- Active (System.Boolean)

True if there is an active reboot cycle for this schedule, false otherwise.

-- Day (Citrix.Broker.Admin.SDK.RebootScheduleDays)

When the frequency is weekly, day of the week on which the schedule reboot starts.

-- DesktopGroupName (System.String)

Name of the desktop group rebooted by this schedule.

-- DesktopGroupUid (System.Int32)

Uid of the desktop group rebooted by this schedule.

-- Enabled (System.Boolean)

True if this schedule is currently enabled, false otherwise.

-- Frequency (Citrix.Broker.Admin.SDK.RebootScheduleFrequency)

Whether the schedule runs daily or weekly.

-- RebootDuration (System.Int32)

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

-- StartTime (System.TimeSpan)

Time of day at which the scheduled reboot cycle starts.

-- WarningDuration (System.Int32)

Number of minutes to display the warning message for.

-- WarningMessage (System.String)

Warning message to display to users in active sessions prior to rebooting the machine.

-- WarningTitle (System.String)

Title of the warning message dialog.

Set-BrokerRebootSchedule

New-BrokerRebootSchedule

Remove-BrokerRebootSchedule

Get-BrokerRebootCycle

Parameters

-DesktopGroupUid<Int32>

Gets the reboot schedule for the desktop group having this Uid.

Required?	true
Default Value	
Accept Pipeline Input?	false

-DesktopGroupName<String>

Gets the reboot schedule for the desktop group having this name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Active<Boolean>

Gets desktop group reboot schedules according to whether they are currently active or not. A schedule is active if there is a reboot cycle currently running that was started as a result of the schedule.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Day<RebootScheduleDays>

Gets the reboot schedules set to run on the specified day (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Gets the reboot schedules with the specified Enabled value.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Frequency<RebootScheduleFrequency>

Gets the reboot schedules with the specified frequency (either Weekly or Daily).

Required?	false
Default Value	
Accept Pipeline Input?	false

-RebootDuration<Int32>

Gets the reboot schedules with the specified duration.

Required?	false
Default Value	

Accept Pipeline Input?	false

-StartTime<TimeSpan>

Gets the reboot schedules with the specified start time (HH:MM).

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if

no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.RebootSchedule

Returns matching reboot schedules.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerRebootSchedule
Enumerates all of the reboot schedules.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerRebootSchedule -Enabled $false -Frequency Daily
Enumerates all disabled reboot schedules that are scheduled to run daily.

---------- EXAMPLE 3 ----------

C:\PS> Get-BrokerRebootSchedule -DesktopGroupUid 11
Returns the unique reboot schedule for the desktop group having the Uid 11.

Get-BrokerRemotePCAccount

Apr 15, 2014

Get RemotePCAccount entries configured for this site.

Syntax

Get-BrokerRemotePCAccount -Uid <Int32> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerRemotePCAccount [-AllowSubfolderMatches <Boolean>] [-CatalogUid <Int32>] [-OU <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves RemotePCAccounts matching the specified criteria. If no parameters are specified this cmdlet enumerates all RemotePCAccounts. Each RemotePCAccount object defines a set of machines either by machine name patterns or by where the machines are placed in Active Directory, and which RemotePC catalog the machines are to be associated with when they are discovered.

---------- BrokerRemotePCAccount Object

RemotePCAccounts define a set of machines either by machine name patterns or by where the machines are placed in Active Directory, and which RemotePC catalog the machines are to be associated with when they are discovered.

-- AllowSubfolderMatches (System.Boolean)

Specifies whether machines subfolders of specified AD OUs are to be considered part of the RemotePCAccount.

-- CatalogUid (System.Int32)

The Uid of the RemotePC catalog to which machines in the RemotePCAccount automatically join during registration.

-- MachinesExcluded (System.String[])

A list of machines which are to be excluded from the RemotePCAccount. Wildcard matching is supported.

-- MachinesIncluded (System.String[])

A list of machines which are to be included in the RemotePCAccount. Wildcard matching is supported.

-- OU (System.String)

Machines within this specified AD OU are considered part of the RemotePCAccount, unless they are in they match the MachinesExcluded

-- Uid (System.Int32)

The Uid of the RemotePCAccount object.

Related topics

New-BrokerRemotePCAccount

Set-BrokerRemotePCAccount

Remove-BrokerRemotePCAccount

Parameters

-Uid<Int32>

Gets the RemotePCAccount with the specified unique ID.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AllowSubfolderMatches<Boolean>

Gets RemotePCAccounts with the specified value of AllowSubfolderMatches.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogUid<Int32>

Gets RemotePCAccounts belonging to the specified Remote PC catalog.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OU<String>

Gets the RemotePCAccount with the specified OU.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.RemotePCAccount

Get-BrokerRemotePCAccount returns an object for each matching RemotePCAccount.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-BrokerRemotePCAccount
```
Find all RemotePCAccounts.

---------- EXAMPLE 2 ----------

```
C:\PS> Get-BrokerRemotePCAccount -CatalogUid 42
```
Find RemotePCAccounts belonging to Remote PC catalog 42.

Get-BrokerResource

Apr 15, 2014

Gets resources that a user can broker connections to.

Syntax

Get-BrokerResource [-User] <String> [-Groups <String[]>] [-ClientName <String>] [-ClientIP <String>] [-ViaAG <Boolean>] [-SmartAccessTags <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieve a list of resources that a user has access to, taking into account the site access policy, configuration of desktop groups, assignments, entitlements, and applications.

What a user has access to depends on a number of attributes:

-- User's name or security identifier.

-- Groups that the user is a member of (names or security identifiers).

-- IP address of the client the user connects from.

-- Name of the client that the user connects from.

-- Whether the user is connecting via Citrix Access Gateway.

-- SmartAccess tags when connecting via Citrix Access Gateway.

You must always specify the user's name or security identifier, but you will not always be able to predict what some of the other values will be. By omitting these values the corresponding access checks are ignored.

Consider for example, a site configuration that uses IP address ranges to allow access to private desktop A when connecting from the local network and private desktop B when connecting from home. Running this cmdlet without specifying a client IP address would return both A and B.

The output of this cmdlet depends on the available resources:

-- Assigned private desktops are returned as PrivateDesktop objects.

-- Shared desktops are returned as EntitlementPolicyRule objects.

-- Assign-On-First-Use desktops that have not been assigned yet are returned as AssignmentPolicyRule objects.

-- Application resources produce Application objects.

If more than one type of resource is available, the output pipeline contains a mixture of the above objects, in no particular order.

Only resources accessible based on the specified parameters, and visible to the administrator running this cmdlet are returned.

Related topics

Parameters

-User<String>

Gets resources given the specified user name or security identifier.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Groups<String[]>

Get resources accessible given a list of group names or security identifiers.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientName<String>

Get resources given the specified client name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientIP<String>

Get resources given the specified client IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ViaAG<Boolean>

Gets resources given the specified ViaAG setting.

Required?	false
Default Value	

Accept Pipeline Input?	false

-SmartAccessTags<String[]>

Get resources given the specified SmartAccess tags.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.PrivateDesktop

Get-BrokerResource returns a PrivateDesktop for each accessible assigned private desktop.Citrix.Broker.Admin.SDK.EntitlementPolicyRule

Get-BrokerResource returns an EntitlementPolicyRule object for each accessible entitlement to a shared desktop.Citrix.Broker.Admin.SDK.AssignmentPolicyRule

Get-BrokerResource returns an AssignmentPolicyRule object for each accessible Assign-On-First-Use desktop.Citrix.Broker.Admin.SDK.Application

Get-BrokerResource returns an Application object for each accessible application.

Examples

---------- EXAMPLE 1 ----------

```
Get-BrokerResource -User MYDOMAIN\User1 -Group MYDOMAIN\Accounts,MYDOMAIN\Managers
```

List resources visible by User1 assuming membership of a couple of groups.

---------- EXAMPLE 2 ----------

```
[int[]]$groups = (Get-BrokerResource -User MYDOMAIN\User1 | %{ $_.DesktopGroupUid })
```

```
Get-BrokerDesktopGroup -Filter { Uid -in $groups } -Property Uid,Name
```

Get all of the desktop groups supporting the resources accessible by User1, outputting the uid and name of each desktop group.

Get-BrokerScopedObject

Apr 15, 2014

Gets the details of the scoped objects for the Broker Service.

Syntax

Get-BrokerScopedObject -ScopeId <Guid> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerScopedObject [-Description <String>] [-ObjectId <String>] [-ObjectName <String>] [-ObjectType <ScopedObjectType>] [-ScopeName <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

---------- BrokerScopedObject Object

A scoped, or scopeable object configured in the broker.

-- Description (System.String)

Description of the object (possibly $null if the object type does not have a description).

-- ObjectId (System.String)

Unique identifier of the object.

-- ObjectName (System.String)

Display name of the object

-- ObjectType (Citrix.Broker.Admin.SDK.ScopedObjectType)

Type of the object this entry relates to.

-- ScopeId (System.Guid?)

Specifies the unique identifier of the scope.

-- ScopeName (System.String)

Specifies the display name of the scope.

Related topics

Parameters

-ScopeId<Guid>

Gets scoped object entries for the given scope identifier.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Description<String>

Gets scoped object entries for objects with the specified description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ObjectId<String>

Gets scoped object entries for objects with the specified object identifier.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ObjectName<String>

Gets scoped object entries for objects with the specified object identifier.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ObjectType<ScopedObjectType>

Gets scoped object entries for objects of the given type.

Required?	false
Default Value	

Accept Pipeline Input?	false

-ScopeName<String>

Gets scoped object entries with the given scope name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Return Values

Citrix.Broker.Sdk.ScopedObject

The Get-BrokerScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was included that could not be interpreted for this command.

PermissionDenied

You do not have permission to execute this command.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-BrokerScopedObject -ObjectType Catalog

        ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
        ScopeName   : Sales
        ObjectType  : Catalog
        ObjectId    : 1
        ObjectName  : MyExampleCatalog
```

```
Description : Test Catalog

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
ObjectType  : Catalog
ObjectId    : 1
ObjectName  : MyExampleCatalog
Description : Test Catalog

ScopeId     :
ScopeName   :
ObjectType  : Catalog
ObjectId    : 2
ObjectName  : AnotherCatalog
Description : Another catalog in no scopes
```

Gets all of the scoped objects with type Catalog. The example output shows a catalog object (MyExampleCatalog) in two scopes Sales and Finance, and another catalog (AnotherCatalog) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.

Get-BrokerServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the Broker Service on the controller.

Syntax

Get-BrokerServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables updates to the Broker Service on the controller to be detected. There is no requirement for a database connection to be configured in order for this command to be used.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

System.Collections.Generic.List<System.String>

List containing added capabilities.

Examples

---------- **EXAMPLE 1** ----------

C:\PS> Get-BrokerServiceAddedCapability
Gets the added capabilities of the Broker Service.

Get-BrokerServiceInstance

Apr 15, 2014

Gets the service instance entries for the Broker Service.

Syntax

Get-BrokerServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This returns the service interfaces published by instances of the Broker Service. These instances can be used to register the Service with a Configuration Service so that other services are able to utilize their functionality. There is no requirement to have configured a database connection for the Service to use this command.

Related topics

Get-BrokerServiceStatus

Reset-BrokerServiceGroupMembership

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Return Values

Citrix.Broker.Admin.SDK.ServiceInstance

Get-BrokerServiceinstance returns an opaque object containing information about the Broker WCF Service.

Examples

---------- **EXAMPLE 1** ----------

C:\PS> Get-BrokerServiceInstance

Gets all the service instances of the Broker service running on the connected server. (If AdminAddress has not been set for the runspace, this is the Service running on the local machine.) To get the service instances of remote services, use the AdminAddress parameter. This defines the service required by the interfaces.

Get-BrokerServiceStatus

Apr 15, 2014

Determines the current state of the Broker Service on the controller.

Syntax

```
Get-BrokerServiceStatus [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

This command provides the ability for the status of the Broker Service in the controller to be determined. Before using this command, you don't have to configure the database connection to the Service.

Related topics

Get-BrokerServiceInstance

Reset-BrokerServiceGroupMembership

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

System.String

Get-BrokerServiceStatus returns a string describing the status of the Broker Service.

DBUnconfigured

The broker does not have a database connection configured.

DBRejectedConnection

The database rejected the logon from the Broker Service. This may be caused by bad credentials, or the database not being installed.

InvalidDBConfigured

The database schema is missing (possibly just the stored procedures in it).

DBNotFound

The specified database could not be located with the configured connection string.

DBMissingOptionalFeature

The broker is connected to a database that is valid, but it does not have the full functionality required for optimal performance. Upgrading the database is advisable.

DBMissingMandatoryFeature

The broker is connected to a database that is valid, but it does not have the full functionality required so the broker cannot function. Upgrading the database is required.

DBNewerVersionThanService

The broker is too old to use the database. A newer version is required.

DBOlderVersionThanService

The database is too old for the Broker Service. Upgrade the database.

DBVersionChangeInProgress

A database schema upgrade is in progress.

OK

The broker is connected to a database that is valid, and the service is running.

PendingFailure

Connectivity between the Broker Service and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

Failed

Connectivity between the broker and the database has been lost for an extended period of time, or has failed due to a configuration problem. The broker service cannot operate while its connection to the database is unavailable.

Unknown

The Service's status cannot be determined.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-BrokerServiceStatus
```

Get the current status of the Service.

Get-BrokerSession

Apr 15, 2014

Gets a list of sessions.

Syntax

Get-BrokerSession -Uid <Int64> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerSession [-AgentVersion <String>] [-ApplicationInUse <String>] [-AutonomouslyBrokered <Boolean>] [-BrokeringDuration <Int32>] [-BrokeringTime <DateTime>] [-BrokeringUserName <String>] [-BrokeringUserSID <String>] [-CatalogName <String>] [-ClientAddress <String>] [-ClientName <String>] [-ClientVersion <String>] [-ConnectedViaHostName <String>] [-ConnectedViaIP <String>] [-ControllerDNSName <String>] [-DesktopGroupName <String>] [-DesktopGroupUid <Int32>] [-DesktopKind <DesktopKind>] [-DesktopSID <String>] [-DesktopUid <Int32>] [-DeviceId <String>] [-DNSName <String>] [-EstablishmentDuration <Int32>] [-EstablishmentTime <DateTime>] [-HardwareId <String>] [-Hidden <Boolean>] [-HostedMachineName <String>] [-HostingServerName <String>] [-HypervisorConnectionName <String>] [-ImageOutOfDate <Boolean>] [-InMaintenanceMode <Boolean>] [-IPAddress <String>] [-IsPhysical <Boolean>] [-LaunchedViaHostName <String>] [-LaunchedViaIP <String>] [-MachineName <String>] [-MachineSummaryState <DesktopSummaryState>] [-MachineUid <Int32>] [-Metadata <String>] [-OSType <String>] [-PersistUserChanges <PersistUserChanges>] [-PowerState <PowerState>] [-Protocol <String>] [-ProvisioningType <ProvisioningType>] [-SecureIcaActive <Boolean>] [-SessionId <Int32>] [-SessionKey <Guid>] [-SessionState <SessionState>] [-SessionStateChangeTime <DateTime>] [-SessionSupport <SessionSupport>] [-SessionType <SessionType>] [-StartTime <DateTime>] [-UserFullName <String>] [-UserName <String>] [-UserSID <String>] [-UserUPN <String>] [-ApplicationUid <Int32>] [-SharedDesktopUid <Int32>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves sessions matching all the specified criteria. If no parameters are specified this cmdlet enumerates all sessions.

---------- BrokerSession Object

The session object returned represents a session on a machine in the site. The session could be for a desktop or application

-- AgentVersion (System.String)

Version of the Citrix Virtual Delivery Agent (VDA) installed on the machine.

-- ApplicationsInUse (System.String[])

List of SDK Name property of applications in use in the session.

-- AutonomouslyBrokered (System.Boolean)

Session property indicating if the session was started without the use of the broker.

-- BrokeringDuration (System.Int32?)

Time taken to broker the session.

-- BrokeringTime (System.DateTime?)

Time at which the session was brokered.

-- BrokeringUserName (System.String)

The user name of the brokering user.

-- BrokeringUserSID (System.String)

The SID of the brokering user.

-- CatalogName (System.String)

The name of the catalog that the machine hosting the session is assigned to.

-- ClientAddress (System.String)

The IP address of the client connected to the desktop.

-- ClientName (System.String)

The host name of the client connected to the session.

-- ClientVersion (System.String)

The version of the Citrix Receiver running on the client connected to the session.

-- ConnectedViaHostName (System.String)

The host name of the incoming connection. This is usually a gateway, router or client.

-- ConnectedViaIP (System.String)

The IP address of the incoming connection This is usually a gateway, router or client.

-- ControllerDNSName (System.String)

The DNS host name of the controller that the session's hosting machine is registered with.

-- DesktopGroupName (System.String)

Name of the desktop group of the machine the session is on.

-- DesktopGroupUid (System.Int32)

UID of the desktop group of the machine the session is on.

-- DesktopKind (Citrix.Broker.Admin.SDK.DesktopKind)

Indicates if the session is shared or private.

-- DesktopSID (System.String)

The Windows SID of the machine the session is on.

-- DesktopUid (System.Int32)

For a desktop session, the unique identifier of the desktop.

-- DeviceId (System.String)

Unique identifier for the client device that has most recently been associated with the session.

-- DNSName (System.String)

The DNS host name of the machine hosting the session.

-- EstablishmentDuration (System.Int32?)

Duration that it took to establish the session.

-- EstablishmentTime (System.DateTime?)

Time at which the session was established.

-- HardwareId (System.String)

Unique identifier for the client hardware that has been most recently associated with the session.

-- Hidden (System.Boolean)

Flag to indicate if the session is currently hidden from the user and not to be reconnected to.

-- HostedMachineName (System.String)

The friendly name of a hosted machine running the session, as used by its hypervisor. This does not necessarily match either the DNS or AD name of the machine.

-- HostingServerName (System.String)

DNS name of the hypervisor that is hosting the machine hosting the session.

-- HypervisorConnectionName (System.String)

The name of the hypervisor connection that the machine hosting the session has been assigned to.

-- ImageOutOfDate (System.Boolean?)

Denotes whether the VM image for a hosted machine is out of date and due to be updated to a new master image when the machine next reboots.

-- InMaintenanceMode (System.Boolean)

Denotes whether the machine hosting the session is in maintentance mode.

-- IPAddress (System.String)

The IP address of the machine hosting the session.

-- IsPhysical (System.Boolean)

This value is false if the machine hosting the session can be power managed, and true otherwise

-- LaunchedViaHostName (System.String)

The host name of the StoreFront server used to launch the session.

-- LaunchedViaIP (System.String)

The IP address of the StoreFront server used to launch the session.

-- MachineName (System.String)

DNS host name of the machine hosting the session.

-- MachineSummaryState (Citrix.Broker.Admin.SDK.DesktopSummaryState)

The summary state of the machine (will be Unregistered, Disconnected, or InUse)

-- MachineUid (System.Int32)

UID of the machine hosting the session.

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

Map of metadata for this session.

-- OSType (System.String)

A string that can be used to identify the operating system that is running on the machine hosting the session.

-- PersistUserChanges (Citrix.Broker.Admin.SDK.PersistUserChanges)

Describes whether/how the user changes are persisted. Possible values are:

o OnLocal - Persist the user changes locally.

o Discard - Discard user changes.

o OnPvd - Persist user changes on the Citrix Personal vDisk.

-- PowerState (Citrix.Broker.Admin.SDK.PowerState)

The current power state of the machine hosting the session. Possible values are: Unmanaged, Unknown, Unavailable, On, Suspended, TurningOn, TurningOff, Suspending and Resuming.

-- Protocol (System.String)

The protocol that the session is using, can be either "HDX" or "RDP".

-- ProvisioningType (Citrix.Broker.Admin.SDK.ProvisioningType)

Describes how the machine hosting the session was provisioned, possible values are:

o Manual: No provisioning.

o PVS: Machine provisioned by PVS (may be physical, blade, VM,...)

o MCS: Machine provisioned by MCS (machine must be VM)

-- SecureIcaActive (System.Boolean?)

Indicates whether SecureICA is active on the session.

-- SessionId (System.Int32)

Deprecated. A unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

-- SessionKey (System.Guid)

GUID that provides a unique identifier for this session.

-- SessionState (Citrix.Broker.Admin.SDK.SessionState)

The state of the session. Valid values are PreparingNewSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, Other, and Unknown.

-- SessionStateChangeTime (System.DateTime)

The time of the most recent state change for the session.

-- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport)

Indicates if the machine hosting the session supports multiple or single sessions.

-- SessionType (Citrix.Broker.Admin.SDK.SessionType)

Indicates if this is an Application or Desktop session.

-- SmartAccessTags (System.String[])

The Smart Access tags for this session.

-- StartTime (System.DateTime?)

Indicates when the session was started.

-- Uid (System.Int64)

Unique identifier of this session.

-- UserFullName (System.String)

The full name of the user.

-- UserName (System.String)

The name of the user.

-- UserSID (System.String)

The user's Windows SID.

-- UserUPN (System.String)

The user's User Principal Name

Related topics

Disconnect-BrokerSession

Stop-BrokerSession

Get-BrokerDesktop

Parameters

-Uid<Int64>

Get session by its Uid.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AgentVersion<String>

Gets sessions with a specific Virtual Desktop Agent version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ApplicationInUse<String>

Gets sessions running specific applications (identified by their SDK Name property).

Required?	false
Default Value	
Accept Pipeline Input?	false

-AutonomouslyBrokered<Boolean>

Get autonomously brokered sessions.

Required?	false
Default Value	
Accept Pipeline Input?	false

-BrokeringDuration<Int32>

Gets session with a specific time taken to broker. In general, Citrix recommends using -Filter and relative comparisons.

Required?	false
Default Value	
Accept Pipeline Input?	false

-BrokeringTime<DateTime>

Get sessions brokered at a specific time. In general, Citrix recommends using -Filter and relative comparisons.

Required?	false
Default Value	
Accept Pipeline Input?	false

-BrokeringUserName<String>

Get sessions by brokering user.

Required?	false
Default Value	
Accept Pipeline Input?	false

-BrokeringUserSID<String>

Get sessions by brokering user SID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogName<String>

Gets sessions on machines from a specific catalog name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientAddress<String>

Get sessions by client IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientName<String>

Get sessions by client name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientVersion<String>

Get sessions by client version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ConnectedViaHostName<String>

Get sessions by host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ConnectedViaIP<String>

Get sessions by IP address of the incoming connection.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ControllerDNSName<String>

Gets sessions that are hosted on machines which are registered with a specific controller.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupName<String>

Gets sessions from a desktop group with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets sessions from a desktop group with the specified UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopKind<DesktopKind>

Gets sessions on a desktop of a particular kind.

Valid values are Private and Shared.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopSID<String>

Get sessions by desktop SID.

Required?	false
Default Value	

Accept Pipeline Input?	false

-DesktopUid<Int32>

Get sessions by desktop Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DeviceId<String>

Get sessions by client device id.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DNSName<String>

Gets sessions by their machine's DNS name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-EstablishmentDuration<Int32>

Gets sessions which took a specific time to establish. In general, Citrix recommends using -Filter and relative comparisons.

Required?	false
Default Value	
Accept Pipeline Input?	false

-EstablishmentTime<DateTime>

Gets sessions which became established at a particular time. In general, Citrix recommends using -Filter and relative comparisons.

Required?	false
Default Value	

Accept Pipeline Input?	false

-HardwareId<String>

Get sessions by client hardware id.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Hidden<Boolean>

Get sessions by whether they are hidden or not. Hidden sessions are treated as though they do not exist when brokering sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineName<String>

Gets sessions by their machine's name as known to its hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostingServerName<String>

Gets sessions hosted by a machine with a specific name of the hosting hypervisor server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionName<String>

Gets sessions hosted by a machine with a specific name of the hosting hypervisor connection.

Required?	false

Default Value	
Accept Pipeline Input?	false

-ImageOutOfDate<Boolean>

Gets sessions hosted by a machine with a specific ImageOutOfDate setting.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Gets sessions hosted by a machine with a specific InMaintenanceMode setting.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IPAddress<String>

Gets sessions hosted by a machine with a specific IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsPhysical<Boolean>

Gets sessions hosted on machines where the flag indicating if the machine can be power managed by the Citrix Broker Service matches the requested value. Where the power state of the machine cannot be controlled, specify $true, otherwise $false.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LaunchedViaHostName<String>

Get sessions by the host name of the Web Interface server from which a user launches a session.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LaunchedViaIP<String>

Get sessions by the IP address of the Web Interface server from which a user launches a session.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Gets sessions by their machine name (DOMAIN\MACHINE).

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineSummaryState<DesktopSummaryState>

Gets sessions on a machine with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, Preparing, and InUse.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineUid<Int32>

Gets sessions on a machine with the specified UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSType<String>

Gets sessions with a specific type of operating system.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PersistUserChanges<PersistUserChanges>

Gets sessions where the user changes are persisted in a particular manner. Values can be:

o OnLocal - User changes are persisted locally.

o Discard - User changes are discarded.

o OnPvd - User changes are persisted on the Pvd.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PowerState<PowerState>

Gets sessions on machines in the specified power state.

Valid values are Unmanaged, Unknown, Unavailable, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Protocol<String>

Get sessions by connection protocol. Valid values are HDX and RDP.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProvisioningType<ProvisioningType>

Gets sessions hosted on machines provisioned in a particular manner. Values can be:

o Manual - No automated provisioning.

o PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).

o MCS - Machine provisioned by MCS (machine must be VM).

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaActive<Boolean>

Get sessions by their use of SecureICA.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionId<Int32>

Deprecated.

Gets sessions by session ID, a unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionKey<Guid>

Gets session having the specified unique key.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionState<SessionState>

Get sessions by their state.

Valid values are Other, PreparingNewSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionStateChangeTime<DateTime>

Get sessions by their last state change time. In general, Citrix recommends using -Filter and relative comparisons.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSupport<SessionSupport>

Gets sessions hosted on machines which support the required pattern of sessions. Values can be:

o SingleSession - Single-session only machine.

o MultiSession - Multi-session capable machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionType<SessionType>

Get sessions by their type.

Valid values are Application and Desktop.

Required?	false

Default Value	
Accept Pipeline Input?	false

-StartTime<DateTime>

Get sessions by their start time. In general, Citrix recommends using -Filter and relative comparisons.

Required?	false
Default Value	
Accept Pipeline Input?	false

-UserFullName<String>

Gets sessions by user's full name (usually 'first-name last-name').

Required?	false
Default Value	
Accept Pipeline Input?	false

-UserName<String>

Get sessions by user name (in the form domain\user).

Required?	false
Default Value	
Accept Pipeline Input?	false

-UserSID<String>

Get sessions by user's Windows SID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-UserUPN<String>

Gets sessions by user's User Principal Name (in the form user@domain).

Required?	false

Default Value	
Accept Pipeline Input?	false

-ApplicationUid<Int32>

Get sessions running the application with the specified Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SharedDesktopUid<Int32>

Get sessions by SharedDesktop Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Session

Returns sessions matching the specified criteria.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerSession
Enumerate all sessions.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerSession -UserName MyDomain\MyAccount -SessionState Disconnected
Get all disconnected sessions for a specific user.

Get-BrokerSharedDesktop

Apr 15, 2014

Get shared desktops configured for this site.

Syntax

Get-BrokerSharedDesktop [-Uid] <Int32> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerSharedDesktop [[-MachineName] <String>] [-AgentVersion <String>] [-ControllerDNSName <String>] [-DesktopGroupUid <Int32>] [-DNSName <String>] [-HostedMachineId <String>] [-HostedMachineName <String>] [-HostingServerName <String>] [-HypervisorConnectionUid <Int32>] [-InMaintenanceMode <Boolean>] [-IPAddress <String>] [-LastDeregistrationReason <DeregistrationReason>] [-LastDeregistrationTime <DateTime>] [-LastHostingUpdateTime <DateTime>] [-OSType <String>] [-OSVersion <String>] [-PowerState <PowerState>] [-RegistrationState <RegistrationState>] [-SID <String>] [-Tag <String>] [-WillShutdownAfterUse <Boolean>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet is deprecated, please use the Get-BrokerMachine cmdlet instead.

Retrieve shared desktops matching the specified criteria. If no parameters are specified, all shared desktops are enumerated.

Get-BrokerSharedDesktop returns configuration information only for shared desktops (a DesktopKind of 'Shared').

For information about advanced filtering options, see about_Broker_Filtering; for information about desktops, see about_Broker_Desktops.

---------- BrokerSharedDesktop Object

Shared desktops are desktops that are assigned randomly to users upon connection from a pool of available machines.

-- AgentVersion (System.String)

Version of the Citrix Virtual Delivery Agent (VDA) installed on the desktop.

-- ControllerDNSName (System.String)

The DNS host name of the controller that the desktop is registered to.

-- DesktopGroupUid (System.Int32)

Uid of the desktop group the desktop has been assigned to.

-- DNSName (System.String)

The DNS host name of the desktop.

-- HostedMachineId (System.String)

Unique ID within the hosting unit of the target managed desktop.

-- HostedMachineName (System.String)

The friendly name of a hosted desktop as used by its hypervisor. This is not necessarily the DNS name of the desktop.

-- HostingServerName (System.String)

DNS name of the hypervisor that is hosting the desktop if managed.

-- HypervisorConnectionUid (System.Int32?)

The UID of the hypervisor connection that the desktop has been assigned to, if managed.

-- InMaintenanceMode (System.Boolean)

Denotes whether the desktop is in maintentance mode.

-- IPAddress (System.String)

The IP address of the desktop.

-- LastDeregistrationReason (Citrix.Broker.Admin.SDK.DeregistrationReason?)

The reason for the last deregistration of the desktop with the broker. Possible values are:

AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

-- LastDeregistrationTime (System.DateTime?)

Time of the last deregistration of the desktop from the controller.

-- LastHostingUpdateTime (System.DateTime?)

Time of last update to any hosting data for this desktop reported by the hypervisor connection.

-- MachineName (System.String)

DNS host name of the machine associated with the desktop.

-- OSType (System.String)

A string that can be used to identify the operating system that is running on the desktop.

-- OSVersion (System.String)

A string that can be used to identify the version of the operating system running on the desktop, if known.

-- PowerState (Citrix.Broker.Admin.SDK.PowerState)

The current power state of the desktop. Possible values are: Unmanaged, Unknown, Unavailable, Off, On, Suspended,

TurningOn, TurningOff, Suspending, resuming.

-- RegistrationState (Citrix.Broker.Admin.SDK.RegistrationState)

Indicates the registration state of the desktop. Possible values are: Unregistered, Initializing, Registered, AgentError.

-- SID (System.String)

The security identifier of the shared desktop.

-- Uid (System.Int32)

The uid of the shared desktop.

-- WillShutdownAfterUse (System.Boolean)

Flag indicating whether this desktop is tainted and will be shutdown after all sessions on the desktop have ended. This flag should only ever be true on power managed, single-session desktops.

Note: The desktop will not shut down if it is in maintenance mode, but will shut down after the desktop is taken out of maintenance mode.

Related topics

Set-BrokerSharedDesktop

Parameters

-Uid<Int32>

Gets desktops by Uid.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Gets desktops by machine name (in the form 'domain\machine').

Required?	false
Default Value	
Accept Pipeline Input?	false

-AgentVersion<String>

Gets desktops with a specific Virtual Desktop Agent version.

Required?	false

Default Value	
Accept Pipeline Input?	false

-ControllerDNSName<String>

Gets desktops by the DNS name of the controller they are registered with.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets desktops from a desktop group with a specific Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DNSName<String>

Gets desktops by DNS name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineId<String>

Gets desktops by the machine id known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineName<String>

Gets desktops by the machine name known to the hypervisor.

Required?	false

Default Value	
Accept Pipeline Input?	false

-HostingServerName<String>

Gets desktops by the name of the hosting hypervisor server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionUid<Int32>

Gets desktops by the uid of the hosting hypervisor connection.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Gets desktops by the InMaintenanceMode setting.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IPAddress<String>

Gets desktops by IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationReason<DeregistrationReason>

Gets desktops whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest,

MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationTime<DateTime>

Gets desktops by the time that they were last deregistered.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastHostingUpdateTime<DateTime>

Gets desktops by the time that the hosting information was last updated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSType<String>

Gets desktops by the type of operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSVersion<String>

Gets desktops by the version of the operating system they are running.

Required?	false
Default Value	

Accept Pipeline Input?	false

-PowerState<PowerState>

Gets desktops by power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RegistrationState<RegistrationState>

Gets desktops by registration state.

Valid values are Registered, Unregistered, and AgentError.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SID<String>

Gets desktops by machine SID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Tag<String>

Get desktops tagged with the given tag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WillShutdownAfterUse<Boolean>

Gets desktops depending on whether they shutdown after use or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.SharedDesktop

Get-BrokerSharedDesktop returns an object for each matching shared desktop.

Notes

To compare dates/times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerSharedDesktop -HostingServerName BigServer12*

Get all shared desktops hosted by the hypervisor server BigServer12.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerSharedDesktop -OSType 'Windows XP*' | ft -a MachineName,OSType,OSVersion
List all shared desktops running Windows XP, including the machine name and OS details.

Get-BrokerSite

Apr 15, 2014

Gets the current XenDesktop broker site.

Syntax

Get-BrokerSite [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-BrokerSite cmdlet gets the current broker site.

The broker site is a top-level, logical representation of the XenDesktop site, from the perspective of the brokering services running within the site. It defines various site-wide default attributes used by the brokering services.

A XenDesktop installation has only a single broker site instance.

---------- BrokerSite Object

The BrokerSite object represents logical representation of the XenDesktop site. It contains the following properties:

-- BaseOU (System.Guid?)

The objectGUID property identifying the base OU in Active Directory used for desktop registrations.

-- BrokerServiceGroupUid (System.Guid)

The Uid for the Broker Service Group.

-- ColorDepth (Citrix.Broker.Admin.SDK.ColorDepth)

The default color depth for new desktop groups.

-- ConfigurationServiceGroupUid (System.Guid?)

The Uid for the Configuration Service Group.

-- DesktopGroupIconUid (System.Int32)

The default desktop icon used for new desktop groups.

-- DnsResolutionEnabled (System.Boolean)

The setting to configure whether numeric IP address or the DNS name to be present in the ICA file.

-- LicensedSessionsActive (System.Int32?)

The count of active liscensed session.

-- LicenseEdition (System.String)

The license edition for session brokering.

-- LicenseGraceSessionsRemaining (System.Int32?)

The count of License Grace Session Remaining

-- LicenseModel (Citrix.Broker.Admin.SDK.LicenseModel?)

The licensing model in use. Values can be 'Concurrent' or 'UserDevice'

-- LicenseServerName (System.String)

The DNS for License Server Name

-- LicenseServerPort (System.Int32)

The port for the License Server

-- LicensingBurnInDate (System.DateTime?)

The date for the license to end

-- LicensingGraceHoursLeft (System.Int32?)

The number of grace hours left after license expiry

-- LicensingGracePeriodActive (System.Boolean?)

The indicator for liscensing grace period active

-- LicensingOutOfBoxGracePeriodActive (System.Boolean?)

The indicator for liscensing out of the box grace period active

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

The metadata for this command.

-- Name (System.String)

The name of the site

-- SecureIcaRequired (System.Boolean)

The default SecureICA usage requirements for new desktop groups.

-- TrustRequestsSentToTheXmlServicePort (System.Boolean)

The XML Service trust settings.

Related topics

Set-BrokerSite

Get-BrokerIcon

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Site

Get-BrokerSite returns the single broker site instance.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerSite
Gets the current broker site.

Get-BrokerTag

Apr 15, 2014

Gets one or more tags.

Syntax

Get-BrokerTag [-Uid] <Int32> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerTag [[-Name] <String>] [-Metadata <String>] [-UUID <Guid>] [-DesktopUid <Int32>] [-DesktopGroupUid <Int32>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets tags that match all of the supplied criteria.

---------- BrokerTag Object

The BrokerTag object represents a single instance of a Tag associated to other objects. It contains the following properties:

-- MetadataMap (System.Collections.Generic.Dictionary<string, string>)

The metadata for this command.

-- Name (System.String)

The name of the Tag

-- Uid (System.Int32)

The Uid of the Tag

-- UUID (System.Guid)

The UUID associated to the Tag

Related topics

Add-BrokerTag

New-BrokerTag

Remove-BrokerTag

Rename-BrokerTag

Parameters

-Uid<Int32>

Gets the tag identified by Uid

Required?	true
Default Value	
Accept Pipeline Input?	false

-Name<String>

Gets tags that match the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-UUID<Guid>

Gets tags associated with a given UUID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopUid<Int32>

Gets tags associated with a Desktop.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets tags associated with a desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false

Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Tag

Returns matching tags.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-BrokerTag
```

Enumerate all tags

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerTag -Uid 5
Get a single specific tag with a Uid of 5.

---------- EXAMPLE 3 ----------

C:\PS> Get-BrokerTag -DesktopUid 1
Get tags associated with Desktop 1.

Get-BrokerUnconfiguredMachine

Apr 15, 2014

Gets machines that have registered but are not yet configured in this site.

Syntax

Get-BrokerUnconfiguredMachine -SID <String> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerUnconfiguredMachine [[-MachineName] <String>] [-AgentVersion <String>] [-ControllerDNSName <String>] [-DNSName <String>] [-FunctionalLevel <FunctionalLevel>] [-LastDeregistrationTime <DateTime>] [-OSType <String>] [-OSVersion <String>] [-SessionSupport <SessionSupport>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieve machines matching the specified criteria, where the machine has registered with a controller in the site but the machine has not yet been configured to be part of the site. If no parameters are specified, this cmdlet enumerates all such machines.

See about_Broker_Filtering for information about advanced filtering options, and about_Broker_Machines for background information about machines.

---------- BrokerUnconfiguredMachine Object

An unconfigured machine is a machine that has registered with the site but is not configured in either a desktop group or a catalog.

-- AgentVersion (System.String)

Version of the Citrix Virtual Delivery Agent (VDA) installed on the unconfigured machine.

-- ControllerDNSName (System.String)

The DNS name of the controller that the unconfigured machine is registered with.

-- DNSName (System.String)

The DNS name of the unconfigured machine.

-- FunctionalLevel (Citrix.Broker.Admin.SDK.FunctionalLevel?)

The functional level of the unconfigured machine. This is determined by the version of the Citrix VDA software installed on the machine.

-- LastDeregistrationTime (System.DateTime?)

The time when the unconfigured machine last deregistered with the Citrix Broker Service.

-- MachineName (System.String)

The machine name of the unconfigured machine in the form domain\machine.

-- OSType (System.String)

The type of operating system installed on the unconfigured machine.

-- OSVersion (System.String)

The version of the operating sysetem installed on the unconfigured machine.

-- SessionSupport (Citrix.Broker.Admin.SDK.SessionSupport?)

The session support of the unconfigured machine. Valid values are:

SingleSession, MultiSession

-- SID (System.String)

Security identifier of the unconfigured machine.

Related topics

Get-BrokerMachine

Parameters

-SID<String>

Gets machines by their machine SID.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Gets machines by their machine name (in the form domain\machine).

Required?	false
Default Value	
Accept Pipeline Input?	false

-AgentVersion<String>

Gets machines with a specific Virtual Desktop Agent version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ControllerDNSName<String>

Gets machines by the DNS name of the controller they are registered with.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DNSName<String>

Gets machines by their DNS name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-FunctionalLevel<FunctionalLevel>

Gets machines with a specific FunctionalLevel.

Valid values are L5, L7

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationTime<DateTime>

Gets machines by the time that they were last deregistered.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSType<String>

Gets machines by the type of operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSVersion<String>

Gets machines by the version of the operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSupport<SessionSupport>

Gets machines that have the specified session capability. Values can be:

o SingleSession - Single-session only machine.

o MultiSession - Multi-session capable machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.UnconfiguredMachine

Get-BrokerUnconfiguredMachine returns an object for each matching machine

Notes

It is generally better to compare dates and times using -Filter and relative comparisons. See about_Broker_Filtering and the examples in this topic for more information.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerUnconfiguredMachine -Filter { ControllerDNSName -eq 'Controller1.domain.com' -and OSType -eq 'Windows XP Service Pack 3' }
This command returns all unconfigured XP SP3 machines which are registered with the controller called 'Controller1.domain.com'.

Get-BrokerUser

Apr 15, 2014

Gets broker users configured for this site.

Syntax

Get-BrokerUser -SID <String> [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Get-BrokerUser [[-Name] <String>] [-FullName <String>] [-UPN <String>] [-ApplicationUid <Int32>] [-MachineUid <Int32>] [-PrivateDesktopUid <Int32>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-Property <String[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieve broker users matching the specified criteria. If no parameters are specified this cmdlet enumerates all broker users.

For information about advanced filtering options, see about_Broker_Filtering.

---------- BrokerUser Object

The BrokerUser object represents a single instance of an user. It contains the following properties:

-- FullName (System.String)

The full name of an user

-- Name (System.String)

The name of an user

-- SID (System.String)

The SID of an user

-- UPN (System.String)

The UPN of an user

Related topics

Add-BrokerUser

Remove-BrokerUser

Parameters

-SID<String>

Gets the broker user with the specified SID property value.

Required?	true
Default Value	

Accept Pipeline Input?	false

-Name<String>

Gets the broker user with the specified Name property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-FullName<String>

Gets the broker user with the specified FullName property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-UPN<String>

Gets the broker user with the specified UPN property value.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ApplicationUid<Int32>

Gets broker users associated with the application with the specified Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineUid<Int32>

Gets broker users associated with the broker machine with the specified Uid.

Required?	false
Default Value	

Accept Pipeline Input?	false

-PrivateDesktopUid<Int32>

Gets broker users associated with the private desktop with the specified Uid.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if

no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.User

Get-BrokerUser returns an object for each matching broker user.

Examples

---------- EXAMPLE 1 ----------

```
Get-BrokerUser DOMAIN7\*
```

Get all broker user objects with names matching the supplied pattern

---------- EXAMPLE 2 ----------

```
$pdt = Get-BrokerPrivateDesktop DOMAIN\MACHINENAME\n
        Get-BrokerUser -PrivateDesktopUid $pdt.Uid
```

Get all broker user objects added to the specified private desktop

Group-BrokerDesktop

Apr 15, 2014

Groups and counts desktops with the same value for a specified property.

Syntax

Group-BrokerDesktop [-Uid] <Int32> -Property <String> [-AdminAddress <String>] [<CommonParameters>]

Group-BrokerDesktop -Property <String> [[-MachineName] <String>] [-AgentVersion <String>] [-ApplicationInUse <String>] [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-AssociatedUserFullName <String>] [-AssociatedUserName <String>] [-AssociatedUserUPN <String>] [-AutonomouslyBrokered <Boolean>] [-CatalogName <String>] [-CatalogUid <Int32>] [-ClientAddress <String>] [-ClientName <String>] [-ClientVersion <String>] [-ColorDepth <ColorDepth>] [-ConnectedViaHostName <String>] [-ConnectedViaIP <String>] [-ControllerDNSName <String>] [-DeliveryType <DeliveryType>] [-Description <String>] [-DesktopCondition <String>] [-DesktopGroupName <String>] [-DesktopGroupUid <Int32>] [-DesktopKind <DesktopKind>] [-DeviceId <String>] [-DNSName <String>] [-FunctionalLevel <FunctionalLevel>] [-HardwareId <String>] [-HostedMachineId <String>] [-HostedMachineName <String>] [-HostingServerName <String>] [-HypervisorConnectionName <String>] [-HypervisorConnectionUid <Int32>] [-IconUid <Int32>] [-ImageOutOfDate <Boolean>] [-InMaintenanceMode <Boolean>] [-IPAddress <String>] [-IsAssigned <Boolean>] [-IsPhysical <Boolean>] [-LastConnectionFailure <ConnectionFailureReason>] [-LastConnectionTime <DateTime>] [-LastConnectionUser <String>] [-LastDeregistrationReason <DeregistrationReason>] [-LastDeregistrationTime <DateTime>] [-LastErrorReason <String>] [-LastErrorTime <DateTime>] [-LastHostingUpdateTime <DateTime>] [-LaunchedViaHostName <String>] [-LaunchedViaIP <String>] [-MachineInternalState <MachineInternalState>] [-MachineUid <Int32>] [-OSType <String>] [-OSVersion <String>] [-PersistUserChanges <PersistUserChanges>] [-PowerActionPending <Boolean>] [-PowerState <PowerState>] [-Protocol <String>] [-ProvisioningType <ProvisioningType>] [-PublishedApplication <String>] [-PublishedName <String>] [-PvdStage <PvdStage>] [-RegistrationState <RegistrationState>] [-SecureIcaActive <Boolean>] [-SecureIcaRequired <Boolean>] [-SessionHidden <Boolean>] [-SessionId <Int32>] [-SessionState <SessionState>] [-SessionStateChangeTime <DateTime>] [-SessionUid <Int64>] [-SessionUserName <String>] [-SessionUserSID <String>] [-SID <String>] [-SmartAccessTag <String>] [-StartTime <DateTime>] [-SummaryState <DesktopSummaryState>] [-Tag <String>] [-WillShutdownAfterUse <Boolean>] [-ApplicationUid <Int32>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet is now deprecated, please use Group-BrokerMachine.

Filters desktops using the specified criteria, then groups and counts matching desktops with the same value for a particular property. The number of desktops in the group, and the property value for the group, is output. For example:

C:\PS> Group-BrokerDesktop -Property SummaryState

Count Name

----- ----

43 Available

17 InUse

3 Disconnected

Filtering supports the same options as the Get-BrokerDesktop cmdlet, and allows filtering on both desktop and session properties.

Group-BrokerDesktop is similar to the standard PowerShell Group-Object, but is faster than piping the output of Get-BrokerDesktop into Group-Object when working with many desktops.

Note that all session information properties for multi-session desktops is always $null, this means that is is not possible to group these desktops by session information using this command. Use Get-BrokerSession to get information on all current sessions.

Also note that the MaxRecordCount, ReturnTotalRecordCount, Skip, and SortBy parameters apply to GroupInfo records output rather than the filtered desktops.

Get-BrokerDesktop

Group-Object

Parameters

-Uid<Int32>

Gets desktops with a specific UID.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Property<String>

Selects the property by which matching desktops are grouped.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Gets desktops with a specific machine name (in the form 'domain\machine').

Required?	false
Default Value	
Accept Pipeline Input?	false

-AgentVersion<String>

Gets desktops with a specific Citrix Virtual Delivery Agent version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ApplicationInUse<String>

Gets desktops running a specified published application (identified by browser name).

String comparisons are case-insensitive.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedClientName<String>

Gets desktops assigned to a specific client name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedIPAddress<String>

Gets desktops assigned to a specific IP address.q

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserFullName<String>

Gets desktops with an associated user identified by their full name (usually in the form 'first-name last-name').

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserName<String>

Gets desktops with an associated user identified by their user name (in the form 'domain\user').

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserUPN<String>

Gets desktops with an associated user identified by their User Principle Name (in the form 'user@domain').

Associated users are the current user for shared desktops, and the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AutonomouslyBrokered<Boolean>

Gets desktops with the autonomously brokered session flag.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogName<String>

Gets desktops from the catalog with the specific name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogUid<Int32>

Gets desktops from a catalog with a specific UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientAddress<String>

Gets desktops with a specific client IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientName<String>

Gets desktops with a specific client name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientVersion<String>

Gets desktops with a specific client version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Gets desktops configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ConnectedViaHostName<String>

Gets desktops with a specific host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ConnectedViaIP<String>

Gets desktops with a specific IP address of the incoming connection.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ControllerDNSName<String>

Gets desktops with a specific DNS name of the controller they are registered with.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DeliveryType<DeliveryType>

Gets desktops of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Get desktops with a specific description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopCondition<String>

Gets desktop with an outstanding desktop condition condition.

Valid values are:

o CPU: Indicates the machine has high CPU usage

o ICALatency: Indicates the network latency is high

o UPMLogonTime: Indicates that the profile load time was high

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupName<String>

Gets desktops from a desktop group with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets desktops from a desktop group with the specified UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopKind<DesktopKind>

Deprecated: Use AllocationType parameter.

Gets desktops of a particular kind.

Valid values are Private, Shared.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DeviceId<String>

Gets desktops with a specific client device ID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DNSName<String>

Get desktops with a specific DNS name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-FunctionalLevel<FunctionalLevel>

Gets desktops with a specific FunctionalLevel.

Valid values are L5, L7

Required?	false
Default Value	
Accept Pipeline Input?	false

-HardwareId<String>

Gets desktops with a specific client hardware ID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineId<String>

Gets desktops with a specific machine ID known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineName<String>

Gets desktops with a specific machine name known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostingServerName<String>

Gets desktops with a specific name of the hosting hypervisor server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionName<String>

Gets desktops with a specific name of the hosting hypervisor connection.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionUid<Int32>

Gets desktops with a specific UID of the hosting hypervisor connection.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Gets desktops with a specific configured icon. Note that desktops with a null IconUid use the icon of the desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ImageOutOfDate<Boolean>

Gets desktops if they have an ImageOutOfDate flag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Gets desktops with a specific InMaintenanceMode setting.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IPAddress<String>

Gets desktops with a specific IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsAssigned<Boolean>

Gets desktops according to whether they are assigned or not. Desktops may be assigned to one or more users or groups, a client IP address or a client endpoint name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsPhysical<Boolean>

Specifies if machines in the catalog can be power managed by the Citrix Broker Service. Where the power state of the machine cannot be controlled, specify $true, otherwise $false. Can only be specified together with a provisioning type of Pvs or Manual, or if used with the deprecated CatalogKind parameter only with Pvs or PvsPvd catalog kinds.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionFailure<ConnectionFailureReason>

Gets desktops with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the desktop yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionTime<DateTime>

Gets desktops that last connected at a specific time. This is the time that the broker detected that the connection attempt either succeeded or failed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionUser<String>

Gets desktops where a specific user name last attempted a connection (in the form 'domain\user').

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationReason<DeregistrationReason>

Gets desktops whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationTime<DateTime>

Gets desktops that were last deregistered by a specific time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastErrorReason<String>

Gets desktops with the specified last error reason.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastErrorTime<DateTime>

Gets desktops with the specified last error time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastHostingUpdateTime<DateTime>

Gets desktops with a specific time that the hosting information was last updated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LaunchedViaHostName<String>

Gets desktops with a specific host name of the StoreFront server from which the user launched the session.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LaunchedViaIP<String>

Gets desktops with a specific IP address of the StoreFront server from which the user launched the session.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineInternalState<MachineInternalState>

Gets desktops with the specified internal machine state.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineUid<Int32>

Gets desktops with a specific machine UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSType<String>

Gets desktops by the type of operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSVersion<String>

Gets desktops by the version of the operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PersistUserChanges<PersistUserChanges>

Gets desktops by the location where the user changes are persisted.

o OnLocal - User changes are persisted locally.

o Discard - User changes are discarded.

o OnPvd - User changes are persisted on the Pvd.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PowerActionPending<Boolean>

Gets desktops with a specific power action pending state.

Valid values are $true or $false.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PowerState<PowerState>

Gets desktops with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Protocol<String>

Gets desktops with connections using a specific protocol, for example 'HDX', or 'RDP'.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProvisioningType<ProvisioningType>

Specifies the provisioning type for the catalog. Values can be:

o Manual - No provisioning.

o PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).

o MCS - Machine provisioned by MCS (machine must be VM).

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedApplication<String>

Gets desktops with a specific application published on them (identified by its browser name).

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Gets desktops with a specific published name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PvdStage<PvdStage>

Gets machines with a specific personal vDisk stage.

Valid values are None, Requested, Starting and Working.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RegistrationState<RegistrationState>

Gets desktops with a specific registration state.

Valid values are Unregistered, Initializing, Registered and AgentError.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaActive<Boolean>

Gets desktops depending on whether the current session uses SecureICA or not.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Gets desktops configured with a particular SecureIcaRequired setting. Note that the desktop setting of $null indicates that the desktop group value is used.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionHidden<Boolean>

Gets desktops by whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionId<Int32>

Deprecated.

Gets desktops by session ID, a unique identifier that Remote Desktop Services uses to track the session but it is only unique on that machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionState<SessionState>

Gets desktops with a specific session state.

Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionStateChangeTime<DateTime>

Gets desktops whose sessions last changed state at a specific time.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUid<Int64>

Gets desktops with a specific session UID ($null for no session).

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUserName<String>

Gets desktops with a specific user name for the current session (in the form 'domain\user').

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUserSID<String>

Gets desktops with a specific SID of the current session user.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SID<String>

Gets desktops with a specific machine SID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SmartAccessTag<String>

Gets desktops where the session has the specific SmartAccess tag.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-StartTime<DateTime>

Gets desktops with a specific session start time.

Session properties are always $null for multi-session desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SummaryState<DesktopSummaryState>

Gets desktops with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, and InUse.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Tag<String>

Gets desktops with a specific tag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WillShutdownAfterUse<Boolean>

Gets desktops depending on whether they shut down after use or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ApplicationUid<Int32>

Gets desktops with a specific published application (identified by its UID).

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.GroupInfo

Each GroupInfo object represents one group, and contains the following properties:

-- Count: The count of desktops in this group.

-- Name: The value of the property the desktops were grouped by (as a string).

If you do not specify -SortBy, groups are sorted with the largest count first.

Notes

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Group-BrokerDesktop -Property SummaryState -DesktopGroupName dg1
```

Group desktops from the dg1 group by summary state.

---------- EXAMPLE 2 ----------

C:\PS> Group-BrokerDesktop -Property LastConnectionFailure -Filter { LastConnectionFailure -ne "None" -and LastConnectionTime -ge '-7' } -MaxRecordCount 1
For desktops where the last connection attempt failed, list the most common reason for failure, ignoring connections that failed over a week ago.

---------- EXAMPLE 3 ----------

C:\PS> Group-BrokerDesktop -Property HostingServerName -DesktopCondition ICALatency -SortBy Name
List alphabetically the hypervisor servers hosting desktops that are currently experiencing high network latency.

Group-BrokerMachine

Apr 15, 2014

Groups and counts machines with the same value for a specified property.

Syntax

Group-BrokerMachine [-Uid] <Int32> -Property <String> [-AdminAddress <String>] [<CommonParameters>]

Group-BrokerMachine -Property <String> [[-MachineName] <String>] [-AgentVersion <String>] [-AllocationType <AllocationType>] [-ApplicationInUse <String>] [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-AssociatedUserFullName <String>] [-AssociatedUserName <String>] [-AssociatedUserSID <String>] [-AssociatedUserUPN <String>] [-CatalogName <String>] [-CatalogUid <Int32>] [-CatalogUUID <Guid>] [-ColorDepth <ColorDepth>] [-ControllerDNSName <String>] [-DeliveryType <DeliveryType>] [-Description <String>] [-DesktopCondition <String>] [-DesktopGroupName <String>] [-DesktopGroupUid <Int32>] [-DesktopGroupUUID <Guid>] [-DesktopKind <DesktopKind>] [-DesktopUid <Int32>] [-DNSName <String>] [-FaultState <MachineFaultState>] [-FunctionalLevel <FunctionalLevel>] [-HostedMachineId <String>] [-HostedMachineName <String>] [-HostingServerName <String>] [-HypervisorConnectionName <String>] [-HypervisorConnectionUid <Int32>] [-HypHypervisorConnectionUid <Guid>] [-IconUid <Int32>] [-ImageOutOfDate <Boolean>] [-InMaintenanceMode <Boolean>] [-IPAddress <String>] [-IsAssigned <Boolean>] [-IsPhysical <Boolean>] [-LastConnectionFailure <ConnectionFailureReason>] [-LastConnectionTime <DateTime>] [-LastConnectionUser <String>] [-LastDeregistrationReason <DeregistrationReason>] [-LastDeregistrationTime <DateTime>] [-LastErrorReason <String>] [-LastErrorTime <DateTime>] [-LastHostingUpdateTime <DateTime>] [-LoadIndex <Int32>] [-MachineInternalState <MachineInternalState>] [-Metadata <String>] [-OSType <String>] [-OSVersion <String>] [-PersistUserChanges <PersistUserChanges>] [-PowerActionPending <Boolean>] [-PowerState <PowerState>] [-ProvisioningType <ProvisioningType>] [-PublishedApplication <String>] [-PublishedName <String>] [-PvdStage <PvdStage>] [-RegistrationState <RegistrationState>] [-ScheduledReboot <ScheduledReboot>] [-SecureIcaRequired <Boolean>] [-SessionAutonomouslyBrokered <Boolean>] [-SessionClientAddress <String>] [-SessionClientName <String>] [-SessionClientVersion <String>] [-SessionConnectedViaHostName <String>] [-SessionConnectedViaIP <String>] [-SessionCount <Int32>] [-SessionDeviceId <String>] [-SessionHardwareId <String>] [-SessionHidden <Boolean>] [-SessionKey <Guid>] [-SessionLaunchedViaHostName <String>] [-SessionLaunchedViaIP <String>] [-SessionProtocol <String>] [-SessionSecureIcaActive <Boolean>] [-SessionsEstablished <Int32>] [-SessionSmartAccessTag <String>] [-SessionsPending <Int32>] [-SessionStartTime <DateTime>] [-SessionState <SessionState>] [-SessionStateChangeTime <DateTime>] [-SessionSupport <SessionSupport>] [-SessionUid <Int64>] [-SessionUserName <String>] [-SessionUserSID <String>] [-SID <String>] [-SummaryState <DesktopSummaryState>] [-SupportedPowerActions <String[]>] [-Tag <String>] [-UUID <Guid>] [-VMToolsState <VMToolsState>] [-WillShutdownAfterUse <Boolean>] [-WindowsConnectionSetting <WindowsConnectionSetting>] [-AssignedUserSID <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Filters machines using the specified criteria, then groups and counts matching machines with the same value for a particular property. The number of machines in the group, and the property value for the group, is output. For example:

C:\PS> Group-BrokerMachine -Property SummaryState

Count Name

----- ----

43 Available

17 InUse

3 Disconnected

Filtering supports the same options as the Get-BrokerMachine cmdlet, and allows filtering on both machine and session properties.

Group-BrokerMachine is similar to the standard PowerShell Group-Object, but is faster than piping the output of Get-BrokerMachine into Group-Object when working with many machines.

Note that the MaxRecordCount, ReturnTotalRecordCount, Skip, and SortBy parameters apply to GroupInfo records output rather than the filtered machines.

Get-BrokerMachine

Group-Object

Parameters

-Uid<Int32>

Gets a machine with a specific UID.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Property<String>

Selects the property by which matching machines are grouped.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MachineName<String>

Gets machines with a specific machine name (in the form domain\machine).

Required?	false
Default Value	
Accept Pipeline Input?	false

-AgentVersion<String>

Gets machines with a specific Virtual Delivery Agent version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AllocationType<AllocationType>

Gets machines from catalogs with the specified allocation type.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ApplicationInUse<String>

Gets machines running a specified published application. String comparisons are case-insensitive.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedClientName<String>

Gets machines that have been assigned to the specific client name.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AssignedIPAddress<String>

Gets machines that have been assigned to the specific client IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserFullName<String>

Gets machines with an associated user identified by their full name (usually 'first-name last-name').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserName<String>

Gets machines with an associated user identified by their user name (in the form 'domain\user').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserSID<String>

Gets machines with an associated user identified by their Windows SID.

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssociatedUserUPN<String>

Gets machiness with an associated user identified by their User Principle Name (in the form 'user@domain').

Associated users are all current users of a desktop, plus the assigned users for private desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogName<String>

Gets machines from the catalog with the specific name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogUid<Int32>

Gets machines from the catalog with the specific UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CatalogUUID<Guid>

Gets machines from the catalog with the specific UUID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Gets machines configured with a specific color depth.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ControllerDNSName<String>

Gets machines by the DNS name of the controller they are registered with.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DeliveryType<DeliveryType>

Gets machines of a particular delivery type.

Valid values are AppsOnly, DesktopsOnly, DesktopsAndApps

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Get machines by description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopCondition<String>

Gets machines with an outstanding desktop condition.

Valid values are:

o CPU: Indicates the machine has high CPU usage

o ICALatency: Indicates the network latency is high

o UPMLogonTime: Indicates that the profile load time was high

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupName<String>

Gets machines from a desktop group with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUid<Int32>

Gets machines from a desktop group with a specific UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupUUID<Guid>

Gets machines from a desktop group with a specific UUID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopKind<DesktopKind>

Deprecated: Use AllocationType parameter.

Gets machines of a particular kind.

Valid values are Private, Shared.

Required?	false
Default Value	

Accept Pipeline Input?	false

-DesktopUid<Int32>

Gets the machine that corresponds to the desktop with the specific UID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DNSName<String>

Gets machines with the specific DNS name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-FaultState<MachineFaultState>

Gets machines currently in the specified fault state.

Required?	false
Default Value	
Accept Pipeline Input?	false

-FunctionalLevel<FunctionalLevel>

Gets machines with a specific FunctionalLevel.

Valid values are L5, L7

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineId<String>

Gets machines with the specific machine ID known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineName<String>

Gets machines with the specific machine name known to the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostingServerName<String>

Gets machines by the name of the hosting hypervisor server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionName<String>

Gets machines with the specific name of the hypervisor connection hosting them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionUid<Int32>

Gets machines with the specific UID of the hypervisor connection hosting them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypHypervisorConnectionUid<Guid>

Gets machines with the specific UUID of the hypervisor connection hosting them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Gets machines by configured icon. Note that machines with a null IconUid use the icon of the desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ImageOutOfDate<Boolean>

Gets machines depending on whether their disk image is out of date or not (for machines provisioned using MCS only).

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Gets machines by whether they are in maintenance mode or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IPAddress<String>

Gets machines with a specific IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsAssigned<Boolean>

Gets machines according to whether they are assigned or not. Machines may be assigned to one or more users or groups, a client IP address or a client endpoint name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsPhysical<Boolean>

Gets machines according to whether they can be power managed by XenDesktop or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionFailure<ConnectionFailureReason>

Gets machines with a specific reason for the last recorded connection failure. This value is None if the last connection was successful or if there has been no attempt to connect to the machine yet.

Valid values are None, SessionPreparation, RegistrationTimeout, ConnectionTimeout, Licensing, Ticketing, and Other.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionTime<DateTime>

Gets machines to which a user session connection occurred at a specific time. This is the time that the broker detected that the connection attempt either succeeded or failed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastConnectionUser<String>

Gets machines where a specific user name last attempted a connection (in the form 'domain\user').

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationReason<DeregistrationReason>

Gets machines whose broker last recorded a specific deregistration reason.

Valid values are $null, AgentShutdown, AgentSuspended, AgentRequested, IncompatibleVersion, AgentAddressResolutionFailed, AgentNotContactable, AgentWrongActiveDirectoryOU, EmptyRegistrationRequest, MissingRegistrationCapabilities, MissingAgentVersion, InconsistentRegistrationCapabilities, NotLicensedForFeature, UnsupportedCredentialSecurityVersion, InvalidRegistrationRequest, SingleMultiSessionMismatch, FunctionalLevelTooLowForCatalog, FunctionalLevelTooLowForDesktopGroup, PowerOff, DesktopRestart, DesktopRemoved, AgentRejectedSettingsUpdate, SendSettingsFailure, SessionAuditFailure, SessionPrepareFailure, ContactLost, SettingsCreationFailure, UnknownError and BrokerRegistrationLimitReached.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastDeregistrationTime<DateTime>

Gets machines by the time that they were last deregistered.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastErrorReason<String>

Gets machines with the specified last error reason.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastErrorTime<DateTime>

Gets machines with the specified last error time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LastHostingUpdateTime<DateTime>

Gets machines with a specific time that the hosting information was last updated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoadIndex<Int32>

Gets machines by their current load index.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachineInternalState<MachineInternalState>

Gets machines with the specified internal state.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSType<String>

Gets machines by the type of operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OSVersion<String>

Gets machines by the version of the operating system they are running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PersistUserChanges<PersistUserChanges>

Gets machines according to the location where user changes are persisted. Values can be:

o OnLocal - User changes are persisted locally.

o Discard - User changes are discarded.

o OnPvd - User changes are persisted on the Pvd.

Required?	false
Default Value	

Accept Pipeline Input?	false

-PowerActionPending<Boolean>

Gets machines depending on whether a power action is pending or not.

Valid values are $true or $false.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PowerState<PowerState>

Gets machines with a specific power state.

Valid values are Unmanaged, Unknown, Unavailable, Off, On, Suspended, TurningOn, TurningOff, Suspending, and Resuming.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProvisioningType<ProvisioningType>

Specifies the provisioning type for the catalog. Values can be:

o Manual - No provisioning.

o PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).

o MCS - Machine provisioned by MCS (machine must be VM).

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedApplication<String>

Gets machines with a specific application published to them (identified by its browser name).

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Gets desktops with a specific published name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PvdStage<PvdStage>

Gets machines at a specific personal vDisk stage.

Valid values are None, Requested, PoweringOn and Working.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RegistrationState<RegistrationState>

Gets machines in a specific registration state.

Valid values are Unregistered, Initializing, Registered, and AgentError.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScheduledReboot<ScheduledReboot>

Gets machines according to their current status with respect to any scheduled reboots (for either scheduled desktop group reboots or image rollout purposes). Valid values are:

o None - No reboot currently scheduled.

o Pending - Reboot scheduled but machine still available for use.

o Draining - Reboot scheduled. New logons are disabled, but reconnections to existing sessions are allowed.

o InProgress - Machine is actively being rebooted.

o Natural - Natural reboot in progress. Machine is awaiting a restart.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Gets machines configured with a particular SecureIcaRequired setting. Note that the machine setting of $null indicates that the desktop group value is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionAutonomouslyBrokered<Boolean>

Gets machines with the autonomously brokered session flag.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionClientAddress<String>

Gets machines with a specific client IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionClientName<String>

Gets machines with a specific client name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionClientVersion<String>

Gets machines with a specific client version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionConnectedViaHostName<String>

Gets machines with a specific host name of the incoming connection. This is usually a proxy or Citrix Access Gateway server.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionConnectedViaIP<String>

Gets machines with a specific IP address of the incoming connection.

Session properties are always null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionCount<Int32>

Gets machines according to the total number of both pending and established user sessions on the machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionDeviceId<String>

Gets machines with a specific client device ID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionHardwareId<String>

Gets machines with a specific client hardware ID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionHidden<Boolean>

Gets machines by whether their sessions are hidden or not. Hidden sessions are treated as though they do not exist when launching sessions using XenDesktop; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionKey<Guid>

Gets machine running the session with the specified unique key.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionLaunchedViaHostName<String>

Gets machines with a specific host name of the Web Interface server from which the user launched the session.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionLaunchedViaIP<String>

Gets machines with a specific IP address of the Web Interface server from which the user launched the session.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionProtocol<String>

Gets machines with connections using a specific protocol, for example 'HDX', or 'RDP'.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSecureIcaActive<Boolean>

Gets machines depending on whether the current session uses SecureICA or not.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionsEstablished<Int32>

Gets machines according to the number of established user sessions present on the machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSmartAccessTag<String>

Gets session machines where the session has the specific SmartAccess tag.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionsPending<Int32>

Get machines according to the number of pending user sessions for the machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionStartTime<DateTime>

Gets machines with a specific session start time.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionState<SessionState>

Gets machines with a specific session state.

Valid values are $null, Other, PreparingSession, Connected, Active, Disconnected, Reconnecting, NonBrokeredSession, and Unknown.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionStateChangeTime<DateTime>

Gets machines whose sessions last changed state at a specific time.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionSupport<SessionSupport>

Gets machines that have the specified session capability. Values can be:

o SingleSession - Single-session only machine.

o MultiSession - Multi-session capable machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUid<Int64>

Gets single-session machines with a specific session UID ($null for no session).

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUserName<String>

Gets machines with a specific user name for the current session (in the form 'domain\user').

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SessionUserSID<String>

Gets machines with a specific SID of the current session user.

Session properties are always $null for multi-session machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SID<String>

Gets machines with a specific machine SID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SummaryState<DesktopSummaryState>

Gets machines with a specific summary state.

Valid values are Off, Unregistered, Available, Disconnected, and InUse.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SupportedPowerActions<String[]>

A list of power actions supported by this machine.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Tag<String>

Gets machines where the session has the given SmartAccess tag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-UUID<Guid>

Gets machines with the specified value of UUID.

Required?	false
Default Value	
Accept Pipeline Input?	false

-VMToolsState<VMToolsState>

Gets machines with a specific VM tools state.

Valid values are NotPresent, Unknown, NotStarted, and Running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WillShutdownAfterUse<Boolean>

Gets machines depending on whether they shut down after use or not.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WindowsConnectionSetting<WindowsConnectionSetting>

Gets machines according to their current Windows connection setting (logon mode). Valid values are:

o LogonEnabled - All logons are enabled.

o Draining - New logons are disabled, but reconnections to existing sessions are allowed.

o DrainingUntilRestart - Same as Draining, but setting reverts to LogonEnabled when machine next restarts.

o LogonDisabled - All logons and reconnections are disabled.

This is a Windows setting and is not controlled by XenDesktop. It applies only to multi-session machines; for single-session machines its value is always LogonEnabled.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedUserSID<String>

Gets machines with the specific SID of the user to whom the desktop is assigned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, this causes the cmdlet to output an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Broker_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250

Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell style filter expression. See about_Broker_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.GroupInfo

Each GroupInfo object represents one group, and contains the following properties:

-- Count: The count of machines in this group.

-- Name: The value of the property the machines were grouped by (as a string).

If you do not specify -SortBy, groups are sorted with the largest count first.

Notes

To compare dates or times, use -Filter and relative comparisons. For more information, see about_Broker_Filtering and the examples.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Group-BrokerMachine -Property SummaryState -DesktopGroupName dg1
Group machines from the dg1 group by summary state.

---------- EXAMPLE 2 ----------

C:\PS> Group-BrokerMachine -Property LastConnectionFailure -Filter { LastConnectionFailure -ne "None" -and LastConnectionTime -ge '-7' } -MaxRecordCount 1
For machines where the last connection attempt failed, list the most common reason for failure, ignoring connections that failed over a week ago.

---------- EXAMPLE 3 ----------

C:\PS> Group-BrokerMachine -Property HostingServerName -DesktopCondition ICALatency -SortBy Name
List alphabetically the hypervisor servers hosting machines that are currently experiencing high network latency.

Import-BrokerDesktopPolicy

Apr 15, 2014

Sets the site wide Citrix Group Policy settings for the site.

Syntax

Import-BrokerDesktopPolicy [-Policy] <Byte[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Import-BrokerDesktopPolicy sets the site wide Citrix Group Policy settings. A successful call to this cmdlet will result in the supplied data being uploaded to every machine in the site prior to its next session launch.

Related topics

Export-BrokerDesktopPolicy

New-BrokerConfigurationSlot

New-BrokerMachineConfiguration

Parameters

-Policy<Byte[]>

The configuration data containing the Citrix Group Policy settings to apply to every machine in the site.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.Byte[] The configuration data as an opaque binary blob.

Return Values

None

Notes

Import-BrokerDesktopPolicy performs a specialized operation. Direct usage of it in scripts is discouraged, and could result in data corruption. It is recommended that this operation be performed via the Citrix Studio.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Import-BrokerDesktopPolicy $policyData
```

This command sets the Citrix Group Policy settings in the site. These policy settings are then applied to every machine prior to the next session launch.

New-BrokerAccessPolicyRule

Apr 15, 2014

Creates a new rule in the site's access policy.

Syntax

New-BrokerAccessPolicyRule [-Name] <String> -DesktopGroupUid <Int32> [-AllowedConnections <AllowedConnection>] [-AllowedProtocols <String[]>] [-AllowedUsers <AllowedUser>] [-AllowRestart <Boolean>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedClientIPFilterEnabled <Boolean>] [-ExcludedClientIPs <IPAddressRange[]>] [-ExcludedClientNameFilterEnabled <Boolean>] [-ExcludedClientNames <String[]>] [-ExcludedSmartAccessFilterEnabled <Boolean>] [-ExcludedSmartAccessTags <String[]>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-HdxSslEnabled <Boolean>] [-IncludedClientIPFilterEnabled <Boolean>] [-IncludedClientIPs <IPAddressRange[]>] [-IncludedClientNameFilterEnabled <Boolean>] [-IncludedClientNames <String[]>] [-IncludedSmartAccessFilterEnabled <Boolean>] [-IncludedSmartAccessTags <String[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-BrokerAccessPolicyRule [-Name] <String> -IncludedDesktopGroups <DesktopGroup[]> [-IncludedDesktopGroupFilterEnabled <Boolean>] [-AllowedConnections <AllowedConnection>] [-AllowedProtocols <String[]>] [-AllowedUsers <AllowedUser>] [-AllowRestart <Boolean>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedClientIPFilterEnabled <Boolean>] [-ExcludedClientIPs <IPAddressRange[]>] [-ExcludedClientNameFilterEnabled <Boolean>] [-ExcludedClientNames <String[]>] [-ExcludedSmartAccessFilterEnabled <Boolean>] [-ExcludedSmartAccessTags <String[]>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-HdxSslEnabled <Boolean>] [-IncludedClientIPFilterEnabled <Boolean>] [-IncludedClientIPs <IPAddressRange[]>] [-IncludedClientNameFilterEnabled <Boolean>] [-IncludedClientNames <String[]>] [-IncludedSmartAccessFilterEnabled <Boolean>] [-IncludedSmartAccessTags <String[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerAccessPolicyRule cmdlet adds a new rule to the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Multiple rules in the access policy can apply to the same desktop group.

For a user to gain access to a desktop group via a rule their connection must match all its enabled include filters, and none of its enabled exclude filters. In addition, for a user to be able to launch a desktop or application resource session from the desktop group, they must have an entitlement to use the resource granted by the entitlement or assignment policies, or by direct machine assignment.

Related topics

Get-BrokerAccessPolicyRule

Set-BrokerAccessPolicyRule

Rename-BrokerAccessPolicyRule

Remove-BrokerAccessPolicyRule

Parameters

-Name<String>

Specifies the administrative name of the new rule. Each rule within the site's access policy must have a unique name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroupUid<Int32>

Specifies the desktop group to which the new rule applies.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-IncludedDesktopGroups<DesktopGroup[]>

This parameter is supported for backward compatibility only. If used only a single desktop group UID can be specified.

The IncludedDesktopGroups and IncludedDesktopGroupFilterEnabled parameters have been superseded by the DesktopGroupUid parameter.

Required?	true
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-AllowedConnections<AllowedConnection>

Specifies whether connections must be local or via Access Gateway, and if so whether specified SmartAccess tags must be provided by Access Gateway with the connection. This property forms part of the included SmartAccess tags filter.

Valid values are Filtered, NotViaAG, and ViaAG.

For a detailed description of this property see "help about_Broker_AccessPolicy".

Required?	false
Default Value	Filtered
Accept Pipeline Input?	true (ByPropertyName)

-AllowedProtocols<String[]>

Specifies the protocols (for example HDX, RDP) available to the user for sessions delivered from the new rule's desktop group. If the user gains access to a desktop group by multiple rules, the allowed protocol list is the combination of the protocol lists from all those rules.

If the protocol list is empty, access to the desktop group is implicitly denied.

Required?	false
Default Value	HDX
Accept Pipeline Input?	true (ByPropertyName)

-AllowedUsers<AllowedUser>

Specifies the behavior of the included users filter of the new rule. This can restrict access to a list of named users or groups, or allow access to any authenticated user. For a detailed description of this property see "help about_Broker_AccessPolicy".

Valid values are Filtered, AnyAuthenticated, and Any.

Required?	false
Default Value	Filtered
Accept Pipeline Input?	true (ByPropertyName)

-AllowRestart<Boolean>

Specifies if the user can restart sessions delivered from the new rule's desktop group. Session restart is handled as follows: For sessions on single-session power-managed machines, the machine is powered off, and a new session launch request made; for sessions on multi-session machines, a logoff request is issued to the session, and a new session launch request made; otherwise the property is ignored.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies an optional description of the new rule. The text is purely informational for the administrator, it is never visible to the end user.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies whether the new rule is initially enabled. A disabled rule is ignored when evaluating the site's access policy.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedClientIPFilterEnabled<Boolean>

Specifies whether the excluded client IP address filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedClientIPs<IPAddressRange[]>

Specifies IP addresses of user devices explicitly denied access to the new rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the excluded client IP address filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedClientNameFilterEnabled<Boolean>

Specifies whether the excluded client names filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedClientNames<String[]>

Specifies names of user devices explicitly denied access to the new rule's desktop group. This property forms part of the excluded client names filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedSmartAccessFilterEnabled<Boolean>

Specifies whether the excluded SmartAccess tags filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedSmartAccessTags<String[]>

Specifies SmartAccess tags which explicitly deny access to the new rule's desktop group if any occur in those provided by Access Gateway with the user's connection. This property forms part of the excluded SmartAccess tags filter.

Required?	false
Default Value	(empty list)

Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUserFilterEnabled<Boolean>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUsers<User[]>

Specifies any users and groups who are explicitly denied access to the new rule's desktop group. This property forms part of the excluded users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-HdxSslEnabled<Boolean>

Indicates whether SSL encryption is enabled for sessions delivered from the rule's desktop group.

Required?	false
Default Value	$false
Accept Pipeline Input?	true (ByPropertyName)

-IncludedClientIPFilterEnabled<Boolean>

Specifies whether the included client IP address filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-IncludedClientIPs<IPAddressRange[]>

Specifies IP addresses of user devices allowed access to the new rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the included client IP address filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-IncludedClientNameFilterEnabled<Boolean>

Specifies whether the included client name filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-IncludedClientNames<String[]>

Specifies names of user devices allowed access to the new rule's desktop group. This property forms part of the included client names filter.

Required?	false
Default Value	(empty list)

Accept Pipeline Input?	true (ByPropertyName)

-IncludedSmartAccessFilterEnabled<Boolean>

Specifies whether the included SmartAccess tags filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-IncludedSmartAccessTags<String[]>

Specifies SmartAccess tags which grant access to the new rule's desktop group if any occur in those provided by Access Gateway with the user's connection. This property forms part of the excluded SmartAccess tags filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUserFilterEnabled<Boolean>

Specifies whether the included users filter is initially enabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUsers<User[]>

Specifies users and groups who are granted access to the new rule's desktop group. This property forms part of the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

-IncludedDesktopGroupFilterEnabled<Boolean>

This parameter is supported for backward compatibility only. If used the supplied value must be $true.

The IncludedDesktopGroups and IncludedDesktopGroupFilterEnabled parameters have been superseded by the DesktopGroupUid parameter.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.AccessPolicyRule

New-BrokerAccessPolicyRule returns the newly created access policy rule.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $dg = Get-BrokerDesktopGroup 'Tech Support'
C:\PS> New-BrokerAccessPolicyRule 'UK Tech Support' -IncludedUserFilterEnabled $true -IncludedUsers support\uk-staff -DesktopGroupUid $dg.Uid -AllowedProtocols 'HDX'
```

Creates an access policy rule allowing access to the Tech Support desktop group for all users of the SUPPORT\uk-staff group. Connections to desktop or application resources in the group can only be made using the HDX protocol.

For users to gain access to resources in the group also requires that, depending on the desktop kind of the group, appropriate assignment or entitlement policy rules, or explicit machine assignments exist.

New-BrokerAppAssignmentPolicyRule

Apr 15, 2014

Creates a new application rule in the site's assignment policy.

Syntax

New-BrokerAppAssignmentPolicyRule [-Name] <String> -DesktopGroupUid <Int32> [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerAppAssignmentPolicyRule cmdlet adds a new application rule to the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

The following constraints apply when creating an application assignment rule for a desktop group:

o The group's desktop kind must be Private

o The group's delivery type must be AppsOnly

o Only a single application rule can apply to a given group

o Application assignment rules cannot be applied to RemotePC groups.

When a user selects an application published from a private group, a currently unassigned machine is selected from the group and permanently assigned to the user. An application session is then launched to the machine. Subsequent launches are routed directly to the now assigned machine.

Once a machine has been assigned in this way, the original assignment rule plays no further part in access to the machine.

Related topics

Get-BrokerAppAssignmentPolicyRule

Set-BrokerAppAssignmentPolicyRule

Rename-BrokerAppAssignmentPolicyRule

Remove-BrokerAppAssignmentPolicyRule

Parameters

-Name<String>

Specifies the administrative name of the new application rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroupUid<Int32>

Specifies the unique ID of the desktop group to which the new application rule applies.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies an optional description of the new application rule. The text is purely informational for the administrator, it is never visible to the end user.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies whether the new application rule is initially enabled. A disabled rule is ignored when evaluating the site's assignment policy.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUserFilterEnabled<Boolean>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUsers<User[]>

Specifies the excluded users filter of the new application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUserFilterEnabled<Boolean>

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the new application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUsers<User[]>

Specifies the included users filter of the new application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

New-BrokerAppAssignmentPolicyRule returns the newly created application rule in the assignment policy.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'
C:\PS> New-BrokerAppAssignmentPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -IncludedUsers sales\uk-staff
```

Creates an application rule in the assignment policy that grants all members of the SALES\uk-staff group an entitlement to a single machine from the Sales Support desktop group. The machine can be used for running applications published from the group.

New-BrokerAppEntitlementPolicyRule

Apr 15, 2014

Creates a new application rule in the site's entitlement policy.

Syntax

New-BrokerAppEntitlementPolicyRule [-Name] <String> -DesktopGroupUid <Int32> [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerAppEntitlementPolicyRule cmdlet adds a new application rule to the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

The following constraints apply when creating an application entitlement rule for a desktop group:

o The group's desktop kind must be Shared

o The group's delivery type must be AppsOnly or DesktopsAndApps

o Only a single application rule can apply to a given group

When a user selects an application published from a shared group, a machine is selected from the group on which to run the application. No permanent association exists between the user and the selected machine; once the session ends the association also ends.

Even though only a single application entitlement and therefore session can be defined for a group, the user can still run multiple applications from the group because the applications run within the same session.

Related topics

Get-BrokerAppEntitlementPolicyRule

Set-BrokerAppEntitlementPolicyRule

Rename-BrokerAppEntitlementPolicyRule

Remove-BrokerAppEntitlementPolicyRule

Parameters

-Name<String>

Specifies the administrative name of the new application rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroupUid<Int32>

Specifies the unique ID of the desktop group to which the new application rule applies.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies an optional description of the new application rule. The text is purely informational for the administrator, it is never visible to the end user.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies whether the new application rule is initially enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUserFilterEnabled<Boolean>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUsers<User[]>

Specifies the excluded users filter of the application rule, that is, the users and groups who are explicitly denied entitlements to published applications from the desktop group.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUserFilterEnabled<Boolean>

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to an application session by the new rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUsers<User[]>

Specifies the included users filter of the application rule, that is, the users and groups who are granted an entitlement to an application session by the new rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

New-BrokerAppEntitlementPolicyRule returns the newly created application rule in the entitlement policy.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'
C:\PS> New-BrokerAppEntitlementPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -IncludedUsers support\uk-staff
```

Creates an application rule in the entitlement policy that entitles all members of the SUPPORT\uk-staff group to a machine for running applications published from the Customer Support desktop group.

New-BrokerApplication

Apr 15, 2014

Creates a new published application.

Syntax

New-BrokerApplication [-Name] <String> -CommandLineExecutable <String> -DesktopGroup <DesktopGroup> [-ApplicationType <ApplicationType>] [-BrowserName <String>] [-ClientFolder <String>] [-CommandLineArguments <String>] [-CpuPriorityLevel <CpuPriorityLevel>] [-Description <String>] [-Enabled <Boolean>] [-IconFromClient <Boolean>] [-IconUid <Int32>] [-Priority <Int32>] [-PublishedName <String>] [-SecureCmdLineArgumentsEnabled <Boolean>] [-ShortcutAddedToDesktop <Boolean>] [-ShortcutAddedToStartMenu <Boolean>] [-StartMenuFolder <String>] [-UserFilterEnabled <Boolean>] [-UUID <Guid>] [-Visible <Boolean>] [-WaitForPrinterCreation <Boolean>] [-WorkingDirectory <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerApplication cmdlet creates a new published application in the site.

New-BrokerApplication creates the application object, and associates it with a desktop group. Application objects have three names that identify them (in addition to their Uid): the Name, BrowserName and the PublishedName. The BrowserName is unique across the entire site, and is primarily used internally. The Name is also unique and is what is seen by the administrator. The PublishedName is not unique and is what is seen by the users.

You can create both HostedOnDesktop and InstalledOnClient applications but the ApplicationType cannot be changed later.

The following special characters are not allowed in either the Name, BrowserName or the PublishedName: \ / ; : # . * ? = < > | [ ] ( ) " '

See about_Broker_Applications for more information.

Related topics

Add-BrokerApplication

Remove-BrokerApplication

Get-BrokerApplication

Remove-BrokerApplication

Rename-BrokerApplication

Set-BrokerApplication

Parameters

-Name<String>

Specifies the unique name of the application.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-CommandLineExecutable<String>

Specifies the name of the executable file to launch. The full path need not be provided if it's already in the path. Environment variables can also be used.

Required?	true
Default Value	(required)
Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroup<DesktopGroup>

Specifies which desktop group this application should be associated with. The association between application and desktop groups can be added or removed using the Add-BrokerApplication and Remove-BrokerApplication cmdlets.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ApplicationType<ApplicationType>

Specifies the type of the application: HostedOnDesktop or InstalledOnClient.

Required?	false
Default Value	(required)
Accept Pipeline Input?	true (ByPropertyName)

-BrowserName<String>

Specifies the internal name for this application. It must be unique in the site.

Required?	false
Default Value	(same as Name)
Accept Pipeline Input?	true (ByPropertyName)

-ClientFolder<String>

Specifies the folder that the application belongs to as the user sees it. This is the application folder that is seen in the Citrix Online Plug-in, in Web Services, and also in the end-user's Start menu. Subdirectories can be specified with '\' character. The following special characters are not allowed: / * ? < > | " :. Note that this property cannot be set for applications of type InstalledOnClient.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-CommandLineArguments<String>

Specifies the command-line arguments to use when launching the executable. Environment variables can be used.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-CpuPriorityLevel<CpuPriorityLevel>

Specifies the CPU priority for the launched process. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High. Note that this property cannot be set for applications of type InstalledOnClient.

Required?	false
Default Value	Normal

Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies the description of the application. This is only seen by Citrix administrators and is not visible to users.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies whether or not this application can be launched.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-IconFromClient<Boolean>

Specifies if the app icon should be retrieved from the application on the client. This is reserved for possible future use, and all applications of type HostedOnDesktop cannot set or change this value.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-IconUid<Int32>

Specifies which icon to use for this application. This icon is visible both to the administrator (in the consoles) and to the user. If no icon is specified, then a generic built-in application icon is used.

Required?	false
Default Value	2
Accept Pipeline Input?	true (ByPropertyName)

-Priority<Int32>

Specifies the priority of the mapping between the application and desktop group. A value of zero has the highest priority, with increasing values indicating lower priorities.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PublishedName<String>

The name seen by end users who have access to this application.

Required?	false
Default Value	The same value as that supplied for the name of the application.

Accept Pipeline Input?	true (ByPropertyName)

-SecureCmdLineArgumentsEnabled<Boolean>

Specifies whether the command-line arguments are secured or not. This is reserved for possible future use, and all applications of type HostedOnDesktop can only have this value set to true.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-ShortcutAddedToDesktop<Boolean>

Specifies whether or not a shortcut to the application should be placed on the user device. This is valid only for the Citrix Online Plug-in.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ShortcutAddedToStartMenu<Boolean>

Specifies whether a shortcut to the application should be placed in the user's start menu on their user device.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-StartMenuFolder<String>

Specifies the name of the start menu folder that holds the application shortcut (if any). This is valid only for the Citrix Online Plug-in. Subdirectories can be specified with '\' character. The following special characters are not allowed: / * ? < > | " :.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-UserFilterEnabled<Boolean>

Specifies whether the application's user filter is enabled or disabled. Where the user filter is enabled, the application is visible only to users who appear in the filter (either explicitly or by virtue of group membership).

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

An optional GUID for this application.

Required?	false

Default Value	A new GUID is generated if none is supplied.
Accept Pipeline Input?	true (ByPropertyName)

-Visible<Boolean>

Specifies whether or not this application is visible to users. Note that it's possible for an application to be disabled and still visible.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-WaitForPrinterCreation<Boolean>

Specifies whether or not the session waits for the printers to be created before allowing the user to interact with the session. Note that this property cannot be set for applications of type InstalledOnClient.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-WorkingDirectory<String>

Specifies which working directory the executable is launched from. Environment variables can be used.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Depends on parameter Parameters can be piped by property name.

Return Values

Citrix.Broker.Admin.SDK.Application

New-BrokerApplication returns an Application object.

Notes

Usually only the Name is specified with the New-BrokerApplication cmdlet, and the system chooses a BrowserName and PublishedName for you. By default the BrowserName is the same as the Name, if it is unique in the site. If not, then "-x" is appended to the name, where "x" is a number. For instance, if there is already an application with a BrowserName of "Notepad" and a new application is created with a Name of "Notepad", then the new application gets a BrowserName of "Notepad-1". If another "Notepad" is published, it has a BrowserName of "Notepad-2".

That said, the BrowserName can optionally be specified as well.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerApplication -ApplicationType HostedOnDesktop -Name "Notepad" -CommandLineExecutable "notepad.exe" -DesktopGroup PrivateDG1
Creates and returns an object for a published application called "Notepad" that launches "notepad.exe".

---------- EXAMPLE 2 ----------

C:\PS> $dg = Get-BrokerDesktopGroup "SharedDG1"
C:\PS> $app = New-BrokerApplication -ApplicationType HostedOnDesktop -Name "Notepad" -CommandLineExecutable "notepad.exe" -DesktopGroup $dg
C:\PS> $group = Get-BrokerDesktopGroup -Name "Shared desktop group"
C:\PS> Add-BrokerApplication $app -DesktopGroup $group
C:\PS> $fta = Get-BrokerImportedFTA -ExtensionName ".txt"
C:\PS> New-BrokerConfiguredFTA -ImportedFTA $fta -ApplicationUid $app.Uid
This is a much more complete example. It creates an application object to publish Notepad and associates it first with the "SharedDG1" desktop group.

Next it adds an additional desktop group (one that can host applications), and publishes the application to that desktop group. It then gets the ImportedFTA object for the .txt file-type extension (this assumes file-type associations have already been imported), and then configures it so that ".txt" is associated with the published application.

Note: The appropriate access policy and app assignment/entitlement rules must also be configured to allow access to the application.

New-BrokerAssignmentPolicyRule

Apr 15, 2014

Creates a new desktop rule in the site's assignment policy.

Syntax

New-BrokerAssignmentPolicyRule [-Name] <String> -DesktopGroupUid <Int32> [-ColorDepth <ColorDepth>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IconUid <Int32>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-MaxDesktops <Int32>] [-PublishedName <String>] [-SecureIcaRequired <Boolean>] [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerAssignmentPolicyRule cmdlet adds a new desktop rule to the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

The following constraints apply when creating a desktop assignment rule for a desktop group:

o The group's desktop kind must be Private

o The group's delivery type must be DesktopsOnly

o Only one desktop assignment rule can be created for RemotePC groups.

When a user selects a machine assignment entitlement from a private group, a currently unassigned machine is selected from the group and permanently assigned to the user to create an assigned desktop. A desktop session is then launched to the machine. Subsequent launches are routed directly to the now assigned machine.

Once a machine has been assigned in this way, the original assignment rule plays no further part in access to the new desktop.

Multiple desktop rules in the assignment policy can apply to the same desktop group. Where a user is granted entitlements by more than one rule for the same group, they can have as many machine assignments from the group as the total of their entitlements.

Related topics

Get-BrokerAssignmentPolicyRule

Set-BrokerAssignmentPolicyRule

Rename-BrokerAssignmentPolicyRule

Remove-BrokerAssignmentPolicyRule

Parameters

-Name<String>

Specifies the administrative name of the new desktop rule. Each rule in the site's assignment policy must have a unique name (irrespective of whether they are desktop or application rules).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroupUid<Int32>

Specifies the unique ID of the desktop group to which the new desktop rule applies.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ColorDepth<ColorDepth>

Specifies the color depth of any desktop sessions to machines assigned by the new rule.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies an optional description of the new desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies whether the new desktop rule is initially enabled. A disabled rule is ignored when evaluating the site's assignment policy.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUserFilterEnabled<Boolean>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUsers<User[]>

Specifies the excluded users filter of the new desktop rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-IconUid<Int32>

Specifies the unique ID of the icon used to display the machine assignment entitlement to the user, and of the assigned desktop itself following the assignment.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUserFilterEnabled<Boolean>

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the new desktop rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

For rules that relate to RemotePC desktop groups however, if the included user filter is disabled, the rule is effectively disabled.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUsers<User[]>

Specifies the included users filter of the new desktop rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-MaxDesktops<Int32>

The number of machines from the rule's desktop group to which a user is entitled. Where an entitlement is granted to a user group rather than an individual, the number of machines applies to each member of the user group independently.

Required?	false
Default Value	1
Accept Pipeline Input?	true (ByPropertyName)

-PublishedName<String>

The name of the new machine assignment entitlement as seen by the user, and of the assigned desktop following its usage.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-SecureIcaRequired<Boolean>

Specifies whether the new desktop rule requires the SecureICA protocol to be used for desktop sessions to machines assigned using the entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

An optional GUID for this rule.

Required?	false
Default Value	A new GUID is generated if none is supplied.
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.AssignmentPolicyRule

New-BrokerAssignmentPolicyRule returns the newly created desktop rule in the assignment policy rule.

Examples

---------- EXAMPLE 1 ----------

C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'
C:\PS> New-BrokerAssignmentPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -IncludedUsers sales\uk-staff -PublishedName 'Sales Desktop'
Creates a desktop rule in the assignment policy that grants all members of the SALES\uk-staff group an entitlement to a single machine from the Sales Support desktop group. The entitlement name seen by users is Sales Desktop.

New-BrokerCatalog

Apr 15, 2014

Adds a new catalog to the site.

Syntax

New-BrokerCatalog [-Name] <String> [-AllocationType] <AllocationType> [-CatalogKind] <CatalogKind> [-PvsForVM <String[]>] [-Description <String>] [-IsRemotePC <Boolean>] [-MachinesArePhysical <Boolean>] [-MinimumFunctionalLevel <FunctionalLevel>] [-PvsAddress <String>] [-PvsDomain <String>] [-RemotePCHypervisorConnectionUid <Int32>] [-Scope <String[]>] [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-BrokerCatalog [-Name] <String> [-AllocationType] <AllocationType> [-ProvisioningType] <ProvisioningType> [-SessionSupport] <SessionSupport> [-PersistUserChanges] <PersistUserChanges> [-ProvisioningSchemeId <Guid>] [-Description <String>] [-IsRemotePC <Boolean>] [-MachinesArePhysical <Boolean>] [-MinimumFunctionalLevel <FunctionalLevel>] [-PvsAddress <String>] [-PvsDomain <String>] [-RemotePCHypervisorConnectionUid <Int32>] [-Scope <String[]>] [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

New-BrokerCatalog adds a catalog through which machines can be provided to the site.

In order for a machine to register in a site, the machine must belong to a catalog with which it is compatible. The compatibility of a machine with a catalog is determined by two of the parameters of New-BrokerCatalog:

o MinimalFunctionalLevel: The minimal functional level supported in the catalog. The functional level of the machine is determined by the capabilities of the Citrix VDA software on it.

o SessionSupport: The session support (single/multi) of the catalog. The session support of the machine is determined by the variant of the Citrix VDA software installed (workstation/terminal services, respectively).

Related topics

Get-BrokerCatalog

Rename-BrokerCatalog

Remove-BrokerCatalog

Set-BrokerCatalog

Parameters

-Name<String>

Specifies a name for the catalog. Each catalog within a site must have a unique name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-AllocationType<AllocationType>

Specifies how machines in the catalog are assigned to users. Values can be:

o Static - Machines in a catalog of this type are permanently assigned to a user.

o Permanent - equivalent to 'Static'.

o Random - Machines in a catalog of this type are picked at random and temporarily assigned to a user.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-CatalogKind<CatalogKind>

Deprecated: The type of machines the catalog will contain. Values can be: ThinCloned, SingleImage, PowerManaged, Unmanaged, Pvs, Pvd or PvsPvd.

Thin-Cloned, Single-Image and Personal vDisk Catalogs

Thin-cloned and single-image catalog kinds are for machines created and managed with Provisioning Services for VMs. All machines in this type of catalog are managed, and so must be associated with a hypervisor connection.

A thin-cloned catalog is used for original golden VM images that are cloned when they are assigned to a VM, and users' changes to the VM image are retained after the VM is restarted.

A single-image catalog is used when multiple machines provisioned with Provisioning Services for VMs all share a single golden VM image when they run and, when restarted, they revert to the original VM image state.

A personal vDisk catalog is similar to a single-image catalog, but it also uses personal vDisk technology.

PowerManaged

This catalog kind is for managed machines that are manually provisioned by administrators. All machines in this type of catalog are managed, and so must be associated with a hypervisor connection.

Unmanaged

This catalog kind is for unmanaged machines, so there is no associated hypervisor connection.

PVS

This catalog kind is for managed machines that are provisioned using Provisioning Services. All machines in this type of catalog are managed, and so must be associated with a hypervisor connection. Only shared desktops are suitable for this catalog kind.

A Provisioning Services-personal vDisk (PvsPvd) catalog is similar to a Provisioning Services catalog, but it also uses personal vDisk technology.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningType<ProvisioningType>

Specifies the ProvisioningType for the catalog. Values can be:

o Manual - No provisioning.

o PVS - Machine provisioned by PVS (machine may be physical, blade, VM,...).

o MCS - Machine provisioned by MCS (machine must be VM).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-SessionSupport<SessionSupport>

Specifies whether machines in the catalog are single or multi-session capable. Values can be:

o SingleSession - Single-session only machine.

o MultiSession - Multi-session capable machine.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PersistUserChanges<PersistUserChanges>

Specifies the location where the user changes will be persisted. Can only be set for single session catalogs. Values can be:

o OnLocal - User changes are persisted locally.

o Discard - User changes are discarded.

o OnPvd - User changes are persisted on the personal vDisk.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PvsForVM<String[]>

Deprecated:

Identifies the provisioning scheme used by this catalog. To be specified in the format: ProvisioningSchemeGuid:ServiceGroupGuid. Applicable only to thin-cloned, single-image or personal vDisk catalogs.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

A description for the catalog.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-IsRemotePC<Boolean>

Specifies whether this is to be a Remote PC catalog.

IsRemotePC can only be enabled when:

o SessionSupport is SingleSession

o MachinesArePhysical is true.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-MachinesArePhysical<Boolean>

Specifies whether machines in the catalog can be power-managed by the Citrix Broker Service. Where the Citrix Broker Service cannot control the power state of themachine specify $true, otherwise $false. Can only be specified together with a provisioning type of Pvs or Manual, or if used with the legacy CatalogKind parameter only with Pvs or PvsPvd catalog kinds.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-MinimumFunctionalLevel<FunctionalLevel>

The minimum FunctionalLevel required for machines to register in the site.

Valid values are L5, L7

Required?	false
Default Value	The FunctionalLevel of the current release (L7); by default no machines with less than the most current FunctionalLevel will be functional.
Accept Pipeline Input?	true (ByPropertyName)

-PvsAddress<String>

Specifies the URL of the Provisioning Services server. Only applicable to Provisioning Services or Provisioning Services-personal vDisk catalogs.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PvsDomain<String>

Specifies the Active Directory domain of the Provisioning Services server. Only applicable to Provisioning Services or Provisioning Services-personal vDisk catalogs.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-RemotePCHypervisorConnectionUid<Int32>

Specifies the hypervisor connection to use for powering on remote PCs in this catalog (only allowed when IsRemotePC is true).

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Scope<String[]>

Specifies the name of the delegated administration scope to which the catalog belongs.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

An optional GUID for this catalog.

Required?	false
Default Value	A new GUID is generated if none is supplied.
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

-ProvisioningSchemeId<Guid>

Specifies the identity of the MCS provisioning scheme the new catalog is associated with (can only be specified for new catalogs with a ProvisioningType of MCS).

Required?	false
Default Value	$null
Accept Pipeline Input?	true (ByPropertyName)

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Catalog

New-BrokerCatalog returns the created catalog.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerCatalog -AllocationType Static -CatalogKind Unmanaged -Description "Catalog1 Description" -Name "Catalog1 Name"
This command creates a catalog that can contain unmanaged physical or virtual machines that are permanently assigned to the user.

---------- EXAMPLE 2 ----------

C:\PS> New-BrokerCatalog -AllocationType Random -CatalogKind PowerManaged -Description "catalog 2 Description" -Name "Catalog2 Name"
This command creates a catalog that can contain power-managed machines that are randomly assigned to the user.

---------- EXAMPLE 3 ----------

C:\PS> New-BrokerCatalog -AllocationType Random -CatalogKind PVS -Description "PVS Catalog Desc" -Name "PVS Catalog Name" -PvsAddress "pvsServer@pvsDomain.com" -PvsDomain "pvsDor
This command creates a catalog that can contain managed machines that are provisioned using Provisioning Services.

New-BrokerConfigurationSlot

Apr 15, 2014

Creates a new configuration slot.

Syntax

New-BrokerConfigurationSlot [-Name] <String> -SettingsGroup <String> [-Description <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creates a new configuration slot. The SettingsGroup of the slot determines the particular collection of related settings that may be specified in a machine configuration associated with this slot.

For example, the configuration slot may be restricted to configuring Citrix User Profile Manager settings by specifying the SettingsGroup parameter as "G=UPM".

Related topics

Get-BrokerConfigurationSlot

Remove-BrokerConfigurationSlot

New-BrokerMachineConfiguration

Parameters

-Name<String>

Name of the new configuration slot. This must be alphanumeric and not contain white space.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-SettingsGroup<String>

The settings group determines the particular collection of related settings that may be controlled by this slot. This must match the format of a Citrix Group Policy configuration group (e.g. "G=UPM"). Only settings that have this exact group may be specified in a machine configuration associated with this configuration slot.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Description of configuration slot.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.ConfigurationSlot

New-BrokerConfigurationSlot returns an object representing the newly created configuration slot

Examples

---------- EXAMPLE 1 ----------

```
New-BrokerConfigurationSlot -Name "UPM" -SettingsGroup "G=UPM"
```

Create a new slot named "UPM" to configure settings specific to "User Profile Management"

New-BrokerConfiguredFTA

Apr 15, 2014

Creates a file type association with a published application.

Syntax

New-BrokerConfiguredFTA -ImportedFTA <ImportedFTA> -ApplicationUid <Int32> [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-BrokerConfiguredFTA -ExtensionName <String> -HandlerName <String> -ApplicationUid <Int32> [-ContentType <String>] [-HandlerDescription <String>] [-HandlerOpenArguments <String>] [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creates an association between a file type and a published application for the purposes of the content redirection.

File type association associates a file extension (such as ".txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when an user clicks on a document it launches the appropriate published application. This is known as "content redirection".

Configured file type associations are different from imported file type associations. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection. Imported file type associations are lists of known file type associations for a given desktop group. See Update-BrokerImportedFTA for more information about imported file type associations.

This cmdlet has two parameter sets, which correspond to the cmdlet's two use cases.

The first use case leverages imported file type associations to configure file types for published applications. Information about the file type association is read from the imported object. See the Update-BrokerImportedFTA cmdlet for more information about importing file type associations from a worker machine.

The second use case is more complex and allows you to create your own file type association without having to import it first. This also lets you create custom file type associations that may not already exist on the worker machines. This use case is more error-prone, however, because the individual attributes of the file type association must be correctly specified by you.

Related topics

Get-BrokerImportedFTA

Get-BrokerConfiguredFTA

Remove-BrokerConfiguredFTA

Parameters

-ApplicationUid<Int32>

Specifies the application with which the file type should be associated.

Required?	true
Default Value	(required)
Accept Pipeline Input?	true (ByPropertyName)

-ImportedFTA<ImportedFTA>

Specifies the ImportedFTA object to use for creating the ConfiguredFTA object. All values needed to create a ConfiguredFTA object are read from the ImportedFTA object.

Required?	true
Default Value	(required)
Accept Pipeline Input?	true (ByPropertyName)

-ExtensionName<String>

Specifies the extension name for the file type association. For example, ".txt" or ".doc".

Required?	true
Default Value	(required)
Accept Pipeline Input?	true (ByPropertyName)

-HandlerName<String>

Specifies the name of the handler for the file type association (as seen in the Registry). For example, "TXTFILE" or "Word.Document.8".

Required?	true
Default Value	(required)
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

An optional GUID for this ConfiguredFTA.

Required?	false
Default Value	A new GUID is generated if none is supplied.
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

-ContentType<String>

Specifies the content type of the file type (as listed in the Registry). For example, content type would be "text/plain" or "application/msword".

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-HandlerDescription<String>

Specifies the description of the handler for the file type association.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-HandlerOpenArguments<String>

Specifies the arguments for the open command that the handler should use. For example, "%1".

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

Input Type

Variable, based on property name. This cmdlet does accept input from the pipeline but only by property name.

Return Values

Citrix.Broker.Admin.SDK.ConfiguredFTA

This cmdlet returns a single ConfiguredFTA object.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $app = Get-BrokerApplication "Notepad"
C:\PS> $fta = Get-BrokerImportedFTA -ExtensionName ".txt"
C:\PS> New-BrokerConfiguredFTA -ImportedFTA $fta -ApplicationUid $app.Uid
```

Gets the Uid for the application, gets the ImportedFTA object for the file extension, and finally associates ".txt" with the published "Notepad" application.

Note that the Get-BrokerImportedFTA cmdlet may return more than one ImportedFTA objects for a specific extension name. See the help for that cmdlet for more details.

---------- EXAMPLE 2 ----------

```
C:\PS> $app = Get-BrokerApplication "Notepad"
C:\PS> New-BrokerConfiguredFTA -ApplicationUid $app.Uid -ExtensionName ".txt" -HandlerName "txtfile" -ContentType "text\plain" -HandlerDescription "Text Document" -HandlerOpenArguments "%1"
```

This example is identical to the first, but shows the the second use case of the cmdlet, specifying each attribute manually.

New-BrokerDelayedHostingPowerAction

Apr 15, 2014

Causes a power action to be queued after a delay.

Syntax

New-BrokerDelayedHostingPowerAction [-MachineName] <String> -Action <PowerManagementAction> -Delay <TimeSpan> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Causes a power action to be queued after the specified period of time.

Only ShutDown or Suspend actions can be requested to be delayed in this manner.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement'.

Related topics

Get-BrokerDelayedHostingPowerAction

New-BrokerDelayedHostingPowerAction

Parameters

-MachineName<String>

Specifies the machine that the action is to be performed on.

The machine can be identified by DNS name, short name, SID, or name of the form domain\machine.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Action<PowerManagementAction>

Specifies the power state change action that is to be performed on the specified machine after the specified delay.

Valid values are Shutdown and Suspend.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Delay<TimeSpan>

Specifies a timespan delay before the action is queued.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.DelayedHostingPowerAction

New-BrokerDelayedHostingPowerAction returns the created delayed power action.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerDelayedHostingPowerAction -Action Shutdown -MachineName 'XD_VDA1' -Delay '00:02:00'
Causes the machine called XD_VDA1 to be shut down after a delay of two minutes.

New-BrokerDesktopGroup

Apr 15, 2014

Create a new desktop group for managing the brokering of groups of desktops.

Syntax

New-BrokerDesktopGroup [-Name] <String> -DesktopKind <DesktopKind> [-AutomaticPowerOnForAssigned <Boolean>] [-AutomaticPowerOnForAssignedDuringPeak <Boolean>] [-ColorDepth <ColorDepth>] [-DeliveryType <DeliveryType>] [-Description <String>] [-Enabled <Boolean>] [-IconUid <Int32>] [-InMaintenanceMode <Boolean>] [-IsRemotePC <Boolean>] [-MinimumFunctionalLevel <FunctionalLevel>] [-OffPeakBufferSizePercent <Int32>] [-OffPeakDisconnectAction <SessionChangeHostingAction>] [-OffPeakDisconnectTimeout <Int32>] [-OffPeakExtendedDisconnectAction <SessionChangeHostingAction>] [-OffPeakExtendedDisconnectTimeout <Int32>] [-OffPeakLogOffAction <SessionChangeHostingAction>] [-OffPeakLogOffTimeout <Int32>] [-PeakBufferSizePercent <Int32>] [-PeakDisconnectAction <SessionChangeHostingAction>] [-PeakDisconnectTimeout <Int32>] [-PeakExtendedDisconnectAction <SessionChangeHostingAction>] [-PeakExtendedDisconnectTimeout <Int32>] [-PeakLogOffAction <SessionChangeHostingAction>] [-PeakLogOffTimeout <Int32>] [-ProtocolPriority <String[]>] [-PublishedName <String>] [-Scope <String[]>] [-SecureIcaRequired <Boolean>] [-SessionSupport <SessionSupport>] [-ShutdownDesktopsAfterUse <Boolean>] [-TimeZone <String>] [-TurnOnAddedMachine <Boolean>] [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerDesktopGroup cmdlet creates a new broker desktop group that can then be used to manage the brokering settings of all desktops within that desktop group. Once the desktop group has been created, you can create desktops in it by adding the appropriate broker machines to it using the Add-BrokerMachine or Add-BrokerMachinesToDesktopGroup cmdlets.

Desktop groups hold settings that apply to all desktops they contain.

For any automatic power management settings of a desktop group to take effect, the group's TimeZone property must be specified. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

Related topics

Get-BrokerDesktopGroup

Set-BrokerDesktopGroup

Rename-BrokerDesktopGroup

Remove-BrokerDesktopGroup

Add-BrokerMachine

Add-BrokerMachinesToDesktopGroup

Get-BrokerSite

Parameters

-Name<String>

The name of the new broker desktop group.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DesktopKind<DesktopKind>

The kind of desktops this group will hold. Valid values are Private and Shared.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-AutomaticPowerOnForAssigned<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started at the start of peak time periods. Only relevant for groups whose DesktopKind is Private.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-AutomaticPowerOnForAssignedDuringPeak<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started throughout peak time periods. Only relevant for groups whose DesktopKind is Private and which have AutomaticPowerOnForAssigned set to true.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ColorDepth<ColorDepth>

Specifies the color depth that the ICA session should use for desktops in this group. Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Required?	false
Default Value	TwentyFourBit

Accept Pipeline Input?	true (ByPropertyName)

-DeliveryType<DeliveryType>

Specifies whether desktops, applications, or both, can be delivered from machines contained within the new desktop group. Desktop groups with a DesktopKind of Private cannot be used to deliver both desktops and applications. Defaults to DesktopsOnly if not specified.

Valid values are DesktopsOnly, AppsOnly, and DesktopsAndApps.

Required?	false
Default Value	DesktopsOnly
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

A description for this desktop group useful for administrators of the site.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Whether the desktop group should be in the enabled state; disabled desktop groups do not appear to users.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-IconUid<Int32>

The UID of the broker icon to be displayed to users for their desktop(s) in this desktop group.

Required?	false
Default Value	The Uid of the default desktop icon in this site - use the Get-BrokerSite cmdlet to find this value.
Accept Pipeline Input?	true (ByPropertyName)

-InMaintenanceMode<Boolean>

Whether the desktop should be created in maintenance mode; a desktop group in maintenance mode will not allow users to connect or reconnect to their desktops.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-IsRemotePC<Boolean>

Specifies whether this is to be a Remote PC desktop group.

IsRemotePC can only be enabled when:

o SessionSupport is SingleSession

o DeliveryType is DesktopsOnly

o DesktopKind is Private

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-MinimumFunctionalLevel<FunctionalLevel>

The minimum FunctionalLevel required for machines to work successfully in the desktop group.

Valid values are L5, L7

Required?	false
Default Value	The FunctionalLevel of the current release (L7); by default no machines with less than the most current FunctionalLevel will be functional.
Accept Pipeline Input?	true (ByPropertyName)

-OffPeakBufferSizePercent<Int32>

The percentage of machines in the desktop group that should be kept available in an idle state outside peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-OffPeakDisconnectAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown

Required?	false
Default Value	Nothing
Accept Pipeline Input?	true (ByPropertyName)

-OffPeakDisconnectTimeout<Int32>

The number of minutes before the configured action should be performed after a user session disconnects outside peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-OffPeakExtendedDisconnectAction<SessionChangeHostingAction>

The action to be performed after a second configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	Nothing
Accept Pipeline Input?	true (ByPropertyName)

-OffPeakExtendedDisconnectTimeout<Int32>

The number of minutes before the second configured action should be performed after a user session disconnects outside peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-OffPeakLogOffAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session ending outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	Nothing
Accept Pipeline Input?	true (ByPropertyName)

-OffPeakLogOffTimeout<Int32>

The number of minutes before the configured action should be performed after a user session ends outside peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-PeakBufferSizePercent<Int32>

The percentage of machines in the desktop group that should be kept available in an idle state in peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-PeakDisconnectAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	Nothing
Accept Pipeline Input?	true (ByPropertyName)

-PeakDisconnectTimeout<Int32>

The number of minutes before the configured action should be performed after a user session disconnects in peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-PeakExtendedDisconnectAction<SessionChangeHostingAction>

The action to be performed after a second configurable period of a user session disconnecting in peak hours. Possible

values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	Nothing
Accept Pipeline Input?	true (ByPropertyName)

-PeakExtendedDisconnectTimeout<Int32>

The number of minutes before the second configured action should be performed after a user session disconnects in peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-PeakLogOffAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session ending in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	Nothing
Accept Pipeline Input?	true (ByPropertyName)

-PeakLogOffTimeout<Int32>

The number of minutes before the configured action should be performed after a user session ends in peak hours.

Required?	false
Default Value	0
Accept Pipeline Input?	true (ByPropertyName)

-ProtocolPriority<String[]>

A list of protocol names in the order in which they should be attempted for use during connection.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-PublishedName<String>

The name that will be displayed to users for their desktop(s) in this desktop group.

Required?	false
Default Value	The same value as that supplied for the name of the desktop group.
Accept Pipeline Input?	true (ByPropertyName)

-Scope<String[]>

Specifies the name of the delegated administration scope to which the desktop group should belong.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-SecureIcaRequired<Boolean>

Whether HDX connections to desktops in the new desktop group require the use of a secure protocol.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-SessionSupport<SessionSupport>

Specifies whether machines in the desktop group are single or multi-session capable. Values can be:

o SingleSession - Single-session only machine.

o MultiSession - Multi-session capable machine.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ShutdownDesktopsAfterUse<Boolean>

Whether desktops in this desktop group should be automatically shut down when each user session completes (only relevant to power-managed desktops).

Required?	false

Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-TimeZone<String>

The time zone in which this desktop group's machines reside.

The time zone must be specified for any of the group's automatic power management settings to take effect. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-TurnOnAddedMachine<Boolean>

This flag specifies whether the Broker Service should attempt to power on machines when they are added to the desktop group.

Required?	false
Default Value	$false for single session machines and $true for multi-session machines.
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

An optional GUID for this desktop group.

Required?	false
Default Value	A new GUID is generated if none is supplied.
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.DesktopGroup

The newly created desktop group.

Notes

Once a new desktop group is created, you can create desktops in it by adding the appropriate broker machines to it using the Add-BrokerMachine or Add-BrokerMachinesToDesktopGroup cmdlets.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerDesktopGroup "Assigned Desktops" -PublishedName "MyDesktop" -DesktopKind Private
Create a desktop group to manage the brokering of private desktops, which will appear to users with the name "MyDesktop".

New-BrokerEntitlementPolicyRule

Apr 15, 2014

Creates a new desktop rule in the site's entitlement policy.

Syntax

New-BrokerEntitlementPolicyRule [-Name] <String> -DesktopGroupUid <Int32> [-ColorDepth <ColorDepth>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IconUid <Int32>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-PublishedName <String>] [-SecureIcaRequired <Boolean>] [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerEntitlementPolicyRule cmdlet adds a new desktop rule to the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

The following constraints apply when creating a desktop entitlement rule for a desktop group:

o The group's desktop kind must be Shared

o The group's delivery type must be DesktopsOnly or DesktopsAndApps

When a user selects a desktop entitlement published from a shared group, a machine is selected from the group on which to run the desktop session. No permanent association exists between the user and the selected machine; once the session ends the association also ends.

Multiple desktop rules in the entitlement policy can apply to the same desktop group. Where a user is granted an entitlement by more than one rule for the same group, they can use as many desktop sessions at the same time as they have entitlements.

Related topics

Get-BrokerEntitlementPolicyRule

Set-BrokerEntitlementPolicyRule

Rename-BrokerEntitlementPolicyRule

Remove-BrokerEntitlementPolicyRule

Parameters

-Name<String>

Specifies the administrative name of the new desktop rule. Each rule in the site's entitlement policy must have a unique name (irrespective of whether they are desktop or application rules).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroupUid<Int32>

Specifies the unique ID of the desktop group to which the new desktop rule applies.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-ColorDepth<ColorDepth>

Specifies the color depth of any desktop sessions launched by a user from this entitlement.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies an optional description of the new desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies whether the new desktop rule is initially enabled. A disabled rule is ignored when evaluating the site's entitlement policy.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUserFilterEnabled<Boolean>

Specifies whether the excluded users filter is initially enabled. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-ExcludedUsers<User[]>

Specifies the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from the new rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	(empty list)

Accept Pipeline Input?	true (ByPropertyName)

-IconUid<Int32>

Specifies the unique ID of the icon used to display the desktop session entitlement to the user.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUserFilterEnabled<Boolean>

Specifies whether the included users filter is initially enabled. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a desktop session by the new rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Required?	false
Default Value	true
Accept Pipeline Input?	true (ByPropertyName)

-IncludedUsers<User[]>

Specifies the included users filter of the rule, that is, the users and groups who are granted an entitlement to a desktop session by the new rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	(empty list)
Accept Pipeline Input?	true (ByPropertyName)

-PublishedName<String>

The name of the new desktop session entitlement as seen by the user.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-SecureIcaRequired<Boolean>

Specifies whether the new desktop rule requires the SecureICA protocol for desktop sessions launched using the entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false

Default Value	null (dynamically inherited from the desktop group)
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

An optional GUID for this rule.

Required?	false
Default Value	A new GUID is generated if none is supplied.
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.EntitlementPolicyRule

New-BrokerEntitlementPolicyRule returns the newly created desktop rule in the entitlement policy.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'
C:\PS> New-BrokerEntitlementPolicyRule 'UK Office' -DesktopGroupUid $dg.Uid -IncludedUsers support\uk-staff -PublishedName 'Support Desktop'
```

Creates an desktop rule in the entitlement policy that entitles all members of the SUPPROT\uk-staff group to a desktop session from the Customer Support desktop group. The desktop entitlement name seen by users is Support Desktop.

New-BrokerHostingPowerAction

Apr 15, 2014

Creates a new action in the power action queue.

Syntax

New-BrokerHostingPowerAction [-MachineName] <String> -Action <PowerManagementAction> [-ActualPriority <Int32>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerHostingPowerAction cmdlet adds a new power action record into the queue of power actions to be performed. The power actions in the queue are processed on a priority basis and sent to the relevant hypervisor to change the power state of a virtual machine.

A power action record defines the action to be performed, the machine on which the action is to be performed, and an initial priority value for the action. Multiple actions may be created that relate to the same machine.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement'.

Related topics

Get-BrokerHostingPowerAction

Set-BrokerHostingPowerAction

Remove-BrokerHostingPowerAction

Parameters

-MachineName<String>

Specifies the machine that the action is to be performed on.

The machine can be identified by DNS name or short name or SID or 'machine\domain' form name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Action<PowerManagementAction>

Specifies the power state change action that is to be performed on the specified machine.

Valid values are: TurnOn, TurnOff, ShutDown, Reset, Restart, Suspend and Resume.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-ActualPriority<Int32>

Specifies an initial priority value for the action in the queue.

This priority is the current action priority; the 'base' priority for actions created via this cmdlet is always 30. Numerically lower priority values indicate more important actions that are processed in preference to actions with numerically higher priority settings.

Required?	false
Default Value	30
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.HostingPowerAction

New-BrokerHostingPowerAction returns the newly created power action record.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> New-BrokerHostingPowerAction -Action Shutdown -MachineName 'XD_VDA1'
```

Causes the machine called 'XD_VDA1' to be shut down.

New-BrokerHypervisorConnection

Apr 15, 2014

Creates a new hypervisor connection.

Syntax

New-BrokerHypervisorConnection [-HypHypervisorConnectionUid] <Guid> [-PreferredController <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerHypervisorConnection cmdlet creates a new hypervisor connection.

Related topics

Get-BrokerHypervisorConnection

Remove-BrokerHypervisorConnection

Set-BrokerHypervisorConnection

Parameters

-HypHypervisorConnectionUid<Guid>

The Guid that identifies the hypervisor connection, as defined in DUM.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PreferredController<String>

The preferred controller machine for the hypervisor connection. Can be specified as (first match is used):

o Full SAM name.

o Full DNS name.

o SID value.

o NetBIOS name (SAM without domain).

o Partial DNS name (DNS name without some or all domain information).

Where not specified, the system selects preferred controller machine based on loading.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None

Return Values

Citrix.Broker.Admin.SDK.HypervisorConnection

New-BrokerHypervisorConnection returns an opaque object containing information about the hypervisor connection.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerHypervisorConnection -PreferredController "domainName\controllerName" -HypHypervisorConnectionUid "d16f4e56-b85e-4ba6-b745-0e978ae4f192"
This command creates a new hypervisor connection with a preferred controller.

---------- EXAMPLE 2 ----------

C:\PS> New-BrokerHypervisorConnection -HypHypervisorConnectionUid "d16f4e56-b85e-4ba6-b745-0e978ae4f192"
This command creates a new hypervisor connection, and leaves it to the system to select a preferred controller.

New-BrokerIcon

Apr 15, 2014

Creates a new icon.

Syntax

New-BrokerIcon [-EncodedIconData] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Accepts Base64 encoded .ICO format icon data, stores it in the database and returns an Icon object containing the Uid assigned to it.

New-BrokerIcon can be used with the Get-CtxIcon cmdlet from Citrix.Common.Commands, to obtain the Base64 icon. See Examples for a demonstration.

Related topics

Get-CtxIcon

Get-BrokerIcon

Remove-BrokerIcon

Parameters

-EncodedIconData<String>

Specifies the Base64 encoded .ICO format icon data.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Icon

Returns an Icon object.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Add-PSSnapin Citrix.Common.Commands
C:\PS> $ctxIcon = Get-CtxIcon -FileName C:\Windows\System32\notepad.exe -index 0
C:\PS> $brokerIcon = New-BrokerIcon -EncodedIconData $ctxIcon.EncodedIconData
C:\PS> $desktopGroup = Get-BrokerDesktopGroup -Name 'MyDesktopGroup'
C:\PS> Set-BrokerDesktopGroup $desktopGroup -IconUid $brokerIcon.Uid
```

Extracts the first icon resource from notepad.exe, and sets this as the icon for a desktop group.

New-BrokerMachine

Apr 15, 2014

Adds a machine that can be used to run desktops and applications.

Syntax

New-BrokerMachine [-MachineName] <String> -CatalogUid <Int32> [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-HostedMachineId <String>] [-HypervisorConnectionUid <Int32>] [-InMaintenanceMode <Boolean>] [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

By adding a machine to a catalog, New-BrokerMachine adds a machine to the site, and is the first step in making the machine available to run users' desktops and applications. The machine may be physical or virtual.

For physical machines, you must specify the machine's SID and the catalog to which it will belong. For virtual machines which are not provisioned by MCS, you must also provide the hypervisor connection responsible for running the machine and the hosted machine ID by which the hypervisor recognizes the machine.

The machine must support the expected capabilities of the catalog: the catalog specifies a SessionType and a MinimalFunctionalLevel. The session support of the machine is determined by the type of Citrix VDA software installed (server or workstation) and the functional level depends on the version of the Citrix VDA software installed. The New-BrokerMachine command will complete successfully if these are not correct but the machine will be unable to register.

For more information about machines, see about_Broker_Machines.

Related topics

Add-BrokerMachine

Parameters

-MachineName<String>

Specify the name of the machine to create (in the form 'domain\machine'). A SID can also be specified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-CatalogUid<Int32>

The catalog to which this machine will belong.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-AssignedClientName<String>

The client name to which this machine will be assigned. Machines can be assigned to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-AssignedIPAddress<String>

The client IP address to which this machine will be assigned. Machines can be assigned to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Required?	false
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-HostedMachineId<String>

The unique ID by which the hypervisor recognizes the machine. Omit this for physical machines or MCS-provisioned VMs.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-HypervisorConnectionUid<Int32>

The hypervisor connection that runs the machine. Omit this for physical machines or MCS-provisioned VMs.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-InMaintenanceMode<Boolean>

Specifies whether the machine is initially in maintenance mode. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

An optional GUID for this machine.

Required?	false
Default Value	A new GUID is generated if none is supplied.
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Machine

New-BrokerMachine returns the created machine.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine'
This adds the physical machine with the specified SAM name to this site and places it in the specified catalog.

---------- EXAMPLE 2 ----------

C:\PS> New-BrokerMachine -CatalogUid 2 -MachineName 'S-1-5-12-1234567890-1234567890-1234567890-1234'
This adds the physical machine with the specified SID to this site and places it in the specified catalog.

---------- EXAMPLE 3 ----------

C:\PS> New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine' -HostedMachineId 'F8143B4F-7371-4efa-868A-54787EF9F64E' -HypervisorConnectionUid 5
This adds the virtual machine, running on the specified hypervisor, to this site and places it in the catalog.

---------- EXAMPLE 4 ----------

C:\PS> $m = New-BrokerMachine -CatalogUid 2 -MachineName 'domain\machine'
C:\PS> Add-BrokerMachine -InputObject $m -DesktopGroup 3
This adds the specified physical machine to the site and uses Add-BrokerMachine to add it to a desktop group.

New-BrokerMachineCommand

Apr 15, 2014

Creates a new command to deliver to a desktop.

Syntax

New-BrokerMachineCommand -User <String> -Category <String> -CommandName <String> [-DesktopGroups <DesktopGroup[]>] [-SendTrigger <MachineCommandTrigger>] [-SendDeadline <TimeSpan>] [-CommandData <Byte[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-BrokerMachineCommand -SessionUid <Int64> -Category <String> -CommandName <String> [-SendTrigger <MachineCommandTrigger>] [-SendDeadline <TimeSpan>] [-CommandData <Byte[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-BrokerMachineCommand -MachineUid <Int32> -Category <String> -CommandName <String> [-SendTrigger <MachineCommandTrigger>] [-SendDeadline <TimeSpan>] [-CommandData <Byte[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-BrokerMachineCommand -Synchronous -MachineUid <Int32> -Category <String> -CommandName <String> [-CommandData <Byte[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Create a new command queued for delivery to a desktop. Commands are sent to a specific handler installed on the desktop using the Category parameter. Each handler has its own list of commands identified by the CommandName parameter. Optional command data can be provided using the CommandData parameter in a format specified by the handler.

Commands are targeted at a specific user, session or machine. Commands targeted at a user can be further be restricted to one or more desktop groups.

The SendTrigger is used to restrict the command to a specific event related to the target. For example, when the target machine registers or when the target user reconnects to a session. The command will be sent to the machine when the SendTrigger occurs for the target.

If the Synchronous switch is provided, the target must be a machine and no SendTrigger can be specified. The command is sent immediately to the machine if it is currently registered and fails if the machine is not registered.

Note that the combined length of the Category and CommandName is limited to 64 characters. The Category and CommandName must both be entirely alphanumeric and not include any white space.

Related topics

Get-BrokerMachineCommand

Remove-BrokerMachineCommand

Parameters

-Category<String>

The service on the desktop to send the command to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-CommandName<String>

The name of the command to send (as defined by the service).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-User<String>

User whose desktop or session should receive the command.

Required?	true
Default Value	Any user.
Accept Pipeline Input?	true (ByPropertyName)

-SessionUid<Int64>

Currently logged on user session that should receive the command.

Required?	true
Default Value	Any session.
Accept Pipeline Input?	true (ByPropertyName)

-MachineUid<Int32>

Specific machine that should receive the command.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Synchronous<SwitchParameter>

Send the command immediately and block while waiting for the reply.

Required?	true
Default Value	false
Accept Pipeline Input?	false

-CommandData<Byte[]>

Optional additional data to include with the command.

Required?	false

Default Value	None
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

-DesktopGroups<DesktopGroup[]>

Further restrict the command targeted at a user to machines in these desktop groups.

Required?	false
Default Value	No restriction by desktop group.
Accept Pipeline Input?	true (ByPropertyName)

-SendTrigger<MachineCommandTrigger>

Queue command for delivery until this particular event occurs. Valid values are NextContact, Broker, LogOn, Logoff, Disconnect and Reconnect.

Required?	false
Default Value	Default value is 'NextContact' so the command is sent during the next communication with the desktop.
Accept Pipeline Input?	true (ByPropertyName)

-SendDeadline<TimeSpan>

Automatically cancel the command if it not delivered before the specified time span passes.

Required?	false
Default Value	Command expires after 24 hours.

Accept Pipeline Input?	true (ByPropertyName)

Input Type

None No parameter is accepted from the input pipeline.

Return Values

Citrix.Broker.Admin.SDK.MachineCommand

New command that was added to the command queue.Citrix.Broker.Admin.SDK.MachineSynchronousCommandResponse

When the Synchronous option is used, the command is immediately sent to the specified machine and processed. The SDK object returned describes the command and the result of this command processing.

Notes

Commands are subject to delegated administration restrictions based on the desktop group, category and command name.

Examples

---------- EXAMPLE 1 ----------

New-BrokerMachineCommand -Category "UPM" -CommandName "ResetProfile" -DesktopGroups 1 -UserUid 23 -SendTrigger Authentication
Instruct the User Profile Manager service to execute the "ResetProfile" command when user 23 logs on to any machine in desktop group 1

---------- EXAMPLE 2 ----------

New-BrokerMachineCommand -Synchronous -Category "MonitorService" -CommandName "EnableLogging" -MachineUid 13
Instruct the monitor service to immediately execute the "EnableLogging" command on the machine having Uid 13.

New-BrokerMachineConfiguration

Apr 15, 2014

Creates a new machine configuration associated with an existing configuration slot.

Syntax

New-BrokerMachineConfiguration -ConfigurationSlotUid <Int32> -LeafName <String> -Policy <Byte[]> [-Description <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creates a new machine configuration containing settings that match the SettingsGroup of the associated configuration slot. This machine configuration can then be applied to a desktop group to have the settings applied to machines in that group.

The SettingsGroup of the configuration slot restricts the permitted settings. Use the SDK snap-in that matches the SettingsGroup to create the encoded settings data.

Related topics

Get-BrokerMachineConfiguration

Set-BrokerMachineConfiguration

Rename-BrokerMachineConfiguration

Remove-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Parameters

-ConfigurationSlotUid<Int32>

Unique identifier of the configuration slot to associate with this machine configuration.

Required?	true
Default Value	None
Accept Pipeline Input?	true (ByPropertyName)

-LeafName<String>

Name of the new machine configuration. This must be unique amongst the machine configurations associated with the same configuration slot.

Required?	true
Default Value	None
Accept Pipeline Input?	true (ByPropertyName)

-Policy<Byte[]>

A binary array of encoded settings (policy) data created with the SDK snap-in that matches the SettingsGroup of the configuration slot.

Required?	true
Default Value	None
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Description of the new machine configuration.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.MachineConfiguration

New-BrokerMachineConfiguration returns the newly created configuration

Notes

Delegated Administration can be used to restrict the configuration slots that an administrator can use and hence which components of the system that can be configured.

Examples

---------- EXAMPLE 1 ----------

New-BrokerMachineConfiguration -LeafName "Finance Department" -Description "Finance Dept. User Profile Management policy" -Policy $policy -ConfigurationSlotUid $csUid
Creates a new configuration named "%SlotName%\Finance Department" where %SlotName% is the name of the configuration slot having the Uid $csUid. The encoded settings in the $policy variable must match the SettingsGroup of the configuration slot having the Uid $csUid.

New-BrokerPowerTimeScheme

Apr 15, 2014

Creates a new power time scheme for a desktop group.

Syntax

New-BrokerPowerTimeScheme [-Name] <String> -DaysOfWeek <TimeSchemeDays> -DesktopGroupUid <Int32> [-DisplayName <String>] [-PeakHours <Boolean[]>] [-PoolSize <Int32[]>] [-PoolUsingPercentage <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerPowerTimeScheme cmdlet adds a new power time scheme to be associated with a desktop group. The power time scheme must relate to days of the week that are not already covered by an existing power time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

See 'help about_Broker_PowerManagement' for a detailed description of the power policy mechanism and pool size management.

Related topics

Get-BrokerPowerTimeScheme

Set-BrokerPowerTimeScheme

Remove-BrokerPowerTimeScheme

Rename-BrokerPowerTimeScheme

Parameters

-Name<String>

Specifies the administrative name of the new power time scheme. Each scheme must have a name which is unique within the site.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DaysOfWeek<TimeSchemeDays>

Specifies the pattern of days of the week that the power time scheme covers.

Valid values are (singly or a list of) Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday, Weekdays and Weekend.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroupUid<Int32>

Specifies the desktop group that the power time scheme applies to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DisplayName<String>

Specifies the name of the new power time scheme as displayed in the DesktopStudio console. Each scheme associated with a desktop group must have a display name which is unique within its desktop group, although the same display name can be used on power schemes for different desktop groups.

Required?	false

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PeakHours<Boolean[]>

A set of 24 boolean flag values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag is $true it means that the associated hour of the day is considered a peak time; if $false it means that it is considered off-peak.

Required?	false
Default Value	24 $false values, meaning all hours are off-peak
Accept Pipeline Input?	true (ByPropertyName)

-PoolSize<Int32[]>

A set of 24 integer values, one for each hour of the day. The first value in the array relates to midnight to 00:59, the next one to 1 AM to 01:59 and so on, with the last array element relating to 11 PM to 11:59. The value defines the number of machines (either as an absolute number or a percentage of the machines in the desktop group) that are to be maintained in a running state, whether they are in use or not. A value of -1 has special meaning: pool size management does not apply during such hours.

Required?	false
Default Value	24 values of '-1', meaning no pool size management is to be performed
Accept Pipeline Input?	true (ByPropertyName)

-PoolUsingPercentage<Boolean>

A boolean flag to indicate whether the integer values in the pool size array are to be treated as absolute values (if this value is $false) or as percentages of the number of machines in the desktop group (if this value is $true).

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.PowerTimeScheme

New-BrokerPowerTimeScheme returns the newly created power time scheme.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerPowerTimeScheme -Name 'First Half Week' -DaysOfWeek Weekend,Monday,Tuesday -DesktopGroupUid 3 -PeakHours (0..23 | %{ $_ -gt 8 -and $_ -lt 18 })
Creates a new scheme attached to the desktop group whose UID value is 3. This new scheme covers the weekend and Monday and Tuesday, and defines 'peak' hours as 9am to 17:59, with all other times being 'off-peak'. No pool size values are supplied, so all size values for all the hours default to -1.

New-BrokerRebootSchedule

Apr 15, 2014

Creates a new reboot schedule for a desktop group.

Syntax

New-BrokerRebootSchedule [-DesktopGroupName] <String> -RebootDuration <Int32> [-Day <RebootScheduleDays>] [-Enabled <Boolean>] [-Frequency <RebootScheduleFrequency>] [-StartTime <TimeSpan>] [-WarningDuration <Int32>] [-WarningMessage <String>] [-WarningTitle <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-BrokerRebootSchedule -DesktopGroupUid <Int32> -RebootDuration <Int32> [-Day <RebootScheduleDays>] [-Enabled <Boolean>] [-Frequency <RebootScheduleFrequency>] [-StartTime <TimeSpan>] [-WarningDuration <Int32>] [-WarningMessage <String>] [-WarningTitle <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerRebootSchedule cmdlet is used to define a reboot schedule for a desktop group.

Related topics

Get-BrokerRebootSchedule

Set-BrokerRebootSchedule

Remove-BrokerRebootSchedule

Start-BrokerRebootCycle

Parameters

-DesktopGroupName<String>

The name of the desktop group that this reboot schedule is applied to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-RebootDuration<Int32>

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroupUid<Int32>

The Uid of the desktop group that this reboot schedule is applied to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Day<RebootScheduleDays>

For weekly schedules, the day of the week on which the scheduled reboot-cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Boolean that indicates if the new reboot schedule is enabled.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Frequency<RebootScheduleFrequency>

Frequency with which this schedule runs (either Weekly or Daily).

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-StartTime<TimeSpan>

Time of day at which the scheduled reboot cycle starts (HH:MM).

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-WarningDuration<Int32>

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-WarningMessage<String>

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-WarningTitle<String>

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.RebootSchedule

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> New-BrokerRebootSchedule -DesktopGroupName BankTellers -Frequency Daily -StartTime "02:00" -Enabled $true -Duration 120
```

Schedules the machines in the desktop group named 'BankTellers' to be rebooted every night between 2 AM and 4 AM.

---------- **EXAMPLE 2** ----------

C:\PS> New-BrokerRebootSchedule -DesktopGroupUid 17 -Frequency Weekly -Day Saturday -StartTime "01:00" -Enabled $true -Duration 240 -WarningTitle "WARNING: Reboot pending" -WarningMes

Schedules the machines in the desktop group having Uid 17 to be rebooted every Saturday night between 1 AM and 5 AM. Ten minutes prior to rebooting, each machine will display a message box with the title "WARNING: Reboot pending" and message "Save your work" in every user session.

New-BrokerRemotePCAccount

Apr 15, 2014

Create a new RemotePCAccount.

Syntax

New-BrokerRemotePCAccount -CatalogUid <Int32> -OU <String> [-AllowSubfolderMatches <Boolean>] [-MachinesExcluded <String[]>] [-MachinesIncluded <String[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Create a new RemotePCAccount. A RemotePCAccount defines machine filters to support Remote PC automation adding unconfigured machines to catalogs.

Related topics

Get-BrokerRemotePCAccount

Set-BrokerRemotePCAccount

Remove-BrokerRemotePCAccount

Parameters

-CatalogUid<Int32>

Specifies the catalog which Remote PC automation adds an unconfigured machine to if it matches this RemotePCAccount.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-OU<String>

Specifies the DN of an AD container, or has the special value 'any'.

When an AD container is specified a machine may only match with the RemotePCAccount when the AD computer object is located relative to the OU.

When 'any' is specified the location of the AD computer object is ignored for purposes of matching this RemotePCAccount. The machine must still meet the MachinesIncluded and MachinesExcluded filters for a match to occur.

In the event that a machine matches with multiple RemotePCAccounts then the RemotePCAccount OU with the longest canonical name takes precedence. The special 'any' OU is treated as lowest priority.

Note that the OU value of every RemotePCAccount must be unique, and this includes only one 'any' entry being permitted.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-AllowSubfolderMatches<Boolean>

When true a machine matches this RemotePCAccount if the AD computer object exists within the container specified by the OU property, or within a child container of the OU.

When false the AD computer object only matches if it exists directly in the AD container specified by the OU property.

This property is not meaningful when OU has the special value 'any'.

Required?	false
Default Value	false
Accept Pipeline Input?	true (ByPropertyName)

-MachinesExcluded<String[]>

MachinesExcluded specifies a set of strings that can include asterisk wildcards. If a machine name matches any entries in MachinesExcluded then it cannot match with this RemotePCAccount regardless of whether there is a MachinesIncluded match.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Required?	false
Default Value	@()
Accept Pipeline Input?	true (ByPropertyName)

-MachinesIncluded<String[]>

MachinesIncluded specifies a set of strings that can include asterisk wildcards. A machine may only match with this RemotePCAccount if it matches a MachinesIncluded entry and does not match any MachinesExcluded entries.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Required?	false
Default Value	@('*')
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.RemotePCAccount

The newly created RemotePCAccount.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerRemotePCAccount -OU 'ou=MyOU,dc=MyDomain,dc=com' -CatalogUid 42
Create a RemotePCAccount that adds unconfigured machines with computer objects in MyOU, into catalog 42.

---------- EXAMPLE 2 ----------

C:\PS> New-BrokerRemotePCAccount -OU 'any' -CatalogUid 42 -MachinesIncluded @('DOMAIN1*') -MachinesExcluded @('DOMAIN1*JOHNDOE*')
Create a RemotePCAccount matching unconfigured machines from DOMAIN1, except those with hostnames containing JOHNDOE, and add them to catalog 42.

---------- EXAMPLE 3 ----------

C:\PS> New-BrokerRemotePCAccount -OU 'any' -CatalogUid 42
Create a RemotePCAccount that matches any unconfigured machine, causing automation to add matching machines to catalog 42.

New-BrokerTag

Apr 15, 2014

Creates a new tag.

Syntax

New-BrokerTag [-Name] <String> [-UUID <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creates a tag that can be associated with other objects using Add-BrokerTag.

Related topics

Add-BrokerTag

Get-BrokerTag

Remove-BrokerTag

Rename-BrokerTag

Parameters

-Name<String>

Specifies a name for the new tag.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-UUID<Guid>

Specifies a UUID for the new tag. When not specified, a UUID is automatically assigned.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None Input cannot be piped to this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.Tag

Outputs the generated tag.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-BrokerTag -Name 'Tag1'
Creates a new tag with name 'Tag1'.

---------- EXAMPLE 2 ----------

C:\PS> New-BrokerTag 'Tag2' | Add-BrokerTag -Desktop $desktop
Creates a new tag with name 'Tag2' and associates it with Desktop $desktop.

New-BrokerUser

Apr 15, 2014

Creates a new broker user object

Syntax

New-BrokerUser [-SID] <SecurityIdentifier> [-AdminAddress <String>] [<CommonParameters>]

New-BrokerUser [-Name] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The New-BrokerUser cmdlet creates a new broker object to represent a user identity (or the identity of a group of users). The object is created local to the PowerShell environment in which the cmdlet is run; no new user object is created in the broker configuration, unless the object is added to another broker object, such as a machine or a desktop. For details, see Add-BrokerUser.

The identity of the user or group must be specified using either the Name or SID parameter

Related topics

Add-BrokerUser

Get-BrokerUser

Remove-BrokerUser

Parameters

-SID<SecurityIdentifier>

The SID of the user or group

Required?	true
Default Value	null
Accept Pipeline Input?	false

-Name<String>

The name of the user or group

Required?	true
Default Value	null
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.Broker.Admin.SDK.User

The broker user object

Notes

Typically, broker user objects are created implicitly using the Add-BrokerUser cmdlet with a user name or SID.

Examples

---------- EXAMPLE 1 ----------

```
$user = New-BrokerUser DOMAIN\UserName
```

Create a broker user object for the specified user.

---------- EXAMPLE 2 ----------

```
$user = New-BrokerUser -SID S-1-5-23-1763203430-193137401-908696819-3450
```

Create a broker user object for the specified user.

Remove-BrokerAccessPolicyRule

Apr 15, 2014

Deletes a rule from the site's access policy.

Syntax

Remove-BrokerAccessPolicyRule [-InputObject] <AccessPolicyRule[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerAccessPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAccessPolicyRule cmdlet deletes a rule from the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Deleting a rule does not affect existing user sessions, but it may result in users being unable to launch new sessions, or reconnect to disconnected sessions if access to the desktop group delivering those sessions was granted by the deleted rule.

Related topics

New-BrokerAccessPolicyRule

Get-BrokerAccessPolicyRule

Set-BrokerAccessPolicyRule

Rename-BrokerAccessPolicyRule

Parameters

-InputObject<AccessPolicyRule[]>

The access policy rule to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the access policy rule to be deleted.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AccessPolicyRule The access policy rule to be deleted.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerAccessPolicyRule 'Temp Staff'
Deletes the access policy rule called Temp Staff. Existing sessions are not affected, but if access was granted by the deleted rule users may be unable to reconnect to sessions if they are subsequently disconnected.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerAccessPolicyRule -IncludedUsers sales\johndoe | Remove-BrokerAccessPolicyRule
Deletes all access policy rules explicitly granting user SALES\johndoe access to any desktop group in the site. Any existing desktop sessions for the user are not affected. The user may still be able to access site resources by access policy rules that grant access through group membership or non-user-based connection filters.

Remove-BrokerAccessPolicyRuleMetadata

Apr 15, 2014

Deletes AccessPolicyRule Metadata from the AccessPolicyRule objects

Syntax

Remove-BrokerAccessPolicyRuleMetadata [-InputObject] <AccessPolicyRule[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAccessPolicyRuleMetadata cmdlet deletes Metadata from the AccessPolicyRule objects.

Related topics

Parameters

-InputObject<AccessPolicyRule[]>

Specifies the AccessPolicyRule object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule You can pipe the AccessPolicyRule to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerAccessPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the AccessPolicyRule whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerAccessPolicyRuleMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the AccessPolicyRule in the site

Remove-BrokerAppAssignmentPolicyRule

Apr 15, 2014

Deletes an application rule from the site's assignment policy.

Syntax

Remove-BrokerAppAssignmentPolicyRule [-InputObject] <AppAssignmentPolicyRule[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerAppAssignmentPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAppAssignmentPolicyRule cmdlet deletes an application rule from the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Deleting an application rule does not remove machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Related topics

New-BrokerAppAssignmentPolicyRule

Get-BrokerAppAssignmentPolicyRule

Set-BrokerAppAssignmentPolicyRule

Rename-BrokerAppAssignmentPolicyRule

Parameters

-InputObject<AppAssignmentPolicyRule[]>

The application rule to be deleted from the assignment policy.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the application rule to be deleted from the assignment policy.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule The application rule to be deleted from the assignment policy.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerAppAssignmentPolicyRule 'Temp Staff'
Deletes the application rule called Temp Staff from the assignment policy. Access to machines already assigned by this rule is not affected in any way.

---------- EXAMPLE 2 ----------

C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'
C:\PS> Get-BrokerAppAssignmentPolicyRule -DesktopGroupUid $dg.Uid | Remove-BrokerAppAssignmentPolicyRule
Deletes the application rule for the Sales Support desktop group from the site's assignment policy. This prevents any further machine assignments being made from this group, but it does not affect existing assignments made by the rule.

Remove-BrokerAppEntitlementPolicyRule

Apr 15, 2014

Deletes an application rule from the site's entitlement policy.

Syntax

Remove-BrokerAppEntitlementPolicyRule [-InputObject] <AppEntitlementPolicyRule[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerAppEntitlementPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAppEntitlementPolicyRule cmdlet deletes an application rule from the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Deleting a rule does not affect existing sessions launched using the rule, but users cannot reconnect to those sessions if they are subsequently disconnected.

Related topics

New-BrokerAppEntitlementPolicyRule

Get-BrokerAppEntitlementPolicyRule

Set-BrokerAppEntitlementPolicyRule

Rename-BrokerAppEntitlementPolicyRule

Parameters

-InputObject<AppEntitlementPolicyRule[]>

The application rule to be deleted from the entitlement policy.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the application rule to be deleted from the entitlement policy.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule The application rule to be deleted from the entitlement policy.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Remove-BrokerAppEntitlementPolicyRule 'Temp Workers'
```

Deletes the application rule called Temp Workers from the entitlement policy rule. Existing application sessions launched using that rule are not affected, but users cannot reconnect to those sessions if they are subsequently disconnected.

---------- EXAMPLE 2 ----------

```
C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'
C:\PS> Get-BrokerAppEntitlementPolicyRule -DesktopGroupUid $dg.Uid | Remove-BrokerAppEntitlementPolicyRule
```

Deletes the application rule from the entitlement policy rule applied to the Customer Support desktop group. This effectively removes all access to the applications published from this group. Existing application sessions are not affected, but users cannot reconnect to those sessions if they are subsequently disconnected.

Remove-BrokerApplication

Apr 15, 2014

Deletes one or more applications, or an association of an application.

Syntax

Remove-BrokerApplication [-InputObject] <Application[]> [-Force] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerApplication [-Name] <String> [-Force] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerApplication cmdlet deletes one or more applications, or you can use it to delete just the association of an application to a desktop group.

Its usage dictates the behavior of the cmdlet. If only the application is specified as a parameter, then the cmdlet deletes the application. It also deletes any associations this application has with other objects, such as with access policy rules or desktop groups. More specifically, when an application is deleted the following happens:

o The association to any desktop groups is removed.

o The association to any tags is removed.

o Any configured file-type association objects for this application are deleted.

o The association to any user accounts is removed.

o The association to any access session conditions is removed.

o The access policy rule object for this application, if one existed, is deleted.

o Finally, the application object itself is deleted.

Note that if the application is in use by a user then the application cannot be deleted.

If more than just the application is supplied as a parameter to the cmdlet (for instance, if a DesktopGroup object is also specified) then the application is not deleted. Instead, only the association from the application to that desktop group is removed.

Related topics

New-BrokerApplication

Add-BrokerApplication

Get-BrokerApplication

Rename-BrokerApplication

Set-BrokerApplication

Parameters

-InputObject<Application[]>

Specifies the applications to delete. The Uid can also be substituted for the application objects.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the application to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Force<SwitchParameter>

Remove application even if it's in use. Removing an application that is currently in use, can potentially leave an application session containing no applications. If all the applications that are currently active in a disconnected application session are removed, the user will be unable to reconnect to the session. Forcing removal of an in-use application does not impact the actual session itself.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-DesktopGroup<DesktopGroup>

Specifies the desktop group that this application should no longer be associated with. The Uid or Name can also be substituted for the desktop group object.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level

Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Application The application objects can be specified as input.

Return Values

None

This cmdlet does not return any output.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerApplication "Notepad"
This command deletes the application that has a BrowserName of "Notepad".

---------- EXAMPLE 2 ----------

C:\PS> $app = Get-BrokerApplication -BrowserName "Notepad"
C:\PS> $group = Get-BrokerDesktopGroup -Name "Private DesktopGroup"
C:\PS> Remove-BrokerApplication -InputObject $app -DesktopGroup $group
This command removes the association of the desktop group that has a name of "Private DesktopGroup" from the application that has a BrowserName of "Notepad". It does not otherwise modify the application.

Remove-BrokerApplicationInstanceMetadata

Apr 15, 2014

Deletes ApplicationInstance Metadata from the ApplicationInstance objects

Syntax

Remove-BrokerApplicationInstanceMetadata [-InputObject] <ApplicationInstance[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerApplicationInstanceMetadata cmdlet deletes Metadata from the ApplicationInstance objects.

Related topics

Parameters

-InputObject<ApplicationInstance[]>

Specifies the ApplicationInstance object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerApplicationInstance You can pipe the ApplicationInstance to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerApplicationInstanceMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the ApplicationInstance whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerApplicationInstanceMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the ApplicationInstance in the site

Remove-BrokerApplicationMetadata

Apr 15, 2014

Deletes Application Metadata from the Application objects

Syntax

Remove-BrokerApplicationMetadata [-InputObject] <Application[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerApplicationMetadata cmdlet deletes Metadata from the Application objects.

Related topics

Parameters

-InputObject<Application[]>

Specifies the Application object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerApplication You can pipe the Application to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerApplicationMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Application whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerApplicationMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Application in the site

Remove-BrokerAssignmentPolicyRule

Apr 15, 2014

Deletes a desktop rule from the site's assignment policy.

Syntax

Remove-BrokerAssignmentPolicyRule [-InputObject] <AssignmentPolicyRule[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerAssignmentPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAssignmentPolicyRule cmdlet deletes a desktop rule from the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Deleting a desktop rule does not remove machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Related topics

New-BrokerAssignmentPolicyRule

Get-BrokerAssignmentPolicyRule

Set-BrokerAssignmentPolicyRule

Rename-BrokerAssignmentPolicyRule

Parameters

-InputObject<AssignmentPolicyRule[]>

The desktop rule to be deleted from the assignment policy.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the desktop rule to be deleted from the assignment policy.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AssignmentPolicyRule The desktop rule to be deleted from the assignment policy.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerAssignmentPolicyRule 'Temp Staff'
Deletes the desktop rule called Temp Staff from the assignment policy. Access to machines already assigned by this rule is not affected in any way.

---------- EXAMPLE 2 ----------

C:\PS> $dg = Get-BrokerDesktopGroup 'Sales Support'
C:\PS> Get-BrokerAssignmentPolicyRule -DesktopGroupUid $dg.Uid | Remove-BrokerAssignmentPolicyRule
Deletes all desktop rules for the Sales Support desktop group from the site's assignment policy. This prevents any further machine assignments being made from this group, but it does not affect existing assignments made by these rules.

Remove-BrokerAssignmentPolicyRuleMetadata

Apr 15, 2014

Deletes AssignmentPolicyRule Metadata from the AssignmentPolicyRule objects

Syntax

Remove-BrokerAssignmentPolicyRuleMetadata [-InputObject] <AssignmentPolicyRule[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerAssignmentPolicyRuleMetadata cmdlet deletes Metadata from the AssignmentPolicyRule objects.

Related topics

Parameters

-InputObject<AssignmentPolicyRule[]>

Specifies the AssignmentPolicyRule object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule You can pipe the AssignmentPolicyRule to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerAssignmentPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the AssignmentPolicyRule whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerAssignmentPolicyRuleMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the AssignmentPolicyRule in the site

Remove-BrokerCatalog

Apr 15, 2014

Removes catalogs from the site.

Syntax

Remove-BrokerCatalog [-InputObject] <Catalog[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerCatalog [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Remove catalogs from the site.

In order to remove a catalog from a site, the catalog must not contain machines. To remove a machine from a catalog use the Remove-BrokerMachine cmdlet. Note: in order to remove a machine from a catalog, it must not belong to a desktop group.

Related topics

Add-BrokerCatalog

Get-BrokerCatalog

New-BrokerCatalog

Rename-BrokerCatalog

Set-BrokerCatalog

Add-BrokerDesktopGroup

Remove-BrokerDesktopGroup

Parameters

-InputObject<Catalog[]>

Specifies the catalog objects to delete.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the catalog to delete.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Catalog You can pipe the catalogs to be deleted to Remove-BrokerCatalog.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerCatalog -Name "MyCatalog"
C:\PS> Remove-BrokerCatalog -InputObject (Get-BrokerCatalog -Name "MyCatalog")
These commands delete the catalog with the name "MyCatalog".

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerCatalog -Name 'test*'
This command deletes all catalogs with names beginning with "test".

---------- EXAMPLE 3 ----------

C:\PS> Get-BrokerCatalog -RemotePCDesktopGroupUid 42 | Remove-BrokerCatalog -RemotePCDesktopGroup 42
Remove all the Remote PC catalogs that are associated with desktop group 42. Note that this only breaks the Remote PC

relationships and does not delete the desktop groups.

Remove-BrokerCatalogMetadata

Apr 15, 2014

Deletes Catalog Metadata from the Catalog objects

Syntax

Remove-BrokerCatalogMetadata [-InputObject] <Catalog[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerCatalogMetadata cmdlet deletes Metadata from the Catalog objects.

Related topics

Parameters

-InputObject<Catalog[]>

Specifies the Catalog object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerCatalog You can pipe the Catalog to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerCatalogMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Catalog whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerCatalogMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Catalog in the site

Remove-BrokerConfigurationSlot

Apr 15, 2014

Removes a configuration slot.

Syntax

Remove-BrokerConfigurationSlot [-InputObject] <ConfigurationSlot[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerConfigurationSlot [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Removes a configuration slot from the site. All machine configurations associated with this slot are also removed.

Related topics

New-BrokerConfigurationSlot

Get-BrokerConfigurationSlot

Parameters

-InputObject<ConfigurationSlot[]>

Configuration slot to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Name of configuration slot to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Configuration slot to remove Configuration slots may be specified through pipeline input.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
Remove-BrokerConfigurationSlot -Name "User Profile Manager"
```

Remove the configuration slot named "User Profile Manager".

Remove-BrokerConfigurationSlotMetadata

Apr 15, 2014

Deletes ConfigurationSlot Metadata from the ConfigurationSlot objects

Syntax

Remove-BrokerConfigurationSlotMetadata [-InputObject] <ConfigurationSlot[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerConfigurationSlotMetadata cmdlet deletes Metadata from the ConfigurationSlot objects.

Related topics

Parameters

-InputObject<ConfigurationSlot[]>

Specifies the ConfigurationSlot object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerConfigurationSlot You can pipe the ConfigurationSlot to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerConfigurationSlotMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the ConfigurationSlot whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerConfigurationSlotMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the ConfigurationSlot in the site

Remove-BrokerConfiguredFTA

Apr 15, 2014

Deletes one or more configured file type associations.

Syntax

Remove-BrokerConfiguredFTA [-InputObject] <ConfiguredFTA[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Deletes one or more file type associations configured for a published application. At least one configured file type association object must be specified.

Related topics

Get-BrokerConfiguredFTA

New-BrokerConfiguredFTA

Parameters

-InputObject<ConfiguredFTA[]>

Specifies the ConfiguredFTA objects to delete.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.ConfiguredFTA[] One or more ConfiguredFTA objects can be supplied as input.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> $ftas = Get-BrokerConfiguredFTA -ExtensionName ".txt"
C:\PS> Remove-BrokerConfiguredFTA $ftas
Deletes all configured file type associations with an extension name of ".txt".

Remove-BrokerControllerMetadata

Apr 15, 2014

Deletes Controller Metadata from the Controller objects

Syntax

Remove-BrokerControllerMetadata [-InputObject] <Controller[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerControllerMetadata cmdlet deletes Metadata from the Controller objects.

Related topics

Parameters

-InputObject<Controller[]>

Specifies the Controller object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerController You can pipe the Controller to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerControllerMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Controller whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerControllerMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Controller in the site

Remove-BrokerDelayedHostingPowerAction

Apr 15, 2014

Cancels one or more delayed power actions.

Syntax

Remove-BrokerDelayedHostingPowerAction [-InputObject] <DelayedHostingPowerAction[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerDelayedHostingPowerAction [-MachineName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Removes one or more delayed power actions that have not yet been queued for execution.

Related topics

Get-BrokerDelayedHostingPowerAction

New-BrokerDelayedHostingPowerAction

Parameters

-InputObject<DelayedHostingPowerAction[]>

The power action to be cancelled.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

Cancels only actions for machines whose name (of the form domain\machine) matches the specified string.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.DelayedHostingPowerAction The power action to be cancelled.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Remove-BrokerHostingPowerAction -MachineName 'XD_VDA1'
```

Cancels any pending delayed power actions for the machine called XD_VDA1.

Remove-BrokerDesktopGroup

Apr 15, 2014

Remove desktop groups from the system or remove them from a Remote PC catalog.

Syntax

Remove-BrokerDesktopGroup [-InputObject] <DesktopGroup[]> [-Force] [-RemotePCCatalog <Catalog>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerDesktopGroup [-Name] <String> [-Force] [-RemotePCCatalog <Catalog>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet has 2 functions:

o Remove desktop groups from the system.

o Break Remote PC associations between desktop groups and a catalog.

The Remote PC relationships are used by Remote PC automation to determine which desktop groups a machine in a particular Remote PC catalog can be published to. The assignment policy rules belonging to those desktop groups also determines the set of users that are allowed to be assigned to machines from the catalog.

Related topics

Get-BrokerDesktopGroup

New-BrokerDesktopGroup

Set-BrokerDesktopGroup

Add-BrokerDesktopGroup

Rename-BrokerDesktopGroup

Add-BrokerCatalog

Remove-BrokerCatalog

Parameters

-InputObject<DesktopGroup[]>

Specifies the desktop groups to remove.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the desktop group to remove.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-Force<SwitchParameter>

Remove desktop groups even if there are active sessions.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-RemotePCCatalog<Catalog>

When this parameter is specified, Remote PC desktop groups are removed from the specified Remote PC catalog.

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.

Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.DesktopGroup You can pipe desktop groups to Remove-BrokerDesktopGroup.

Return Values

None

Notes

If a desktop group contains desktops when it is removed, these desktops are also removed (but the underlying broker machine remains).

A desktop group that still has active sessions cannot be removed unless the -Force switch is used.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerDesktopGroup EMEA*
Remove all desktop groups with names starting with "EMEA".

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerDesktopGroup -Enabled $false | Remove-BrokerDesktopGroup -Force
Remove all desktops that are currently disabled even if there are active sessions.

---------- EXAMPLE 3 ----------

C:\PS> Get-BrokerDesktopGroup -RemotePCCatalogUid 42 | Remove-BrokerDesktopGroup -RemotePCCatalog 42
Remove all the Remote PC desktop groups that are associated with catalog 42. Note that this only breaks the Remote PC relationships and does not delete the desktop groups.

Remove-BrokerDesktopGroupMetadata

Apr 15, 2014

Deletes DesktopGroup Metadata from the DesktopGroup objects

Syntax

Remove-BrokerDesktopGroupMetadata [-InputObject] <DesktopGroup[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerDesktopGroupMetadata cmdlet deletes Metadata from the DesktopGroup objects.

Related topics

Parameters

-InputObject<DesktopGroup[]>

Specifies the DesktopGroup object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerDesktopGroup You can pipe the DesktopGroup to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerDesktopGroupMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the DesktopGroup whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerDesktopGroupMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the DesktopGroup in the site

Remove-BrokerEntitlementPolicyRule

Apr 15, 2014

Deletes a desktop rule from the site's entitlement policy.

Syntax

Remove-BrokerEntitlementPolicyRule [-InputObject] <EntitlementPolicyRule[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerEntitlementPolicyRule [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerEntitlementPolicyRule cmdlet deletes a desktop rule from the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Deleting a rule does not affect existing sessions launched using the rule, but users cannot reconnect to those sessions if they are subsequently disconnected.

Related topics

New-BrokerEntitlementPolicyRule

Get-BrokerEntitlementPolicyRule

Set-BrokerEntitlementPolicyRule

Rename-BrokerEntitlementPolicyRule

Parameters

-InputObject<EntitlementPolicyRule[]>

The desktop rule to be deleted from the entitlement policy.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the desktop rule to be deleted from the entitlement policy.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.EntitlementPolicyRule The desktop rule to be deleted from the entitlement policy.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerEntitlementPolicyRule 'Temp Workers'
Deletes the desktop rule called Temp Workers from the entitlement policy. Existing desktop sessions launched using the rule are not affected, but users cannot reconnect to sessions if they are subsequently disconnected.

---------- EXAMPLE 2 ----------

C:\PS> $dg = Get-BrokerDesktopGroup 'Customer Support'
C:\PS> Get-BrokerEntitlementPolicyRule -DesktopGroupUid $dg.Uid | Remove-BrokerEntitlementPolicyRule
Deletes all desktop rules from the entitlement policy applying to the Customer Support desktop group. This effectively removes all access to the desktops published from this group. Existing desktop sessions are not affected, but users cannot reconnect to sessions if they are subsequently disconnected.

Remove-BrokerEntitlementPolicyRuleMetadata

Apr 15, 2014

Deletes EntitlementPolicyRule Metadata from the EntitlementPolicyRule objects

Syntax

Remove-BrokerEntitlementPolicyRuleMetadata [-InputObject] <EntitlementPolicyRule[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerEntitlementPolicyRuleMetadata cmdlet deletes Metadata from the EntitlementPolicyRule objects.

Related topics

Parameters

-InputObject<EntitlementPolicyRule[]>

Specifies the EntitlementPolicyRule object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule You can pipe the EntitlementPolicyRule to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerEntitlementPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the EntitlementPolicyRule whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerEntitlementPolicyRuleMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the EntitlementPolicyRule in the site

Remove-BrokerHostingPowerAction

Apr 15, 2014

Cancel one or more pending power actions.

Syntax

Remove-BrokerHostingPowerAction [-InputObject] <HostingPowerAction[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerHostingPowerAction [-MachineName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Causes one or more of the pending power actions in the queue to be marked as cancelled. The affected power actions are not sent to the hypervisor for processing, and take no further part in the queuing activity.

Power actions cannot be cancelled once they have started to be processed by the hypervisor.

Related topics

Get-BrokerHostingPowerAction

New-BrokerHostingPowerAction

Set-BrokerHostingPowerAction

Parameters

-InputObject<HostingPowerAction[]>

The power action to be cancelled.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

Cancels only actions for machines whose name (of the form domain\machine) matches the specified string.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.HostingPowerAction The power action to be cancelled.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerHostingPowerAction -MachineName 'XD_VDA1'
Cancels any pending power actions for the machine called 'XD_VDA1'.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerHostingPowerAction -Filter { State -eq "Pending" -and RequestTime -gt "-00:05" } | Remove-BrokerHostingPowerAction
Cancels any pending power actions requested in the last five minutes.

Remove-BrokerHostingPowerActionMetadata

Apr 15, 2014

Deletes HostingPowerAction Metadata from the HostingPowerAction objects

Syntax

Remove-BrokerHostingPowerActionMetadata [-InputObject] <HostingPowerAction[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerHostingPowerActionMetadata cmdlet deletes Metadata from the HostingPowerAction objects.

Related topics

Parameters

-InputObject<HostingPowerAction[]>

Specifies the HostingPowerAction object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerHostingPowerAction You can pipe the HostingPowerAction to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerHostingPowerActionMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the HostingPowerAction whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerHostingPowerActionMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the HostingPowerAction in the site

Remove-BrokerHypervisorAlertMetadata

Apr 15, 2014

Deletes HypervisorAlert Metadata from the HypervisorAlert objects

Syntax

Remove-BrokerHypervisorAlertMetadata [-InputObject] <HypervisorAlert[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerHypervisorAlertMetadata cmdlet deletes Metadata from the HypervisorAlert objects.

Related topics

Parameters

-InputObject<HypervisorAlert[]>

Specifies the HypervisorAlert object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerHypervisorAlert You can pipe the HypervisorAlert to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerHypervisorAlertMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the HypervisorAlert whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerHypervisorAlertMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the HypervisorAlert in the site

Remove-BrokerHypervisorConnection

Apr 15, 2014

Removes a hypervisor connection from the system.

Syntax

Remove-BrokerHypervisorConnection [-InputObject] <HypervisorConnection[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerHypervisorConnection [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Remove-BrokerHypervisorConnection removes a hypervisor connection from the system. A hypervisor connection cannot be removed if it's being used by a machine.

Related topics

Get-BrokerHypervisorConnection

Set-BrokerHypervisorConnection

New-BrokerHypervisorConnection

Parameters

-InputObject<HypervisorConnection[]>

Specifies the hypervisor connection object to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the hypervisor connection object to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop

Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.HypervisorConnection You can pipe the hypervisor connection to be removed to Remove-BrokerHypervisorConnection.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
c:\PS> Remove-BrokerHypervisorConnection -Name "Xen Server Connection"
```

This command removes a hypervisor connection by name.

---------- EXAMPLE 2 ----------

```
c:\PS> $hvConn = Get-BrokerHypervisorConnection -PreferredController "controllerName" -Name "Xen Server Connection"
c:\PS> Remove-BrokerHypervisorConnection -InputObject $hvConn
```

Gets a hypervisor connection by preferred controller and removes it.

Remove-BrokerHypervisorConnectionMetadata

Apr 15, 2014

Deletes HypervisorConnection Metadata from the HypervisorConnection objects

Syntax

Remove-BrokerHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerHypervisorConnectionMetadata cmdlet deletes Metadata from the HypervisorConnection objects.

Related topics

Parameters

-InputObject<HypervisorConnection[]>

Specifies the HypervisorConnection object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerHypervisorConnection You can pipe the HypervisorConnection to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerHypervisorConnectionMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the HypervisorConnection whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerHypervisorConnectionMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the HypervisorConnection in the site

Remove-BrokerIcon

Apr 15, 2014

Remove an icon.

Syntax

Remove-BrokerIcon [-InputObject] <Icon[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Removes an icon from the database.

Related topics

Add-BrokerIcon

New-BrokerIcon

Parameters

-InputObject<Icon[]>

Specifies the icon to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.

Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Icon The icon to be removed can be piped into the cmdlet.

Return Values

None

Notes

Note that if the icon is currently in use, for example, as a desktop icon, it cannot be removed until the association is cleared.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerIcon 3
Removes the icon with Uid 3.

Remove-BrokerIconMetadata

Apr 15, 2014

Deletes Icon Metadata from the Icon objects

Syntax

Remove-BrokerIconMetadata [-InputObject] <Icon[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerIconMetadata cmdlet deletes Metadata from the Icon objects.

Related topics

Parameters

-InputObject<Icon[]>

Specifies the Icon object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerIcon You can pipe the Icon to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerIconMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Icon whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerIconMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Icon in the site

Remove-BrokerImportedFTA

Apr 15, 2014

Deletes one or more imported file type associations.

Syntax

Remove-BrokerImportedFTA -DesktopGroupUids <Int32[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Deletes all of the imported file type associations belonging to one or more desktop groups. At least one desktop group must be specified.

Imported file type associations are grouped together based on the desktop group of the machine from which they were imported. All file types for a desktop group are deleted. There is no mechanism for deleting a subset imported file type associations for a specific desktop group.

Imported file type associations are different from configured file type associations. Imported file type associations are lists of known file type associations for a given desktop group. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection.

Related topics

Get-BrokerImportedFTA

Update-BrokerImportedFTA

Parameters

-DesktopGroupUids<Int32[]>

Deletes the imported file type associations belonging to specified desktop groups.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Int32[] An array of Uids for the desktop groups can be supplied as input. The desktop groups must be of the Private or Shared desktop kind.

Return Values

None

Notes

If an imported file type association is used to create a new configured file type association and the imported file type association is subsequently deleted, the configured file type association is not affected.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $dg = Get-BrokerDesktopGroup -Name "Sales VMs"
C:\PS> Remove-BrokerImportedFTA -DesktopGroupUids $dg.Uid
```

Deletes all imported file type associations belonging to the "Sales VMs" desktop group.

Remove-BrokerMachine

Apr 15, 2014

Removes one or more machines from its desktop group or catalog.

Syntax

Remove-BrokerMachine [-InputObject] <Machine[]> [-Force] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerMachine [-MachineName] <String> [-Force] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerMachine cmdlet removes one or more machines from their desktop group or catalog. There are three forms:

o Use the -InputObject parameter to remove a single machine instance or array of instances from their desktop group or catalog.

o Use the -MachineName parameter to remove the single named machine from its group or catalog.

o Use pipelining to pipe machine instances to the command.

To remove machines from their desktop group use the -DesktopGroup parameter; the specified group must be the one that contains the machines. If more than one machine is being removed from its group they must all be members of the same group.

If the -DesktopGroup parameter is not used then the machines are removed from their catalog. Removing a machine from its catalog deletes the record of the machine from the Citrix Broker Service.

Machines cannot be removed from their catalog while they are members of a desktop group.

Related topics

Add-BrokerMachine

Get-BrokerMachine

Parameters

-InputObject<Machine[]>

An array of machines to be removed from their desktop group or catalog.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

The name of the single machine to remove (must match the MachineName property of the machine).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Force<SwitchParameter>

Forces removal of machine from a desktop group even if it is still in use (that is, there are user sessions running on the machine). Forcing removal of a machine does not disconnect or logoff the user sessions.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroup<DesktopGroup>

The desktop group from which the machines are to be removed, specified by name, UID, or instance.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Machine You can pipe in the machines to be removed.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerMachine -InputObject $machine -DesktopGroup $desktopGroup
C:\PS> Remove-BrokerMachine -InputObject $machine -DesktopGroup 2
C:\PS> Remove-BrokerMachine $machine -DesktopGroup "MyDesktopGroup"
These all remove a single machine from a desktop group, identifying the group by instance, UID, or name.

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerMachine -MachineName "DOMAIN\MyMachine" -DesktopGroup 2
C:\PS> Remove-BrokerMachine DOMAIN\MyMachine -DesktopGroup "MyDesktopGroup"
C:\PS> Remove-BrokerMachine DOMAIN\MyMachine -DesktopGroup $desktopGroup
These remove the machine called "DOMAIN\MyMachine" from its desktop group.

---------- EXAMPLE 3 ----------

C:\PS> Remove-BrokerMachine -MachineName DOMAIN\MyMachine
C:\PS> Remove-BrokerMachine "DOMAIN\MyMachine"
C:\PS> Remove-BrokerMachine $machine
These all remove a machine from its catalog.

---------- EXAMPLE 4 ----------

C:\PS> Get-BrokerMachine -Uid 3 | Remove-BrokerMachine -DesktopGroup $dg
C:\PS> Get-BrokerMachine -CatalogUid 4 | Remove-BrokerMachine
These find specific machines and remove them from their desktop group or catalog.

Remove-BrokerMachineCommand

Apr 15, 2014

Cancel a pending command queued for delivery to a desktop.

Syntax

Remove-BrokerMachineCommand [-InputObject] <MachineCommand[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the state of a pending command queued for delivery to a desktop to Canceled. The command is not removed from the system.

Related topics

Get-BrokerMachineCommand

New-BrokerMachineCommand

Parameters

-InputObject<MachineCommand[]>

Commands to cancel.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.MachineCommand Commands to cancel.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
Get-BrokerMachineCommand | Remove-BrokerMachineCommand
```

Cancel all pending commands.

---------- EXAMPLE 2 ----------

```
Get-BrokerMachineCommand -Category "UPM" | Remove-BrokerMachineCommand
```

Cancel all pending commands that have the category "UPM".

Remove-BrokerMachineCommandMetadata

Apr 15, 2014

Deletes MachineCommand Metadata from the MachineCommand objects

Syntax

Remove-BrokerMachineCommandMetadata [-InputObject] <MachineCommand[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerMachineCommandMetadata cmdlet deletes Metadata from the MachineCommand objects.

Related topics

Parameters

-InputObject<MachineCommand[]>

Specifies the MachineCommand object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerMachineCommand You can pipe the MachineCommand to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerMachineCommandMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the MachineCommand whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerMachineCommandMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the MachineCommand in the site

Remove-BrokerMachineConfiguration

Apr 15, 2014

Deletes a machine configuration from the site or removes the association from a desktop group.

Syntax

Remove-BrokerMachineConfiguration [-InputObject] <MachineConfiguration[]> [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerMachineConfiguration [-Name] <String> [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-MachineConfiguration cmdlet deletes machine configurations from the site. A machine configuration cannot be removed while it is applied to a desktop group.

When a desktop group is provided, the Remove-MachineConfiguration cmdlet removes the association between machine configuration and the desktop group. In this case, the machine configuration is not removed from the site.

Related topics

New-BrokerMachineConfiguration

Get-BrokerMachineConfiguration

Set-BrokerMachineConfiguration

Rename-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Parameters

-InputObject<MachineConfiguration[]>

Machine configuration to remove.

Required?	true
Default Value	None
Accept Pipeline Input?	true (ByValue)

-Name<String>

Name of machine configuration for which the remove operation applies.

Required?	true
Default Value	None

Accept Pipeline Input?	true (ByPropertyName)

-DesktopGroup<DesktopGroup>

The desktop group from which this machine configuration is to be removed.

Required?	false
Default Value	None
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.MachineConfiguration Machine configuration to remove

Return Values

None

Notes

A machine configuration can only be removed if it is not currently applied to a desktop group.

Examples

---------- EXAMPLE 1 ----------

Remove-BrokerMachineConfiguration -Name UPM\Finance
Removes the machine configuration named "UPM\Finance".

---------- EXAMPLE 2 ----------

Remove-BrokerMachineConfiguration -Name Receiver\HumanResources -DesktopGroup SharedWorkers
Removes the association of the machine configuration named "Receiver\HumanResources" from the "SharedWorkers" desktop group.

Remove-BrokerMachineConfigurationMetadata

Apr 15, 2014

Deletes MachineConfiguration Metadata from the MachineConfiguration objects

Syntax

Remove-BrokerMachineConfigurationMetadata [-InputObject] <MachineConfiguration[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerMachineConfigurationMetadata cmdlet deletes Metadata from the MachineConfiguration objects.

Related topics

Parameters

-InputObject<MachineConfiguration[]>

Specifies the MachineConfiguration object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerMachineConfiguration You can pipe the MachineConfiguration to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerMachineConfigurationMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the MachineConfiguration whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerMachineConfigurationMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the MachineConfiguration in the site

Remove-BrokerMachineMetadata

Apr 15, 2014

Deletes Machine Metadata from the Machine objects

Syntax

Remove-BrokerMachineMetadata [-InputObject] <Machine[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerMachineMetadata cmdlet deletes Metadata from the Machine objects.

Related topics

Parameters

-InputObject<Machine[]>

Specifies the Machine object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerMachine You can pipe the Machine to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerMachineMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Machine whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerMachineMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Machine in the site

Remove-BrokerPowerTimeScheme

Apr 15, 2014

Deletes an existing power time scheme.

Syntax

Remove-BrokerPowerTimeScheme [-InputObject] <PowerTimeScheme[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerPowerTimeScheme [-Name] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerPowerTimeScheme cmdlet deletes a power time scheme from the system, and leaves the days that the time scheme used to cover for the associated desktop group as defaulting to all hours off-peak and all hours with pool size of -1.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

Rename-BrokerPowerTimeScheme

Parameters

-InputObject<PowerTimeScheme[]>

The power time scheme to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the power time scheme to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.PowerTimeScheme The power time scheme to be deleted.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerPowerTimeScheme -Name 'Development Weekdays'
Deletes the power time scheme named 'Development Weekdays'.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerPowerTimeScheme -DesktopGroupUid (Get-BrokerDesktopGroup -name 'Finance desk1').Uid | Remove-BrokerPowerTimeScheme
Deletes all power time schemes for the desktop group named 'Finance desk1'.

Remove-BrokerPowerTimeSchemeMetadata

Apr 15, 2014

Deletes PowerTimeScheme Metadata from the PowerTimeScheme objects

Syntax

Remove-BrokerPowerTimeSchemeMetadata [-InputObject] <PowerTimeScheme[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerPowerTimeSchemeMetadata cmdlet deletes Metadata from the PowerTimeScheme objects.

Related topics

Parameters

-InputObject<PowerTimeScheme[]>

Specifies the PowerTimeScheme object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme You can pipe the PowerTimeScheme to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerPowerTimeSchemeMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the PowerTimeScheme whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerPowerTimeSchemeMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the PowerTimeScheme in the site

Remove-BrokerRebootCycleMetadata

Apr 15, 2014

Deletes RebootCycle Metadata from the RebootCycle objects

Syntax

Remove-BrokerRebootCycleMetadata [-InputObject] <RebootCycle[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerRebootCycleMetadata cmdlet deletes Metadata from the RebootCycle objects.

Related topics

Parameters

-InputObject<RebootCycle[]>

Specifies the RebootCycle object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerRebootCycle You can pipe the RebootCycle to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerRebootCycleMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the RebootCycle whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerRebootCycleMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the RebootCycle in the site

Remove-BrokerRebootSchedule

Apr 15, 2014

Removes the reboot schedule.

Syntax

Remove-BrokerRebootSchedule [-InputObject] <RebootSchedule[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerRebootSchedule [-DesktopGroupName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerRebootSchedule cmdlet is used to delete an existing reboot schedule.

Related topics

Get-BrokerRebootSchedule

Set-BrokerRebootSchedule

New-BrokerRebootSchedule

Stop-BrokerRebootCycle

Parameters

-InputObject<RebootSchedule[]>

The reboot schedule to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-DesktopGroupName<String>

The name of the desktop group whose reboot schedule is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop

Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.RebootSchedule Reboot schedules may be specified through pipeline input.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerRebootSchedule | Remove-BrokerRebootSchedule
Deletes every reboot schedule.

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerRebootSchedule 12
Deletes the reboot schedule for the desktop group having Uid 12.

---------- EXAMPLE 3 ----------

C:\PS> Remove-BrokerRebootSchedule -DesktopGroupName Accounting
Deletes the reboot schedule for the desktop group named Accounting.

Remove-BrokerRemotePCAccount

Apr 15, 2014

Delete RemotePCAccounts from the system.

Syntax

Remove-BrokerRemotePCAccount [-InputObject] <RemotePCAccount[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Delete RemotePCAccounts from the site.

Related topics

Get-BrokerRemotePCAccount

New-BrokerRemotePCAccount

Set-BrokerRemotePCAccount

Parameters

-InputObject<RemotePCAccount[]>

Specifies the RemotePCAccounts to delete.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.RemotePCAccount You can pipe the RemotePCAccounts to be deleted into this cmdlet.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerRemotePCAccount 42
Delete RemotePCAccount 42.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerRemotePCAccount -OU 'any' | Remove-BrokerRemotePCAccount
Delete the 'any' OU RemotePCAccount.

---------- EXAMPLE 3 ----------

C:\PS> Get-BrokerRemotePCAccount | Remove-BrokerRemotePCAccount
Delete all RemotePCAccounts.

Remove-BrokerScope

Apr 15, 2014

Remove the specified catalog/desktop group from the given scope(s).

Syntax

Remove-BrokerScope [-InputObject] <Scope[]> [-Catalog <Catalog>] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerScope cmdlet is used to remove a catalog/desktop group object from the given scope(s).

To remove a catalog/desktop group from a scope you need permission to change the scopes of the catalog/desktop group.

If the catalog/desktop group is not in a specified scope, that scope will be silently ignored.

Related topics

Parameters

-InputObject<Scope[]>

Specifies the scopes to remove the object from.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByValue)

-Catalog<Catalog>

Specifies the catalog object to be removed.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-DesktopGroup<DesktopGroup>

Specifies the desktop group object to be removed.

Required?	false
Default Value	

Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Scope You can pipe scopes to Remove-BrokerScope.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerScope -Scope Chalfont,Cambourne -DesktopGroup "Win7 Desktops"
Removes the "Win7 Desktops" desktop group from both the Chalfont and Cambourne scopes.

---------- EXAMPLE 2 ----------

C:\PS> 'Chalfont','Cambourne' | Remove-BrokerScope -DesktopGroup 'Win7 Desktops'
Removes the "Win7 Desktops" desktop group from both the Chalfont and Cambourne scopes.

Remove-BrokerSessionMetadata

Apr 15, 2014

Deletes Session Metadata from the Session objects

Syntax

Remove-BrokerSessionMetadata [-InputObject] <Session[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerSessionMetadata cmdlet deletes Metadata from the Session objects.

Related topics

Parameters

-InputObject<Session[]>

Specifies the Session object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerSession You can pipe the Session to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerSessionMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Session whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerSessionMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Session in the site

Remove-BrokerSiteMetadata

Apr 15, 2014

Deletes Site Metadata from the Site objects

Syntax

Remove-BrokerSiteMetadata -Name <String> [[-InputObject] <Site[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerSiteMetadata cmdlet deletes Metadata from the Site objects.

Related topics

Parameters

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-InputObject<Site[]>

Specifies the Site object's instance whose Metadata is to be deleted.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerSite You can pipe the Site to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerSiteMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Site

Remove-BrokerTag

Apr 15, 2014

Removes a tag from the system or clears a tag to object association.

Syntax

Remove-BrokerTag [-InputObject] <Tag[]> [-Desktop <Desktop>] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerTag [-Name] <String> [-Desktop <Desktop>] [-DesktopGroup <DesktopGroup>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Clears tag to object associations or delete tags from the system altogether.

To clear an association, supply one of the Application, DesktopGroup or PrivateDesktop parameters.

To delete the tag, and any associations between the tag and other objects in the database, specify the tag without any associated object parameters.

Related topics

Add-BrokerTag

Get-BrokerTag

New-BrokerTag

Rename-BrokerTag

Parameters

-InputObject<Tag[]>

Specifies one or more tag objects.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies a tag by name.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-Desktop<Desktop>

Clears the association between the given tag and Desktop.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-DesktopGroup<DesktopGroup>

Clears the association between the given tag and desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Tag Tags may be specified through pipeline input.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerTag $tag -Desktop $desktop
Clears the association between a tag and a desktop. Note that the tag itself continues to exist as an object in the database.

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerTag $tag
Deletes the tag object from the database and clears any associations that may exist between that tag and other objects.

Remove-BrokerTagMetadata

Apr 15, 2014

Deletes Tag Metadata from the Tag objects

Syntax

Remove-BrokerTagMetadata [-InputObject] <Tag[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerTagMetadata cmdlet deletes Metadata from the Tag objects.

Related topics

Parameters

-InputObject<Tag[]>

Specifies the Tag object's instance whose Metadata is to be deleted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata to be deleted

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerTag You can pipe the Tag to delete the metadata.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-BrokerTagMetadata -InputObject $obj-Uid -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for the Tag whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Remove-BrokerTagMetadata -Name "MyMetadataName"
This command deletes the Metadata "MyMetadataName" key-value pair for all the Tag in the site

Remove-BrokerUser

Apr 15, 2014

Remove broker user objects from another broker object

Syntax

Remove-BrokerUser [-InputObject] <User[]> [-Application <Application>] [-Machine <Machine>] [-PrivateDesktop <PrivateDesktop>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-BrokerUser [-Name] <String> [-Application <Application>] [-Machine <Machine>] [-PrivateDesktop <PrivateDesktop>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-BrokerUser cmdlet removes broker user objects from another specified object, such as a broker private desktop, to which the user had previously been added.

Related topics

Add-BrokerUser

Get-BrokerUser

Parameters

-InputObject<User[]>

Specifies the user objects to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the user objects to remove, based on their Name property.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-Application<Application>

The application from which to remove the user

Required?	false

Default Value	null
Accept Pipeline Input?	true (ByValue)

-Machine<Machine>

The machine from which to remove the user

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByValue)

-PrivateDesktop<PrivateDesktop>

The desktop from which to remove the user

Required?	false
Default Value	null
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.USer You can pipe the users to be removed to Remove-BrokerUser.

Return Values

None

Notes

Specify one of the -Machine or -PrivateDesktop parameters only.

Examples

---------- EXAMPLE 1 ----------

Remove-BrokerUser "DOMAIN\UserName" -PrivateDesktop "DOMAIN\MachineName"
Remove the assignment of the specified private desktop to the specified user.

Rename-BrokerAccessPolicyRule

Apr 15, 2014

Renames a rule in the site's access policy.

Syntax

Rename-BrokerAccessPolicyRule [-InputObject] <AccessPolicyRule[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerAccessPolicyRule [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerAccessPolicyRule cmdlet renames a rule in the site's access policy. The Name property of the rule is changed.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Related topics

New-BrokerAccessPolicyRule

Get-BrokerAccessPolicyRule

Set-BrokerAccessPolicyRule

Remove-BrokerAccessPolicyRule

Parameters

-InputObject<AccessPolicyRule[]>

The access policy rule to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The existing name of the access policy rule to be renamed.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

The new name for the access policy rule being renamed. The new name must not match that of any other existing rules in the policy.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AccessPolicyRule The access policy rule to be renamed.

Return Values

None or Citrix.Broker.Admin.SDK.AccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AccessPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerAccessPolicyRule 'Sales' -NewName 'TeleSales'
Renames the access policy rule called Sales to TeleSales. The new name of the rule must be unique in the access policy.

Rename-BrokerAppAssignmentPolicyRule

Apr 15, 2014

Renames an application rule in the site's assignment policy.

Syntax

Rename-BrokerAppAssignmentPolicyRule [-InputObject] <AppAssignmentPolicyRule[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerAppAssignmentPolicyRule [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerAppAssignmentPolicyRule cmdlet renames an application rule in the site's assignment policy. The Name property of the rule is changed.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Related topics

New-BrokerAppAssignmentPolicyRule

Get-BrokerAppAssignmentPolicyRule

Set-BrokerAppAssignmentPolicyRule

Remove-BrokerAppAssignmentPolicyRule

Parameters

-InputObject<AppAssignmentPolicyRule[]>

The application rule in the assignment policy to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The existing name of the application rule in the assignment policy to be renamed.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

The new name of the application rule in the assignment policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule The application rule in the assignment policy being renamed.

Return Values

None or Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerAppAssignmentPolicyRule 'Offshore' -NewName 'Remote Workers'
Renames the application rule in the assignment policy called Offshore to Remote Workers. The new name of the rule must be unique in the assignment policy.

Rename-BrokerAppEntitlementPolicyRule

Apr 15, 2014

Renames an application rule in the site's entitlement policy.

Syntax

Rename-BrokerAppEntitlementPolicyRule [-InputObject] <AppEntitlementPolicyRule[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerAppEntitlementPolicyRule [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerAppEntitlementPolicyRule cmdlet renames an application rule in the site's entitlement policy. The Name property of the rule is changed.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Related topics

Parameters

-InputObject<AppEntitlementPolicyRule[]>

The application rule in the entitlement policy to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The existing name of the application rule in the entitlement policy to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

The new name of the application rule in the entitlement policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule The application rule in the entitlement policy being renamed.

Return Values

None or Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerAppEntitlementPolicyRule 'Prod Dev' -NewName 'Product Development'
Renames the application rule in the entitlement policy called Prod Dev to Product Development. The new name of the rule must be unique in the entitlement policy.

Rename-BrokerApplication

Apr 15, 2014

Renames an application.

Syntax

Rename-BrokerApplication [-InputObject] <Application[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerApplication [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerApplication cmdlet changes the administrative name of an application. An application cannot have the same name as another application.

Renaming an application does not alter its published name. To change the name with which this application appears to end-users, set a new value for the PublishedName property using the Set-BrokerApplication cmdlet.

Renaming an application does not alter its BrowserName. If the BrowserName property also needs to be changed, use the Set-BrokerApplication cmdlet to modify it.

Related topics

Parameters

-InputObject<Application[]>

Specifies the application to rename.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the application to rename.

Required?	true

Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

Specifies the new name for the application.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Application You can pipe applications to Rename-BrokerApplication.

Return Values

None or Citrix.Broker.Admin.SDK.Application

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Application object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerApplication -Name "Old Name" -NewName "New Name"
Renames the application with name "Old Name" to "New Name".

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerApplication -Uid 1 | Rename-BrokerApplication -NewName "New Name" -PassThru
Renames application with the Uid 1 to "New Name", showing the result.

Rename-BrokerAssignmentPolicyRule

Apr 15, 2014

Renames a desktop rule in the site's assignment policy.

Syntax

Rename-BrokerAssignmentPolicyRule [-InputObject] <AssignmentPolicyRule[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerAssignmentPolicyRule [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerAssignmentPolicyRule cmdlet renames a desktop rule in the site's assignment policy. The Name property of the rule is changed.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Parameters

-InputObject<AssignmentPolicyRule[]>

The desktop rule in the assignment policy to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The existing name of the desktop rule in the assignment policy to be renamed.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

The new name of the desktop rule in the assignment policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AssignmentPolicyRule The desktop rule in the assignment policy being renamed.

Return Values

None, or Citrix.Broker.Admin.SDK.AssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AssignmentPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerAssignmentPolicyRule 'Offshore' -NewName 'Remote Workers'
Renames the desktop rule in the assignment policy called Offshore to Remote Workers. The new name of the rule must be unique in the assignment policy.

Rename-BrokerCatalog

Apr 15, 2014

Renames a catalog.

Syntax

Rename-BrokerCatalog [-InputObject] <Catalog[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerCatalog [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerCatalog cmdlet changes the name of a catalog. A catalog cannot have the same name as another catalog.

The following special characters are not allowed in a catalog name: \ / ; : # . * ? = < > | [ ] ( ) " '

Related topics

Parameters

-InputObject<Catalog[]>

Specifies the catalog to rename.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the catalog to rename.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

Specifies the new name of the catalog.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Catalog You can pipe catalogs to Rename-BrokerCatalog.

Return Values

None or Citrix.Broker.Admin.SDK.Catalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Catalog object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerCatalog -Name "Old Name" -NewName "New Name"
Renames the catalog with the name "Old Name" to "New Name".

---------- EXAMPLE 2 ----------

C:\PS> c:\$catalog = Get-BrokerCatalog -Name "Old Name"
C:\PS> Rename-BrokerCatalog -InputObject $catalog -NewName "New Name"
Renames the catalog with the name "Old Name" to "New Name".

Rename-BrokerDesktopGroup

Apr 15, 2014

Renames a desktop group.

Syntax

Rename-BrokerDesktopGroup [-InputObject] <DesktopGroup[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerDesktopGroup [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerDesktopGroup cmdlet changes the name of a desktop group. A desktop group cannot have the same name as another desktop group.

Related topics

Get-BrokerDesktopGroup

Set-BrokerDesktopGroup

Remove-BrokerDesktopGroup

Parameters

-InputObject<DesktopGroup[]>

Specifies the desktop group to rename.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the desktop group to rename.

Required?	true
Default Value	null
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

Specifies the new name that the desktop group will have.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.DesktopGroup You can pipe desktop groups to Rename-BrokerDesktopGroup.

Return Values

None or Citrix.Broker.Admin.SDK.DesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.DesktopGroup object.

Notes

Renaming a desktop group does not alter its published name. If you need to change the name with which this desktop group appears to end-users, set a new value for the PublishedName property using the Set-BrokerDesktopGroup cmdlet.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerDesktopGroup -Name "Old Name" -NewName "New Name"
Renames desktop group with the name "Old Name" to "New Name".

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerDesktopGroup -Uid 1 | Rename-BrokerDesktopGroup -NewName "New Name" -PassThru
Renames desktop group with the Uid 1 to "New Name", showing the result.

Rename-BrokerEntitlementPolicyRule

Apr 15, 2014

Renames a desktop rule in the site's entitlement policy.

Syntax

Rename-BrokerEntitlementPolicyRule [-InputObject] <EntitlementPolicyRule[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerEntitlementPolicyRule [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerEntitlementPolicyRule cmdlet renames a desktop rule in the site's entitlement policy. The Name property of the rule is changed.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Related topics

Parameters

-InputObject<EntitlementPolicyRule[]>

The desktop rule in the entitlement policy to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The existing name of the desktop rule in the entitlement policy to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

The new name of the desktop rule in the entitlement policy being renamed. The new name must not match that of any other existing rule in the policy (irrespective of whether it is a desktop or application rule).

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.EntitlementPolicyRule The desktop rule in the entitlement policy being renamed.

Return Values

None or Citrix.Broker.Admin.SDK.EntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.EntitlementPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerEntitlementPolicyRule 'Prod Dev' -NewName 'Product Development'
Renames the desktop rule in the entitlement policy called Prod Dev to Product Development. The new name of the rule must be unique in the entitlement policy.

Rename-BrokerMachineConfiguration

Apr 15, 2014

Renames a machine configuration.

Syntax

Rename-BrokerMachineConfiguration [-InputObject] <MachineConfiguration[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerMachineConfiguration [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-MachineConfiguration cmdlet changes the name of a machine configuration. A machine configuration cannot have the same name as another machine configuration associated with the same slot.

Related topics

New-BrokerMachineConfiguration

Get-BrokerMachineConfiguration

Set-BrokerMachineConfiguration

Remove-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Parameters

-InputObject<MachineConfiguration[]>

Machine configuration to rename.

Required?	true
Default Value	None
Accept Pipeline Input?	true (ByValue)

-Name<String>

Current name of machine configuration.

Required?	true
Default Value	None
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

New name for machine configuration. This may have the form "ConfigurationSlotName\MachineConfigurationName" or "MachineConfigurationName". If the "ConfigurationSlotName" is provided it must match the name of the configuration slot that the machine configuration is associated with.

Required?	true
Default Value	None
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.MachineConfiguration Machine configuration to rename.

Return Values

None or Citrix.Broker.Admin.SDK.MachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.MachineConfiguration object.

Notes

The configuration slot can not be changed. Thus the left term of the Name and NewName must match.

Examples

---------- EXAMPLE 1 ----------

Rename-BrokerMachineConfiguration -Name "UPM\All Departments" -NewName "UPM\Finance Department"
Renames the machine configuration named "UPM\All Departments" to "UPM\Finance Department".

---------- EXAMPLE 2 ----------

Rename-BrokerMachineConfiguration -Name "UPM\All Departments" -NewName "Finance Department"
Renames the machine configuration named "UPM\All Departments" to "UPM\Finance Department".

Rename-BrokerPowerTimeScheme

Apr 15, 2014

Changes the name of an existing power time scheme.

Syntax

Rename-BrokerPowerTimeScheme [-InputObject] <PowerTimeScheme[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerPowerTimeScheme [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-BrokerPowerTimeScheme cmdlet renames a particular power time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times. In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

Accept Pipeline Input?	true (ByValue)

-Name<String>

The current name of the power time scheme to be renamed.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

The new name to be applied to the power time scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.PowerTimeScheme The power time scheme to be renamed.

Return Values

None or Citrix.Broker.Admin.SDK.PowerTimeScheme

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.PowerTimeScheme object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerPowerTimeScheme -Name 'Development Weekdays' -NewName 'Dev Week'
Renames the power time scheme named 'Development Weekdays' to 'Dev Week'.

Rename-BrokerTag

Apr 15, 2014

Rename one or more tags.

Syntax

Rename-BrokerTag [-InputObject] <Tag[]> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-BrokerTag [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Renames one or more tags with the supplied name.

Related topics

Add-BrokerTag

Get-BrokerTag

New-BrokerTag

Remove-BrokerTag

Parameters

-InputObject<Tag[]>

Specifies one or more tag objects to rename.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Identifies tags to be renamed by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

Specifies new name for the tags.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Tag The tag to rename can be piped into this cmdlet.

Return Values

None or Citrix.Broker.Admin.SDK.Tag

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Tag object.

Notes

Note that when renaming a tag, its UUID remains the same and any associations are maintained.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Rename-BrokerTag -Name 'OldName' -NewName 'ReplacementName'
Renames tags with the name 'OldName' to 'ReplacementName'.

Reset-BrokerLicensingConnection

Apr 15, 2014

Resets the broker's license server connection.

Syntax

Reset-BrokerLicensingConnection [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Reset-BrokerLicensingConnection cmdlet resets the broker's connection to the license server.

Licensing changes resulting from new license files or alterations to the site-level licensing properties don't become effective immediately. There will typically be a delay as the changes are propagated across the site based on the scheduling of refresh logic built into the controllers and the license server.

Resetting the connection causes the list of available licenses for the connection to be updated. After adding licenses or changing the site-level licensing properties you can run Reset-BrokerLicensingConnection to ensure that the broker can access the new licenses immediately.

Each broker service instance holds its own connection to the license server. In order for the licensing changes to be applied immediately throughout the XenDesktop site this command needs to be run on every controller in the site.

Related topics

Get-BrokerSite

Set-BrokerSite

Parameters

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Reset-BrokerLicensingConnection
Reset the broker's license server connection.

Reset-BrokerServiceGroupMembership

Apr 15, 2014

Makes the broker load, from the specified Configuration Service instance, the addresses that the Service can be reached on.

Syntax

Reset-BrokerServiceGroupMembership -ConfigServiceInstance <PSObject[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet reloads the access permissions and Configuration Service locations for the Broker Service. It must be run on at least one instance of the Broker Service after installation and registration with the Configuration Service. Without this operation, the Broker Services cannot communicate with the other services that form part of the Citrix XenDesktop deployment. Once the cmdlet is run, the services keep up to date when additional services are added to the deployment provided that the Configuration Service is not stopped. Run this cmdlet to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one Configuration Service instance is passed to the cmdlet, only the first is used that meets the expected service type requirements.

Parameters

-ConfigServiceInstance<PSObject[]>

The Configuration Service Instance object that represents a service instance of the type InterService that in turn references a Configuration Service for the deployment.

Required?	true
Default Value	LocalHost
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.XDPowerShell.ServiceInstance You can pipe a ServiceInstance that contains a ServiceInstance object that in turn refers to the Configuration Service InterService interface.

Return Values

Citrix.XDPowerShell.ServiceInstance

Reset-BrokerServiceGroupMembership returns opaque objects containing Configuration Service instances that are used by the Broker Service instance.

Examples

---------- EXAMPLE 1 ----------

c:\PS$gt;Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-BrokerServiceGroupMembership
Resets the Broker Service's group membership. This assumes that the Configuration Service is running and configured on the same machine as the Broker service.

---------- EXAMPLE 2 ----------

c:\PS$gt;Get-ConfigRegisteredServiceInstance -ServiceType Config -AdminAddress OtherServer.com | Reset-BrokerServiceGroupmembership
Resets the Broker Service's group membership. This uses a Configuration Service that is running and configured on a server called OtherServer.com.

Send-BrokerSessionMessage

Apr 15, 2014

Sends a message to a session.

Syntax

Send-BrokerSessionMessage [-InputObject] <Session[]> [-MessageStyle] <SendMessageStyle> [-Title] <String> [-Text] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Generates a message box in the target session(s).

Related topics

Get-BrokerSession

Parameters

-InputObject<Session[]>

The target session(s) to send the message to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MessageStyle<SendMessageStyle>

The style of message box to use (valid values are Critical, Question, Exclamation, or Information).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Title<String>

Text to display in the messagebox title bar.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Text<String>

The message to display.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Session The session to which to send the message can be piped in.

Return Values

None

Notes

Sessions can be passed as the InputObject parameter as either session objects or their numeric Uids.

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between controller and machine, if bad arguments are passed to the cmdlet itself or if the machine cannot successfully execute the operation.

The transient nature of sessions means that the list of session objects or UIDs supplied to Send-BrokerSessionMessage could consist of valid and invalid sessions. Invalid sessions are detected and disregarded and the send message operation is invoked on the machines running valid sessions.

The system can fail to invoke the operation if the machine is not in an appropriate state or if there are problems in communicating with the machine. When an operation is invoked the system detects if the operation was initiated successfully

or not by the session. As this operation is non-blocking the system doesn't detect or report whether the operation ultimately succeeded or failed after its successful initialization in the session.

Operation failures are reported through the broker SDK error handling mechanism (see about_Broker_ErrorHandling). In the event of errors the SdkErrorRecord error status code is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

o OperationsAttemptedCount: The number of operations attempted.

o OperationsFailedCount - The number of failed operations.

o OperationsSucceededCount - The number of successfully executed operations.

o UnresolvedSessionFailuresCount - The number of operations that failed due to invalid sessions being supplied.

o OperationInvocationFailuresCount - The number of operations that failed because they could not be invoked in the session.

o DesktopExecutionFailuresCount - The number of operations that failed because they could not be successfully executed in the session.

The SdkErrorRecord message will also display the number of attempted, failed and successful operations in the following format:

"Session operation error - attempted:<OperationsAttemptedCount>, failed:<OperationsFailedCount>, succeeded: <OperationsSucceededCount>"

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $sessions = Get-BrokerSession -UserName MYDOMAIN\*
C:\PS> Send-BrokerSessionMessage $sessions -MessageStyle Information -Title TestTitle -Text TestMessage
```

Sends a message to all the sessions for any user in MYDOMAIN.

---------- EXAMPLE 2 ----------

```
C:\PS> $desktop = Get-BrokerDesktop -Uid 1
C:\PS> Send-BrokerSessionMessage $desktop.SessionUid -MessageStyle Information -Title TestTitle -Text TestMessage
```

Sends a message to the session on the desktop with Uid 1.

---------- EXAMPLE 3 ----------

```
C:\PS> trap  [Citrix.Broker.Admin.SDK.SdkOperationException]
C:\PS> {
C:\PS>   write $("Exception name = " + $_.Exception.GetType().FullName)
C:\PS>   write $("SdkOperationException.Status = " + $_.Exception.Status)
C:\PS>   write $("SdkOperationException.ErrorData=")
C:\PS>   $_.Exception.ErrorData
C:\PS>
C:\PS>   write $("SdkOperationException.InnerException = " + $_.Exception.InnerException)
C:\PS>   $_.Exception.InnerException
C:\PS>   continue
C:\PS> }
C:\PS>
```

```
C:\PS> Send-BrokerSessionMessage -InputObject 10,11,12 -MessageStyle Information -Title "message title" -Text "message text"
```

Trap and display error information.

Set-BrokerAccessPolicyRule

Apr 15, 2014

Modifies an existing rule in the site's access policy.

Syntax

Set-BrokerAccessPolicyRule [-InputObject] <AccessPolicyRule[]> [-PassThru] [-AddExcludedClientIPs <IPAddressRange[]>] [-AddExcludedClientNames <String[]>] [-AddExcludedSmartAccessTags <String[]>] [-AddExcludedUsers <User[]>] [-AddIncludedClientIPs <IPAddressRange[]>] [-AddIncludedClientNames <String[]>] [-AddIncludedSmartAccessTags <String[]>] [-AddIncludedUsers <User[]>] [-AllowedConnections <AllowedConnection>] [-AllowedProtocols <String[]>] [-AllowedUsers <AllowedUser>] [-AllowRestart <Boolean>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedClientIPFilterEnabled <Boolean>] [-ExcludedClientIPs <IPAddressRange[]>] [-ExcludedClientNameFilterEnabled <Boolean>] [-ExcludedClientNames <String[]>] [-ExcludedSmartAccessFilterEnabled <Boolean>] [-ExcludedSmartAccessTags <String[]>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-HdxSslEnabled <Boolean>] [-IncludedClientIPFilterEnabled <Boolean>] [-IncludedClientIPs <IPAddressRange[]>] [-IncludedClientNameFilterEnabled <Boolean>] [-IncludedClientNames <String[]>] [-IncludedSmartAccessFilterEnabled <Boolean>] [-IncludedSmartAccessTags <String[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-RemoveExcludedClientIPs <IPAddressRange[]>] [-RemoveExcludedClientNames <String[]>] [-RemoveExcludedSmartAccessTags <String[]>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedClientIPs <IPAddressRange[]>] [-RemoveIncludedClientNames <String[]>] [-RemoveIncludedSmartAccessTags <String[]>] [-RemoveIncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAccessPolicyRule [-Name] <String> [-PassThru] [-AddExcludedClientIPs <IPAddressRange[]>] [-AddExcludedClientNames <String[]>] [-AddExcludedSmartAccessTags <String[]>] [-AddExcludedUsers <User[]>] [-AddIncludedClientIPs <IPAddressRange[]>] [-AddIncludedClientNames <String[]>] [-AddIncludedSmartAccessTags <String[]>] [-AddIncludedUsers <User[]>] [-AllowedConnections <AllowedConnection>] [-AllowedProtocols <String[]>] [-AllowedUsers <AllowedUser>] [-AllowRestart <Boolean>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedClientIPFilterEnabled <Boolean>] [-ExcludedClientIPs <IPAddressRange[]>] [-ExcludedClientNameFilterEnabled <Boolean>] [-ExcludedClientNames <String[]>] [-ExcludedSmartAccessFilterEnabled <Boolean>] [-ExcludedSmartAccessTags <String[]>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-HdxSslEnabled <Boolean>] [-IncludedClientIPFilterEnabled <Boolean>] [-IncludedClientIPs <IPAddressRange[]>] [-IncludedClientNameFilterEnabled <Boolean>] [-IncludedClientNames <String[]>] [-IncludedSmartAccessFilterEnabled <Boolean>] [-IncludedSmartAccessTags <String[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-RemoveExcludedClientIPs <IPAddressRange[]>] [-RemoveExcludedClientNames <String[]>] [-RemoveExcludedSmartAccessTags <String[]>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedClientIPs <IPAddressRange[]>] [-RemoveIncludedClientNames <String[]>] [-RemoveIncludedSmartAccessTags <String[]>] [-RemoveIncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerAccessPolicyRule cmdlet modifies an existing rule in the site's access policy.

An access policy rule defines a set of connection filters and access control rights relating to a desktop group. These allow fine-grained control of what access is granted to a desktop group based on details of, for example, a user's endpoint device, its address, and the user's identity.

Changing a rule does not affect existing user sessions, but it may result in users being unable to launch new sessions, or reconnect to disconnected sessions if the change removes access to the desktop group delivering those sessions.

Related topics

New-BrokerAccessPolicyRule

Get-BrokerAccessPolicyRule

Rename-BrokerAccessPolicyRule

Remove-BrokerAccessPolicyRule

Parameters

-InputObject <AccessPolicyRule[]>

The access policy rule to be modified.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the access policy rule to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AddExcludedClientIPs<IPAddressRange[]>

Adds the specified user device IP addresses to the excluded client IP address filter of the rule.

See the ExcludedClientIPs parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddExcludedClientNames<String[]>

Adds the specified user device names to the excluded client names filter of the rule.

See the ExcludedClientNames parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddExcludedSmartAccessTags<String[]>

Adds the specified SmartAccess tags to the excluded SmartAccess tags filter of the rule.

See the ExcludedSmartAccessTags parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddExcludedUsers<User[]>

Adds the specified users and groups to the excluded users filter of the rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedClientIPs<IPAddressRange[]>

Adds the specified user device IP addresses to the included client IP address filter of the rule.

See the IncludedClientIPs parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedClientNames<String[]>

Adds the specified user device names to the included client names filter of the rule.

See the IncludedClientNames parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedSmartAccessTags<String[]>

Adds the specified SmartAccess tags to the included SmartAccess tags filter of the rule.

See the IncludedSmartAccessTags parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedUsers<User[]>

Adds the specified users and groups to the included users filter of the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AllowedConnections<AllowedConnection>

Changes whether connections must be local or via Access Gateway, and if so whether specified SmartAccess tags must be provided by Access Gateway with the connection. This property forms part of the included SmartAccess tags filter.

Valid values are Filtered, NotViaAG, and ViaAG.

For a detailed description of this property see "help about_Broker_AccessPolicy".

Required?	false
Default Value	
Accept Pipeline Input?	false

-AllowedProtocols<String[]>

Changes the protocols (for example HDX, RDP) available to the user for sessions delivered from the rule's desktop group. If the user gains access to a desktop group by multiple rules, the allowed protocol list is the combination of the protocol lists from all those rules.

If the protocol list is empty, access to the desktop group is implicitly denied.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AllowedUsers<AllowedUser>

Changes the behavior of the included users filter of the rule. This can restrict access to a list of named users or groups, or allow access to any authenticated user. For a detailed description of this property see "help about_Broker_AccessPolicy".

Valid values are Filtered, AnyAuthenticated, and Any.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AllowRestart<Boolean>

Changes whether the user can restart sessions delivered from the rule's desktop group. Session restart is handled as follows: For sessions on single-session power-managed machines, the machine is powered off, and a new session launch request made; for sessions on multi-session machines, a logoff request is issued to the session, and a new session launch request made; otherwise the property is ignored.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Changes the description of the rule. The text is purely informational for the administrator, it is never visible to the end user.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Changes whether the rule is enabled or disabled. A disabled rule is ignored when evaluating the site's access policy.

Required?	false

Default Value	
Accept Pipeline Input?	false

-ExcludedClientIPFilterEnabled<Boolean>

Changes whether the excluded client IP address filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedClientIPs<IPAddressRange[]>

Changes the IP addresses of user devices explicitly denied access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the excluded client IP address filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedClientNameFilterEnabled<Boolean>

Changes whether the excluded client names filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedClientNames<String[]>

Changes which names of user devices are explicitly denied access to the rule's desktop group. This property forms part of the excluded client names filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedSmartAccessFilterEnabled<Boolean>

Changes whether the excluded SmartAccess tags filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedSmartAccessTags<String[]>

Changes which SmartAccess tags explicitly deny access to the rule's desktop group if any occur in those provided by Access Gateway with the user's connection. This property forms part of the excluded SmartAccess tags filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUserFilterEnabled<Boolean>

Changes whether the excluded users filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUsers<User[]>

Changes which users and groups are explicitly denied access to the rule's desktop group. This property forms part of the excluded users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HdxSslEnabled<Boolean>

Indicates whether SSL encryption is enabled for sessions delivered from the rule's desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedClientIPFilterEnabled<Boolean>

Changes whether the included client IP address filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedClientIPs<IPAddressRange[]>

Changes which IP addresses of user devices allowed access to the rule's desktop group. Addresses can be specified as simple numeric addresses or as subnet masks (for example, 10.40.37.5 or 10.40.0.0/16). This property forms part of the included client IP address filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedClientNameFilterEnabled<Boolean>

Changes whether the included client name filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedClientNames<String[]>

Changes which names of user devices are allowed access to the rule's desktop group. This property forms part of the included client names filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedSmartAccessFilterEnabled<Boolean>

Changes whether the included SmartAccess tags filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedSmartAccessTags<String[]>

Changes which SmartAccess tags grant access to the rule's desktop group if any occur in those provided by Access Gateway with the user's connection. This property forms part of the excluded SmartAccess tags filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUserFilterEnabled<Boolean>

Changes whether the included users filter is enabled or disabled. If the filter is disabled, it is ignored when the access policy rule is evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUsers<User[]>

Changes which users and groups are granted access to the rule's desktop group. This property forms part of the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedClientIPs<IPAddressRange[]>

Removes the specified user device IP addresses from the excluded client IP address filter of the rule.

See the ExcludedClientIPs parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedClientNames<String[]>

Removes the specified user device names from the excluded client names filter of the rule.

See the ExcludedClientNames parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedSmartAccessTags<String[]>

Removes the specified SmartAccess tags from the excluded SmartAccess tags filter of the rule.

See the ExcludedSmartAccessTags parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedUsers<User[]>

Removes the specified users and groups from the excluded users filter of the rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveIncludedClientIPs<IPAddressRange[]>

Removes the specified user device IP addresses from the included client IP address filter of the rule.

See the IncludedClientIPs parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveIncludedClientNames<String[]>

Removes the specified client names from the included client names filter of the rule.

See the IncludedClientNames parameter for more information.

Required?	false

Default Value	
Accept Pipeline Input?	false

-RemoveIncludedSmartAccessTags<String[]>

Removes the specified SmartAccess tags from the included SmartAccess tags filter of the rule.

See the IncludedSmartAccessTags parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveIncludedUsers<User[]>

Removes the specified users and groups from the included users filter of the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AccessPolicyRule The access policy rule to be modified.

Return Values

None, or Citrix.Broker.Admin.SDK.AccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AccessPolicyRule object.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Set-BrokerAccessPolicyRule 'Temp Staff' -AddIncludedUsers office\contractors
Adds user group OFFICE\contractors to the Temp Staff access policy rule. The resources that the group can access are dependent on the existing properties of the rule in addition to the site's assignment and entitlement policies.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Set-BrokerAccessPolicyRule 'Temp Staff' -ExcludedClientIPFilterEnabled $true -AddExcludedClientIPs '10.15.0.0/16' -AllowedConnections ViaAG
Modifies the Temp Staff access policy rule to remove access to any user device with an IP address matching 10.15.0.0/16, and requires that all connections by the rule must come through Access Gateway (assuming that the included SmartAccess tags filter is enabled).

Set-BrokerAccessPolicyRuleMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for AccessPolicyRule

Syntax

Set-BrokerAccessPolicyRuleMetadata [-AccessPolicyRuleId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAccessPolicyRuleMetadata [-AccessPolicyRuleId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAccessPolicyRuleMetadata [-AccessPolicyRuleId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAccessPolicyRuleMetadata [-InputObject] <AccessPolicyRule[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAccessPolicyRuleMetadata [-InputObject] <AccessPolicyRule[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAccessPolicyRuleMetadata [-AccessPolicyRuleName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAccessPolicyRuleMetadata [-AccessPolicyRuleName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerAccessPolicyRuleMetadata cmdlet creates/updates metadata key-value pairs for AccessPolicyRule. The AccessPolicyRule can be specified by ImputObject or piping.

Related topics

Parameters

-AccessPolicyRuleId<Int32>

Specifies the AccessPolicyRule object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<AccessPolicyRule[]>

Specifies the AccessPolicyRule objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AccessPolicyRuleName<String>

Specifies the AccessPolicyRule object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule You can pipe the AccessPolicyRule to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerAccessPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerAccessPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the AccessPolicyRule whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerAccessPolicyRule | Set-BrokerAccessPolicyRuleMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the AccessPolicyRule in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerAccessPolicyRuleMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the AccessPolicyRule in the site whose name is 'objname'

Set-BrokerAppAssignmentPolicyRule

Apr 15, 2014

Modifies an existing application rule in the site's assignment policy.

Syntax

Set-BrokerAppAssignmentPolicyRule [-InputObject] <AppAssignmentPolicyRule[]> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAppAssignmentPolicyRule [-Name] <String> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerAppAssignmentPolicyRule cmdlet modifies an existing application rule in the site's assignment policy.

An application rule in the assignment policy defines the users who are entitled to a self-service persistent machine assignment from the rule's desktop group; once assigned the machine can run one or more applications published from the group.

Changing an application rule does not alter machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Related topics

New-BrokerAppAssignmentPolicyRule

Get-BrokerAppAssignmentPolicyRule

Rename-BrokerAppAssignmentPolicyRule

Remove-BrokerAppAssignmentPolicyRule

Parameters

-InputObject<AppAssignmentPolicyRule[]>

The application rule in the assignment policy to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the application rule in the assignment policy to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AddExcludedUsers<User[]>

Adds the specified users to the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedUsers<User[]>

Adds the specified users to the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Changes the description of the application rule. The text is purely informational for the administrator, it is never visible to

the end user.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Enables or disables the application rule. A disabled rule is ignored when evaluating the site's assignment policy.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUserFilterEnabled<Boolean>

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUsers<User[]>

Changes the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from the rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUserFilterEnabled<Boolean>

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUsers<User[]>

Changes the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule, or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedUsers<User[]>

Removes the specified users from the excluded users filter of the application rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveIncludedUsers<User[]>

Removes the specified users from the included users filter of the application rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level

Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule The application rule within the assignment policy to be modified.

Return Values

None or Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppAssignmentPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerAppAssignmentPolicyRule 'Temp Staff' -AddIncludedUsers office\interns
Adds the user group OFFICE\interns to the Temp Staff application rule in the assignment policy. This grants all members of that user group an entitlement to a machine in the rule's desktop group. The machines can run applications published from the group. The application session properties obtained using the rule are determined by the rule's other properties.

---------- EXAMPLE 2 ----------

C:\PS> Set-BrokerAppAssignmentPolicyRule 'Temp Staff' -Enabled $false
Disables the Temp Staff application rule in the assignment policy. This prevents further machine assignments being made using this rule until it is re-enabled. However, access to machines already assigned using the rule is not impacted.

Set-BrokerAppEntitlementPolicyRule

Apr 15, 2014

Modifies an existing application rule in the site's entitlement policy.

Syntax

Set-BrokerAppEntitlementPolicyRule [-InputObject] <AppEntitlementPolicyRule[]> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAppEntitlementPolicyRule [-Name] <String> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerAppEntitlementPolicyRule cmdlet modifies an existing application rule in the site's entitlement policy.

An application rule in the entitlement policy defines the users who are allowed per-session access to a machine to run one or more applications published from the rule's desktop group.

Changing a rule does not affect existing sessions launched using the rule, but if the change removes an entitlement to a machine that was previously granted, users may be unable to reconnect to a disconnected session on that machine.

Related topics

New-BrokerAppEntitlementPolicyRule

Get-BrokerAppEntitlementPolicyRule

Rename-BrokerAppEntitlementPolicyRule

Remove-BrokerAppEntitlementPolicyRule

Parameters

-InputObject<AppEntitlementPolicyRule[]>

The application rule in the entitlement policy to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the application rule in the entitlement policy to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AddExcludedUsers<User[]>

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedUsers<User[]>

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Changes the description of the application rule. The text is purely informational for the administrator, it is never visible to the end user.

Required?	false

Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Enables or disables the application rule. A disabled rule is ignored when evaluating the site's entitlement policy.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUserFilterEnabled<Boolean>

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUsers<User[]>

Changes the excluded users filter of the rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

This can be used to exclude users or groups or users who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUserFilterEnabled<Boolean>

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to an application session by the application rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Required?	false
Default Value	

Accept Pipeline Input?	false

-IncludedUsers<User[]>

Changes the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedUsers<User[]>

Removes the specified users from the excluded users filter of the application rule, that is, the users and groups who are explicitly denied entitlements to run applications published from the desktop group.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveIncludedUsers<User[]>

Removes the specified users from the included users filter of the rule, that is, the users and groups who are granted an entitlement to an application session by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule The application rule in the entitlement policy rule to be modified.

Return Values

None or Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AppEntitlementPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerAppEntitlementPolicyRule 'Temp Workers' -AddIncludedUsers office\contractors
Adds the user group OFFICE\contractors to those entitled to run applications from the rule's associated desktop group. This grants all members of that group an entitlement to an application session from that group.

---------- EXAMPLE 2 ----------

C:\PS> Set-BrokerAppEntitlementPolicyRule 'Temp Workers' -Enabled $false
Disables the Temp Workers application rule in the entitlement policy. This prevents further application sessions being launched using this rule until it is re-enabled. However, access to existing application sessions is not affected.

Set-BrokerApplication

Apr 15, 2014

Changes the settings of an application to the value specified in the command.

Syntax

Set-BrokerApplication [-InputObject] <Application[]> [-PassThru] [-BrowserName <String>] [-ClientFolder <String>] [-CommandLineArguments <String>] [-CommandLineExecutable <String>] [-CpuPriorityLevel <CpuPriorityLevel>] [-Description <String>] [-Enabled <Boolean>] [-IconFromClient <Boolean>] [-IconUid <Int32>] [-PublishedName <String>] [-SecureCmdLineArgumentsEnabled <Boolean>] [-ShortcutAddedToDesktop <Boolean>] [-ShortcutAddedToStartMenu <Boolean>] [-StartMenuFolder <String>] [-UserFilterEnabled <Boolean>] [-Visible <Boolean>] [-WaitForPrinterCreation <Boolean>] [-WorkingDirectory <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplication [-Name] <String> [-PassThru] [-BrowserName <String>] [-ClientFolder <String>] [-CommandLineArguments <String>] [-CommandLineExecutable <String>] [-CpuPriorityLevel <CpuPriorityLevel>] [-Description <String>] [-Enabled <Boolean>] [-IconFromClient <Boolean>] [-IconUid <Int32>] [-PublishedName <String>] [-SecureCmdLineArgumentsEnabled <Boolean>] [-ShortcutAddedToDesktop <Boolean>] [-ShortcutAddedToStartMenu <Boolean>] [-StartMenuFolder <String>] [-UserFilterEnabled <Boolean>] [-Visible <Boolean>] [-WaitForPrinterCreation <Boolean>] [-WorkingDirectory <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerApplication cmdlet changes the value of one or more properties of an application, such as its CpuPriorityLevel or its CommandLineArguments, to the value specified in the command.

This cmdlet lets you change only the settings of the Application object, and not the relationships to other objects. For instance, it does not let you change which users can access this application, or change which desktop groups this application is published to. To do this, you need to remove the existing association, and then add a new association. The following example shows how to change the desktop group that an application is associated with from $group1 to $group2:

Remove-BrokerApplication -DesktopGroup $group1

Add-RemoveApplication -DesktopGroup $group2

You can change properties of both HostedOnDesktop and InstalledOnClient applications but it is not possible to change the ApplicationType. Also, the Name cannot be changed using this cmdlet; to do this, use the Rename-BrokerApplication cmdlet.

Related topics

New-BrokerApplication

Add-BrokerApplication

Get-BrokerApplication

Remove-BrokerApplication

Rename-BrokerApplication

Parameters

-InputObject<Application[]>

Specifies the application to modify. The Uid of the application can also be substituted for the object.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the application to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-BrowserName<String>

Specifies the name of the application to modify. Note that the BrowserName cannot be changed in this manner; to modify the BrowserName of an application, use the Rename-BrokerApplication cmdlet.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ClientFolder<String>

Specifies the folder that the application belongs to as the user sees it. This is the application folder displayed in the Citrix Online Plug-in, in Web Services, and also in the user's start menu. Subdirectories can be specified with '\' character. The following special characters are not allowed: / * ? < > | " :. Note that this property cannot be set for applications of type InstalledOnClient.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CommandLineArguments<String>

Specifies the command-line arguments to use when launching the executable.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CommandLineExecutable<String>

Specifies the name of the executable file to launch.

Required?	false
Default Value	
Accept Pipeline Input?	false

-CpuPriorityLevel<CpuPriorityLevel>

Specifies the CPU priority for the launched executable. Valid values are: Low, BelowNormal, Normal, AboveNormal, and High. Note that this property cannot be set for applications of type InstalledOnClient.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Specifies the description of the application.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Specifies whether or not this application can be launched.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconFromClient<Boolean>

Specifies if the app icon should be retrieved from the application on the client. This is reserved for possible future use, and all applications of type HostedOnDesktop cannot set or change this value.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Specifies which icon to use for this application. This application is visible both to the administrator (in the consoles) and also to the user. If no icon is specified, then a generic built-in application icon is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Specifies the name seen by end users who have access to this application.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureCmdLineArgumentsEnabled<Boolean>

Specifies whether the command-line arguments should be secured. This is reserved for possible future use, and all applications of type HostedOnDesktop can only have this value set to true.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ShortcutAddedToDesktop<Boolean>

Specifies whether or not a shortcut to the application should be placed on the user device.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ShortcutAddedToStartMenu<Boolean>

Specifies whether a shortcut to the application should be placed in the user's start menu on their user device.

Required?	false
Default Value	
Accept Pipeline Input?	false

-StartMenuFolder<String>

Specifies the name of the start menu folder that holds the application shortcut (if any). This is valid only for the Citrix Online Plug-in. Subdirectories can be specified with '\' character. The following special characters are not allowed: / * ? < > | " :.

Required?	false
Default Value	
Accept Pipeline Input?	false

-UserFilterEnabled<Boolean>

Specifies whether the application's user filter is enabled or disabled. Where the user filter is enabled, the application is only visible to users who appear in the filter (either explicitly or by virtue of group membership).

Required?	false
Default Value	
Accept Pipeline Input?	false

-Visible<Boolean>

Specifies whether or not this application is visible to users. Note that it's possible for an application to be disabled and still visible.

Required?	false
Default Value	

Accept Pipeline Input?	false

-WaitForPrinterCreation<Boolean>

Specifies whether or not the session waits for the printers to be created before allowing the end-user to interact with the session. Note that this property cannot be set for applications of type InstalledOnClient.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WorkingDirectory<String>

Specifies from which working directory the executable is launched from.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Application, or depends on parameter You can pipe the application to be added to Set-

BrokerApplication. You can also pipe some of the other parameters by name.

Return Values

None or Citrix.Broker.Admin.SDK.Application

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Application object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerApplication -Name "Notepad" -Description 'Windows Notepad'
Modifies the application that has a Name of "Notepad" so that its description reads Windows Notepad.

---------- EXAMPLE 2 ----------

C:\PS> $app = Get-BrokerApplication -BrowserName "Calculator"
C:\PS> Set-BrokerApplication -InputObject $app -Enabled $false
First gets the application with a BrowserName of "Calculator", then modifies that application (by supplying the application object in the first position) so that it is disabled for users.

Set-BrokerApplicationInstanceMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for ApplicationInstance

Syntax

Set-BrokerApplicationInstanceMetadata [-ApplicationInstanceId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationInstanceMetadata [-ApplicationInstanceId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationInstanceMetadata [-ApplicationInstanceId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationInstanceMetadata [-InputObject] <ApplicationInstance[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationInstanceMetadata [-InputObject] <ApplicationInstance[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerApplicationInstanceMetadata cmdlet creates/updates metadata key-value pairs for ApplicationInstance. The ApplicationInstance can be specified by ImputObject or piping.

Related topics

Parameters

-ApplicationInstanceId<Int64>

Specifies the ApplicationInstance object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-InputObject<ApplicationInstance[]>

Specifies the ApplicationInstance objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerApplicationInstance You can pipe the ApplicationInstance to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerApplicationInstance

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerApplicationInstance object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerApplicationInstanceMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the ApplicationInstance whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerApplicationInstance | Set-BrokerApplicationInstanceMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the ApplicationInstance in the site

Set-BrokerApplicationMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Application

Syntax

Set-BrokerApplicationMetadata [-ApplicationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationMetadata [-ApplicationId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationMetadata [-ApplicationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationMetadata [-InputObject] <Application[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationMetadata [-InputObject] <Application[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationMetadata [-ApplicationName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerApplicationMetadata [-ApplicationName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerApplicationMetadata cmdlet creates/updates metadata key-value pairs for Application. The Application can be specified by ImputObject or piping.

Related topics

Parameters

-ApplicationId<Int32>

Specifies the Application object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<Application[]>

Specifies the Application objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-ApplicationName<String>

Specifies the Application object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerApplication You can pipe the Application to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerApplication

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerApplication object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerApplicationMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Application whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerApplication | Set-BrokerApplicationMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Application in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerApplicationMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Application in the site whose name is 'objname'

Set-BrokerAssignmentPolicyRule

Apr 15, 2014

Modifies an existing desktop rule in the site's assignment policy.

Syntax

Set-BrokerAssignmentPolicyRule [-InputObject] <AssignmentPolicyRule[]> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-ColorDepth <ColorDepth>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IconUid <Int32>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-MaxDesktops <Int32>] [-PublishedName <String>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-SecureIcaRequired <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAssignmentPolicyRule [-Name] <String> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-ColorDepth <ColorDepth>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IconUid <Int32>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-MaxDesktops <Int32>] [-PublishedName <String>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-SecureIcaRequired <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerAssignmentPolicyRule cmdlet modifies an existing desktop rule in the site's assignment policy.

A desktop rule in the assignment policy defines the users who are entitled to self-service persistent machine assignments from the rule's desktop group. A rule defines how many machines a user is allowed from the group for delivery of full desktop sessions.

Changing a desktop rule does not alter machine assignments that have already been made by the rule, nor does it affect active sessions to those machines in any way.

Related topics

New-BrokerAssignmentPolicyRule

Get-BrokerAssignmentPolicyRule

Rename-BrokerAssignmentPolicyRule

Remove-BrokerAssignmentPolicyRule

Parameters

-InputObject<AssignmentPolicyRule[]>

The desktop rule in the assignment policy to be modified.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the desktop rule in the assignment policy to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AddExcludedUsers<User[]>

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedUsers<User[]>

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Changes the color depth of any desktop sessions to machines assigned by the rule.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Changes the description of the desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Enables or disables the desktop rule. A disabled rule is ignored when evaluating the site's assignment policy.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUserFilterEnabled<Boolean>

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when assignment policy rules are evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUsers<User[]>

Changes the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Changes the unique ID of the icon used to display the machine assignment entitlement to the user, and of the assigned desktop itself following the assignment.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUserFilterEnabled<Boolean>

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a machine assignment by the rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

For rules that relate to RemotePC desktop groups however, if the included user filter is disabled, the rule is effectively disabled.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUsers<User[]>

Changes the included users filter of the rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

If a user appears explicitly in the excluded users filter of the rule, or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	

Accept Pipeline Input?	false

-MaxDesktops<Int32>

The number of machines from the rule's desktop group to which a user is entitled. Where an entitlement is granted to a user group rather than an individual, the number of machines applies to each member of the user group independently.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Changes the published name of the machine assignment entitlement as seen by the user. Changing the published name does not affect the names of desktops that have already been assigned by the rule.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedUsers<User[]>

Removes the specified users from the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a machine assignment from this rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveIncludedUsers<User[]>

Removes the specified users from the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a machine assignment by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	

Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Changes whether the desktop rule requires the SecureICA protocol for desktop sessions to machines assigned using the entitlement.

The default null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.AssignmentPolicyRule The desktop rule within the assignment policy to be modified.

Return Values

None or Citrix.Broker.Admin.SDK.AssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.AssignmentPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerAssignmentPolicyRule 'Temp Staff' -AddIncludedUsers office\interns
Adds the user group OFFICE\interns to the Temp Staff desktop rule in the assignment policy. This grants all members of that user group entitlements to machines in the rule's desktop group. The number of machine entitlements per user and the session properties of the desktops obtained using the rule are determined by the rule's other properties.

---------- EXAMPLE 2 ----------

C:\PS> Set-BrokerAssignmentPolicyRule 'Temp Staff' -Enabled $false
Disables the Temp Staff desktop rule in the assignment policy. This prevents further machine assignments being made using this rule until it is re-enabled. However, access to machines already assigned using the rule is not impacted.

Set-BrokerAssignmentPolicyRuleMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for AssignmentPolicyRule

Syntax

Set-BrokerAssignmentPolicyRuleMetadata [-AssignmentPolicyRuleId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAssignmentPolicyRuleMetadata [-AssignmentPolicyRuleId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAssignmentPolicyRuleMetadata [-AssignmentPolicyRuleId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAssignmentPolicyRuleMetadata [-InputObject] <AssignmentPolicyRule[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAssignmentPolicyRuleMetadata [-InputObject] <AssignmentPolicyRule[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAssignmentPolicyRuleMetadata [-AssignmentPolicyRuleName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerAssignmentPolicyRuleMetadata [-AssignmentPolicyRuleName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerAssignmentPolicyRuleMetadata cmdlet creates/updates metadata key-value pairs for AssignmentPolicyRule. The AssignmentPolicyRule can be specified by InputObject or piping.

Related topics

Parameters

-AssignmentPolicyRuleId<Int32>

Specifies the AssignmentPolicyRule object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<AssignmentPolicyRule[]>

Specifies the AssignmentPolicyRule objects whose Metadata is to be created/updated.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-AssignmentPolicyRuleName<String>

Specifies the AssignmentPolicyRule object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule You can pipe the AssignmentPolicyRule to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerAssignmentPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerAssignmentPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the AssignmentPolicyRule whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerAssignmentPolicyRule | Set-BrokerAssignmentPolicyRuleMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the AssignmentPolicyRule in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerAssignmentPolicyRuleMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the AssignmentPolicyRule in the site whose name is 'objname'

Set-BrokerCatalog

Apr 15, 2014

Sets the properties of a catalog.

Syntax

Set-BrokerCatalog [-InputObject] <Catalog[]> [-PassThru] [-Description <String>] [-IsRemotePC <Boolean>] [-MinimumFunctionalLevel <FunctionalLevel>] [-ProvisioningSchemeId <Guid>] [-PvsAddress <String>] [-PvsDomain <String>] [-RemotePCHypervisorConnectionUid <Int32>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerCatalog [-Name] <String> [-PassThru] [-Description <String>] [-IsRemotePC <Boolean>] [-MinimumFunctionalLevel <FunctionalLevel>] [-ProvisioningSchemeId <Guid>] [-PvsAddress <String>] [-PvsDomain <String>] [-RemotePCHypervisorConnectionUid <Int32>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerCatalog cmdlet sets properties of a catalog or set of catalogs. The catalog can be specified by name, in which case only one catalog can be specified, or one or more catalog instances can be passed to the command either by piping or by using the -InputObject parameter.

Related topics

Get-BrokerCatalog

New-BrokerCatalog

Remove-BrokerCatalog

Rename-BrokerCatalog

Parameters

-InputObject<Catalog[]>

Specifies the catalog objects to modify.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Identifies the catalog to modify.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-Description<String>

Supplies the new value of the Description property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsRemotePC<Boolean>

Supplies a new value for IsRemotePC.

IsRemotePC can only be enabled when:

o SessionSupport is SingleSession

o MachinesArePhysical is true.

IsRemotePC can only be set from true to false when no RemotePCAccount references this catalog, and when no Remote PC relationship exists between this catalog and a desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MinimumFunctionalLevel<FunctionalLevel>

The new minimum FunctionalLevel required for machines to work successfully in the catalog. If this is higher than the FunctionalLevel of any machines already in the catalog, they will immediately cease to function.

Valid values are L5, L7

Required?	false

Default Value	
Accept Pipeline Input?	false

-ProvisioningSchemeId<Guid>

Specifies the identity of the MCS provisioning scheme the catalog is associated with (can only be specified for new catalogs with a ProvisioningType of MCS; once set can never be changed).

Required?	false
Default Value	
Accept Pipeline Input?	false

-PvsAddress<String>

Supplies the new value of the PvsAddress property. Can only be set if CatalogKind is Pvs or PvsPvd.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PvsDomain<String>

Supplies the new value of the PvsDomain property. Can only be set if CatalogKind is PvsPvd.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemotePCHypervisorConnectionUid<Int32>

Supplies the new hypervisor connection to use for powering on remote PCs in this catalog (only allowed when IsRemotePC is true); this will affect all machines already in the catalog as well as those created later.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level

Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Catalog You can pipe the catalogs to be modified to Set-BrokerCatalog.

Return Values

None or Citrix.Broker.Admin.SDK.Catalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Catalog object.

Notes

A catalog's Name property cannot be changed by Set-BrokerCatalog. To rename a catalog use Rename-BrokerCatalog.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Set-BrokerCatalog -Name "MyCatalog" -Description "New Description"
```

This example specifies a catalog by name and sets its description.

---------- EXAMPLE 2 ----------

```
C:\PS> $permCatalogs = Get-BrokerCatalog -AllocationType Static
C:\PS> Set-BrokerCatalog -InputObject $permCatalogs -Description "Permanently assigned machines"
```

This example sets the description for all catalogs with AllocationType 'Static'.

Set-BrokerCatalogMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Catalog

Syntax

Set-BrokerCatalogMetadata [-CatalogId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerCatalogMetadata [-CatalogId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerCatalogMetadata [-CatalogId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerCatalogMetadata [-InputObject] <Catalog[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerCatalogMetadata [-InputObject] <Catalog[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerCatalogMetadata [-CatalogName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerCatalogMetadata [-CatalogName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerCatalogMetadata cmdlet creates/updates metadata key-value pairs for Catalog. The Catalog can be specified by ImputObject or piping.

Related topics

Parameters

-CatalogId<Int32>

Specifies the Catalog object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Catalog[]>

Specifies the Catalog objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-CatalogName<String>

Specifies the Catalog object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerCatalog You can pipe the Catalog to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerCatalog

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerCatalog object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerCatalogMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Catalog whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerCatalog | Set-BrokerCatalogMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Catalog in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerCatalogMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Catalog in the site whose name is 'objname'

Set-BrokerConfigurationSlotMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for ConfigurationSlot

Syntax

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-InputObject] <ConfigurationSlot[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-InputObject] <ConfigurationSlot[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerConfigurationSlotMetadata [-ConfigurationSlotName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerConfigurationSlotMetadata cmdlet creates/updates metadata key-value pairs for ConfigurationSlot. The ConfigurationSlot can be specified by ImputObject or piping.

Related topics

Parameters

-ConfigurationSlotId<Int32>

Specifies the ConfigurationSlot object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<ConfigurationSlot[]>

Specifies the ConfigurationSlot objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-ConfigurationSlotName<String>

Specifies the ConfigurationSlot object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerConfigurationSlot You can pipe the ConfigurationSlot to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerConfigurationSlot

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerConfigurationSlot object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerConfigurationSlotMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the ConfigurationSlot whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerConfigurationSlot | Set-BrokerConfigurationSlotMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the ConfigurationSlot in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerConfigurationSlotMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the ConfigurationSlot in the site whose name is 'objname'

Set-BrokerControllerMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Controller

Syntax

Set-BrokerControllerMetadata [-ControllerId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerControllerMetadata [-ControllerId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerControllerMetadata [-ControllerId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerControllerMetadata [-InputObject] <Controller[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerControllerMetadata [-InputObject] <Controller[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerControllerMetadata [-ControllerName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerControllerMetadata [-ControllerName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerControllerMetadata cmdlet creates/updates metadata key-value pairs for Controller. The Controller can be specified by ImputObject or piping.

Related topics

Parameters

-ControllerId<Int32>

Specifies the Controller object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<Controller[]>

Specifies the Controller objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-ControllerName<String>

Specifies the Controller object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerController You can pipe the Controller to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerController

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerController object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerControllerMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Controller whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerController | Set-BrokerControllerMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Controller in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerControllerMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Controller in the site whose name is 'objname'

Set-BrokerDBConnection

Apr 15, 2014

Specifies the Citrix Broker Service's database connection string.

Syntax

Set-BrokerDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [[-Force]] [<CommonParameters>]

Detailed Description

Specifies the database connection string for use by the currently selected Citrix Broker Service instance.

The service records the connection string and attempts to contact the specified database. If the database cannot initially be contacted the service retries the connection at intervals until contact with the database is successfully established.

Is is not possible to set a new database connection string for the service if one is already recorded. The connection string must first be set to $null. This action causes the service to reset and return to its idle state, at which point a new connection string can be set.

When a database connection string is successfully set for the service, a status of OK is returned by the cmdlet. If the database connection string is set to $null, a DBUnconfigured status is returned.

A syntactically invalid connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Broker SDK cmdlet.

Related topics

Get-BrokerServiceStatus

Get-BrokerDBConnection

Test-BrokerDBConnection

Parameters

-DBConnection<String>

Specifies the new database connection string for the currently selected Citrix Broker Service instance.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

System.String

The Set-BrokerDBConnection cmdlet returns a string describing the new status of the selected Citrix Broker Service instance. Possible values are:

-- OK:

The service instance is configured with a valid database and service schema. The service is operational.

-- DBUnconfigured:

No database connection string is set for the service instance.

-- DBRejectedConnection:

The database server rejected the logon from the service instance. This is typically caused by invalid credentials.

-- InvalidDBConfigured:

The specified database does not exist, is not visible to the service instance, or the service's schema within the database is invalid.

-- DBNotFound:

The specified database could not be located with the given connection string.

-- DBNewerVersionThanService:

The service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

-- DBOlderVersionThanService:

The service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

-- DBVersionChangeInProgress:

A database schema upgrade is in progress.

-- PendingFailure:

Connectivity between the service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

-- Failed:

Connectivity between the service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

-- Unknown:

Service status cannot be determined.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Set-BrokerDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;Trusted_Connection=True"
Configures the service instance to use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

---------- EXAMPLE 2 ----------

C:\PS>Set-BrokerDBConnection -DBConnection $null
Resets the service instance's database connection string. The service instance resets and returns to an idle state until a

valid new database connection string is specified.

Set-BrokerDesktopGroup

Apr 15, 2014

Adjusts the settings of a broker desktop group.

Syntax

Set-BrokerDesktopGroup [-InputObject] <DesktopGroup[]> [-PassThru] [-AutomaticPowerOnForAssigned <Boolean>] [-AutomaticPowerOnForAssignedDuringPeak <Boolean>] [-ColorDepth <ColorDepth>] [-DeliveryType <DeliveryType>] [-Description <String>] [-Enabled <Boolean>] [-IconUid <Int32>] [-InMaintenanceMode <Boolean>] [-IsRemotePC <Boolean>] [-MinimumFunctionalLevel <FunctionalLevel>] [-OffPeakBufferSizePercent <Int32>] [-OffPeakDisconnectAction <SessionChangeHostingAction>] [-OffPeakDisconnectTimeout <Int32>] [-OffPeakExtendedDisconnectAction <SessionChangeHostingAction>] [-OffPeakExtendedDisconnectTimeout <Int32>] [-OffPeakLogOffAction <SessionChangeHostingAction>] [-OffPeakLogOffTimeout <Int32>] [-PeakBufferSizePercent <Int32>] [-PeakDisconnectAction <SessionChangeHostingAction>] [-PeakDisconnectTimeout <Int32>] [-PeakExtendedDisconnectAction <SessionChangeHostingAction>] [-PeakExtendedDisconnectTimeout <Int32>] [-PeakLogOffAction <SessionChangeHostingAction>] [-PeakLogOffTimeout <Int32>] [-ProtocolPriority <String[]>] [-PublishedName <String>] [-SecureIcaRequired <Boolean>] [-ShutdownDesktopsAfterUse <Boolean>] [-TimeZone <String>] [-TurnOnAddedMachine <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroup [-Name] <String> [-PassThru] [-AutomaticPowerOnForAssigned <Boolean>] [-AutomaticPowerOnForAssignedDuringPeak <Boolean>] [-ColorDepth <ColorDepth>] [-DeliveryType <DeliveryType>] [-Description <String>] [-Enabled <Boolean>] [-IconUid <Int32>] [-InMaintenanceMode <Boolean>] [-IsRemotePC <Boolean>] [-MinimumFunctionalLevel <FunctionalLevel>] [-OffPeakBufferSizePercent <Int32>] [-OffPeakDisconnectAction <SessionChangeHostingAction>] [-OffPeakDisconnectTimeout <Int32>] [-OffPeakExtendedDisconnectAction <SessionChangeHostingAction>] [-OffPeakExtendedDisconnectTimeout <Int32>] [-OffPeakLogOffAction <SessionChangeHostingAction>] [-OffPeakLogOffTimeout <Int32>] [-PeakBufferSizePercent <Int32>] [-PeakDisconnectAction <SessionChangeHostingAction>] [-PeakDisconnectTimeout <Int32>] [-PeakExtendedDisconnectAction <SessionChangeHostingAction>] [-PeakExtendedDisconnectTimeout <Int32>] [-PeakLogOffAction <SessionChangeHostingAction>] [-PeakLogOffTimeout <Int32>] [-ProtocolPriority <String[]>] [-PublishedName <String>] [-SecureIcaRequired <Boolean>] [-ShutdownDesktopsAfterUse <Boolean>] [-TimeZone <String>] [-TurnOnAddedMachine <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerDesktopGroup cmdlet is used to disable or enable an existing broker desktop group or to alter its settings.

Related topics

Get-BrokerDesktopGroup

New-BrokerDesktopGroup

Rename-BrokerDesktopGroup

Remove-BrokerDesktopGroup

Parameters

-InputObject<DesktopGroup[]>

Specifies the desktop groups to adjust.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the desktop groups to adjust, based on their Name property.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AutomaticPowerOnForAssigned<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started at the start of peak time periods. Only relevant for groups whose DesktopKind is Private.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AutomaticPowerOnForAssignedDuringPeak<Boolean>

Specifies whether assigned desktops in the desktop group should be automatically started throughout peak time periods. Only relevant for groups whose DesktopKind is Private and which have AutomaticPowerOnForAssigned set to true.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Specifies the color depth that the ICA session should use for desktops in this group. Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DeliveryType<DeliveryType>

Specifies whether desktops, applications, or both, can be delivered from machines contained within the desktop group. Desktop groups with a DesktopKind of Private cannot be used to deliver both desktops and applications.

When changing the delivery type to desktops only, there must be no remaining desktop-hosted applications associated with the group, or application-specific assignment/entitlement policy rules for the group.

When changing the delivery type to applications only, there must be no remaining client-hosted applications associated with the group, or desktop-specific assignment/entitlement policy rules for the group.

Valid values are DesktopsOnly, AppsOnly, and DesktopsAndApps.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

A description for this desktop group useful for administrators of the site.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Whether the desktop group should be in the enabled state; disabled desktop groups do not appear to users.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

The UID of the broker icon to be displayed to users for their desktop(s) in this desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Whether the desktop should be put into maintenance mode; a desktop group in maintenance mode will not allow users to connect or reconnect to their desktops.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsRemotePC<Boolean>

Supplies a new value for IsRemotePC.

IsRemotePC can only be enabled when:

o SessionSupport is SingleSession

o DeliveryType is DesktopsOnly

o DesktopKind is Private

IsRemotePC can be switched from true to false only if no RemotePC relationship exists between a catalog and this desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MinimumFunctionalLevel<FunctionalLevel>

The new minimum FunctionalLevel required for machines to work successfully in the desktop group. If this is higher than the FunctionalLevel of any machines already in the desktop group, they will immediately cease to function.

Required?	false
Default Value	

Accept Pipeline Input?	false

-OffPeakBufferSizePercent<Int32>

The percentage of machines in the desktop group that should be kept available in an idle state outside peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OffPeakDisconnectAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OffPeakDisconnectTimeout<Int32>

The number of minutes before the configured action should be performed after a user session disconnects outside peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OffPeakExtendedDisconnectAction<SessionChangeHostingAction>

The action to be performed after a second configurable period of a user session disconnecting outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OffPeakExtendedDisconnectTimeout<Int32>

The number of minutes before the second configured action should be performed after a user session disconnects outside peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OffPeakLogOffAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session ending outside peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OffPeakLogOffTimeout<Int32>

The number of minutes before the configured action should be performed after a user session ends outside peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakBufferSizePercent<Int32>

The percentage of machines in the desktop group that should be kept available in an idle state in peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakDisconnectAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakDisconnectTimeout<Int32>

The number of minutes before the configured action should be performed after a user session disconnects in peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakExtendedDisconnectAction<SessionChangeHostingAction>

The action to be performed after a second configurable period of a user session disconnecting in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakExtendedDisconnectTimeout<Int32>

The number of minutes before the second configured action should be performed after a user session disconnects in peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakLogOffAction<SessionChangeHostingAction>

The action to be performed after a configurable period of a user session ending in peak hours. Possible values are Nothing, Suspend, or Shutdown.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakLogOffTimeout<Int32>

The number of minutes before the configured action should be performed after a user session ends in peak hours.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProtocolPriority<String[]>

A list of protocol names in the order in which they should be attempted for use during connection.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

The name that will be displayed to users for their desktop(s) in this desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Whether HDX connections to desktops in the new desktop group require the use of a secure protocol.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ShutdownDesktopsAfterUse<Boolean>

Whether desktops in this desktop group should be automatically shut down when each user session completes (only relevant to power-managed desktops).

Required?	false
Default Value	
Accept Pipeline Input?	false

-TimeZone<String>

The time zone in which this desktop group's machines reside.

The time zone must be specified for any of the group's automatic power management settings to take effect. Automatic power management operations include pool management (power time schemes), reboot schedules, session disconnect and logoff actions, and powering on assigned machines etc.

Required?	false
Default Value	
Accept Pipeline Input?	false

-TurnOnAddedMachine<Boolean>

This flag specifies whether the Broker Service should attempt to power on machines when they are added to the desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.DesktopGroup You can pipe the desktop groups to be adjusted to Set-BrokerDesktopGroup.

Return Values

None or Citrix.Broker.Admin.SDK.DesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.DesktopGroup object.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Set-BrokerDesktopGroup EMEA* -InMaintenanceMode $true -PassThru
```

Sets all desktop groups with names starting "EMEA" into maintenance mode, returning the set of desktop groups.

---------- EXAMPLE 2 ----------

```
C:\PS> Get-BrokerDesktopGroup -InMaintenanceMode $true | Set-BrokerDesktopGroup -Enabled $false
```

Disable all desktop groups that are in maintenance mode.

Set-BrokerDesktopGroupMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for DesktopGroup

Syntax

Set-BrokerDesktopGroupMetadata [-DesktopGroupId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-InputObject] <DesktopGroup[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-InputObject] <DesktopGroup[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerDesktopGroupMetadata [-DesktopGroupName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerDesktopGroupMetadata cmdlet creates/updates metadata key-value pairs for DesktopGroup. The DesktopGroup can be specified by ImputObject or piping.

Related topics

Parameters

-DesktopGroupId<Int32>

Specifies the DesktopGroup object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<DesktopGroup[]>

Specifies the DesktopGroup objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-DesktopGroupName<String>

Specifies the DesktopGroup object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerDesktopGroup You can pipe the DesktopGroup to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerDesktopGroup

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerDesktopGroup object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerDesktopGroupMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the DesktopGroup whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerDesktopGroup | Set-BrokerDesktopGroupMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the DesktopGroup in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerDesktopGroupMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the DesktopGroup in the site whose name is 'objname'

Set-BrokerEntitlementPolicyRule

Apr 15, 2014

Modifies an existing desktop rule in the site's entitlement policy.

Syntax

Set-BrokerEntitlementPolicyRule [-InputObject] <EntitlementPolicyRule[]> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-ColorDepth <ColorDepth>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IconUid <Int32>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-PublishedName <String>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-SecureIcaRequired <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerEntitlementPolicyRule [-Name] <String> [-PassThru] [-AddExcludedUsers <User[]>] [-AddIncludedUsers <User[]>] [-ColorDepth <ColorDepth>] [-Description <String>] [-Enabled <Boolean>] [-ExcludedUserFilterEnabled <Boolean>] [-ExcludedUsers <User[]>] [-IconUid <Int32>] [-IncludedUserFilterEnabled <Boolean>] [-IncludedUsers <User[]>] [-PublishedName <String>] [-RemoveExcludedUsers <User[]>] [-RemoveIncludedUsers <User[]>] [-SecureIcaRequired <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerEntitlementPolicyRule cmdlet modifies an existing desktop rule in the site's entitlement policy.

A desktop rule in the entitlement policy defines the users who are allowed per-session access to a machine from the rule's associated desktop group to run a full desktop session.

Changing a rule does not affect existing sessions launched using the rule, but if the change removes an entitlement to a machine that was previously granted, users may be unable to reconnect to a disconnected session on that machine.

Related topics

New-BrokerEntitlementPolicyRule

Get-BrokerEntitlementPolicyRule

Rename-BrokerEntitlementPolicyRule

Remove-BrokerEntitlementPolicyRule

Parameters

-InputObject<EntitlementPolicyRule[]>

The desktop rule in the entitlement policy to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The name of the desktop rule in the entitlement policy to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AddExcludedUsers<User[]>

Adds the specified users to the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AddIncludedUsers<User[]>

Adds the specified users to the included users filter of the rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Changes the color depth of any desktop sessions launched by a user from this entitlement. Existing sessions are not

affected.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Changes the description of the desktop rule. The text may be visible to the end user, for example, as a tooltip associated with the desktop entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Enables or disables the desktop rule. A disabled rule is ignored when evaluating the site's entitlement policy.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUserFilterEnabled<Boolean>

Enables or disables the excluded users filter. If the filter is disabled then any user entries in the filter are ignored when entitlement policy rules are evaluated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ExcludedUsers<User[]>

Changes the excluded users filter of the desktop rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

This can be used to exclude users or groups who would otherwise gain access by groups specified in the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Changes the icon (identified by its unique ID) for the published desktop entitlement as seen by the user.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUserFilterEnabled<Boolean>

Enables or disables the included users filter. If the filter is disabled then any user who satisfies the requirements of the access policy is implicitly granted an entitlement to a desktop session by the rule.

Users who would be implicitly granted access when the filter is disabled can still be explicitly denied access using the excluded users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IncludedUsers<User[]>

Changes the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

If a user appears explicitly in the excluded users filter of the rule or is a member of a group that appears in the excluded users filter, no entitlement is granted whether or not the user appears in the included users filter.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Changes the name of the published desktop entitlement as seen by the user.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveExcludedUsers<User[]>

Removes the specified users from the excluded users filter of the rule, that is, the users and groups who are explicitly denied an entitlement to a desktop session from this rule.

See the ExcludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RemoveIncludedUsers<User[]>

Removes the specified users from the included users filter of the desktop rule, that is, the users and groups who are granted an entitlement to a desktop session by the rule.

See the IncludedUsers parameter for more information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Changes whether the desktop rule requires the SecureICA protocol for desktop sessions launched using the entitlement.

A null value indicates that the equivalent setting from the rule's desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop

Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.EntitlementPolicyRule The desktop rule in the entitlement policy to be modified.

Return Values

None or Citrix.Broker.Admin.SDK.EntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.EntitlementPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerEntitlementPolicyRule 'Temp Workers' -AddIncludedUsers office\contractors
Adds the user group OFFICE\contractors to the Temp Workers desktop rule of the entitlement policy. This grants all members of that group an entitlement to a desktop session in the rule's associated desktop group. The session properties of the desktops obtained using the rule are determined by the rule's other properties.

---------- EXAMPLE 2 ----------

C:\PS> Set-BrokerEntitlementPolicyRule 'Temp Workers' -Enabled $false
Disables the Temp Workers desktop rule in the entitlement policy. This prevents further desktop sessions being launched using this rule until it is re-enabled. However, access to existing desktop sessions is not affected.

Set-BrokerEntitlementPolicyRuleMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for EntitlementPolicyRule

Syntax

Set-BrokerEntitlementPolicyRuleMetadata [-EntitlementPolicyRuleId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerEntitlementPolicyRuleMetadata [-EntitlementPolicyRuleId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerEntitlementPolicyRuleMetadata [-EntitlementPolicyRuleId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerEntitlementPolicyRuleMetadata [-InputObject] <EntitlementPolicyRule[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerEntitlementPolicyRuleMetadata [-InputObject] <EntitlementPolicyRule[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerEntitlementPolicyRuleMetadata [-EntitlementPolicyRuleName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerEntitlementPolicyRuleMetadata [-EntitlementPolicyRuleName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerEntitlementPolicyRuleMetadata cmdlet creates/updates metadata key-value pairs for EntitlementPolicyRule. The EntitlementPolicyRule can be specified by InputObject or piping.

Related topics

Parameters

-EntitlementPolicyRuleId<Int32>

Specifies the EntitlementPolicyRule object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<EntitlementPolicyRule[]>

Specifies the EntitlementPolicyRule objects whose Metadata is to be created/updated.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-EntitlementPolicyRuleName<String>

Specifies the EntitlementPolicyRule object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule You can pipe the EntitlementPolicyRule to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerEntitlementPolicyRule object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerEntitlementPolicyRuleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the EntitlementPolicyRule whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerEntitlementPolicyRule | Set-BrokerEntitlementPolicyRuleMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the EntitlementPolicyRule in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerEntitlementPolicyRuleMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the EntitlementPolicyRule in the site whose name is 'objname'

Set-BrokerHostingPowerAction

Apr 15, 2014

Changes the priority of one or more pending power actions.

Syntax

Set-BrokerHostingPowerAction [-InputObject] <HostingPowerAction[]> [-PassThru] [-ActualPriority <Int32>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerAction [-MachineName] <String> [-PassThru] [-ActualPriority <Int32>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHostingPowerAction cmdlet modifies an existing power action in the site's power action queue. The only property of power actions you can change, is the current priority of the action.

For a detailed description of the queuing mechanism, see 'help about_Broker_PowerManagement'.

Related topics

Get-BrokerHostingPowerAction

New-BrokerHostingPowerAction

Remove-BrokerHostingPowerAction

Parameters

-InputObject<HostingPowerAction[]>

The power action whose priority is to be changed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

Changes the priority of actions that are for machines whose name (of the form domain\machine) matches the specified string.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-ActualPriority<Int32>

Specifies a new priority value for the action in the queue.

This priority is the current action priority; the 'base' or original priority for actions cannot be altered. Numerically lower priority values indicate more important actions that are processed in preference to actions with numerically higher priority settings.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.HostingPowerAction The power action whose priority is to be changed.

Return Values

None or Citrix.Broker.Admin.SDK.HostingPowerAction

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.HostingPowerAction object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerHostingPowerAction -MachineName 'XD_VDA1' -ActualPriority 25
Sets the current priority of actions for the machine called 'XD_VDA1' to 25. Numerically lower priority values indicate more important actions that will be processed in preference to actions with numerically higher priority settings.

Set-BrokerHostingPowerActionMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for HostingPowerAction

Syntax

Set-BrokerHostingPowerActionMetadata [-HostingPowerActionId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerActionMetadata [-HostingPowerActionId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerActionMetadata [-HostingPowerActionId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerActionMetadata [-InputObject] <HostingPowerAction[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerActionMetadata [-InputObject] <HostingPowerAction[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerActionMetadata [-HostingPowerActionName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHostingPowerActionMetadata [-HostingPowerActionName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHostingPowerActionMetadata cmdlet creates/updates metadata key-value pairs for HostingPowerAction. The HostingPowerAction can be specified by ImputObject or piping.

Related topics

Parameters

-HostingPowerActionId<Int64>

Specifies the HostingPowerAction object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<HostingPowerAction[]>

Specifies the HostingPowerAction objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-HostingPowerActionName<String>

Specifies the HostingPowerAction object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerHostingPowerAction You can pipe the HostingPowerAction to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerHostingPowerAction

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerHostingPowerAction object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerHostingPowerActionMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the HostingPowerAction whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerHostingPowerAction | Set-BrokerHostingPowerActionMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the HostingPowerAction in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerHostingPowerActionMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the HostingPowerAction in the site whose name is 'objname'

Set-BrokerHypervisorAlertMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for HypervisorAlert

Syntax

Set-BrokerHypervisorAlertMetadata [-HypervisorAlertId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorAlertMetadata [-HypervisorAlertId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorAlertMetadata [-HypervisorAlertId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorAlertMetadata [-InputObject] <HypervisorAlert[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorAlertMetadata [-InputObject] <HypervisorAlert[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHypervisorAlertMetadata cmdlet creates/updates metadata key-value pairs for HypervisorAlert. The HypervisorAlert can be specified by ImputObject or piping.

Related topics

Parameters

-HypervisorAlertId<Int64>

Specifies the HypervisorAlert object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<HypervisorAlert[]>

Specifies the HypervisorAlert objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerHypervisorAlert You can pipe the HypervisorAlert to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerHypervisorAlert

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerHypervisorAlert object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerHypervisorAlertMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the HypervisorAlert whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerHypervisorAlert | Set-BrokerHypervisorAlertMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the HypervisorAlert in the site

Set-BrokerHypervisorConnection

Apr 15, 2014

Sets the properties of a hypervisor connection.

Syntax

Set-BrokerHypervisorConnection [-InputObject] <HypervisorConnection[]> [-PassThru] [-PreferredController <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnection [-Name] <String> [-PassThru] [-PreferredController <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHypervisorConnection cmdlet sets the properties on a hypervisor connection.

Related topics

Get-BrokerHypervisorConnection

New-BrokerHypervisorConnection

Remove-BrokerHypervisorConnection

Parameters

-InputObject<HypervisorConnection[]>

Specifies the hypervisor connection object to adjust.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the hypervisor connection object to adjust.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-PreferredController<String>

Supplies the new value of the PreferredController property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.HypervisorConnection You can pipe the hypervisor connection to be modified to Set-BrokerHypervisorConnection.

Return Values

None or Citrix.Broker.Admin.SDK.HypervisorConnection

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.HypervisorConnection object.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS> $hvConn = Get-BrokerHypervisorConnection -PreferredController "oldController" -Name "Xen Server Connection"
c:\PS> Set-BrokerHypervisorConnection -InputObject $hvConn -PreferredController "newController"
```

Updates the preferred controller for a hypervisor connection.

Set-BrokerHypervisorConnectionMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for HypervisorConnection

Syntax

Set-BrokerHypervisorConnectionMetadata [-HypervisorConnectionId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-HypervisorConnectionId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-HypervisorConnectionId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerHypervisorConnectionMetadata cmdlet creates/updates metadata key-value pairs for HypervisorConnection. The HypervisorConnection can be specified by InputObject or piping.

Related topics

Parameters

-HypervisorConnectionId<Int32>

Specifies the HypervisorConnection object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<HypervisorConnection[]>

Specifies the HypervisorConnection objects whose Metadata is to be created/updated.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-HypervisorConnectionName<String>

Specifies the HypervisorConnection object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerHypervisorConnection You can pipe the HypervisorConnection to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerHypervisorConnection

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerHypervisorConnection object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerHypervisorConnectionMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the HypervisorConnection whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerHypervisorConnection | Set-BrokerHypervisorConnectionMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the HypervisorConnection in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerHypervisorConnectionMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the HypervisorConnection in the site whose name is 'objname'

Set-BrokerIconMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Icon

Syntax

Set-BrokerIconMetadata [-IconId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerIconMetadata [-IconId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerIconMetadata [-IconId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerIconMetadata [-InputObject] <Icon[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerIconMetadata [-InputObject] <Icon[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerIconMetadata cmdlet creates/updates metadata key-value pairs for Icon. The Icon can be specified by ImputObject or piping.

Related topics

Parameters

-IconId<Int32>

Specifies the Icon object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Icon[]>

Specifies the Icon objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerIcon You can pipe the Icon to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerIcon

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerIcon object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerIconMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Icon whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerIcon | Set-BrokerIconMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Icon in the site

Set-BrokerMachine

Apr 15, 2014

Sets properties on a machine.

Syntax

Set-BrokerMachine [-InputObject] <Machine[]> [-PassThru] [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-HostedMachineId <String>] [-HypervisorConnectionUid <Int32>] [-InMaintenanceMode <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachine [-MachineName] <String> [-PassThru] [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-HostedMachineId <String>] [-HypervisorConnectionUid <Int32>] [-InMaintenanceMode <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerMachine cmdlet sets properties on a machine or set of machines. You can specify a single machine by name or multiple machine instances can be passed to the command by piping or using the -InputObject parameter.

Related topics

Get-BrokerMachine

New-BrokerMachine

Parameters

-InputObject<Machine[]>

The machine instances whose properties you want to set.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

The machine whose properties you want to set.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected

record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AssignedClientName<String>

Changes the client name assignment of the machine. Set this to $null to remove the assignment. You can assign machines to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedIPAddress<String>

Changes the client IP address assignment of the machine. Set this to $null to remove the assignment. You can assign machines to multiple users, a single client IP address, or a single client name, but only to one of these categories at a time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HostedMachineId<String>

The unique ID by which the hypervisor recognizes the machine. This may only be set for VMs which are not provisioned by MCS.

Required?	false
Default Value	
Accept Pipeline Input?	false

-HypervisorConnectionUid<Int32>

The hypervisor connection that runs the machine. This may only be set for VMs which are not provisioned by MCS.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Sets whether the machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Machine You can pipe in the machines whose properties you want to set.

Return Values

None or Citrix.Broker.Admin.SDK.Machine

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Machine object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerMachine -MachineName 'MyDomain\MyMachine' -HypervisorConnectionUid 3

This example specifies a machine by name and sets its hypervisor connection.

---------- EXAMPLE 2 ----------

```
C:\PS> $machines = Get-BrokerMachine -MachineName 'MyDomain\*'
C:\PS> Set-BrokerMachine -InputObject $machines -HypervisorConnectionUid 3
```

This example finds all machines in domain MyDomain and sets their hypervisor connections.

---------- EXAMPLE 3 ----------

```
C:\PS> Get-BrokerMachine -MachineName 'MyDomain\*' | Set-BrokerMachine -HypervisorConnectionUid 3
```

This example also finds all machines in domain MyDomain and sets their hypervisor connections.

Set-BrokerMachineCatalog

Apr 15, 2014

Moves one or more machines into a different catalog.

Syntax

Set-BrokerMachineCatalog [-InputObject] <Machine[]> [-CatalogUid] <Int32> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerMachineCatalog cmdlet is used to move machines into a different catalog. The following properties of the destination catalog must exactly match those of the machine's current catalog otherwise the command fails:

o AllocationType

o ProvisioningType

o PersistUserChanges

o SessionSupport

o IsRemotePC

o MinimumFunctionalLevel

o PhysicalMachines

Changing a machine's catalog does not change the machine's desktop group membership. There is no effect on user sessions present on a machine if its catalog is changed.

Related topics

Set-BrokerMachine

New-BrokerCatalog

Parameters

-InputObject<Machine[]>

The machine instances that are being moved into a different catalog.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-CatalogUid<Int32>

The unique identifier of the catalog into which the machines are being moved.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Machine You can pipe in the machines that are to be moved into a new catalog.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $catalog = Get-BrokerCatalog MarketingMachines
    C:\PS> $machines = Get-BrokerMachine -MachineName 'Marketing\*'
    C:\PS> Set-BrokerMachineCatalog $machines -CatalogUid $cat.Uid
```

This example finds all machines in domain Marketing and moves them into a catalog called MarketingMachines.

Set-BrokerMachineCommandMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for MachineCommand

Syntax

Set-BrokerMachineCommandMetadata [-MachineCommandId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineCommandMetadata [-MachineCommandId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineCommandMetadata [-MachineCommandId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineCommandMetadata [-InputObject] <MachineCommand[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineCommandMetadata [-InputObject] <MachineCommand[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerMachineCommandMetadata cmdlet creates/updates metadata key-value pairs for MachineCommand. The MachineCommand can be specified by ImputObject or piping.

Related topics

Parameters

-MachineCommandId<Int64>

Specifies the MachineCommand object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-InputObject<MachineCommand[]>

Specifies the MachineCommand objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerMachineCommand You can pipe the MachineCommand to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerMachineCommand

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerMachineCommand object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerMachineCommandMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the MachineCommand whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerMachineCommand | Set-BrokerMachineCommandMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the MachineCommand in the site

Set-BrokerMachineConfiguration

Apr 15, 2014

Sets the properties of a machine configuration.

Syntax

Set-BrokerMachineConfiguration [-InputObject] <MachineConfiguration[]> [-PassThru] [-Description <String>] [-Policy <Byte[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfiguration [-Name] <String> [-PassThru] [-Description <String>] [-Policy <Byte[]>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the properties of a machine configuration. The encoded settings data must only contain settings that match the SettingsGroup of the associated configuration slot. Use the SDK snap-in that matches the SettingsGroup of the associated configuration slot to generate new encoded settings data or modify existing settings values.

Related topics

New-BrokerMachineConfiguration

Get-BrokerMachineConfiguration

Rename-BrokerMachineConfiguration

Remove-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Parameters

-InputObject<MachineConfiguration[]>

Machine configuration to modify.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Name of machine configuration to modify.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-Description<String>

New description for the machine configuration.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Policy<Byte[]>

New binary array of encoded settings data.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.MachineConfiguration Machine configuration to modify.

Return Values

None or Citrix.Broker.Admin.SDK.MachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.MachineConfiguration object.

Examples

---------- EXAMPLE 1 ----------

```
Set-BrokerMachineConfiguration -Name "UPM\Finance Department" -Policy $newPolicy
```

Use the encoded settings binary data in $newPolicy to update the machine configuration.

---------- EXAMPLE 2 ----------

```
Get-BrokerMachineConfiguration -Name "UPM\*" | Set-BrokerMachineConfiguration -Description "User Profile Management"
```

Assign the description "User Profile Management" to every machine configuration associated with the UPM slot.

Set-BrokerMachineConfigurationMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for MachineConfiguration

Syntax

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-InputObject] <MachineConfiguration[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-InputObject] <MachineConfiguration[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineConfigurationMetadata [-MachineConfigurationName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerMachineConfigurationMetadata cmdlet creates/updates metadata key-value pairs for MachineConfiguration. The MachineConfiguration can be specified by ImputObject or piping.

Related topics

Parameters

-MachineConfigurationId<Int32>

Specifies the MachineConfiguration object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-InputObject<MachineConfiguration[]>

Specifies the MachineConfiguration objects whose Metadata is to be created/updated.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineConfigurationName<String>

Specifies the MachineConfiguration object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerMachineConfiguration You can pipe the MachineConfiguration to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerMachineConfiguration

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerMachineConfiguration object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerMachineConfigurationMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the MachineConfiguration whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerMachineConfiguration | Set-BrokerMachineConfigurationMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the MachineConfiguration in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerMachineConfigurationMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the MachineConfiguration in the site whose name is 'objname'

Set-BrokerMachineMaintenanceMode

Apr 15, 2014

Sets whether the specified machine(s) are in maintenance mode.

Syntax

Set-BrokerMachineMaintenanceMode [-InputObject] <Machine[]> [-MaintenanceMode] <Boolean> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The cmdlet can be used to set whether a machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

There are times when it is necessary to disable desktops. You can do this by setting the InMaintenanceMode property of a desktop to $true. This puts it into maintenance mode. The broker excludes single-session desktops in maintenance mode from brokering decisions and does not start new sessions on them. Existing sessions are unaffected. For multi-session desktops in maintenance mode, reconnections to existing sessions are allowed, but no new sessions are created on the machine.

Desktops in maintenance mode are also excluded from automatic power management, although explicit power actions are still performed.

This cmdlet is equivalent to using the Set-BrokerMachine cmdlet to set the value of only the InMaintenanceMode property.

Related topics

Set-BrokerMachine

Parameters

-InputObject<Machine[]>

The machine instances whose InMaintenanceMode property you want to set.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MaintenanceMode<Boolean>

Sets whether the machine is in maintenance mode or not. A machine in maintenance mode is not available for new sessions, and for managed machines all automatic power management is disabled.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Machine You can pipe in the machines whose properties you want to set.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $machines = Get-BrokerMachine -MachineName 'MyDomain\*'
    C:\PS> Set-BrokerMachineMaintenanceMode -InputObject $machines $false
```

This example finds all machines in domain MyDomain and removes them from maintenance mode by setting their InMaintenanceMode property to false.

Set-BrokerMachineMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Machine

Syntax

Set-BrokerMachineMetadata [-MachineId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-MachineId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-MachineId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-InputObject] <Machine[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-InputObject] <Machine[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-MachineName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerMachineMetadata [-MachineName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerMachineMetadata cmdlet creates/updates metadata key-value pairs for Machine. The Machine can be specified by ImputObject or piping.

Related topics

Parameters

-MachineId<Int32>

Specifies the Machine object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Machine[]>

Specifies the Machine objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

Specifies the Machine object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerMachine You can pipe the Machine to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerMachine

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerMachine object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerMachineMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Machine whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerMachine | Set-BrokerMachineMetadata -Name "MyMetadataName" -Value "1234"

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Machine in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerMachineMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Machine in the site whose name is 'objname'

Set-BrokerPowerTimeScheme

Apr 15, 2014

Modifies an existing power time scheme.

Syntax

Set-BrokerPowerTimeScheme [-InputObject] <PowerTimeScheme[]> [-PassThru] [-DaysOfWeek <TimeSchemeDays>] [-DisplayName <String>] [-PeakHours <Boolean[]>] [-PoolSize <Int32[]>] [-PoolUsingPercentage <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeScheme [-Name] <String> [-PassThru] [-DaysOfWeek <TimeSchemeDays>] [-DisplayName <String>] [-PeakHours <Boolean[]>] [-PoolSize <Int32[]>] [-PoolUsingPercentage <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerPowerTimeScheme cmdlet modifies an existing time scheme.

Each power time scheme is associated with a particular desktop group, and covers one or more days of the week, defining which hours of those days are considered peak times and which are off-peak times.In addition, the time scheme defines a pool size value for each hour of the day for the days of the week covered by the time scheme. No one desktop group can be associated with two or more time schemes that cover the same day of the week.

For more information about the power policy mechanism and pool size management, see 'help about_Broker_PowerManagement'.

Related topics

Get-BrokerPowerTimeScheme

Rename-BrokerPowerTimeScheme

New-BrokerPowerTimeScheme

Remove-BrokerPowerTimeScheme

Parameters

-InputObject<PowerTimeScheme[]>

The power time scheme to be changed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Identifies the power time scheme to be changed by name.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-DaysOfWeek<TimeSchemeDays>

Changes the pattern of days of the week that the time scheme applies to. The pattern of days is specified as a single value or a list of values, where each value refers to either a single day or defined group of days.

Valid values are: Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Weekend and Weekdays.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DisplayName<String>

Changes the name that is used by the DesktopStudio console when showing the time scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PeakHours<Boolean[]>

Changes the pattern of hours considered 'peak' vs 'off-peak' for the days covered by the time scheme. A 24-entry array of boolean truth values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:59, the first relates to 1am to 1:59 and so on, with the last array element relating to 11 PM to 11:59. If the flag value is $true it means the associated hour of the day is considered a peak time; if $false it means that it is considered off-peak.

If fewer than 24 values are supplied, the final missing values are assumed to be 'false', and if more than 24 values are supplied, only the first 24 are used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PoolSize<Int32[]>

Changes the requested pool size of running machines at the various hours of the day for the days covered by the time scheme. A 24-entry array of integer values is expected, where the zeroth entry of the array relates to the time period between midnight and 0:59, the first relates to 1am to 1:59 and so on, with the last array element relating to 11 PM to 11:59. The pool size array entry values are either absolute numbers of machines that should be running or are a percentage of the machines in the desktop group that should be running during the associated hour of the day. A value of -1 in the array signifies that no management of the number of running machines should be attempted during the associated hour of the day.

If fewer than 24 values are supplied, the final missing values are assumed to be -1, and if more than 24 values are supplied, only the first 24 are used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PoolUsingPercentage<Boolean>

Changes whether pool size values from the 'PoolSize' array are evaluated as absolute numbers of running machines or as a percentage of machines in the desktop group that are to be maintained as running.

A value of $true indicates that the pool size array values are percentages of total machines in the desktop group and a value of $false indicates that the pool size array values are absolute numbers of machines to maintain as running.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.PowerTimeScheme The power time scheme to be changed.

Return Values

None or Citrix.Broker.Admin.SDK.PowerTimeScheme

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.PowerTimeScheme object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerPowerTimeScheme -Name 'Development Weekdays' -PoolSize (0..23 | %{ if ($_ -lt 8 -or $_ -gt 19) { 5 } else { 20 } })
Sets the pool size for the power time scheme named 'Development Weekdays' to be 20 for the time between 8am to 7:59pm, and 5 for other times.

Set-BrokerPowerTimeSchemeMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for PowerTimeScheme

Syntax

Set-BrokerPowerTimeSchemeMetadata [-PowerTimeSchemeId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeSchemeMetadata [-PowerTimeSchemeId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeSchemeMetadata [-PowerTimeSchemeId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeSchemeMetadata [-InputObject] <PowerTimeScheme[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeSchemeMetadata [-InputObject] <PowerTimeScheme[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeSchemeMetadata [-PowerTimeSchemeName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPowerTimeSchemeMetadata [-PowerTimeSchemeName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerPowerTimeSchemeMetadata cmdlet creates/updates metadata key-value pairs for PowerTimeScheme. The PowerTimeScheme can be specified by ImputObject or piping.

Related topics

Parameters

-PowerTimeSchemeId<Int32>

Specifies the PowerTimeScheme object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-InputObject<PowerTimeScheme[]>

Specifies the PowerTimeScheme objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PowerTimeSchemeName<String>

Specifies the PowerTimeScheme object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme You can pipe the PowerTimeScheme to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerPowerTimeScheme object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerPowerTimeSchemeMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the PowerTimeScheme whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerPowerTimeScheme | Set-BrokerPowerTimeSchemeMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the PowerTimeScheme in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerPowerTimeSchemeMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the PowerTimeScheme in the site whose name is 'objname'

Set-BrokerPrivateDesktop

Apr 15, 2014

Change the settings of a private desktop.

Syntax

Set-BrokerPrivateDesktop [-InputObject] <PrivateDesktop[]> [-PassThru] [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-ColorDepth <ColorDepth>] [-Description <String>] [-IconUid <Int32>] [-InMaintenanceMode <Boolean>] [-PublishedName <String>] [-SecureIcaRequired <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerPrivateDesktop [-MachineName] <String> [-PassThru] [-AssignedClientName <String>] [-AssignedIPAddress <String>] [-ColorDepth <ColorDepth>] [-Description <String>] [-IconUid <Int32>] [-InMaintenanceMode <Boolean>] [-PublishedName <String>] [-SecureIcaRequired <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Private desktops are automatically created when a machine is added to a desktop group with a DesktopKind of 'Private', and these inherit default properties. Use Set-BrokerPrivateDesktop to change the configuration settings of an existing private desktop.

To specify private desktops, you can choose whether to update by machine name, or by passing a PrivateDesktop or an array of PrivateDesktop objects. You can also use the Uid or an array of Uids instead.

You cannot modify many properties of a private desktop as these contain status information; for example DNSName, RegistrationState, and OSVersion.

Use Add- and Remove- cmdlets to update relationships between private desktops and other objects. For example, you can add a tag to a private desktop with:

Add-BrokerTag $tag -Desktop $desktop.Uid

Similarly, assign users to private desktops with:

Add-BrokerUser $user -PrivateDesktop $desktop

Many of the fields that can be set with this cmdlet can also be set with Set-BrokerMachine, such as MaintenanceMode. Using Set-BrokerMachine is preferred in these cases.

For more information about desktops, see about_Broker_Desktops; for more information about machines, see about_Broker_Machines.

Related topics

Get-BrokerMachine

Parameters

-InputObject<PrivateDesktop[]>

Specifies the desktop or array of desktops to modify. You can also use an integer Uid of the desktop instead.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

Specifies the desktop to modify using its machine name (in the form 'domain\machine').

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AssignedClientName<String>

Changes the client name assignment of the desktop. Set this to $null to remove the assignment. Desktops can be assigned to multiple users, a single IP address, or a single client name, but only to one of these categories at one time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AssignedIPAddress<String>

Changes the IP address assignment of the desktop. Set this to $null to remove the assignment. Desktops can be assigned to multiple users, a single IP address, or a single client name, but only to one of these categories at one time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Changes the color depth connections to this desktop should use.

Valid values are $null, FourBit, EightBit, SixteenBit, and TwentyFourBit. A value of $null results in the desktop group value being used instead.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Changes the description of the desktop. This is seen only by Citrix Administrators and is not visible to users.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IconUid<Int32>

Changes the icon displayed for this desktop. When this setting is $null, the icon displayed is determined by the desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Changes the maintenance mode setting of a desktop. When a desktop is in maintenance mode, it is not included as a candidate when brokering new sessions, and it does not participate in automatic power management (idle pool); however, it still responds to explicit power operations.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PublishedName<String>

Changes the name displayed to the user for this desktop. When this setting is $null, the name displayed is determined by

the PublishedName of the desktop group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Changes whether or not SecureICA is required for connections to this desktop. When this setting is $null, the SecureIcaRequired setting from the desktop group is used.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.PrivateDesktop You can pipe PrivateDesktop objects into this cmdlet instead of on the command line with the -InputObject parameter.

Return Values

None or Citrix.Broker.Admin.SDK.PrivateDesktop

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.PrivateDesktop object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerPrivateDesktop DOMAIN\Machine1 -ColorDepth SixteenBit
Change the color depth of Machine1 to be 16-bit.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerPrivateDesktop -InMaintenanceMode $true | Set-BrokerPrivateDesktop -InMaintenanceMode $false
Bring all private desktops currently in maintenance mode back into normal service.

Set-BrokerRebootCycleMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for RebootCycle

Syntax

Set-BrokerRebootCycleMetadata [-RebootCycleId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-RebootCycleId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-RebootCycleId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-InputObject] <RebootCycle[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootCycleMetadata [-InputObject] <RebootCycle[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerRebootCycleMetadata cmdlet creates/updates metadata key-value pairs for RebootCycle. The RebootCycle can be specified by ImputObject or piping.

Related topics

Parameters

-RebootCycleId<Int64>

Specifies the RebootCycle object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<RebootCycle[]>

Specifies the RebootCycle objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerRebootCycle You can pipe the RebootCycle to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerRebootCycle

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerRebootCycle object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerRebootCycleMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the RebootCycle whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerRebootCycle | Set-BrokerRebootCycleMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the RebootCycle in the site

Set-BrokerRebootSchedule

Apr 15, 2014

Updates the values of one or more desktop group reboot schedules.

Syntax

Set-BrokerRebootSchedule [-InputObject] <RebootSchedule[]> [-PassThru] [-Day <RebootScheduleDays>] [-Enabled <Boolean>] [-Frequency <RebootScheduleFrequency>] [-RebootDuration <Int32>] [-StartTime <TimeSpan>] [-WarningDuration <Int32>] [-WarningMessage <String>] [-WarningTitle <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerRebootSchedule [-DesktopGroupName] <String> [-PassThru] [-Day <RebootScheduleDays>] [-Enabled <Boolean>] [-Frequency <RebootScheduleFrequency>] [-RebootDuration <Int32>] [-StartTime <TimeSpan>] [-WarningDuration <Int32>] [-WarningMessage <String>] [-WarningTitle <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerRebootSchedule cmdlet is used to alter the settings of an existing desktop group reboot schedule.

Related topics

Get-BrokerRebootSchedule

New-BrokerRebootSchedule

Remove-BrokerRebootSchedule

Parameters

-InputObject<RebootSchedule[]>

The reboot schedule to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-DesktopGroupName<String>

The name of the desktop group whose reboot schedule is to be modified.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-Day<RebootScheduleDays>

For weekly schedules, the day of the week on which the scheduled reboot-cycle starts (one of Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday).

Required?	false
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Boolean that indicates if the reboot schedule is to be enabled or disabled.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Frequency<RebootScheduleFrequency>

Frequency with which this schedule runs (either Weekly or Daily).

Required?	false
Default Value	
Accept Pipeline Input?	false

-RebootDuration<Int32>

Approximate maximum number of minutes over which the scheduled reboot cycle runs.

Required?	false
Default Value	
Accept Pipeline Input?	false

-StartTime<TimeSpan>

Time of day at which the scheduled reboot cycle starts (HH:MM).

Required?	false
Default Value	
Accept Pipeline Input?	false

-WarningDuration<Int32>

Time prior to the initiation of a machine reboot at which warning message is displayed in all user sessions on that machine. If the warning duration is zero then no message is displayed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WarningMessage<String>

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WarningTitle<String>

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.RebootSchedule Reboot schedules may be specified through pipeline input.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerRebootSchedule -DesktopGroupName Accounting -WarningMessage "Save your work" -WarningDuration 10 -WarningTitle "WARNING: Reboot pending"
Sets the reboot schedule for the desktop group named Accounting to display a message with the title "WARNING: Reboot pending" and body "Save your work" ten minutes prior to rebooting each machine. The message is displayed in every user session on that machine.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerRebootSchedule -Frequency Weekly | Set-BrokerRebootSchedule -Day Friday
Sets all weekly reboot schedules to run on Friday.

Set-BrokerRemotePCAccount

Apr 15, 2014

Modify one or more RemotePCAccounts.

Syntax

Set-BrokerRemotePCAccount [-InputObject] <RemotePCAccount[]> [-PassThru] [-AllowSubfolderMatches <Boolean>] [-MachinesExcluded <String[]>] [-MachinesIncluded <String[]>] [-OU <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Modify one or more RemotePCAccounts.

Related topics

Get-BrokerRemotePCAccount

New-BrokerRemotePCAccount

Remove-BrokerRemotePCAccount

Parameters

-InputObject<RemotePCAccount[]>

Specifies the RemotePCAccounts to modify.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-AllowSubfolderMatches<Boolean>

When true a machine matches this RemotePCAccount if the AD computer is in the container specified by the OU property, or within a child container of the OU.

When false the AD computer object only matches if it is directly in the AD container specified by the OU property.

This property is not meaningful when OU has the special value 'any'.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesExcluded<String[]>

MachinesExcluded specifies a set of strings that can include asterisk wildcards. If a machine name matches any entries in MachinesExcluded then it cannot match with this RemotePCAccount regardless of whether there is a MachinesIncluded match.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesIncluded<String[]>

MachinesIncluded specifies a set of strings that can include asterisk wildcards. A machine may only match with this RemotePCAccount if it matches a MachinesIncluded entry and does not match any MachinesExcluded entries.

Matches are performed against the domain name joined with the machine name by a backslash (DOMAIN\MACHINE), e.g.:

DOMAIN1\M*

DOMAIN*\M*

\M

Required?	false
Default Value	
Accept Pipeline Input?	false

-OU<String>

Specifies the DN of an AD container, or has the special value 'any'.

When an AD container is specified a machine may only match with the RemotePCAccount when the AD computer object is located relative to the OU.

When 'any' is specified the location of the AD computer object is ignored for purposes of matching this RemotePCAccount. The machine must still meet the MachinesIncluded and MachinesExcluded filters for a match to occur.

In the event that a machine matches with multiple RemotePCAccounts then the RemotePCAccount OU with the longest canonical name takes precedence. The special 'any' OU is treated as lowest priority.

Note that the OU value of every RemotePCAccount must be unique, and this includes only one 'any' entry being permitted.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.RemotePCAccount You can pipe the RemotePCAccounts to be modified into this cmdlet.

Return Values

None or Citrix.Broker.Admin.SDK.RemotePCAccount

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.RemotePCAccount object.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-BrokerRemotePCAccount | Set-BrokerRemotePCAccount -MachinesExcluded @('DOMAIN42\*')
```

Make all RemotePCAccounts filter out machines from DOMAIN42.

Set-BrokerSession

Apr 15, 2014

Sets properties of a session.

Syntax

Set-BrokerSession [-InputObject] <Session[]> [-PassThru] [-Hidden <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerSession cmdlet sets properties on a session or set of sessions. You can specify a single session by Uid or multiple session instances can be passed to the command by piping or using the -InputObject parameter.

Related topics

Get-BrokerSession

Parameters

-InputObject<Session[]>

The session instances whose properties you want to set.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-Hidden<Boolean>

Changes whether the session is hidden or not. Hidden sessions are treated as though they do not exist when brokering sessions; a hidden session cannot be reconnected to, but a new session may be launched using the same entitlement.

A session may be hidden automatically by the system when an attempt is made to reconnect to a session that is unreachable due to, for example, the failure of a VM's hypervisor. This allows a new session to be brokered provided that other machines in the same desktop group are still available. If the original session still exists after the hypervisor is restored then it must be unhidden to allow the user to reconnect to it.

Only sessions for shared desktops or applications can be hidden or unhidden. Private desktop or application sessions can never be hidden.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Session You can pipe in the sessions whose properties you want to set.

Return Values

None or Citrix.Broker.Admin.SDK.Session

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Session object.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $sessions = Get-BrokerSession -User ACCOUNTS\JohnSmith -Hidden $true
C:\PS> $sessions | Set-BrokerSession -Hidden $false
```

Finds all sessions in the site for user John Smith that have been hidden, and makes them available for reconection again.

Set-BrokerSessionMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Session

Syntax

Set-BrokerSessionMetadata [-SessionId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-SessionId] <Int64> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-SessionId] <Int64> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-InputObject] <Session[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSessionMetadata [-InputObject] <Session[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerSessionMetadata cmdlet creates/updates metadata key-value pairs for Session. The Session can be specified by ImputObject or piping.

Related topics

Parameters

-SessionId<Int64>

Specifies the Session object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InputObject<Session[]>

Specifies the Session objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerSession You can pipe the Session to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerSession

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerSession object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerSessionMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Session whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerSession | Set-BrokerSessionMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Session in the site

Set-BrokerSharedDesktop

Apr 15, 2014

Change the settings of a shared desktop.

Syntax

Set-BrokerSharedDesktop [-InputObject] <SharedDesktop[]> [-PassThru] [-InMaintenanceMode <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSharedDesktop [-MachineName] <String> [-PassThru] [-InMaintenanceMode <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Shared desktops are automatically created when a machine is added to a desktop group with a DesktopKind of 'Shared', and these inherit default properties. Use Set-BrokerSharedDesktop to change the configuration settings of an existing shared desktop.

To specify shared desktops, you can choose whether to update by machine name or by passing a SharedDesktop or an array of SharedDesktop objects. You can also use the Uid or an array of Uids instead.

Most properties of a shared desktop cannot be modified as these contain status information; for example DNSName, RegistrationState, and OSVersion. You can change only the maintenance mode setting with this cmdlet.

Many of the properties that can be set with Set-BrokerSharedDesktop can be set by using Set-BrokerMachine (e.g. InMaintenanceMode). Using the Set-BrokerMachine cmdlet, where possible, is the preferred behaviour.

See about_Broker_Desktops for more information about desktops.

Related topics

Get-BrokerSharedDesktop

Parameters

-InputObject<SharedDesktop[]>

Specifies the desktop or array of desktops to modify. You can also use an integer Uid of the desktop instead.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MachineName<String>

Specifies the desktop to modify using its machine name (in the form 'domain\machine').

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-InMaintenanceMode<Boolean>

Changes the maintenance mode setting of a desktop. When a desktop is in maintenance mode, it is not included as a candidate when brokering new sessions, and it does not participate in automatic power management (idle pool); however, it still responds to explicit power operations.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.SharedDesktop You can pipe SharedDesktop objects into this cmdlet instead of on the command line with the -InputObject parameter.

Return Values

None or Citrix.Broker.Admin.SDK.SharedDesktop

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.SharedDesktop object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerSharedDesktop DOMAIN\Machine1 -InMaintenanceMode $true
Put the Machine1 shared desktop into maintenance mode.

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerSharedDesktop -InMaintenanceMode $true | Set-BrokerSharedDesktop -InMaintenanceMode $false
Bring all shared desktops currently in maintenance mode back into normal service.

Set-BrokerSite

Apr 15, 2014

Changes the overall settings of the current XenDesktop broker site.

Syntax

Set-BrokerSite [-PassThru] [-BaseOU <Guid>] [-ColorDepth <ColorDepth>] [-DesktopGroupIconUid <Int32>] [-DnsResolutionEnabled <Boolean>] [-SecureIcaRequired <Boolean>] [-TrustRequestsSentToTheXmlServicePort <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerSite cmdlet modifies properties of the current broker site.

The broker site is a top-level, logical representation of the XenDesktop site, from the perspective of the brokering services running within the site. It defines various site-wide default attributes used by the brokering services.

A XenDesktop installation has only a single broker site instance.

Related topics

Get-BrokerSite

New-BrokerIcon

Parameters

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-BaseOU<Guid>

Changes the objectGUID property identifying the base OU in Active Directory used for desktop registrations. For sites using only registry-based discovery (the default) this value is $null.

Any desktop attempting to register through a different OU from the one specified here is rejected. Note that desktops configured for registry-based discovery can register with the site, even if a BaseOU value is specified.

Information held in Active Directory is not modified by changing this value.

Typically, this property is changed only by using the Set-ADControllerDiscovery.ps1 script.

Required?	false

Default Value	
Accept Pipeline Input?	false

-ColorDepth<ColorDepth>

Changes the default color depth for new desktop groups, if no color depth is specified explicitly when a group is created. Changing this default has no impact on the color depths used already by existing groups.

Valid values are FourBit, EightBit, SixteenBit, and TwentyFourBit.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DesktopGroupIconUid<Int32>

Changes the default desktop icon used for new desktop groups if no icon is specified explicitly when a group is created. Changing this default has no impact on the icons used already by existing groups.

The specified icon must already have been added to the site using New-BrokerIcon.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DnsResolutionEnabled<Boolean>

Changes whether ICA files returned by a broker service to a user device contain the numeric IP address or the DNS name of the desktop machine to which a session should be established.

With the default value ($false), ICA files will always contain a numeric IP address. To have DNS names appear in the ICA files, set the value to $true.

Even when DNS resolution is enabled ($true), IP addresses may still appear in ICA files. The reasons for this include, for example, that the broker service is unable to obtain a DNS name for the target machine, or that Web Interface is configured to always use numeric IP addresses in this context.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecureIcaRequired<Boolean>

Changes the default SecureICA usage requirements for new desktop groups if no SecureICA setting is specified explicitly when a group is created. Changing this default has no impact on the SecureICA usage requirements of existing groups.

Required?	false
Default Value	
Accept Pipeline Input?	false

-TrustRequestsSentToTheXmlServicePort<Boolean>

Changes whether the XML Service (as used by Web Interface) implicitly trusts the originator of requests it receives, or whether it fully authenticates them.

With the default value ($false), full authentication checks are performed. However, you must enable this setting ($true) to allow support for "Pass-through" authentication, and/or connections routed through Access Gateway.

If this setting is enabled, you must ensure that controllers running the brokering services are securely firewalled.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

None or Citrix.Broker.Admin.SDK.Site

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.Site object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerSite -ColorDepth SixteenBit
Specifies that any new desktop groups created, where a color depth value is not specified, default to using 16-bit color depth for user sessions to desktops or applications within that group.

Set-BrokerSiteMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Site

Syntax

Set-BrokerSiteMetadata -Name <String> -Value <String> [[-InputObject] <Site[]>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSiteMetadata -Map <PSObject> [[-InputObject] <Site[]>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSiteMetadata -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSiteMetadata -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerSiteMetadata -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerSiteMetadata cmdlet creates/updates metadata key-value pairs for Site. The Site can be specified by ImputObject or piping.

Related topics

Parameters

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-InputObject<Site[]>

Specifies the Site objects whose Metadata is to be created/updated.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerSite You can pipe the Site to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerSite

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerSite object.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-BrokerSiteMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates the Metadata "MyMetadataName" key-value pair for the Site

---------- EXAMPLE 2 ----------

C:\PS> Get-BrokerSite | Set-BrokerSiteMetadata -Name "MyMetadataName" -Value "1234"
This command creates/updates metadata key "MyMetadataName" with the value "1234"

Set-BrokerTagMetadata

Apr 15, 2014

Creates/Updates metadata key-value pairs for Tag

Syntax

Set-BrokerTagMetadata [-TagId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerTagMetadata [-TagId] <Int32> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerTagMetadata [-TagId] <Int32> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerTagMetadata [-InputObject] <Tag[]> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerTagMetadata [-InputObject] <Tag[]> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerTagMetadata [-TagName] <String> -Name <String> -Value <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-BrokerTagMetadata [-TagName] <String> -Map <PSObject> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-BrokerTagMetadata cmdlet creates/updates metadata key-value pairs for Tag. The Tag can be specified by InputObject or piping.

Related topics

Parameters

-TagId<Int32>

Specifies the Tag object whose Metadata is to be created/updated by ID.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-InputObject<Tag[]>

Specifies the Tag objects whose Metadata is to be created/updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-TagName<String>

Specifies the Tag object whose Metadata is to be created/updated by name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Name<String>

Specifies the name of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Value<String>

Specifies the value of the Metadata member to be created/updated

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Map<PSObject>

Specifies a hashtable containing name/value pairs to be used to create or update Metadata members

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-PassThru<SwitchParameter>

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it returns the affected record.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.BrokerTag You can pipe the Tag to hold the new or updated metadata.

Return Values

None or Citrix.Broker.Admin.SDK.BrokerTag

This cmdlet does not generate any output, unless you use the PassThru parameter, in which case it generates a Citrix.Broker.Admin.SDK.BrokerTag object.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Set-BrokerTagMetadata -InputObject $obj-Uid -Name "MyMetadataName" -Value "1234"
```

This command creates/updates the Metadata "MyMetadataName" key-value pair for the Tag whose instance is pointed by $obj-Uid

---------- EXAMPLE 2 ----------

```
C:\PS> Get-BrokerTag | Set-BrokerTagMetadata -Name "MyMetadataName" -Value "1234"
```

This command creates/updates metadata key "MyMetadataName" with the value "1234" for all the Tag in the site

---------- EXAMPLE 3 ----------

C:\PS> @{ 'name1' = 'value1'; 'name2' = 'value2' } | Set-BrokerTagMetadata 'objname'
This command creates/updates two metadata keys "name1" and "name2" with the values "value1" and "value2" respectively for the Tag in the site whose name is 'objname'

Start-BrokerCatalogPvdImagePrepare

Apr 15, 2014

Start the PVD Image prepare process in the Broker for the machines in the specified catalog(s).

Syntax

Start-BrokerCatalogPvdImagePrepare [-InputObject] <Catalog[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Start-BrokerCatalogPvdImagePrepare cmdlet instructs the Broker to request the Personal VDisk (PVD) preparation process for all of the machines in the specified catalog(s). The process begins when each machine is subsequently powered off, at which point brokering of user desktop sessions is suspended as well as regular machine power operations until the process completes. Only catalogs with a PersistUserChanges value of OnPvd are supported by this cmdlet.

Related topics

Start-BrokerMachinePvdImagePrepare

Parameters

-InputObject<Catalog[]>

The catalog(s) holding the machines on which to start the PVD Image Preparation process.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Catalog You can pipe in the catalogs on which to start the PVD image preparation process.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerCatalog 'MyCatalog' | Start-BrokerCatalogPvdImagePrepare
Instruct the Broker that the Personal VDisk preparation process will start the next time the machines in the specified catalog are powered off.

Start-BrokerMachinePvdImagePrepare

Apr 15, 2014

Start the PVD Image prepare process in the Broker for the specified machine(s).

Syntax

Start-BrokerMachinePvdImagePrepare [-InputObject] <Machine[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Start-BrokerMachinePvdImagePrepare cmdlet instructs the Broker to request the Personal VDisk (PVD) preparation process for the specified machine(s). The process begins when each machine is subsequently powered off, at which point brokering of user desktop sessions is suspended as well as regular machine power operations until the process completes. Only machines in catalogs with a PersistUserChanges value of OnPvd are supported by this cmdlet.

Related topics

Start-BrokerCatalogPvdImagePrepare

Parameters

-InputObject<Machine[]>

The machine(s) to start the PVD Image Preparation process on.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Machine You can pipe in the machines to start the PVD image preparation process on.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerMachine 'MyMachine' | Start-BrokerMachinePvdImagePrepare
Instruct the Broker that the Personal VDisk preparation process will start the next time the specified machine(s) are powered off.

Start-BrokerNaturalRebootCycle

Apr 15, 2014

Reboots all machines from the specified catalog when they are not in use.

Syntax

Start-BrokerNaturalRebootCycle [-InputObject] <Catalog[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creating a natural reboot cycle for catalog ensures that all machines in the catalog are running the most recent image for the catalog and that all PvD image updates have been performed.

The machines are rebooted in a non disruptive manner, allowing machines that are in use to continue working and be restarted only after they become idle.

Related topics

None

Parameters

-InputObject<Catalog[]>

Reboots all machines from this input catalog. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Catalog Catalogs may be specified through pipeline input. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects

Return Values

None

Notes

Natural reboot cycles do not apply to non-power managed and multi session catalogs

Examples

---------- EXAMPLE 1 ----------

```
$c = Get-BrokerCatalog -Uid 1
    Start-BrokerNaturalRebootCycle -InputObject $c
```

The above code applies a natural reboot cycle on catalog with Id 1

Start-BrokerRebootCycle

Apr 15, 2014

Creates and starts a reboot cycle for each desktop group that contains machines from the specified catalog.

Syntax

Start-BrokerRebootCycle [-InputObject] <Catalog[]> -RebootDuration <Int32> [-WarningDuration <Int32>] [-WarningTitle <String>] [-WarningMessage <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Start-BrokerRebootCycle cmdlet is used to create and start a reboot cycle for each desktop group that contains machines from the specified catalog. For a given desktop group, only the machines from the target catalog are rebooted and any machines from other catalogs are not rebooted.

Creating a reboot cycle for catalog ensures that all machines in the catalog are running the most recent image for the catalog and that all PvD image updates have been performed.

Related topics

Stop-BrokerRebootCycle

Get-BrokerRebootCycle

Parameters

-InputObject<Catalog[]>

Creates a reboot cycle for each desktop group that contains machines from this input catalog SDK object. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-RebootDuration<Int32>

Approximate maximum duration in minutes over which the reboot cycle runs.

Required?	true
Default Value	
Accept Pipeline Input?	false

-WarningDuration<Int32>

Time in minutes prior to a machine reboot at which a warning message is displayed in all user sessions on that machine. If the warning duration value is zero then no message is displayed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-WarningTitle<String>

The window title used when showing the warning message in user sessions on a machine scheduled for reboot.

Required?	false

Default Value	
Accept Pipeline Input?	false

-WarningMessage<String>

Warning message displayed in user sessions on a machine scheduled for reboot. If the message is blank then no message is displayed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Catalog Catalogs may be specified through pipeline input. The catalogs can be specified using UID values, name values (including wildcards) or catalog objects

Return Values

none

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerCatalog -Name "SampleCatalog" | Start-BrokerRebootCycle -RebootDuration 240 -WarningMessage "Save your work" -WarningDuration 15
Starts a new reboot cycle for each desktop group containing machines from the catalog "SampleCatalog". Each reboot cycle will have a duration of six hours. Fifteen minutes prior to rebooting a machine, the message "Save your work" will be displayed in each active user session.

Stop-BrokerRebootCycle

Apr 15, 2014

Cancels the specified reboot cycle.

Syntax

Stop-BrokerRebootCycle [-InputObject] <RebootCycle[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Stop-BrokerRebootCycle cmdlet is used to cancel the specified reboot cycle.

Related topics

Get-BrokerRebootCycle

Start-BrokerRebootCycle

Parameters

-InputObject<RebootCycle[]>

Cancels this reboot cycle.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.RebootCycle Reboot cycles may be specified through pipeline input.

Return Values

none

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-BrokerRebootCycle -CatalogUid 7 | Stop-BrokerRebootCycle
```

Cancels every reboot cycle for the catalog that has the Uid of 7.

Stop-BrokerSession

Apr 15, 2014

Stop or log off a session.

Syntax

Stop-BrokerSession [-InputObject] <Session[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Stops or logs off sessions.

Related topics

Disconnect-BrokerSession

Get-BrokerSession

Parameters

-InputObject<Session[]>

Identifies the session(s) to terminate. This can be expressed as either a session Uid or a session object.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.

Accept Pipeline Input?	false

Input Type

Citrix.Broker.Admin.SDK.Session The sessions to stop can be piped into this cmdlet.

Return Values

None

Notes

This operation is non-blocking and returns before it completes. The operation, however, is unlikely to fail unless there are communication problems between the controller and the machine, if bad arguments are passed to the cmdlet itself or if the machine cannot successfully execute the operation.

The transient nature of sessions means that the list of session objects or UIDs supplied to Stop-BrokerSession could consist of valid and invalid sessions. Invalid sessions are detected and disregarded and the stop session operation is invoked on the valid sessions.

The system can fail to invoke the operation if the machine is not in an appropriate state or if there are problems in communicating with the machine. When an operation is invoked the system detects if the operation was initiated successfully or not by the machine. As this operation is non-blocking the system doesn't detect or report whether the operation ultimately succeeded or failed after its successful initialization on the machine.

Operation failures are reported through the broker SDK error handling mechanism (see about_Broker_ErrorHandling). In the event of errors the SdkErrorRecord error status is set to SessionOperationFailed and its error data dictionary is populated with the following entries:

o OperationsAttemptedCount - The number of operations attempted.

o OperationsFailedCount - The number of failed operations.

o OperationsSucceededCount - The number of successfully executed operations.

o UnresolvedSessionFailuresCount - The number of operations that failed due to invalid sessions being supplied.

o OperationInvocationFailuresCount - The number of operations that failed because they could not be invoked on the desktop.

o DesktopExecutionFailuresCount - The number of operations that failed because they could not be successfully executed by the desktop.

The SdkErrorRecord message will also display the number of attempted, failed and successful operations in the following format:

"Session operation error - attempted:<OperationsAttemptedCount>, failed:<OperationsFailedCount>, succeeded: <OperationsSucceededCount>"

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-BrokerSession -UserName MyDomain\MyAccount | Stop-BrokerSession

Stops all sessions for the user MyDomain\MyAccount.

-------------------------- EXAMPLE 2 --------------------------

```
C:\PS> $desktop = Get-BrokerDesktop -DNSName MyMachine.MyDomain.com
C:\PS> Stop-BrokerSession $desktop.SessionUid
```

Stops the session on MyMachine.

-------------------------- EXAMPLE 3 --------------------------

```
C:\PS> Get-BrokerSession -Filter { SessionState -eq Disconnected -and SessionStateChangeTime -lt '-1' } | Stop-BrokerSession
```

Stop sessions that have been disconnected for more than one day.

-------------------------- EXAMPLE 4 --------------------------

```
C:\PS> trap  [Citrix.Broker.Admin.SDK.SdkOperationException]
C:\PS> {
C:\PS>   write $("Exception name = " + $_.Exception.GetType().FullName)
C:\PS>   write $("SdkOperationException.Status = " + $_.Exception.Status)
C:\PS>   write $("SdkOperationException.ErrorData=")
C:\PS>   $_.Exception.ErrorData
C:\PS>
C:\PS>   write $("SdkOperationException.InnerException = " + $_.Exception.InnerException)
C:\PS>   $_.Exception.InnerException
C:\PS>   continue
C:\PS> }
C:\PS>
C:\PS> Stop-BrokerSession -InputObject 10,11,12
```

Trap and display error information.

Test-BrokerAccessPolicyRuleNameAvailable

Apr 15, 2014

Determine whether the proposed AccessPolicyRule Name is available for use.

Syntax

Test-BrokerAccessPolicyRuleNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed AccessPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerAccessPolicyRule

New-BrokerAccessPolicyRule

Rename-BrokerAccessPolicyRule

Parameters

-Name<String[]>

The AccessPolicyRule Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerAccessPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerAccessPolicyRuleNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerAppAssignmentPolicyRuleNameAvailable

Apr 15, 2014

Determine whether the proposed AppAssignmentPolicyRule Name is available for use.

Syntax

Test-BrokerAppAssignmentPolicyRuleNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed AppAssignmentPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerAppAssignmentPolicyRule

New-BrokerAppAssignmentPolicyRule

Rename-BrokerAppAssignmentPolicyRule

Parameters

-Name<String[]>

The AppAssignmentPolicyRule Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerAppAssignmentPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerAppAssignmentPolicyRuleNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerAppEntitlementPolicyRuleNameAvailable

Apr 15, 2014

Determine whether the proposed AppEntitlementPolicyRule Name is available for use.

Syntax

Test-BrokerAppEntitlementPolicyRuleNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed AppEntitlementPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerAppEntitlementPolicyRule

New-BrokerAppEntitlementPolicyRule

Rename-BrokerAppEntitlementPolicyRule

Parameters

-Name<String[]>

The AppEntitlementPolicyRule Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerAppEntitlementPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerAppEntitlementPolicyRuleNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerApplicationNameAvailable

Apr 15, 2014

Determine whether the proposed Application Name is available for use.

Syntax

Test-BrokerApplicationNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed Application Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerApplication

New-BrokerApplication

Rename-BrokerApplication

Parameters

-Name<String[]>

The Application Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerApplicationNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerApplicationNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerAssignmentPolicyRuleNameAvailable

Apr 15, 2014

Determine whether the proposed AssignmentPolicyRule Name is available for use.

Syntax

Test-BrokerAssignmentPolicyRuleNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed AssignmentPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Parameters

-Name<String[]>

The AssignmentPolicyRule Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerAssignmentPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerAssignmentPolicyRuleNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerCatalogNameAvailable

Apr 15, 2014

Determine whether the proposed Catalog Name is available for use.

Syntax

Test-BrokerCatalogNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed Catalog Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerCatalog

New-BrokerCatalog

Rename-BrokerCatalog

Parameters

-Name<String[]>

The Catalog Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerCatalogNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerCatalogNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerDBConnection

Apr 15, 2014

Tests whether a database is suitable for use by the Citrix Broker Service.

Syntax

Test-BrokerDBConnection [-DBConnection] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Tests whether the database specified in the given connection string is suitable for use by the currently selected Citrix Broker Service instance.

The service attempts to contact the specified database and returns a status indicating whether the database is both contactable and usable. The test does not impact any currently established connection from the service instance to another database in any way. The tested connection string is not recorded.

Only use of Windows authentication within the connection string is supported; a connection string containing SQL authentication credentials is always rejected as invalid.

The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Broker SDK cmdlet.

Related topics

Get-BrokerServiceStatus

Get-BrokerDBConnection

Set-BrokerDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the currently selected Citrix Broker Service instance.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Return Values

System.String

The Test-BrokerDBConnection cmdlet returns a string describing the status of the selected Citrix Broker Service instance that would result if the connection string were used with the Set-BrokerDBConnection cmdlet; the actual current status of the service is not changed. Possible values are:

-- OK:

The service instance is configured with a valid database and service schema. The service is operational.

-- DBUnconfigured:

No database connection string is set for the service instance.

-- DBRejectedConnection:

The database server rejected the logon from the service instance. This is typically caused by invalid credentials.

-- InvalidDBConfigured:

The specified database does not exist, is not visible to the service instance, or the service's schema within the database is invalid.

-- DBNotFound:

The specified database could not be located with the given connection string.

-- DBNewerVersionThanService:

The service instance is older than, and incompatible with, the service's schema in the database. The service instance needs upgrading.

-- DBOlderVersionThanService:

The service instance is newer than, and incompatible with, the service's schema in the database. The database schema needs upgrading.

-- DBVersionChangeInProgress:

A database schema upgrade is in progress.

-- PendingFailure:

Connectivity between the service instance and the database has been lost. This may be a transitory network error, but may indicate a loss of connectivity that requires administrator intervention.

-- Failed:

Connectivity between the service instance and the database has been lost for an extended period of time, or has failed due to a configuration problem. The service instance cannot operate while its connection to the database is unavailable.

-- Unknown:

Service status cannot be determined.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Test-BrokerDBConnection "Server=dbserver\SQLEXPRESS;Database=XDDB;Trusted_Connection=True"
Tests whether the service instance could use a database called XDDB on an SQL Server Express database running on the machine called dbserver. Integrated Windows authentication is required.

Test-BrokerDesktopGroupNameAvailable

Apr 15, 2014

Determine whether the proposed DesktopGroup Name is available for use.

Syntax

Test-BrokerDesktopGroupNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed DesktopGroup Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerDesktopGroup

Parameters

-Name<String[]>

The DesktopGroup Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerDesktopGroupNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerDesktopGroupNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerEntitlementPolicyRuleNameAvailable

Apr 15, 2014

Determine whether the proposed EntitlementPolicyRule Name is available for use.

Syntax

Test-BrokerEntitlementPolicyRuleNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed EntitlementPolicyRule Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerEntitlementPolicyRule

New-BrokerEntitlementPolicyRule

Rename-BrokerEntitlementPolicyRule

Parameters

-Name<String[]>

The EntitlementPolicyRule Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerEntitlementPolicyRuleNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerEntitlementPolicyRuleNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerLicenseServer

Apr 15, 2014

Tests whether or not a license server can be used by the broker.

Syntax

Test-BrokerLicenseServer [-ComputerName] <String> [-AdminAddress <String>] [[-Port] <Int32>] [<CommonParameters>]

Detailed Description

Tests whether or not a given license server can be used by the broker.

Related topics

Get-BrokerSite

Set-BrokerSite

Parameters

-ComputerName<String>

The name of the license server to test (machine.domain).

Required?	true
Default Value	None
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

-Port<Int32>

The port number to use on the server.

Required?	false
Default Value	27000
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

System.string

Test-BrokerLicenseServer returns:

o 'Compatible' - the server is a compatible license server that can be used.

o 'Incompatible' - the server is an incompatible license server that can't be used.

o 'Inaccessible' - the server cannot be accessed. The server may be down, unreachable, or non-existent.

o 'InternalError - the server can't be used due to an internal error. A required licensing component on the server may not be installed, configured, or working correctly.

Examples

-------------------------- EXAMPLE 1 --------------------------

C:\PS> Test-BrokerLicenseServer -LicenseServerAddress "machine.domain" 1234
Tests whether or not the license server "machine.domain" with port number 1234 can be used.

-------------------------- EXAMPLE 2 --------------------------

C:\PS> Test-BrokerLicenseServer -LicenseServerAddress "machine.domain"
Tests whether or not the license server "machine.domain" with port number 2700 can be used.

Test-BrokerMachineNameAvailable

Apr 15, 2014

Determine whether the proposed Machine MachineName is available for use.

Syntax

Test-BrokerMachineNameAvailable [-MachineName] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed Machine MachineName is available for use. It returns a record for each MachineName indicating the availability of that MachineName, with $true indicating that the MachineName is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerMachine

New-BrokerMachine

Parameters

-MachineName<String[]>

The Machine MachineName to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the MachineName to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each MachineName specified. An availability of "True" indicates the MachineName is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerMachineNameAvailable -MachineName Test1
Checks whether the MachineName "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerMachineNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerPowerTimeSchemeNameAvailable

Apr 15, 2014

Determine whether the proposed PowerTimeScheme Name is available for use.

Syntax

Test-BrokerPowerTimeSchemeNameAvailable [-Name] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed PowerTimeScheme Name is available for use. It returns a record for each Name indicating the availability of that Name, with $true indicating that the Name is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerPowerTimeScheme

New-BrokerPowerTimeScheme

Rename-BrokerPowerTimeScheme

Parameters

-Name<String[]>

The PowerTimeScheme Name to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the Name to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each Name specified. An availability of "True" indicates the Name is available for use, and "False" if it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerPowerTimeSchemeNameAvailable -Name Test1
Checks whether the Name "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerPowerTimeSchemeNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Test-BrokerRemotePCAccountNameAvailable

Apr 15, 2014

Determine whether the proposed RemotePCAccount OU is available for use.

Syntax

Test-BrokerRemotePCAccountNameAvailable [-OU] <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet checks whether proposed RemotePCAccount OU is available for use. It returns a record for each OU indicating the availability of that OU, with $true indicating that the OU is unused and available for use, or $false if it is not available.

Related topics

Get-BrokerRemotePCAccount

New-BrokerRemotePCAccount

Parameters

-OU<String[]>

The RemotePCAccount OU to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.String You can pipe a string that contains the OU to test.

Return Values

Citrix.Broker.Admin.SDK.NameAvailability

The cmdlet returns a result for each OU specified. An availability of "True" indicates the OU is available for use, and "False" if

it is not available.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-BrokerRemotePCAccountNameAvailable -OU Test1
Checks whether the OU "Test1" is available.

---------- EXAMPLE 2 ----------

C:\PS> Test-BrokerRemotePCAccountNameAvailable @("Test1","Test2","Test3")
Checks whether each of the specified names is available.

Update-BrokerImportedFTA

Apr 15, 2014

Imports or updates all of the file type associations for the specified worker.

Syntax

Update-BrokerImportedFTA -DesktopUids <Int32[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Imports or updates the file type associations from a specified worker machine.

File type association associates a file extension (such as ".txt") with an application (such as Notepad). In a Citrix environment file type associations on a user device can be configured so that when an user clicks on a document it launches the appropriate published application. This is known as "content redirection".

Imported file type associations are different from configured file type associations. Imported file type associations are lists of known file type associations for a given desktop group. Configured file type associations are those that are actually associated with published applications for the purposes of content redirection.

Initially the system is not aware of any extensions, and they must be imported by the Citrix administrator. To import or update file type associations from a worker machine, two criteria must be met:

o The worker machine must not be in use

o The worker machine must be in maintenance mode

For more information about putting a worker machine in maintenance mode, see the Set-BrokerPrivateDesktop and Set-BrokerSharedDesktop cmdlets.

Imported file type associations are grouped together based on the desktop group of the machine from which they were imported. All file types for a desktop group are deleted. There is no mechanism for deleting a subset imported file type associations for a specific desktop group.

If file type associations are imported more than once for a desktop group, for example, if this cmdlet is run twice for two workers belonging to the same desktop group, all existing imported file type associations for that desktop group are deleted and imported again.

Related topics

Get-BrokerImportedFTA

Remove-BrokerImportedFTA

Parameters

-DesktopUids<Int32[]>

Imports or updates the file type associations from the specified desktop. The desktop must belong to a desktop group of the Private or Shared desktop kind.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high level operation that this cmdlet call forms a part of. Desktop Studio and Desktop Director typically create High Level Operations. PowerShell scripts can also wrap a series of cmdlet calls in a High Level Operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

Int32[] An array of Uids for desktops can be supplied as input.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $desktop = Get-BrokerSharedDesktop -MachineName "ACME\Worker1"
C:\PS> Set-BrokerSharedDesktop $desktop -InMaintenanceMode $true
C:\PS> Update-BrokerImportedFTA -DesktopUids $desktop.Uid
C:\PS> Set-BrokerSharedDesktop $desktop -InMaintenanceMode $false
```

Gets an object for the worker machine named "Worker1" in the "ACME" domain, and ensures no users can connect to it, before importing the file type associations from that desktop and re-enabling it.

Update-BrokerNameCache

Apr 15, 2014

Performs administrative operations on the user and machine name cache.

Syntax

Update-BrokerNameCache [-Machines] [-Users] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Triggers an immediate asynchronous refresh of the name cache. This may be useful to ensure up-to-date name information is present in the cache after user and/or machine accounts are known to have changed and you need to see those changes immediately instead of waiting for the periodic automatic refresh.

The Broker Service maintains a cache of the names of users and machines in use by the site. By default, name information is obtained periodically from Active Directory and the cache refreshed automatically.

During normal usage, you should not need to perform administrative operations on the name cache.

For users/groups, the following name information is cached:

Windows name (DOMAIN\user)

User Principal Name or 'UPN' (user@upndomain)

Full Name or 'Common Name' (typically a user's full name)

For machines, the following name information is cached:

Windows name (DOMAIN\machine)

DNS name (machine.dnsdomain)

Related topics

Parameters

-Machines<SwitchParameter>

Triggers an asynchronous refresh of all cached machine name information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Users<SwitchParameter>

Triggers an asynchronous refresh of all cached user name information.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snapin will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

None

Notes

For some user accounts, for example, the built-in domain administrator, the UPN and/or Full Name values may not be available because they are not typically specified within Active Directory.

For group accounts, UPN and Full Name values are not available because they are not applicable or not specified within Active Directory.

The DNS name information for a machine is obtained from Active Directory and not from the DNS sub-system. If a machine has only recently been configured, the DNS information may not be available initially.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Update-BrokerNameCache -Machines
Triggers an immediate asynchronous refresh of all machine name information held within the name cache.

---------- EXAMPLE 2 ----------

C:\PS> Update-BrokerNameCache -Machines -Users
Triggers an immediate asynchronous refresh of all machine and user name information held within the name cache.

Citrix.Configuration.Admin.V2

Apr 15, 2014

Overview

Name	Description
ConfigConfigurationSnapin	The Configuration service PowerShell snap-in provides administrative
Config Filtering	Describes the common filtering options for XenDesktop cmdlets.

Cmdlets

Name	Description
Add-ConfigRegisteredServiceInstanceMetadata	Adds metadata on the given ServiceInstance.
Add-ConfigServiceGroupMetadata	Adds metadata on the given ServiceGroup.
Export-ConfigFeatureTable	Returns the current feature table.
Get-ConfigDBConnection	Gets the database string for the specified data store used by the Configuration Service.
Get-ConfigDBSchema	Gets a script that creates the Configuration Service database schema for the specified data store.
Get-ConfigDBVersionChangeScript	Gets a script that updates the Configuration Service database schema.
Get-ConfigEnabledFeature	Lists features of the site that are enabled.
Get-ConfigInstalledDBVersion	Gets a list of all available database schema versions for the Configuration Service.
Get-ConfigLicensingModel	Lists the supported licensing models.
Get-ConfigLocalData	Gets the service local data.
Get-ConfigProduct	Lists the site's supported product names and codes.
Get-ConfigProductEdition	Lists the supported product editions.
Get-ConfigProductFeature	Lists the supported features.
Get-ConfigProductVersion	Lists the supported product versions.
Get-ConfigRegisteredServiceInstance	Gets the service instances that are registered in the directory.

Name	Description
Get-ConfigService	Gets the service record entries for the Configuration Service.
Get-ConfigServiceAddedCapability	Gets any added capabilities for the Configuration Service on the controller.
Get-ConfigServiceGroup	Gets the service groups that match the parameters supplied.
Get-ConfigServiceInstance	Gets the service instance entries for the Configuration Service.
Get-ConfigServiceStatus	Gets the current status of the Configuration Service on the controller.
Get-ConfigSite	Gets the site.
Import-ConfigFeatureTable	Sets the feature table of the site.
Register-ConfigServiceInstance	Allows the registration of a service instance.
Remove-ConfigRegisteredServiceInstanceMetadata	Removes metadata from the given ServiceInstance.
Remove-ConfigServiceGroup	Removes service groups.
Remove-ConfigServiceGroupMetadata	Removes metadata from the given ServiceGroup.
Remove-ConfigServiceMetadata	Removes metadata from the given Service.
Remove-ConfigSiteMetadata	Removes metadata from the given Site.
Reset-ConfigServiceGroupMembership	Reloads the access permissions and configuration service locations for the Configuration Service.
Set-ConfigDBConnection	Configures a database connection for the Configuration Service.
Set-ConfigRegisteredServiceInstance	Updates a service instance.
Set-ConfigRegisteredServiceInstanceMetadata	Adds or updates metadata on the given ServiceInstance.
Set-ConfigServiceGroupMetadata	Adds or updates metadata on the given ServiceGroup.
Set-ConfigServiceMetadata	Adds or updates metadata on the given Service.
Set-ConfigSite	Changes the overall settings of the site.
Set-ConfigSiteMetadata	Adds or updates metadata on the Site.
Test-ConfigDBConnection	Tests a database connection for the Configuration Service.
Test-ConfigServiceInstanceAvailability	Tests whether the supplied service instances are responding to requests.
Unregister-	Removes a service instance from the Configuration Service registry.

Name	Description
ConfigRegisteredServiceInstance	

about_ConfigConfigurationSnapin

Apr 15, 2014

TOPIC

about_ConfigConfigurationSnapin

SHORT DESCRIPTION

The Configuration service PowerShell snap-in provides administrative functions for the Configuration service.

COMMAND PREFIX

All commands in this snap-in have 'Config' in their name.

LONG DESCRIPTION

The Configuration service PowerShell snap-in enables both local and remote administration of the Configuration service. It provides facilities to store details about other services that are used in the XenDesktop deployment.

All the services in the XenDesktop deployment use the Configuration service as a directory to locate other services with which they need to communicate. The directory publishes a list of all the services, the communication types they accept, and the facilities they offer.

The snap-in provides the following main entities:

Site Metadata

> Metadata for the entire XenDesktop deployment. This metadata is not used directly by any of the XenDesktop services, but can be used by third parties to store information for other purposes.

Registered Service Instances

> Service instance items that have been retrieved from the available services in the XenDesktop deployment and held in a directory in the Configuration service. Each physical service can host a collection of service instances to provide different facilities.

Service Groups

> A collection of service instances that are considered equivalent. Service instances that are registered in the same service group provide the same state and offer the same functionality.
>
> Only one service group of each type is supported. For example, there

must not be more than one service group with a ServiceType of 'Config'.

Site and Features

The configuration site is a top-level, logical representation of the XenDesktop site, from the perspective of the configuration services running within the site.

about_Config_Filtering

Apr 15, 2014

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

Add-ConfigRegisteredServiceInstanceMetadata

Apr 15, 2014

Adds metadata on the given ServiceInstance.

Syntax

Add-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ServiceInstance objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ConfigRegisteredServiceInstanceMetadata cmdlet instead.

Related topics

Set-ConfigRegisteredServiceInstanceMetadata

Remove-ConfigRegisteredServiceInstanceMetadata

Parameters

-ServiceInstanceUid<Guid>

Id of the ServiceInstance

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ServiceInstance[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the ServiceInstance specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Configuration.Sdk.Metadata

Add-ConfigRegisteredServiceInstanceMetadata returns an array of objects containing the new definition of the metadata.

\n Property <string>

\n Specifies the name of the property.

\n Value <string>

\n Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Add-ConfigRegisteredServiceInstanceMetadata -ServiceInstanceUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Property                       Value
    --------                       -----
    property                       value
```

Add metadata with a name of 'property' and a value of 'value' to the ServiceInstance with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Add-ConfigServiceGroupMetadata

Apr 15, 2014

Adds metadata on the given ServiceGroup.

Syntax

Add-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ServiceGroup objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ConfigServiceGroupMetadata cmdlet instead.

Related topics

Set-ConfigServiceGroupMetadata

Remove-ConfigServiceGroupMetadata

Parameters

-ServiceGroupUid<Guid>

Id of the ServiceGroup

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ServiceGroup[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the ServiceGroup specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Configuration.Sdk.Metadata

Add-ConfigServiceGroupMetadata returns an array of objects containing the new definition of the metadata.

\n Property <string>

\n Specifies the name of the property.

\n Value <string>

\n Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Add-ConfigServiceGroupMetadata -ServiceGroupUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Property                       Value
    --------                       -----
    property                       value
```

Add metadata with a name of 'property' and a value of 'value' to the ServiceGroup with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Export-ConfigFeatureTable

Apr 15, 2014

Returns the current feature table.

Syntax

Export-ConfigFeatureTable [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

Examples

```

Returns the current feature table.

Get-ConfigDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the Configuration Service.

Syntax

```
Get-ConfigDBConnection [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-ConfigServiceStatus

Set-ConfigDBConnection

Test-ConfigDBConnection

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the Configuration Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the Configuration Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True
```

Get the database connection string for the Configuration Service.

Get-ConfigDBSchema

Apr 15, 2014

Gets a script that creates the Configuration Service database schema for the specified data store.

Syntax

Get-ConfigDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new Configuration Service database schema, add a new Configuration Service to an existing site, remove a Configuration Service from a site, or create a database server logon for a Configuration Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Configuration Service instance, otherwise the scripts relate to Configuration Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Configuration SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to Configuration Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to Configuration Service roles

If ScriptType is Evict, the returned script contains:

o Removal of Configuration Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before

using this command.

Related topics

Set-ConfigDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Configuration services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the Configuration Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further Configuration services to an existing database instance that already contains the full Configuration service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Configuration Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified Configuration Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Configuration services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the Configuration Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigDBSchema -DatabaseName MyDB -ServiceGroupName  MyServiceGroup > c:\ConfigSchema.sql
```

Get the full database schema for site data store of the Configuration Service and copy it to a file called 'c:\ConfigSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Configuration Service site schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-ConfigDBSchema -DatabaseName MyDB -scriptType Login > c:\ConfigurationLogins.sql
```

Get the logon scripts for the Configuration Service.

Get-ConfigDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the Configuration Service database schema.

Syntax

Get-ConfigDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Configuration Service from the current schema version to a different version.

Related topics

Get-ConfigInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Configuration services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-ConfigServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Configuration Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-ConfigDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-ConfigEnabledFeature

Apr 15, 2014

Lists features of the site that are enabled.

Syntax

```
Get-ConfigEnabledFeature [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Related topics

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-ConfigEnabledFeature
```

Retrieves the list of enabled features for the site's current configuration.

Get-ConfigInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the Configuration Service.

Syntax

Get-ConfigInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the Configuration Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-ConfigInstalledDbVersion command returns objects containing the new definition of the Configuration Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Configuration Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the Configuration Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-ConfigInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the Configuration Service database schema for which upgrade scripts are supplied.

Get-ConfigLicensingModel

Apr 15, 2014

Lists the supported licensing models.

Syntax

```
Get-ConfigLicensingModel -ProductCode <String> [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Related topics

Get-ConfigProduct

Get-ConfigSite

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-ProductCode<String>

The product code

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by the Get-ConfigSite cmdlet contains the currently configured product code.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-ConfigLicensingModel -ProductCode "XDS"
```

Retrieves the list of supported licensing models for product code "XDS".

Get-ConfigLocalData

Apr 15, 2014

Gets the service local data.

Syntax

```
Get-ConfigLocalData [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Get-ConfigLocalData returns service-and-controller-specific local data. This information is not site-wide, but rather controller-specific. The Configuration Service currently stores the controller product version as local data. The overall site version used by Studio is an aggregate of the product versions from each controller.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

This cmdlet does not accept pipeline input

Return Values

Citrix.Configuration.DataModel.LocalData

Contains the ControllerProductVersion field

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-ConfigLocalData

ControllerProductVersion
-----------
7.1
```

Gets the service local data.

Get-ConfigProduct

Apr 15, 2014

Lists the site's supported product names and codes.

Syntax

```
Get-ConfigProduct [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Related topics

Get-ConfigSite

Set-ConfigSite

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

PSObject

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-ConfigProduct
```

Lists the supported products by name and code.

Get-ConfigProductEdition

Apr 15, 2014

Lists the supported product editions.

Syntax

Get-ConfigProductEdition [-ProductCode] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Get-ConfigProduct

Get-ConfigSite

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-ProductCode<String>

The product code

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by Get-ConfigSite cmdlet contains the currently configured product code.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-ConfigProductEdition -ProductCode "XDS"
```

Retrieves the list of supported editions for XenDesktop.

Get-ConfigProductFeature

Apr 15, 2014

Lists the supported features.

Syntax

Get-ConfigProductFeature [-ProductCode] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Lists the supported features. Use the Get-ConfigEnabledFeature command to determine which features are currently enabled.

Related topics

Get-ConfigProduct

Get-ConfigSite

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-ProductCode<String>

The product code

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by Get-ConfigSite cmdlet contains the currently configured product code.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-ConfigProductFeature -ProductCode "XDS"
Retrieves the list of supported features for XenDesktop.

Get-ConfigProductVersion

Apr 15, 2014

Lists the supported product versions.

Syntax

```
Get-ConfigProductVersion [-ProductCode] <String> [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Related topics

Get-ConfigProduct

Get-ConfigSite

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-ProductCode<String>

The product code

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

The list of supported licensing models for the specified product code.

Notes

The Get-ConfigProduct cmdlet lists the available product codes.

The site object returned by Get-ConfigSite cmdlet contains the currently configured product code.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-ConfigProductVersion -ProductCode "XDS"
```

Retrieves the list of supported versions for XenDesktop.

Get-ConfigRegisteredServiceInstance

Apr 15, 2014

Gets the service instances that are registered in the directory.

Syntax

Get-ConfigRegisteredServiceInstance [-ServiceInstanceUid <Guid>] [-ServiceGroupUid <Guid>] [-ServiceGroupName <String>] [-ServiceType <String>] [-Address <String>] [-Binding <String>] [-Version <Int32>] [-ServiceAccountSid <String>] [-InterfaceType <String>] [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to retrieve the service instances currently registered with the Configuration Service that match the parameters supplied. If no parameters are supplied, all the service instances are returned.

Related topics

Register-ConfigServiceInstance

Unregister-ConfigRegisteredServiceInstance

Set-ConfigRegisteredServiceInstance

Parameters

-ServiceInstanceUid<Guid>

The unique identifier for the service instance.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupUid<Guid>

The unique identifier for the service group to which the service instance belongs.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

The name for the service group to which the service instance belongs.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceType<String>

The service type for the service instance.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Address<String>

The connection address for the service instance.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Binding<String>

The binding for the service instance.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Version<Int32>

The service instance version.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceAccountSid<String>

The AD account SID for the computer account that the computer hosting the service instance is running as.

Required?	false
Default Value	
Accept Pipeline Input?	false

-InterfaceType<String>

The interface type for the service instance.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

See about_Configfiltering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

See about_Configfiltering for details.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

See about_Configfiltering for details.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

See about_Configfiltering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Filter<String>

See about_Configfiltering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters;

ServiceGroupUid <Guid>

The unique identifier for the service group to which the service instance belongs.

ServiceGroupName <string>

The name of the service group to which the service instance belongs.

ServiceInstanceUid <Guid>

The unique identifier for the service instance.

ServiceType <string>

The type of the service group.

Address <string>

The contact address for the service instance.

Binding <string>

The binding to use for connections to the service instance.

Version <int>

The version of the service instance.

ServiceAccount <string>

The AD computer account for the computer that is providing the service instance.

ServiceAccountSid <string>

The AD computer account SID for the computer that is providing the service instance.

InterfaceType <string>

The interface type for the service instance.

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes ---------- PartialData Only a subset of the available data was returned. CouldNotQueueryDatabase The query

required to get the database was not defined. CommunicationError An error occurred while communicating with the service. DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet. ExceptionThrown An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

ServiceType      : MySnapIn
Version          : 1
```

Return all the service instances that are registered in the Configuration Service and are of type 'SDK'.

Get-ConfigService

Apr 15, 2014

Gets the service record entries for the Configuration Service.

Syntax

Get-ConfigService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the Configuration Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Config_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Config_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Configuration.Sdk.Service

The Get-ConfigServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the Configuration Service running in the current service group.

Get-ConfigServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the Configuration Service on the controller.

Syntax

```
Get-ConfigServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the Configuration Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigServiceAddedCapability
```

Get the added capabilities of the Configuration Service.

Get-ConfigServiceGroup

Apr 15, 2014

Gets the service groups that match the parameters supplied.

Syntax

Get-ConfigServiceGroup [-ServiceGroupUid <Guid>] [-ServiceGroupName <String>] [-ServiceType <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to retrieve existing service groups that match the parameters supplied. If no parameters are supplied, all the service groups are returned.

Related topics

Parameters

-ServiceGroupUid<Guid>

The unique identifier for the service group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceType<String>

The service type for the service group.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

See about_Configfiltering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

See about_Acctfiltering for details.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

See about_Acctfiltering for details.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

See about_Acctfiltering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Filter<String>

See about_Acctfiltering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Configuration.Sdk.ServiceGroup

This represents a service instance and has the following parameters;

ServiceGroupUid <Guid>

The unique identifier for the service group.

ServiceGroupName <string>

The name of the service group.

ServiceType <string>

The type of the service group.

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The metadata for the service group.

Notes

In the case of failure, the following errors can result.

Error Codes ----------

DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. PartialData Only a subset of the available data was returned. CouldNotQuueryDatabase The Query required to get the database was not defined. CommunicationError An error occurred while communicating with the service. InvalidFilter A filtering expression was supplied that could not be interpreted for this cmdlet. ExceptionThrown An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\>Get-ConfigServiceGroup
Return all the service groups that are registered in the Configuration Service.

---------- EXAMPLE 2 ----------

C:\>Get-ConfigRegisteredServiceInstance -ServiceType "config"
Return all the service groups that are registered in the Configuration Service and are of type 'config' (i.e. the service groups

for the Configuration Service).

Get-ConfigServiceInstance

Apr 15, 2014

Gets the service instance entries for the Configuration Service.

Syntax

Get-ConfigServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the Configuration Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Configuration.Sdk.ServiceInstance

The Get-ConfigServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Config.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigServiceInstance

Address           : http://MyServer.com:80/Citrix/ConfigurationService
Binding           : wcf_HTTP_kerb
InterfaceType     : SDK
Metadata          :
MetadataMap       :
ServiceAccount    : ENG\MyAccount$
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
ServiceGroupName  : MyServiceGroup
ServiceGroupUid   : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType       : Config
Version           : 1

Address           : http://MyServer.com:80/Citrix/ConfigurationService/IServiceApi
Binding           : wcf_HTTP_kerb
InterfaceType     : InterService
Metadata          :
MetadataMap       :
ServiceAccount    : ENG\MyAccount
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
```

```
ServiceGroupName   : MyServiceGroup
ServiceGroupUid    : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType        : Config
Version            : 1
```

Get all instances of the Configuration Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-ConfigServiceStatus

Apr 15, 2014

Gets the current status of the Configuration Service on the controller.

Syntax

Get-ConfigServiceStatus [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables the status of the Configuration Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-ConfigDBConnection

Test-ConfigDBConnection

Get-ConfigDBConnection

Get-ConfigDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-ConfigServiceStatus command returns an object containing the status of the Configuration Service together with extra diagnostics information.

DBUnconfigured

The Configuration Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to

log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Configuration Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Configuration Service currently in use is incompatible with the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

DBOlderVersionThanService

The version of the Configuration Service schema on the database is incompatible with the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Configuration Service is running and is connected to a database containing a valid schema.

Failed

The Configuration Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-ConfigServiceStatus

DBUnconfigured
Get the current status of the Configuration Service.

Get-ConfigSite

Apr 15, 2014

Gets the site.

Syntax

Get-ConfigSite [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-ConfigSite cmdlet gets the site.

A XenDesktop installation has only a single site instance.

Related topics

Set-ConfigSite

Import-ConfigFeatureTable

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Get-ConfigSite returns the site instance.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-ConfigSite
Gets the site.

Import-ConfigFeatureTable

Apr 15, 2014

Sets the feature table of the site.

Syntax

Import-ConfigFeatureTable [-Path] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Import-ConfigFeatureTable -Content <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Export-ConfigFeatureTable

Get-ConfigSite

Set-ConfigSite

Get-ConfigProduct

Get-ConfigProductEdition

Get-ConfigProductFeature

Get-ConfigProductVersion

Get-ConfigLicensingModel

Parameters

-Path<String>

The path to the file containing the feature table

Required?	true
Default Value	
Accept Pipeline Input?	false

-Content<String>

Set the site's feature table.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

C:\PS> Import-ConfigFeatureTable $xml
Specifies the use of a Platinum edition license. A suitable license must be available on the site's license server.

Register-ConfigServiceInstance

Apr 15, 2014

Allows the registration of a service instance.

Syntax

Register-ConfigServiceInstance -ServiceGroupUid <Guid> -ServiceGroupName <String> -ServiceType <String> -Address <String> -Binding <String> -Version <Int32> -ServiceAccount <String> -InterfaceType <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Register-ConfigServiceInstance -ServiceGroupUid <Guid> -ServiceGroupName <String> -ServiceType <String> -Address <String> -Binding <String> -Version <Int32> -ServiceAccountSid <String> -InterfaceType <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Register-ConfigServiceInstance -ServiceInstance <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to register service instance items in the Configuration Service. Service instances can be registered either by retrieving the data directly from other services or by manually entering the details into this command.

If the service group specified by the service instance already exists, the service is added to the service group, otherwise a new service group is created to hold the service instance.

Add-ConfigServiceGroupMetadata

Set-ConfigServiceGroupMetadata

Remove-ConfigServiceGroupMetadata

Parameters

-ServiceGroupUid<Guid>

The Service Group Unique Identifier

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ServiceGroupName<String>

The name of the service group

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ServiceType<String>

The type of the service group

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Address<String>

The address that is used to access the service instance.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Binding<String>

The binding type that must be used to access the service instance.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Version<Int32>

The version of the service instance.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ServiceAccount<String>

The AD computer account name (domain qualified) for the computer on which the service instance is hosted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-InterfaceType<String>

The type of interface that the service provides (i.e. SDK, InterService, Peer).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ServiceAccountSid<String>

The AD computer account Sid for the computer on which the service instance is hosted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ServiceInstance<ServiceInstance[]>

The service instances to register.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the logging id of the high-level operation that this cmdlet is part of.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can be provide this as a host

name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.Configuration.Sdk.ServiceInstance An object with the following parameters can be used to register a service instance. Address, ServiceGroupUid, ServiceGroupName, ServiceType, Binding, Version, InterfaceType.

Return Values

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters;

ServiceGroupUid <Guid>

The unique identifier for the service group to which the service instance belongs.

ServiceGroupName <string>

The name of the service group to which the service instance belongs.

ServiceInstanceUid <Guid>

The unique identifier for the service instance.

ServiceType <string>

The type of the service group.

Address <string>

The contact address for the service instance.

Binding <string>

The binding to use for connections to the service instance.

Version <int>

The version of the service instance.

ServiceAccount <string>

The AD computer account for the computer that is providing the service instance.

ServiceAccountSid <string>

The AD computer account SID for the computer that is providing the service instance.

InterfaceType <string>

The interface type for the service instance.

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes ---------- ActiveDirectoryAccountResolutionFailed The account name provided could not be found in Active Directory.
ServiceGroupWithSameUidExistsForDifferentServiceGroupNameOrSameUidExistsForDifferentServiceGroupNameOrServiceType The service group name or service type do not match the service group found with the specified uid. TypeAlreadyExists A different service group with the same type is registered already in the Configuration Service. DatabaseError An error occurred in the service while attempting a database operation. DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. DataStoreException An error occurred in the service while attempting a database operation - communication with the database failed for various reasons. CommunicationError An error occurred while communicating with the service. ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Get-ConfigServiceInstance | Register-ConfigServiceInstance
Gets the service instances for the Configuration Service and registers them.

Remove-ConfigRegisteredServiceInstanceMetadata

Apr 15, 2014

Removes metadata from the given ServiceInstance.

Syntax

Remove-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given ServiceInstance.

Related topics

Add-ConfigRegisteredServiceInstanceMetadata

Set-ConfigRegisteredServiceInstanceMetadata

Parameters

-ServiceInstanceUid<Guid>

Id of the ServiceInstance

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ServiceInstance[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigServiceInstance | Remove-ConfigRegisteredServiceInstanceMetadata
```

Remove all metadata from all ServiceInstance objects.

Remove-ConfigServiceGroup

Apr 15, 2014

Removes service groups.

Syntax

Remove-ConfigServiceGroup [-ServiceGroupUid] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to remove a service group and all the service instances that it contains.

Related topics

Register-ConfigServiceInstance

Add-ConfigServiceGroupMetadata

Set-ConfigServiceGroupMetadata

Remove-ConfigServiceGroupMetadata

Parameters

-ServiceGroupUid<Guid>

The unique identifier for the service group.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the logging id of the high-level operation this cmdlet invocation is part of.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

In the case of failure, the following errors can result.

Error Codes ---------- ServiceGroupObjectNotFound The service group specified could not be located. DatabaseError An error occurred in the service while attempting a database operation. DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. DataStoreException An error occurred in the service while attempting a database operation - communication with the database failed for various reasons. CommunicationError An error occurred while communicating with the service. ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Remove-ConfigServiceGroup -ServiceGroupUid 31951f6f-7703-4abb-938a-2861d76ecfea
Removes the service group (and all contained service instances) for the service group with a unique identifier of '31951f6f-7703-4abb-938a-2861d76ecfea'.

---------- EXAMPLE 2 ----------

C:\PS> Get-configServiceGroup | remove-ConfigServiceGroup
Removes all the service groups (and all contained service instances) for the XenDesktop deployment.

Remove-ConfigServiceGroupMetadata

Apr 15, 2014

Removes metadata from the given ServiceGroup.

Syntax

Remove-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given ServiceGroup.

Related topics

Add-ConfigServiceGroupMetadata

Set-ConfigServiceGroupMetadata

Parameters

-ServiceGroupUid<Guid>

Id of the ServiceGroup

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ServiceGroup[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Get-ConfigServiceGroup | % { Remove-ConfigServiceGroupMetadata -Map $_.MetadataMap }
```

Remove all metadata from all ServiceGroup objects.

Remove-ConfigServiceMetadata

Apr 15, 2014

Removes metadata from the given Service.

Syntax

Remove-ConfigServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-ConfigServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigService | % { Remove-ConfigServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Service objects.

Remove-ConfigSiteMetadata

Apr 15, 2014

Removes metadata from the given Site.

Syntax

Remove-ConfigSiteMetadata -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ConfigSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Site.

Related topics

Set-ConfigSiteMetadata

Parameters

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigSite | % { Remove-ConfigSiteMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Site objects.

Reset-ConfigServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the Configuration Service.

Syntax

Reset-ConfigServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload Configuration Service access permissions and configuration service locations. The Reset-ConfigServiceGroupMembership command must be run on at least one instance of the service type (Config) after installation and registration with the configuration service. Without this operation, the Configuration services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-ConfigServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.Configuration.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-ConfigServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-ConfigServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

---------- EXAMPLE 2 ----------

c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-ConfigServiceGroupmembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-ConfigDBConnection

Apr 15, 2014

Configures a database connection for the Configuration Service.

Syntax

Set-ConfigDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the Configuration Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-ConfigServiceStatus

Get-ConfigDBConnection

Test-ConfigDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the Configuration Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-ConfigDBConnection command returns an object containing the status of the Configuration Service together with extra diagnostics information.

DBUnconfigured

The Configuration Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Configuration Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Configuration Service currently in use is incompatible with the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

DBOlderVersionThanService

The version of the Configuration Service schema on the database is incompatible with the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Configuration Service is running and is connected to a database containing a valid schema.

Failed

The Configuration Service has failed.

Unknown

The status of the Configuration Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-ConfigDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK
Configures a database connection string for the Configuration Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Set-ConfigDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the Configuration Service.

Set-ConfigRegisteredServiceInstance

Apr 15, 2014

Updates a service instance.

Syntax

Set-ConfigRegisteredServiceInstance -ServiceInstanceUid <Guid> -Address <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to change the address property of an existing service instance that is registered in the Configuration Service.

Related topics

Get-ConfigRegisteredServiceInstance

Register-ConfigServiceInstance

Unregister-ConfigRegisteredServiceInstance

Parameters

-ServiceInstanceUid<Guid>

The unique identifier for the service instance to be updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Address<String>

The new address for the service instance.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Defines whether or not the command returns a result showing the new state of the updated service instance.

Required?	false
Default Value	true
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the logging id of the high-level operation this cmdlet invocation is part of.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Configuration.Sdk.ServiceInstance

This represents a service instance and has the following parameters:

ServiceGroupUid <Guid>

The unique identifier for the service group to which the service instance belongs.

ServiceGroupName <string>

The name of the service group to which the service instance belongs.

ServiceInstanceUid <Guid>

The unique identifier for the service instance.

ServiceType <string>

The type of the service group.

Address <string>

The contact address for the service instance.

Binding <string>

The binding to use for connections to the service instance.

Version <int>

The version of the service instance.

ServiceAccount <string>

The AD computer account for the computer that is providing the service instance.

ServiceAccountSid <string>

The AD computer account SID for the computer that is providing the service instance.

InterfaceType <string>

The interface type for the service instance.

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The metadata for the service instance.

Notes

In the case of failure, the following errors can result.

Error Codes ---------- ObjectToUpdateDoesNotExist The service instance specified could not be located. DatabaseError An error occurred in the service while attempting a database operation. DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. DataStoreException An error occurred in the service while attempting a database operation - communication with the database failed for various reasons. CommunicationError An error occurred while communicating with the service. ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Set-ConfigResgisteredService -ServiceInstanceUid "9805f39d-99eb-44f0-8f63-9d8e3f1228e0" -Address "http://myServer.com/Citrix/sdkHostingUnitService"
Update the service instance with the unique identifier of '9805f39d-99eb-44f0-8f63-9d8e3f1228e0' to use the new address.
```

Set-ConfigRegisteredServiceInstanceMetadata

Apr 15, 2014

Adds or updates metadata on the given ServiceInstance.

Syntax

Set-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigRegisteredServiceInstanceMetadata [-ServiceInstanceUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigRegisteredServiceInstanceMetadata [-InputObject] <ServiceInstance[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ServiceInstance objects.

Related topics

Add-ConfigRegisteredServiceInstanceMetadata

Remove-ConfigRegisteredServiceInstanceMetadata

Parameters

-ServiceInstanceUid<Guid>

Id of the ServiceInstance

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ServiceInstance[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the ServiceInstance specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-ConfigRegisteredServiceInstanceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-ConfigRegisteredServiceInstanceMetadata -ServiceInstanceUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                         Value
    ---                         -----
    property                    value
```

Add metadata with a name of 'property' and a value of 'value' to the ServiceInstance with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-ConfigServiceGroupMetadata

Apr 15, 2014

Adds or updates metadata on the given ServiceGroup.

Syntax

Set-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigServiceGroupMetadata [-ServiceGroupUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigServiceGroupMetadata [-InputObject] <ServiceGroup[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ServiceGroup objects.

Related topics

Add-ConfigServiceGroupMetadata

Remove-ConfigServiceGroupMetadata

Parameters

-ServiceGroupUid<Guid>

Id of the ServiceGroup

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ServiceGroup[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the ServiceGroup specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-ConfigServiceGroupMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Set-ConfigServiceGroupMetadata -ServiceGroupUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

```
Key                             Value
---                             -----
property                        value
```

Add metadata with a name of 'property' and a value of 'value' to the ServiceGroup with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-ConfigServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given Service.

Syntax

Set-ConfigServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-ConfigServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1";

"name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-ConfigServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-ConfigServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                         value
```

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-ConfigSite

Apr 15, 2014

Changes the overall settings of the site.

Syntax

Set-ConfigSite [-SiteName <String>] [-ProductCode <String>] [-ProductEdition <String>] [-ProductVersion <String>] [-LicensingModel <String>] [-LicenseServerName <String>] [-LicenseServerPort <Int32>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-ConfigSite cmdlet modifies properties of the site.

The site is a top-level, logical representation of the XenDesktop site, from the perspective of the configuration services running within the site.

A XenDesktop installation has only a single site instance.

Modifications to the product code, product edition, product version and licensing model properties are successful only if their values are consistent with the feature table. Use the Get-ConfigProduct, Get-ConfigProductEdition, Get-ConfigProductVersion and Get-ConfigLicensingModel cmdlets to determine consistent values.

To configure the site, first import the feature table using the Import-ConfigFeatureTable cmdlet.

Related topics

Export-ConfigFeatureTable

Get-ConfigSite

Get-ConfigProduct

Get-ConfigProductEdition

Get-ConfigProductFeature

Get-ConfigProductVersion

Get-ConfigLicensingModel

Parameters

-SiteName<String>

Changes the name of the site.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProductCode<String>

Changes the product code.

The Get-ConfigProduct cmdlet returns a list of supported values.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProductEdition<String>

Changes the license edition. A license matching the specified edition must be available within the site's license server.

The Get-ConfigProductEdition returns a list of supported values.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProductVersion<String>

Changes the product version.

The Get-ConfigProductVersion returns a list of supported values.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LicensingModel<String>

Changes the license model. A license matching the specified model must be available within the site's license server.

The Get-ConfigLicensingModel returns a list of supported values.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LicenseServerName<String>

Changes the machine used by the brokering services to obtain licenses for desktop and application session brokering. The specified machine must be running a Citrix license server and have suitable licenses installed.

The license server machine can be specified by its DNS name ('machine.domain') or its numeric IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LicenseServerPort<Int32>

Changes the port number on the license server machine used by the brokering services to contact the Citrix license server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Site

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-ConfigSite -ProductEdition PLT

Specifies the use of a Platinum edition license. A suitable license must be available on the site's license server.

Set-ConfigSiteMetadata

Apr 15, 2014

Adds or updates metadata on the Site.

Syntax

Set-ConfigSiteMetadata -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ConfigSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against the Site.

Related topics

Remove-ConfigSiteMetadata

Parameters

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Site specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-ConfigSiteMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-ConfigSiteMetadata -Name property -Value value

    Key                         Value
    ---                         -----
    property                    value
```

Add metadata with a name of 'property' and a value of 'value' to the Site.

Test-ConfigDBConnection

Apr 15, 2014

Tests a database connection for the Configuration Service.

Syntax

```
Test-ConfigDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Tests a connection to the database in which the Configuration Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-ConfigServiceStatus

Get-ConfigDBConnection

Set-ConfigDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the Configuration Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-ConfigDBConnection command returns an object containing the status of the Configuration Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the Configuration Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Configuration Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Configuration Service currently in use is incompatible with the version of the Configuration Service schema on the database. Upgrade the Configuration Service to a more recent version.

DBOlderVersionThanService

The version of the Configuration Service schema on the database is incompatible with the version of the Configuration Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-ConfigDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The Configuration Service has failed.

Unknown

The status of the Configuration Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Test-ConfigDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Tests a database connection string for the Configuration Service.

---------- EXAMPLE 2 ----------

```
c:\PS>Test-ConfigDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Tests an invalid database connection string for the Configuration Service.

Test-ConfigServiceInstanceAvailability

Apr 15, 2014

Tests whether the supplied service instances are responding to requests.

Syntax

Test-ConfigServiceInstanceAvailability [-ServiceInstance] <ServiceInstance[]> [-MaxDelaySeconds <Int32>] [-ForceWaitForOneOfEachType] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Related topics

Register-ConfigServiceInstance

Unregister-ConfigRegisteredServiceInstance

Get-ConfigRegisteredServiceInstance

Parameters

-ServiceInstance<ServiceInstance[]>

The service instances to test.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-MaxDelaySeconds<Int32>

The timeout period to wait before concluding that services are unresponsive.

Required?	false
Default Value	Infinite
Accept Pipeline Input?	false

-ForceWaitForOneOfEachType<SwitchParameter>

If at least one of each type of service responds, finish immediately.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the host name or IP address of the controller to which the PowerShell snap-in connects.

Required?	false
Default Value	'LocalHost'. Once a value is specified by any command, this value becomes the new default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

This represents a service instance and has the following parameters;

ServiceGroupUid <Guid>

The unique identifer for the service group to which the service instance belongs.

ServiceGroupName <string>

The name of the service group that the service instance is part of.

ServiceInstanceUid <Guid>

The unique identifier for the service instance.

ServiceType <string>

The type of the service group.

Address <string>

The contact address for the service instance.

Binding <string>

The binding to use for connections to the service instance.

Version <int>

The version of the service instance.

ServiceAccount <string>

The AD computer account for the computer that is providing the service instance.

ServiceAccountSid <string>

The AD computer account SID for the computer that is providing the service instance.

InterfaceType <string>

The interface type for the service instance.

Metadata <Citrix.Configuration.Sdk.Metadata[]>

The metadata for the service instance.

Status <Citrix.Configuration.Sdk.Commands.Availability>

An enumeration value indicating whether the service is Responding, NotResponding, Unknown, or BadBindingType.

ResponseTime <System.TineSpan>

The interval elapsed between hailing the service and getting a definite response

Notes

The Availability Status Codes are o Responding: Got a positive response o NotResponding: Got a response, but it was negative or the connection was refused o Unknown: Did not respond in time / timed-out o BadBindingType: Binding parameter in ServiceInstance is not wcf_HTTP_kerb

Examples

---------- EXAMPLE 1 ----------

C:\>Get-ConfigRegisteredServiceInstance | Test-ConfigServiceInstanceAvailability -ForceWaitForOneOfEachType
Test all the service instances that are registered in the Configuration Service, returning when one of each type is responding.

---------- EXAMPLE 2 ----------

C:\>Test-ConfigServiceInstanceAvailability -ServiceInstance $services -MaxDelaySeconds 5
Test each of the given services, allowing a 5 second time-out.

Unregister-ConfigRegisteredServiceInstance

Apr 15, 2014

Removes a service instance from the Configuration Service registry.

Syntax

Unregister-ConfigRegisteredServiceInstance [-ServiceInstanceUid] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to remove a service instance from the Configuration Service registry. This does not remove any service groups (if all service instances for a Service Group are removed, an empty service group remains and must be removed using the Remove-ConfigServiceGroup command).

Related topics

Register-ConfigServiceInstance

Parameters

-ServiceInstanceUid<Guid>

The unique identifier for the service instance to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the logging id of the high-level operation this cmdlet invocation is part of.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Input Type

Citrix.Configuration.Sdk.ServiceInstance An object with a parameter called 'ServiceInstanceUid' can be used to unregister service instances.

Notes

In the case of failure, the following errors can result.

Error Codes ---------- ServiceInstanceObjectNotFound The service instance specified could not be located. DatabaseError An error occurred in the service while attempting a database operation. DatabaseNotConfigured The operation could not be completed because the database for the service is not configured. DataStoreException An error occurred in the service while attempting a database operation - communication with the database failed for various reasons. CommunicationError An error occurred while communicating with the service. ExceptionThrown An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Get-ConfigRegisteredServiceInstance -ServiceType "Config" | Unregister-ConfigRegisteredServiceInstance
Unregisters all the service instances that are for a service type of 'Config' from the Configuration Service instance register.

Citrix.ConfigurationLogging.Admin.V1

Apr 15, 2014

Overview

Name	Description
LogConfigurationLoggingSnapin	The Configuration Logging Service PowerShell snap-in provides administrative
Log Filtering	Describes the common filtering options for XenDesktop cmdlets.
logical operators	Describes the operators that connect statements in Windows PowerShell.

Cmdlets

Name	Description
Export-LogReportCsv	Exports Configuration Logging data into a CSV file.
Export-LogReportHtml	Exports Configuration Logging data into a HTML report.
Get-LogDataStore	Gets details for each of the ConfigurationLogging data stores.
Get-LogDBConnection	Gets the database string for the specified data store used by the ConfigurationLogging Service.
Get-LogDBSchema	Gets a script that creates the ConfigurationLogging Service database schema for the specified data store.
Get-LogDBVersionChangeScript	Gets a script that updates the ConfigurationLogging Service database schema.
Get-LogHighLevelOperation	Gets high level operations
Get-LogInstalledDBVersion	Gets a list of all available database schema versions for the ConfigurationLogging Service.
Get-LogLowLevelOperation	Gets low level operations
Get-LogService	Gets the service record entries for the ConfigurationLogging Service.
Get-LogServiceAddedCapability	Gets any added capabilities for the ConfigurationLogging Service on the controller.
Get-LogServiceInstance	Gets the service instance entries for the ConfigurationLogging Service.
Get-LogServiceStatus	Gets the current status of the ConfigurationLogging Service on the controller.
Get-LogSite	Gets global configuration logging settings.

Name	Description
Get-LogSummary	Gets operations logged within time intervals inside a date range.
Remove-LogOperation	Deletes configuration logs
Remove-LogServiceMetadata	Removes metadata from the given Service.
Remove-LogSiteMetadata	Removes metadata from the given Site.
Reset-LogDataStore	Refreshes the database string currently being used by the Log service.
Reset-LogServiceGroupMembership	Reloads the access permissions and configuration service locations for the ConfigurationLogging Service.
Set-LogDBConnection	Configures a database connection for the ConfigurationLogging Service.
Set-LogServiceMetadata	Adds or updates metadata on the given Service.
Set-LogSite	Sets global configuration logging settings.
Set-LogSiteMetadata	Adds or updates metadata on the given Site.
Start-LogHighLevelOperation	Logs the start of a high level operation.
Stop-LogHighLevelOperation	Logs the completion of a previously started high level operation.
Test-LogDBConnection	Tests a database connection for the ConfigurationLogging Service.

about_LogConfigurationLoggingSnapin

Apr 15, 2014

TOPIC

about_LogConfigurationLoggingSnapin

SHORT DESCRIPTION

The Configuration Logging Service PowerShell snap-in provides administrative functions for the Configuration Logging Service.

COMMAND PREFIX

All commands in this snap-in have the noun prefixed with 'Log'.

LONG DESCRIPTION

The Configuration Logging Service PowerShell snap-in enables both local and remote administration of the Configuration Logging Service.

The Configuration Logging Service logs configuration changes or administrator requested state changes made to the site. Configuration Logging can be configured, site wide, to be mandatory or optional. If mandatory logging is selected, then any attempts to change site configuration or state when the logging mechanism is unavailable are denied.

The Configuration Logging Service stores information about the logged changes in a database which can be configured to be separate from the site database.

The snap-in provides storage and configuration of these entities:

Site

> The Configuration Logging Site object holds global settings which control the behaviour of the Configuration Logging Service. The site object can be configured by the Set-LogSite cmdlet. The properties of the site object are returned by the Get-LogSite cmdlet.

High Level Operations

> A high level operation object represents a logged configuration change performed from Desktop Studio, Desktop Director or a PowerShell Script.
>
> The XenDesktop consoles log high level operations when:
>
> 1) Executing operations which performs configuration changes.
> 2) Executing operations which performs administration related activities which may affect site configuration.

PowerShell scripts which carry out customized configuration changes can also log high level operations via cmdlets Start-LogHighLevelOperation and Stop-LogHighLevelOperation.

Low Level Operations

A low level operation object represents a logged configuration change performed by a service. One or more low level operation objects are used to record the actions performed by a services in order to fulfil a high level operation initiated from the consoles, or from PowerShell scripts.

Low level operations in the system are returned by cmdlet Get-LogLowLevelOperation.

Operation Details

A low level operation performed by a service can affect a number of individual objects, or a number of properties on an object. An operation detail log records each individual change to an object. This includes the creation and deletion of the object, as well as changes to individual properties of the object.

One or more operation detail objects are used to record specific changes to each object that is affected by a low level service operation.

Operation details are included in the data returned from the Get-LogLowLevelOperation cmdlet.

High Level Operations, Low Level Operations and Operation Details are arranged in a hierarchy. A High Level Operation can have multiple Low Level Operations, and each Low Level Operation can have multiple Operation Details.

Setting up a separate logging database ---------- After creating the database on the database server, the logging database can be setup and configured for use by:

1) Generating the database schema, and applying it the logging database
2) Configuring the configuration logging service to use the new logging database.

The logging database schema can be generated from the Get-LogDBSchem cmdlet, as illustrated below:

```
Get-LogDBSchema -DatabaseName "loggingDB"
        -ServiceGroupName "service group name"
        -ScriptType Database
        -LocalDatabase:$LocalDB
        -DataStore Logging
```

The configuration logging service can be configured to use the logging database with the Set-LogDBConnection cmdlet, as illustrated below:

```
Set-LogDBConnection -DataStore Logging -DBConnection $null
Set-LogDBConnection -DataStore Logging -DBConnection "new logging db connection string"
```

Configuration Logging site settings ----------

On the Site object:

- The 'State' setting allows configuration logging to be disabled, enabled, or made mandatory.
- The 'Locale' setting specifies the language in which configuration logging data text will be stored.

See Get-LogSite cmdlet help for further information on these settings.

This locale setting applies to the text description that is associated with each log , e.g. "Create Catalog". It doesn't apply to other textual information in the log like the names of parameters passed to operations, e.g. "CatalogName".

This localisation is applied when the data is logged, and not when the logs are viewed later. For example, logs which are created in English will be displayed in English on an end user system which may be configured with a different locale.

about_Log_Filtering

Apr 15, 2014

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

about_logical_operators

Apr 15, 2014

TOPIC

about_Logical_Operators

SHORT DESCRIPTION

Describes the operators that connect statements in Windows PowerShell.

LONG DESCRIPTION

The Windows PowerShell logical operators connect expressions and statements, allowing you to use a single expression to test for multiple conditions.

For example, the following statement uses the and operator and the or operator to connect three conditional statements. The statement is true only when the value of $a is greater than the value of $b, and either $a or $b is less than 20.

```
($a -gt $b) -and (($a -lt 20) -or ($b -lt 20))
```

Windows PowerShell supports the following logical operators.

Operator	Description	Example
-and	Logical and. TRUE only when both statements are TRUE.	(1 -eq 1) -and (1 -eq 2) False
-or	Logical or. TRUE when either or both statements are TRUE.	(1 -eq 1) -or (1 -eq 2) True
-xor	Logical exclusive or. TRUE only when one of the statements is TRUE and the other is FALSE.	(1 -eq 1) -xor (2 -eq 2) False
-not	Logical not. Negates the statement that follows it.	-not (1 -eq 1) False
!	Logical not. Negates the statement that follows it. (Same as -not)	!(1 -eq 1) False

Note: The previous examples also use the equal to comparison

operator (-eq). For more information, see about_Comparison_Operators.
The examples also use the Boolean values of integers. The integer 0
has a value of FALSE. All other integers have a value of TRUE.

The syntax of the logical operators is as follows:

<statement> {-AND | -OR | -XOR} <statement>
{! | -NOT} <statement>

Statements that use the logical operators return Boolean (TRUE or FALSE) values.

The Windows PowerShell logical operators evaluate only the statements required to determine the truth value of the statement. If the left operand in a statement that contains the and operator is FALSE, the right operand is not evaluated. If the left operand in a statement that contains the or statement is TRUE, the right operand is not evaluated. As a result, you can use these statements in the same way that you would use the If statement.

Export-LogReportCsv

Apr 15, 2014

Exports Configuration Logging data into a CSV file.

Syntax

Export-LogReportCsv -OutputFile <String> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet exports the Configuration Logging data into a CSV data file. The hierarchical logging data is flattened into a single CSV 'table'. The content of CSV file is not intended to be human-readable. It is meant to be input data for external reporting or manipulation tools (for example, a spread sheet application).

Related topics

Export-LogReportHtml

Parameters

-OutputFile<String>

Specifies the path to a file where the CSV data will be saved.

Required?	true
Default Value	
Accept Pipeline Input?	false

-StartDateRange<DateTime>

Specifies the start time of the earliest operation to include.

Required?	false
Default Value	DateTime.Min
Accept Pipeline Input?	false

-EndDateRange<DateTime>

Specifies the end time of the latest operation to include.

Required?	false
Default Value	DateTime.UtcNow
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

C:\PS> Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv"
Export all logged operations to a csv file.

---------- EXAMPLE 2 ----------

C:\PS> Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv" -StartDateRange "2012-12-21 09:00"
Export to a CSV file logged operations started on or after a specified datetime..

---------- EXAMPLE 3 ----------

C:\PS> Export-LogReportCsv -OutputFile "c:\MyReports\LoggingData.csv" -StartDateRange "2012-12-21 09:00" -EndDateRange "2012-12-311 18:00"
Export to a CSV file logged operations started and completed between a date range.

Export-LogReportHtml

Apr 15, 2014

Exports Configuration Logging data into a HTML report.

Syntax

Export-LogReportHtml -OutputDirectory <String> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet exports the Configuration Logging data into a HTML report. The report consists of two HTML files:

o Summary.Html - this shows summary information from the high level operation logs.

o Details.Html - this shows additional logging data from the low level operation and operation detail logs.

Hyperlinks in summary.html allow drill-down into the associated low level logging data contained within details.html.

Related topics

Export-LogReportCsv

Parameters

-OutputDirectory<String>

Specifies the path to a directory where the HTML report files will will be saved.

Required?	true
Default Value	
Accept Pipeline Input?	false

-StartDateRange<DateTime>

Specifies the start time of the earliest operation to include.

Required?	false
Default Value	DateTime.Min
Accept Pipeline Input?	false

-EndDateRange<DateTime>

Specifies the end time of the latest operation to include.

Required?	false
Default Value	DateTime.UtcNow
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

C:\PS> Export-LogReportHtml -OutputDirectory "c:\MyReports"
Export all logged operations to HTML.

---------- EXAMPLE 2 ----------

C:\PS> Export-LogReportHtml -OutputDirectory "c:\MyReports" -StartDateRange "2012-12-21 09:00"
Export to a HTML logged operations started on or after a specified datetime..

---------- EXAMPLE 3 ----------

C:\PS> Export-LogReportHtml -OutputDirectory "c:\MyReports" -StartDateRange "2012-12-21 09:00" -EndDateRange "2012-12-311 18:00"
Export to HTML logged operations started and completed between a date range.

Get-LogDataStore

Apr 15, 2014

Gets details for each of the ConfigurationLogging data stores.

Syntax

Get-LogDataStore [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns an object for each of the ConfigurationLogging data stores describing the connection string, data store name, db type, provider, schema name, and DB status.

A database connection must be configured in order for this command to be used if the service has a secondary data store. This is not required for the site data store.

Related topics

Reset-LogDataStore

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.DataStoreConfiguration

An object describing the connection string, data store name, database type, provider, schema name and database status.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-LogDataStore

ConnectionString : Server=.\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
DataStore        : Site
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : LogSiteSchema
Status           : OK

ConnectionString :
DataStore        : Secondary
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : LogSecondarySchema
Status           : DBUnconfigured
```

Get the database connection string for the ConfigurationLogging Service.

Get-LogDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the ConfigurationLogging Service.

Syntax

Get-LogDBConnection [[-DataStore] <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-LogServiceStatus

Get-LogDataStore

Set-LogDBConnection

Test-LogDBConnection

Parameters

-DataStore<String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the ConfigurationLogging Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the ConfigurationLogging Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-LogDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the ConfigurationLogging Service.

Get-LogDBSchema

Apr 15, 2014

Gets a script that creates the ConfigurationLogging Service database schema for the specified data store.

Syntax

Get-LogDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new ConfigurationLogging Service database schema, add a new ConfigurationLogging Service to an existing site, remove a ConfigurationLogging Service from a site, or create a database server logon for a ConfigurationLogging Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected ConfigurationLogging Service instance, otherwise the scripts relate to ConfigurationLogging Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a ConfigurationLogging SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to ConfigurationLogging Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to ConfigurationLogging Service roles

If ScriptType is Evict, the returned script contains:

o Removal of ConfigurationLogging Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.

Related topics

Get-LogDataStore

Set-LogDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the ConfigurationLogging services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the ConfigurationLogging Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further ConfigurationLogging services to an existing database instance that already contains the full ConfigurationLogging service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the ConfigurationLogging Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified ConfigurationLogging Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for ConfigurationLogging services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the ConfigurationLogging Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-DataStore<String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-LogDBSchema -DatabaseName MyDB -ServiceGroupName  MyServiceGroup > c:\LogSchema.sql
```

Get the full database schema for site data store of the ConfigurationLogging Service and copy it to a file called 'c:\LogSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a ConfigurationLogging Service site schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-LogDBSchema -DatabaseName MyDB -scriptType Login > c:\ConfigurationLoggingLogins.sql
```

Get the logon scripts for the ConfigurationLogging Service.

---------- EXAMPLE 3 ----------

```
c:\PS>Get-LogDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup -DataStore Secondary > c:\LogSchema.sql
```

Get the full database schema for the secondary data store of the ConfigurationLogging Service and copy it to a file called 'c:\LogSecondarySchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a ConfigurationLogging Service secondary schema.

Get-LogDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the ConfigurationLogging Service database schema.

Syntax

Get-LogDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the ConfigurationLogging Service from the current schema version to a different version.

Related topics

Get-LogInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-DataStore<String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any ConfigurationLogging services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-LogServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the ConfigurationLogging Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-LogDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-LogHighLevelOperation

Apr 15, 2014

Gets high level operations

Syntax

Get-LogHighLevelOperation [-Id <Guid>] [-Text <String>] [-StartTime <DateTime>] [-Source <String>] [-EndTime <DateTime>] [-IsSuccessful <Boolean>] [-User <String>] [-AdminMachineIP <String>] [-OperationType <OperationType>] [-TargetType <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves high level operations matching the specified criteria. If no parameters are specified this cmdlet returns all high level operations.

Related topics

Start-LogHighLevelOperation

Stop-LogHighLevelOperation

Get-LogLowLevelOperation

Parameters

-Id<Guid>

Gets the high level operation with the specified identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Text<String>

Gets high level operations with the specified text

Required?	false
Default Value	
Accept Pipeline Input?	false

-StartTime<DateTime>

Gets high level operations with the specified start time

Required?	false
Default Value	
Accept Pipeline Input?	false

-Source<String>

Gets high level operations with the specified source.

Required?	false
Default Value	
Accept Pipeline Input?	false

-EndTime<DateTime>

Gets high level operations with the specified end time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsSuccessful<Boolean>

Gets high level operations with the specified success indicator.

Required?	false
Default Value	
Accept Pipeline Input?	false

-User<String>

Gets high level operations logged by the specified user.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminMachineIP<String>

Gets high level operations logged from the machine with the specified IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OperationType<OperationType>

Gets high level operations with the specified operation type. Values can be:

o AdminActivity - to get operations which log administration activity.

o ConfigurationChange - to get operations which log configuration changes.

Required?	false
Default Value	
Accept Pipeline Input?	false

-TargetType<String>

Gets high level operations with the specified target type. The target type describes the type of object that was the target of the configuration change. For example, "Session" or "Machine".

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250

Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.HighLevelOperation

The returned HighLevelOperation object has the following properties:

o Id - The unique identifier of the operation.

o Text - A description of the operation.

o StartTime - The date and time that the operation started.

o EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.

o IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation never completed.

o User - The identifier of the administrator who performed the operation.

o AdminMachineIP - The IP address of the machine that the operation was initiated from.

o Source - Identifies the XenDesktop console, or custom script, where the operation was initiated from. For example, "Desktop Studio", "Desktop Director", "My custom script".

o OperationType - The operation type. This can be 'AdminActivity' or 'ConfigurationChange'.

o TargetTypes - Identifies the type of objects that were affected by the operation. For example, "Catalog" or "Desktop","Machine".

o Parameters - The names and values of the parameters that were supplied for the operation.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-LogHighLevelOperation
Get all high level operations

---------- EXAMPLE 2 ----------

C:\PS> Get-LogHighLevelOperation -OperationType ConfigurationChange
Get high level operations which log configuration changes.

---------- EXAMPLE 3 ----------

C:\PS> Get-LogHighLevelOperation -OperationType AdminActivity
Get high level operations which log administration activities.

---------- EXAMPLE 4 ----------

C:\PS> Get-LogHighLevelOperation -Filter{ StartTime -ge "2013-02-27 09:00:00" -and EndTime -le "2013-02-27 18:00:00"}
Use advanced filtering to get high level operations with a start time on or after "2013-02-27 09:00:00" and an end time on or before "2013-02-27 18:00:00".

---------- EXAMPLE 5 ----------

C:\PS> Get-LogHighLevelOperation -EndTime $null
C:\PS> Get-LogHighLevelOperation -IsSuccessful $null

Either of these commands will get high level operations which have not yet been completed.

---------- EXAMPLE 6 ----------

C:\PS> Get-LogHighLevelOperation -User "DOMAIN\UserName"
Get high level operations performed by user "DOMAIN\UserName".

Get-LogInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the ConfigurationLogging Service.

Syntax

Get-LogInstalledDBVersion [-Upgrade] [-Downgrade] [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the ConfigurationLogging Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DataStore<String>

Specifies the database connection logical name the schema script should be returned for. The parameter is optional.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-LogInstalledDbVersion command returns objects containing the new definition of the ConfigurationLogging Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the ConfigurationLogging Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-LogInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the ConfigurationLogging Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-LogInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the ConfigurationLogging Service database schema for which upgrade scripts are supplied.

Get-LogLowLevelOperation

Apr 15, 2014

Gets low level operations

Syntax

Get-LogLowLevelOperation [-Id <Guid>] [-HighLevelOperationId <Guid>] [-StartTime <DateTime>] [-EndTime <DateTime>] [-IsSuccessful <Boolean>] [-User <String>] [-AdminMachineIP <String>] [-Text <String>] [-Source <String>] [-SourceSdk <String>] [-OperationType <OperationType>] [-TargetType <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves low level operations matching the specified criteria. If no parameters are specified this cmdlet returns all low level operations.

Related topics

Get-LogLowLevelOperation

Parameters

-Id<Guid>

Gets the low level operation with the specified identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-HighLevelOperationId<Guid>

Gets low level operations for the high level operation with the specified identifier.

Required?	false
Default Value	
Accept Pipeline Input?	false

-StartTime<DateTime>

Gets low level operations with the specified start time

Required?	false
Default Value	

Accept Pipeline Input?	false

-EndTime<DateTime>

Gets low level operations with the specified end time.

Required?	false
Default Value	
Accept Pipeline Input?	false

-IsSuccessful<Boolean>

Gets low level operations with the specified success indicator.

Required?	false
Default Value	
Accept Pipeline Input?	false

-User<String>

Gets low level operations logged by the specified administrator.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminMachineIP<String>

Gets low level operations logged from the machine with the specified IP address.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Text<String>

Gets low level operations with the specified text

Required?	false
Default Value	

Accept Pipeline Input?	false

-Source<String>

Gets low level operations with the specified source.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SourceSdk<String>

Gets low level operations logged from the SDK with the specified identifier.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OperationType<OperationType>

Gets low level operations with the specified operation type. Values can be:

o AdminActivity - to get operations which log administration activity.

o ConfigurationChange - to get operations which log configuration changes.

Required?	false
Default Value	
Accept Pipeline Input?	false

-TargetType<String>

Gets low level operations with the specified target type. The target type describes the type of object that was the target of the configuration change. For example, "Session" or "Machine".

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is

additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.LowLevelOperation

The returned LowLevelOperation object has the following properties:

o Id - The unique identifier of the operation.

o Text - A description of the operation.

o HighLevelOperationId - The unique identifier of the related high level operation.

o StartTime - The date and time that the operation started.

o EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.

o IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation never completed.

o AdminSid - The identifier of the administrator who performed the operation.

o AdminMachineIP - The IP address of the machine that the operation was performed on.

o Source - The name of the XenDesktop service that the operation was performed on; for example, "MachineCreation", "DelegatedAdmin".

o SourceSdk - The identifier of the XenDesktop service SDK through which the operation was performed; for example, "Prov", "Admin".

o OperationType - The operation type. This can be 'AdminActivity' or 'ConfigurationChange'.

o TargetTypes - Identifies the type of objects that were affected by the operation. For example, "Catalog" or "Desktop","Machine".

o Parameters - The names and values of the parameters that were supplied for the operation.

o Details - A collection of OperationDetail objects containing specific information about each object affected by the operation.

Each OperationDetail object in the 'Details' collection has the following properties:

o TargetUid - The unique identifier of the target object affected by the operation.

o TargetName - The name of the target object affected by the operation.

o TargetType - The type of the target object.

o Text - The description of operation performed on the target object.

o StartTime - The date and time that the operation started.

o EndTime - The date and time that the operation completed. This will be null if the operation is still in progress, or if the operation never completed.

o IsSuccessful - Indicates whether the operation completed successfully or not. This will be null if the operation is still in progress, or if the operation didn't complete.

The following properties will be set if the operation changed a property on the object:

o PropertyName - The name of the changed property.

o NewValue - The new property value.

o PreviousValue - The previous property value.

o AddValue - If the object property contains a set of values, this specifies the new value which was added to the set.

o RemoveValue- If the object property contains a set of values, this specifies the value which was removed from the set.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-LogLowLevelOperation
Get all low level operations

---------- EXAMPLE 2 ----------

C:\PS> Get-LogLowLevelOperation -OperationType ConfigurationChange
Get low level operations which log configuration changes.

---------- EXAMPLE 3 ----------

C:\PS> Get-LogLowLevelOperation -OperationType AdminActivity
Get low level operations which log administration activities.

---------- EXAMPLE 4 ----------

C:\PS> Get-LogLowLevelOperation -Filter{ StartTime -ge "2013-02-27 09:00:00" -and EndTime -le "2013-02-27 18:00:00"}
Use advanced filtering to get low level operations with a start time on or after "2013-02-27 09:00:00" and an end time on or before "2013-02-27 18:00:00".

---------- EXAMPLE 5 ----------

C:\PS> Get-LogLowLevelOperation -EndTime $null
C:\PS> Get-LogLowLevelOperation -IsSuccessful $null

Either of these commands will get low level operations which have not yet been completed.

---------- EXAMPLE 6 ----------

C:\PS> Get-LogLowLevelOperation -User "DOMAIN\UserName"
Get low level operations performed by user "DOMAIN\UserName".

Get-LogService

Apr 15, 2014

Gets the service record entries for the ConfigurationLogging Service.

Syntax

Get-LogService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the ConfigurationLogging Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Log_Filtering for details.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Log_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.Service

The Get-LogServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-LogService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the ConfigurationLogging Service running in the current service group.

Get-LogServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the ConfigurationLogging Service on the controller.

Syntax

```
Get-LogServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the ConfigurationLogging Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Get-LogServiceAddedCapability
```

Get the added capabilities of the ConfigurationLogging Service.

Get-LogServiceInstance

Apr 15, 2014

Gets the service instance entries for the ConfigurationLogging Service.

Syntax

Get-LogServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the ConfigurationLogging Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.ServiceInstance

The Get-LogServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Log.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.ConfigurationLogging.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

ServiceType        : Log
Version            : 1
```

Get all instances of the ConfigurationLogging Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-LogServiceStatus

Apr 15, 2014

Gets the current status of the ConfigurationLogging Service on the controller.

Syntax

```
Get-LogServiceStatus [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables the status of the ConfigurationLogging Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Get-LogDataStore

Set-LogDBConnection

Test-LogDBConnection

Get-LogDBConnection

Get-LogDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-LogServiceStatus command returns an object containing the status of the ConfigurationLogging Service together with extra diagnostics information.

DBUnconfigured

The ConfigurationLogging Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the ConfigurationLogging Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the ConfigurationLogging Service currently in use is incompatible with the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

DBOlderVersionThanService

The version of the ConfigurationLogging Service schema on the database is incompatible with the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The ConfigurationLogging Service is running and is connected to a database containing a valid schema.

Failed

The ConfigurationLogging Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-LogServiceStatus
```

DBUnconfigured
Get the current status of the ConfigurationLogging Service.

Get-LogSite

Apr 15, 2014

Gets global configuration logging settings.

Syntax

Get-LogSite [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet retrieves the global configuration logging settings.

Related topics

Set-LogSite

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.Site

Get-LogSite returns an object containing the following properties:

o Locale - the current language that logs should be recorded in. Can be: 'en', 'ja', 'zh-CN', 'de', 'es' or 'fr'.

o State - the current state of configuration logging. Can be: Enabled, Disabled, Mandatory or NotSupported.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-LogSite
Gets configiration logging site settings.

Get-LogSummary

Apr 15, 2014

Gets operations logged within time intervals inside a date range.

Syntax

Get-LogSummary [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-IntervalSeconds <Int64>] [-GetLowLevelOperations] [-IncludeIncomplete] [-OperationType <OperationType>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-LogSummary cmdlet retrieves summary counts of operations logged within time intervals inside a date range. The returned data indicates the rate at which configuration changes and activities were performed out within a time period.

Related topics

Get-LogHighLevelOperation

Get-LogLowLevelOperation

Parameters

-StartDateRange<DateTime>

Specifies the start of the summary period date range

Required?	false
Default Value	1900-01-01 00:00:00
Accept Pipeline Input?	false

-EndDateRange<DateTime>

Specifies the end of the summary period date range.

Required?	false
Default Value	DateTime.UtcNow
Accept Pipeline Input?	false

-IntervalSeconds<Int64>

Specifies the size, in seconds, of each time interval required within the summary date range. If this is not specified, is null, zero or exceeds the specified date range, it defaults to the total number of seconds between EndDateRange and StartDateRange.

Required?	false
Default Value	Total number of seconds in the EndDateRange and StartDateRange time span.
Accept Pipeline Input?	false

-GetLowLevelOperations<SwitchParameter>

Specifies if the cmdlet should return low level operation summary counts.

Required?	false
Default Value	$false - high level operations counts are returned.
Accept Pipeline Input?	false

-IncludeIncomplete<SwitchParameter>

Specifies if incomplete operations should be included in the returned summary counts.

Required?	false
Default Value	$false - incomplete operations are excluded.
Accept Pipeline Input?	false

-OperationType<OperationType>

Specifies the type of logged operations to include. Values can be 'AdminActivity' or 'ConfigurationChange'

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary<string, int>

The summary data is returned as a collection of dictionary items. The 'Key' value of each dictionary item specifies the start of the time interval within the overall summary date range. The 'Value' data in each dictionary item contains the count of operations which were started within that time interval.

Notes

If the specified summary date range and interval period will result in more than 50,000 intervals being returned Get-LogSummary will generate an error and abort the operation.

Examples

---------- EXAMPLE 1 ----------

C:\PS> $logSummary = Get-LogSummary
Get a summary of all completed high level operations. The returned log summary collection will contain a single item for the time period spanning the entire [1900-01-01 00:00:00]-[UtcNow] date range. e.g.

Key ==> Value

01/01/1900 00:00:00 ==> 41

---------- EXAMPLE 2 ----------

C:\PS> $daily = 60*60*24
C:\PS> [DateTime]$startRange = "2013-02-01 14:50:39"
C:\PS> [DateTime]$endRange = $startRange.AddDays(14)
C:\PS> Get-LogSummary -StartDateRange $startRange -EndDateRange $endRange -intervalSeconds $daily
Gets a summarised count of completed high level operations logged over two weeks, at daily intervals. The returned log summary collection will contain multiple items; one for each day in the summary date range. - e.g.

Key ==> Value

01/02/2013 14:50:39 ==> 0

02/02/2013 14:50:39 ==> 4

03/02/2013 14:50:39 ==> 21

04/02/2013 14:50:39 ==> 0

05/02/2013 14:50:39 ==> 0

06/02/2013 14:50:39 ==> 0

07/02/2013 14:50:39 ==> 5

08/02/2013 14:50:39 ==> 0

09/02/2013 14:50:39 ==> 0

10/02/2013 14:50:39 ==> 0

11/02/2013 14:50:39 ==> 0

12/02/2013 14:50:39 ==> 7

13/02/2013 14:50:39 ==> 0

14/02/2013 14:50:39 ==> 0

15/02/2013 14:50:39 ==> 12

---------- EXAMPLE 3 ----------

C:\PS> $hourly = 60*60
C:\PS> [DateTime]$startRange = "2013-02-03 00:00:00"
C:\PS> [DateTime]$endRange = "2013-02-03 23:59:59"
C:\PS> Get-LogSummary -StartDateRange $startRange -EndDateRange $endRange -intervalSeconds $hourly -GetLowLevelOperations
Gets a summarised count of completed low level operations logged during a day, at hourly intervals. The returned log summary collection will contain multiple items; one for each hour in the summary date range - e.g.

Key ==> Value

04/03/2013 00:00:00 ==> 12

04/03/2013 01:00:00 ==> 10

04/03/2013 02:00:00 ==> 5

.

.

.

04/03/2013 21:00:00 ==> 26

04/03/2013 22:00:00 ==> 0

04/03/2013 23:00:00 ==> 9

Remove-LogOperation

Apr 15, 2014

Deletes configuration logs

Syntax

Remove-LogOperation -DatabaseCredentials <PSCredential> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-IncludeIncomplete] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogOperation -UserName <String> -SecurePassword <SecureString> [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-IncludeIncomplete] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogOperation -UserName <String> [-Password <String>] [-StartDateRange <DateTime>] [-EndDateRange <DateTime>] [-IncludeIncomplete] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Remove-LogOperation deletes logs from the Configuration Logging database. This cmdlet targets high level operation logs for deletion. The associated low level operations logs are deleted as part of this operation via cascade deletion functionality present in the configuration logging database schema.

Related topics

Parameters

-DatabaseCredentials<PSCredential>

Specifies the credentials of a database user with permission to delete records from the Configuration Logging database.

Required?	true
Default Value	
Accept Pipeline Input?	false

-UserName<String>

Specifies the user name of a database user with permission to delete records from the Configuration Logging database.

Required?	true
Default Value	
Accept Pipeline Input?	false

-SecurePassword<SecureString>

Specifies the password a database user, in secure string form, with permission to delete records from the Configuration Logging database.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Password<String>

Specifies the password of a database user with permission to delete records from the Configuration Logging database.

Required?	false
Default Value	
Accept Pipeline Input?	false

-StartDateRange<DateTime>

Specifies the start time of the earliest high level operation to delete

Required?	false
Default Value	DateTime.Min
Accept Pipeline Input?	false

-EndDateRange<DateTime>

Specifies the end time of the latest high level operation to delete

Required?	false
Default Value	DateTime.UtcNow
Accept Pipeline Input?	false

-IncludeIncomplete<SwitchParameter>

Specifies if incomplete high level operations should be deleted.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-LogOperation -UserName "DOMAIN\User" -Password "UserPassword"
Remove all completed operation logs

---------- EXAMPLE 2 ----------

C:\PS> Remove-LogOperation -UserName "DOMAIN\User" -Password "UserPassword" -IncludeIncomplete
Remove all operations

---------- EXAMPLE 3 ----------

C:\PS> Remove-LogOperation -username "domain\userName" -password "password" -StartDateRange "2013-01-01 12:00:00" -EndDateRange "2013-01-31 12:00:00"
Delete logs started on or after "2013-01-01 12:00:00" and completed on or before "2013-01-31 12:00:00"

---------- EXAMPLE 4 ----------

```
C:\PS> $securePassword = ConvertTo-SecureString -String "UserPassword" -AsPlainText -Force
C:\PS> $credentials    = New-Object -TypeName System.Management.Automation.PSCredential -ArgumentList "DOMAIN\UserName", $securePassword
C:\PS> Remove-LogOperation -StartDateRange -DatabaseCredentials $credentials
```

Delete logs by supplying database user credentials via a credentials object.

Remove-LogServiceMetadata

Apr 15, 2014

Removes metadata from the given Service.

Syntax

Remove-LogServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-LogServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-LogService | % { Remove-LogServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Service objects.

Remove-LogSiteMetadata

Apr 15, 2014

Removes metadata from the given Site.

Syntax

```
Remove-LogSiteMetadata -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogSiteMetadata -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Provides the ability to remove metadata from the given Site.

Related topics

Set-LogSiteMetadata

Parameters

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-

LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-LogSite | % { Remove-LogSiteMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Site objects.

Reset-LogDataStore

Apr 15, 2014

Refreshes the database string currently being used by the Log service.

Syntax

Reset-LogDataStore [-DataStore] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the string for the database connection currently being used by the ConfigurationLogging Service. Can only be called for secondary data stores.

There is no requirement for a database connection to be configured in order for this command to be used.

Related topics

Get-LogDataStore

Parameters

-DataStore<String>

Specifies the database connection logical name to be used by the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store. Specifying the site data store will display an error because this operation is not supported for site data stores.

Required?	true
Default Value	Site
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.ServiceStatus

The status of the specified data store.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- **EXAMPLE 1** ----------

```
c:\PS>Reset-LogDataStore -DataStore Secondary
OK
Refresh the database connection string for the ConfigurationLogging Service.
```

Reset-LogServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the ConfigurationLogging Service.

Syntax

Reset-LogServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload ConfigurationLogging Service access permissions and configuration service locations. The Reset-LogServiceGroupMembership command must be run on at least one instance of the service type (Log) after installation and registration with the configuration service. Without this operation, the ConfigurationLogging services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-LogServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.ConfigurationLogging.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-LogServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-LogServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-LogServiceGroupmembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-LogDBConnection

Apr 15, 2014

Configures a database connection for the ConfigurationLogging Service.

Syntax

Set-LogDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [[-DataStore] <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the ConfigurationLogging Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-LogServiceStatus

Get-LogDBConnection

Test-LogDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the ConfigurationLogging Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

-DataStore<String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-LogDBConnection command returns an object containing the status of the ConfigurationLogging Service together with extra diagnostics information.

DBUnconfigured

The ConfigurationLogging Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the ConfigurationLogging Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the ConfigurationLogging Service currently in use is incompatible with the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

DBOlderVersionThanService

The version of the ConfigurationLogging Service schema on the database is incompatible with the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The ConfigurationLogging Service is running and is connected to a database containing a valid schema.

Failed

The ConfigurationLogging Service has failed.

Unknown

The status of the ConfigurationLogging Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-LogDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"
```

OK
Configures a database connection string for the ConfigurationLogging Service.

---------- EXAMPLE 2 ----------

c:\PS>Set-LogDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the ConfigurationLogging Service.

Set-LogServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given Service.

Syntax

Set-LogServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-LogServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-LogServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-LogServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-LogServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/:;#.*?=<> | []()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-LogServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Set-LogServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                         Value
    ---                         -----
    property                    value
```

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-LogSite

Apr 15, 2014

Sets global configuration logging settings.

Syntax

Set-LogSite [-State <LoggingState>] [-Locale <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet sets the global configuration logging settings.

Related topics

Get-LogSite

Parameters

-State<LoggingState>

Sets the state of configuration logging. Values can be:

o Enabled - state changes will be logged. If logging is unavailable, the state change will still be permitted. o Disabled - state changes will not be logged.

o Mandatory - state change will be logged. If logging is unavailable, the state change will not be permitted.

When the state is set to Enabled or Mandatory, XenDesktop services will attempt to log operations (which perform configuration changes) before performing them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Locale<String>

Sets the language that logs should be recorded in. Values can be: 'en', 'ja', 'zh-CN', 'de', 'es' or 'fr'.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.Site

Current logging settings

Notes

Configuration logging will automatically transition to a 'NotSupported' state if the logging feature is not licensed. Set-LogSite will reject request to set logging to 'Enabled' or 'Mandatory' while the logging feature is not licensed.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Set-LogSite -Locale "zh-CN"
Set the logging language to Chinese. The logging state will be unchanged.

---------- EXAMPLE 2 ----------

C:\PS> Set-LogSite -State "Mandatory"
Set the logging state to mandatory. The logging locale will be unaffected. In this state, no configuration change will be

allowed unless it is successfully logged.

---------- EXAMPLE 3 ----------

C:\PS> Set-LogSite -Locale "de" -State "Enabled"
Set the logging language to German and the state to Enabled.

Set-LogSiteMetadata

Apr 15, 2014

Adds or updates metadata on the given Site.

Syntax

Set-LogSiteMetadata -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-LogSiteMetadata -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-LogSiteMetadata -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Site objects.

Related topics

Remove-LogSiteMetadata

Parameters

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Site specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	

Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-LogSiteMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-LogSiteMetadata -SiteDUMMY_IdProperty 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                         Value
    ---                         -----
    property                        value
```

Add metadata with a name of 'property' and a value of 'value' to the Site with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Start-LogHighLevelOperation

Apr 15, 2014

Logs the start of a high level operation.

Syntax

Start-LogHighLevelOperation -Text <String> -Source <String> [-StartTime <DateTime>] [-OperationType <OperationType>] [-TargetTypes <String[]>] [-Parameters <Hashtable>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Start-LogHighLevelOperation creates a log entry to record the start of a high level operation.

Start-LogHighLevelOperation can be called to log high level configuration changes which originate from customized configuration scripts. Start-LogHighLevelOperation should be called before the script invokes service SDK cmdlets which execute the configuration changes.

Start-LogHighLevelOperation returns a HighLevelOperation object which contains information about the started high level operation. The "Id" property of the returned HighLevelOperation uniquely identifies the started high level operation. This can be supplied into the "-LoggingId" parameter which is implemented in all service SDK cmdlets which execute loggable configuration changes.

High level operation logs are automatically created by the XenDesktop consoles when:

o Initiating an operation which performs configuration changes.

o Initiating an operation which performs an administration activity.

Configuration Change and Administrator Activity

A configuration change is an operation which alters the configuration of the XenDesktop site. Examples of a configuration changes include:

o Creating or editing a host.

o Creating or editing a catalog.

o Adding a user to a delivery group.

o Deleting a machine.

An administrator activity operation doesn't directly alter site configuration, but it could be an operation carried out by an administrator as part of site management or helpdesk support. Examples of administrator activities include:

o Shutdown/start/restart of a user desktop.

o Studio or Director sending a message to a user.

o Rebooting a user's desktop.

Once the change being logged has completed (whether successfully or not) the Stop-LogHighLevelOperation cmdlet should be called to log the completion of a started high level operation.

Related topics

Stop-LogHighLevelOperation

Get-LogHighLevelOperation

Parameters

-Text<String>

Specifies text to describe the high level operation.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Source<String>

Specifies the source of the high level operation.

Required?	true
Default Value	
Accept Pipeline Input?	false

-StartTime<DateTime>

Specifies the start time of the high level operation.

Required?	false
Default Value	DateTime.UtcNow
Accept Pipeline Input?	false

-OperationType<OperationType>

Specifies the type of operation being logged. Values can be:

o AdminActivity - If the operation being logged performs an administration activity.

o ConfigurationChange - If the operation being logged performs a configuration change.

Required?	false
Default Value	ConfigurationChange
Accept Pipeline Input?	false

-TargetTypes<String[]>

Specifies the names of the object types that will be affected by the operation being logged.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Parameters<Hashtable>

Specifies the names and values of parameters that are supplied to the operation being logged.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.ConfigurationLogging.Sdk.HighLevelOperation

The newly logged high level operation start.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $succeeded = $false #indicates if high level operation succeeded.
C:\PS> # Log high level operation start.
C:\PS> $highLevelOp = Start-LogHighLevelOperation -Text "Create catalog" -Source "My Custom Script"
```

```
C:\PS>
C:\PS> try
C:\PS> {
C:\PS>   # Create catalog object
C:\PS>   $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -LoggingId $highLevelOp.Id
C:\PS>
C:\PS>   # Add a machine to the catalog
C:\PS>   $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "DOMAIN\Machine" -LoggingId $highLevelOp.Id
C:\PS>   $succeeded = $true
C:\PS> }
C:\PS> catch{ "Error encountered" }
C:\PS>
C:\PS> finally{
C:\PS>   # Log high level operation stop, and indicate its success
C:\PS>   Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -IsSuccessful $succeeded
C:\PS> }
```

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId" parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.

Stop-LogHighLevelOperation

Apr 15, 2014

Logs the completion of a previously started high level operation.

Syntax

Stop-LogHighLevelOperation -HighLevelOperationId <String> -IsSuccessful <Boolean> [-EndTime <DateTime>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Stop-LogHighLevelOperation logs the completion of a started high level operation.

Related topics

Start-LogHighLevelOperation

Get-LogHighLevelOperation

Parameters

-HighLevelOperationId<String>

Specifies the identifier of the high level operation being completed.

Required?	true
Default Value	
Accept Pipeline Input?	false

-IsSuccessful<Boolean>

Specifies if the started high level operation completed sucessfully.

Required?	true
Default Value	
Accept Pipeline Input?	false

-EndTime<DateTime>

Specifies the end time of the high level operation being completed.

Required?	false
Default Value	DateTime.UtcNow.
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $succeeded = $false #indicates if high level operation succeeded.
C:\PS> # Log high level operation start.
C:\PS> $highLevelOp = Start-LogHighLevelOperation -Text "Create unmanaged catalog" -Source "My Custom Script"
C:\PS>
C:\PS> try
C:\PS> {
C:\PS>   # Create catalog object
```

```
C:\PS>   $catalog = New-BrokerCatalog -Name "MyCatalog" -ProvisioningType Manual -AllocationType Permanent -MinimumFunctionalLevel 'LMAX' -LoggingId $highLevelOp.Id
C:\PS>
C:\PS>   # Add a machine to the catalog
C:\PS>   $machine = New-BrokerMachine -CatalogUid $catalog.Uid -MachineName "DOMAIN\Machine" -LoggingId $highLevelOp.Id
C:\PS>   $succeeded = $true
C:\PS> }
C:\PS> catch{ "Error encountered" }
C:\PS>
C:\PS> finally{
C:\PS>   # Log high level operation stop, and indicate its success
C:\PS>   Stop-LogHighLevelOperation -HighLevelOperationId $highLevelOp.Id -IsSuccessful $succeeded
C:\PS> }
```

Creates an unmanaged catalog and assigns a machine to it, within the scope of a high level operation start and stop. The identifier of the high level operation is passed into the "-LoggingId" parameter of the service SDK cmdlets. The execution of the cmdlets in the services will create the low level operation logs for the supplied high level operation.

Test-LogDBConnection

Apr 15, 2014

Tests a database connection for the ConfigurationLogging Service.

Syntax

Test-LogDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [[-DataStore] <String>] [<CommonParameters>]

Detailed Description

Tests a connection to the database in which the ConfigurationLogging Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-LogServiceStatus

Get-LogDBConnection

Set-LogDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the ConfigurationLogging Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

-DataStore<String>

Specifies the logical name of the data store for the ConfigurationLogging Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-LogDBConnection command returns an object containing the status of the ConfigurationLogging Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the ConfigurationLogging Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the ConfigurationLogging Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the ConfigurationLogging Service currently in use is incompatible with the version of the ConfigurationLogging Service schema on the database. Upgrade the ConfigurationLogging Service to a more recent version.

DBOlderVersionThanService

The version of the ConfigurationLogging Service schema on the database is incompatible with the version of the ConfigurationLogging Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-LogDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The ConfigurationLogging Service has failed.

Unknown

The status of the ConfigurationLogging Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Test-LogDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Tests a database connection string for the ConfigurationLogging Service.

-------------------------- EXAMPLE 2 --------------------------

```
c:\PS>Test-LogDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Tests an invalid database connection string for the ConfigurationLogging Service.

Citrix.DelegatedAdmin.Admin.V1

Apr 15, 2014

Overview

Name	Description
AdminDelegatedAdminSnapin	The Delegated Administration Service PowerShell snap-in provides
Admin Filtering	Describes the common filtering options for XenDesktop cmdlets.

Cmdlets

Name	Description
Add-AdminPermission	Add permissions to the set of permissions of a role.
Add-AdminRight	Grants a given right to the specified administrator.
Get-AdminAdministrator	Gets administrators configured for this site.
Get-AdminDBConnection	Gets the database string for the specified data store used by the DelegatedAdmin Service.
Get-AdminDBSchema	Gets a script that creates the DelegatedAdmin Service database schema for the specified data store.
Get-AdminDBVersionChangeScript	Gets a script that updates the DelegatedAdmin Service database schema.
Get-AdminEffectiveAdministrator	Retrieve the effective administrator objects for a user.
Get-AdminEffectiveRight	Gets the set of Right objects associated with the current user.
Get-AdminInstalledDBVersion	Gets a list of all available database schema versions for the DelegatedAdmin Service.
Get-AdminPermission	Gets permissions configured for the site.
Get-AdminPermissionGroup	Gets permission groups configured for the site.
Get-AdminRevision	Gets the current revision of the delegated administration configuration data.
Get-AdminRole	Gets roles configured for this site.
Get-AdminRoleConfiguration	Gets role configurations for this site.
Get-AdminScope	Gets scopes configured for this site.
Get-AdminService	Gets the service record entries for the DelegatedAdmin Service.

Name	Description
Get-AdminServiceAddedCapability	Gets any added capabilities for the DelegatedAdmin Service on the controller.
Get-AdminServiceInstance	Gets the service instance entries for the DelegatedAdmin Service.
Get-AdminServiceStatus	Gets the current status of the DelegatedAdmin Service on the controller.
Import-AdminRoleConfiguration	Imports role configuration data into the Delegated Administration Service.
New-AdminAdministrator	Adds a new administrator to the site.
New-AdminRole	Adds a new custom role to the site.
New-AdminScope	Adds a new scope to the site.
Remove-AdminAdministrator	Removes administrators from the site.
Remove-AdminAdministratorMetadata	Removes metadata from the given Administrator.
Remove-AdminPermission	Remove permissions from the set of permissions of a role.
Remove-AdminRight	Removes rights from an administrator.
Remove-AdminRole	Removes a role from the site.
Remove-AdminRoleMetadata	Removes metadata from the given Role.
Remove-AdminScope	Removes a scope from the site.
Remove-AdminScopeMetadata	Removes metadata from the given Scope.
Remove-AdminServiceMetadata	Removes metadata from the given Service.
Rename-AdminRole	Rename a role
Rename-AdminScope	Rename a scope
Reset-AdminServiceGroupMembership	Reloads the access permissions and configuration service locations for the DelegatedAdmin Service.
Set-AdminAdministrator	Sets the properties of an administrator.
Set-AdminAdministratorMetadata	Adds or updates metadata on the given Administrator.
Set-AdminDBConnection	Configures a database connection for the DelegatedAdmin Service.
Set-AdminRole	Set the properties of a role.

Name	Description
Set-AdminRoleMetadata	Adds or updates metadata on the given Role.
Set-AdminScope	Set the properties of a scope.
Set-AdminScopeMetadata	Adds or updates metadata on the given Scope.
Set-AdminServiceMetadata	Adds or updates metadata on the given Service.
Test-AdminAccess	Retrieves the scopes where the specified operation is permitted.
Test-AdminDBConnection	Tests a database connection for the DelegatedAdmin Service.

about_AdminDelegatedAdminSnapin

Apr 15, 2014

TOPIC

about_AdminDelegatedAdminSnapin

SHORT DESCRIPTION

The Delegated Administration Service PowerShell snap-in provides administrative functions for the Delegated Administration Service.

COMMAND PREFIX

All commands in this snap-in are prefixed with 'Admin'.

LONG DESCRIPTION

The Delegated Administration Service PowerShell snap-in enables both local and remote administration of the Delegated Administration Service.

The Delegated Administration Service (or DAS for short) stores information about Citrix administrators and the rights they have. Services in the XenDesktop deployment use the DAS to determine whether a particular user has the privilege to perform an operation or not.

The snap-in provides storage and configuration of these entities:

Administrators

> Each administrator object represents an individual person or a group of people identified by their Active Directory account. Administrators can be enabled and disabled.
>
> The effective rights that a user has is the superset of any rights that they have by looking at their Active Directory group membership. Disabled administrator entries are ignored for this calculation.
>
> Once a site is setup, there must always be a full administrator and the Delegated Administration snap-in rejects requests to remove or disable the last full administrator.

Roles

> A role represents a job function. That is, anyone with a given role is expected to be able to use or perform the tasks, wizards, and actions associated with that role. Administrators may have multiple roles for a particular site.

Some roles are built-in, and some editions of the product allow custom roles to be created with different combinations of permissions.

Scopes

Scopes represent a collection of objects, and are used to group objects for administrative purposes in a way that is relevant to the organisation. They can be used to represent both hierarchical and non-hierarchical relationships.

Objects can exist in multiple scopes at once. You may find it easier to think of scopes as labels, or a non-exclusive grouping such as a play-list.

All objects are implicitly in the built-in 'All' scope.

Some objects are not scoped, and access to them is through either the 'All' scope or indirectly through a scoped object. For example sessions are not directly scoped but can be accessed using the scope of the desktop group.

The DAS stores information about scopes, but the mapping between scopes and objects is stored and updated using the PowerShell snap-ins of each corresponding service. For example, Delivery Group scopes are managed using the Broker PowerShell snap-in.

Rights

Rights determine what an administrator can do and where they can do it. They are expressed as a number of <role, scope> pairs associated with each administrator.

To gain access to any particular object, a person must match an administrator object that has an appropriate right that allows the required operation in a scope that the object is a member of.

Permissions

Each task, wizard or action in the Citrix Studio or Director consoles represents a unit of functionality that an administrator can perform. Permissions are expressed at a high level and generally correspond directly to the labels in the consoles. For example: "Edit catalog", or "Create delivery group".

Permission groups:

Permissions are grouped into related functionality when displayed by the console.

Operations

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets. Internally, each permission requires a number of operations to be performed, possibly by different services.

about_Admin_Filtering

Apr 15, 2014

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

Add-AdminPermission

Apr 15, 2014

Add permissions to the set of permissions of a role.

Syntax

Add-AdminPermission [-InputObject] <Permission[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-AdminPermission [-Permission] <String[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Add extra permissions to the set of permissions that a role maps to.

Any administrator with a right including that role immediately gains the ability to use the operations of the new permissions.

Duplicate permissions do not produce an error, and permissions are skipped if the role already contains the permission (without error).

You cannot modify the permissions of built-in roles.

Related topics

Remove-AdminPermission

Get-AdminPermission

Get-AdminRole

Get-AdminPermissionGroup

Test-AdminAccess

Parameters

-InputObject<Permission[]>

Specifies the permissions to add.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Permission<String[]>

Specifies the list of permissions to add (by identifier).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Role<String>

Role name or identifier of the role to update.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Permission You can pipe a list of permissions to be added into this command.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Add-AdminPermission -Role MyRole -Permission Global_Read,Logging_Read
```
Add a couple of specific permissions to the 'MyRole' role.

---------- EXAMPLE 2 ----------

```
C:\PS> $list = Get-AdminRole "Delivery Administrator" | Select -Expand Permissions
C:\PS> Add-AdminPermission -Role MyRole -Permission $list
```
Add all of the permissions of the Delivery Administrator role to MyRole.

Add-AdminRight

Apr 15, 2014

Grants a given right to the specified administrator.

Syntax

Add-AdminRight -Scope <String> -Role <String> -Administrator <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-AdminRight -Role <String> -Administrator <String> [-All] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-AdminRight [-InputObject] <Right[]> -Administrator <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use the Add-AdminRight cmdlet to add rights (role and scope pairs) to an administrator.

For convenience, you can use the -All parameter to specify the 'All' scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

Related topics

Get-AdminAdministrator

Get-AdminEffectiveRight

Remove-AdminRight

Parameters

-InputObject<Right[]>

Specifies the rights to add from Right objects.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Scope<String>

Specifies the scope name or scope identifier.

Required?	true
Default Value	

Accept Pipeline Input?	false

-Role<String>

Specifies the role name or role identifier.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Administrator<String>

Specifies the name or SID of the administrator.

Required?	true
Default Value	
Accept Pipeline Input?	false

-All<SwitchParameter>

Specifies the 'All' scope. This parameter avoids localization issues or having to type the identifier of the 'All' scope.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Right You can pipe the rights to be added into this command.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Add-AdminRight -Role 'Help Desk Administrator' -Scope London -Administrator DOMAIN\Admin1
Assigns the 'Help Desk Administrator' role and 'London' scope to the 'Admin1' administrator.

---------- EXAMPLE 2 ----------

C:\PS> Add-AdminRight -Role 'Full Administrator' -All -Administrator DOMAIN\Admin1
Assigns the 'Full Administrator' role and 'All' scope to the 'Admin1' administrator.

---------- EXAMPLE 3 ----------

C:\PS> $admin = Get-AdminAdministrator -Name DOMAIN\ExistingAdmin
C:\PS> Add-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\NewAdmin
Copies the administrator rights from 'ExistingAdmin' to 'NewAdmin'.

Get-AdminAdministrator

Apr 15, 2014

Gets administrators configured for this site.

Syntax

Get-AdminAdministrator [[-Name] <String>] [-Sid <String>] [-Enabled <Boolean>] [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves administrators matching the specified criteria. If no parameters are specified this cmdlet enumerates all administrators.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

New-AdminAdministrator

Set-AdminAdministrator

Remove-AdminAdministrator

Set-AdminAdministratorMetadata

Remove-AdminAdministratorMetadata

Parameters

-Name<String>

Gets administrators with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Sid<String>

Gets administrators with the specified SID (security identifier).

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Gets administrators with the specified value of Enabled.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Administrator

Get-AdminAdministrator returns an object for each matching administrator.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-AdminAdministrator -Name DOMAIN\TestUser
Finds the administrator object (if one exists) for user "DOMAIN\TestUser".

---------- EXAMPLE 2 ----------

C:\PS> Get-AdminAdministrator -Enabled $false
Finds all disabled administrator objects.

Get-AdminDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the DelegatedAdmin Service.

Syntax

Get-AdminDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-AdminServiceStatus

Set-AdminDBConnection

Test-AdminDBConnection

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the DelegatedAdmin Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the DelegatedAdmin Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True
```

Get the database connection string for the DelegatedAdmin Service.

Get-AdminDBSchema

Apr 15, 2014

Gets a script that creates the DelegatedAdmin Service database schema for the specified data store.

Syntax

Get-AdminDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new DelegatedAdmin Service database schema, add a new DelegatedAdmin Service to an existing site, remove a DelegatedAdmin Service from a site, or create a database server logon for a DelegatedAdmin Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected DelegatedAdmin Service instance, otherwise the scripts relate to DelegatedAdmin Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a DelegatedAdmin SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to DelegatedAdmin Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to DelegatedAdmin Service roles

If ScriptType is Evict, the returned script contains:

o Removal of DelegatedAdmin Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before

using this command.

Related topics

Set-AdminDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the DelegatedAdmin services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the DelegatedAdmin Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further DelegatedAdmin services to an existing database instance that already contains the full DelegatedAdmin service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the DelegatedAdmin Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified DelegatedAdmin Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for DelegatedAdmin services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the DelegatedAdmin Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminDBSchema -DatabaseName MyDB -ServiceGroupName  MyServiceGroup > c:\AdminSchema.sql
```

Get the full database schema for site data store of the DelegatedAdmin Service and copy it to a file called 'c:\AdminSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a DelegatedAdmin Service site schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-AdminDBSchema -DatabaseName MyDB -scriptType Login > c:\DelegatedAdminLogins.sql
```

Get the logon scripts for the DelegatedAdmin Service.

Get-AdminDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the DelegatedAdmin Service database schema.

Syntax

Get-AdminDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the DelegatedAdmin Service from the current schema version to a different version.

Related topics

Get-AdminInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any DelegatedAdmin services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-AdminServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the DelegatedAdmin Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-AdminDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-AdminEffectiveAdministrator

Apr 15, 2014

Retrieve the effective administrator objects for a user.

Syntax

Get-AdminEffectiveAdministrator [-Name] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command determines what groups the specified user belongs to and retrieves the matching administrator records. It includes the set of rights that would be granted to the user if he or she used the system.

As this command uses Active Directory to determine what groups the user has, the caller must have the ability to read this information from Active Directory.

Only enabled administrator records are returned.

Related topics

Get-AdminAdministrator

Parameters

-Name<String>

User name or SID of user to query

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

string User name or SID of user to query

Return Values

Citrix.DelegatedAdmin.Sdk.Administrator

Administrator records matching the specified user

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-AdminEffectiveAdministrator MYDOMAIN\testuser
Retrieve the administrator records matching user 'testuser'.

Get-AdminEffectiveRight

Apr 15, 2014

Gets the set of Right objects associated with the current user.

Syntax

Get-AdminEffectiveRight [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Get-AdminEffectiveRight cmdlet returns the effective rights of the current user. This is the superset of all rights of the enabled administrators that the current user matches, taking into account Active Directory group membership.

Related topics

Get-AdminAdministrator

Add-AdminRight

Remove-AdminRight

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Right

The Rights associated with the current user

Examples

---------- **EXAMPLE 1** ----------

C:\PS> Get-AdminEffectiveRight
Return the effective rights for the current user.

Get-AdminInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the DelegatedAdmin Service.

Syntax

Get-AdminInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the DelegatedAdmin Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-AdminInstalledDbVersion command returns objects containing the new definition of the DelegatedAdmin Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the DelegatedAdmin Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the DelegatedAdmin Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-AdminInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the DelegatedAdmin Service database schema for which upgrade scripts are supplied.

Get-AdminPermission

Apr 15, 2014

Gets permissions configured for the site.

Syntax

Get-AdminPermission [[-Name] <String>] [-Id <String>] [-Description <String>] [-GroupId <String>] [-GroupName <String>] [-Metadata <String>] [-Operation <String>] [-ReadOnly <Boolean>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves permission matching the specified criteria. If no parameters are specified this cmdlet enumerates all permissions.

Permissions are configured using the Import-AdminRoleConfiguration command, and are used to represent collections of operations that are needed to perform a particular task. These permissions are presented in Citrix Studio when configuring roles.

Permissions can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

Add-AdminPermission

Remove-AdminPermission

Get-AdminRole

Get-AdminPermissionGroup

Test-AdminAccess

Parameters

-Name<String>

Gets permissions with the specified name (localized)

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Id<String>

Gets permissions with the specified identifier.

Required?	false

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Gets permissions with the specified description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-GroupId<String>

Gets permissions that are a member of the specified permission group (by group id).

Required?	false
Default Value	
Accept Pipeline Input?	false

-GroupName<String>

Gets permissions that are a member of the specified permission group (by group name).

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Operation<String>

Gets permissions that contain a specific operation.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReadOnly<Boolean>

Gets permissions with the specified value for the ReadOnly flag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Permission

Get-AdminPermission returns an object for each matching permission.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-AdminPermission -Name *Edit*
```
Finds all permissions with 'Edit' in their names.

---------- EXAMPLE 2 ----------

```
C:\PS> Get-AdminPermission -Operation "Broker:SetCatalog"
C:\PS> Get-AdminPermission -Filter { Operations -contains "Broker:SetCatalog" -or Operations -contains "Broker:NewCatalog" }
```
Finds permissions that contain specific operations, with the -Filter form needed to match multiple values.

Get-AdminPermissionGroup

Apr 15, 2014

Gets permission groups configured for the site.

Syntax

Get-AdminPermissionGroup [[-Name] <String>] [-Id <String>] [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves permission groups matching the specified criteria. If no parameters are specified this cmdlet enumerates all permission groups.

Permission groups are configured using the Import-AdminRoleConfiguration command, and are primarily used to store the localized name for a group of permissions. Permission groups can also have metadata associated with them.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

Import-AdminRoleConfiguration

Get-AdminPermission

Parameters

-Name<String>

Gets permission groups matching the given name. This is the localized name of the group.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Id<String>

Gets permission groups with the given identifier. This is the non-localized identifier used to associate permissions with permission groups.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.PermissionGroup

Get-AdminPermissionGroup returns an object for each matching permission group.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-AdminPermissionGroup -Name *s
Finds all permission groups that end with the letter 's'.

---------- EXAMPLE 2 ----------

C:\PS> $list = @("Hosts","Other")
C:\PS> Get-AdminPermissionGroup -Filter { Id -in $list } -SortBy Name
Retrieve two specific permission group objects with the matching identifiers.

Get-AdminRevision

Apr 15, 2014

Gets the current revision of the delegated administration configuration data.

Syntax

Get-AdminRevision [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Delegated Administration Service maintains a revision number that is incremented whenever its configuration is changed. This command retrieves the current revision number.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

System.Int32

The configuration revision number

Notes

If Int32.MaxValue is reached the value of the revision number will wrap around to Int32.MinValue.

In some cases the value may be incremented by more than one.

Examples

---------- **EXAMPLE 1** ----------

C:\PS> Get-AdminRevision
Retrieve the current revision number.

Get-AdminRole

Apr 15, 2014

Gets roles configured for this site.

Syntax

Get-AdminRole [[-Name] <String>] [-Id <Guid>] [-BuiltIn <Boolean>] [-Description <String>] [-Metadata <String>] [-Permission <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves roles matching the specified criteria. If no parameters are specified, this cmdlet enumerates all roles.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

New-AdminRole

Set-AdminRole

Rename-AdminRole

Remove-AdminRole

Set-AdminRoleMetadata

Remove-AdminRoleMetadata

Parameters

-Name<String>

Gets roles with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Id<Guid>

Gets the role with the specified identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-BuiltIn<Boolean>

Gets roles with the specified value of the BuiltIn flag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Gets roles with the specified description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Permission<String>

Gets roles that contain a specific permission.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false

Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Role

Get-AdminRole returns an object for each matching role.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-AdminRole -Id 20852cdf-f527-4953-ba6e-e7545217122d
Gets the details of the role with the specific id.

---------- EXAMPLE 2 ----------

C:\PS> Get-AdminRole -BuiltIn $false
List all custom roles.

Get-AdminRoleConfiguration

Apr 15, 2014

Gets role configurations for this site.

Syntax

Get-AdminRoleConfiguration [[-Name] <String>] [-Id <Guid>] [-Locale <String>] [-Priority <Int32>] [-Version <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves role configurations matching the specified criteria. If no parameters are specified, this cmdlet enumerates and returns all role configurations.

Role configurations are part of the product configuration and define what permissions, permission groups, and built-in roles the product has. This cmdlet also provides the mapping of permissions to operations.

Related topics

Import-AdminRoleConfiguration

Parameters

-Name<String>

Gets role configurations matching the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Id<Guid>

Gets role configurations with the specified id.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Locale<String>

Gets role configurations with the specified locale. Role configurations usually have a consistent locale.

Required?	false

Default Value	
Accept Pipeline Input?	false

-Priority<Int32>

Gets role configurations with the specified priority.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Version<String>

Gets role configurations with the matching version number.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.RoleConfiguration

Get-AdminRoleConfiguration returns an object for each matching role configuration.

Notes

This command is supplied for infrastructure purposes only and is not intended for public use.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-AdminRoleConfiguration -Name Director
Retrieve the role configuration for the Citrix Director component.

Get-AdminScope

Apr 15, 2014

Gets scopes configured for this site.

Syntax

Get-AdminScope [[-Name] <String>] [-Id <Guid>] [-BuiltIn <Boolean>] [-Description <String>] [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieves scopes matching the specified criteria. If no parameters are specified this cmdlet enumerates all scopes.

There is one special built-in scope, the 'All' scope.

To determine what objects are currently in a scope, use the Get-<Prefix>ScopedObject from each of the relevant PowerShell snap-ins.

See about_Admin_Filtering for information about advanced filtering options.

Related topics

New-AdminScope

Set-AdminScope

Rename-AdminScope

Remove-AdminScope

Set-AdminScopeMetadata

Remove-AdminScopeMetadata

Parameters

-Name<String>

Gets scopes with the specified name.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-Id<Guid>

Gets the scope with the specified identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-BuiltIn<Boolean>

Gets scopes with the specified value of the BuiltIn flag.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Description<String>

Gets scopes with the specified description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Scope

Get-AdminScope returns an object for each matching scope.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Get-AdminScope -Name *Sales*
```
List all scopes that contain the word 'Sales'.

---------- EXAMPLE 2 ----------

```
C:\PS> Get-AdminScope -Id 21862daf-e529-4553-ba6e-f7543217111e
```
Gets the details of the scope with the specific id.

Get-AdminService

Apr 15, 2014

Gets the service record entries for the DelegatedAdmin Service.

Syntax

Get-AdminService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the DelegatedAdmin Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Admin_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Admin_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.DelegatedAdmin.Sdk.Service

The Get-AdminServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the DelegatedAdmin Service running in the current service group.

Get-AdminServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the DelegatedAdmin Service on the controller.

Syntax

```
Get-AdminServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the DelegatedAdmin Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminServiceAddedCapability
```

Get the added capabilities of the DelegatedAdmin Service.

Get-AdminServiceInstance

Apr 15, 2014

Gets the service instance entries for the DelegatedAdmin Service.

Syntax

Get-AdminServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the DelegatedAdmin Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.DelegatedAdmin.Sdk.ServiceInstance

The Get-AdminServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Admin.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.DelegatedAdmin.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminServiceInstance

Address           : http://MyServer.com:80/Citrix/DelegatedAdminContract
Binding           : wcf_HTTP_kerb

MetadataMap       :
ServiceAccount    : ENG\MyAccount
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
```

ServiceGroupName : MyServiceGroup
ServiceGroupUid : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType : Admin
Version : 1

Get all instances of the DelegatedAdmin Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-AdminServiceStatus

Apr 15, 2014

Gets the current status of the DelegatedAdmin Service on the controller.

Syntax

Get-AdminServiceStatus [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables the status of the DelegatedAdmin Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-AdminDBConnection

Test-AdminDBConnection

Get-AdminDBConnection

Get-AdminDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-AdminServiceStatus command returns an object containing the status of the DelegatedAdmin Service together with extra diagnostics information.

DBUnconfigured

The DelegatedAdmin Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted

to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

DBOlderVersionThanService

The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The DelegatedAdmin Service is running and is connected to a database containing a valid schema.

Failed

The DelegatedAdmin Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminServiceStatus

DBUnconfigured
```

Get the current status of the DelegatedAdmin Service.

Import-AdminRoleConfiguration

Apr 15, 2014

Imports role configuration data into the Delegated Administration Service.

Syntax

Import-AdminRoleConfiguration [-Path] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Import-AdminRoleConfiguration -Content <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command is intended for use by Citrix Studio to import definitions, roles, permissions, and their mappings to operations.

The supplied configuration requires a digital signature; this is used to validate the integrity of the configuration.

Related topics

Get-AdminRoleConfiguration

Parameters

-Path<String>

The path to the file containing the role configuration data.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Content<String>

The content of the role configuration data.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Force<SwitchParameter>

Allows older versions of role configuration to replace newer versions.

Required?	false

Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

None

Notes

This command is supplied for infrastructure purposes only and is not intended for public use.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Import-AdminRoleConfiguration -Path 'C:\MyAdminConfig.xml'
Imports the contents of 'C:\MyAdminConfig.xml' to the Delegated Administration Service.

New-AdminAdministrator

Apr 15, 2014

Adds a new administrator to the site.

Syntax

New-AdminAdministrator [-Name] <String> [-Enabled <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-AdminAdministrator -Sid <String> [-Enabled <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

New-AdminAdministrator creates a new administrator object in the site. Once a new administrator has been created you can assign rights (role and scope pairs) to the administrator.

Administrator objects are used to determine what rights, and therefore what permissions a particular Active Directory user has through the various SDKs and consoles of the site.

When the Enabled flag of an administrator is set to false, any rights of the administrator are ignored by the system when performing permission checks.

Related topics

Get-AdminAdministrator

Set-AdminAdministrator

Remove-AdminAdministrator

Set-AdminAdministratorMetadata

Remove-AdminAdministratorMetadata

Parameters

-Name<String>

Specifies the user or group name in Active Directory that this administrator corresponds to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Sid<String>

Specifies the SID (security identifier) of the user in Active Directory that this administrator corresponds to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies whether the new administrator starts off enabled or not.

Required?	false
Default Value	True
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Administrator

The newly created administrator.

Examples

---------- EXAMPLE 1 ----------

C:\PS> New-AdminAdministrator -Name DOMAIN\TestUser
Creates a new administrator object for user "DOMAIN\TestUser". It defaults to enabled.

---------- EXAMPLE 2 ----------

C:\PS> New-AdminAdministrator -Sid S-1-2-34-1234567890-1234567890-1234567890-123
Creates a new administrator object for user with SID "S-1-2-34-1234567890-1234567890-1234567890-123". It defaults to enabled.

New-AdminRole

Apr 15, 2014

Adds a new custom role to the site.

Syntax

New-AdminRole [-Name] <String> [-Description <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

New-AdminRole adds a new custom role object to the site. Once a new role has been created, you can add permissions to the role which define what operations the role conveys.

Roles represent a job function, such as 'help desk administrator', and contain a list of permissions that are required to perform that job function.

To assign a role to an administrator, you combine it with a scope which indicates what objects the role can operate on. This pair (also known as a 'right') can then be assigned to an administrator. See Add-AdminRight for further details.

The identifier of the new role is chosen automatically, and custom roles created with this cmdlet always have their BuiltIn flag set to false.

You cannot modify built-in roles, and only some license editions support custom roles.

Related topics

Get-AdminRole

Set-AdminRole

Rename-AdminRole

Remove-AdminRole

Set-AdminRoleMetadata

Remove-AdminRoleMetadata

Add-AdminPermission

Add-AdminRight

Parameters

-Name<String>

Specifies the name of the role. Each role in a site must have a unique name.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies the description of the role.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Role

The newly created role.

Notes

Roles are created without any permissions. Use the Add-AdminPermission to add permissions.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> New-AdminRole -Name Supervisor -Description "My custom supervisor role"
C:\PS> $list = Get-AdminRole 'Help Desk Administrator' | Select -Expand Permissions
C:\PS> Add-AdminPermission -Role Supervisor -Permission $list
C:\PS> Add-AdminPermission -Role Supervisor -Permission $extras
C:\PS> Add-AdminRight -Administrator DOMAIN\TestUser -Role Supervisor -All
```

Creates a new role called 'Supervisor', and then copies the permissions from the help desk role and adds some extras. Then gives this role (with the all scope) to user 'TestUser'.

New-AdminScope

Apr 15, 2014

Adds a new scope to the site.

Syntax

New-AdminScope [-Name] <String> [-Description <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

New-AdminScope adds a new scope object to the site.

A scope represents a collection of objects. Scopes are used to group objects in a way that is relevant to the organization; for example, the set of delivery groups used by the Sales team.

You can create objects in particular scopes by specifying the -Scope parameter of a New- cmdlet for an object that can be scoped. You can then modify the contents of a scope with Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the correpsonding PowerShell snap-ins.

To assign a scope to an administrator, combine it with a role and then assign this pair (also known as a 'right') to an administrator. See Add-AdminRight for further details.

The identifier of the new scope is chosen automatically.

Related topics

Get-AdminScope

Set-AdminScope

Rename-AdminScope

Remove-AdminScope

Set-AdminScopeMetadata

Remove-AdminScopeMetadata

Add-AdminRight

Parameters

-Name<String>

Specifies the name of the scope. Each scope in a site must have a unique name.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Specifies the description of the scope.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

None You cannot pipe input into this cmdlet.

Return Values

Citrix.DelegatedAdmin.Sdk.Scope

The newly created scope.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> New-AdminScope -Name Sales -Description "Sales department scope"
C:\PS> Add-HypHypervisorConnectionScope -HypervisorConnectionName XenServer2 -Scope Sales
C:\PS> Add-AdminRight -Administrator DOMAIN\TestUser -Role Hosting -Scope Sales
```

Creates a new scope called 'Sales', adds a hypervisor connection object to the scope, and then assigns the right to use the hosting role on the Sales scope to the 'TestUser' administrator.

Remove-AdminAdministrator

Apr 15, 2014

Removes administrators from the site.

Syntax

Remove-AdminAdministrator [-InputObject] <Administrator[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministrator -Sid <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministrator [-Name] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-AdminAdministrator cmdlet deletes administrators from the site.

Related topics

New-AdminAdministrator

Get-AdminAdministrator

Set-AdminAdministrator

Set-AdminAdministratorMetadata

Remove-AdminAdministratorMetadata

Parameters

-InputObject<Administrator[]>

Specifies the administrators to delete.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String[]>

Specifies the name of the administrator to delete.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Sid<String[]>

Specifies the SID of the administrator to delete.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Administrator You can pipe the adminstrators to be deleted into this command.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Remove-AdminAdministrator DOMAIN\TestUser
```

Remove the administrator called "DOMAIN\TestUser".

---------- EXAMPLE 2 ----------

```
C:\PS> Get-AdminAdministrator -Enabled $false | Remove-AdminAdministrator
```

Remove all disabled administrators.

Remove-AdminAdministratorMetadata

Apr 15, 2014

Removes metadata from the given Administrator.

Syntax

Remove-AdminAdministratorMetadata -AdministratorSid <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata -AdministratorSid <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-AdministratorName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-AdministratorName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Administrator.

Related topics

Set-AdminAdministratorMetadata

Parameters

-AdministratorName<String>

Name of the Administrator

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Administrator[]>

Objects to which the metadata is to be added.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-AdministratorSid<String>

Sid of the Administrator

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-AdminAdministrator | % { Remove-AdminAdministratorMetadata -Map $_.MetadataMap }
Remove all metadata from all Administrator objects.

Remove-AdminPermission

Apr 15, 2014

Remove permissions from the set of permissions of a role.

Syntax

Remove-AdminPermission [-InputObject] <Permission[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminPermission [-Permission] <String[]> -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminPermission -All -Role <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Remove permissions from the set of permissions that a role maps to.

Any administrator with a right including that role immediately loses the ability to use the operations of the removed permissions.

Duplicate permissions do not produce an error, and permissions that the roles does not already have are skipped (without error).

You cannot modify the permissions of built-in roles.

Related topics

Add-AdminPermission

Get-AdminRole

Get-AdminPermissionGroup

Test-AdminAccess

Parameters

-InputObject<Permission[]>

Specifies the permissions to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Permission<String[]>

Specifies the list of permissions to remove (by identifier).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Role<String>

Role name or identifier of the role to update.

Required?	true
Default Value	
Accept Pipeline Input?	false

-All<SwitchParameter>

Remove all permissions.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Permission You can pipe a list of permissions to be removed into this command.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> Remove-AdminPermission -Role MyRole -Permission Global_Read,Logging_Read
Remove a couple of specific permissions from the 'MyRole' role.

---------- EXAMPLE 2 ----------

C:\PS> Remove-AdminPermission -Role MyRole -All
Remove all permissions from the 'MyRole' role.

Remove-AdminRight

Apr 15, 2014

Removes rights from an administrator.

Syntax

Remove-AdminRight -Scope <String> -Role <String> -Administrator <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRight -Role <String> -Administrator <String> [-All] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRight [-InputObject] <Right[]> -Administrator <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command removes rights from the specified administrator.

For convenience, you can use the -All parameter to specify the 'All' scope.

Use the Get-AdminAdministrator cmdlet to determine what rights an administrator has.

Related topics

Get-AdminAdministrator

Get-AdminEffectiveRight

Add-AdminRight

Parameters

-InputObject<Right[]>

Specifies the rights to remove.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Scope<String>

Specifies the scope name or scope identifier.

Required?	true
Default Value	

Accept Pipeline Input?	false

-Role<String>

Specifies the role name or role identifier.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Administrator<String>

Specifies the name or SID of the administrator.

Required?	true
Default Value	
Accept Pipeline Input?	false

-All<SwitchParameter>

Specifies the 'All' scope. This parameter avoids localization issues or having to type the identifier of the 'All' scope.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Right You can pipe the rights to be removed into this command.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

C:\PS> RemoveAdminRight -Role 'Help Desk Administrator' -Scope London -Administrator DOMAIN\Admin1
Removes the 'Help Desk Administrator' role and 'London' scope from user 'Admin1'

---------- EXAMPLE 2 ----------

C:\PS> $admin = Get-AdminAdministrator -Name DOMAIN\Admin
C:\PS> Remove-AdminRight -InputObject $admin.Rights -Administrator DOMAIN\Admin
Removes all rights from administrator 'Admin'.

Remove-AdminRole

Apr 15, 2014

Removes a role from the site.

Syntax

Remove-AdminRole [-InputObject] <Role[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRole [-Id] <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRole [-Name] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Remove-AdminRole cmdlet deletes roles from the site.

You cannot remove built-in roles or roles that are currently assigned to an administrator.

Set-AdminRoleMetadata

Remove-AdminRoleMetadata

Parameters

-InputObject<Role[]>

Specifies the roles to remove (by role object).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Id<Guid[]>

Specifies the roles to remove (by role id).

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-Name<String[]>

Specifies the roles to remove (by role name).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Role You can pipe the roles to be deleted into this command.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Remove-AdminRole -Name Supervisor
```

Remove the Supervisor role.

---------- EXAMPLE 2 ----------

```
C:\PS> Get-AdminRole -BuiltIn $false | Remove-AdminRole
```

Attempt to remove all custom roles. This fails if one of the roles is assigned to an administrator.

Remove-AdminRoleMetadata

Apr 15, 2014

Removes metadata from the given Role.

Syntax

Remove-AdminRoleMetadata [-RoleId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-RoleId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-RoleName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-RoleName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-InputObject] <Role[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminRoleMetadata [-InputObject] <Role[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Role.

Related topics

Set-AdminRoleMetadata

Parameters

-RoleId<Guid>

Id of the Role

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-RoleName<String>

Name of the Role

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Role[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminRole | % { Remove-AdminRoleMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Role objects.

Remove-AdminScope

Apr 15, 2014

Removes a scope from the site.

Syntax

```
Remove-AdminScope [-InputObject] <Scope[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminScope [-Id] <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminScope [-Name] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

The Remove-AdminScope cmdlet deletes scopes from the site.

You cannot remove the built-in 'All' scope or scopes that are currently assigned to an administrator.

Related topics

Set-AdminScopeMetadata

Remove-AdminScopeMetadata

Parameters

-InputObject<Scope[]>

Specifies the scopes to remove (by scope object).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Id<Guid[]>

Specifies the scopes to remove (by scope id).

Required?	true
Default Value	

Accept Pipeline Input?	true (ByPropertyName)

-Name<String[]>

Specifies the scopes to remove (by scope name).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Scope You can pipe the scopes to be deleted into this command.

Return Values

None

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Remove-AdminScope -Name Sales
```

Remove the Sales scope.

---------- EXAMPLE 2 ----------

```
C:\PS> Get-AdminScope -BuiltIn $false | Remove-AdminScope
```

Attempt to remove all scopes (excluding the built-in 'All' scope). This fails if one of the scopes is assigned to an administrator.

Remove-AdminScopeMetadata

Apr 15, 2014

Removes metadata from the given Scope.

Syntax

Remove-AdminScopeMetadata [-ScopeId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminScopeMetadata [-ScopeId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminScopeMetadata [-ScopeName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminScopeMetadata [-ScopeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminScopeMetadata [-InputObject] <Scope[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-AdminScopeMetadata [-InputObject] <Scope[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Scope.

Related topics

Set-AdminScopeMetadata

Parameters

-ScopeId<Guid>

Id of the Scope

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ScopeName<String>

Name of the Scope

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Scope[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-AdminService | % { Remove-AdminServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Service objects.

Rename-AdminRole

Apr 15, 2014

Rename a role

Syntax

Rename-AdminRole [-InputObject] <Role> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-AdminRole [-Id] <Guid> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-AdminRole [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-AdminRole cmdlet changes the name of a role.

Role names must be unique, and you cannot modify the name of built-in roles.

Related topics

New-AdminRole

Get-AdminRole

Set-AdminRole

Remove-AdminRole

Set-AdminRoleMetadata

Remove-AdminRoleMetadata

Parameters

-InputObject<Role>

Specifies the role to rename (by object).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Id<Guid>

Specifies the role to rename (by id).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Name<String>

Specifies the role to rename (by name).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

Specifies the new name of the role.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Role You can pipe the role to be renamed into this command.

Return Values

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Rename-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Rename-AdminRole -Name Supervisor -NewName HelpDeskLead
```

Renames the 'Supervisor' role to 'HelpDeskLead'.

Rename-AdminScope

Apr 15, 2014

Rename a scope

Syntax

Rename-AdminScope [-InputObject] <Scope> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-AdminScope [-Id] <Guid> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-AdminScope [-Name] <String> [-NewName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Rename-AdminScope cmdlet changes the name of a scope.

Scope names must be unique, and you cannot modify the name of the built-in 'All' scope.

Related topics

New-AdminScope

Get-AdminScope

Set-AdminScopeMetadata

Remove-AdminScopeMetadata

Parameters

-InputObject<Scope>

Specifies the scope to rename (by object).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Id<Guid>

Specifies the scope to rename (by id).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Name<String>

Specifies the scope to rename (by name).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-NewName<String>

Specifies the new name of the scope.

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Scope You can pipe the scope to be renamed into this command.

Return Values

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Rename-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Rename-AdminScope -Name Sales -NewName SalesDesktops
```

Renames the 'Sales' scope to 'SalesDesktops'.

Reset-AdminServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the DelegatedAdmin Service.

Syntax

Reset-AdminServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload DelegatedAdmin Service access permissions and configuration service locations. The Reset-AdminServiceGroupMembership command must be run on at least one instance of the service type (Admin) after installation and registration with the configuration service. Without this operation, the DelegatedAdmin services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-AdminServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-AdminServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-AdminServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-AdminServiceGroupmembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-AdminAdministrator

Apr 15, 2014

Sets the properties of an administrator.

Syntax

Set-AdminAdministrator [-InputObject] <Administrator[]> [-Enabled <Boolean>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministrator -Sid <String[]> [-Enabled <Boolean>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministrator [-Name] <String[]> [-Enabled <Boolean>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-AdminAdministrator cmdlet is used to enable or disable an existing administrator.

You can specify the administrators to modify in a number of ways, by piping in existing objects, by passing existing objects with the InputObject parameter, or by specifying the names or SIDs explicitly.

Related topics

New-AdminAdministrator

Get-AdminAdministrator

Remove-AdminAdministrator

Set-AdminAdministratorMetadata

Remove-AdminAdministratorMetadata

Parameters

-InputObject<Administrator[]>

Specifies the administrators to modify.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String[]>

Specifies the names of the administrators to modify.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Sid<String[]>

Specifies the SIDs of the administrators to modify.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Enabled<Boolean>

Specifies the new value for the Enabled property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name

or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Administrator You can pipe the adminstrators to be modified into this command.

Return Values

None or Citrix.DelegatedAdmin.Sdk.Administrator

When you use the PassThru parameter, Set-AdminAdministrator generates a Citrix.DelegatedAdmin.Sdk.Administrator object. Otherwise, this cmdlet does not generate any output.

Examples

---------- EXAMPLE 1 ----------

C:\PS> Get-AdminAdministrator -Enabled $false | Set-AdminAdministrator -Enabled $true
Enable all administrators that are currently disabled.

---------- EXAMPLE 2 ----------

C:\PS> Set-AdminAdministrator -Name DOMAIN\TestUser1,DOMAIN\TestUser2 -Enabled $true
Enable two specific users specified by name (TestUser1 and TestUser2).

Set-AdminAdministratorMetadata

Apr 15, 2014

Adds or updates metadata on the given Administrator.

Syntax

Set-AdminAdministratorMetadata -AdministratorSid <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata -AdministratorSid <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-AdministratorName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-AdministratorName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminAdministratorMetadata [-InputObject] <Administrator[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Administrator objects.

Related topics

Remove-AdminAdministratorMetadata

Parameters

-AdministratorName<String>

Name of the Administrator

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Administrator[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdministratorSid<String>

Sid of the Administrator

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Administrator specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-AdminAdministratorMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-AdminAdministratorMetadata -AdministratorSid S-1-5-21-1505241163-3345470479-1241728991-1000 -Name property -Value value

    Key                            Value
    ---                            -----
    property                         value
```

Add metadata with a name of 'property' and a value of 'value' to the Administrator with the identifier 'S-1-5-21-1505241163-3345470479-1241728991-1000'.

Set-AdminDBConnection

Apr 15, 2014

Configures a database connection for the DelegatedAdmin Service.

Syntax

```
Set-AdminDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Configures a connection to a database in which the DelegatedAdmin Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-AdminServiceStatus

Get-AdminDBConnection

Test-AdminDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the DelegatedAdmin Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-AdminDBConnection command returns an object containing the status of the DelegatedAdmin Service together with extra diagnostics information.

DBUnconfigured

The DelegatedAdmin Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

DBOlderVersionThanService

The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The DelegatedAdmin Service is running and is connected to a database containing a valid schema.

Failed

The DelegatedAdmin Service has failed.

Unknown

The status of the DelegatedAdmin Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-AdminDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK
Configures a database connection string for the DelegatedAdmin Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Set-AdminDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the DelegatedAdmin Service.

Set-AdminRole

Apr 15, 2014

Set the properties of a role.

Syntax

Set-AdminRole [-InputObject] <Role[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRole [-Id] <Guid[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRole [-Name] <String[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-AdminRole command allows the description of custom roles to be updated. You cannot modify built-in roles.

To modify the permissions of a role, use the Add-AdminPermission and Remove-AdminPermission cmdlets.

To update the metadata associated with a role, use the Set-AdminRoleMetadata and Remove-AdminRoleMetadata cmdlets.

Related topics

New-AdminRole

Get-AdminRole

Remove-AdminRole

Rename-AdminRole

Set-AdminRoleMetadata

Remove-AdminRoleMetadata

Add-AdminPermission

Remove-AdminPermission

Parameters

-InputObject<Role[]>

Specifies the roles to update (by object).

Required?	true
Default Value	

Accept Pipeline Input?	true (ByValue)

-Id<Guid[]>

Specifies the roles to update (by id).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Name<String[]>

Specifies the roles to update (by name).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Supplies the new description value.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Role You can pipe the roles to be updated into this command.

Return Values

None or Citrix.DelegatedAdmin.Sdk.Role

When you use the PassThru parameter, Set-AdminRole generates a Citrix.DelegatedAdmin.Sdk.Role object. Otherwise, this cmdlet does not generate any output.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Set-AdminRole -Name Supervisor -Description "Helpdesk supervisor role"
```

Change the description of the 'Supervisor' role.

Set-AdminRoleMetadata

Apr 15, 2014

Adds or updates metadata on the given Role.

Syntax

Set-AdminRoleMetadata [-RoleId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-RoleId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-RoleName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-RoleName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-InputObject] <Role[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminRoleMetadata [-InputObject] <Role[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Role objects.

Related topics

Remove-AdminRoleMetadata

Parameters

-RoleId<Guid>

Id of the Role

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-RoleName<String>

Name of the Role

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Role[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Role specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create

high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-AdminRoleMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-AdminRoleMetadata -RoleId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                       value
```

Add metadata with a name of 'property' and a value of 'value' to the Role with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-AdminScope

Apr 15, 2014

Set the properties of a scope.

Syntax

Set-AdminScope [-InputObject] <Scope[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScope [-Id] <Guid[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScope [-Name] <String[]> [-Description <String>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The Set-AdminScope command allows the description of scopes to be updated. You cannot modify the built-in 'All' scope.

To change the contents of a scope, use the Add-<Noun>Scope and Remove-<Noun>Scope cmdlets from the corresponding PowerShell snap-in.

To update the metadata associated with a scope, use the Set-AdminScopeMetadata and Remove-AdminScopeMetadata cmdlets.

Related topics

New-AdminScope

Get-AdminScope

Remove-AdminScope

Rename-AdminScope

Set-AdminScopeMetadata

Remove-AdminScopeMetadata

Parameters

-InputObject<Scope[]>

Specifies the scopes to update (by object).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Id<Guid[]>

Specifies the scopes to update (by id).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Name<String[]>

Specifies the scopes to update (by name).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Supplies the new description value.

Required?	false
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Returns the affected record. By default, this cmdlet does not generate any output.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.DelegatedAdmin.Sdk.Scope You can pipe the scopes to be updated into this command.

Return Values

None or Citrix.DelegatedAdmin.Sdk.Scope

When you use the PassThru parameter, Set-AdminScope generates a Citrix.DelegatedAdmin.Sdk.Scope object. Otherwise, this cmdlet does not generate any output.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Set-AdminScope -Name Sales -Description "Sales department desktops"
```

Change the description of the 'Sales' scope.

Set-AdminScopeMetadata

Apr 15, 2014

Adds or updates metadata on the given Scope.

Syntax

Set-AdminScopeMetadata [-ScopeId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-ScopeId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-ScopeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-ScopeName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-InputObject] <Scope[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminScopeMetadata [-InputObject] <Scope[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Scope objects.

Related topics

Remove-AdminScopeMetadata

Parameters

-ScopeId<Guid>

Id of the Scope

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ScopeName<String>

Name of the Scope

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Scope[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Scope specified. The property cannot contain any of the following characters \/:;#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create

high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-AdminScopeMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-AdminScopeMetadata -ScopeId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                           value
```

Add metadata with a name of 'property' and a value of 'value' to the Scope with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-AdminServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given Service.

Syntax

Set-AdminServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-AdminServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-AdminServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The

property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-AdminServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-AdminServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                         value
```

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Test-AdminAccess

Apr 15, 2014

Retrieves the scopes where the specified operation is permitted.

Syntax

Test-AdminAccess [-Operation] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This cmdlet evaluates what rights the current user has, and from these determines the scopes where the specified operation is permitted.

Operations are the indivisible unit of functionality that each XenDesktop service can perform, and usually correspond to individual cmdlets.

Related topics

Parameters

-Operation<String>

The operation to query.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.DelegatedAdmin.Sdk.ScopeReference

The list of permissible scopes for the specified operation.

Notes

If the specified operation has unrestricted access a single object is returned representing the 'All' scope with a ScopeId of

Guid.Empty (00000000-0000-0000-0000-000000000000).

Examples

---------- EXAMPLE 1 ----------

C:\PS> Test-AdminAccess -Operation 'Broker:GetCatalog'
Queries the scopes where 'Broker:GetCatalog' is permitted.

Test-AdminDBConnection

Apr 15, 2014

Tests a database connection for the DelegatedAdmin Service.

Syntax

```
Test-AdminDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Tests a connection to the database in which the DelegatedAdmin Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-AdminServiceStatus

Get-AdminDBConnection

Set-AdminDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the DelegatedAdmin Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-AdminDBConnection command returns an object containing the status of the DelegatedAdmin Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the DelegatedAdmin Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the DelegatedAdmin Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the DelegatedAdmin Service currently in use is incompatible with the version of the DelegatedAdmin Service schema on the database. Upgrade the DelegatedAdmin Service to a more recent version.

DBOlderVersionThanService

The version of the DelegatedAdmin Service schema on the database is incompatible with the version of the DelegatedAdmin Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-AdminDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The DelegatedAdmin Service has failed.

Unknown

The status of the DelegatedAdmin Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Test-AdminDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Tests a database connection string for the DelegatedAdmin Service.

---------- EXAMPLE 2 ----------

```
c:\PS>Test-AdminDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Tests an invalid database connection string for the DelegatedAdmin Service.

Citrix.EnvTest.Admin.V1

Apr 15, 2014

Overview

Name	Description
EnvTestEnvTestSnapin	The Citrix Environment Test Service provides tools to test and inspect the state of a XenDesktop installation.
EnvTest Filtering	Describes the common filtering options for XenDesktop cmdlets.

Cmdlets

Name	Description
Get-EnvTestConfiguration	Gets the Environment Test Service's configuation options
Get-EnvTestDBConnection	Gets the database string for the specified data store used by the EnvTest Service.
Get-EnvTestDBSchema	Gets a script that creates the EnvTest Service database schema for the specified data store.
Get-EnvTestDBVersionChangeScript	Gets a script that updates the EnvTest Service database schema.
Get-EnvTestDefinition	Gets the one or more test definitions
Get-EnvTestInstalledDBVersion	Gets a list of all available database schema versions for the EnvTest Service.
Get-EnvTestService	Gets the service record entries for the EnvTest Service.
Get-EnvTestServiceAddedCapability	Gets any added capabilities for the EnvTest Service on the controller.
Get-EnvTestServiceInstance	Gets the service instance entries for the EnvTest Service.
Get-EnvTestServiceStatus	Gets the current status of the EnvTest Service on the controller.
Get-EnvTestSuiteDefinition	Gets one or more test suite definitions.
Get-EnvTestTask	Gets one or more EnvTestTask(s)
New-EnvTestDiscoveryTargetDefinition	Creates a new EnvTestDiscoveryTargetDefinition object
Remove-EnvTestServiceMetadata	Removes metadata from the given Service.

Name	Description
Remove-EnvTestTask	Removes from the database completed tasks for the EnvTest Service.
Remove-EnvTestTaskMetadata	Removes metadata from the given Task.
Reset-EnvTestServiceGroupMembership	Reloads the access permissions and configuration service locations for the EnvTest Service.
Set-EnvTestConfiguration	Sets the Environment Test Service's configuation options
Set-EnvTestDBConnection	Configures a database connection for the EnvTest Service.
Set-EnvTestServiceMetadata	Adds or updates metadata on the given Service.
Set-EnvTestTaskMetadata	Adds or updates metadata on the given Task.
Start-EnvTestTask	Starts a new test task.
Stop-EnvTestTask	Stops a still running task from completing.
Switch-EnvTestTask	Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.
Test-EnvTestDBConnection	Tests a database connection for the EnvTest Service.

about_EnvTestEnvTestSnapin

Apr 15, 2014

TOPIC

about_EnvTestEnvTestSnapin

SHORT DESCRIPTION

The Citrix Environment Test Service provides tools to test and inspect the state of a XenDesktop installation.

COMMAND PREFIX

All commands in this snap-in have the noun prefixed with 'EnvTest'.

LONG DESCRIPTION

The Citrix Environment Test Service provides tools to test and inspect the state of a XenDesktop installation at different points during and after configuration and install.

about_EnvTest_Filtering

Apr 15, 2014

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

Get-EnvTestConfiguration

Apr 15, 2014

Gets the Environment Test Service's configuation options

Syntax

Get-EnvTestConfiguration [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets the Environment Test Service's configuation options and returns them as key/value pairs.

Related topics

Parameters

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Dictionary<string, object>

All configuration settings

Examples

---------- EXAMPLE 1 ----------

Get-EnvTestConfiguration

Gets all configuration options

Get-EnvTestDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the EnvTest Service.

Syntax

```
Get-EnvTestDBConnection [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-EnvTestServiceStatus

Set-EnvTestDBConnection

Test-EnvTestDBConnection

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the EnvTest Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the EnvTest Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-EnvTestDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the EnvTest Service.

Get-EnvTestDBSchema

Apr 15, 2014

Gets a script that creates the EnvTest Service database schema for the specified data store.

Syntax

Get-EnvTestDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new EnvTest Service database schema, add a new EnvTest Service to an existing site, remove a EnvTest Service from a site, or create a database server logon for a EnvTest Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected EnvTest Service instance, otherwise the scripts relate to EnvTest Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a EnvTest SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to EnvTest Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to EnvTest Service roles

If ScriptType is Evict, the returned script contains:

o Removal of EnvTest Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.

Related topics

Set-EnvTestDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the EnvTest services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the EnvTest Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further EnvTest services to an existing database instance that already contains the full EnvTest service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the EnvTest Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified EnvTest Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for EnvTest services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the EnvTest Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-EnvTestDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\EnvTestSchema.sql
Get the full database schema for site data store of the EnvTest Service and copy it to a file called 'c:\EnvTestSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a EnvTest Service site schema.

---------- EXAMPLE 2 ----------

c:\PS>Get-EnvTestDBSchema -DatabaseName MyDB -scriptType Login > c:\EnvTestLogins.sql
Get the logon scripts for the EnvTest Service.

Get-EnvTestDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the EnvTest Service database schema.

Syntax

Get-EnvTestDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the EnvTest Service from the current schema version to a different version.

Related topics

Get-EnvTestInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any EnvTest services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-EnvTestServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the EnvTest Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-EnvTestDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-EnvTestDefinition

Apr 15, 2014

Gets the one or more test definitions

Syntax

Get-EnvTestDefinition [-TestId <String[]>] [-CultureName <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of test definitions that are available from currently running components.

Related topics

Get-EnvTestSuiteDefinition

Get-EnvTestTask

Start-EnvTestTask

Switch-EnvTestTask

Stop-EnvTestTask

Remove-EnvTestTask

Add-EnvTestTaskMetadata

Remove-EnvTestTaskMetadata

Parameters

-TestId<String[]>

The id of one or more tests.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-CultureName<String>

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.String A test id. System.String[] An array of test ids.

Return Values

Citrix.EnvTest.Sdk.EnvTestDefinition

One or more test definitions.

Examples

---------- EXAMPLE 1 ----------

```
$allTestDefinitions = Get-EnvTestDefinition
```
Retrieve all tests.

---------- EXAMPLE 2 ----------

```
$allTestDefinitionsTranslatedIntoSpanish = Get-EnvTestDefinition -CultureName es-ES
```
Retrieve all tests with localized properties returned in Spanish.

---------- EXAMPLE 3 ----------

```
$monitorConfigServiceRegistrationDefinition = Get-EnvTestDefinition -TestId Monitor_RegisteredWithConfigurationService
```
Retrieve the definition of the 'Monitor_RegisteredWithConfigurationService' test.

Get-EnvTestInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the EnvTest Service.

Syntax

Get-EnvTestInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the EnvTest Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-EnvTestInstalledDbVersion command returns objects containing the new definition of the EnvTest Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the EnvTest Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-EnvTestInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the EnvTest Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-EnvTestInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the EnvTest Service database schema for which upgrade scripts are supplied.

Get-EnvTestService

Apr 15, 2014

Gets the service record entries for the EnvTest Service.

Syntax

Get-EnvTestService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the EnvTest Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_EnvTest_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_EnvTest_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.EnvTest.Sdk.Service

The Get-EnvTestServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-EnvTestService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the EnvTest Service running in the current service group.

Get-EnvTestServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the EnvTest Service on the controller.

Syntax

```
Get-EnvTestServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the EnvTest Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-EnvTestServiceAddedCapability
```

Get the added capabilities of the EnvTest Service.

Get-EnvTestServiceInstance

Apr 15, 2014

Gets the service instance entries for the EnvTest Service.

Syntax

Get-EnvTestServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the EnvTest Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.EnvTest.Sdk.ServiceInstance

The Get-EnvTestServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always EnvTest.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.EnvTest.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-EnvTestServiceInstance

Address           : http://MyServer.com:80/Citrix/EnvTestContract
Binding           : wcf_HTTP_kerb
InterfaceType     : SDK
Metadata          :
MetadataMap       :
ServiceAccount    : ENG\MyAccount$
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
ServiceGroupName  : MyServiceGroup
ServiceGroupUid   : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType       : EnvTest
Version           : 1

Address           : http://MyServer.com:80/Citrix/EnvTestContract/IServiceApi
Binding           : wcf_HTTP_kerb
InterfaceType     : InterService
Metadata          :
MetadataMap       :
ServiceAccount    : ENG\MyAccount
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
```

```
ServiceGroupName   : MyServiceGroup
ServiceGroupUid    : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType        : EnvTest
Version            : 1
```

Get all instances of the EnvTest Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-EnvTestServiceStatus

Apr 15, 2014

Gets the current status of the EnvTest Service on the controller.

Syntax

Get-EnvTestServiceStatus [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables the status of the EnvTest Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-EnvTestDBConnection

Test-EnvTestDBConnection

Get-EnvTestDBConnection

Get-EnvTestDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-EnvTestServiceStatus command returns an object containing the status of the EnvTest Service together with extra diagnostics information.

DBUnconfigured

The EnvTest Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on

with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

DBOlderVersionThanService

The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The EnvTest Service is running and is connected to a database containing a valid schema.

Failed

The EnvTest Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-EnvTestServiceStatus

DBUnconfigured
Get the current status of the EnvTest Service.

Get-EnvTestSuiteDefinition

Apr 15, 2014

Gets one or more test suite definitions.

Syntax

Get-EnvTestSuiteDefinition [-TestSuiteId <String[]>] [-CultureName <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of test suite definitions that are available from currently running components.

Related topics

Get-EnvTestDefinition

Get-EnvTestTask

Start-EnvTestTask

Switch-EnvTestTask

Stop-EnvTestTask

Remove-EnvTestTask

Add-EnvTestTaskMetadata

Remove-EnvTestTaskMetadata

Parameters

-TestSuiteId<String[]>

The id of one or more test suites.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-CultureName<String>

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.String A test suite id. System.String[] An array of test suite ids.

Return Values

Citrix.EnvTest.Sdk.EnvTestSuiteDefinition

The definition of a test suite

Examples

---------- EXAMPLE 1 ----------

$allTestSuiteDefinitions = Get-EnvTestSuiteDefinition
Retrieve all test suites.

---------- EXAMPLE 2 ----------

$allTestSuiteDefinitionsTranslatedIntoSpanish = Get-EnvTestSuiteDefinition -CultureName es-ES
Retrieve all test suites with localized properties returned in Spanish.

---------- EXAMPLE 3 ----------

$infrastructureSuiteDefinition = Get-EnvTestSuiteDefinition -TestSuiteId Infrastructure
Retrieve the definition of the 'Infrastructure' test suite.

Get-EnvTestTask

Apr 15, 2014

Gets one or more EnvTestTask(s)

Syntax

Get-EnvTestTask [-TaskId <Guid>] [-List] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns either the current task, a specified task, or list of tasks that are currently known to the EnvTest Service.

Related topics

Get-EnvTestDefinition

Get-EnvTestSuiteDefinition

Start-EnvTestTask

Switch-EnvTestTask

Stop-EnvTestTask

Remove-EnvTestTask

Add-EnvTestTaskMetadata

Remove-EnvTestTaskMetadata

Parameters

-TaskId<Guid>

Specifies the task identifier to be returned. This value can be retrieved from an existing task's $task.TaskId property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-List<SwitchParameter>

List all running tasks, including the current one.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.EnvTest.Sdk.EnvTestTask

A description of a previously started task.

Examples

---------- EXAMPLE 1 ----------

$currentTask = Get-EnvTestTask
Retrieve the current task. The current task is the most recently created task unless Switch-EnvTestTask explicitly changes it.

---------- EXAMPLE 2 ----------

$taskOfSpecificId = Get-EnvTestTask -TaskId 36C0EC52-2039-4D6E-B690-9F02F8CEFFCC
Retrieve a fresh copy of a task object based on a known task id, which is always a Guid. This id can be retrieved from an existing task object via its $task.TaskId property.

---------- EXAMPLE 3 ----------

$allKnownTasks = Get-EnvTestTask -List
Retrieve the list of current tasks. This list includes any task started by the Start-EnvTestTask cmdlet since the service started that has not later been removed via Remove-EnvTestTask.

New-EnvTestDiscoveryTargetDefinition

Apr 15, 2014

Creates a new EnvTestDiscoveryTargetDefinition object

Syntax

New-EnvTestDiscoveryTargetDefinition -TestId <String> [-TargetIdType <String>] [-TargetId <String>] [-AdminAddress <String>] [<CommonParameters>]

New-EnvTestDiscoveryTargetDefinition -TestSuiteId <String> [-TargetIdType <String>] [-TargetId <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Creates a new EnvTestDiscoveryTargetDefinition object that can be piped into Start-EnvTestTask to define one or more targets of execution, optionally including root objects for discovery.

Related topics

Get-EnvTestDefinition

Get-EnvTestSuiteDefinition

Get-EnvTestTask

Start-EnvTestTask

Switch-EnvTestTask

Stop-EnvTestTask

Remove-EnvTestTask

Add-EnvTestTaskMetadata

Remove-EnvTestTaskMetadata

Parameters

-TestId<String>

Test identifiers. If specified, do not specify -TestSuiteId.

Required?	true
Default Value	Empty
Accept Pipeline Input?	false

-TestSuiteId<String>

Test suite identifiers. If specified, do not specify -TestId.

Required?	true
Default Value	Empty
Accept Pipeline Input?	false

-TargetIdType<String>

Describes the type of corresponding object passed with -TargetId

Required?	false
Default Value	Empty
Accept Pipeline Input?	false

-TargetId<String>

The Ids that object tests or test suites will target. By default, other components are queried for objects related to these.

Required?	false
Default Value	Empty
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition

Defines a target of a task

Examples

---------- EXAMPLE 1 ----------

```
$singleSimpleTestTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestId Monitor_RegisteredWithConfigurationService
$singleSimpleTestTaskTarget | Start-EnvTestTask
```

Create a discovery target definition with a single test and no target object, then start a task based on it.

---------- EXAMPLE 2 ----------

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Infrastructure
$singleSimpleTestSuiteTaskTarget | Start-EnvTestTask
```

Create a discovery target definition with a single test suite and no target object, then start a task based on it.

---------- EXAMPLE 3 ----------

```
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
$singleTestSuiteTaskTarget | Start-EnvTestTask
```

Create a discovery target definition with a single test suite and a catalog target object, then start a task based on it.

---------- EXAMPLE 4 ----------

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Infrastructure
$singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
@($singleSimpleTestSuiteTaskTarget, $singleTestSuiteTaskTarget) | Start-EnvTestTask
```

Create two different discovery target definitions, put them in an array, then start a task based on both.

Remove-EnvTestServiceMetadata

Apr 15, 2014

Removes metadata from the given Service.

Syntax

Remove-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-EnvTestServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-EnvTestService | % { Remove-EnvTestServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Service objects.

Remove-EnvTestTask

Apr 15, 2014

Removes from the database completed tasks for the EnvTest Service.

Syntax

Remove-EnvTestTask [-TaskId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestTask [-Task <EnvTestTask>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables completed tasks that have run within the EnvTest Service to be removed from the database.

Related topics

Get-EnvTestDefinition

Get-EnvTestSuiteDefinition

Get-EnvTestTask

Start-EnvTestTask

Switch-EnvTestTask

Stop-EnvTestTask

Add-EnvTestTaskMetadata

Remove-EnvTestTaskMetadata

Parameters

-TaskId<Guid>

Specifies the identifier of the task to be removed, retrieveable from the $task.TaskId property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Task<EnvTestTask>

Specifies the task to be removed.

Required?	false
Default Value	

Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

```
Remove-EnvTestTask
```

Removes the current task from the EnvTest service.

---------- EXAMPLE 2 ----------

```
Remove-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
```

Removes a task from the EnvTest service via its id, which is available from an existing task's $task.TaskId property.

---------- EXAMPLE 3 ----------

```
$secondTask = $(Get-EnvTestTask -List)[1]
Remove-EnvTestTask -Task $secondTask
```

Removes the second task in the list returned by Get-EnvTestTask -List.

Remove-EnvTestTaskMetadata

Apr 15, 2014

Removes metadata from the given Task.

Syntax

Remove-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Task.

Related topics

Set-EnvTestTaskMetadata

Parameters

-TaskTaskId<Guid>

Id of the Task

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<EnvTestTask[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-EnvTestTask | % { Remove-EnvTestTaskMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Task objects.

Reset-EnvTestServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the EnvTest Service.

Syntax

Reset-EnvTestServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload EnvTest Service access permissions and configuration service locations. The Reset-EnvTestServiceGroupMembership command must be run on at least one instance of the service type (EnvTest) after installation and registration with the configuration service. Without this operation, the EnvTest services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-EnvTestServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.EnvTest.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice

interface can be piped to the Reset-EnvTestServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-EnvTestServiceGroupMembership
```

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-EnvTestServiceGroupmembership
```

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-EnvTestConfiguration

Apr 15, 2014

Sets the Environment Test Service's configuation options

Syntax

Set-EnvTestConfiguration [-PerTypeDiscoveredObjectLimit <Int32>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the Environment Test Service's configuation options and broadcasts the changes to other machines in the Site.

Related topics

Parameters

-PerTypeDiscoveredObjectLimit<Int32>

Sets the maximum number of objects of a particular type to be explored when discovering objects during a test run. Default: 50

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Input Type

Integer Must be greater than zero.

Return Values

System.String

Examples

---------- EXAMPLE 1 ----------

Set-EnvTestConfiguration -PerTypeDiscoveredObjectLimit 100
Set the maximum to 100

Set-EnvTestDBConnection

Apr 15, 2014

Configures a database connection for the EnvTest Service.

Syntax

Set-EnvTestDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the EnvTest Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-EnvTestServiceStatus

Get-EnvTestDBConnection

Test-EnvTestDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the EnvTest Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-EnvTestDBConnection command returns an object containing the status of the EnvTest Service together with extra diagnostics information.

DBUnconfigured

The EnvTest Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

DBOlderVersionThanService

The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The EnvTest Service is running and is connected to a database containing a valid schema.

Failed

The EnvTest Service has failed.

Unknown

The status of the EnvTest Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Set-EnvTestDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Configures a database connection string for the EnvTest Service.

-------------------------- EXAMPLE 2 --------------------------

```
c:\PS>Set-EnvTestDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Configures an invalid database connection string for the EnvTest Service.

Set-EnvTestServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given Service.

Syntax

Set-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-EnvTestServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-EnvTestServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-EnvTestServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                           -----
    property                        value
```

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-EnvTestTaskMetadata

Apr 15, 2014

Adds or updates metadata on the given Task.

Syntax

Set-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestTaskMetadata [-TaskTaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-EnvTestTaskMetadata [-InputObject] <EnvTestTask[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Task objects.

Related topics

Remove-EnvTestTaskMetadata

Parameters

-TaskTaskId<Guid>

Id of the Task

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<EnvTestTask[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-EnvTestTaskMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-EnvTestTaskMetadata -TaskTaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                       value
```

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Start-EnvTestTask

Apr 15, 2014

Starts a new test task.

Syntax

Start-EnvTestTask -TestId <String> [-TargetIdType <String>] [-TargetId <String>] [-CultureName <String>] [-IgnoreRelatedObjects] [-RunAsynchronously] [-ExcludeNotRunTests] [-AdminAddress <String>] [<CommonParameters>]

Start-EnvTestTask -TestSuiteId <String> [-TargetIdType <String>] [-TargetId <String>] [-CultureName <String>] [-IgnoreRelatedObjects] [-RunAsynchronously] [-ExcludeNotRunTests] [-AdminAddress <String>] [<CommonParameters>]

Start-EnvTestTask -InputObject <PSObject[]> [-CultureName <String>] [-IgnoreRelatedObjects] [-RunAsynchronously] [-ExcludeNotRunTests] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Starts a new test task based on a set of criteria provided via parameters or piped input and either waits for the tests to run or returns immediately depending on how it is called. When running a test suite and providing a target object for that suite, the service will discover related objects by default, but this behavior may be disabled if desired.

Parameters

-TestId<String>

Test identifiers. If specified, do not specify -TestSuiteId.

Required?	true
Default Value	Empty
Accept Pipeline Input?	false

-TestSuiteId<String>

Test suite identifiers. If specified, do not specify -TestId.

Required?	true
Default Value	Empty
Accept Pipeline Input?	false

-InputObject<PSObject[]>

One or more test targets defining the task, see Input Types for details about what kind of objects are permissible. Any valid object passed to this parameter may also be piped into this cmdlet.

Required?	true
Default Value	Empty
Accept Pipeline Input?	true (ByValue)

-TargetIdType<String>

Describes the type of corresponding object passed with -TargetId

Required?	false
Default Value	Empty
Accept Pipeline Input?	false

-TargetId<String>

The Ids that object tests or tests suites will target. By default, other components are queried for objects related to these.

Required?	false
Default Value	Empty
Accept Pipeline Input?	false

-CultureName<String>

The culture name in which to produce results. The culture name is in standard language/region-code format; for example "en-US".

Required?	false
Default Value	The current user interface culture
Accept Pipeline Input?	false

-IgnoreRelatedObjects<SwitchParameter>

Do not ask other components for objects related to a specified target.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-RunAsynchronously<SwitchParameter>

Do not wait for the test run to complete, return immediately.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-ExcludeNotRunTests<SwitchParameter>

If set, tests that are not run because no object matching their requirements is found are NOT included in test counts and results.

Required?	false
Default Value	False (include Not Run tests)
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition A single EnvTestDiscoveryTargetDefinition can be specified to target one test or test suite. Citrix.EnvTest.Sdk.EnvTestDiscoveryTargetDefinition[] An array of EnvTestDiscoveryTargetDefinition(s) can be specified to target any combination of tests and/or test suites. PSCustomObject A single PSCustomObject with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target one test or test suite. PSCustomObject[] An array of PSCustomObject(s) with properties matching the required EnvTestDiscoveryTargetDefinition properties can be specified to target any combination of tests and/or test suites.

Return Values

Ctrix.EnvTest.Sdk.EnvTestTask

The newly started task.

Examples

---------- EXAMPLE 1 ----------

$singleSimpleTestTask = Start-EnvTestTask -TestId Monitor_RegisteredWithConfigurationService
Create and start a task with a single test and no target object.

---------- EXAMPLE 2 ----------

$singleSimpleTestTaskInSpanish = Start-EnvTestTask -TestId Monitor_RegisteredWithConfigurationService -CultureName es-ES
Create and start a task with a single test and no target object, with localized properties translated into Spanish.

---------- EXAMPLE 3 ----------

```
$singleSimpleTestSuiteTask = Start-EnvTestTask -TestSuiteId Infrastructure
```

Create and start a task with a single test suite and no target object.

---------- EXAMPLE 4 ----------

```
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
```

Create and start a task with a single test suite and a catalog target object.

---------- EXAMPLE 5 ----------

```
$singleTestSuiteTask = Start-EnvTestTask -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid -RunAsynchronously
```

Create and start a task with a single test suite and a catalog target object, and return immediately not waiting for the tests to complete.

---------- EXAMPLE 6 ----------

```
$adAccountPool = Get-AcctIdentityPool
    $singleTestTaskWithNoObjectDiscovery = StartEnvTestTask -IgnoreRelatedObjects -TestId ADIdentity_IdentityPool_ValidatePoolIsUnlocked -TargetIdType IdentityPool -TargetId $adAccountPool.
```

Create and start a task with a single test, a target object for that test, and no object discovery based on that target.

---------- EXAMPLE 7 ----------

```
$singleSimpleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Infrastructure
    $singleTestSuiteTaskTarget = New-EnvTestDiscoveryTargetDefinition -TestSuiteId Catalog -TargetIdType Catalog -TargetId $(Get-BrokerCatalog).Uuid
    $inputObjects = @($singleSimpleTestSuiteTaskTarget, $singleTestSuiteTaskTarget)
    Start-EnvTestTask -InputObject $inputObjects
```

Create two different discovery target definitions, put them in an array, then start a task based on both via -InputObject.

Stop-EnvTestTask

Apr 15, 2014

Stops a still running task from completing.

Syntax

```
Stop-EnvTestTask [-TaskId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Stop-EnvTestTask [-Task <EnvTestTask>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Stops a still running task from completing. A task may still be retreived via Get-EnvTestTask until it Remove-EnvTestTask is called with its task id.

Related topics

Get-EnvTestDefinition

Get-EnvTestSuiteDefinition

Get-EnvTestTask

New-EnvTestTask

Start-EnvTestTask

Switch-EnvTestTask

Remove-EnvTestTask

Add-EnvTestTaskMetadata

Remove-EnvTestTaskMetadata

Parameters

-TaskId<Guid>

The id of the task to stop, retrieveable from the $task.TaskId property.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Task<EnvTestTask>

An EnvTestTask representing the task to stop

Required?	false

Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

Stop-EnvTestTask
Stops the current task from completing if it is still running.

---------- EXAMPLE 2 ----------

Stop-EnvTestTask -TestId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
Stops a task from completing via its id, which is available from an existing task's $task.TaskId property.

---------- EXAMPLE 3 ----------

$secondTask = $(Get-EnvTestTask -List)[1]
Stop-EnvTestTask -Task $secondTask
Stops the second task in the list returned by Get-EnvTestTask -List.

Switch-EnvTestTask

Apr 15, 2014

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Syntax

Switch-EnvTestTask [-TaskId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Switch-EnvTestTask [-Task <EnvTestTask>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the current task that will be returned by a call to Get-EnvTestTask with no parameters.

Related topics

Get-EnvTestDefinition

Get-EnvTestSuiteDefinition

Get-EnvTestTask

New-EnvTestTask

Start-EnvTestTask

Stop-EnvTestTask

Remove-EnvTestTask

Add-EnvTestTaskMetadata

Remove-EnvTestTaskMetadata

Parameters

-TaskId<Guid>

Specifies the identifier of the task to be made current.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Task<EnvTestTask>

The task object to be made current, retrieveable from the $task.TaskId property.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Remove-EnvTestTask command.

Examples

---------- EXAMPLE 1 ----------

Switch-EnvTestTask -TaskId 50A4139F-2B55-4A97-A1BE-20EE4E124AA3
Switches the current task to another via its id, which is available from an existing task's $task.TaskId property.

---------- EXAMPLE 2 ----------

$secondTask = $(Get-EnvTestTask -List)[1]
Switch-EnvTestTask -Task $switchTask
Switches the current task to the second in the list returned by Get-EnvTestTask -List.

Test-EnvTestDBConnection

Apr 15, 2014

Tests a database connection for the EnvTest Service.

Syntax

```
Test-EnvTestDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Tests a connection to the database in which the EnvTest Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-EnvTestServiceStatus

Get-EnvTestDBConnection

Set-EnvTestDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the EnvTest Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-EnvTestDBConnection command returns an object containing the status of the EnvTest Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the EnvTest Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the EnvTest Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the EnvTest Service currently in use is incompatible with the version of the EnvTest Service schema on the database. Upgrade the EnvTest Service to a more recent version.

DBOlderVersionThanService

The version of the EnvTest Service schema on the database is incompatible with the version of the EnvTest Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-EnvTestDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The EnvTest Service has failed.

Unknown

The status of the EnvTest Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Test-EnvTestDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"
```

OK
Tests a database connection string for the EnvTest Service.

---------- EXAMPLE 2 ----------

```
c:\PS>Test-EnvTestDBConnection -DBConnection "Invalid Connection String"
```

Invalid database connection string format.
Tests an invalid database connection string for the EnvTest Service.

Citrix.Host.Admin.V2

Apr 15, 2014

Overview

Name	Description
HypHostSnapin	The Host Service PowerShell snap-in provides administrative functions for
Hyp Filtering	Describes the common filtering options for XenDesktop cmdlets.

Cmdlets

Name	Description
Add-HypHostingUnitMetadata	Adds metadata on the given HostingUnit.
Add-HypHostingUnitNetwork	Makes additional hypervisor networks available for use in a HostingUnit.
Add-HypHostingUnitStorage	Adds storage locations to a hosting unit.
Add-HypHypervisorConnectionAddress	Add a connection address to a hypervisor connection.
Add-HypHypervisorConnectionMetadata	Adds metadata on the given HypervisorConnection.
Add-HypHypervisorConnectionScope	Add the specified HypervisorConnection(s) to the given scope(s).
Add-HypMetadata	Adds metadata to a hypervisor connection or a hosting unit.
Get-HypConfigurationDataForItem	Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.
Get-HypConfigurationObjectForItem	Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.
Get-HypConnectionRegion	Enumerates the regions of a hypervisor connection that are based on cloud technology.
Get-HypDBConnection	Gets the database string for the specified data store used by the Host Service.
Get-HypDBSchema	Gets a script that creates the Host Service database schema for the specified data store.
Get-HypDBVersionChangeScript	Gets a script that updates the Host Service database schema.
Get-HypHypervisorPlugin	Gets the available hypervisor types.

Name	Description
Get-HypInstalledDBVersion	Gets a list of all available database schema versions for the Host Service.
Get-HypScopedObject	Gets the details of the scoped objects for the Host Service.
Get-HypService	Gets the service record entries for the Host Service.
Get-HypServiceAddedCapability	Gets any added capabilities for the Host Service on the controller.
Get-HypServiceInstance	Gets the service instance entries for the Host Service.
Get-HypServiceStatus	Gets the current status of the Host Service on the controller.
Get-HypVMMacAddress	Retrieves a list the MAC addresses for the VMs in the specified connection.
Get-HypVolumeServiceConfiguration	Gets instances of the VolumeServiceConfiguration that are configured for this site.
Get-HypXenServerAddress	Gets all the available addresses for a XenServer hypervisor connection.
Grant-HypSecurityGroupEgress	Adds an egress rule to a security group.
Grant-HypSecurityGroupIngress	Adds an ingress rule to a security group.
New-HypVMSnapshot	Creates a new snapshot for the specified VM item path.
Remove-HypHostingUnitMetadata	Removes metadata from the given HostingUnit.
Remove-HypHostingUnitNetwork	Removes networks from a hosting unit.
Remove-HypHostingUnitStorage	Removes storage from a hosting unit.
Remove-HypHypervisorConnectionAddress	Removes addresses from the list of available connection addresses.
Remove-HypHypervisorConnectionMetadata	Removes metadata from the given HypervisorConnection.
Remove-HypHypervisorConnectionScope	Remove the specified HypervisorConnection(s) from the given scope(s).
Remove-HypMetadata	Removes metadata from a hypervisor connection or hosting unit.
Remove-HypServiceMetadata	Removes metadata from the given Service.
Reset-HypServiceGroupMembership	Reloads the access permissions and configuration service locations for the Host Service.
Revoke-HypSecurityGroupEgress	Removes an egress rule from a security group.
Revoke-HypSecurityGroupIngress	Removes an ingress rule from a security group.

Name	Description
Set-HypAdminConnection	Set the controller to be used by the cmdlets that form the Host service PowerShell snap-in.
Set-HypDBConnection	Configures a database connection for the Host Service.
Set-HypHostingUnitMetadata	Adds or updates metadata on the given HostingUnit.
Set-HypHostingUnitStorage	Sets options for a storage location on a hosting unit.
Set-HypHypervisorConnectionMetadata	Adds or updates metadata on the given HypervisorConnection.
Set-HypServiceMetadata	Adds or updates metadata on the given Service.
Set-HypVolumeServiceConfiguration	Applies a change to one of the VolumeServiceConfiguration instances in the site.
Start-HypVM	Starts a VM.
Stop-HypVM	Stops a VM by issuing a Shutdown request
Test-HypDBConnection	Tests a database connection for the Host Service.
Test-HypHostingUnitNameAvailable	Checks to ensure that the proposed name for a hosting unit is unused.
Test-HypHypervisorConnectionNameAvailable	Checks to ensure that the proposed name for a hypervisor connection is unused.
Update-HypHypervisorConnection	Requests the host service to update the connection properties that depend on the version of hypervisor in use.

about_HypHostSnapin

Apr 15, 2014

TOPIC

about_HypHostSnapin

SHORT DESCRIPTION

The Host Service PowerShell snap-in provides administrative functions for the Host Service.

COMMAND PREFIX

All commands in this snap-in have 'Hyp' in their name.

LONG DESCRIPTION

The Host Service PowerShell snap-in enables both local and remote administration of the Host Service. It lets you configure XenDesktop deployments to make use of hypervisors, networks, and storage, and enables browsing of their contents using the Host PowerShell provider (Citrix.HypervisorProvider).

The provider creates a default PSDrive with a drive identifier of 'XDHyp'. This drive provides two root folders:

HostingUnits Folder

Contains a list of all the hosting units that have been defined using the new-Item provider command.

Hosting units define not only a hypervisor connection, but also reference networks and storage. Hosting units are used by the Machine Creation Service to provide the information required to create and manage virtual machines that can be used by other services. A hosting unit references a root path. This is a specific point in the provider connection tree. The hosting unit is constrained to provide only items below this point in the tree. This restricts the locations that the Machine Creation Service can use to create virtual machines and the networks and storage that can be used.

Connections Folder

Contains a list of all the hosting unit connections that are defined using the new-Item provider command.

Change directory to a specific connection and use the dir/Get-ChildItem command to list all of the infrastructure (such as folders, hypervisors, networks, storage, and virtual machines) that is available in the hosting unit to which the connection refers. The paths to these items

are used as the input to commands in the Host Service and Machine Creation Service snap-ins.

The contents of the Hosting Unit and Connection folders reflect the content and structure of the hypervisor to which they refer. The item extensions reflect the object type for each item. Not all item types are appropriate for all hypervisor types. Possible item types are:

Virtual Machine (.vm)
Snapshot (.snapshot)
Cluster (.cluster)
Host (.host)
HostGroup (.hostgroup)
DataCenter (.datacenter)
Folder (.folder)
ResourcePool (.resourcepool)
ComputeResource (.computeresource)

When used with a path that refers to the Host provider (with a default drive of 'XDHyp:'), the Host provider extends the standard New-Item, Get-Item, Get-ChildItem, Remove-Item, Rename-Item, and Set-Item commands as described below. For more information about the basic behavior of these commands, see the help for the command. The Move-Item and Copy-Item commands are not supported for the Host provider.

New-Item

The following parameters are available when using New-Item in the Connections directory (or a path that refers to the directory). The Credential parameter is not supported.

-Name
Specifies the name of the connection, which must not contain any of the following characters: \/;:#.*?=<>|[]()"'{}. The Name parameter is optional but, if not included, the connection name must be specified as part of the Path parameter.

-HypervisorAddress <String[]>
Specifies an array of addresses that can be used to contact the required hypervisor. All the addresses are considered equivalent, that is, all of the addresses provide access to the same virtual machines, snapshots, network, and storage.

-ConnectionType <ConnectionType>
Specifies the type of hypervisor that the connection is for. Supported hypervisor types are:

XenServer

SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

-PluginId <String>
Specifies the class name for the Citrix Managed Machine library that is used to access the hypervisor. You can obtain this list using the Get-HypHypervisorPlugin command. The PluginId parameter must be specified if the ConnectionType is set to 'Custom'.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>
Specifies the credentials for the connection to the hypervisor. You can specify the password as either Password or SecurePassword, but not both. The UserName parameter, and either Password or SecurePassword, specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>
Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as UserName and either Password or SecurePassword, so use of one precludes use of the other.

-Persist
Specifies that the connection details are persistent. If this parameter is not included, the connection is held only for the duration of the current runspace and PSDrive combination. Only persistent connection items are visible to administrators in other runspaces and PSDrives. Hosting units cannot be created from connections that are not persistent.

-AdminAddress <String>
Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <String>
Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-Scopes <String[]>

Specifies the list of administrative scopes that the new connection will be a part of. The scopes control which administrators are able to work with the connection.

The following parameters are available when using New-Item in the HostingUnits directory (or a path that refers to the directory).

-Name
Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()"'{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-HypervisorConnectionName <String>
Specifies the name of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-HypervisorConnectionUid <Guid>
Specifies the unique identifier of the connection that the hosting unit uses. To create a hosting unit, the referenced connection must be persistent and the ConnectionType must not be set to 'Custom'.

-RootPath <String>
Specifies the location in a connection that is used as the starting reference for the hosting unit. The path must point to an item in the connection that is marked as a SymLink. The root of a XenServer connection is a special case that is also considered a SymLink. If this parameter is not included, the current location in the provider is used.

-NetworkPath <String>
Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-StoragePath <String>
Specifies one or more paths in a connection to storage items that are used when the Machine Creation Service creates new virtual machines. After they are set, you can modify storage paths using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. If the connection is based on cloud infrastructure, storage items are typically not available, in which case this parameter can be omitted.

-PersonalvDiskStoragePath <String>
Specifies one or more paths in a connection to storage items

that are used when the Machine Creation Service creates disks
for the virtual machines. After they are set, you can modify storage paths
using the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage
commands.

-NoVmTagging
Specifies that new virtual machines are not tagged with
metadata from the hypervisor. By default, all virtual machines
created by the Machine Creation Service are tagged to show they are created
by XenDesktop. These tags are used by the provider to restrict the
list of virtual machines displayed when viewing the content of the
Connections or HostingUnit paths. If this parameter is not
included, all virtual machines are displayed at all times.

-AdminAddress <String>
Specifies the address of the Host Service that the command will
communicate with. After it is set, this address is used for all commands
in the Host Service PowerShell snap-in. If this parameter is not
included or set by another command, or if Set-HypAdminConnection
has not been used, the command attempts to use a local Host
Service.

-UseLocalStorageCaching
When Get-HypServiceAddedCapability indicates that the LocalStorageCaching
feature is available, use this parameter to specify that
the virtual machines created for this hosting unit will use local
storage caching for their disk images.

-GpuGroup

Specifies a path to a GPU Group in a connection that will be used when

Machine Creation Services creates VMs. Only a single GPU Group is supported and the value is immutable.

-LoggingId <String>
Specifies the identifier of the high-level operation that this cmdlet call
forms a part of. Citrix Studio and Director typically create
high-level operations. PowerShell scripts can also wrap a series of cmdlet
calls in a high-level operation by way of the Start-LogHighLevelOperation
and Stop-LogHighLevelOperation cmdlets.

The following parameters are available when using New-Item relative to a
connection or hosting unit.

-ItemType <string>
Specifies the type of item to create when invoked relative to a connection
or hosting unit. Supported ItemType values are:

SecurityGroup (cloud only)

-Description
Specifies a description for the security group.

-VpcId
Specifies a VPC ID for the security group.

Get-Item

Get-ChildItem (alias dir)

Rename-Item

Remove-Item

The following additional parameters are available.

AdminAddress
Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-LoggingId <String>
Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

You can specify the Path parameter by name or by using the unique identifier for the connection or hosting unit enclosed in braces. For example:

-Path XDHyp:\{1233-3213ACDF-12323}

The Filter parameter is not supported. Virtual machines created by the Machine Creation Service are returned only if the -Force parameter is used or if virtual machine tagging was disabled on the hosting unit with the NoVmTagging parameter when the VMs were created.

The following parameters are available when using Set-Item in the Connections directory.

-UserName <String>, -Password <String>, -SecurePassword <SecureString>
Specifies the credentials for the connection to the hypervisor. The password can be given as either Password or SecurePassword, but not both. The UserName parameter and either Password or SecurePassword specify the same information as the HypervisorCredential parameter, so use of one precludes use of the other.

-HypervisorCredential <PSCredential>
Specifies credentials for the connection to the hypervisor. The HypervisorCredential parameter specifies the same information as the UserName parameter and either Password or SecurePassword, so use of one precludes use of the other.

-HypervisorAddress <string[]>
Specifies the addresses of the hypervisor that this connection represents. This replaces all existing addresses.

-LoggingId <String>
Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

-MaintenanceMode <Boolean>
Places the connection into maintenance mode which disables all communication between XenDesktop and the Hypervisor. Use this mode when making changes to the hypervisor; for instance, if the password for the access account needs to be changed.

-AdminAddress <String>
Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command tries to use a local Host Service.

The Credential parameter is not supported. Addresses can be modified with the Add-HypHypervisorConnectionAddress and Remove-HypHypervisorConnectionAddress commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The following parameters are available when using New-Item in the

HostingUnits directory.

-Name
Specifies the name of the hosting unit, which must not contain any of the following characters: \/;:#.*?=<>|[]()"'{}. The Name parameter is optional but, if not included, the hosting unit name must be provided as part of the Path parameter.

-NetworkPath <String>
Specifies the path in a connection to the network item that is used when the Machine Creation Service creates new virtual machines.

-NoVmTagging
Specifies that new virtual machines are not tagged with metadata from the hypervisor. By default, all virtual machines created by the Machine Creation Service are tagged to show they are created by XenDesktop. These tags are used by the provider to restrict the list of virtual machines displayed when viewing the content of the Connections or HostingUnit paths. If this parameter is not included, all virtual machines are displayed at all times.

-AdminAddress <String>
Specifies the address of the Host Service that the command communicates with. After it is set, this address is used for all commands in the Host Service PowerShell snap-in. If this parameter is not included or set by another command, or if Set-HypAdminConnection has not been used, the command attempts to use a local Host Service.

-UseLocalStorageCaching <bool>
When Get-HypServiceAddedCapability indicates that the LocalStorageCaching feature is available, use this parameter to specify that the virtual machines created for this hosting unit will use local storage caching for their disk images.

-LoggingId <String>
Specifies the identifier of the high-level operation that this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Storage can be modified with the Add-HypHostingUnitStorage and Remove-HypHostingUnitStorage commands. Metadata can be modified with the Add-HypMetadata and Remove-HypMetadata commands.

The item types returned when these commands are used in the Host Service provider are defined in the Object Definitions section below.

EXAMPLES

To Create a Persistent Hypervisor Connection

```
new-item -path "xdhyp:\Connections" -Name MyConn -ConnectionType
   XenServer -HypervisorAddress "http:\\address" -UserName user
   -Password password -Persist

PSPath:                Citrix.HostingUnitService.Admin.V1.0\
                       Citrix.Hypervisor::XDHyp:\Connections\MyConn
PSParentPath:          Citrix.HostingUnitService.Admin.V1.0\
                       Citrix.Hypervisor::XDHyp:\Connections
PSChildName:           MyConn
PSDrive:               XDHyp
PSProvider:            Citrix.HostingUnitService.Admin.V1.0\
                       Citrix.Hypervisor
PSIsContainer:         True
HypervisorConnectionUid:  04e6daa2-5cbd-4491-b70c-6daf733ee82a
HypervisorConnectionName: MyConn
ConnectionType:        XenServer
HypervisorAddress:     {http:\\address}
UserName:              user
Persistent:            True
PluginId:              XenFactory
SupportsPvsVMs:        True
Revision:              1b0b0d02-bc1b-49d8-b2b0-be6fb7f150ad
MaintenanceMode:       False
Metadata:              {MaxAbsoluteActiveActions = 100,
                       MaxAbsoluteNewActionsPerMinute = 100,
                       MaxPowerActionsPercentageOfDesktops = 20}
```

To Create a Hosting Unit

```
new-item -Path "xdhyp:\HostingUnits"
   -Name MyHU
   -HypervisorConnectionName MyConn
   -RootPath XDHYP:\Connections\MyConn
   -NetworkPath XDHYP:\Connections\MyConn\Network 0.network
   -StoragePath XDHYP:\Connections\MyConn\Local storage on
   myXenServer.storage

PSPath:            Citrix.HostingUnitService.Admin.V1.0\
                   Citrix.Hypervisor::XDHyp:\HostingUnits\MyHU
PSParentPath:      Citrix.HostingUnitService.Admin.V1.0\
                   Citrix.Hypervisor::XDHyp:\HostingUnits
```

PSChildName: MyHU
PSDrive: XDHyp
PSProvider: Citrix.HostingUnitService.Admin.V1.0\
Citrix.Hypervisor
PSIsContainer: True
HostingUnitUid: df91f886-1141-4280-bd59-2ee260a4df79
HostingUnitName: MyHU
HypervisorConnection: MyConn
RootPath: /
RootId:
NetworkPath: /Network 0.network
NetworkId: ab47080b-ca15-771a-c8dc-6ad9650158f1
Storage: {/Local storage on myXenServer.storage}
VMTaggingEnabled: True
Metadata: {}

Relative paths can be used for all parameters.

OBJECT DEFINITIONS

Citrix.XDInterServiceTypes.HypervisorConnection

The hypervisor connection object is returned when a connection item is
located. This item has the following parameters.

HypervisorConnectionUid <Guid>
Specifies the unique identifier for the connection item.

HypervisorConnectionName <String>
Specifies the name of the connection item.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>
Specifies the type of hypervisor that the connection is for.
Supported hypervisor types are:

XenServer
SCVMM (Microsoft Hyper-V)
vCenter (VMware vSphere/ESX)
Custom

HypervisorAddress <String[]>
Specifies the addresses that can be used to contact the
required hypervisor.

Username <String>
Specifies the administrator user name for the connection to the hypervisor
(from the user name and password given as administrator credentials when

setting up this connection)

Persistent <Boolean>
Specifies whether or not the connection is persistent.

PluginId <String>
Specifies the Citrix Managed Machine class identifier for the hypervisor.

SupportsPvsVM <Boolean>
Specifies whether or not the connection can be used as part of a hosting unit. If this parameter is set to 'True', a hosting unit referencing this connection can be created.

Revision <Guid>
A unique identifier that is changed every time any properties of the connection are changed.

MaintenanceMode <Boolean>
Specifies whether or not the connection is currently in maintenance mode.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>
The collection of metadata associated with the connection.

Citrix.XDInterServiceTypes.HostingUnit

The hosting unit object is returned when a hosting unit item is located. This item has the following parameters.

HostingUnitName <String>
Specifies the name of the hosting unit.

HostingUnitUid <Guid>
Specifies the unique identifier for the hosting unit.

HypervisorConnection <Citrix.XDInterServiceTypes.HypervisorConnection>
Specifies the hypervisor connection item that the hosting unit references.

NetworkId <String>
Specifies the unique identifier for the network in the hypervisor context that the hosting unit references.

NetworkPath <String>
Specifies the path to the network in the Host Service provider.

RootId <String>
Specifies the unique identifier for the root connection item in the hypervisor context that the hosting unit references.

RootPath <String>
Specifies the path to the root of the hosting unit from within the Host Service provider.

Storage <Citrix.XDInterServiceTypes.Storage[]>
Specifies the collection of storage objects that are defined for use as part of the hosting unit. This object contains the following parameters.

StorageID <String>
Specifies the identifier for the storage in the hypervisor context.

StoragePath <String>
Specifies the path to the storage in the Host Service provider.

VMTaggingEnabled <Boolean>
Specifies whether or not virtual machine metadata is used to tag virtual machines created by XenDesktop.

Metadata <Citrix.XDInterServiceTypes.Metadata[]>
Specifies the collection of metadata associated with the hosting unit.

Citrix.HostingUnitService.Sdk.HypervisorObject

The hypervisor object is returned when any item is located from within a Connection or HostingUnit folder. This item has the following parameters.

AdditionalData <Dictionary<String,String>
Stores extra untyped data for the item. This dictionary contains different information for each item type.

For Storage Items
Key = StorageType
Values = Shared or Local

For VM Items

Key = PowerState Values = PoweredOn,

PoweredOff,

Suspended,
TransitioningToOn,
TransitioningToOff,
Suspending,
Resuming,
Unknown,
Error

Name <String>
Specifies the name of the item.

FullName <String>
Specifies the name with the appropriate file extension.

ObjectPath <String>
Specifies the relative path to the item from the root of the connection of which the item is part.

FullPath <String>
Specifies the absolute path to the item in the Citrix.Hypervisor provider.

Id <String>
Specifies the identity of the item in the hypervisor context.

IsContainer <Boolean>
Specifies whether or not the item can contain other items.

IsSymLink <Boolean>
Specifies whether or not the item can be used as a RootPath of a hosting unit.

ObjectType <Citrix.HostingUnitService.Sdk.NodeType>
Specifies the item type.

ERROR CODES

The provider commands can return the following error codes.

New-Item

ConnectionNameOrUidInvalid
The name or unique identifier of the hypervisor connection

specified for the hosting unit is invalid.

HostingUnitRootPathInvalid
The root path specified for the hosting unit is invalid. The root path must be a valid item in the hypervisor tree and a SymLink.

HostingUnitNetworkPathInvalid
The network path specified for the hosting unit is invalid. The network path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitStoragePathInvalid
The storage path specified for the hosting unit is invalid. The storage path must be a valid item in the hypervisor tree and relative to the root path.

HostingUnitDuplicateObjectExists
A hosting unit object with the same name already exists. Hosting unit names must be unique.

HostingUnitStorageDuplicateObjectExists
A hosting unit storage object with the same storage path already exists for this hosting unit. There can be only one object for each combination of hosting unit and storage path.

HypervisorNotContactable
The hypervisor could not be contacted at the supplied address, which is either invalid or unreachable.

HypervisorAddressInvalidFormat
The address is not in a valid form for the specified hypervisor type.

ConnectionAddressInvalid
The specified address is invalid and does not belong to the same pool.

HypervisorConnectionDuplicateObjectExists
A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

HypervisorConnectionAddressDuplicateObjectExists
A hypervisor connection address object with the same address already exists for this hypervisor connection. There can be only one object for each combination of hypervisor connection and address.

HypervisorConnectionForHostingUnitIsVirtual
The specified hypervisor connection for the hosting unit is a virtual

non-persistent connection. A persistent connection is required when creating a hosting unit.

InputNameInvalid
The name specified for the hosting unit or hypervisor connection
is invalid because it contains one or more of the following characters:
\/;:#.*?=<>|[]()"'{}.

InputPathInvalid
The specified path is invalid because it is not in one of the following
formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections\{Guid}

ExceptionThrown
An unexpected error occurred.

DatabaseError
There was a problem communicating with the database.

CommunicationError
There was a problem communicating with the remote service.

PermissionDenied
The user does not have administrative rights to perform this operation.

ScopeNotFound
One or more of the scopes nominated for the new connection do not exist.

CannotCreateSecurityGroupHere
Security groups can only be created in a virtual private cloud (VPC).

Get-Item and Get-ChildItem

HypervisorConnectionObjectNotFound
The hypervisor connection object specified in the path could not be
found.

HostingUnitObjectNotFound
The specified hosting unit object could not be found.

HypervisorInMaintenanceMode

The hypervisor for the specified connection is currently in
maintenance mode and cannot be accessed.

FailureToRetrieveConnectionPassword
The password for the HypervisorConnection cannot be retrieved or decrypted.

ExceptionThrown
An unexpected error occurred.

DatabaseError
There was a problem communicating with the database.

CommunicationError
There was a problem communicating with the remote service.

Remove-Item

HostingUnitObjectToDeleteDoesNotExist
The specified hosting unit object does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist
The specified hypervisor connection object does not exist.

InputPathInvalid
The specified path is invalid because it is not in one of the following
formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections\{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits\{Guid}

HypervisorConnectionObjectToDeleteIsInUse
The specified hypervisor connection object cannot be deleted
because it is being used by one or more hosting units.

ExceptionThrown
An unexpected error occurred.

DatabaseError
There was a problem communicating with the database.

CommunicationError
There was a problem communicating with the remote service.

ObjectCannotBeRemoved
The specified object cannot be removed.

Rename-Item

InputPathInvalid
The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections\{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits\{Guid}

HostingUnitDuplicateNameExists
A hosting unit object with the same name already exists. Hosting unit names must be unique.

HypervisorConnectionDuplicateNameExists
A hypervisor connection object with the same name already exists. Hypervisor connection names must be unique.

InputNameInvalid
The new name specified for the hosting unit or hypervisor connection is invalid because it contains one or more of the following characters: \/;:#.*?=<>|[]()"'{}.

ExceptionThrown
An unexpected error occurred.

DatabaseError
There was a problem communicating with the database.

CommunicationError
There was a problem communicating with the remote service.

Set-Item

InputPathInvalid
The specified path is invalid because it is not in one of the following formats:

XDHyp:\Connections\<Name>
XDHyp:\Connections\{Guid}
XDHyp:\HostingUnits\<Name>
XDHyp:\HostingUnits\{Guid}

HostingUnitObjectToUpdateDoesNotExist
The specified hosting unit object does not exist.

HostingUnitNetworkPathInvalid
The new network path specified for the hosting unit is invalid. Either the network path does not exist or it is not relative to the root path of the hosting unit.

HypervisorConnectionObjectToUpdateDoesNotExist
The specified hypervisor connection object does not exist.

ExceptionThrown
An unexpected error occurred.

DatabaseError
There was a problem communicating with the database.

DatabaseNotConfigured
The operation could not be completed because the database for the service is not configured.

DataStoreException
An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

CommunicationError
There was a problem communicating with the remote service.

about_Hyp_Filtering

Apr 15, 2014

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

Add-HypHostingUnitMetadata

Apr 15, 2014

Adds metadata on the given HostingUnit.

Syntax

Add-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHostingUnitMetadata [-HostingUnitName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHostingUnitMetadata [-HostingUnitName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given HostingUnit objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHostingUnitMetadata cmdlet instead.

Related topics

Set-HypHostingUnitMetadata

Remove-HypHostingUnitMetadata

Parameters

-HostingUnitUid<Guid>

Id of the HostingUnit

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HostingUnitName<String>

Name of the HostingUnit

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<HostingUnit[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the HostingUnit specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.Metadata

Add-HypHostingUnitMetadata returns an array of objects containing the new definition of the metadata.

\n Property <string>

\n Specifies the name of the property.

\n Value <string>

\n Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Add-HypHostingUnitMetadata -HostingUnitUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Property                       Value
    --------                      -----
    property                       value
```

Add metadata with a name of 'property' and a value of 'value' to the HostingUnit with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Add-HypHostingUnitNetwork

Apr 15, 2014

Makes additional hypervisor networks available for use in a HostingUnit.

Syntax

Add-HypHostingUnitNetwork [-LiteralPath] <String> [-NetworkPath] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to extend the set of hypervisor networks that are made available through the HostingUnit to the Citrix Machine Creation Service. When new machines are created, their virtual NICs can be associated only with networks that are in this set. This command cannot be used if the connection for the hosting unit is in maintenance mode.

Related topics

New-Item

Add-HypMetadata

remove-HypHostingUnitNetwork

Parameters

-LiteralPath<String>

Specifies the path to the hosting unit to which the network will be added. The path must be in one of the following formats: <drive>:\HostingUnits\<HostingUnitName> or <drive>:\HostingUnits\{<HostingUnit Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	false

-NetworkPath<String>

Specifies the path to the network that will be added. The path must be in one of the following formats: <drive>:\Connections\<ConnectionName>\MyNetwork.network or <drive>:\Connections\{<Connection Uid>}\MyNetwork.network or <drive>:\HostingUnits\<HostingUnitName>\MyNetwork.network or <drive>:\HostingUnits\{<hostingUnit Uid>}\MyNetwork.network

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. This can be a host name or an IP address.

Required?	false

Default Value	LocalHost. When a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Add-HypHostingUnitNetwork (NetworkPath parameter).

Return Values

Citrix.Host.Sdk.HostingUnit

Add-HypHostingUnitNetwork returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.Host.Sdk.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the default network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the default network specified for the hosting unit.

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

PermittedNetworks <Citrix.Host.Sdk.Network[]>

A full list of the hypervisor networks that are exposed for use in the hosting unit.

Notes

The network path must be valid for the hosting unit. The rules that are applied are as follows: XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The network path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

NA

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkPathInvalid

The specified path is invalid.

HostingUnitNetworkPathInvalid

The network path cannot be found or is invalid. See notes above about validity.

HostingUnitNetworkDuplicateObjectExists

The specified network path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

------------------------- EXAMPLE 1 -------------------------

```
c:\PS>Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\newNetwork.network'

    HostingUnitUid      : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
    HostingUnitName     : MyHostingUnit
    HypervisorConnection : MyConnection
    RootPath            : /
    RootId              :
    NetworkPath         : /Network 0.network
    NetworkId           : ab47080b-ca15-771a-c8dc-6ad9650158f1
    Storage             : {/Local storage.storage}
    PersonalvDiskStorage : {}
```

```
    VMTaggingEnabled     : True
    Metadata             : {}
    PermittedNetworks    : {/Network 0.network, /newNetwork.network}
```
The command adds a new network called "newNetwork.network" to the hosting unit called "MyHostingUnit".

---------- EXAMPLE 2 ----------

```
XDHyp:\HostingUnits\MyHostingUnit>Add-HypHostingUnitNetwork -LiteralPath . -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\newNetwork.network'

    HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
    HostingUnitName      : MyHostingUnit
    HypervisorConnection : MyConnection
    RootPath             : /
    RootId               :
    NetworkPath          : /Network 0.network
    NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
    Storage              : {/Local storage.storage}
    PersonalvDiskStorage : {}
    VMTaggingEnabled     : True
    Metadata             : {}
    PermittedNetworks    : {/Network 0.network, /newNetwork.network}
```
The command adds a new network called "newNetwork.network" to the current directory. The dot (.) represents the current location (not its contents).

---------- EXAMPLE 3 ----------

```
XDHyp:\HostingUnits\MyHostingUnit>dir *.network | Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\MyHostingUnit
```
The command adds all of the networks that are available in the hosting unit to the specified hosting unit.

---------- EXAMPLE 4 ----------

```
c:\PS>Add-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\newNetwork.network'

    HostingUnitUid       : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
    HostingUnitName      : MyHostingUnit
    HypervisorConnection : MyConnection
    RootPath             : /
    RootId               :
    NetworkPath          : /Network 0.network
    NetworkId            : ab47080b-ca15-771a-c8dc-6ad9650158f1
    Storage              : {/Local storage.storage}
    PersonalvDiskStorage : {}
    VMTaggingEnabled     : True
    Metadata             : {}
    PermittedNetworks    : {/Network 0.network, /newNetwork.network}
```
The command adds a new network location called "newNetwork.network" to the hosting unit called "MyHostingUnit".

Add-HypHostingUnitStorage

Apr 15, 2014

Adds storage locations to a hosting unit.

Syntax

Add-HypHostingUnitStorage [-LiteralPath] <String> [-StoragePath] <String> [-StorageType <StorageType>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to add storage locations for storing the hard disks required by the virtual machines created by the Citrix Machine Creation Service. You cannot use this command if the connection for the hosting unit is in maintenance mode.

Related topics

New-Item

Add-HypMetadata

remove-HypHostingUnitStorage

Parameters

-LiteralPath<String>

Specifies the path to the hosting unit to which storage will be added. The path must be in one of the following formats: <drive>:\HostingUnits\<HostingUnitName> or <drive>:\HostingUnits\{<HostingUnit Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	false

-StoragePath<String>

Specifies the path to the storage that will be added. The path must be in one of the following formats: <drive>:\Connections\<ConnectionName>\MyStorage.storage or <drive>:\Connections\{<Connection Uid>}\MyStorage.storage or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage or <drive>:\HostingUnits\{<hostingUnit Uid>}\MyStorage.storage

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-StorageType<StorageType>

Specifies the type of storage in StoragePath. Supported storage types are: OSStorage PersonalvDiskStorage

Required?	false
Default Value	OSStorage
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. This can be a host name or an IP address.

Required?	false
Default Value	LocalHost. When a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).

Return Values

Citrix.Host.Sdk.HostingUnit

Add-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.Host.Sdk.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.Host.Sdk.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

The storage path must be valid for the hosting unit. The rules that are applied are as follows: XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The storage path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStoragePathInvalid

The specified path is invalid.

HostingUnitStoragePathInvalid

The storage path cannot be found or is invalid. See notes above about validity.

HostingUnitStorageDuplicateObjectExists

The specified storage path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Add-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\newStorage.storage'

    HostingUnitUid      : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
    HostingUnitName     : MyHostingUnit
    HypervisorConnection : MyConnection
    RootPath            : /
    RootId              :
    NetworkPath         : /Network 0.network
    NetworkId           : ab47080b-ca15-771a-c8dc-6ad9650158f1
    Storage             : {/Local storage.storage, /newStorage.storage}
    PersonalvDiskStorage : {/newStorage.storage}
    VMTaggingEnabled    : True
    Metadata            : {}
```

The command adds a new storage location called "newStorage.storage" to the hosting unit called "MyHostingUnit".

---------- EXAMPLE 2 ----------

```
XDHyp:\HostingUnits\MyHostingUnit>Add-HypHostingUnitStorage -LiteralPath . -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\newStorage.storage' -StorageType OSStorage

    HostingUnitUid      : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
    HostingUnitName     : MyHostingUnit
    HypervisorConnection : MyConnection
    RootPath            : /
    RootId              :
    NetworkPath         : /Network 0.network
    NetworkId           : ab47080b-ca15-771a-c8dc-6ad9650158f1
    Storage             : {/Local storage.storage, /newStorage.storage}
    PersonalvDiskStorage : {/Local storage.storage}
    VMTaggingEnabled    : True
    Metadata            : {}
```

The command adds a new storage location called "newStorage.storage" to the current directory. The dot (.) represents the current location (not its contents).

---------- EXAMPLE 3 ----------

```
XDHyp:\HostingUnits\MyHostingUnit>dir *.storage | Add-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit
```

The command adds all of the storage that is available in the hosting unit to the specified hosting unit.

---------- EXAMPLE 4 ----------

```
c:\PS>Add-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\newStorage.storage' -StorageType PersonalvDiskStorage

    HostingUnitUid      : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
    HostingUnitName     : MyHostingUnit
    HypervisorConnection : MyConnection
    RootPath            : /
    RootId              :
    NetworkPath         : /Network 0.network
    NetworkId           : ab47080b-ca15-771a-c8dc-6ad9650158f1
    Storage             : {/Local storage.storage}
```

```
    PersonalvDiskStorage : {/Local storage.storage, /newStorage.storage}
    VMTaggingEnabled     : True
    Metadata             : {}
```

The command adds a new storage location called "newStorage.storage" to the hosting unit called "MyHostingUnit".

Add-HypHypervisorConnectionAddress

Apr 15, 2014

Add a connection address to a hypervisor connection.

Syntax

Add-HypHypervisorConnectionAddress [-LiteralPath] <String> [-HypervisorAddress] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to add addresses by which a hypervisor can be contacted. All addresses added to a single hypervisor connection are assumed to be equivalent (i.e. they all result in the ability to communicate with the same hypervisors). The hypervisor that the addresses reference is stored at the point of creation of the hypervisor connection. Once this is done, to be valid, all addresses must resolve to this hypervisor.

The addresses required are; XenServer - The address of the XenServer machines (must all reference the same XenServer pool). VMWare vSphere/ESX - The address of a vCenter Server. Microsoft SCVMM/Hyper-V - the address of an SCVMM server.

Related topics

Remove-HypHypervisorConnectionAddress

Get-HypXenServerAddress

Parameters

-LiteralPath<String>

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats; <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections\{HypervisorConnection Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	false

-HypervisorAddress<String>

Specifies the address to be used. The address will be validated and the hypervisor must be contactable at the address supplied.

XenServer (ConnectionType = XenServer) The address being added must reference the same XenServer pool referenced by any existing addresses for the same connection. VMware vSphere\ESX (ConnectionType = vCenter) The address being added must be to the same VMware vCenter as the existing addresses. SCVMM\Hyper-v (ConnectionType = SCVMM) The address being added must be to the same SCVMM server as the existing addresses. Custom Connection Types ?Validation here I assume none need to check? #PUBS NOTE: ASSUME THIS TO BE UPDATED?#

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.HypervisorConnection

Add-HypHypervisorConnectionAddress returns an object containing the new definition of the hypervisor connection.

HypervisorConnectionUid <Guid>

Specifies the unique identifier for the hypervisor connection.

HypervisorConnectionName <string>

Specifies the name of the hypervisor connection.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

Specifies the connection type of the connection.

XenServer - A Citrix XenServer hypervisor

SCVMM - A Microsoft SCVMM/Hyper-V hypervisor

vCenter - A VMWare vSphere/ESX hypervisor

Custom - A 3rd party hypervisor

HypervisorAddress <string[]>

A list of addresses that can be used to communicate with the hypervisor.

UserName <string>

The user name that is used when connecting to the hypervisor.

Persistent <Boolean>

Indicates whether the connection is stored in the database or is a temporary connection only with the same lifetime as the current Powershell session.

PlugInId <string>

The Citrix identifier for the Citrix Machine Management plug-in.

Revision <Guid>

Identifier for the current version of the hypervisor connection. This value changes every time a property of the hypervisor connection is updated.

SupportsPvsVMs <Boolean>

Indicates whether or not the connection can be used as part of a hosting unit and therefore used by the Citrix XenDesktop Machine Creation Service to create virtual machines. Only the built-in supported hypervisor connection types can be used for this (i.e. XenServer, SCVMM and vCenter).

Metadata <Citrix.Host.Sdk.Metadata[]>

A list of key value pairs that can store additional information relating to the hosting unit.

Notes

The address format must be valid for the hypervisor connection. The rules that are applied are as below: XenServer (HypervisorConnection Type = XenServer)

http:\\<IP Address>

or http:\\<server Name>

or https:\\<server Name>

Note: To use multiple addresses to the same XenServer pool to provide failover functionality, all XenServers in the pool must have a shared block storage device. If the use of https connections and failover is required, the certificates on the servers must be trusted by all of the controllers (typically this means having a root certificate installed).

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

http:\\<IP Address>\<sdk path>

http:\\<server Name>\<sdk path>

or https:\\<Server Name>\<sdk path>

Notes:

* Http requires manual vCenter configuration; https is the only supported default format.

* Default sdk path is 'sdk'

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

IP Address

server Name (short or FQDN)

Note: If XenServers are moved to new XenServer pools after being added to a hypervisor connection, unpredictable results can occur.

Once a XenServer is assigned to a hypervisor connection, it must not be moved to a new XenServer pool.

In the case of failure the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a sub directory of a hosting unit item.

HypervisorConnectionAddressForeignKeyObjectDoesNotExist

The hypervisor connection to which the address is to be added could not be located.

ConnectionAddressInvalid

The address could not be used to contact a hypervisor or the validation rules have not been met.

HypervisorConnectionAddressDuplicateObjectExists

The address specified is already part of the hypervisor connection.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Add-HypHypervisorConnectionAddress -LiteralPath XDHyp:\Connections\MyConnection -HypervisorAddress http:\\myserver.com
```

```
PSPath                : Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor::XDHyp:\Connections\MyConnection
PSParentPath          : Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor::XDHyp:\Connections
PSChildName           : MyConnection
PSDrive               : XDHyp
PSProvider            : Citrix.HostingUnitService.Admin.V1.0\Citrix.Hypervisor
PSIsContainer         : True

ConnectionType        : XenServer
HypervisorAddress     : {http:\\myserver2.com,http:\\myserver.com}
UserName              : root
Persistent            : False
PluginId              : XenFactory
SupportsPvsVMs        : True
Revision              : 4c95c857-c54d-4f92-abef-0cce32c02502
Metadata              :
Add the address 'http:\\myserver.com' to the hypervisor connection called "MyConnection".
```

Add-HypHypervisorConnectionMetadata

Apr 15, 2014

Adds metadata on the given HypervisorConnection.

Syntax

Add-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given HypervisorConnection objects. This cmdlet will not overwrite existing metadata on an object - use the Set-HypHypervisorConnectionMetadata cmdlet instead.

Related topics

Set-HypHypervisorConnectionMetadata

Remove-HypHypervisorConnectionMetadata

Parameters

-HypervisorConnectionUid<Guid>

Id of the HypervisorConnection

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HypervisorConnectionName<String>

Name of the HypervisorConnection

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<HypervisorConnection[]>

Objects to which the metadata is to be added.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the HypervisorConnection specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.Metadata

Add-HypHypervisorConnectionMetadata returns an array of objects containing the new definition of the metadata.

\n Property <string>

\n Specifies the name of the property.

\n Value <string>

\n Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Add-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

```
Property                Value
--------                -----
property                value
```

Add metadata with a name of 'property' and a value of 'value' to the HypervisorConnection with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Add-HypHypervisorConnectionScope

Apr 15, 2014

Add the specified HypervisorConnection(s) to the given scope(s).

Syntax

Add-HypHypervisorConnectionScope [-Scope] <String[]> -InputObject <HypervisorConnection[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The AddHypHypervisorConnectionScope cmdlet is used to associate one or more HypervisorConnection objects with given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:

- HypervisorConnection objects can be piped in or specified by the InputObject parameter

- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid

- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To add a HypervisorConnection to a scope you need permission to change the scopes of the HypervisorConnection and permission to add objects to all of the scopes you have specified.

If the HypervisorConnection is already in a scope, that scope will be silently ignored.

Related topics

Remove-HypHypervisorConnectionScope

Get-HypScopedObject

Parameters

-Scope<String[]>

Specifies the scopes to add the objects to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-InputObject<HypervisorConnection[]>

Specifies the HypervisorConnection objects to be added.

Required?	true
Default Value	

Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HypervisorConnectionUid<Guid[]>

Specifies the HypervisorConnection objects to be added by HypervisorConnectionUid.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HypervisorConnectionName<String[]>

Specifies the HypervisorConnection objects to be added by HypervisorConnectionName.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

None

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Add-HypHypervisorConnectionScope Finance -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single HypervisorConnection to the 'Finance' scope.

---------- EXAMPLE 2 ----------

c:\PS>Add-HypHypervisorConnectionScope Finance,Marketing -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single HypervisorConnection to the multiple scopes.

---------- EXAMPLE 3 ----------

c:\PS>Get-HypHypervisorConnection | Add-HypHypervisorConnectionScope Finance
Adds all visible HypervisorConnection objects to the 'Finance' scope.

---------- EXAMPLE 4 ----------

c:\PS>Add-HypHypervisorConnectionScope Finance -HypervisorConnectionName A*
Adds HypervisorConnection objects with a name starting with an 'A' to the 'Finance' scope.

Add-HypMetadata

Apr 15, 2014

Adds metadata to a hypervisor connection or a hosting unit.

Syntax

Add-HypMetadata [-LiteralPath] <String> [-Property] <String> [-Value] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to store additional custom data against a hosting unit or hypervisor connection. This data is not used by the Machine Creation Service, and is provided only for consumers of the services to store any data that may be required for their operations. The metadata is returned along with the hypervisor connection or hosting unit that it is assigned to.

Related topics

Remove-HypMetadata

Parameters

-LiteralPath<String>

Specifies the path within a hosting unit provider to the hosting unit or hypervisor connection item to which to add the metadata. The path specified must be in one of the following formats: <drive>:\HostingUnits\<HostingUnitName> or <drive>:\HostingUnits\{<HostingUnit Uid> or <drive>:\Connections\<Connection Name> or <drive>:\Connections\{<Connection Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Property<String>

Specifies the property name of the metadata to be added. The property must be unique for the item specified by the path.

The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string the contains a path to Add-HypMetadata (Path parameter).

Return Values

Citrix.Host.Sdk.Metadata

Add-HypMetadata returns an object containing the new definition of the metadata.

Property <string>

Specifies the property of the metadata.

Value <string>

Specifies the value of the metadata.

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataForeignKeyObjectDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionMetadataForeignKeyObjectDoesNotExist

The hypervisor connection supplied in the path does not exist.

HostingUnitMetadataDuplicateObjectExists

Metadata for the specified hosting unit item already exists with the same property name.

HypervisorConnectionMetadataDuplicateObjectExists

Metadata for the specified hypervisor connection item already exists with the same property name.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Add-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -Property MyProperty -Value MyValue

Property                       Value
--------                       -----
MyProperty                     MyValue
```

The command adds the metadata with the property name of "MyProperty" and value of "MyValue" to the hypervisor connection item called "MyConnection".

---------- EXAMPLE 2 ----------

```
c:\PS>dir xdhyp\connections\Citrix* | Add-HypMetadata -Property MyProperty -Value MyValue

Property                       Value
--------                       -----
MyProperty                     MyValue
MyProperty                     MyValue
MyProperty                     MyValue
```

The command adds the metadata with the property name of "MyProperty" and value of "MyValue" to all the hypervisor connection items that begin with the string "Citrix".

Get-HypConfigurationDataForItem

Apr 15, 2014

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

Syntax

Get-HypConfigurationDataForItem [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHyp:\Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in, the only provider items that can be used with this operation are VM items. For a VM, this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (in GB).

Related topics

Get-Item

Parameters

-LiteralPath<String>

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats; <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Return Values

PSObject

Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item

CPUCount <int>

Specifies the number of CPUs assigned to the VM.

MemoryMB <int>

The amount of memory allocated to the VM.

HardDiskSizeGB <int>

The capacity of the primary hard drive assigned to the VM.

Notes

For this release, this cmdlet provides only configuration data for VM objects in the provider. Using a path to an item that is not a VM results in a error.

In the case of failure the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied

The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm

CpuCount                MemoryMB                HardDiskSizeGB
--------                --------                --------------
1                       1024                    24
```

This command gets the configuration properties for a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

---------- EXAMPLE 2 ----------

```
XDHyp:\HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\MyVm.vm

CpuCount                MemoryMB                HardDiskSizeGB
--------                --------                --------------
1                       1024                    24
```

This command gets the configuration properties for a VM called 'MyVm.vm' within the current directory. The dot (.) represents the current location (not its contents).

---------- EXAMPLE 3 ----------

```
C:\PS>(Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm).CPUCount
```

This command gets the CPU count for a VM called 'MyVm.vm'. The CPUCount is just one property of the VM items. To see all properties of an item, type "(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member".

Get-HypConfigurationObjectForItem

Apr 15, 2014

Retrieves the configuration data for an item in the Host Service provider path. Note: For this release, only VM items are supported for this operation.

Syntax

Get-HypConfigurationObjectForItem [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command provides a mechanism for retrieving extra data about an entry in the hosting unit service provider. The referenced item must be contained within the connections directory in the provider (i.e. XDHyp:\Connections).

This mechanism is used for obtaining data that is not required frequently and/or has a high overhead associated with its retrieval (so as to maintain the responsiveness of the provider). For this release of the PowerShell snap-in the only provider items that can be used with this operation are VM items. For a VM this provides a mechanism to obtain the number of CPUs, the amount of Memory (in MB) and hard disk drive capacity (GB).

Related topics

Get-Item

Parameters

-LiteralPath<String>

Specifies the path within a hosting unit provider to the item for which configuration data is to be retrieved. The path specified must be in one of the following formats; <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string the contains a path to Get-HypConfigurationDataForItem

Return Values

PSObject

Get-HypConfigurationDataForItem returns a PSObject containing the properties that are appropriate for the item specified by the path.

Properties for VM Item

CPUCount <int>

Specifies the number of CPUs assigned to the VM.

MemoryMB <int>

The amount of memory allocated to the VM.

HardDiskSizeGB <int>

The capacity of the primary hard drive assigned to the VM.

Network Map

The networks that this Vm or Snaphot is connected to

Notes

For this release this cmdlet only provides configuration data for VM objects in the provider. Using a path to an item that is not a VM will result in a error.

In the case of failure the following errors can be produced.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

DatabaseError

An error occurred in the service whilst attempting a database operation.

DatabaseNotConfigured

The operation could not be completed as the database for the service is not configured.

DataStoreException

An error occurred in the service whilst attempting a database operation - communication to database failed for

for various reasons.

CommunicationError

An error occurred whilst communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

HypervisorPermissionDenied

The hypervisor login used does not provide authorization to access the data for this item.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm

CpuCount	MemoryMB	HardDiskSizeGB
1	1024	24

This command gets the configuration properties for a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

---------- EXAMPLE 2 ----------

XDHyp:\HostingUnits\PS>Get-HypConfigurationDataForItem -LiteralPath .\MyVm.vm

CpuCount	MemoryMB	HardDiskSizeGB
1	1024	24

This command gets the configuration properties for a VM called 'MyVm.vm' within the current directory. The dot (.) represents the current location (not its contents).

---------- EXAMPLE 3 ----------

C:\PS>(Get-HypConfigurationDataForItem -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm).CPUCount

This command gets the CPU count for a VM called 'MyVm.vm'. The CPUCount is just one property of the VM items. To see all properties of an item, type "(Get-HypConfigurationDataForItem <ItemPath>) | Get-Member".

Get-HypConnectionRegion

Apr 15, 2014

Enumerates the regions of a hypervisor connection that are based on cloud technology.

Syntax

Get-HypConnectionRegion [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to enumerate the available regions within a public or private cloud, when making hypervisor connections to cloud services. Sometimes, regions need to be selected and applied before the cloud connection can be used in a meaningful way. This cmdlet allows the supported regions to be listed so that one may be selected.

Once a region has been chosen, use the standard Set-Item provider cmdlet to select it. See the examples for further details.

This cmdlet may return no output, in which case the cloud connection can be considered "regionless" (or, implicitly, all within a single region). In such cases, there is no need to select a region, and the hypervisor connection can be used as is.

Related topics

Set-Item

Parameters

-LiteralPath<String>

Specifies the path to the hypervisor connection whose regions are being examined. This cmdlet is valid only for hypervisor connections that have the UsesCloudInfrastructure flag set to true. The path must be in one of the following formats: <drive>:\Connections\<ConnectionName> or <drive>:\Connections\{<Connection Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide a host name or an IP address.

Required?	false
Default Value	LocalHost. When a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Get-HypConnectionRegion (LiteralPath parameter).

Return Values

Citrix.Host.Sdk.HypervisorRegion

Get-HypConnectionRegion returns zero or more instances of the HypervisorConnectionRegion object, each of which contain the following properties:

Name <string> Specifies the unique name of the region. Endpoint <string> Specifies the URL endpoint that is specific to the region, if relevant. This may be an empty string, and is returned only for information purposes.

A full list of the hypervisor networks that are exposed for use in the hosting unit.

Notes

In the case of failure, the following errors can be produced.

Error Codes

ConnectionsPathInvalid

The path provided is not to an item in the Connections subdirectory of the host service provider.

HypervisorConnectionObjectNotFound

The path provided could not be resolved to an existing hypervisor connection. The name or GUID is invalid.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

ConnectionIsNotCloud

The hypervisor connection is not associated with cloud infrastructure, making it invalid to enumerate regions.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypConnectionRegions -LiteralPath XDHyp:\Connections\AWS

    RegionName        : us-east-1
    Endpoint          : ec2.us-east-1.amazonaws.com

    RegionName        : us-west-1
    Endpoint          : ec2.us-west-1.amazonaws.com

    RegionName        : eu-west-1
    Endpoint          : ec2.eu-west-1.amazonaws.com

    (...)

    c:\PS>Set-Item -Path XDHyp:\Connections\AWS -Region "us-east-1"
```

This sequence of commands enumerates the available regions of an Amazon AWS cloud connection, and then selects one of them for use in the connection.

Get-HypDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the Host Service.

Syntax

Get-HypDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-HypServiceStatus

Set-HypDBConnection

Test-HypDBConnection

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the Host Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the Host Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-HypDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the Host Service.

Get-HypDBSchema

Apr 15, 2014

Gets a script that creates the Host Service database schema for the specified data store.

Syntax

Get-HypDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new Host Service database schema, add a new Host Service to an existing site, remove a Host Service from a site, or create a database server logon for a Host Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Host Service instance, otherwise the scripts relate to Host Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Host SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to Host Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to Host Service roles

If ScriptType is Evict, the returned script contains:

o Removal of Host Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.

Related topics

Set-HypDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Host services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the Host Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further Host services to an existing database instance that already contains the full Host service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Host Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified Host Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Host services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the Host Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypDBSchema -DatabaseName MyDB -ServiceGroupName  MyServiceGroup > c:\HypSchema.sql
```

Get the full database schema for site data store of the Host Service and copy it to a file called 'c:\HypSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Host Service site schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-HypDBSchema -DatabaseName MyDB -scriptType Login > c:\HostLogins.sql
```

Get the logon scripts for the Host Service.

Get-HypDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the Host Service database schema.

Syntax

Get-HypDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Host Service from the current schema version to a different version.

Related topics

Get-HypInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Host services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-HypServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Host Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-HypDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-HypHypervisorPlugin

Apr 15, 2014

Gets the available hypervisor types.

Syntax

Get-HypHypervisorPlugin [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to retrieve a list of all the available hypervisor types, and their localized names.

Related topics

New-Item

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.HypervisorPlugin

Get-HypHypervisorPlugin returns a list of objects containing the definition of the hypervisor plug-ins.

ConnectionType <Citrix.XDInterServiceTypes.ConnectionType>

The hypervisor connection type. This can be one of the following:

XenServer - XenServer hypervisor

SCVMM - Microsoft SCVMM/Hyper-V

vCenter - VMWare vSphere/ESX

Custom - a third-party hypervisor

DisplayName <string>

The localized display name (localized using the locale of the Powershell snap-in session)

PluginFactoryName <string>

The name of the hypervisor plug-in factory used to manage the hypervisor connections.

Notes

To use third-party plug-ins, the plug-in assemblies must be installed into the appropriate location on each controller machine that forms part of the Citrix controller site. Failure to do this can result in unpredictable behavior, especially during service failover conditions.

In the case of failure the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS> Get-HypHypervisorPlugin | Format-Table -AutoSize

    ConnectionType DisplayName            PluginFactoryName
    -------------- -----------            -----------------
         SCVMM Microsoft virtualization MicrosoftPSFactory
       VCenter VMware virtualization    VmwareFactory
      XenServer Citrix XenServer        XenFactory
```

Get the available hypervisor management plug-ins.

Get-HypInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the Host Service.

Syntax

Get-HypInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the Host Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-HypInstalledDbVersion command returns objects containing the new definition of the Host Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Host Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the Host Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-HypInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the Host Service database schema for which upgrade scripts are supplied.

Get-HypScopedObject

Apr 15, 2014

Gets the details of the scoped objects for the Host Service.

Syntax

Get-HypScopedObject [-ScopeId <Guid>] [-ScopeName <String>] [-ObjectType <ScopedObjectType>] [-ObjectId <String>] [-ObjectName <String>] [-Description <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Related topics

Parameters

-ScopeId<Guid>

Gets scoped object entries for the given scope identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ScopeName<String>

Gets scoped object entries with the given scope name.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ObjectType<ScopedObjectType>

Gets scoped object entries for objects of the given type.

Required?	false

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ObjectId<String>

Gets scoped object entries for objects with the specified object identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ObjectName<String>

Gets scoped object entries for objects with the specified object identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Gets scoped object entries for objects with the specified description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.ScopedObject

The Get-HypScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
```

```
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     :
ScopeName   :
ObjectType  : Scheme
ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
ObjectName  : AnotherScheme
Description : Another scheme in no scopes
```

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.

Get-HypService

Apr 15, 2014

Gets the service record entries for the Host Service.

Syntax

Get-HypService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the Host Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.Service

The Get-HypServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the Host Service running in the current service group.

Get-HypServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the Host Service on the controller.

Syntax

```
Get-HypServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the Host Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

List containing added capabilities.

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypServiceAddedCapability
```

Get the added capabilities of the Host Service.

Get-HypServiceInstance

Apr 15, 2014

Gets the service instance entries for the Host Service.

Syntax

Get-HypServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the Host Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.ServiceInstance

The Get-HypServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

\n Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

\n Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

\n Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

\n Specifies the service instance type. For this service, the service instance type is always Hyp.

Address

\n Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

\n Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

\n Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

\n Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

\n Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

\n Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

\n SDK - for PowerShell operations

\n InterService - for operations between different services

\n Peer - for communications between services of the same type

Metadata <Citrix.Host.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypServiceInstance

Version : 1

Get all instances of the Host Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-HypServiceStatus

Apr 15, 2014

Gets the current status of the Host Service on the controller.

Syntax

Get-HypServiceStatus [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables the status of the Host Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-HypDBConnection

Test-HypDBConnection

Get-HypDBConnection

Get-HypDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-HypServiceStatus command returns an object containing the status of the Host Service together with extra diagnostics information.

DBUnconfigured

The Host Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on

with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

DBOlderVersionThanService

The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Host Service is running and is connected to a database containing a valid schema.

Failed

The Host Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-HypServiceStatus

DBUnconfigured
Get the current status of the Host Service.

Get-HypVMMacAddress

Apr 15, 2014

Retrieves a list the MAC addresses for the VMs in the specified connection.

Syntax

Get-HypVMMacAddress [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to obtain a list of MAC addresses of all the virtual machines in the specified connection.

Related topics

Get-Item

Parameters

-LiteralPath<String>

The path to a connection item in the hosting provider. Paths to anything other than a connection item will result in an error being returned. The path can be provided as either <drive>:\connections\<Connection Name> or <drive:>\connections\{<Connection Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Return Values

Citrix.Host.Sdk.HypervisorVMObject

Get-HypVMMMacAddress returns an object containing the following properties.

MacAddress <string> - specifies the MAC address of the VM.

VMId <string> - specifies the identifier for the VM as defined in the hypervisor hosting it.

Notes

The path must refer to a connection item. Hosting unit items are not valid.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

If the path is not provided in an expected format, an InputConnectionsPathInvalid error results.

HypervisorConnectionObjectNotFound

The hypervisor connection object specified cannot be found.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Get-HypVMMacAddress -LiteralPath XDHyp:\Connections\MyConnection

MacAddress                VMId
----------                ----
52:b0:1c:ed:60:fa         f3395d2a-a196-41c2-e37d-764acf871599
62:6f:f0:40:d5:af         5f4457b0-cc3c-f806-8ca7-5f57e4bdf2d1
4e:a5:9f:00:b2:0c         3115177b-85a9-d8ee-d0f9-0c7437483c09
```

This command gets the MAC addresses for the connection called "MyConnection".

---------- EXAMPLE 2 ----------

```
XDHyp:\Connections\MyConnection>Get-HypVMMacAddress -Path .

MacAddress                VMId
----------                ----
52:b0:1c:ed:60:fa         f3395d2a-a196-41c2-e37d-764acf871599
62:6f:f0:40:d5:af         5f4457b0-cc3c-f806-8ca7-5f57e4bdf2d1
4e:a5:9f:00:b2:0c         3115177b-85a9-d8ee-d0f9-0c7437483c09
```

This command gets the MAC addresses for the connection at the current directory. The dot (.) represents the current location (not its contents).

---------- EXAMPLE 3 ----------

```
C:\PS>Get-HypVMMacAddress -LiteralPath Xdhyp:\connections\"{268c66db-9b8c-47f6-9265-42326dbff006}"
```

This command gets the MAC addresses for the connection that has a ConnectionUid of 268c66db-9b8c-47f6-9265-42326dbff006.

Get-HypVolumeServiceConfiguration

Apr 15, 2014

Gets instances of the VolumeServiceConfiguration that are configured for this site.

Syntax

Get-HypVolumeServiceConfiguration [[-VolumeServiceConfigurationName] <String>] [-VolumeServiceConfigurationUid <Guid>] [-ConnectionType <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Retrieve VolumeServiceConfigurations whose properties match the given filter criteria. If no parameters are specified, this cmdlet retrieves all VolumeServiceConfiguration objects.

Related topics

Set-HypVolumeServiceConfiguration

Parameters

-VolumeServiceConfigurationName<String>

Specifies a filter for the configuration name.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-VolumeServiceConfigurationUid<Guid>

Specifies a filter for the configuration ID.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ConnectionType<String>

Specifies a filter for the cloud connection type, such as "AWS" or "CloudPlatform".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Hyp_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Hyp_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

string The name of a configuration (or set of configurations) to retrieve.

Return Values

Citrix.Host.Sdk.VolumeServiceConfiguration

This cmdlet returns matching VolumeServiceConfiguration objects.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Get-HypVolumeServiceConfiguration -VolumeServiceConfigurationName SiteDefault -ConnectionType CloudPlatform
This command lists the site default volume service configuration for connections that use Citrix Cloud Platform.

Get-HypXenServerAddress

Apr 15, 2014

Gets all the available addresses for a XenServer hypervisor connection.

Syntax

Get-HypXenServerAddress [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to retrieve all the available hypervisor connection addresses that can be used to connect to the same XenServer pool. When used in conjunction with Add-HypHypervisorAddress, you can easily populate a connection with all the addresses that can be used to provide full failover support for a XenServer connection.

If the addresses are https addresses, the command uses the certificates installed on the XenServers to provide suitable https addresses where possible. Only servers that can be resolved are returned.

Related topics

Add-HypHypervisorConnectionAddress

Parameters

-LiteralPath<String>

Specifies the path within a Host Service provider to the hypervisor connection item to which to add the address. The path specified must be in one of the following formats: <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections\{HHypervisorConnection Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

Get-HypXenServerAddress returns a list of strings containing the available address.

Notes

For this to work as required with https connections, the certificates installed on the XenServers must be trusted by all controllers. Typically this means having the root certificate for the certificate trust chain installed on all controllers. Wildcard certificates are not supported for this operation.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a sub-directory of a hosting unit item.

HypervisorConnectionNotXenServer

The hypervisor connection to which the path refers is not for a Citrix XenServer hypervisor.

HypervisorConnectionObjectNotFound

The hypervisor connection at the path specified cannot be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypXenServerAddress -Path XDHyp:\Connections\MyConnection

https:\\myserver.com
https:\\myServer1.com
```

Gets the available addresses for the connection "MyConnection".

---------- EXAMPLE 2 ----------

```
c:\PS>Get-HypXenServerAddress -LiteralPath XDHyp:\Connections\MyConnection | Add-HypHypervisorConnectionAddress -Path XDHyp:\Connections\MyConnectionPath
```

Adds all the available addresses for the XenServer pool in "MyConnection" to the hypervisor connection.

Grant-HypSecurityGroupEgress

Apr 15, 2014

Adds an egress rule to a security group.

Syntax

Grant-HypSecurityGroupEgress [-LiteralPath] <String> -GroupId <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Grant-HypSecurityGroupEgress [-LiteralPath] <String> -IPRange <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Adding an egress rule permits network traffic from instances within the security group to pass to one or more destination CIDR IP address ranges or security groups.

Related topics

Amazon AuthorizeSecurityGroupEgress: http://docs.aws.amazon.com/AWSEC2/latest/APIReference/ApiReference-query-AuthorizeSecurityGroupEgress.html

IANA protocol numbers: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Grant-HypSecurityGroupIngress

Revoke-HypSecurityGroupIngress

Revoke-HypSecurityGroupEgress

Parameters

-LiteralPath<String>

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Protocol<String>

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Required?	true
Default Value	
Accept Pipeline Input?	false

-GroupId<String[]>

Specifies one or more destination security groups to which traffic will be permitted by this rule. This parameter cannot be specified in

conjunction with IPRange.

Required?	true
Default Value	
Accept Pipeline Input?	false

-IPRange<String[]>

Specifies one or more destination CIDR IP address ranges to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Required?	true
Default Value	
Accept Pipeline Input?	false

-FromPort<Decimal>

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-ToPort<Decimal>

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string The LiteralPath can be piped in.

Return Values

None

Notes

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS> $Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS -Name MySecurityGroup -Description 'Example group'
    c:\PS> Grant-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '0.0.0.0/16'
```

Create a security group and grant full egress to anywhere.

---------- EXAMPLE 2 ----------

```
c:\PS> $Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS -Name MySecurityGroup1 -Description 'Example group 1'
    c:\PS> $Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS\MySecurityGroup2 -Description 'Example group 2'
    c:\PS> Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 0 -ToPort 0 -Protocol icmp -GroupId $Group2.Id
    c:\PS> Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 0 -ToPort 0 -Protocol icmp -GroupId $Group1.Id
```

Make 2 security groups and permit group 1 to ping group 2.

Grant-HypSecurityGroupIngress

Apr 15, 2014

Adds an ingress rule to a security group.

Syntax

Grant-HypSecurityGroupIngress [-LiteralPath] <String> -GroupId <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Grant-HypSecurityGroupIngress [-LiteralPath] <String> -IPRange <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Adding an egress rule permits network traffic from source CIDR IP address ranges or security groups to pass to instances within a security group.

Related topics

Amazon AuthorizeSecurityGroupEgress: http://docs.aws.amazon.com/AWSEC2/latest/APIReference/ApiReference-query-AuthorizeSecurityGroupEgress.html

IANA protocol numbers: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Grant-HypSecurityGroupEgress

Revoke-HypSecurityGroupIngress

Revoke-HypSecurityGroupEgress

Parameters

-LiteralPath<String>

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Protocol<String>

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Required?	true
Default Value	
Accept Pipeline Input?	false

-GroupId<String[]>

Specifies one or more source security groups from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction

with IPRange.

Required?	true
Default Value	
Accept Pipeline Input?	false

-IPRange<String[]>

Specifies one or more source CIDR IP address ranges from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Required?	true
Default Value	
Accept Pipeline Input?	false

-FromPort<Decimal>

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-ToPort<Decimal>

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string The LiteralPath can be piped in.

Return Values

None

Notes

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS> $Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS -Name MySecurityGroup -Description 'Example group'
    c:\PS> Grant-HypSecurityGroupIngress $Group.FullPath -FromPort 80 -ToPort 80 -Protocol tcp -IPRange '0.0.0.0/0'
```

Create a security group and grant ingress on port 80 from anywhere.

---------- EXAMPLE 2 ----------

```
c:\PS> $Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS -Name MySecurityGroup1 -Description 'Example group 1'
    c:\PS> $Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS\MySecurityGroup2 -Description 'Example group 2'
    c:\PS> Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort 8080 -Protocol tcp -GroupId $Group2.Id
    c:\PS> Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort 8080 -Protocol tcp -GroupId $Group1.Id
    c:\PS> Grant-HypSecurityGroupEgress $Group2.FullPath -Protocol '-1' -GroupId $Group1.Id
    c:\PS> Grant-HypSecurityGroupIngress $Group1.FullPath -Protocol '-1' -GroupId $Group2.Id
```

Make 2 security groups and permit group 1 access to group 2 only on port 8080 while granting full access to group 1 from group 2.

New-HypVMSnapshot

Apr 15, 2014

Creates a new snapshot for the specified VM item path.

Syntax

New-HypVMSnapshot [-LiteralPath] <String> [-SnapshotName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [[-SnapshotDescription] <String>] [<CommonParameters>]

Detailed Description

Use this command to create a new snapshot of a virtual machine, for a given Host Service provider path to a VM. The resulting snapshot can then be used for operations that require a snapshot to work.

Related topics

Parameters

-LiteralPath<String>

Specifies the path within a hosting unit provider to the virtual machine item for which to create a new snapshot. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-SnapshotName<String>

The name of the new snapshot. This is visible in the hypervisor management console.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

-SnapshotDescription<String>

The description to add to the snapshot. This is visible in the hypervisor management console.

Required?	false
Default Value	
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Get-HypConfigurationDataForItem

Return Values

System.string.

The provider path to the newly created snapshot.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

SnapshotNameAlreadyInUse

The specified name is already in use and will cause a name resolution clash.

FailedToCreateSnapshot

The snapshot creation process failed.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

SnapshotChainTooLong

Snapshot creation failed. Snapshot chain is too long.

SnapshotCreationNotAuthorized

Snapshot creation failed. User not authorized to create snapshots.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>New-HypVMSnapshot -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm -SnapshotName "New snapshot" -SnapshotDescription "Example snapshot"

        XDHyp:\Connections\MyConnection\MyVm.vm\New snapshot.snapshot
```

This command creates a snapshot of a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

Remove-HypHostingUnitMetadata

Apr 15, 2014

Removes metadata from the given HostingUnit.

Syntax

Remove-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-HostingUnitName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-HostingUnitName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given HostingUnit.

Related topics

Add-HypHostingUnitMetadata

Set-HypHostingUnitMetadata

Parameters

-HostingUnitUid<Guid>

Id of the HostingUnit

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HostingUnitName<String>

Name of the HostingUnit

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<HostingUnit[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypHostingUnit | % { Remove-HypHostingUnitMetadata -Map $_.MetadataMap }
```

Remove all metadata from all HostingUnit objects.

Remove-HypHostingUnitNetwork

Apr 15, 2014

Removes networks from a hosting unit.

Syntax

Remove-HypHostingUnitNetwork [-LiteralPath] <String> [-NetworkPath] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to remove networks from a hosting unit. This does not remove the network from the hypervisor, only the reference to the network for the Host Service. After it is removed, the network is no longer available for associating with virtual NICs (when creating new virtual machines with the Machine Creation Service). Any virtual machines that have been created already continue to use the network until they are removed from the deployment. This command cannot be used if the connection for the hosting unit is in maintenance mode. If the network to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the network location.

Related topics

Add-HypHostingUnitNetwork

Parameters

-LiteralPath<String>

Required?	true
Default Value	
Accept Pipeline Input?	false

-NetworkPath<String>

Specifies the path in the hosting unit provider of the network to remove. The path specified must be in one of the following formats: <drive>:\Connections\<HostingUnitName>\MyNetwork.network or <drive>:\Connections\{<hostingUnit Uid>}\MyNetwork.network

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. This can be a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Remove-HypHostingUnitNetwork (Path parameter).

Notes

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitNetworkObjectToDeleteDoesNotExist

The network path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Remove-HypHostingUnitNetwork -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -NetworkPath 'XDHyp:\HostingUnits\MyHostingUnits\newNetwork.network'
The command removes the network called "newNetwork.network" from the hosting unit called "MyHostingUnit"

Remove-HypHostingUnitStorage

Apr 15, 2014

Removes storage from a hosting unit.

Syntax

Remove-HypHostingUnitStorage [-LiteralPath] <String> [-StoragePath <String>] [-StorageType <StorageType>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to remove storage locations from a hosting unit. This does not remove the storage from the hypervisor, only the reference to the storage for the Host Service. After removal, the storage is no longer used to store hard disks (when creating new virtual machines with the Machine Creation Service). The hard disks located already on the storage remain in place and virtual machines that have been created already continue to use the storage until they are removed from the deployment. Do not use this command if the connection for the hosting unit is in maintenance mode. If the storage location to be removed no longer exists on the hypervisor for the hosting unit, you must supply a fully qualified path to the storage location.

Related topics

Add-HypHostingUnitStorage

Parameters

-LiteralPath<String>

Required?	true
Default Value	
Accept Pipeline Input?	false

-StoragePath<String>

Specifies the path in the hosting unit provider of the storage to remove. If StoragePath is not specified, all storage is removed from the hosting unit. The path specified must be in one of the following formats: <drive>:\Connections\<HostingUnitName>\MyStorage.storage or <drive>:\Connections\{<hostingUnit Uid>}\MyStorage.storage

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-StorageType<StorageType>

Specifies the type of storage in StoragePath. Supported storage types are: OSStorage PersonalvDiskStorage

Required?	false
Default Value	OSStorage
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. This can be a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Remove-HypHostingUnitStorage (Path parameter).

Notes

After storage is removed, it is the administrator's responsibility to maintain its contents. The Citrix XenDesktop Machine Creation Service does not attempt to clean up any data that is stored in the storage location.

If all storage is removed from the hosting unit, other features of the Machine Creation Service stops functioning until some storage is added again.

In the case of failure, the following errors can result.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStorageObjectToDeleteDoesNotExist

The storage path specified is not part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Remove-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\newStorage.storage'
The command removes the OS storage location called "newStorage.storage" from the hosting unit called "MyHostingUnit"

---------- EXAMPLE 2 ----------

c:\PS>Get-ChildItem XDHYP:\HostingUnits\Host*.storage | Remove-HypHostingUnitStorage XDHYP:\HostingUnits\Host1
The command removes all OS storage from all hosting units called "Host1".

---------- EXAMPLE 3 ----------

c:\PS>Get-ChildItem XDHYP:\HostingUnits\Host*.storage | Remove-HypHostingUnitStorage -StorageType PersonalvDiskStorage
The command removes all PersonalvDisk storage from all hosting units called "Host1".

Remove-HypHypervisorConnectionAddress

Apr 15, 2014

Removes addresses from the list of available connection addresses.

Syntax

Remove-HypHypervisorConnectionAddress [-LiteralPath] <String> [-HypervisorAddress] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to remove addresses that can be used to connect to the hypervisor specified by the hypervisor connection. If all addresses are removed, the connection cannot be used until a valid address is added to the hypervisor connection.

Related topics

Add-HypHypervisorConnectionAddress

Parameters

-LiteralPath<String>

Specifies the path within a Host Service provider to the hosting unit item to which to add the address. The path specified must be in one of the following formats: <drive>:\HostingUnits\<HostingUnitName> or <drive>:\HostingUnits\{HostingUnit Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	false

-HypervisorAddress<String>

Specifies the address to be removed. If this parameter is not provided, all addresses are removed from the hypervisor connection.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Remove-HypHypervisorConnectionAddress (Path parameter).

Notes

Changes to a hypervisor connection affect all entities that reference the connection. If all addresses are removed from the connection, any other entities that reference the hypervisor connection (e.g. hosting units) cannot make new connections to the hypervisor.

In the case of failure, the following errors can result.

Error Codes

InputConnectionsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HypervisorConnectionAddressForeignKeyObjectDoesNotExist

The hypervisor connection to which the address is to be added could not be located.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Remove-HypHypervisorConnectionAddress -LiteralPath XDHyp:\HostingUnits\MyHypervisorConnection -HypervisorAddress 'http:\\myserver.com'
The command removes the address "http:\\myserver.com" from the hypervisor connection called "MyHypervisorConnection".

---------- EXAMPLE 2 ----------

c:\PS>Get-Item –Path XDHYP:\Connections* | Remove-HypHypervisorConnectionAddress
The command removes all addresses from all the hypervisor connections currently defined.

Remove-HypHypervisorConnectionMetadata

Apr 15, 2014

Removes metadata from the given HypervisorConnection.

Syntax

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given HypervisorConnection.

Related topics

Add-HypHypervisorConnectionMetadata

Set-HypHypervisorConnectionMetadata

Parameters

-HypervisorConnectionUid<Guid>

Id of the HypervisorConnection

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HypervisorConnectionName<String>

Name of the HypervisorConnection

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<HypervisorConnection[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypHypervisorConnection | % { Remove-HypHypervisorConnectionMetadata -Map $_.MetadataMap }
```

Remove all metadata from all HypervisorConnection objects.

Remove-HypHypervisorConnectionScope

Apr 15, 2014

Remove the specified HypervisorConnection(s) from the given scope(s).

Syntax

Remove-HypHypervisorConnectionScope [-Scope] <String[]> -InputObject <HypervisorConnection[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypHypervisorConnectionScope [-Scope] <String[]> -HypervisorConnectionName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The RemoveHypHypervisorConnectionScope cmdlet is used to remove one or more HypervisorConnection objects from the given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the HypervisorConnection objects in different ways:

- HypervisorConnection objects can be piped in or specified by the InputObject parameter

- The HypervisorConnectionUid parameter specifies objects by HypervisorConnectionUid

- The HypervisorConnectionName parameter specifies objects by HypervisorConnectionName (supports wildcards)

To remove a HypervisorConnection from a scope you need permission to change the scopes of the HypervisorConnection.

If the HypervisorConnection is not in a specified scope, that scope will be silently ignored.

Related topics

Add-HypHypervisorConnectionScope

Get-HypScopedObject

Parameters

-Scope<String[]>

Specifies the scopes to remove the objects from.

Required?	true
Default Value	
Accept Pipeline Input?	false

-InputObject<HypervisorConnection[]>

Specifies the HypervisorConnection objects to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HypervisorConnectionUid<Guid[]>

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionUid.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HypervisorConnectionName<String[]>

Specifies the HypervisorConnection objects to be removed by HypervisorConnectionName.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

None

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
```

Removes a single HypervisorConnection from the 'Finance' scope.

---------- EXAMPLE 2 ----------

```
c:\PS>Remove-HypHypervisorConnectionScope Finance,Marketing -HypervisorConnectionUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
```

Removes a single HypervisorConnection from multiple scopes.

---------- EXAMPLE 3 ----------

```
c:\PS>Get-HypHypervisorConnection | Remove-HypHypervisorConnectionScope Finance
```

Removes all visible HypervisorConnection objects from the 'Finance' scope.

---------- EXAMPLE 4 ----------

```
c:\PS>Remove-HypHypervisorConnectionScope Finance -HypervisorConnectionName A*
```

Removes HypervisorConnection objects with a name starting with an 'A' from the 'Finance' scope.

Remove-HypMetadata

Apr 15, 2014

Removes metadata from a hypervisor connection or hosting unit.

Syntax

Remove-HypMetadata [-LiteralPath] <String> [-Property <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to remove custom data from a specific hosting unit or hypervisor connection. If the Property parameter is not provided, all metadata is removed from the specified item.

Related topics

Remove-HypMetadata

Parameters

-LiteralPath<String>

Specifies the path within a Host Service provider to the hosting unit or hypervisor connection item from which to remove the metadata. The path specified must be in one of the following formats: <drive>:\HostingUnits\<HostingUnitName> or <drive>:\HostingUnits\{<HostingUnit Uid> or <drive>:\Connections\<Connection Name> or <drive>:\Connections\{<Connection Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Property<String>

Specifies the property name of the metadata to be removed.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Add-HypMetadata (Path parameter).

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HostingUnitMetadataObjectToDeleteDoesNotExist

The hosting unit supplied in the path does not exist.

HypervisorConnectionObjectToDeleteDoesNotExist

The hypervisor connection supplied in the path does not exist.

MetadataContainerUndefined

The specified path does not reference a hosting unit or a hypervisor connection.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection -Property MyProperty
The command removes the metadata with the property "MyProperty" from the hypervisor connection called "MyConnection".

---------- EXAMPLE 2 ----------

C:\PS>Remove-HypMetadata -LiteralPath XDHyp:\Connections\MyConnection
The command removes all the metadata from the hypervisor connection called "MyConnection".

---------- EXAMPLE 3 ----------

C:\PS>dir XDHyp:\connections | Remove-HypMetadata
The command removes all the metadata from all the hypervisor connections.

Remove-HypServiceMetadata

Apr 15, 2014

Removes metadata from the given Service.

Syntax

Remove-HypServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-HypServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-HypServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-HypService | % { Remove-HypServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Service objects.

Reset-HypServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the Host Service.

Syntax

Reset-HypServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload Host Service access permissions and configuration service locations. The Reset-HypServiceGroupMembership command must be run on at least one instance of the service type (Hyp) after installation and registration with the configuration service. Without this operation, the Host services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-HypServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.Host.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-HypServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-HypServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

---------- EXAMPLE 2 ----------

c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-HypServiceGroupmembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Revoke-HypSecurityGroupEgress

Apr 15, 2014

Removes an egress rule from a security group.

Syntax

Revoke-HypSecurityGroupEgress [-LiteralPath] <String> -GroupId <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Revoke-HypSecurityGroupEgress [-LiteralPath] <String> -IPRange <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

To remove a rule, specify parameters matching an existing rule's values.

Related topics

Amazon AuthorizeSecurityGroupEgress: http://docs.aws.amazon.com/AWSEC2/latest/APIReference/ApiReference-query-AuthorizeSecurityGroupEgress.html

IANA protocol numbers: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Grant-HypSecurityGroupIngress

Grant-HypSecurityGroupEgress

Revoke-HypSecurityGroupIngress

Parameters

-LiteralPath<String>

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Protocol<String>

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Required?	true
Default Value	
Accept Pipeline Input?	false

-GroupId<String[]>

Specifies one or more destination security groups to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Required?	true
Default Value	
Accept Pipeline Input?	false

-IPRange<String[]>

Specifies one or more destination CIDR IP address ranges to which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Required?	true
Default Value	
Accept Pipeline Input?	false

-FromPort<Decimal>

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-ToPort<Decimal>

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string The LiteralPath can be piped in.

Return Values

None

Notes

Security groups cannot be removed in AWS if they are referened by rules from other security groups.

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS> $Group = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS -Name MySecurityGroup -Description 'Example group'
    c:\PS> Grant-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '0.0.0.0/0'
    c:\PS> Revoke-HypSecurityGroupEgress $Group.FullPath -Protocol '-1' -IPRange '0.0.0.0/0'
    c:\PS> Remove-Item $Group.FullPath
```

Create a security group, grant full egress to anywhere, then revoke access and delete the security group.

Revoke-HypSecurityGroupIngress

Apr 15, 2014

Removes an ingress rule from a security group.

Syntax

Revoke-HypSecurityGroupIngress [-LiteralPath] <String> -GroupId <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Revoke-HypSecurityGroupIngress [-LiteralPath] <String> -IPRange <String[]> -Protocol <String> [-FromPort <Decimal>] [-ToPort <Decimal>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

To remove a rule, specify parameters matching an existing rule's values.

Related topics

Amazon AuthorizeSecurityGroupEgress: http://docs.aws.amazon.com/AWSEC2/latest/APIReference/ApiReference-query-AuthorizeSecurityGroupEgress.html

IANA protocol numbers: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Grant-HypSecurityGroupIngress

Grant-HypSecurityGroupEgress

Revoke-HypSecurityGroupIngress

Parameters

-LiteralPath<String>

Specifies the full XDHyp provider path to the security group, equivalent to the FullPath property of the security group object. The path can specify a security group relative to a hypervisor conection or hosting unit.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Protocol<String>

Specifies the protocol name or number. Protocol numbers can be found at: http://www.iana.org/assignments/protocol-numbers/protocol-numbers.xhtml

Use -1 to specify all protocols.

Required?	true
Default Value	
Accept Pipeline Input?	false

-GroupId<String[]>

Specifies one or more source security groups from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Required?	true

Default Value	
Accept Pipeline Input?	false

-IPRange<String[]>

Specifies one or more source CIDR IP address ranges from which traffic will be permitted by this rule. This parameter cannot be specified in conjunction with IPRange.

Required?	true
Default Value	
Accept Pipeline Input?	false

-FromPort<Decimal>

The start of the port range for port based protocols. For ICMP this specifies the type number.

Use -1 to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-ToPort<Decimal>

The end of the port range for port based protocols. For ICMP this specifies the type number, where -1 can be used to specify all ICMP types.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string The LiteralPath can be piped in.

Return Values

None

Notes

Security groups cannot be removed in AWS if they are referened by rules from other security groups.

Security groups can be added and removed using the New-Item and Remove-Item cmdlets.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS> $Group1 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS -Name MySecurityGroup1 -Description 'Example group 1'
    c:\PS> $Group2 = New-Item -ItemType SecurityGroup -Path XDHyp:\Connections\AWS -Name MySecurityGroup2 -Description 'Example group 2'
    c:\PS> Grant-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort 8085 -Protocol tcp -GroupId $Group2.Id
    c:\PS> Grant-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort 8085 -Protocol tcp -GroupId $Group1.Id
    c:\PS> Revoke-HypSecurityGroupEgress $Group1.FullPath -FromPort 8080 -ToPort 8085 -Protocol tcp -GroupId $Group2.Id
    c:\PS> Revoke-HypSecurityGroupIngress $Group2.FullPath -FromPort 8080 -ToPort 8085 -Protocol tcp -GroupId $Group1.Id
```

Create 2 security groups, grant access from group 1 to group 2, then revoke access.

Set-HypAdminConnection

Apr 15, 2014

Set the controller to be used by the cmdlets that form the Host service PowerShell snap-in.

Syntax

```
Set-HypAdminConnection [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Use this command to set the default controller address to be used by the cmdlets to communicate with the controller. Most Host service cmdlets take an 'AdminAddress' parameter that can be used to define the controller (when used, this overrides this setting). However, the Set-Location cmdlet in the Host service provider does not offer this option. Therefore, the controller address must be set using this cmdlet, if no other cmdlets have set the address previously in the current runspace.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-HypAdminConnection -AdminAddress myserver.com
```

This command sets the controller address for the commands to be "myserver.com". All commands run use this address until it is altered, either by another call to this command or by the use of the 'AdminAddress' parameter in another command in the Host service snap-in.

Set-HypDBConnection

Apr 15, 2014

Configures a database connection for the Host Service.

Syntax

```
Set-HypDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Configures a connection to a database in which the Host Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-HypServiceStatus

Get-HypDBConnection

Test-HypDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the Host Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-HypDBConnection command returns an object containing the status of the Host Service together with extra diagnostics information.

DBUnconfigured

The Host Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

DBOlderVersionThanService

The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Host Service is running and is connected to a database containing a valid schema.

Failed

The Host Service has failed.

Unknown

The status of the Host Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Set-HypDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK
Configures a database connection string for the Host Service.

---------- EXAMPLE 2 ----------

c:\PS>Set-HypDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the Host Service.

Set-HypHostingUnitMetadata

Apr 15, 2014

Adds or updates metadata on the given HostingUnit.

Syntax

Set-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHostingUnitMetadata [-HostingUnitUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHostingUnitMetadata [-HostingUnitName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHostingUnitMetadata [-HostingUnitName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHostingUnitMetadata [-InputObject] <HostingUnit[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given HostingUnit objects.

Related topics

Add-HypHostingUnitMetadata

Remove-HypHostingUnitMetadata

Parameters

-HostingUnitUid<Guid>

Id of the HostingUnit

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HostingUnitName<String>

Name of the HostingUnit

Required?	true
Default Value	

Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<HostingUnit[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the HostingUnit specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-HypHostingUnitMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-HypHostingUnitMetadata -HostingUnitUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                           -----
    property                          value
```

Add metadata with a name of 'property' and a value of 'value' to the HostingUnit with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-HypHostingUnitStorage

Apr 15, 2014

Sets options for a storage location on a hosting unit.

Syntax

Set-HypHostingUnitStorage [-LiteralPath] <String> [-StoragePath] <String> [-StorageType <StorageType>] [-Superseded <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to set options for storage locations that are defined for a hosting unit. Do not use this command if the connection for the hosting unit is in maintenance mode.

Related topics

Parameters

-LiteralPath<String>

Specifies the path to the hosting unit which defines the storage. The path must be in one of the following formats: <drive>:\HostingUnits\<HostingUnitName> or <drive>:\HostingUnits\{<HostingUnit Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	false

-StoragePath<String>

Specifies the path to the storage that will be modified. The path must be in one of the following formats: <drive>:\Connections\<ConnectionName>\MyStorage.storage or <drive>:\Connections\{<Connection Uid>}\MyStorage.storage or <drive>:\HostingUnits\<HostingUnitName>\MyStorage.storage or <drive>:\HostingUnits\{<hostingUnit Uid>}\MyStorage.storage

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-StorageType<StorageType>

Specifies the type of storage in StoragePath. Supported storage types are: OSStorage PersonalvDiskStorage

Required?	false
Default Value	OSStorage
Accept Pipeline Input?	false

-Superseded<Boolean>

Specifies that this storage has been superseded and must not be used for future provisioning operations. Existing virtual machines using this storage will continue to function.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects. This can be a host name or an IP address.

Required?	false
Default Value	LocalHost. When a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path to Add-HypHostingUnitStorage (StoragePath parameter).

Return Values

Citrix.XDPowerShell.HostingUnit

Add-HypHostingUnitStorage returns an object containing the new definition of the hosting unit.

HostingUnitUid <Guid>

Specifies the unique identifier for the hosting unit.

HostingUnitName <string>

Specifies the name of the hosting unit.

HypervisorConnection <Citrix.XDPowerShell.HypervisorConnection>

Specifies the connection that the hosting unit uses to access a hypervisor.

RootId <string>

Identifies, to the hypervisor, the root of the hosting unit.

RootPath <string>

The hosting unit provider path that represents the root of the hosting unit.

Storage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use.

PersonalvDiskStorage <Citrix.XDPowerShell.Storage[]>

The list of storage items that the hosting unit can use for storing personal data.

VMTaggingEnabled <Boolean>

Specifies whether or not the metadata in the hypervisor can be used to store information about the XenDesktop Machine Creation Service.

NetworkId <string>

The hypervisor's internal identifier that represents the network specified for the hosting unit.

NetworkPath <string>

The hosting unit provider path to the network specified for the hosting unit.

Metadata <Citrix.XDPowerShell.Metadata[]>

A list of key value pairs that can store additional information about the hosting unit.

Notes

The storage path must be valid for the hosting unit. The rules that are applied are as follows: XenServer (HypervisorConnection Type = XenServer)

NA

VMWare vSphere/ESX (HypervisorConnection Type = vCenter)

The storage path must be directly contained in the root path item of the hosting unit.

Microsoft SCVMM/Hyper-v (HypervisorConnection Type = SCVMM)

Only one storage entry for these connection types is valid, and it must reference an SMB share. Additionally, if a Hyper-V failover cluster is used the SMB share must be the top-level mount point of the cluster shared volume on one of the servers in the cluster (i.e. C:\ClusterStorage).

In the case of failure, the following errors can be produced.

Error Codes

HostingUnitsPathInvalid

The path provided is not to an item in a subdirectory of a hosting unit item.

HostingUnitStoragePathInvalid

The specified path is invalid.

HostingUnitStoragePathInvalid

The storage path cannot be found or is invalid. See notes above about validity.

HostingUnitStorageDuplicateObjectExists

The specified storage path is already part of the hosting unit.

HypervisorInMaintenanceMode

The hypervisor for the connection is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-HypHostingUnitStorage -LiteralPath XDHyp:\HostingUnits\MyHostingUnit -StoragePath 'XDHyp:\HostingUnits\MyHostingUnits\newStorage.storage' -Superseded $true

        HostingUnitUid      : bcd3d649-86d1-4aa8-8ec2-d322b6a2c457
        HostingUnitName     : MyHostingUnit
        HypervisorConnection : MyConnection
        RootPath            : /
        RootId              :
        NetworkPath         : /Network 0.network
        NetworkId           : ab47080b-ca15-771a-c8dc-6ad9650158f1
        Storage             : {/Local storage.storage, /newStorage.storage}
        PersonalvDiskStorage : {/newStorage.storage}
        VMTaggingEnabled    : True
        Metadata            : {}
```

The command updates a storage location called "newStorage.storage" associated with the hosting unit called "MyHostingUnit".

Set-HypHypervisorConnectionMetadata

Apr 15, 2014

Adds or updates metadata on the given HypervisorConnection.

Syntax

Set-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHypervisorConnectionMetadata [-HypervisorConnectionUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHypervisorConnectionMetadata [-HypervisorConnectionName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypHypervisorConnectionMetadata [-InputObject] <HypervisorConnection[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given HypervisorConnection objects.

Related topics

Add-HypHypervisorConnectionMetadata

Remove-HypHypervisorConnectionMetadata

Parameters

-HypervisorConnectionUid<Guid>

Id of the HypervisorConnection

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-HypervisorConnectionName<String>

Name of the HypervisorConnection

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<HypervisorConnection[]>

Objects to which the metadata is to be added.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the HypervisorConnection specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-HypHypervisorConnectionMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Set-HypHypervisorConnectionMetadata -HypervisorConnectionUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

```
Key                         Value
---                         -----
```

```
property                    value
```

Add metadata with a name of 'property' and a value of 'value' to the HypervisorConnection with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-HypServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given Service.

Syntax

Set-HypServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-HypServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-HypServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-HypServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                         Value
    ---                         -----
    property                        value
```

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-HypVolumeServiceConfiguration

Apr 15, 2014

Applies a change to one of the VolumeServiceConfiguration instances in the site.

Syntax

Set-HypVolumeServiceConfiguration -VolumeWorkerPackageUri <String> -ConnectionType <String> -VolumeServiceConfigurationName <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-HypVolumeServiceConfiguration -RegionName <String> -BaseLinuxTemplateId <String> -ConnectionType <String> -VolumeServiceConfigurationName <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Volume service configurations are used to control how cloud-based host connections behave when provisioning machines. They contain two pieces of information. The first is a per-region specification of the cloud template that provides the standard Linux operating system for the cloud. The second is the specification of a URL from which the Citrix Volume Worker software can be installed (not all cloud connections make use of this URL, but they all make use of the template map).

Each cmdlet invocation can be used to either change the volume worker URL, or to modify (or add) an entry in the Linux template map. These two operations are supported by parameter sets. To change both properties, you must invoke the cmdlet twice.

Related topics

Get-HypVolumeServiceConfiguration

Parameters

-ConnectionType<String>

Specifies the cloud connection type, such as "AWS" or "CloudPlatform".

Required?	true
Default Value	
Accept Pipeline Input?	false

-VolumeServiceConfigurationName<String>

Specifies the name of the configuration you want to modify. This parameter is used alongside the ConnectionType to specify a single configuration set unambiguously. There can be only one named configuration per connection type. In a newly-configured site, there will be exactly one configuration set called "SiteDefault" for each of CloudPlatform and AWS.

Required?	true
Default Value	
Accept Pipeline Input?	false

-VolumeWorkerPackageUri<String>

Specifies a (new) URI for the volume worker package.

Required?	true
Default Value	
Accept Pipeline Input?	false

-RegionName<String>

Specifies the cloud region in which the Linux template resides. This parameter is used only when passing the BaseLinuxTemplateId parameter. The format of the string is cloud-specific. For example, for an AWS-based cloud, it would be a region identifier such as "us-east-1".

Required?	true
Default Value	
Accept Pipeline Input?	false

-BaseLinuxTemplateId<String>

Specifies a change to the standard Linux template that should be used in the cloud. When passing this parameter, you must also specify the RegionName parameter to indicate the region in which this template resides. The format of the string is cloud-specific. For example, for an AWS-based cloud, it would be an AMI identifier such as "ami-1234abcd".

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Host.Sdk.VolumeServiceConfiguration

This cmdlet returns the updated VolumeServiceConfiguration object.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Set-HypVolumeServiceConfiguration -VolumeServiceConfigurationName SiteDefault -ConnectionType CloudPlatform -RegionName Region1 -BaseLinuxTemplateId 9883ba7a-74bf-4002-9b12-1
This command specifies a Linux template that should be used by default for CloudPlatform connections.

---------- EXAMPLE 2 ----------

C:\PS>Set-HypVolumeServiceConfiguration -VolumeServiceConfigurationName SiteDefault -ConnectionType CloudPlatform -VolumeWorkerPackageUri "http://cloudadmin.net/citrix/volumeworker/versic
This command specifies a worker package download URL that should be used by default for CloudPlatform connections.

Start-HypVM

Apr 15, 2014

Starts a VM.

Syntax

Start-HypVM [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

This command provides a mechanism to start a VM.

Related topics

Parameters

-LiteralPath<String>

Specifies the path within a hosting unit provider to the virtual machine item to start. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path.

Return Values

System.void.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Start-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
```

This command starts a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

Stop-HypVM

Apr 15, 2014

Stops a VM by issuing a Shutdown request

Syntax

Stop-HypVM [-LiteralPath] <String> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to change the power state of a VM from running to stopped.

Related topics

Parameters

-LiteralPath<String>

Specifies the path within a hosting unit provider to the virtual machine item to stop. The path specified must be in one of the following formats: <drive>:\Connections\<Connection Name>\<Item Path of VM object> or <drive>:\Connections\{<connection Uid>\<Item Path of VM object>} or <drive>:\HostingUnits\<HostingUnit Name>\<Item Path of VM object> or <drive>:\HostingUnits\{<hostingUnit Uid>\<Item Path of VM object>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Input Type

System.string You can pipe a string that contains a path.

Return Values

System.void.

Notes

In the case of failure, the following errors can result.

Error Codes

InputHypervisorItemPathInvalid

The path provided is not to an item in a sub-directory of a connection item or a hosting unit item.

InvalidHypervisorItemPath

No item exists with the specified path.

InvalidHypervisorItem

The item specified by the path exists, but is not a VM Item.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Stop-HypVM -LiteralPath XDHyp:\Connections\MyConnection\MyVm.vm
```

This command stops a VM called 'MyVm.vm' within a hypervisor connection called 'MyConnection'.

Test-HypDBConnection

Apr 15, 2014

Tests a database connection for the Host Service.

Syntax

```
Test-HypDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Tests a connection to the database in which the Host Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-HypServiceStatus

Get-HypDBConnection

Set-HypDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the Host Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-HypDBConnection command returns an object containing the status of the Host Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the Host Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Host Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Host Service currently in use is incompatible with the version of the Host Service schema on the database. Upgrade the Host Service to a more recent version.

DBOlderVersionThanService

The version of the Host Service schema on the database is incompatible with the version of the Host Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-HypDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The Host Service has failed.

Unknown

The status of the Host Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Test-HypDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Tests a database connection string for the Host Service.

---------- EXAMPLE 2 ----------

```
c:\PS>Test-HypDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Tests an invalid database connection string for the Host Service.

Test-HypHostingUnitNameAvailable

Apr 15, 2014

Checks to ensure that the proposed name for a hosting unit is unused.

Syntax

Test-HypHostingUnitNameAvailable -HostingUnitName <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to check that the proposed name for a hosting unit is unused. This check is done without regard for scoping of the existing hosting unit, so the names of inaccessible hosting units are also checked.

Related topics

New-Item

Rename-Item

Parameters

-HostingUnitName<String[]>

The name or names of the hosting units(s) to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

object[]

An array of PSObjects which pair the name and availability of the name

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
Test-HypHostingUnitNameAvailable -HostingUnitName $NewHostingUnitName
```

This tests whether the value of $NewHostingUnitName is unique or not, and can be used to create a new hosting unit or rename an existing one without failing. True is returned if the name is unique.

Test-HypHypervisorConnectionNameAvailable

Apr 15, 2014

Checks to ensure that the proposed name for a hypervisor connection is unused.

Syntax

Test-HypHypervisorConnectionNameAvailable -HypervisorConnectionName <String[]> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to check that the proposed name for a hypervisor connection is unused. This check is done without regard for scoping of the existing hypervisor connection, so the names of inaccessible hypervisor connection are also checked.

Related topics

New-Item

Rename-Item

Parameters

-HypervisorConnectionName<String[]>

The name or names of the hypervisor connection(s) to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

object[]

An array of PSObjects which pair the name and availability of the name

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

Test-HypHypervisorConnectionNameAvailable -HypervisorConnectionName $NewConnectionName
This tests whether the value of $NewConnectionName is unique or not, and can be used to create a new hypervisor connection or rename an existing one. True is returned if the name is unique.

Update-HypHypervisorConnection

Apr 15, 2014

Requests the host service to update the connection properties that depend on the version of hypervisor in use.

Syntax

Update-HypHypervisorConnection [-LiteralPath] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this command to update the version-specific properties of a hypervisor connection, after an upgrade to the hypervisor system which may provide new capabilities.

Related topics

Parameters

-LiteralPath<String>

Specifies the path within a Host Service provider to the hypervisor connection item to be updated. The path specified must be in one of the following formats; <drive>:\Connections\<HypervisorConnectionName> or <drive>:\Connections\{HypervisorConnection Uid>}

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in will connect to. This can be provided as a host name or an IP address.

Required?	false

Default Value	LocalHost. Once a value is provided by any cmdlet, this value will become the default.
Accept Pipeline Input?	false

Notes

In the case of failure, the following errors can result.

Error Codes

InvalidPath

The path provided is not in the required format.

HypervisorInMaintenanceMode

The hypervisor is in maintenance mode and cannot be updated.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Update-HypHypervisorConnection -LiteralPath xdhyp:\connections\Connection1
```

This command requests that the properties of Connection1 be updated to match the current capabilities of the hypervisor.

Citrix.MachineCreation.Admin.V2

Apr 15, 2014

Overview

Name	Description
ProvMachineCreationSnapin	The Machine Creation Service PowerShell snap-in provides administrative
Prov Filtering	Describes the common filtering options for XenDesktop cmdlets.
providers	Describes how Windows PowerShell providers provide access to data and

Cmdlets

Name	Description
Add-ProvSchemeControllerAddress	Adds a list of host names (as DNS addresses) to a provisioning scheme.
Add-ProvSchemeMetadata	Adds metadata on the given ProvisioningScheme.
Add-ProvSchemeScope	Add the specified ProvisioningScheme(s) to the given scope(s).
Add-ProvTaskMetadata	Adds metadata on the given Task.
Get-ProvDBConnection	Gets the database string for the specified data store used by the MachineCreation Service.
Get-ProvDBSchema	Gets a script that creates the MachineCreation Service database schema for the specified data store.
Get-ProvDBVersionChangeScript	Gets a script that updates the MachineCreation Service database schema.
Get-ProvInstalledDBVersion	Gets a list of all available database schema versions for the MachineCreation Service.
Get-ProvObjectReference	Returns the number of local objects holding references to objects from other services.
Get-ProvScheme	Gets the list of provisioning schemes.
Get-ProvSchemeMasterVMImageHistory	Gets the list of master VM snapshots that have been used to provide hard disks to provisioning schemes.
Get-ProvScopedObject	Gets the details of the scoped objects for the MachineCreation Service.
Get-ProvService	Gets the service record entries for the MachineCreation Service.
Get-ProvServiceAddedCapability	Gets any added capabilities for the MachineCreation Service on the controller.

Name	Description
Get-ProvServiceConfigurationData	Gets configuration data for the service.
Get-ProvServiceInstance	Gets the service instance entries for the MachineCreation Service.
Get-ProvServiceStatus	Gets the current status of the MachineCreation Service on the controller.
Get-ProvTask	Gets the task history for the MachineCreation Service.
Get-ProvVM	Gets the VMs that were created using Citrix XenDesktop Machine Creation Services.
Lock-ProvVM	Locks a VM.
New-ProvScheme	Creates a new provisioning scheme.
New-ProvVM	Creates a new virtual machine.
Publish-ProvMasterVmImage	Update the master image associated with the provisioning scheme.
Remove-ProvScheme	Removes a provisioning scheme
Remove-ProvSchemeControllerAddress	Removes metadata from a provisioning scheme.
Remove-ProvSchemeMasterVMImageHistory	Removes the history of provisioning scheme master image VMs.
Remove-ProvSchemeMetadata	Removes metadata from the given ProvisioningScheme.
Remove-ProvSchemeScope	Remove the specified ProvisioningScheme(s) from the given scope(s).
Remove-ProvServiceConfigurationData	Removes configuration data from the service.
Remove-ProvServiceMetadata	Removes metadata from the given Service.
Remove-ProvTask	Removes from the database completed tasks for the MachineCreation Service.
Remove-ProvTaskMetadata	Removes metadata from the given Task.
Remove-ProvVM	Removes virtual machines.
Rename-ProvScheme	Renames a provisioning scheme.
Reset-ProvServiceGroupMembership	Reloads the access permissions and configuration service locations for the MachineCreation Service.
Set-ProvDBConnection	Configures a database connection for the MachineCreation Service.
Set-ProvScheme	Changes the parameter values for a provisioning scheme.

Name	Description
Set-ProvSchemeMetadata	Adds or updates metadata on the given ProvisioningScheme.
Set-ProvServiceConfigurationData	Sets the value for the given key in the service configuration data.
Set-ProvServiceMetadata	Adds or updates metadata on the given Service.
Set-ProvTaskMetadata	Adds or updates metadata on the given Task.
Stop-ProvTask	Stops currently running MachineCreation Service tasks.
Switch-ProvTask	Moves all MachineCreation Service tasks from the current execution host to another.
Test-ProvDBConnection	Tests a database connection for the MachineCreation Service.
Test-ProvSchemeNameAvailable	Checks to ensure that the proposed name for a provisioning scheme is unused.
Unlock-ProvScheme	Unlocks a Provisioning Scheme.
Unlock-ProvVM	Unlocks a VM.

about_ProvMachineCreationSnapin

Apr 15, 2014

TOPIC

about_ProvMachineCreationSnapin

SHORT DESCRIPTION

The Machine Creation Service PowerShell snap-in provides administrative functions for the Machine Creation Service.

COMMAND PREFIX

All commands in this snap-in have 'Prov' in their name.

LONG DESCRIPTION

The Machine Creation Service PowerShell snap-in enables both local and remote administration of the Machine Creation Service. It provides facilities to create virtual machines and manage the associated disk images.

The snap-in provides two main entities:

Provisioning Scheme

Specifies details of new virtual machines created by the Machine Creation Service. Provisioning schemes define the following information.

Hosting Unit
: Provides details of the hypervisor and storage on which new virtual machines will be created. Stored and maintained by the Host Service and PowerShell snap-in.

Identity Pool
: Lists the Active Directory computer accounts available for use by new virtual machines. Stored and maintained by the Active Directory Identity Service and PowerShell snap-in.

Master Image
: Specifies the disk image that will be used for new virtual machines. Accessed through the hosting provider in the Host Service snap-in.

Provisioned VM

Defines the virtual machines created by the Machine Creation Services. These virtual machines are associated with the provisioning scheme from

which they were created.

The processes of creating provisioning schemes and new virtual machines can take a significant amount of time to complete. For this reason, these long-running tasks can be run asynchronously so that other commands are accessible while the processes are running. Note, however, that only one long-running task can operate on a provisioning scheme at any one time. The processes are monitored using the Get-ProvTask command. For more information, see the help for Get-ProvTask.

about_Prov_Filtering

Apr 15, 2014

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

about_providers

Apr 15, 2014

TOPIC

about_Providers

SHORT DESCRIPTION

Describes how Windows PowerShell providers provide access to data and components that would not otherwise be easily accessible at the command line. The data is presented in a consistent format that resembles a file system drive.

LONG DESCRIPTION

Windows PowerShell providers are Microsoft .NET Framework-based programs that make the data in a specialized data store available in Windows PowerShell so that you can view and manage it.

The data that a provider exposes appears in a drive, and you access the data in a path like you would on a hard disk drive. You can use any of the built-in cmdlets that the provider supports to manage the data in the provider drive. And, you can use custom cmdlets that are designed especially for the data.

The providers can also add dynamic parameters to the built-in cmdlets. These are parameters that are available only when you use the cmdlet with the provider data.

BUILT-IN PROVIDERS

Windows PowerShell includes a set of built-in providers that you can use to access the different types of data stores.

Provider Drive Data store -------- ----- ---------- Alias Alias: Windows PowerShell aliases

Certificate Cert: x509 certificates for digital signatures

Environment Env: Windows environment variables

FileSystem * File system drives, directories, and files

Function Function: Windows PowerShell functions

Registry HKLM:, HKCU Windows registry

Variable Variable: Windows PowerShell variables

WS-Management WSMan WS-Management configuration information

* The FileSystem drives vary on each system.

You can also create your own Windows PowerShell providers, and you can install providers that others develop. To list the providers that are available in your session, type:

```
get-psprovider
```

INSTALLING AND REMOVING PROVIDERS

Windows PowerShell providers are delivered to you in Windows PowerShell snap-ins, which are .NET Framework-based programs that are compiled into .dll files. The snap-ins can include providers and cmdlets.

Before you use the provider features, you have to install the snap-in and then add it to your Windows PowerShell session. For more information, see about_PsSnapins.

You cannot uninstall a provider, although you can remove the Windows PowerShell snap-in for the provider from the current session. If you do, you will remove all the contents of the snap-in, including its cmdlets.

To remove a provider from the current session, use the Remove-PsSnapin cmdlet. This cmdlet does not uninstall the provider, but it makes the provider unavailable in the session.

You can also use the Remove-PsDrive cmdlet to remove any drive from the current session. This data on the drive is not affected, but the drive is no longer available in that session.

VIEWING PROVIDERS

To view the Windows PowerShell providers on your computer, type:

```
get-psprovider
```

The output lists the built-in providers and the providers that you added to the session.

THE PROVIDER CMDLETS

The following cmdlets are designed to work with the data exposed by any provider. You can use the same cmdlets in the same way to manage the different types of data that providers expose. After you learn to manage the data of one provider, you can use the same procedures with the data from any provider.

For example, the New-Item cmdlet creates a new item. In the C: drive that is supported by the FileSystem provider, you can use New-Item to create a new file or folder. In the drives that are supported by the Registry provider, you can use New-Item to create a new registry key. In the Alias: drive, you can use New-Item to create a new alias.

For detailed information about any of the following cmdlets, type:

```
get-help <cmdlet-name> -detailed
```

CHILDITEM CMDLETS

```
Get-ChildItem
```

CONTENT CMDLETS

```
Add-Content
```

Clear-Content
Get-Content
Set-Content

ITEM CMDLETS

Clear-Item
Copy-Item
Get-Item
Invoke-Item
Move-Item
New-Item
Remove-Item
Rename-Item
Set-Item

ITEMPROPERTY CMDLETS

Clear-ItemProperty
Copy-ItemProperty
Get-ItemProperty
Move-ItemProperty
New-ItemProperty
Remove-ItemProperty
Rename-ItemProperty
Set-ItemProperty

LOCATION CMDLETS

Get-Location
Pop-Location
Push-Location
Set-Location

PATH CMDLETS

Join-Path
Convert-Path
Split-Path
Resolve-Path
Test-Path

PSDRIVE CMDLETS

Get-PSDrive
New-PSDrive
Remove-PSDrive

PSPROVIDER CMDLETS

Get-PSProvider

VIEWING PROVIDER DATA

The primary benefit of a provider is that it exposes its data in a familiar and consistent way. The model for data presentation is a file system drive.

To use data that the provider exposes, you view it, move through it, and change it as though it were data on a hard drive. Therefore, the most important information about a provider is the name of the drive that it supports.

The drive is listed in the default display of the Get-PsProvider cmdlet, but you can get information about the provider drive by using the Get-PsDrive cmdlet. For example, to get all the properties of the Function: drive, type:

```
get-psdrive Function | format-list *
```

You can view and move through the data in a provider drive just as you would on a file system drive.

To view the contents of a provider drive, use the Get-Item or Get-ChildItem cmdlets. Type the drive name followed by a colon (:). For example, to view the contents of the Alias: drive, type:

```
get-item alias:
```

You can view and manage the data in any drive from another drive by including the drive name in the path. For example, to view the HKLM\Software registry key in the HKLM: drive from another drive, type:

```
get-childitem hklm:\software
```

To open the drive, use the Set-Location cmdlet. Remember the colon when you specify the drive path. For example, to change your location to the root directory of the Cert: drive, type:

```
set-location cert:
```

Then, to view the contents of the Cert: drive, type:

get-childitem

MOVING THROUGH HIERARCHICAL DATA

You can move through a provider drive just as you would a hard disk drive. If the data is arranged in a hierarchy of items within items, use a backslash (\) to indicate a child item. Use the following format:

drive:\location\child-location\...

For example, to change your location to the HKLM\Software registry key, type a Set-Location command, such as:

```
set-location hklm:\software
```

You can also use relative references to locations. A dot (.) represents the current location. For example, if you are in the HKLM:\Software\Microsoft registry key, and you want to list the registry subkeys in the HKLM:\Software\Micrsoft\PowerShell key, type the following command:

```
get-childitem .\powershell
```

FINDING DYNAMIC PARAMETERS

Dynamic parameters are cmdlet parameters that are added to a cmdlet by a provider. These parameters are available only when the cmdlet is used with the provider that added them.

For example, the Cert: drive adds the CodeSigningCert parameter to the Get-Item and Get-ChildItem cmdlets. You can use this parameter only when you use Get-Item or Get-ChildItem in the Cert: drive.

For a list of the dynamic parameters that a provider supports, see the Help file for the provider. Type:

get-help <provider-name>

For example:

get-help certificate

LEARNING ABOUT PROVIDERS

Although all provider data appears in drives, and you use the same methods to move through them, the similarity stops there. The data stores that the provider exposes can be as varied as Active Directory locations and Microsoft Exchange Server mailboxes.

For information about individual Windows PowerShell providers, type:

```
get-help <ProviderName>
```

For example:

```
get-help registry
```

For a list of Help topics about the providers, type:

```
get-help * -category provider
```

about_Path_Syntax

Add-ProvSchemeControllerAddress

Apr 15, 2014

Adds a list of host names (as DNS addresses) to a provisioning scheme.

Syntax

Add-ProvSchemeControllerAddress [-ProvisioningSchemeName] <String> [-ControllerAddress] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeControllerAddress -ProvisioningSchemeUid <Guid> [-ControllerAddress] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to associate controller hosts (and hence implicitly a set of brokers) with a specific provisioning scheme. This optional data is passed to the machines created by the Machine Creation Services, where it is used to associate the newly created machine with a broker. The list is returned along with the provisioning scheme that it is assigned to.

Related topics

Get-ProvScheme

Remove-ProvSchemeControllerAddress

Parameters

-ProvisioningSchemeName<String>

The name for the provisioning scheme that the list of addresses is to be added to.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The unique identifier for the provisioning scheme that the list of addresses is to be added to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-ControllerAddress<String[]>

Specifies the array of DNS names to be added to the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.MachineCreation.Sdk.ProvisioningScheme You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Add-ProvSchemeControllerAddress.

Return Values

Citrix.MachineCreation.Sdk.ProvisioningScheme

Add-ProvSchemeControllerAddress returns the updated ProvisioningScheme object containing the union of the old and new controller address lists.

ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme.

ProvisioningSchemeName <string>

The name of the provisioning scheme.

CpuCount <int>

The number of processors that VMs will be created with when using this scheme.

MemoryMB <int>

The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM <string>

The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate <DateTime>

The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme will use.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme will use.

CleanOnBoot <Boolean>

Indicates whether or not the VMs created are to be reset to a clean state on each boot.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme for Quick Deploy purposes.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Add-ProvSchemeControllerAddress -ProvisioningSchemeUid "01a4a008-8ce8-4165-ba9c-cdf15a6b0501" -ControllerAddress (ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com)

```
ProvisioningSchemeUid  : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
ProvisioningSchemeName : Scheme2
CpuCount               : 1
MemoryMB               : 1024
MasterImageVM          : Base.vm/Base.snapshot
MasterImageVMDate      : 17/05/2010 09:53:40
IdentityPoolUid        : 03743136-e43b-4a87-af74-ab71686b3c16
IdentityPoolName       : idPool1
HostingUnitUid         : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName        : HostUnit1
CleanOnBoot            : True
TaskId                 : 00000000-0000-0000-0000-000000000000
Metadata               : {}
ControllerAddress      : {ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com}
```

Add a set of controllers to the provisioning scheme with the identifier "01a4a008-8ce8-4165-ba9c-cdf15a6b0501".

---------- EXAMPLE 2 ----------

C:\PS>Get-ProvScheme -ProvisioningSchemeName scheme1 | Add-ProvSchemeControllerAddress -ControllerAddress (ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com)

```
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : Scheme1
CpuCount               : 1
MemoryMB               : 1024
MasterImageVM          : Base.vm/Base.snapshot
MasterImageVMDate      : 17/05/2010 09:53:40
IdentityPoolUid        : 03743136-e43b-4a87-af74-ab71686b3c16
IdentityPoolName       : idPool1
HostingUnitUid         : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName        : HostUnit1
CleanOnBoot            : True
TaskId                 : 00000000-0000-0000-0000-000000000000
Metadata               : {}
ControllerAddress      : {ddcA.citrix.com,ddcB.citrix.com,ddcC.citrix2.com}
```

Add controller addresses to a provisioning scheme using a ProvisioningScheme object.

Add-ProvSchemeMetadata

Apr 15, 2014

Adds metadata on the given ProvisioningScheme.

Syntax

Add-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ProvisioningScheme objects. This cmdlet will not overwrite existing metadata on an object - use the Set-ProvSchemeMetadata cmdlet instead.

Related topics

Set-ProvSchemeMetadata

Remove-ProvSchemeMetadata

Parameters

-ProvisioningSchemeUid<Guid>

Id of the ProvisioningScheme

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ProvisioningSchemeName<String>

Name of the ProvisioningScheme

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ProvisioningScheme[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the ProvisioningScheme specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.Metadata

Add-ProvSchemeMetadata returns an array of objects containing the new definition of the metadata.

\n Property <string>

\n Specifies the name of the property.

\n Value <string>

\n Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Add-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Property                       Value
    --------                       -----
    property                       value
```

Add metadata with a name of 'property' and a value of 'value' to the ProvisioningScheme with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Add-ProvSchemeScope

Apr 15, 2014

Add the specified ProvisioningScheme(s) to the given scope(s).

Syntax

Add-ProvSchemeScope [-Scope] <String[]> -InputObject <ProvisioningScheme[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The AddProvSchemeScope cmdlet is used to associate one or more ProvisioningScheme objects with given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the ProvisioningScheme objects in different ways:

- ProvisioningScheme objects can be piped in or specified by the InputObject parameter

- The ProvisioningSchemeUid parameter specifies objects by ProvisioningSchemeUid

- The ProvisioningSchemeName parameter specifies objects by ProvisioningSchemeName (supports wildcards)

To add a ProvisioningScheme to a scope you need permission to change the scopes of the ProvisioningScheme and permission to add objects to all of the scopes you have specified.

If the ProvisioningScheme is already in a scope, that scope will be silently ignored.

Related topics

Remove-ProvSchemeScope

Get-ProvScopedObject

Parameters

-Scope<String[]>

Specifies the scopes to add the objects to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-InputObject<ProvisioningScheme[]>

Specifies the ProvisioningScheme objects to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ProvisioningSchemeUid<Guid[]>

Specifies the ProvisioningScheme objects to be added by ProvisioningSchemeUid.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ProvisioningSchemeName<String[]>

Specifies the ProvisioningScheme objects to be added by ProvisioningSchemeName.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Return Values

None

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Add-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single ProvisioningScheme to the 'Finance' scope.

---------- EXAMPLE 2 ----------

c:\PS>Add-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Adds a single ProvisioningScheme to the multiple scopes.

---------- EXAMPLE 3 ----------

c:\PS>Get-ProvScheme | Add-ProvSchemeScope Finance
Adds all visible ProvisioningScheme objects to the 'Finance' scope.

---------- EXAMPLE 4 ----------

c:\PS>Add-ProvSchemeScope Finance -ProvisioningSchemeName A*
Adds ProvisioningScheme objects with a name starting with an 'A' to the 'Finance' scope.

Add-ProvTaskMetadata

Apr 15, 2014

Adds metadata on the given Task.

Syntax

Add-ProvTaskMetadata [-TaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Add-ProvTaskMetadata [-InputObject] <Task[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to store additional custom data against given Task objects. This cmdlet does not overwrite existing metadata on an object - use the Set-ProvTaskMetadata cmdlet instead.

Related topics

Set-ProvTaskMetadata

Remove-ProvTaskMetadata

Get-ProvTask

Stop-ProvTask

Remove-ProvTask

Switch-ProvTask

Parameters

-TaskId<Guid>

Id of the Task

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Task[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.Metadata

Add-ProvTaskMetadata returns an array of objects containing the new definition of the metadata.

Property <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DuplicateObject

One of the specified metadata already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Add-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Property                  Value
    --------                  -----
    property                  value
```

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Get-ProvDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the MachineCreation Service.

Syntax

Get-ProvDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-ProvServiceStatus

Set-ProvDBConnection

Test-ProvDBConnection

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the MachineCreation Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the MachineCreation Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True
```

Get the database connection string for the MachineCreation Service.

Get-ProvDBSchema

Apr 15, 2014

Gets a script that creates the MachineCreation Service database schema for the specified data store.

Syntax

Get-ProvDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new MachineCreation Service database schema, add a new MachineCreation Service to an existing site, remove a MachineCreation Service from a site, or create a database server logon for a MachineCreation Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected MachineCreation Service instance, otherwise the scripts relate to MachineCreation Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a MachineCreation SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to MachineCreation Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to MachineCreation Service roles

If ScriptType is Evict, the returned script contains:

o Removal of MachineCreation Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before

using this command.

Related topics

Set-ProvDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the MachineCreation services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the MachineCreation Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further MachineCreation services to an existing database instance that already contains the full MachineCreation service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the MachineCreation Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified MachineCreation Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for MachineCreation services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the MachineCreation Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvDBSchema -DatabaseName MyDB -ServiceGroupName  MyServiceGroup > c:\ProvSchema.sql
```

Get the full database schema for site data store of the MachineCreation Service and copy it to a file called 'c:\ProvSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a MachineCreation Service site schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-ProvDBSchema -DatabaseName MyDB -scriptType Login > c:\MachineCreationLogins.sql
```

Get the logon scripts for the MachineCreation Service.

Get-ProvDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the MachineCreation Service database schema.

Syntax

Get-ProvDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the MachineCreation Service from the current schema version to a different version.

Related topics

Get-ProvInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any MachineCreation services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-ProvServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the MachineCreation Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-ProvDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-ProvInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the MachineCreation Service.

Syntax

Get-ProvInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the MachineCreation Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-ProvInstalledDbVersion command returns objects containing the new definition of the MachineCreation Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the MachineCreation Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the MachineCreation Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-ProvInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the MachineCreation Service database schema for which upgrade scripts are supplied.

Get-ProvObjectReference

Apr 15, 2014

Returns the number of local objects holding references to objects from other services.

Syntax

Get-ProvObjectReference [-HostingUnitUid <Guid[]>] [-IdentityPoolUid <Guid[]>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns for each hosting unit or identity pool GUID the number of references by provisioning schemes or by long running task. This check is done without regard for scoping of existing provisioning schemes, references by inaccessible schemes are also checked.

Related topics

Parameters

-HostingUnitUid<Guid[]>

The identifiers of the hosting units(s) to be tested.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-IdentityPoolUid<Guid[]>

The identifiers of the identity pool(s) to be tested.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

ObjectReferenceCount

An object which contain the input object identifier, its type, the type of referencing object and the number of references.

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
Get-ProvObjectReference -HostingUnitUid 5B66A060-85E1-4DBD-9D1B-BF79881D3BB1

Count       : 1
ObjectId    : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source      : ProvisioningScheme
Target      : HostingUnit

Count       : 0
ObjectId    : 5b66a060-85e1-4dbd-9d1b-bf79881d3bb1
Source      : Task
```

Target : HostingUnit

This checks a single hosting unit for objects that have references to them; in this case we only have a single provisioning scheme that relates to it.

Get-ProvScheme

Apr 15, 2014

Gets the list of provisioning schemes.

Syntax

Get-ProvScheme [[-ProvisioningSchemeName] <String>] [-ProvisioningSchemeUid <Guid>] [-ScopeId <Guid>] [-ScopeName <String>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Lets you retrieve the list of defined provisioning schemes.

Related topics

New-ProvScheme

Remove-ProvScheme

Add-ProvSchemeMetadata

Remove-ProvSchemeMetadata

Add-ProvSchemeControllerAddress

Remove-ProvSchemeControllerAddress

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScopeId<Guid>

Gets only results with a scope matching the specified scope identifier.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScopeName<String>

Gets only results with a scope matching the specified scope name.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

See about_Prov_Filtering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

See about_Prov_Filtering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-Skip<Int32>

See about_Prov_Filtering for details.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Filter<String>

See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. When a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme.

ProvisioningSchemeName <string>

The name of the provisioning scheme.

CpuCount <int>

The number of processors that VMs will be created with when using this scheme.

MemoryMB <int>

The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM <string>

The path within the hosting unit provider to the copy of the VM snapshot that the scheme uses.

MasterImageVMDate <DateTime>

The date and time that the copy was made of the VM snapshot used by the scheme.

IdentityPoolUid <Guid>

The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid <Guid>

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme uses.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the scheme uses.

CleanOnBoot <Boolean>

Indicates whether the VMs that are created will be reset to a clean state on each boot.

TaskId <Guid>

The identifier of any current task that is running for the provisioning scheme.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The metadata associated with this provisioning scheme.

ControllerAddress <string[]>

The DNS names of the controllers associated with this provisioning scheme for Quick Deploy purposes.

VMMetadata <char[]>

The opaque VM metadata block

UsePersonalVDiskStorage <bool>

True if the scheme will use personal vDisk storage.

PersonalVDiskDriveLetter <char>

The drive letter for the personal vDisk

PersonalVDiskDriveSize <int>

The size of the personal vDisk in GB

ProfileUsagePercentage <double>

The percentage of the personal vDisk to be used for profile data

DedicatedTenancy <bool>

Whether to use dedicated tenancy when creating machines in Cloud Hypervisors.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Get-ProvScheme

ProvisioningSchemeUid : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : Scheme1

```

HostingUnitName      : HostUnit1
CleanOnBoot          : True
TaskId               : 00000000-0000-0000-0000-000000000000
Metadata             : {}
```

```
ControllerAddress      : {}
VMMetadata             : {0, 1, 0, 0...}
```

Returns all of the provisioning schemes that have the name 'Scheme0' or 'Scheme1'.

Get-ProvSchemeMasterVMImageHistory

Apr 15, 2014

Gets the list of master VM snapshots that have been used to provide hard disks to provisioning schemes.

Syntax

Get-ProvSchemeMasterVMImageHistory [-ProvisioningSchemeName <String>] [-ProvisioningSchemeUid <Guid>] [-MasterImageVM <String>] [-VMImageHistoryUid <Guid>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to discover the master VM snapshots that have been used previously to provide the hard disk image for provisioning schemes. This information includes the date and time when the image was introduced. This information can be used to roll back a provisioning scheme to a previous image.

Related topics

Publish-ProvMasterVMImage

Remove-ProvSchemeMasterVMImageHistory

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-MasterImageVM<String>

The path to the snapshot item in the hosting unit PowerShell provider.

Required?	false
Default Value	
Accept Pipeline Input?	false

-VMImageHistoryUid<Guid>

The unique identifier for the Image History item.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

See about_Prov_Filtering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

See about_Prov_Filtering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-Skip<Int32>

See about_Prov_Filtering for details.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-Sort By<String>

See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Filter<String>

See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.VMImage

The object that represents a master VM history. This contains the following parameters:

VMImageHistoryUid <Guid>

The unique identifier for the History item.

ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme that the VM was used for.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the VM was used for.

MasterImageVM <string>

The path to the Snapshot item that was used as the master VM image.

Date <DateTime>

The date and time that the VM or snapshot was used in the provisioning scheme.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CouldNotQueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Get-ProvSchemeMasterVMImageHistory

VMImageHistoryUid : 3cba3a75-89cd-4868-989b-27feb378fec5
ProvisioningSchemeUid : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
MasterImageVM : /Base.vm/base.snapshot
Date : 17/05/2010 09:27:50
Gets all the hard disk images that have been used across all provisioning schemes.

---------- EXAMPLE 2 ----------

C:\PS>Get-ProvSchemeMasterVMImageHistory -ProvisioningScheme MyScheme -masterImageVM "/BaseXp.vm/update1.snapshot" | Publish-ProvMasterVmImage
Roll back the provisioning scheme to use the hard disk from the update1.snapshot for the provisioning scheme called "MyScheme".

Get-ProvScopedObject

Apr 15, 2014

Gets the details of the scoped objects for the MachineCreation Service.

Syntax

Get-ProvScopedObject [-ScopeId <Guid>] [-ScopeName <String>] [-ObjectType <ScopedObjectType>] [-ObjectId <String>] [-ObjectName <String>] [-Description <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of directly scoped objects including the names and identifiers of both the scope and object as well as the object description for display purposes.

There will be at least one result for every directly scoped object. When an object is associated with multiple scopes the output contains one result per scope duplicating the object details.

No records are returned for the All scope, though if an object is not in any scope a result with a null ScopeId and ScopeName will be returned.

Related topics

Parameters

-ScopeId<Guid>

Gets scoped object entries for the given scope identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ScopeName<String>

Gets scoped object entries with the given scope name.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ObjectType<ScopedObjectType>

Gets scoped object entries for objects of the given type.

Required?	false

Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ObjectId<String>

Gets scoped object entries for objects with the specified object identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ObjectName<String>

Gets scoped object entries for objects with the specified object identifier.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-Description<String>

Gets scoped object entries for objects with the specified description.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ScopedObject

The Get-ProvScopedObject command returns an object containing the following properties:

ScopeId <Guid?>

Specifies the unique identifier of the scope.

ScopeName <String>

Specifies the display name of the scope.

ObjectType <ScopedObjectType>

Type of the object this entry relates to.

ObjectId <String>

Unique identifier of the object.

ObjectName <String>

Display name of the object

Description <String>

Description of the object (possibly $null if the object type does not have a description).

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvScopedObject -ObjectType Scheme

ScopeId     : eff6f464-f1ee-4442-add3-99982e0cec01
ScopeName   : Sales
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     : 304e0fa7-d390-47f0-a94f-7e956a324c41
ScopeName   : Finance
```

```
ObjectType  : Scheme
ObjectId    : cd4174ee-9e4b-4e57-b126-9dbf757fe493
ObjectName  : MyExampleScheme
Description : Test scheme

ScopeId     :
ScopeName   :
ObjectType  : Scheme
ObjectId    : 5062e46b-71bc-4ac9-901a-30fe6797e2f6
ObjectName  : AnotherScheme
Description : Another scheme in no scopes
```

Gets all of the scoped objects with type Scheme. The example output shows a scheme object (MyExampleScheme) in two scopes Sales and Finance, and another scheme (AnotherScheme) that is not in any scope. The ScopeId and ScopeName values returned are null in the final record.

Get-ProvService

Apr 15, 2014

Gets the service record entries for the MachineCreation Service.

Syntax

Get-ProvService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the MachineCreation Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.Service

The Get-ProvServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the MachineCreation Service running in the current service group.

Get-ProvServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the MachineCreation Service on the controller.

Syntax

```
Get-ProvServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the MachineCreation Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvServiceAddedCapability
```

Get the added capabilities of the MachineCreation Service.

Get-ProvServiceConfigurationData

Apr 15, 2014

Gets configuration data for the service.

Syntax

Get-ProvServiceConfigurationData [-Name <String[]>] [-Value <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to determine the configuration parameters for the service

Related topics

Set-ProvServiceConfigurationData

Remove-ProvServiceConfigurationData

Parameters

-Name<String[]>

The Configuration data item Name .

Required?	false
Default Value	
Accept Pipeline Input?	false

-Value<String[]>

The Configuration data item value.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Required?	false
Default Value	False

Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ServiceConfigurationData

This object provides details of the configuration data and contains the following information:

Name <string>

The Name for the configuration item.

Value <string>

The value for the configuration item.

Notes

In the case of failure the following errors can be produced.

Error Codes

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Get-ProvConfiguratuionData

Name              : DeltaDiskDelete.timeDelay
Value             : 10
```

Get the Configuration data for the service.

Get-ProvServiceInstance

Apr 15, 2014

Gets the service instance entries for the MachineCreation Service.

Syntax

Get-ProvServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the MachineCreation Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ServiceInstance

The Get-ProvServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Prov.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvServiceInstance

Address           : http://MyServer.com:80/Citrix/MachineCreationService
Binding           : wcf_HTTP_kerb

```

ServiceGroupName : MyServiceGroup
ServiceGroupUid : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType : Prov
Version : 1
Get all instances of the MachineCreation Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-ProvServiceStatus

Apr 15, 2014

Gets the current status of the MachineCreation Service on the controller.

Syntax

Get-ProvServiceStatus [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables the status of the MachineCreation Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-ProvDBConnection

Test-ProvDBConnection

Get-ProvDBConnection

Get-ProvDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-ProvServiceStatus command returns an object containing the status of the MachineCreation Service together with extra diagnostics information.

DBUnconfigured

The MachineCreation Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted

to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

DBOlderVersionThanService

The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The MachineCreation Service is running and is connected to a database containing a valid schema.

Failed

The MachineCreation Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvServiceStatus

DBUnconfigured
```

Get the current status of the MachineCreation Service.

Get-ProvTask

Apr 15, 2014

Gets the task history for the MachineCreation Service.

Syntax

Get-ProvTask [[-TaskId] <Guid>] [-Type <JobType>] [-Active <Boolean>] [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of tasks that have run or are currently running within the MachineCreation Service.

Related topics

Remove-ProvTask

Stop-ProvTask

Switch-ProvTask

Add-ProvTaskMetadata

Remove-ProvTaskMetadata

Parameters

-TaskId<Guid>

Specifies the task identifier to be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Type<JobType>

Specifies the type of task to be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Active<Boolean>

Specifies whether currently running tasks only or completed tasks only are returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Prov_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can result.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvTask -Active $false

TaskId          : cfe5b3a2-c471-443e-b05e-8658e672d10f
Type            : MyTask
Host            : NYSERVER
```

```
Status                : Finished
CurrentOperation      :
TaskProgress          : 100
TaskExpectedCompletion  : 10/10/2012 15:28:12
LastUpdateTime        : 10/10/2012 15:28:12
ActiveElapsedTime     : 56
DateFinished          : 10/10/2012 15:28:12
TerminatingError      :
...
```

Get all completed tasks for the MachineCreation Service.

All tasks will publish at least the fields listed above, plus more related to the particular task being performed.

Get-ProvVM

Apr 15, 2014

Gets the VMs that were created using Citrix XenDesktop Machine Creation Services.

Syntax

Get-ProvVM [[-ProvisioningSchemeName] <String>] [-ProvisioningSchemeUid <Guid>] [-VMName <String>] [-Locked <Boolean>] [-Tag <String>] [-OutOfDate] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to obtain a list of the VMs that were created using Machine Creation Services.

Related topics

New-ProvVM

Remove-ProvVM

Lock-ProvVM

Unlock-ProvVM

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-VMName<String>

The name of the VM in the hypervisor context.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Locked<Boolean>

Indicates whether only VMs that are marked as locked are returned or not (see Lock-ProvVM and Unlock-ProvVM for details).

Required?	false
Default Value	
Accept Pipeline Input?	false

-Tag<String>

The tag string that was associated with the VM when it was locked.

Required?	false
Default Value	
Accept Pipeline Input?	false

-OutOfDate<SwitchParameter>

Indicates that the image currently assigned to the VM is out of date. The image will be updated the next time the VM is restarted.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

See about_Prov_Filtering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

See about_Prov_Filtering for details.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-Skip<Int32>

See about_Prov_Filtering for details.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Filter<String>

See about_Prov_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine

The object has the following properties:

ADAccountSid <string>

The SID of the AD computer account that the VM is using.

ADAccountName <string>

The name of the AD computer account that the VM is using.

CpuCount <int>

The number of processors that the VM has been allocated.

CreationDate <DateTime>

The date and time that the VM was created.

Domain <string>

The Domain of the AD computer account that the VM is using.

ImageOutOfDate <Boolean>

Indicates if the image will be updated next time the VM is started.

Lock <Boolean>

Indicates whether the VM is locked or not.

MemoryMB <int>

The maximum amount of memory that VMs will be created with when using this scheme.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the VM is part of.

ProvisioningSchemeUid <Guid>

The unique identifier for the provisioning scheme that the VM is part of.

Tag <string>

Provides the string associated with a locked VM.

VMId <string>

The identifier for the VM (hypervisor context).

VMName <string>

The name of the VM (hypervisor context).

AssignedImage <string>

The identifier (in the hypervisor) for the hard disk image that the VM is currently assigned.

BootedImage <string>

The identifier (in the hypervisor) for the hard disk image with which the VM is currently started.

HostingUnitUid <Guid>

The unique identifier for the hosting unit that was used to create the VM.

HypervisorConnectionUid <Guid>

The unique identifier of the hypervisor connection that was used to create the VM.

LastBootTime <DateTime>

The date and time of the last start of the VM.

OSDiskIndex <int>

The disk index at which the hard disk image, from which the VM is currently started, is attached (or [int]::MinValue for VMs inherited from versions of XenDesktop before 5.6)

PersonalVDiskIndex <int>

The disk index at which the personal vdisk is attached (defaults to [int]::MinValue for VMs without a personal vdisk)

PersonalVDiskStorage <string>

The identifier (in the hypervisor) for the storage on which the personal virtual disk image from which the VM is currently started is located. This is set only if the VM has a personal vDisk attached

StorageId <string>

The identifier (in the hypervisor) for the storage on which the hard disk image, from which the VM is currently started, is located.

Notes

In the case of failure, the following errors can result.

Error Codes

PartialData

Only a subset of the available data was returned.

CouldNotQueryDatabase

The query required to get the database was not defined.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Get-ProvVM -provisioningSchemeName MyScheme

ADAccountName          : MYDomain\computer2$

StorageId               : 33ad07a7-edd7-589b-716a-86cad4739f5e
```

Gets all the Virtual Machines that were locked, regardless of which Provisioning Scheme the VM is part of.

Lock-ProvVM

Apr 15, 2014

Locks a VM.

Syntax

Lock-ProvVM [-VMID] <String[]> -ProvisioningSchemeName <String> [-Tag <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Lock-ProvVM [-VMID] <String[]> -ProvisioningSchemeUid <Guid> [-Tag <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to 'lock' a virtual machine with a tag string. This stops other commands from being able to remove the virtual machine without unlocking the VM first. This is to enable consumers of the virtual machines to indicate that the VM is being used.

Related topics

UnLock-ProvVM

Get-ProvVM

Remove-ProvVM

Parameters

-VMID<String[]>

The virtual machine Id (hypervisor context).

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Tag<String>

The string to be held against the VM being locked.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine You can pipe an object containing a parameter called 'VMId' and 'ProvisioningSchemeName' to Lock-ProvVM

Notes

In the case of failure, the following errors can result.

Error Codes

VMDoesNotExist

The specified VM cannot be located.

VMAlreadyLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.

PermissionDenied

The user is not authorized to perform this operation

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Lock-ProvVM -provisioningSchemeName MyScheme -VMId bc79802c-ba6e-8de8-99e9-4c35d7ad24b4 -Tag LockedString
Locks the VM with the Id 'bc79802c-ba6e-8de8-99e9-4c35d7ad24b4' in the provisioning scheme 'MyScheme' with the tag 'LockedString'.

---------- EXAMPLE 2 ----------

C:\PS>Get-ProvVM -provisioningSchemeName MyScheme | Lock-ProvVM -Tag LockedString
Locks all the VMs in the provisioning scheme 'MyScheme' with the tag 'LockedString'.

New-ProvScheme

Apr 15, 2014

Creates a new provisioning scheme.

Syntax

New-ProvScheme [-ProvisioningSchemeName] <String> -HostingUnitName <String> -IdentityPoolName <String> -MasterImageVM <String> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-CleanOnBoot] [-UsePersonalVDiskStorage] [-Scope <String[]>] [-NoImagePreparation] [-NetworkMapping <Hashtable>] [-Metadata <Hashtable>] [-ServiceOffering <String>] [-SecurityGroup <String[]>] [-DedicatedTenancy] [-VhdTemplateSource <String>] [-VhdResultDestination <String>] [-AppScanResultsFile <String>] [-ResetAdministratorPasswords] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Lets you create a new provisioning scheme. The creation process makes a copy of the hard disk attached to a virtual machine snapshot and stores it in every storage location that the hosting unit referenced by the provisioning scheme defines. This is a long-running task and typically takes several minutes to complete (depending on the size of the hard disk that is being copied and the number of snapshots that the hard disk consists of).

A snapshot must be used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot is specified using a path into the Citrix Host Service Powershell Provider the Citrix Host Service Powershell snap-in must also be loaded for this cmdlet to be used.

This cmdlet requires information to be provided that is retrieved using other snap-ins that form part of the Citrix Machine Creation Services: Hosting Unit Service Snapin The snap-in that provides information about the hypervisors. AD Identity Service Snapin The snap-in that provides information about the identity pools.

The provisioning scheme is a collection of all of the data that is required to form a template against which virtual machines can be created. It therefore requires the following: Hosting Unit A reference to an item defined in the Host Service that defines the hypervisor, the network, and the storage to be used. Identity Pool A reference to the collection of Active Directory accounts that is used for virtual machines created from the provisioning scheme.

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme to be created. This must be a name that is not being used by an existing provisioning scheme, and it must not contain any of the following characters \/;:#.*?= <> | []()"'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-HostingUnitName<String>

The name of the hosting unit used for the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-IdentityPoolName<String>

The name for the identity pool used for the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-HostingUnitUid<Guid>

The identifier for the hosting unit used for the provisioning scheme.

Required?	true
Default Value	

Accept Pipeline Input?	false

-IdentityPoolUid<Guid>

The identifier of the identity pool used for the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MasterImageVM<String>

The path in the hosting unit provider to the virtual machine snapshot that is used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot item in the same hosting unit that the hosting unit name or hosting unit UID refers to.

Valid paths are of the format; XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VmName>.vm\<SnapshotName>.snapshot

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-VMCpuCount<Int32>

The number of processors used by virtual machines created from the provisioning scheme.

Required?	false
Default Value	The number of CPUs assigned to the base image VM snapshot.
Accept Pipeline Input?	false

-VMMemoryMB<Int32>

The maximum amount of memory used by virtual machines created from the provisioning scheme.

Required?	false
Default Value	The amount of memory assigned to the base image VM snapshot.
Accept Pipeline Input?	false

-CleanOnBoot<SwitchParameter>

Indicates whether or not the virtual machines created from this provisioning scheme are reset to their initial condition each time they are started.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-UsePersonalVDiskStorage<SwitchParameter>

Indicates whether or not personal vDisks are used for the VMs in this provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Scope<String[]>

The administration scopes to be applied to the new provisioning scheme.

Required?	false
Default Value	
Accept Pipeline Input?	false

-NoImagePreparation<SwitchParameter>

Indicates that Image Preparation should not be performed on this Provisioning Scheme

Required?	false
Default Value	
Accept Pipeline Input?	false

-NetworkMapping<Hashtable>

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, provisioned VMs are created with a single NIC, which is mapped to the default network in the HostingUnit. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Metadata<Hashtable>

Specifies any metadata to be attached to the scheme when it is created.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceOffering<String>

The Service Offering to use when creating machines in Cloud Hypervisors.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SecurityGroup<String[]>

The security groups to apply to machines created in Cloud Hypervisors

Required?	false
Default Value	
Accept Pipeline Input?	false

-DedicatedTenancy<SwitchParameter>

Whether to use dedicated tenancy when creating machines in Cloud Hypervisors.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-VhdTemplateSource<String>

A file path to a source VHD template to be used when performing Application Scanning during Image Preparation. The presence of this parameter in conjunction with VhdResultDestination implies that application scanning is to be performed

Required?	false
Default Value	
Accept Pipeline Input?	false

-VhdResultDestination<String>

A file path (including file name) where the VHD disk file containing the results of application scanning should be written.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AppScanResultsFile<String>

File name to which the results of application scanning should be written.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ResetAdministratorPasswords<SwitchParameter>

Indicates whether to reset the password for the administrator accounts on provisioned machines.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RunAsynchronously<SwitchParameter>

Indicates whether or not the command returns before it is complete. If specified, the command returns an identifier for the task that was created. This task can be monitored using the get-ProvTask command.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-PurgeJobOnSuccess<SwitchParameter>

Indicates that the task history is removed from the database when the task has finished. This can only be specified for tasks that are not run asynchronously.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new provisioning scheme tasks, this is always NewProvisioningScheme.

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks, this is empty until metadata is added.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme that the task was for.

MasterImage <string>

The path (in the hosting unit provider) of the virtual machine snapshot that was used as the master VM image for the task.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

IdentityPoolUid <guid>

The unique identifier name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

PersonalVDiskDriveLetter

The drive letter on which a personal vDisk is mounted (blank if the personal vDisk feature was not selected).

PersonalVDiskDriveSize

The size of any personal vDisk (zero if the personal vDisk feature was not selected).

Scopes <Citrix.Fma.Sdk.ServiceCoreScopeReference[]>

The delegated administration scopes to which the scheme will belong.

NetworkMap <Citrix.MachineCreation.Sdk.NetworkMap>

The list of NIC to network associations, if specified.

ProvisioningSchemeMetadata <Dictionary<string, string>>

The metadata to apply to the provisioning scheme, if specified.

TaskState <Citrix.MachineCreation.Sdk.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

The task has begun but has not done anything yet.

LocatingResources,

The workflow is locating resources from other services.

HostingUnitNotFound

The task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

The task failed because the required VM snapshot could not be located.

ConsolidatingMasterImage

The task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

The task is replicating the consolidated master image.

StoringProvisioningScheme

The task is storing the provisioning scheme data in the database.

Finished

The task completed with no errors.

ProvisioningSchemeAlreadyExists

The task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

The task failed because the specified identity pool could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

The task failed because the hosting unit from which the master image originated is not the same hosting unit that the provisioning scheme is using.

MasterVmImageIsASnapshot

The task failed because the master VM path does not refer to a Snapshot item.

ProvisioningSchemeNotFound

The task failed because it could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

The task failed because a task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration

The task failed because the VM snapshot specified as the master has an invalid configuration.

InvalidMasterVMState

The task failed because the VM snapshot specified as the master is currently in an invalid state.

InsufficientResources

The task failed because the hypervisor did not have enough resources to complete the task.

DiskConsolidationFailed

The disk consolidation task failed. Details are in the task state information string.

StorageNotFound

The task failed because no associated storage was found in the hosting unit.

ConfigurationError

The task failed because the service is unable to contact one of the other services. This is because not all appropriate Configuration Service registrations have been performed.

Canceled

The task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation

Additional information about the current task state.

TaskProgress

The progress of the task 0-100%.

DiskSize

The size of the master image in GB

DedicatedTenancy

Whether to use dedicated tenancy when creating machines in Cloud Hypervisors.

Notes

Only one long-running task for each provisioning scheme can be processed at a time.

In case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

MachineCreationServiceDoesNotSupportPersonalDisk

The service instance being used has not been upgraded to support the personal vDisk feature.

DatabaseMissingCapabilites

The database supporting the service instance being used has not been upgraded to support the personal vDisk feature.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

ScopeNotFound

One or more of the scopes nominated for the new provisioning scheme do not exist.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used, or examine the XenDesktop logs. VhdParametersMustBeSupplied

When parameter VhdTemplateSource or VhdResultDestination is supplied, both parameters are required to be supplied.

The cmdlet is associated with a task of type NewProvisioningScheme, and while active will move through the following operations (CurrentOperation field)

New-ProvVM

Apr 15, 2014

Creates a new virtual machine.

Syntax

New-ProvVM -ProvisioningSchemeName <String> -ADAccountName <String[]> [-FastBuild] [-NetworkMapping <Hashtable>] [-AutoAssignVLAN] [-SecurityGroup <String[]>] [-MachinesPerAssistant <Int32>] [-MaxAssistants <Int32>] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

New-ProvVM -ProvisioningSchemeUid <Guid> -ADAccountName <String[]> [-FastBuild] [-NetworkMapping <Hashtable>] [-AutoAssignVLAN] [-SecurityGroup <String[]>] [-MachinesPerAssistant <Int32>] [-MaxAssistants <Int32>] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Lets you create new virtual machines with the configuration specified by a provisioning scheme.

The virtual machines are created using all of the storage specified in the provisioning scheme. The storage is used in a round robin mechanism. For the duration of this task, the AD accounts are locked (by the AD Identity Service), which stops the same accounts being used by other virtual machine creation tasks.

Related topics

Unlock-ProvVM

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme in which the virtual machines are created.

Required?	true
Default Value	
Accept Pipeline Input?	false

-ProvisioningSchemeUid<Guid>

The unique identifier for the provisioning scheme in which the virtual machines are created.

Required?	true

Default Value	
Accept Pipeline Input?	false

-ADAccountName<String[]>

A list of the Active Directory account names that are used for the virtual machines. The accounts must be provided in a domain-qualified format. This parameter accepts Identity objects as returned by the New-AcctADAccount cmdlet, or any PSObject with string properties "Domain" and "ADAccountName".

Required?	true
Default Value	
Accept Pipeline Input?	false

-FastBuild<SwitchParameter>

Indicates whether or not the command can improve speed by using optimizations in the creation process. This may mean that machines you create cannot be booted until ResetVM operations have been performed by the Broker and Machine Identity Services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-NetworkMapping<Hashtable>

Specifies how the attached NICs are mapped to networks. If this parameter is omitted, provisioned VMs are created with network settings as inherited from the provisioning scheme. If this parameter is supplied, machines are created with the number of NICs specified in the map, and each NIC is attached to the specified network.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AutoAssignVLAN<SwitchParameter>

Indicates whether or not the VLAN of the network should be automatically assigned to the new VM or if the VLAN from the master image should be used

Required?	false
Default Value	false

Accept Pipeline Input?	false

-SecurityGroup<String[]>

The security groups to apply to machines created in Cloud Hypervisors

Required?	false
Default Value	
Accept Pipeline Input?	false

-MachinesPerAssistant<Int32>

The number of concurrent volume operations that may be performed by each volume worker helper machine

Required?	false
Default Value	
Accept Pipeline Input?	false

-MaxAssistants<Int32>

The maximum number of volume worker help machines that may be created for this operation.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RunAsynchronously<SwitchParameter>

Indicates whether or not the command returns before it is complete. If specified, the command returns an identifier for the task that was created. This task can be monitored using the get-ProvTask command.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-PurgeJobOnSuccess<SwitchParameter>

Indicates that the task history is removed from the database when the task has finished. This cannot be specified for tasks that are run asynchronously.

Required?	false

Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller to which the PowerShell snap-in connects. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For newly provisioned VM tasks, this is always "NewVirtualMachine".

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this is empty until metadata is added.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme that the task was for.

MasterImage <string>

The path (in the hosting unit provider) of the virtual machine snapshot that was used as the master image for the task.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

IdentityPoolUid <guid>

The unique identifier name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme uses.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

HypervisorInMaintenanceMode

Indicates that the hypervisor is not available for normal use.

NoAvailableStorage

Indicates that no storage is available for the hypervisor.

NoAvailableNetwork

Indicates that no network is available for the hypervisor.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

The job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask).

TaskStateInformation

Provides more detailed information about the current task state.

VirtualMachinesToCreateCount <int>

The total number of virtual machines that the task is trying to create.

VirtualMachinesCreatedCount <int>

The number of virtual machines that the task has created so far. Details of the machines that were created are in the CreatedVirtualMachines parameter.

VirtualMachinesCreationFailedCount <int>

The number of virtual machines that the task has failed to create. Details of the machines that were not created are in the FailedVirtualMachines parameter.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents

Message <string>

The exception message

Details <string>

The full exception content including stack trace

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state

Status <string>

StatusAdditionalInformation <string>

VMId <string>

The virtual machine identifier within the hypervisor in which the VM resides.

VMName <string>

The display name of the virtual machine within the hypervisor in which the VM resides.

CreatedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

Notes

Only one long-running task in each provisioning scheme can be processed at a time.

In the case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified.

When running asynchronously, the cmdlet terminates before the job does,

so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs

on the controller being used, or examine the XenDesktop logs.

The cmdlet is associated with a task of type NewVirtualMachine, and while active will move through the following operations (CurrentOperation field)

```

Creates a new virtual machine using the AD account "domain\account" in the provisioning scheme "MyScheme".

---------- EXAMPLE 2 ----------

C:\PS>New-provVM -ProvisioningSchemeName MyScheme -ADAccountName "domain\Account" -RunAsynchronously

Guid

6dd85fec-96cf-46b1-9cd4-d8ba7d06e85b
Creates a new virtual machine using the AD account "domain\account" in the provisioning scheme "MyScheme" asynchronously. To get the task details, use Get-ProvTask -TaskID <task id>

i.e.

C:\PS>Get-ProvTask -TaskID 6dd85fec-96cf-46b1-9cd4-d8ba7d06e85b

TaskId : 4b49f13a-277c-4cb0-bc40-f088430cfe8a

Active : False

Host : MyHost

DateStarted : 18/05/2010 10:54:32

Type : NewVirtualMachine

Metadata : {}

WorkflowStatus : Completed

MasterImage : /Base.vm/Base.snapshot

Publish-ProvMasterVmImage

Apr 15, 2014

Update the master image associated with the provisioning scheme.

Syntax

Publish-ProvMasterVmImage [-ProvisioningSchemeName] <String> -MasterImageVM <String> [-DoNotStoreOldImage] [-VhdTemplateSource <String>] [-VhdResultDestination <String>] [-AppScanResultsFile <String>] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Publish-ProvMasterVmImage -ProvisioningSchemeUid <Guid> -MasterImageVM <String> [-DoNotStoreOldImage] [-VhdTemplateSource <String>] [-VhdResultDestination <String>] [-AppScanResultsFile <String>] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to update the hard disk image used to provision virtual machines. If the provisioning scheme is a 'CleanOnBoot' type, then the next time that virtual machines are started, their hard disks are updated to this new image. Regardless of the 'CleanOnBoot' type, all new virtual machines created after this command will use this new hard disk image.

A background task will be created to remove the old hard disk copies. You can locate and monitor this task using the Get-ProvTask cmdlet.

A snapshot is used rather than a VM, so that the content of the hard disk for the provisioning scheme can be easily determined.

As the snapshot is specified using a path into the Citrix Host Service Powershell Provider, the Citrix Host Service Powershell snap-in must also be loaded for this cmdlet to be used.

The previous hard disk image path is stored into the history (see Get-provSchemeMasterVMImageHistory). The data stored in the history allows for a roll back to be undertaken, to revert to the previous hard disk image if required.

Related topics

Get-ProvSchemeMasterVMImageHistory

Get-ProvScheme

Parameters

-ProvisioningSchemeName<String>

The provisioning scheme to which the hard disk image should be updated.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The provisioning scheme identifier to which the hard disk image should be updated.

Required?	true
Default Value	
Accept Pipeline Input?	false

-MasterImageVM<String>

The path in the hosting unit provider to the virtual machine snapshot that will be used. This identifies the hard disk to be used and the default values for the memory and processors. This must be a path to a Snapshot Item in the same hosting unit that the hosting unit name or hosting unit Uid refers to.

Valid paths are of the format; XDHyp:\HostingUnits\<HostingUnitName>\<path>\<VmName>.vm\<SnapshotName>.snapshot

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-DoNotStoreOldImage<SwitchParameter>

Specifies that the current image should not be added to the image history list for the provisioning scheme. This is useful when rolling back to a previous image.

Required?	false
Default Value	
Accept Pipeline Input?	false

-VhdTemplateSource<String>

A file path to a source VHD template to be used when performing Application Scanning during Image Preparation. The presence of this parameter in conjunction with VhdResultDestination implies that application scanning is to be performed

Required?	false
Default Value	
Accept Pipeline Input?	false

-VhdResultDestination<String>

A file path (including file name) where the VHD disk file containing the results of application scanning should be written.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AppScanResultsFile<String>

File name to which the results of application scanning should be written.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RunAsynchronously<SwitchParameter>

Indicates whether or not the cmdlet should return before it is complete. If specified, the command returns an identifier for the task that was created. You can monitor this task using the get-ProvTask cmdlet.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-PurgeJobOnSuccess<SwitchParameter>

Indicates that the task history will be removed from the database once the task has finished. This cannot be specified for tasks that are run asynchronously.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Guid

When "RunAsynchronously" is specified, this identifier is returned to provide the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>

The type of the task. For new provisioning scheme tasks this is always "NewProvisioningScheme".

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored against the task. For new tasks this will be empty until metadata is added.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is being used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the task was for.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme that the task was for.

MasterImage <string>

The path (in the hosting unit provider) of the virtual machine snapshot that was used as the master image for the task.

IdentityPoolName <string>

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme will use.

IdentityPoolUid <guid>

The unique identifier name of the identity pool (from the ADIdentity PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName <string>

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

TaskState <Citrix.DesktopUpdateManager.SDK.NewProvisioningSchemeState>

The state of the task. This can be any of the following:

Processing

Indicates that the task has just begun and has not done anything yet.

LocatingResources,

Indicates that the workflow is locating resources from other services.

HostingUnitNotFound

Indicates that the task failed because the required hosting unit could not be located.

VirtualMachineSnapshotNotFound

Indicates that the task failed because the required snapshot could not be located.

ConsolidatingMasterImage

Indicates that the task is consolidating the master image.

ReplicatingConsolidatedImageToAllStorage

Indicates that the task is replicating the consolidated master image.

StoringProvisioningScheme

Indicates that the task is storing the provisioning scheme data to the database.

Finished

Indicates that the task has completed with no errors.

ProvisioningSchemeAlreadyExists

Indicates that the task failed because a provisioning scheme with the same name already exists.

IdentityPoolNotFound

Indicates that the task failed because the identity pool specified could not be found.

MasterVMImageIsNotPartOfProvisioningSchemeHostingUnit,

Indicates that the hosting unit that the master image originated from is not the same hosting unit that the provisioning scheme is defined to use.

MasterVmImageIsNotASnapshot

Indicates that the task failed because the master VM Image path does not refer to a Snapshot item.

ProvisioningSchemeNotFound

Could not find a provisioning scheme with the specified name.

TaskAlreadyRunningForProvisioningScheme

A task for a provisioning scheme with the same name is already running.

InvalidMasterVMConfiguration

The VM snapshot specified as the master had an invalid configuration.

InvalidMasterVMState

The VM snapshot specified as the master is currently in an invalid state.

InsufficientResources

Indicates that the task failed because the hypervisor did not have enough resources to complete the task.

StorageNotFound

Indicates that no associated storage was found in the hosting unit.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation <string>

Holds string data providing more details about the current task state.

TaskProgress

The progress of the task 0-100%.

Notes

Only one long running task per provisioning scheme can be processed at any one time.

In the case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type PublishImage, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

ConsolidatingMasterImage

PreparingMasterImage

ReplicatingMasterImage

CommittingScheme

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Publish-ProvMasterVMImage -ProvisioningSchemeName MyScheme -MasterImageVM XDHyp:\H
stingUnits\HostUnit1\RhoneCC_baseXP.vm\base.snapshot

TaskId               : 248f102f-073f-45fe-aea9-1819a6d6dd1f
Active               : False
Host                 : MyHost
DateStarted          : 17/05/2010 17:37:57
Type                 : PublishImage
Metadata             : {}
WorkflowStatus       : Completed
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : MyScheme
MasterImage          : /RhoneCC_baseXP.vm/base.snapshot
HostingUnitName      : HostUnit1
HostingUnitUid       : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
ADIdentityPoolName   :

CurrentOperation     :
TaskState            : Finished
TaskStateInformation :
```

Updates the master hard disk image for the provisioning Scheme "MyScheme" to use the "base.snapshot" hard disk image.

Remove-ProvScheme

Apr 15, 2014

Removes a provisioning scheme

Syntax

Remove-ProvScheme [-ProvisioningSchemeName] <String> [-ForgetVM] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvScheme -ProvisioningSchemeUid <Guid> [-ForgetVM] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove a provisioning Scheme. The provisioning scheme must not contain any VMs unless the 'ForgetVM' option is specified.

If 'ForgetVM' is not specified, a cmdlet task is created that runs in the background to remove the hard disk copies that have been created for the provisioning scheme in hypervisor storage. Use the Get-ProvTask command to monitor the progress of this task.

Related topics

Get-ProvTask

New-ProvScheme

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The unique identifier for the provisioning scheme to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ForgetVM<SwitchParameter>

Indicates whether or not the VMs in the provisioning scheme should be left in the hypervisor and only the data held in the Machine Creation Services removed. If this is specified, it is up to the administrator of the hypervisor to remove the VMs and hard disk images using the tools provided by the hypervisor itself.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

ProvisioningSchemeUid

The unique identifier for the provisioning scheme.

ProvisioningSchemeName

The name of the provisioning scheme.

CpuCount

The number of processors that VMs will be created with when using this scheme.

MemoryMB

The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM

The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate

The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid

The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName

The name of the hosting unit (from the hosting unit PowerShell snap-in) that the new provisioning scheme will use.

CleanOnBoot

Indicates whether the VMs created are to be reset to a clean state on each boot.

TaskId

The identifier of any current task that is running for the provisioning scheme.

Notes

If the hosting unit referenced by the provisioning scheme no longer exists (i.e. it has been removed using the Hosting Unit PowerShell snap-in), the provisioning scheme data is deleted from the database without errors. However, the hard disks associated with the provisioning scheme cannot be removed and remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes

IllegalParameter

One or more parameters are illegal or are not specified.

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

UnableToRemoveProvisioningSchemeDueToAssociatedVM

The provisioning scheme contained VMs and the 'ForgetVM' parameter was not specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type DisusedImageCleanUp, and while active will move through the following operations (CurrentOperation field)

Running

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Remove-ProvScheme -ProvisioningSchemeName $provScheme.ProvisioningSchemeName
```

Remove the empty provisioning scheme by name.

Remove-ProvSchemeControllerAddress

Apr 15, 2014

Removes metadata from a provisioning scheme.

Syntax

Remove-ProvSchemeControllerAddress [-ProvisioningSchemeName] <String> [-ControllerAddress] <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeControllerAddress -ProvisioningSchemeUid <Guid> -ControllerAddress <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Removes the specified controller addresses from the specified object. Attempting to remove an address not present writes an error record to the pipeline.

Related topics

Get-ProvScheme

Add-ProvSchemeControllerAddress

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme from which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The identifier of the provisioning scheme from which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	false

-ControllerAddress<String[]>

Specifies the array of DNS names to be removed from the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.MachineCreation.Sdk.ProvisioningScheme You can pipe an object containing a parameter called 'ProvisioningSchemeName' to Remove-ProvSchemeMetadata.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ControllerAddressNotFound

The specified address was not associated with the provisioning scheme.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Get-ProvScheme -ProvisioningSchemeName scheme1 | Remove-ProvSchemeControllerAddress

```
ProvisioningSchemeUid  : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : Scheme1

Metadata               : {}
```

```
ControllerAddress      : {}
```
Remove all controller addresses from the provisioning scheme with the name "scheme1".

---------- **EXAMPLE 2** ----------

```
C:\PS>Remove-ProvSchemeControllerAddress -ProvisioningSchemeUid "01a4a008-8ce8-4165-ba9c-cdf15a6b0501" -ControllerAddress (ddcA.citrix.com,ddcC.citrix2.com)

ProvisioningSchemeUid  : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
ProvisioningSchemeName : Scheme2
CpuCount               : 1
MemoryMB               : 1024
MasterImageVM          : Base.vm/Base.snapshot
MasterImageVMDate      : 17/05/2010 09:53:40
IdentityPoolUid        : 03743136-e43b-4a87-af74-ab71686b3c16
IdentityPoolName       : idPool1
HostingUnitUid         : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName        : HostUnit1
CleanOnBoot            : True
TaskId                 : 00000000-0000-0000-0000-000000000000
Metadata               : {}
ControllerAddress      : {ddcB.citrix.com}
```
Remove a subset of the controller address list from the provisioning scheme with the identifier "01a4a008-8ce8-4165-ba9c-cdf15a6b0501".

Remove-ProvSchemeMasterVMImageHistory

Apr 15, 2014

Removes the history of provisioning scheme master image VMs.

Syntax

Remove-ProvSchemeMasterVMImageHistory [-ProvisioningSchemeName] <String> [-VMImageHistoryUid <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMasterVMImageHistory -ProvisioningSchemeUid <Guid> [-VMImageHistoryUid <Guid>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMasterVMImageHistory -VMImageHistoryUid <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove the record of previously used master VMs or snapshots for provisioning schemes.

Related topics

Get-ProvSchemeMasterVMImageHistory

Publish-ProvMasterVMImage

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-VMImageHistoryUid<Guid>

The unique identifier for the Image History item.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Remove-ProvSchemeMasterVMImageHistory -ProvisioningSchemeName MyScheme
Removes all history for the provisioning scheme called "MyScheme".

---------- EXAMPLE 2 ----------

c:\PS>Get-ProvScheme | Remove-ProvSchemeMasterVMImageHistory
Removes all history for all provisioning schemes.

Remove-ProvSchemeMetadata

Apr 15, 2014

Removes metadata from the given ProvisioningScheme.

Syntax

Remove-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given ProvisioningScheme.

Related topics

Add-ProvSchemeMetadata

Set-ProvSchemeMetadata

Parameters

-ProvisioningSchemeUid<Guid>

Id of the ProvisioningScheme

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ProvisioningSchemeName<String>

Name of the ProvisioningScheme

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ProvisioningScheme[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvScheme | Remove-ProvSchemeMetadata
```

Remove all metadata from all ProvisioningScheme objects.

Remove-ProvSchemeScope

Apr 15, 2014

Remove the specified ProvisioningScheme(s) from the given scope(s).

Syntax

Remove-ProvSchemeScope [-Scope] <String[]> -InputObject <ProvisioningScheme[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeUid <Guid[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvSchemeScope [-Scope] <String[]> -ProvisioningSchemeName <String[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The RemoveProvSchemeScope cmdlet is used to remove one or more ProvisioningScheme objects from the given scope(s).

There are multiple parameter sets for this cmdlet, allowing you to identify the ProvisioningScheme objects in different ways:

- ProvisioningScheme objects can be piped in or specified by the InputObject parameter

- The ProvisioningSchemeUid parameter specifies objects by ProvisioningSchemeUid

- The ProvisioningSchemeName parameter specifies objects by ProvisioningSchemeName (supports wildcards)

To remove a ProvisioningScheme from a scope you need permission to change the scopes of the ProvisioningScheme.

If the ProvisioningScheme is not in a specified scope, that scope will be silently ignored.

Related topics

Add-ProvSchemeScope

Get-ProvScopedObject

Parameters

-Scope<String[]>

Specifies the scopes to remove the objects from.

Required?	true
Default Value	
Accept Pipeline Input?	false

-InputObject<ProvisioningScheme[]>

Specifies the ProvisioningScheme objects to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ProvisioningSchemeUid<Guid[]>

Specifies the ProvisioningScheme objects to be removed by ProvisioningSchemeUid.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ProvisioningSchemeName<String[]>

Specifies the ProvisioningScheme objects to be removed by ProvisioningSchemeName.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

None

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

ScopeNotFound

One of the specified scopes was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command with the specified objects or scopes.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Remove-ProvSchemeScope Finance -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Removes a single ProvisioningScheme from the 'Finance' scope.

---------- EXAMPLE 2 ----------

c:\PS>Remove-ProvSchemeScope Finance,Marketing -ProvisioningSchemeUid 6702C5D0-C073-4080-A0EE-EC74CB537C52
Removes a single ProvisioningScheme from multiple scopes.

---------- EXAMPLE 3 ----------

c:\PS>Get-ProvScheme | Remove-ProvSchemeScope Finance
Removes all visible ProvisioningScheme objects from the 'Finance' scope.

---------- EXAMPLE 4 ----------

c:\PS>Remove-ProvSchemeScope Finance -ProvisioningSchemeName A*
Removes ProvisioningScheme objects with a name starting with an 'A' from the 'Finance' scope.

Remove-ProvServiceConfigurationData

Apr 15, 2014

Removes configuration data from the service.

Syntax

Remove-ProvServiceConfigurationData [[-Name] <String>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove data from the MachineCreation Service configuration data.

Related topics

Set-ProvServiceConfigurationData

Get-ProvServiceConfigurationData

Parameters

-Name<String>

The name of the configuration data item to remove.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Remove-ProvServiceConfigurationData -Name "MyName"
```

Removes the configuration data item with name "MyName".

Remove-ProvServiceMetadata

Apr 15, 2014

Removes metadata from the given Service.

Syntax

Remove-ProvServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-ProvServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvService | % { Remove-ProvServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Service objects.

Remove-ProvTask

Apr 15, 2014

Removes from the database completed tasks for the MachineCreation Service.

Syntax

Remove-ProvTask [-TaskId] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables completed tasks that have run within the MachineCreation Service to be removed from the database.

Related topics

Get-ProvTask

Add-ProvTaskMetadata

Remove-ProvTaskMetadata

Parameters

-TaskId<Guid>

Specifies the identifier for the task to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Remove-ProvTask command.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

InvalidWorkflow

The specified task could not be found.

InvalidWorkflowState

The task was not in an appropriate state for the requested operation.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvTask -active $false | Remove-ProvTask
Success
```

Remove entries for all completed tasks from the MachineCreation Service.

Remove-ProvTaskMetadata

Apr 15, 2014

Removes metadata from the given Task.

Syntax

Remove-ProvTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvTaskMetadata [-TaskId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvTaskMetadata [-InputObject] <Task[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Task.

Related topics

Add-ProvTaskMetadata

Set-ProvTaskMetadata

Get-ProvTask

Remove-ProvTask

Stop-ProvTask

Switch-ProvTask

Parameters

-TaskId<Guid>

Id of the Task

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Task[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvTask | Remove-ProvTaskMetadata
```

Remove all metadata from all Task objects.

Remove-ProvVM

Apr 15, 2014

Removes virtual machines.

Syntax

Remove-ProvVM [-ProvisioningSchemeName] <String> -VMName <String[]> [-ForgetVM] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-ProvVM [-ProvisioningSchemeUid] <Guid> -VMName <String[]> [-ForgetVM] [-RunAsynchronously] [-PurgeJobOnSuccess] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Lets you remove VMs from the Machine Creation Services and the hypervisor that they run on.

Related topics

Get-ProvVM

New-ProvVM

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme from which virtual machines will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The unique identifier for the provisioning scheme from which the virtual machines are removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-VMName<String[]>

List of VM names that will be removed from the provisioning scheme.

Required?	true

Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ForgetVM<SwitchParameter>

The named VMs will only be removed from the provisioning scheme database, but will remain in the hypervisor.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RunAsynchronously<SwitchParameter>

Indicates whether or not the command returns before it is complete. If this is specified, the command returns an identifier for the task that was created. This task can be monitored using the get-ProvTask command.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-PurgeJobOnSuccess<SwitchParameter>

Indicates that the task history is removed from the database when the task finishes. This cannot be specified for tasks that are run asynchronously.

Required?	false
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. When a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Guid

When the RunAsynchronously identifier is specified, this GUID is returned and provides the task identifier.

System.Management.Automation.PSCustomObject

This object provides details of the task that was run and contains the following information:

TaskId <Guid>

The identifier for the task that was performed.

Active <Boolean>

Indicates whether the task is still processing or is complete.

Host <string>

The name of the host on which the task is running or was run.

DateStarted <DateTime>

The date and time that the task was initiated.

Type <Citrix.XDInterServiceTypes.JobType>

The type of task. For new remove-VM tasks, this is always "RemoveVirtualMachine".

Metadata <Citrix.MachineCreation.Sdk.Metadata[]>

The list of metadata stored for the task. For new tasks, this is empty until metadata is added.

WorkflowStatus <System.Workflow.Runtime.WorkflowStatus>

Indicates the status of the workflow that is used to process the task.

ProvisioningSchemeName <string>

The name of the provisioning scheme that the task is for.

ProvisioningSchemeUid <Guid>

The unique identifier of the provisioning scheme that the task is for.

TaskState <Citrix.DesktopUpdateManager.SDK.ProvisionVMState>

The state of the task. This can be any of the following:

Processing

Indicates that the task is in its initial state.

LocatingResources,

Indicates that the task is locating information from other services.

HostingUnitNotFound

Indicates that the required hosting unit could not be located.

ProvisioningSchemeNotFound

Indicates that the required provisioning scheme could not be located.

Provisioning

Indicates that the task is at the provisioning stage.

IdentityPoolNotFound

Indicates that the required identity pool could not be located.

TaskAlreadyRunningForProvisioningScheme

Indicates that the provisioning scheme already has another task running.

Finalizing

Indicates that the task is finalizing.

Finished

Indicates that the task is complete.

FinishedWithErrors

Indicates that the task is complete but there were errors. Specific details of errors are included with each failed virtual machine.

Removing

Indicates that the task is removing virtual machines from the hypervisor.

Failed

Job failed for reasons specified in TaskStateInformation.

Canceled

Indicates that the task was stopped by user intervention (using Stop-ProvTask)

TaskStateInformation

Provides more detailed information about the current task state.

VirtualMachinesToRemoveCount <int>

The total number of virtual machines that the task is trying to remove.

VirtualMachinesRemovedCount <int>

The number of virtual machines that the task has removed so far. Details of the machines that have been removed are in the RemovedVirtualMachines parameter.

VirtualMachinesFailedCount <int>

The number of virtual machines that the task has failed to remove. Details of the machines that failed are in the FailedVirtualMachines parameter.

FailedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

ADAccountName <string>

The domain-qualified AD Account name of the machine.

ADAccountSid <string>

The AD account SID of the machine account.

DiagnosticInformation <Citrix.MachineCreation.Sdk.ExceptionSurrogate[]>

A collection of handled error states which caused the provisioning to fail.

ExceptionType <string>

The type of exception this object represents

Message <string>

The exception message

Details <string>

The full exception content including stack trace

InnerException <Citrix.MachineCreation.Sdk.ExceptionSurrogate>

Information relating to any contributing error state

Status <string>

StatusAdditionalInformation <string>

VMId <string>

The virtual machine identifier in the hypervisor.

VMName <string>

The display name of the virtual machine in the hypervisor.

RemovedVirtualMachines <Citrix.DesktopUpdateManager.SDK.VirtualMachineCreation[]>

See FailedVirtualMachines for details of the object parameters.

ProgressEstimator

Gives an estimate of the number of virtual machines processed, averaging over virtual machines that were both partly and completely processed.

Notes

Only one long-running task for each provisioning scheme can be processed at a time.

This task still operates if the hosting unit or VMs in the hypervisor are missing. This removes the data from the Citrix Machine Creation Services, but the VMs remain in the hypervisor.

In the case of failure, the following errors can result.

Error Codes

JobCreationFailed

The requested task could not be started.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation. Communication with the database failed for

for various reasons.

WorkflowHostUnavailable

The task could not be started because the database connection is inactive.

CommunicationError

An error occurred while communicating with the service.

InvalidParameterCombination

Both PurgeJobOnSuccess and RunAsynchronously were specified. When running asynchronously, the cmdlet terminates before the job does, so it cannot clean up the completed job.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

The cmdlet is associated with a task of type RemoveVirtualMachine, and while active will move through the following operations (CurrentOperation field)

ValidatingInputs

RemovingVirtualMachines

Remove all VMs from provisioning scheme XenPS

Rename-ProvScheme

Apr 15, 2014

Renames a provisioning scheme.

Syntax

Rename-ProvScheme [-ProvisioningSchemeName] <String> [-NewProvisioningSchemeName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Rename-ProvScheme -ProvisioningSchemeUid <Guid> [-NewProvisioningSchemeName] <String> [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to change the name of an existing provisioning scheme. The unique identifier for the provisioning scheme never changes after it has been created so, regardless of any name changes, the provisioning scheme can always be identified by its unique identifier.

Related topics

New-ProvScheme

Set-ProvScheme

Get-ProvScheme

Test-ProvSchemeNameAvailable

Parameters

-ProvisioningSchemeName<String>

The current name of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-ProvisioningSchemeUid<Guid>

The identifier for the provisioning scheme that is to be renamed.

Required?	true
Default Value	
Accept Pipeline Input?	false

-NewProvisioningSchemeName<String>

The new name for the provisioning scheme. This must be a name that is not being used by an existing provisioning scheme, and it must not contain any of the following characters \/;:#.*?=<>|[]()'"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Defines whether or not the command returns a result showing the new state of the updated identity pool.

Required?	false
Default Value	true
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

ProvisioningSchemeUid

The unique identifier for the provisioning scheme.

ProvisioningSchemeName

The name of the provisioning scheme.

CpuCount

The numer of processors that VMs will be created with when using this scheme.

MemoryMB

The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM

The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate

The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid

The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

CleanOnBoot

Indicates whether the VMs created are to be reset to a clean state on each boot.

TaskId

The identifier of any current task that is running for the provisioning scheme.

Metadata

The metadata for the provisioning scheme.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

ProvisioningSchemeNameAlreadyExists

A provisioning scheme with the same name as the new provisioning scheme name already exists.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

C:\PS>Rename-ProvScheme -provisioningSchemeName CurrentName -NewProvisioningSchemeName NewName
Renames a provisioning scheme from "currentName" to "NewName".

---------- EXAMPLE 2 ----------

C:\PS>Rename-ProvScheme -provisioningSchemeName CurrentName -NewProvisioningSchemeName NewName -PassThru

ProvisioningSchemeUid : 7585f0de-192e-4847-a6d8-22713c3a2f42
ProvisioningSchemeName : NewName
CpuCount : 1
MemoryMB : 1024
MasterImageVM : /Base.vm
MasterImageVMDate : 17/05/2010 08:27:50

```
IdentityPoolUid       : 03743136-e43b-4a87-af74-ab71686b3c16
IdentityPoolName      : IdPool1
HostingUnitUid        : 01a4a008-8ce8-4165-ba9c-cdf15a6b0501
HostingUnitName       : XenHU
CleanOnBoot           : True
TaskId                :
Metadata              : {}
```

Renames a provisioning scheme from "currentName" to "NewName" and displays the resulting state.

Reset-ProvServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the MachineCreation Service.

Syntax

Reset-ProvServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload MachineCreation Service access permissions and configuration service locations. The Reset-ProvServiceGroupMembership command must be run on at least one instance of the service type (Prov) after installation and registration with the configuration service. Without this operation, the MachineCreation services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-ProvServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.MachineCreation.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-ProvServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-ProvServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

---------- EXAMPLE 2 ----------

c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-ProvServiceGroupmembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-ProvDBConnection

Apr 15, 2014

Configures a database connection for the MachineCreation Service.

Syntax

Set-ProvDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the MachineCreation Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-ProvServiceStatus

Get-ProvDBConnection

Test-ProvDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the MachineCreation Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-ProvDBConnection command returns an object containing the status of the MachineCreation Service together with extra diagnostics information.

DBUnconfigured

The MachineCreation Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

DBOlderVersionThanService

The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The MachineCreation Service is running and is connected to a database containing a valid schema.

Failed

The MachineCreation Service has failed.

Unknown

The status of the MachineCreation Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

c:\PS>Set-ProvDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK
Configures a database connection string for the MachineCreation Service.

-------------------------- EXAMPLE 2 --------------------------

c:\PS>Set-ProvDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the MachineCreation Service.

Set-ProvScheme

Apr 15, 2014

Changes the parameter values for a provisioning scheme.

Syntax

Set-ProvScheme [-ProvisioningSchemeName] <String> -IdentityPoolName <String> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvScheme [-ProvisioningSchemeName] <String> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvScheme [-ProvisioningSchemeName] <String> -IdentityPoolUid <Guid> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvScheme -ProvisioningSchemeUid <Guid> -IdentityPoolUid <Guid> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvScheme -ProvisioningSchemeUid <Guid> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvScheme -ProvisioningSchemeUid <Guid> -IdentityPoolName <String> [-VMCpuCount <Int32>] [-VMMemoryMB <Int32>] [-PassThru] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to update the parameters of an existing provisioning scheme.

This allows the following parameters to be updated:

Number of CPUs that will be used for VMs created from the provisioning scheme. Maximum amount of memory that will be used for VMs created from the provisioning scheme.

To change the name of the provisioning scheme see Rename-ProvScheme.

Related topics

New-ProvScheme

Remove-ProvScheme

Get-ProvScheme

Rename-ProvScheme

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme to be updated.

Required?	true

Default Value	
Accept Pipeline Input?	false

-IdentityPoolName<String>

The name of an identity pool to associate with the provisioning scheme, replacing the present one.

Required?	true
Default Value	
Accept Pipeline Input?	false

-IdentityPoolUid<Guid>

The identifier of an identity pool to associate with the provisioning scheme, replacing the present one.

Required?	true
Default Value	
Accept Pipeline Input?	false

-ProvisioningSchemeUid<Guid>

The identifier of the provisioning scheme to be updated.

Required?	true
Default Value	
Accept Pipeline Input?	false

-VMCpuCount<Int32>

The number of processors that virtual machines created from the provisioning scheme should use.

Required?	false
Default Value	
Accept Pipeline Input?	false

-VMMemoryMB<Int32>

The maximum amount of memory that virtual machines created from the provisioning scheme should use.

Required?	false

Default Value	
Accept Pipeline Input?	false

-PassThru<SwitchParameter>

Defines whether or not the command returns a result showing the new state of the updated provisioning scheme.

Required?	false
Default Value	true
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ProvisioningScheme

This object provides details of the provisioning scheme and contains the following information:

ProvisioningSchemeUid

ProvisioningSchemeName

The name of the provisioning scheme.

CpuCount

The numer of processors that VMs will be created with when using this scheme.

MemoryMB

The maximum amount of memory that VMs will be created with when using this scheme.

MasterImageVM

The path within the hosting unit provider to the VM or snapshot of which the scheme is currently using a copy.

MasterImageVMDate

The date and time that the copy of the VM image was made for the scheme.

IdentityPoolUid

The unique identifier of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

IdentityPoolName

The name of the identity pool (from the ADIdentity PowerShell snap-in) that the scheme uses.

HostingUnitUid

The unique identifier of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

HostingUnitName

The name of the hosting unit (from the Hosting Unit PowerShell snap-in) that the new provisioning scheme will use.

CleanOnBoot

Indicates whether the VMs created are to be reset to a clean state on each boot.

TaskId

The identifier of any current task that is running for the provisioning scheme.

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> Set-ProvScheme -ProvisioningSchemeName MyScheme -VMCpuCount 2
```

Updates a provisioning scheme called "MyScheme" to use two processors on the VMs that are created from the provisioning scheme.

Set-ProvSchemeMetadata

Apr 15, 2014

Adds or updates metadata on the given ProvisioningScheme.

Syntax

Set-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-ProvisioningSchemeUid] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-ProvisioningSchemeName] <String> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvSchemeMetadata [-InputObject] <ProvisioningScheme[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given ProvisioningScheme objects.

Related topics

Add-ProvSchemeMetadata

Remove-ProvSchemeMetadata

Parameters

-ProvisioningSchemeUid<Guid>

Id of the ProvisioningScheme

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-ProvisioningSchemeName<String>

Name of the ProvisioningScheme

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<ProvisioningScheme[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the ProvisioningScheme specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-ProvSchemeMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-ProvSchemeMetadata -ProvisioningSchemeUid 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                         value
```

Add metadata with a name of 'property' and a value of 'value' to the ProvisioningScheme with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-ProvServiceConfigurationData

Apr 15, 2014

Sets the value for the given key in the service configuration data.

Syntax

Set-ProvServiceConfigurationData [-Name] <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored for the MachineCreation Service.

Related topics

Remove-ProvServiceConfigurationData

Get-ProvServiceConfigurationData

Parameters

-Name<String>

Specifies the key name of the metadata to be added. The key must be unique.

The Name cannot contain any of the following characters \/;:#.*?=<>|[]()'"""

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the name. If the name already exists, its value is updated.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.MachineCreation.Sdk.ServiceConfigurationData

Set-ProvServiceConfigurationData returns an object containing the new definition of the configuration.

Name <string>

Specifies the name for the item of data.

Value <string>

Specifies the value of the data.

Notes

In the case of failure the following errors can be produced.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

An error occurred while communicating with the service.

ExceptionThrown

An unexpected error occurred. To locate more details see the Windows event logs on the controller being used, or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Set-ProvServiceConfigurationData -Name "customProperty1" -Value "value2"

Name                 Value
--------             -----
customProperty1      value2
```

Set data with a name of 'customProperty1' and value of 'value2' to the service configuration.

Set-ProvServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given Service.

Syntax

Set-ProvServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-ProvServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" =

"val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()'"

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.

Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-ProvServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-ProvServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                           value
```

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-ProvTaskMetadata

Apr 15, 2014

Adds or updates metadata on the given Task.

Syntax

Set-ProvTaskMetadata [-TaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvTaskMetadata [-InputObject] <Task[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-ProvTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Use this cmdlet to store additional custom data against given Task objects.

Related topics

Add-ProvTaskMetadata

Remove-ProvTaskMetadata

Get-ProvTask

Stop-ProvTask

Remove-ProvTask

Switch-ProvTask

Parameters

-TaskId<Guid>

Id of the Task

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Task[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-ProvTaskMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-ProvTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                           value
```

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Stop-ProvTask

Apr 15, 2014

Stops currently running MachineCreation Service tasks.

Syntax

Stop-ProvTask [-TaskId] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables tasks currently running in the MachineCreation Service to be stopped. Once stopped, tasks cannot be restarted.

Related topics

Get-ProvTask

Remove-ProvTask

Switch-ProvTask

Parameters

-TaskId<Guid>

Specifies the identifier for the task to be stopped.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Stop-ProvTask command.

Notes

If the command fails, the following errors can result.

Error Codes

InvalidWorkflow

The specified task could not be found.

InvalidWorkflowHost

The specified task is executing on a different server.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

DatabaseError

There was a problem communicating with the database.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ProvTask -active $true | Stop-ProvTask
Success
```

Terminate all tasks currently executing on the MachineCreation Service.

---------- EXAMPLE 2 ----------

```
c:\PS>Stop-ProvTask -TaskId bd52e688-e40d-4790-83de-9f7633481454
Success
```

Terminate the named task executing on the MachineCreation Service.

Switch-ProvTask

Apr 15, 2014

Moves all MachineCreation Service tasks from the current execution host to another.

Syntax

Switch-ProvTask [-Host2] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables tasks running within the MachineCreation Service to be moved from one execution host to a different host.

Tasks can only execute on a single host. If the host is removed from a deployment, the tasks cannot continue to execute. These 'orphaned' tasks can be moved to a different host within the deployment so that they can continue to execute. All tasks must be moved; there is no mechanism to move individual tasks. Run the Switch-ProvTask command against the host to which the tasks are to be moved; that is, if you are not running the command directly on the host, use the AdminAddress parameter to specify the host to which tasks will be moved.

Related topics

Get-ProvTask

Stop-ProvTask

Remove-ProvTask

Parameters

-Host2<String>

Specifies the host from which the tasks should be removed.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can result.

Error Codes

PartialData

Only a subset of the requested data was returned.

NoOp

The operation was successful but had no effect.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Switch-ProvTask -Host CRASHED
Success
```

Transfer the execution of tasks that had been executing on the MachineCreation Service instance on host CRASHED to the local instance.

Test-ProvDBConnection

Apr 15, 2014

Tests a database connection for the MachineCreation Service.

Syntax

```
Test-ProvDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Tests a connection to the database in which the MachineCreation Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-ProvServiceStatus

Get-ProvDBConnection

Set-ProvDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the MachineCreation Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-ProvDBConnection command returns an object containing the status of the MachineCreation Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the MachineCreation Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the MachineCreation Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the MachineCreation Service currently in use is incompatible with the version of the MachineCreation Service schema on the database. Upgrade the MachineCreation Service to a more recent version.

DBOlderVersionThanService

The version of the MachineCreation Service schema on the database is incompatible with the version of the MachineCreation Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-ProvDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The MachineCreation Service has failed.

Unknown

The status of the MachineCreation Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Test-ProvDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Tests a database connection string for the MachineCreation Service.

---------- EXAMPLE 2 ----------

```
c:\PS>Test-ProvDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Tests an invalid database connection string for the MachineCreation Service.

Test-ProvSchemeNameAvailable

Apr 15, 2014

Checks to ensure that the proposed name for a provisioning scheme is unused.

Syntax

```
Test-ProvSchemeNameAvailable -ProvisioningSchemeName <String[]> [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Checks to ensure that the proposed name for a provisioning scheme is unused. This check is done without regard for scoping of existing provisioning schemes, so the names of inaccessible schemes are also checked.

Related topics

New-ProvScheme

Rename-ProvScheme

Parameters

-ProvisioningSchemeName<String[]>

The name or names of the provisioning scheme(s) to be tested.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

NameAvailability

Pairs of name and the availability of the name

Notes

In the case of failure, the following errors can result.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

Test-ProvSchemeNameAvailable -ProvisioningSchemeName $NewSchemeName
This tests whether the value of $NewSchemeName is unique or not, and can be used to create a new provisioning scheme or rename an existing one without failing. True is returned if the name is good.

Unlock-ProvScheme

Apr 15, 2014

Unlocks a Provisioning Scheme.

Syntax

Unlock-ProvScheme [-ProvisioningSchemeName] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Unlock-ProvScheme -ProvisioningSchemeUid <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to unlock a provisioning scheme that has the Id of a failed Task still associated with it. This allows another long-running task to operate on that scheme. The cmdlet will not unlock a scheme with a task still marked as being active. Use Stop-ProvTask (or, if the task is registered with a failed server, Switch-ProvTask and Stop-ProvTask) to stop any active task first.

Related topics

Get-ProvScheme

Stop-ProvTask

Parameters

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create

high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

In the case of failure, the following errors can result.

Error Codes

ProvisioningSchemeNotFound

The specified provisioning scheme could not be located.

NoOp

The specified provisioning scheme had no task object associated.

TaskActive

The task object associated with the provisioning scheme is still active.

DatabaseError

An error occurred in the service while attempting a database operation.

CouldNotQuueryDatabase

The query required to get the database was not defined.

CommunicationError

An error occurred while communicating with the service.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Unlock-ProvScheme -provisioningSchemeName MyScheme
```

Unlocks the provisioning scheme 'MyScheme'.

Unlock-ProvVM

Apr 15, 2014

Unlocks a VM.

Syntax

Unlock-ProvVM [-VMID] <String[]> -ProvisioningSchemeName <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Unlock-ProvVM [-VMID] <String[]> -ProvisioningSchemeUid <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to unlock a virtual machine.

Related topics

Get-ProvVM

Lock-ProvVM

Parameters

-VMID<String[]>

The virtual machine Id (hypervisor context)

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeName<String>

The name of the provisioning scheme.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-ProvisioningSchemeUid<Guid>

The unique identifier of the provisioning scheme.

Required?	true

Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller that the PowerShell snap-in connects to. You can provide this as a host name or an IP address.

Required?	false
Default Value	LocalHost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.MachineCreation.Sdk.ProvisionedVirtualMachine You can pipe an object containing a parameter called 'VMId' and 'ProvisioningSchemeName' to Lock-ProvVM

Notes

In the case of failure, the following errors can result.

Error Codes

VMDoesNotExist

The specified VM cannot be located.

VMAlreadyUnLocked

The VM is already unlocked.

VMDoesNotExistForProvisioningScheme

The specified VM does exist in the hypervisor, but is not part of the specified provisioning scheme.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for

for various reasons.

CommunicationError

An error occurred while communicating with the service.

PermissionDenied

The user does not have administrative rights to perform this operation.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error

ExceptionThrown

An unexpected error occurred. To locate more details, see the Windows event logs on the controller being used or examine the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS>Unlock-ProvVM -provisioningSchemeName MyScheme -VMId  bc79802c-ba6e-8de8-99e9-4c35d7ad24b4
```

Unlocks the VM with the Id 'bc79802c-ba6e-8de8-99e9-4c35d7ad24b4' in the provisioning scheme 'MyScheme'.

---------- EXAMPLE 2 ----------

```
C:\PS>Get-ProvVM -provisioningSchemeName MyScheme | Unlock-ProvVM
```

Unlocks all the VMs in the provisioning scheme 'MyScheme'.

---------- EXAMPLE 3 ----------

```
C:\PS>Get-ProvVM -Locked $True | Unlock-ProvVM
```

Unlocks all the VMs that are currently locked.

Citrix.Monitor.Admin.V1

Apr 15, 2014

Overview

Name	Description
MonitorMonitorSnapin	The Monitor Service PowerShell snap-in provides administrative functions for the Monitor Service.
Monitor Filtering	Describes the common filtering options for XenDesktop cmdlets.

Cmdlets

Name	Description
Get-MonitorConfiguration	Gets the configuration settings currently being used by the Monitor Service.
Get-MonitorDataStore	Gets details for each of the Monitor data stores.
Get-MonitorDBConnection	Gets the database string for the specified data store used by the Monitor Service.
Get-MonitorDBSchema	Gets a script that creates the Monitor Service database schema for the specified data store.
Get-MonitorDBVersionChangeScript	Gets a script that updates the Monitor Service database schema.
Get-MonitorInstalledDBVersion	Gets a list of all available database schema versions for the Monitor Service.
Get-MonitorService	Gets the service record entries for the Monitor Service.
Get-MonitorServiceAddedCapability	Gets any added capabilities for the Monitor Service on the controller.
Get-MonitorServiceInstance	Gets the service instance entries for the Monitor Service.
Get-MonitorServiceStatus	Gets the current status of the Monitor Service on the controller.
Remove-MonitorServiceMetadata	Removes metadata from the given Service.
Reset-MonitorDataStore	Refreshes the database string currently being used by the Monitor service.
Reset-MonitorServiceGroupMembership	Reloads the access permissions and configuration service locations for the Monitor Service.
Set-MonitorConfiguration	Sets the database string currently being used by the Monitor Service.

Name	Description
Set-MonitorDBConnection	Configures a database connection for the Monitor Service.
Set-MonitorServiceMetadata	Adds or updates metadata on the given Service.
Test-MonitorDBConnection	Tests a database connection for the Monitor Service.

about_MonitorMonitorSnapin

Apr 15, 2014

TOPIC

about_MonitorMonitorSnapin

SHORT DESCRIPTION

The Monitor Service PowerShell snap-in provides administrative functions for the Monitor Service.

COMMAND PREFIX

All commands in this snap-in have the noun prefixed with 'Monitor'.

LONG DESCRIPTION

The Monitor Service PowerShell snap-in enables both local and remote administration of the Monitor service. It provides

facilities to query the Monitor service configuration settings and to modify those settings. It also provides the

standard set of XenDesktop service cmdlets.

about_Monitor_Filtering

Apr 15, 2014

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

Get-MonitorConfiguration

Apr 15, 2014

Gets the configuration settings currently being used by the Monitor Service.

Syntax

Get-MonitorConfiguration [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the configuration currently being used by the Monitor Service.

A site database connection must be configured for this command to be used.

Related topics

Set-MonitorConfiguration

Parameters

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Get-MonitorConfiguration returns the configuration settings.

Examples

---------- **EXAMPLE 1** ----------

```
c:\PS>Get-MonitorConfiguration
```

Gets the current configuration for the Monitor Service.

Get-MonitorDataStore

Apr 15, 2014

Gets details for each of the Monitor data stores.

Syntax

Get-MonitorDataStore [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns an object for each of the Monitor data stores describing the connection string, data store name, db type, provider, schema name, and DB status.

A database connection must be configured in order for this command to be used if the service has a secondary data store. This is not required for the site data store.

Related topics

Reset-MonitorDataStore

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Monitor.Sdk.DataStoreConfiguration

An object describing the connection string, data store name, database type, provider, schema name and database status.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorDataStore

ConnectionString : Server=.\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
DataStore        : Site
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : MonitorSiteSchema
Status           : OK

ConnectionString :
DataStore        : Secondary
DatabaseType     : SqlServer
Provider         : MSSQL
SchemaName       : MonitorSecondarySchema
Status           : DBUnconfigured
```

Get the database connection string for the Monitor Service.

Get-MonitorDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the Monitor Service.

Syntax

Get-MonitorDBConnection [[-DataStore] <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-MonitorServiceStatus

Get-MonitorDataStore

Set-MonitorDBConnection

Test-MonitorDBConnection

Parameters

-DataStore<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the Monitor Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the Monitor Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True
```

Get the database connection string for the Monitor Service.

Get-MonitorDBSchema

Apr 15, 2014

Gets a script that creates the Monitor Service database schema for the specified data store.

Syntax

Get-MonitorDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new Monitor Service database schema, add a new Monitor Service to an existing site, remove a Monitor Service from a site, or create a database server logon for a Monitor Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Monitor Service instance, otherwise the scripts relate to Monitor Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Monitor SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to Monitor Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to Monitor Service roles

If ScriptType is Evict, the returned script contains:

o Removal of Monitor Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.

Related topics

Get-MonitorDataStore

Set-MonitorDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Monitor services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the Monitor Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further Monitor services to an existing database instance that already contains the full Monitor service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Monitor Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified Monitor Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Monitor services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the Monitor Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-DataStore<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-MonitorDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup > c:\MonitorSchema.sql
Get the full database schema for site data store of the Monitor Service and copy it to a file called 'c:\MonitorSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Monitor Service site schema.

---------- EXAMPLE 2 ----------

c:\PS>Get-MonitorDBSchema -DatabaseName MyDB -scriptType Login > c:\MonitorLogins.sql
Get the logon scripts for the Monitor Service.

---------- EXAMPLE 3 ----------

c:\PS>Get-MonitorDBSchema -DatabaseName MyDB -ServiceGroupName MyServiceGroup -DataStore Secondary > c:\MonitorSchema.sql
Get the full database schema for the secondary data store of the Monitor Service and copy it to a file called 'c:\MonitorSecondarySchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Monitor Service secondary schema.

Get-MonitorDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the Monitor Service database schema.

Syntax

Get-MonitorDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Monitor Service from the current schema version to a different version.

Related topics

Get-MonitorInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-DataStore<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Monitor services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-MonitorServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Monitor Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-MonitorDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-MonitorInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the Monitor Service.

Syntax

Get-MonitorInstalledDBVersion [-Upgrade] [-Downgrade] [-DataStore <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the Monitor Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DataStore<String>

Specifies the database connection logical name the schema script should be returned for. The parameter is optional.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-MonitorInstalledDbVersion command returns objects containing the new definition of the Monitor Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Monitor Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the Monitor Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-MonitorInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the Monitor Service database schema for which upgrade scripts are supplied.

Get-MonitorService

Apr 15, 2014

Gets the service record entries for the Monitor Service.

Syntax

Get-MonitorService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the Monitor Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Monitor_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Monitor_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Monitor.Sdk.Service

The Get-MonitorServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the Monitor Service running in the current service group.

Get-MonitorServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the Monitor Service on the controller.

Syntax

```
Get-MonitorServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the Monitor Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorServiceAddedCapability
```

Get the added capabilities of the Monitor Service.

Get-MonitorServiceInstance

Apr 15, 2014

Gets the service instance entries for the Monitor Service.

Syntax

Get-MonitorServiceInstance [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns service interfaces published by the instance of the Monitor Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Monitor.Sdk.ServiceInstance

The Get-MonitorServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Monitor.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Monitor.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorServiceInstance

Address           : http://MyServer.com:80/Citrix/Monitor
Binding           : wcf_HTTP_kerb
InterfaceType     : SDK
Metadata          :
MetadataMap       :
ServiceAccount    : ENG\MyAccount$
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
ServiceGroupName  : MyServiceGroup
ServiceGroupUid   : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType       : Monitor
Version           : 1

Address           : http://MyServer.com:80/Citrix/Monitor/IServiceApi
Binding           : wcf_HTTP_kerb
InterfaceType     : InterService
Metadata          :
MetadataMap       :
ServiceAccount    : ENG\MyAccount
ServiceAccountSid : S-1-5-21-2406005612-3133289213-1653143164
```

ServiceGroupName : MyServiceGroup
ServiceGroupUid : a88d2f6b-c00a-4f76-9c38-e8330093b54d
ServiceInstanceUid : 00000000-0000-0000-0000-000000000000
ServiceType : Monitor
Version : 1

Get all instances of the Monitor Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-MonitorServiceStatus

Apr 15, 2014

Gets the current status of the Monitor Service on the controller.

Syntax

Get-MonitorServiceStatus [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables the status of the Monitor Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Get-MonitorDataStore

Set-MonitorDBConnection

Test-MonitorDBConnection

Get-MonitorDBConnection

Get-MonitorDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-MonitorServiceStatus command returns an object containing the status of the Monitor Service together with extra diagnostics information.

DBUnconfigured

The Monitor Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

DBOlderVersionThanService

The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Monitor Service is running and is connected to a database containing a valid schema.

Failed

The Monitor Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorServiceStatus

DBUnconfigured
```

Get the current status of the Monitor Service.

Remove-MonitorServiceMetadata

Apr 15, 2014

Removes metadata from the given Service.

Syntax

Remove-MonitorServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-MonitorServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-MonitorServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-MonitorServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Service.

Related topics

Set-MonitorServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-MonitorService | % { Remove-MonitorServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Service objects.

Reset-MonitorDataStore

Apr 15, 2014

Refreshes the database string currently being used by the Monitor service.

Syntax

Reset-MonitorDataStore [-DataStore] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the string for the database connection currently being used by the Monitor Service. Can only be called for secondary data stores.

There is no requirement for a database connection to be configured in order for this command to be used.

Related topics

Get-MonitorDataStore

Parameters

-DataStore<String>

Specifies the database connection logical name to be used by the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store. Specifying the site data store will display an error because this operation is not supported for site data stores.

Required?	true
Default Value	Site
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Monitor.Sdk.ServiceStatus

The status of the specified data store.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Reset-MonitorDataStore -DataStore Secondary
OK
Refresh the database connection string for the Monitor Service.
```

Reset-MonitorServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the Monitor Service.

Syntax

Reset-MonitorServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload Monitor Service access permissions and configuration service locations. The Reset-MonitorServiceGroupMembership command must be run on at least one instance of the service type (Monitor) after installation and registration with the configuration service. Without this operation, the Monitor services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-MonitorServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.Monitor.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-MonitorServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-MonitorServiceGroupMembership
Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

---------- EXAMPLE 2 ----------

c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-MonitorServiceGroupmembership
Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-MonitorConfiguration

Apr 15, 2014

Sets the database string currently being used by the Monitor Service.

Syntax

Set-MonitorConfiguration [-GroomSessionsRetentionDays <Int32>] [-GroomFailuresRetentionDays <Int32>] [-GroomLoadIndexesRetentionDays <Int32>] [-GroomDeletedRetentionDays <Int32>] [-GroomSummariesRetentionDays <Int32>] [-DataCollectionEnabled <Boolean>] [-FullPollStartHour <Int32>] [-ResolutionPollTimeHours <Int32>] [-SyncPollTimeHours <Int32>] [-DetailedSqlOutputEnabled <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the string for the database connection currently being used by the Monitor Service.

A database connection need not be configured for this command to be used.

Related topics

Get-MonitorConfiguration

Parameters

-GroomSessionsRetentionDays<Int32>

Determines how many days to keep Session and Connection records after the Session is terminated.

Required?	false
Default Value	7 for non-platinum, 90 for platinum.
Accept Pipeline Input?	false

-GroomFailuresRetentionDays<Int32>

Determines how many days to keep MachineFailureLog and ConnectionFailureLog records after these are created.

Required?	false
Default Value	7 for non-platinum, 90 for platinum.
Accept Pipeline Input?	false

-GroomLoadIndexesRetentionDays<Int32>

Determines how many days to keep LoadIndex records after these are created.

Required?	false

Default Value	7 for non-platinum, 90 for platinum.
Accept Pipeline Input?	false

-GroomDeletedRetentionDays<Int32>

Determines how many days to keep Machine, Catalog, DesktopGroup and Hypervisor entities around that have a LifecycleState of 'Deleted'. This also deletes any related Session, Connection, Summary, Failure or LoadIndex records.

Required?	false
Default Value	7 for non-platinum, 90 for platinum.
Accept Pipeline Input?	false

-GroomSummariesRetentionDays<Int32>

Determines how many days to keep DesktopGroupSummary, FailureLogSummary and LoadIndexSummary records at the daily granularity.

Required?	false
Default Value	7 for non-platinum, 90 for platinum.
Accept Pipeline Input?	false

-DataCollectionEnabled<Boolean>

Starts / stops data collection. Stopping data collection turns off polling, and does not persist operational event data to the database.

Required?	false
Default Value	True
Accept Pipeline Input?	false

-FullPollStartHour<Int32>

Hour of day when Full Poll should begin.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ResolutionPollTimeHours<Int32>

Start time for the Resolution Poll worker.

Required?	false
Default Value	
Accept Pipeline Input?	false

-SyncPollTimeHours<Int32>

Start time for Sync Poll worker.

Required?	false
Default Value	
Accept Pipeline Input?	false

-DetailedSqlOutputEnabled<Boolean>

Determines if the SqlLog should be enabled to send SQL statements to the CDF Trace

Required?	false
Default Value	False
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Examples

---------- EXAMPLE 1 ----------

C:\PS>Set-MonitorConfiguration -GroomSessionsRetentionDays 5 -GroomFailuresRetentionDays 4 ...
Updates the settings in the site database with the newly specified values.

Set-MonitorDBConnection

Apr 15, 2014

Configures a database connection for the Monitor Service.

Syntax

Set-MonitorDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [[-DataStore] <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the Monitor Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-MonitorServiceStatus

Get-MonitorDBConnection

Test-MonitorDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the Monitor Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	

Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

-DataStore<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-MonitorDBConnection command returns an object containing the status of the Monitor Service together with extra diagnostics information.

DBUnconfigured

The Monitor Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

DBOlderVersionThanService

The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Monitor Service is running and is connected to a database containing a valid schema.

Failed

The Monitor Service has failed.

Unknown

The status of the Monitor Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Set-MonitorDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK
Configures a database connection string for the Monitor Service.

---------- EXAMPLE 2 ----------

c:\PS>Set-MonitorDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Configures an invalid database connection string for the Monitor Service.

Set-MonitorServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given Service.

Syntax

Set-MonitorServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-MonitorServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-MonitorServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-MonitorServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given Service objects.

Related topics

Remove-MonitorServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the Service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-MonitorServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-MonitorServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                         value
```

Add metadata with a name of 'property' and a value of 'value' to the Service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Test-MonitorDBConnection

Apr 15, 2014

Tests a database connection for the Monitor Service.

Syntax

Test-MonitorDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [[-DataStore] <String>] [<CommonParameters>]

Detailed Description

Tests a connection to the database in which the Monitor Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Related topics

Get-MonitorServiceStatus

Get-MonitorDBConnection

Set-MonitorDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be tested by the Monitor Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

-DataStore<String>

Specifies the logical name of the data store for the Monitor Service. Can be either be 'Site' or the logical name of the secondary data store.

Required?	false
Default Value	Site
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-MonitorDBConnection command returns an object containing the status of the Monitor Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the Monitor Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Monitor Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Monitor Service currently in use is incompatible with the version of the Monitor Service schema on the database. Upgrade the Monitor Service to a more recent version.

DBOlderVersionThanService

The version of the Monitor Service schema on the database is incompatible with the version of the Monitor Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-MonitorDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The Monitor Service has failed.

Unknown

The status of the Monitor Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseError

An error occurred in the service while attempting a database operation.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Test-MonitorDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Tests a database connection string for the Monitor Service.

---------- EXAMPLE 2 ----------

```
c:\PS>Test-MonitorDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Tests an invalid database connection string for the Monitor Service.

Citrix.Storefront.Admin.V1

Apr 15, 2014

Overview

Name	Description
SfStorefrontSnapin	This service short description
Sf Filtering	Describes the common filtering options for XenDesktop cmdlets.

Cmdlets

Name	Description
Add-SfServerToCluster	Adds a new server to an existing cluster.
Add-SfStorefrontAddress	Modifies a StoreFront address configuration by adding an additional StoreFront address to it.
Get-SfCluster	Gets all Storefront clusters present in the site.
Get-SfDBConnection	Gets the database string for the specified data store used by the Storefront Service.
Get-SfDBSchema	Gets a script that creates the Storefront Service database schema for the specified data store.
Get-SfDBVersionChangeScript	Gets a script that updates the Storefront Service database schema.
Get-SfInstalledDBVersion	Gets a list of all available database schema versions for the Storefront Service.
Get-SfIsStorefrontInstalled	Tells whether StoreFront Services and Privileged Service are installed.
Get-SfService	Gets the service record entries for the Storefront Service.
Get-SfServiceAddedCapability	Gets any added capabilities for the Storefront Service on the controller.
Get-SfServiceInstance	Gets the service instance entries for the Storefront Service.
Get-SfServiceStatus	Gets the current status of the Storefront Service on the controller.
Get-SfStorefrontAddress	Gets the high-level description of a configuration for StoreFront addresses, based on a configuration byte array.
Get-SfTask	Gets the task history for the Storefront Service.
New-SfCluster	Creates new Storefront cluster with default set of services.

Name	Description
New-SfStorefrontAddress	Creates a new StoreFront address configuration, specifying a single address.
Remove-SfServerFromCluster	Removes server from the cluster.
Remove-SfServiceMetadata	Removes metadata from the given service.
Remove-SfTask	Removes from the database completed tasks for the Storefront Service.
Remove-SfTaskMetadata	Removes metadata from the given Task.
Reset-SfServiceGroupMembership	Reloads the access permissions and configuration service locations for the Storefront Service.
Set-SfCluster	Sets the parameters on the given cluster.
Set-SfDBConnection	Configures a database connection for the Storefront Service.
Set-SfServiceMetadata	Adds or updates metadata on the given service.
Set-SfTaskMetadata	Adds or updates metadata on the given Task.
Test-SfDBConnection	Tests a database connection for the Storefront Service.

TOPIC

XenDesktop - Advanced Dataset Filtering

SHORT DESCRIPTION

Describes the common filtering options for XenDesktop cmdlets.

LONG DESCRIPTION

Some cmdlets operate on large quantities of data and, to reduce the overhead of sending all of that data over the network, many of the Get- cmdlets support server-side filtering of the results.

The conventional way of filtering results in PowerShell is to pipeline them into Where-Object, Select-Object, and Sort-Object, for example:

```
Get-<Noun> | Where { $_.Size = 'Small' } | Sort 'Date' | Select -First 10
```

However, for most XenDesktop cmdlets the data is stored remotely and it would be slow and inefficient to retrieve large amounts of data over the network and then discard most of it. Instead, many of the Get- cmdlets provide filtering parameters that allow results to be processed on the server, returning only the required results.

You can filter results by most object properties using parameters derived from the property name. You can also sort results or limit them to a specified number of records:

```
Get-<Noun> -Size 'Small' -SortBy 'Date' -MaxRecordCount 10
```

You can express more complex filter conditions using a syntax and set of operators very similar to those used by PowerShell expressions.

Those cmdlets that support filtering have the following common parameters:

-MaxRecordCount <int>

Specifies the maximum number of results to return.
For example, to return only the first nine results use:

```
Get-<Noun> -MaxRecordCount 9
```

If not specified, only the first 250 records are returned, and if more
are available, a warning is produced:

WARNING: Only first 250 records returned. Use -MaxRecordCount to
retrieve more.

You can suppress this warning by using -WarningAction or by specifying
a value for -MaxRecordCount.

To retrieve all records, specify a large number for -MaxRecordCount.
As the value is an integer, you can use the following:

Get-<Noun> -MaxRecordCount [int]::MaxValue

-ReturnTotalRecordCount [<SwitchParameter>]

When specified, this causes the cmdlet to output an error record
containing the number of records available. This error record is
additional information and does not affect the objects written to the
output pipeline. For example:

```
Get-<Noun> -MaxRecordCount 9 -ReturnTotalRecordCount
....

Get-<Noun> : Returned 9 of 10 items
At line:1 char:18
+ Get-<Noun> <<<<  -MaxRecordCount 9 -ReturnTotalRecordCount
+ CategoryInfo          : OperationStopped: (:) [Get-<Noun>], PartialDataException
+ FullyQualifiedErrorId : PartialData,Citrix.<SDKName>.SDK.Get<Noun>
```

The count can be accessed using the TotalAvailableResultCount property:

```
$count = $error[0].TotalAvailableResultCount
```

-Skip <int>

Skips the specified number of records before returning results.
Also reduces the count returned by -ReturnTotalRecordCount.

-SortBy <string>

Sorts the results by the specified list of properties. The list is a
set of property names separated by commas, semi-colons, or spaces.
Optionally, prefix each name with a + or - to indicate ascending or
descending order, respectively. Ascending order is assumed if no
prefix is present.

Sorting occurs before -MaxRecordCount and -Skip parameters are
applied. For example, to sort by Name and then by Count (largest first)
use:

-SortBy 'Name,-Count'

By default, sorting by an enumeration property uses the numeric value
of the elements. You can specify a different sort order by qualifying
the name with an ordered list of elements or their numeric values,
or <null> to indicate the placement of null values.
Elements not mentioned are placed at the end in their numeric order.
For example, to sort by two different enums and then by the object id:

-SortBy 'MyState(StateC,<null>,StateA,StateB),Another(0,3,2,1),Id'

-Filter <String>

This parameter lets you specify advanced filter expressions, and
supports combination of conditions with -and and -or, and grouping
with braces. For example:

Get-<Noun> -Filter 'Name -like "High*" -or (Priority -eq 1 -and Severity -ge 2)'

The syntax is close enough to PowerShell syntax that you can use
script blocks in most cases. This can be easier to read as it reduces
quoting:

Get-<Noun> -Filter { Count -ne $null }

The full -Filter syntax is provided below.

EXAMPLES

Filtering by strings performs a case-insensitive wildcard match.
Separate parameters are combined with an implicit -and operator.
Normal PowerShell quoting rules apply, so you can use single or double
quotes, and omit the quotes altogether for many strings. The order of
parameters does not make any difference. The following are equivalent:

```
Get-<Noun> -Company Citrix -Product Xen*
Get-<Noun> -Company "citrix" -Product '[X]EN*'
Get-<Noun> -Product "Xen*" -Company "CITRIX"
Get-<Noun> -Filter { Company -eq 'Citrix' -and Product -like 'Xen*' }
```

See about_Quoting_Rules and about_Wildcards for details about PowerShell handling of quotes and wildcards.

To avoid wildcard matching or include quote characters, you can escape the wildcards using the normal PowerShell escape mechanisms (see about_Escape_Characters), or switch to a filter expression and the -eq operator:

```
Get-<Noun> -Company "Abc[*]"              # Matches Abc*
Get-<Noun> -Company "Abc`*"               # Matches Abc*
Get-<Noun> -Filter { Company -eq "Abc*" }    # Matches Abc*
Get-<Noun> -Filter { Company -eq "A`"B`'C" } # Matches A"B'C
```

Simple filtering by numbers, booleans, and TimeSpans perform direct equality comparisons, although if the value is nullable you can also search for null values. Here are some examples:

```
Get-<Noun> -Uid 123
Get-<Noun> -Enabled $true
Get-<Noun> -Duration 1:30:40
Get-<Noun> -NullableProperty $null
```

More comparisons are possible using advanced filtering with -Filter:

```
Get-<Noun> -Filter 'Capacity -ge 10gb'
Get-<Noun> -Filter 'Age -ge 20 -and Age -lt 40'
Get-<Noun> -Filter 'VolumeLevel -like "[123]"'
Get-<Noun> -Filter 'Enabled -ne $false'
Get-<Noun> -Filter 'NullableProperty -ne $null'
```

You can check boolean values without an explicit comparison operator, and you can also combine them with -not:

```
Get-<Noun> -Filter 'Enabled'      # Equivalent to 'Enabled -eq $true'
Get-<Noun> -Filter '-not Enabled' # Equivalent to 'Enabled -eq $false'
```

See about_Comparison_Operators for an explanation of the operators, but note that only a subset of PowerShell operators are supported (-eq, -ne, -gt, -ge, -lt, -le, -like, -notlike, -in, -notin, -contains, -notcontains).

Enumeration values can either be specified using typed values or the string name of the enumeration value:

```
Get-<Noun> -Shape [Shapes]::Square
Get-<Noun> -Shape Circle
```

With filter expressions, typed values can be specified with simple variables or quoted strings. They also support enumerations with wildcards:

```
$s = [Shapes]::Square
Get-<Noun> -Filter { Shape -eq $s -or Shape -eq "Circle" }
Get-<Noun> -Filter { Shape -like 'C*' }
```

By their nature, floating point values, DateTime values, and TimeSpan values are best suited to relative comparisons rather than just equality. DateTime strings are converted using the locale and time zone of the user device, but you can use ISO8601 format strings (YYYY-MM-DDThh:mm:ss.sTZD) to avoid ambiguity. You can also use standard PowerShell syntax to create these values:

```
Get-<Noun> -Filter { StartTime -ge "2010-08-23T12:30:00.0Z" }
$d = [DateTime]"2010-08-23T12:30:00.0Z"
Get-<Noun> -Filter { StartTime -ge $d }
$d = (Get-Date).AddDays(-1)
Get-<Noun> -Filter { StartTime -ge $d }
```

Relative times are quite common and, when using filter expressions, you can also specify DateTime values using a relative format:

```
Get-<Noun> -Filter { StartTime -ge '-2' }        # Two days ago
Get-<Noun> -Filter { StartTime -ge '-1:30' }     # Hour and a half ago
Get-<Noun> -Filter { StartTime -ge '-0:0:30' }   # 30 seconds ago
```

ARRAY PROPERTIES

When filtering against list or array properties, simple parameters perform a case-insensitive wildcard match against each of the members. With filter expressions, you can use the -contains and -notcontains operators. Unlike PowerShell, these perform wildcard matching on strings.
Note that for array properties the naming convention is for the returned property to be plural, but the parameter used to search for any match is singular. The following are equivalent (assuming Users is an array property):

```
Get-<Noun> -User Fred*
Get-<Noun> -Filter { User -like "Fred*" }
Get-<Noun> -Filter { Users -contains "Fred*" }
```

You can also use the singular form with -Filter to search using other operators:

```
# Match if any user in the list is called "Frederick"
Get-<Noun> -Filter { User -eq "Frederick" }
# Match if any user in the list has a name alphabetically below 'F'
Get-<Noun> -Filter { User -lt 'F' }
```

COMPLEX EXPRESSIONS

When matching against multiple values, you can use a sequence of
comparisons joined with -or operators, or you can use -in and -notin:

```
Get-<Noun> -Filter { Shape -eq 'Circle' -or Shape -eq 'Square' }
$shapes = 'Circle','Square'
Get-<Noun> -Filter { Shape -in $shapes }
$sides = 1..4
Get-<Noun> -Filter { Sides -notin $sides }
```

Braces can be used to group complex expressions, and override the default
left-to-right evaluation of -and and -or. You can also use -not to invert
the sense of any sub-expression:

```
Get-<Noun> -Filter { Size -gt 4 -or (Color -eq 'Blue' -and Shape -eq 'Circle') }
Get-<Noun> -Filter { Sides -lt 5 -and -not (Color -eq 'Blue' -and Shape -eq 'Circle') }
```

PAGING

The simplest way to page through data is to use the -Skip and
-MaxRecordCount parameters. So, to read the first three pages of data with
10 records per page, use:

```
Get-<Noun> -Skip 0  -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 10 -MaxRecordCount 10 <other filtering criteria>
Get-<Noun> -Skip 20 -MaxRecordCount 10 <other filtering criteria>
```

You must include the same filtering criteria on each call, and
ensure that the data is sorted consistently.

The above approach is often acceptable, but as each call performs an
independent query, data changes can result in records being skipped or
appearing twice. One approach to improve this is to sort by a unique id
field and then start the search for the next page at the unique id after
the last unique id of the previous page. For example:

```
# Get the first page
Get-<Noun> -MaxRecordCount 10 -SortBy SerialNumber

SerialNumber  ...
------------  ---
A120004
A120007
... 7 other records ...
A120900

# Get the next page
Get-<Noun> -MaxRecordCount 10 -Filter { FirstName -gt 'A120900' }

SerialNumber  ...
```

```
------------  ---
A120901
B220000
...
```

FILTER SYNTAX DEFINITION

<Filter> ::= <ScriptBlock> | <ComponentList>

<ScriptBlock> ::= "{" <ComponentList> "}"

<ComponentList> ::= <Component> <AndOrOperator> <ComponentList> |

<Component>

<Component> ::= <NotOperator> <Factor> |

<Factor>

<Factor> ::= "(" <ComponentList> ")" |

<PropertyName> <ComparisonOperator> <Value> |
<PropertyName>

<AndOrOperator> ::= "-and" | "-or"

<NotOperator> ::= "-not" | "!"

<ComparisonOperator>

::= "-eq" | "-ne" | "-le" | "-ge" | "-lt" | "-gt" |
"-like" | "-notlike" | "-contains" | "-notcontains" |
"-in" | "-notin"

<PropertyName> ::= <simple name of property>

<Value> ::= <string literal> | <numeric literal> |

<scalar variable> | <array variable> |
"$null" | "$true" | "$false"

Numeric literals support decimal and hexadecimal literals, with optional multiplier suffixes (kb, mb, gb, tb, pb).

Dates and times can be specified as string literals. The current culture determines what formats are accepted. To avoid any ambiguity, use strings formatted to the ISO8601 standard. If not specified, the current time zone is used.

Relative date-time string literals are also supported, using a minus sign followed by a TimeSpan. For example, "-1:30" means 1 hour and 30 minutes ago.

Add-SfServerToCluster

Apr 15, 2014

Adds a new server to an existing cluster.

Syntax

Add-SfServerToCluster -ClusterId <Guid> -ServerName <String> [-StorefrontUrl <Uri>] [-FarmName <String>] [-XmlServices <Uri[]>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Adds a new server to an existing cluster. Optionally updates Farm and Storefront Url. After operation succeeds, all servers are configured identically.

Related topics

Get-SfCluster

New-SfCluster

Remove-SfServerFromCluster

Set-SfCluster

Parameters

-ClusterId<Guid>

The id of the cluster to perform operation on.

Required?	true
Default Value	
Accept Pipeline Input?	false

-ServerName<String>

The name of the server to join to exisiting cluster. The name must be one of the values returned by Get-SfCluster

Required?	true
Default Value	
Accept Pipeline Input?	false

-StorefrontUrl<Uri>

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Required?	false
Default Value	Server name and http binding.
Accept Pipeline Input?	false

-FarmName<String>

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-XmlServices<Uri[]>

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RunAsynchronously<Boolean>

If set, the command will run asynchronously.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Examples

---------- EXAMPLE 1 ----------

Add-SfServerToCluster -ClusterId (Guid) -ServerName NewSfServer -RunAsynchronously $true
Adds "NewSfServer" to cluster with id (Guid).

Add-SfStorefrontAddress

Apr 15, 2014

Modifies a StoreFront address configuration by adding an additional StoreFront address to it.

Syntax

Add-SfStorefrontAddress [-ByteArray] <Byte[]> -Name <String> -Url <String> -Enabled <Boolean> -Description <String> [<CommonParameters>]

Detailed Description

Use this command to transform an existing StoreFront configuration into a new configuration, where the new configuration contains one additional address. The original configuration is supplied as an input, along with the properties of the new StoreFront address being added. The cmdlet outputs the modified configuration, which can then be passed to the Citrix Broker Service using the Add-BrokerMachineConfiguration command.

This command does not, by itself, have any persistent effects within XenDesktop. To make the change persistent, the new configuration byte array must first be transformed into a machine configuration within the Citrix Broker Service. To do this, use the New-BrokerMachineConfiguration command. You can then use the Add-BrokerMachineConfiguration and Set-BrokerMachineConfiguration commands to fully associate the new configuration with a delivery group.

Related topics

New-SfStorefrontAddress

Get-SfStorefrontAddress

New-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Set-BrokerMachineConfiguration

Parameters

-ByteArray<Byte[]>

Specifies the initial configuration, on which the new configuration is based. All of the addresses in the original configuration are also present in the new configuration, along with the additional address specified. This configuration byte array is obtained from an earlier call to New-SfStorefrontAddress, or from Get-BrokerMachineConfiguration.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the name of the new StoreFront.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Url<String>

Specifies the URL to the StoreFront, such as "https://mysite.com/Citrix/StoreWeb".

Required?	true
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Specifies if the new StoreFront address should be enabled for user access.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Description<String>

Specifies a human-readable description of the new StoreFront.

Required?	true
Default Value	

Accept Pipeline Input?	false

Input Type

System.Byte[] This cmdlet accepts configurations as pipeline input, as an alternative to supplying the ByteArray parameter.

Return Values

System.Byte[]

This cmdlet outputs the new, modified configuration. This differs from the original configuration in that it contains the additional StoreFront address.

Examples

---------- EXAMPLE 1 ----------

C:\PS> $newConfiguration = Add-SfStorefrontAddress -ByteArray $originalConfiguration -Url "https://mysite.com/Citrix/StoreWeb" -Description "This StoreFront delivers my corporate applications" -Name
This command transforms the configuration byte array specified by $originalConfiguration, adds the new StoreFront details, and stores the resulting configuration in $newConfiguration.

Get-SfCluster

Apr 15, 2014

Gets all Storefront clusters present in the site.

Syntax

```
Get-SfCluster [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Gets all Storefront clusters present in the site. There is one special Cluster with null id that lists the servers that are not part to any cluster (they are available to join any).

Related topics

New-SfCluster

Add-SfServerToCluster

Remove-SfServerFromCluster

Set-SfCluster

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Storefront.DataModel.Cluster[]

Returns array of clusters available in current deployment.

Get-SfDBConnection

Apr 15, 2014

Gets the database string for the specified data store used by the Storefront Service.

Syntax

Get-SfDBConnection [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the database connection string for the specified data store.

If the returned string is blank, no valid connection string has been specified. In this case the service is running, but is idle and awaiting specification of a valid connection string.

Related topics

Get-SfServiceStatus

Set-SfDBConnection

Test-SfDBConnection

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

system.string

The database connection string configured for the Storefront Service.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoDBConnections

The database connection string for the Storefront Service has not been specified.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-SfDBConnection

Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True
Get the database connection string for the Storefront Service.

Get-SfDBSchema

Apr 15, 2014

Gets a script that creates the Storefront Service database schema for the specified data store.

Syntax

Get-SfDBSchema [-DatabaseName <String>] [-ServiceGroupName <String>] [-ScriptType <ScriptTypes>] [-LocalDatabase] [-Sid <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Gets SQL scripts that can be used to create a new Storefront Service database schema, add a new Storefront Service to an existing site, remove a Storefront Service from a site, or create a database server logon for a Storefront Service. If no Sid parameter is provided, the scripts obtained relate to the currently selected Storefront Service instance, otherwise the scripts relate to Storefront Service instance running on the machine identified by the Sid provided. When obtaining the Evict script, a Sid parameter must be supplied. The current service instance is that on the local machine, or that explicitly specified by the last usage of the -AdminAddress parameter to a Storefront SDK cmdlet. The service instance used to obtain the scripts does not need to be a member of a site or to have had its database connection configured. The database scripts support only Microsoft SQL Server, or SQL Server Express, and require Windows integrated authentication to be used. They can be run using SQL Server's SQLCMD utility, or by copying the script into an SQL Server Management Studio (SSMS) query window and executing the query. If using SSMS, the query must be executed in 'SMDCMD mode'. The ScriptType parameter determines which script is obtained. If ScriptType is not specified, or is FullDatabase, the script contains:

o Creation of service schema

o Creation of database server logon

o Creation of database user

o Addition of database user to Storefront Service roles

If ScriptType is Instance, the returned script contains:

o Creation of database server logon

o Creation of database user

o Addition of database user to Storefront Service roles

If ScriptType is Evict, the returned script contains:

o Removal of Storefront Service instance from database

o Removal of database user

If ScriptType is Login, the returned script contains:

o Creation of database server logon only

If the service uses two data stores they can exist in the same database. You do not need to configure a database before using this command.

Related topics

Set-SfDBConnection

Parameters

-DatabaseName<String>

Specifies the name of the database for which the schema will be generated.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ServiceGroupName<String>

Specifies the name of the service group to be used when creating the database schema. The service group is a collection of all the Storefront services that share the same database instance and are considered equivalent; that is, all the services within a service group can be used interchangeably.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ScriptType<ScriptTypes>

Specifies the type of database script returned. Available script types are:

Database

Returns a full database script that can be used to create a database schema for the Storefront Service in a database instance that does not already contain a schema for this service. The DatabaseName and ServiceGroupName parameters must be specified to create a script of this type.

Instance

Returns a permissions script that can be used to add further Storefront services to an existing database instance that already contains the full Storefront service schema, associating the services to the Service Group. The Sid parameter can optionally be specified to create a script of this type.

Login

Returns a database logon script that can be used to add the required logon accounts to an existing database instance that contains the Storefront Service schema. This is used primarily when creating a mirrored database environment. The DatabaseName parameter must be specified to create a script of this type.

Evict

Returns a script that can be used to remove the specified Storefront Service from the database entirely. The DatabaseName and Sid parameters must be specified to create a script of this type.

Required?	false
Default Value	Database
Accept Pipeline Input?	false

-LocalDatabase<SwitchParameter>

Specifies whether the database script is to be used in a database instance run on the same controller as other services in the service group. Including this parameter ensures the script creates only the required permissions for local services to access the database schema for Storefront services.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Sid<String>

Specifies the SID of the controller on which the Storefront Service instance to remove from the database is running.

Required?	false
Default Value	
Accept Pipeline Input?	true (ByValue)

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.string

A string containing the required SQL script for application to a database.

Notes

The scripts returned support Microsoft SQL Server Express Edition, Microsoft SQL Server Standard Edition, and Microsoft SQL Server Enterprise Edition databases only, and are generated on the assumption that integrated authentication will be used.

If the ScriptType parameter is not included or set to 'FullDatabase', the full database script is returned, which will:

Create the database schema.

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist).

If the ScriptType parameter is set to 'Instance', the script will:

Create the user and the role (providing the schema does not already exist).

Create the logon (providing the schema does not already exist) and associate it with a user.

If the ScriptType parameter is set to 'Login', the script will:

Create the logon (providing the schema does not already exist) and associate it with a pre-existing user of the same name.

If the LocalDatabase parameter is included, the NetworkService account will be added to the list of accounts permitted to access the database. This is required only if the database is run on a controller.

If the command fails, the following errors can be returned.

Error Codes

GetSchemasFailed

The database schema could not be found.

ActiveDirectoryAccountResolutionFailed

The specified Active Directory account or Group could not be found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-SfDBSchema -DatabaseName MyDB -ServiceGroupName  MyServiceGroup > c:\SfSchema.sql
```

Get the full database schema for site data store of the Storefront Service and copy it to a file called 'c:\SfSchema.sql'.

This script can then be used to create the schema in a pre-existing database named 'MyDB' that does not already contain a Storefront Service site schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-SfDBSchema -DatabaseName MyDB -scriptType Login > c:\StorefrontLogins.sql
```

Get the logon scripts for the Storefront Service.

Get-SfDBVersionChangeScript

Apr 15, 2014

Gets a script that updates the Storefront Service database schema.

Syntax

Get-SfDBVersionChangeScript -DatabaseName <String> -TargetVersion <Version> [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a database script that can be used to upgrade or downgrade the site or secondary schema for the Storefront Service from the current schema version to a different version.

Related topics

Get-SfInstalledDBVersion

Parameters

-DatabaseName<String>

Specifies the name of the database instance to which the update applies.

Required?	true
Default Value	
Accept Pipeline Input?	false

-TargetVersion<Version>

Specifies the version of the database you want to update to.

Required?	true
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Management.Automation.PSObject

A PSObject containing the required SQL script for application to a database.

Notes

The PSObject returned by this cmdlet contains the following properties:

-- Script The raw text of the SQL script to apply the update, or null in the case when no upgrade path to the specified target version exists.

-- NeedExclusiveAccess Indicates whether all services in the service group must be shut down during the update or not.

-- CanUndo Indicates whether the generated script allows the updated schema to be reverted to the state prior to the update.

Scripts to update the schema version are stored in the database so any service in the service group can obtain these scripts. Extreme caution should be exercised when using update scripts. Citrix recommends backing up the database before attempting to upgrade the schema. Database update scripts may require exclusive use of the schema and so may not be able to execute while any Storefront services are running. However, this depends on the specific update being carried out.

After a schema update has been carried out, services that require the previous version of the schema may cease to operate. The ServiceState parameter reported by the Get-SfServiceStatus command provides information about service compatibility. For example, if the schema has been upgraded to a more recent version that a service cannot use, the service reports "DBNewerVersionThanService".

If the command fails, the following errors can be returned.

Error Codes

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Storefront Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $update = Get-SfDBVersionChangeScript -DatabaseName MyDb -TargetVersion 1.0.75.0
C:\PS> $update.Script > update_75.sql
```

Gets an SQL update script to update the current schema to version 1.0.75.0. The resulting update_75.sql script is suitable for direct use with the SQL Server SQLCMD utility.

Get-SfInstalledDBVersion

Apr 15, 2014

Gets a list of all available database schema versions for the Storefront Service.

Syntax

Get-SfInstalledDBVersion [-Upgrade] [-Downgrade] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns the current version of the Storefront Service database schema, if no flags are set, otherwise returns versions for which upgrade or downgrade scripts are available and have been stored in the database.

Related topics

Parameters

-Upgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be updated should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-Downgrade<SwitchParameter>

Specifies that only schema versions to which the current database version can be reverted should be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Version

The Get-SfInstalledDbVersion command returns objects containing the new definition of the Storefront Service database schema version.

Major <Integer>

Minor <Integer>

Build <Integer>

Revision <Integer>

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

Both the Upgrade and Downgrade flags were specified.

NoOp

The operation was successful but had no effect.

NoDBConnections

The database connection string for the Storefront Service has not been specified.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-SfInstalledDBVersion

Major  Minor  Build  Revision
-----  -----  -----  --------
5      6      0      0
```

Get the currently installed version of the Storefront Service database schema.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-SfInstalledDBVersion -Upgrade

Major  Minor  Build  Revision
-----  -----  -----  --------
6      0      0      0
```

Get the versions of the Storefront Service database schema for which upgrade scripts are supplied.

Get-SfIsStorefrontInstalled

Apr 15, 2014

Tells whether StoreFront Services and Privileged Service are installed.

Syntax

```
Get-SfIsStorefrontInstalled [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

bool

True if both StoreFront Services and Privileged Service are installed, false otherwise.

Get-SfService

Apr 15, 2014

Gets the service record entries for the Storefront Service.

Syntax

Get-SfService [-Metadata <String>] [-Property <String[]>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns instances of the Storefront Service that the service publishes. The service records contain account security identifier information that can be used to remove each service from the database.

A database connection for the service is required to use this command.

Related topics

Parameters

-Metadata<String>

Gets records with matching metadata entries.

The value being compared with is a concatenation of the key name, a colon, and the value. For example: -Metadata "abc:x*" matches records with a metadata entry having a key name of "abc" and a value starting with the letter "x".

Required?	false
Default Value	
Accept Pipeline Input?	false

-Property<String[]>

Specifies the properties to be be returned. This is similar to piping the output of the command through Select-Object, but the properties are filtered more efficiently at the server.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

Required?	false

Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false
Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Storefront.Sdk.Service

The Get-SfServiceInstance command returns an object containing the following properties.

Uid <Integer>

Specifies the unique identifier for the service in the group. The unique identifier is an index number.

ServiceHostId <Guid>

Specifies the unique identifier for the service instance.

DNSName <String>

Specifies the domain name of the host on which the service runs.

MachineName <String>

Specifies the short name of the host on which the service runs.

CurrentState <Citrix.Fma.Sdk.ServiceCore.ServiceState>

Specifies whether the service is running, started but inactive, stopped, or failed.

LastStartTime <DateTime>

Specifies the date and time at which the service was last restarted.

LastActivityTime <DateTime>

Specifies the date and time at which the service was last stopped or restarted.

OSType

Specifies the operating system installed on the host on which the service runs.

OSVersion

Specifies the version of the operating system installed on the host on which the service runs.

ServiceVersion

Specifies the version number of the service instance. The version number is a string that reflects the full build version of the service.

DatabaseUserName <string>

Specifies for the service instance the Active Directory account name with permissions to access the database. This will be either the machine account or, if the database is running on a controller, the NetworkService account.

Sid <string>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

ActiveSiteServices <string[]>

Specifies the names of active site services currently running in the service. Site services are components that perform long-running background processing in some services. This field is empty for services that do not contain site services.

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-SfService

Uid              : 1
ServiceHostId    : aef6f464-f1ee-4042-a523-66982e0cecd0
DNSName          : MyServer.company.com
MachineName      : MYSERVER
CurrentState     : On
LastStartTime    : 04/04/2011 15:25:38
LastActivityTime : 04/04/2011 15:33:39
OSType           : Win32NT
OSVersion        : 6.1.7600.0
ServiceVersion   : 5.1.0.0
DatabaseUserName : NT AUTHORITY\NETWORK SERVICE
SID              : S-1-5-21-2316621082-1546847349-2782505528-1165
ActiveSiteServices : {MySiteService1, MySiteService2...}
```

Get all the instances of the Storefront Service running in the current service group.

Get-SfServiceAddedCapability

Apr 15, 2014

Gets any added capabilities for the Storefront Service on the controller.

Syntax

```
Get-SfServiceAddedCapability [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables updates to the Storefront Service on the controller to be detected.

You do not need to configure a database connection before using this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.String

String containing added capabilities.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-SfServiceAddedCapability
```

Get the added capabilities of the Storefront Service.

Get-SfServiceInstance

Apr 15, 2014

Gets the service instance entries for the Storefront Service.

Syntax

```
Get-SfServiceInstance [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Returns service interfaces published by the instance of the Storefront Service. Each instance of a service publishes multiple interfaces with distinct interface types, and each of these interfaces is represented as a ServiceInstance object. Service instances can be used to register the service with a central configuration service so that other services can use the functionality.

You do not need to configure a database connection to use this command.

Related topics

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Storefront.Sdk.ServiceInstance

The Get-SfServiceInstance command returns an object containing the following properties.

ServiceGroupUid <Guid>

Specifies the unique identifier for the service group of which the service is a member.

ServiceGroupName <String>

Specifies the name of the service group of which the service is a member.

ServiceInstanceUID <Guid>

Specifies the unique identifier for registered service instances, which are service instances held by and obtained from a central configuration service. Unregistered service instances do not have unique identifiers.

ServiceType <String>

Specifies the service instance type. For this service, the service instance type is always Sf.

Address

Specifies the address of the service instance. The address can be used to access the service and, when registered in the central configuration service, can be used by other services to access the service.

Binding

Specifies the binding type that must be used to communicate with the service instance. In this release of XenDesktop, the binding type is always 'wcf_HTTP_kerb'. This indicates that the service provides a Windows Communication Foundation endpoint that uses HTTP binding with integrated authentication.

Version

Specifies the version of the service instance. The version number is used to ensure that the correct versions of the services are used for communications.

ServiceAccount <String>

Specifies the Active Directory account name for the machine on which the service instance is running. The account name is used to provide information about the permissions required for interservice communications.

ServiceAccountSid <String>

Specifies the Active Directory account security identifier for the machine on which the service instance is running.

InterfaceType <String>

Specifies the interface type. Each service can provide multiple service instances, each for a different purpose, and the interface defines the purpose. Available interfaces are:

SDK - for PowerShell operations

InterService - for operations between different services

Peer - for communications between services of the same type

Metadata <Citrix.Storefront.Sdk.Metadata[]>

The collection of metadata associated with registered service instances, which are service instances held by and obtained from a central configuration service. Metadata is not stored for unregistered service instances.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-SfServiceInstance

Address           : http://MyServer.com:80/Citrix/StorefrontContract

ServiceType        : Sf
Version            : 1
```

Get all instances of the Storefront Service running on the specified machine. For remote services, use the AdminAddress parameter to define the service for which the interfaces are required. If the AdminAddress parameter has not been specified for the runspace, service instances running on the local machine are returned.

Get-SfServiceStatus

Apr 15, 2014

Gets the current status of the Storefront Service on the controller.

Syntax

```
Get-SfServiceStatus [-AdminAddress <String>] [<CommonParameters>]
```

Detailed Description

Enables the status of the Storefront Service on the controller to be monitored. If the service has multiple data stores it will return the overall state as an aggregate of all the data store states. For example, if the site data store status is OK and the secondary data store status is DBUnconfigured then it will return DBUnconfigured.

Related topics

Set-SfDBConnection

Test-SfDBConnection

Get-SfDBConnection

Get-SfDBSchema

Parameters

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Get-SfServiceStatus command returns an object containing the status of the Storefront Service together with extra diagnostics information.

DBUnconfigured

The Storefront Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log

on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

DBOlderVersionThanService

The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Storefront Service is running and is connected to a database containing a valid schema.

Failed

The Storefront Service has failed.

Unknown

(0) The service status cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for

various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

c:\PS>Get-SfServiceStatus

DBUnconfigured
Get the current status of the Storefront Service.

Get-SfStorefrontAddress

Apr 15, 2014

Gets the high-level description of a configuration for StoreFront addresses, based on a configuration byte array.

Syntax

Get-SfStorefrontAddress [-ByteArray] <Byte[]> [<CommonParameters>]

Detailed Description

Use this command to convert a configuration byte array into a set of named property settings. The byte array will either have been retrieved from the Citrix Broker Service, or from the New-SfStorefrontAddress cmdlet.

Related topics

New-SfStorefrontAddress

Add-SfStorefrontAddress

New-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Set-BrokerMachineConfiguration

Parameters

-ByteArray<Byte[]>

Specifies the low-level byte array (blob) to be interpreted.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

Input Type

System.Byte[] The cmdlet accepts the ByteArray parameter as pipeline input.

Return Values

Citrix.Storefront.Sdk.SfStorefrontAddress

This cmdlet outputs one SfStorefrontAddress object for each address that is configured within the slot. Each object has the following properties:

Name - Specifies the name of the StoreFront.

Url - Specifies the URL to the StoreFront, such as "https://mysite.com/Citrix/StoreWeb".

Enabled - Specifies whether the StoreFront is enabled for users.

Description - Specifies the human-readable name of the StoreFront.

Examples

---------- **EXAMPLE 1** ----------

```
C:\PS> $configuration = New-SfStorefrontAddress -Url "https://mysite.com/Citrix/StoreWeb" -Description "This StoreFront delivers my corporate applications" -Name "StoreFront1" -Enabled $true

C:\PS> Get-SfStorefrontAddress -ByteArray $configuration

Name         Url                          Enabled Description
----         ---                          ------- -----------
StoreFront1  https://mysite.com/Citrix/StoreWeb  True This StoreFront delivers my corporate applications.
```

This example shows a new configuration byte array being created to specify a single StoreFront address. The configuration byte array is then provided as input to the Get-SfStorefrontAddress command, which interprets and outputs the same fields.

Get-SfTask

Apr 15, 2014

Gets the task history for the Storefront Service.

Syntax

Get-SfTask [[-TaskId] <Guid>] [-ReturnTotalRecordCount] [-MaxRecordCount <Int32>] [-Skip <Int32>] [-SortBy <String>] [-Filter <String>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Returns a list of tasks that have run or are currently running within the Storefront Service.

Related topics

Remove-SfTask

Add-SfTaskMetadata

Remove-SfTaskMetadata

Parameters

-TaskId<Guid>

Specifies the task identifier to be returned.

Required?	false
Default Value	
Accept Pipeline Input?	false

-ReturnTotalRecordCount<SwitchParameter>

When specified, the cmdlet outputs an error record containing the number of records available. This error record is additional information and does not affect the objects written to the output pipeline. See about_Sf_Filtering for details.

Required?	false
Default Value	False
Accept Pipeline Input?	false

-MaxRecordCount<Int32>

Specifies the maximum number of records to return.

Required?	false

Default Value	250
Accept Pipeline Input?	false

-Skip<Int32>

Skips the specified number of records before returning results. Also reduces the count returned by -ReturnTotalRecordCount.

Required?	false
Default Value	0
Accept Pipeline Input?	false

-SortBy<String>

Sorts the results by the specified list of properties. The list is a set of property names separated by commas, semi-colons, or spaces. Optionally, prefix each name with a + or - to indicate ascending or descending order. Ascending order is assumed if no prefix is present.

Required?	false
Default Value	The default sort order is by name or unique identifier.
Accept Pipeline Input?	false

-Filter<String>

Gets records that match a PowerShell-style filter expression. See about_Sf_Filtering for details.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

UnknownObject

One of the specified objects was not found.

PartialData

Only a subset of the available data was returned.

InvalidFilter

A filtering expression was supplied that could not be interpreted for this cmdlet.

CouldNotQueryDatabase

The query required to get the database was not defined.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration service.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

New-SfCluster

Apr 15, 2014

Creates new Storefront cluster with default set of services.

Syntax

New-SfCluster -ServerName <String> -FarmName <String> -XmlServices <Uri[]> [-StorefrontUrl <Uri>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

The server will have a default set of services containing fully-functionaly Storefront server with Authentication, Store, Receiver for Web and Desktop Appliance.

Related topics

Get-SfCluster

Add-SfServerToCluster

Remove-SfServerFromCluster

Set-SfCluster

Parameters

-ServerName<String>

The name of the server to build a cluster on. The name must be one of the values returned by Get-SfCluster

Required?	true
Default Value	
Accept Pipeline Input?	false

-FarmName<String>

Name of the farm that will be used within Store service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-XmlServices<Uri[]>

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port.

Required?	true

Default Value	
Accept Pipeline Input?	false

-StorefrontUrl<Uri>

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Required?	false
Default Value	Server name and http binding.
Accept Pipeline Input?	false

-RunAsynchronously<Boolean>

If set, the command will run asynchronously.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Examples

---------- EXAMPLE 1 ----------

New-SfCluster -FarmName "XdSiteName" -XmlServices http://farm1,http://farm2 -ServerName SfServer -RunAsynchronously $true
Creates a new cluster on server "SfServer". The server will have a default set of services containing fully-functionaly Storefront server with Authentication, Store, Receiver for Web, Desktop Appliance site and the required infrastructure. The Store service will have a farm named "XdSiteName" that will contain servers farm1 and farm2, whose will be contacted using http on default port 80.

New-SfStorefrontAddress

Apr 15, 2014

Creates a new StoreFront address configuration, specifying a single address.

Syntax

New-SfStorefrontAddress -Name <String> -Url <String> -Enabled <Boolean> -Description <String> [<CommonParameters>]

Detailed Description

Use this command when you want to create a new StoreFront configuration byte array from scratch, rather than modifying an existing one. You must define the URL for the StoreFront, and some additional details.

This command does not, by itself, have any persistent effects within XenDesktop. To make the change persistent, the new configuration byte array must first be transformed into a machine configuration within the Citrix Broker Service. To do this, use the New-BrokerMachineConfiguration command. You can then use the Add-BrokerMachineConfiguration and Set-BrokerMachineConfiguration commands to fully associate the new configuration with a delivery group.

Related topics

Add-SfStorefrontAddress

Get-SfStorefrontAddress

New-BrokerMachineConfiguration

Add-BrokerMachineConfiguration

Set-BrokerMachineConfiguration

Parameters

-Name<String>

Specifies the name of the new StoreFront.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Url<String>

Specifies the URL to the StoreFront, such as "https://mysite.com/Citrix/StoreWeb".

Required?	true
Default Value	
Accept Pipeline Input?	false

-Enabled<Boolean>

Specifies if the new StoreFront address should be enabled for user access.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Description<String>

Specifies a human-readable description of the new StoreFront.

Required?	true
Default Value	
Accept Pipeline Input?	false

Input Type

None

Return Values

System.Byte[]

The new configuration set, with all of the given modifications applied.

Examples

---------- EXAMPLE 1 ----------

```
C:\PS> $configuration = New-SfStorefrontAddress -Url "https://mysite.com/Citrix/StoreWeb" -Description "This StoreFront delivers my corporate applications" -Name "StoreFront1" -Enabled $true

C:\PS> Get-SfStorefrontAddress -ByteArray $configuration

Name            Url                         Enabled Description
----            ---                         ------- -----------
StoreFront1     https://mysite.com/Citrix/StoreWeb          True This StoreFront delivers my corporate applications.
```

This example shows a new configuration byte array being created to specify a single StoreFront address. The configuration byte array is then provided as input to the Get-SfStorefrontAddress command, which interprets and outputs the same fields.

Remove-SfServerFromCluster

Apr 15, 2014

Removes server from the cluster.

Syntax

Remove-SfServerFromCluster -ClusterId <Guid> -ServerName <String> [-StorefrontUrl <Uri>] [-FarmName <String>] [-XmlServices <Uri[]>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Removes server from the cluster and propagates information to other servers. The configuration of the server is wiped out, so the server can be reused.

Related topics

Get-SfCluster

New-SfCluster

Add-SfServerToCluster

Set-SfCluster

Parameters

-ClusterId<Guid>

The if of the cluster to perform operation on.

Required?	true
Default Value	
Accept Pipeline Input?	false

-ServerName<String>

The name of the server to remove from cluster. The name must be one of the values returned by Get-SfCluster.

Required?	true
Default Value	
Accept Pipeline Input?	false

-StorefrontUrl<Uri>

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Required?	false
Default Value	Server name and http binding.
Accept Pipeline Input?	false

-FarmName<String>

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-XmlServices<Uri[]>

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RunAsynchronously<Boolean>

If set, the command will run asynchronously.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Examples

---------- EXAMPLE 1 ----------

Remove-SfServerFromCluster -ClusterId (Guid) -ServerName BrokenSfServer -RunAsynchronously $true
Removes Server "BrokenSfServer" from a Cluster with id (Guid).

Remove-SfServiceMetadata

Apr 15, 2014

Removes metadata from the given service.

Syntax

Remove-SfServiceMetadata [-ServiceHostId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfServiceMetadata [-InputObject] <Service[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given service.

Related topics

Set-SfServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-SfService | % { Remove-SfServiceMetadata -Map $_.MetadataMap }
```

Remove all metadata from all service objects.

Remove-SfTask

Apr 15, 2014

Removes from the database completed tasks for the Storefront Service.

Syntax

Remove-SfTask [-TaskId] <Guid> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables completed tasks that have run within the Storefront Service to be removed from the database.

Related topics

Get-SfTask

Add-SfTaskMetadata

Remove-SfTaskMetadata

Parameters

-TaskId<Guid>

Specifies the identifier for the task to be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByPropertyName)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

System.Management.Automation.PSObject Objects containing the TaskId parameter can be piped to the Remove-SfTask command.

Notes

If the command fails, the following errors can be returned.

Error Codes

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

ServiceStatusInvalidDb

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration service.

OperationDeniedByConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Remove-SfTaskMetadata

Apr 15, 2014

Removes metadata from the given Task.

Syntax

Remove-SfTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfTaskMetadata [-TaskId] <Guid> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Remove-SfTaskMetadata [-InputObject] <Task[]> -Name <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability to remove metadata from the given Task.

Related topics

Set-SfTaskMetadata

Parameters

-TaskId<Guid>

Id of the Task

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Task[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can be either a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]"). The properties whose names match keys in the map will be removed.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

The metadata property to remove.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-SfTask | % { Remove-SfTaskMetadata -Map $_.MetadataMap }
```

Remove all metadata from all Task objects.

Reset-SfServiceGroupMembership

Apr 15, 2014

Reloads the access permissions and configuration service locations for the Storefront Service.

Syntax

Reset-SfServiceGroupMembership [-ConfigServiceInstance] <ServiceInstance[]> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Enables you to reload Storefront Service access permissions and configuration service locations. The Reset-SfServiceGroupMembership command must be run on at least one instance of the service type (Sf) after installation and registration with the configuration service. Without this operation, the Storefront services will be unable to communicate with other services in the XenDesktop deployment. When the command is run, the services are updated when additional services are added to the deployment, provided that the configuration service is not stopped. The Reset-SfServiceGroupMembership command can be run again to refresh this information if automatic updates do not occur when new services are added to the deployment. If more than one configuration service instance is passed to the command, the first instance that meets the expected service type requirements is used.

Related topics

Parameters

-ConfigServiceInstance<ServiceInstance[]>

Specifies the configuration service instance object that represents the service instance for the type 'InterService' that references a configuration service for the deployment.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Input Type

Citrix.Storefront.Sdk.ServiceInstance[] Service instances containing a ServiceInstance object that refers to the central configuration service interservice interface can be piped to the Reset-SfServiceGroupMembership command.

Notes

If the command fails, the following errors can be returned.

Error Codes

NoSuitableServiceInstance

None of the supplied service instance objects were suitable for resetting service group membership.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Get-ConfigRegisteredServiceInstance -ServiceType Config | Reset-SfServiceGroupMembership
```

Reset the service group membership for a service in a deployment where the configuration service is configured and running on the same machine as the service.

---------- EXAMPLE 2 ----------

```
c:\PS>Get-ConfigRegisterdServiceInstance -ServiceType Config -AdminAddress OtherServer.example.com | Reset-SfServiceGroupmembership
```

Reset the service group membership for a service in a deployment where the configuration service that is configured and running on a machine named 'OtherServer.example.com'.

Set-SfCluster

Apr 15, 2014

Sets the parameters on the given cluster.

Syntax

Set-SfCluster -ClusterId <Guid> [-StorefrontUrl <Uri>] [-FarmName <String>] [-XmlServices <Uri[]>] [-RunAsynchronously <Boolean>] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Sets the parameters on the given cluster and propagate the changes to all servers within a given cluster.

Related topics

Get-SfCluster

New-SfCluster

Add-SfServerToCluster

Remove-SfServerFromCluster

Parameters

-ClusterId<Guid>

The if of the cluster to perform operation on.

Required?	true
Default Value	
Accept Pipeline Input?	false

-StorefrontUrl<Uri>

The url that will be used by Receivers to contact Storefront. Http or https absolute urls are accepted.

Required?	false
Default Value	Server name and http binding.
Accept Pipeline Input?	false

-FarmName<String>

Name of the farm that will be used within Store service. Either both FarmName and XmlServices need to be specified or none of them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-XmlServices<Uri[]>

Collection of the url of xml services that will be used inside a farm. The urls neeed to be http or https, be absolute and share the same schema and port. Either both FarmName and XmlServices need to be specified or none of them.

Required?	false
Default Value	
Accept Pipeline Input?	false

-RunAsynchronously<Boolean>

If set, the command will run asynchronously.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Storefront.Sdk.Task or Citrix.Storefront.DataModel.Cluster

Returns cluster description or a task, if ran asynchronously.

Examples

---------- EXAMPLE 1 ----------

Set-SfCluster -StorefrontUrl http://SfUrl -ClusterId (Guid) -RunAsynchronously $true
Sets a Storefront Url in a Cluster with id (Guid). Propagates changes to all servers that are part of the cluster.

Set-SfDBConnection

Apr 15, 2014

Configures a database connection for the Storefront Service.

Syntax

Set-SfDBConnection [-DBConnection] <String> [-Force] [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Configures a connection to a database in which the Storefront Service can store its state. The service will attempt to connect and start using the database immediately after the connection is configured. The database connection string is updated to the specified value regardless of whether it is valid or not. Specifying an invalid connection string prevents a service from functioning until the error is corrected.

After a connection is configured, you cannot alter it without first clearing it (by setting the connection to $null).

You do not need to configure a database connection to use this command.

Related topics

Get-SfServiceStatus

Get-SfDBConnection

Test-SfDBConnection

Parameters

-DBConnection<String>

Specifies the database connection string to be used by the Storefront Service. Passing in $null will clear any existing database connection configured.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Force<SwitchParameter>

If present, allows the local administrator to set the connection string to null when there are problems contacting the database or other services.

Required?	false
Default Value	false
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false

Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Set-SfDBConnection command returns an object containing the status of the Storefront Service together with extra diagnostics information.

DBUnconfigured

The Storefront Service does not have a database connection configured.

DBRejectedConnection

The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

DBOlderVersionThanService

The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Storefront Service is running and is connected to a database containing a valid schema.

Failed

The Storefront Service has failed.

Unknown

The status of the Storefront Service cannot be determined.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

DatabaseConnectionDetailsAlreadyConfigured

There was already a database connection configured. After a configuration is set, it can only be set to $null.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

-------------------------- EXAMPLE 1 --------------------------

```
c:\PS>Set-SfDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName;  Integrated Security = True"

OK
```

Configures a database connection string for the Storefront Service.

-------------------------- EXAMPLE 2 --------------------------

```
c:\PS>Set-SfDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
```

Configures an invalid database connection string for the Storefront Service.

Set-SfServiceMetadata

Apr 15, 2014

Adds or updates metadata on the given service.

Syntax

Set-SfServiceMetadata [-ServiceHostId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfServiceMetadata [-ServiceHostId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfServiceMetadata [-InputObject] <Service[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfServiceMetadata [-InputObject] <Service[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Allows you to store additional custom data against given service objects.

Related topics

Remove-SfServiceMetadata

Parameters

-ServiceHostId<Guid>

Id of the service

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Service[]>

Objects to which metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the service specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-SfServiceMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-SfServiceMetadata -ServiceHostId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                            Value
    ---                            -----
    property                       value
```

Add metadata with a name of 'property' and a value of 'value' to the service with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Set-SfTaskMetadata

Apr 15, 2014

Adds or updates metadata on the given Task.

Syntax

Set-SfTaskMetadata [-TaskId] <Guid> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfTaskMetadata [-TaskId] <Guid> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfTaskMetadata [-InputObject] <Task[]> -Name <String> -Value <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Set-SfTaskMetadata [-InputObject] <Task[]> -Map <PSObject> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Detailed Description

Provides the ability for additional custom data to be stored against given Task objects.

Related topics

Remove-SfTaskMetadata

Parameters

-TaskId<Guid>

Id of the Task

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue, ByPropertyName)

-InputObject<Task[]>

Objects to which the metadata is to be added.

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-Name<String>

Specifies the property name of the metadata to be added. The property must be unique for the Task specified. The property cannot contain any of the following characters \/;:#.*?=<>|[]()"'

Required?	true
Default Value	
Accept Pipeline Input?	false

-Value<String>

Specifies the value for the property.

Required?	true
Default Value	
Accept Pipeline Input?	false

-Map<PSObject>

Specifies a dictionary of (name, value)-pairs for the properties. This can either be a hashtable (created with @{"name1" = "val1"; "name2" = "val2"}) or a string dictionary (created with new-object "System.Collections.Generic.Dictionary[String,String]").

Required?	true
Default Value	
Accept Pipeline Input?	true (ByValue)

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false

Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Return Values

System.Collections.Generic.Dictionary[String,String]

Set-SfTaskMetadata returns a dictionary containing the new (name, value)-pairs.

Key <string>

Specifies the name of the property.

Value <string>

Specifies the value for the property.

Notes

If the command fails, the following errors can be returned.

Error Codes

InvalidParameterCombination

The cmdlet parameters are inconsistent.

UnknownObject

One of the specified objects was not found.

DatabaseError

An error occurred in the service while attempting a database operation.

DatabaseNotConfigured

The operation could not be completed because the database for the service is not configured.

DataStoreException

An error occurred in the service while attempting a database operation - communication with the database failed for various reasons.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

Examples

---------- EXAMPLE 1 ----------

```
c:\PS>Set-SfTaskMetadata -TaskId 4CECC26E-48E1-423F-A1F0-2A06DDD0805C -Name property -Value value

    Key                         Value
    ---                         -----
    property                    value
```

Add metadata with a name of 'property' and a value of 'value' to the Task with the identifier '4CECC26E-48E1-423F-A1F0-2A06DDD0805C'.

Test-SfDBConnection

Apr 15, 2014

Tests a database connection for the Storefront Service.

Test-SfDBConnection [-DBConnection] <String> [-LoggingId <Guid>] [-AdminAddress <String>] [<CommonParameters>]

Tests a connection to the database in which the Storefront Service can store its state. The service will attempt to connect to the database without affecting the current connection to the database.

You do not have to clear the connection to use this command.

Get-SfServiceStatus

Get-SfDBConnection

Set-SfDBConnection

-DBConnection<String>

Specifies the database connection string to be tested by the Storefront Service.

Required?	true
Default Value	
Accept Pipeline Input?	false

-LoggingId<Guid>

Specifies the identifier of the high-level operation this cmdlet call forms a part of. Citrix Studio and Director typically create high-level operations. PowerShell scripts can also wrap a series of cmdlet calls in a high-level operation by way of the Start-LogHighLevelOperation and Stop-LogHighLevelOperation cmdlets.

Required?	false
Default Value	
Accept Pipeline Input?	false

-AdminAddress<String>

Specifies the address of a XenDesktop controller the PowerShell snap-in will connect to. You can provide this as a host name or an IP address.

Required?	false
Default Value	Localhost. Once a value is provided by any cmdlet, this value becomes the default.
Accept Pipeline Input?	false

Citrix.Fma.Sdk.Utilities.Service.ServiceStatusInfo

The Test-SfDBConnection command returns an object containing the status of the Storefront Service if the connection string of the specified data store were to be set to the string being tested, together with extra diagnostics information for the specified connection string.

DBRejectedConnection

The database rejected the logon attempt from the Storefront Service. This may be because the service attempted to log on with invalid credentials or because a database has not been installed in the specified location.

InvalidDBConfigured

The expected stored procedures are missing from the database. This may be because the Storefront Service schema has not been added to the database.

DBNotFound

The specified database could not be located with the configured connection string.

DBNewerVersionThanService

The version of the Storefront Service currently in use is incompatible with the version of the Storefront Service schema on the database. Upgrade the Storefront Service to a more recent version.

DBOlderVersionThanService

The version of the Storefront Service schema on the database is incompatible with the version of the Storefront Service currently in use. Upgrade the database schema to a more recent version.

DBVersionChangeInProgress

A database schema upgrade is currently in progress.

OK

The Set-SfDBConnection command would succeed if it were executed with the supplied connection string.

Failed

The Storefront Service has failed.

Unknown

The status of the Storefront Service cannot be determined.

If the command fails, the following errors can be returned.

Error Codes

InvalidDBConnectionString

The database connection string has an invalid format.

PermissionDenied

You do not have permission to execute this command.

AuthorizationError

There was a problem communicating with the Citrix Delegated Administration Service.

ConfigurationLoggingError

The operation could not be performed because of a configuration logging error.

CommunicationError

There was a problem communicating with the remote service.

ExceptionThrown

An unexpected error occurred. For more details, see the Windows event logs on the controller or the XenDesktop logs.

---------- EXAMPLE 1 ----------

c:\PS>Test-SfDBConnection -DBConnection "Server=serverName\SQLEXPRESS;Initial Catalog = databaseName; Integrated Security = True"

OK
Tests a database connection string for the Storefront Service.

---------- EXAMPLE 2 ----------

c:\PS>Test-SfDBConnection -DBConnection "Invalid Connection String"

Invalid database connection string format.
Tests an invalid database connection string for the Storefront Service.
